Selects targets with the specified portal.

{-target-name <text>} - iSCSI Name
Selects targets with the specified target name.

{-status-admin {down|up]} - Administrative Status
Selects targets with the specified administrative status.

{-status-oper {down|up]} - Operational Status
Selects targets with the specified operational status.

{-failure-reason <text>} - Failure Reason
Selects targets with the specified failure reason.

Examples
The following example displays the list of iSCSI targets for each node in the cluster.

<table>
<thead>
<tr>
<th>Node Type</th>
<th>Label</th>
<th>Target Portal</th>
<th>Target Name</th>
<th>Status</th>
<th>Admin/Op</th>
</tr>
</thead>
<tbody>
<tr>
<td>mailbox</td>
<td>mediator</td>
<td>10.235.14.141</td>
<td>iqn.2012-05.local:mailbox.group.1</td>
<td>up/up</td>
<td></td>
</tr>
<tr>
<td>partner</td>
<td>partner</td>
<td>10.63.7.205:65200</td>
<td>iqn.2012-06.com.bsdctl:target0</td>
<td>up/up</td>

</tr>
</tbody>
</table>
storage load commands

The load directory

storage load balance

Balance storage I/O across controller's initiator ports

Availability: This command is available to cluster administrators at the admin privilege level.

Description
This command is obsolete. I/O load is balanced automatically every five minutes.

Parameters
- -node {<nodename>|local} - Node to balance on
    The name of the clustered node for which information is being displayed.

Examples

storage load show

Display I/O statistics to array LUNs, grouped by initiator port.

Availability: This command is available to cluster administrators at the admin privilege level.

Description
This command is obsolete. The storage load show command displays the load distribution of I/O on the cluster.

Parameters
{ [-fields <fieldname>, ...]  
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use ‘-fields ?’ to display the fields to specify.

| [-switch ]
The switch parameter adds switch information to the display.

| [-instance ]}
If you specify the -instance parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Controller name
The name of the clustered node for which information is being displayed.

[-initiator-port <text>] - Initiator Port
The initiator port of the array LUN for which I/O stats are being displayed.

[-wwpn <text>] - Target Port WWPN
The World Wide Port Name of the array LUN for which I/O stats are being displayed.
### Examples

```
cluster1::> storage load show -switch  
Initiator port: 0a connected to vnbr3850s4:7.

<table>
<thead>
<tr>

### storage path commands

The path directory
**storage path quiesce**

Quiesce I/O on a path to array

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The `storage path quiesce` command quiesces I/O on one path to a LUN. It also quiesces the given entire path immediately or can monitor the given path for error threshold before quiesce. After the I/O has been quiesced, no new I/O is sent on the path unless the `storage path resume` command is issued to continue I/O.

**Parameters**

- **-node <nodename>|local** - Node name
  The name of the clustered node for which information is being displayed.

- **-initiator <initiator name>** - Initiator Port
  Initiator port that the clustered node uses.

- **-target-wwpn <wwpn name>** - Target Port
  Target World Wide Port Name. Port on the storage array that is being used.

{ [-lun-number <integer>] - LUN Number
  Logical Unit number. The range is: [0...65535]. If this parameter is not specified, Data ONTAP resumes the entire path to an array.

| [ -path-failure-threshold <integer>] - Max Number of Path Failures Acceptable During wait-duration
  The path failure count, exceeding this value within wait duration will quiesce the path.

[ -wait-duration <integer>]} - Wait Duration in minutes
  The time duration(minutes) in which path is monitored for path failures.

**Examples**

The following example suspends I/O between node vbv3170f1b, port 0a and the array port 50001fe1500a8669, LUN 1.
```
node::> storage path quiesce -node vbv3170f1b -initiator 0a -target-wwpn 50001fe1500a8669 -lun-number 1
```

The following example suspends I/O immediately between node vbv3170f1b, port 0a and the array port 50001fe1500a8669.
```
node::> storage path quiesce -node vbv3170f1b -initiator 0a -target-wwpn 50001fe1500a8669
```

The following example suspends I/O between node vbv3170f1b, port 0a and the array port 50001fe1500a8669 after reaching 10 or more errors in duration of 5 mins.
```
node::> storage path quiesce -node vbv3170f1b -initiator 0a -target-wwpn 50001fe1500a8669 -path-failure-threshold 10 -wait-duration 5
```

**Related references**

`storage path resume` on page 848
storage path resume

Resume I/O on a path to array

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The storage path resume command continues I/O flow to an array LUN on a path or the entire path that was previously quiesced. It also disables the path failures monitoring feature, if it was enabled using the storage path quiesce -path-failure-threshold count command.

Parameters
- node {<nodename>|local} - Node name
  The name of the clustered node for which information is being displayed.
- initiator <initiator name> - Initiator Port
  Initiator port that the clustered node uses.
- target-wwpn <wwpn name> - Target Port
  Target World Wide Port Name. Port on the storage array that is being used.
[-lun-number <integer>] - LUN Number
  Logical Unit number. The range is: [0...65535]. If this parameter is not specified, Data ONTAP resumes the entire path to an array.

Examples
The following example resumes I/O between node vbv3170f1b, port 0a and the array port 50001fe1500a8669, LUN 1
node::> storage path resume -node vbv3170f1b -initiator 0a -target-wwpn 50001fe1500a8669 -lun-number 1

The following example resumes I/O between node vbv3170f1b, port 0a and the array port 50001fe1500a8669
node::> storage path resume -node vbv3170f1b -initiator 0a -target-wwpn 50001fe1500a8669

storage path quiesce on page 847

storage path show

Display a list of paths to attached arrays.

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The storage path show command displays path based statistics. The default command shows:
- Node name
- Initiator port
- Target port
- TPGN
• Port speeds
• Path I/O in Kbytes/sec
• IOPs

Parameters

[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-array]
Using this option displays:
• Array name
• Target port
• Target I/O in Kbytes/sec
• Target side switch port
• Path I/O in Kbytes/sec
• Initiator side switch port
• Initiator I/O in Kbytes/sec
• Initiator port

[-by-target]
Using this option displays the same information as the array option, but grouped by target port.

[-detail]
Using this option displays the same information as the array and by-target options, but adds the following:
• Target IOPs
• Target LUNs
• Path IOPs
• Path errors
• Path quality
• Path LUNs
• Initiator IOPs
• Initiator LUNs

[-switch]
Using this option adds switch port information to the default display.

[-instance]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-node {[<nodename> | local]} - Controller name
The name of the clustered node for which information is being displayed.

[-array-name <array name>] - Array Name
Name of the storage array that is connected to the cluster.
[-target-wwpn <text>] - Target Port
    Target World Wide Port Name. Port on the storage array that is being used.

[-initiator <text>] - Initiator Port
    Initiator port that the clustered node uses.

[-initiator-side-switch-port <text>] - Initiator Side Switch Port
    Switch port connected to the clustered node.

[-tpgn <integer>] - Target Port Group Number
    TPGN refers to the target port group to which the target port belongs. A target port group is a set of target ports which share the same LUN access characteristics and failover behaviors.

[-port-speed <text>] - Port Speed
    Port Speed of the specified port.

[-path-io-kbps <integer>] - Kbytes of I/O per second on Path (Rolling Average)
    Rolling average of I/O per second on the path.

[-path-iops <integer>] - Number of IOPS on Path (Rolling Average)
    Rolling average of Kbytes of I/O per second on the path.

[-initiator-io-kbps <integer>] - Kbytes of I/O per second on Initiator (Rolling Average)
    Rolling average of I/O per second on the initiator port.

[-initiator-iops <integer>] - Number of IOPS on Initiator (Rolling Average)
    Rolling average of Kbytes of I/O per second on the initiator port.

[-target-io-kbps <integer>] - Kbytes of I/O per second to Target (Rolling Average)
    Rolling average of I/O per second on the target port.

[-target-iops <integer>] - Number of IOPS to Target (Rolling Average)
    Rolling average of Kbytes of I/O per second on the target port.

[-target-side-switch-port <text>] - Target Side Switch Port
    Switch port connected to the array.

[-path-link-errors <integer>] - Link Error count on path
    Fibre Channel link error count.

[-path-quality <integer>] - Percentage of weighted error threshold
    A number representing the threshold of errors that is allowed on the path. Path quality is a weighted error value. When the error weight of a path exceeds the threshold, I/O is routed to a different path.

[-path-lun-in-use-count <integer>] - Number of LUNs in the in-use state on this path
    Number of LUNs on this path.

[-initiator-lun-in-use-count <integer>] - Number of LUNs in the in-use state on this initiator
    Number of LUNs on this initiator.

[-target-lun-in-use-count <integer>] - Number of LUNs in the in-use state on this target
    Number of LUNs on this target.

[-vmdisk-device-id <integer>] - Virtual disk device ID
    Common device identifier, shared by a VM and its hypervisor, of a virtual disk. On ESX servers, this is the Disk ID component of a virtual device node, with a value of 0 to 15.

[-path-failure-threshold <integer>] - Max number of path failures acceptable in wait-duration
    The path failure count, exceeding this value within wait duration will quiesce the path.
[\[-\text{wait-duration} \langle\text{integer}\rangle\]\] - Wait Duration in minutes

The time duration(minutes) in which path is monitored for path failures.

### storage path show-by-initiator

Display a list of paths to attached arrays from the initiator's perspective.

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

The `storage path show-by-initiator` command displays path based statistics. The output is similar to the `storage path show` command but the output is listed by initiator.

**Parameters**

```
[[-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.
][[-instance]]
  If you specify the -instance parameter, the command displays detailed information about all fields.
[-node {<nodename>|local}] - Controller name
  The name of the clustered node for which information is being displayed.
[-initiator <text>] - Initiator Port
  Initiator port that the clustered node uses.
[-target-wwpn <text>] - Target Port
  Target World Wide Port Name. Port on the storage array that is being used.
[-initiator-side-switch-port <text>] - Initiator Side Switch Port
  Switch port connected to the clustered node.
[-target-side-switch-port <text>] - Target Side Switch Port
  Switch port connected to the array.
```

5 entries were displayed.
[-array-name <array name>] - Array Name
Name of the storage array that is connected to the cluster.

[-tpgn <integer>] - Target Port Group Number
TPGN refers to the target port group to which the target port belongs. A target port group is a set of target ports which share the same LUN access characteristics and failover behaviors.

[-port-speed <text>] - Port Speed
Port Speed of the specified port.

[-path-io-kbps <integer>] - Kbytes of I/O per second on Path (Rolling Average)
Rolling average of I/O per second on the path.

[-path-iops <integer>] - Number of IOPS on Path (Rolling Average)
Rolling average of Kbytes of I/O per second on the path.

[-initiator-io-kbps <integer>] - Kbytes of I/O per second on Initiator (Rolling Average)
Rolling average of I/O per second on the initiator port.

[-initiator-iops <integer>] - Number of IOPS on Initiator (Rolling Average)
Rolling average of Kbytes of I/O per second on the initiator port.

[-target-io-kbps <integer>] - Kbytes of I/O per second to Target (Rolling Average)
Rolling average of I/O per second on the target port.

[-target-iops <integer>] - Number of IOPS to Target (Rolling Average)
Rolling average of Kbytes of I/O per second on the target port.

Examples

```
vnv3070f20b::> storage path show-by-initiator
Node: vnv3070f20b
                   Initiator I/O       Initiator Side     Path I/O          Target Side   Target I/O

Storage pool Commands

Manage storage pools

The *storage pool* command family provides the ability to create and manage SSD storage pools. Storage pools are collections of solid-state disks (SSDs) that can be shared between multiple Flash Pool or All-Flash aggregates and between two nodes of an HA pair.

A storage pool’s capacity cannot be shared between Flash Pool and All-Flash aggregates at the same time.
For provisioning storage pool capacity into All-Flash aggregates, the `vserver` option `raid.storagepool.data.enable` must be set to `true`. The storage pool data enabled mode of operation is not currently supported by OnCommand management software.

The use of SSD storage pools is optional. Aggregates can use whole SSDs, or they can use SSD capacity from storage pools. When multiple aggregates share the SSD capacity from an SSD storage pool, there is a reduction in parity overhead and you have the ability to share high SSD performance across multiple aggregates and across both nodes of an HA pair. A storage pool contains a minimum of 3 and a maximum of 29 SSDs.

When an SSD storage pool is created using the `storage pool create` command, the SSDs are divided into four equal-sized partitions. The capacity of the group of disks is expressed in terms of allocation units. Each allocation unit is 25% of the capacity. The storage pool initially contains unprovisioned allocation units which can be displayed using the `storage pool show-available-capacity` command.

In an HA configuration, each node takes ownership of two allocation units representing 50% of the total capacity. If desired, the ownership of the allocation units can be adjusted using the `storage pool reassign` command before the capacity is used in an aggregate.

Storage pools do not have an associated RAID type. The RAID type is determined when an allocation unit is added to an aggregate using the `storage aggregate add-disks` command. A storage pool contains four allocation units, and they might be used in up to four aggregates. You can add multiple allocation units to a Flash Pool or All-Flash aggregate to increase its cache or usable capacity respectively.

The space in an SSD storage pool can be expanded by adding SSDs to the storage pool using the `storage pool add` command. The size of each of the four allocation units will expand by 25% of the capacity of the disks being added. For example, if an SSD with a usable size of 745 GB is added to a storage pool that is part of four aggregates, each aggregate will grow its cache or usable capacity by 186.25 GB. If a different allocation is desired, create a new SSD storage pool using the `storage pool create` command.

All storage pool available capacity can be provisioned into aggregates. Available capacity within a storage pool is not used to protect against a disk failure. In the case of an SSD failure or predicted failure, Data ONTAP moves a suitable whole spare SSD from outside the storage pool into the storage pool and begins the recovery process (using either reconstruction or Rapid RAID Recovery, whichever is appropriate).

- `storage pool add` on page 854

**storage pool add**

Add disks to a storage pool

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**

The `storage pool add` command increases the total capacity of an existing storage pool by adding the specified SSDs to the storage pool. The disks are split into four equal partitions and added to each of the allocation units of the storage pool. If any allocation units from the storage pool have already been allocated to an aggregate, the cache or usable capacity of that aggregate is increased depending on whether it is a Flash Pool or an All-Flash aggregate.

If capacity from a storage pool is already provisioned into a Flash Pool aggregate, the same storage pool cannot be used to provision an All-Flash aggregate and vice-versa.

For provisioning storage pool capacity into All-Flash aggregates, the Vserver option `raid.storagepool.data.enable` must be set to `true`. The storage pool data enabled mode of operation is not currently supported by OnCommand management software.
For example, if an SSD with a usable size of 745 GB is added to a storage pool that is part of four aggregates, each aggregate will grow its cache or usable capacity by 186.2 GB. If a different allocation is desired, create a new storage pool using the `storage pool create` command.

**Parameters**

- **-storage-pool <storage pool name>** - Storage Pool Name
  This parameter specifies the storage pool to which disks are to be added.

- **[-disk-count <integer>]** - Number of Disks to Add in Storage Pool
  This parameter specifies the number of disks that are to be added to the storage pool. The disks to be added come from the pool of spare disks.

- **[-nodes <nodename>|local>,...]** - Nodes From Which Spares Should be Selected
  This parameter specifies a list of nodes from which SSD disks are selected for addition to the storage pool. If this parameter is not specified, disks to be added to the storage pool can be selected from both the nodes sharing the storage pool. Use this parameter to restrict the selection of spare disks to one particular node.

- **[-disk-list <disk path name>,...]** - List of Spare Disks
  This parameter specifies a list of disks to be added to the storage pool. In an HA configuration, SSDs being added to a storage pool can be owned by either node in the HA pair.

- **[-quiet [true]]** - Confirmations off (privilege: advanced)
  When set to `true`, this parameter specifies the operation should be executed without pausing for confirmation.

- **[-simulate [true]]** - Simulate Storage Pool Addition
  When set to `true`, this parameter specifies the operation should be performed as a simulation. The command reports which aggregates would grow automatically as a result of adding the disks to the storage pool. The disks are not added to the storage pool.

**Examples**

In this example, the user requests a report detailing the changes that would occur if a new disk is added to the storage pool `SP1`. In this case, 186.2 GB of cache is added to the Flash Pool aggregates `nodeA_flashpool_1` and `nodeB_flashpool_1`. There are two unprovisioned allocation units in the storage pool and therefore the storage pool available capacity also grows by 372.5 GB.

```
cluster1::> storage pool add -storage-pool SP1 -disk-list 1.0.23 -simulate
```

This operation will result in capacity being allocated in the following way:

<table>
<thead>
<tr>
<th>Container Name</th>
<th>Capacity</th>
<th>Current Size</th>
<th>New Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>nodeA_flashpool_1</td>
<td>186.2GB</td>
<td>558.7GB</td>
<td>744.9GB</td>
</tr>
<tr>
<td>nodeB_flashpool_1</td>
<td>186.2GB</td>
<td>558.7GB</td>
<td>744.9GB</td>
</tr>
<tr>
<td>(Available Capacity)</td>
<td>372.5GB</td>
<td>1.09TB</td>
<td>1.45TB</td>
</tr>
</tbody>
</table>

Check via simulation whether there is available capacity within allocation units in storage pool `SP1` for allocation units that are provisioned into aggregates.

```
cluster1::> storage pool add -storage-pool SP1 -simulate -auto-grow-aggregates true
```

Info: This operation results in capacity being allocated in the following way:

<table>
<thead>
<tr>
<th>Container Name</th>
<th>Capacity</th>
<th>Current Size</th>
<th>New Size</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
The following example adds one disk to a storage pool named *SP1*. The spare disks are selected from either local node or its partner or both based on spare availability.

```
cluster-1::> storage pool add -storage-pool SP1 -disk-count 1
Info: The following disks will be added to storage pool "SP1":

<table>
<thead>
<tr>
<th>Disk</th>
<th>Size</th>
<th>Type</th>
<th>Owner</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.0.12</td>
<td>744.9GB</td>
<td>SSD</td>
<td>cluster-1-01</td>
</tr>
</tbody>
</table>

New Allocation Unit Size: 744.8GB
Capacity will be allocated in the following way:

<table>
<thead>
<tr>
<th>Container Name</th>
<th>Capacity To Be Added</th>
<th>Current Size</th>
<th>New Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>nodeA_flashpool_1</td>
<td>186.2GB</td>
<td>558.7GB</td>
<td>744.9GB</td>
</tr>
<tr>
<td>nodeB_flashpool_1</td>
<td>186.2GB</td>
<td>558.7GB</td>
<td>744.9GB</td>
</tr>
<tr>
<td>(Available Capacity)</td>
<td>372.5GB</td>
<td>1.09TB</td>
<td>1.45TB</td>
</tr>
</tbody>
</table>

Are you sure you want to continue with this operation?
{y|n}: y

[Job 48] Job succeeded: storage pool add job for "SP1" completed successfully
```

**Related references**

- *storage pool create* on page 856

---

**storage pool create**

Create a new storage pool

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The *storage pool create* command creates an SSD storage pool using a given list of spare SSDs.

When a storage pool is created, Data ONTAP splits the capacity provided by the SSDs into four equally-sized allocation units. In an HA configuration, two allocation units (containing 50% of the total capacity) are assigned to each node in the HA pair. This assignment can be modified using the *storage pool reassign* command.

After the storage pool is created, its allocation units can be provisioned into Flash Pool or All-Flash aggregates using the *storage aggregate add-disks* command and the `-storage-pool` parameter.

If capacity from a storage pool is already provisioned into a Flash Pool aggregate, the same storage pool cannot be used to provision an All-Flash aggregate and vice versa.

For provisioning storage pool capacity into All-Flash aggregates, the *vserver* option *raid.storagepool.data.enable* must be set to *true*. The storage pool data enabled mode of operation is not currently supported by OnCommand management software.

**Parameters**

- `-storage-pool <storage pool name>` - *Storage Pool Name*

  This parameter specifies the name of the storage pool that is to be created. The SSDs are partitioned and placed into the new storage pool.
[-nodes {<nodename>|local}, ...] - Nodes Sharing the Storage Pool

This parameter specifies a list of nodes from which SSD disks are selected to create the storage pool. If two
nodes are specified then they need to be in HA configuration. Spare disks are selected from either node or its
partner or both. If this parameter is not specified, storage pool will be created by selecting disks from either
the node or its partner or both from where command is run.

-disk-count <integer> - Number of Disks in Storage Pool

This parameter specifies the number of disks that are to be included in the storage pool. The disks in this
newly created storage pool come from the pool of spare disks. The smallest disks in this pool are added to the
storage pool first, unless you specify the -disk-size parameter.

[-disk-size {<integer>[KB|MB|GB|TB|PB]}] - Disk Size

This parameter specifies the size of the disks on which the storage pool is to be created. Disks with a usable
size between 95% and 105% of the specified size are selected.

[-disk-list <disk path name>, ...} - Disk List for Storage Pool Creation

This parameter specifies a list of SSDs to be included in the new storage pool. The SSDs must be spare disks
and can be owned by either node in an HA pair.

[-simulate [true]] - Simulate Storage Pool Creation

This option simulates the storage pool creation and prints the allocation unit size that would be used for the
storage pool.

Examples

The following example creates a storage pool named SP1. The storage pool contains 3 SSD disks, the spare disks selected
are from either local node, or its partner or both based on spare availability.

```shell
cluster1::> storage pool create -storage-pool SP1 -disk-count 3
```

The following example creates a storage pool named SP2. The storage pool contains 3 SSD disks, the spare disks selected
are from either node0, or its partner node1 or both based on spare availability.

```shell
cluster1::> storage pool create -storage-pool SP2 -disk-count 3 -nodes node0,node1
```

The following example creates a storage pool named SP3 from four SSDs using disk list.

```shell
cluster1::> storage pool create -storage-pool SP3 -disk-list 1.0.13, 1.0.15, 1.0.17, 1.0.19
```

storage pool delete

Delete an existing storage pool

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The storage pool delete command deletes an existing SSD storage pool. At the end of the operation, the SSDs are
converted back to spare disks.
Parameters

(storage-pool <storage pool name>) - Storage Pool Name

This parameter specifies the storage pool that you want to delete. You can delete the storage pool only if all of the allocation units in the storage pool are available.

Examples

Verify that storage pool SP3 is ready for deletion by confirming it has four available allocation units and then delete it.

```
cluster1::> storage pool show-available-capacity -storage-pool SP3

<table>
<thead>
<tr>
<th>Node</th>
<th>Storage Pool</th>
<th>Storage SyncMirror</th>
<th>Allocation Unit</th>
<th>Total</th>
</tr>
</thead>
<tbody>
<tr>
<td>node-a</td>
<td>SP3</td>
<td>SSD</td>
<td>Pool0</td>
<td>372.5GB</td>
</tr>
<tr>
<td>node-b</td>
<td>SP3</td>
<td>SSD</td>
<td>Pool0</td>
<td>372.5GB</td>
</tr>
</tbody>
</table>

2 entries were displayed.
```

```
cluster1::> storage pool delete -storage-pool SP3

Warning: Are you sure you want to delete storage pool "SP3"? [y|n]: y

[Job 313] Job succeeded: storage pool delete job for "SP3" completed successfully
```

storage pool reassign

Reassign capacity from one node to another node in storage pool

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The storage pool reassign command changes the ownership of unprovisioned (available) storage pool allocation units from one HA partner to the other for an existing storage pool.

Parameters

(storage-pool <storage pool name>) - Storage Pool Name

This parameter specifies the storage pool within which available capacity is reassigned from one node to another.

(from-node <nodename>|local) - Reassign Available Capacity from This Node

This parameter specifies the name of the node that currently owns the allocation units.

(to-node <nodename>|local) - Reassign Available Capacity to This Node

This parameter specifies the name of the node that will now own the allocation units.

(allocation-units <integer>) - Allocation Units

This parameter specifies the number of allocation units to be reassigned.

Examples

Move an available allocation unit from node-b to node-a in preparation for provisioning the allocation units on node-a.

```
cluster1::*> storage pool show-available-capacity -storage-pool SP2

<table>
<thead>
<tr>
<th>Node</th>
<th>Storage Pool</th>
<th>Storage SyncMirror</th>
<th>Allocation Unit</th>
<th>Total</th>
</tr>
</thead>
<tbody>
<tr>
<td>node-a</td>
<td>SP2</td>
<td>SSD</td>
<td>Pool0</td>
<td>744.9GB</td>
</tr>
<tr>
<td>node-b</td>
<td>SP2</td>
<td>SSD</td>
<td>Pool0</td>
<td>744.9GB</td>
</tr>
</tbody>
</table>

2 entries were displayed.
```

```
cluster1::*> storage pool reassign -storage-pool SP2 -from-node node-b -to-node node-a -allocation-units 1
```
cluster1::*> storage pool show-available-capacity -storage-pool SP2

<table>
<thead>
<tr>
<th>Node</th>
<th>Storage Pool</th>
<th>Type</th>
<th>Pool</th>
<th>Unit size</th>
<th>Count</th>
<th>Usable Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>node-a</td>
<td>SP2</td>
<td>SSD</td>
<td>Pool0</td>
<td>744.9GB</td>
<td>3</td>
<td>2.18TB</td>
</tr>
<tr>
<td>node-b</td>
<td>SP2</td>
<td>SSD</td>
<td>Pool0</td>
<td>744.9GB</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

2 entries were displayed.

storage pool show-available-capacity on page 862

storage pool show

Display details of storage pools

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The storage pool show command displays information about SSD storage pools in the cluster. By default, the command displays information about all storage pools in the cluster. You can specify parameters to limit the output to a specific set of storage pools.

Parameters

{ [-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

| [-instance ] |

If you specify the -instance parameter, the command displays detailed information about all fields.

[-storage-pool <storage pool name>] - Storage Pool Name

Selects the storage pools that match this parameter value.

[-storage-pool-uuid <UUID>] - UUID of Storage Pool

Selects the storage pools that match this parameter value.

[-nodes {<nodename>|local}, ...] - Nodes Sharing the Storage Pool

Selects the storage pools that match this parameter value.

In an HA pair, either node name may be specified.

[-disk-count <integer>] - Number of Disks in Storage Pool

Selects the storage pools that match this parameter value.

[-allocation-unit-size {<integer> [KB|MB|GB|TB|PB]}] - Allocation Unit Size

Selects the storage pools that match this parameter value.

Allocation units represent the unit of storage allocated to aggregates from this storage pool.

[-allocation-unit-data-size-raid4 {<integer> [KB|MB|GB|TB|PB]}] - Allocation Unit Data Size for RAID4

This parameter shows the amount of additional data capacity provided if an allocation unit from this storage pool was added to an aggregate with -raidtype as raid4.
- `allocation-unit-data-size-raid-dp <integer> [KB|MB|GB|TB|PB]` - Allocation Unit Data Size for RAID-DP
  This parameter shows the amount of additional data capacity provided if an allocation unit from this storage pool was added to an aggregate with `-raidtype` as `raid_dp`.

- `allocation-unit-data-size-raid-tec <integer> [KB|MB|GB|TB|PB]` - Allocation Unit Data Size for RAID-TEC
  This parameter shows the amount of additional data capacity provided if an allocation unit from this storage pool was added to an aggregate with `-raidtype` as `raid_tec`.

- `storage-type <SSD>` - Storage Type
  Selects the storage pools that match this parameter value.
  Only the `SSD` type is supported for this version of Data ONTAP.

- `pool usable-size <integer> [KB|MB|GB|TB|PB]` - Storage Pool Usable Size
  Selects the storage pools that match this parameter value.
  The `pool usable-size` is the sum of the capacities of the allocation units that are assigned to nodes but not yet provisioned. The amount of `pool usable-size` that is contributed to the cache or usable capacity of an aggregate depends upon the RAID type used when provisioning the allocation units.

- `pool total-size <integer> [KB|MB|GB|TB|PB]` - Storage Pool Total Size
  Selects the storage pools that match this parameter value.
  The `pool total-size` is the sum of the capacities of allocation units belonging to this storage pool.

- `is-healthy {true|false}` - Is Pool Healthy?
  Selects the storage pools that match this parameter value.
  For storage pools with `is-healthy false`, the `unhealthy-reason` parameter provides more information.
  `is-healthy` must be `true` to provision allocation units from a storage pool into an aggregate.

- `pool state <State of the Storage Pool>` - State of the Storage Pool
  Selects the storage pools that match this parameter value. Possible states are:
  - normal - the storage pool is operating normally.
  - degraded - the storage pool has one or more failed disks.
  - creating - the storage pool is being created.
  - deleting - the storage pool is being deleted.
  - reassigning - allocation units are being reassigned from one node to another.
  - growing - allocation units in the storage pool are expanding due to the addition of new capacity into the storage pool.

- `unhealthy-reason <text>` - Reason for Storage Pool Being Unhealthy
  Selects the storage pools that match this parameter value.
  The message provided gives additional details about why the storage pool is unhealthy.

- `current-operation-job-id <integer>` - Job ID of the Currently Running Operation
  Selects the storage pools that match this parameter value.
  Long-running operations associated with storage pools will be managed via jobs. For example, if you provision allocation units from a storage pool into an aggregate and the disks associated with the storage pool need to be zeroed, the operation will be completed via a job.
Examples
Display the storage pools in the cluster.

```
cluster1::> storage pool show
Storage Pool Type   #Disks Nodes       Total Size
-------------------- ----- -------------- ------------
LargeSP             SSD       10 node-a,node-b  7.27TB
SmallSP             SSD        2 node-a,node-b  1.45TB
2 entries were displayed.
```

The following example displays the details of a storage pool named SmallSP. Only one of its four allocation unit has been provisioned, so 75% of its size is available (usable).

```
cluster1::> storage pool show -storage-pool SmallSP

Storage Pool Name: SmallSP
UUID of Storage Pool: 60f2f1b9-e60f-11e3-a5e7-00a0981899a2
Nodes Sharing the Storage Pool: node-a, node-b
Number of Disks in Storage Pool: 2
Allocation Unit Size: 372.5GB
Storage Type: SSD
Storage Pool Usable Size: 1.09TB
Storage Pool Total Size: 1.45TB
Is Pool Healthy?: true
State of the Storage Pool: normal
Reason for storage pool being unhealthy: -
Job ID of the Currently Running Operation: -

Is Allocation Unit Broken?: false
```

storage pool show-aggregate
Display aggregates provisioned from storage pools

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The `storage pool show-aggregate` command displays allocation information for SSD storage pools in the cluster. The command output depends upon the parameter or parameters specified with the command. If no parameters are specified, the command displays information about allocations of all storage pools in the cluster.

Parameters

```
[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use ‘-fields ?’ to display the fields to specify.

[-instance]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-storage-pool <storage pool name>] - Name of Storage Pool
Selects the storage pools that match this parameter value.

[-aggregate <aggregate name>] - Aggregate
Selects the storage pools that match this parameter value.
```
[-capacity <integer>[KB|MB|GB|TB|PB]] - Capacity
Selects the storage pools that match this parameter value.
Capacity includes space provided by data and parity portions of each allocation unit. Only the data portions of each allocation unit contribute to the cache or usable capacity of Flash Pool or All-Flash aggregates respectively.

[-allocated-unit-count <integer>] - Number of AU's Assigned to ThisAggregate
Selects the storage pools that match this parameter value.

[-original-owner <text>] - Original Owner Name
Selects the storage pools that match this parameter value.

[-node <nodename>|local]] - Node
Selects the storage pools that match this parameter value.

Examples
Display information about the aggregate or aggregates using a storage pool called SP2:

```
cluster1::> storage pool show-aggregate -storage-pool SP2 -instance
Name of Storage Pool: SP2
Aggregate: node2_flashpool_1
Capacity: 744.9GB
Number of AU's Assigned to This Aggregate: 1
Original Owner Name: node2
Node: node2
```

storage pool show-available-capacity
Display available capacity of storage pools

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The `storage pool show-available-capacity` command displays information about available capacity in SSD storage pools on each node in the cluster. The command output depends upon the parameter or parameters specified with the command. If no parameters are specified, the command displays information about available capacities in all shared pools in the cluster.

Storage pool available capacity is data storage space that has not yet been provisioned into Flash Pool or All-Flash aggregates. Allocation units might be provisioned into aggregates using the `storage aggregate add-disks` command and the `-storage-pool` parameter.

Note: All storage pool available capacity can be provisioned into aggregates. Available capacity within a storage pool is not used to protect against a disk failure. In the case of an SSD failure or predicted failure, Data ONTAP moves a suitable whole SSD spare disk from outside the storage pool into the storage pool and begins the recovery process (using either reconstruction or Rapid RAID Recovery, whichever is appropriate).

Parameters

| [-fields <fieldname>, ...] 
  If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

| [-instance ]] 
  If you specify the `-instance` parameter, the command displays detailed information about all fields. |
[-storage-pool <storage_pool name>] - Name of Storage Pool
Selects the available capacities that match this parameter value.

[-node {<nodename>|local}] - Node
Selects the available capacities that match this parameter value.

[-allocation-unit-size <integer>[KB|MB|GB|TB|PB]] - Allocation Unit Size
Selects the available capacities that match this parameter value.
Allocation units are the units of storage capacity that are available to be provisioned into aggregates.

[-storage-type <SSD>] - Type of Storage Pool
Selects the available capacities that match this parameter value. Only the SSD type is supported for this version of Data ONTAP.

[-allocation-unit-count <integer>] - Number of Allocation Units Available
Selects the available capacities that match this parameter value.
Allocation units are the units of storage capacity that are available to be provisioned into aggregates. Each allocation unit is one minimum unit of allocation (MUA) and its capacity is given as allocation-unit-size.

[-syncmirror-pool <text>] - Syncmirror Pool
Selects the available capacities that match this parameter value.
The SyncMirror pool of an allocation unit must match the SyncMirror pool of the disks of the aggregate when adding allocation units into an aggregate.
Mirroring of aggregates that are provisioned from SSD storage pools is not supported.

[-available-size <integer>[KB|MB|GB|TB|PB]] - Total Usable Available Size
Selects the available capacities that match this parameter value.
The available-size is the sum of the capacities of the allocation units that are assigned but not yet provisioned. The amount of available-size that is contributed to the cache or usable capacity of an aggregate depends upon the RAID type used when provisioning the allocation units.

Examples
In this example, two nodes of an HA pair share available capacity from two storage pools, SP1 and SP2. There are a total of 5 allocation units that have not yet been provisioned.

<table>
<thead>
<tr>
<th>Node</th>

storage aggregate add-disks on page 668

storage pool show-disks
Display disks in storage pools
Availability: This command is available to cluster administrators at the admin privilege level.
Description
The `storage pool show-disks` command displays information about disks in storage pools in the cluster. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays information about all disks in all storage pools in the cluster.

Parameters

`[-fields <fieldname>, ...]`
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

`[-instance]`
If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-storage-pool <storage pool name>]` - Name of Storage Pool
Selects the storage pools that match this parameter value.

`[-disk <disk path name>]` - Name of the disk
Selects the storage pools with the disks that match this parameter value.

`[-disk-type {ATA | BSAS | FCAL | FSAS | LUN | MSATA | SAS | SSD | VMDISK}]` - Disk Type
Selects the storage pools with the disks that match this parameter value. Only the `SSD` type is supported for this version of Data ONTAP.

`[-usable-size <integer>[KB|MB|GB|TB|PB]]` - Disk Usable Size
Selects the storage pools with the disks that match this parameter value.

In this command, `usable-size` refers to the sum of the capacities of all of the partitions on the disk.

`[-total-size <integer>[KB|MB|GB|TB|PB]]` - Total Size
Selects the storage pools with the disks that match this parameter value.

`[-node-list <nodename>, ...]` - List of Nodes
Selects the storage pools with the disks that are visible to all of the specified nodes.

Examples

Show information about SSDs in a storage pool called `SP2`.

```
cluster1:/> storage pool show-disks -storage-pool SP2
Storage Pool Name: SP2

<table>
<thead>
<tr>
<th>Disk</th>
<th>Type</th>
<th>Usable Size</th>
<th>Total Size</th>

```

Storage Port Commands

Manage storage ports

The `storage port` command family manages the storage ports of the cluster. The command set allows you to view the current status of all storage ports. You can also enable, disable, reset, or rescan a given port or reset a device behind a port.
storage port disable

Disable a storage port

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The storage port disable command disables a specified storage port.

Parameters
- **-node \{<nodename>|local\}** - Node
  Use this parameter to specify the node on which the port resides.
- **-port <text>** - Port
  Use this parameter to specify the port that needs to be disabled.
- **[-force [true]]** - Force (privilege: advanced)
  Use this optional parameter to force the disabling of the storage port. The parameter can be used to disable the specified port even if some devices can only be accessed using this port. Note that doing so might cause multiple device failures.

Examples
The following example disables port 0a on node node1:

```
cluster1::> storage port disable -node node1 -port 0a
```

storage port enable

Enable a storage port

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The storage port enable command enables a specified storage port.

Parameters
- **-node \{<nodename>|local\}** - Node
  Use this parameter to specify the node on which the port resides.
- **-port <text>** - Port
  Use this parameter to specify the port that needs to be enabled.

Examples
The following example enables port 0a on node node1:

```
cluster1::> storage port enable -node node1 -port 0a
```
storage port rescan

Rescan a storage port

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

The storage port rescan command rescans a specified storage port.

Parameters

- **-node <nodename>|local** - Node
  
  Use this parameter to specify the node on which the port resides.

- **-port <text>** - Port
  
  Use this parameter to specify the port that needs to be rescanned.

Examples

The following example rescans port 0a on node node1:

```
cluster1::> storage port rescan -node node1 -port 0a
```

storage port reset

Reset a storage port

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

The storage port reset command resets a specified storage port.

Parameters

- **-node <nodename>|local** - Node
  
  Use this parameter to specify the node on which the port resides.

- **-port <text>** - Port
  
  Use this parameter to specify the port that needs to be reset.

Examples

The following example resets port 0a on node node1:

```
cluster1::> storage port reset -node node1 -port 0a
```

storage port reset-device

Reset a device behind a storage port

Availability: This command is available to cluster administrators at the advanced privilege level.
Description
The storage port reset-device command resets a device behind a port. If the device is behind a SAS port, you need to specify the shelf name and bay ID where the device resides. If the device is behind a FC port, you need to specify the loop ID of the device.

Parameters
- node {<nodename>|local} - Node
  Use this parameter to specify the node on which the port resides.
- port <text> - Port
  Use this parameter to specify the port used to reset the device.
{ -shelf-name <text> - Shelf Name
  Use this parameter to specify the shelf where the device resides.
- bay-id <integer> - Bay ID
  Use this parameter to specify the bay where the device resides.
| -loop-id <integer> - Loop ID
  Use this parameter to specify the loop ID of the device.

Examples
The following example resets a device behind SAS port 0a on node node1:

```
cluster1::> storage port reset-device -node node1 -port 0a -shelf-name 1.0 -bay-id 10
```

The following example resets a device behind FC port 1b on node node1:

```
cluster1::> storage port reset-device -node node1 -port 1b -loop-id 20
```

storage port show
Show storage port information

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The storage port show command displays information about the storage ports in the cluster. If no parameters are specified, the default command displays the following information about the storage ports:

- Node
- Port
- Type
- Speed
- State
- Status

To display detailed profile information about a single storage port, use the -node and -port parameters.
### Parameters

`[-fields <fieldname>,...]`
Displays the specified fields for all the storage ports, in column style output.

`[[-errors]]`
Displays the following error status information about the storage ports which have errors:

- Error type
- Error severity
- Error description

`[[-instance]]`
Displays expanded information about all the storage ports in the system. If a storage port is specified, then this parameter displays detailed information for that port only.

`[-node <nodename>|local]` - Node
Displays detailed information about the storage ports on the specified node.

`[-port <text>]` - Port
Selects the ports with the specified port name.

`[-port-type {Unknown|SAS|FC}]` - Port Type
Selects the ports of the specified type.

`[-port-speed {0|1|1.5|2|3|4|6|8|10|12|16}]` - Port Speed
Selects the ports with the specified speed.

`[-state {enabled|disabled}]` - Port State
Selects the ports with the specified state.

`[-status {unknown|online|online-degraded|offline|link-down}]` - Port Status
Selects the ports with the specified operational status.

`[-description <text>]` - Description
Selects the ports with the specified description.

`[-firmware-rev <text>]` - Firmware Revision
Selects the ports with the specified firmware revision.

`[-serial-number <text>]` - Serial Number
Selects the ports with the specified serial number.

`[-connection-mode {Unknown|Loop|Point-to-point}]` - Connection Mode
Selects the ports with the specified connection mode.

`[-wwnn <FC WWN>]` - World Wide Node Name
Selects the ports with the specified World Wide Node Name.

`[-wwpn <FC WWN>]` - World Wide Port Name
Selects the ports with the specified World Wide Port Name.

`[-board-name <text>]` - Board Name
Selects the ports with the specified board name.

`[-connector-capabilities <integer>,...]` - Connector Capabilities
Selects the ports with the specified list of connector capabilities.

`[-wwn <FC WWN>]` - Base World Wide Name
Selects the ports with the specified World Wide Name.
[-mfg-part-number <text>] - MFG Part Number
Selects the ports with the specified manufacturer part number.

[-part-number <text>] - Part Number
Selects the ports with the specified part number.

[-date-code <text>] - Date Code
Selects the ports with the specified date code.

[-cable-length <text>] - Cable Length
Selects the ports with the specified cable length.

[-cable-identifier <text>] - Cable Identifier
Selects the ports with the specified cable identifier.

[-cable-end-id {end_0|end_1}] - Cable End Identifier
Selects the ports with the specified cable end identifier.

[-connector-technology {active-copper|passive-copper|optical}] - Connector Technology
Selects the ports with the specified connector technology.

[-phy-id <integer>,...] - Phy ID
Selects the ports that have phys with the specified phy ID.

[-phy-state {enabled|disabled},...] - Phy State
Selects the ports that have phys with the specified state.

[-phy-status {unknown|online|offline|speed-negotiation-failed|sata-oob-failed},...] - Phy Status
Selects the ports that have phys with the specified status.

[-phy-speed {0|1|1.5|2|3|4|6|8|10|12|16},...] - Phy Speed
Selects the ports that have phys with the specified speed.

[-error-type {unknown|online|online-degraded|offline|link-down}] - Error Type
Selects the ports with the specified error type.

[-error-severity {unknown|notice|warning|error|critical}] - Error Severity
Selects the ports with the specified error severity.

[-error-text <text>] - Error Text
Selects the ports with the specified error text.

[-corrective-action <text>] - Corrective Action
Selects the ports with the specified corrective action.

[-connector-type {QSFP|QSFP+|Mini-SAS HD|SFP}] - Connector Type
Selects the ports with the specified connector type.

[-connector-vendor <text>] - Connector Vendor
Selects the ports with the specified connector vendor.

[-connector-part-number <text>] - Connector Part Number
Selects the ports with the specified connector part number.

[-connector-serial-number <text>] - Connector Serial Number
Selects the ports with the specified connector serial number.

Examples
The following example displays information about all storage ports in the cluster:
cluster1::> storage port show

<table>
<thead>
<tr>
<th>Node</th>
<th>Port</th>
<th>Type</th>
<th>Speed (Gb/s)</th>
<th>State</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>node1</td>
<td>0a</td>
<td>SAS</td>
<td>0</td>
<td>disabled</td>
<td>offline</td>
</tr>
<tr>
<td>node1</td>
<td>0b</td>
<td>SAS</td>
<td>6</td>
<td>enabled</td>
<td>online</td>
</tr>
<tr>
<td>node1</td>
<td>1a</td>
<td>FC</td>
<td>0</td>
<td>disabled</td>
<td>offline</td>
</tr>
<tr>
<td>node1</td>
<td>1b</td>
<td>FC</td>
<td>2</td>
<td>enabled</td>
<td>online</td>
</tr>
<tr>
<td>node2</td>
<td>0a</td>
<td>SAS</td>
<td>6</td>
<td>enabled</td>
<td>online</td>
</tr>
<tr>
<td>node2</td>
<td>0b</td>
<td>SAS</td>
<td>6</td>
<td>enabled</td>
<td>online-degraded</td>
</tr>
<tr>
<td>node2</td>
<td>1a</td>
<td>FC</td>
<td>2</td>
<td>enabled</td>
<td>online</td>
</tr>
<tr>
<td>node2</td>
<td>1b</td>
<td>FC</td>
<td>2</td>
<td>enabled</td>
<td>online</td>
</tr>
</tbody>
</table>

The following example displays detailed information about port 0a on node node1:

```bash
cluster1::> storage port show -node node1 -port 0b
```

```
Node: node1
Port: 0b
Description: SAS Host Adapter 0b (PMC-Sierra PM8001 rev. C)
Firmware Revision: 01.12.06.00
Base WWN: 50:0a:09:80:00:82:47:b4
Connector Type: qsfp
Connector Vendor: Molex Inc.
Connector Part Number: 112-00177+A0
Connector Technology: passive_copper
Connector Serial Number: 017920547
Cable Length: 2m
Cable End Identifier: end_1
Cable Identifier: 500a09800082847f-500a0980008247b4
Port Speed: 6 Gb/s
Port State: enabled
Port Status: online
Phy State: [0] enabled, online, 6 Gb/s
[1] enabled, online, 6 Gb/s
[2] enabled, online, 6 Gb/s
[3] enabled, online, 6 Gb/s
```

### Storage raid-options Commands

The raid-options directory

The sub commands `storage raid-options modify` and `storage raid-options show` are used to change and view the configurable node RAID options. Following are the RAID options that can be configured:

raid.background_disk_fw_update.enable

This option determines the behavior of automatic disk firmware update. Valid values are on or off. The default value is on. If the option is set to on, firmware updates to spares and file-system disks are performed in a non-disruptive manner in the background. If the option is turned off automatic firmware update occur when the system is booted or a disk is inserted.

raid.disk.copy.auto.enable

This option determines the action taken when a disk reports a predictive failure. Valid values for this option are on or off. The default value for this option is on.

Sometimes, it is possible to predict that a disk will fail soon based on a pattern of recovered errors that have occurred on the disk. In such cases, the disk reports a predictive failure to Data ONTAP. If this option is set to on, Data ONTAP initiates Rapid RAID Recovery to copy data from the failing disk to a spare disk. When data is copied, the disk is marked failed and placed in the pool of broken disks. If a spare is not available, the node will continue to use the prefailed disk until the disk fails.

If the option is set to off, the disk is immediately marked as failed and placed in the pool of broken disks. A spare disk is selected and data from the missing disk is reconstructed from other disks in the RAID group. The disk does not fail if the RAID
group is already degraded or is being reconstructed. This ensures that a disk failure does not lead to the failure of the entire RAID group.

**raid.disktype.enable**

This option is obsolete. Use options `raid.mix.hdd.disktype.capacity` and `raid.mix.hdd.disktype.performance` instead.

**raid.media_scrub.rate**

This option sets the rate of media scrub on an aggregate. Valid values for this option range from 300 to 3000 where a rate of 300 represents a media scrub of approximately 512 MB per hour, and 3000 represents a media scrub of approximately 5 GB per hour. The default value for this option is 600, which is a rate of approximately 1 GB per hour.

**raid.min_spare_count**

This option specifies the minimum number of spare drives required to avoid warnings about low spare drives. If every file-system drive has the minimum number of spare drives specified in `raid.min_spare_count` that are appropriate replacements, then no warning is displayed for low spares. This option can be set from 0 to 4. The default setting is 1. Setting this option to 0 means that no warnings will be displayed for low spares even if there are no spares available. This option can be set to 0 only on systems that have 16 or fewer attached drives and that are running with RAID-DP aggregates. A setting of 0 is not allowed on systems with RAID4 aggregates.

**raid.mirror_read_plex_pref**

This option specifies the plex preference when reading from a mirrored aggregate on a MetroCluster-configured system. There are three possible values:

- **local** indicates that all reads are handled by the local plex (plex consisting of disks from Pool0).
- **remote** indicates that all reads are handled by the remote plex (plex consisting of disks from Pool1).
- **alternate** indicates that the handling of read requests is shared between the two plexes.

This option is ignored if the system is not in a MetroCluster configuration. The option setting applies to all aggregates on the node.

**raid.mix.hdd.disktype.capacity**

Controls mixing of SATA, BSAS, FSAS and ATA disk types. The default value is **on**, which allows mixing.

When this option is set to **on**, SATA, BSAS, FSAS and ATA disk types are considered interchangeable for all aggregate operations, including aggregate creation, adding disks to an aggregate, and replacing disks within an existing aggregate, whether this is done by the administrator or automatically by Data ONTAP.

If you set this option to **off**, SATA, BSAS, FSAS and ATA disks cannot be combined within the same aggregate. If you have existing aggregates that combine those disk types, those aggregates will continue to function normally and accept any of those disk types.

**raid.mix.hdd.disktype.performance**

Controls mixing of FCAL and SAS disk types. The default value is **off**, which prevents mixing.

If you set this option to **on**, FCAL and SAS disk types are considered interchangeable for all aggregate operations, including aggregate creation, adding disks to an aggregate, and replacing disks within an existing aggregate, whether this is done by the administrator or automatically by Data ONTAP.

When this option is set to **off**, FCAL and SAS disks cannot be combined within the same aggregate. If you have existing aggregates that combine those disk types, those aggregates will continue to function normally and accept either disk type.

**raid.mix.hdd.rpm.capacity**

This option controls separation of capacity-based hard disk drives (ATA, SATA, BSAS, FSAS, MSATA) by uniform rotational speed (RPM). If you set this option to **off**, Data ONTAP always selects disks with the same RPM when creating new
aggregates or when adding disks to existing aggregates using these disk types. If you set this option to on, Data ONTAP does
not differentiate between these disk types based on rotational speed. For example, Data ONTAP might use both 5400 RPM and
7200 RPM disks in the same aggregate. The default value is on.

**raid.mix.hdd.rpm.performance**

This option controls separation of performance-based hard disk drives (SAS, FCAL) by uniform rotational speed (RPM). If you
set this option to off, Data ONTAP always selects disks with the same RPM when creating new aggregates or when adding
disks to existing aggregates using these disk types. If you set this option to on, Data ONTAP does not differentiate between
these disk types based on rotational speed. For example, Data ONTAP might use both 10K RPM and 15K RPM disks in the
same aggregate. The default value is off.

**raid.reconstruct.perf_impact**

This option sets the overall performance impact of RAID reconstruction. When the CPU and disk bandwidth are not consumed
by serving clients, RAID reconstruction consumes as much bandwidth as it needs. If the serving of clients is already consuming
most or all of the CPU and disk bandwidth, this option allows control over the CPU and disk bandwidth that can be taken away
for reconstruction, and thereby enables control over the negative performance impact on the serving of clients. As the value of
this option is increased, the speed of reconstruction also increases. The possible values are low, medium, and high. The default
value is medium. When mirror resync and reconstruction are running at the same time, the system does not distinguish between
their separate resource consumption on shared resources (like CPU or a shared disk). In this case, the combined resource
utilization of these operations is limited to the maximum resource entitlement for individual operations.

**raid.resync.perf_impact**

This option sets the overall performance impact of RAID mirror resync (whether started automatically by the system or
implicitly by an operator-issued command). When the CPU and disk bandwidth are not consumed by serving clients, a resync
operation consumes as much bandwidth as it needs. If the serving of clients is already consuming most or all of the CPU and
disk bandwidth, this option allows control over the CPU and disk bandwidth that can be taken away for resync operations, and
thereby enables control over the negative performance impact on the serving of clients. As the value of this option is increased,
the speed of resync also increases. The possible values are low, medium, and high. The default value is medium. When RAID
mirror resync and reconstruction are running at the same time, the system does not distinguish between their separate resource
consumption on shared resources (like CPU or a shared disk). In this case, the combined resource utilization of these operations
is limited to the maximum resource entitlement for individual operations.

**raid.rpm.ata.enable**

This option is obsolete. Use option **raid.mix.hdd.rpm.capacity** instead.

**raid.rpm.fcal.enable**

This option is obsolete. Use option **raid.mix.hdd.rpm.performance** instead.

**raid.scrub.perf_impact**

This option sets the overall performance impact of RAID scrubbing (whether started automatically or manually). When the CPU
and disk bandwidth are not consumed by serving clients, scrubbing consumes as much bandwidth as it needs. If the serving of
clients is already consuming most or all of the CPU and disk bandwidth, this option allows control over the CPU and disk bandwidth
that can be taken away for scrubbing, and thereby enables control over the negative performance impact on the serving of clients.
As the value of this option is increased, the speed of scrubbing also increases. The possible values for this option are low, medium, and high. The default value is low. When scrub and mirror verify are running at the same time, the
system does not distinguish between their separate resource consumption on shared resources (like CPU or a shared disk). In this
case, the combined resource utilization of these operations is limited to the maximum resource entitlement for individual
operations.

**raid.scrub.schedule**

This option specifies the weekly schedule (day, time and duration) for scrubs started automatically. The default schedule is daily
at 1 a.m. for the duration of 4 hours except on Sunday when it is 12 hours. If an empty string (""") is specified as an argument, it
will delete the previous scrub schedule and add the default schedule. One or more schedules can be specified using this option.
The syntax is duration[h|m]@weekday@start_time,[duration[h|m]@weekday@start_time,...] where duration is the time period for which scrub operation is allowed to run, in hours or minutes ('h' or 'm' respectively).

Weekday is the day on which the scrub is scheduled to start. The valid values are sun, mon, tue, wed, thu, fri, sat.

start_time is the time when scrub is scheduled to start. It is specified in 24 hour format. Only the hour (0-23) needs to be specified.

For example, options raid.scrub.schedule 240m@tue@2,8h@sat@22 will cause scrub to start on every Tuesday at 2 a.m. for 240 minutes, and on every Saturday at 10 p.m. for 480 minutes.

raid.timeout

This option sets the time, in hours, that the system will run after a single disk failure in a RAID4 group or a two disk failure in a RAID-DP group has caused the system to go into degraded mode or double degraded mode respectively, or after NVRAM battery failure has occurred. The default is 24, the minimum acceptable value is 0 and the largest acceptable value is 4,294,967,295. If the raid.timeout option is specified when the system is in degraded mode or in double degraded mode, the timeout is set to the value specified and the timeout is restarted. If the value specified is 0, automatic system shutdown is disabled.

raid.verify.perf_impact

This option sets the overall performance impact of RAID mirror verify. When the CPU and disk bandwidth are not consumed by serving clients, a verify operation consumes as much bandwidth as it needs. If the serving of clients is already consuming most or all of the CPU and disk bandwidth, this option allows control over the CPU and disk bandwidth that can be taken away for verify, and thereby enables control over the negative performance impact on the serving of clients. As you increase the value of this option, the verify speed also increases. The possible values are low, medium, and high. The default value is low. When scrub and mirror verify are running at the same time, the system does not distinguish between their separate resource consumption on shared resources (like CPU or a shared disk). In this case, the combined resource utilization of these operations is limited to the maximum resource entitlement for individual operations.

storage raid-options modify

Modify a RAID option

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The storage raid-options modify command is used to modify the available RAID options for each node in a cluster. The options are described in the storage raid-options manual page.

Parameters

- **-node {<nodename>|local}** - Node
  
  This parameter specifies the node on which the RAID option is to be modified.

- **-name <text>** - Option Name

  This parameter specifies the RAID option to be modified. To see the list of RAID options that can be modified, use the storage raid-options show command.

- **[-value <text>]** - Option Value

  This parameter specifies the value of the selected RAID option.

Related references

storage raid-options show on page 874
storage raid-options show

Display RAID options

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The storage raid-options show command displays information about all the RAID options in a cluster. The options are described in the storage raid-options manual page.

Parameters
[-fields <fieldname>, ...]  
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance]  
If you specify the -instance parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node  
Selects information about all the RAID options on the specified node.

[-name <text>] - Option Name  
Selects information about the RAID options that have the specified name.

[-value <text>] - Option Value  
Selects information about all the RAID options that have the specified value.

[-constraint <text>] - Option Constraint  
Selects information about all the RAID options that have the specified constraint. The 'constraint' field indicates the expected setting for a RAID option across both nodes of an HA pair. The possible values are:
- none - no constraint on the value of this RAID option; nodes can have different values
- same_preferred - the same value should be used on both nodes of an HA pair, otherwise the next takeover may not function correctly
- same_required - the same value must be used on both nodes of an HA pair, otherwise the next takeover will not function correctly
- only_one - the same value should be used on both nodes of an HA pair. If the values are different and a takeover is in progress, the value of the RAID option on the node that is taking over will be used
- unknown - no information about constraints for this RAID option

Examples
The following example shows the raid scrub settings for a node named node1:

```
cluster1:/> storage raid-options show -node node1 -name raid.scrub*
<table>
<thead>
<tr>
<th>Node</th>
<th>Option</th>
<th>Value</th>
<th>Constraint</th>
</tr>
</thead>
<tbody>
<tr>
<td>node1</td>
<td>raid.scrub.perf_impact</td>
<td>low</td>
<td>only_one</td>
</tr>
<tr>
<td>node1</td>
<td>raid.scrub.schedule</td>
<td></td>
<td>none</td>
</tr>
</tbody>
</table>
3 entries were displayed.
```

storage shelf commands

Manage storage shelves

storage shelf show

Display a list of storage shelves

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The storage shelf show command displays information about all the storage shelves in the storage system. If no parameters are specified, the default command displays the following information about the storage shelves:

- Shelf Name
- Shelf ID
- Serial Number
- Model
- Module Type
- Status

To display detailed profile information about a single storage shelf, use the \(-shelf\) parameter.

Parameters

\([-fields <fieldname>, ...]\) Displays the specified fields for all the storage shelves, in column style output.

\([-bay\) Displays the following details about the disk bays in the storage shelf:

- The unique positional identifier of the disk bay
- Whether a disk drive is installed in the bay
- Bay type
- Operational status of the disk bay

\([-connectivity\) Displays the following details about the connectivity from the node to the storage shelf:

- Node name
- Initiator side switch port
- Target side switch port
- World wide port name
- Target Port Group Number (TPGN)
• Port speed at which the Host Bus Adapter (HBA) is running
• I/O throughput in Kbytes/sec
• Rate of I/O operations per second

[-cooling]
Displays the following details about the cooling elements and temperature sensors of the storage shelf:
• Element ID of the cooling fan
• The current speed of the cooling fan in revolutions per minute (rpm)
• Location of the fan in the storage shelf
• Sensor ID of the temperature sensor element
• Temperature at the sensor in degrees Celsius
• Whether the current temperature at the sensor is the ambient temperature
• Low critical threshold value for the temperature sensor
• Low warning threshold value for the temperature sensor
• High critical threshold value for the temperature sensor
• High warning threshold value for the temperature sensor

[-errors]
Displays the following error status information about the storage shelves which have errors:
• Error type
• Error severity
• Component
• Error description
• Corrective action

[-module]
Displays the following details about the I/O modules attached to the storage shelf:
• Module ID
• Module Part number
• Serial number of the Enclosure Services Controller Electronics element
• Whether monitoring is enabled on this module
• Whether this module is the SAS expander master module
• Whether this module is the element reporting
• Status of the firmware update on the module
• Version of the firmware installed on the module
• Latest firmware revision
• Number of times, since last boot, that this module has been swapped
• Operational status of the module
• Location of the module within the storage shelf

[-port]
Displays the following details about the storage shelf ports:
• Expander phy element identifier
• SAS shelf port type
• World Wide Port Name of the SAS port
• Negotiated physical link rate of the SAS port in Gb/s
• Power status of the SAS port
• Fibre Channel shelf port ID
• Fibre Channel shelf port type
• Fibre Channel shelf port status

[-power]
Displays the following details about the power supplies, voltage sensors and current sensors of the storage shelf:
• Power Supply Unit (PSU) number
• PSU type
• PSU part number
• PSU serial number
• Whether the PSU can be reset via software control
• Whether the auto power reset of the PSU is enabled
• PSU firmware revision
• Operational status of the PSU
• Location of the power supply unit within the storage shelf
• Voltage sensor number
• Voltage detected by the voltage sensor, in volts (V)
• Operational status of the voltage sensor
• Location of the voltage sensor within the storage shelf
• Current sensor number
• Current detected by the current sensor, in milliamps (mA)
• Operational status of the current sensor
• Location of the current sensor within the storage shelf
• PSU power rating in watts
• PSU crest factor
• Power drawn from the PSU in watts

|-instance

Displays expanded information about all the storage shelves in the system. If a storage shelf is specified, then this parameter displays the same detailed information for the storage shelf you specify as does the -shelf parameter.

|node {<nodename> | local} - Node

Displays information only about the storage shelves that are attached to the node you specify.

|shelf <text> - Shelf Name

Displays information only about the storage shelves that match the names you specify.

|shelf-uid <text> - Shelf UID

Displays information only about the storage shelf that matches the shelf UID you specify. Example: 50:05:0c:c0:02:10:64:26

|stack-id {<integer> | -} - Stack ID

Displays information only about the storage shelves that are attached to the stack that matches the stack ID you specify.

|shelf-id <text> - Shelf ID

Displays information only about the storage shelves that match the shelf ID you specify.

|module-type {unknown | atfcx | esh4 | iom3 | iom6 | iom6e | iom12 | iom12e} - Shelf Module Type

Displays information only about the storage shelves that match the module-type you specify.

|connection-type {unknown | fc | sas} - Shelf Connection Type

Displays information only about the storage shelves that match the connection type you specify. Example: FC or SAS.

|is-local-attach {true | false} - Is the Shelf Local to This Cluster?

Displays information only about the storage shelves that are local (TRUE) or remote (FALSE) to this cluster.

|vendor <text> - Shelf Vendor

Displays information only about the storage shelves that match the vendor you specify.

|product-id <text> - Shelf Product Identification

Displays information only about the storage shelves that match the product ID you specify.

|serial-number <text> - Shelf Serial Number

Displays information only about the storage shelf that matches the serial number you specify.

|disk-count {<integer> | -} - Disk Count

Displays information only about the storage shelves that have the disk count you specify.

|state {unknown | no-status | init-required | online | offline | missing} - Shelf State

Displays information only about the storage shelves that are in the state you specify.

|op-status {unknown | normal | warning | error | critical | standby-power} - Shelf Operational Status

Displays information only about the storage shelves that are currently operating under the status condition you specify.

|bay-id {<integer> | -}, ... - Bay ID

Displays information only about the storage shelves that have bays that match the bay ID you specify.

|bay-type {unknown | single-disk | multi-lun}, ... - Bay Type

Displays information only about the storage shelves that have bays that match the type of bay you specify.
[-bay-has-disk {true|false}, ...] - Bay Has Disk
Displays information only about the storage shelves that have bays with disk drives inserted in them (true) or empty bays (false).

[-bay-op-status {unknown|normal|error}, ...] - Bay Operational Status
Displays information only about the storage shelves that have bays that match the operational state you specify.

[-controller {<nodename>|local}, ...] - Controller Name
Displays information only about the storage shelves that are connected to the node you specify.

[-controller-uuid <text>, ...] - Controller UUID
Displays information only about the storage shelves that are connected to the node UUID you specify.

[-initiator <text>, ...] - Initiator
Displays information only about the storage shelves that are visible to the initiator you specify.

[-initiator-wwpn <text>, ...] - Initiator WWPN
Displays information only about the storage shelves that are visible to the initiator WWPN you specify.

[-initiator-side-switch-port <text>, ...] - Initiator Side Switch Port
Displays information only about the storage shelves that are visible to an initiator connected to the switch port you specify.

[-target-side-switch-port <text>, ...] - Target Side Switch Port
Displays information only about the storage shelves visible on target ports identified by the switch port to which they are connected.

[-target-port <text>, ...] - Target Port
Displays information only about the storage shelves visible on the specified target ports identified by their World Wide Port Name (WWPN).

[-tpgn {<integer>|-, ...} - Target Port Group Number
Displays information only about the storage shelves that belong to the Target Port Group Name (TPGN) you specify.

[-port-speed {<integer>|-, ...} - Port Speed
Displays information only about the storage shelves with ports that match the port speed you specify.

[-io-kbps {<integer>|-, ...] - Kbytes/sec on Storage Shelf
Displays information only about the storage shelves visible to an initiator that has executed I/O at the throughput you specify.

[-iops {<integer>|-, ...] - Number IOPS per Second on Storage Shelf
Displays information only about the storage shelves visible to an initiator that has executed the number of IOPs you specify.

[-current-sensor-id {<integer>|-, ...] - Current Sensor ID
Displays information only about the storage shelves with current sensor that matches the current sensor ID you specify.

[-current-sensor-location <text>, ...] - Current Sensor Location
Displays information only about the storage shelves with current sensors installed at the location you specify.

[-current-sensor-reading {<integer>|-, ...] - Current Sensor Reading
Displays information only about the storage shelves with current sensors that match the current reading you specify.
[-current-op-status {unknown|normal|over-current-critical|under-current-critical|not-supported|not-installed}, ...] - Operational Status
Displays information only about the storage shelves with current sensors that match the operational status you specify.

[-fan-id <integer> | -], ...] - Fan ID
Displays information only about the storage shelves with a cooling fans that match the fan IDs you specify.

[-fan-location <text>, ...] - Fan Location
Displays information only about the storage shelves with cooling fans installed.

[-fan-rpm <integer> | -], ...] - Fan Rotation Per Minute
Displays information only about the storage shelves with cooling fans that match the rpm you specify.

[-fan-op-status {unknown|normal|off|error|not-supported|not-installed}, ...] - Fan Operational Status
Displays information only about the storage shelves with cooling fans that match the operational status you specify.

[-module-id <text>, ...] - Module ID
Displays information only about the storage shelves with an I/O module that matches the module ID you specify.

[-module-location <text>, ...] - Module Location
Displays information only about the storage shelves with I/O modules in the specified shelf module slots.

[-module-part-number <text>, ...] - Module Part Number
Displays information only about the storage shelves with I/O modules that match the module part numbers you specify.

[-is-sas-master-module {true|false}, ...] - Is SAS Expander Master Module?
Displays information only about the storage shelves with a SAS master I/O module (true) or an I/O module that is not a SAS master (false). This parameter applies only to SAS shelves.

[-is-monitor-active {true|false}, ...] - Is Monitor Active?
Displays information only about the storage shelves whose monitoring is enabled (true) or disabled (false).

[-enclosure-type <text>, ...] - Module Enclosure Type
Displays information only about the storage shelves that match the enclosure types you specify.

[-es-serial-number <text>, ...] - ES Electronics Element Serial Number
Displays information only about the storage shelves with I/O modules that match the electronics serial numbers you specify.

[-module-fru-id <text>, ...] - Field Replaceable Unit ID
Displays information only about the storage shelves with I/O modules that match the field replaceable unit (FRU) IDs you specify.

[-module-is-reporting-element {true|false}, ...] - Is Reporting Element?
Displays information only about the storage shelves with element reporting I/O modules (true) or not (false).

[-module-fw-revision <text>, ...] - Firmware Revision
Displays information only about the storage shelves with I/O modules that match the firmware revision you specify.

[-module-latest-fw-revision <text>, ...] - Latest Firmware Revision
Displays information only about the storage shelves with I/O modules that match the latest firmware revision you specify.
[module-fw-progress {not-available|ready|in-progress|failed}, ...] - Module Firmware Progress
Displays information only about the storage shelves with I/O modules that match the specified firmware update progress.

[module-swap-count (<integer>| -), ...] - Module Swap Count
Displays information only about the storage shelves whose I/O modules have been swapped the specified number of times.

[module-op-status {unknown|normal|warning|error}, ...] - Module Operational Status
Displays information only about the storage shelves with I/O modules that match the operational status you specify.

[sas-port-id <text>, ...] - Port ID
Displays information only about the storage shelves with SAS Ports that match the port IDs you specify.

[sas-port-type {unknown|circle|square|sil|disk|in|out|unused|host|aux1|aux2|hi_ho|a_to_b|b_to_a}, ...] - Port Type
Displays information only about the storage shelves with SAS Ports that match the SAS port type you specify.

[sas-port-wwpn <text>, ...] - Port World Wide Port Name
Displays information only about the storage shelves with SAS Ports that match the World Wide Port Names you specify.

[sas-port-speed <text>, ...] - Port Speed
Displays information only about the storage shelves with SAS Ports that match the port speed you specify.

[sas-negotiated-port-speed <text>, ...] - Negotiated Port Speed
Displays information only about the storage shelves with SAS Ports that match the negotiated port speed you specify.

[sas-port-power-status <text>, ...] - Port Power Status
Displays information only about the storage shelves with SAS Ports that match the power status you specify.

[sas-port-op-status {error|normal|off|unknown|byp-bad-term|bad-zone-recovery|byp_clk_thr|byp_drv_fault|byp_drvcycle|byp_drv_pwr|byp_clk_bits|byp_drvcycle|byp_crc_burst_thr|byp_data_timeout|byp_gen|byp_init|byp_lip_burst_thr|byp_lip_f8|byp_lip_rate_thr|byp_lipf7|byp_lth|byp_present|byp_no_drive|byp_osci|byp_other_thr|byp_reclos|byp_rport|byp_stall_thr|byp_wrd_burst_thr|byp_wrd_rate_thr|byp_xmit_fault|diag_transmit|inserted|loopback|status_unknown|warn_high_clk_delta|warn_high_crc_rate|warn_high_lip|warn_high_wrd_rate|term|phy_dis_clk_fault|phy_dis_crc_err|phy_dis_crc_err_burst|phy_dis_disparity|phy_dis_disparity_burst|phy_dis_emulate_reserve|phy_dis_emulate_reserve|phy_dis_inval_dword|phy_dis_inval_dword_burst|phy_dis_loss_dword|phy_dis_loss_dword_burst|phy_dis_manual|phy_dis_mirored|empty|phy_dis_phy_change|phy_dis_phy_change_burst|phy_dis_phy_reset|phy_dis_phy_reset_burst|phy_dis_phy_unused|phy_ena|phy_ena_not_attach|phy_ena_unknown|phy_unknown}, ...] - Port Operational Status
Displays information only about the storage shelves with SAS Ports that match the operational status you specify. Displays information only about the storage shelves with SAS Ports that match the operational status you specify.

[fc-port-id <text>, ...] - Fibre Channel Port ID
Displays information only about the storage shelves with FC Ports that match the port IDs you specify.

[fc-port-mode {unknown|circle|square|sil|disk|in|out|unused|host|aux1|aux2|hi_ho|a_to_b|b_to_a}, ...] - Fibre Channel Port Mode
Displays information only about the storage shelves with FC Ports that match the port modes you specify.
- Fibre Channel Port Operational Status

Displays information only about the storage shelves with FC Ports that match the operational status you specify.

- Power Supply Unit ID

Displays information only about the storage shelves with power supply units (PSU) that match the unit IDs you specify.

- Power Supply Unit Location

Displays information only about the storage shelves with PSUs that are located at the specified location inside the shelf.

- Power Supply Unit Type

Displays information only about the storage shelves with PSUs that match the PSU types you specify.

- Power Supply Unit Part Number

Displays information only about the storage shelves with PSUs that match the PSU part number you specify.

- Power Supply Unit Serial Number

Displays information only about the storage shelves with PSUs that match the PSU serial numbers you specify.

- Power Supply Unit Reset Capability

Displays information only about the storage shelves with reset capable PSUs (true) or reset incapable PSUs (false).

- Power Supply Unit Enable/Disable Status

Displays information only about the storage shelves with PSUs that are enabled (true) or disabled (false).

- Power Supply Unit Firmware Version

Displays information only about the storage shelves with PSUs that have the firmware version you specify.

- Operational Status

Displays information only about the storage shelves with PSUs that match the operational status you specify.

- Power Supply Power Ratings In Watts

Displays information only about the storage shelves with PSUs that match the power rating you specify.

- Power Supply Crest Factor

Displays information only about the storage shelves with PSUs that match the crest factor value you specify.

- Power Drawn From PSU In Watts

 Displays information only about the storage shelves with PSUs that match the drawn power you specify.

- Sensor Name

Displays information only about the storage shelves with temperature sensors that match the sensor IDs you specify.
[-temp-sensor-location <text>, ...] - Sensor Location
Displays information only about the storage shelves with temperature sensors that match the specified sensor locations inside the shelf.

[-temp-sensor-reading <integer>| -], ...] - Temperature Reading
Displays information only about the storage shelves with temperature sensors that match the temperature reading you specify.

[-temp-is-ambient {true|false}, ...] - Temperature Reading at Ambient Value
Displays information only about the storage shelves with temperature sensors whose current temperature reading is ambient (true) or not (false).

[-temp-high-critical-threshold {<integer>| -}, ...] - High Critical Threshold
Displays information only about the storage shelves with temperature sensors that match the high critical threshold you specify.

[-temp-high-warning-threshold {<integer>| -}, ...] - High Warning Threshold
Displays information only about the storage shelves with temperature sensors that match the high warning threshold you specify.

[-temp-low-warning-threshold {<integer>| -}, ...] - Low Warning Threshold
Displays information only about the storage shelves with temperature sensors that match the low warning threshold you specify.

[-temp-low-critical-threshold {<integer>| -}, ...] - Low Critical Threshold
Displays information only about the storage shelves with temperature sensors that match the low critical threshold you specify.

[-temp-op-status {unknown|normal|under-temperature|over-temperature|error|not-supported|not-installed}, ...] - Operational Status
Displays information only about the storage shelves with temperature sensors that match the operational status you specify.

[-voltage-sensor-id {<integer>| -}, ...] - Voltage Sensor ID
Displays information only about the storage shelves with voltage sensors that match the sensor IDs you specify.

[-voltage-sensor-location <text>, ...] - Voltage Sensor Location
Displays information only about the storage shelves with voltage sensors that match the specified sensor locations inside the shelf.

[-voltage-sensor-reading <text>, ...] - Voltage Current Reading
Displays information only about the storage shelves with voltage sensors that match the voltage reading you specify.

[-voltage-op-status {unknown|normal|over-voltage-critical|under-voltage-critical|not-supported|not-installed}, ...] - Operational Status
Displays information only about the storage shelves with voltage sensors that match the operational status you specify.

[-error-type {unknown|acpp|bay|configuration|current|disk|internal|fan|module|port|power|temperature|voltage}, ...] - Error Type
Displays information only about the storage shelves with errors that match the error type you specify.

[-error-severity {unknown|notice|warning|error|critical}, ...] - Error Severity
Displays information only about the storage shelves with errors that match the error severity you specify.
Examples

The following example displays information about all storage shelves:

```
cluster1::> storage shelf show

```

Storage ACP Commands

Manage alternate control path (ACP)

The `storage shelf acp` command family manages the alternate control path connectivity on the system. The command set allows you to view the current connectivity, and the ACP modules. You can also configure the connection or disable the connection across the cluster.

```
storage shelf acp configure

Configure alternate control path (ACP)

Availability: This command is available to `cluster` administrators at the `admin` privilege level.

Description
Configure the ACP connectivity on the cluster.

Parameters
- `-is-enabled {true|false}` - Is Enabled?
  Configures the connectivity to the specified state.

  `-subnet <IP Address>` - Subnet
  Configures the connectivity to the specified subnet.

  `-netmask <IP Address>` - Netmask
  Configures the connectivity to the specified netmask.
```

888 Commands: Manual Page Reference
[-channel {out-of-band|in-band}] - Channel

Configures the connectivity to the specified channel.

**Examples**

The following example configures out-of-band ACP connectivity on each node:

```
cluster1::> storage shelf acp configure -is-enabled true -channel out-of-band -subnet 192.168.0.1 -netmask 255.255.255.0
```

The following example configures in-band ACP connectivity on each node:

```
cluster1::> storage shelf acp configure -is-enabled true -channel in-band
```

The following example disables ACP connectivity on each node:

```
cluster1::> storage shelf acp configure -is-enabled false
```

**storage shelf acp show**

Show connectivity information

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

Displays information about the ACP connectivity on each node.

**Parameters**

{[-fields <fieldname>, ...]
  If you specify the -fields <field-name>", ... parameter, the command output also includes the specified field or fields. You can use "-fields ?" to display the fields to specify.

[-errors]
  If you specify the -errors parameter, the command displays detailed information about all modules with errors.

[-instance]
  If you specify the -instance parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node
  Selects the nodes that match this parameter value.

[-is-enabled {true|false}] - Is Enabled?
  Selects the nodes that are enabled or disabled.

[-port <text>] - Port
  Selects the nodes that match the specified port on which ACP is configured.

[-address <IP Address>] - IP Address
  Selects the nodes with the specified IP address.

[-subnet <IP Address>] - Subnet
  Selects the nodes with the specified subnet.

[-netmask <IP Address>] - Netmask
  Selects the nodes with the specified netmask.
-connection-status [no-connectivity|partial-connectivity|full-connectivity|additional-connectivity|unknown-connectivity|not-available|connection-disabled] - Connection Status

Selects the nodes with the specified connection status.

-error-id <integer> - Error ID

Selects the node with the specified error ID.

-error-type {No-Error|Connection-Issue|Connection-Activity|Module-Error|Shelf-Error} - Error Type

The error type, in case of a connection error.

-error-severity {unknown|notice|warning|error|critical} - Error Severity

The error severity, in case of a connection error.

-error-text <text> - Error Text

Selects the node with the specified error text.

-corrective-action <text> - Corrective Action

Selects the node with the specified corrective action.

-channel {unknown|out-of-band|in-band} - Channel

Selects the nodes that has channel configured out-of-band or in-band.

Examples

The following example displays ACP connectivity on each node:

```
cluster1::> storage shelf acp show
Node                Channel                Connectivity
------------------  --------------------   ----------------------
stor-8020-1         in-band                active
stor-8020-2         in-band                active
stor-8060-1         out-of-band            full-connectivity
stor-8060-2         out-of-band            full-connectivity
4 entries were displayed.
```

The following example displays the -instance output of the storage acp show. More details on the connectivity and configuration can be seen here.

```
cluster1::> storage shelf acp show -instance

Node: stor-8020-1
Channel: out-of-band
Enable Status: enabled

storage shelf acp module commands

Display the modules connected to the cluster
storage shelf acp module show

Show modules connected to the cluster

Availability: This command is available to cluster administrators at the admin privilege level.

Description
Displays information about the modules connected to each node

Parameters
{ [-fields <fieldname>, ...]  
  If you specify the -fields <fieldname>". ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify
  
  [-errors]  
  If you specify the -errors parameter, the command displays detailed information about all modules with errors.
  
  [-instance]}  
  If you specify the -instance parameter, the command displays detailed information about all fields.

-node {<nodename>|local} - Node
Selects the modules that match this parameter value.

-mac-address <text> - MAC Address
Selects the module that match the specified MAC address.

-module-name <text> - Module name
Selects the module that match the specified module name.

-module-address <IP Address> - IP Address
Selects the module that match the specified IP address.

-protocol-version <text> - Protocol Version
Selects the modules that match the specified protocol version.

-firmware-version <text> - Firmware Version
Selects the modules that match the specified firmware version.

-acpa-id <integer> - ACPA assigner ID
Selects the modules that match the specified ACPA ID.

-shelf-serial-number <text> - Shelf Serial Number
Selects the modules that match the specified shelf serial number.

-iom-type {Unknown|iom3|iom6|iom6e|iom12|iom12e} - IOM Type
Selects the modules that match the specified IOM type (IOM3/IOM6/IOM6E).

-last-contact <integer> - Last Contact (secs)
Selects the modules that match the specified last contact.

-state {unknown|initializing|discovery-complete|awaiting-inband|no-inband|active|awaiting-bootp|updating-firmware|connection-error|firmware-update-required|rebooting|fail|unsupported|degraded|shelf-off} - Local Node State
Selects the modules that match the specified state.

-stack-id [<integer>|-] - Stack ID
Selects the modules that match the specified stack ID.
[-shelf-id <text>] - Shelf ID
Selects the modules that match the specified shelf ID.

[-adapter-name <text>] - Adapter Name
Selects the modules that match the specified adapter name.

[-error-id <integer>, ...] - Error ID
Selects the modules that match the specified error ID.

[-error-text <text>, ...] - Error Text
The error text, in case of a module error.

[-corrective-action <text>, ...] - Corrective Action
The corrective action, in case of a module error.

[-error-type {No-Error|Connection-Issue|Connection-Activity|Module-Error|Shelf-Error}, ...] - Error Type
Selects the modules that match the specified error type.

[-error-severity {unknown|notice|warning|error|critical}, ...] - Error Severity
Selects the modules that match the specified error severity.

Examples

The following example displays the ACP modules connected to each node:

```
cluster1::> storage acp module show
Node            Module Name    State
-----------------  -----------------  ----------------------
stor-v4-la-1b-01  1.10.A         Active
                 1.10.B         Active
                 1.254.B        Active
                 1.254.A        Active

stor-v4-la-1b-02  1.10.A         Active
                 1.10.B         Active
                 1.254.B        Active
                 1.254.A        Active
```

8 entries were displayed.

The following example displays the -instance output of the storage acp module show. More details on each module can be seen here.

```
cluster1::> storage acp module show -instance

storage shelf firmware commands

The firmware directory

storage shelf firmware show-update-status

Display the Shelf Firmware Update (SFU) Status.

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The storage shelf firmware show-update-status command displays the state of the Shelf Firmware Update process.

Parameters

[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?' to display the fields to specify.

[-instance ]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-node <nodename>] - Node
Selects the node that matches this parameter value.

[-update-status {running|idle}] - Disk Shelf Firmware Update Status
Selects the nodes whose SFU process status matches this parameter value. Possible values are:
• running - Disk shelf firmware update is in progress.
• idle - Disk shelf firmware update is not in progress.

[-in-progress-count <integer>] - Number of Shelves with Earlier Revisions Being Updated
Selects the nodes that matches the number of shelves the SFU process is updating to this parameter value. This specifies the number of shelves with earlier revisions that are being updated.

Examples

```
cluster1:*> storage shelf firmware show-update-status
            Update  In-Progress
            Status     Count
              --------  ----------
   cluster-n1       running          10
   cluster-n2       idle              -
   cluster-n3       running           7
```

storage shelf firmware update

Update Shelf Firmware

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The storage shelf firmware update command updates the firmware on one or more shelves. You can download the latest firmware by using the storage firmware download command. You can specify a shelf whose firmware is to be updated by using the -shelf parameter. You can update the firmware on all the shelves by not providing the -shelf parameter. All the shelves of a specific module type can be updated by providing a value to the -module-type parameter.
### Parameters

- `-shelf <text>` - Shelf Name
  This specifies the name of the shelf whose firmware is to be updated.

- `[-module-type \{atfcx|esh4|iom3|iom6|iom6e|iom12|iom12e\}]` - Shelf Module Type
  Update the firmware on the shelves that match the module-type you specify.

- `[-refresh [true]]` - Refresh
  Forces an update on the shelf with the highest revision of the applicable firmware, resulting in a refresh of the firmware image already present on the shelf.

### Examples

The following example updates the firmware on all the shelves in the cluster:

```
cluster1::*> storage shelf firmware update
```

The following example updates the firmware on all shelves with the IOM6 module type:

```
cluster1::*> storage shelf firmware update -module-type IOM6
```

The following example updates the firmware on shelf 1.2:

```
cluster1::*> storage shelf firmware update -shelf 1.2
```

The following example refreshes the firmware on all shelves with the IOM6 module type:

```
cluster1::*> storage shelf firmware update -refresh -module-type IOM6
```

The following example refreshes the firmware on shelf 1.2:

```
cluster1::*> storage shelf firmware update -refresh -shelf 1.2
```

**storage shelf location-led commands**

Manage the shelf location led

**storage shelf location-led modify**

Modify the state of the shelf Location LED

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

The `storage shelf location-led modify` command modifies the on/off state of the shelf location LED.
## Parameters

- **-node** `{<nodename>|local}` - Node
  
  This parameter specifies the node that modifies the led state.

- **-[shelf-name <text>]** - Shelf Name
  
  This parameter specifies the shelf whose LED is to be turned on or turned off.

- **-[led-status {on|off}]** - Location LED
  
  This parameter specifies whether the shelf location LED needs to be turned on or turned off.

### Examples

The following example turns on the shelf location LED of the specified shelf.

```bash
cluster1::> storage shelf location-led modify -node node1 -shelf-name 1.0 -led-status on
Info: Shelf locate request successful for shelf "1.0".
```

The following example turns off the shelf location LED of the specified shelf.

```bash
cluster1::> storage shelf location-led modify -node node1 -shelf-name 1.0 -led-status off
Info: Shelf locate request successful for shelf "1.0".
```

### storage shelf location-led show

Display the Location LED status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The `storage shelf location-led show` command displays the state of shelf location LED.

**Parameters**

```bash
{ [ -fields <fieldname>, ... ]
  If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

  [ -instance ]
  If you specify the `-instance` parameter, the command displays detailed information about all fields.

  -node `{<nodename>|local}` - Node
    Selects the nodes that match this parameter value.

  -shelf-name <text> - Shelf Name
    Selects the shelves whose shelf-name matches this parameter value.

  -stack-id <integer> - Stack ID
    Selects the shelves whose stack-id matches this parameter value.

  -shelf-id <integer> - Shelf ID
    Selects the shelves whose shelf-id matches this parameter value.

  -led-status {on|off} - Location LED
    Shows the state of the shelf location LED.
```
Examples
The following example shows the state of the shelf location LED for each shelf.

```
carousel1::> storage shelf location-led show
Shelf Name Stack ID Shelf ID LED Status
---------- -------- -------- -----------
8.2        8        2 off
8.3        8        3 off
6.0        6        0 unsupported
8.1        8        1 off
4 entries were displayed.
```

storage switch commands
Storage switch monitoring commands

storage switch add
Add a switch for monitoring

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The `storage switch add` command enables you to add FC switches for SNMP monitoring in a MetroCluster configuration.

Parameters
- `address <IP Address>` - FC Switch Management IP Address
  This parameter specifies the IP address of the switch that is being added for monitoring.
- `snmp-community <text>` - SNMP Community
  This parameter specifies the SNMP community set on the switch that is being added for monitoring.
- `veto-backend-fabric-check {true|false}` - Veto Backend Fabric Check? (privilege: advanced)
  If specified, the `storage switch add` command will not check if the switch is present in the MetroCluster's backend fabric. By default, it does not let you add switches that are not present.
- `blades <integer>, ...` - Cisco Director Class Switch Blades to Monitor
  This parameter specifies the blades to monitor on the switch that is being added for monitoring. It is only applicable to director-class switches.

Examples
The following command adds a switch with IP Address 10.226.197.34 for monitoring:

```
carousel1::> storage switch add -address 10.226.197.34 -snmp-community public
carousel1::> storage switch show
Symbolic Name Vendor Model Switch WWN Is Monitor
Switch -------------- ------- ---------- ---------------- --------- -------
Cisco_10.226.197.34 mcc-cisco-8Gb-fab-4 Cisco DS-C9148-16P-K9 2000547fee78f088 true ok
mcc-cisco-8Gb-fab-1
mcc-cisco-8Gb-fab-1
mcc-cisco-8Gb-fab-2
```
The following command adds a Cisco Director Class switch for monitoring:

```
cluster1::> storage switch add -address 10.228.56.208 -snmp-community public -blades 3,4
```

**storage switch modify**

Modify information about a switch's configuration

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

The *storage switch modify* enables you to modify certain parameters for identifying and accessing the FC switches added for monitoring in a MetroCluster configuration.

**Parameters**

- `-switch-name <text>` - FC Switch Name
  This parameter specifies the name of the switch.

- `[-switch-ipaddress <IP Address>]` - Switch Ip Address
  This parameter specifies the IP address of the switch.

- `[-snmp-community <text>]` - SNMP Community
  This parameter specifies the SNMP community set on the switch.

- `[-blades <integer>, ...]` - Director-Class Switch Blades to Monitor
  This parameter specifies the blades to monitor on the switch. It is only applicable to director-class switches.

**Examples**

The following command modifies Cisco_10.226.197.34 switch SNMP community to 'public':

```
cluster1::> storage switch modify -switch-name Cisco_10.226.197.34 -switch-ipaddress 10.226.197.34 -snmp-community public
cluster1::>
```

The following command modifies the blades being monitored on a director-class switch:

```
cluster1::> storage switch modify -switch-name Cisco_10.228.56.208 -blades 3,4
cluster1::>
```
storage switch refresh

Refresh storage switch info

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The storage switch refresh command triggers a refresh of the SNMP data for the MetroCluster FC switches and FC-to-SAS bridges. It does not do anything if the refresh is already going on. The FC switches and FC-to-SAS bridges must have been previously added for monitoring by using the storage switch add and storage bridge add commands respectively.

Examples
The following command triggers a refresh for the SNMP data:

```
cluster1::*> storage switch refresh
```

storage bridge add on page 735

storage switch remove

Remove a switch from monitoring

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The storage switch remove enables you to remove FC switches that were previously added for SNMP monitoring.

Parameters
-swigth-name <text> - FC Switch Name

This parameter specifies the name of the switch added for monitoring.

Examples
The following command removes 'Cisco_10.226.197.34' switch from monitoring:

```
cluster1::> storage switch show
Symbolic                                     Is        Monitor
Switch      Name     Vendor  Model      Switch WWN       Monitored Status
----------- -------- ------- ---------- ---------------- --------- -------
Cisco_10.226.197.34
mcc-cisco-8Gb-fab-4
Cisco   DS-C9148-16P-K9

**storage switch show**

Display switch information

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The `storage switch show` command displays information about all the storage switches in the MetroCluster configuration. The switches must have been previously added for monitoring using the `storage switch add` command. If no parameters are specified, the default command displays the following information about the storage switches:

- Switch
- Symbolic Name
- Vendor
- Model
- Switch WWN
- Is Monitored
- Monitor Status

To display detailed profile information about a single storage switch, use the `-switch-name` parameter.

**Parameters**

`[-fields <fieldname>, ...]`

Displays the specified fields for all the storage switches, in column style output.

`[-connectivity]`

Displays the following details about the connectivity from the storage switch to connected entities:

- Port name
- Port operating mode
- Port world wide name
Displays the following details about the connectivity from the node to the storage switch:

- Node name
- Adapter name
- Switch port name
- Switch port speed
- Adapter type

\([-\text{cooling}]\)

Displays the following details about the fans and temperature sensors on the storage switch:

- Fan name
- Fan speed in rotations per minute (RPM)
- Fan operational status
- Temperature sensor name
- Temperature sensor reading in Celsius (C)
- Temperature sensor status

\([-\text{error}]\)

Displays the errors related to the storage switch.

\([-\text{port}]\)

Displays the following details about the storage switch ports:

- Port name
- Port world wide name
- Port administrative status
- Port operational status
- Port operating mode
- Whether SFP is present in the port
- Port speed in gigabits per second (Gbps)
- Port BB credit
- Peer port world wide name

\([-\text{power}]\)

Displays the following details about the storage switch power supplies:

- Power supply name
- Power supply serial number
- Power supply operational status
[-san-config]
Displays the following details about the Virtual Storage Area Networks (VSAN) and Zones of the storage switch:
- VSAN identifier
- VSAN name
- VSAN operational status
- Type of load balancing configured for the VSAN
- Where in-order-delivery set for the VSAN
- Whether the auto power reset of the PSU is enabled
- VSAN member switch name and port
- Zone name
- VSAN ID of the zone
- Zone member switch name and port
- Zone member port id
- Zone member port world wide name

[-sfp]
Displays the following details about the storage switch ports Small Formfactor Pluggable (SFP):
- Port name
- Type of SFP
- SFP transmitter type
- SFP vendor
- SFP part number
- SFP serial number

[-stats]
Displays the following details about the storage switch ports:
- Port name
- Frames received through the port (Rx Frames)
- Frames transmitted through the port (Tx Frames)
- Octets received through the port (Rx Octets)
- Octets transmitted through the port (Tx Octets)
- Port error frames

[-instance]
Displays expanded information about all the storage switches in the system. If a storage switch is specified, then this parameter displays the same detailed information for the storage switch you specify as does the -switch-name parameter.
[-switch-name <text>] - FC Switch Name
Displays information only about the storage switches that match the name you specify.

[-switch-wwn <text>] - Switch World Wide Name
Displays information only about the storage switches that match the switch wwn you specify.

[-switch-symbolic-name <text>] - Switch Symbolic Name
Displays information only about the storage switches that match the switch symbolic name you specify.

[-switch-fabric-name <text>] - Fabric Name
Displays information only about the storage switches that match the switch fabric you specify.

[-domain-id <integer>] - Switch Domain ID
Displays information only about the storage switches that match the switch domain id you specify.

[-switch-role {unknown|primary|subordinate}] - Switch Role in Fabric
Displays information only about the storage switches that match the switch role you specify.

[-snmp-version {SNMPv1|SNMPv2c}] - Supported SNMP Version
Displays information only about the storage switches that match the switch SNMP version you specify.

[-switch-model <text>] - Switch Model
Displays information only about the storage switches that match the switch model you specify.

[-switch-vendor {unknown|Brocade|Cisco}] - Switch Vendor
Displays information only about the storage switches that match the switch vendor you specify.

[-fw-version <text>] - Switch Firmware Version
Displays information only about the storage switches that match the switch firmware version you specify.

[-serial-number <text>] - Switch Serial Number
Displays information only about the storage switches that match the switch serial number you specify.

[-switch-ipaddress <IP Address>] - Switch Ip Address
Displays information only about the storage switches that match the switch IP address you specify.

[-switch-status {unknown|ok|error}] - Switch Status
Displays information only about the storage switches that match the switch status you specify.

[-snmp-community <text>] - SNMP Community
Displays information only about the storage switches that match the switch SNMP community you specify.

[-profile-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [+-]hh:mm}]] - Switch Profile Data Last Successful Refresh Timestamp
Displays information only about the storage switches that match the profile data last successful refresh
timestamp you specify.

[-is-monitoring-enabled {true|false}] - Is Monitoring Enabled for Switch
Displays information only about the storage switches that match the switch monitoring value you specify.

[-blades <integer>, ...] - Director-Class Switch Blades to Monitor
Displays information only about the storage switches that match the blade value you specify.

[-psu-name-list <text>, ...] - Switch Power Supply Name List
Displays information only about the storage switches that have the power supply units with the names you specify.

[-psu-serial-number-list <text>, ...] - Switch Power Supply Serial Number List
Displays information only about the storage switches that have the power supply units with the serial numbers you specify.
[-psu-status-list (unknown|normal|warning|faulty|not-present), ...] - Switch Power Supply Status List
Displays information only about the storage switches that have the power supply units with the statuses you specify.

[-psu-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}] - Switch Power Supply Data Last Successful Refresh Timestamp
Displays information only about the storage switches that match the power supply unit data last successful refresh timestamp you specify.

[-temp-sensor-name-list <text>, ...] - Switch Temperature Sensor Name List
Displays information only about the storage switches that have the temperature sensors with the names you specify.

[-temp-sensor-reading-list <integer>, ...] - Switch Temperature Sensor Reading (C) List
Displays information only about the storage switches that have the temperature sensors with the readings you specify.

[-temp-sensor-status-list (unknown|normal|warning|critical), ...] - Switch Temperature Sensor Status List
Displays information only about the storage switches that have the temperature sensors with the statuses you specify.

[-temp-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}] - Switch Temperature Sensor Data Last Successful Refresh Timestamp
Displays information only about the storage switches that match the temperature sensor data last successful refresh timestamp you specify.

[-fan-name-list <text>, ...] - Switch Fan Name List
Displays information only about the storage switches that match the fans with the names you specify.

[-fan-rpm-list <integer>, ...] - Switch Fan Speed (RPM) List
Displays information only about the storage switches that match the fans with the RPM speeds you specify.

[-fan-status-list (unknown|operational|failed|not-operational|not-present), ...] - Switch Fan Operational Status List
Displays information only about the storage switches that match the fans with the statuses you specify.

[-fan-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}] - Switch Fan Data Last Successful Refresh Timestamp
Displays information only about the storage switches that match the fan data last successful refresh timestamp you specify.

[-vsan-index-list <integer>, ...] - Switch VSAN Index List
Displays information only about the storage switches that have the VSANs with the indexes you specify.

[-vsan-name-list <text>, ...] - Switch VSAN Name List
Displays information only about the storage switches that have the VSANs with the names you specify.

[-vsan-oper-status-list {up|down}, ...] - Switch VSAN Operational Status List
Displays information only about the storage switches that have the VSANs with the operational statuses you specify.

[-vsan-load-balancing-type-list {src-id-dest-id|src-id-dest-id-ox-id}, ...] - Switch VSAN Load balancing Type List
Displays information only about the storage switches that have the VSANs with the load balancing types you specify.
[-is-vsan-iod-list (true|false), ...] - Is In-order Delivery Set for VSAN List
Displays information only about the storage switches that have the VSANs with the IOD setting you specify.

[-vsan-data-last-successful-refresh-timestamp (MM/DD/YYYY HH:MM:SS [+|-]hh:mm)] - Switch VSAN Data Last Successful Refresh Timestamp
Displays information only about the storage switches that match the VSAN data last successful refresh timestamp you specify.

[-member-switch-name-list <text>, ...] - Member Switch List
Displays information only about the storage switches that have the VSANs with the member switch names you specify.

[-member-switch-port-name-list <text>, ...] - Member Switch Port Name List
Displays information only about the storage switches that have the VSANs with the member switch port names you specify.

[-vsan-id-list <integer>, ...] - Zone VSAN ID List
Displays information only about the storage switches that have the VSANs with the IDs you specify.

[-zone-name-list <text>, ...] - Switch Zone Name List
Displays information only about the storage switches that have the zones with the names you specify.

[-zone-member-sw-domain-id-list <integer>, ...] - Zone Member Switch Port Domain ID List
Displays information only about the storage switches that have the zones with the member switch domain ids you specify.

[-zone-member-port-name-list <text>, ...] - Zone Member Port Name List
Displays information only about the storage switches that have the zones with the port names you specify.

[-zone-member-wwn-list <text>, ...] - Zone Member WWN List
Displays information only about the storage switches that have the zones with the member WWNs you specify.

[-zone-member-port-id-list <text>, ...] - Zone Member Port ID List
Displays information only about the storage switches that have the zones with the member port ids you specify.

[-port-wwn-list <text>, ...] - Switch Port World Wide Name (WWPN) List
Displays information only about the storage switches that have the ports with the WWNs you specify.

[-port-name-list <text>, ...] - Switch Port Name List
Displays information only about the storage switches that have the ports with the names you specify.

[-port-admin-status-list (unknown|enabled|disabled), ...] - Switch Port Admin Status List
Displays information only about the storage switches that have the ports with administrative statuses you specify.
[-port-oper-status-list (unknown|online|offline), ...] - Switch Port Operational Status List
Displays information only about the storage switches that have the ports with operational statuses you specify.

[-port-mode-list (unknown|auto|F-port|FL-port|E-port|TE-port|U-port|G-port), ...] - Switch Port Mode List
Displays information only about the storage switches that have the ports with the operating modes you specify.

[-port-oper-speed-list <integer>, ...] - Switch Port Current Speed (in Gbits/sec) List
Displays information only about the storage switches that have the ports with the operational speeds you specify.

[-port-bb-credit-list <integer>, ...] - Switch Port BB Credit List
Displays information only about the storage switches that have the ports with the BB credits you specify.

[-port-sfp-present-list (true|false), ...] - Switch Port Is SFP Present List
Displays information only about the storage switches that have the ports with the SFP present values you specify.

[-port-peer-wwpn-list <text>, ...] - Switch Port Peer WWPN List
Displays information only about the storage switches that have the ports with the peer port WWPNs you specify.

[-port-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}, ...] - Switch Port Data Last Successful Refresh Timestamp
Displays information only about the storage switches that match the port data last successful refresh timestamp you specify.

[-port-stat-name-list <text>, ...] - Switch Port Name List
Displays information only about the storage switches that have the ports with the names you specify.

[-port-tx-frames-list <integer>, ...] - Switch Port Transmitted Frame Count List
Displays information only about the storage switches that have the ports with the transmitted frames values you specify.

[-port-rx-frames-list <integer>, ...] - Switch Port Received Frame Count List
Displays information only about the storage switches that have the ports with the received frames values you specify.

[-port-tx-octets-list <integer>, ...] - Switch Port Total Transmitted Octets List
Displays information only about the storage switches that have the ports with the transmitted octets values you specify.

[-port-rx-octets-list <integer>, ...] - Switch Port Total Received Octets List
Displays information only about the storage switches that have the ports with the received octets values you specify.

[-port-frame-error-list <integer>, ...] - Switch Port Frame Error Count List
Displays information only about the storage switches that have the ports with the error frame values you specify.

[-port-stat-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}, ...] - Switch Port Stat Data Last Update Timestamp
Displays information only about the storage switches that match the port statistics data last successful refresh timestamp you specify.

[-sfp-port-name-list <text>, ...] - Switch Port Name List
Displays information only about the storage switches that have the ports with the names you specify.

[-sfp-type-list (unknown|other|gbic|embedded|glm|gbic-with-serial-id|gbic-without-serial-id|sfp-with-serial-id|sfp-without-serial-id|xfp|x2-short|x2-medium|x2-tall|xpak-short|}...] - Switch Port SFP Type List
Displays information only about the storage switches that have the ports with the SFP types you specify.
xpak-medium|xpak-tall|xenpak|sfp-dw-dm|qsfp|x2-dw-dm|gbic-not-installed|small-form-factor}, ... - Switch Port SFP Type List

Displays information only about the storage switches that have the ports with the SFP types you specify.

Displays information only about the storage switches that have the ports with the SFP transmitter types you specify.

[-sfp-vendor-list <text>, ...] - Switch Port SFP Vendor List

Displays information only about the storage switches that have the ports with the SFP vendors you specify.

[-sfp-part-number-list <text>, ...] - Switch Port SFP Part Number List

Displays information only about the storage switches that have the ports with the SFP part numbers you specify.

[-sfp-serial-number-list <text>, ...] - Switch Port SFP Serial Number List

Displays information only about the storage switches that have the ports with the SFP serial numbers you specify.

[-sfp-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [+|-]hh:mm}] - Switch Port SFP Data Last Successful Refresh Timestamp

Displays information only about the storage switches that match the port SFP data last successful refresh timestamp you specify.

[-switch-error-text-list <text>, ...] - Switch Error Text List

Displays information only about the storage switches that have the errors you specify.

[-conn-switch-port-name-list <text>, ...] - Switch Port Name List

Displays information only about the storage switches that have the ports with the names you specify.

[-conn-switch-port-mode-list {unknown|auto|F-port|FL-port|E-port|TE-port|U-port|G-port}, ...] - Switch Port Operating Mode List

Displays information only about the storage switches that have the ports with the operating modes you specify.

[-conn-switch-port-wwn-list <text>, ...] - Switch Port WWN List

Displays information only about the storage switches that have the ports with the WWNs you specify.

[-conn-switch-port-peer-port-wwn-list <text>, ...] - Switch Port Peer Port WWN List

Displays information only about the storage switches that have the ports with the peer port WWNs you specify.

[-conn-switch-port-peer-info-list <text>, ...] - Switch Port Peer Host & Port Name List

Displays information only about the storage switches that have the ports with the peer information values you specify.

[-conn-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [+|-]hh:mm}] - Switch Connectivity Data Last Successful Refresh Timestamp

Displays information only about the storage switches that match the switch connectivity data last successful refresh timestamp you specify.

[-conn-switch-port-peer-type-list {unknown|bridge|switch|fcp-adapter|fcvi-adapter}, ...] - Switch Port Peer Type List

Displays information only about the storage switches that have the ports connected to the peer types you specify.

[-switch-port-name-list <text>, ...] - Switch Port Name List

Displays information only about the storage switches that have the ports with the names you specify.
[-switch-port-speed-list <integer>, ...] - Switch Port Speed (in Gbps) List
Displays information only about the storage switches that have the ports with the speeds you specify.

[-node-name-list <nodename>, ...] - Node Name List
Displays information only about the storage switches that are connected to the nodes you specify.

[-adapter-name-list <text>, ...] - Node Adapter Name List
Displays information only about the storage switches that are connected to the adapters you specify.

[-adapter-port-name-list <text>, ...] - Node Adapter Port Name List
Displays information only about the storage switches that are connected to the adapter ports you specify.

[-adapter-type-list {unknown|FCP-Initiator|FC-VI|FCP-Target}, ...] - Node Adapter Type List
Displays information only about the storage switches that are connected to the types of adapters you specify.

[-path-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}] - Switch Path Data Last Successful Refresh Timestamp
Displays information only about the storage switches that match the node to switch path data last successful refresh timestamp you specify.

[-name-list <text>, ...] - Switch Name List
Displays information only about the storage switches that match the names you specify.

[-domain-id-list <integer>, ...] - Switch Domain ID List
Displays information only about the storage switches that match the domain ids you specify.

[-wwn-list <text>, ...] - Switch WWN List
Displays information only about the storage switches that match the switch WWNs you specify.

[-role-list {unknown|primary|subordinate}, ...] - Switch Role in Fabric List
Displays information only about the storage switches that match the switch roles you specify.

[-address-list <IP Address>, ...] - Switch IP Address List
Displays information only about the storage switches that match the switch IP addresses you specify.

Examples
The following example displays information about all storage switches:

```
cluster::>storage switch show
Symbolic Name   Vendor  Model      Switch WWN       Monitored Status
-------------- ------- ---------- ---------------- --------- -------
Cisco_10.226.197.34 mcc-cisco-8Gb-fab-4 Cisco DS-C9148-16P-K9 2000547fee78f088 true ok
Cisco_10.226.197.35 mcc-cisco-8Gb-fab-3 Cisco DS-C9148-16P-K9 2000547fee78f0f0 true ok
Cisco_10.226.197.36 mcc-cisco-8Gb-fab-2 Cisco DS-C9148-16P-K9 2000547fee78efb0 true ok
Cisco_10.226.197.37 mcc-cisco-8Gb-fab-1 Cisco DS-C9148-16P-K9 2000547fee78f0d8 true ok
4 entries were displayed.
cluster::>
```
The following example displays connectivity (switch to peer and node to switch) information about all storage switches:

```bash
cluster::> storage switch show -connectivity

storage tape commands

Manage tape devices

storage tape offline

Take a tape drive offline

Availability: This command is available to cluster administrators at the admin privilege level.

Description

This command takes the specified tape drive offline.

Parameters

- **node (<nodename> | local) - Node**

  Use this parameter to specify the node to which the tape drive is attached.

  { - **name <text>** - Tape Drive Device Name

  Use this parameter to specify the device name of the tape drive that needs to be taken offline. The format of the device name includes a prefix to specify how the tape cartridge is handled and a suffix to describe the density of the tape. The prefix suggests 'r', 'nr' or 'ur' for rewind, no rewind, or unload/reload and a suffix shows density of 'l', 'm', 'h' or 'a'. For example, a tape device name for this operation might have the form "nrst8m" were 'nr' is the 'no rewind' prefix, 'st8' is the alias-name and 'm' is the tape density. You can use the
'storage tape show -device-names' command to find more information about device names of tape drives attached to a node.

<table>
<thead>
<tr>
<th>-device-id &lt;text&gt;</th>
<th>- Tape Drive Device ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use this parameter to specify the device ID of the tape drive that needs to be taken offline.</td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

The following example takes the tape drive with device name 'nrst8m' offline. This tape drive is attached to cluster1-01.

```
cluster1::> storage tape offline -node cluster1-01 -name nrst8m
```

---

**storage tape online**

Bring a tape drive online

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

This command brings a specified tape drive online.

**Parameters**

- **-node <nodename>|local** - Node
  
  Use this parameter to specify the node to which the tape drive is attached.

- **{ -device-id <text> | -name <text> }** - Tape Drive Device ID
  
  Use this parameter to specify the device ID or the device name of the tape drive that needs to be brought online.

- **| -name <text> |** - Tape Drive Device Name
  
  Use this parameter to specify the device name of the tape drive that needs to be brought online. The format of the device name includes a prefix to specify how the tape cartridge is handled and a suffix to describe the density of the tape. The prefix suggests 'r', 'nr' or 'ur' for rewind, no rewind, or unload/reload and a suffix shows density of 'l', 'm', 'h' or 'a'. For example, a tape device name for this operation might have the form "nrst8m" were 'nr' is the 'no rewind' prefix, 'st8' is the alias-name and 'm' is the tape density. You can use the 'storage tape show -device-names' command to find more information about device names of tape drives attached to a node.

**Examples**

The following example brings the tape drive with device id sw4:2.126L4 attached to the node, cluster1-01, online.

```
cluster1::> storage tape online -node cluster1-01 -device-id sw4:2.126L4
```

---

**storage tape position**

Modify a tape drive cartridge position

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

This command changes the tape drive cartridge position.
Parameters

- **-node <nodename> | local** - Node
  Use this parameter to specify the node to which the tape drive is attached.

- **-name <text>** - Tape Drive Device Name
  Use this parameter to specify the device name of the tape drive whose cartridge position needs to be changed. The format of the device **-name** includes a prefix to specify how the tape cartridge is handled and a suffix to describe the density of the tape. The prefix suggests 'r', 'nr' or 'ur' for rewind, no rewind, or unload/reload and a suffix shows density of 'l', 'm', 'h' or 'a'. For example, a tape device name for this operation might have the form "nrst8m" were 'nr' is the 'no rewind' prefix, 'st8' is the alias-name and 'm' is the tape density. You can use the 'storage tape show -device-names' command to find more information about device names of tape drives attached to a node.

- **-operation {weof|fsf|bsf|fsr|bsr|rewind|erase|eom}** - Tape Position Operation
  Use this parameter to specify the tape positioning operation. The possible values for **-operation** are:
  - weof - Write end-of-file marks
  - fsf - Forward space end-of-file marks
  - bsf - Backward space end-of-file marks
  - fsr - Forward space records
  - bsr - Backward space records
  - rewind - Rewind the tape
  - erase - Erase then entire tape media from current position
  - eom - Position the tape at end of data (end of media if full)

- **[-count <integer>]** - Count for Positioning
  Use this parameter to specify the count for a tape positioning operation. You can specify this parameter only with the following operations: weof, fsf, bsf, fsr, and bsr. The default value of this parameter is one.

Examples

The following example specifies a rewind operation on a tape device. Note the -count parameter does not need to be specified for this type of operation.

```
cluster1::> storage tape position -node cluster1-01 -name nrst8m -operation rewind
```

The following example specifies an fsf (forward space filemark) operation on a tape device. Note the -count parameter specifies 5 forward space filemarks for this operation.

```
cluster1::> storage tape position -node cluster1-01 -name nrstla -operation fsf -count 5
```

The following example specifies an eom (end-of-media) operation on a tape device. The 'eom' positions a tape at end of data (end of media if full). Note the -count parameter does not need to be specified for this type of operation.

```
cluster1::> storage tape position -node cluster1-01 -name rst0h -operation eom
```
storage tape reset

Reset a tape drive

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
This command resets a specified tape drive.

Parameters
- `-node <nodename>|local` - Node
  Use this parameter to specify the node to which the tape drive is attached.
- `-device-id <text>` - Tape Drive Device ID
  Use this parameter to specify the device ID of the tape drive is to be reset.

Examples
The following example resets the tape drive with device ID sw4:2.126L3 attached to the node, cluster1-01.

```
cluster1::> storage tape reset -node cluster1-01 -device-id sw4:2.126L3
```

storage tape show

Display information about tape drives and media changers

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The storage tape show command displays information about tape drives and media changers attached to the cluster. Where it appears in the remainder of this document "device" may refer to either a tape drive or a media changer. By default, this command displays the following information about all tape drives and media changers:

- Node to which the tape drive/media changer is attached
- Device ID of the tape drive/media changer
- Description of the tape drive/media changer
- Type of device: tape drive or media changer
- Functional status of the tape drive/media changer

Parameters

```
[-fields <fieldname>, ...]  
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.
```

```
[-alias]  
Displays the tape drive/media changer alias with the following details:
- Node to which tape drive/media changer is attached
- Device ID of the tape drive/media changer
- Alias name of the tape drive/media changer
```
• Alias mapping for tape drive/media changer

[[-connectivity]]
Displays the connectivity from the node to the tape drive/media changer with the following details:
• Node to which tape drive/media changer is attached
• Device ID of the tape drive/media changer
• Tape drive/media changer description
• Type of device: tape drive or media changer
• Interface type for the tape drive/media changer
• World Wide Node Name of tape drive/media changer
• World Wide Port Name of tape drive/media changer
• Serial Number of tape drive/media changer
• Tape drive/media changer errors
• Initiator port which hosts the tape drive/media changer
• Alias name of the tape drive/media changer
• Operational state of tape drive/media changer
• Functional status of tape drive/media changer

[[-device-names]]
Displays the tape drive names for used tape positioning using the following details: rewind, no rewind, unload/reload and density
• Node to which tape drive/media changer is attached
• Device ID of the tape drive/media changer
• Tape drive/media changer description
• Device Names that include Rewind, no Rewind, Unload/Reload

[[-status]]
Displays the status of tape drive/media changer with the following details:
• Device ID of the tape drive/media changer
• Tape drive/media changer description
• World Wide Node Name of tape drive/media changer
• World Wide Port Name of tape drive/media changer
• Serial Number of tape drive/media changer
• Alias name of the tape drive/media changer
• Format used for tape cartridge mounted by tape drive
• Tape drive/media changer errors
• Node to which tape drive/media changer is attached
• Operational state of tape drive/media changer

922

Command: Manual Page Reference
- File number following last tape drive I/O operation
- Block number following last tape drive I/O operation
- Residual count following last tape drive I/O operation

[-instance ]
If you specify the `instance` parameter, the command displays detailed information about all fields.

[-device-id <text>] - Device ID
Selects the tape drive/media changer with the specified device ID.

[-node {<nodename> [local]}] - Node
Displays detailed information about tape drives or media changers on the specified node.

[-device-type <text>] - Device Type
Selects the devices with the specified type of tape drive or media changer.

[-description <text>] - Description
Selects the tape drives/media changers with the specified description.

[-alias-name <text>] - Alias Name
Selects the tape drive/media changer with the specified alias name.

[-alias-mapping <text>] - Alias Mapping
Selects the tape drive/media changer with the specified alias mapping.

[-wwnn <text>] - World Wide Node Name
Selects the tape drives/media changers with the specified World Wide Node Name.

[-wwpn <text>] - World Wide Port Name
Selects the tape drive/media changer with the specified World Wide Port Name.

[-serial-number <text>] - Serial Number
Selects the tape drive/media changer with the specified serial number.

[-functional-status {unknown|normal|error}] - Functional Status
Selects the tape drives/media changers with the specified functional status of the device.

[-device-if-type {unknown|fibre-channel|SAS|pSCSI}] - Device Interface Type
Selects the tape drives/media changers with the specified interface type.

[-device-state {unknown|available|ready-write-enabled|ready-write-protected|offline|in-use|error|reserved-by-another-host|normal}] - Operational State of Device
Selects the tape drives/media changers with the specified operational state.

[-format <text>,...] - Tape Cartridge Format
Selects the tape drives with the specified tape format.

[-error <text>] - Tape Error
Selects the tape drives/media changers with the specified error string.

[-initiator <text>] - Initiator Port
Selects the tape drives/media changers with the specified initiator port.

[-file-number <integer>] - File Number
Selects the tape drives/media changers with the specified file number. The file number is the number of file
marks between the beginning of media and current logical position. File number gets modified on write file
mark, and forward or backward space file operations. A value of -1 indicates unknown position on the tape
media or tape not loaded in the tape drive.
[[-block-number <integer>]] - Block Number
Selects the tape drives/media changers with the specified block number. The block number is the number of logical blocks between the beginning of tape media or the prior file mark and the current logical position on the tape media. Block number gets modified on writes, reads, and forward or backward space over records (blocks). The block number also gets reset to zero when a file mark is crossed or another file mark is written that designates a new file. If the tape is back spaced to a prior file mark, the block number might be zeroed. A value of -1 indicates unknown position on the tape media or that a tape not loaded in the tape drive.

[[-residual-count <integer>]] - Residual Count of Last I/O Operation
Selects the tape drives with the specified residual count.

[[-device-name-r <text>, ...]] - Device Name for Rewind
Selects the tape drives with the specified device name for rewind.

[[-device-name-nr <text>, ...]] - Device Name for No Rewind
Selects the tape drives with the specified device name for no rewind.

[[-device-name-ur <text>, ...]] - Device Name for Unload Reload
Selects the tape drives with the specified device name for unload/reload.

[[-resv-type {off|persistent|scsi}]] - Reservation Type for device
Selects the tape drives with the specified type.

### Examples
The following example displays information about all tape drives and media changers attached to the cluster:

```
cluster1::> storage tape show
Node: cluster1-01
Device ID               Device Type     Description                     Status
----------------------  --------------  ------------------------------  --------
sw4:10.11               tape drive      HP LTO-3                        error

Node: cluster1-01
Device ID               Device Type     Description                     Status
----------------------  --------------  ------------------------------  --------
sw4:10.11L1             media changer   PX70-TL                         normal
```

The following example displays detailed information about a tape drive named sw4:10.11

```
cluster1::> storage tape show -device-id sw4:10.11
Node: cluster1-01
Device ID               Device Type     Description                     Status
----------------------  --------------  ------------------------------  --------
sw4:10.11               tape drive      HP LTO-3                        error
```

### storage tape show-errors
Display tape drive errors

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
The `storage tape show-errors` command displays error information about tape drives attached to the cluster. By default, this command displays the following information about all tape drives:

- Node to which the tape drive is attached
- Device ID of the tape drive
- Type of device (tape drive)
- Description of the tape drive
- Alias name of the tape drive
- Tape drive errors

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance ]
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[-node (<nodename> | local)] - Node
```

Displays detailed information about tape drives on the specified node.

```
[-device-id <text>] - Device ID
```

Selects the tape drive with the specified device ID.

```
[-device-type <text>] - Device Type
```

Selects the devices with the specified type of tape drive.

```
[-description <text>] - Description
```

Selects the tape drives with the specified description.

```
[-alias-name <text>] - Alias Name
```

Selects the tape drive with the specified alias name.

```
[-wwnn <text>] - World Wide Node Name
```

Selects the tape drives with the specified World Wide Node Name.

```
[-wwpn <text>] - World Wide Port Name
```

Selects the tape drive with the specified World Wide Port Name.

```
[-serial-number <text>] - Serial Number
```

Selects the tape drive with the specified serial number.

```
[-error <text>] - Tape Drive Error Description
```

Selects the tape drives with the specified error string.

```
[-initiator <text>] - Initiator Port
```

Selects the tape drives with the specified initiator port.

**Examples**

The following example shows error information for all tape drives attached to cluster1.

```
cluster1::> storage tape show-errors
   Node: node1
       Device ID: 0d.125
       Device Type: tape drive
       Description: Hewlett-Packard LTO-5
       Alias: st0

       Errors: hardware error; repair or replace tape drive

   Node: node1
       Device ID: 2d.0
```
The following example shows error information for tape drive sw4:2.126L1 attached to the node, node1.

```
cluster1::> storage tape-show-errors -device-id sw4:2.126L1 -node node1
```

Node: node1
Device ID: sw4:2.126L1
Device Type: tape drive
Description: Hewlett-Packard LTO-3
Alias: st3
Errors: -

---

**storage tape show-media-changer**

Display information about media changers

**Availability:** This command is available to cluster administrators at the *admin* privilege level.

**Description**

This `storage tape show-media-changer` command displays information about media changers attached to the cluster. By default, this command displays the following information about all media changers:

- Device ID of media changer
- Description of media changer
- World Wide Node Name of media changer
- World Wide Port Name of media changer
- Serial number of media changer
- Media changer errors
- Node to which the media changer is attached
- Initiator port which hosts the media changer
- Alias name of media changer
- Operational state of media changer
- Functional status of media changer

**Parameters**

`[-fields <fieldname>, ...]`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

`[-instance]`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-device-id <text>] - Device ID`

Selects the media changer with the specified device ID.
[-node {<nodename> | local}] - Node
Displays detailed information about media changers on the specified node.

[-description <text>] - Description
Selects the media changers with the specified description.

[-alias-name <text>] - Alias Name
Selects the media changer with the specified alias name.

[-wwnn <text>] - World Wide Node Name
Selects the media changers with the specified World Wide Node Name.

[-wwpn <text>] - World Wide Port Name
Selects the media changer with the specified World Wide Port Name.

[-serial-number <text>] - Serial Number
Selects the media changer with the specified serial number.

[-device-if-type {unknown | fibre-channel | SAS | pSCSI}] - Device If Type
Selects the media changers with the specified interface type.

[-device-state {unknown | available | ready-write-enabled | ready-write-protected | offline | in-use | error | reserved-by-another-host | normal}] - Operational State of Device
Selects the media changers with the specified operational state.

[-error <text>] - Media Changer Error Description
Selects the media changers with the specified error string.

[-initiator <text>] - Initiator Port
Selects the media changers with the specified initiator port.

**Examples**
The following example displays information about all media changers attached to the cluster:

```
cluster1::> storage tape show-media-changer

Media Changer: sw4:10.11L1
Description: PX70-TL
 WWNN: 2:00a:000e11:10b919

```
storage tape show-supported-status

Displays the qualification and supported status of tape drives

Availability: This command is available to cluster administrators at the admin privilege level.

Description
This command displays the supported and qualification status of all tape drives recognized by Data ONTAP attached to a node in the cluster. This includes nonqualified tape drives. Such tape drives do not have a Tape Configuration File (TCF) on the storage system. A nonqualified tape drive can be used if the tape drive emulates a qualified tape drive or if the appropriate TCF for the nonqualified tape drive is downloaded from the NetApp Support Site to the storage system.

Parameters

[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-node <nodename> | local] - Node
Selects the tape drives that match this parameter value.

[-tape-drive <text>] - Tape Drive Name
Selects the tape drives that match this parameter value.

[-is-supported {true | false}] - Tape Drive Supported
Selects the tape drives that match this parameter value.

[-status <text>] - Supported Status
Selects the tape drives that match this parameter value.

Examples
The following example displays support and qualification status of tape drives recognized by Data ONTAP. The command also identifies tape drives attached to the node that are nonqualified (not supported).

```
cluster1::> storage tape show-supported-status
Node: Node1
<table>
<thead>
<tr>
<th>Tape Drive</th>
<th>Supported</th>
<th>Support Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>sw412.126L6</td>
<td>false</td>
<td>Nonqualified tape drive</td>
</tr>
<tr>
<td>Hewlett-Packard C1533A</td>
<td>true</td>
<td>Qualified</td>
</tr>
<tr>
<td>Hewlett-Packard C1553A</td>
<td>true</td>
<td>Qualified</td>
</tr>
<tr>
<td>Hewlett-Packard Ultrium 1</td>
<td>true</td>
<td>Qualified</td>
</tr>
<tr>
<td>Sony SDX-300C</td>
<td>true</td>
<td>Qualified</td>
</tr>
<tr>
<td>Sony SDX-500C</td>
<td>true</td>
<td>Qualified</td>
</tr>
<tr>
<td>StorageTek T9840C</td>
<td>true</td>
<td>Dynamically Qualified</td>
</tr>
<tr>
<td>StorageTek T9840D</td>
<td>true</td>
<td>Dynamically Qualified</td>
</tr>
<tr>
<td>Tandberg LTO-2 HH</td>
<td>true</td>
<td>Dynamically Qualified</td>
</tr>
</tbody>
</table>
```

The following example displays support and qualification status of tape drives selected by tape-drive. The command identifies the supported status of the selected tape drive.

```
cluster1::> storage tape show-supported-status -tape-drive "Sony SDX-300C"
Node: Node1
<table>
<thead>
<tr>
<th>Is</th>
</tr>
</thead>
</table>
```

storage tape show-tape-drive

Display information about tape drives

Availability: This command is available to cluster administrators at the admin privilege level.

Description
This storage tape show-tape-drive command displays information about tape drives attached to the cluster. By default, this command displays the following information about all tape drives:

- Device ID of tape drive
- Description of tape drive
- World Wide Node Name of tape drive
- World Wide Port Name of tape drive
- Serial Number of tape drive
- Tape drive errors
- Node to which the tape drive is attached
- Initiator port which hosts the tape drive
- Alias name of tape drive
- Operational state of tape drive
- Functional status of tape drive

Parameters

{ [-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use ‘-fields ?’ to display the fields to specify.

  | [-instance ]
  If you specify the -instance parameter, the command displays detailed information about all fields.

 [-device-id <text>] - Device ID
 Selects the tape drive with the specified device ID.

 [-node {<nodename>|local}] - Node
 Displays detailed information about tape drives on the specified node.

 [-description <text>] - Description
 Selects the tape drives with the specified description.

 [-alias-name <text>] - Alias Name
 Selects the tape drive with the specified alias name.

 [-wwnn <text>] - World Wide Node Name
 Selects the tape drives with the specified World Wide Node Name.
[-wwpn <text>] - World Wide Port Name
Selects the tape drive with the specified World Wide Port Name.

[-serial-number <text>] - Serial Number
Selects the tape drive with the specified serial number.

[-device-if-type {unknown|fibre-channel|SAS|pSCSI}] - Device If Type
Selects the tape drives with the specified interface type.

[-device-state {unknown|available|ready-write-enabled|ready-write-protected|offline|in-use|error|reserved-by-another-host|normal}] - Operational State of Device
Selects the tape drives with the specified operational state.

[-error <text>] - Tape Drive Error Description
Selects the tape drives with the specified error string.

[-initiator <text>] - Initiator Port
Selects the tape drives with the specified initiator port.

[-resv-type {off|persistent|scsi}] - Reservation type for device
Selects the tape drives with the specified type.

Examples
The following example displays information about all tape drives attached to the cluster:

```
cluster1::> storage tape show-tape-drive
Tape Drive: sw4:11.126
  Description: StorageTek T10000C
  WWNN: 5:001:04f000:b39ec8
  WWPN: 5:001:04f000:b39ec9
  Serial Number: 576004000041
  Errors: -

Paths:

  Errors: -

Paths:
Node Initiator Alias      Device State              Status
------------------------  ---------  -------  ------------------------  --------
cluster1-01               0b         st1      ready-write-enabled       normal
```

**storage tape trace**
Enable/disable tape trace operations

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
This command enables or disables diagnostic tape trace operations for all tape drives attached to the node you have specified.
Parameters

- **node** `<nodename>|local` - Node
  Use this parameter to specify the node on which the tape trace feature is enabled or disabled.

- **-is-trace-enabled** `{true|false}` - Tape Trace Enabled or Disabled
  Use this parameter to enable or disable the tape trace feature. By default, the tape trace feature is enabled.

**Examples**

The following example enables tape trace operation on the node, `cluster1-01`.

```
class cluster1::> storage tape trace -node cluster1-01 -is-trace-enabled true
```

---

**storage tape alias commands**

Manage tape device aliases

**storage tape alias clear**

Clear alias names

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**

This command clears alias names for a tape drive or media changer.

**Parameters**

- **node** `<nodename>|local` - Node
  Use this parameter to specify the node to which the tape drive is attached.

- `{ -name <text> - Alias Name That Is to Be Cleared
  Use this parameter to specify the alias name that is to be cleared. You can use the `storage show -alias` command to find more information about alias names of tape drives and media changers attached to a node.
  The `-clear-scope` and `-name` parameters are mutually exclusive. If you specify the `-name` parameter, a single alias name is cleared.

- **-clear-scope** `{tape|media-changer|all}` - Scope of Alias Clear Operation
  Use this parameter to specify the scope of the alias clear operation. The `-clear-scope` and `-name` parameters are mutually exclusive. If you specify the `-clear-scope` parameter, multiple aliases are cleared depending upon the value of the parameter.

  The possible values for `-clear-scope` are as follows:
  - tape - Clear all tape drive aliases
  - media-changer - Clear all media-changer aliases
  - all - Clear both tape drive and media-changer aliases

**Examples**

The following example clears an alias name `st3` attached to the node, `cluster1-01`.

```
class cluster1::> storage tape alias clear -node cluster1-01 -name st3
```
### storage tape alias clear

Set an alias name for tape drive or media changer

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

This command sets an alias name for a tape drive or media changer.

**Parameters**

- `-node <nodename>|local` - Node
  
  Use this parameter to specify the node to which the tape drive is attached.

- `-name <text>` - Alias Name for Tape Drive or Media Changer
  
  Use this parameter to specify the alias name for tape drive or media changer. For a tape drive alias name, the format is 'st' followed by one or more digits. For a media changer alias name, the format is 'mc' followed by one or more digits.

- `-mapping <text>` - Mapping for Alias Name
  
  Use this parameter to specify the mapping for an alias name. Use the format 'SN[<serial-number>]'. Valid mapping for serial numbers are in the format 'SN[<serial-number>] where the <serial-number> is from 2 to 90 characters long and includes the following characters: 0-9, a-z, and A-Z.

**Examples**

The following example clears all tape drive alias names attached to the node, cluster1-01.

```text
cluster1::> storage tape alias clear -node cluster1-01 -clear-scope tape
```

The following example clears all media changer alias names attached to the node, cluster1-01.

```text
cluster1::> storage tape alias clear -node cluster1-01 -clear-scope media-changer
```

The following example clears both tape and media changer alias names attached to the node, cluster1-01.

```text
cluster1::> storage tape alias clear -node cluster1-01 -clear-scope all
```
storage tape alias show

Displays aliases of all tape drives and media changers

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
This command displays aliases of all tape drives and media changers attached to every node in the cluster.

**Parameters**

```
{-fields <fieldname>, ...}
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
][-instance]]
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**Examples**

The following example shows the aliases of all tape drives and media changers attached to every node in the cluster:

```
cluster1::> storage tape alias show
Node: node1
<table>
<thead>
<tr>
<th>Alias</th>
<th>Mapping</th>

```

**storage tape library commands**

View connectivity of tape libraries in cluster

**storage tape library config commands**

View configuration of tape LUNs attached to tape libraries
storage tape library config show

Display connectivity to back-end storage tape libraries.

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
This command displays information such as how the storage tape libraries connect to the cluster, LUN groups, number of LUNs, WWPN, and switch port information. Use this command to verify the cluster's storage tape library configuration or to assist in troubleshooting.

**Parameters**

```
[-fields <fieldname>, ...]
```
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-switch]
```
If you specify this parameter, switch port information is shown.

```
[-instance]
```
If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[-node (<nodename> | local)] - Controller Name
```
The name of the clustered node for which information is being displayed.

```
[-group <integer>] - LUN Group
```
A LUN group is a set of LUNs that shares the same path set.

```
[-target-wwpn <text>] - Library Target Ports
```
The World Wide Port Name of a storage tape library port.

```
[-initiator <text>] - Initiator
```
The host bus adapter that the clustered node uses to connect to storage tape libraries.

```
[-array-name <array name>] - Library Name
```
Name of the storage tape library that is connected to the clustered node.

```
[-target-side-switch-port <text>] - Target Side Switch Port
```
This identifies the switch port that connects to the tape library's target port.

```
[-initiator-side-switch-port <text>] - Initiator Side Switch Port
```
This identifies the switch port that connects to the node's initiator port.

```
[-lun-count <integer>] - Number of LUNS
```
This is a command-line switch (-lun-count) used to restrict what LUN groups are displayed in the output.

**Examples**
The following example displays the storage tape library configuration information.

```
cluster1::> storage tape library config show
LUN LUN
Node Group Count Library Name Library Target Port Initiator
---------- ----- ------ --------------- ----------------- -------
cluster1-01
```

storage tape library path commands

View connectivity of tape libraries in cluster

storage tape library path show

Display a list of Tape Libraries on the given path

Availability: This command is available to cluster administrators at the admin privilege level.

Description
This command displays path information for a tape library and has the following parameters by default:

• Node name
• Initiator port
• Target port
• TPGN (Target Port Group Number)
• Port speeds
• Path I/O in Kbytes/sec
• IOPs

Parameters
{-fields <fieldname>,...}
fields used to be used in this display

| [-detail ]
Using this option displays the following:
• Target IOPs
• Target LUNs
• Path IOPs
• Path errors
• Path quality
• Path LUNs
• Initiator IOPs
• Initiator LUNs

| [-instance ]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-node (<nodename> | local)] - Controller name
The name of the clustered node for which information is being displayed.
[-array-name <array name>] - Library Name
   Name of the storage tape library that is connected to the cluster.

[-target-wwpn <text>] - Target Port
   Target World Wide Port Name. Port on the storage tape library that is being used.

[-initiator <text>] - Initiator Port
   Initiator port that the clustered node uses.

[-initiator-side-switch-port <text>] - Initiator Side Switch Port
   Switch port connected to the clustered node.

[-tpgn <integer>] - Target Port Group Number
   TPGN refers to the target port group to which the target port belongs. A target port group is a set of target ports which share the same LUN access characteristics and failover behaviors.

[-port-speed <text>] - Port Speed
   Port Speed of the specified port.

[-path-io-kbps <integer>] - Kbytes of I/O per second on Path(Rolling Average)
   Rolling average of Kbytes of I/O per second on the library path.

[-path-iops <integer>] - Number of I/O per second on Path(Rolling Average)
   Rolling average of I/O per second on the library path.

[-initiator-io-kbps <integer>] - Kbytes of I/O per second on Initiator(Rolling Average)
   Rolling average of Kbytes of I/O per second on the initiator port.

[-initiator-iops <integer>] - Number of I/O per second on Initiator(Rolling Average)
   Rolling average of I/O per second on the initiator port.

[-target-io-kbps <integer>] - Kbytes of I/O per second to Target(Rolling Average)
   Rolling average of Kbytes of I/O per second on the target port.

[-target-iops <integer>] - Number of I/O per second to Target(Rolling Average)
   Rolling average of I/O per second on the target port.

[-target-side-switch-port <text>] - Target Side Switch Port
   Switch port connected to the tape library.

[-path-link-errors <integer>] - Link Error count on path
   Fibre Channel link error count.

[-path-quality <integer>] - Percentage of weighted error threshold
   A number representing the threshold of errors that is allowed on the path. Path quality is a weighted error value. When the error weight of a path exceeds the threshold, I/O is routed to a different path.

[-path-lun-in-use-count <integer>] - Number of LUNs in the in-use state on this path
   Number of LUNs on this path.

[-initiator-lun-in-use-count <integer>] - Number of LUNs in the in-use state on this initiator
   Number of LUNs on this initiator.

[-target-lun-in-use-count <integer>] - Number of LUNs in the in-use state on this target
   Number of LUNs on this target.

**Examples**

The following example displays the path information for a storage tape library.
cluster1::> storage tape library path show

<table>

storage tape library path show-by-initiator

Display a list of LUNs on the given tape library

Availability: This command is available to cluster administrators at the admin privilege level.

Description
This command displays path information for every initiator port connected to a tape library. The output is similar to the storage library path show command but the output is listed by initiator.

Parameters

- `-fields <fieldname>,...`
  fields used to be used in this display

- `-instance []`
  If you specify the -instance parameter, the command displays detailed information about all fields.

- `-node (<nodename>|local)` - Controller name
  The name of the clustered node for which information is being displayed.

- `-initiator <text>` - Initiator Port
  Initiator port that the clustered node uses.

- `-target-wwpn <text>` - Target Port
  Target World Wide Port Name. Port on the storage tape library that is being used.

- `-initiator-side-switch-port <text>` - Initiator Side Switch Port
  Switch port connected to the clustered node.

- `-target-side-switch-port <text>` - Target Side Switch Port
  Switch port connected to the tape library.

- `-array-name <array name>` - Library Name
  Name of the storage tape library that is connected to the cluster.

- `-tpgn <integer>` - Target Port Group Number
  TPGN refers to the target port group to which the target port belongs. A target port group is a set of target ports which share the same LUN access characteristics and failover behaviors.

- `-port-speed <text>` - Port Speed
  Port Speed of the specified port.

- `-path-io-kbps <integer>` - Kbytes of I/O per second on Path (Rolling Average)
  Rolling average of Kbytes of I/O per second on the library path.
[-path-iops <integer>] - Number of I/O per second on Path (Rolling Average)
  Rolling average of I/O per second on the library path.

[-initiator-io-kbps <integer>] - Kbytes of I/O per second on Initiator (Rolling Average)
  Rolling average of Kbytes of I/O per second on the initiator port.

[-initiator-iops <integer>] - Number of I/O per second on Initiator (Rolling Average)
  >Rolling average of I/O per second on the initiator port.

[-target-io-kbps <integer>] - Kbytes of I/O per second to Target (Rolling Average)
  Rolling average of Kbytes of I/O per second on the target port.

[-target-iops <integer>] - Number of I/O per second to Target (Rolling Average)
  Rolling average of I/O per second on the target port.

Examples
The following example displays the path information by initiator for a storage tape library.

```
cluster1::> storage tape library path show-by-initiator
Node: cluster1-01
Initiator I/O Initiator Side Path I/O Target Side Target I/O
(KB/s) Switch Port (KB/s) Switch Port (KB/s)

50050763124bd6f TAPE_LIB_2
3d                    0 N/A                             0                  N/A            0
3 entries were displayed.
```

storage tape config-file commands
Manage tape configuration files

storage tape config-file delete
Delete a tape config file

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The `storage tape config-file delete` command deletes the specified tape drive configuration file from all nodes that are currently part of the cluster.

Parameters
-`filename <text>` - Config File Filename
  This parameter specifies the name of the tape configuration file that will be deleted from all nodes that are currently part of the cluster.

Examples
The following example deletes the specified tape drive configuration files on every node that is currently part of the cluster:
**storage tape config-file get**

Get a tape drive configuration file

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The `storage tape config-file get` command uploads a specified tape drive configuration file to each node that is currently part of the cluster.

**Parameters**
- `-url <text>` - Config File URL.
  
  This parameter specifies the URL that provides the location of the package to be fetched. Standard URL schemes, including HTTP and TFTP, are accepted.

**Examples**
The following example uploads the specified tape drive configuration file to each node that is currently part of the cluster:

```
cluster1::> storage tape config-file get -url http://example.com/~tapeconfigfile/XYZ_LTO-6.TCF
```

**storage tape config-file show**

Display the list of tape drive configuration files on the given node

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The `storage tape config-file show` command lists the tape drive configuration files loaded onto each node in the cluster.

**Parameters**

- `{ [-fields <fieldname>, ...]`
  
  If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?' to display the fields to specify.

- `| [-instance ]}
  
  If you specify the `-instance` parameter, the command displays detailed information about all fields.

- `[-node <nodename>|local]` - Node
  
  Selects information about tape drive configuration files for the specified node.

- `[-config-file <text>]` - Tape Config File
  
  Selects information about the tape drive configuration file specified.

**Examples**
The following example lists the tape drive config files loaded onto each node in the cluster:

```
cluster1::> storage tape config-file show
Node: node1
Tape Config Files
```
storage tape load-balance commands

Manage tape load balance

storage tape load-balance modify

Modify the tape load balance configuration

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The `storage tape load-balance modify` command modifies the tape load balance setting for a specified node in the cluster.

Parameters
- `-node {<nodename>|local} - Node`
  This parameter specifies the node on which the tape load balance setting is to be modified.
- `[<-is-enabled {true|false}] - Is Tape Load Balance Enabled`
  This parameter specifies whether tape load balancing is enabled on the node. The default setting is false.

Examples
The following example modifies the tape load balance setting on node1 in the cluster:

```
cluster1::> storage tape load-balance modify -node node1 -is-enabled true
```

storage tape load-balance show

Displays the tape load balance configuration

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The `storage tape load-balance show` command displays tape load balance settings for each node in the cluster.

Parameters
- `[-fields <fieldname>,...]
  If you specify the `-fields <fieldname>,...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.`
If you specify the `--instance` parameter, the command displays detailed information about all fields.

```
--node {<nodename>|local} - Node
```

Selects information about tape load balancing for the specified node.

```
--is-enabled {true|false} - Is Tape Load Balance Enabled
```

Selects information about load balance configuration as specified by enabled or disabled setting.

### Examples

The following example shows the load balance setting for each node in the cluster:

```
cluster1::> storage tape load-balance show

<table>
<thead>
<tr>
<th>Node</th>
<th>Enabled</th>
</tr>
</thead>
<tbody>
<tr>
<td>node1</td>
<td>false</td>
</tr>
<tr>
<td>node2</td>
<td>false</td>
</tr>
</tbody>
</table>

2 entries were displayed.
```

### System Commands

The system directory

The system commands enable you to monitor and control cluster nodes.

#### system chassis commands

Chassis health monitor directory

#### system chassis show

Display all the chassis in the cluster

**Availability:** This command is available to cluster administrators at the *admin* privilege level.

**Description**

The `system chassis show` command displays information about all the chassis in the cluster. By default, the command displays the following information about all the chassis in the cluster:

- Chassis ID
- Status
- List of nodes in the chassis

To display more details, use the `--instance` parameter.

**Parameters**

```
[-fields <fieldname>, ...]
```

Selects the fields that you specify.

```
[-instance ]
```

Displays detailed information about all the chassis in the cluster.
[\texttt{-chassis-id <text>\texttt{]} · Chassis ID
Selects information about the specified chassis.

[\texttt{-member-nodes \{<nodename>|local\},\ldots\texttt{]} · List of Nodes in the Chassis
Selects information about the chassis with the specified member node list.

[\texttt{-num-nodes <integer>\texttt{]} · Number of Nodes in the Chassis
Selects information about the chassis with the specified number of nodes.

[\texttt{-status \{ok|ok-with-suppressed|degraded|unreachable|unknown\}\texttt{]} · Status
Selects information about the chassis with the specified status.

\begin{table}

**system chassis fru commands**

The fru directory

**system chassis fru show**

Display the FRUs in the cluster

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
The \texttt{system chassis fru show} command displays information about all the major chassis specific FRUs in the cluster. By default, the command displays the following information about all the FRUs in the cluster:

- Chassis ID
- FRU name
- FRU type
- FRU state
- Nodes sharing the FRU

To display more details, use the \texttt{-instance} parameter.
Parameters

[-fields <fieldname>, ...]
Selects the fields that you specify.

[-instance]
Displays detailed information about FRUs.

[-node <nodename>|local] - Node
Specifies the primary node name in the cluster on which Chassis health monitor is running.

[-serial-number <text>] - FRU Serial Number
Selects information about the FRU with the specified serial number.

[-fru-name <text>] - FRU Name
Selects information about the FRU with the specified FRU name.

[-type {controller|psu|fan|dimm|bootmedia}] - FRU Type
Selects information about all the FRUs with the specified FRU type.

[-name <text>] - FRU ID
Selects information about the FRU with the specified FRU unique name.

[-state <text>] - FRU State
Selects information about all the FRUs with the specified state.

[-status {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status
Selects information about all the FRUs with the specified status.

[-display-name <text>] - Display Name for the FRU
Selects information about all the FRUs with the specified FRU display name.

[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example}] - Monitor Name
Selects information about all the FRUs with the specified monitor name.

[-model <text>] - Model Type
Selects information about all the FRUs with the specified FRU model.

[-shared {shared|not_shared}] - Shared Resource
Selects information about all the FRUs with the specified sharing type.

[-chassis-id <text>] - Chassis ID
Selects information about all the FRUs in the specified chassis.

[-additional-info <text>] - Additional Information About the FRU
Selects information about all the FRUs with the specified additional information.

[-connected-nodes <nodename>|local>, ...] - List of Nodes Sharing the FRU
Selects information about all the FRUs with the specified node list.

[-num-nodes <integer>] - Number of Nodes Sharing the FRU
Selects information about all the FRUs with the specified number of connected nodes.

Examples

The following example displays information about all major chassis specific FRUs in the cluster:

```
class1::> system chassis fru show
Chassis ID   FRU      Type   State         Nodes Sharing the FRU
------------- -------- ------ ----------- ------------------
4591227214   node1   controller   ...  
```

system chassis commands
The following example displays detailed information about a specific FRU:

```
cluster1::> system chassis fru show -instance -fru-name "PSU1 FRU"
```

Node: node1
FRU Serial Number: XXT122737891
FRU Name: PSU1 FRU
FRU Type: psu
FRU Name: XXT122737891
FRU State: GOOD
Status: ok
Display Name for the FRU: PSU1 FRU
Monitor Name: chassis
Model Type: none
Shared Resource: shared
Chassis ID: 4591227214
Additional Information About the FRU: Part Number: 114-00065+A0
Revision: 020F
Manufacturer: NetApp
FRU Name: PSU
List of Nodes Sharing the FRU: node1,node2
Number of Nodes Sharing the FRU: 2

**system cluster-switch commands**

**system cluster-switch commands**

cluster switch health monitor directory

**system cluster-switch create**

Add information about a cluster switch or management switch

**Availability**: This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The `system cluster-switch create` command adds information about a cluster switch or management switch. The cluster switch health monitor uses this information to monitor the health of the switch.

Use this command if Data ONTAP cannot automatically discover a cluster or management switch. Data ONTAP relies on discovery protocols to discover the switches. By default, Data ONTAP automatically attempts to discover and monitor supported cluster and management switches.

If the Cisco Discovery Protocol v1 (CDPv1) Daemon is disabled, Data ONTAP cannot discover the cluster and management switches. To verify whether the discovery protocol is enabled or disabled, run the command: `system node run -node <node_name> -command options cdpd.enable`

Use the `system cluster-switch show` command to identify the switches that the cluster switch health monitor is monitoring.

**Parameters**
- `device <text>` - Device Name

  Specifies the device name of the switch that you want to monitor. Data ONTAP uses the device name of the switch to identify the SNMP agent with which it wants to communicate.
- **address <IP Address>** - IP Address
  Specifies the IP address of switch's management interface.

- **snmp-version (SNMPv1|SNMPv2c)** - SNMP Version
  Specifies the SNMP version that Data ONTAP uses to communicate with the switch. The default is SNMP v2c.

- **community <text>** - Community String
  Specifies the community string for SNMPv2 authentication. The default is cshm1!.

- **model {NX5010|NX5020|CAT2960|OTHER|NX5596|CN1610|CN1601|NX3132}** - Model Number
  Specifies the model number of the switch. You should not set this parameter to OTHER. Data ONTAP does not monitor switches that match this value. Data ONTAP sets this parameter to OTHER if a switch that it automatically discovers is not supported for health monitoring.

- **type {cluster-network|management-network}** - Switch Network
  Specifies the switch type.

- **[is-monitoring-enabled-admin {true|false}]** - Enable Switch Monitoring
  Specifies the switch admin monitoring status.

### Examples

```
cluster1::> system cluster-switch create -device SwitchA -address 1.2.3.4 -snmp-version SNMPv2c -community cshm1! -model NX55596 -type cluster-network
```

### Related references

- [system cluster-switch show](#) on page 947

### system cluster-switch delete

Delete information about a cluster switch or management switch

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The `system cluster-switch delete` command disables switch health monitoring for a cluster or management switch.

**Parameters**

- **device <text>** - Device Name
  Specifies the name of the switch.

- **[force {true}]** - Force Delete (privilege: advanced)
  Specifies if force delete or not.

### Examples

```
cluster1::> system cluster-switch delete -device SwitchA
```

Disables monitoring for the switch named SwitchA.
system cluster-switch modify

Modify information about a switch's configuration

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
The `system cluster-switch modify` command modifies information about a cluster switch or management switch. The cluster switch health monitor uses this information to monitor the switch.

**Parameters**
- `-device <text>` - Device Name
  Specifies the device name of switch that you want to monitor.
- `[-address <IP Address>]` - IP Address
  Specifies the IP address of switch's management interface.
- `[-snmp-version {SNMPv1|SNMPv2c}]` - SNMP Version
  Specifies the SNMP version that Data ONTAP uses to communicate with the switch. The default is SNMPv2c.
- `[-community <text>]` - Community String
  Specifies the community string for SNMPv2 authentication.
- `[-type {cluster-network|management-network}]` - Switch Network
  Specifies the switch type.
- `[-is-monitoring-enabled-admin {true|false}]` - Enable Switch Monitoring
  Specifies the switch admin monitoring status.

**Examples**
```
cluster1::> system cluster-switch modify -device SwitchA -address 2.3.4.5
```

system cluster-switch prepare-to-downgrade

Changes the model number of manually created switches based on the switch support provided in the Data ONTAP releases earlier to 8.2.1

**Availability:** This command is available to cluster administrators at the advanced privilege level.

**Description**
This command changes switch information so it is compatible with Data ONTAP 8.2. When executed, it changes the model numbers of the switches that are supported in Data ONTAP 8.2.1 and not supported in Data ONTAP 8.2 to OTHER. It also deletes the entries of the switches which were deleted by the user but maintained for record by the cluster switch health monitor. By doing these operations, it prepares cluster switch health monitor to work smoothly in Data ONTAP 8.2.
**Examples**

**system cluster-switch show**

Display the configuration for cluster and management switches

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The `system cluster-switch show` command displays configuration details for the monitored cluster switches and management switches.

**Parameters**

- `[-fields <fieldname>,...]
  Selects the fields that have the specified name.

- `[-snmp-config]
  Displays the following information about a switch:
  • Device Name
  • Community String
  • SNMP Version

- `[-status]
  Displays the following status information about a switch:
  • Is Discovered
  • Community String
  • Model Number
  • Switch Network
  • Software Version
  • Reason For Not Monitoring
  • Source Of Switch Version
  • Is Monitored ?

- `[-instance]
  Selects detailed information for all the switches.

- `[-device <text>]
  Selects the switches that match the specified device name.

- `[-address <IP Address>]
  Selects the switches that match the specified IP address.

- `[-snmp-version (SNMPv1|SNMPv2c)]
  Selects the switches that match the specified SNMP version.

- `[-is-discovered (true|false)]
  Selects the switches that match the specified discovery setting.

**system cluster-switch commands**
[-community <text>] - Community String
Selects the switches that match the specified community string.

[-model \(\text{NX5010|NX5020|CAT2960|OTHER|NX5596|CN1610|CN1601|NX3132}\)] - Model Number
Selects the switches that match the specified model number.

[-type \{cluster-network|management-network\}] - Switch Network
Selects the switches that match the specified switch type.

[-sw-version <text>] - Software Version
Selects the switches that match the specified software version.

[-reason <text>] - Reason For Not Monitoring
Selects the switches that match the specified reason.

[-version-source <text>] - Source Of Switch Version
Selects the switches that match the specified version source (for example, from SNMP, CDP or ISDP).

[-is-monitoring-enabled-operational \{true|false\}] - Is Monitored ?
Selects the switches that match the specified operational monitoring status.

[-serial-number <text>] - Serial Number of the Device
Selects the switches that match the specified serial number.

The example above displays the configuration of all cluster switches and management switches.
system cluster-switch show-all

Displays the list of switches that were added and deleted

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The system cluster-switch show-all command displays configuration details for discovered monitored cluster switches and management switches, including switches that are user-deleted. From the list of deleted switches, you can delete a switch permanently from the database to re-enable automatic discovery of that switch.

Parameters
{ [-fields <fieldname>,...]
    Selects the fields that have the specified name.
| [-instance ]]}
    Selects detailed information for all the switches.
[-device <text>] - Device Name
    Selects the switches that match the specified device name.
[-address <IP Address>] - IP Address
    Selects the switches that match the specified IP address.
[-snmp-version {SNMPv1|SNMPv2c}] - SNMP Version
    Selects the switches that match the specified SNMP version.
[-community <text>] - Community String
    Selects the switches that match the specified community string.
[-discovered {true|false}] - Is Discovered
    Selects the switches that match the specified discovery setting.
[-model {NX5010|NX5020|CAT2960|OTHER|NX5596|CN1610|CN1601|NX3132}] - Model Number
    Selects the switches that match the specified model number.
[-type {cluster-network|management-network}] - Switch Network
    Selects the switches that match the specified switch type.
[-sw-version <text>] - Software Version
    Selects the switches that match the specified software version.
[-is-monitoring-enabled-operational {true|false}] - Switch Monitoring Status
    Selects the switches that match the specified operational monitoring status.
[-reason <text>] - Reason For Not Monitoring
    Selects the switches that match the specified reason.
[-version-source <text>] - Source Of Switch Version
    Selects the switches that match the specified version source (for example, from SNMP, CDP or ISDP).
[-serial-number <text>] - Serial Number of the Device
    Selects the switches that match the specified serial number.
system cluster-switch polling-interval commands

The polling-interval directory

system cluster-switch polling-interval modify

Modify the polling interval for monitoring cluster and management switch health

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

The system cluster-switch polling-interval modify command modifies the interval in which the cluster switch health monitor polls cluster and management switches.

Parameters

[-polling-interval <integer>] - Polling Interval

Specifies the interval in which the health monitor polls switches. The interval is in minutes. The default value is 5. The allowed range of values is 2 to 120.

Examples

```
cluster1::> system cluster-switch polling-interval modify -polling-interval 41
```

system cluster-switch polling-interval show

Display the polling interval for monitoring cluster and management switch health

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The system cluster-switch polling-interval show command displays the polling interval used by the health monitor.

Examples

```
cluster1::> system cluster-switch polling-interval show
Polling Interval (in minutes): 40
```
**system cluster-switch threshold commands**

The threshold directory

**system cluster-switch threshold show**

Display the cluster switch health monitor alert thresholds

*Availability:* This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The `system cluster-switch threshold show` command displays thresholds used by health monitor alerts.

**Examples**

```
cluster1::> system cluster-switch threshold show
Per 0.10% values: 1 = 0.10%, 5 = 0.50%
In Errors Threshold (%) Out Errors Threshold (%)
----------------------- ------------------------
1                        1
```

**system configuration commands**

Manage configuration backup and recovery

**system configuration recovery commands**

Configuration Recovery

**system configuration recovery node commands**

The node directory

**system configuration recovery node restore**

Restore node configuration from a backup

*Availability:* This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**

The `system configuration recovery node restore` command restores the configuration of the local node from a configuration backup file.

Use the `system configuration backup show` command to view available configuration backup files.

**Parameters**

`-backup <text>` - *Backup Name*

Use this parameter to specify the name of a configuration backup file to use as the configuration template.

`[-nodename-in-backup <text>]` - *Use Backup Identified by this Nodename*

Use this parameter to specify a node within the configuration backup file to use as a configuration template. Only specify this parameter if you are specifying a name other than the name of the local node.
**[-force [true]] - Force Restore Operation**

Use this parameter with the value `true` to force the restore operation and overwrite the current configuration of the local node. This overrides all compatibility checks between the node and the configuration backup. The configuration in the backup is installed even if it is not compatible with the node's software and hardware.

Use this parameter with the value `false` to be warned of the specific dangers of restoring and be prompted for confirmation before executing the command. This value also assures that the command performs compatibility checks between configuration stored in the backup and the software and hardware of the node. The default is `false`.

**Examples**

The following example shows how to restore the configuration of the local node from the configuration backup of `node3` that is stored in the configuration backup file `example.backup.7z`.

```
cluster1::*> system configuration recovery node restore -backup example.backup.7z
Warning: This command overwrites local configuration files with files contained in the specified backup file. Use this command only to recover from a disaster that resulted in the loss of the local configuration files.
The node will reboot after restoring the local configuration.
Do you want to continue? {y|n}: y
```

**Related references**

`system configuration backup show` on page 958

**system configuration recovery cluster commands**

The cluster directory

**system configuration recovery cluster modify**

Modify cluster recovery status

**Availability:** This command is available to `cluster` administrators at the `advanced` privilege level.

**Description**

The `system configuration recovery cluster modify` command modifies the cluster recovery status. This command should be used to end the cluster recovery after all recovery procedures are applied.

**Parameters**

`[-recovery-status {complete|in-progress|not-in-recovery}] - Cluster Recovery Status`

Use this parameter with the value `complete` to set the cluster recovery status after the cluster has been recreated and all of the nodes have been rejoined to it. This enables each node to resume normal system operations. The `in-progress` and `not-in-recovery` values are not applicable to this command.

**Examples**

The following example modifies the cluster recovery status.

```
source::> system configuration recovery cluster modify -recovery-status complete
```

**system configuration recovery cluster recreate**

Recreate cluster

**Availability:** This command is available to `cluster` administrators at the `advanced` privilege level.
Description
The `system configuration recovery cluster recreate` command re-creates a cluster, using either the current node or a configuration backup as a configuration template. After you re-create the cluster, rejoin nodes to the cluster using the `system configuration recovery cluster rejoin` command.

Parameters
- `--from {node|backup}` - From Node or Backup
  Use this parameter with the value `node` to re-create the cluster using the current node as a configuration template. Use this parameter with the value `backup` to re-create the cluster using a configuration backup as a configuration template.

- `--backup <text>` - Backup Name
  Use this parameter to specify the name of a configuration backup file to use as a configuration template. If you specified the `--from` parameter with the value `backup`, you must use this parameter and specify a backup name. Use the `system configuration backup show` command to view available configuration backup files.

Examples
The following example shows how to re-create a cluster using the node `node1` as a configuration template.

```
cluster1::*> system configuration recovery cluster recreate --from node
```

The following example shows how to re-create a cluster using the configuration backup `siteconfig.backup.7z` as a configuration template.

```
cluster1::*> system configuration recovery cluster recreate --from backup --backup siteconfig.backup.7z
```

Related references
- `system configuration backup show` on page 958
- `system configuration recovery cluster rejoin` on page 953

**system configuration recovery cluster rejoin**

Rejoin a cluster

**Availability:** This command is available to cluster administrators at the `advanced` privilege level.

Description
The `system configuration recovery cluster rejoin` command rejoins a node to a new cluster created earlier using the `system configuration recovery cluster recreate` command. Only use this command to recover a node from a disaster. Because this synchronization can overwrite critical cluster information, and will restart the node you specify, you are required to confirm this command before it executes.

Parameters
- `--node {<nodename>|local}` - Node to Rejoin
  Use this parameter to specify the node to rejoin to the cluster.

Examples
This example shows how to rejoin the node `node2` to the cluster.
cluster1::*> system configuration recovery cluster rejoin -node node2

Warning: This command will rejoin node "node2" into the local cluster, potentially overwriting critical cluster configuration files. This command should only be used to recover from a disaster. Do not perform any other recovery operations while this operation is in progress. This command will cause node "node2" to reboot.
Do you want to continue? {y|n}: y

Related references
system configuration recovery cluster recreate on page 952

system configuration recovery cluster show
Show cluster recovery status

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The system configuration recovery cluster show command displays the cluster recovery status. Cluster recovery status is "not-in-recovery" under normal operations, and it becomes "in-progress" if a new cluster is created using the system configuration recovery cluster recreate command with the -from backup parameter. When cluster recovery status is "in-progress", wait until the output of the "Is Recovery Status Persisted" field is true before using the system configuration recovery cluster rejoin command to recover other nodes in the cluster.

Examples
The following example displays the cluster recovery status.

source::> system configuration recovery cluster show
    Recovery Status: in-progress
    Is Recovery Status Persisted: true

Related references
system configuration recovery cluster recreate on page 952
system configuration recovery cluster rejoin on page 953

system configuration recovery cluster sync
Sync a node with cluster configuration

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The system configuration recovery cluster sync command synchronizes a node with the cluster configuration. Only use this command to recover a node from a disaster. Because this synchronization can overwrite critical cluster information, and will restart the node you specify, you are required to confirm this command before it executes.

Parameters
- -node {<nodename>|local} - Node to Synchronize

Use this parameter to specify the name of the node to synchronize with the cluster.

Examples
The following example shows the synchronization of the node node2 to the cluster configuration.
system configuration backup commands

Configuration Backup

system configuration backup copy

Copy a configuration backup

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

The system configuration backup copy command copies a configuration backup from one node in the cluster to another node in the cluster.

Use the system configuration backup show command to display configuration backups to copy.

Parameters

- **-from-node** {<nodename>|local} - Source Node
  
  Use this parameter to specify the name of the source node where the configuration backup currently exists.

- **-backup** <text> - Backup Name
  
  Use this parameter to specify the name of the configuration backup file to copy.

- **-to-node** {<nodename>|local} - Destination Node
  
  Use this parameter to specify the name of the destination node where the configuration backup copy is created.

Examples

The following example copies the configuration backup file node1.special.7z from the node node1 to the node node2.

```bash
cluster1::*> system configuration backup copy -from-node node1 -backup node1.special.7z -to-node node2
[Job 295] Job is queued: Copy backup job.
```

Related references

system configuration backup show on page 958

system configuration backup create

Create a configuration backup

Availability: This command is available to cluster administrators at the advanced privilege level.
Description
The `system configuration backup create` command creates a new configuration backup file.

Parameters
- `node <nodename>|local` - Node
  Use this parameter to specify the node on which to create the backup file.
- `[backup-name <text>]` - Backup Name
  Use this parameter to specify the name of the backup file to create. The backup name cannot contain a space or any of the following characters: * ? /
- `[backup-type {node|cluster}]` - Backup Type
  Use this parameter to specify the type of backup file to create.

Examples
The following example creates a new cluster configuration backup file called `node1.special.7z` on the node `node1`.

```
cluster1::*> system configuration backup create -node node1 -backup-name node1.special.7z -backup-type cluster
```

Delete a configuration backup

Availability: This command is available to `cluster` administrators at the `advanced` privilege level.

Description
The `system configuration backup delete` command deletes a saved configuration backup.

Use the `system configuration backup show` command to display saved configuration backups.

Parameters
- `node <nodename>|local` - Node
  Use this parameter to specify the name of the source node where the configuration backup currently exists.
- `backup <text>` - Backup Name
  Use this parameter to specify the name of the configuration backup file to delete.

Examples
The following example shows how to delete the configuration backup file `node1.special.7z` from the node `node1`.

```
cluster1::*> system configuration backup delete -node node1 -backup node1.special.7z
```

Related references
`system configuration backup show` on page 958

Download a configuration backup

Availability: This command is available to `cluster` administrators at the `advanced` privilege level.
**Description**
The `system configuration backup download` command copies a configuration backup from a source URL to a node in the cluster.

**Parameters**
- `node (<nodename>|local)` - Node
  - Use this parameter to specify the name of the node to which the configuration backup is downloaded.
- `source <text>` - Source URL
  - Use this parameter to specify the source URL of the configuration backup to download.
- `[-backup-name <text>]` - Backup Name
  - Use this parameter to specify a new local file name for the downloaded configuration backup.

**Examples**
The following example shows how to download a configuration backup file from a URL to a file named `exampleconfig.download.7z` on the node `node2`.

```bash
cluster1::*> system configuration backup download -node node2 -source http://www.example.com/config/download/nodeconfig.7z -backup-name exampleconfig.download.7z
```

**system configuration backup rename**

Rename a configuration backup

**Availability:** This command is available to cluster administrators at the `advanced` privilege level.

**Description**
The `system configuration backup rename` command changes the file name of a configuration backup file. Use the `system configuration backup show` command to display configuration backups to rename.

**Parameters**
- `node (<nodename>|local)` - Node
  - Use this parameter to specify the name of the source node where the configuration backup currently exists.
- `backup <text>` - Backup Name
  - Use this parameter to specify the name of the configuration backup file to rename.
- `new-name <text>` - New Name
  - Use this parameter to specify a new name for the configuration backup file.

**Examples**
The following example renames the saved configuration file `download.config.7z` on the node `node1` to `test.config.7z`.

```bash
cluster1::*> system configuration backup rename -node node1 -backup download.config.7z -new-name test.config.7z
```

**system configuration commands**
system configuration backup show

Show configuration backup information

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The system configuration backup show command displays information about saved configuration backups.

Parameters

{ [-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[[-instance]]
  If you specify the -instance parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node
  Selects configuration backups that are saved on the node you specify.

[-backup <text>] - Backup Name
  Selects configuration backups that have the backup name you specify.

[-backup-type {node|cluster}] - Backup Type
  Selects configuration backups of the type you specify.

[-time <MM/DD HH:MM:SS>] - Backup Creation Time
  Selects configuration backups that were saved on the date and time you specify.

[-cluster-name <text>] - Cluster Name
  Selects configuration backups that were saved in the cluster that has the name you specify.

[-cluster-uuid <UUID>] - Cluster UUID
  Selects configuration backups that were saved in the cluster that has the UUID you specify.

[-size {<integer> [KB|MB|GB|TB|PB]}] - Size of Backup
  Selects configuration backups that have the file size you specify.

[-nodes-in-backup {<nodename>|local}, ...] - Nodes In Backup
  Selects configuration backups that include the configuration of the nodes you specify.

[-version <text>] - Software Version
  Selects configuration backups that have the software version you specify.

[-is-auto {true|false}] - Backup Created from Schedule (true or false)
  A value of true selects configuration backups that were created from a schedule. A value of false selects configuration backups that were created manually.

[-schedule <text>] - Name of Backup Schedule
  Selects configuration backups that were created by the schedule you specify.

Examples
The following example shows typical output for this command.

```
cluster1::*> system configuration backup show
Node       Backup Tarball                            Time               Size
---------  ----------------------------------------- ------------------ ----- 
node1      cluster1.8hour.2011-02-22.18_15_00.7z     02/22 18:15:00     7.78MB
node1      cluster1.8hour.2011-02-23.02_15_00.7z     02/23 02:15:00     7.98MB
```

Commands: Manual Page Reference
system configuration backup upload

Upload a configuration backup

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**
The `system configuration backup upload` command copies a configuration backup from a node in the cluster to a remote URL.

**Parameters**

- `-node {<nodename>|local}` - Node
  
  Use this parameter to specify the name of the node from which the configuration backup is uploaded.

- `-backup <text>` - Backup Name
  
  Use this parameter to specify the file name of the configuration backup to upload.

- `-destination <text>` - Destination URL
  
  Use this parameter to specify the destination URL of the configuration backup.

**Examples**
The following example show how to upload the configuration backup file *testconfig.7z* from the node *node2* to a remote URL.

```
cluster1::*> system configuration backup upload -node node2 -backup testconfig.7z -destination ftp://www.example.com/config/uploads/testconfig.7z
```

system configuration backup settings commands

The settings directory

system configuration backup settings modify

Modify configuration backup settings

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**
The `system configuration backup settings modify` command changes settings for configuration backup.

**Parameters**

- `[-destination <text>]` - Backup Destination URL

  Use this parameter to specify the destination URL for uploads of configuration backups. Use the value "" to remove the destination URL.

- `[-username <text>]` - Username for Destination

  Use this parameter to specify the user name to use to log in to the destination system and perform the upload. Use the `system configuration backup settings set-password` command to change the password used with this user name.
[-numbackups1 <integer>] - Number of Backups to Keep for Schedule 1
   Use this parameter to specify the number of backups created by backup schedule 1 to keep on the destination system. If the number of backups exceeds this number, the oldest backup is removed.

[-numbackups2 <integer>] - Number of Backups to Keep for Schedule 2
   Use this parameter to specify the number of backups created by backup schedule 2 to keep on the destination system. If the number of backups exceeds this number, the oldest backup is removed.

[-numbackups3 <integer>] - Number of Backups to Keep for Schedule 3
   Use this parameter to specify the number of backups created by backup schedule 3 to keep on the destination system. If the number of backups exceeds this number, the oldest backup is removed.

Examples
The following example shows how to set the destination URL and user name used for uploads of configuration backups.

```
cluster1::*> system configuration backup settings modify -destination ftp://www.example.com/config/uploads/ -username admin
```

Related references
- system configuration backup settings set-password on page 960

system configuration backup settings set-password
Modify password for destination URL

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The system configuration backup settings set-password command sets the password used for uploads of configuration backups. This password is used along with the username you specify using the system configuration backup settings modify command to log in to the system and perform the upload. Enter the command without parameters. The command prompts you for a password, and for a confirmation of that password. Enter the same password at both prompts. The password is not displayed.

Use the system configuration backup settings show command to display the destination URL for configuration backups. Use the system configuration backup settings modify command to change the destination URL and remote username for configuration backups.

Examples
The following example shows successful execution of this command.

```
cluster1::*> system configuration backup settings set-password
Enter the password: 
Confirm the password: 
```

system configuration backup settings show

Show configuration backup settings

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

The system configuration backup settings show command displays current settings for configuration backup. These settings apply to backups created automatically by schedules. By default, the command displays the URL to which configuration backups are uploaded, and the user name on the remote system used to perform the upload.

Use the system configuration backup settings set-password command to change the password used with the user name on the destination. Use the system configuration backup settings modify command to change the destination URL and username for uploads of configuration backups, and to change the number of backups to keep for each schedule.

Parameters

[-instance]

Use this parameter to display detailed information about configuration backup settings, including the number of backups to keep for each backup schedule.

Examples

The following example displays basic backup settings information.

```
cluster1:~> system configuration backup settings show
Backup Destination URL: ftp://www.example.com/config/uploads/
Username: jdoe
```

The following example shows detailed output using the -instance parameter.

```
cluster1:~> system configuration backup settings show -instance
Backup Destination URL: ftp://www.example.com/config/uploads/
Username for Destination: admin
Schedule 1: 8hour
Number of Backups to Keep for Schedule 1: 2
Schedule 2: daily
Number of Backups to Keep for Schedule 2: 2
Schedule 3: weekly
Number of Backups to Keep for Schedule 3: 2
```

system controller commands

Controller health monitor directory

system controller show

Display the controller information

Availability: This command is available to cluster administrators at the admin privilege level.
Description
The system controller show command displays information about all the controllers in the cluster. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported. By default, the command displays the following information about all the controllers in the cluster:

- Controller name
- System ID
- System serial number
- Controller model name
- Health monitor status

To display more details, use the -instance parameter.

Parameters

```
[-fields <fieldname>,...]  Selects the fields that you specify.
[-instance]                Displays detailed information about all the controllers in the cluster.
[-node <nodename>|local] - Node       Selects information about the specified controller.
[-system-id <text>] - System ID    Selects information about the controller with the specified System ID.
[-model <text>] - Model Name       Selects information about the controllers with the specified model name.
[-part-number <text>] - Part Number Selects information about the controllers with the specified part number.
[-revision <text>] - Revision       Selects information about the controllers with the specified revision.
[-serial-number <text>] - Serial Number Selects information about the controller with the specified system serial number.
[-controller-type <text>] - Controller Type Selects information about the controllers with the specified controller type.
[-status {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status Selects information about the controllers with the specified health monitor status.
[-chassis-id <text>] - Chassis ID    Selects information about the controllers with the specified chassis ID.
```

Examples

The below example displays information about all controllers in the cluster.
The example below displays detailed information about specified controller in the cluster.

cluster1::> system controller show -instance -node node1
Node: node1
System ID: 140733730268652
Model Name: FAS2520
Part Number: 111-01316
Revision: 21
Serial Number: 700001456939
Controller Type: none
Status: ok
Chassis ID: 4591227214

system controller bootmedia commands

The bootmedia directory

system controller bootmedia show

Display the Boot Media Device Health Status

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The system controller bootmedia show command displays details of the bootmedia devices present in all the nodes in a cluster. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported. By default, the command displays the following information about the bootmedia:

- Node name
- Display name
- Vendor ID
- Device ID
- Memory size
- Bootmedia state
- Health monitor status

To display more details, use the -instance parameter.

Parameters

[-fields <fieldname>, ...]  Selects the fields that you specify.
[-instance]  Displays detailed information for all the bootmedia devices.
[-node <nodename> | local]  Selects the bootmedia device that is present on the specified node.
[-vendor-id <Hex Integer>] - Vendor ID
    Selects the bootmedia devices with the specified vendor ID.

[-device-id <Hex Integer>] - Device ID
    Selects the bootmedia devices with the specified device ID.

[-display-name <text>] - Display Name
    Selects the bootmedia devices with the specified display name.

[-unique-name <text>] - Unique Name
    Selects the bootmedia device with the specified unique name.

[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example}] - Health Monitor Name
    Selects the bootmedia devices with the specified health monitor.

[-usbmon-status {present|not-present}] - Bootmedia Health Monitor
    Selects the bootmedia devices with the specified USBMON status.

[-device-state {good|warn|bad}] - Bootmedia State
    Selects the bootmedia devices with the specified device state.

[-size <integer>] - Max memory size(in MB)
    Selects the bootmedia devices with the specified memory size.

[-health {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status
    Selects the bootmedia devices with the specified health monitor status.

[-serial-num <text>] - Serial number
    Selects the bootmedia devices with the specified serial number.

### Examples
The example below displays the information of the bootmedia devices present in all the nodes in a cluster.

```
cluster1::> system controller bootmedia show

<table>
<thead>
<tr>
<th>Node</th>
<th>Display Name</th>
<th>Vendor ID</th>
<th>Device ID</th>
<th>Size Bootmedia</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>node1</td>
<td>Micron Technology 0x655</td>
<td>634</td>
<td>655</td>
<td>1929 good</td>
<td>ok</td>
</tr>
<tr>
<td>node2</td>
<td>Micron Technology 0x655</td>
<td>634</td>
<td>655</td>
<td>1929 good</td>
<td>ok</td>
</tr>
</tbody>
</table>
```

The example below displays the detailed information about the bootmedia present in a node.

```
cluster1::> system controller bootmedia show -instance -node node1

Node: node1
Vendor ID: 634
Device ID: 655
Display Name: Micron Technology 0x655
Unique Name: Micron Technology 0x655 (ad.0)
Health Monitor Name: controller
USBMON Health Monitor: present
Bootmedia State: good
Max memory size(in MB): 1929
Status: ok
```

### system controller bootmedia serial commands
The serial directory
system controller bootmedia serial show

Display the Boot Media Device serial number

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system controller bootmedia serial show command displays the Boot Media Device serial number. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported. By default, the command displays the following information about the bootmedia:

- Node name
- Display name
- Serial Number
- Size
- Bootmedia state
- Status

To display more details, use the -instance parameter.

Parameters

{ [-fields <fieldname>, …]
   Selects the fields that you specify.
  } [-instance ]

Displays detailed information for all the bootmedia devices.

[-node {<nodename> | local}] - Node
Selects the bootmedia device that is present on the specified node.

[-vendor-id <Hex Integer>] - Vendor ID
Selects the bootmedia devices with the specified vendor ID.

[-device-id <Hex Integer>] - Device ID
Selects the bootmedia devices with the specified device ID.

[-display-name <text>] - Display Name
Selects the bootmedia devices with the specified display name.

[-unique-name <text>] - Unique Name
Selects the bootmedia device with the specified unique name.

[-monitor {node-connect | system-connect | system | controller | chassis | cluster-switch | example} ] - Health Monitor Name
Selects the bootmedia devices with the specified health monitor.

[-usbmon-status {present | not-present}] - Bootmedia Health Monitor
Selects the bootmedia devices with the specified USBMON status.

[-device-state {good | warn | bad}] - Bootmedia State
Selects the bootmedia devices with the specified device state.

[-size <integer>] - Max memory size(in MB)
Selects the bootmedia devices with the specified memory size.
Selects the bootmedia devices with the specified health monitor status.

`-serial-num <text>` - Serial number

Selects the bootmedia devices with the specified serial number.

### Examples

The example below displays the information of the bootmedia devices present in all the nodes in a cluster.

```
cluster1::> system controller bootmedia serial show
```

<table>
<thead>
<tr>
<th>Node</th>
<th>Display Name</th>
<th>Serial No</th>
<th>Size Bootmedia (MB)</th>
<th>State</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>node1</td>
<td>TOSHIBA</td>
<td>Y4IS104FTNEW</td>
<td>16367</td>
<td>good</td>
<td>ok</td>
</tr>
<tr>
<td>node2</td>
<td>TOSHIBA</td>
<td>Y4IS107HTNEW</td>
<td>16367</td>
<td>good</td>
<td>ok</td>
</tr>
</tbody>
</table>

2 entries were displayed.

The example below displays the detailed information about the bootmedia present in a node.

```
cluster1::> system controller bootmedia serial show -instance -node node1
```

Node: node1
Vendor ID: 8086
Device ID: 8d02
Display Name: TOSHIBA THNSNJ060GMCU
Unique Name: /dev/ad4s1 (TOSHIBA THNSNJ060GMCU)
Health Monitor Name: controller
Bootmedia Health Monitor: present
Bootmedia State: good
Max memory size (in MB): 16367
Status: ok
Serial number: Y4IS104FTNEW

### system controller clus-flap-threshold commands

The clus-flap-threshold directory

### system controller clus-flap-threshold show

Display the controller cluster port flap threshold

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The `system controller clus-flap-threshold show` command allows the display of the threshold for link flapping counts for all nodes. This threshold would be the number of times the cluster port links for a given node can flap (go down) within a polling period before triggering an alert.

### system controller config commands

Configuration information directory

### system controller config show-errors

Display configuration errors

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.
Description
The `system controller config show-errors` displays configuration errors.

- node
- description

To display more details, use the `-instance` parameter.

Parameters

`[-fields <fieldname>,...]
Selects the fields that you specify.

`[-instance]]
Displays detailed information for all the PCI devices.

`[-node <nodename>|local]] - Node
Displays configuration errors on the specified node.

`[-verbose [true]] - Verbose Output?
The `-verbose` parameter enables verbose mode, resulting in the display of more detailed output.

`[-description <text>] - Error Description
Displays the node with the specified configuration error.

Examples
The example below displays configuration errors on all the nodes in the cluster.

```
cluster1::> system controller config show-errors
Configuration Info and Errors for Node: cluster1-01
Chelsio T320E 2x10G NIC card (PN X1008A) in slot 1 is not supported on model FAS3210
Configuration Info and Errors for Node: cluster1-02
PCI-E Dual 10/100/1000 Ethernet G20 card (PN X1039A) in slot 2 is not supported on model FAS3210
cluster1::>
```

```
cluster1::> system controller config show-errors -verbose
Configuration Info and Errors for Node: cluster1-01
sysconfig: Card in slot 2 (7-1275-0008-46848) is not supported.
sysconfig: slot 12 OK: X2067:Proprietary embedded SAS HBA
cluster1::>
```

system controller config pci commands

PCI device information directory

system controller config pci show-add-on-devices
Display PCI devices in expansion slots

Availability: This command is available to `cluster` administrators at the `admin` privilege level.
**Description**
The `system controller config pci show-add-on-devices` command displays information about the PCIe devices in I/O expansion slots. The command displays the following information about the PCIe devices:

- Node
- Model
- Type
- Slot
- Device
- Vendor
- Sub-device ID

To display more details, use the `-instance` parameter.

**Parameters**

```
[-fields <fieldname>, ...]
```
Selects the fields that you specify.

```
[-instance]
```
Displays detailed information about PCI devices.

```
[-node {<nodename>|local}] - Node
```
Selects the PCI devices that are present in the specified node.

```
[-model <text>] - Model String
```
Selects the PCI devices that are present on the system with the specified model name.

```
[-type <integer>] - Device Type
```
Selects the PCI devices with the specified device type.

```
[-slot-and-sub <text>] - PCI Slot Number
```
Selects the PCI devices present in the specified slot or slot-subslot combination.

```
[-device <text>] - Device
```
Selects the PCI devices with the specified device ID.

```
[-vendor <text>] - Vendor Number
```
Selects the PCI devices with the specified vendor ID.

```
[-sub-device-id <integer>] - Sub Device ID
```
Selects the PCI devices with the specified sub-device ID.

**Examples**
The example below displays information about PCI devices found in I/O expansion slots of all the nodes in the cluster.

```
cluster1::> system controller config pci show-add-on-devices
Node   Model   Slot  Type  Device  Vendor  Sub-Device ID
-------- ----- ---- ---- ---- ------ ----------
cluster1-01  FAS6240  6   7    0x2532 0x1077 10
           5   1    0x1527 0x8086 0
           2   7    0x6732 0x15B3 0
           3   1    0x8030 0x1077 0
           1   2    0x8001 0x11FB 0
           15  1    0x10FB 0x8086 0
           13  1    0x150E 0x8086 1
```

Commands: Manual Page Reference
### system controller config pci show-hierarchy

Display PCI hierarchy

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The `system controller config pci show-hierarchy` command displays the PCI Hierarchy of all PCI devices found in a controller. The command displays the following information about the PCI devices:

- **Node**
- **Level**
- **Device**
- **Link Capability**
- **Link Status**

To display more details, use the `-instance` parameter.

**Parameters**

```
[ [-fields <fieldname>, ...] ]
```

Selects the fields that you specify.

```
[ [-instance ]]
```

Displays detailed information for PCI devices.

```
[-node <nodename>|local] - Node
```

Displays the PCI hierarchy of the specified node.

```
[-level <integer>] - PCI Device Level
```

Displays the PCI devices that match the specified level within the PCI hierarchy.

```
[-pci-device <text>] - PCI Device
```

Displays the PCI devices that match the specified device description.

```
[-link-cap <text>] - Link Capability
```

Displays the PCI devices that match the specified link capability.

```
[-link-status <text>] - Link Status
```

Displays the PCI devices that match the specified link status.

**Examples**
The example below displays the PCI hierarchy for all of the nodes in the cluster.
cluster1::> system controller config pci show-hierarchy
PCI Hierarchy

Commands: Manual Page Reference
system controller environment commands

The environment directory

system controller environment show

Display the FRUs in the controller

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system controller environment show displays information about all environment FRUs in the cluster. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported. By default, the command displays the following information about the environment FRUs in the cluster:

- Node
- FRU name
- FRU state

To display more details, use the -instance parameter.

Parameters

[-fields <fieldname>, ...]
Selects the fields that you specify.

[-instance ]
Displays detailed information about the environment FRUs.

[-node <nodename> | local] - Node
Selects information about all the environment FRUs that the specified node owns.

[-serial-number <text>] - FRU Serial Number
Selects information about all the environment FRUs with the specified serial number.

[-fru-name <text>] - FRU Name
Selects information about the environment FRU with the specified FRU name.
[-type {controller|psu|fan|dimm|bootmedia}] - FRU Type
   Selects information about all the environment FRUs with the specified FRU type.

[-name <text>] - Name
   Selects information about all the environment FRUs with the specified unique name.

[-state <text>] - FRU State
   Selects information about all the environment FRUs with the specified FRU state.

[-status {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status
   Selects information about all the environment FRUs with the specified health monitor status.

[-display-name <text>] - Display Name for the FRU
   Selects information about all the environment FRUs with the specified display name.

[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example}] - Monitor Name
   Selects information about all the environment FRUs with the specified monitor.

[-model <text>] - Model Type
   Selects information about all the environment FRUs with the specified FRU model.

[-shared {shared|not_shared}] - Shared Resource
   Selects information about all the environment FRUs with the specified sharing type.

[-chassis-id <text>] - Chassis ID
   Selects information about all the environment FRUs in the specified chassis.

[-additional-info <text>] - Additional Information About the FRU
   Selects information about all the environment FRU with specified additional information.

Examples
The following example displays information about all major environment FRUs in the cluster:

cluster1::> system controller environment show

<table>
<thead>
<tr>
<th>Node</th>
<th>FRU Name</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>node1</td>
<td>PSU1 FRU</td>
<td>GOOD</td>
</tr>
<tr>
<td>node1</td>
<td>PSU2 FRU</td>
<td>GOOD</td>
</tr>
<tr>
<td>node2</td>
<td>PSU1 FRU</td>
<td>GOOD</td>
</tr>
<tr>
<td>node2</td>
<td>PSU2 FRU</td>
<td>GOOD</td>
</tr>
</tbody>
</table>

The following example displays detailed information about a specific environment FRU:

cluster1::> system controller environment show -node node1 -fru-name "PSU1 FRU" -instance

  Node: node1
  FRU Serial Number: XXT122737891
  FRU Name: PSU1 FRU
  FRU Type: psu
  Name: XXT122737891
  FRU State: GOOD
  Status: ok
  Display Name for the FRU: PSU1 FRU
  Monitor Name: controller
  Model Type: none
  Shared Resource: shared
  Chassis ID: 4591227214
  Additional Information About the FRU: Part Number: 114-00065+A0
system controller fru commands

The fru directory

system controller fru show

Display Information About the FRUs in the Controller

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system controller fru show command displays information about all the controller specific Field Replaceable Units (FRUs) in the cluster. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported. By default, the command displays the following information about all the FRUs in the cluster:

- Node
- FRU name
- Health monitor subsystem
- Health monitor status

To display more details, use the -instance parameter.

Parameters

[-fields <fieldname>,...]
Selects the fields that you specify.

[-instance]
Displays detailed information about the controller specific FRUs in the cluster.

[-node <nodename> | local] - Node
Selects information about the FRUs in the specified node.

[-subsystem <Subsystem>] - Subsystem
Selects information about the FRUs of the specified subsystem.

[-serial-number <text>] - FRU Serial Number
Selects information about the FRU with the specified serial number.

[-fru-name <text>] - Name of the FRU
Selects information about the FRU with the specified FRU name.

[-type {controller|psu|fan|dimm|bootmedia}] - FRU Type
Selects information about the FRU with the specified FRU type.

[-name <text>] - FRU Name
Selects information about the FRU with the specified unique name.

[-state <text>] - FRU State
Selects information about the FRU with the specified state.
[-status {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status
Selects information about the FRU with the specified health monitor status.

[-display-name <text>] - Display Name for the Fru
Selects information about the FRU with the specified display name.

[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example}] - Monitor Name
Selects information about the FRU with the specified health monitor type.

[-model <text>] - Model Type
Selects information about the FRU with the specified model.

[-chassis-id <text>] - Chassis ID
Selects information about the FRU with the specified chassis ID.

[-location <text>] - Location of the FRU
Selects information about the FRU with the specified FRU location.

[-additional-info <text>] - Additional Information About the FRU
Selects information about the FRU with the specified additional information.

Examples
The example below displays information about all controller specific FRUs in the cluster.

```
cluster1::> system controller fru show
Node   FRU Name    Subsystem         Status
node1  PSU1 FRU   Environment  ok
node1  PSU2 FRU   Environment  ok
node1  DIMM-NV1  Memory        ok
node1  DIMM-1    Memory        ok
node1  Micron Technology 0x655 (ad.0) Motherboard  ok
node2  PSU1 FRU   Environment  ok
node2  PSU2 FRU   Environment  ok
node2  DIMM-NV1  Memory        ok
node2  DIMM-1    Memory        ok
node2  Micron Technology 0x655 (ad.0) Motherboard  ok
10 entries were displayed.
```

The example below displays information about the specific FRU.

```
cluster1::> system controller fru show -instance -serial-number AD-01-1306-2EA01E9A
Node: node1
Subsystem: Memory
FRU Serial Number: AD-01-1306-2EA01E9A
Name of the FRU: DIMM-1
FRU Type: dimm
FRU Name: DIMM-1
FRU State: ok
Status: ok
Display Name for the Fru: DIMM-1
Monitor Name: controller
Model Type: none
Chassis ID: 4591227214
Location of the FRU: Memory Slot: 1
Additional Information About the FRU: Part No: HMT82GV7MMR4A-H9
```

system controller fru led commands
FRU LED Commands
**system controller fru led disable-all**

Turn off all the LEDs Data Ontap has lit

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**

The `system controller fru led disable-all` command turns off all the controller and IOXM FRU fault LEDs.

A FRU (Field Replaceable Unit) is any piece of the system that is designed to be easily and safely replaced by a field technician.

Both the controller and IOXM FRUs have a number of internal FRUs for which there are corresponding fault LEDs. In addition, there is a summary FRU fault LED on the external face-plate of both the controller and IOXM; labeled with a "!". A summary fault LED will be on when any of the internal FRU fault LEDs are on. Only the controller and IOXM internal FRU fault LEDs can be controlled by the end-user. The summary fault LEDs are turned on and off based on the simple policy described above. If you want to turn off the summary fault LED, you must turn off all internal FRU fault LEDs.

All FRU fault LEDs are amber in color. However, not all amber LEDs in the system are FRU fault LEDs. Externally visible fault LEDs are labeled with a "!" and internal FRU fault LEDs remain on, even when the controller or IOXM is removed from the chassis. In addition, internal FRU fault LEDs will remain on until explicitly turned off by the end-user, even after a FRU has been replaced.

FRUs are identified by a FRU ID and slot tuple. FRU IDs include: DIMMs, cards in PCI slots, boot media devices, NV batteries and coin cell batteries. For each FRU ID, the FRUs are numbered 1 through N, where N is the number of FRUs of that particular type that exist in the controller or IOXM. Both controller and IOXM have a FRU map label for use in physically locating internal FRUs. The FRU ID/slot tuple used by the `system controller fru led show` command matches that specified on the FRU map label.

**Examples**

Turn off all FRU fault LEDs.

```
cluster1:*> system controller fru led disable-all
14 entries were modified.
```

- `system controller fru led show` on page 977

**system controller fru led enable-all**

Light all the LEDs

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**

The `system controller fru led enable-all` command turns on all the controller and IOXM FRU fault LEDs.

A FRU (Field Replaceable Unit) is any piece of the system that is designed to be easily and safely replaced by a field technician.

Both the controller and IOXM FRUs have a number of internal FRUs for which there are corresponding fault LEDs. In addition, there is a summary FRU fault LED on the external face-plate of both the controller and IOXM; labeled with a "!". A summary fault LED will be on when any of the internal FRU fault LEDs are on. Only the controller and IOXM internal FRU fault LEDs can be controlled by the end-user. The summary fault LEDs are turned on and off based on the simple policy described above. If you want to turn off the summary fault LED, you must turn off all internal FRU fault LEDs.
All FRU fault LEDs are amber in color. However, not all amber LEDs in the system are FRU fault LEDs. Externally visible fault LEDs are labeled with a "!" and internal FRU fault LEDs remain on, even when the controller or IOXM is removed from the chassis. In addition, internal FRU fault LEDs will remain on until explicitly turned off by the end-user, even after a FRU has been replaced.

FRUs are identified by a FRU ID and slot tuple. FRU IDs include: DIMMs, cards in PCI slots, boot media devices, NV batteries and coin cell batteries. For each FRU ID, the FRUs are numbered 1 through N, where N is the number of FRUs of that particular type that exist in the controller or IOXM. Both controller and IOXM have a FRU map label for use in physically locating internal FRUs. The FRU ID/slot tuple used by the `system controller fru led show` command matches that specified on the FRU map label.

**Examples**

Turn on all FRU fault LEDs.

```bash
cluster1:*> system controller fru led enable-all
14 entries were modified.
```

- `system controller fru led show` on page 977

**system controller fru led modify**

Modify the status of FRU LEDs

**Availability:** This command is available to cluster administrators at the advanced privilege level.

**Description**

The `system controller fru led modify` command modifies the current state of the controller and IOXM FRU fault LEDs.

A FRU (Field Replaceable Unit) is any piece of the system that is designed to be easily and safely replaced by a field technician. Both the controller and IOXM FRUs have a number of internal FRUs for which there are corresponding fault LEDs. In addition, there is a summary FRU fault LED on the external face-plate of both the controller and IOXM; labeled with a "!". A summary fault LED will be on when any of the internal FRU fault LEDs are on. Only the controller and IOXM internal FRU fault LEDs can be controlled by the end-user. The summary fault LEDs are turned on and off based on the simple policy described above. If you want to turn off the summary fault LED, you must turn off all internal FRU fault LEDs.

All FRU fault LEDs are amber in color. However, not all amber LEDs in the system are FRU fault LEDs. Externally visible fault LEDs are labeled with a "!" and internal FRU fault LEDs remain on, even when the controller or IOXM is removed from the chassis. In addition, internal FRU fault LEDs will remain on until explicitly turned off by the end-user, even after a FRU has been replaced.

FRUs are identified by a FRU ID and slot tuple. FRU IDs include: DIMMs, cards in PCI slots, boot media devices, NV batteries and coin cell batteries. For each FRU ID, the FRUs are numbered 1 through N, where N is the number of FRUs of that particular type that exist in the controller or IOXM. Both controller and IOXM have a FRU map label for use in physically locating internal FRUs. The FRU ID/slot tuple used by the `system controller fru led show` command matches that specified on the FRU map label.

**Parameters**

- **-node (node|local)** - Node
  
  Selects FRU fault LEDs on the specified nodes.
-fru-id <FRU LED key> - FRU ID
Selects the FRU fault LEDs that match the specified FRU type.

-fru-slot <integer> - FRU Slot
Selects the FRU fault LEDs that match the specified slot.

[-fru-state {on|off|unknown}] - FRU State
Specifies the target state for the FRU fault LED.

Examples
Turn off DIMM 3's FRU fault LED.

```
cluster1:*> system controller fru led modify -node node1 -fru-id dimm -fru-slot 3 -fru-state on
```

The example below turns on all PCI FRU fault LEDs.

```
cluster1:*> system controller led modify -node node1 -fru-id pci -fru-slot * -fru-state on
```

**system controller fru led show**
Display the status of FRU LEDs

**Availability:** This command is available to cluster administrators at the advanced privilege level.

**Description**
The `system controller fru led show` command displays information about the current state of the controller and IOXM FRU fault LEDs.

A FRU (Field Replaceable Unit) is any piece of the system that is designed to be easily and safely replaced by a field technician. Both the controller and IOXM FRUs have a number of internal FRUs for which there are corresponding fault LEDs. In addition, there is a summary FRU fault LED on the external face-plate of both the controller and IOXM; labeled with a "!". A summary fault LED will be on when any of the internal FRU fault LEDs are on.

All FRU fault LEDs are amber in color. However, not all amber LEDs in the system are FRU fault LEDs. Externally visible fault LEDs are labeled with a "!", and internal FRU fault LEDs remain on, even when the controller or IOXM is removed from the chassis.

FRUs are identified by a FRU ID and slot tuple. FRU IDs include: DIMMs, cards in PCI slots, boot media devices, NV batteries and coin cell batteries. For each FRU ID, the FRUs are numbered 1 through N, where N is the number of FRUs of that particular type that exist in the controller or IOXM. Both controller and IOXM have a FRU map label for use in physically locating internal FRUs. The FRU ID/slot tuple used by the `system controller fru led show` command matches that specified on the FRU map label.

**Parameters**

[-fields <fieldname>, ...]
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

[-instance]
If you specify the `-instance` parameter, the command displays detailed information about all fields.
[\texttt{-node} \texttt{\{<nodename>|local\}}] - Node
Selects FRU fault LEDs on the specified nodes.

[\texttt{-fru-id \{<FRU LED key>\}}] - FRU ID
Selects the FRU fault LEDs that match the specified FRU type.

[\texttt{-fru-slot \{integer\}}] - FRU Slot
Selects the FRU fault LEDs that match the specified slot.

[\texttt{-fru-bay \{<text>\}}] - FRU Bay
Selects the FRU fault LEDs that match the specified bay.

[\texttt{-fru-state \{on|off|unknown\}}] - FRU State
Selects the FRU fault LEDs that match the specified status.

[\texttt{-lit-by \{<text>\}}] - Lit By
Selects the FRU fault LEDs that were lit by the specified source.

### Examples

List the current state of all FRU fault LEDs.

```
cluster1:*> system controller fru led show
<table>
<thead>
<tr>
<th>Node</th>
<th>FRU Type</th>

### system controller ioxm commands

The ioxm directory

### system controller ioxm show

Displays IOXM Device Health Status

**Availability:** This command is available to cluster administrators at the admin privilege level.
Description
The `system controller ioxm show` command displays the details of the IO expansion modules (IOXMs) that are connected to the nodes in a cluster. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported. By default, the command displays the following information about the IOXMs:

- Node name
- Display name
- Is IOXM present?
- Power status
- Health monitor status

To display more details, use the `-instance` parameter.

Parameters

```
[-fields <fieldname>, ...]
```
Selects the fields that you specify.

```
[-instance]
```
Displays detailed information for all the IOXMs.

```
[-node <nodename> | local] - Node
```
Selects the IOXM that is connected to the specified node.

```
[-chassis-config {c-i | c-c | c-b}] - Controller-IOXM or Controller-Controller or Controller-Blank
```
Selects the IOXMs with the specified chassis configuration.

```
[-is-present {present | not-present}] - IOXM Presence
```
Selects the IOXMs that are connected and detected (present) or connected but not detected (not-present).

```
[-power {good | bad}] - Power to IOXM
```
Selects the IOXMs with the specified power state.

```
[-display-name <text>] - Display Name
```
Selects the IOXMs with the specified display name.

```
[-unique-name <text>] - Unique Name
```
Selects the IOXM with the specified unique name.

```
[-monitor {node-connect | system-connect | system | controller | chassis | cluster-switch | example}] - Health Monitor Name
```
Selects the IOXMs with the specified health monitor.

```
[-status {ok | ok-with-suppressed | degraded | unreachable | unknown}] - IOXM Health
```
Selects the IOXMs with the specified health monitor status.

Examples
The example below displays the information of all the IOXMs that are connected to the nodes in a cluster.

```
cluster1::> system controller ioxm show

+-------+---------+-------------+-------+-----+
<table>
<thead>
<tr>
<th>Node</th>
<th>Display</th>
<th>Is-Present?</th>
<th>Power</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>node1</td>
<td>IOXM</td>
<td>present</td>
<td>good</td>
<td>ok</td>
</tr>
<tr>
<td>node2</td>
<td>IOXM</td>
<td>present</td>
<td>good</td>
<td>ok</td>
</tr>
</tbody>
</table>
```

The example below displays detailed information of an IOXM that is connected to a node.
**system controller memory commands**

The memory directory

**system controller memory dimm commands**

The dimm directory

**system controller memory dimm show**

Display the Memory DIMM Table

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The `system controller memory dimm show` command displays information about the DIMMs in all the nodes in the cluster. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported. By default, the command displays the following information about all the DIMMs in the cluster:

- Node
- DIMM name
- Uncorrectable ECC error count
- Correctable ECC error count
- CPU socket
- Channel
- Slot number
- Health monitor status

To display more details, use the `-instance` parameter.

**Parameters**

```
[...fields <fieldname>, ...]
```

Selects the fields that you specify.

```
[...-instance ]
```

Displays detailed information about the DIMMs in all the controllers in the cluster.

```
[-node {<nodename>|local}] - Node
```

Selects information about the DIMMs in the specified node.

```
[-pds-id <integer>] - DIMM ID
```

Selects information about the DIMMs with the specified DIMM ID.
[[-slotname <text>]] - Slot Name
Selects information about the DIMMs with the specified slot name.

[[-socket <integer>]] - CPU Socket
Selects information about the DIMMs with the specified socket ID.

[[-channel <integer>]] - Channel
Selects information about the DIMMs with the specified channel number.

[[-slot-no <integer>]] - Slot Number on a Channel
Selects information about the DIMMs with the specified slot number.

[[-serial <text>]] - Serial Number
Selects information about the DIMMs with the specified serial number.

[[-part-no <text>]] - Part Number
Selects information about the DIMMs with the specified part number.

[[-cecc-count <integer>]] - Correctable ECC Error Count
Selects information about the DIMMs with the specified correctable ECC error count.

[[-uecc-count <integer>]] - Uncorrectable ECC Error Count
Selects information about the DIMMs with the specified uncorrectable ECC error count.

[[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example}]] - Health Monitor Name
Selects information about the DIMMs with the specified health monitor.

[[-status {ok|ok-with-suppressed|degraded|unreachable|unknown}]] - Status
Selects information about the DIMMs with the specified health monitor status.

[[-name <text>]] - Unique Name of DIMM
Selects information about the DIMMs with the specified unique name.

[[-display-name <text>]] - Display Name for the DIMM
Selects information about the DIMMs with the specified display name.

### Examples

The example below displays information about the DIMMs in all the nodes in the cluster.

```
cluster1::> system controller memory dimm show

+----------+----------+---------+---------+--------+----------+--------+-------+-------+
| Node     | DIMM     | UECC    | CECC    | CPU    | Channel  | Slot   | Status|
|----------|----------|---------|---------|--------|----------|--------|-------|-------|
| node1    | DIMM-1   | 0       | 0       | 0      | 0        | 0      | ok    |
| node1    | DIMM-NV1 | 0       | 0       | 1      | 1        | 1      | ok    |
| node2    | DIMM-1   | 1       | 0       | 0      | 0        | 0      | ok    |
| node3    | DIMM-NV1 | 0       | 1       | 0      | 0        | 1      | ok    |
+----------+----------+---------+---------+--------+----------+--------+-------+-------+
```

The example below displays detailed information about a specific DIMM in a specific controller.

```
cluster1::> system controller memory dimm show -instance -node node1 -pds-id 1

Node: node1
DIMM ID: 1
Slot Name: DIMM-1
CPU Socket: 0
Channel: 0
Slot Number on a Channel: 0
Serial Number: AD-01-1306-2EA01E9A
Part Number: HMT82GV7MMR4A-H9
Correctable ECC Error Count: 0
Uncorrectable ECC Error Count: 0
```

system controller commands 981
system controller pci commands

The pci directory

system controller pci show

Display the PCI Device Table

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system controller pci show command displays details of the PCI devices present in all of the nodes in a cluster. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported. By default, the command displays the following information about the PCI devices:

• Node name
• Display name
• Correctable error count
• Functional link width
• Functional link speed
• Health monitor status

To display more details, use the -instance parameter.

Parameters

{ [-fields <fieldname>, ...]  
  Selects the fields that you specify.

| [-instance ]}  
  Displays detailed information for all of the PCI devices.

[-node {<nodename>|local}] - Node  
  Selects the PCI devices that are present in the specified node.

[-bus-number <integer>] - Bus Number  
  Selects the PCI devices with the specified bus number.

[-device-number <integer>] - Device Number  
  Selects the PCI devices with the specified device number.

[-function-number <integer>] - Function Number  
  Selects the PCI devices with the specified function number.

[-slot-number <integer>] - Slot Info  
  Selects the PCI devices with the specified slot number.

[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example}] -  
  Health Monitor Name  
  Selects the PCI devices monitored by the specified health monitor.
[-vendor-id <Hex Integer>] - Vendor ID
Selects the PCI devices with the specified vendor ID.

[-device-id <Hex Integer>] - Device ID
Selects the PCI devices with the specified device ID.

[-physical-link-width <integer>] - Physical Link Width
Selects the PCI devices with the specified physical link width.

[-functional-link-width <integer>] - Functional Link Width
Selects the PCI devices with the specified functional link width.

[-physical-link-speed <text>] - Physical Link Speed(GT/s)
Selects the PCI devices with the specified physical link speed.

[-functional-link-speed <text>] - Functional Link Speed(GT/s)
Selects the PCI devices with the specified functional link speed.

[-unique-name <text>] - Unique Name
Selects the PCI devices with the specified unique name.

[-corr-err-count <integer>] - Correctable Error Count
Selects the PCI devices with the specified correctable error count.

[-health {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status
Selects the PCI devices with the specified health monitor status.

[-display-name <text>] - Display Name
Selects the PCI devices with the specified display name.

[-cerr-diff <integer>] - Correctable Error Difference
Selects the PCI devices with the specified difference in correctable error count.

Examples
The example below displays the information about the PCIe devices present in all of the nodes in the cluster.

```
cluster1::> system controller pci show

Display                  Correctable Functional Functional
Node          Name                     Error Count Link Width Link Speed Status
------------- ------------------------ ----------- ---------- ---------- -------
cluster1-01   Ontap PCI Device 0                 0          4      5GT/s ok
cluster1-02   Ontap PCI Device 4                 0          4      5GT/s ok
```

The example below displays detailed information about a PCIe device in a node.

```
cluster1::> system controller pcie show -instance -node cluster1-01 -bus-number 1

Node: cluster1-01
Bus Number: 1
Device Number: 0
Function Number: 0
Slot Info: 0
Health Monitor Name: controller
Vendor ID: 11f8
Device ID: 8001
Physical Link Width: 4
Functional Link Width: 4
Physical Link Speed(GT/s): 5GT/s
Functional Link Speed(GT/s): 5GT/s
Unique Name: ontap0@pci0:1:0:0
```
system controller pcicerr commands

The pcicerr directory

system controller pcicerr threshold commands

The threshold directory

system controller pcicerr threshold modify

Modify the Node PCIe error alert threshold

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

The system controller pcicerr threshold modify command modifies node-wide PCIe correctable error threshold counts in the cluster.

Parameters

The PCIe error threshold count that would trigger an alert if exceeded.

Examples

The example below displays the information about setting node-wide PCIe error threshold count in the cluster:

    cluster1::> system controller threshold modify -pcie-cerr-threshold 100

system controller pcicerr threshold show

Display the Node PCIe error alert threshold

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The system controller pcicerr threshold show command displays information about node-wide PCIe correctable error threshold counts in the cluster.

Examples

The example below displays the information about node-wide PCIe error threshold count in the cluster:

    cluster1::> system controller pcicerr threshold show
    PCIe Error Threshold
    ------------------------
    200
system controller sp commands

The sp directory

system controller sp config commands

The config directory

system controller sp config show

Display the Service Processor Config Table

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system controller sp config show command displays the following configuration information of the service processor for all nodes in the cluster:

- Node name
- Service processor status
- Service processor firmware version
- Booted firmware version
- Service processor configuration status
- Physical Ethernet link status of service processor
- Health monitor status

To display more details, use the -instance parameter. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported.

Parameters

{-fields <fieldname>,...}  Selects the field that you specify.

[-instance ]
Displays detailed configuration information of the service processor.

[-node {<nodename>|local}] - Node
Use this parameter to list the service processor configuration of the specific node.

[-version <text>] - Firmware Version
Selects the service processor configuration with the specified firmware version.

[-boot-version {primary|backup}] - Booted Version
Selects the service processor configuration with the specified version of the currently booted partition.

[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example}] - Health Monitor Name
Selects the service processor configuration with the specified monitor name.

[-sp-status {online|offline|sp-daemon-offline|node-offline|degraded|rebooting|unknown}] - SP Status
Selects the service processor configuration with the specified status of service processor.
[-sp-config {true|false}] - Auto Update Configured
Selects information about the service processor with the specified configuration status of the service processor.

[-status {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status
Selects the service processor configuration information with the specified service processor status.

[-link-status {up|down|disabled|unknown}] - Public Link Status
Selects the service processor configuration with the specified physical ethernet link status.

[-name <text>] - Display Name
Selects the service processor configuration with the specified unique name.

Examples
The example below displays configuration of the service processor in all the nodes in the cluster:

```
cluster1::> system controller sp config show
Firmware Version: Booted Version: Auto Update Configured SP Status: Public Link Status: Display Name:
Node Version Configured Status Status Status
---- -------- ------------ -------- --------- ------- -------
node1 2.2.2     true          online up ok
node2 2.2.2     true          online up ok
```

The example below displays configuration of the service processor of a particular node in detail:

```
cluster1::> system controller sp config show -instance -node node1
Node: node1
Firmware Version: 2.2.2
Booted Version: primary
Health Monitor Name: controller
SP Status: online
Auto Update Configured: true
Status: ok
Public Link Status: up
Display Name: SP Config
```

system controller sp upgrade commands
The upgrade directory

system controller sp upgrade show
Display the Service Processor Upgrade Table

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system controller sp upgrade show command displays the following information about the service processor firmware of all the nodes in the cluster:

- Node name
- Is new firmware available?
- Is autoupdate enabled?
- Status of autoupdate
- Health monitor status
To display more details, use the -instance parameter. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported.

**Parameters**

{ [-fields <fieldname>, ...]  
  Selects the fields that you specify.  
| [-instance ]  
  Displays detailed upgrade information of the service processor.  
[-node {<nodename>|local}] - Node  
  Use this parameter to list the upgrade information of the service processor on the specified node.  
[-new-fw-avail {true|false}] - New Firmware Available  
  Selects the information of the service processors which have new firmware available.  
[-new-fw-version <text>] - New Firmware Version  
  Selects the information about service processors with the specified firmware version.  
[-auto-update {true|false}] - Auto Update  
  Selects the information about service processors with the specified state.  
[-auto-update-stat {installed|corrupt|updating|auto-updating|none}] - Auto Update Status  
  Selects the information about service processors with the specified auto update status.  
  Selects the information about service processors with the specified start time.  
  Selects the information about service processors with the specified end time.  
[-auto-update-per <integer>] - Auto Update Percent Done  
  Selects the information about service processors with the specified auto update percentage completed.  
[-auto-update-maxret <integer>] - Auto Update Maximum Retries  
  Selects the information about service processors with the specified maximum number of retries.  
[-auto-update-curret <integer>] - Auto Update Current Retries  
  Selects the information about service processors with the specified number of current retries.  
[-auto-update-prevstat {failed|passed}] - Previous AutoUpdate Status  
  Selects the information about service processors with the specified automatic update status.  
[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example}] - Health Monitor Name  
  Selects the information about service processors with the specified monitor name.  
[-status {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status  
  Selects the information about service processors with the specified health monitor status.  
[-name <text>] - Display Name  
  Selects the information about service processors with the specified display name.  

**Examples**

The example below displays service processor upgrade information for all nodes in the cluster:

```
cluster1::> system controller sp upgrade show
New   Firmware         Auto Update   Auto Update
Node  Available        Feature       Status          Status
----  ---------------  ------------  --------------  ---------
```

system controller commands  987
The example below displays the detailed service processor upgrade information for a specific node:

```
cluster1::> system controller sp upgrade show -instance -node node1

Node: node1
New Firmware Available: false
New Firmware Version: Not Applicable
Auto Update: true
Auto Update Status: installed
Auto Update Start Time: Thu Oct 20 20:06:03 2012 Etc/UTC
Auto Update End Time: Thu Oct 20 20:09:19 2012 Etc/UTC
Auto Update Percent Done: 0
Auto Update Maximum Retries: 5
Previous AutoUpdate Status: passed
Health Monitor Name: controller
Status: ok
Display Name: SP Upgrade
```

---

**system feature-usage commands**

Display feature information

**system feature-usage show-history**

Display Feature Usage History

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**

Display feature usage information in the cluster on a per-node and per-week basis.

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

```
| [-instance ]
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[-node {<nodename>|local] - Node
```

Displays feature usage information for the specified node name.

```
[-serial-number <Node Serial Number>] - Node Serial Number
```

Displays feature usage information for the specified serial number.

```
[-feature-name <Managed Feature>] - Feature Name
```

Displays feature usage information for the specified feature name.

```
[-week-number <Sequence Number>] - Week Number
```

Displays feature usage information for the specified week number.

```
[-usage-status not-used configured in-use not-available] - Usage Status
```

Displays feature usage information that matches the specified usage status.

988 Commands: Manual Page Reference
system feature-usage show-history -serial-number 1-81-0000000000000001122334455 - feature-name NFS

system feature-usage show-summary
Display Feature Usage Summary

Availability: This command is available to cluster administrators at the admin privilege level.

Description
Display usage summary information about features in the cluster on a per-node basis. The summary information includes counter information such as the number of weeks the feature was in use and the last date and time the feature was used. Additional information can also be displayed by using the -instance parameter.

Parameters

[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

[-instance]]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-serial-number <Node Serial Number>] - Node Serial Number
Displays usage summary information for the specified serial number.

[-feature-name <Managed Feature>] - Feature Name
Displays usage summary information for the specified feature name.

[-weeks-in-use <integer>] - Weeks In-Use
Displays usage summary information for features matching the number of weeks in use.

[-last-used <MM/DD/YYYY HH:MM:SS>] - Date last used
Displays usage summary information for features last used on the specified date.

[-owner <text>] - Owner
Displays usage summary information for the specified owner name.
[-weeks-not-used <integer>] - Weeks Not Used
Displays usage summary information for features matching the number of weeks not in use.

[-weeks-configured <integer>] - Weeks Configured
Displays usage summary information for features matching the number of weeks that the feature was in configuration.

[-weeks-not-available <integer>] - Weeks Data Not Available
Displays usage summary information for features matching the number of weeks when usage data was not available.

**Examples**
The following example displays a usage summary output for a cluster of two nodes:

    cluster1:/> system feature-usage show-summary
    Node Serial Number: 1-81-0000000000000001122334455
    Owner: node1
    Feature Name  Weeks In Use      Date Last Used
    -----------  ----------------- -------------------
    CIFS         10 1/1/2013 23:27:49
    NFS          15 1/8/2013 23:48:03

    Node Serial Number: 1-81-0000000000000001122334466
    Owner: node2
    Feature Name  Weeks In Use      Date Last Used
    -----------  ----------------- -------------------
    CIFS         10 1/1/2013 23:26:38

The config directory

The `system ha interconnect config` directory displays the interconnect device basic configuration information.

**system ha interconnect config show**
Display the high-availability interconnect configuration information

**Availability:** This command is available to `cluster` administrators at the `advanced` privilege level.

**Description**
The `system ha interconnect config show` command displays the high-availability interconnect device basic configuration information.
Parameters

\{-fields <fieldname>, ...\}

If you specify the -fields <fieldname>, ... parameter, the command displays only the fields that you specify.

\{-instance \}

Use this parameter to display all the fields from all nodes in cluster.

\{-node <nodename>[local]\} - Node

Use this parameter to display all the fields from the specified node in the cluster.

\{-transport <text>\} - Interconnect Type

Selects the nodes that match this HA interconnect transport type.

\{-local-sysid <integer>\} - Local System ID

Selects the nodes that match this local system unique identifier.

\{-partner-sysid <integer>\} - Partner System ID

Selects the nodes that match this partner system unique identifier.

\{-initiator {local|partner}\} - Connection Initiator

Selects the nodes that match this parameter value. The value is the initiator of the connection request.

\{-port-name <text>, ...\} - Port

Selects the nodes that match this port name.

\{-ipaddress <text>, ...\} - IP Address

Selects the nodes that match this IP address.

\{-interface {backplane|external}\} - Interface

Selects the nodes that match this parameter value. external means the HA interconnect links between partner nodes are connected externally. backplane means the HA interconnect links between partner nodes are connected over the backplane.

Examples

The following example displays the HA interconnect configuration information on FAS3200 series, FAS6200 series, and FAS8000 series nodes in the cluster:

```
cluster1::*> system ha interconnect config show

    Node: ic-f6210-01
    Interconnect Type: Infiniband (Mellanox ConnectX)
    Local System ID: 1873748022
    Partner System ID: 1873750763
    Connection Initiator: partner
    Interface: external
    Port   IP Address
    ----   -----------------

```

2 entries were displayed.

High-Availability interconnect device link operation

The link directory

The `system ha interconnect link directory` toggles the interconnect links.

**system ha interconnect link off**

Turn off the interconnect link

**Availability:** This command is available to cluster administrators at the `advanced` privilege level.

**Description**

The `system ha interconnect link off` command turns off the specified link on the high-availability interconnect device. For the nodes in the cluster with two external high-availability interconnect links, you must specify the link number (0-based) to turn off the specified link. For the nodes in the cluster with interconnect links over the backplane, you must specify the link number 1 to turn off the link.

**Parameters**

- `--node <nodename>` - Node
  This mandatory parameter specifies the node on which the interconnect link is to be turned off. The value "local" specifies the current node.

- `--link {0|1}` - Link
  This mandatory parameter specifies the interconnect link number (0-based) to turn off.
**Examples**

The following example displays output of the command on the nodes with a single interconnect link or nodes with interconnect links over the backplane:

```
cluster1::*> system ha interconnect link off -node ic-f3250-02 -link 0
Error: command failed: Invalid link value 0. Specify 1.
cluster1::*> system ha interconnect link off -node ic-f3250-02 -link 1
```

The following example displays output of the command on the nodes with two interconnect links connected externally:

```
cluster1::*> system ha interconnect link off -node ic-f3250-02 -link 0
cluster1::*> system ha interconnect link off -node ic-f3250-02 -link 1
```

---

**system ha interconnect link on**

Turn on the interconnect link

**Availability:** This command is available to cluster administrators at the advanced privilege level.

**Description**
The `system ha interconnect link on` command turns on the specified link on the high-availability interconnect device. For the nodes in the cluster with two external high-availability interconnect links, you must specify the link number (0-based) to turn on the specified link. For the nodes in the cluster with interconnect links over the backplane, you must specify the link number 1 to turn on the link.

**Parameters**

- `-node <nodename>` - Node
  
  This mandatory parameter specifies the node on which the interconnect link is to be turned on. The value "local" specifies the current node.

- `-link {0|1}` - Link
  
  This mandatory parameter specifies the interconnect link number (0-based) to turn on.

---

**Examples**

The following example displays output of the command on the nodes with a single interconnect link or nodes with interconnect links over the backplane:

```
cluster1::*> system ha interconnect link on -node ic-f3250-02 -link 0
Error: command failed: Invalid link value 0. Specify 1.
cluster1::*> system ha interconnect link on -node ic-f3250-02 -link 1
```

The following example displays output of the command on the nodes with two interconnect links connected externally:
High-Availability interconnect device port information

The port directory

The `system ha interconnect port directory` displays the interconnect device port information.

system ha interconnect port show

Display the high-availability interconnect device port information

**Availability:** This command is available to `cluster` administrators at the `advanced` privilege level.

**Description**
The `system ha interconnect port show` command displays the high-availability interconnect device port physical layer and link layer status information.

**Parameters**

```latex
\{ [-fields <fieldname>, ...] \\
| [-instance] \\
\} - Node
```

Use this parameter to display all the fields from all nodes in the cluster.

```latex
[-node {<nodename>|local}] - Node
```

Use this parameter to display all the fields from the specified node in the cluster.

```latex
[-link-monitor {on|off}] - Link Monitor Detection
```

Selects the nodes that match this parameter value.

```latex
[-port <integer>, ...] - Port Number
```

Selects the nodes that match this parameter value.

```latex
[-phy-layer-state {invalid|sleep|polling|disabled|port-configuration-testing|linkup|link-error-recovery|phytest|reserved}, ...] - Physical Layer State
```

Selects the nodes that match this parameter value.

```latex
[-link-layer-state {invalid|down|initialize|armed|active|reserved}, ...] - Link Layer State
```

Selects the nodes that match this parameter value.

```latex
[-phy-link-up-count <integer>, ...] - Physical Link Up Count
```

Selects the nodes that match this parameter value. The value is total number of times the link on a given port is transitioned up.

```latex
[-phy-link-down-count <integer>, ...] - Physical Link Down Count
```

Selects the nodes that match this parameter value. The value is total number of times the link on a given port is transitioned down.

```latex
[-is-active-link {true|false}, ...] - Is the Link Active
```

Selects the nodes that match this parameter value. The value `true` means the interconnect data channels are established on this link.
Examples

The following example displays the HA interconnect device port information on FAS6200 series nodes in the cluster:

```
cluster1::* system ha interconnect port show

Physical  Link
Node      Monitor  Port  Layer  State  Layer  State  Physical  Physical  Active
--------------  -------  ----  ----  -----  -----  -------  ---------  --------
ic-f6210-01     on     0     linkup  active  1    0 true
              1     linkup  active  1    0 false
ic-f6210-02     on     0     linkup  active  1    0 true
              1     linkup  active  1    0 false
```

2 entries were displayed.

High-Availability interconnect device out-of-order delivery capability configuration

The ood directory

The `system ha interconnect ood` directory manages the interconnect device out-of-order delivery capability configuration. These commands are only supported on FAS2000 series nodes in the cluster.

**system ha interconnect ood clear-error-statistics**

Clear error statistics

**Availability:** This command is available to cluster administrators at the *advanced* privilege level.

**Description**

The `system ha interconnect ood clear-error-statistics` command enables you to clear all the error statistics collected for the out-of-order delivery-capable high-availability interconnect device. This command is only supported on FAS2000 series nodes in the cluster.

**Parameters**

- `-node <nodename>` - Node

This mandatory parameter specifies which node will have the error statistics cleared. The value "local" specifies the current node.

```
Examples

cluster1::* system ha interconnect ood clear-error-statistics -node ic-f2240-03
```

**system ha interconnect ood clear-performance-statistics**

Clear performance statistics

**Availability:** This command is available to cluster administrators at the *advanced* privilege level.

**Description**

The `system ha interconnect ood clear-performance-statistics` command enables you to clear all the performance statistics collected for the out-of-order delivery-capable high-availability interconnect device. This command is only supported on FAS2000 series nodes in the cluster.
Parameters
- **node <nodename>- Node**

This mandatory parameter specifies which node will have the performance statistics cleared. The value "local" specifies the current node.

### Examples

```
cluster1:*> system ha interconnect ood clear-performance-statistics -node ic-f2240-03
```

### system ha interconnect ood disable-optimization

Disable coalescing work requests

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**
The *system ha interconnect ood disable-optimization* command disables the optimization capability on the high-availability interconnect device. The command is only supported on FAS2000 series nodes in the cluster.

**Parameters**
- **node <nodename>- Node**

This mandatory parameter specifies which node will have the optimization disabled. The value "local" specifies the current node.

### Examples

```
cluster1:*> system ha interconnect ood disable-optimization -node ic-f2240-03
```

### system ha interconnect ood disable-statistics

Disable detailed statistics collection

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**
The *system ha interconnect ood disable-statistics* command disables collection of the statistics on the out-of-order delivery-capable high-availability interconnect device. This command is only supported on FAS2000 series nodes in the cluster.

**Parameters**
- **node <nodename>- Node**

This mandatory parameter specifies which node will have the statistics collection disabled. The value "local" specifies the current node.
**system ha interconnect ood enable-optimization**

Enable coalescing work requests

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**
The `system ha interconnect ood enable-optimization` command enables you to turn on optimization (coalescing out-of-order delivery requests) on the high-availability interconnect device. This command is only supported on FAS2000 series nodes in the cluster.

**Parameters**
- `node <nodename>` - Node
  
  This mandatory parameter specifies which node will have the optimization enabled. The value "local" specifies the current node.

**Examples**

```
cluster1:*> system ha interconnect ood enable-optimization -node ic-f2240-03
```

---

**system ha interconnect ood enable-statistics**

Enable detailed statistics collection

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**
The `system ha interconnect ood enable-statistics` command enables collection of the statistics on the out-of-order delivery-capable high-availability interconnect device. This command is only supported on FAS2000 series nodes in the cluster.

**Parameters**
- `node <nodename>` - Node
  
  This mandatory parameter specifies which node will have the statistics collection enabled. The value "local" specifies the current node.

**Examples**

```
cluster1:*> system ha interconnect ood enable-statistics -node ic-f2240-03
```
**system ha interconnect ood send-diagnostic-buffer**

Send diagnostic buffer to partner

**Availability:** This command is available to cluster administrators at the *advanced* privilege level.

**Description**
The `system ha interconnect ood send-diagnostic-buffer` command enables you to run a short out-of-order delivery diagnostic test. The command sends a buffer to the partner controller over the high-availability interconnect. This command is only supported on FAS2000 series nodes in the cluster.

**Parameters**
- `-node <nodename>` - Node
  This mandatory parameter specifies which node will send the diagnostic buffer to its partner. The value "local" specifies the current node.

**Examples**
```
cluster1::*> system ha interconnect ood send-diagnostic-buffer -node ic-f2240-03
```

**system ha interconnect ood status commands**

The status directory

Displays the high-availability interconnect device out-of-order delivery configuration information. This command is supported only on FAS2000 series nodes in the cluster.

**system ha interconnect ood status show**

Display the high-availability interconnect device out-of-order delivery (OOD) information

**Availability:** This command is available to cluster administrators at the *advanced* privilege level.

**Description**
The `system ha interconnect ood status show` command displays configuration information of the out-of-order delivery-capable high-availability interconnect devices. This command is supported only on FAS2000 series nodes in the cluster.

**Parameters**

- `{ [-fields <fieldname>, ...] }
  If you specify the `-fields <fieldname>, ...` parameter, the command displays only the fields that you specify.
- `[-instance ]`
  Use this parameter to display all the fields from all nodes in cluster.
- `[-node {<nodename> | local}] - Node`
  Use this parameter to display all the fields from the specified node in the cluster.
- `[-is-ood-enabled {true | false}] - Is OOD Enabled`
  Selects the nodes that match this parameter value.
- `[-is-coalescing-enabled {true | false}] - Is Coalescing Enabled`
  Selects the nodes that match this parameter value.
Examples
The following example displays the HA interconnect device out-of-order delivery configuration information on FAS2000 series nodes in the cluster.

```
cluster1::*>
```

Node: ic-f2240-03
NIC Used: 0
Is OOD Enabled: true
Is Coalescing Enabled: true

Node: ic-f2240-04
NIC Used: 0
Is OOD Enabled: true
Is Coalescing Enabled: true

High-Availability interconnect device scatter-gather list statistics
The statistics directory

The `system ha interconnect statistics show-scatter-gather-list` directory displays the interconnect device scatter-gather list statistics.

Related references
`system ha interconnect statistics show-scatter-gather-list` on page 1000

system ha interconnect statistics clear-port
Clear the high-availability interconnect port counters

Availability: This command is available to `cluster` administrators at the `advanced` privilege level.

Description
The `system ha interconnect statistics clear-port` command clears the high-availability interconnect device port statistics. This command is supported only on FAS2000 series, FAS6200 series, and FAS8000 series nodes in the cluster.

Note: To display the high-availability interconnect device port statistics, use the `statistics show -object ic_hw_port_stats` command.

Parameters
- `node <nodename>` - Node
  Selects the nodes that match this parameter value.

Examples
```
cluster1::*>
```

```
 system ha interconnect statistics clear-port -node ic-f6210-01
```
system ha interconnect statistics clear-port-symbol-error

Clear the high-availability interconnect port symbol errors

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The `system ha interconnect statistics clear-port-symbol-error` command clears the high-availability interconnect device port symbol errors. This command is supported only on FAS2000 series nodes in the cluster.

Note: To display the high-availability interconnect device port statistics, use the `statistics show -object ic_hw_port_stats` command.

Parameters
- **-node <nodename>** - Node
  Selects the nodes that match this parameter value.

Examples
```
cluster1::*> system ha interconnect statistics clear-port-symbol-error -node ic-f2240-03
```

system ha interconnect statistics show-scatter-gather-list

Display the high-availability interconnect scatter-gather list entry statistics

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The `system ha interconnect statistics show-scatter-gather-list` command displays the high-availability interconnect device scatter-gather list entry statistics. Out of all possible 32 entries in a scatter-gather list, the command displays only the entries that have valid data.

Parameters
{ [ -fields <fieldname>, ... ]
  If you specify the -fields <fieldname>, ... parameter, the command displays only the fields that you specify.
  [-instance ]
  Use this parameter to display all the fields from all nodes in cluster.
  [-node (<nodename> | local)] - Node
  Use this parameter to display all the fields from the specified node in the cluster.
  [-sge <integer>, ...] - Scatter-Gather Entry
  Selects the nodes that match this scatter-gather element index value.
  [-total-count <integer>, ...] - Total Count
  Selects the nodes that match this parameter value. The value is the total number of times a particular scatter-gather list element is used.
  [-total-size <integer>, ...] - Total Size
  Selects the nodes that match this parameter value. The value is the total number of bytes written by the high-availability interconnect device using a particular scatter-gather list element.
Examples

```
cluster1:*> system ha interconnect statistics show-scatter-gather-list
Node: ic-f6210-01
Entry  Count              Size
-----  -----------------  ----------------
1       410925          7734493
2        988           1246987
3         72           747325
4       93264        152715579

High-Availability interconnect device performance statistics

The performance directory

The `system ha interconnect statistics performance` displays the high-availability interconnect device performance statistics.

**system ha interconnect statistics performance show**

Display the high-availability interconnect device performance statistics

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**

The `system ha interconnect statistics performance show` command displays the high-availability interconnect device performance statistics.

**Parameters**

```
[-fields <fieldname>,...]
```

If you specify the `-fields <fieldname>,...` parameter, the command displays only the fields that you specify.

```
[-instance ]
```

Use this parameter to display all the fields from all nodes in cluster.

```
[-node <nodename> | local] - Node
```

Use this parameter to display all the fields from the specified node in the cluster.

```
[-elapsed <integer>] - Elapsed Time (secs)
```

Selects the nodes that match this parameter value. Displays the total elapsed time between statistics collection start time to end time. During the initialization stage, statistics collection starts when the partner node is up and ready. After the initialization stage, the statistics collection start time is reset after every execution of this command. This means that after the initialization stage, elapsed time represents the time between current command execution and previous command execution.
[-qmax-wait <integer>] - Maximum Queue Wait Count
   Selects the nodes that match this wait value. The queue maximum wait value is the total number of times the interconnect device waited to post requests on the send queue.

[-qmax-wait-time <integer>] - Average Queue Wait Time (usecs)
   Selects the nodes that match this average wait time value. The queue maximum wait time is the average amount of time the interconnect device waited to post requests on the send queue.

[-qmax-timeout <integer>] - Maximum Queue Timeouts
   Selects the nodes that match this parameter value. The queue maximum timeout value is the total number of times the interconnect device timed out waiting to post requests on the send queue.

[-preempt-timeout <integer>] - Preempt Timeouts
   Selects the nodes that match this parameter value. The timeout value is the total number of times polling on the given transfer ID is preempted.

[-nonpreempt-timeout <integer>] - Non-Preempt Timeouts
   Selects the nodes that match this parameter value. The timeout value is the total number of times polling on the given transfer ID stopped due to interconnect device read/write timeout.

[-notify-timeout <integer>] - Notify Timeouts
   Selects the nodes that match this parameter value. The timeout value is the total number of times data transfer on the HA interconnect timed out.

[-avg-rnv-mgs-time <integer>] - Remote NV Messages Average Time (usecs)
   Selects the nodes that match this parameter value. The value is the average time between remote NV messages.

[-rnv-transfers <integer>] - Total Remote NV Transfers
   Selects the nodes that match this parameter value. The value is the total number of remote NV transfers attempted.

[-avg-rnv-transfer-size <integer>] - Remote NV Average Transfer Size
   Selects the nodes that match this parameter value. The value is the average remote NV message transfer size.

[-avg-rnv-transfer-time <integer>] - Remote NV Transfers Average Time (usecs)
   Selects the nodes that match this parameter value. The value is the average transfer time taken by remote NV messages.

[-ic-waits <integer>] - Total Count of IC waits for Given ID
   Selects the nodes that match this parameter value. The value is the total number of times the interconnect device waits until the transfer of a given ID is successful.

[-ic-waitdone-time <integer>] - Average IC Waitdone Time (usecs)
   Selects the nodes that match this parameter value. The value is the average time the interconnect device spent waiting for the IDs to be transferred successfully.

[-ic-isdone <integer>] - Total IC isdone Checks
   Selects the nodes that match this parameter value. The value is the total number of times the interconnect client checked for the completion of a given transfer ID.

[-ic-isdone-pass <integer>] - Total IC isdone Checks Success
   Selects the nodes that match this parameter value. The value is the total number of times the check for the completion of a given transfer ID is successful.

[-ic-isdone-fail <integer>] - Total IC isdone Checks Failed
   Selects the nodes that match this parameter value. The value is the total number of times the check for the completion of a given transfer ID is not successful.
[ic-small-writes <integer>] - IC Small Writes
Selects the nodes that match this parameter value. The value is the total number of <4K size writes performed by the interconnect device.

[ic-4k-writes <integer>] - IC 4K Writes
Selects the nodes that match this parameter value. The value is the total number of 4K size writes performed by the interconnect device.

[ic-8k-writes <integer>] - IC 8K Writes
Selects the nodes that match this parameter value. The value is the total number of 8K size writes performed by the interconnect device.

[ic-16k-writes <integer>] - IC 16K+ Writes
Selects the nodes that match this parameter value. The value is the total number of 16K or more size writes performed by the interconnect device.

[ic-xorder-writes <integer>] - IC XORDER Writes
Selects the nodes that match this parameter value. The value is the total number of out-of-order writes performed by the interconnect device.

[ic-xorder-reads <integer>] - IC XORDER Reads
Selects the nodes that match this parameter value. The value is the total number of out-of-order reads performed by the interconnect device.

[rdma-read <integer>] - RDMA Reads Count
Selects the nodes that match this parameter value. The value is the total number of RDMA reads performed by the interconnect device.

[rdma-read-waitdone-time <integer>] - Average IC Waitdone RDMA-READ Time (usecs)
Selects the nodes that match this parameter value. The value is the average time the interconnect device spent polling for transfer IDs on the RDMA-read channel.

[avg-mbytes-second <text>] - Average MegaBytes Transferred per second
Selects the nodes that match this parameter value. The value is the average megabytes (MB) transferred per second.

[avg-bytes-transfer <integer>] - Average Bytes per Transfer
Selects the nodes that match this parameter value. The value is the average amount of bytes sent per transfer.

[total-transfers <integer>] - Total Transfers
Selects the nodes that match this parameter value. The value is the total number of transfers made through the interconnect device.

[avg-nvlog-sync-time <integer>] - Average Time for NVLOG Sync (msecs)
Selects the nodes that match this parameter value. The value is the average time taken to sync NVLOG between HA partner nodes.

[max-nvlog-sync-time <integer>] - Maximum Time for NVLOG Sync (msecs)
Selects the nodes that match this parameter value. The value is the maximum time taken to sync NVLOG between HA partner nodes.

[max-sgl-length <integer>] - Maximum Scatter-Gather Elements in a List
Selects the nodes that match this parameter value. The value is the maximum length of the scatter-gather list supported by the interconnect device.

[ic-recq-waits <integer>] - Total Receive Queue Waits to Post Buffer
Selects the nodes that match this parameter value. The value is the total number of times the interconnect device waited to post an empty buffer into the receive queue.
### [avg-recq-wait-time <integer>] - Average Time Receive Queue Waited (usecs)

Selects the nodes that match this parameter value. The value is the average amount of time the interconnect device waited to post an empty buffer into the receive queue.

#### Examples

The following example displays the HA interconnect device performance statistics for FAS3200 series, FAS6200 series, and FAS8000 series nodes in the cluster:

```

High-Availability interconnect device status information

The status directory

The `system ha interconnect status` directory displays the interconnect device status information. At instance level, these commands displays detailed information about the interconnect device.

**system ha interconnect status show**

Display the high-availability interconnect connection status

**Availability:** This command is available to cluster administrators at the `advanced` privilege level.

**Description**

The `system ha interconnect status show` command displays the high-availability interconnect connection status. Connection status information displayed by this command varies by controller model. For FAS3200 series, FAS6200 series, and FAS8000 series with two HA interconnect links over the backplane or connected externally, this command displays the following information:

- Node
- Link status on the first port
- Link status on the second port
- Is the link on first port active?
- Is the link on second port active?
- Interconnect RDMA status

For FAS2000 series, FAS3200 series, FAS6200 series, and FAS8000 series machines with a single HA interconnect link, this command displays following the information:

- Node
- Link status
- Interconnect RDMA status

Running the command with the `-instance` or `-node` parameter displays detailed information about the interconnect device and its ports.

**Parameters**

```bash
[-fields <fieldname>,...]
```

If you specify the `-fields <fieldname>,...` parameter, the command displays only the fields that you specify.

```bash
[-instance]
```

Use this parameter to display all the fields for the specified node or all the nodes.

```bash
[-node <nodename>|local] - Node
```

Use this parameter to display all the fields for the specified node.

```bash
[-link-status {up|down}] - Link Status
```

Selects the nodes that match this parameter value. The value `up` means link is online.

```bash
[-link0-status {up|down}] - Link 0 Status
```

Selects the nodes that match this parameter value. The value `up` means link is online.
[-link1-status {up|down}] - Link 1 Status
Selects the nodes that match this parameter value. The value up means link is online.

[-ic-rdma {up|down}] - IC RDMA Connection
Selects the nodes that match this parameter value. The value up means active interconnect connection with its partner.

[-is-link0-active {true|false}] - Is Link 0 Active
Selects the nodes that match this parameter value. The value true means the interconnect data channels are established on this link.

[-is-link1-active {true|false}] - Is Link 1 Active
Selects the nodes that match this parameter value. The value true means the interconnect data channels are established on this link.

[-slot <integer>] - Slot Number
Selects the nodes that match this PCI slot number.

[-driver-name <text>] - Driver Name
Selects the nodes that match this interconnect device driver name.

[-firmware <text>] - Firmware Revision
Selects the nodes that match this firmware version.

[-version <text>] - Version Number
Selects the nodes that match this parameter value.

[-device-type <text>] - Device Type
Selects the nodes that match this interconnect device type.

[-serial-number <text>] - Serial Number
Selects the nodes that match this interconnect device serial number.

[-debug-firmware {yes|no}] - Debug Firmware
Selects the nodes that match this parameter value.

[-command-revision <integer>] - Command Revision
Selects the nodes that match this interconnect device command revision.

[-hardware-revision <integer>] - Hardware Revision
Selects the nodes that match this interconnect device hardware revision.

[-port1 <integer>] - Port Number 1
Selects the nodes that match this parameter value.

[-port1-port-name <text>] - Port Name
Selects the nodes that match this port name.

[-port1-gid <text>] - Global Identifier
Selects the nodes that match this global identifier value.

[-port1-base-lid <text>] - Base Local Identifier
Selects the nodes that match this base local identifier value.

[-port1-rm-lid <text>] - Remote Local Identifier
Selects the nodes that match this remote local identifier value.

[-port1-mtu <integer>] - Maximum Transmission Unit
Selects the nodes that match this parameter value.
[-port1-data-rate <text>] - Data Rate
  Selects the nodes that match this parameter value.

[-port1-link-info <text>] - Link Information
  Selects the nodes that match this parameter value.

[-port1-qsfp-vendor <text>] - QSFP Vendor
  Selects the nodes that match this QSFP (Quad Small Form-factor Pluggable) vendor name.

[-port1-qsfp-part-number <text>] - QSFP Part Number
  Selects the nodes that match this QSFP (Quad Small Form-factor Pluggable) part-number.

[-port1-qsfp-type <text>] - QSFP Type
  Selects the nodes that match this QSFP (Quad Small Form-factor Pluggable) type.

[-port1-qsfp-serial-number <text>] - QSFP Serial Number
  Selects the nodes that match this QSFP (Quad Small Form-factor Pluggable) serial number.

[-port2 <integer>] - Port Number 2
  Selects the nodes that match this parameter value.

[-port2-port-name <text>] - Port Name
  Selects the nodes that match this port name.

[-port2-gid <text>] - Global Identifier
  Selects the nodes that match this global identifier value.

[-port2-base-lid <text>] - Base Local Identifier
  Selects the nodes that match this base local identifier value.

[-port2-rm-lid <text>] - Remote Local Identifier
  Selects the nodes that match this remote local identifier value.

[-port2-mtu <integer>] - Maximum Transmission Unit
  Selects the nodes that match this parameter value.

[-port2-data-rate <text>] - Data Rate
  Selects the nodes that match this parameter value.

[-port2-link-info <text>] - Link Information
  Selects the nodes that match this parameter value.

[-port2-qsfp-vendor <text>] - QSFP Vendor
  Selects the nodes that match this QSFP (Quad Small Form-factor Pluggable) vendor name.

[-port2-qsfp-part-number <text>] - QSFP Part Number
  Selects the nodes that match this QSFP (Quad Small Form-factor Pluggable) part number.

[-port2-qsfp-type <text>] - QSFP Type
  Selects the nodes that match this QSFP (Quad Small Form-factor Pluggable) type.

[-port2-qsfp-serial-number <text>] - QSFP Serial Number
  Selects the nodes that match this QSFP (Quad Small Form-factor Pluggable) serial number.

Examples
The following example displays status information about the HA interconnect connection on FAS3200 series, FAS6200 series, and FAS8000 series nodes with two HA interconnect links in the cluster:
The following example displays status information about the HA interconnect connection on FAS2000 series, FAS3200 series, FAS6200 series, and FAS8000 series nodes with a single HA interconnect link in the cluster:

```
cluster1::*> system ha interconnect status show

Node: ic-f6210-01
  Link Status: up
  IC RDMA Connection: up

Node: ic-f6210-02
  Link Status: up
  IC RDMA Connection: up

2 entries were displayed.
```

The following example displays detailed information about the HA interconnect link when parameters like `-instance` and `-node` are used with the `system ha interconnect status show` command:

```
cluster1::*> system ha interconnect status show -instance -node ic-f6210-01

Node: ic-f6210-01
  Link 0 Status: up
  Link 1 Status: up
  Is Link 0 Active: true
  Is Link 1 Active: false
  IC RDMA Connection: up
    Slot: 2
      Driver Name: IB Host Adapter i2 (NVRAM8 ConnectX MT26418 rev. B0)

```
system health commands

System Health Management and Diagnosis commands

system health alert commands

The alert directory

system health alert delete

Delete system health alert

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system health alert delete command deletes all the alerts on the cluster with the specified input parameters.

Parameters
- `-node <nodename>|local` - Node
  Use this parameter to delete alerts generated on a cluster only on the node you specify.
- `-monitor <hm_type>` - Monitor
  Use this parameter to delete alerts generated on a cluster only on the monitor you specify.
- `-alert-id <text>` - Alert ID
  Use this parameter to delete alerts generated on a cluster only on the alert ID you specify.
- `-alerting-resource <text>` - Alerting Resource
  Use this parameter to delete alerts generated on a cluster on the alerting resource you specify.

Examples
This example shows how to delete an alert with the specified alert-id:

```bash
cluster1::> system health alert delete -alert-id DualPathToDiskShelf_Alert -alerting-resource *
```

system health alert modify

Modify system health alert

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system health alert modify command suppresses alerts generated on the cluster and sets the acknowledgement state for an alert.
Parameters

- **node** (<nodename>|local) - Node
  Use this parameter to specify the node on which you want to change the state.

- **monitor** <hm_type> - Monitor
  Use this parameter to specify the monitor name on which you want to change the state.

- **alert-id** <text> - Alert ID
  Use this parameter to specify the alert ID on which you want to change the state.

- **alerting-resource** <text> - Alerting Resource
  Use this parameter to specify the alerting resource name on which you want to change the state.

- **acknowledge** (true|false) - Acknowledge
  Use this parameter to set the acknowledgement state to true or false.

- **suppress** (true|false) - Suppress
  Use this parameter to set the suppress state to true or false.

- **acknowledger** <text> - Acknowledger
  Use this parameter to set the acknowledger as the filter for setting state.

- **suppressor** <text> - Suppressor
  Use this parameter to set the suppressor as the filter for setting state.

Examples

This example modifies the alert field states on the cluster:

```
cluster1::> system health alert modify -node * -alert-id DualPathToDiskShelf_Alert -suppress true
```

system health alert show

View system health alerts

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

The system health alert show command displays information about all the alerts generated on the system. Using -instance will add detailed information.

**Parameters**

{ [-fields <fieldname>,...]
  Selects the fields that you specify.
} [-instance ]

Displays the following additional information about each alert:

- Node name
- Resource name
- Severity of the alert
- Time of alert generation
- Suppress state of the alert
- Acknowledge state of the alert
• Probable cause for the alert
• Possible effect due to the alert
• Recommended corrective actions to follow

[-node {<nodename>|local}] - Node
   Selects the alerts generated for the specified node.

[-monitor <hm_type>] - Monitor
   Selects the alerts with the specified monitor name.

[-alert-id <text>] - Alert ID
   Selects the alerts with the specified alert ID.

[-alerting-resource <text>] - Alerting Resource
   Selects the alerts with the specified alerting resource name.

[-subsystem <hm_subsystem>] - Subsystem
   Selects the alerts generated on the monitoring subsystem.

[-indication-time <Date>] - Indication Time
   Selects the alerts with the specified indicated time.

[-perceived-severity <hm_perceived_sev>] - Perceived Severity
   Selects the alerts with the perceived severity level.

[-probable-cause <hm_probable_cause>] - Probable Cause
   Selects the alerts that contain the specified probable cause.

[-probable-cause-description <text>] - Description
   Selects the alerts containing the specified probable cause description.

[-corrective-actions <text>] - Corrective Actions
   Selects the alerts with the specified recommended corrective action.

[-possible-effect <text>] - Possible Effect
   Selects the alerts with the specified possible effect.

[-acknowledge {true|false}] - Acknowledge
   Selects the alerts with the specified acknowledgement status.

[-suppress {true|false}] - Suppress
   Selects the alerts with the specified suppressor field status of true or false.

[-policy <text>] - Policy
   Selects the alerts with the specified policy name.

[-acknowledger <text>] - Acknowledger
   Selects the alerts with the specified acknowledger field.

[-suppressor <text>] - Suppressor
   Selects the alerts with the specified suppressor field.

[-additional-info <text>,...] - Additional Information
   Selects the alerts with the specified additional information.

[-alerting-resource-name <text>] - Alerting Resource Name
   Selects the alerts with the specified alerting resource name.

[-tags <hm_alert_type>,...] - Additional Alert Tags
   Selects the alerts with the specified keywords.
Examples

The example below displays information about all the alerts generated in the cluster:

```
cluster1::> system health alert show

Node: node1
Resource: Shelf ID 2
Severity: Major
Suppress: false
Acknowledge: false
Tags: quality-of-service, nondisruptive-upgrade
Probable Cause: Disk shelf 2 does not have two paths to controller node1.
Possible Effect: Access to disk shelf 2 via controller node1 will be lost with a single hardware component failure (e.g. cable, HBA, or IOM failure).
Corrective Actions: 1. Halt controller node1 and all controllers attached to disk shelf 2.
2. Connect disk shelf 2 to controller node1 via two paths following the rules in the Universal SAS and ACP Cabling Guide.
3. Reboot the halted controllers.
4. Contact support personnel if the alert persists.
```

The example below displays additional information about a specific alert generated in the cluster:

```
cluster1::> system health alert show -monitor node-connect -alert-id DualPathToDiskShelf_Alert -instance

Node: node1
Monitor: node-connect
Alert ID: DualPathToDiskShelf_Alert
Alerting Resource: 50:05:0c:c1:02:00:0f:02
Subsystem: SAS-connect
Indication Time: Mon Mar 21 10:26:38 2011
Perceived Severity: Major
Probable Cause: Connection_establishment_error
Description: Disk shelf 2 does not have two paths to controller node1.
Corrective Actions: 1. Halt controller node1 and all controllers attached to disk shelf 2.
2. Connect disk shelf 2 to controller node1 via two paths following the rules in the Universal SAS and ACP Cabling Guide.
3. Reboot the halted controllers.
4. Contact support personnel if the alert persists.
Possible Effect: Access to disk shelf 2 via controller node1 will be lost with a single hardware component failure (e.g. cable, HBA, or IOM failure).
Acknowledge: false
Suppress: false
Policy: DualPathToDiskShelf_Policy
Acknowledger: -
Suppressor: -
Additional Information: Shelf uuid: 50:05:0c:c1:02:00:0f:02
    Shelf id: 2
    Shelf Name: 4d.shelf2
    Number of Paths: 1
    Number of Disks: 6
    Adapter connected to IOMA:
    Adapter connected to IOMB: 4d
Alerting Resource Name: Shelf ID 2
Additional Alert Tags: quality-of-service, nondisruptive-upgrade
```

**system health alert definition commands**

The definition directory

**system health alert definition show**

Display system health alert definition

**Availability:** This command is available to cluster administrators at the admin privilege level.
Description
The `system health alert definition show` command displays information about the various alerts defined in the system health monitor policy file. Using `-instance` will display additional details.

Parameters

[-fields <fieldname>, ...]
Selects the fields that you specify.

[-instance]
Use this parameter to display additional information on each alert definition.

- Node name
- Monitor name
- Subsystem identifier
- Alert ID
- Severity of the alert
- Probable cause
- Probable cause description
- Possible effect due the error state
- Recommended corrective actions to be followed
- Any additional information
- Additional alert tags

[-node <nodename> | local]
Selects the alert definitions for the specified node.

[-monitor <hm_type]]
Selects the alert definitions with the specified monitor name.

[-alert-id <text]]
Selects the alert definitions with the specified alert identifier.

[-perceived-severity <hm_perceived_sev>]
Selects the alert definitions with the specified perceived severity.

[-probable-cause <hm_probable_cause>]
Selects the alert definitions with the specified probable cause of the alert.

[-probable-cause-description <text>]
Selects the alert definitions with the specified probable cause description.

[-possible-effect <text>]
Selects the alert definitions with the specified possible effect.

[-corrective-actions <text>]
Selects the alert definitions with the specified corrective action.

[-subsystem <hm_subsystem>]
Selects the alert definitions with the specified subsystem.

[-additional-information <text>]
Selects the alert definitions with the specified additional information.
[<tags <hm_alert_type>, ...> - Additional Alert Tags]

Selects the alert definitions with the specified keywords.

**Examples**

The example below displays information about all the definitions in the alert definition file:

```bash
cluster1::> system health alert definition show
```

<table>
<thead>
<tr>
<th>Node</th>
<th>Monitor</th>
<th>Subsystem</th>
<th>Alert ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>node-01</td>
<td>system-connect</td>
<td>SAS-connect</td>
<td>DualControllerNonHa_Alert</td>
</tr>
</tbody>
</table>

Severity: Major
Probable Cause: Configuration_error
Probable Cause Description: Disk shelf $(sschm_shelf_info.id) is connected to two controllers $(sschm_shelf_info.connected-nodes) that are not an HA pair.
Possible Effect: Access to disk shelf $(sschm_shelf_info.id) may be lost with a single controller failure.
Corrective Actions: 1. Halt all controllers that are connected to disk shelf $(sschm_shelf_info.id).
2. Connect disk shelf $(sschm_shelf_info.id) to both HA controllers following the rules in the Universal SAS and ACP Cabling Guide.
3. Reboot the halted controllers.
4. Contact support personnel if the alert persists.

Additional Info: -
Tags: quality_of_service, nondisruptive-upgrade

The example below displays detailed information about the definitions in the alert definition file:

```bash
cluster1::> system health alert definition show -instance
```

```
Node: krivC-01
Monitor: system-connect
Class of Alert: DualControllerNonHa_Alert
Severity of Alert: Major
Probable Cause: Configuration_error
Probable Cause Description: Disk shelf $(sschm_shelf_info.id) is connected to two controllers $(sschm_shelf_info.connected-nodes) that are not an HA pair.
Possible Effect: Access to disk shelf $(sschm_shelf_info.id) may be lost with a single controller failure.
Corrective Actions: 1. Halt all controllers that are connected to disk shelf $(sschm_shelf_info.id).
2. Connect disk shelf $(sschm_shelf_info.id) to both HA controllers following the rules in the Universal SAS and ACP Cabling Guide.
3. Reboot the halted controllers.
4. Contact support personnel if the alert persists.
Subsystem Name: SAS-connect
Additional Relevant Data: -
Additional Alert Tags: quality_of_service, nondisruptive-upgrade
```

**system health config commands**

The config directory

**system health config show**

Display system health configuration

**Availability:** This command is available to cluster administrators at the admin privilege level.
Description
The `system health config show` command displays the configuration and status of each health monitor in the cluster. The command shows a health status for each health monitor. The health status is an aggregation of the subsystem health for each subsystem that the health monitor monitors. For example, if a health monitor monitors two subsystems and the health status of one subsystem is "ok" and the other is "degraded", the health status for the health monitor is "degraded".

Parameters
```bash
[-fields <fieldname>, ...]
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

[-instance]]
If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node <nodename>|local]] - Node
Use this parameter to list the health monitors present on the specified node.

[-monitor <hm_type>] - Monitor
Use this parameter to display the health monitors with the specified monitor name.

[-subsystem <hm_subsystem>, ...] - Subsystem
Selects the health monitors with the specified subsystems.

[-health {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Health
Selects the health monitors with the specified health status.

[-mon-version <text>] - Monitor Version
Selects the health monitors with the specified monitor version.

[-pol-version <text>] - Policy File Version
Selects the health monitors with the specified health monitor policy version.

[-context {Node |Cluster}] - Context
Selects the health monitors with the specified running context.

[-aggregator <hm_type>] - Aggregator
Selects the health monitors with the specified aggregator.

[-resources <text>, ...] - Resource
Selects the health monitors with the specified resource name.

[-init-state {Invalid|Initailizing|Initialized|Starting_Discovery|Starting_Re-Discovery|Discovery_Done_Partially|Discovery_Done}] - Subsystem Initialization Status
Selects the health monitors with the specified subsystem initialization state.

[-sub-pol-versions <text>] - Subordinate Policy Versions
Selects the health monitors with the specified subordinate policy version.
```

Examples
The example below displays information about health monitor configuration:

```
cluster1::> system health config show
Node    Monitor                Subsystem         Health
------------- ---------------------- ----------------- ------------------
node1         node-connect           SAS-connect       degraded
node1         system-connect         SAS-connect       degraded
node1         system                SAS-connect       degraded
```

The example below displays detailed information about health monitor configuration:

```
```

1016 Commands: Manual Page Reference
system health autosupport commands

The autosupport directory

system health autosupport trigger commands

The trigger directory

system health autosupport trigger history commands

The history directory

**system health autosupport trigger history show**

View system health alert history

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The `system health autosupport trigger history show` command displays all the alert triggers in the cluster that generated the AutoSupport messages. The following fields are displayed in the output:

- Node name
- Monitor name
- Subsystem
- Alert identifier
- Alerting resource
- Severity
- If an AutoSupport has been sent due to this alert

**Parameters**

`[-fields <fieldname>,...]

Use this parameter to display only the fields you specify.

`[-instance ]

Use this parameter to display additional information about all of the alerts that were generated.

`[-node (<nodename> | local)] - Node

Use this parameter to display AutoSupport trigger history on the specified node.
[-monitor <hm_type>] - Monitor

Use this parameter to display AutoSupport trigger history with the specified monitor name.

[-alert-id <text>] - Alert ID

Use this parameter to display the AutoSupport message that was triggered by the specified alert ID.

[-alerting-resource <text>] - Alerting Resource

Use this parameter to display the AutoSupport message that was triggered by the specified alerting resource.

[-subsystem <hm_subsystem>] - Subsystem

Use this parameter to display the AutoSupport message that was triggered by the specified subsystem.

[-indication-time <Date>] - Indication Time

Use this parameter to display the AutoSupport message that was triggered at the indicated time.

[-perceived-severity <hm_perceived_sev>] - Perceived Severity

Use this parameter to display the AutoSupport message that was triggered by alerts with the specified perceived severity.

[-autosupport-triggered {true|false}] - AutoSupport Triggered

Use this parameter to display the alerts that generated AutoSupport messages.

[-probable-cause <hm_probable_cause>] - Probable Cause

Use this parameter to display the alerts that were generated with the specified probable cause.

[-corrective-actions <text>] - Corrective Actions

Use this parameter to display the AutoSupport alerts with the specified corrective actions.

[-asup-enable {true|false}] - Enable Asup for This Alert

Use this parameter to enable or disable an AutoSupport message for this alert.

[-alert-clear-time <Date>] - Alert Clear Time

Use this parameter to display the alerts that were cleared at a given time.

Examples

This example displays information about the AutoSupport trigger history

```
cluster1::> system health autosupport trigger history show
Node       Monitor                Subsystem         Alert ID
------------ ---------------------- ----------------- ----------------------
node1       node-connect           SAS-connect       DualPathToDiskShelf_Alert

Resource: 50:05:0c:c1:02:00:0f:02
Severity: Major
AutoSupport sent: true
```

This example displays info about the autosupport trigger history in detail

```
cluster1::> system health autosupport trigger history show -instance
  
Node: node1
  Monitor: node-connect
  Alert ID: DualPathToDiskShelf_Alert
  Alerting Resource: 50:05:0c:c1:02:00:0f:02
  Subsystem: SAS-connect
  Indication Time: Thu Mar 17 11:59:09 2011
  Perceived Severity: Major
  AutoSupport Triggered: true
  Probable Cause: Connection_establishment_error
  Corrective Actions: 1. Halt controller node1 and all controllers attached to disk shelf 2.
  2. Connect disk shelf 2 to controller node1 via two paths following the rules in the Universal SAS
  and ACP Cabling Guide.
```
system health policy commands

The policy directory

system health policy definition commands

The definition directory

system health policy definition modify

Modify system health policy definition

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system health policy definition modify enables or disables health monitoring policies based on input parameters the user provides.

Parameters
-node {<nodename>|local} - Node
Use this parameter to specify the node on which you want to enable or disable the policy.

-monitor <hm_type> - Monitor
Use this parameter to specify the monitor name for which you want to be enable or disable the policy.

-policy-id <text> - Policy
Use this parameter to specify the policy identifier that you want to enable or disable.

[-enable {true|false}] - Policy Status
Use this parameter with the value "true" to enable the policy. Set the value to "false" to disable the policy.

[-asup-enable {true|false}] - Enable AutoSupport for This Alert
Use this parameter to enable or disable an AutoSupport message for this alert.

Examples
This example modifies policy state on the cluster:

    cluster1::> system health policy definition modify -node node1
                 -policy-id ControllerToShelfIomA_Policy -enable false -monitor *

system health policy definition show

Display system health policy definitions

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system health policy definition show command lists the health monitor policy definitions as described by the health monitor policy file. The command displays the following fields:
• Node name
• Monitor name
• Policy name
• Policy rule expression
• Expression for joining two tables
• Policy status
• Alert identifier
• Responsible resource name

Parameters

\{ [-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

\{ [-instance]

If you specify the -instance parameter, the command displays detailed information about all fields.

\{ [-node <nodename>|local] - Node

Selects policy definitions for the specified node.

\{ [-monitor <hm_type>] - Monitor

Selects policy definitions with the specified monitor name.

\{ [-policy-id <text>] - Policy

Selects policy definitions with the specified policy identifier.

\{ [-rule-expression <ArithExpr>] - Rule Expression

Selects policy definitions with the specified rule of expression.

\{ [-where <ArithExpr>] - Variable Equivalence

Selects rules that match the provided expression. This expression is part of the alert definition. It is shown for reference only and cannot be changed.

\{ [-enable {true|false}] - Policy Status

Use this parameter with the value set to "true" to select policy definitions that are enabled. Set the value to "false" to select policy definitions that are disabled.

\{ [-alert-id <text>] - Alert ID

Selects all policy definitions of the specified alert identifier.

\{ [-responsible-resource-info <text>] - Table and ID of Resource at Fault

Selects all policy definitions with the specified responsible resource.

\{ [-asup-enable {true|false}] - Enable AutoSupport for This Alert

Selects policy definitions for which AutoSupport messages are either enabled or disabled.

Examples

The example below displays information about all the policy definitions present in the cluster:

```
cluster1:~> system health policy definition show
Node       Monitor         Policy
---------- --------------- ----------------------
node1      node-connect    ControllerToShelfIomA_Policy
Policy Rule Expression: nschm_shelf_info.num-paths == 2 &&
```
The example below displays detailed information about all the policy definitions present in the cluster:

```
cluster1::> system health policy definition show -instance

Node: node1
Monitor: node-connect
Policy: ControllerToShelfIomA_Policy
Rule Expression: nschm_shelf_info.num-paths == 2 && nschm_shelf_info.iomb-adapter == NULL
Variable Equivalence: -
Policy Status: true
Alert ID: ControllerToShelfIomA_Alert
Table and ID of Resource at Fault: nschm_shelf_info.name
```

**system health status commands**

The status directory

**system health status show**

Display system health monitoring status

*Availability:* This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The `system health status show` command displays the health monitor status. The possible states are:

- ok
- ok-with-suppressed
- degraded
- unreachable

**Examples**

This example displays information about health monitoring status:

```
cluster1::> system health status show
Status
--------
degraded
```

**system health subsystem commands**

The subsystem directory
system health subsystem show

Display the health of subsystems

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system health subsystem show command displays the health status of each subsystem for which health monitoring is available. This command aggregates subsystem health status from each node in the cluster. A subsystem's health status changes to "degraded" when a health monitor raises an alert. You can use the system health alert show command to display information about generated alerts.

Parameters

{ [-fields <fieldname>, ...]  
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.  
} [-instance ]  
  If you specify the -instance parameter, the command displays detailed information about all fields.  

[-subsystem <hm_subsystem>] - Subsystem

Selects the specified subsystem.

[-health {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Health

Selects subsystems that have the specified health status.

[-init-state {Invalid|Initializing|Initialized|Starting_Discovery|Starting_Re-Discovery|Discovery_Done_Partially|Discovery_Done}] - Initialization State

Selects subsystems that have the specified initialization state.

[-outstanding-alert-count <integer>] - Number of Outstanding Alerts

Selects subsystems that have the specified number of outstanding alerts.

[-suppressed-alert-count <integer>] - Number of Suppressed Alerts

Selects subsystems that have the specified number of suppressed alerts.

[-node { <nodename> | local }, ...] - Node

Selects subsystems for the specified node.

[-refresh-interval <[<integer>h][<integer>m][<integer>s]>, ...] - Subsystem Refresh Interval

The refresh interval is in minutes. A value of zero disables the sub-system refresh until a reboot or restart of the subsystem process.

Examples

The example below displays the health status of each subsystem:

```
cluster1::> system health subsystem show
Subsystem          Health
----------------------------------
SAS-connect         degraded
Switch-Health       OK
CIFS-NDO            OK
```

The example below displays detailed information about the health status of each subsystem:

```
cluster1::> system health subsystem show -instance
 Subsystem: SAS-connect
          Health: degraded
```

*system health alert show* on page 1011

### system license commands

Manage licenses

#### system license add

Add one or more licenses

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

This command adds a license to a cluster. To add a license you must specify a valid license key, which you can obtain from your sales representative.

**Parameters**

- `license-code License Code V2`, ... - License Code V2

This parameter specifies the key of the license that is to be added to the cluster. The parameter accepts a list of 28 digit upper-case alphanumeric character keys.

**Examples**

The following example adds a list of licenses with the keys AAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAA and BBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBB to the cluster

```
cluster1:/> system license add -license-code AAAAAAAAAAAAAAAAAAAAAAAAAAAAA, BBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBB
```

#### system license clean-up

Remove unnecessary licenses

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.
Description
This command manages licenses in the cluster that have no effect, and so can be removed. Licenses that have expired or are not affiliated with any controller in the cluster are deleted by this command.

Parameters

-`-unused [true]` - Remove unused licenses
  If you use this parameter, the command removes licenses in the cluster that are not affiliated with any controller in the cluster.

-`-expired [true]` - Remove expired licenses
  If you use this parameter, the command removes licenses in the cluster that have expired.

-`-simulate | -n [true]` - Simulate Only
  If you use this parameter, the command will not remove the licenses. Instead it will display the licenses that will be removed if this parameter was not provided.

Examples
The following example simulates and displays the licenses that can be cleaned up:

```
classroom1::> system license clean-up -n -unused -expired
Serial number: 1-80-000011
Owner: classroom
Package                   Reason
------------------------- -----------------------------------------------------
SnapLock                  Demo License has expired
SnapProtectApps           Demo License has expired

Serial number: 1-81-000000000000000004062522917
Owner: none
Package                   Reason
------------------------- -----------------------------------------------------
NFS                       Serial number is not used by any node in the cluster
CIFS                      Serial number is not used by any node in the cluster
```

The following example deletes the expired licenses:

```
classroom1::> system license clean-up -expired
2 demo licenses deleted.
```

The following example deletes the unused licenses:

```
classroom1::> system license clean-up -unused
2 unused licenses deleted.
```
-package <Licensable Package> - Package

This parameter specifies the name of the package that is to be deleted from the cluster.

Examples

The following example deletes a license named CIFS and serial number 1-81-0000000000000000000123456 from the cluster:

```plaintext
cluster1::> system license delete -serial-number 1-81-0000000000000000000123456 -package CIFS
```

system license show

Display licenses

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The `system license show` command displays the information about licenses in the system.

Parameters

```
{-fields <fieldname>, ...}
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
{-instance}
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
{-serial-number <Node Serial Number> } - Serial Number
```

If you use this parameter, the command displays information only about the licenses that matches the serial number you specify.

```
{-package <Licensable Package> } - Package
```

If you use this parameter, the command displays information only about the specified package.

```
{-owner <text> } - Owner
```

If you use this parameter, the command displays information only about the packages that matches the owner name you specify.

```
{-expiration <MM/DD/YYYY HH:MM:SS> } - Expiration
```

If you use this parameter, the command displays information only about the licenses that have the expiration date you specify.

```
{-description <text> } - Description
```

If you use this parameter, the command displays information only about the licenses that matches the description you specify.

```
{-type {license|site|demo|subscr|capacity}} - Type
```

If you use this parameter, the command displays information only about the licenses that have the license type you specify.

```
{-legacy {yes|no}} - Legacy
```

If you use this parameter, the command displays information only about the licenses that matches the legacy field you specify.

```
{-customer-id <text> } - Customer ID
```

If you use this parameter, the command displays information only about the licenses that have the customer-id you specify.
Examples

The following example displays default information about all licensed packages in the cluster:

```
cluster1::> system license show
Serial Number: 1-80-123456
Owner: cluster1
Package         Type    Description            Expiration
----------------- ------- --------------------- ----------------------
Base             site    Cluster Base License  -
NFS              site    NFS License           -
iSCSI            site    iSCSI License         -
```

```
Serial Number: 1-81-0000000000000001122334455
Owner: node1
Package         Type    Description            Expiration
----------------- ------- --------------------- ----------------------
NFS              license NFS License           -
SnapRestore      license SnapRestore License   -
```

5 entries were displayed.

system license capacity commands

The capacity directory

system license capacity show

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The system license capacity show command displays the information about the licenses in the system that are specifically related to storage capacity limits.

Parameters

`{-fields <fieldname>, ...}

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `?-fields ?` to display the fields to specify.

`{-instance}

If you specify the -instance parameter, the command displays detailed information about all fields.

`{-serial-number <Node Serial Number>}` - Serial Number

If you use this parameter, the command displays information only about the capacity-related licenses that matches the serial number you specify.

`{-package <Licensable Package>}` - Package

If you use this parameter, the command displays information only about the package you specify.

`{-owner <text>}` - Owner

If you use this parameter, the command displays information only about the capacity-related licenses that have the owner you specify.

`{-max-capacity {<integer> [KB|MB|GB|TB|PB]}}` - Maximum Capacity

If you use this parameter, the command displays information only about the capacity-related licenses that have the maximum amount of attached storage capacity you specify.

`{-current-capacity {<integer> [KB|MB|GB|TB|PB]}}` - Current Capacity

If you use this parameter, the command displays information only about the capacity-related licenses that apply to the node with the current attached capacity you specify.
[-expiration <MM/DD/YYYY HH:MM:SS>] - Expiration Date
If you use this parameter, the command displays information only about the capacity-related licenses that have the expiration date you specify.

[-reported-state {evaluation|warning|missing|enforcement|installed}] - Reported State
If you use this parameter, the command displays information only about the capacity-related licenses that have the reported state you specify.

[-node {<nodename>|local}] - Node Name
If you use this parameter, the command displays information only about the capacity-related licenses that apply to the node you specify.

**Examples**

The following example displays information about all capacity-related licensed packages in the cluster, for a hypothetical cluster of four nodes:

Note that for some nodes below, the maximum capacity is displayed as "-" (meaning "unlimited"). This happens when there is no capacity license for the node - the node is operating with a limited-time temporary capacity license.

```
cluster1::> system license capacity show
Node: node1
Serial Number: 1-81-000000000000001234567890123456
Package | Capacity Capacity Expiration
---------|-------|-------------------
Select   | 2TB   | 15.81GB 4/11/2016 00:00:00

Node: node2
Serial Number: 1-81-0000000000000000000123456788
Package | Capacity Capacity Expiration
---------|-------|-------------------
Select   | -     | 10.40TB 4/11/2016 00:00:00

Node: node3
Serial Number: 1-81-0000000000000000000123456789
Package | Capacity Capacity Expiration
---------|-------|-------------------
Select   | -     | 10.40TB 4/11/2016 00:00:00

Node: node4
Serial Number: 1-81-000000000000001234567890123456
Package | Capacity Capacity Expiration
---------|-------|-------------------
Select   | 2TB   | 15.81GB 4/11/2016 00:00:00
```

**system license entitlement-risk commands**

The entitlement-risk directory

**system license entitlement-risk show**

Display Cluster License Entitlement Risk

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.
Description

This command displays information about license entitlement risk of the cluster for each license package. The command displays license package name, entitlement risk, corrective action to reduce the entitlement risk for each package, and the names and serial numbers for the nodes that do not have a node-locked license for a given package. If command is used with the "-detail" parameter, the output displays the names and serial numbers for all nodes in the cluster instead of only the nodes missing a node-locked license. It also displays whether each node has a license and if the features corresponding to the package are used in the past week.

License entitlement risk does not apply to base license. If a node has a site or a valid demo license for the given package, the entitlement risk will be shown as "medium" and the nodes missing a node-locked license will be displayed. The corrective action, if the cluster has a site license for the given package is, "Verify all controllers are entitled". If the entitlement risk is high, the corrective action is "Acquire node-locked license". For the low entitlement risk and if the cluster is unlicensed for a given package, the corrective action is "None". If the license entitlement risk cannot be computed because of infrastructure issues, the entitlement risk is shown as "unknown" and the corrective action is displayed as "Verify system health".

For more information regarding license entitlement risk, see http://mysupport.netapp.com/licensing/ontapentitlementriskstatus

Parameters

[[-fields <fieldname>,...]

With this parameter, you can specify which fields should be displayed by the command. License package names and node serial numbers are always displayed.

[[-detail]]

If you use this parameter, the command displays the license package name, entitlement risk, corrective action, all nodes' names, their serial numbers, whether a node-locked license is present and whether a given license package has been in use in the past week for each node in the cluster.

[[-instance]]

If this parameter is used, the command displays values for all fields for each license package and each node in the cluster individually.

[-package <Licensable Package>] - Package Name

If you use this parameter, the command displays information only for the specified license package.

[-serial-number <Node Serial Number>] - Node Serial Number

If you use this parameter, the command displays information only for the node with the specified serial number. The displayed entitlement risk and corrective action apply to the entire cluster.

[-node-name <text>] - Node Name

If you use this parameter, the command displays information only for the node with the specified name. The displayed entitlement risk and corrective action apply to the entire cluster.

[-risk {high|medium|low|unlicensed|unknown}] - Entitlement Risk

If you use this parameter, the command displays information only for the license packages that have the specified license entitlement risk.

[-action <text>] - Corrective Action

If you use this parameter, the command displays information only for the license packages which need the specified corrective action to reduce entitlement risk.

[-is-licensed {true|false}] - Is Node-Locked License Present

If you use this parameter, the command displays information only for the license packages for which at least one node in the cluster has a node-locked license. It also displays the nodes in the cluster which do not have a node-locked license.
[-in-use [true|false]] - Usage Status

If you use this parameter, the command displays information only for the license packages with corresponding features in use.

[-missing-serial-numbers <text>, ...] - Serial Numbers Missing a Node-Locked License

If you use this parameter, the command displays the packages for which the node with the specified serial number does not have a node-locked license.

[-missing-node-names <text>, ...] - Node Names Missing a Node-Locked License

If you use this parameter, the command displays all the packages for which the node with the specified name does not have a node-locked license.

[-action-code {acquire-license|adjust-capacity|verify-entitlement|verify-system-health|none}] - Corrective Action Code

If you use this parameter, the command displays information only for the license packages which need specified corrective action code to reduce entitlement risk. This parameter is same as the parameter "action".

**Examples**

The following example displays the information for license package NFS. NFS is unlicensed in the cluster and no action is necessary to reduce the entitlement risk. The nodes, cluster1-01 and cluster-02, are missing a node-locked license. The serial numbers for both nodes are also displayed.

```
cluster1::> system license entitlement-risk show
Package             Entitlement Risk Corrective Action
------------------- ---------------- -----------------------------------
NFS                 unlicensed       None
Nodes Without a Node-Locked License
-----------------------------------------------
cluster1-01                    1-81-0000000000000004073806282
cluster1-02                    1-81-0000000000000004073806283
```

The following example displays the information for license package CIFS. The cluster has high entitlement risk for CIFS. The command displays serial numbers for all nodes in the cluster. Both nodes are missing a node-locked CIFS license. Node with serial number 1-81-0000000000000004073806282 has used CIFS feature in the past week, and the node with serial number 1-81-0000000000000004073806283 has not used this feature in the past week.

```
cluster1::> system license entitlement-risk show -detail
Package             Entitlement Risk Corrective Action
------------------- ---------------- -----------------------------------
CIFS                high             Acquire a node-locked license
Serial Numbers Licensed Usage
-----------------------------------------------
1-81-0000000000000004073806282 false    true
1-81-0000000000000004073806283 false    false
```

**system license status commands**

- **system license status commands**

  Display license status

**system license status show**

- **system license status show**

  Display license status

  **Availability:** This command is available to *cluster* administrators at the *admin* privilege level.
Description
This command displays the list of licensable packages in the system and their current licensing status.

Parameters
{-fields <fieldname>,...}  
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

{-instance}  
If you specify the -instance parameter, the command displays detailed information about all fields.

{-package <Licensable Package>} - Package Name  
If you use this parameter, the command displays information only about the specified package.

{-method (none|license|site|demo|subscr|capacity)} - Licensed Method  
If you use this parameter, the command displays information only about the packages with the specified licensed method.

{-expiration <MM/DD/YYYY HH:MM:SS>} - Expiration Date  
If you use this parameter, the command displays information only about the licenses that have the expiration date you specify.

{-description <text>} - Description  
If you use this parameter, the command displays information only about the licenses that match the description you specify.

{-status-details <text>} - Additional Information About Status  
This option displays additional information regarding the cluster-level license status for license methods.

Examples
The following example displays the license status of the cluster:

```
cluster1::> system license status show
alokadcluster-1::> system license status show
Package   Licensed Method  Expiration            Status Details
-----------------  ---------------  --------------------  ----------------------
Base         site             -                     -
NFS          site             -                     -
CIFS         demo             12/7/2015 00:00:00    Demo expires on given date
iSCSI        none             -                     -

17 entries were displayed.
```

system node commands
The system node directory
**system node halt**

Shut down a node

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The `system node halt` command stops all activity on a node. You may supply a reason for the shutdown, which will be stored in the audit log. You may also keep partner nodes from performing storage takeover during the shutdown.

**Parameters**
- `-node` `<nodename>|local>` - Node
  
  Use this mandatory parameter to specify the node that you want to shut down. The value `local` specifies the current node.

- `[reason `<text>`]` - Reason for Shutdown
  
  Use this parameter to enter a brief note to indicate the reason for the restart, which will be stored in the audit log. Providing this information assists support personnel with troubleshooting efforts.

- `[inhibit-takeover | -f [true]]` - Disallow Storage Takeover by Partner
  
  This parameter optionally forces the shutdown and prevents storage failover. In a two-node MetroCluster configuration, this parameter prevents automatic unplanned switchover.

  **Note:** If `-inhibit-takeover` is set to true, the default behavior as seen with command `storage failover show -fields onreboot` is ignored.

  If you enter this command without using this parameter, its effective value is false and storage takeover is allowed. If you enter this parameter without a value, it is automatically set to true and storage takeover is disabled during reboot.

- `[dump | -d [true]]` - Create a Core Dump
  
  If this parameter is set to true, it forces a dump of the kernel core when halting the node.

- `[skip-lif-migration-before-shutdown [true]]` - Skip Migrating LIFs Away from Node Prior to Shutdown
  
  If this parameter is specified, LIF migration prior to the shutdown will be skipped. However if LIFs on this node are configured for failover, those LIFs may still failover after the shutdown has occurred. The default is to migrate LIFs prior to the shutdown. In the default case, the command attempts to synchronously migrate data and cluster management LIFs away from the node prior to shutdown. If the migration fails or times out, the shutdown will be aborted.

- `[ignore-quorum-warnings [true]]` - Skip Quorum Check Before Shutdown
  
  If this parameter is specified, quorum checks will be skipped prior to the shutdown. The operation will continue even if there is a possible data outage due to a quorum issue.

**Examples**
The following example shuts down the node named `cluster1` for hardware maintenance:

```
cluster1::> system halt -node cluster1 -reason 'hardware maintenance'
```

**Related references**

`storage failover show` on page 804
system node migrate-root

Start the root aggregate migration on a node

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

The system node migrate-root command migrates the root aggregate of a node to a different set of disks. You need to specify the node name and the list of disks on which the new root aggregate will be created. The command starts a job that backs up the node configuration, creates a new aggregate, sets it as new root aggregate, restores the node configuration and restores the names of original aggregate and volume. The job might take as long as a few hours depending on time it takes for zeroing the disks, rebooting the node and restoring the node configuration.

Parameters

- **-node {<nodename>|local}** - Node
  
  Specifies the node that owns the root aggregate that you wish to migrate. The value local specifies the current node.

- **-disklist <disk path name>, ...** - List of Disks for New Root Aggregate
  
  Specifies the list of disks on which the new root aggregate will be created. All disks must be spares and owned by the same node. Minimum number of disks required is dependent on the RAID type.

- **-raid-type {raid_tec|raid_dp|raid4}** - RAID Type for the New Root Aggregate
  
  Specifies the RAID type of the root aggregate. The default value is raid-dp.

Examples

The command in the following example starts the root aggregate migration on node node1:

```
cluster1::> system node migrate-root -node node1 -disklist 1.11.8,1.11.9,1.11.10,1.11.11,1.11.12 -raid-type raid-dp
```

system node modify

Modify node attributes

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The system node modify command sets the attributes of a node.

The owner, location, and asset tag attributes are informational only, and do not affect the operation of the node or the cluster. The cluster eligibility attribute marks a node as eligible to participate in a cluster. The epsilon attribute marks a node as the tie-breaker vote if the cluster has an even number of nodes.

Any field of type <text> may be set to any text value. However, if the value contains spaces or other special characters, you must enter it using double-quotes as shown in the example below.

Use the system node show command to display the field values that this command modifies.

Parameters

- **-node {<nodename>|local}** - Node
  
  This mandatory parameter specifies which node will have its attributes modified. The value "local" specifies the current node.
[-owner <text>] - Owner
   This optional text string identifies the node's owner. Fill it in as needed for your organization.

[-location <text>] - Location
   Use this text string to identify the physical location of the node. This text string is optional; fill it in as needed for your organization.

[-assettag <text>] - Asset Tag
   If your organization uses asset tags to track equipment, you can use this text string to store that tag's value.

[-eligibility {true|false}] - Eligibility (privilege: advanced)
   This parameter specifies whether the node is eligible to participate in a cluster. If you modify another node's eligibility to false, it will no longer be visible from other nodes in the cluster. If you modify the local node's eligibility to false, the node will no longer be active in the cluster and you will not be able to see any cluster nodes from it.

[-epsilon {true|false}] - Epsilon (privilege: advanced)
   If specified as true for a node, this value designates the specified node as epsilon for this cluster. In a cluster, only one node can be designated as epsilon at any given time. A node can be designated as Epsilon to add weight to its voting in a cluster with an even number of nodes.

[-skip-quorum-check-before-ineligible {true}] - Skip Quorum Check Before Setting Node Ineligible (privilege: advanced)
   If this parameter is specified, quorum checks will be skipped prior to setting a node ineligible. When setting a node to ineligible, the operation will continue even if there is a possible data outage due to a quorum issue.

[-is-diff-svcs {true|false}] - Differentiated Services
   If set to true this means that the specified node and its HA partner is part of differentiated services storage infrastructure. The default value for this setting is false.

Examples

The following example modifies the attributes of a node named node0. The node's owner is set to "IT" and its location to "Data Center 2."

```shell
cluster1::> system node modify -node node0 -owner "IT" -location "Data Center 2"
```

system node show on page 1038

system node reboot

Reboot a node

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system node reboot command restarts a node. You can supply a reason for the reboot, which is stored in the audit log. You can also keep partner nodes from performing storage takeover during the reboot and instruct the rebooted node to create a core dump.

Parameters

-`-node {<nodename>|local}` - Node
   Specifies the node that is to be restarted. The value "local" specifies the current node.
-inhibit-takeover | -f [true] - Disallow Storage Takeover by Partner

If set to true, this parameter specifies that the node's failover partner is not allowed to take over for the node when the node is rebooted. In a two-node MetroCluster configuration, this parameter prevents automatic unplanned switchover. If you enter this command without using this parameter, its effective value is false and storage takeover is allowed. If you enter this parameter without a value, it is automatically set to true and storage takeover is disabled during reboot.

-reason <text> - Reason for Reboot

Use this parameter to enter a brief note to indicate the reason for the restart, which will be stored in the audit log. Providing this information assists support personnel with troubleshooting efforts.

-dump | -d [true] - Create a Core Dump

If you would like the node to create a core dump before restarting, specify the true value with this parameter. If you enter this command without using this parameter, its effective value is false and the node doesn't create a core dump. If you enter this parameter without a value, it is automatically set to true and the node creates a core dump.

-skip-lif-migration-before-reboot [true] - Skip Migrating LIFs Away from Node Prior to Reboot

If this parameter is specified, LIF migration prior to the reboot will be skipped. However if LIFs on this node are configured for failover, those LIFs may still failover after the reboot has occurred. The default is to migrate LIFs prior to the reboot. In the default case, the command attempts to synchronously migrate data and cluster management LIFs away from the node prior to reboot. If the migration fails or times out, the reboot will be aborted.

-ignore-quorum-warnings [true] - Skip Quorum Check Before Reboot

If this parameter is specified, quorum checks will be skipped prior to the reboot. The operation will continue even if there is a possible data outage due to a quorum issue.

Examples

The command in the following example restarts the node named cluster1 for a software upgrade:

```
cluster1::> system node reboot -node cluster1 -reason "software upgrade"
```

system node rename

Rename a node

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The system node rename command changes a node's name. Both the node to be modified and the new name of that node must be specified with the following parameters. This command is best executed from the node that is being renamed, using the -node local parameter.

Use the system node show command to display the names of all the nodes in the current cluster.

Parameters

-node <nodename> | local - Node

This parameter specifies which node you are renaming. The value local specifies the current node.

-newname <text> - New Name

Use this parameter to specify the new name of the node.

- The name must contain only the following characters: A-Z, a-z, 0-9, ".", or ":".
- The first character must be one of the following characters: A-Z or a-z.
The last character must be one of the following characters: A-Z, a-z or 0-9.

The maximum supported length is 47 characters.

The system reserves the following names: "all", "cluster", "local" and "localhost".

Examples
The following example changes the name of the node named node3 to node4.

```
cluster1::> system node rename -node node3 -newname node4
```

Related references
system node show on page 1038

system node restore-backup

Restore the original backup configuration to the HA target node

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The system node restore-backup command restores the backup configuration file that is stored on the partner node to the specified target node in an HA pair. The backup configuration file is restored after Data ONTAP has been installed on the target node.

The backup configuration file is stored on the HA partner node while the target node is down. After the target node has been installed, the partner node sends this backup configuration file to the target node through the management network by using the system node restore-backup command to restore the original configuration. This procedure is commonly used when replacing the target node's boot device.

The target IP address should be the address of the target node used for netboot installation.

Parameters
- `-node <nodename> | local` - Node
  Specifies the partner node that sends the backup configuration file to the target node. The value "local" specifies the current node.

- `-target-address <Remote InetAddress>` - HA Partner IP Address
  Specifies the IP address for the target node.

system node revert-to

Revert a node to a previous release of Data ONTAP

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The system node revert-to command reverts a node's cluster configuration to the given version. After the system node revert-to command has finished, the revert_to command must be run from the nodeshell. The revert_to command reverts the filesystem on individual nodes to the target release. Before running revert-to in the cluster shell, the target release must be installed on the node.

Parameters
- `-node <nodename> | local` - Node
  Specifies the node that is to be reverted. The value local specifies the current node.
Data ONTAP Version

Specifies the version of Data ONTAP to which the node is to be reverted.

Capability Check

If set to true, this parameter specifies that the cluster configuration revert should perform checks to verify all of the preconditions necessary for revert-to to complete successfully. Setting the parameter to true does not run through the actual revert process. By default this option is set to false.

Examples

The command in the following example reverts cluster configuration of a node named node1 to Data ONTAP version 8.3:

```
cluster1:~> system node revert-to -node node1 -version 8.3
```

system node run

Run interactive or non-interactive commands in the nodeshell

Availability: This command is available to cluster administrators at the admin privilege level.

Description

Use the `system node run` command to run certain commands from the nodeshell CLI on a specific node in the cluster. You can run a single nodeshell command from the clustershell that returns immediately, or you can start an interactive nodeshell session from which you can run multiple nodeshell commands.

Nodeshell commands are useful for root volume management and system troubleshooting. Commands that are available through the nodeshell are scoped to a single node in the cluster. That is, they affect only the node specified by the value of the `node` parameter and do not operate on other nodes in the cluster. To see a list of available nodeshell commands, type '?' at the interactive nodeshell prompt. For more information on the meanings and usage of the available commands, use the `man` command in the nodeshell.

Only one interactive nodeshell session at a time can be run on a single node. Up to 24 concurrent, non-interactive sessions can be run at a time on a node.

When running the nodeshell interactively, exit the nodeshell and return to the clustershell by using the `exit` command. If the nodeshell does not respond to commands, terminate the nodeshell process and return to the clustershell by pressing Ctrl-D.

The `system node run` command is not available from the GUI interface.

Note: An alternate way to invoke the `system node run` command is by typing the `run` as a single word.

Parameters

- `node <nodename|local>` - Node
  
  Use this parameter to specify the name of the node on which you want to run the nodeshell command. If you specify only this parameter, the command starts an interactive nodeshell session that lasts indefinitely. You can exit the nodeshell to the clustershell by pressing Ctrl-D or by typing the `exit` command.

- `[-command <text>, ...]` - Command to Run
  
  This optionally specifies the name of a single nodeshell command to run on the specified node. To see a list of available nodeshell commands, type '?' at an interactive nodeshell prompt.

- `[-reset [true]]` - Reset Existing Connection
  
  If this parameter is specified with the `true` value, it terminates any existing interactive nodeshell session on the specified node. The default value is `false`. 

Examples

The following example runs the nodeshell command `sysconfig -V` on a node named node1:

```bash
cluster1::> system node run -node node1 -command sysconfig -V
volume node1_aggr0 (1 RAID group):
    group 0: 3 disks
```

The following example starts a nodeshell session on a node named node2 and then runs the nodeshell `sysconfig -V` command. The system remains in the nodeshell after running the `sysconfig -V` command.

```bash
cluster1::> run -node node2
Type 'exit' or 'Ctrl-D' to return to the CLI
node2> sysconfig -V
volume node2_aggr0 (1 RAID group):
    group 0: 3 disks
```

The following example starts a nodeshell session on a node named node1 and then runs two nodeshell commands, `aggr status` first and `vol status` second. Use quotation marks and semicolons when executing multiple nodeshell commands with a single `run` command.

```bash
cluster1::> run -node node1 -command "aggr status; vol status"
Aggr State          Status            Options
aggr0 online        raid_dp, aggr     root
                    parity uninit'd!
                    32-bit
aggr1 online        raid_dp, aggr     root
                    parity uninit'd!
                    32-bit
Volume State        Status            Options
vol0 online         raid_dp, flex     root, nvfail=on
                    parity uninit'd!
root_vs0 online     raid_dp, flex     create_ucode=on,
                    cluster           convert_ucode=on,
                    parity uninit'd!  maxdirsize=102400
```

system node run-console

Access the console of a node

Availability: This command is available to cluster administrators at the admin privilege level.

Description

This command allows you to access the console of any remote node on the same cluster. The remote access is helpful in situations where the node cannot be booted up or has network issues. This command establishes an SSH session with the Service Processor of a remote node and accesses that node’s console over the serial channel. This command works even if Data ONTAP is not booted up on the remote node. You can get back to the original node by pressing Ctrl+D. This command works only on SSH sessions and not on physical console sessions.

Parameters

- `-node (<nodename> | local) - Node`
  This parameter specifies the node whose physical console you want to access.

Examples

The following example accesses the console of node2 in the same cluster.
cluster1::> system node run-console -node node2
Pressing Ctrl-D will end this session and any further sessions you might open on top of this
session.
Type Ctrl-D.
SP-login: admin
Password: ****************************************************
* This is an SP console session. Output from the serial console is also mirrored on this session. *
****************************************************
node2::>
node2::> Connection to 192.168.1.202 closed.
cluster1::>

system node show

Display the list of nodes in the cluster

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system node show command displays information about the nodes in a cluster. You can limit output to specific types of information and specific nodes in the cluster, or filter output by specific field values.

To see a list of values that are in use for a particular field, use the -fields parameter of this command with the list of field names you wish to view. Use the system node modify command to change some of the field values that this command displays.

Parameters

{-fields <fieldname>,...}
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?’ to display the fields to specify.

[-inventory]
Use this parameter to display inventory information such as serial numbers, asset tags, system identifiers, and model numbers.

[-messages]
Use this parameter to display system messages for each node.

[-instance]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-node <nodename>|local] - Node
Selects information for node names that match this parameter value.

[-owner <text>] - Owner
Selects nodes that have owner values that match this parameter value.

[-location <text>] - Location
Selects nodes at specific physical locations that match this parameter value.

[-model <text>] - Model
Selects nodes that have model numbers that match this parameter value.

[-serialnumber <text>] - Serial Number
Selects nodes that have serial numbers that match this parameter value.
[-assettag <text>] - Asset Tag
Selects nodes that have asset tags that match this parameter value.

[-uptime {<seconds> | [<d> days] <hh>:<mm>:<ss>]}] - Uptime
Selects nodes that have uptimes that match this parameter value. This parameter is most useful when used with a range indicator such as less than or greater than, as in:

```
show -uptime >"30 days 00:00"
```

[-nvramid <nvramid>] - NVRAM System ID
Selects nodes that have NVRAM system IDs that match this parameter value.

[-systemid <text>] - System ID
Selects nodes that have system IDs that match this parameter value.

[-vendor <text>] - Vendor
Selects nodes that have vendor names that match this parameter value.

[-health {true|false}] - Health
Selects nodes that have health values that match this parameter value. Specify true to display healthy nodes, and false to display unhealthy nodes.

[-eligibility {true|false}] - Eligibility
Selects nodes that have voting eligibility values that match this parameter value.

[-epsilon {true|false}] - Epsilon ( privilege: advanced)
Selects nodes that have epsilon holding designations that match this parameter value. This is useful to find out which node, if any, in the current cluster has been designated as epsilon. Specify true to display the node holding epsilon, and false to display nodes not holding epsilon.

[-uuid <UUID>] - UUID (privilege: advanced)
Selects nodes that have the specified universal unique identifiers that match this parameter value.

[-is-diff-svcs {true|false}] - Differentiated Services
If true, the corresponding node is considered to be part of differentiated services storage infrastructure.

[-is-all-flash-optimized {true|false}] - All-Flash Optimized
Selects nodes that have "All-Flash Optimized" personality values that match this parameter value. Specify true to display nodes which support only SSD drives, and false to display nodes which support all kinds of drives.

**Examples**

```
cluster1::> system node show
Node   Health Eligibility Uptime        Model    Owner  Location
------ ------ ----------- ------------- -------- ------ -------------
node0  true   true        89 days 23:47 MODELXX  IT     Data Center 2
node1  true   true        15 days 22:37 MODELXX  Data Center 2
node2  true   true        15 days 23:00 MODELXX  Data Center 2
node3  true   true        15 days 22:37 MODELXX  Data Center 2
4 entries were displayed.
```

This example displays the locations and model numbers of all nodes that are in physical locations that have names beginning with "Lab":

---

**system node show-discovered**

Display all nodes discovered on the local network

**Availability:** This command is available to cluster administrators at the _advanced_ privilege level.

**Description**

The **system node show-discovered** command displays information about all the detectable nodes on the local cluster network. This includes both nodes in a cluster and nodes that do not belong to a cluster. You can filter the output to show only nodes that do not belong to a cluster or nodes that are in a cluster.

To see a list of values that are in use for a particular field, use the **-fields** parameter of this command with the list of field names you wish to view.

**Parameters**

- **[-fields <fieldname>, ...]**
  
  If you specify the -fields <fieldname>, ... parameter, the command only displays the fields that you specify.

- **[-instance]**
  
  If the -instance parameter is specified, the command displays detailed information about each node.

- **[-node <text>] - Node Name**
  
  This parameter specifies the name of a node for which information is to be displayed. If this parameter is not specified, the command displays information about all discovered nodes.

- **[-is-in-cluster {true|false}] - Is in a Cluster**
  
  If this parameter is set to false, the command lists only nodes that do not belong to a cluster.

- **[-cluster-uuid <UUID>] - Cluster UUID**
  
  Displays information about nodes belonging to the cluster that has the UUID you specify.
[\texttt{-cluster-name <text>}] - Cluster Name
Displays information about nodes belonging to the cluster that has the name you specify.

[\texttt{-serial-number <text>}] - Node Serial Number
Displays information about the node that has the serial number you specify.

[\texttt{-addresses <IP Address>, ...}] - Cluster IP Addresses
Displays information about the node that has the cluster IP addresses you specify.

[\texttt{-netmask <IP Address>}] - Cluster Address Mask
Displays information about the nodes that have the netmask address you specify.

[\texttt{-nvramid <nvramid>}] - Node NVRAM ID
Displays information about the node that has the NVRAM ID you specify.

[\texttt{-partner-nvramid <nvramid>}] - Partner NVRAM ID
Displays information about the node that has an HA partner with the NVRAM ID you specify.

[\texttt{-model <text>}] - Model
Displays the nodes that have the specified model number.

[\texttt{-version <text>}] - Software Version
Displays the nodes that have the specified version of Data ONTAP.

**Examples**
The following example displays information about all discovered nodes in the cluster network:

```
cluster1::*> system node show-discovered
Node          Cluster       Addresses       NVRAM ID    Partner NVRAM
------------- ------------- --------------- ----------- --------------
4069114-60-0  -             169.254.232.178 4069114600  -
4069114-60-2  -             169.254.79.38   4069114602  -
4069114-60-3  -             169.254.195.76  4069114603  -
cluster1-01   cluster1      169.254.140.39  4069114628  4069114629
cluster1-02   cluster1      169.254.138.137 4069114629  4069114628
```

**system node show-memory-errors**
Display Memory Errors on DIMMs

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**
*system node show-memory-errors* prints the history of memory (storage controller's RAM) errors since boot. This command can be useful in diagnosing memory problems or determining which DIMM, if any, might need replacement. Some correctable ECC errors are to be expected under normal operation, but many occurring on a particular DIMM might indicate a problem. All the fields are read only and can be used to filter the output. The maximum number of physical address and timestamps reported is 160.

**Parameters**

- `[-fields <fieldname>, ...]`
  If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

- `[ -verbose ]`
  The `-verbose` parameter enables verbose mode, resulting in the display of more detailed output.
If you specify the `-instance` parameter, the command displays detailed information about all fields.

**-node {<nodename>|local}** - Node

When provided, the `-node` parameter specifies the nodes for which the memory error statistics are to be displayed. When the `-node` is not provided, the command is applied to all the nodes in the cluster.

**-id <integer>** - DIMM ID

This parameter refers to the DIMM ID. It can be used to look at the correctable ECC error count on a specific DIMM.

**-name <text>** - DIMM Name

This parameter specifies the DIMM name for which the memory error statistics are to be displayed.

**-cecc <integer>** - Correctable ECC Error Count

This parameter can be used to get all the DIMMs with the specified correctable ECC error count.

**-merr {true|false}** - Multiple Errors on Same Address

Use this parameter with the values true to specify whether the error was seen multiple times on the same physical address. It can also be used to look at all the DIMMs with multiple errors on same address.

**-timestamp <text>, ...** - Error Time

This specifies the time at which the error was seen on the DIMM.

**-addr <text>, ...** - Error Address

This specifies the physical address on which the error was seen.

### Examples

```
cluster1:*> system node show-memory-errors
Correctable ECC Memory Errors:

Node: localhost

<table>
<thead>
<tr>
<th>DIMM</th>
<th>CECC</th>
<th>Multiple Err</th>
<th>Name</th>
<th>Count</th>

1042 Commands: Manual Page Reference
system node autosupport commands

Manage AutoSupport service

system node autosupport invoke

Generate and send an AutoSupport message

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The `system node autosupport invoke` command sends an AutoSupport message from a node.

**Parameters**
- **-node** `<nodename>|local` - Node
  
  Use this parameter to specify the node from which the AutoSupport message is sent.

- **[-message <text>] - Message Included in the AutoSupport Subject**
  
  Use this parameter to specify text sent in the subject line of the AutoSupport message. This parameter is not available when the `type` parameter is set to `performance`.

- **-type {test|performance|all} - Type of AutoSupport Collection to Issue**
  
  Use this parameter to specify the type of AutoSupport collection to issue. There is no default; you must specify a `type`.
  
  • **test** - The message contains basic information about the node. When the AutoSupport message is received by technical support, an e-mail confirmation is sent to the system owner of record. This enables you to confirm that the message is being received by technical support.
  
  • **all** - The message contains all collected information about the node.
  
  • **performance** - The message contains only performance information about the node. This parameter has effect only if performance AutoSupport messages are enabled, which is controlled by the `perf` parameter of the `system node autosupport modify` command.

- **[-uri <text>] - Alternate Destination for This AutoSupport**
  
  Use this parameter to send the AutoSupport message to the destination you specify instead of the configured destination. Only "file", "mailto", "http", and "https" protocols are supported. If this parameter is omitted, the message is sent to all of the recipients defined by the `system node autosupport modify` command.

- **[-force [true]] - Generate and Send Even if Disabled**
  
  Use this parameter to generate and send the message even if AutoSupport is disabled on the node.

**Examples**
The following example sends a test AutoSupport message from a node named `node0` with the text "Testing ASUP":

```
cluster1:~> system node autosupport invoke -node node0 -type test -message "Testing ASUP"
```
system node autosupport invoke-core-upload

Generate and send an AutoSupport message with an existing core file.

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system node autosupport invoke-core-upload command sends an AutoSupport message with an existing core file from a node. The core file specified by the "-core-filename" option is included in the AutoSupport message. The command requires that the specified file be present while the AutoSupport message is being transmitted.

Parameters
- **-node {<nodename>|local}** - Node
  Use this parameter to specify the node from which the AutoSupport message is sent. Defaults to localhost.

- **[-message <text>]** - Message Included in the AutoSupport Subject
  Use this parameter to specify the text in the subject line of the AutoSupport message.

- **[-uri <text>]** - Alternate Destination for This AutoSupport
  Use this parameter to send the AutoSupport message to an alternate destination. Only "file," "http," and "https" protocols are supported. If this parameter is omitted, the message is sent to the all of the recipients defined by the system node autosupport modify command.

- **[-force [true]]** - Generate and Send Even if Disabled
  Use this parameter to generate and send the AutoSupport message even if AutoSupport is disabled on the node.

- **[-case-number <text>]** - Case Number for This Core Upload
  Use this parameter to specify the optional case number to be associated with this AutoSupport message.

- **-core-filename <text>** - The Existing Core Filename to Upload
  Use this parameter to specify the core file to be included in the AutoSupport message. Use the system node coredump show command to list the core files by name.

Examples
Use this command to list the core files from a node:

```
cluster1::> system node coredump show -node local
Node:Type Core Name                                   Saved Panic Time
--------- ------------------------------------------- ----- ----------------- 
node:kernel core.4073000068.2013-09-11_15_05_01.nz     true  9/11/2013 15:05:01
```

Use this command to invoke an AutoSupport message with the corefile core.4073000068.2013-09-11_15_05_01.nz:

```
cluster1::> system node autosupport invoke-core-upload -core-filename core.4073000068.2013-09-11_15_05_01.nz -node local
```

Related references
- system node coredump show on page 1069
**system node autosupport invoke-performance-archive**

Generate and send an AutoSupport message with performance archives.

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
The `system node autosupport invoke-performance-archive` command sends an AutoSupport message with the performance archives from a node. The command requires that the performance archives in the specified date range be present while the AutoSupport message is being transmitted.

**Parameters**
- `-node {<nodename>|local}` - Node
  Use this parameter to specify the node from which the AutoSupport message is sent. The default setting is localhost.

  `-message <text>` - Message Included in the AutoSupport Subject
  Use this parameter to specify the text in the subject line of the AutoSupport message.

  `-uri <text>` - Alternate Destination for This AutoSupport
  Use this parameter to send the AutoSupport message to an alternate destination. Only "file," "http," and "https" protocols are supported. If this parameter is omitted, the message is sent to the all of the recipients defined by the system node autosupport modify command.

  `-force [true]` - Generate and Send Even if Disabled
  Use this parameter to generate and send the AutoSupport message even if AutoSupport is disabled on the node.

  `-case-number <text>` - Case Number for This Performance Archive Upload
  Use this parameter to specify the optional case number to be associated with this AutoSupport message.

  `-start-date <MM/DD/YYYY HH:MM:SS>` - Start Date for Performance Archive Dataset
  Use this parameter to specify the start date for the files in the performance archive dataset to be included in the AutoSupport message.

  `{ -end-date <MM/DD/YYYY HH:MM:SS> - End Date for Performance Archive Dataset
  Use this parameter to specify the end date for the files in the performance archive dataset to be included in the AutoSupport message. The end date should be within six hours of the start date.

  `-duration <[<integer>h][<integer>m][<integer>s]>} - Duration of Performance Archive Dataset
  Use this parameter with start-date to specify the duration of the performance archive dataset to be included in the AutoSupport message. The maximum duration limit is six hours from the start date.

**Examples**

Use this command to invoke an AutoSupport message to include the performance archives in the given date range:

```
```

```
cluster1::> system node autosupport invoke-performance-archive -node local -start-date 11/21/2013 13:42:09 -duration 6h
```

**system node autosupport invoke-splog**

Generate and send an AutoSupport message with collected service-processor log files

**Availability:** This command is available to cluster administrators at the admin privilege level.
Description
The system node autosupport invoke-splog command sends an AutoSupport message with the Service Processor log files from a specified node in the cluster.

Parameters
-remote-node {<nodename>|local} - Node
  Use this parameter to specify the node from which Service Processor log files are to be collected.

-log-sequence <integer> - Log File Sequence Number
  Use this parameter to specify the sequence number of the Service Processor log files to be collected. If this parameter is omitted, the latest Service Processor log files are collected.

-uri <text> - Alternate Destination for This AutoSupport
  Use this parameter to send the AutoSupport message to an alternate destination. Only "file," "http," and "https" protocols are supported. If this parameter is omitted, the message is sent to the all of the recipients defined by the system node autosupport modify command.

-force [true] - Generate and Send Even if Disabled
  Use this parameter to generate and send the AutoSupport message even if AutoSupport is disabled on the node.

Examples
Use this command to invoke an AutoSupport message to include the Service Processor log files collected from node cluster1-02.

```
cluster1::> system node autosupport invoke-splog -remote-node cluster1-02
[Job 777] Job succeeded: Log files from the service processor have been transferred to "/mroot/etc/log/sp/ondemand" on node cluster1-01, and AutoSupport message has been triggered.
cluster1::>
```

Related references
system node autosupport modify on page 1046

system node autosupport modify
Modify AutoSupport configuration

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system node autosupport modify command modifies the AutoSupport configuration of a node.

Parameters
-node {<nodename>|local} - Node
  Use this parameter to specify the node being configured.

-state {enable|disable} - State
  Use this parameter to specify whether AutoSupport is enabled or disabled on the node. The default setting is enable. When AutoSupport is disabled, messages are not sent to anyone, including the vendor's technical support, your internal support organization, or partners.
[-mail-hosts <text>,...] - SMTP Mail Hosts

Use this parameter to specify up to five SMTP mail hosts through which the node sends AutoSupport messages. This parameter is required if you specify e-mail addresses in the -to, -noteto, or -partner-address parameters or if you specify smtp in the -transport parameter. Separate multiple mail hosts with commas with no spaces in between. The AutoSupport delivery engine attempts to use these hosts for delivery in the order that you specify.

You can optionally specify a port value for each mail server. A port value can be specified on none, all, or some of the mail hosts. The port specification for a mail host consists of a colon (":") and a decimal value between 1 and 65535, and follows the mailhost name (for example, mymailhost.example.com:5678). The default port value is 25.

Also, you can optionally prepend a user name and password combination for authentication to each mail server. The format of the username and password pair is user1:pwl@mymailhost.example.com. The username and password can be specified on none, all, or some of the mail hosts.

The default value for this parameter is mailhost.

[-from <mail address>] - From Address

Use this parameter to specify the e-mail address from which the node sends AutoSupport messages. The default is Postmaster@xxx where xxx is the name of the system.

[-to <mail address>,...] - List of To Addresses

Use this parameter to specify up to five e-mail addresses to receive AutoSupport messages that are most relevant for your internal organization. Separate multiple addresses with commas with no spaces in between. For this parameter to have effect, the -mail-hosts parameter must be configured correctly. Individual trigger events can change the default usage of this parameter using the -to parameter of the system node autosupport trigger modify command. By default, no list is defined.

[-noteto <mail address>,...] - (DEPRECATED) List of Noteto Addresses

Note: This parameter has been deprecated and might be removed in a future version of Data ONTAP.

Use this parameter to specify up to five addresses to receive a short-note version of AutoSupport messages that are most relevant for your internal organization. Short-note e-mails contain only the subject line of the AutoSupport message, which is easier to view on a mobile device. For this parameter to have effect, the -mail-hosts parameter must be configured correctly. Individual trigger events can change the default usage of this parameter using the -noteto parameter of the system node autosupport trigger modify command. By default, no list is defined.

[-partner-address <mail address>,...] - List of Partner Addresses

Use this parameter to specify up to five e-mail addresses to receive all AutoSupport messages including periodic messages. This parameter is typically used for support partners. For this parameter to have effect, the -mail-hosts parameter must be configured correctly. By default, no list is defined.

[-support {enable|disable}] - Send AutoSupport Messages to Vendor Support

Use this parameter to specify whether to send all AutoSupport messages to your vendor's technical support. (Destination information is pre-defined and does not require configuration.) When -state is enabled and -support is disabled, messages are sent to the addresses specified in the -to, -noteto, or -partner-address parameters but are not sent to your vendor's technical support. The default is enable.

[-transport {smtp|http|https}] - Protocol to Contact Support

Use this parameter to specify the protocol used to deliver AutoSupport messages to your vendor's technical support. This parameter applies only when the -support parameter is set to enable. If you specify http or https and your network uses a proxy, you must also set the -proxy-url parameter. If you specify smtp, you must also configure -the mail-hosts parameter.

[-proxy-url <text>] - Support Proxy URL

Use this parameter to specify an HTTP or HTTPS proxy if the -transport parameter is set to HTTP or HTTPS and your organization uses a proxy. Enter the URL without an http:// or https:// prefix. If
authentication is required, use the format "[username]@[host][[:port]]". You will be prompted for the password. The default is an empty string. To specify a proxy that contains a question mark, press ESC followed by the "?".

\[-hostname-subj \{true|false\}\] - Hostname Subject

Use this parameter to specify whether the hostname of the node is included in the subject line of the AutoSupport message. The default is false. This parameter applies only if the -remove-private-data parameter is true.

\[-nht \{true|false\}\] - NHT Enable

Use this parameter to specify whether NHT disk drive health data is sent to technical support and addresses specified in the -partner-address parameter when disk drives fail. The default is true.

\[-perf \{true|false\}\] - Performance Data Enable

Use this parameter to specify whether performance data is sent to technical support and addresses specified in the -partner-address parameter. The default is true.

\[-retry-interval <[<integer>h][<integer>m]<integer>s]>\] - Retry Interval

Use this parameter to specify the amount of time to delay before trying to send an AutoSupport message again after a sending failure. Values may end with "s", "m", or "h" to indicate seconds, minutes, or hours, respectively. The minimum interval is 30 seconds and the maximum is 1 day. The default is 4 minutes.

\[-retry-count <integer>\] - Retry Count

Use this parameter to specify the number of times to try resending mail before dropping it. The minimum number is 5 and the maximum is 30. The default is 15 times.

\[-reminder \{true|false\}\] - Reminder Enable

Use this parameter to enable or disable a reminder message that is sent when AutoSupport is not configured to send messages to technical support. This reminder is logged as an EMS event called "autosupport.general.reminder" every 24 hours. The default is true.

\[-max-http-size \{<integer>[KB|MB|GB|TB|PB]\}\] - Maximum HTTP Size

Use this parameter to specify the maximum file size (in bytes by default, but can also be specified in KB, MB, TB or PB) for HTTP and HTTPS transfers. This parameter applies only to messages sent to technical support and only if the -transport parameter is set to HTTP or HTTPS. Setting the value to 0 disables the delivery size budget. The default is 10 MB and the minimum supported size is 2 MB.

If the size of the AutoSupport message exceeds this value, AutoSupport will deliver as much of the message as possible. You can use the "system node autosupport manifest show" command to identify the sections of the message that AutoSupport sent. AutoSupport collects and sends the content in order of priority. The priority is predefined for each AutoSupport message. To identify the collection order for an AutoSupport trigger, use the "system node autosupport trigger show" command with the -instance parameter.

\[-max-smtp-size \{<integer>[KB|MB|GB|TB|PB]\}\] - Maximum SMTP Size

Use this parameter to specify the maximum file size (in bytes by default, but can also be specified in KB, MB, TB or PB) for SMTP (e-mail) transfers. This parameter applies to messages sent to the addresses specified in the -to, -noteto, and -partner-address parameters. If the -transport parameter is set to smtp, this parameter also applies to messages sent to the vendor's technical support. Setting the value to 0 disables the delivery size budget. The default is 5 MB and the minimum supported size is 2 MB.

If the size of the AutoSupport message exceeds this value, AutoSupport will deliver as much of the message as possible. You can use the "system node autosupport manifest show" command to identify the sections of the message that AutoSupport sent. AutoSupport collects and sends the content in order of priority. The priority is predefined for each AutoSupport message. To identify the collection order for an AutoSupport trigger, use the "system node autosupport trigger show" command with the -instance parameter.

\[-remove-private-data \{true|false\}\] - Remove Sensitive Data

Use this parameter with the value true to remove, encode, or mask sensitive data from AutoSupport attachments and headers. Use this feature to eliminate private data from all AutoSupport messages.
Eliminated data might include: IP addresses, MAC addresses, URIs, DNS names, e-mail addresses, port numbers, node names, Vserver names, cluster names, aggregate names, volume names, junction paths, policy names, user IDs, group IDs, LUNs, and qtree names.

The default is false.

Note: Changing this value from false to true deletes the AutoSupport history and all files associated with it.

[-validate-digital-certificate {true|false}] - Validate Digital Certificate Received
Use this parameter with the value true to force the node to validate digital certificates that it receives. The default is true.

[-ondemand-state {enable|disable}] - AutoSupport OnDemand State (privilege: advanced)
Use this parameter to specify whether the AutoSupport OnDemand feature is enabled or disabled on the node. The default is enable. When AutoSupport OnDemand is enabled, support personnel can remotely trigger new AutoSupport messages, re-send existing AutoSupport messages and decline the delivery of unwanted AutoSupport messages. When this option is disabled, this node will not respond to any AutoSupport OnDemand requests from support personnel.

[-ondemand-remote-diagnostics-state {enable|disable}] - AutoSupport OnDemand Remote Diagnostics State (privilege: advanced)
Use this parameter to specify whether the AutoSupport OnDemand Remote Diagnostics feature is enabled or disabled on the node. The default is enable. When AutoSupport OnDemand Remote Diagnostics is enabled, support personnel can remotely trigger new AutoSupport messages on this node to gather information during troubleshooting scenarios. When this option is disabled, support personnel will still be able to re-send existing AutoSupport messages that may not have been transmitted correctly.

**Examples**

The following example enables AutoSupport on a node named node3 with the following settings:

- SMTP mail host named smtp.example.com.
- E-mail "from" address of alerts@node3.example.com
- E-mail "to" address of support@example.com
- AutoSupport messages sent to support personnel
- HTTPS set as transport protocol
- Short-note address of pda@example.com
- If sending fails, the system will wait 23 minutes before retrying.

```
cluster1::> system node autosupport modify -node node3 -state enable -mail-hosts smtp.example.com -from alerts@node3.example.com -to support@example.com -support enable -transport https -noteto pda@example.com -retry-interval 23m
```

The following examples show how to modify AutoSupport URLs when using IPv6 address literals:

```
cluster1::> system node autosupport modify -node node1 -mail-hosts [2620:10a:4002:6004::bbbb]:25
```

```
cluster1::> system node autosupport modify -node node1 -proxy-url username:password@[2620:10a:4002:6004::bbbb]:8080
```

system node autosupport show

Display AutoSupport configuration

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system node autosupport show command displays the AutoSupport configuration of one or more nodes.

Parameters

- [-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

- [-config]
  Use this parameter to display the retry interval, retry count, throttle, and reminder settings of all nodes in the cluster.

- [-nht-performance]
  Use this parameter to display NHT and performance information about all nodes in the cluster.

- [-recent]
  Use this parameter to display the subject and time of the last AutoSupport message generated by each node in the cluster.

- [-support-http]
  Use this parameter to display whether HTTP support is enabled for each node in the cluster, and identify the transport protocol and the support proxy URL used by each node.

- [-support-smtp]
  Use this parameter to display whether SMTP (e-mail) support is enabled for each node in the cluster, and identify the transport protocol and the "to" mail address used by each node.

- [-instance]
  If you specify the -instance parameter, the command displays detailed information about all fields.

- [node {<nodename>|local}]- Node
  Use this parameter to display detailed information about the node you specify.

- [state {enable|disable}]- State
  Use this parameter to display information only about nodes that have the AutoSupport state you specify.

- [mail-hosts <text>, ...]- SMTP Mail Hosts
  Use this parameter to display information only about nodes that use the mail hosts you specify.

- [from <mail address>]- From Address
  Use this parameter to display information only about nodes that have the "from" e-mail address you specify.

- [to <mail address>, ...]- List of To Addresses
  Use this parameter to display information only about nodes that have the "to" e-mail addresses you specify.

- [noteto <mail address>, ...]- (DEPRECATED) List of Noteto Addresses
  Note: This parameter has been deprecated and might be removed in a future version of Data ONTAP.
  Use this parameter to display information only about nodes that send short-note e-mail messages to the e-mail addresses you specify. Short-note e-mails contain only the subject line of the AutoSupport message, which is easier to view on a mobile device.
[-partner-address <mail address>, ...] - List of Partner Addresses

Use this parameter to display information only about nodes that have the "partner-address" e-mail addresses you specify. These addresses are not subject to the delivery limitations configured for the "-to" addresses of AutoSupport triggers.

[-support {enable|disable}] - Send AutoSupport Messages to Vendor Support

Use this parameter with the value "enable" to display information only about nodes that send AutoSupport messages to your vendor's technical support. Use this parameter with the value "disable" to display information only about nodes that do not send AutoSupport messages to your vendor's technical support.

[-transport {smtp|http|https}] - Protocol to Contact Support

Use this parameter to display information only about nodes that use the protocol you specify to send AutoSupport messages.

[-url <text>] - Support URL for HTTP/HTTPS

Use this parameter to display information only about nodes that use the URL you specify to send messages through HTTP and HTTPS POST operations.

[-put-url <text>] - Support URL for HTTP/S PUT

Use this parameter to display information only about nodes that use the URL you specify to send messages through HTTP PUT operations.

[-proxy-url <text>] - Support Proxy URL

Use this parameter to display information only about nodes that use the proxy URL you specify.

[-support-address <mail address>, ...] - Support Address

Use this parameter to display information only about nodes that use the external support address you specify.

[-hostname-subj {true|false}] - Hostname Subject

Use this parameter to display information only about nodes that include their hostname in the "Subject:" line of AutoSupport messages. If the parameter "remove-private-data" is false, this parameter has no effect.

[-nht {true|false}] - NHT Enable

Use this parameter with the value "true" to display information only about nodes that send NHT disk drive data. Use this parameter with the value "false" to display information only about nodes that do not send NHT data.

[-perf {true|false}] - Performance Data Enable

Use this parameter with the value "true" to display information only about nodes that send periodic performance AutoSupport messages. Use this parameter with the value "false" to display information only about nodes that do not send periodic performance messages.

[-retry-interval <[<integer>h][<integer>m][<integer>s]>] - Retry Interval

Use this parameter to display information only about nodes that use the retry interval you specify.

[-retry-count <integer>] - Retry Count

Use this parameter to display information only about nodes that use the retry count you specify.

[-reminder {true|false}] - Reminder Enable

Use this parameter with the value "true" to display information only about nodes that send messages reminding administrators to enable AutoSupport if AutoSupport is not enabled. Use this parameter with the value "false" to display information only about nodes that do not send reminder messages.

[-last-subject <text>] - Last Subject Sent

Use this parameter to display information only about nodes whose last AutoSupport message had the "Subject:" line you specify.
[-last-time <MM/DD/YYYY HH:MM:SS>] - Last Time Sent
Use this parameter to display information only about nodes whose last AutoSupport message was sent at the
date and time you specify. Specify the date and time in the format "MM/DD/YYYY HH:MM:SS".

[-max-http-size {<integer>[KB|MB|GB|TB|PB]}] - Maximum HTTP Size
Use this parameter to display information only about nodes that limit the maximum size of HTTP transfers to
the file size you specify.

[-max-smtp-size {<integer>[KB|MB|GB|TB|PB]}] - Maximum SMTP Size
Use this parameter to display information only about nodes that limit the maximum size of SMTP (e-mail)
transfers to the file size you specify.

[-remove-private-data {true|false}] - Remove Sensitive Data
Use this parameter with the value "true" to display information only about nodes that remove sensitive data
from AutoSupport messages. Use this parameter with the value "false" to display information only about
nodes that do not remove sensitive data.

[-validate-digital-certificate {true|false}] - Validate Digital Certificate Received
Use this parameter with the value "true" to display information only about nodes that validate digital
certificates they receive. Use this parameter with the value "false" to display information only about nodes that
do not validate digital certificates.

[-ondemand-state {enable|disable}] - AutoSupport OnDemand State (privilege: advanced)
Use this parameter to display information only about nodes that have the AutoSupport OnDemand state you
specify.

[-ondemand-remote-diagnostics-state {enable|disable}] - AutoSupport OnDemand Remote Diagnostics
State (privilege: advanced)
Use this parameter to display information only about nodes that have the AutoSupport OnDemand Remote
Diagnostics state you specify.

[-ondemand-server-url <text>] - AutoSupport OnDemand Server URL
Use this parameter to display information only about nodes that have the AutoSupport OnDemand Server
URL you specify.

Examples
The following example displays the AutoSupport configuration for a node named node3:

```
cluster1::> system node autosupport show -node node3
   Node: node3
   State: enable
   SMTP Mail Hosts: smtp.example.com
   From Address: alerts@node3.example.com
   List of To Addresses: support@example.com
   List of Noteto Addresses: -
   List of Partner Addresses: partner@node4.example.com
   Send AutoSupport Messages to Vendor Support: enable
   Protocol to Contact Support: https
   Support Proxy URL: support.proxy.example.com
   Hostname Subject: true
   NHT Enable: true
   Performance Data Enable: true
   Retry Interval: 4m
   Retry Count: 15
   Reminder Enable: true
   The Transmission Window: 1h
   Last Subject Sent: WEEKLY
   Last Time Sent: 3/11/2011 06:00:03
   Maximum HTTP Size: 10MB
   Maximum SMTP Size: 5MB
   Remove Sensitive Data: false
   Validate Digital Certificate Received: true
   Continue Local Collection while Disabled: true
```
system node autosupport check commands

Check AutoSupport connectivity and configuration

system node autosupport check show

Display overall status of AutoSupport subsystem

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The `system node autosupport status check show` command displays the overall status of the AutoSupport subsystem.

Parameters

`[-fields <fieldname>, ...]`  
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

`[-instance]`  
If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-node <nodename>] - Node`  
Selects the nodes that match this parameter value. This parameter specifies the node whose status is being displayed.

`[-http-status {ok|warning|failed|not-run}] - Overall Status of AutoSupport HTTP/HTTPS Destinations`  
Selects the nodes that match this parameter value. This parameter specifies whether connectivity to the AutoSupport HTTP destination was established.

`[-aod-status {ok|warning|failed|not-run}] - Overall Status of AutoSupport OnDemand Server`  
Selects the nodes that match this parameter value. This parameter specifies the detailed description of the connectivity status to the AutoSupport OnDemand Server.

`[-smtp-status {ok|warning|failed|not-run}] - Overall Status of AutoSupport SMTP Destinations`  
Selects the nodes that match this parameter value. This parameter specifies whether connectivity to the AutoSupport mailhost was established.

`[-config-status {ok|warning|failed|not-run}] - Overall Status of AutoSupport Configuration`  
Selects the nodes that match this parameter value. This parameter specifies whether the AutoSupport configuration check succeeded or not.

`[-warning-text <text>] - Conditional Warning Message`  
Selects the nodes that match this parameter value. This parameter specifies how to get more details regarding the status of the AutoSupport subsystem, in case of any errors.

Examples

The following example displays the overall status of the AutoSupport subsystem on a node named node2:

```
cluster1::> system node autosupport check show -node node2
```
system node autosupport check show-details

Display detailed status of AutoSupport subsystem

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system node autosupport check show-details command displays the detailed status of the AutoSupport subsystem. This includes verifying connectivity to your vendor's AutoSupport destinations by sending test messages and providing a list of possible errors in your AutoSupport configuration settings.

Parameters

<table>
<thead>
<tr>
<th>[-fields &lt;fieldname&gt;, ...]</th>
</tr>
</thead>
<tbody>
<tr>
<td>If you specify the -fields &lt;fieldname&gt;, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>[-instance ]</th>
</tr>
</thead>
<tbody>
<tr>
<td>If you specify the -instance parameter, the command displays detailed information about all fields.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>[-node &lt;nodename&gt;] - Node</th>
</tr>
</thead>
<tbody>
<tr>
<td>Selects the check results that match this parameter value. This parameter specifies the node whose status is being displayed.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>[-check-type &lt;Type of AutoSupport Check&gt;] - AutoSupport Check Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Selects the check results that match this parameter value. This parameter specifies the type of AutoSupport check being performed.</td>
</tr>
</tbody>
</table>

| [-status {ok|warning|failed|not-run}] - Status of the Check |
|------------------------------------------------------------|
| Selects the check results that match this parameter value. This parameter specifies the result of this AutoSupport check. |

<table>
<thead>
<tr>
<th>[-error-detail &lt;text&gt;] - Detailed Description of Error</th>
</tr>
</thead>
<tbody>
<tr>
<td>Selects the check results that match this parameter value. This parameter specifies the detailed error message for this AutoSupport check.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>[-corrective-action &lt;text&gt;] - Corrective Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Selects the check results that match this parameter value. This parameter specifies a description of how to correct any errors seen as part of this AutoSupport Check</td>
</tr>
</tbody>
</table>

Examples
The following example displays the detailed status of the AutoSupport subsystem for a node named node2:

```
cluster1::> system node autosupport check show-details -node node2
```

Node: node2
Category: http-https
  Component: http-put-destination
    Status: ok
    Detail: Successfully connected to "support.netapp.com/put".
  Component: http-post-destination
    Status: ok
    Detail: Successfully connected to "support.netapp.com/post".
system node autosupport destinations commands

The AutoSupport Destinations directory

system node autosupport destinations show

Display a summary of the current AutoSupport destinations

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system node autosupport destinations show command displays a list of all message destinations used by AutoSupport. The command provides you with a quick summary of all addresses and URLs that receive AutoSupport messages from all nodes in the cluster.

Parameters

[-fields <fieldname>, ...]  
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?' to display the fields to specify.

[-instance ]  
If you specify the -instance parameter, the command displays detailed information about all fields.

[-node <nodename>|local] - Node  
Use this parameter to display only destinations that receive AutoSupport messages from the node you specify.

[-destinations <text>, ...] - Destinations  
Use this parameter to display only destination lists for nodes that send AutoSupport messages to the destinations you specify.

Examples
This example displays all of the destinations in use by the current cluster. Each node uses the same destination for HTTP POST, HTTP PUT, and e-mail notifications.

<table>
<thead>
<tr>
<th>node1</th>
<th>Destinations</th>
</tr>
</thead>
<tbody>
<tr>
<td>node1</td>
<td></td>
</tr>
</tbody>
</table>
system node autosupport history commands

The AutoSupport History Directory

system node autosupport history cancel

Cancel an AutoSupport Transmission.

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system node autosupport history cancel command cancels an active AutoSupport transmission. This command is used to pause or abandon a long running delivery of an AutoSupport message. The cancelled AutoSupport message remains available for retransmission using the system node autosupport history retransmit command.

Parameters
-
node {<nodename>|local} - Node
Use this parameter to specify the node on which to cancel the AutoSupport message. The default setting is localhost.

- seq-num <Sequence Number> - AutoSupport Sequence Number
Use this parameter to specify the sequence number of the AutoSupport message you want to cancel.

-destination {smtp|http|noteto|retransmit} - Destination for This AutoSupport
Use this parameter to specify the destination type for the AutoSupport message you want to cancel.

Examples
Use this command to cancel the AutoSupport message delivery with seq-num 10 to all destinations.

cluster1::> system node autosupport history cancel -node local -seq-num 10

Use this command to cancel the AutoSupport message delivery with seq-num 10 via HTTP only.

cluster1::> system node autosupport history cancel -node local -seq-num 10 -destination http

Related references
system node autosupport history retransmit on page 1056

system node autosupport history retransmit

Selectively retransmit a previously collected AutoSupport.

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system node autosupport history retransmit command retransmits a locally stored AutoSupport message.
Support personnel might ask you to run this command to retransmit an AutoSupport message. You might also retransmit an AutoSupport message if you run the `system node autosupport history show` command and notice that a message was not delivered.

If you retransmit an AutoSupport message, and if support already received that message, the support system will not create a duplicate case. If, on the other hand, support did not receive that message, then the AutoSupport system will analyze the message and create a case, if necessary.

Use the `system node autosupport history show` command to display the 50 most recent AutoSupport messages, which are available for retransmission.

**Parameters**
- `--node {<nodename>|local}` - Node
  
  Use this parameter to specify the node from which the AutoSupport message is sent.
- `--seq-num <Sequence Number>` - AutoSupport Sequence Number
  
  Use this parameter to specify the sequence number of the AutoSupport message to retransmit.
- `--uri <text>` - Destination to Send this AutoSupport
  
  Use this parameter to specify the HTTP, HTTPS, FILE, or MAILTO uniform resource indicator (URI) to which the AutoSupport message is sent.
- `[--size-limit {<integer>[KB|MB|GB|TB|PB]}]` - Transmit Size Limit for this AutoSupport.
  
  Use this parameter to specify a size limit for the retransmitted AutoSupport message. If the message information exceeds this limit, it will be trimmed to fit the limit you specify. Omit the size limit or set it to 0 to disable it, which is useful to retransmit an AutoSupport message that was truncated by a mail or Web server due to the default size limits.

### Examples

The following example retransmits the AutoSupport message with sequence number 45 on the node "node1" to a support address by e-mail.

```
cluster1::> system node autosupport history retransmit --node node1 --seq-num 45 --uri mailto:support@example.com
```

### Related references

- `system node autosupport history show` on page 1057
**Parameters**

```bash
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```bash
[-delivery]
```

Use this parameter to display destination information about each AutoSupport message.

```bash
[-detail]
```

Use this parameter to display trigger and subject information about each AutoSupport message.

```bash
[-instance]]
```

Use this parameter to display the following detailed information about all entries:

- Trigger event
- Subject of the message
- Delivery URI
- Last error
- Compressed Size
- Decompressed Size
- Total Collection Time (in ms)

```bash
[-node <nodename> | local]] - Node
```

Use this parameter to display only AutoSupport messages sent from the node you specify.

```bash
[-seq-num <Sequence Number>] - AutoSupport Sequence Number
```

Use this parameter to display only AutoSupport messages with the sequence number you specify. Sequence numbers are unique to a node. Use this parameter with the `-node` parameter to display information about an individual message.

```bash
[-destination (smtp|http|noteto|retransmit)] - Destination for This AutoSupport
```

Use this parameter to display only AutoSupport messages that were sent to the destination type you specify.

```bash
[-trigger <Message Name>] - Trigger Event
```

Use this parameter to display only AutoSupport messages that match the trigger event you specify.

```bash
[-last-update <MM/DD/YYYY HH:MM:SS>] - Time of Last Update
```

Use this parameter to display only AutoSupport messages that were updated most recently at the time you specify. Specify time in "MM/DD/YYYY HH:MM:SS" format.

```bash
[-status <AutoSupport general status>] - Status of Delivery
```

Use this parameter to display only AutoSupport messages with the status you specify. Possible statuses are:

- initializing - The AutoSupport message request is being processed.
- collection-failed - The AutoSupport collection failed. View the 'Last Error' field of this message for more information.
- collection-in-progress - The AutoSupport collection is in progress.
- queued - The AutoSupport message is queued for delivery.
- transmitting - The AutoSupport message transmission is in progress.
- sent-successful - The AutoSupport message was sent successfully.
ignore - The AutoSupport message was processed successfully, but the trigger event is not configured for
delivery to the current destination type.

re-queued - The AutoSupport message transmission failed, has been re-queued, and will be retried.

transmission-failed - The AutoSupport message transmission failed, and the retry limit was exceeded.

ondemand-ignore - The AutoSupport message was processed successfully, but the AutoSupport On
Demand server chose to ignore it.

[-attempt-count <integer>] - Delivery Attempts
Use this parameter to display only AutoSupport messages that the system has attempted to send the number of
times you specify. This parameter is most useful when given a range, such as ">5".

[-subject <text>] - AutoSupport Subject
Use this parameter to display only AutoSupport messages of the type you specify.

[-uri <text>] - Delivery URI
Use this parameter to display only AutoSupport messages sent to the destination URI you specify.

[-error <text>] - Last Error
Use this parameter to display only AutoSupport messages that failed with the "Last Error" description you
specify.

[-generated-on <MM/DD/YYYY HH:MM:SS>] - Time of Generation
Use this parameter to display only AutoSupport messages that were generated (collected) at a particular time.

[-size {<integer>[KB|MB|GB|TB|PB]}] - AutoSupport Compressed Size
Use this parameter to display only AutoSupport messages of the compressed size you specify.

[-percent-complete <integer>] - Percent Complete
Use this parameter to display the percentage completed for any active (incomplete) AutoSupport message.

[-upload-rate {<integer>[Bps|KBps|MBps|GBps]|unlimited}] - Rate of Upload
Use this parameter to display the rate in bytes per second that upload is using currently, otherwise zero when
not active.

[-time-remaining <[<integer>h][<integer>m][<integer>s]>] - Time Remaining for Upload
Use this parameter to display the estimated time for the transmission of the AutoSupport message to complete.

[-decompressed-size {<integer>[KB|MB|GB|TB|PB]}] - AutoSupport Decompressed Size
Use this parameter to display only AutoSupport messages of the decompressed size you specify.

[-total-time <integer>] - Total Collection Time (ms)
Use this parameter to display only AutoSupport messages of total collection time you specify. A value is only
shown when the collection has completed.

Examples
The following example shows the first three results output by the history command. Note that "q" was pressed at the
prompt.

```
cluster1::> system node autosupport history show -node node1
Seq Num Destination Status      Attempt Count Last Update
----------- ----- ----------- -------------------- -------- -----------------------
nodel1 56  smtp          ignore  1        11/18/2010 01:10:01
         http       re-queued  2        11/18/2010 02:50:07
         noteto    transmitting 1        11/18/2010 01:10:01
         55  smtp          ignore  1        11/18/2010 00:53:59
         http     sent-successful 3        11/18/2010 01:50:03
         noteto  sent-successful 1        11/18/2010 00:53:59
```
system node autosupport history show-upload-details

Display upload details of recent AutoSupport messages

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system node autosupport history show-upload-details command displays upload details of the 50 most recent AutoSupport messages sent by nodes in the cluster. By default, it displays the following information:

- AutoSupport Sequence Number
- Destination
- Compressed Size
- Percentage Complete
- Rate of upload
- Time Remaining

Parameters

[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[instance]
Use this parameter to display the following detailed information about all entries:

- AutoSupport Sequence Number
- Destination
- Compressed Size
- Percentage Complete
- Rate of upload
- Time Remaining

[-node <nodename>|local] - Node
Use this parameter to display details of AutoSupport messages sent from the node you specify.

[-seq-num <Sequence Number>] - AutoSupport Sequence Number
Use this parameter to display details of AutoSupport messages with the sequence number you specify. Sequence numbers are unique to a node. Use this parameter with the -node parameter to display information about an individual message.

[-destination (smtp|http|noteto|retransmit)] - Destination for this AutoSupport
Use this parameter to display details of AutoSupport messages that were sent to the destination type you specify.
Use this parameter to display details of AutoSupport messages of the compressed size you specify.

- **Percent Complete**
  Use this parameter to display the percentage completed for any active (incomplete) AutoSupport message.

- **Rate of Upload**
  Use this parameter to display the rate in bytes per second that upload is using currently, otherwise zero when not active.

- **Time remaining for Upload**
  Use this parameter to display the estimated time for the transmission of the AutoSupport message to complete.

**Examples**

The following example shows the first three results output by the history show-upload-details command. Note that "q" was pressed at the prompt.

```
cluster1::> system node autosupport history show-upload-details -node node1

<table>

**system node autosupport manifest commands**

The AutoSupport Manifest directory

**system node autosupport manifest show**

Display AutoSupport content manifest

**Availability:** This command is available to cluster administrators at the **admin** privilege level.

**Description**

The system node autosupport manifest show command reports what information is contained in AutoSupport messages. The name and size of each file collected for the message is reported, along with any errors.

**Parameters**

- **[-fields <fieldname>,...]**
  If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

- **[-content]**
  Use this parameter to display detailed information about the content of the files contained in the report.
If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-node {<nodename>|local}]` - Node

Use this parameter to display information about only AutoSupport messages sent from the node you specify.

`[-seq-num <Sequence Number>]` - AutoSupport Sequence Number

Use this parameter to display information about only AutoSupport message content with the sequence number you specify. Sequence numbers are unique to a node. Use this parameter with the `-node` parameter to display information about an individual message.

`[-prio-num <integer>]` - Priority Order of Collection

Use this parameter to display information about only AutoSupport message content with the collection priority you specify. Content is collected in order, by priority number.

`[-subsys <subsys1,subsys2,...>]` - Subsystem

Use this parameter to display information about only AutoSupport message content collected by the AutoSupport subsystem you specify.

`[-cmd-tgt <Execution domain of AutoSupport content>]` - Execution Domain for Command

Use this parameter to display information about only AutoSupport message content produced in the execution domain you specify.

`[-body-file <text>]` - The AutoSupport Content Filename for this Data

Use this parameter to display information about only AutoSupport message content stored in the body file with the file name you specify.

`[-cmd <text>]` - Actual Data Being Collected

Use this parameter to display information about only AutoSupport message content produced by the D-Blade command, BSD command, file, or XML table you specify.

`[-query <text>]` - Table Query for XML Collection

Use this parameter to display information about only AutoSupport message content produced by the table query you specify.

`[-size-collected {<integer>[KB|MB|GB|TB|PB]}]` - Number of Bytes Collected

Use this parameter to display information about only AutoSupport message content collected in files with the file size you specify.

`[-time-collected <integer>]` - Collection Time for this Data Item (ms)

Use this parameter to display information about only AutoSupport message content collected in the amount of time you specify, in milliseconds.

`[-status <AutoSupport manifest collection status>]` - Status of this Data Item

Use this parameter to display information about only AutoSupport message content with the collection status you specify. Possible statuses are:

- `requested` - The AutoSupport request has been added to the queue and is waiting processing by the collector.
- `working` - The AutoSupport collector is actively gathering the needed data.
- `file-not-found` - AutoSupport data collection failed because a necessary file is missing.
- `no-such-table` - The AutoSupport collector was unable to find the requested SMF table.
- `collection-truncated-size-limit` - AutoSupport data was truncated due to size limits, but partial data is available.
• **collection-truncated-file-size-limit** - AutoSupport data for a particular data item or file was truncated due to file size limits, but partial data is available.

• **collection-skipped-size-limit** - AutoSupport data was skipped due to size limits, and no data is available.

• **collection-truncated-time-limit** - AutoSupport data was truncated due to time limits, but partial data is available.

• **collection-skipped-time-limit** - AutoSupport data was skipped due to time limits, and no data is available.

• **delivery-skipped-size-limit** - AutoSupport data was skipped at delivery time due to size limits.

• **general-error** - AutoSupport data collection failed. Additional information (if any) is in the Error String field.

• **completed** - AutoSupport data collection is complete, and the AutoSupport message is ready for delivery.

• **content-not-collected-precheck** - AutoSupport content was not collected due to pre-check function violation.

• **content-not-collected-privacy** - AutoSupport content was not collected because the operation is disabled in privacy mode.

• **content-empty** - AutoSupport content was collected successfully, but the output was empty.

• **collection-aborted** - AutoSupport data collection was aborted.

[error <text>] - Textual Description of Error

Use this parameter to display information about only AutoSupport message content with the error text you specify. If data collection has failed, the error text contains a description of the failure. If data collection completes successfully, this field is empty.

[content-type <Type of AutoSupport content>] - AutoSupport Content Type for this Data

Use this parameter to display information about only AutoSupport message content of the type you specify. Types supported are:

• **basic** - Configuration data about this subsystem

• **troubleshooting** - Detailed diagnostic data about this subsystem

[orig-size-collected {<integer> [KB|MB|GB|TB|PB]}] - Initial Number of Bytes Collected

Use this parameter to display information about only AutoSupport message content collected in files with the original file size you specify.

[size-compressed {<integer> [KB|MB|GB|TB|PB]}] - Compressed Size

Use this parameter to display information about only AutoSupport message content collected in files with the compressed file size you specify.

### Examples

This example displays the content of AutoSupport message number 372 on the node "node1".

```
cluster1::> system node autosupport manifest show -node node1 -seq-num 372
```

<table>
<thead>
<tr>
<th>Node</th>

**system node commands**
This example shows how you can use parameters to limit output to specific fields of a specific AutoSupport message. This is helpful when troubleshooting.

```
cluster1::> system node autosupport manifest show -node node5 -seq-num 842 -fields body-file,status,size-collected,time-collected,cmd,cmd-tgt,subsys
```

```
node       seq-num prio-num subsys    cmd-tgt body-file       cmd            size-collected time-collected status
---------- ------- -------- --------- ------- --------------- -------------- --------------
node5      842     0        mandatory dblade  SYSCONFIG-A.txt "sysconfig -a" 16.44KB
            256            completed
node5      842     1        mandatory dblade  OPTIONS.txt     options        29.67KB

node5      842     14       log_files dblade_file MESSAGES-PARTNER.gz /etc/log/messages -
            14 entries were displayed.
```
**Description**

Use the `system node autosupport trigger modify` command to enable and disable AutoSupport messages for individual triggers, and to specify additional subsystem reports to include if an individual trigger sends an AutoSupport message.

**Parameters**

- `node {<nodename>|local}` - Node  
  Use this parameter to specify the node whose AutoSupport trigger configuration is modified.

- `autosupport-message {Autosupport Message}` - EMS Message  
  Use this parameter to specify the AutoSupport trigger to modify. AutoSupport triggers are EMS messages whose names begin with "callhome." However, for the purposes of this command, "callhome." is implied, does not need to be entered, and will not be displayed in command output.

- `[to {enabled|disabled}]` - Deliver to AutoSupport -to Addresses  
  Use this parameter with the value "enabled" to enable sending AutoSupport messages to the configured "to" addresses.

- `[noteto {enabled|disabled}]` - (DEPRECATED) Deliver to AutoSupport -noteto Addresses  
  Note: This parameter has been deprecated and might be removed in a future version of Data ONTAP.  
  Use this parameter with the value "enabled" to enable sending short notes to the configured "noteto" addresses.

- `[basic-additional <subsys1, subsys2, ...>, ...]` - Additional Subsystems Reporting Basic Info  
  Use this parameter to include basic content from the additional subsystems you specify. Content is collected from these subsystems in addition to the default list of subsystems.

- `[troubleshooting-additional <subsys1, subsys2, ...>, ...]` - Additional Subsystems Reporting Troubleshooting Info  
  Use this parameter to include troubleshooting content from the additional subsystems you specify. Content is collected from these subsystems in addition to the default list of subsystems.

- `[suppress {true|false}]` - Suppress all occurrences of this trigger  
  Use this parameter with the value "true" to suppress the collection when the AutoSupport message is triggered.

**Examples**

The following example enables messages to the configured "to" addresses from the `battery.low` trigger on the node `node1`.

```
cluster1::> system node autosupport trigger modify -node node1 -autosupport-message battery.low -to enabled
```

**Related references**

- `system node autosupport manifest show` on page 1061

**system node autosupport trigger show**

Display AutoSupport trigger configuration

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**

The `system node autosupport trigger show` command displays what system events trigger AutoSupport messages. When a trigger event occurs, the node may send an AutoSupport message to a predefined destination, and a short note to another destination. The full AutoSupport message contains detail for troubleshooting. The short message is meant for short pager or SMS text messages.
Use the `system node autosupport destinations show` command to view available destinations.

**Parameters**

`[-fields <fieldname>, ...]`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

`[-basic]`

Use this parameter to display which subsystem information is included as *basic* content when the AutoSupport message is triggered.

`[-troubleshooting]`

Use this parameter to display which subsystem information is included as *troubleshooting* content when the AutoSupport message is triggered.

`[-instance]`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-node <nodename>|local] - Node`

Use this parameter to display AutoSupport triggers only on the node you specify.

`[-autosupport-message <Autosupport Message>] - EMS Message`

Use this parameter to display only AutoSupport triggers with the name you specify. AutoSupport triggers are EMS messages whose names begin with "callhome.". However, for the purposes of this command, "callhome." is implied, does not need to be entered, and will not be displayed in command output.

`[-to {enabled|disabled}] - Deliver to AutoSupport -to Addresses`

Use this parameter with the value "enabled" to display only AutoSupport messages that send full messages to the "to" address when triggered. Use this parameter with the value "disabled" to display only AutoSupport messages that do not send full messages.

`[-noteto {enabled|disabled}] - (DEPRECATED) Deliver to AutoSupport -noteto Addresses`

**Note:** This parameter has been deprecated and might be removed in a future version of Data ONTAP. Use this parameter with the value "enabled" to display only AutoSupport messages that send short notes to the "noteto" address when triggered. Use this parameter with the value "disabled" to display only AutoSupport messages that do not send short notes.

`[-basic-default <subsys1, subsys2, ...>, ...] - Default Subsystems Reporting Basic Info`

Use this parameter to display only AutoSupport triggers that include in their messages, by default, *basic* content from the subsystems you specify.

`[-troubleshooting-default <subsys1, subsys2, ...>, ...] - Default Subsystems Reporting Troubleshooting Info`

Use this parameter to display only AutoSupport triggers that include in their messages, by default, *troubleshooting* content from the subsystems you specify.

`[-additional-content <Type of AutoSupport content>, ...] - Additional Content Flag`

Use this parameter to display only AutoSupport triggers that have been configured to include additional *basic* or *troubleshooting* content.

`[-basic-additional <subsys1, subsys2, ...>, ...] - Additional Subsystems Reporting Basic Info`

Use this parameter to display only AutoSupport triggers that have been configured to include additional *basic* content from the subsystems you specify.

`[-troubleshooting-additional <subsys1, subsys2, ...>, ...] - Additional Subsystems Reporting Troubleshooting Info`

Use this parameter to display only AutoSupport triggers that have been configured to include additional *troubleshooting* content from the subsystems you specify.
[-suppress {true|false}] - Suppress all occurrences of this trigger

Use this parameter with the value "true" to display only AutoSupport messages that have been suppressed.

## Examples

This example shows the first page of output from the command. Note that "q" was pressed at the prompt to quit.

```bash
cluster1::> system node autosupport trigger show
AutoSupport Message To Note To Additional Content
------------ ------------------------- --------- ------------- ---------------

### system node coredump commands

Manage coredumps

#### system node coredump delete

Delete a coredump

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

The `system node coredump delete` command deletes a specified core dump. If the command is issued while the specified core dump is being saved, the command prompts you before stopping the save operation and deleting the core dump.

**Parameters**

- `-node <nodename> | local` - Node That Owns the Coredump
  
  This specifies the node from which core files are to be deleted.

- `[-type {kernel|ancillary-kernel-segment|application}]` - Coredump Type
  
  This specifies the type of core file to be deleted. If the type is kernel, the specified kernel core file will be deleted. If the type is application, the specified application core file will be deleted.

- `-corename <text>` - Coredump Name
  
  This specifies the core file that is to be deleted.
**Examples**

The following example deletes a core dump named core.101268397.2010-05-30.19_37_31.nz from a node named node0:

```
cluster1::> system node coredump delete -node node0 -corename core.101268397.2010-05-30.19_37_31.nz
```

**system node coredump delete-all**

Delete all coredumps owned by a node

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

The `system node coredump delete-all` command deletes either all unsaved core dumps or all saved core files on a node. You can specify whether saved core files or unsaved core dumps are deleted by using the optional `-saved` parameter. If the command is issued while a core dump is being saved, the command prompts you before stopping the save operation and deleting the core dump.

**Parameters**

- `-node <nodename>` - Node That Owns the Coredump
  
  This specifies the node from which core files or core dumps are to be deleted.

- `[-type {unsaved-kernel|saved-kernel|kernel|application|all}]` - Type of Core to delete
  
  This parameter specifies the type of core file to be deleted. If the type is unsaved, all unsaved core dumps will be deleted. If the type is saved, all saved core files will be deleted. If the type is kernel, all kernel core files and kernel core dumps will be deleted. If the type is application, all application core files will be deleted. If the type is all, all core files will be deleted. The default setting is to delete only unsaved kernel core dumps and core files.

**Examples**

The following example deletes all unsaved kernel core dumps on a node named node0:

```
cluster1::> system node coredump delete-all -node node0
```

**system node coredump save**

Save an unsaved kernel coredump

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

The `system node coredump save` command saves a specified core dump. If the node has already attempted to save the core dump by the value specified by the `-save-attempts` parameter, the command prompts you before continuing. The `-save-attempts` parameter is set by invoking the command `system node coredump config modify`. A saved core dump can be uploaded to a remote site for support analysis; see the `system node coredump upload` command man page for more information.

**Parameters**

- `-node {<nodename>|local}` - Node That Owns the Coredump
  
  This specifies the node on which the core dump is located.

- `-corename <text>` - Coredump Name
  
  This specifies the core dump that is to be saved.
Examples
The following example saves a core dump named core.101268397.2010-05-30.19_37_31.nz on a node named node0:

    cluster1::> system node coredump save -node node0 -corename core.101268397.2010-05-30.19_37_31.nz

Related references
system node coredump config modify on page 1077
system node coredump upload on page 1076
system node coredump save-all on page 1069

system node coredump save-all

Save all unsaved kernel core dumps owned by a node

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system node coredump save-all saves all unsaved core dumps on a specified node. If the node has already attempted to save the core dump by the value set by the -save-attempts parameter, the command prompts you before continuing. The save-attempts parameter is set by invoking the command system node coredump config modify.

Parameters
-node <nodename> - Node That Owns the Coredump
    This specifies the node on which unsaved core dumps are to be saved.

Examples
The following example saves all unsaved core dumps on a node named node0:

    cluster1::> system node coredump save-all -node node0

Related references
system node coredump save on page 1068

system node coredump show

Display a list of core dumps

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system node coredump show command displays basic information about core dumps, such as the core dump name, time of panic that triggered the core dump and whether the core file is saved. You can specify optional parameters to display information that matches only those parameters. For example, to display the list of kernel core files, run the command with -type kernel.

Parameters
[-fields <fieldname>, ...]
    If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use ‘-fields ?’ to display the fields to specify.
If you specify this parameter, the command displays the following information:

- Node name
- Core dump name
- Core dump ID
- Node that panicked and generated the core
- System ID of the node that panicked and generated the core
- Version of the core

If you specify the -instance parameter, the command displays detailed information about all fields.

If you specify both this parameter and the -corename parameter, the command displays detailed information about the specified core. If you specify this parameter by itself, the command displays information about the core files on the specified node.

This parameter specifies the type of core files to be displayed. If the type is kernel and the system supports segmented core files, the command displays information about primary kernel core segment files. If the type is kernel and the system does not support segmented core files, the command displays information about full core files. If the type is ancillary-kernel-segment, the command displays information about ancillary kernel core segment files. If the type is application, the command displays information about application core files. If no type is specified, the command displays information about core files of type kernel or application.

If you specify both this parameter and the -node parameter, the command displays detailed information about the specified core. If you specify this parameter by itself, the command displays information about the core files that match the specified name.

If you specify this parameter with a node name, the command displays information only about the core files that were generated when the specified node panicked.

If you specify this parameter, the command displays information only about the core files that were generated when the node with the specified system ID panicked.

If you specify this parameter, the command displays information only about the core files that match the specified version.

If you specify this parameter, the command displays information only about the core files that were generated by a panic at the specified time. Specify time in the format of MM/DD/YYYY HH:MM:SS [+- HH:MM]. You can use [+- HH:MM] to specify the time range within which all core files triggered by a panic are displayed. [+- HH:MM] is relative to UTC.

If you specify this parameter, the command displays information only about the core files that match the specified panic string.
[-is-saved {true|false}] - Saved Core
If you specify this parameter, the command displays information only about the core dumps that are or are not saved yet to a core file.

[-is-partial {true|false}] - Partial Core
If you specify this parameter, the command displays information only about the core dumps that are or are not partially saved.

[-save-attempts <integer>] - Number of Attempts to Save Core
If you specify this parameter, the command displays information only about the core dumps that have the specified number of successful or failed save attempts.

[-space-needed {<integer>[KB|MB|GB|TB|PB]}] - Space Needed To Save Core
If you specify this parameter, the command displays information only about the core dumps that need the specified amount of disk space to save into a core file.

[-size <text>] - Size of Core (bytes)
If you specify this parameter, the command displays information only about the saved core files that are of the specified size.

[-md5-data-chksum <text>] - MD5 Checksum of the Compressed Data of Core
If you specify this parameter, the command displays information only about the saved core files that have the specified MD5 checksum for compressed data of the core.

[-ancillary-segment-directory <text>] - Directory Holding Ancillary Kernel Core Segments
If you specify this parameter, the command displays information only about the saved core files that have the specified ancillary segment directory.

Examples
The following examples display information about the core files:

```
cluster1::> system node coredump show
Node   Core Name                  Saved  Panic Time
-------- ------------------------------------------- ------- -----------------
node0
    core.101182345.2010-02-01.14_19_08.nz    false  2/1/2010 09:19:08

system node coredump status on page 1072
**system node coredump status**

Display kernel coredump status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The `system node coredump status` command displays status information about core dumps. The command output depends on the parameters specified with the command. If a core dump is in the process of being saved into a core file, the command also displays its name, the total number of blocks that are to be saved, and the current number of blocks that are already saved.

You can specify additional parameters to display only information that matches those parameters. For example, to display coredump status information about the local node, run the command with the parameter `--node local`.

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify the `--fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `--fields ?` to display the fields to specify.

```
[-disks]
```

If you specify this parameter, the command displays the following information:

- Node name
- Total number of disks
- Number of spare disks
- Number of disks used
- Number of disks with partial cores

```
[-spraycore]
```

If you specify this parameter, the command displays the following information:

- Node name
- Whether spray cores are supported
- Number of spray-core disks
- Number of spray-core blocks
- Number of disks needed for spray core
- Number of blocks needed for spray core

```
[-instance]
```

If you specify the `--instance` parameter, the command displays detailed information about all fields.

```
--node <nodename> | local
```

- Node

If you specify this parameter, the command displays the following information:

- Node name
- State of the core-dump process
- Space available on the internal file system
- Name of the core being saved, if applicable
- Total number of blocks in the core being saved, if applicable
- Number of blocks currently saved, if applicable
- Type of core dump
- Number of unsaved complete cores on the node
- Number of unsaved partial cores on the node
- Whether spray cores are supported on the node
- Whether any spare disks are available on the node
- Number of disks that have cores
- Number of unsaved cores
- Number of disks that have partial cores
- Number of partial cores
- Number of unused spray-core disks
- Number of spray-core blocks
- Number of disks available for core dumps
- Number of blocks needed for spray core
- Number of disks needed for spray core

[-state <text>] - State
  If you specify this parameter, the command displays information only about the nodes that are in the specified core dump state. Possible values include: nocore, idle, init, saving, and waitdump.

[-space-available <integer> [KB|MB|GB|TB|PB]] - Space Available On Internal Filesystem
  If you specify this parameter, the command displays information only about the nodes that have the specified amount of available space, in bytes, on their internal file systems.

[-corename <text>] - Name of Core Being Saved
  If you specify this parameter, the command displays information only about the node that is currently saving the specified core file name.

[-total-blocks <integer>] - Total Number of Blocks in Core Being Saved
  If you specify this parameter, the command displays information only about the nodes that have the specified number of blocks in the core dump being saved.

[-blocks-saved <integer>] - Number of Blocks saved
  If you specify this parameter, the command displays information only about the nodes that have the specified number of blocks saved.

[-type <text>] - Type of Core Dump
  If you specify this parameter, the command displays information only about the nodes that have the specified core dump type. Possible values include zipped, sprayed, and spare.

[-spraycore-supported {true|false}] - Spray Core Supported on Node
  If you specify this parameter, the command displays information only about the nodes that do or do not support the spray method of dumping core.
[-spares-available {true|false}] - Spare Disk(s) Available on Node
  If you specify this parameter, the command displays information only about the nodes that do or do not have spare disks available.

[-disks-used <integer>] - Number of Disks with Cores
  If you specify this parameter, the command displays information only about the nodes that have the specified number of disks that contain core dumps.

[-unsaved-cores <integer>] - Number of Unsaved Complete Cores
  If you specify this parameter, the command displays information only about the nodes that have the specified number of complete core dumps that are not yet saved into a core file.

[-partial-disks <integer>] - Number of Disks with Partial Cores
  If you specify this parameter, the command displays information only about the nodes that have the specified number of disks with partial core dumps.

[-partial-cores <integer>] - Number of Unsaved Partial Cores
  If you specify this parameter, the command displays information only about the nodes that have the specified number of partial core dumps that are not yet saved into a core file.

[-spraycore-disks <integer>] - Number of Unused Spray Core Disks
  If you specify this parameter, the command displays information only about the nodes that have the specified number of unused spray-core disks.

[-spraycore-blocks <integer>] - Number of Spray Core Blocks
  If you specify this parameter, the command displays information only about the nodes that have the specified number of spray-core blocks.

[-numdisks <integer>] - Total Number of Disks Available for Core Dump
  If you specify this parameter, the command displays information only about the nodes that have the specified total number of disks available for core dump.

[-blocks-needed <integer>] - Number of Blocks Needed for Spray Core
  If you specify this parameter, the command displays information only about the nodes that have the specified number of blocks needed for the spray method of dumping core.

[-disks-needed <integer>] - Number of Disks Needed for Spray Core
  If you specify this parameter, the command displays information only about the nodes that have the specified number of disks needed for the spray method of dumping core.

[-space-needed {<integer> [KB|MB|GB|TB|PB]}] - Space Needed to Save All Unsaved Cores
  If you specify this parameter, the command displays information only about the nodes that require the specified amount of disk space to save all unsaved core dumps.

[-min-free {<integer> [KB|MB|GB|TB|PB]}] - Minimum Free Bytes on Root Filesystem
  If you specify this parameter, the command displays information only about the nodes that need to have the specified number of bytes available on the root filesystem after a core dump is saved.

**Examples**

The following example displays core dump information about the node named node0:

```
cluster1::> system node coredump status -node node0 -instance
                     Node: node0
                     State: idle
     Space Available On Internal Filesystem: 132.1GB
             Name of Core Being Saved: -
     Total Number of Blocks in Core Being Saved: -
           Number of Blocks saved: -
            Type of core dump: spray
```
system node coredump trigger

Related references

system node coredump show on page 1069

Make the node dump system core and reset

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

This command triggers a Non-maskable Interrupt (NMI) on the specified node via the Service Processor of that node, causing a dirty shutdown of the node. This operation forces a dump of the kernel core when halting the node. LIF migration or storage takeover occurs as normal in a dirty shutdown. This command is different from the -dump parameter of the system node shutdown, system node halt, or system node reboot command in that this command uses a control flow through the Service Processor of the remote node, whereas the -dump parameter uses a communication channel between Data ONTAP running on the nodes. This command is helpful in cases where Data ONTAP on the remote node is hung or does not respond for some reason. If the panic node reboots back up, then the generated coredump can be seen by using the system node coredump show command. This command works for a single node only and the full name of the node must be entered exactly.

Parameters

-node (<nodename>|local) - Node

This parameter specifies the node for which you want to trigger a coredump.

Examples

The following example triggers a NMI via the Service Processor and causes node2 to panic and generate a coredump. Once node2 reboots back up, the command system node coredump show can be used to display the generated coredump.

```
cluster1::> set advanced
Warning: These advanced commands are potentially dangerous; use them only when directed to do so by NetApp personnel.
Do you want to continue? {y|n}: y
cluster1::*> system node coredump trigger -node node2
Warning: The Service Processor is about to perform an operation that will cause a dirty shutdown of node "node2". This operation can cause data loss. Before using this command, ensure that the cluster will have enough remaining nodes to stay in quorum. To reboot or halt a node gracefully, use the "system node reboot" or "system node halt" command instead. Do you want to continue? {yes|no}: yes
Warning: This operation will reboot the current node. You will lose this login session. Do you want to continue? {y|n}: y
cluster1::*>
cluster1::> system coredump show
Node:Type Core Name                                   Saved Panic Time
-------- ------------------------------------------- ----- -----------------
Partial Core: false
Number of Attempts to Save Core: 0
Space Needed To Save Core: 3.60GB
```
system node coredump upload

(DEPRECATED)-Upload a coredump to a remote site

Availability: This command is available to cluster administrators at the admin privilege level.

Description
Attention: This command is deprecated and might be removed in a future release of Data ONTAP. Use "system node autosupport invoke-core-upload" instead.

The system node coredump upload command uploads a saved core file to a specified URL. You should use this command only at the direction of technical support.

Parameters
node {<nodename>|local} - Node That Owns the Coredump
This specifies the node on which the core file is located.

[-type {kernel|ancillary-kernel-segment|application}] - Coredump Type
This specifies the type of core files to be uploaded. If the type is kernel, kernel core files will be uploaded. If the type is application, application core file will be uploaded.

-corename <text> - Coredump Name
This specifies the name of the core file that is to be uploaded.

[-location <text>] - URL for Coredump Upload Directory
This specifies the URL to which the core file is to be uploaded. If this parameter is not specified, the command uploads the core file to the location specified by the -upload-location parameter of the system node coredump config modify command. The following protocols are supported: ftp and http. (By default, the location is set to ftp://ftp.netapp.com/to-ntap/)

[-casenum <integer>] - Case Number
This specifies the support case number that will be prefixed to the core file name at the destination. The case number is critical information for quick and automated processing of the received core file.

Examples
The following example uploads a core file named core.07142005145732.2010-10-05.19_03_41.nz on a node named node0 to the default location. The support case number is 2001234567.

cluster1::> system node coredump upload -node node0 -corename core.07142005145732.2010-10-05.19_03_41.nz -casenum 2001234567
system node coredump commands

Manage the coredump configuration

system node coredump config modify

Modify coredump configuration

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The `system node coredump config modify` command modifies the cluster's core dump configuration.

Parameters

- `-node <nodename>|local` - Node
  
  This parameter specifies the node whose coredump configuration you want to modify.

- `[-sparsecore-enabled {true|false}]` - Enable Sparse Cores
  
  If you set this parameter to true, the command enables sparse cores. A sparse core omits all memory buffers that contain only user data.

- `[-min-free <integer>[KB|MB|GB|TB|PB]]` - Minimum Free Bytes On Root Filesystem
  
  If you specify this parameter, the command displays the number of bytes that need to be made available in the root filesystem after saving the core dump. If the minimum number of bytes cannot be guaranteed, core dumps are not generated. The default setting is 250 MB.

- `[-coredump-attempts <integer>]` - Maximum Number Of Attempts to Dump Core
  
  If you specify this parameter, the command displays the maximum number of times the system will attempt to generate a core dump when encountering repeated disk failures. The default setting is 2.

- `[-save-attempts <integer>]` - Maximum Number Attempts to Save Core
  
  If you specify this parameter, the command displays the maximum number of times the system will attempt to save a core dump. The default setting is 2.

- `[-save-onstartup {true|false}]` - Enable Auto Save of Coredumps on Startup
  
  If you set this parameter to true, the system will automatically start saving the core dump after reboot.

- `[-upload-location <text>]` - URL for Coredump Upload Directory
  
  Attention: This option is deprecated and might be removed in a future release of Data ONTAP. Use the `-uri` parameter of the "system node autosupport invoke-core-upload" command instead.

  If you specify this parameter, the system uploads the core dumps to the specified URL. The following protocols are supported: ftp and http. (The default setting is ftp://ftp.netapp.com/to-ntap/.)

Examples

The following example sets the maximum number of core dump attempts to 5 and the maximum number of save attempts to 5:

```
cluster1:~> system node coredump config modify -coredump-attempts 5 -save-attempts 5
```

*system node autosupport invoke-core-upload* on page 1044

**system node coredump config show**

Display coredump configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The *system node coredump config show* command displays basic information about a cluster's core dump configuration, such as whether sparse cores are enabled, minimum number of free bytes on the root volume file system that need to be available after saving the core files, maximum number of times the process attempts to generate a core dump when encountering repeated disk failures, maximum number of times the process attempts to save a core dump, the URL to which core dumps are uploaded, and whether core dumps are automatically saved when a node restarts.

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance]
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[-node {<nodename>|local}] - Node
```

If you specify this parameter, the command displays the coredump configuration information of the specified node.

```
[-sparsecore-enabled {true|false}] - Enable Sparse Cores
```

If you specify this parameter, the command displays only the coredump information that matches the specified spare core setting. A sparse core omits all memory buffers that contain only user data.

```
[-min-free {<integer>[KB|MB|GB|TB|PB]}] - Minimum Free Bytes On Root Filesystem
```

If you specify this parameter, the command displays only the core dump information that matches the specified number of bytes that need to be made available in the root file system after saving the core dump.

```
[-coredump-attempts <integer>] - Maximum Number Of Attempts to Dump Core
```

If you specify this parameter, the command displays only the core dump information that matches the specified maximum number of times the system will attempt to generate a core dump when encountering repeated disk failures.

```
[-save-attempts <integer>] - Maximum Number Attempts to Save Core
```

If you specify this parameter, the command displays only the coredump information that matches the maximum number of times the system will attempt to save a core dump.

```
[-save-onstartup {true|false}] - Enable Auto Save of Coredumps on Startup
```

If you specify this parameter, the command displays only the coredump information that matches the specified configuration of whether the system will automatically start saving the core dump after reboot.

```
[-upload-location <text>] - URL for Coredump Upload Directory
```

**Attention:** This option is deprecated and might be removed in a future release of Data ONTAP. Use the `-uri` parameter of the "*system node autosupport invoke-core-upload*" command instead.

If you specify this parameter, the command displays only the core dump information that matches the specified URL where core dumps are uploaded.

**Examples**
The following example displays information about the cluster's core dump configuration:

system node coredump reports commands

Manage application core reports

system node coredump reports delete

Delete an application core report

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The system node coredump reports delete command deletes the specified application core report.

Parameters

- -node {<nodename>|local} - Node That Owns the Coredump
  This specifies the node from which reports are to be deleted.

- -reportname <text> - Report Name
  This specifies the report that is to be deleted.

Examples

The following example shows how a report named notifyd.1894.80335005.2011-03-25.09_59_43.ucore.report is deleted from a node named node0:

  cluster1::> system node coredump reports delete -node node0 -reportname notifyd.1894.80335005.2011-03-25.09_59_43.ucore.report

system node coredump reports show

Display a list of application core reports

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The system node coredump reports show command displays basic information about application core reports, such as the report name and time of the panic that triggered the application core dump. You can specify optional parameters to display information that matches only those parameters. For example, to display the list of reports in the local node, run the command with -node local.

<table>

4 entries were displayed.
Parameters

{[-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

|[-instance ]|

If you specify the -instance parameter, the command displays detailed information about all fields.

[-node <nodename> |local] - Node That Owns the Coredump

Selects information about all the reports on the specified node. If you specify both this parameter and the -reportname parameter, the command displays detailed information about the specified report.

[-reportname <text>] - Report Name

Selects information about the reports that match the specified name. If you specify both this parameter and the -node parameter, the command displays detailed information about the specified report.

[-panic-node <text>] - Node That Generated Core

Selects information about the reports that were generated by the specified node.

[-panic-systemid <integer>] - System ID of Node That Generated Core

Selects information about the reports that were generated by the node with the specified system ID.

[-version <text>] - Data ONTAP Version of Core

Selects information about the reports that match the specified version.

[-panic-time <MM/DD/YYYY HH:MM:SS>] - Time of Panic That Generated Core

Selects information about the reports that were generated by a panic at the specified time. Specify time in the format of MM/DD/YYYY HH:MM:SS [-+ HH:MM]. You can use [+ HH:MM] to specify the time range within which all core files triggered by a panic are displayed. [+HH:MM] is relative to UTC.

[-panic-string <text>] - Panic String

Selects information about the reports that match the specified panic string.

Examples

The following example displays information about the reports:

```
cluster1::> system node coredump reports show
<table>
<thead>
<tr>
<th>Node</th>
<th>Report Name</th>
<th>Panic Time</th>
</tr>
</thead>
</table>
```

system node coredump reports upload

(DEPRECATED)-Upload an application core report to a remote site

Availability: This command is available to cluster administrators at the admin privilege level.

Description

Attention: This command is deprecated and might be removed in a future release of Data ONTAP. See core report information in the SmartSoft tool.

The system node coredump reports upload command uploads an application report to a specified URL. You should use this command only at the direction of technical support.
Parameters

- **node \(<\text{nodename}>\mid local\)** - Node That Owns the Coredump
  This specifies the node on which the report is located.

- **reportname <text>** - Report Name
  This specifies the name of the report that is to be uploaded.

- **location <text>** - URL for Coredump Upload Directory
  This specifies the URL to which the report is to be uploaded. The following protocols are supported: ftp and http. (By default, the location is set to ftp://ftp.netapp.com/to-ntap/)

- **casenum <integer>** - Case Number
  This specifies the support case number that is be prefixed to the core file name at the destination. The case number is critical information for quick and automated processing of the received core file.

Examples

The following example shows how a report named notifyd.1894.80335005.2011-03-25.09_59_43.ucore.bz2 is uploaded on a node named node0 to the default location. The support case number is 2001234567.

```
cluster1::> system node coredump reports upload -node node0 -corename notifyd.1894.80335005.2011-03-25.09_59_43.ucore.bz2 -casenum 2001234567
```

system node coredump segment commands

Manage Core Segments

system node coredump segment delete

Delete a core segment

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
This command deletes a core segment.

Parameters

- **node \(<\text{nodename}>\mid local\)** - Node
  This specifies the node on which to delete the core segments.

- **segment <text>** - Core Segment
  This specifies the core segment to delete. The pathname is relative to the coredump directory. If a directory is specified, all core segment files within it are deleted. If the directory is empty, it is deleted.

- **owner-node <text>** - Node That Owns the Core Segment File
  This specifies the node that owns the core segment. Use this parameter only in takeover mode to delete a partner's coredump segment.

Examples

This deletes all core segments in the directory, core.151708240.2012-01-11.05_56_52.

```
cluster1::> system node coredump segment delete -node node1 -segment core.151708240.2012-01-11.05_56_52
```
system node coredump segment delete-all

Delete all core segments on a node

Availability: This command is available to cluster administrators at the admin privilege level.

Description
This command deletes all the core segments on a node.

Parameters

- `-node {<nodename>|local}` - Node
  This specifies the node on which to delete the core segments.

Examples
This deletes all the core segments for node1.

```
cluster1::> system node coredump segment delete-all -node node1
```

system node coredump segment show

Display a list of core segments

Availability: This command is available to cluster administrators at the admin privilege level.

Description
This command displays the following information about core segments:

- name of the core segment directory
- time of the panic that generated the core segment
- total number of core segment files
- core segment file name

Parameters

{{ -fields <fieldname>, ... }}

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

| [[-instance ]] |

Displays the following details:

- Core segment file name
- Node that owns the core segment file
- System ID of the node that generated the core
- MD5 checksum of the compressed data of the core segment file
- Name of the core segment
- Total number of core segments for the core file
- Timestamp of the panic that triggered the core segment
[\(-\text{node} \{\text{<nodename>|\text{local}}\}\)] - Node

Selects information about the core segments on the specified node.

[\(-\text{segment} \{\text{<text>}\}\)] - Core Segment

Selects information about the specified core segment. If segment is a directory, the command displays the information for the first core segment file. If segment is a file, the command displays the file information.

[\(-\text{owner-node} \{\text{<text>}\}\)] - Node That Owns the Core Segment File

Selects information about the core segments owned by the specified node. This parameter should only be used in takeover mode to display information about the partner's core segments.

[\(-\text{panic-system-id} \{\text{<integer>}\}\)] - System ID of Node That Generated Core

Selects information about the core segments that were generated when the node with the specified system ID panicked.

[\(-\text{md5-data-chksum} \{\text{<text>}\}\)] - Md5 Checksum of the Compressed Data of the Core Segment

Selects information about the core segments whose data segment's MD5 checksum matches the specified checksum.

[\(-\text{segment-name} \{\text{<text>}\}\)] - Name of the Core Segment

Selects information about the core segments with the specified name.

[\(-\text{total-segment-count} \{\text{<integer>}\}\)] - Number of Segments Generated

Selects information about the core segments with the specified name.

[\(-\text{panic-time} \{\text{MM/DD/YYYY HH:MM:SS}\}\)] - Time of Panic That Generated Core

Selects information about the core segments that were generated by a panic at the specified time.

[\(-\text{size} \{\text{<text>}\}\)] - Size of Core Segment (bytes)

Selects information about the core segments that are of the specified size.

[\(-\text{panic-string} \{\text{<text>}\}\)] - Panic String of Panic That Generated Core

Selects information about the core segments that match the specified panic string.

**Examples**

The example below displays the core segments on `node1`.

```bash
cluster1::> system node coredump segment show -node node1
Node: node1
Segment Directory: core.118049106.2012-01-05.17_11_11
Panic Time: 1/5/2012 12:11:11
Number of Segments: 2
Segment File Name:
core.118049106.2012-01-05.17_11_11.nvram.nz
core.118049106.2012-01-05.17_11_11.ontap.nz
2 entries were displayed.
```

The example below displays detailed information a specific core segment file on `node1`.

```bash
cluster1::> system node coredump segment show -node node1 -segment core.118049106.2012-01-05.17_11_11.ontap.nz -instance
Node: node1
Core Segment: core.118049106.2012-01-05.17_11_11.ontap.nz
Node That Owns the Core Segment File: node1
System ID of Node That Generated Core: 118049106
Md5 Checksum of the Compressed Data of the Core Segment: 1a936d805dcd4fd5f1180fa6464fdee4
Name of the Core Segment: ontap
```
system node environment commands

Display fan and temperature information

system node environment sensors commands

Display environment sensors

system node environment sensors show

Display the sensor table

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The system node environment sensors show command displays the following information:

- Node name
- Sensor name
- Sensor state
- Sensor value
- Sensor units
- Critically Low threshold for the sensor
- Warning Low threshold for sensor
- Warning High threshold for sensor
- Critically High threshold for the sensor
- FRU name (detailed view only)

Parameters

[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

[-instance]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-node <nodename> [local]] - Node
Selects information about the sensors on the specified node. If this parameter is specified with the -name parameter, the command displays information only about the specified sensor.

[-name <text>] - Sensor Name
Selects information about the sensors that have the specified name. If this parameter is specified with the -node parameter, the command displays information only about the specified sensor.

[-fru <text>] - FRU
Selects information about the sensors associated with the specified Field Replaceable Unit (FRU).
[-type {fan|thermal|voltage|current|battery-life|discrete|fru|nvmem|counter|minutes|percent|agent|unknown}] - Sensor Type
   Selects information about the sensors that have the specified sensor type. Possible values vary among
   platforms but may include fan, temperature, thermal and voltage.

[-units <text>] - Value Units
   Selects information about the sensors that have readings displayed in the specified units of measure. Possible
   values vary among platforms but may include RPM, C and mV.

[-state {normal|warn-low|warn-high|crit-low|crit-high|disabled|uninitialized|init-failed|not-available|invalid|retry|bad|not-present|failed|ignored|fault|unknown}] - Sensor State
   Selects information about the sensors that have the specified state. Possible values vary among platforms but
   may include normal, warn_lo, warn_hi, crit_lo, crit_hi and failed.

[-discrete-state {normal|warn-low|warn-high|crit-low|crit-high|disabled|uninitialized|init-failed|not-available|invalid|retry|bad|not-present|failed|ignored|fault|unknown}] - Discrete Sensor State
   Selects information about the discrete-valued sensors that are in the specified state. A discrete-valued sensor
   has a set of possible discrete values rather than a range of possible values. For example, a presence sensor
   which has the discrete values PRESENT and NOT_PRESENT is a discrete-valued sensor. Possible values vary
   among platforms but may include normal and failed.

[-value <integer>] - Last Sensor Value
   Selects information about the sensors that have the specified sensor value.

[-discrete-value <text>] - Discrete Sensor Value
   Selects information about the discrete-valued sensors that have the specified discrete value. Possible values
   vary among sensors but may include PRESENT, NOT_PRESENT, ON, OFF, OK and FAULT.

[-crit-low <integer>] - Critical Low Threshold
   Selects information about the sensors that have the specified critically low threshold.

[-warn-low <integer>] - Warning Low Threshold
   Selects information about the sensors that have the specified warning-low threshold.

[-warn-hi <integer>] - Warning Hi Threshold
   Selects information about the sensors that have the specified warning-high threshold.

[-crit-hi <integer>] - Critical Hi Threshold
   Selects information about the sensors that have the specified critically high threshold.

[-inactive {true|false}] - Show Inactive Sensors
   Specify true to include inactive sensors in the output. By default, only sensors with the value false are
   shown.

[-hidden {true|false}] - Show Hidden Sensors
   Specify true to include hidden sensors in the output. By default, only sensors with the value false are
   shown.

Examples
The following example displays information about all sensors on a cluster named cluster1:

```
cluster1::> system node environment sensors show
     mynode          Partner IO Pre         NOT_PRESENT
                     Partner Ctrl Pre         PRESENT
```

system node hardware commands
The system node hardware directory

system node hardware tape commands
Manage tape related devices

system node hardware tape library commands
The library directory

*system node hardware tape library show*
Display information about tape libraries

**Availability:** This command is available to _cluster_ administrators at the _admin_ privilege level.

**Description**
This command displays the following information about tape libraries:

- Node to which the tape library is attached
- Device ID of the tape library
- Description of the tape library
- NDMP path of the tape library

**Parameters**

```
[-fields <fieldname>, ...]
```
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance]
```
If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[-node <nodename> | local] - Node
```
Displays detailed information about tape libraries on the specified node.

```
[-device-id <text>] - Device ID
```
Selects information about the tape library that has the specified device ID.

```
[-description <text>] - Description
```
Selects information about the tape library or libraries that have the specified description.

```
[-wwn <text>] - World Wide Name
```
Selects information about the tape library that has the specified worldwide name.

```
[-serial-number <text>] - Serial Number
```
Selects information about the tape library that has the specified serial number.
[-ndmp-path <text>] - NDMP Path

Selects information about the tape library or libraries that have the specified NDMP path.

Examples

The following example displays information about all tape libraries attached to the cluster:

```
cluster1::> system node hardware tape library show
Node   Device Id Drive Description    NDMP Path
------ --------- -------------------- -----------------
cluster1-00
  0b.125L1  HP       MSL G3      mc1
  Series
  0c.125L1  HP       MSL G3      mc0
  Series
2 entries were displayed.
```

system node hardware tape drive commands

The drive directory

```
- system node hardware tape drive show
```

Displays information about tape drives

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

This command displays the following information about tape drives:

- Node to which the tape drive is attached
- Device ID of the tape drive
- Description of the tape drive
- NDMP path of the tape drive

**Parameters**

```
{-fields <fieldname>,...}  
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

{-instance}  
If you specify the -instance parameter, the command displays detailed information about all fields.

{-node <nodename>|local} - Node
Displays detailed information about tape drives on the specified node.

{-device-id <text>} - Device ID
Selects information about the tape drive that has the specified device ID.

{-description <text>} - Description
Selects information about the tape drive or drives that have the specified description.

{-wwn <text>} - World Wide Name
Selects information about the tape drive that has the specified worldwide name.

{-serial-number <text>} - Serial Number
Selects information about the tape drive that has the specified serial number.
[-ndmp-path <text>, ...] - NDMP Path

Selects information about the tape drive or drives that have the specified NDMP path.

**Examples**

The following example displays information about all tape drives in the cluster:

```
cluster1::> system node hardware tape drive show
Node   Device Id Drive Description    NDMP Path

**system node hardware unified-connect commands**

Manage Fibre Channel and converged networking adapters

Commands used for managing Fibre Channel and converged networking adapters.

**system node hardware unified-connect modify**

Modify the Fibre Channel and converged networking adapter configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The `system node hardware unified-connect modify` command changes the adapter configuration. Any changes to the adapter mode or type will require a reboot for the changes to take effect. The adapter must also be offline before you can make any changes.

The adapter argument is in the form Xy where X is an integer and y is a letter. For example: `4a`

For a target adapter, use the `network fcp adapter modify` command to bring the adapter offline.

For an initiator adapter, use the `system node run local storage disable adapter` command to take the adapter offline.

The `-node` parameter refers to the mode of the adapter and can be either `fc` or `cna`.

The `-type` parameter refers to the FC-4 type of the adapter and can be `initiator`, `target`, or `fcvi`.

The `-force` parameter suppresses confirmation prompts.

**Note:** The adapter type `fcvi` is supported only on platforms with FCVI adapters.

**Parameters**

- `-node <nodename>|local` - Node

  Specifies the node of the adapter.
-adapter <text> - Adapter
  Specifies the adapter.

[-mode | -m {fc|cna}] - Configured Mode
  Specifies the mode.

[-type | -t {initiator|target|fcvi}] - Configured Type
  Specifies the FC-4 type.

[-force | -f {true}] - Force
  Suppresses warnings and confirmation prompts.

Examples

```
cluster1::> system node hardware unified-connect modify -node node1 -adapter 0d -mode cna
```

network fcp adapter modify on page 276

system node hardware unified-connect show

Displays information about Fibre Channel and converged networking adapters

Availability: This command is available to cluster administrators at the admin privilege level.

Description

This command manages Fibre Channel and converged networking adapters used by the storage subsystem. Use the command to show the current mode and FC-4 type of adapters or the capabilities of adapters.

Parameters

{ [-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-capability ]
  If this parameter is specified, the command displays the capabilities of the adapters.

| [-instance ]
  If this parameter is specified, the command displays detailed information about all fields.

[-node {<nodename> | local}] - Node
  If this parameter is specified, the command displays information about Fibre Channel and converged networking adapters on the specified node.

[-adapter <text>] - Adapter
  If this parameter is specified, the command displays information about the specified adapter.

[-current-mode {fc|cna}] - Current Mode
  If this parameter is specified, the command displays adapters configured to the specified mode.

[-current-type {initiator|target|fcvi}] - Current Type
  If this parameter is specified, the command displays adapters configured to the specified FC-4 type.

[-pending-mode {fc|cna}] - Pending Mode
  If this parameter is specified, the command displays adapters configured to the specified mode on the next reboot.
[-pending-type \texttt{(initiator|target|fcvi)}] - Pending Type

If this parameter is specified, the command displays adapters configured to the specified FC-4 on the next reboot.

[-status-admin \texttt{<text>}] - Administrative Status

If this parameter is specified, the command displays adapters with the specified status.

[-supported-modes \texttt{(fc|cna)}, ...] - Supported Modes

The list of modes that the adapter supports.

[-supported-fc-types \texttt{(initiator|target|fcvi)}, ...] - Supported FC Types

The list of FC-4 types the adapter supports when configured into fc mode.

[-supported-cna-types \texttt{(initiator|target|fcvi)}, ...] - Supported CNA Types

The list of FC-4 types the adapter supports when configured into cna mode.

\textbf{Examples}

The following example displays information about all Fibre Channel and converged networking adapters in the cluster:

\begin{verbatim}
cluster1::> system node hardware unified-connect show

    Node     Adapter  Current Mode  Current Type  Pending Mode  Pending Type  Admin Status
------------ ------- ------- ------- ------- ------- ------- -----------
node1       0c      fc      initiator -        -        -          online
node1       0d      fc      initiator -        -        -          online
node1       3a      fc      target   -        -        -          online
node1       3b      fc      target   -        -        -          online
node1       4a      cna     target   -        -        -          online
node1       4b      cna     target   -        -        -          online
node1       6a      cna     target   -        -        -          online
node1       6b      cna     target   -        -        -          online
node2       0c      fc      initiator -        -        -          online
node2       0d      fc      initiator -        -        -          online
node2       3a      fc      target   -        -        -          online
node2       3b      fc      target   -        -        -          online
node2       4a      cna     target   -        -        -          online
node2       4b      cna     target   -        -        -          online
node2       6a      cna     target   -        -        -          online
node2       6b      cna     target   -        -        -          online
16 entries were displayed.
\end{verbatim}

\textbf{system node external-cache commands}

The external-cache directory

\textbf{system node external-cache modify}

Modify external cache settings.

\textbf{Availability:} This command is available to cluster administrators at the admin privilege level.

\textbf{Description}

The \texttt{system node external-cache modify} command can be used to modify the following attributes of external-cache for a node:

\begin{itemize}
  \item is-enabled
  \item is-rewarm-enabled
  \item is-mbuf-inserts-enabled
  \item pcs-size
\end{itemize}
• is-hya-enabled

Parameters

- **-node \(<nodename>|local\) - Node**
  
  This specifies the node on which the modifications need to be made.

- **-[is-enabled \{true|false\}] - Is Enabled**
  
  Enables external-cache module (Flash Cache Family) on the storage system. Valid values for this option are true and false. If external-cache hardware is present, then this option will enable external-cache functionality in WAFL. If no hardware is present, this option will enable external-cache pcs (Predictive Cache Statistics). The default value for this option is false.

- **-[is-rewarm-enabled \{true|false\}] - Is rewarm on**
  
  Specifies whether an external-cache module should attempt to preserve data across reboots. Valid values for this option are true and false. This option applies only to cache hardware with persistent media. It does not apply to Predictive Cache Statistics (PCS). Enabling this option will marginally increase the duration of system boot and shutdown, but it will reduce or eliminate the time required for cache warming. The default value for this option is determined by the cache hardware type. The option is disabled by default.

- **-[is-mbuf-inserts-enabled \{true|false\}] - Is Mbuf inserts on**
  
  Specifies whether the external-cache module allows insert of mbuf data as part of a network write. In rare cases, inserting mbuf data may cause excessive CPU usage. We provide this workaround to disable the behavior, if necessary. Do not change the value of this option unless directed to do so by technical support. The data from the mbuf network writes can still be stored in the external cache, but only after a subsequent disk read of that data.

- **-[pcs-size <integer>] - PCS size**
  
  Controls the size of the cache emulated by external-cache PCS. Valid values for this option are integers between 16 and 16383. This option is only used when PCS is enabled. The default value for this option is chosen automatically based on the amount of memory in the controller, and the upper limit is further restricted on controllers with smaller amounts of memory.

- **-[is-hya-enabled \{true|false\}] - Is hya caching enabled**
  
  Specifies whether the external-cache module allows caching of blocks targeted for hybrid aggregates. This option is set to true by default when the external-cache is enabled.

Examples

```shell
cluster::> system node external-cache modify -node node1 -is-enabled true
```

**system node external-cache show**

Display external cache settings.

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

The system node external-cache show command displays external-cache information for each of the nodes available.

**Parameters**

```
{-fields <fieldname>,...}
```

Valid values for this option are \(node|is-enabled|is-rewarm-enabled|is-mbuf-inserts-enabled|pcs-size|is-hya-enabled\). Specifying the value will display all entries that correspond to it.
This option does not need an input value. Specifying this option will display the information about all the entries.

```
[-instance ]
```

**[-node \(<nodename>|local\)] - Node**

Specify this parameter to display external-cache parameters that match the specified node.

```
[-is-enabled \(true|false\)] - Is Enabled
```

Valid values for this option are true and false. Specifying the value will display all entries that correspond to it.

```
[-is-rewarm-enabled \(true|false\)] - Is rewarm on
```

Valid values for this option are true and false. Specifying the value will display all entries that correspond to it.

```
[-is-mbuf-inserts-enabled \(true|false\)] - Is Mbuf inserts on
```

Valid values for this option are true and false. Specifying the value will display all entries that correspond to it.

```
[-pcs-size <integer>] - PCS size
```

Valid values for this option are integers between 16 and 16383. Specifying the value will display all entries that correspond to it.

```
[-is-hya-enabled \(true|false\)] - Is hya caching enabled
```

Valid values for this option are true and false. Specifying the value will display all entries that correspond to it.

### Examples

```
cluster1::> system node external-cache show -node node1
```

```
Node: node1
   Is Enabled: false
   Is rewarm on: false
   Is Mbuf inserts on: true
   PCS size: 256
   Is hya caching enabled: true
```

### system node image commands

Manage software images

### system node image abort-operation

Abort software image 'update' or 'get' operation

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

The system node image abort-operation command aborts software installation ("update") or download ("get") operation on the specified node.

**Parameters**

```
-node \(<nodename>|local\) - Node
```

This specifies the node on which to abort the operation.

### Examples

The following example aborts the software installation operation on a node named node1.
system node image get

Fetch a file from a URL

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
This command fetches a file from the specified URL and stores it in the `/mroot/etc/software` directory.

**Parameters**

- `-node {<nodename>|local}` - Node
  This parameter specifies the node that fetches and stores the package.

- `package <text>` - Package URL
  This parameter specifies the URL that provides the location of the package to be fetched. Standard URL schemes, including HTTP, FTP and FILE, are accepted.

- `[-replace-package [true]]` - Replace the Local File
  Specifies whether an existing package is deleted and replaced with a new package. If you enter this command without using this parameter, its effective value is false and an existing package is not replaced with the new one. If you enter this parameter without a value, it is set to true and an existing package is replaced with the new one.

- `[-rename-package <text>]` - Rename the File
  Use this parameter to enter a package name that is different than the file name in the URL.

- `[-background [true]]` - Run in the background
  This parameter allows the operation to run in the background. The progress of the operation can be checked with the command `system image show-update-progress`. If this command is entered without using this parameter, its effective value is false and the operation runs in the foreground. If this parameter is used without a value, it is set to true.

**Examples**

```
cluster1::> system image get http://example.com/image.tgz -rename-package image2.tgz -replace-package
```

system node image modify

Modify software image configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The `system node image modify` command sets the default software image on a specified node. The default software image is the image that is run when the node is started. A node holds two software images; when you set one as the default image, the other image is automatically unset as the default. Conversely, if you unset a software image as the default, the other image is automatically set as the default.

**Parameters**

- `-node {<nodename>|local}` - Node
  This specifies the node on which the software image is located.
-image {image1|image2|remote} - Image Name
This specifies the software image that is to be set or unset as the default.

-[isdefault {true|false}] - Is Default Image
This optionally specifies whether the specified image is the default.

Examples
The following example sets the software image named image2 as the default image on a node named node0.

```
node::> system node image modify -node node0 -image image2 -isdefault true
Default Image Changed.
```

system node image show
Display software image information

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The `system node image show` command displays information about software images. By default, the command displays the following information:

- Node name
- Image name
- Whether the image is the default image
- Whether the image is the current image
- Software version
- Installation date

To display detailed information about a specific software image, run the command with the -node and -image parameters. The detailed view adds information about the kernel image path, and the root file system image path.

You can specify additional parameters to select specific information. For example, to display information only about software images that are currently running, run the command with the `--iscurrent true` parameter.

Parameters

```
[-fields <fieldname>, ...]
If you specify the `--fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `--fields ?` to display the fields to specify.
```

```
[--instance]
If you specify the `--instance` parameter, the command displays detailed information about all fields.
```

```
[-node <nodename> | local] - Node
Selects information about the software images on the specified node. If this parameter and the -image parameter are both used, the command displays detailed information about the specified software image.
```

```
[-image {image1|image2|remote}] - Image Name
Selects information about the software images that match the specified name. If this parameter and the -node parameter are specified, the command displays detailed information about the specified software image.
```

```
[-isdefault {true|false}] - Is Default Image
Selects information about the software images with the specified default setting.
```
Selects information about the software images that have the specified currency value.

- [kernel-path <text>] - Kernel Image Path
  Selects information about the software images that have the specified kernel image path.

- [rootfs-path <text>] - Root Filesystem Image Path
  Selects information about the software images that have the specified root file system image path.

- [version <text>] - Software Version
  Selects information about the software images that have the specified root file system image path.

- [installdate <MM/DD/YYYY HH:MM:SS>] - Install Date
  Selects information about the software image that have the specified installation date. Specify the date in the format MM/DD/YYYY HH:MM:SS [+- HH:MM].

---

**Examples**

The following example displays information about the software images on a node named node1:

```
cluster1::> system node image show -node node1
          Is    Is      Install
         Node   Image Default Current Version Date
          ------ ------ -------- ------- --------- ------------------
          node1
             image1 true   true   8.0       8/20/2009 17:42:42
             image2 false  false   8.0       6/26/2009 17:44:50
          2 entries were displayed.
```

**system node image show-update-progress**

Show progress information for a currently running update

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

The `system node image show-update-progress` command displays the progress of a software-image update initiated by using the `system node image update` command. The command displays progress until the update completes; you can also interrupt it by pressing Ctrl-C.

**Parameters**

- [node <nodename>|local] - Node
  This optionally specifies the name of a node whose image-update progress is to be displayed.

- [follow [true]] - Follow the Progress in the Foreground
  Do use not use background processing for this command. If you do not use this parameter, the value is `true`.

**Examples**

The following example displays image-update progress:

```
node::> system node image show-update-progress
ERROR: command failed: There is no update/install in progress
```

**Related references**

*system node image update* on page 1097
system node image update

Perform software image upgrade/downgrade

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The `system node image update` command downloads the software image from a specified location and updates the alternate software image (that is, the image that is not currently running on the node). By default, validation of the software image is not performed. Use the "-validate-only" parameter to validate the software image first, before performing the update on the cluster nodes.

At the advanced privilege level, you can specify whether to disable version-compatibility checking.

Parameters

- `-node {<nodename>|local}` - Node
  This specifies the node on which the software image is located.

- `-package <text>` - Package URL
  This specifies the location from which the software image is to be downloaded. The location can be specified in any of the following ways:

  - As an HTTP URL in the form `http://host_name[:port]/path_to_file`. For instance, `http://example.com/downloads/image.tgz`. The management utility prompts you for a user name and password before beginning the download.

    Note: If you use HTTP to transfer software images, be aware that the management utility does not check whether the Web server is password protected; if it is not, press Enter at the prompt for user name and password.

  - As an FTP URL in the form `ftp://host_name[:port]/path_to_file`. For instance, `ftp://example.com/downloads/image.tgz`. If required, the management utility prompts you for a user name and password before beginning the download.

  - As a filename of a package left behind by a previous installation, or a package fetched using `system node image get`. For example, `image.tgz`. Available packages can be displayed using `system node image package show`.

  - As a path to a package in a mounted file system in the form `file://localhost/path_to_file`. For example, `file://localhost/mroot/etc/software/image.tgz`.

- `[--replace {image1|image2}]` - Image to Replace
  This optionally specifies the image that is to be replaced when the node is booted from the network.

- `[--setdefault [true]]` - Set Newly Updated Image as Default
  This optionally specifies whether to set the newly updated image as the default image (that is, the image that runs the next time the node is restarted). Note that for this parameter to work correctly, the cluster must be in quorum when the image is updated.

- `[--replace-package [true]]` - Replace the Local File
  Specifies whether an existing package is deleted and replaced with a new package. If this command is entered without using this parameter, its effective value is false and an existing package is not replaced with the new one. If this parameter is used without a value, it is set to true and an existing package is replaced with the new one.

- `[--rename-package <text>]` - Rename the File
  Use this parameter to enter a package name that is different than the file name in the URL.
[-background [true]] - Run in the Background
   This parameter will allow the operation to run in the background. The progress of the operation can be
   checked with the command `system node image show-update-progress`. If this command is entered
   without using this parameter, its effective value is false and the operation will run in the foreground. If this
   parameter is used without a value, it is set to true.

[-validate-only [true]] - Validate the Package before Installation
   Use this parameter to validate the package. Validation consists of verifying whether there is enough space on
   the system to install the package, verifying the checksum for each component within the package and so on.
   Validation usually takes from 30 to 60 minutes. If you specify this parameter, the package will be validated
   only, not installed.

Examples
   The following example updates the software image on a node named node0 from a software package located at ftp://
   ftp.example.com/downloads/image.tgz:

   ```
   node::> system node image update -node node0 -package ftp://ftp.example.com/downloads/image.tgz -
   setdefault true
   ```

system node image package commands
   The package directory

system node image package delete
   Delete a software package
   **Availability:** This command is available to cluster administrators at the `admin` privilege level.
   **Description**
   The delete command will delete the specified software package.
   **Parameters**
   - **-node {<nodename>|local} - Node**
     The package will be deleted from the repository belonging to the node specified with this parameter. The local
     node is used as the default if this parameter is omitted.
   - **-package <text> - Package File Name**
     This parameter specifies the package to be deleted.

Examples
   ::> system image package delete image.tgz
   1 entry was deleted.
**system node image package show**

Display software package information

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The package show command displays details of the software packages residing on the storage controller.

**Parameters**

```
{-fields <fieldname>, ...}
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
{-instance}
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
{-node <nodename>|local} - Node
```

Selects which node's packages are displayed. The local node is the default if this parameter is omitted.

```
{-package <text>} - Package File Name
```

This parameter specifies which package's information will be displayed.

---

**Examples**

```
cluster1::> system image package show
Package
Node Repository Package File Name
---- ---------- -----------------
node-01 mroot image.tgz
1 entries were displayed.
```

---

**system node firmware commands**

The system node firmware directory

**system node firmware download**

Download motherboard firmware and system diagnostics

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**
The *system node firmware download* command downloads new system firmware to the boot device. A reboot followed by the 'update_flash' command at the firmware prompt is required for the firmware to take effect.

**Parameters**

```
{-node <nodename>|local} - Node
```

This specifies the node or nodes on which the firmware is to be updated.

```
{-package <text>} - Package URL
```

This parameter specifies the URL that provides the location of the package to be fetched. Standard URL schemes, including HTTP, FTP and FILE, are accepted.
Examples
The following example downloads firmware to node-01 from a web server:

```
cluster1:*> system node firmware download -node node-01 -package http://example.com/serviceimage.zip
```

**system node internal-switch commands**
Manage onboard switches

**system node internal-switch show**
Display onboard switch attributes

*Availability:* This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The `system node internal-switch show` command is used to display the internal switch state information and the link status.

**Parameters**

- `[-fields <fieldname>, ...]`
  - If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

- `[-instance]`
  - If you specify the `-instance` parameter, the command displays detailed information about all fields.

- `[-node {<nodename>|local}]` - Node
  - Use this parameter to specify the node the switch resides on.

- `[-switch-id <integer>]` - Switch
  - Use this parameter to specify the switch id. For example, 1.

- `[-port-id <integer>]` - Port
  - Use this parameter to specify the port id. For example, 0.

- `[-port-name <text>]` - Port Name
  - Use this parameter to specify the port name. For example, e0M.

- `[-auto-admin <Auto-negotiation setting>]` - Auto-Negotiation Administrative
  - Use this parameter to show the auto-negotiation administrative setting. 'enable' or 'disable'.

- `[-auto-op <Auto-negotiation setting>]` - Auto-Negotiation Operational
  - Use this parameter to show the auto-negotiation operational setting. 'unknown', 'complete', 'incomplete', 'failed' or 'disabled'.

- `[-duplex-admin <Duplex>]` - Duplex Mode Administrative
  - Use this parameter to show the duplex mode administrative setting. 'half' or 'full'.

- `[-duplex-op <Duplex>]` - Duplex Mode Operational
  - Use this parameter to show the duplex mode operational setting. 'half' or 'full'.

- `[-speed-admin <Link speed>]` - Speed Administrative
  - Use this parameter to show the speed administrative setting. '10', '100' or '1000'.

1100

Commands: Manual Page Reference
-speed-op <Link speed> - Speed Operational
  Use this parameter to show the speed operational setting. '10', '100' or '1000'.
-<Link Status> - Link State
  Use this parameter to show the link state, 'up' or 'down'.
-up-admin <Link Status> - Up Administrative
  Use this parameter to show the up administrative setting, 'up' or 'down'.
-fc-op <Flow control> - Flow Control Operational
  Use this parameter to show the flow control operational setting, 'full', 'send', 'receive' or 'none'.

Examples

The example shows the attributes of the internal switch 0 on the node Node1.

```
cluster1::> system node internal-switch show -node Node1 -switch-id 0
Auto-Negot       Duplex      Speed(Mbps) 
Port  Role               Link       Admin/Oper     Admin/Oper   Admin/Oper
--- -----------  ----------------  -----------  -----------  -----------
0    sw-wrench         up       enable/complete    full/full    1000/1000
1    sw-locked-wrench  down     enable/incomplete  full/half     100/10
2    sw-e0M            up       enable/complete    full/full    1000/1000
3    sw-e0F            down     enable/incomplete  full/half     100/10
4    sw-midplane-1     down     enable/incomplete  full/half     100/10
5    sw-expander-1     up       enable/unknown     full/full     100/100
6    sw-sp-1           up       enable/unknown     full/full     100/100
7 entries were displayed.
```

system node internal-switch dump commands

Dump onboard switch info

system node internal-switch dump eeprom

Display onboard switch eeprom config

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The `system node internal-switch dump eeprom` command is used to show the internal switch eeprom firmware content.

Parameters

```
{-fields <fieldname>,...}  
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

[-instance]  
  If you specify the -instance parameter, the command displays detailed information about all fields.

[-node <nodename>] - Node
  Use this parameter to specify the node the internal switch resides on.

[-switch-id <integer>] - Switch
  Use this parameter to specify the switch id. For example, 1.
```
--version <text> - Version
Use this parameter to specify the version of firmware needs to be dumped.

--eeprom <text> - Firmware
Use this parameter to specify the firmware content needs to be dumped.

Examples

The following example shows the internal switch eeprom firmware content of the internal switch 0 on Node1.

```
cluster1::> system node internal-switch dump eeprom -node Node1 -switch-id 0
EEPROM Configuration

```

system node internal-switch dump port-mapping
Display onboard switch port mapping

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The `system node internal-switch dump port-mapping` command is used to show the internal switch port connections.

Parameters

```
[-fields <fieldname>, ...]  
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance]  
If you specify the -instance parameter, the command displays detailed information about all fields.

[-node <nodename>] - Node
Use this parameter to specify the node the switch resides on.

[-switch-id <integer>] - Switch
Use this parameter to specify the switch id. For example, 1.

[-port-id <integer>] - Port
Use this parameter to specify the port id. For example, 0.

[-role <text>] - Port Name
Use this parameter to specify the port name. For example, e0M.
```
Examples

The following example shows the port connections of the internal switch 0 on Node1.

```
cluster1::> system node internal-switch dump port-mapping -node Node1 -switch-id 0
Port  Port Name
----  -----------------
Node: Node1 , Switch: 0
0     sw-wrench
1     sw-locked-wrench
2     sw-e0M
3     sw-e0P
4     sw-midplane-1
5     sw-expander-1
6     sw-sp-1
7 entries were displayed.
```

system node internal-switch dump stat

Display onboard switch port statistics counter

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The `system node internal-switch dump stat` command is used to display the counter information of the internal switch ports.

Parameters

```
{-fields <fieldname>, ...}

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

{-instance}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

{-node <nodename>} - Node

Use this parameter to specify the node the switch resides on.

{-switch-id <integer>} - Switch

Use this parameter to specify the switch id. For example, 1.

{-port-id <integer>} - Port

Use this parameter to specify the port id. For example, 0.

{-stat-id <text>} - Counter Name

Use this parameter to specify the counter name.

{-valued <integer>} - Counter Value

Use this parameter to show the value of specified counter.

{-port-name <text>} - Port Name

Use this parameter to specify the port name. For example, e0M.
```

Examples

The following example shows partial counter information of the internal switch 0 on Node1.

```
```

system node commands
system node power commands

The power directory

system node power on

Power nodes on

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
This command switches on the power of the main controller of the specified node. This command works for a single node only and the full name of the node must be entered exactly.

Parameters

- `node {<nodename>|local)` - Node
  
  This parameter specifies the node whose power you want to switch on.

Examples

The following example switches on the power of node2.

```
cluster1::> set advanced
Warning: These advanced commands are potentially dangerous; use them only when
directed to do so by NetApp personnel.
Do you want to continue? {y|n}: y
cluster1::> system node power on -node node2
cluster1::>
```

system node power show

Display the current power status of the nodes

 Availability: This command is available to cluster administrators at the admin privilege level.

Description
This command displays the power status of the main controller in each node across the cluster.
Parameters
{[-fields <fieldname>, ...]}

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

[[-instance]]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-node (<nodename> | local)] - Node

This optional parameter specifies the name of a node for which information is to be displayed. If this parameter is not specified, the command displays information about all nodes in the cluster.

[-status {on | off}] - Current Power Status

If the -status parameter is specified, the command only lists information about the node with the power status value you enter.

Examples
The following example displays power status of all the nodes in cluster1.

```
cluster1::> system node power show
Node     Status
--------  --------
node1     on
node2     on
2 entries were displayed.
cluster1::>
```

system node root-mount commands

The root-mount directory

system node root-mount create

Create a mount from one node to another node's root volume.

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system node root-mount create command produces a root-mount from one node in the cluster to another node's root volume. The root-mount is marked for immediate creation by a background task. Use the system node root-mount show command to view the current status of root-mount or verify task completion.

Parameters
- node <nodename> - Owner of the Root-mount

  The node name where the root-mount will be created.

- root-node <nodename> - Root-mount Destination Node

  The node name that the root-mount will access.

Examples
The following example shows the creation of a root-mount from cluster1::nodeA to cluster1::nodeB and the verification of the successful completion.
cluster1::> system node root-mount show
This table is currently empty.

cluster1::> system node root-mount create -node nodeA -root-node nodeB

cluster1::> system node root-mount show
Node        Root Node       State       Last Error
----------------- ----------------- ----------- -------------------------------
nodeA         nodeB           ready

Related references
- system node root-mount show on page 1107
- system node root-mount delete on page 1106

**system node root-mount delete**

Delete a mount from one node to another node's root volume.

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
The `system node root-mount delete` command removes a root-mount from one node in the cluster to another node's root volume. The root-mount is marked for immediate deletion by a background task. Use the `system node root-mount show` command to view the current status of root-mount or verify task completion.

**Parameters**

- `-node <nodename>` - Owner of the Root-mount
  The node which has the mount.

- `-root-node <nodename>` - Root-mount Destination Node
  The node accessed by the mount.

**Examples**

This example shows the deletion of a root-mount from `cluster1::nodeA` to `cluster1::nodeB` and the verification of the command's successful completion.

```
cluster1::> system node root-mount show
Node        Root Node       State       Last Error
----------------- ----------------- ----------- -------------------------------
nodeA         nodeB           ready

cluster1::> system node root-mount delete -node nodeA -root-node nodeB

cluster1::> system node root-mount show
This table is currently empty.
```

Related references
- system node root-mount show on page 1107
- system node root-mount create on page 1105
system node root-mount show

Show the existing mounts from any node to another node’s root volume.

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system node root-mount show command displays the status of current root-mounts from any node to another node's root volume. These root-mounts are used by cluster services to access data on other nodes in the cluster. These root-mounts are not pre-created, but are created as they are needed. They can also be manually created or deleted.

Parameters

```
[-fields <fieldname>, ...]  
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance ]  
If you specify the -instance parameter, the command displays detailed information about all fields.

[-node <nodename>] - Owner of the Root-mount  
Selects information about root-mounts that exist on the specified node.

[-root-node <nodename>] - Root-mount Destination Node  
Selects information about root-mounts that connect to the specified node.

[-create-time <MM/DD/YYYY HH:MM:SS>] - Mount Creation Time  
Selects information about root-mounts that were created at the specified time.

[-state <Mount State>] - State of the Root-Mount  
Selects information about root-mounts that have the specified state. The states are:

• unknown: The state of the root-mount is being determined.
• initializing: A root-mount was found and needs testing to determine the correct state.
• mount-requested: The root-mount has been requested, but is not ready.
• mounting: The root-mount is being created, but is not ready.
• ready: The root-mount is ready to be used.
• not-responding: The root-mount exists but is not responding.
• does-not-exist: No root-mount is possible to this node's root volume.
• ha-busy: The root-mount is busy pending completion of an HA event.
• clean-up-requested: The root-mount is being deleted.
• cleaning-up: The root-mount is being deleted.
• create-error: The root-mount could not be created.

[-last-error <text>] - Last Error  
Selects information about root-mounts that have the specified last-error value.
```

Examples
The following example shows the default state of the root-mounts on a cluster that is not using root-node services:
The following example displays the root-mounts that exist for a cluster that has nodeA mounted to nodeB, and nodeB mounted to nodeA:

```
cluster1::> system node root-mount show
          Node              Root Node         State       Last Error
          ----------------- ----------------- ----------- -------------------------------
          nodeA             nodeB                   ready
          nodeB             nodeA                   ready
```

**system node upgrade-revert commands**

The upgrade-revert directory

**system node upgrade-revert show**

Display upgrade/revert node status.

**Availability:** This command is available to cluster administrators at the `advanced` privilege level.

**Description**

The `system node upgrade-revert show` command displays information about the status of upgrades or reversions. If an upgrade has failed, this command enables you to determine which phase of the upgrade contains the failed upgrade task and the reason for the failure.

**Parameters**

```
[[-fields <fieldname>, ...]

If you specify the `--fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `--fields ?` to display the fields to specify.

[[-instance]]

If you specify the `--instance` parameter, the command displays detailed information about all fields.

[-node <nodename>|local] - Node

Use this parameter to display status information only about upgrades or reversions that are slated to occur on the nodes you specify.

[-upgrade-version <integer>] - Cluster Upgrade Version

Selects status information about upgrades or reversions that are to the version number you specify.

[-startup-phase (pre-root|pre-apps|post-apps)] - Startup Phase

Selects status information about upgrades or reversions that are slated to occur during the startup phase you specify. Startup phases are:

- pre-root - Upgrade is applied before mroot is mounted
- pre-apps - Upgrade is applied before other cluster apps are started
- post-apps - Upgrade is applied after all RDB apps are online
```
[-status <Upgrade/Revert Execution Status>] - Execution Status
Selects status information about upgrades or reversions that have the execution status you specify. Execution statuses are:
• prepared - Ready to upgrade
• applied - Successful upgrade
• reverted - Successful reversion
• failed - Unsuccessful upgrade or reversion
• aborted - Unsuccessful upgrade or reversion
• skipped - Upgrade or reversion was skipped for that phase
• locked - Upgrading or reverting

[-status-msg <text>] - Status Message
Selects status information about upgrades or reversions that have the status message you specify. The status message displays the current status of the phase with which it appears.

[-direction {upgrade|revert}] - Upgrade/Revert Direction
Use this parameter with the value upgrade to select status information about upgrades. Use this parameter with the value revert to select status information about reversions.

[-node-status {reverting|complete|not-needed|aborted|failed|waiting|in-progress|stopped}] - Node Status
Selects status information about upgrades or reversions that have the status you specify on nodes where they are slated to occur. Node statuses are:
• aborted - Upgrade process aborted. Contact support personnel.
• failed - Upgrade process failed. Contact support personnel.
• stopped - Upgrade process stopped due to node or management application restart. Use the system node upgrade-revert upgrade command to complete the upgrade manually.
• complete - Upgrade process completed successfully.
• waiting - Upgrade process is waiting the replication database to come online or for applications to be stable. If the RDB is not online, check network connectivity using cluster show and cluster ping-cluster to ensure that all nodes are healthy and in communication.

[-node-status-msg <text>] - Node Status Message
Selects status information about upgrades or reversions that have the node status message you specify. The node status message displays the upgrade or reversion status of the node with which it appears. If the upgrade or reversion fails, this message provides information that helps to diagnose the cause of the failure.

Examples
The following example shows typical output for a cluster with two nodes. Status messages for each phase display information about the tasks in that phase.

```
classeter1:*> system node upgrade-revert show
Node: node1                                             Status: complete
Status Message: The upgrade is complete.
Vers Phase       Status       Upgrade Phase Status Message
----------      -----------   ------------------------------------------------------
```

system node commands
Related references

*system node upgrade-revert upgrade* on page 1110  
*cluster show* on page 24  
*cluster ping-cluster* on page 20

**system node upgrade-revert upgrade**

Run the upgrade at a specific phase.

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**

The `system node upgrade-revert upgrade` command manually executes an upgrade. Use this command to execute an upgrade after issues that caused an upgrade failure are resolved. If the upgrade is successful, no messages display.

Before the command executes upgrades, it checks the configuration of the nodes in the cluster. If no upgrades are needed, the command displays a message and does not execute any upgrades.

**Parameters**

- `-node <nodename>|local` - Node

  Specifies the node that is to be upgraded. The value *local* specifies the current node.

**Examples**

This example shows command output of a node named *node0* if node configuration is current.

```
cluster1::*> system node upgrade-revert upgrade -node node0
The node configuration is up-to-date. No upgrade is needed.
```

**system node virtual-machine commands**

Configure Data ONTAP virtual machine settings

The `system node virtual-machine commands` enable virtual machine and hypervisor management.

**system node virtual-machine instance commands**

View virtual machine instance information

The `system node virtual-machine instance commands` enable virtual machine instance management.
system node virtual-machine instance show

Display virtual machine instance information per node

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The `system node virtual-machine instance show` command displays virtual machine information. With this information you can determine the relationship between a Data ONTAP *node* and its associated virtual machine instance running within a cloud provider. Several other details about the virtual machine can be extracted as well, such as the cloud provider account ID to which it belongs. To filter command output, specify any number of optional fields listed below.

**Parameters**

```bash
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance]
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[-node {<nodename> | local}] - Node
```

This optional parameter represents the name of the Data ONTAP node running in a virtual machine for which information is to be displayed. If this parameter is not specified, the command displays information about all nodes in the cluster.

```
[-instance-id <text>] - ID of This Instance
```

A cloud provider-supplied unique instance ID for this virtual machine, for example "i-a9d42f89" or "db00a7755a5e4e8a8fe4b19bc3b330c3.1".

```
[-account-id <text>] - ID of This Account
```

The cloud provider-associated account ID for this virtual machine. This parameter is usually associated with a cloud provider login ID and password.

```
[-image-id <text>] - ID Of the Image in Use on This Instance
```

The image ID installed on this virtual machine instance. It identifies a pre-defined template of a computing device's software environment. It contains the operating system and can also include application software, such as database servers, middleware, and web servers. In this case, the ID refers to an image that contains everything required to run Data ONTAP in the cloud.

```
[-instance-type <text>] - Specifies System Attributes and Use Cost
```

A specification (as defined by the cloud provider) that defines the memory, CPU, storage capacity and usage cost for a virtual machine instance. Some instance types are designed for standard applications, whereas others are designed for CPU-intensive or memory-intensive applications and so on.

```
[-region <text>] - Set of Resources in the Same Geographic Area
```

A named set of resources in the same geographical area. For example "us-east-1" might be the name for a collection of compute and storage resources on the eastern coast of the United States. Typically, a region contains multiple availability zones.

```
[-version <text>] - Version of This VM Instance Information
```

The version of the Instance Metadata or Agent Wire Protocol as defined by the cloud provider.

```
[-availability-zone <text>] - Distinct Location within a Region
```

A distinct location within a *region* that is insulated from failures in other availability zones. It provides low-latency network connectivity to other availability zones in the same region.

```
[-primary-ip <text>] - Primary IP Address Assigned to this Instance
```

The primary IP address assigned to this virtual machine instance.
deployment-id <text> - Deployment ID of This Instance

A cloud provider-supplied unique deployment ID for this virtual machine, for example "2831c724-97ca-4395-b8d3-a65c2a65b502".

fault-domain <integer> - Fault Domain of This Instance

A cloud provider-assigned numerical fault domain ID for this virtual machine within an Availability Set.

update-domain <integer> - Update Domain of This Instance

A cloud provider-assigned numerical update domain ID for this virtual machine within an Availability Set.

provider <text> - Provider on which this instance is running.

The provider on which this instance is running.

Examples

The following examples illustrate typical output from the system node virtual-machine instance show command for a virtual machine running in a cloud provider environment.

```
cluster1::> system node virtual-machine instance show
Node:  node1
Instance ID:  i-b9c42e97
Account ID:  751083215869
Image ID:  ami-7fb4a1c6
Instance Type:  m3.xlarge
Region:  us-east-1
Version:  2010-08-31
Availability Zone:  us-east-1d
Primary IP:  192.168.0.1
Provider:  AWS

cluster1::> system node virtual-machine instance show
Node:  node1
Instance ID:  2831c724-97ca-4395-b8d3-a65c2a65b502._cloudontap-vm
Deployment ID:  2831c724-97ca-4395-b8d3-a65c2a65b502
Version:  2012-11-30
Availability Set:  Fault Domain:  0
Update Doamin:  0
Primary IP:  192.168.0.1
Provider:  Azure
```

system node virtual-machine instance show-system-disks

Display information about Data ONTAP-v system disks

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The system node virtual-machine instance show-system-disks command displays the system disks information of the Data ONTAP node running on the virtual machine. There are three types of Data ONTAP-v system disks - boot, core and log. The details contain the physical properties of the disk and its backing information (e.g. backing store name, iSCSI Lun UUID, etc). To filter command output, specify any number of optional fields listed below.

Parameters

{ [-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.
  }

[ [-instance]]
  If you specify the -instance parameter, the command displays detailed information about all fields.
-node {<nodename>|local]} - Node Name
  The name of the Data ONTAP node running in a virtual machine for which information is to be displayed. If
  this optional parameter is not specified, the command displays information about all nodes in the cluster.

-[vmdisk-type <text>] - Type of the System Disk
  The type of the system disk, for example "Boot", "Core" or "Log". This optional parameter selects the
  information about the system disk with the specified type.

-[vmdisk-name <text>] - Data ONTAP Supplied Name of the System Disk
  The Data ONTAP-supplied name of the system disk. This optional parameter selects the information about
  system disk with the specified name.

-[vmdisk-serial-number <text>] - Data ONTAP Supplied Serial Number of the System Disk
  The Data ONTAP-supplied serial number of the system disk. This optional parameter selects the information
  about system disk with the specified serial number.

-[vmdisk-capacity {<integer>[KB|MB|GB|TB|PB]}] - Size of the System Disk
  The size of the system disk. This optional parameter selects the information about system disks with the
  specified size.

-[vmdisk-area-name <text>] - Name of the System Disk Backing Store
  The name of the disk backing store. A backing store represents a storage location for virtual machine files. It
  can be a VMFS volume, a directory on network-attached storage, or a local file system path. This optional
  parameter selects the information about the system disks that reside on the specified backing store.

-[vmdisk-file-name <text>] - File Name of the System Disk Used By the Hypervisor
  The file name of the virtual disk used by the hypervisor. Each Data ONTAP disk is mapped to a unique VM
  disk file. This optional parameter selects the information about the system disk mapped to the specified file
  name.

-[vmdisk-backing-store-type <text>] - Type of the System Disk Backing Store
  The type of the disk backing store. It can be a VMFS volume, a directory on network-attached storage, or a
  local file system path. This optional parameter selects the information about the system disks that are backed
  by the specified type.

-[vmdisk-backing-store-capacity {<integer>[KB|MB|GB|TB|PB]}] - Size of the System Disk Backing Store
  The size of the disk backing store. This optional parameter selects the information about the system disks that
  are backed by stores with the specified capacity.

-[vmdisk-backing-store-nas-path <text>] - Full Path to the Backing Store for NAS
  The full path to the backing store for network-attached storage. This optional parameter selects the
  information about the system disks with the specified NAS path.

-[vmdisk-backing-adapter-pci <text>] - Backing Adapter PCI Device ID
  The backing adapter PCI device ID for the virtual disk. This optional parameter selects the information about
  the system disks that have the specified ID as their backing adapter PCI ID.

-[vmdisk-backing-adapter-device <text>] - Name of the Backing Adapter Device
  The name of the backing adapter device. This optional parameter selects the information about the system
  disks that have the specified name as their backing adapter device name.

-[vmdisk-backing-adapter-model <text>] - Type of the Backing Adapter Model
  The type of the backing adapter model. This optional parameter selects the information about the system disks
  that have the specified type as their backing adapter model type.

-[vmdisk-backing-adapter-driver <text>] - Backing Adapter Driver Name of the Initiator
  The backing adapter driver name of the initiator. This optional parameter selects the information about the
  system disks that have the specified name as their initiator's backing adapter driver name.
**[vmdisk-backing-target-iscsi-name <text>] - iSCSI Name of the System Disk Backing Target**

The iSCSI name of the disk backing target. This field is valid only for iSCSI connections. This optional parameter selects the information about the system disks that have the specified name as their backing device iSCSI target name.

**[vmdisk-backing-target-iscsi-address <text>] - iSCSI IP Address of the System Disk Backing Target**

The iSCSI IP address of the disk backing target. This field is valid only for iSCSI connections. This optional parameter selects the information about the system disks that have the specified IP as their backing device iSCSI target IP address.

**[vmdisk-backing-device-address <text>] - SCSI Device Name (target-id:lun-id) for the Backing Disk**

The SCSI device name for the backing disk. It takes the form target-id:lun-id, for example "2:1". This optional parameter selects the information about the system disks that have the specified backing device address.

**[vmdisk-backing-device-uuid <text>] - Hypervisor-Assigned Unique ID of the Backing Device**

The hypervisor-assigned unique ID of the backing device (disk or LUN). This optional parameter selects the information about system disks that have the specified UUID.

**[vmdisk-backing-device-partition <integer>] - Backing Disk Partition Number for the VM Disk File**

The backing disk partition number where the corresponding VM disk file resides. This optional parameter selects the information about the system disks that reside on the specified partition number on any disk.

**[vmdisk-backing-device-capacity {<integer> [KB|MB|GB|TB|PB]}] - Size of the Backing Device (Disk or LUN)**

The size of the backing device (disk or LUN) in bytes. This optional parameter selects the information about the system disks that have backing devices with the specified capacity.

---

**Examples**

The following example shows typical output from the `system node virtual-machine instance show-system-disks` command for the Data ONTAP node running on a virtual machine.

```
cluster1::> system node virtual-machine instance show-system-disks
Disk Disk Disk Node Type Name Capacity Name VM Disk File Name
---- ---- ----- -------- ------ -------------------------------
node1 Boot ad0  1.032 GB store1 store1/node1/DataONTAP.vmdk
Core ad1  1.505 GB store2 store2/node1/DataONTAP-var.vmdk
Log  ad2  5.001 GB store3 store3/node1/DataONTAP-nvram.vmdk

Warning: Unable to list entries on node node2. Access to the vSphere server is failing since the server hostname or IP address is not set. Correct the vSphere credentials with the "system node virtual-machine hypervisor modify-credentials* command.
3 entries were displayed.
```

**system node virtual-machine hypervisor commands**

View and configure hypervisor information

The `system node virtual-machine hypervisor commands` enable you to view and manage information about the hypervisor on which Data ONTAP resides.
**system node virtual-machine hypervisor modify-credentials**

Modify hypervisor IP address and its credentials

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The `system node virtual-machine hypervisor modify-credentials` command is used to set the IP address of the hypervisor on which the node is running or vSphere credentials (i.e. `-new-username` or `-new-password`).

**Parameters**

- `-node {<nodename>|local}` - Node
  
  Name of the Data ONTAP node running in a virtual machine. It is a required field and the node must exist in the cluster.

- `[-new-server <text>]` - New Hypervisor IP Address
  
  New vSphere server controlling this virtual machine. It can be either an IP address or (if name resolution is enabled) a hostname.

- `[-new-username <text>]` - New Hypervisor Username
  
  New vSphere username for the `-new-server` specified above.

- `[-new-password <text>]` - New Hypervisor Password
  
  New vSphere password for the `-new-server` specified above.

**Examples**

The following example sets the IP address and the credentials of the vSphere server on which the node is running.

```
cluster1::> system node virtual-machine hypervisor modify-credentials
   -node node1 -new-server 192.168.0.1 -new-username admin -new-password pass123
```

- `system node virtual-machine hypervisor show-credentials` on page 1118

**system node virtual-machine hypervisor show**

Display hypervisor information about Data ONTAP-v nodes

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The `system node virtual-machine hypervisor show` command displays information for each hypervisor that is hosting a Data ONTAP virtual machine. The output contains the hypervisor-specific information, such as host name and IP address, as well as network configuration details. The command only scans hypervisors on which Data ONTAP virtual machines are installed. To filter command output, specify any number of optional fields listed below.

**Parameters**

`{ [-fields <fieldname>,...] }

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?' to display the fields to specify.
If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-node {<nodename>|local}]` - Node
The name of the Data ONTAP node running in a virtual machine for which information is to be displayed. If this optional parameter is not specified, the command displays information about all nodes in the cluster.

`[-vm-uuid <UUID>]` - UUID of the Virtual Machine
The hypervisor-supplied unique ID for this virtual machine. This optional parameter selects information about the hypervisor on which the Data ONTAP virtual machine is running with the specified UUID. Since UUID is unique per host, an alternative and easier way is to use `[-node]` to filter out the same information.

`[-vmhost-bios-release-date <text>]` - Release Date for the Hypervisor BIOS
The release date for the currently running hypervisor BIOS. This optional parameter selects information about the hypervisors that have the specified BIOS release date.

`[-vmhost-bios-version <text>]` - Current BIOS Version of the Hypervisor Physical Chassis
The current BIOS version of the hypervisor physical chassis. This optional parameter selects information about the hypervisors that are running with the specified BIOS version.

`[-vmhost-boot-time <text>]` - Time When Hypervisor was Last Booted
The time when the hypervisor was last booted. This optional parameter selects information about the hypervisors which were last booted at the specified boot time.

`[-vmhost-cpu-clock-rate <integer>]` - Speed of the Hypervisor CPU Cores (MHz)
The speed of the hypervisor CPU cores. This optional parameter selects information about the hypervisors that are running with the specified CPU clock rate.

`[-vmhost-cpu-core-count <integer>]` - Number of Physical CPU Cores on the Hypervisor
The number of physical CPU cores on the hypervisor. Physical CPU cores are the processors contained by a CPU package. This optional parameter selects information about the hypervisors that are running with the specified CPU cores.

`[-vmhost-cpu-socket-count <integer>]` - Number of Physical CPU Packages on the Hypervisor
The number of physical CPU packages on the hypervisor. Physical CPU packages are chips that contain one or more processors. Processors contained by a package are also known as CPU cores. For example, one dual-core package is comprised of one chip that contains two CPU cores. This optional parameter selects information about the hypervisors that are running with the specified CPU sockets.

`[-vmhost-cpu-thread-count <integer>]` - Number of Physical CPU Threads on the Hypervisor
The number of physical CPU threads on the hypervisor. This optional parameter selects information about the hypervisors that are running with the specified CPU threads.

`[-vmhost-gateway <text>]` - Default Gateway for the Hypervisor
The default gateway for the hypervisor. This optional parameter selects information about the hypervisors with the specified gateway address.

`[-vmhost-hardware-vendor <text>]` - Hardware Vendor of the Hypervisor
The name of hypervisor hardware manufacturer. This optional parameter selects information about the hypervisors with the specified hardware vendor.

`[-vmhost-hypervisor <text>]` - Complete Product Name, including the Version Information for the Hypervisor
The complete product name, including the version information for the hypervisor. This optional parameter selects information about the hypervisors that are running with the specified hypervisor version.

`[-vmhost-ip-address <text>]` - Primary IP Address Assigned to the Hypervisor
The primary IP address assigned to the hypervisor. This optional parameter selects information about the hypervisors with the specified IP address.
[-vmhost-memory <integer>] - Physical Memory Size of the Hypervisor (Bytes)

The physical memory size of the hypervisor in bytes. This optional parameter selects information about the
hypervisors that are running with the specified physical memory.

[-vmhost-model <text>] - Hypervisor Manufacturer-Supplied Hardware Model Name

The hypervisor manufacturer-supplied hardware model name. This optional parameter selects information
about the hypervisors with the specified hardware model.

[-vmhost-name <text>] - Hostname of the Hypervisor

The host name assigned to the hypervisor. This optional parameter selects information about the hypervisor
with the specified host name.

[-vmhost-netmask <text>] - Subnet Mask Address for the Hypervisor

The subnet mask address for the hypervisor. This optional parameter selects information about the hypervisors
with the specified netmask address.

[-vmhost-processor-id <text>] - Processor ID of the Hypervisor

The processor ID of the hypervisor. This optional parameter selects information about the hypervisors with the
specified processor ID.

[-vmhost-processor-type <text>] - CPU Model of the Hypervisor

The CPU model of the hypervisor. This optional parameter selects information about the hypervisors that are
running with the specified processor type.

[-vmhost-software-vendor <text>] - Name of the Virtual Machine Software Manufacturer

The name of the virtual machine software manufacturer. This optional parameter selects information about the
hypervisors with the specified software vendor.

[-vmhost-uuid <UUID>] - UUID of the Hypervisor

A unique ID for the hypervisor. This optional parameter selects information about the hypervisor with the
specified UUID.

[-vmhost-error <text>] - Error in case Hypervisor Info Retrieval Fails

Displays a list of nodes on which the hypervisor has received the specified error. This parameter is most useful
when entered with wildcards.

[-vm-custom-max-capacity <integer>] - Maximum Storage Capacity of the Virtual Machine (in TB)

The maximum system capacity (in TB) that can be configured on the VM. This optional parameter selects
information about the node's storage capacity.

Examples

The following example shows typical output from the `system node virtual-machine hypervisor show`
command for the Data ONTAP virtual machines running in the cluster.

```
cluster1::> system node virtual-machine hypervisor show

system node virtual-machine instance show-system-disks on page 1112

system node virtual-machine hypervisor show-credentials

Display hypervisor IP address and its credentials

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The system node virtual-machine hypervisor show-credentials command displays the current vSphere authentication information (except the password). This consists of the vSphere server and username. The vSphere password is not displayed for security reasons. vSphere authentication information is required to use (system node virtual-machine hypervisor show -node <node>, system node virtual-machine instance show-system-disks -node <node> and storage disk show -virtual-machine-disk-info -node <node>) to be able to gather information about the physical host machine. It also attempts to verify the current vSphere authentication information with the vSphere host. If the check succeeds and the credentials are correct, the command displays the following information. If you want to see details about a single node, use the -node parameter.

• Node
• Hypervisor name or IP Address
• vSphere Username
• Credentials Correct?: true

If the check fails or credentials are incorrect, the command displays an additional Error.

• Node
• Hypervisor name or IP Address
• vSphere Username
• Credentials Correct?: false
• Error:

Parameters
{ [ -fields <fieldname>, ... ]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?' to display the fields to specify.
}[ -instance ]
  If you specify the -instance parameter, the command displays detailed information about all fields.
[-node { <nodename> | local } ] - Node
  This optional parameter represents the name of the Data ONTAP node running in a virtual machine for which information is to be displayed. If this parameter is not specified, the command displays information about all nodes in the cluster.
[-server <text> ] - Hypervisor IP Address or Hostname
  Use this parameter to only display the Data ONTAP nodes in the cluster whose vSphere server matches this value.
[ -username <text> ] - Hypervisor Username
  Use this parameter to only display the Data ONTAP nodes in the cluster whose vSphere username matches this value.
[ -are-credentials-correct { true | false } ] - Credentials Correct?
  Get a list of Data ONTAP nodes running with either incorrect (false) or correct (true) vSphere credentials.
[ -error <text> ] - Error
  Get a list of nodes with the specified error. This parameter is most useful when entered with wildcards.

Examples
The following example shows the vSphere server and vSphere username. It also displays whether the server address or its credentials are correct and displays an error if they are not.

```
cluster1::> system node virtual-machine hypervisor show-credentials
  Node: node1
  Hypervisor IP Address: 192.168.0.1
  vSphere Username: administrator
  Credentials Correct?: true

  Node: node2
  Hypervisor IP Address: 
  vSphere Username: admin
  Credentials Correct?: false
  Error: [13166] could not find IP addr for host.
  Correct the vSphere credentials with the
  "system node virtual-machine hypervisor modify-credentials -node" command.

2 entries were displayed.

system node virtual-machine provider commands

Configure how Data ONTAP accesses the provider's services

The system node virtual-machine provider commands configure how Data ONTAP accesses the provider's services.

system node virtual-machine provider credential commands

Configure the credentials used to access the provider's services

The system node virtual-machine provider credential commands configure the credentials used to access provider services.

**system node virtual-machine provider credential create**

Add provider credentials

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

The system node virtual-machine provider credential create command configures a node with the given credentials. The credentials are used by the Data ONTAP node to access the provider's services.

**Parameters**

- `node <nodename>|local` - Node
  
  This parameter specifies the name of the Data ONTAP node for which the credentials will be configured.

- `aws-access-key <text>` - Amazon Web Services Access Key
  
  This parameter specifies the AWS access key. The key must be 16 to 32 characters in length.

- `aws-secret-key <text>` - Amazon Web Services Secret Key
  
  This parameter specifies the AWS secret key associated with the `aws-access-key`.

**Examples**

The following example configures a node with an AWS access key pair.

```
cluster1::> system node virtual-machine provider credential create
    -node node1 -aws-access-key AKIAIOSFODNN7EXAMPLE
    -aws-secret-key wJalrXUttnFEMI/K7MDENG/bFxRfiCyzEXAMPLEKEY
```

**system node virtual-machine provider credential delete**

Remove provider credentials

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

The system node virtual-machine provider credential delete command removes the credentials configured on a node. The credentials are used by the Data ONTAP node to access the provider's services.

**Parameters**

- `node <nodename>|local` - Node
  
  This parameter specifies the name of the Data ONTAP node for which the credentials will be deleted.
Examples
The following example removes provider credentials from all nodes in the cluster.

cluster1::> system node virtual-machine provider credential delete -node *

**system node virtual-machine provider credential modify**

Modify provider credentials

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
The `system node virtual-machine provider credential modify` command reconfigures a node with the given credentials. The credentials are used by the Data ONTAP node to access the provider's services.

**Parameters**

- `-node <nodename>|local` - Node
  This parameter specifies the name of the Data ONTAP node for which the credentials will be modified.

  - `[-aws-access-key <text>]` - Amazon Web Services Access Key
    This parameter specifies the AWS access key. The key must be 16 to 32 characters in length.

  - `[-aws-secret-key <text>]` - Amazon Web Services Secret Key
    This parameter specifies the AWS secret key associated with the provided `aws-access-key`.

**Examples**
The following example reconfigures all nodes with an AWS access key pair.

cluster1::> system node virtual-machine provider credential modify
  -node * -aws-access-key AKIAIOSFODNN7EXAMPLE
  -aws-secret-key wJalrXUtnFEMI/K7MDENG/bPxRfiCYzEXAMPLEKEY

**system node virtual-machine provider credential show**

Display the provider credentials

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
The `system node virtual-machine provider credential show` command displays the provider credentials configured for each Data ONTAP node in the cluster. The credentials are used by the Data ONTAP node to access the provider's services.

**Parameters**

- `[-fields <fieldname>,...]
  If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

- `[-instance]
  If you specify the `-instance` parameter, the command displays detailed information about all fields.
[-node {<nodename>|local}] - Node

This optional parameter represents the name of the Data ONTAP node for which information is to be displayed. If this parameter is not specified, the command displays information about all nodes in the cluster.

[-aws-access-key <text>] - Amazon Web Services Access Key

This optional parameter selects nodes configured with the specified AWS access key.

Examples

The following example illustrates typical output from the `system node virtual-machine provider credential show` command for the Data ONTAP virtual machines running in the cluster.

```
cluster1::> system node virtual-machine provider credential show
Node                Amazon Web Services Access Key
------------------- ------------------------------
node1               AKIAIOSFODNN7EXAMPLE
node2               AKIAIOSFODNN7EXAMPLE
2 entries were displayed.
```

**system node virtual-machine provider proxy commands**

Configure the proxy server used to access the provider's services

The `system node virtual-machine provider proxy` commands configure whether a proxy server is used to access the provider's services.

**system node virtual-machine provider proxy create**

Add a proxy server

*Availability:* This command is available to `cluster` administrators at the `admin` privilege level.

*Description*

The `system node virtual-machine provider proxy create` command configures a `node` to use a proxy server to access the provider's services.

*Parameters*

- `[-node {<nodename>|local}] - Node`

  This parameter specifies the name of the Data ONTAP node for which the proxy server will be configured.

- `[-server <text>] - Proxy Server`

  This parameter specifies the proxy server. It takes the form: [protocol://]server[:port]

*Examples*

The following example configures a `node` to use a proxy server.

```
cluster1::> system node virtual-machine provider proxy create
    -node node1 -server http://10.11.12.13:9090
```

**system node virtual-machine provider proxy delete**

Remove the proxy server

*Availability:* This command is available to `cluster` administrators at the `admin` privilege level.
Description
The `system node virtual-machine provider proxy delete` command removes the proxy configuration from a `node`. The proxy is used by the Data ONTAP `node` to access the provider's services.

Parameters
- `-node <nodename>|local` - `Node`
  This parameter specifies the name of the Data ONTAP node for which the proxy configuration will be deleted.

Examples
The following example removes the proxy configuration from all `nodes` in the cluster.

```
cluster1::> system node virtual-machine provider proxy delete -node *
```

**system node virtual-machine provider proxy modify**

Modify the proxy server

Availability: This command is available to `cluster` administrators at the `admin` privilege level.

Description
The `system node virtual-machine provider proxy modify` command changes the proxy configuration on a `node`. The proxy is used by the Data ONTAP `node` to access the provider's services.

Parameters
- `-node <nodename>|local` - `Node`
  This parameter specifies the name of the Data ONTAP node for which the proxy configuration will be modified.

- `-server <text>` - `Proxy Server`
  This parameter specifies the proxy server. It takes the form: `[protocol://]server[:port]`

Examples
The following example reconfigures all `nodes` to use a proxy server.

```
cluster1::> system node virtual-machine provider proxy modify
```

**system node virtual-machine provider proxy show**

Display the proxy server

Availability: This command is available to `cluster` administrators at the `admin` privilege level.

Description
The `system node virtual-machine provider proxy show` command displays the proxy server configured for each Data ONTAP `node` in the cluster. The proxy is used by the Data ONTAP `node` to access the provider's services.

Parameters

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.
If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-node <nodename>|local]` - Node

This optional parameter represents the name of the Data ONTAP node for which information is to be displayed. If this parameter is not specified, the command displays information about all nodes in the cluster.

`[-server <text>]` - Proxy Server

This optional parameter selects nodes configured with the specified proxy server.

### Examples

The following example illustrates typical output from the `system node virtual-machine provider proxy show` command for the Data ONTAP virtual machines running in the cluster.

```markdown
cluster1:/> system node virtual-machine provider proxy show
Node                Proxy Server
------------------- ------------------------------
node1               http://10.11.12.13:9090
node2               http://10.11.12.13:9090
2 entries were displayed.
```

### system script commands

Capture CLI session to a file for later upload. Analogous to the unix `script` command

#### system script delete

Delete saved CLI session logs

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**

The `system script delete` command deletes files that contain CLI session records. Use the `system script show` command to display saved CLI sessions.

**Parameters**

`-username <text>` - Log Owner Username

Use this parameter to specify the name of the user whose CLI session record files are deleted. The default is the username that is that of the logged in user.

`-filename <text>` - Log Filename

Use this parameter to specify the names of CLI session record files to delete.

#### Examples

The following example shows how to delete the files named `sessionlog2` and `sessionlog3`.

```bash
cluster1:/> system script delete -filename sessionlog2,sessionlog3
```

The following example deletes all saved script files.

```bash
cluster1:/> system script delete *
```
system script show

Display saved CLI session logs

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system script show command displays information about files that contain records of CLI sessions.

For security reasons, the command normally displays only the script files created by the logged in user. Administrative users can display all log files using the -user parameter.

Parameters

{ [-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.
  [-user]
  Use this parameter to display all script files created by all users, along with the username associated with each file.
  [-instance]
  If you specify the -instance parameter, the command displays detailed information about all fields.
 [-username <text>] - Log Owner Username
  Use this parameter to display information only about files saved by the user you specify. The default username is that of the logged in user.
 [-filename <text>] - Log Filename
  Use this parameter to display information only about files that have the file name you specify.
 [-size-limit {<integer>[KB|MB|GB|TB|PB]}] - Logfile Size Limit
  Use this parameter to display information only about files that have the size limit you specify.
 [-state <State of CLI session log>] - Current State
  Use this parameter to display information only about files that have the state you specify. Valid values for this parameter are open-and-logging, file-full, and file-closed.
 [-size {<integer>[KB|MB|GB|TB|PB]}] - Current Logfile Size
  Use this parameter to display information only about files that are the size you specify.
 [-mtime <MM/DD/YYYY HH:MM:SS>] - Last Modification Time
  Use this parameter to display information only about files that were last modified at the date and time you specify.
 [-this-session {yes|no}] - Session is Logging
  Use this parameter with the value yes to display information only about files that are recording the current CLI session. Use this parameter with the value no to display information only about files that are not recording the current CLI session.

Examples

The following example displays typical system script information.
system script start

Start logging all CLI I/O to session log

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
The `system script start` command starts creating a record of your CLI session. The record is stored in a file. Use the `system script show -this-session yes` command to display files that are recording the current CLI session. Use the `system script stop` command to stop recording the current CLI session.

**Parameters**

- **-filename `<text>` - Filename to Log To**
  Use this parameter to specify the file name to which the CLI session record is saved.

- **-size-limit `{<integer> [KB|MB|GB|TB|PB]}` - Logfile Size Limit Max:2GB**
  Use this parameter to specify the maximum size of the file that contains the CLI session record. When the file size reaches this limit, recording stops. The default file size limit is 1 MB. The maximum file size limit is 2 GB.

**Examples**
The following example shows how to start creating a record of the CLI session in a file named `sessionlog3`. The size limit of this file is 20 MB.

```
cluster1::> system script start -filename sessionlog3 -size-limit 20MB
```

**Related references**

- `system script stop` on page 1126

system script stop

Stops logging CLI I/O

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
The `system script stop` command stops creating a record of your CLI session, if you started creating the record by using the `system script start` command. Use the `system script show -this-session yes` command to display files that are recording the current CLI session.

**Examples**
The following example shows how to stop creating a record of your CLI session.
system script upload

Upload the selected CLI session log

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The system script upload command uploads a CLI session record file to a remote location. Specify the remote location using an FTP or HTTP URI. Use the system script show command to display saved CLI sessions. Use the system script start command to record a CLI session and save it to a file.

Parameters

-username <text> - Username If Not Your Own

Use this parameter to specify the name of the user who owns the file to upload. By default, this is the user who is logged in.

-filename <text> - Filename to Log To

Use this parameter to specify the name of a file to be uploaded.

-destination {(ftp|http://(hostname|IPv4 Address|'['IPv6 Address'])}...} - URI to Send File To

Use this parameter to specify the FTP or HTTP destination of the file.

Examples

The following example shows how to upload the file named sessionlog3 to the destination ftp://now.example.com/cli_sessions.

cluster1::> system script upload -filename sessionlog3 -destination ftp://now.example.com/cli_sessions

system script start on page 1126

system service-processor commands

Display and configure the Service Processor

system service-processor reboot-sp

Reboot the Service Processor on a node

Availability: This command is available to cluster administrators at the admin privilege level.
Description
The `system service-processor reboot-sp` command reboots the Service Processor of the specified node.

Parameters
- `node {<nodename>|local}` - Node
  This parameter specifies the node whose Service Processor is to be rebooted.

  `[ -image {primary|backup} ]` - Image to Boot with After Reboot
  This parameter specifies the image that the Service Processor uses after the reboot. By default, the `primary` image is used. Avoid booting the SP from the backup image. Booting from the backup image is reserved for troubleshooting and recovery purposes only. It might require that the SP automatic firmware update be disabled, which is not a recommended setting. You should contact technical support before attempting to boot the SP from the backup image.

Examples
The following command reboots the Service Processor of node "node1" into the `primary` image.

```
cluster1::> system service-processor reboot-sp -node node1 -image primary
```

NOTE: If your console connection is through the SP, it will be disconnected.
Do you want to reboot the SP? {y|n}: y

cluster1::>

The following command reboots the Service Processors of all nodes. Since `-image` is not specified, the Service Processors will boot into the `primary` image.

```
cluster1::> system service-processor reboot-sp -node *
```

NOTE: If your console connection is through the SP, it will be disconnected.
Do you want to reboot the SP? {y|n}: y
2 entries were acted on.

cluster1::>

**system service-processor show**

Display the Service Processor information

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**
The `system service-processor show` command displays information about the Service Processor of each node in a cluster. You can limit output to specific types of information and specific nodes in the cluster, or filter output by specific field values.

In case a node is offline or its Service Processor management daemon is down, the command displays the last known IP address of its Service Processor. Only the IP address is displayed in such cases.

Parameters
```
[-fields <fieldname>, ...]
```
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.
If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-node {<nodename>|local}]` - Node
Selects information for the Service Processor of the specified node.

`[-type {SP|NONE}]` - Type of Device
Selects information for the Service Processors of the specified type.

`[-status {online|offline|sp-daemon-offline|node-offline|degraded|rebooting|unknown}]` - Status
Selects information for the Service Processors whose status matches the specified value.

`[-ip-configured {true|false}]` - Is Network Configured
Selects information for the Service Processors whose network is configured (`true`) or not configured (`false`).

`[-address <IP Address>, ...]` - Public IP Address
Selects information for the Service Processors that use the specified IP address or addresses.

`[-mac <MAC Address>]` - MAC Address
Selects information for the Service Processors that use the specified MAC address.

`[-fw-version <text>]` - Firmware Version
Selects information for the Service Processors that are running the specified firmware version.

`[-part-num <text>]` - Part Number
Selects information for the Service Processors that have the specified part number.

`[-serial-num <text>]` - Serial Number
Selects information for the Service Processors that have the specified serial number.

`[-dev-rev <text>]` - Device Revision
Selects information for the Service Processors that have the specified device revision.

`[-autoupdate-enabled {true|false}]` - Is Firmware Autoupdate Enabled
Selects information for the Service Processors that have the specified status for firmware automatic update.

**Examples**

The following example displays basic information for the Service Processors of all the nodes.

```
cluster1::> system service-processor show
Node        Type  Status  IP   Configured  Firmware Version  IP Address
----------- ---- ------- ---- ------------ --------- -------------------------
node1       SP    online  true  2.2X5        true         192.168.1.201
node2       SP    online  true  2.2X5        true         192.168.1.202
2 entries were displayed.
```

The following example displays all available information for the Service Processors of all the nodes.

```
cluster1::> system service-processor show -instance
        Node: node1
        Type of Device: SP
        Status: online
        Is Network Configured: true
        Public IP Address: 192.168.1.201
        MAC Address: ab:cd:ef:fe:ed:01
        Firmware Version: 2.2X5
        Part Number: Not Applicable
```
The following example displays only the type, status and firmware version for the Service Processors of all the nodes.

```
cluster1::> system service-processor show -fields type,status,fw-version
node  type status fw-version
node1  SP online 2.2X5
node2  SP online 2.2X5
2 entries were displayed.
```

**system service-processor api-service commands**

Display and configure the Service Processor API service

**system service-processor api-service modify**

Modify service processor API service configuration

**Availability:** This command is available to cluster administrators at the advanced privilege level.

**Description**
The system service-processor api-service modify command modifies SP API service configuration. The SP API is a secure network API that enables Data ONTAP to communicate with the Service Processor over the network.

**Parameters**

- **[-is-enabled (true|false)]** - Is SP API Service Enabled
  
  This parameter enables or disables the API service of the Service Processor. When the API service is disabled, features like network-based firmware updates and network-based down filer log collection will not be available, and the slower serial-interface will be used for firmware updates and down filer log collections.

- **[-port <integer>]** - SP API Service Port

  This parameter specifies the port number on the Service Processor used for the API service. By default, port 50000 is used.

**Examples**
The following example modifies the port number used for the SP API service and then disables the SP API service.
system service-processor api-service renew-certificates

Renew SSL and SSH certificates used for secure communication with Service Processor API service

**Availability:** This command is available to cluster administrators at the advanced privilege level.

**Description**

The `system service-processor api-service renew-certificates` command renews the internal SSL and SSH certificates used for secure communication with the Service Processor API service. If the parameter `-renew-all` is not specified, only host certificates are renewed.

**Parameters**

`[-renew-all {true | false}]` - Renew CA Certificates Also

This parameter specifies the type of certificates that needs to be renewed. If this parameter is set to false, only the host certificates (that is, the client and server certificates) are renewed. If this parameter is set to true, the root-ca certificate is renewed along with the host certificates.

**Examples**

The following example renews the host certificates and the root-ca certificates. The second command renews only the host certificates.

```
cluster1::*>system service-processor api-service renew-certificates -renew-all true
cluster1::*>system service-processor api-service renew-certificates
```

system service-processor api-service show

Display service processor API service configuration

**Availability:** This command is available to cluster administrators at the advanced privilege level.

**Description**

The `system service-processor api-service show` command displays the Service Processor API service configuration.

**Examples**

The following example displays the SP API service configuration:
system service-processor image commands

Service Processor Firmware Image commands

system service-processor image modify

Enable/Disable automatic firmware update

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The `system service-processor image modify` command enables or disables automatic firmware update on the Service Processor of specified node or nodes.

Parameters

- `node <nodename> | local` - Node
  
  The parameter specifies the node on which automatic Service Processor firmware update is to be enabled or disabled.

- `[-autoupdate {true | false}]` - Firmware Autoupdate

  Setting this parameter to `true` enables automatic firmware update. Setting this parameter to `false` disables automatic firmware update. This is a mandatory parameter.

Examples

The following command enables automatic firmware update for the Service Processor on the local node.

```
cluster1::> system service-processor image modify -node local -autoupdate true
```

The following command enables automatic firmware update for the Service Processors on all the nodes.

```
cluster1::> system service-processor image modify -node * -autoupdate true
2 entries were modified.
```

system service-processor image show

Display the details of currently installed Service Processor firmware image

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The `system service-processor image show` command displays information about the currently installed firmware images on the Service Processor of each node in a cluster. You can limit output to specific types of information and specific nodes in the cluster, or filter output by specific field values.
Parameters
{[-fields <fieldname>, ...]
   If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.
([-instance])
   If you specify the -instance parameter, the command displays detailed information about all fields.
[-node <nodename>|local] - Node
   Selects firmware image information for the Service Processor of the specified node.
[-image primary|backup] - Image
   Selects firmware image information for the Service Processors that are running the primary or backup image as specified.
[-type SP|NONE] - Type
   Selects firmware image information for the Service Processors of the specified type.
[-status installed|corrupt|updating|auto-updating|none] - Image Status
   Selects firmware image information for the Service Processors whose image status matches the specified value.
[-is-current true|false] - Is Image Current
   Selects firmware image information for the SP whose current image matches the specified status. This parameter indicates the partition (primary or backup) that the SP is currently booted from, not whether the installed firmware version is most current.
[-version <text>] - Firmware Version
   Selects firmware image information for the Service Processors running the specified firmware version.
[-autoupdate true|false] - Firmware Autoupdate
   Selects firmware image information for the Service Processors whose automatic update matches the specified configuration.
[-last-update-status failed|passed] - Last Update Status
   Selects firmware image information for the Service Processors whose last update is of the specified status.

Examples
The following command displays basic firmware information for the Service Processors of all the nodes.

```
class1::> system service-processor image show
<table>
<thead>
<tr>
<th>Node</th>
<th>Type</th>
<th>Image</th>
<th>Status</th>
<th>Current Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>node1</td>
<td>SP</td>
<td>primary</td>
<td>installed</td>
<td>true</td>
</tr>
<tr>
<td></td>
<td></td>
<td>backup</td>
<td></td>
<td></td>
</tr>
<tr>
<td>node2</td>
<td>SP</td>
<td>primary</td>
<td>installed</td>
<td>true</td>
</tr>
<tr>
<td></td>
<td></td>
<td>backup</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
4 entries were displayed.
```

class1::>

The following command displays all available firmware information for the Service Processors of all the nodes.

```
class1::> system service-processor image show -instance
Node: node1
Image: primary
```

system service-processor commands

1133
system service-processor image update

Update Service Processor firmware

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system service-processor image update command installs a new firmware version on the Service Processor of specified node in a cluster. If this command fails, it will display and log an appropriate error message and abort. No automatic command retries will be performed. This command also specifies which firmware image is to be installed on the Service Processor and how.

You can use the command system service-processor image update-progress show to check the progress of the update.

The following parameter combinations are not supported for this command:

• -update-type differential with -clear-logs true
• -baseline true with -package <text>

Parameters
-node <nodename>|local - Node
This parameter specifies the node whose Service Processor's firmware is to be updated.

[<package <text>]] - Firmware Package
This parameter specifies the package that will be installed. You can find the package file in the SP Update Repository field of the system node image package show command. If you do not specify this
parameter, the Service Processor is updated to the most recent version of the firmware that is available in the update repository. You must specify this parameter if \texttt{baseline} is false or omitted.

\texttt{[-baseline \{true|false\}] - Install Baseline}

If you set this parameter to true, the command installs the Service Processor firmware version that is bundled with the currently running release of Data ONTAP. This is a safety mechanism that allows you to revert the SP firmware to the version that was qualified and bundled with the currently running version of Data ONTAP on your system. If not specified, this parameter defaults to false.

\texttt{[-update-type \{serial-full|serial-differential|network-full\] - Type}

This parameter specifies the type of update to be performed.

If you set the value to \texttt{serial-full}, the command transfers contents of the entire SP firmware image to the SP via the packetized serial interface, and the contents are written to the SP primary partition.

If you set the value to \texttt{serial-differential}, the command transfers the SP firmware files that are different between the old SP firmware image and the new SP firmware image to the SP via the packetized serial interface, and the contents are written to SP primary partition.

If you set the value to \texttt{network-full}, the command transfers the entire SP firmware image to the SP via the SP network interface, and the contents are written to the SP primary partition.

If you do not specify the update-type option, the command checks for dependencies of network-based SP firmware updates. If the dependencies are satisfied, then the command uses the SP network interface to update the SP firmware. If the dependencies are not satisfied, then the serial interface is used.

\texttt{[-clear-logs \{true|false\}] - Clear Logs After Update}

If you set this parameter to \texttt{true}, the command resets log settings to factory default and clears contents of all logs maintained by the Service Processor, including:

- Event logs
- IPMI logs
- Forensics logs

**Examples**

The following command reverts the firmware on the Service Processor of the local node to the version that was packaged with the currently running release of Data ONTAP. A complete install will be performed, clearing all logs maintained by the Service Processor. The second command displays the status of the in-progress firmware install.

```
cluster1::> system service-processor image update -node local -update-type full -baseline true -clear-logs true
```

```
cluster1::>
cluster1::> system service-processor image update-progress show

<table>
<thead>
<tr>
<th>Node</th>
<th>In Progress</th>
<th>Start Time</th>
<th>Percent</th>
<th>Done</th>
<th>End Time</th>
</tr>
</thead>

```
cluster1::>
```
system service-processor image update-progress commands

system service-processor image update-progress show

Display status for the latest Service Processor firmware update

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The `system service-processor image update-progress show` command displays the progress information of firmware updates on the Service Processor of the specified nodes. The "in-progress" field displays "no" if no update is in progress. This command does not display the progress of an SP firmware update that is triggered from the SP CLI.

Parameters

{-fields <fieldname>, ...}
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

{-instance}
If you specify the `-instance` parameter, the command displays detailed information about all fields.

{-node {<nodename> | local}} - Node
This parameter displays the status of Service Processor firmware update for the specified node.

{-start-time <MM/DD/YYYY HH:MM:SS>} - Latest SP Firmware Update Start Timestamp
This parameter displays the status of the Service Processor whose firmware update start time matches the specified value.

{-percent-done <integer>} - Latest SP Firmware Update Percentage Done
This parameter displays the status of the Service Processor whose update completion percentage matches the specified value.

{-end-time <MM/DD/YYYY HH:MM:SS>} - Latest SP Firmware Update End Timestamp
This parameter displays the status of the Service Processor whose firmware update end time matches the specified value.

{-in-progress {yes|no}} - Is Update in Progress
This parameter displays the update status of the Service Processor that matches the specified in-progress status.

Examples

The following example starts a firmware update on the local node and then uses the command `system service-processor image update-progress show` to display progress of firmware updates on Service Processors of all nodes in the system.

```
cluster1::> system service-processor image update -node local -update-type full -baseline true -clear-logs true
cluster1::>
cluster1::> system node service-processor image update-progress show
In       Percent
```
### system service-processor log commands

Service Processor Logs

#### system service-processor log show-allocations

Display the Service Processor log allocation map

**Availability:** This command is available to cluster administrators at the *admin* privilege level.

**Description**
The `system service-processor log show-allocations` command displays the allocation map of the Service Processor logs collected in the cluster. The Service Processor logs of a node are archived in the mroot directory of the collecting node. This command displays the sequence numbers for the Service Processor log files that reside in each collecting node.

**Parameters**

- `[-fields <fieldname>, ...]`
  
  If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

- `[-instance]`
  
  If you specify the `-instance` parameter, the command displays detailed information about all fields.

- `[-node <nodename>|local] - Node`
  
  If you specify this parameter, the command displays the sequence numbers of Service Processor log files that the specified node has collected.

- `[-remote-node <text>] - Remote Node`
  
  If you specify this parameter, the command displays the sequence numbers of Service Processor log files that have been collected from the specified remote node.

- `[-seqList <integer>, ...] - Log File Sequence Numbers`
  
  If you specify this parameter, the command displays information about Service Processor log files with the specified sequence number.

**Examples**
The following example displays the allocation map of the Service Processor log files in the cluster.

```plaintext
cluster1::> system service-processor log show-allocation

<table>
<thead>
<tr>
<th>Node</th>
<th>From Which Node</th>
<th>Log File Sequence</th>
</tr>
</thead>
<tbody>
<tr>
<td>cluster1-01</td>
<td>cluster1-01</td>
<td>10, 11, 12, 13, 15</td>
</tr>
<tr>
<td>cluster1-01</td>
<td>cluster1-02</td>
<td>14, 15, 16, 17</td>
</tr>
<tr>
<td>cluster1-02</td>
<td>cluster1-01</td>
<td>14</td>
</tr>
<tr>
<td>cluster1-02</td>
<td>cluster1-02</td>
<td>11, 12, 13</td>
</tr>
</tbody>
</table>
```
system service-processor network commands

Display and configure the Service Processor Network

system service-processor network modify

Modify the network configuration

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The `system service-processor network modify` command modifies the network configuration of the Service Processor of specified node or nodes in a cluster. If the SP automatic network configuration has been enabled, the `system service-processor network modify` command allows you to only enable or disable the SP IPv4 or Ipv6 network interface.

Parameters
- `-node <nodename> | local` - Node
  This parameter specifies the node whose Service Processor's network configuration is to be modified.
- `-address-family {IPv4 | IPv6}` - Address Family
  This parameter specifies whether the IPv4 or the IPv6 configuration is to be modified.
- `[-enable {true | false}]` - Interface Enabled
  This parameter enables or disables the underlying network interface for the specified address-family. This is a mandatory parameter.
- `[-dhcp {v4 | none}]` - DHCP Status
  If this parameter is set to v4, the Service Processor uses network configuration from the DHCP server. Otherwise, the Service Processor uses the network address you specify. If this parameter is not set to v4 or is not specified, you must specify the IP address, netmask, prefix-length, and gateway in the command. DHCP is not supported for IPv6 configuration.
- `[-ip-address <IP Address>]` - IP Address
  This parameter specifies the public IP address for the Service Processor. You must specify this parameter when the `-dhcp` parameter is not set to v4.
- `[-netmask <IP Address>]` - Netmask
  This parameter specifies the netmask for a Service Processor that uses an IPv4 address. This parameter has no effect if the IP address family is set to IPv6. You must specify this parameter when DHCP is not set to v4 and the address family is IPv4.
- `[-prefix-length <integer>]` - Prefix Length of Subnet Mask
  This parameter specifies the network prefix-length of the Service Processor if the address family is set to IPv6. The parameter has no effect when the address family is set to IPv4. You must specify this parameter when DHCP is not set to v4 and when the address family is set to IPv6.
- `[-gateway <IP Address>]` - Gateway IP Address
  This parameter specifies network gateway of the Service Processor. You must specify this parameter when DHCP is not set to v4.
Examples

The following example enables the network interface for IPv4 on the Service Processor of the local node. It first displays the current network configuration information of the local node to show the network interface is initially disabled, and then enables it with IP address 192.168.1.202, netmask as 255.255.255.0 and gateway as 192.168.1.1. It displays the interim state with SP Network Setup Status field showing "in-progress". It finally displays the network configuration again to confirm the specified values took effect.

```
cluster1::> system service-processor network show -instance -node local

      MAC Address: ab:cd:ef:fe:ed:02
```
system service-processor network show

Display the network configuration

Availability: This command is available to cluster administrators at the admin privilege level.
Description
The `system service-processor network show` command displays the network configuration of the Service Processor of each node in a cluster. You can limit output to specific types of information and specific nodes in the cluster, or filter output by specific field values.

In case a node is offline or its Service Processor management daemon is down, the command displays the last known IP address of its Service Processor. Only the IP address is displayed in such cases.

Parameters

```
[-fields <fieldname>, ...]
```
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance]
```
If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[-node <nodename>|local] - Node
```
Selects network configuration information for the Service Processor of the specified node.

```
[-address-family {IPv4|IPv6}] - Address Family
```
Selects network configuration information for the Service Processors that have the specified IP address family.

```
[-enable {true|false}] - Interface Enabled
```
Selects network configuration information for the Service Processors whose network interface for the given `address-family` is enabled or disabled as specified.

```
[-type {SP|NONE}] - Type of Device
```
Selects network configuration information for the Service Processors of the specified type.

```
[-status {online|offline|sp-daemon-offline|node-offline|degraded|rebooting|unknown}] - Status
```
Selects network configuration information for the Service Processors whose status matches the specified value.

```
[-link-status {up|down|disabled|unknown}] - Link Status
```
Selects network configuration information for the Service Processors whose link status matches the specified value.

```
[-dhcp {v4|none}] - DHCP Status
```
Selects network configuration information for the Service Processors whose DHCP status matches the specified value.

```
[-ip-address <IP Address>] - IP Address
```
Selects network configuration information for the Service Processors that use the specified IP address.

```
[-mac <MAC Address>] - MAC Address
```
Selects network configuration information for the Service Processors that use the specified MAC address.

```
[-netmask <IP Address>] - Netmask
```
This parameter displays information only for the Service Processors that use the specified netmask.

```
[-prefix-length <integer>] - Prefix Length of Subnet Mask
```
Selects network configuration information for the Service Processors whose prefix length of subnet mask matches the specified value.

```
[-router-ip <IP Address>] - Router Assigned IP Address
```
Selects network configuration information for the Service Processors whose router-assigned IP address matches the specified value.
### Examples

The following example displays basic network configuration information for the Service Processors of all the nodes.

<table>

cluster1::>
system service-processor network auto-configuration commands

Manage Service Processor Auto-Configuration Resource

**system service-processor network auto-configuration disable**

Disable Service Processor Auto-Configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The `system service-processor network auto-configuration disable` command disables the SP's use of subnet resource for the automatic configuration of its networking port. This command is a cluster-wide configuration. When you disable the SP automatic network configuration, all SPs in the cluster will be configured to use IPv4 DHCP. Any addresses previously allocated from the subnet to the SP will be released. If the SP fails to obtain an IPv4 IP address from the DHCP server, an EMS message warns you about the failure. The IPv6 interface will be disabled.

**Parameters**

- **-address-family {IPv4|IPv6}** - Subnet Address Family
  
  This parameter specifies whether the IPv4 or the IPv6 automatic configuration is to be disabled for the SP.

**Examples**
The following example disables the automatic configuration for IPv4 on the SP. It first displays the current network configuration and then disables the SP IPv4 automatic network configuration.

```
cluster1::>system service-processor network show
Address
Node Status Family Link State IP Address
```
system service-processor network auto-configuration enable

Enable Service Processor Auto-Configuration

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The system service-processor network auto-configuration enable command enables the automatic network configuration for the SP. This is a cluster-wide configuration. Every node in the cluster will use the specified subnet to allocate IP address, subnet mask and gateway address for the SP configuration. When the SP automatic network configuration is enabled, you do not need to manually manage the SP network of individual nodes. A node that subsequently joins the cluster uses the specified subnet to configure its SP network automatically.

Prior to running this command, the subnet you want to use for the SP automatic network configuration must already be defined in the cluster and must have no resource conflicts with the SP network interface.

Parameters

- **-address-family** *(IPv4|IPv6)* - Subnet Address Family
  This parameter specifies whether the IPv4 or the IPv6 automatic configuration is to be enabled for the SP.

- **-subnet-name** <text> - Subnet Name
  This parameter specifies the network subnet that the SP will use for automatic network configuration.
Examples
The following example enables the automatic network configuration for IPv4 on the SP. It first displays the current SP network configuration, displays available network subnet in the cluster, and then enable the SP to use the subnet for IPv4 automatic configuration.

```
cluster1::> system service-processor network show
Address
Node          Status         Family    Link State  IP Address
------------- -------------- --------- ----------- ------------------------
node1         online         IPv4      up          192.168.1.201
               DHCP: v4
MAC Address: ab:cd:ef:fe:ed:01
Network Gateway: 192.168.1.1

Prefix Length (IPv6 only): -
IPv6 RA Enabled: -
Subnet Name: ipv4_test
SP Network Setup Status: succeeded
```

```
system service-processor network auto-configuration show
Display Service Processor Auto-Configuration Setup
Availability: This command is available to cluster administrators at the admin privilege level.
Description
The system service-processor network auto-configuration show command displays the names of the IPv4 and IPv6 network subnet objects configured in the cluster that the SP uses for automatic configuration.
```
Examples
The following example shows that the SP is configured to use the "ipv4_test" IPv4 subnet in the cluster for the SP automatic network configuration.

```
cluster1::> system service-processor network auto-configuration show
Cluster Name       SP IPv4 Subnet Name       SP IPv6 Subnet Name
-------------------- ---------------------------- ----------------------------
cluster1           ipv4_test              -
```

system service-processor ssh commands

The ssh directory

system service-processor ssh add-allowed-addresses

Add IP addresses to the list that is allowed to access the Service Processor

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system service-processor ssh add-allowed-addresses command grants IP addresses access to the Service Processor.

Parameters
-allowed-addresses <IP Address/Mask>, ... - Public IP Addresses

Use this parameter to specify one or more IP addresses with corresponding netmasks. The value should be specified in the format of address/netmask, for example, 10.98.150.10/24, fd20:8b1e:b255:c09b::/64. Use commas to separate multiple address/netmask pairs. If "0.0.0.0/0, ::/0" is specified in the parameter, any IP address is allowed to access the Service Processor.

Examples
The following examples grant the specified IP addresses access to the Service Processor and display the list of public IP addresses that are allowed to access the Service Processor.

```
cluster1::> system service-processor ssh show
Allowed Addresses: 0.0.0.0/0, ::/0

cluster1::> system service-processor ssh add-allowed-addresses -allowed-addresses 192.168.1.202/24, 192.168.10.201/24
Warning: The default "allow all" setting (0.0.0.0/0, ::/0) will be replaced with your changes. Do you want to continue? {y|n}: y

cluster1::> system service-processor ssh show
Allowed Addresses: 192.168.1.202/24, 192.168.10.201/24

The following example enables all IP addresses to access the Service Processor.
cluster1::> system service-processor ssh add-allowed-addresses -allowed-addresses 0.0.0.0/0, ::/0

cluster1::> system service-processor ssh show
Allowed Addresses: 0.0.0.0/0, ::/0

cluster1::>
```
system service-processor ssh remove-allowed-addresses

Remove IP addresses from the list that is allowed to access the Service Processor

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The `system service-processor ssh remove-allowed-addresses` command blocks the specified IP address from accessing the Service Processor. If all IP addresses are removed from the access list, then the Service Processor is not accessible from any IP address.

Parameters
`-allowed-addresses <IP Address/Netmask>, ...` - Public IP Addresses

Use this parameter to specify one or more IP addresses with corresponding netmasks. The value should be specified in the format of address/netmask, for example, 10.98.150.10/24, fd20:8b1e:b255:c09b::/64. Use commas to separate multiple address/netmask pairs.

Examples
The following example prevents the specified IP addresses from accessing the Service Processor. It also displays the list of public IP addresses that are allowed to access the Service Processor.

```
cluster1::> system service-processor ssh show
   Allowed Addresses: 192.168.1.202/24, 192.168.10.201/24

cluster1::> system service-processor ssh remove-allowed-addresses -allowed-addresses
   192.168.1.202/24, 192.168.10.201/24

Warning: If all IP addresses are removed from the allowed address list, all IP addresses will be denied access. To restore the "allow all" default, use the "system service-processor ssh add-allowed-addresses -allowed-addresses 0.0.0.0/0, ::/0" command. Do you want to continue? {y|n}: y

cluster1::> system service-processor ssh show
   Allowed Addresses: -

cluster1::>
```

system service-processor ssh show

Display SSH security information about the Service Processor

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The `system service-processor ssh show` command displays the IP addresses that are allowed to access the Service Processor by using SSH.

Examples
The following example displays SSH security information about the Service Processor.

```
cluster1::> system service-processor ssh show
   Allowed Addresses: 192.168.1.202/24, 192.168.10.201/24

cluster1::> system service-processor ssh show
   Allowed Addresses: -

cluster1::>
```
system services commands

Manage system services

system services firewall commands

Manage local firewall configuration

system services firewall modify

Modify firewall status

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system services firewall modify command modifies a node's firewall configuration.

Parameters
- **-node** `<nodename>|local` - Node
  Use this parameter to specify the node on which to modify firewall configuration.

- **[-enabled **`true|false`]** - Service Enabled
  Use this parameter to specify whether firewall protection is enabled ("true") or disabled ("false") for the node's network ports. The default setting is true.

- **[-logging **`true|false`]** - (DEPRECATED)-Enable Logging
  Note: This parameter is deprecated and may be removed in a future version of Data ONTAP.
  Use this parameter to specify whether logging is enabled ("true") or disabled ("false") for the firewall service. The default setting is false.

Examples
The following example enables firewall protection and logging for a node named node1:

```
cluster1::> system services firewall modify -node node1 -enabled true -logging true
```

system services firewall show

Show firewall status

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system services firewall show command displays firewall configuration and logging information. If the command is issued without any parameters, it displays information about all nodes in the cluster. You can also query specific nodes for their firewall information by running the command with the `-node` parameter.
Parameters

\{-fields <fieldname>,...\}

If you specify the \{-fields <fieldname>, ...\} parameter, the command output also includes the specified field or fields. You can use \{-fields ?\} to display the fields to specify.

\{-instance\}

If you specify the \{-instance\} parameter, the command displays detailed information about all fields.

\{-node <nodename>|local\} - Node

Selects information about the firewall settings on the node you specify.

\{-enabled true|false\} - Service Enabled

Selects information about the nodes with the firewall enabled ("true") or disabled ("false").

\{-logging true|false\} - (DEPRECATED)-Enable Logging

Note: This parameter is deprecated and may be removed in a future version of Data ONTAP.

Selects information about the nodes with firewall logging enabled ("true") or disabled ("false").

Examples

The following example displays information about firewall configuration for all nodes in the cluster:

```
cluster1::> system services firewall show
Node   Enabled Logging
------ -------- -------
node0  true    false
node1  true    false
node2  true    false
node3  true    false
4 entries were displayed.
```

system services firewall policy commands

Manage firewall policy configuration

system services firewall policy clone

Clone an existing firewall policy

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The system services firewall policy clone command creates a new firewall policy that is an exact copy of an existing policy, but has a new name.

Parameters

\{-vserver <text>\} - Vserver owning the Policy

Use this parameter to specify the name of the Vserver owning the existing policy to copy.

\{-policy <text>\} - Firewall Policy to be Cloned

Use this parameter to specify the name of the existing policy to copy.

\{-destination-vserver <text>\} - Vserver owning the New Firewall Policy

Use this parameter to specify the name of the Vserver that will own the new policy to create.

\{-destination-policy <text>\} - Name of New Firewall Policy

Use this parameter to specify the name of the new policy to create.
system services firewall policy create

Create a firewall policy entry for a network service

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The `system services firewall policy create` command creates a firewall policy entry with the specified name and network service. This command is used both to create the first network service associated with a new firewall policy, or to add to an existing firewall policy by associating another network service with an existing policy. You can optionally specify one or more IP addresses with corresponding netmasks that are allowed to use the firewall policy entry.

You can use the `network interface modify` command with the `-firewall-policy` parameter to put a firewall policy into effect for a given logical interface by modifying that logical interface to use the specified firewall policy.

**Parameters**
- `-vserver <vserver>` - Vserver Name
  Use this parameter to specify the name of the Vserver on which the policy is to be created.
- `-policy <textpolicy_name>` - Policy
  Use this parameter to specify the name of the policy that is to be created.
- `-service <service>` - Service
  Use this parameter to specify the network service that is associated with the policy. Possible values include:
  - default - The default protocol or protocols for the port to which the firewall is applied
  - http - The HTTP protocol
  - https - The HTTPS protocol
  - ntp - The NTP protocol
  - rsh - The RSH protocol
  - snmp - The SNMP protocol
  - ssh - The SSH protocol
  - telnet - The Telnet protocol
- `-allow-list <IP Address/Mask>, ...` - Allowed IPs
  Use this parameter to specify one or more IP addresses with corresponding netmasks that are to be allowed by this firewall policy. The correct format for this parameter is address/netmask, similar to "192.0.2.128/25". Multiple address/netmask pairs should be separated with commas. Use the value `0.0.0.0/0` for "any".

**Examples**
The following example creates a firewall policy named data that uses the SSH protocol and enables access from all IP addresses on the 192.0.2.128/25 subnet:
The following example adds an entry to the firewall policy named data, associating the HTTPS protocol with that policy and enabling access from all IP addresses on the 192.0.2.128/25 subnet:

```
cluster1::> system services firewall policy create -policy data -service ssh -allow-list 192.0.2.128/25
```

```
cluster1::> system services firewall policy create -policy data -service https -allow-list 192.0.2.128/25
```

**Related references**

*network interface modify* on page 287

**system services firewall policy delete**

Remove a service from a firewall policy

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The `system services firewall policy delete` command deletes a firewall policy. You cannot delete a policy that is being used by a logical interface. Use the `network interface modify` command with the `-firewall-policy` parameter to change a network interface's firewall policy.

**Parameters**

- `-vserver <vserver>` - Vserver Name
  
  Use this parameter to specify the Vserver of the policy to delete.

- `-policy <textpolicy_name>` - Policy
  
  Use this parameter to specify the name of the policy to delete.

- `-service <service>` - Service
  
  Use this parameter to specify the policy's network service to delete.

**Examples**

The following example deletes a firewall policy that uses the Telnet protocol on the policy named data:

```
cluster1::> system services firewall policy delete -policy data -service telnet
```

Use wildcards to delete entire policies at once, or particular services from every policy. This example deletes the entire intercluster policy.

```
cluster1::> system services firewall policy delete -policy intercluster -service *
```

This example deletes the telnet service from every policy.

```
cluster1::> system services firewall policy delete -policy * -service telnet
```

**Related references**

*network interface modify* on page 287
system services firewall policy modify

Modify a firewall policy entry for a network service

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The **system services firewall modify** command enables you to modify the list of IP addresses and netmasks associated with a firewall policy.

**Parameters**

`-vserver <vserver>` - Vserver Name

Use this parameter to specify the Vserver of the policy to modify.

`-policy <textpolicy_name>` - Policy

Use this parameter to specify the name of the policy to modify.

`-service <service>` - Service

Use this parameter to specify the policy's network service to modify.

`[-allow-list <IP Address/Mask>, ...]` - Allowed IPs

Use this parameter to specify one or more IP addresses with corresponding netmasks that are allowed by this firewall policy. The correct format for this parameter is address/netmask, similar to "192.0.2.128/25". Multiple address/netmask pairs should be separated with commas. Use the value `0.0.0.0/0` for "any".

**Examples**

The following example modifies the firewall policy named data that uses the SSH protocol to enable access from all addresses on the 192.0.2.128 subnet:

```
cluster1::> system services firewall policy modify -policy data -service ssh -allow-list 192.0.2.128/25
```

**Related references**

- [system services firewall modify on page 1149](#)

system services firewall policy show

Show firewall policies

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The **system services firewall policy show** command displays information about firewall policies.

**Parameters**

`{ [-fields <fieldname>, ...]` (optional)

If you specify the `-fields <fieldname>, ...` parameter, the command displays only the fields that you specify.

`[-instance]` (optional)

Use this parameter to display all the fields for the specified policies.

`[-vserver <vserver>]` - Vserver Name

Use this parameter to display information only about the Vserver you specify.
[\text{-policy <textpolicy\_name>}] - Policy
Use this parameter to display information about the policy you specify.

[\text{-service <service>}] - Service
Use this parameter to display information about the services you specify.

[\text{-allow\_list <IP Address/Mask>, ...}] - Allowed IPs
Use this parameter to display information about the firewall policies that match the list of allowed IP addresses and netmasks you specify. The correct format for this parameter is address/netmask, similar to "192.0.2.128/25". Multiple address/netmask pairs should be separated with commas.

[\text{-ipspace <text>}] - IPspace
Use this parameter to display information only about the IPspace you specify.

Examples
The following example displays information about all firewall policies:

```
cluster1::> system services firewall policy show
Vserver Policy  Service    Allowed
-------  ------------ ---------- -------------------
cluster1    data
            dns  0.0.0.0/0, ::/0
            ndmp 0.0.0.0/0, ::/0
            ndmps 0.0.0.0/0, ::/0
cluster1    intercluster
            ndmp 0.0.0.0/0, ::/0
            ndmps 0.0.0.0/0, ::/0
cluster1    mgmt
            dns  0.0.0.0/0, ::/0
            http 0.0.0.0/0, ::/0
            https 0.0.0.0/0, ::/0
            ndmp 0.0.0.0/0, ::/0
            ndmps 0.0.0.0/0, ::/0
            ntp 0.0.0.0/0, ::/0
            snmp 0.0.0.0/0, ::/0
            ssh 0.0.0.0/0, ::/0
```

system services manager commands
Manage services in a cluster

system services manager install commands
Manage installed services

system services manager install show
Display a list of installed services

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system services manager install show command displays information about installed services.

Parameters
\{ [-fields <fieldname>, ...] \}
If you specify the \text{-fields <fieldname>, ...} parameter, the command output also includes the specified field or fields. You can use \text{\textquotesingle-fields \textquotesingle} to display the fields to specify.
| [-instance ] | If you specify the -instance parameter, the command displays detailed information about all fields. |
| [-service <text>] - Service | Selects information about installed services that have the name you specify. |
| [-version <service version>] - Version | Selects information about installed services that have the version number you specify. |
| [-constituent <text>] - Constituent | Selects information about installed services that have the constituent process you specify. |
| [-nodes {<nodename>|local}, ...] - Nodes | Selects information about services that are installed on the nodes you specify. |
| [-description <text>] - Description | Selects information about installed services that match the description you specify. |

**Examples**
The following example shows typical output from a two-node cluster.

```
cluster1::> system services manager install show
Service           Version Constituent Nodes
----------------- ------- ----------- ---------------------------------------
diagnosis         1.0     schmd       node1, node2
1.0     shmd        node1, node2
2 entries were displayed.
```

**system services manager policy commands**
Manage service policies

**system services manager policy add**
Add a new service policy

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system services manager policy add command adds a new service policy to the services manager. Policies determine which versions of a service can run on the nodes of the cluster.

Parameters
- **-service <text>** - Service
  Use this parameter to specify the name of the service for which to add a policy.
- **-version <service version>** - Version
  Use this parameter to specify the minimum version number of the service to run.

Examples
This example adds a service manager policy for version 1.0 of the diagnosis service.

```
cluster1::> system services manager policy add -service diagnosis -version 1.0
```
**system services manager policy remove**

Remove a service policy

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
The `system services manager policy remove` command removes a policy from the services manager. Policies determine which versions of a service can run on the nodes of the cluster.

**Parameters**
- `service <text>` - **Service**
  
  Use this parameter to specify the name of the service from which to remove a policy.

- `version <service version>` - **Version**
  
  Use this parameter to specify the version number that is configured by the policy to remove.

**Examples**
The following example shows the removal of the service policy for version 1.0 of the diagnosis service.

```
cluster1::> system services manager policy remove -service diagnosis -version 1.0
```

**system services manager policy setstate**

Enable/disable a service policy

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
The `system services manager policy setstate` command enables or disables services manager policies. Use the `system services manager policy show` command to display information about configured policies.

**Parameters**
- `service <text>` - **Service**
  
  Use this parameter to set the state of the policy you specify.

- `version <service version>` - **Version**
  
  Use this parameter to set the state of the policy with the version number you specify.

- `state {on|off}` - **State**
  
  Use this parameter with the value "on" to enable the policy. Use this parameter with the value "off" to disable the policy.

**Examples**
The following example sets the policy for version 1.0 of the diagnosis service to off.

```
cluster1::> system services manager policy setstate -service diagnosis -version 1.0 -state off
```

**Related references**
- `system services manager policy show` on page 1157
system services manager policy show

Display service policies

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system services manager policy show command displays information about policies that determine which versions of a service can run on the nodes of the cluster.

Use the system services manager status show command to view information about services that are configured to run in the cluster.

Parameters
[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance]
If you specify the -instance parameter, the command displays detailed information about all fields.

-service <text> - Service
Selects policies that apply to the service you specify.

-version <service version> - Version
Selects policies that have the version number you specify.

-constituent <text> - Constituent
Selects policies that have the constituent process you specify.

-state {on|off} - State
Use this parameter with the value "on" to select information about policies that are currently active. Use this parameter with the value "off" to select information about policies that are not currently active.

-num-active <integer> - Number Active
Selects policies that have the number of active (running) instances you specify.

-target-nodes <service affinity>, ... - Target Nodes
Selects policies that are configured to run on the nodes you specify.

-tag <UUID> - Tag (privilege: advanced)
Selects policies that have the UUID you specify. Use this parameter with the -fields parameter to display a list of the UUIDs of configured services.

Examples
The following example shows typical output for this command.

```
cluster1::> system services manager policy show
+-----------------+--------+-------------+-------------+
<table>
<thead>
<tr>
<th>Service</th>
<th>Version</th>
<th>State</th>
<th>Constituent</th>
</tr>
</thead>
<tbody>
<tr>
<td>-----------------</td>
<td>--------</td>
<td>-------------</td>
<td>-------------</td>
</tr>
<tr>
<td>diagnosis</td>
<td>1.0</td>
<td>on</td>
<td>schmd</td>
</tr>
<tr>
<td>diagnosis</td>
<td>1.0</td>
<td>on</td>
<td>shmd</td>
</tr>
</tbody>
</table>
+-----------------+--------+-------------+-------------+
2 entries were displayed.
```
system services manager status show

Display the status of a service

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system services manager status show command displays the status of system services that are configured to run in the cluster.

System services run on the nodes of the cluster based on policies. Policies determine which versions of a service can run on the nodes of the cluster. Use the system services manager policy show command to view existing policies.

Parameters

[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

[-instance]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-service <text>] - Service
Selects information about services that match the service name you specify.

[-version <service version>] - Version
Selects information about services that are configured to run the version number you specify. The configured version is the minimum version that is allowed to run in the cluster according to a policy. Use the system services manager policy show command to view information about service policies.

[-constituent <text>] - Constituent
Selects information about services that have the constituent process you specify.

[-actual-version <service version>] - Actual Version
Selects information about services that are running the version number you specify. This number can be higher than the configured version if a more recent version is installed on the node that is running the service.

[-node <nodename>] - Node
Selects information about services that the services manager has assigned to run on the nodes you specify. If the service state is "running", the service is running on these nodes.

[-state <svc_state>] - State
Selects information about services that are in the state you specify.

[-is-running {true|false}] - Is Running
Use this parameter with the value "true" to select information about services that are currently running. Use this parameter with the value "false" to select information about services that are not currently running.

Examples
The example below shows typical output for a simple cluster.

**system services ndmp commands**

Manage NDMP services

These commands can be used to view or modify the configurations of NDMP service across all the nodes in the cluster. These commands are not supported on Infinite Volumes.

**system services ndmp kill**

Kill the specified NDMP session

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The `system services ndmp kill` command is used to terminate a specific NDMP session on a particular node in the cluster. This command is not supported on Infinite Volumes.

**Parameters**

`<integer>` - Session Identifier

Session ID of the NDMP session.

**Examples**
The following example shows how a specific NDMP session on the node named node1 can be terminated:

```
cluster1::> system services ndmp kill 4323 -node node1
```

**system services ndmp kill-all**

Kill all NDMP sessions

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The `system services ndmp kill-all` command is used to terminate all NDMP sessions on a particular node in the cluster. This command is not supported on Infinite Volumes.

**Parameters**

`-node {<nodename> | local}` - Node

Node on which all NDMP sessions needs to be terminated.
system services ndmp modify

(DEPRECATED) - Modify NDMP service configuration

Availability: This command is available to cluster administrators at the admin privilege level.

Description

Note: This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of Data ONTAP. Use the Vserver-aware "vserver services ndmp modify" command.

The system services ndmp modify command allows you to modify the NDMP configurations for a node in the cluster. One or more of the following configurations can be modified:

- Enable/disable NDMP service
- Enable/disable sending the NDMP password in clear text. Note that MD5 authentication mode is always enabled.
- NDMP user ID

This command is not supported on Infinite Volumes.

Parameters

-node {<nodename>|local} - Node
This specifies the node whose NDMP configuration is to be modified.

- [enable {true|false}] - NDMP Service Enabled
This optionally specifies whether NDMP is enabled on the node. The default setting is true.

- [clear-text {true|false}] - Allow Clear Text Password
This optionally specifies whether the NDMP password can be sent in clear text. The default setting is true.

- [user-id <text>] - NDMP User ID
This optionally specifies the ID of the NDMP user.

Examples

The following example modifies the NDMP configuration on a node named node1. The configuration enables NDMP, disables sending the password in clear text, and specifies an NDMP user named ndmp:

```
cluster1::> system services ndmp modify -node node1 -enable true -clear-text false -user-id ndmp
```

system services ndmp off

(DEPRECATED) - Disable NDMP service

Availability: This command is available to cluster administrators at the admin privilege level.
Description

Note: This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of Data ONTAP. Use the Vserver-aware "vserver services ndmp off" command.

The `system services ndmp off` command is used to disable the NDMP service on any node in the cluster. This command is not supported on Infinite Volumes.

Parameters

`-node {<nodename>|local} - Node`

The specific node on which NDMP service is to be disabled.

Examples

The following example is used to turn off the NDMP service on node named node1:

```
cluster1:/> system services ndmp off -node node1
```

`vserver services ndmp off` on page 1850

system services ndmp on

(DEPRECATED)-Enable NDMP service

Availability: This command is available to cluster administrators at the admin privilege level.

Description

Note: This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of Data ONTAP. Use the Vserver-aware "vserver services ndmp on" command.

The `system services ndmp on` command is used to enable the NDMP service across any node in the cluster. This command is not supported on Infinite Volumes.

Parameters

`-node {<nodename>|local} - Node`

The specific node on which the NDMP service is to be enabled.

Examples

The following example is used to turn on the NDMP service on node named node1:

```
cluster1:/> system services ndmp on -node node1
```

Related references

`vserver services ndmp on` on page 1850

system services ndmp password

(DEPRECATED)-Change the NDMP password for the node

Availability: This command is available to cluster administrators at the admin privilege level.
Description

Note: This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of Data ONTAP. Use the Vserver-aware "vserver services ndmp generate-password" command.

The system services ndmp password command is used to change the NDMP password for a node in the cluster. This command is not supported on Infinite Volumes.

Parameters

-node {<nodename>|local} - Node

The specific node for which the password is to be changed.

Examples

The following example is used to change the NDMP password for the node named node1:

```
cluster1:/> system services ndmp password -node node1
Please enter password:
Confirm password:
```

vserver services ndmp generate-password on page 1844

system services ndmp probe

Display list of NDMP sessions

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The system services ndmp probe command displays diagnostic information about all the NDMP sessions in the cluster. The following fields are displayed for each of the sessions:

- Node
- Session identifier
- NDMP version
- Session authorized
- Data state
- Data operation
- Data server halt reason
- Data server connect type
- Data server connect address
- Data server connect port
- Data bytes processed
- Mover state
- Mover mode
- Mover pause reason
- Mover halt reason
- Mover record size
- Mover record number
- Mover bytes moved
- Mover seek position
- Mover bytes left to read
- Mover window offset
- Mover window length
- Mover position
- Mover SetRecordSize flag
- Mover SetWindow flag
- Mover connect type
- Mover connect address
- Mover connect port
- Effective host
- NDMP client address
- NDMP client port
- SCSI device ID
- SCSI hostadapter
- SCSI target ID
- SCSI LUN ID
- Tape device
- Tape mode
- Is Secure Control Connection
- Data Backup Mode
- Data Path
- NDMP Source Address

This command is not supported on Infinite Volumes.

Parameters

[-node {<nodename>|local}] - Node

If this parameter is specified, the command displays information about the sessions running on the specified node only. Node should be a valid node name.

[-session-id <integer>] - Session Identifier

If this parameter is specified, the command displays information only about the specified session.
[-ndmp-version <integer>] - NDMP Version
This parameter refers to the NDMP protocol version being used in the session.

[-session-authorized (true|false)] - Session Authorized
This parameter indicates whether an NDMP session is authenticated or not.

[-data-state <component state>] - Data State
This parameter identifies the current state of the data server's state machine.

[-data-operation <data operation>] - Data Operation
This parameter identifies the data server's current operation.

[-data-halt-reason <halt reason>] - Data Server Halt Reason
This parameter identifies the event that caused the data server state machine to enter the HALTED state.

[-data-con-addr-type <address type>] - Data Server Connect Type
This parameter specifies the type of data connection established by the data server. The data connection can be established locally within a given system or between remote networked systems.

[-data-con-addr <text>] - Data Server Connect Address
This parameter specifies the connection endpoint information for the data server's data connection.

[-data-con-port <integer>] - Data Server Connect Port
This parameter specifies the TCP/IP port that the data server will use when establishing a data connection.

[-data-bytes-processed <integer>] - Data Bytes Processed
This parameter represents the cumulative number of data stream bytes transferred between the backup or recovery method and the data connection during the current data operation.

[-mover-state <component state>] - Mover State
This parameter identifies the current state of the NDMP tape server's mover state machine.

[-mover-mode <mover mode>] - Mover Mode
This parameter identifies the direction of the mover data transfer.

[-mover-pause-reason <pause reason>] - Mover Pause Reason
This parameter identifies the event that caused the mover state machine to enter the PAUSED state.

[-mover-halt-reason <halt reason>] - Mover Halt Reason
This parameter identifies the event that caused the mover state machine to enter the HALTED state.

[-mover-record-size <integer>] - Mover Record Size
This parameter represents the current mover record size in bytes.

[-mover-record-num <integer>] - Mover Record Number
This parameter represents the last tape record processed by the mover.

[-mover-bytes-moved <integer>] - Mover Bytes Moved
This parameter represents the cumulative number of data stream bytes written to the data connection or the number of data stream bytes read from the data connection and written to the tape subsystem, depending on the mode of mover operation.

[-mover-seek-position <integer>] - Mover Seek Position
This parameter represents the data stream offset of the first byte the DMA requested the mover to transfer to the data connection during a mover read operation.

[-mover-bytes-left-to-read <integer>] - Mover Bytes Left to Read
This parameter represents the number of data bytes remaining to be transferred to the data connection to satisfy the current NDMP_MOVER_READ request.
[-mover-window-offset <integer>] - Mover Window Offset
This parameter represents the absolute offset of the first byte of the mover window within the overall data stream.

[-mover-window-length <integer>] - Mover Window Length
This parameter represents the length of the current mover window in bytes.

[-mover-position <integer>] - Mover Position
This parameter can be used to list only those sessions, whose mover position matches a specific value. Mover-position should be an integer.

[-mover-setrecordsize-flag {true|false}] - Mover SetRecordSize Flag
This parameter is used by the DMA to establish the record size used for mover-initiated tape read and write operations.

[-mover-setwindow-flag {true|false}] - Mover SetWindow Flag
This parameter represents whether a mover window has been set or not. A mover window represents the portion of the overall backup stream that is accessible to the mover without intervening DMA tape manipulation.

[-mover-con-addr-type <address type>] - Mover Connect Type
This parameter specifies the type of data connection established by the mover. The data connection can be established locally within a given system or between remote networked systems.

[-mover-con-addr <text>] - Mover Connect Address
This parameter specifies the endpoint address or addresses that the mover will use when establishing a data connection.

[-mover-con-port <integer>] - Mover Connect Port
This parameter specifies the TCP/IP port that the mover will use when establishing a data connection.

[-eff-host <host type>] - Effective Host
This parameter indicates the host context in which the NDMP session runs. The valid values are: PRIMARY or PARTNER.

[-client-addr <text>] - NDMP Client Address
This parameter specifies the client's IP address.

[-client-port <integer>] - NDMP Client Port
This parameter specifies the client's port number.

[-spt-device-id <text>] - SCSI Device ID
This parameter specifies the SCSI device ID.

[-spt-ha <integer>] - SCSI Host Adapter
This parameter specifies the SCSI host adapter.

[-spt-scsi-id <integer>] - SCSI Target ID
This parameter specifies the SCSI target.

[-spt-scsi-lun <integer>] - SCSI LUN ID
This parameter specifies the SCSI LUN ID.

[-tape-device <text>] - Tape Device
This parameter specifies the name to identify the tape device.

[-tape-mode <mover mode>] - Tape Mode
This parameter specifies the mode in which tapes are opened.
[-is-secure-control-connection {true|false}]- Is Secure Control Connection

This parameter specifies whether the control connection is secure or not.

[-data-backup-mode <text>]- Data Backup Mode

This parameter specifies whether the mode of data backup is Dump or SM Tape.

[-data-path <text>]- Data Path

This parameter specifies the path of data being backed up.

[-source-addr <text>]- NDMP Source Address

This parameter specifies the control connection IP address of the NDMP session.

**Examples**

The following example displays diagnostic information about all the sessions in the cluster:

```
cluster1::> system services ndmp probe

Node: cluster1-01
Session identifier: 4952
NDMP version: 4
Session authorized: true
Data state: IDLE
Data operation: NOACTION
Data server halt reason: NA
Data server connect type: LOCAL
....

Node: cluster1-02
Session identifier: 5289
NDMP version: 4
Session authorized: true
Data state: IDLE
Data operation: NOACTION
Data server halt reason: NA
Data server connect type: LOCAL
....
```

The following example displays diagnostic information of sessions running on the node cluster1-01 only:

```
cluster1::> system services ndmp probe -node cluster1-01

Node: cluster1-01
Session identifier: 4952
NDMP version: 4
Session authorized: true
Data state: IDLE
Data operation: NOACTION
Data server halt reason: NA
Data server connect type: LOCAL
....
```

- [system services ndmp status](#) on page 1167

**system services ndmp show**

(DEPRECATED)-Display NDMP service configuration

**Availability:** This command is available to cluster administrators at the admin privilege level.
Description

**Note:** This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of Data ONTAP. Use the Vserver-aware "vserver services ndmp show" command.

The `system services ndmp show` command displays the following information about the NDMP configuration across all the nodes in the cluster:

- Node name
- Whether NDMP is enabled on the node
- Whether sending the NDMP password in clear text is enabled on the node
- NDMP user ID

A combination of parameters can be optionally supplied to filter the results based on specific criteria. This command is not supported on Infinite Volumes.

**Parameters**

```
[-fields <fieldname>,...]
```

If this parameter is specified, the command displays only the fields that you specify.

```
[-instance]
```

If this parameter is specified, the command displays detailed information about all entries.

```
[-node <nodename>|local] - Node
```

Selects information about the specified node.

```
[-enable {true|false}] - NDMP Service Enabled
```

Selects information about the nodes where NDMP is enabled/disabled.

```
[-clear-text {true|false}] - Allow Clear Text Password
```

Selects information about the nodes whose clear-text setting matches the specified value.

```
[-user-id <text>] - NDMP User ID
```

Selects information about the nodes that have the specified NDMP user ID.

**Examples**

The following example displays information about the NDMP configuration of all nodes in the cluster:

```
cluster1::> system services ndmp show
Node        Enabled   Clear Text  User ID
----------- --------- ----------- -------
node0       true      true        ndmp
node1       true      true        ndmp
node2       true      true        ndmp
node3       true      true        ndmp
4 entries were displayed.
```

**system services ndmp status**

Display list of NDMP sessions

**Availability:** This command is available to cluster administrators at the admin privilege level.
Description
The system services `ndmp status` command lists all the NDMP sessions in the cluster. By default it lists the following
details about the active sessions:

• Node
• Session ID

A combination of parameters can be optionally supplied so as to list only those sessions which match specific conditions. A
short description of each of the parameter is provided in the parameters section. This command is not supported on Infinite
Volumes.

Parameters
`[-fields <fieldname>,...]`
This optional parameter specifies which all additional fields to display. Any combination of the following
fields are valid:

• ndmp-version
• session-authorized
• data-state
• data-operation
• data-halt-reason
• data-con-addr-type
• data-con-addr
• data-con-port
• data-bytes-processed
• mover-state
• mover-mode
• mover-pause-reason
• mover-halt-reason
• mover-record-size
• mover-record-num
• mover-bytes-moved
• mover-seek-position
• mover-bytes-left-to-read
• mover-window-offset
• mover-window-length
• mover-position
• mover-setrecordsize-flag
• mover-setwindow-flag
• mover-con-addr-type
• mover-con-addr
• mover-con-port
• eff-host
• client-addr
• client-port
• spt-device-id
• spt-ha
• spt-scsi-id
• spt-scsi-lun
• tape-device
• tape-modes
• is-secure-control-connection
• data-backup-mode
• data-path
• source-addr

[[-instance ]]
If this parameter is specified, the command displays detailed information about all the active sessions.

[-node {<nodename>|local}] - Node
If this parameter is specified, the command displays information about the sessions running on the specified
node only. Node should be a valid node name.

[-session-id <integer>] - Session Identifier
If this parameter is specified, the command displays information about specific NDMP session. A session-id is
a number used to identify a particular NDMP session.

[-ndmp-version <integer>] - NDMP Version
This parameter refers to the NDMP protocol version being used in the session.

[-session-authorized {true|false}] - Session Authorized
This field indicates whether an NDMP session is authenticated or not.

[-data-state <component state>] - Data State
This field identifies the current state of the data server's state machine.

[-data-operation <data operation>] - Data Operation
This field identifies the data server's current operation.

[-data-halt-reason <halt reason>] - Data Server Halt Reason
This field identifies the event that caused the data server state machine to enter the HALTED state.

[-data-con-addr-type <address type>] - Data Server Connect Type
This field specifies the type of data connection established by the data server. The data connection can be
established locally within a given system or between remote networked systems.

[-data-con-addr <text>] - Data Server Connect Address
This specifies the connection endpoint information for the data server's data connection.
[-data-con-port <integer>] - Data Server Connect Port
    This specifies the TCP/IP port that the data server will use when establishing a data connection.

[-data-bytes-processed <integer>] - Data Bytes Processed
    This field represents the cumulative number of data stream bytes transferred between the backup or recovery
    method and the data connection during the current data operation.

[-mover-state <component state>] - Mover State
    This parameter identifies the current state of the NDMP tape server's mover state machine.

[-mover-mode <mover mode>] - Mover Mode
    This parameter identifies the direction of the mover data transfer.

[-mover-pause-reason <pause reason>] - Mover Pause Reason
    This parameter identifies the event that caused the mover state machine to enter the PAUSED state.

[-mover-halt-reason <halt reason>] - Mover Halt Reason
    This integer field identifies the event that caused the mover state machine to enter the HALTED state.

[-mover-record-size <integer>] - Mover Record Size
    This field represents the current mover record size in bytes.

[-mover-record-num <integer>] - Mover Record Number
    This field represents the last tape record processed by the mover.

[-mover-bytes-moved <integer>] - Mover Bytes Moved
    This field represents the cumulative number of data stream bytes written to the data connection or the number
    of data stream bytes read from the data connection and written to the tape subsystem, depending on the mode
    of mover operation.

[-mover-seek-position <integer>] - Mover Seek Position
    This field represents the data stream offset of the first byte the DMA requested the mover to transfer to the
    data connection during a mover read operation.

[-mover-bytes-left-to-read <integer>] - Mover Bytes Left to Read
    This field represents the number of data bytes remaining to be transferred to the data connection to satisfy the
    current NDMP_MOVER_READ request.

[-mover-window-offset <integer>] - Mover Window Offset
    This field represents the absolute offset of the first byte of the mover window within the overall data stream.

[-mover-window-length <integer>] - Mover Window Length
    This field represents the length of the current mover window in bytes.

[-mover-position <integer>] - Mover Position
    This parameter can be used to list only those sessions, whose mover position matches a specific value. Mover-
    position should be an integer.

[-mover-setrecordszize-flag {true|false}] - Mover SetRecordSize Flag
    This field is used by the DMA to establish the record size used for mover-initiated tape read and write
    operations.

[-mover-setwindow-flag {true|false}] - Mover SetWindow Flag
    This flag represents whether a mover window has been set or not. A mover window represents the portion of
    the overall backup stream that is accessible to the mover without intervening DMA tape manipulation.

[-mover-con-addr-type <address type>] - Mover Connect Type
    This field specifies the type of data connection established by the mover. The data connection can be
    established locally within a given system or between remote networked systems.
[-mover-con-addr <text>] - Mover Connect Address
This specifies the endpoint address or addresses that the mover will use when establishing a data connection.

[-mover-con-port <integer>] - Mover Connect Port
This specifies the TCP/IP port that the mover will use when establishing a data connection.

[-eff-host <host type>] - Effective Host
This field indicates the host context in which the NDMP session runs. The valid values are: PRIMARY or PARTNER.

[-client-addr <text>] - NDMP Client Address
This parameter specifies the client's IP address.

[-client-port <integer>] - NDMP Client Port
This parameter specifies the client's port number.

[-spt-device-id <text>] - SCSI Device ID
This parameter specifies the SCSI device ID.

[-spt-ha <integer>] - SCSI Host Adapter
This parameter specifies the SCSI host adapter.

[-spt-scsi-id <integer>] - SCSI Target ID
This parameter specifies the SCSI target.

[-spt-scsi-lun <integer>] - SCSI LUN ID
This parameter specifies the SCSI LUN ID.

[-tape-device <text>] - Tape Device
This parameter specifies the name to identify the tape device.

[-tape-mode <mover mode>] - Tape Mode
This parameter specifies the mode in which tapes are opened.

[-is-secure-control-connection {true|false}] - Is Secure Control Connection
This parameter specifies whether the control connection is secure or not.

[-data-backup-mode <text>] - Data Backup Mode
This parameter specifies whether the mode of data backup is Dump or SMTape.

[-data-path <text>] - Data Path
This parameter specifies the path of data being backed up.

[-source-addr <text>] - NDMP Source Address
This parameter specifies the control connection IP address of the NDMP session.

Examples
The following example displays all the NDMP sessions on the cluster:

```
cluster1::> system services ndmp status

<table>
<thead>
<tr>
<th>Node</th>
<th>Id</th>
</tr>
</thead>
<tbody>
<tr>
<td>node-01</td>
<td>17479</td>
</tr>
<tr>
<td>node-01</td>
<td>19769</td>
</tr>
<tr>
<td>node-02</td>
<td>21118</td>
</tr>
</tbody>
</table>

3 entries were displayed.
```

The following example shows how to display only the sessions running on node-01:
system services ndmp status -node node-01

<table>
<thead>
<tr>
<th>Session</th>
<th>Id</th>
</tr>
</thead>
<tbody>
<tr>
<td>node-01</td>
<td>17479</td>
</tr>
<tr>
<td>node-01</td>
<td>19769</td>
</tr>
</tbody>
</table>

2 entries were displayed.

system services ndmp log commands

The log directory

system services ndmp log start

(DEPRECATED)-Start logging for the specified NDMP session

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

Note: This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of Data ONTAP. Use the Vserver-aware "vserver services ndmp log start" command.

This command is used to start logging on an active NDMP session on a node. You can start logging two different kinds of sessions. The NDMP server session manages all NDMP tasks on the node. If you want to log information regarding the NDMP server, use server with the -session-id parameter to enable logging. If you want to log information about a particular NDMP session, for example a restore operation, then determine the session ID for the session using the "system services ndmp status" command and use that ID with the -session-id parameter to enable logging.

Parameters

-node {<nodename>|local} - Node

This parameter specifies the node.

-session-id {<integer>|server} - Session Identifier

This parameter specifies the NDMP session-id on which logging needs to be started. The session-id is associated with a unique NDMP session. Specify server to start logging on the NDMP server session.

-filter <text> - Level Filter

Use this parameter to specify the filter for a particular session ID. This parameter controls the NDMP modules for which logging is to be enabled. This parameter can take five values. They are as follows: all, none, normal, backend or "filter-expression". The default value for this is none.

- all turns on logging for all modules.
- none disables logging for all modules.
- normal is a short cut parameter that enables logging for all modules except verbose and io_loop. The equivalent filter string is all-verbose-io_loop
- backend is a short cut parameter that enables logging for all modules except verbose, io_loop, ndmps and ndmpd. The equivalent filter string is all-verbose-io_loop-ndmps-ndmpp
- (filter-expression) is a combination of one or more modules for which logs needs to be enabled. Multiple module names can be combined using following operators :
  - to remove the given module from the list of specified modules in the filter string. For example the filter all-ndmpp will enable logging for all modules but not ndmpp.
° to add the given module or modules to the list of modules specified in the filter string. For example
the filter ndmpp^mover^data will enable logging for ndmpp, mover and data.

The possible module names and a brief description is given below:

<table>
<thead>
<tr>
<th>Modules</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>verbose</td>
<td>verbose message</td>

</table>

Examples

The following example shows how to start logging on a specific NDMP session 33522, running on the node cluster1-01 with filter normal.

```
cluster1::*> system services ndmp log start -node cluster1-01 -session-id 33522 -filter normal
```

The following example shows how to start logging on the NDMP server session, on the node cluster1-01 with filter all.

```
cluster1::*> system services ndmp log start -session-id server -filter all -node cluster1-01
```

system services ndmp log stop

(DEPRECATED)-Stop logging for the specified NDMP session

**Availability**: This command is available to cluster administrators at the advanced privilege level.
Description

Note: This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of Data ONTAP. Use the Vserver-aware "vserver services ndmp log stop" command.

This command is used to stop logging on an active NDMP session on a node. The NDMP server session manages all NDMP tasks on the node. If you want to stop logging information regarding the NDMP server, use server with the -session-id parameter to disable logging. If you want to stop logging information about a particular NDMP session, for example a restore operation, then determine the session ID for the session using the "system services ndmp status" command and use that ID with the -session-id parameter to disable logging.

Parameters

-node {<nodename>|local} - Node
  This parameter specifies the node.

-session-id {<integer>|server} - Session Identifier
  This parameter specifies the NDMP session-id on which logging needs to be stopped. The session-id is associated with a unique NDMP session. Specify server to stop logging on the NDMP server session.

Examples

The following example shows how to stop logging on a specific NDMP session 35512, running on node cluster1-01.

    cluster1::*> system services ndmp log stop -session-id 35512 -node cluster1-01

The following example shows how to stop logging on the NDMP server session, running on node cluster1-01.

    cluster1::*> system services ndmp log stop -session-id server -node cluster1-01

system services ndmp node-scope-mode commands

The node-scope-mode directory

Note: These node-scoped NDMP commands are deprecated. Node-scoped NDMP functionality may be removed in a future release of Data ONTAP. Use the Vserver-aware "vserver services ndmp" commands.

Related references

vserver services ndmp on page 1843

system services ndmp node-scope-mode off

(DEPRECATED)-Disable NDMP node-scope-mode

Availability: This command is available to cluster administrators at the admin privilege level.

Description

Note: This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of Data ONTAP. Use the Vserver-aware "vserver services ndmp" command.
This command puts NDMP server in Vserver-aware mode. The Vserver-aware commands are available under `vserver services ndmp`.

**Examples**
The following example shows how to disable the node-scope-mode of NDMP server.

```
cluster1::> system services ndmp node-scope-mode off
NDMP node-scope-mode is disabled.
```

**Related references**
[vserver services ndmp](#) on page 1843

**system services ndmp node-scope-mode on**
(DEPRECATED)-Enable NDMP node-scope-mode

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**

**Note:** This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of Data ONTAP. Use the Vserver-aware "`vserver services ndmp`" command.

This command puts the NDMP server in the node-scope-mode. In the node-scope-mode, NDMP server has the following behavior:

- All NDMP operations are restricted to resources on the node
- Vserver-aware NDMP commands are disabled
- NDMP authentication falls back to DATA ONTAP 8.1 NDMP authentication scheme

```
cluster1::> system services ndmp node-scope-mode on
NDMP node-scope-mode is enabled.
```

**Related references**
[vserver services ndmp](#) on page 1843

**system services ndmp node-scope-mode status**
(DEPRECATED)-Status of NDMP node-scope-mode

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**

**Note:** This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of Data ONTAP. Use the Vserver-aware "`vserver services ndmp`" command.

This command displays whether the NDMP server is operating in node-scope-mode or not.

- NDMP node-scope-mode is disabled - NDMP server is Vserver-aware
• NDMP node-scope-mode is enabled - NDMP server is node scoped

**Examples**

The following example shows how to check the status of NDMP server in a cluster

```bash
cluster1::> system services ndmp node-scope-mode status
NDMP node-scope-mode is disabled.
```

- `vserver services ndmp` on page 1843
- `system services ndmp service commands`
- `system services ndmp service modify`

**system services ndmp service commands**

The service directory

**system services ndmp service modify**

Modify NDMP service configuration

**Availability:** This command is available to `cluster` administrators at the `advanced` privilege level.

**Description**

The `system services ndmp service modify` command allows you to modify the NDMP service configurations for a node in the cluster. The following configuration can be modified:

- NDMP Common Sessions

This command is not supported on Infinite Volumes.

**Parameters**

- `-node <nodename>|local` - Node
  
  This specifies the node whose NDMP configuration is to be modified.

- `[-common-sessions <integer>]` - NDMP Common Sessions

  This optional parameter specifies the number of extra common NDMP sessions supported, in addition to the number of backup and restore sessions supported for a platform. The default value is 4 for all platforms. The number of backup and restore sessions are platform dependent.

  **Caution:**

  Increasing this parameter can make the storage system unresponsive.

**Examples**

The following example modifies the NDMP configuration on a node named node1. The configuration sets the NDMP Common Sessions to 16:

```bash
cluster1::> system services ndmp modify -node node1
                 -common-sessions 16
```
**system services ndmp service show**

Display NDMP service configuration

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**
The `system services ndmp service show` command displays the following information about the NDMP service configuration across all the nodes in the cluster:

- Node name
- NDMP Common Sessions

A combination of parameters can be optionally supplied to filter the results based on specific criteria. This command is not supported on Infinite Volumes.

**Parameters**

```
{ [-fields <fieldname>, ...] }
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[ [-instance ] }
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[-node {<nodename>|local}] - Node
```

Selects information about the specified node.

```
[-common-sessions <integer>] - NDMP Common Sessions
```

Selects information about the nodes that have the specified number of NDMP common sessions.

**Examples**
The following example displays information about the NDMP configuration of all nodes in the cluster:

```
cluster1:~> system services ndmp service show
Node        Common Sessions
----------- ---------------
node0        16
node1        16
node2        16
node3        16
4 entries were displayed.
```

**system services ndmp service start**

Start the NDMP service

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**
The `system services ndmp service start` command starts the NDMP service daemon for a node. This is different from the `system services ndmp on` command. The `system services ndmp on` command enables the daemon to accept NDMP requests. The NDMP service daemon starts automatically on a node when it boots up. Use this command to start the NDMP service daemon that has been stopped by the `system services ndmp service stop` command. This command is not supported on Infinite Volumes.
Parameters

- `node {<nodename>|local} - Node`

  The node on which the NDMP service needs to be started.

Examples

```bash
cluster1::*> system services ndmp service start -node node0
```

Related references

- `system services ndmp on` on page 1161
- `system services ndmp service stop` on page 1178

**system services ndmp service stop**

Stop the NDMP service

**Availability:** This command is available to `cluster` administrators at the `advanced` privilege level.

**Description**

The `system services ndmp service stop` command stops the NDMP service daemon on a node. This is a disruptive command and should not be used in normal scenarios. Processing of active sessions continues but the ability to view or kill sessions is lost. This is different from the `system services ndmp off` command. The `system services ndmp off` command disables new NDMP connections on the node but does not stop the NDMP service daemon. This command is not supported on Infinite Volumes.

Parameters

- `node {<nodename>|local} - Node`

  The node on which the NDMP service needs to be stopped.

Examples

```bash
cluster1::*> system services ndmp service stop -node node0
```

Related references

- `system services ndmp off` on page 1160
- `system services ndmp service start` on page 1177

**system services ndmp service terminate**

Terminate all NDMP sessions

**Availability:** This command is available to `cluster` administrators at the `advanced` privilege level.

**Description**

The `system services ndmp service terminate` command terminates all active sessions on the node. This command forcefully terminates all NDMP sessions without an opportunity for a graceful shutdown. Use `system services ndmp kill-all` for a clean termination of all active sessions on a node. This command is not supported on Infinite Volumes.

Parameters

- `node {<nodename>|local} - Node`

  The node on which the NDMP sessions need to be terminated
Examples

```
cluster1::*> system services ndmp service terminate -node node0
```

* system services ndmp kill-all on page 1159

Manage Web Protocols

Manage web protocols

These commands manage the availability of web protocols (HTTP/HTTPS) in the cluster, including the port and encryption configurations for those protocols.

**system services web modify**

Modify the cluster-level configuration of web protocols

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

This command modifies the overall availability of web services in the cluster, including the core protocol configurations for those services. In a pre-root or unclustered scenario, its scope applies to the local node.

**Parameters**

[-external *{true|false}]* - External Web Services

Defines whether remote clients can access HTTP or HTTPS service content. Along with the *system services firewall* configuration, this parameter controls the visibility for client connections. The default value for this parameter after installation is 'true', which exports web protocols for remote access. If no value is provided during modification, its behavior does not change.

[-per-address-limit <integer>] - Per Address Limit (privilege: advanced)

Limits the number of connections that can be processed concurrently from the same remote address. If more connections are accepted, those in excess of the limit are delayed and processed after the number of connections being processed drops below the limit. The default value is 96.

[-http-enabled *{true|false}]* - HTTP Enabled (privilege: advanced)

Defines whether HTTP is enabled. The default value for this parameter is *false*.

Examples

The following command changes the maximum size of the wait queue:

```
cluster1::> system services web modify -wait-queue-capacity 256
```

Related references

* system services firewall on page 1149

**system services web show**

Display the cluster-level configuration of web protocols

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.
Description
This command displays the overall availability of web services in the cluster, including the core protocol configurations for those services. In a pre-root or unclustered scenario, its output applies to the local node. The following information explains the **External Web Services** and **Status** attributes, two features of web services' availability.

The **External Web Services** field indicates whether remote clients are allowed to access the HTTP or HTTPS service content. Along with the `system services firewall` configuration, the **External Web Services** field indicates the visibility for client connections.

The **Status** field describes the aggregated operational state of cluster-level web services as retrieved from the `system services web node` command. The **Status** field does not reflect whether the protocols are externally visible, but whether the server processes are running correctly. For detailed information about individual servers, use the `system services web node show` command. The following are the possible values for the **Status** in node configuration or availability:

- online, all web services are consistently configured and working correctly.
- partial, one or more nodes' web services are unavailable due to an error condition.
- mixed, the nodes in the cluster do not share the same web services configuration. This situation might occur if individual nodes were reconfigured with the `system services web node` command.
- offline, all of the nodes' web services are unavailable due to an error condition.
- unclustered, the current node is not part of an active cluster.

The **HTTP Enabled** field indicates whether HTTP is enabled.

The **per-address-limit** field is the limit of the number of connections that can be processed concurrently from the same remote address. If more connections are accepted, those in excess of the limit are delayed and processed after the number of connections being processed drops below the limit.

### Examples
The following example displays the availability of web services for the cluster.

```
class1:/> system services web show
External Web Services: true
  Status: online
HTTP Protocol Port: 80
HTTPS Protocol Port: 443
HTTP Enabled: true
```

### Manage Node Web Servers
Manage the nodes' web servers

These commands manage the availability of web protocols (HTTP/HTTPS) on specific nodes in the cluster, including the port and encryption configurations for those protocols.

### system services web node show
Display the status of the web servers at the node level

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.
Description
This command displays operational configuration for the web server processes on the nodes in the cluster. This output is aggregated to produce the content for the system services web show command.

Parameters

{[-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

|[instance |]
  If you specify the -instance parameter, the command displays detailed information about all fields.

[-node <nodename>|local] - Node
  Selects the nodes that match this parameter value. Identifies the node where the web server process is being executed.

[-external {true|false}] - External Web Services
  Selects the nodes that match this parameter value. Defines whether remote clients can access the HTTP or HTTPS service content. Along with the system services firewall command configuration, this parameter controls the visibility for client connections. The default value for this parameter after installation is true, which exports web protocols for remote access.

[-http-port <integer>] - HTTP Port
  Selects the nodes that match this parameter value. Defines the HTTP port for the node-level web services.

[-https-port <integer>] - HTTPS Port
  Selects the nodes that match this parameter value. Defines the encrypted HTTP (HTTPS) port for the node-level web services.

[-http-enabled {true|false}] - HTTP Enabled
  Selects the nodes that match this parameter value. Defines whether HTTP is enabled.

[-per-address-limit <integer>] - Per Address Limit (privilege: advanced)
  Selects the nodes that match this parameter value. Limits the number of connections that can be processed concurrently from the same remote address. If more connections are accepted, those in excess of the limit are delayed and processed after the number of connections being processed drops below the limit.

[-status {offline|partial|mixed|online|unclustered}] - Protocol Status
  Selects the nodes that match this parameter value. Describes the operational state of node-level web services. This parameter does not reflect whether protocols are externally visible, but whether the server processes are running correctly. The following are the possible values that describe the service availability:
  • online, indicates that web services are working correctly.
  • offline, indicates that web services are unavailable due to an error condition.
  • unclustered, indicates that the current node is not part of an active cluster.

[-total-hits <integer>] - Total HTTP Requests
  Selects the nodes that match this parameter value. Indicates the total number of requests serviced by the web server.

[-total-bytes <integer>] - Total Bytes Served
  Selects the nodes that match this parameter value. Indicates the total number of bytes returned by the web server.

Examples
The following example displays the status of web servers for nodes in the cluster.

### SMTape Commands

Manage SMTape operations

smtape commands description

#### system smtape abort

Abort an active SMTape session

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

This command aborts the backup or restore operations based on the session identifier. You can perform SMTape operations using the *system smtape backup* or *system smtape restore* commands. A unique session identifier is assigned for each new SMTape operation. This command aborts sessions that are in active and waiting states.

**Parameters**

- `-session <Sequence Number>` - Session Identifier
  
  Use this parameter to specify the session identifier for a backup or restore session.

**Examples**

Abort the SMTape session with the session identifier 20

```
cluster1::> system smtape abort -session 20
Abort posted to session 20.
```

Related references

*system smtape backup* on page 1182
*system smtape restore* on page 1185

#### system smtape backup

Backup a volume to tape devices

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.
Description

This command performs a baseline backup of a specified volume path to a tape device. You can use the command `system hardware tape drive show` to view the list of tape devices in the cluster. You must specify a Snapshot copy name to perform an SMTape backup operation. The Snapshot copy name specified is used as the base Snapshot copy. A new unique session ID is assigned for this SMTape operation and the status of the session can be monitored using the command `system smtape status`. This session ID can be subsequently used to perform other operations such as to find the SMTape status, abort an SMTape operation, and continue an SMTape operation.

The volume and tape device must reside on the same node in the cluster. You must retain the base Snapshot copy created during this backup operation in order to use this Snapshot copy to re-establish a SnapMirror relationship upon a restore.

Parameters

- `vserver <vserver name>` - Vserver Name
  
  Use this parameter to specify the Vserver name on which the volume is located. You need not specify this parameter if only one cluster Vserver exists.

- `volume <volume name>` - Volume Name
  
  Use this parameter to specify the name of the volume that needs to be backed up to tape.

- `backup-snapshot <snapshot name>` - Snapshot Name
  
  Use this parameter to specify the name of the Snapshot copy while performing an SMTape backup operation.

- `tape </node_name/tape_device>` - Tape Name
  
  Use this parameter to specify the name of the tape device which is used for this SMTape operation. The format of the tape device name is `/node_name/tape_device`, where `node_name` is the name of the cluster node owning the tape and `tape_device` is the name of the tape device.

- `[-tape-block-size <integer>]` - Tape Record Size in KB
  
  Use this parameter to specify the tape record size in KB for backup and restore operations. The tape record size is in multiples of 4KB, ranging from 4KB to 256KB. The default tape record size is 240KB unless it is specified.

Examples

The following example will start the backup of a volume `datavol` in a Vserver `vserver0` to a tape `rst0a`. Both the volume and tape reside on the same node `cluster1-01`. The Snapshot copy to be backed up is `datavol_snapshot` and the tape record size has the value of 256KB.

```
cluster1::> system smtape backup -vserver vserver0 -volume datavol
   -backup-snapshot datavol_snapshot -tape /cluster1-01/rst0a
   -tape-block-size 256
Session 21 created successfully
```

The following example will start the backup of a volume `datavol` in a Vserver `vserver0` to a tape `rst0a`. The volume `datavol` is in a Vserver `vserver0`. Both the volume and tape reside on the same node `cluster1-01`. The Snapshot copy to be backed up is `datavol_snapshot` and the tape record size has the default value of 240KB.

```
cluster1::> system smtape backup -vserver vserver0 -volume datavol
   -backup-snapshot datavol_snapshot -tape /cluster1-01/nrst0l
Session 22 created successfully
```

system smtape break

Make a restored volume read-write

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
This command breaks the relationship between the tape backup of a volume and a restored volume, changing the restored volume from read-only to read/write.

**Parameters**

- **-vserver `<vserver name>`** - Vserver Name
  
  Use this parameter to specify the Vserver name on which the volume is located. You need not specify this parameter if only one cluster Vserver exists.

- **-volume `<volume name>`** - Volume Name
  
  Use this parameter to specify the name of the read-only volume that needs to be made read/writeable after a restore.

**Examples**

Make the read-only volume *datavol* on Vserver vserver0 writeable after a restore.

```
cluster1::> system smtape break -vserver vserver0 -volume datavol
[Job 84] Job succeeded: SnapMirror Break Succeeded
```

system smtape continue

Continue SMTape session waiting at the end of tape

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
This command continues the SMTape backup and restore operations using the specified tape device. You can use this command when an SMTape operation has reached the end of current tape and is in the wait state to write to or read from a new tape.

If a tape device is not specified, the original tape device will be used.

User has to make sure that the correct tape media is inserted in the device and positioned appropriately before issuing this command.
Parameters

-tape <node_name/tape_device> - Tape Name

Use this parameter to specify the name of the tape device which is used for this SMTape operation. The format of the tape device name is /node_name/tape_device, where node_name is the name of the cluster node owning the tape and tape_device is the name of the tape device.

-session <Sequence Number> - Session Identifier

Use this parameter to specify the session identifier for the SMTape backup or restore operations.

Examples

Continues an SMTape session having session ID 20 on tape device rst0a on the node node1 in the cluster.

```
cluster1::> system smtape continue -session 20 -tape /node1/rst0a
continue on session 20 succeeded
```

The following example continues session 40 on the same tape device that was being used by the session.

```
cluster1::> system smtape continue -session 40
continue on session 40 succeeded
```

system smtape restore

Restore a volume from tape devices

Availability: This command is available to cluster administrators at the admin privilege level.

Description

This command performs restore of a backup image created using the command system smtape backup in the specified tape device to a destination volume path. A new unique session ID is assigned for this operation; the status of the session can be monitored using the command system smtape status. It is required that the volume and tape device reside in the same cluster node. The volume must be of type DP (Data Protection) and should be placed in the restricted mode prior to a restore. Any existing data on the volume will get overwritten upon a restore. The volume will remain as read-only and of type DP after the restore. You can use the command system smtape break to get read/write permissions on the volume. Restore to an Infinite Volume is not supported. Restore can be done to a non-root DP volume.

Parameters

-vserver <vserver name> - Vserver Name

Use this parameter to specify the Vserver name on which the volume is located. You need not specify this parameter if only one cluster Vserver exists.

-volume <volume name> - Volume Name

Use this parameter to specify the volume name on which the tape content will be restored.

-tape <node_name/tape_device> - Tape Name

Use this parameter to specify the name of the tape device which is used for this SMTape operation. The format of the tape device name is /node_name/tape_device, where node_name is the name of the cluster node owning the tape and tape_device is the name of the tape device.

[-tape-block-size <integer>] - Tape Record Size in KB

Use this parameter to specify the tape record size in KB for backup and restore operations. The tape record size is in multiples of 4KB, ranging from 4KB to 256KB. The default tape record size is 240KB unless it is specified. Use the same record size which was used during the backup. If the tape record size is different from the tape record size that was used at the time of backup then system smtape restore will fail.
### Examples

The following example will start the restore to a volume `datavol` from a tape `rst0a`. The volume `datavol` is in a Vserver `vserver0`. Both `vserver0` and `rst0a` reside on the same node `cluster1-01`.

```bash
cluster1::> system smtape restore -vserver vserver0 -volume datavol -tape /cluster1-01/rst0a -tape-block-size 256
Session 2 created successfully
```

The following example will start the restore to a volume `datavol` from a tape `rst0a`. The volume `datavol` is in a Vserver `vserver0`. Both `vserver0` and `rst0a` reside on the same node `cluster1-01`. The default tape record size of 240KB was used during backup.

```bash
cluster1::> system smtape restore -vserver vserver0 -volume datavol -tape /cluster1-01/rst0a
Session 5 created successfully
```

### system smtape showheader

Display SM Tape header

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**

This command displays the image header of a tape. The tape must have a valid backup of data. The following information about the backup is displayed:

- Tape Number - the tape number if the backup spans multiple tape devices.
- WAFL Version - WAFL version of the storage system when the volume was backed up on tape.
- Backup Set ID - a unique backup set ID for the baseline backup.
- Source Storage System - the source storage system where the volume resided when the backup was performed.
- Source Volume - the source volume that was backed up to tape.
- Source Volume Capacity - the capacity of the source volume that was backed up to tape.
- Source Volume Used Size - the used size of the source volume that was backed up to tape.
- Source Snapshot - name of the Snapshot copy used for the backup.
- Volume Type - type of the volume.
- Is SIS Volume - this field is true if the backed up volume was a SIS volume.
- Backup Version - the SMTape backup version.
- Backup Sequence No - the backup sequence number.
- Backup Mode - this field describes the backup mode.
- Time of Backup - the time at which the backup was performed.
- Time of Previous Backup - the time at which the previous backup was performed; this information is displayed only if the previous backup was an incremental backup.
- Volume Total Inodes - number of inodes of the backed up volume.
- Volume Used Inodes - number of used inodes of the backed up volume.
- Number of Snapshots - number of Snapshot copies present in this backup.
- Snapshot ID - is the Snapshot ID of the backup Snapshot.
- Snapshot Time - time at which the backup Snapshot copy was created.
- Snapshot Name - name of the Snapshot copy which was backed up to tape.

**Parameters**

- `tape <node_name/tape_device>` - Tape Name
  
  Use this parameter to specify the name of the tape device which is used for this SMTape operation. The format of the tape device name is `/node_name/tape_device`, where `node_name` is the name of the cluster node owning the tape and `tape_device` is the name of the tape device.

- `[-tape-block-size <integer>]` - Tape Record Size in KB
  
  Use this parameter to specify the tape record size in KB for backup and restore operations. The tape record size is in multiples of 4KB, ranging from 4KB to 256KB. The default tape record size is 240KB unless it is specified.

**Examples**

The following example reads the image header from the tape `nrst01` residing on the node `cluster1-01` and displays relevant tape header information.

```
cluster1::> system smtape showheader -tape /cluster1-01/nrst01
  -tape-block-size 240

Tape record size in KB: 240
  Tape Number: 1
  WAFL Version: 23577
  Backup Set ID: 7d0c9a15-8e20-11e1-8741-123478563412
  Source Storage System: cluster1-01
  Source Volume: /vs1/srcvol
  Source Volume Capacity: 400.00MB
  Source Volume Used Size: 0.00
  Source Snapshot: mysnap
  Volume Type: Flex
  Is SISVolume: no
  Backup Version: 1:3
  Backup Sequence No: 0
  Backup Mode: dw-data
  Time of Backup: 4/24/2012 15:16:38
  Time of Previous Backup: 0/0/0 00:00:00
  Volume Total Inodes: 12789
  Volume Used Inodes: 100
  Number of Snapshots: 1
  Snapshot ID: 1
  Snapshot Time: 4/24/2012 15:16:10
  Snapshot Name: mysnap
```
system smtape status commands

The status directory

system smtape status clear

Clear SM Tape sessions

Availability: This command is available to cluster administrators at the admin privilege level.

Description
This command clears SM Tape sessions which are completed, failed or Unknown state.

Parameters

- **session** <Sequence Number> - Session Identifier
  Use this parameter to clear the SM Tape sessions with the specified session identifier.

- **node** (<nodename>|local) - Node Name
  Use this parameter to clear the SM Tape sessions related to the specified node.

- **type** {backup|restore} - Operation Type
  Use this parameter to clear the SM Tape sessions of the specified operation type. These can be either backup or restore sessions.

- **status** {COMPLETED|FAILED|UNKNOWN} - Session Status
  Use this parameter to clear the SM Tape sessions which have the status as specified in the parameter.

- **path** <text> - Path Name
  Use this parameter to clear the SM Tape sessions which have path as specified in the parameter.

- **device** <text> - Device Name
  Use this parameter to clear the SM Tape sessions on a specific tape device.

- **backup-snapshot** <snapshot name> - Snapshot Name
  Use this parameter to clear the SM Tape sessions using the Snapshot copy name as specified in the parameter.

- **tape-block-size** <integer> - Tape Block Size
  Use this parameter to clear the SM Tape sessions with the tape block size as specified in the parameter.

Examples

The following example clears all the completed SM Tape sessions in the cluster:

```
cluster1::> system smtape status clear
5 sessions are purged.
```

The SM Tape sessions on the node node1 in the cluster are cleared.

```
cluster1::> system smtape status clear -node node1
3 sessions are purged.
```
system smtape status show

Show status of SMTape sessions

Availability: This command is available to cluster administrators at the admin privilege level.

Description

This command lists the status of all SMTape sessions in the cluster. By default, this command lists the following information:

- Session
- Type
- Status
- Progress
- Path
- Device
- Node

Parameters

\{-fields <fieldname>, ...\}

Use this parameter to display additional fields about each session apart from the default entries. This parameter is optional. Any combination of the following fields is valid:

- Session
- Node
- Type
- Status
- Path
- Device
- Progress
- Start-time
- End-time
- Update-time
- Backup-snapshot
- Tape-block-size
- Error

\{-instance \}

Displays detailed information about the specified sessions.

\{-session <Sequence Number>\} - Session Identifier

Selects information about a specific SMTape session. A Session Identifier is a number that is used to identify a particular SMTape session.
[-node {<nodename> | local}] - Node Name
Selects information about sessions related to the specified node.

[-type {backup | restore}] - Operation Type
Selects information about SM Tape sessions of the specified operation type.

[-status {COMPLETED | FAILED | ACTIVE | WAITING | ABORTING | UNKNOWN}] - Session Status
Selects information about SM Tape sessions having the specified status in the parameter.

[-path <text>] - Path Name
Selects information about SM Tape sessions on a volume which is at the specified path name. This is the logical path of the volume and you must specify the path name in the following format: /vserver_name/volume_name.

[-device <text>] - Device Name
Selects information about the SM Tape sessions on the specified tape device. You must specify the tape device name in the following format: /node_name/tape_device.

[-progress {<integer> [KB | MB | GB | TB | PB]}] - Bytes Transferred
Selects information about SM Tape sessions in which the number of data bytes transferred in a particular session matches with the number specified in this parameter.

[-start-time <MM/DD/YYYY HH:MM:SS>] - Start Time
Selects information about SM Tape sessions whose starting time matches the specified starting time.

[-end-time <MM/DD/YYYY HH:MM:SS>] - End Time
Selects information about SM Tape sessions whose ending time matches the specified ending time.

[-backup-snapshot <snapshot name>] - Snapshot Name
Selects information about SM Tape sessions that use a particular Snapshot copy name which matches the specified Snapshot copy name in the parameter in backup or restore operations.

[-tape-block-size <integer>] - Tape Block Size
Selects information about SM Tape sessions that use a particular tape block size which matches the specified tape block size parameter in backup or restore operations.

[-error <text>] - Error Description
Selects information about SM Tape sessions that have a particular error description which matches the specified error description in the parameter.

Examples
Displays default entries about the five SM Tape sessions.

cluster1::> system smtape status show

<table>
<thead>
<tr>
<th>Session</th>
<th>Type</th>

<td>/cls1-01/nrst0n</td>
<td>cluster1-01</td>
</tr>
</tbody>
</table>

5 entries were displayed.

The following example shows the output with the -instance argument.

cluster1::> system smtape status show -instance

Session Identifier: 1
Node Name: node1
Operation Type: Backup
Status: COMPLETED
system timeout commands

Manage the timeout value for CLI sessions

system timeout modify

Set the CLI inactivity timeout value

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system timeout modify command sets the timeout value for CLI sessions. If there is no CLI activity during the length of the timeout interval, the logged in user is logged out. The default value is 30 minutes. To prevent CLI sessions from timing out, specify a value of 0 (zero).

Parameters
[-timeout <integer>] - Timeout (in minutes)
Use this parameter to specify the timeout value, in minutes.

Examples
The following example shows how to modify the timeout value for CLI sessions to be 10 minutes:

    cluster1::> system timeout modify -timeout 10

The following example shows how to prevent CLI sessions from timing out:

    cluster1::> system timeout modify -timeout 0

system timeout show

Display the CLI inactivity timeout value

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system timeout show command displays the timeout value for CLI sessions. If there is no CLI activity during the length of the timeout interval, the logged in user is logged out. A timeout value of 0 minutes means that the CLI sessions never time out.

Examples
The following example displays the timeout value for CLI sessions:
**system snmp commands**

The `snmp` directory
Manage cluster-wide SNMP settings.
SetRequest PDU is not supported. There is no default community for the SNMP agent.
SNMPv3 users are created using "security login create" CLI.

**system snmp authtrap**

Enables or disables SNMP authentication traps

**Availability:** This command is available to cluster administrators at the `admin` privilege level.

**Description**
Use this command to either enable or disable the standard SNMP authentication failure traps.

**Parameters**

`[-authtrap <integer>]` - Enables SNMP Authentication Trap

Enter the value of 1 to enable SNMP authentication failure traps. By default, SNMP authentication trap is disabled and the value is 0.

**Examples**
The following example demonstrates how to set the SNMP authtrap.

```
cluster1::> system snmp authtrap -authtrap 1
cluster1::> system snmp show
contact: private
location: NB
authtrap: 1
init: 0
traphosts: 
community: _ _
```

**system snmp contact**

Displays or modifies contact details

**Availability:** This command is available to cluster administrators at the `admin` privilege level.

**Description**
Sets the contact name as the System.sysContact.0 MIB-II variable.
Parameters
[contact <text>] - Contact

Specifies the contact name. Without any value specified, this command displays current setting of contact name.

Examples
The following example sets the contact name for SNMP.

```
cluster1::> system snmp contact -contact private
cluster1::> system snmp show
contact: private
location: NB
authtrap: 1
init: 0
traphosts: -
community: _ _
```

**system snmp init**

Enables or disables SNMP traps

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
Initializes or disables sending of traps by the SNMP daemon from the cluster.

**Parameters**
[init <integer>] - Initialize Traps

Use the value of 1 to initialize SNMP daemon to send traps or use a value of 0 to stop sending traps from the cluster. If no value is specified, this command displays the current setting of init. Traps are enabled by default.

**Examples**
The following command initializes SNMP daemon to send traps.

```
cluster1::> system snmp init -init 1
cluster1::> system snmp show
contact: private
location: NB
authtrap: 1
init: 1
traphosts: -
community: _ _
```
system snmp location
Displays or modifies location information

Availability: This command is available to cluster administrators at the admin privilege level.

Description
Sets the location name as the System.sysLocation.0 MIB-II variable.

Parameters
[-location <text>] - Location
   Specifies the location details. If no value is specified, this command displays the current setting of location.

Examples
This command sets the location name.

```
cluster1::> system snmp location -location NB
cluster1::> system snmp show
contact:  private
location:  NB
authtrap:  1
init:  1
traphosts:  
community:  
```

system snmp show
Displays SNMP settings

Availability: This command is available to cluster administrators at the admin privilege level.

Description
Lists the current values of all the SNMP parameters.

Examples
The example below shows a typical command display.

```
cluster1::> system snmp show
contact:  private
location:  NB
authtrap:  1
init:  1
traphosts:  
```
system snmp community commands

The community directory
Adds, deletes and displays communities.

system snmp community add

Adds a new community with the specified access control type

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system snmp community add command adds communities with the specified access control type. Only read-only communities are supported. There is no limit for the number of communities supported.

Parameters
- vserver <Vserver Name> - Vserver
  This parameter specifies the Vserver to which the community will be added. If no Vserver is specified, the community is added to the admin Vserver.

- community-name <text> - Community
  This parameter specifies the name of the community.

- type <ctype> - access type
  This parameter specifies 'ro' for read-only community.

Examples
The following example adds the read-only community name 'private'.

```
cluster1::> system snmp community add -type ro
   -community-name private

cluster1::> system snmp community show
     ro  private
```

system snmp community delete

Deletes community with the specified access control type

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system snmp community delete command deletes communities with the specified access control type. Only read-only communities are supported.

Parameters
- vserver <Vserver Name> - Vserver
  This parameter specifies the Vserver from which you wish to delete the community. If no Vserver is specified, the community is deleted from the admin Vserver.
-community-name <text> - Community
    Specify the name of the community.

-type <ctype> - access type
    Specify 'ro' for a read-only community.

Examples
The following example deletes the read-only community 'private':

    cluster1::> system snmp community delete -type ro
                   -community-name private
    cluster1::> system snmp community show
This table is currently empty.

system snmp community show
Displays communities

Availability: This command is available to cluster administrators at the admin privilege level.

Description
Displays the current list of SNMP communities.

Parameters
{ [-fields <fieldname>, ... ]
    If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

    [-instance ]
    If you specify the -instance parameter, the command displays detailed information about all fields.

    [-vserver <Vserver Name>] - Vserver
    Selects the Vserver to which the SNMP community belongs

    [-community-name <text>] - Community
    Selects the SNMP v1/v2c community string

    [-access <ctype>] - access
    Selects the access type of the SNMP v1/v2c community. Read-only (ro) is the only access type supported

Examples

    cluster1::> system snmp community show
    cluster1
          ro private

system snmp traphost commands
The traphost directory
Add, delete and display SNMP managers.
system snmp traphost add

Add a new traphost

Availability: This command is available to cluster administrators at the admin privilege level.

Description
Adds SNMP managers who receive the SNMP trap PDUs. SNMP manager can be a hostname or IP address. There is no limit on the number of traphosts supported.

Parameters
- **peer-address** <Remote InetAddress> - **hostname|ipaddress**
  Specifies the IP address or hostname of the host.

Examples
This command adds a new hostname 'yyy.example.com'.

```
cluster1::> system snmp traphost add -peer-address yyy.example.com
Or
cluster1::> system snmp traphost add yyy.example.com

cluster1::> system snmp traphost show
  yyy.example.com(yyy.example.com)(192.168.xxx.xxx)
  xxx.example.com(xxx.example.com)(xxx.xxx.xxx.xxx)
```

system snmp traphost delete

Delete a traphost

Availability: This command is available to cluster administrators at the admin privilege level.

Description
Deletes SNMP managers who receive SNMP trap PDUs. SNMP managers can be hostname or IP address. There is no limit on the number of traphosts supported.

Parameters
- **peer-address** <Remote InetAddress> - **hostname|ipaddress**
  Specifies the IP address or hostname of the host.

Examples
This command deletes a traphost 'yyy.example.com'.

```
cluster1::> system snmp traphost delete -peer-address yyy.example.com
Or
cluster1::> system snmp traphost delete yyy.example.com

cluster1::> system snmp show
  xxx.example.com(xxx.example.com)(xxx.xxx.xxx.xxx)
```
system snmp traphost show
Displays traphosts

Availability: This command is available to cluster administrators at the admin privilege level.

Description
Displays list of the SNMP managers that receive trap PDUs.

Examples
The example below displays all host names or IP addresses that have been added until now.

    cluster1::> system snmp traphost show
    xxx.example.com(xxx.example.com){xxx.xxx.xxx.xxx}

Volume Commands
Manage virtual storage, including volumes, snapshots, and mirrors

The volume commands enable you to manage volumes, mirrors, and Snapshot(tm) copies.

volume autosize
Set/Display the autosize settings of the flexible volume.

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The volume autosize command allows the user to specify the maximum size that a volume will automatically grow to when it is out of space or the minimum size that it will shrink to when the amount of used space is below a certain threshold. If only the volume/Vserver name is specified then the current settings are displayed. This command is not supported on Infinite Volumes.

Parameters
-vserver <vserver name> - Vserver Name
This parameter can be used to specify the Vserver on which the volume is located.

-volume <volume name> - Volume Name
This parameter specifies the volume for which the user wants to set or display the autosize configuration.

{ [-maximum-size {<integer>[KB|MB|GB|TB|PB]}] - Maximum Autosize
This parameter allows the user to specify the maximum size to which a flexible volume can grow. The default for FlexVol volumes is 120% of the volume size. If the value of this parameter is invalidated by manually resizing the volume or is invalid when the autosize feature is enabled, the maximum size is reset to 120% of the volume size. The value for -maximum-size cannot be set larger than the platform-dependent maximum FlexVol volume size. If you specify a larger value, the value of -maximum-size is automatically reset to the supported maximum without returning an error. This parameter is not supported on Infinite Volumes.

[-minimum-size {<integer>[KB|MB|GB|TB|PB]}] - Minimum Autosize
This parameter specifies the minimum size to which the volume can automatically shrink. If the volume was created with the grow_shrink autosize mode enabled, then the default minimum size is equal to the initial
volume size. If the value of the `-minimum-size` parameter is invalidated by a manual volume resize or is invalid when autosize is enabled, the minimum size is reset to the volume size. This parameter is not supported on Infinite Volumes.

`[-grow-threshold-percent <percent>]` - Grow Threshold Used Space Percentage
This parameter specifies the used space threshold for the automatic growth of the volume. When the volume’s used space becomes greater than this threshold, the volume will automatically grow unless it has reached the maximum autosize. This parameter is not supported on Infinite Volumes.

`[-shrink-threshold-percent <percent>]` - Shrink Threshold Used Space Percentage
This parameter specifies the used space threshold for the automatic shrinking of the volume. When the amount of used space in the volume drops below this threshold, the volume will shrink unless it has reached the specified minimum size. This parameter is not supported on Infinite Volumes.

`[mode {off|grow|grow_shrink}]` - Autosize Mode
This parameter specifies the autosize mode for the volume. The supported autosize modes are:

- `off` - The volume will not grow or shrink in size in response to the amount of used space.
- `grow` - The volume will automatically grow when used space in the volume is above the grow threshold.
- `grow_shrink` - The volume will grow or shrink in size in response to the amount of used space.

By default, `mode` is `off` for new FlexVol volumes, except for DP mirrors, for which the default value is `grow_shrink`. The `grow` and `grow_shrink` modes work together with Snapshot autodelete to automatically reclaim space when a volume is about to become full. The volume parameter `-space-mgmt-try-first` controls the order in which these two space reclamation policies are attempted. This parameter is not supported in Infinite Volumes.

`[[-reset [true]]]` - Autosize Reset
This option allows the user to reset the values of autosize, max-autosize, min-autosize, autosize-grow-threshold-percent, autosize-shrink-threshold-percent and autosize-mode to their default values based on the current size of the volume. For example, the max-autosize value will be set to 120% of the current size of the volume.

### Examples
The following example sets the autosize settings on a volume named vol1. The maximum size to grow is 1TB and autogrow is enabled.

```bash
cluster1::> vol autosize vol1 -maximum-size 1t -mode grow (volume autosize) vol autosize: Flexible volume 'vs1:vol1' autosize settings UPDATED.
```

The following example shows the autosize settings on a volume named vol1. The maximum size to grow is 1TB and autogrow is enabled.

```bash
cluster1::> vol autosize vol1 (volume autosize) Volume autosize is currently ON for volume 'vs1:vol1'. The volume is set to grow to a maximum of 1t.
```

### volume create
Create a new volume

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.
Description
The `volume create` command creates a volume on a specified Vserver and storage aggregates. You can optionally specify the following attributes for the new volume:

- Size
- State (online, offline, restricted)
- Type (read-write or data-protection)
- Export policy
- User ID
- Group ID
- Security style (All volume types: UNIX mode bits, CIFS ACLs, or mixed NFS and CIFS permissions. Only Infinite Volumes can use unified.)
- Default UNIX permissions for files on the volume
- Language
- Junction path
- Whether the junction path is active (advanced privilege level or higher only)
- Whether the volume is the root volume for its Vserver (advanced privilege level or higher only)
- Comment
- Whether autosizing is enabled for FlexVols
- Maximum size for autosizing FlexVols
- Minimum size for autosize
- Grow used space threshold percentage for autosize
- Shrink used space threshold percentage for autosize
- Whether autosizing is enabled for FlexVols
- Current mode of operation of volume autosize
- Maximum directory size (advanced privilege level or higher only)
- Space guarantee style (none or volume)
- Space SLO type (none, thick or semi-thick)
- Snapshot policy
- Snapshot reserve percentage
- Whether the volume create operation runs as a foreground or background process
- Caching policy
- Cache retention priority
- Efficiency policy
Parameters

-vserver <vserver name> - Vserver Name
This specifies the Vserver on which the volume is located. If only one data Vserver exists, you do not need to specify this parameter.

-volume <volume name> - Volume Name
This specifies the name of the volume that is to be created. A volume's name must start with an alphabetic character (a to z or A to Z) and be 150 or fewer characters in length for Infinite Volumes, 197 or fewer characters in length for FlexGroups, and 203 or fewer characters in length for all other volume types. Volume names must be unique within a Vserver.

{-aggregate <aggregate name> - Aggregate Name
This specifies the storage aggregate on which the volume is to be created. This parameter only applies to FlexVol volumes.

| -aggr-list <aggregate name>, ... - List of Aggregates for FlexGroup Constituents
Specifies an array of names of aggregates to be used for FlexGroup constituents. Each entry in the list will create a constituent on the specified aggregate. An aggregate may be specified multiple times to have multiple constituents created on it. This parameter only applies to FlexGroups.

[-aggr-list-multiplier <integer>] - Aggregate List Repeat Count
Specifies the number of times to iterate over the aggregates listed with the -aggr-list parameter when creating a FlexGroup. The aggregate list will be repeated the specified number of times. Example:

```
-aggr-list aggr1,aggr2 -aggr-list-multiplier 2
```

will cause four constituents to be created in the order aggr1, aggr2, aggr1, aggr2.

The default value is 4.

This parameter only applies to FlexGroups

[-size {<integer>[KB|MB|GB|TB|PB]} - Volume Size
This optionally specifies the size of the volume. The size is specified as a number followed by a unit designation: k (kilobytes), m (megabytes), g (gigabytes), or t (terabytes). If the unit designation is not specified, bytes are used as the unit, and the specified number is rounded up to the nearest 4 KB. The minimum size for a FlexVol volume is 20 MB. The minimum size for a FlexGroup is 20MB per constituent. For Infinite Volumes, the minimum size is 1.33 TB per node that will host a data constituent. For all volumes, the default size is set to the minimum size. The volume's maximum size is limited by the platform maximum. If the volume's guarantee is set to volume, the volume's maximum size can also be limited by the available space in the hosting aggregates. Volumes can be increased and decreased in size with the volume modify command. The maximum number of files a volume is configured for is listed under "Total Files" when running the command volume show-instance.

[-state {online|restricted|offline|force-online|force-offline|mixed}] - Volume State
This optionally specifies the volume's state. A restricted volume does not provide client access to data but is available for administrative operations.

Note: The mixed state applies to FlexGroups and Infinite Volumes only and cannot be specified as a target state.

[-policy <text>] - Export Policy
This optionally specifies the ID number of the export policy associated with the volume. For information on export policies, see the documentation for the vserver export-policy create command. FlexGroups do not support policies that allow CIFS or NFSv4 protocol access.

[-user <user name>] - User ID
This optionally specifies the name or ID of the user that is set as the owner of the volume's root.
[-group <group name>] - Group ID
   This optionally specifies the name or ID of the group that is set as the owner of the volume's root.

[-security-style <security style>] - Security Style
   This optionally specifies the security style for the volume. Possible values include unix (for UNIX mode
   bits), ntfs (for CIFS ACLs), mixed (for mixed NFS and CIFS permissions) and unified (for mixed NFS
   and CIFS permissions with unified ACLs). Regardless of the security style, both NFS and CIFS clients can
   read from and write to the volume. The unified security style can only be used on Infinite Volumes.
   FlexGroups and FlexGroup Constituents only support the unix security style.

[-unix-permissions <unix perm>] - UNIX Permissions
   This optionally specifies the default UNIX permissions for files on the volume. Specify UNIX permissions
   either as a four-digit octal value (for example, 0700) or in the style of the UNIX ls command (for example, -
   rwxr-x---). For information on UNIX permissions, see the UNIX or Linux documentation. The default setting
   is 0755 or ---rwxr-xr-x.

[-junction-path <junction path>] - Junction Path
   This optionally specifies the volume's junction path. The junction path name is case insensitive and must be
   unique within a Vserver's namespace.

[-junction-active {true|false}] - Junction Active (privilege: advanced)
   This optionally specifies whether the volume's junction path is active. The default setting is true. If the
   junction path is inactive, the volume does not appear in the Vserver's namespace. This parameter is available
   only at the advanced privilege level and higher.

[-vsroot {true|false}] - Vserver Root Volume (privilege: advanced)
   This optionally specifies whether the volume is the root volume of its Vserver. The default setting is false. If
   this parameter is set to true, the default size of the newly created volume is 1GB. This parameter is not
   supported on FlexGroups or Infinite Volumes.

[-comment <text>] - Comment
   This optionally specifies a comment for the volume.

[-max-autosize (<integer>[KB|MB|GB|TB|PB])] - Maximum Autosize (for flexvols only)
   This parameter allows the user to specify the maximum size to which a flexible volume can grow. The default
   for FlexVol volumes is 120% of the volume size. If the value of this parameter is invalidated by manually
   resizing the volume or is invalid when the autosize feature is enabled, the maximum size is reset to 120% of
   the volumesize. The value for -max-autosize cannot be set larger than the platform-dependent maximum
   FlexVol volume size. If you specify a larger value, the value of -max-autosize is automatically reset to the
   supported maximum without returning an error. This parameter is not supported on FlexGroups or Infinite
   Volumes.

[-min-autosize (<integer>[KB|MB|GB|TB|PB])] - Minimum Autosize
   This parameter specifies the minimum size to which the volume can automatically shrink. If the volume was
   created with the grow_shrink autosize mode enabled, then the default minimum size is equal to the initial
   volume size. If the value of the -min-autosize parameter is invalidated by a manual volume resize or is
   invalid when autosize is enabled, the minimum size is reset to the volume size. This parameter is not supported
   on FlexGroups or Infinite Volumes.

[-autosize-grow-threshold-percent <percent>] - Autosize Grow Threshold Percentage
   This parameter specifies the used space threshold for the automatic growth of the volume. When the volume’s
   used space becomes greater than this threshold, the volume will automatically grow unless it has reached the
   maximum autosize. This parameter is not supported on FlexGroups or Infinite Volumes.

[-autosize-shrink-threshold-percent <percent>] - Autosize Shrink Threshold Percentage
   This parameter specifies the used space threshold for the automatic shrinking of the volume. When the amount
   of used space in the volume drops below this threshold, the volume will shrink unless it has reached the
   specified minimum size. This parameter is not supported on FlexGroups or Infinite Volumes.
[-autosize-mode {off|grow|grow_shrink}] - Autosize Mode

This parameter specifies the autosize mode for the volume. The supported autosize modes are:

- **off**: The volume will not grow or shrink in size in response to the amount of used space.
- **grow**: The volume will automatically grow when used space in the volume is above the grow threshold.
- **grow_shrink**: The volume will grow or shrink in size in response to the amount of used space.

By default, `-autosize-mode` is `off` for new FlexVol volumes, except for data protection mirrors, for which the default value is `grow_shrink`. The `grow` and `grow_shrink` modes work together with Snapshot autodelete to automatically reclaim space when a volume is about to become full. The volume parameter `space-mgmt-try-first` controls the order in which these two space reclamation policies are attempted. This parameter is not supported on FlexGroups or Infinite Volumes.

[-maxdir-size {<integer>[KB|MB|GB|TB|PB]}] - Maximum Directory Size (privilege: advanced)

This optionally specifies the maximum directory size. The default maximum directory size is model-dependent and optimized for the size of system memory.

{{[-space-slo {none|thick|semi-thick}] - Space SLO

This optionally specifies the Service Level Objective for space management (the space SLO setting) for the volume. The space SLO value is used to enforce volume settings so that sufficient space is set aside to meet the space SLO. This parameter is not supported on Infinite Volumes. The default setting is `none`. There are three supported values: `none`, `thick` and `semi-thick`.

- **none**: The value of `none` does not provide any guarantee for overwrites or enforce any restrictions. It should be used if the admin plans to manually manage space consumption in the volume and aggregate, and out of space errors.

- **thick**: The value of `thick` guarantees that the hole fills and overwrites to space-reserved files in this volume will always succeed by reserving space. To meet this space SLO, the following volume-level settings are automatically set and cannot be modified:
  - Space Guarantee: `volume` - The entire size of the volume is preallocated in the aggregate. Changing the volume's `space-guarantee` type is not supported.
  - Fractional Reserve: `100` - 100% of the space required for overwrites is reserved. Changing the volume's `fractional-reserve` setting is not supported.

- **semi-thick**: The value of `semi-thick` is a best-effort attempt to ensure that overwrites succeed by restricting the use of features that share blocks and auto-deleting backups and Snapshot copies in the volume. To meet this space SLO, the following volume-level settings are automatically set and cannot be modified:
  - Space Guarantee: `volume` - The entire size of the volume is preallocated in the aggregate. Changing the volume's `space-guarantee` type is not supported.
  - Fractional Reserve: `0` - No space will be reserved for overwrites by default. However, changing the volume's `fractional-reserve` setting is supported. Changing the setting to `100` means that 100% of the space required for overwrites is reserved.
  - Snapshot Autodelete: `enabled` - Automatic deletion of Snapshot copies is enabled to reclaim space. To ensure that the overwrites can be accommodated when the volume reaches threshold capacity, the following volume snapshot autodelete parameters are set automatically to the specified values and cannot be modified:
    - `enabled`: `true`
    - `commitment`: `destroy`
In addition, with a value of semi-thick, the following technologies are not supported for the volume:

- File Clones with autodelete disabled: Only full file clones of files or LUNs that can be autodeleted can be created in the volume. The use of autodelete for file clone create is required.
- Partial File Clones: Only full file clones of files or LUNs that can be autodeleted can be created in the volume. The use of range for file clone create is not supported.
- Volume Efficiency: Enabling volume efficiency is not supported to allow autodeletion of Snapshot copies.

```
[-space-guarantee | -s {none | volume}] - Space Guarantee Style

This optionally specifies the space-reservation policy for the volume. A value of volume reserves space on the aggregates for the entire volume. A value of none reserves no space on the aggregates, meaning that writes can fail if an aggregate runs out of space; because CIFS does not handle out-of-space conditions, do not use this value if the volume is accessible to CIFS clients. The default setting for the volumes on All Flash FAS systems is none, otherwise the default setting is volume. The file setting is no longer supported.

[-type {RW | DP | DC}] - Volume Type

This optionally specifies the volume's type, either read-write or data-protection. If you do not specify a value for this parameter, a read-write volume is created by default. Only rw is supported for FlexGroups.

[-percent-snapshot-space <percent>] - Space Reserved for Snapshot Copies

This optionally specifies the amount of space that is reserved in the volume for Snapshots. The default setting is 5 percent, except for data protection mirrors for which the default is 0 percent.

[-snapshot-policy <snapshot policy>] - Snapshot Policy

This optionally specifies the Snapshot policy for the volume. The default is the Snapshot policy for all volumes on the Vserver, as specified by the -snapshot-policy parameter of the vserver create and vserver modify commands. The schedules associated with the snapshot-policy for an Infinite Volume cannot have an interval shorter than hourly. The schedules associated with the snapshot-policy for a FlexGroup cannot have an interval shorter than 30 minutes.

[-language <Language code>] - Language

This optionally specifies the language encoding setting for the volume. By default, the volume inherits the Vserver language encoding setting. You cannot specify the language encoding setting for an Infinite Volume.

   Note: You cannot modify the language encoding setting of a volume.

[-foreground {true | false}] - Foreground Process

This specifies whether the operation runs in the foreground. The default setting is true (the operation runs in the foreground). When set to true, the command will not return until the operation completes. This parameter applies only to FlexGroups and Infinite Volumes. For FlexVol volumes, the command always runs in the foreground.

[-nvfail {on | off}] - NVFAIL Option

Setting this optional parameter to true causes the volume to set the in-nvfailed-state flag to true, if committed writes to the volume are lost due to a failure. The in-nvfailed-state flag fences the volume from further data access and prevents possible corruption of the application data. Without specifying a value, this parameter is automatically set to false.

[-storage-service <storage service name>] - Storage Service Name (privilege: advanced)

The name of the initial storage service for the Infinite Volume. This is required if the parameter -is-managed-by-service is set to true. This parameter applies to Infinite Volumes only.
[\texttt{--enable-snapdiff \{true|false\}]} - Create Namespace Mirror Constituents For SnapDiff Use

When set to \texttt{true} for an Infinite Volume that spans three or more nodes, namespace mirror constituents are created for SnapDiff use. One namespace mirror constituent is created on every node that contains a data constituent for the Infinite Volume. A namespace constituent is not created on nodes that contain either the namespace constituent or a namespace mirror constituent used for data protection of the namespace constituent. An automatic daily replication schedule is set up for every namespace mirror constituent created. The default setting is \texttt{false}. This parameter applies to Infinite Volumes only.

[\texttt{--unreachable-attr-action \{return-generated|wait\}]} - Action When Attributes Are Not Reachable

(privilege: advanced)

This parameter specifies the information that an Infinite Volume returns when a client lists a directory that contains one or more files with inaccessible attributes, which can happen when a data constituent is not online. When this parameter is set to \texttt{return-generated}, the Infinite Volume returns default values for the attributes, which appear to the client as a file size of 0 and timestamps that are in the past. When this parameter is set to \texttt{wait}, the Infinite Volume returns a RETRY error, which may cause some clients to hang. When the inaccessible file attributes become available, the Infinite Volume returns them to the client. The default setting is \texttt{return-generated}. This parameter applies to Infinite Volumes only.

[\texttt{--namespace-aggregate <aggregate name>]} - Namespace Aggregate (privilege: advanced)

The name of the aggregate in which to create the Infinite Volume namespace constituent. If a name is not provided, Data ONTAP picks the aggregate assigned to the Vserver that has the most usable space. This parameter applies to Infinite Volumes only.

[\texttt{--max-namespace-constituent-size \{<integer>[KB|MB|GB|TB|PB]\}]} - Maximum Size of Namespace Constituent (privilege: advanced)

The maximum size of the namespace constituent. The default value is 10TB. This parameter applies to Infinite Volumes only.

[\texttt{--ns-mirror-aggr-list <aggregate name>, ...}]} - List of Aggregates for Namespace Mirrors (privilege: advanced)

Specifies the aggregates that can be used to create Infinite Volume namespace mirror constituents. No other aggregate will be chosen for this purpose. Aggregates in this list will remain available for other uses in the Infinite Volume. This parameter applies to Infinite Volumes only.

[\texttt{--data-aggr-list <aggregate name>, ...}]} - List of Aggregates for Data Constituents (privilege: advanced)

Specifies the aggregates that can be used to create Infinite Volume data constituents. No other aggregate will be chosen for this purpose. Aggregates in this list will remain available for other uses in the Infinite Volume. This parameter applies to Infinite Volumes only.

[\texttt{--max-data-constituent-size \{<integer>[KB|MB|GB|TB|PB]\}]} - Maximum Size of Each Data Constituent (privilege: advanced)

This optional parameter specifies the maximum size of an Infinite Volume data constituent. The default value is determined by checking the maximum FlexVol size setting on all nodes used by the Infinite Volume. The smallest value found is chosen as the default for the \texttt{max-data-constituent-size} for the Infinite Volume. This parameter applies to Infinite Volumes only.

[\texttt{--qos-policy-group <text>]} - QoS Policy Group Name

This optionally specifies which QoS policy group to apply to the volume. This policy group defines measurable service level objectives (SLOs) that apply to the storage objects with which the policy group is associated. If you do not assign a policy group to a volume, the system will not monitor and control the traffic to it. This parameter is not supported on Infinite Volumes.

[\texttt{--caching-policy <text>]} - Caching Policy Name

This optional parameter specifies the caching policy to apply to the volume. A caching policy defines how the system caches this volume's data in a Flash Pool aggregate. If a caching policy is not assigned to this volume, the system uses \texttt{auto} as the default caching policy. This parameter is not supported on Infinite Volumes.
Both metadata and user data are eligible for caching. Metadata consists of directories, indirect blocks and system metafiles. They are eligible for read caching only. When a random write pattern is detected on user data, the first such write is eligible for read caching while all subsequent overwrites are eligible for write caching. The available caching policies are:

- **none** - Does not cache any user data or metadata blocks.
- **auto** - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
- **meta** - Read caches only metadata blocks.
- **random_read** - Read caches all metadata and randomly read user data blocks.
- **random_read_write** - Read caches all metadata, randomly read and randomly written user data blocks.
- **all_read** - Read caches all metadata, randomly read and sequentially read user data blocks.
- **all_read_random_write** - Read caches all metadata, randomly read, sequentially read and randomly written user data.
- **all** - Read caches all data blocks read and written. It does not do any write caching.
- **noread-random_write** - Write caches all randomly overwritten user data blocks. It does not do any read caching.
- **meta-random_write** - Read caches all metadata and write caches randomly overwritten user data blocks.
- **random_read_write-random_write** - Read caches all metadata, randomly read and randomly written user data blocks. It also write caches randomly overwritten user data blocks.
- **all_read-random_write** - Read caches all metadata, randomly read and sequentially read user data blocks. It also write caches randomly overwritten user data blocks.
- **all-random_write** - Read caches all data blocks read and written. It also write caches randomly overwritten user data blocks.

Note that in a caching-policy name, a hyphen (-) separates read and write policies. Default caching-policy is auto.

`[-cache-retention-priority {normal|low|high}]` - Cache Retention Priority (privilege: advanced)

This optional parameter specifies the cache retention priority to apply to the volume. A cache retention priority defines how long the blocks of a volume will be cached in flash pool once they become cold. If a cache retention priority is not assigned to this volume, the system uses the default policy. This parameter is available only at the advanced privilege level and higher. This parameter is not supported on Infinite Volumes.

The available cache retention priority are:

- **low** - Cache the cold blocks for the lowest time.
- **normal** - Cache the cold blocks for the default time.
- **high** - Cache the cold blocks for the highest time.

`[-is-autobalance-eligible {true|false}]` - Is Eligible for Auto Balance Aggregate (privilege: advanced)

If the Auto Balance feature is enabled, this parameter specifies whether the volume might be considered for system workload balancing. When set to `true`, the Auto Balance Aggregate feature might recommend moving this volume to another aggregate. The default value is `true`. 

1206

Commands: Manual Page Reference
[-max-constituent-size {<integer> [KB|MB|GB|TB|PB]}] - Maximum size of a FlexGroup Constituent (privilege: advanced)

This optional parameter specifies the maximum size of a FlexGroup constituent. The default value is determined by checking the maximum FlexVol size setting on all nodes used by the FlexGroup. The smallest value found is chosen as the default for the -max-constituent-size for the FlexGroup. This parameter applies to FlexGroups only.

[-efficiency-policy <efficiency policy>] - Storage Efficiency Policy (privilege: advanced)

This optionally specifies which storage efficiency policy to apply to the volume. This parameter is applicable only for All-Flash FAS. This parameter is not supported on Infinite Volumes or data protection volumes on any platform. To disable compression on the volume in All-Flash FAS, use the value none. The default value is inline-only.

[-vserver-dr-protection {protected|unprotected}] - Vserver DR Protection

This optionally specifies whether the volume should be protected by Vserver level SnapMirror. This parameter is applicable only if the Vserver is the source of a Vserver level SnapMirror relationship. The default value for a volume of type “RW” is protected. This parameter is not supported on Infinite Volumes.

Examples

Specifies the number of times to iterate over the aggregates listed with the -aggr-list parameter when creating a FlexGroup. The aggregate list will be repeated the specified number of times. Example:

-aggr-list aggr1,aggr2 -aggr-list-multiplier 2

The following example creates a new volume named user_jdoe on a Vserver named vs0 and a storage aggregate named aggr1. Upon its creation, the volume is placed in the online state. It uses the export policy named default_expolicy. The owner of the volume’s root is a user named jdoe whose primary group is named dev. The volume’s junction path is /user/jdoe. The volume is 250 GB in size, space for the entire volume is reserved on the aggregate, and the create operation runs in the background.

```
cluster1::> volume create -vserver vs0 -volume user_jdoe -aggregate aggr1
-aggr-list aggr1,aggr2 -aggr-list-multiplier 2 -state online -policy default_expolicy -user jdoe -group dev
-junction-path /user/jdoe -size 250g -space-guarantee volume
-percent-snapshot-space 20 -foreground false
```

The following example creates a new volume named vol_cached on a Vserver named vs0 and a Flash Pool storage aggregate named aggr1. The newly created volume is placed online and uses auto as the caching policy.

```
cluster1::> volume create -vserver vs0 -volume vol_cached -aggregate aggr1
-aggregate aggr1 -state online -caching-policy auto
```

The following example creates a new FlexGroup named media_vol on a Vserver named vs0 with 4 constituents on aggregates aggr1 and aggr2. Upon its creation, the volume is placed in the online state. The volume’s junction path is /media. The volume is 200 TB in size, no space for the volume is reserved on the aggregates, and the create operation runs in the background.

```
cluster1::> volume create -vserver vs0 -volume media_vol
-aggr-list aggr1,aggr1,aggr2,aggr2 -aggr-list-multiplier 2 -junction-path /media -size 200TB
-space-guarantee none -foreground false
```

volume modify on page 1209
volume show on page 1223
volume delete

Delete an existing volume

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The `volume delete` command deletes the specified volumes. Before deleting a volume, the user is prompted to confirm the operation unless the `-force` flag is specified. If this volume was associated with a policy group the underlying qos workload is deleted.

Note:
- If there is a qtree or quota policy associated with a volume, it is deleted when you delete the volume.
- A volume must be offline (see `volume offline`) to be deleted.

Parameters
- `-vserver <vserver name>` - Vserver Name
  This specifies the name of the Vserver from which the volume is to be deleted. If only one data Vserver exists, you do not need to specify this parameter.
- `-volume <volume name>` - Volume Name
  This specifies the name of the volume that is to be deleted.
- `[-force [true]]` - Force Delete (privilege: advanced)
  If this parameter is specified, the user is not prompted to confirm each deletion operation. In addition, the operation is run only on the local node, and several potential errors are ignored. By default, this setting is `false`. This parameter is available only at the advanced privilege level and higher.
- `[-foreground {true|false}]` - Foreground Process
  This specifies whether the operation runs in the foreground. The default setting is `true` (the operation runs in the foreground). When set to true, the command will not return until the operation completes.

Examples
The following example deletes a volume named vol1_old from a Vserver named vs0:

```
cluster1::> volume delete -vserver vs0 -volume vol1_old
```

volume make-vsroot

Designate a non-root volume as a root volume of the Vserver

Availability: This command is available to cluster administrators at the advanced privilege level.
The `volume make-vsroot` command promotes a non-root volume of the Vserver to be the Vserver's root volume. The Vserver's root volume must be a FlexVol volume with a size of at least 1 GB.

For instance, if you run this command on a volume named `user` that is located on a Vserver named `vs0`, the volume `user` is made the root volume of the Vserver `vs0`.

If you run this command on a Vserver with Infinite Volume, you must create a new root volume. You cannot promote an existing non-root volume to be the root volume of the Vserver with Infinite Volume. When the command executes, the new root volume is created on the aggregate specified by the `aggregate` parameter, and the old root volume is deleted.

This command is available only at the advanced privilege level and higher.

**Parameters**

- `-vserver <vserver name>` - Vserver Name
  This specifies the Vserver on which a non-root volume is to be made the root volume.

- `-volume <volume name>` - Volume Name
  This specifies the non-root volume that is to be made the root volume of its Vserver. For Vservers with FlexVol volume this must be an existing FlexVol volume. For Vservers with Infinite Volume this must be a non-existent volume that will be created during the execution of the command. Using a SnapLock volume as the root volume for a Vserver is not supported.

- `[-aggregate <aggregate name>]` - Aggregate Name
  This specifies the aggregate that the new root volume will be created on for Vservers with Infinite Volume. This parameter is not supported for Vservers with FlexVol volumes.

**Examples**

The following example makes a volume named `root_vs0_backup` the root volume of its Vserver with FlexVol volumes, which is named `vs0`.

```
node::> volume make-vsroot -vserver vs0 -volume root_vs0_backup
```

The following example makes a volume named `root_vs1` the root volume of the Vserver with Infinite Volume `vs1`.

```
node::> volume make-vsroot -vserver vs1 -volume root_vs1 -aggregate aggr1
```

---

**volume modify**

Modify volume attributes

**Availability:** This command is available to cluster and Vserver administrators at the `admin` privilege level.

**Description**

The `volume modify` command can be used to modify the following attributes of a volume:

- Size
- State (online, offline, restricted, force-online or force-offline)
- Export policy
- User ID
- Group ID
- Security style (All volume types: UNIX mode bits, CIFS ACLs, or mixed NFS and CIFS permissions. Only Infinite Volumes can use unified.)
- Default UNIX permissions for files on the volume
- Whether the junction path is active
- Comment
- Volume nearly full threshold percent
- Volume full threshold percent
- Maximum size for autosizing
- Minimum size for autosizing
- Grow used space threshold percentage for autosize
- Shrink used space threshold percentage for autosize
- Whether autosizing is enabled
- Current mode of operation of volume autosize
- Reset the autosize values to their defaults
- Total number of files for user-visible data permitted on the volume
- Space guarantee style (none or volume)
- Space SLO type (none, thick or semi-thick)
- Snapshot policy
- Convert ucode
- Caching policy
- Cache retention priority

You can use the `volume move` command to change a volume's aggregate or node. You can use the `volume rename` command to change a volume's name. You can use the `volume make-vsroot` command to make a volume the root volume of its Vserver.

You can change additional volume attributes by using this command at the advanced privilege level and higher.

### Parameters

- **vserver <vserver name>** - Vserver Name
  
  This specifies the Vserver on which the volume is located. If only one data Vserver exists, you do not need to specify this parameter. Although node Vservers are not displayed when using <Tab> completion, this parameter supports node Vservers for modifying the root volume of the specified node Vserver.

- **volume <volume name>** - Volume Name
  
  This specifies the volume that is to be modified.

- **[-size \{<integer> [KB|MB|GB|TB|PB]\}** - Volume Size
  
  This optionally specifies the new size of the volume. The size is specified as a number followed by a unit designation: k (kilobytes), m (megabytes), g (gigabytes), or t (terabytes). If the unit designation is not specified, bytes are used as the unit, and the specified number is rounded up to the nearest 4 KB. A relative rather than absolute size change can be specified by adding + or - before the given size: for example,
specifying +30m adds 30 megabytes to the volume's current size. The minimum size for a volume is 20 MB (the default setting). The volume's maximum size is limited by the platform maximum. If the volume's guarantee is set to `volume`, the volume's maximum size can also be limited by the available space in the hosting aggregate. If the volume's guarantee is currently disabled, its size cannot be increased. This parameter is not supported on FlexGroups or Infinite Volumes that are managed by storage services.

```
[-state {online|restricted|offline|force-online|force-offline|mixed}] - Volume State
```

This optionally specifies the volume's state. A restricted volume does not provide client access to data but is available for administrative operations.

**Note:** The `mixed` state applies to Infinite Volumes only and cannot be specified as a target state.

```
[-policy <text>] - Export Policy
```

This optionally specifies the ID number of the export policy associated with the volume. For information on export policy, see the documentation for the `vserver export-policy create` command. FlexGroups do not support export policies that allow CIFS or NFSv4 protocol access.

```
[-user <user name>] - User ID
```

This optionally specifies the name or ID of the user that is set as the owner of the volume's root.

```
[-group <group name>] - Group ID
```

This optionally specifies the name or ID of the group that is set as the owner of the volume's root.

```
[-security-style <security style>] - Security Style
```

This optionally specifies the security style for the volume. Possible values include `unix` (for UNIX mode bits), `ntfs` (for CIFS ACLs), `mixed` (for mixed NFS and CIFS permissions) and `unified` (for mixed NFS and CIFS permissions with unified ACLs). Regardless of the security style, both NFS and CIFS clients can read from and write to the volume. The `unified` security style can only be used on Infinite Volumes. FlexGroup and FlexGroup Constituents only support the `unix` security style.

```
[-unix-permissions <unix perm>] - UNIX Permissions
```

This optionally specifies the default UNIX permissions for files on the volume. Specify UNIX permissions either as a four-digit octal value (for example, 0700) or in the style of the UNIX `ls` command (for example, `-rwxr-x---`). For information on UNIX permissions, see the UNIX or Linux documentation. The default setting is 0755 or `-rwxr-xr-x`.

```
[-junction-active {true|false}] - Junction Active (privilege: advanced)
```

This optionally specifies whether the volume's junction path is active. The default setting is `true`. If the junction is inactive, the volume does not appear in the Vserver's namespace.

```
[-comment <text>] - Comment
```

This optionally specifies a comment for the volume.

```
[-space-nearly-full-threshold-percent <percent>] - Volume Nearly Full Threshold Percent
```

This optionally specifies the percentage at which the volume is considered nearly full, and above which an EMS warning will be generated. This parameter is not supported on Infinite Volumes. The default value is 95%. The maximum value for this option is 99%. Setting this threshold to 0 disables the volume nearly full space alerts.

```
[-space-full-threshold-percent <percent>] - Volume Full Threshold Percent
```

This optionally specifies the percentage at which the volume is considered full, and above which a critical EMS error will be generated. This parameter is not supported on Infinite Volumes. The default value is 98%. The maximum value for this option is 100%. Setting this threshold to 0 disables the volume full space alerts.

```
{ [ -max-autosize (<integer> [KB|MB|GB|TB|PB])] - Maximum Autosize (for flexvols only)
```

This parameter allows the user to specify the maximum size to which a flexible volume can grow. The default for FlexVol volumes is 120% of the volume size. If the value of this parameter is invalidated by manually resizing the volume or is invalid when the autosize feature is enabled, the maximum size is reset to 120% of the volume size. The value for `max-autosize` cannot be set larger than the platform-dependent maximum size.
FlexVol volume size. If you specify a larger value, the value of \texttt{-max-autosize} is automatically reset to the supported maximum without returning an error. This parameter is not supported on FlexGroups or Infinite Volumes.

\texttt{[-min-autosize <integer> \{KB|MB|GB|TB|PB\}]} - Minimum Autosize

This parameter specifies the minimum size to which the volume can automatically shrink. If the volume was created with the \texttt{grow_shrink} autosize mode enabled, then the default minimum size is equal to the initial volume size. If the value of the \texttt{-min-autosize} parameter is invalidated by a manual volume resize or is invalid when autosize is enabled, the minimum size is reset to the volume size. This parameter is not supported on FlexGroups or Infinite Volumes.

\texttt{[-autosize-grow-threshold-percent <percent>]} - Autosize Grow Threshold Percentage

This parameter specifies the used space threshold for the automatic growth of the volume. When the volume’s used space becomes greater than this threshold, the volume will automatically grow unless it has reached the maximum autosize. This parameter is not supported on FlexGroups or Infinite Volumes.

\texttt{[-autosize-shrink-threshold-percent <percent>]} - Autosize Shrink Threshold Percentage

This parameter specifies the used space threshold for the automatic shrinking of the volume. When the amount of used space in the volume drops below this threshold, the volume will shrink unless it has reached the specified minimum size. This parameter is not supported on FlexGroups or Infinite Volumes.

\texttt{[-autosize-mode \{off|grow|grow_shrink\}]} - Autosize Mode

This parameter specifies the autosize mode for the volume. The supported autosize modes are:

- \texttt{off} - The volume will not grow or shrink in size in response to the amount of used space.
- \texttt{grow} - The volume will automatically grow when used space in the volume is above the grow threshold.
- \texttt{grow_shrink} - The volume will grow or shrink in size in response to the amount of used space.

By default, \texttt{-autosize-mode} is \texttt{off} for new flexible volumes, except for DP mirrors, for which the default value is \texttt{grow_shrink}. The \texttt{grow} and \texttt{grow_shrink} modes work together with Snapshot autodelete to automatically reclaim space when a volume is about to become full. The volume parameter \texttt{-space-mgmt-try-first} controls the order in which these two space reclamation policies are attempted. This parameter is not supported on FlexGroups or Infinite Volumes.

\texttt{[-autosize-reset \{true\}]} - Autosize Reset

This allows the user to reset the values of autosize, max-autosize, min-autosize, autosize-grow-threshold-percent, autosize-shrink-threshold-percent and autosize-mode to their default values. For example, the max-autosize value will be set to 120% of the current size of the volume. This parameter is not supported on FlexGroups or Infinite Volumes.

\texttt{[-files <integer>]} - Total Files (for user-visible data)

This optionally specifies the total number of files for user-visible data permitted on the volume. This value can be raised or lowered. Raising the total number of files does not immediately cause additional disk space to be used to track files. Instead, as more files are created on the volume, the system dynamically increases the number of disk blocks that are used to track files. The space assigned to track files is never freed, and the \texttt{files} value cannot be decreased below the current number of files that can be tracked within the assigned space for the volume.

\texttt{[-maxdir-size <integer> \{KB|MB|GB|TB|PB\}]} - Maximum Directory Size (privilege: advanced)

This optionally specifies the maximum directory size. The default maximum directory size is model-dependent, and optimized for the size of system memory. You can increase it for a specific volume by using this option, but doing so could impact system performance. If you need to increase the maximum directory size, work with customer support. This parameter is not supported on Infinite Volumes.

\texttt{[-space-slo \{none|thick|semi-thick\}]} - Space SLO

This optionally specifies the Service Level Objective for space management (the space SLO setting) for the volume. The space SLO value is used to enforce volume settings so that sufficient space is set aside to meet
the space SLO. This parameter is not supported on Infinite Volumes. The default setting is `none`. There are three supported values: `none`, `thick` and `semi-thick`.

- **none**: The value of `none` does not provide any guarantee for overwrites or enforce any restrictions. It should be used if the admin plans to manually manage space consumption in the volume and aggregate, and out of space errors.

- **thick**: The value of `thick` guarantees that the hole fills and overwrites to space-reserved files in this volume will always succeed by reserving space. To meet this space SLO, the following volume-level settings are automatically set and cannot be modified:
  - **Space Guarantee**: `volume` - The entire size of the volume is preallocated in the aggregate. Changing the volume's `space-guarantee` type is not supported.
  - **Fractional Reserve**: 100 - 100% of the space required for overwrites is reserved. Changing the volume's `fractional-reserve` setting is not supported.

- **semi-thick**: The value of `semi-thick` is a best-effort attempt to ensure that overwrites succeed by restricting the use of features that share blocks and auto-deleting backups and Snapshot copies in the volume. To meet this space SLO, the following volume-level settings are automatically set and cannot be modified:
  - **Space Guarantee**: `volume` - The entire size of the volume is preallocated in the aggregate. Changing the volume's `space-guarantee` type is not supported.
  - **Fractional Reserve**: 0 - No space will be reserved for overwrites by default. However, changing the volume's `fractional-reserve` setting is supported. Changing the setting to 100 means that 100% of the space required for overwrites is reserved.
  - **Snapshot Autodelete**: `enabled` - Automatic deletion of Snapshot copies is enabled to reclaim space. To ensure that the overwrites can be accommodated when the volume reaches threshold capacity, the following volume snapshot autodelete parameters are set automatically to the specified values and cannot be modified:
    - `enabled`: true
    - `commitment`: destroy
    - `trigger`: volume
    - `defer-delete`: none
    - `destroy-list`: vol_clone, lun_clone, file_clone, cifs_share

In addition, with a value of `semi-thick`, the following technologies are not supported for the volume:

- **File Clones with autodelete disabled**: Only full file clones of files or LUNs that can be autodeleted can be created in the volume. The use of `autodelete` for file clone create is required.
- **Partial File Clones**: Only full file clones of files or LUNs that can be autodeleted can be created in the volume. The use of `range` for file clone create is not supported.
- **Volume Efficiency**: Enabling volume efficiency is not supported to allow autodeletion of Snapshot copies.

```
[[-space-guarantee] -s {none|volume}] - Space Guarantee Style
```

This option controls whether the volume is guaranteed some amount of space in the aggregate. The default setting for the volumes on All Flash FAS systems is `none`, otherwise the default setting is `volume`. The `file` setting is no longer supported. Volume guaranteed means that the entire size of the volume is preallocated. The `none` value means that no space is preallocated, even if the volume contains space-reserved files or LUNs; if the aggregate is full, space is not available even for space-reserved files and LUNs within the volume. Setting
this parameter to none enables you to provision more storage than is physically present in the aggregate (thin provisioning). When you use thin provisioning for a volume, it can run out of space even if it has not yet consumed its nominal size and you should carefully monitor space utilization to avoid unexpected errors due to the volume running out of space. For flexible root volumes, to ensure that system files, log files, and cores can be saved, the space-guarantee must be volume. This is to ensure support of the appliance by customer support, if a problem occurs. Disk space is preallocated when the volume is brought online and, if not used, returned to the aggregate when the volume is brought offline. It is possible to bring a volume online even when the aggregate has insufficient free space to preallocate to the volume. In this case, no space is preallocated, just as if the none option had been selected. In this situation, the vol options and vol status command display the actual value of the space-guarantee option, but indicate that it is disabled. This parameter is not supported on FlexGroups or Infinite Volumes that are managed by storage services.

[-fractional-reserve <percent>] - Fractional Reserve
This option changes the amount of space reserved for overwrites of reserved objects (LUNs, files) in a volume. This parameter is not supported on Infinite Volumes. The option is set to 100 by default with guarantee set to volume. A setting of 100 means that 100% of the required reserved space is actually reserved so the objects are fully protected for overwrites. The value is set to 0 by default with guarantee set to none. The value can be either 0 or 100 when guarantee is set to volume or none. Using a value of 0 indicates that no space will be reserved for overwrites. This returns the extra space to the available space for the volume, decreasing the total amount of space used. However, this does leave the protected objects in the volume vulnerable to out of space errors. If the percentage is set to 0%, the administrator must monitor the space usage on the volume and take corrective action.

[-min-readahead {true|false}] - Minimum Read Ahead (privilege: advanced)
This optionally specifies whether minimum readahead is used on the volume. The default setting is false.

[-atime-update {true|false}] - Access Time Update Enabled (privilege: advanced)
This optionally specifies whether the access time on inodes is updated when a file is read. The default setting is true.

[-snapdir-access {true|false}] - Snapshot Directory Access Enabled
This optionally specifies whether clients have access to .snapshot directories. The default setting is true.

[-percent-snapshot-space <percent>] - Space Reserved for Snapshot Copies
This optionally specifies the amount of space that is reserved on the volume for Snapshot copies. The default setting is 5 percent.

[-snapshot-policy <snapshot policy>] - Snapshot Policy
This optionally specifies the Snapshot policy for the volume. The default is the Snapshot policy for all volumes on the Vserver, as specified by the -snapshot-policy parameter of the vserver create and vserver modify commands. The schedules associated with the snapshot-policy for an Infinite Volume cannot have an interval shorter than hourly.

[-foreground {true|false}] - Foreground Process
This specifies whether the operation runs in the foreground. The default setting is true (the operation runs in the foreground). When set to true, the command will not return until the operation completes. This parameter applies only to Infinite Volumes. For FlexVol volumes, the command always runs in the foreground.

[-nvfail {on|off}] - NVFAIL Option
Setting this optional parameter to true causes the volume to set the in-nvfailed-state flag to true, if committed writes to the volume are lost due to a failure. The in-nvfailed-state flag fences the volume from further data access and prevents possible corruption of the application data. Without specifying a value, this parameter is automatically set to false.

[-in-nvfailed-state {true|false}] - Volume's NVFAIL State (privilege: advanced)
This field is automatically set to true on a volume when committed writes to the volume are possibly lost due to a failure, and the volume has the nvfail option enabled. With this field set, the client access to the volume is fenced to protect against possible corruptions that result from accessing stale data. The administrator needs to
take appropriate recovery actions to recover the volume from the possible data loss. After the recovery is completed, the administrator can clear this field and restore the client access to the volume. This field can be cleared using the CLI but it cannot be set.

[-dr-force-nvfail {on|off}] - Force NVFAIL on MetroCluster Switchover

Setting this optional parameter to true on a volume causes the MetroCluster switchover operation to set the in-nvfailed-state flag to true on that volume. The in-nvfailed-state flag prevents further data access to the volume.

The default value is false. This parameter has no effect on a negotiated or an automatic switchover, and is not supported on FlexGroups or Infinite Volumes.

[-filesys-size-fixed {true|false}] - Is File System Size Fixed

This option causes the file system to remain the same size and not grow or shrink when a SnapMirrored volume relationship is broken, or when a volume add is performed on it. It is automatically set to true when a volume becomes a SnapMirrored volume. It stays set to true after the snapmirror break command is issued for the volume. This allows a volume to be SnapMirrored back to the source without needing to add disks to the source volume. If the volume is a traditional volume and the size is larger than the file system size, setting this option to false forces the file system to grow to the size of the volume. If the volume is a flexible volume and the volume size is larger than the file system size, setting this option to false forces the volume size to equal the file system size. The default setting is false.

[-extent-enabled {off|on|space-optimized}] - (DEPRECATED)-Extent Option

**Note:** This parameter has been deprecated and may be removed in a future release of Data ONTAP.

Setting this option to on or space-optimized enables extents in the volume. This causes application writes to be written in the volume as a write of a larger group of related data blocks called an extent. Using extents may help workloads that perform many small random writes followed by large sequential reads. However, using extents may increase the amount of disk operations performed on the controller, so this option should only be used where this trade-off is desired. If the option is set to space-optimized then the reallocation update will not duplicate blocks from Snapshot copies into the active file system, and will result in conservative space utilization. Using space-optimized may be useful when the volume has Snapshot copies or is a SnapMirror source, when it can reduce the storage used in the volume and the amount of data that SnapMirror needs to move on the next update. The space-optimized value can result in degraded read performance of Snapshot copies. The default value is off; extents are not used.

[-space-mgmt-try-first {volume_grow|snap_delete}] - Primary Space Management Strategy

A flexible volume can be configured to automatically reclaim space in case the volume is about to run out of space, by either increasing the size of the volume using autogrow or deleting Snapshot copies in the volume using Snapshot autodelete. If this option is set to volume_grow the system will try to first increase the size of volume before deleting Snapshot copies to reclaim space. If the option is set to snap_delete the system will first automatically delete Snapshot copies and in case of failure to reclaim space will try to grow the volume. This parameter is not supported on Infinite Volumes.

[-read-realloc {off|on|space-optimized}] - Read Reallocation Option

Setting this option to on or space-optimized enables read reallocation in the volume. This results in the optimization of file layout by writing some blocks to a new location on disk. The layout is updated only after the blocks have been read because of a user read operation, and only when updating their layout will provide better read performance in the future. Using read reallocation may help workloads that perform a mixture of random writes and large sequential reads. If the option is set to space-optimized then the reallocation update will not duplicate blocks from Snapshot copies into the active file system, and will result in conservative space utilization. Using space-optimized may be useful when the volume has Snapshot copies or is a SnapMirror source, when it can reduce the storage used in the volume and the amount of data that snapmirror needs to move on the next update. The space-optimized value can result in degraded read performance of Snapshot copies. The default value is off.

[-sched-snap-name {create-time|ordinal}] - Naming Scheme for Automatic Snapshot Copies

This option specifies the naming convention for automatic Snapshot copies. If set to create-time, automatic Snapshot copies are named using the format <schedule_name>.yyyy-mm-dd_hhmm. Example: "hourly.
2010-04-01_0831". If set to *ordinal*, only the latest automatic Snapshot copy is named using the format `<schedule_name>.<n>`. Example: "hourly.0". Older automatic Snapshot copies are named using the format `<schedule_name>.yyyy-mm-dd_hhmm`. Example: "hourly.2010-04-01_0831".

[-storage-service <storage service name>] - Storage Service Name (privilege: advanced)
The name of the storage service for the Infinite Volume. This parameter applies to Infinite Volumes only.

[-enable-snapdiff {true|false}] - Create Namespace Mirror Constituents For SnapDiff Use
When set to *true* for an Infinite Volume that spans three or more nodes, namespace mirror constituents are created for SnapDiff use. One namespace mirror constituent is created on every node that contains a data constituent for the Infinite Volume. A namespace mirror constituent is not created on nodes that contain either the namespace constituent or a namespace mirror constituent used for data protection of the namespace constituent. An automatic daily replication schedule is set up for every namespace mirror constituent created. If set to *false*, all existing namespace mirror constituents used by SnapDiff are deleted. The namespace mirror constituent used for namespace data protection is not affected. This parameter applies to Infinite Volumes only.

[-unreachable-attr-action {return-generated|wait}] - Action When Attributes Are Not Reachable (privilege: advanced)
This parameter specifies the information that an Infinite Volume returns when a client lists a directory that contains one or more files with inaccessible attributes, which can happen when a data constituent is not online. When this parameter is set to *return-generated*, the Infinite Volume returns default values for the attributes, which appear to the client as a file size of 0 and timestamps that are in the past. When this parameter is set to *wait*, the Infinite Volume returns a RETRY error, which may cause some clients to hang. When the inaccessible file attributes become available, the Infinite Volume returns them to the client. The default setting is *return-generated*. This parameter applies to Infinite Volumes only.

[-namespace-aggregate <aggregate name>] - Namespace Aggregate (privilege: advanced)
The name of the aggregate in which to create the Infinite Volume namespace constituent. If a name is not provided, Data ONTAP picks the aggregate assigned to the Vserver that has the most usable space. This parameter can only be specified for DP Infinite Volumes that do not have an existing namespace constituent. This parameter applies to Infinite Volumes only.

[-max-name-space-constituent-size {<integer>[KB|MB|GB|TB|PB]}] - Maximum Size of Namespace Constituent (privilege: advanced)
The maximum size of the namespace constituent. The default value is 10TB. This parameter applies to Infinite Volumes only.

[-ns-mirror-aggr-list <aggregate name>, ...] - List of Aggregates for Namespace Mirrors (privilege: advanced)
Specifies the aggregates that can be used to create Infinite Volume namespace mirror constituents. No other aggregate will be chosen for this purpose. Aggregates in this list will remain available for other uses in the Infinite Volume. This parameter applies to Infinite Volumes only.

[-max-data-constituent-size {<integer>[KB|MB|GB|TB|PB]}] - Maximum Size of Each Data Constituent (privilege: advanced)
This parameter specifies the maximum size of an Infinite Volume data constituent. The default value is determined by checking the maximum FlexVol size setting on all nodes used by the Infinite Volume. The smallest value found is chosen as the default for the maximum constituent size. This parameter applies to Infinite Volumes only.

[-qos-policy-group <text>] - QoS Policy Group Name
This optionally specifies which QoS policy group to apply to the volume. This policy group defines measurable service level objectives (SLOs) that apply to the storage objects with which the policy group is associated. If you do not assign a policy group to a volume, the system will not monitor and control the traffic to it. To remove this volume from a policy group, enter the reserved keyword "none". This parameter is not supported on Infinite Volumes.
[-caching-policy <text>] - Caching Policy Name

This parameter specifies the caching policy to apply to the volume. A caching policy defines how the system caches this volume's data in a Flash Pool aggregate. This parameter is not supported on Infinite Volumes.

Both metadata and user data are eligible for caching. Metadata consists of directories, indirect blocks and system metafiles. They are eligible for read caching only. When a random write pattern is detected on user data, the first such write is eligible for read caching while all subsequent overwrites are eligible for write caching. The available caching policies are:

- none - Does not cache any user data or metadata blocks.
- auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
- meta - Read caches only metadata blocks.
- random_read - Read caches all metadata and randomly read user data blocks.
- random_read_write - Read caches all metadata, randomly read and randomly written user data blocks.
- all_read - Read caches all metadata, randomly read and sequentially read user data blocks.
- all_read_random_write - Read caches all metadata, randomly read, sequentially read and randomly written user data.
- all - Read caches all data blocks read and written. It does not do any write caching.
- noread-random_write - Write caches all randomly overwritten user data blocks. It does not do any read caching.
- meta-random_write - Read caches all metadata and write caches randomly overwritten user data blocks.
- random_read-write-random_write - Read caches all metadata, randomly read and randomly written user data blocks. It also write caches randomly overwritten user data blocks.
- all_read-random_write - Read caches all metadata, randomly read and sequentially read user data blocks. It also write caches randomly overwritten user data blocks.
- all_read_random_write-random_write - Read caches all metadata, randomly read, sequentially read and randomly written user data. It also write caches randomly overwritten user data blocks.
- all-random_write - Read caches all data blocks read and written. It also write caches randomly overwritten user data blocks.

Note that in a caching-policy name, a hyphen (-) separates read and write policies. Default caching-policy is auto.

[-cache-retention-priority (normal|low|high)] - Cache Retention Priority (privilege: advanced)

This parameter specifies the cache retention priority to apply to the volume. A cache retention priority defines how long the blocks of a volume will be cached in flash pool once they become cold. If a cache retention priority is not assigned to this volume, the system uses the default policy. This parameter is not supported on Infinite Volumes.

The available cache retention priority are:

- low - Cache the cold blocks for the lowest time.
- normal - Cache the cold blocks for the default time.
- high - Cache the cold blocks for the highest time.
[\textbf{-is-autobalance-eligible \{true|false\}}] - Is Eligible for Auto Balance Aggregate (privilege: advanced)

If the Auto Balance feature is enabled, this parameter specifies whether the volume might be considered for system workload balancing. When set to \textit{true}, the Auto Balance Aggregate feature might recommend moving this volume to another aggregate. The default value is \textit{true}.

[\textbf{-max-constituent-size \{<integer>\[KB|MB|GB|TB|PB]\}}] - Maximum size of a FlexGroup Constituent (privilege: advanced)

This optional parameter specifies the maximum size of a FlexGroup constituent. The default value is determined by checking the maximum FlexVol size setting on all nodes used by the FlexGroup. The smallest value found is chosen as the default for the \textbf{-max-constituent-size} for the FlexGroup. This parameter applies to FlexGroups only.

[\textbf{-vserver-dr-protection \{protected|unprotected\}}] - Vserver DR Protection

This optionally specifies whether the volume should be protected by Vserver level SnapMirror. This parameter is applicable only if the Vserver is the source of a Vserver level SnapMirror relationship. This parameter is not supported on Infinite Volumes.

\section*{Examples}

The following example modifies a volume named vol4 on a Vserver named vs0. The volume's export policy is changed to default\_expolicy and its size is changed to 500 GB.

```
class=volume modify -vserver vs0 -volume vol4 -policy default\_expolicy -size 500g
```

The following example modifies a volume named vol2. It enables autogrow and sets the maximum autosize to 500g.

```
class=volume modify -volume vol2 -autosize-mode grow -max-autosize 500g
```

The following example modifies a volume named vol2 to have a space guarantee of none.

```
class=volume modify -space-guarantee none -volume vol2
```

The following example modifies all volumes in Vserver vs0 to have a fractional reserve of 30%.

```
class=volume modify -fractional-reserve 30 -vserver vs0 *
```

The following example modifies a volume named vol2 to grow in size by 5 gigabytes.

```
class=volume modify -volume vol2 -size +5g
```

The following example modifies a volume named vol2 to have a different caching policy. The volume must be on a Flash Pool aggregate.

```
class=volume modify -volume vol2 -caching-policy none
```

**volume mount**

Mount a volume on another volume with a junction-path

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `volume mount` command mounts a volume at a specified junction path.

**Parameters**
- `vserver <vserver name>` - Vserver Name
  This specifies the Vserver on which the volume is located.

- `volume <volume name>` - Volume Name
  This specifies the volume that is to be mounted.

- `junction-path <junction path>` - Junction Path Of The Mounting Volume
  This specifies the junction path of the mounted volume. The junction path name is case insensitive and must be unique within a Vserver's namespace.

- `[-active {true|false}]` - Activate Junction Path
  This optionally specifies whether the mounted volume is accessible. The default setting is `false`. If the mounted path is not accessible, it does not appear in the Vserver's namespace.

- `[-policy-override {true|false}]` - Override The Export Policy
  This optionally specifies whether the parent volume's export policy overrides the mounted volume's export policy. The default setting is `false`.

**Examples**
The following example mounts a volume named user_tsmith on a Vserver named vs0. The junction path for the mounted volume is /user/tsmith. The mounted volume is accessible, and the mounted volume's export policy is not overridden by the parent volume's export policy.

```
node::> volume mount -vserver vs0 -volume user_tsmith
   -junction-path /user/tsmith -active true -policy-override false
```

**volume offline**

Take an existing volume offline

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `volume offline` command takes the volume offline. If the volume is already in restricted or iron_restricted state, then it is already unavailable for data access, and much of the following description does not apply. The current root volume may not be taken offline. A number of operations being performed on the volume in question can prevent volume offline from succeeding for various lengths of time. If such operations are required, the command may take additional time to complete. If they do not, the command is aborted. The `-force` flag can be used to forcibly offline a volume.
Parameters

- `vserver <vserver name>` - Vserver Name
  This specifies the name of the Vserver from which the volume is to be taken offline. If only one data Vserver exists, you do not need to specify this parameter.

- `volume <volume name>` - Volume Name
  This specifies the name of the volume that is to be taken offline.

[[-force | -f [true]]] - Force Offline
This specifies whether the offline operation is forced. Using this option to force a volume offline can potentially disrupt access to other volumes. The default setting is false.

[-foreground {true|false}] - Foreground Process
This specifies whether the operation runs in the foreground. The default setting is true (the operation runs in the foreground). When set to true, the command will not return until the operation completes. This parameter applies only to Infinite Volumes. For FlexVol volumes, the command always runs in the foreground.

[[-disable-luns-check [true]]] - Disable Check for Existing LUNs
Taking the volume offline will make all associated LUNs unavailable, which normally requires a user confirmation. If this parameter is specified, the command proceeds without a confirmation. The default setting is false.

Examples
The following example takes the volume named vol1 offline:

```
cluster1::> volume offline vol1
Volume 'vs1:vol1' is now offline.
```

volume online

Bring an existing volume online

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The `volume online` command brings the volume online. A volume can only be brought online if it is offline or restricted. If the volume is inconsistent but has not lost data, the user will be cautioned and prompted before bringing it online. It is advisable to run wafl-iron (or do a snapmirror initialize in case of a replica volume) prior to bringing an inconsistent volume online. Bringing an inconsistent volume online increases the risk of further file system corruption. If the containing aggregate cannot honor the space guarantees required by this volume, the volume online operation will fail. It is not advisable to use volumes with their space guarantees disabled. Lack of free space can lead to failure of writes which in turn can appear as data loss to some applications.

Parameters

- `vserver <vserver name>` - Vserver Name
  This parameter specifies the name of the Vserver from which the volume is to be brought online. If only one data Vserver exists, you do not need to specify this parameter.

- `volume <volume name>` - Volume Name
  This parameter specifies the name of the volume that is to be brought online.
[-force] -f [true] - Force Online
When this parameter is used, the volume will be brought online even if there is not enough space available in
the aggregate to honor the volume's space guarantee.

[-foreground] -f [true|false] - Foreground Process
This parameter specifies whether the operation runs in the foreground. The default setting is true (the
operation runs in the foreground). When set to true, the command will not return until the operation completes.
This parameter applies only to Infinite Volumes. For FlexVol volumes, the command always runs in the
foreground.

Examples
The following example brings a volume named vol1 online:

classid1::> volume online vol1
Volume 'vs1:vol1' is now online.

volume rehost
Rehost a volume from one Vserver into another Vserver

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The volume rehost command rehosts a volume from source Vserver onto destination Vserver. The volume name must be
unique among the other volumes on the destination Vserver.

Parameters
-vserver <vserver name> - Source Vserver name
This specifies the Vserver on which the volume is located.

-volume <volume name> - Target volume name
This specifies the volume that is to be rehosted.

-destination-vserver <vserver name> - Destination Vserver name
This specifies the destination Vserver where the volume must be located post rehost operation.

{ [-force-unmap-luns] - Unmap LUNs in volume
This specifies whether the rehost operation should unmap LUNs present on volume. The default setting is false (the rehost operation shall not unmap LUNs). When set to true, the command will unmap all mapped
LUNs on the volume.

| [-auto-remap-luns] - Automatic Remap of LUNs
This specifies whether the rehost operation should perform LUN mapping operation at the destination Vserver
for the LUNs mapped on the volume at the source Vserver. The default setting is false (the rehost operation
shall not map LUNs at the destination Vserver). When set to true, at the destination Vserver the command will
create initiators groups along with the initiators (if present) with same name as that of source Vserver. Then
the LUNs on the volume are mapped to initiator groups at the destination Vserver as mapped in source
Vserver.

Examples
The following example rehosts a volume named vol3 on Vserver named vs1 to a destination Vserver named vs2:
volume rename

Rename an existing volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `volume rename` command renames a volume. The volume name must be unique among the other volumes on the same Vserver. The `volume rename` command is not supported for FlexGroups.

**Parameters**
- `vserver <vserver name>` - Vserver Name
  This specifies the Vserver on which the volume is located. For a node's root volume, use the name of the node for this parameter.
- `volume <volume name>` - Volume Name
  This specifies the volume that is to be renamed.
- `newname <volume name>` - Volume New Name
  This specifies the volume's new name. A volume's name must start with an alphabetic character (a to z or A to Z) and be 203 or fewer characters in length.
- `[-foreground {true|false}]` - Foreground Process
  This specifies whether the operation runs in the foreground. The default setting is `true` (the operation runs in the foreground). When set to true, the command will not return until the operation completes. This parameter applies only to Infinite Volumes. For FlexVol volumes, the command always runs in the foreground.

**Examples**
The following example renames a volume named `vol3_backup` as `vol3_save` on a Vserver named `vs0`:

```bash
node::> volume rename -vserver vs0 -volume vol3_backup -newname vol3_save
```

volume restrict

Restrict an existing volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `volume restrict` command puts the volume in restricted state. If the volume is online, then it will be made unavailable for data access as described under *volume offline*.

**Parameters**
- `vserver <vserver name>` - Vserver Name
  This specifies the name of the Vserver from which the volume is to be restricted. If only one data Vserver exists, you do not need to specify this parameter.
-volume <volume name> - Volume Name

This specifies the name of the volume that is to be restricted.

[-foreground {true|false}] - Foreground Process

This specifies whether the operation runs in the foreground. The default setting is true (the operation runs in the foreground). When set to true, the command will not return until the operation completes. This parameter applies only to Infinite Volumes. For FlexVol volumes, the command always runs in the foreground.

**Examples**
The following example restricts a volume named vol1:

```
cluster1::> volume restrict vol1
Volume 'vsi:vol1' is now restricted.
```

**Related references**

*volume offline* on page 1219

**volume show**

Display a list of volumes

**Availability:** This command is available to cluster and Vserver administrators at the *admin* privilege level.

**Description**
The `volume show` command displays information about volumes. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays the following information about all volumes:

- Vserver name
- Volume name
- Aggregate name
- State (online, offline, restricted, or mixed)
- Type (RW for read-write or DP for data-protection)
- Size
- Available size
- Percentage of space used

To display detailed information about a single volume, run the command with the `-vserver` and `-volume` parameters. The detailed view provides all of the information in the previous list and the following additional information:

- Name ordinal
- Volume data set ID
- Volume master data set ID
- Volume style (trad, flex or infinitevol)
- Whether the volume is a Cluster volume or Node volume
• Export policy name
• User ID
• Group ID
• Security style (unix, ntfs, mixed or unified)
• UNIX permissions
• Junction path
• Junction path source
• Whether the junction path is active
• Parent volume name
• Vserver root volume
• Comment
• Filesystem size
• Total user-visible size
• Used size
• Used percentage
• Volume nearly full threshold percent
• Volume full threshold percent
• Autosize enabled
• Maximum autosize
• Minimum autosize
• Autosize grow threshold percent
• Autosize shrink threshold percent
• Autosize mode
• Total files
• Files used
• Maximum directory size
• Space guarantee style
• Whether a space guarantee is in effect
• Space SLO type (none, thick or semi-thick)
• Whether space SLO is in effect
• Whether minimum readahead is enabled
• Whether access time update is enabled
• Whether Snapshot directory access is enabled
• Percentage of space reserved for Snapshot Copies
• Percentage of Snapshot copy space used
• Snapshot policy name
• Creation time
• If the filesystem size is fixed
• Overwrite reserve
• Fractional reserve
• Which space management strategy to try first
• Language
• Whether there’s one data volume per member aggregate
• Concurrency level
• Optimization policy
• Whether the volume is a clone
• Volume UUID
• Whether failover is enabled
• Failover state
• (DEPRECATED)-Extent option
• Read reallocation option
• Consistency state
• Whether volume is quiesced on disk
• Whether volume is quiesced in memory
• Whether volume contains shared or compressed data
• Space saved by storage efficiency
• Percentage of space saved by storage efficiency
• Space saved by deduplication
• Percentage of space saved by deduplication
• Space shared by deduplication
• Space saved by compression
• Percentage of space saved by compression
• Volume Size Used by Snapshot Copies
• Caching policy
• FlexGroup master data set ID
• FlexGroup index
• FlexGroup UUID
• Maximum size of the FlexGroup constituent

volume show

1225
• Whether the volume has FlexGroup enabled
• List of the aggregates used by the FlexGroup
• List of the nodes used by the FlexGroup
• SnapLock Type
• Is in precommiti phase of Copy-Free Transition

To display detailed information about all volumes, run the command with the `-instance` parameter. Fields not supported by Infinite Volumes will display a value of "-".

You can specify additional parameters to display information that matches only those parameters. For example, to display information only about data-protection volumes, run the command with the `-type DP` parameter.

**Parameters**

```
[-fields <fieldname>, ...]
```

This specifies the fields that need to be displayed. The fields Vserver and policy are the default fields (see example).

```
[-junction]
```

If this parameter is specified, the command displays the following information:

• Vserver name
• Volume name
• Whether the volume's junction is active
• Junction path
• Junction path source (if the volume is a mirror)

```
[-settings] (privilege: advanced)
```

If this parameter is specified, the command displays the following information:

• Vserver name
• Volume name
• Whether minimum readahead is enabled on the volume
• Whether the access time is updated on inodes when a file on the volume is read
• Whether clients have access to .snapshot directories
• Whether automatic Snapshot copies are enabled on the volume

```
[-instance]
```

If this parameter is specified, the command displays information about all entries.

```
[-vserver <vserver name>] - Vserver Name
```

If this parameter and the `-volume` parameter are specified, the command displays detailed information about the specified volume. If this parameter is specified by itself, the command displays information about volumes on the specified Vserver.

```
[-volume <volume name>] - Volume Name
```

If this parameter and the `-vserver` parameter are specified, the command displays detailed information about the specified volume. If this parameter is specified by itself, the command displays information about all volumes matching the specified name.
[-aggregate <aggregate name>] - Aggregate Name
If this parameter is specified, the command displays information only about the volume or volumes that are
located on the specified storage aggregate. This field is displayed as "-" for FlexGroups.

[-aggr-list <aggregate name>, ...] - List of Aggregates for FlexGroup Constituents
If this parameter is specified, the command displays information only about the FlexGroup or FlexGroups that
are located on the specified list of storage aggregates. This parameter applies to FlexGroups only.

[-size {<integer> [KB|MB|GB|TB|PB]}] - Volume Size
If this parameter is specified, the command displays information only about the volume or volumes that have
the specified size. Size is the maximum amount of space a volume can consume from its associated
aggregate(s), including user data, metadata, Snapshot copies, and Snapshot reserve. Note that for volumes
without a space-guarantee of volume, the ability to fill the volume to this maximum size depends on the
space available in the associated aggregate or aggregates.

[-name-ordinal <text>] - Name Ordinal (privilege: advanced)
If this parameter is specified, it denotes the ordinal assignment used in relation to this volume's name. Ordinals
are used to disambiguate volumes that have the same base name on the same controller. A value of "0"
indicates that the base volume name is unique on the controller. A value greater than zero indicates that the
volume's base name is used by two or more volumes on the same controller, and that appending "(n)" to this
volume's name uniquely identifies it on this controller.

[-dsid <integer>] - Volume Data Set ID
If this parameter is specified, the command displays information only about the volume or volumes that match
the specified data set ID. This field is displayed as "-" for FlexGroups.

[-msid <integer>] - Volume Master Data Set ID
If this parameter is specified, the command displays information only about the volume or volumes that match
the specified master data set ID.

[-state {online|restricted|offline|force-online|force-offline|mixed}] - Volume State
If this parameter is specified, the command displays information only about the volume or volumes that have
the specified state. The mixed state only applies to FlexGroups and Infinite Volumes. If the state of a
FlexGroup or Infinite Volume is mixed, that indicates that not all of the constituents are in the same state. If
this is the case use the "volume show -is-constituent true" command to find out which constituents are not in
the proper state.

[-volume-style {flex|infinitevol}] - Volume Style
If this parameter is specified, the command displays information only about the volumes that have the
specified style. Possible values are flex for FlexVol volumes, and infinitevol for Infinite Volumes.

[-volume-style-extended {flexvol|infinitevol|infinitevol-constituent|flexgroup|flexgroup-constituent}] - Extended Volume Style
If this parameter is specified, the command displays information only about the volumes that are configured
with the specified extended style. Possible values are flexvol for FlexVol volumes, infinitevol for
Infinite Volumes, infinitevol-constituent for Infinite Volume constituents, flexgroup for FlexGroups
and flexgroup-constituent for FlexGroup constituents.

[-is-cluster-volume {true|false}] - Is Cluster-Mode Volume
If this parameter is specified, the command displays information only about cluster volumes (true) or node
root volumes and other node scoped volumes (false).

[-is-constituent {true|false}] - Is Constituent Volume
If this parameter is specified, the command displays information only about volumes that either are or are not
constituents of a FlexGroup or Infinite Volume, depending on the value provided.
[-policy <text>] - Export Policy
If this parameter is specified, the command displays information only about the volume or volumes that use
the specified export policy.

[-user <user name>] - User ID
If this parameter is specified, the command displays information only about the volume or volumes whose root
is owned by the specified user.

[-group <group name>] - Group ID
If this parameter is specified, the command displays information only about the volume or volumes whose root
is owned by the specified group.

[-security-style <security style>] - Security Style
If this parameter is specified, the command displays information only about the volume or volumes that have
the specified security style (unix for UNIX mode bits, ntfs for CIFS ACLs, mixed for both styles or
unified for Unified UNIX, NFS and CIFS permissions).

[-unix-permissions <unix perm>] - UNIX Permissions
If this parameter is specified, the command displays information only about the volume or volumes whose
default UNIX permissions match the specified permissions. Specify UNIX permissions either as a four-digit
octal value (for example, 0700) or in the style of the UNIX ls command (for example, -rwxr-x---). For
information on UNIX permissions, see the UNIX or Linux documentation.

[-junction-path <junction path>] - Junction Path
If this parameter is specified, the command displays information only about the volume or volumes that have
the specified junction path.

[-junction-path-source {RW volume|LS mirror}] - Junction Path Source
If this parameter is specified, the command displays information only about the volume or volumes that have
the specified junction path source.

[-junction-active {true|false}] - Junction Active
If this parameter is specified, the command displays information only about the volume or volumes whose
junction paths have the specified status.

[-junction-parent <volume name>] - Junction Parent Volume
If this parameter is specified, the command displays information only about the volume or volumes that have
the specified parent volume.

[-vsroot {true|false}] - Vserver Root Volume (privilege: advanced)
If this parameter is specified, the command displays information only about the volume or volumes that match
the specified setting; that is, whether they are the root volumes for their Vservers.

[-comment <text>] - Comment
If this parameter is specified, the command displays information only about the volume or volumes that match
the specified comment text.

[-available <integer> [KB|MB|GB|TB|PB]] - Available Size
If this parameter is specified, the command displays information only about the volume or volumes that have
the specified available size. Available is the amount of free space currently available to be used by this volume.
For a volume with a -space-guarantee of type volume, available is always -total minus -used. For
volumes that do not have a -space-guarantee of type volume, available could be reduced if the volume’s
associated aggregate or aggregates are space constrained.

[-filesystem-size <integer> [KB|MB|GB|TB|PB]] - Filesystem Size
If this parameter is specified, the command displays information only about the volume or volumes that have
the specified filesystem size. Filesystem size is the same as the volume’s -size unless the volume is or was a
physical replica destination. In this case, the file system size corresponds to the -size of the source volume,
until -filesys-size-fixed is set to false.
[-total {<integer> [KB|MB|GB|TB|PB]}] - Total User-Visible Size
If this parameter is specified, the command displays information only about the volume or volumes that have the specified total size. Total is the total space available for user data and file system metadata. It does not include the Snapshot reserve.

[-used {<integer> [KB|MB|GB|TB|PB]}] - Used Size
If this parameter is specified, the command displays information only about the volume or volumes that have the specified used size. Used is the amount of space occupied by user data and file system metadata. It includes Snapshot spill (the amount of space by which Snapshot copies exceed Snapshot reserve). It does not include the Snapshot reserve.

[-percent-used <percent>] - Used Percentage
If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of used space. This row is based on a value of used space that includes the space used by Snapshot copies or the Snapshot reserve (whichever is greater) in relation to the current volume size.

[-space-nearly-full-threshold-percent <percent>] - Volume Nearly Full Threshold Percent
If this parameter is specified, the command displays information only about the volume or volumes that have the specified nearly full threshold percent.

[-space-full-threshold-percent <percent>] - Volume Full Threshold Percent
If this parameter is specified, the command displays information only about the volume or volumes that have the specified full threshold percent.

[-max-autosize {<integer> [KB|MB|GB|TB|PB]}] - Maximum Autosize (for flexvols only)
If this parameter is specified, the command displays information only about the volume or volumes that have the specified maximum automatic size.

[-min-autosize {<integer> [KB|MB|GB|TB|PB]}] - Minimum Autosize
If this parameter is specified, the command displays information only about the volume or volumes that have the specified minimum automatic size. This field is displayed as "-" for FlexGroups.

[-autosize-grow-threshold-percent <percent>] - Autosize Grow Threshold Percentage
If this parameter is specified, the command displays information only about the volume or volumes that have the specified automatic grow used space threshold percentage. This field is displayed as "-" for FlexGroups.

[-autosize-shrink-threshold-percent <percent>] - Autosize Shrink Threshold Percentage
If this parameter is specified, the command displays information only about the volume or volumes that have the specified automatic shrink used space threshold percentage. This field is displayed as "-" for FlexGroups.

[-autosize-mode {off|grow|grow_shrink}] - Autosize Mode
If this parameter is specified, the command displays information only about the volume or volumes that have the specified automatic sizing mode setting. This field is displayed as "-" for FlexGroups.

[-files <integer>] - Total Files (for user-visible data)
If this parameter is specified, the command displays information only about the volume or volumes that have the specified number of files.

[-files-used <integer>] - Files Used (for user-visible data)
If this parameter is specified, the command displays information only about the volume or volumes that have the specifies number of files used.

[-maxdir-size {<integer> [KB|MB|GB|TB|PB]}] - Maximum Directory Size (privilege: advanced)
If this parameter is specified, the command displays information only about the volume or volumes that have the specified maximum directory size.

[-space-guarantee-enabled {true|false}] - Space Guarantee in Effect
If this parameter is specified, the command displays information only about the volume or volumes that have the specified space-guarantee setting. If the value of -space-guarantee is none, the value of -space-
guarantee-enabled is always true. In other words, because there is no guarantee, the guarantee is always in effect. If the value of -space-guarantee is volume, the value of -space-guarantee-enabled can be true or false, depending on whether the guaranteed amount of space was available when the volume was mounted.

[-is-space-slo-enabled {true|false}] - Space SLO in Effect

If this parameter is specified, the command displays information only about the volume or volumes that have their space-slo setting in effect or not, depending on the value specified for this parameter. If the value of space-slo is none, the space SLO is always considered to be in effect. If the value of space-slo is semi-thick or thick, the space SLO may be in effect depending on whether the required amount of space was available when the volume was mounted.

[-space-slo {none|thick|semi-thick}] - Space SLO

If this parameter is specified, the command displays information only about the volume or volumes that have the specified space-slo setting. The space SLO setting is the Service Level Objective for space management for the volume.

[-space-guarantee | -s {none|volume}] - Space Guarantee Style

If this parameter is specified, the command displays information only about the volume or volumes that have the specified space-reservation policy. If the value of space-guarantee is none, the value of space-guarantee-enabled is always true. In other words, because there is no guarantee, the guarantee is always in effect. If the value of space-guarantee is volume, the value of space-guarantee-enabled can be true or false, depending on whether the guaranteed amount of space was available when the volume was mounted.

[-fractional-reserve <percent>] - Fractional Reserve

If this parameter is specified, the command displays information only about the volume or volumes that have the specified fractional-reserve setting.

[-type {RW|DP|DC}] - Volume Type

If this parameter is specified, the command displays information only about the volume or volumes of the specified volume type (RW for read-write or DP for data-protection).

[-min-readahead {true|false}] - Minimum Read Ahead (privilege: advanced)

If this parameter is specified, the command displays information only about the volume or volumes that have the specified minimum-readahead setting.

[-atime-update {true|false}] - Access Time Update Enabled (privilege: advanced)

If this parameter is specified, the command displays information only about the volume or volumes that have the specified access-time update setting.

[-snapdir-access {true|false}] - Snapshot Directory Access Enabled

If this parameter is specified, the command displays information only about the volume or volumes that have the specified Snapshot-copy access setting.

[-percent-snapshot-space <percent>] - Space Reserved for Snapshot Copies

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space reserved for Snapshot copies.

[-snapshot-space-used <percent_no_limit>] - Snapshot Reserve Used

If this parameter is specified, the command displays information only about the volume or volumes that have the specified used percentage of the reserve for Snapshot copies.

[-snapshot-policy <snapshot policy>] - Snapshot Policy

If this parameter is specified, the command displays information only about the volume or volumes that use the specified Snapshot policy.
[-create-time <Date>] - Creation Time
   If this parameter is specified, the command displays information only about the volume or volumes that have
   the specified creation time.

[-language <Language code>] - Language
   If this parameter is specified, the command displays information only about the volume or volumes that store
data in the specified language. To determine the available languages, enter volume show -language at the
clustershell command prompt.

[-clone-volume {true|false}] - Clone Volume
   If this parameter is specified, the command displays information only about volumes that are clones (true) or
not clones (false).

[-node {<nodename> | local}] - Node name
   If this parameter is specified, the command displays information only the volume or volumes that are located
on the specified storage system. This field is displayed as "-" for FlexGroups.

[-clone-parent-vserver <vserver name>] - Clone Parent Vserver Name
   If this parameter is specified, the command displays information only about the volumes with a matching
FlexClone parent Vserver name.

[-clone-parent-name <volume name>] - FlexClone Parent Volume
   If this parameter is specified, the command displays the name of the FlexClone parent volume. If this
parameter is specified, the command displays information only about the volumes with a matching FlexClone
parent volume name.

[-uuid <UUID>] - UUID of the Volume (privilege: advanced)
   If this parameter is specified, the command displays information only about the volume or volumes that match
the specified UUID.

[-nvfail {on|off}] - NVFAIL Option
   If this parameter is specified, the command displays information only about volumes for which failover is
enabled (on) or disabled (off).

[-in-nvfailed-state {true|false}] - Volume's NVFAIL State
   If this parameter is specified, the command displays information only about volumes which are in the failed
over state (true) or not (false).

[-dr-force-nvfail {on|off}] - Force NVFAIL on MetroCluster Switchover
   If this parameter is specified, the command displays information only about volumes for which dr-force-nvfail
is enabled (on) or disabled (off).

[-filesys-size-fixed {true|false}] - Is File System Size Fixed
   If this parameter is specified, the command displays information only about the volume or volumes that have
the specified filesys-size-fixed setting.

[-extent-enabled {off|on|space-optimized}] - (DEPRECATED)-Extent Option
   Note: This parameter has been deprecated and may be removed in a future release of Data ONTAP.
   If this parameter is specified, the command displays information only about volumes that have extents enabled
(on), not enabled (off) or space optimized (space-optimized).

[-overwrite-reserve <integer> [KB|MB|GB|TB|PB]] - Reserved Space for Overwrites
   If this parameter is specified, the command displays information only about the volume or volumes that have
the specified overwrite-reserve setting.
[-space-mgmt-try-first \{volume_grow|snap_delete\}] - Primary Space Management Strategy

If this parameter is specified, the command displays information only about the volume or volumes that have the specified space-mgmt-try-first setting. Possible values are volume_grow and snap_delete. This field is displayed as "-" for FlexGroups.

[-read-realloc \{off|on|space-optimized\}] - Read Reallocation Option

If this parameter is specified, the command displays information only about volumes that have read reallocation enabled (on), not enabled (off) or space optimized (space-optimized).

[-sched-snap-name \{create-time|ordinal\}] - Naming Scheme for Automatic Snapshot Copies

If this parameter is specified, the command displays information only about the volume or volumes that have the specified automatic Snapshot-copy naming convention.

[-is-inconsistent \{true|false\}] - Inconsistency in the File System

If this parameter is specified, the command displays information only about volumes that are inconsistent (true) or consistent (false) in the file system.

[-is-quiesced-on-disk \{true|false\}] - Is Volume Quiesced (On-Disk)

If this parameter is specified, the command displays information only about volumes that are quiesced (true) or not quiesced (false) on disk.

[-is-quiesced-in-memory \{true|false\}] - Is Volume Quiesced (In-Memory)

If this parameter is specified, the command displays information only about volumes that are quiesced (true) or not quiesced (false) in memory.

[-transition-state <state>] - Transition Operation State (privilege: advanced)

If this parameter is specified, the command displays information only about the volume or volumes that match the specified transition state.

[-transition-behavior \{data-move|data-protection|none\}] - Transition Behavior (privilege: advanced)

If this parameter is specified, the command displays information only about the volume or volumes that match the specified transition behavior. Possible values are:

- data-move: Volumes that are being moved from a system operating in 7-Mode.
- data-protection: Volumes that are being replicated from a system operating in 7-Mode for disaster recovery.
- none: Volumes that are not part of transition.

[-is-copied-for-transition \{true|false\}] - Copied for Transition (privilege: advanced)

If this parameter is specified, the command displays information only about the volume or volumes that match the specified value based on whether the volume is copied for transition or not.

[-is-transitioned \{true|false\}] - Transitioned (privilege: advanced)

If this parameter is specified, the command displays information only about the volume or volumes that match the specified value based on whether the volume is transitioned or not.

[-is-sis-volume \{true|false\}] - Volume Contains Shared or Compressed Data

If this parameter is specified, the command displays information only about those volumes that match the specified storage efficiency setting. Infinite Volumes will report the aggregated setting of their constituent data volumes as true or false if all constituents have the same setting, otherwise no value will be reported.

[-sis-space-saved \{<integer>\[KB|MB|GB|TB|PB]\}] - Space Saved by Storage Efficiency

If this parameter is specified, the command displays information only about those volumes that have the specified amount of space saved by the storage efficiency technology.

[-sis-space-saved-percent \{percent\}] - Percentage Saved by Storage Efficiency

If this parameter is specified, the command displays information only about those volumes that have the specified percentage of space saved by the storage efficiency technology.
[-dedupe-space-saved \(<integer>\ [KB|MB|GB|TB|PB]\)] - Space Saved by Deduplication
If this parameter is specified, the command displays information only about those volumes that have the specified amount of space saved due to deduplication.

[-dedupe-space-saved-percent \(<percent>\)] - Percentage Saved by Deduplication
If this parameter is specified, the command displays information only about those volumes that have the specified percentage of space saved due to deduplication.

[-dedupe-space-shared \(<integer>\ [KB|MB|GB|TB|PB]\)] - Space Shared by Deduplication
If this parameter is specified, the command displays information only about those volumes that have the specified amount of shared space due to deduplication.

[-compression-space-saved \(<integer>\ [KB|MB|GB|TB|PB]\)] - Space Saved by Compression
If this parameter is specified, the command displays information only about those volumes that have the specified amount of space saved due to compression.

[-compression-space-saved-percent \(<percent>\)] - Percentage Space Saved by Compression
If this parameter is specified, the command displays information only about those volumes that have the specified percentage of space saved due to compression.

[-size-used-by-snapshots \(<integer>\ [KB|MB|GB|TB|PB]\)] - Volume Size Used by Snapshot Copies
If this parameter is specified, the command displays information about those volumes that have the specified volume size used by Snapshot copies.

[-block-type \(64\)-bit\)] - Block Type
If this parameter is specified, the command displays information about only the volumes with the specified indirect block format. Possible values are 32-bit to display 32-bit volumes and 64-bit to display 64-bit volumes.

[-is-moving \(true|false\)] - Is Volume Moving
If this parameter is specified, the command displays information only about volumes that are moving (true) or not moving (false).

[-hybrid-cache-eligibility \(read|read-write\)] - Flash Pool Caching Eligibility
If this parameter is specified, the command displays information only about the volume or volumes with the specified Flash Pool caching attributes. Possible caching attributes are:

• 'read' ... Indicates that the volume cannot participate in write caching.

• 'read-write' ... Indicates that the volume can participate in read and write caching.

[-hybrid-cache-write-caching-ineligibility-reason \(<text>\)] - Flash Pool Write Caching Ineligibility Reason
If this parameter is specified, the command displays information only about the volume or volumes which are ineligible to participate in write caching due to the specified reason.

[-is-managed-by-service \(true|false\)] - Managed By Storage Service
If this parameter is specified as true, only display volumes that are managed by storage services. This field is displayed as "-" for FlexGroups.

[-storage-service \(<storage\ service\ name>\)] - Storage Service Name (privilege: advanced)
If this parameter is specified, the command displays information only about volumes that match the specified storage service.

[-enable-snapdiff \(true|false\)] - Create Namespace Mirror Constituents For SnapDiff Use
Setting this parameter displays information only about Infinite Volumes that either do or do not have namespace mirror constituents for SnapDiff use, depending on the value provided. This parameter applies to Infinite Volumes only.
[-unreachable-attr-action {return-generated|wait}] - Action When Attributes Are Not Reachable
(privilege: advanced)

This parameter specifies the information that an Infinite Volume returns when a client lists a directory that contains one or more files with inaccessible attributes. If this parameter is specified, the command displays information only about volumes that match the specified action. This parameter is not supported for FlexVol volumes.

[-constituent-role <Constituent Roles>] - Constituent Volume Role

If this parameter is specified, the command displays information only about the constituent volume or volumes that are of the specified role. This parameter applies to Infinite Volumes and FlexGroups only.

[-max-namespace-constituent-size {<integer> [KB|MB|GB|TB|PB]}] - Maximum Size of Namespace Constituent
(privilege: advanced)

If this parameter is specified, the command displays information only about volumes that match the specified namespace constituent size.

[-max-data-constituent-size {<integer> [KB|MB|GB|TB|PB]}] - Maximum Size of Each Data Constituent
(privilege: advanced)

If this parameter is specified, the command displays information only about the Infinite Volume or Infinite Volumes that have the specified maximum data constituent size. This parameter applies to Infinite Volumes only.

[-is-cft-precommit [true|false]] - Is in the precommit phase of Copy-Free Transition
(privilege: advanced)

If this parameter is specified with the true value, it displays information only about the volumes that are in the precommit phase of a Copy-Free Transition workflow.

[-qos-policy-group <text>] - QoS Policy Group Name

If this parameter is specified, the command displays information only about volumes that match the specified Qos policy group.

[-caching-policy <text>] - Caching Policy Name

If this parameter is specified, the command displays the volumes that match the specified caching policy.

A caching policy defines how the system caches a volume's data in a Flash Pool aggregate. Both metadata and user data are eligible for caching. The available caching policies are:

- none - Does not cache any user data or metadata blocks.
- auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
- meta - Read caches only metadata blocks.
- random_read - Read caches all metadata and randomly read user data blocks.
- random_read_write - Read caches all metadata, randomly read and randomly written user data blocks.
- all_read - Read caches all metadata, randomly read and sequentially read user data blocks.
- all_read_random_write - Read caches all metadata, randomly read, sequentially read, and randomly written user data.
- all - Read caches all data blocks read and written. It does not do any write caching.
- noread-random_write - Write caches all randomly overwritten user data blocks. It does not do any read caching.
- meta-random_write - Read caches all metadata and write caches randomly overwritten user data blocks.
- random_read_write-random_write - Read caches all metadata, randomly read and randomly written user data blocks. It also write caches randomly overwritten user data blocks.
- all_read-random_write - Read caches all metadata, randomly read and sequentially read user data blocks. It also write caches randomly overwritten user data blocks.

- all_read_random_write-random_write - Read caches all metadata, randomly read, sequentially read, and randomly written user data. It also write caches randomly overwritten user data blocks.

- all-random_write - Read caches all data blocks read and written. It also write caches randomly overwritten user data blocks.

Note that in a caching-policy name, a hyphen (-) separates read and write policies. Default caching-policy is auto.

[-cache-retention-priority {normal|low|high}] - Cache Retention Priority (privilege: advanced)

If this parameter is specified, the command displays the volumes that match the specified cache retention priority policy.

A cache retention priority defines how long the blocks of a volume will be cached in flash pool once they become cold. This parameter is not supported on Infinite Volumes. The available cache retention priority are:

- low - Cache the cold blocks for the lowest time.
- normal - Cache the cold blocks for the default time.
- high - Cache the cold blocks for the highest time.

[-is-volume-in-cutover {true|false}] - Is Volume Move in Cutover Phase

If this parameter is specified, the command displays information only about volumes that are in the cutover phase (true) or not in the cutover phase (false) of a volume move. This field is displayed as "-" for FlexGroups.

[-snapshot-count <integer>] - Number of Snapshot Copies in the Volume

If this parameter is specified, the command displays information only about the volumes that have the specified number of Snapshot copies.

[-vbn-bad-present {true|false}] - VBN_BAD may be present in the active filesystem

If this parameter is specified, the command displays information only about volumes that may have VBN_BAD present in its active filesystem (true) or do not have VBN_BAD present in its active filesystem (false).

[-is-autobalance-eligible {true|false}] - Is Eligible for Auto Balance Aggregate (privilege: advanced)

If this parameter is specified, the command displays information only about the volume or volumes that are eligible for consideration by the Auto Balance Aggregate feature.

[-is-vol-on-hybrid-aggr {true|false}] - Is Volume on a hybrid aggregate

If this parameter is specified, the command displays information only about volumes associated with a Flash Pool aggregate (true) or not (false). This field is displayed as "-" for FlexGroups.

[-physical-used <integer>[KB|MB|GB|TB|PB]] - Total Physical Used Size

If this parameter is specified, the command displays information only about the volume or volumes that have the specified physical used size. This differs from total-used space by the space that is reserved for future writes. The value includes blocks in use by Snapshot copies.

[-physical-used-percent <percent_no_limit>] - Physical Used Percentage

If this parameter is specified, the command displays information only about the volume or volumes that have the specified physical used percent based on volume size including the space reserved for Snapshot copies.

[-flexgroup-maid <integer>] - FlexGroup Master Data Set ID (privilege: advanced)

If this parameter is specified, the command displays information only about the FlexGroup or FlexGroup constituents that have the specified FlexGroup master data-set ID. This parameter applies to FlexGroups and FlexGroup constituents only.
[-flexgroup-index <integer>] - FlexGroup Index (privilege: advanced)
If this parameter is specified, the command displays information only about the FlexGroup constituents that have the specified FlexGroup index. This parameter applies to FlexGroup constituents only.

[-flexgroup-uuid <UUID>] - UUID of the FlexGroup (privilege: advanced)
If this parameter is specified, the command displays information only about the FlexGroup or FlexGroup constituents that have the specified FlexGroup UUID. This parameter applies to FlexGroups and FlexGroup constituents only.

[-max-constituent-size {<integer> [KB|MB|GB|TB|PB]}] - Maximum size of a FlexGroup Constituent (privilege: advanced)
If this parameter is specified, the command displays information only about the FlexGroup or FlexGroups that have the specified maximum constituent size. This parameter applies to FlexGroups only.

[-inofile-version <integer>] - Inofile Version (privilege: advanced)
If this parameter is specified, the command displays information only about the volumes whose inode files are at the specified version.

[-nodes {<nodename>|local}, ...] - List of Nodes
If this parameter is specified, the command displays information only about the FlexGroup or FlexGroups that are located on the specified list of storage systems. This parameter applies to FlexGroups only.

[-is-flexgroup {true|false}] - Is Volume a FlexGroup
If this parameter is specified, the command displays information only about the volume or volumes that are either FlexGroups or not, depending on the value provided.

[-snaplock-type {non-snaplock|compliance|enterprise}] - SnapLock Type
If this parameter is specified, the command displays information only about volumes that match the specified snaplock-type.

[-vserver-dr-protection {protected|unprotected}] - Vserver DR Protection
If this parameter is specified, the command displays information only about the volumes having the specified Vserver Snapmirror protection. This parameter is not supported on Infinite Volumes.

**Examples**

The following example displays information about all volumes on the Vserver named vs1:

```
cluster1::> volume show -vserver vs1

```
volume show-footprint

Display a list of volumes and their data and metadata footprints in their associated aggregate.

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**

The `volume show-footprint` command displays information about the space used in associated aggregates by volumes and features enabled in volumes. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays the following information about all volumes.

The `volume show-footprint` command is not supported for Infinite Volumes; however, the command displays information about Infinite Volume constituents as if the constituents were FlexVol volumes.

**Parameters**

```
{-fields <fieldname>,...}
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
{-instance}
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
{-vserver <vserver name>}- Vserver
```

If this parameter and the `-volume` parameter are specified, the command displays detailed information about the specified volume. If this parameter is specified by itself, the command displays information about volumes on the specified Vserver.

```
{-volume <volume name>}- Volume Name
```

If this parameter and the `-vserver` parameter are specified, the command displays detailed information about the specified volume. If this parameter is specified by itself, the command displays information about all volumes matching the specified name.

```
{-volume-msid <integer>}- Volume MSID
```

If this parameter is specified, the command displays information only about the volume that has the specified MSID.
[-volume-dsid <integer>] - Volume DSID
If this parameter is specified, the command displays information only about the volume that has the specified DSID.

[-vserver-uuid <UUID>] - Vserver UUID
If this parameter is specified, the command displays information only about the volume on the vserver which has the specified UUID.

[-aggregate <aggregate name>] - Aggregate Name
If this parameter is specified, the command displays information only about the volumes that are associated with the specified aggregate.

[-aggregate-uuid <UUID>] - Aggregate UUID
If this parameter is specified, the command displays information only about the volumes on the aggregate which have the specified UUID.

[-hostname <text>] - Hostname
If this parameter is specified, the command displays information only about the volumes that belong to the specified host.

[-tape-backup-metafiles-footprint {<integer>[KB|MB|GB|TB|PB]}] - Tape Backup Metadata Footprint
If this parameter is specified, the command displays information only about the volumes whose tape backup metafiles use the specified amount of space in the aggregate.

[-tape-backup-metafiles-footprint-percent <percent>] - Tape Backup Metadata Footprint Percent
If this parameter is specified, the command displays information only about the volumes whose tape backup metafiles use the specified percentage of space in the aggregate.

[-dedupe-metafiles-footprint {<integer>[KB|MB|GB|TB|PB]}] - Deduplication Footprint
If this parameter is specified, the command displays information only about the volumes whose deduplication metafiles use the specified amount of space in the aggregate.

[-dedupe-metafiles-footprint-percent <percent>] - Deduplication Footprint Percent
If this parameter is specified, the command displays information only about the volumes whose deduplication metafiles use the specified percentage of space in the aggregate.

[-dedupe-metafiles-temporary-footprint {<integer>[KB|MB|GB|TB|PB]}] - Temporary Deduplication Footprint
If this parameter is specified, the command displays information only about the volumes whose temporary deduplication metafiles use the specified amount of space in the aggregate.

[-dedupe-metafiles-temporary-footprint-percent <percent>] - Temporary Deduplication Footprint Percent
If this parameter is specified, the command displays information only about the volumes whose temporary deduplication metafiles use the specified percentage of space in the aggregate.

[-volume-blocks-footprint {<integer>[KB|MB|GB|TB|PB]}] - Volume Data Footprint
If this parameter is specified, the command displays information only about the volumes whose data blocks use the specified amount of space in the aggregate.

This field is the total amount of data written to the volume. It includes data in the active file system in the volume as well as data that is consumed by volume Snapshot copies. This row only includes data and not reserved space, so when volumes have reserved files, the volume's total used in the volume show-space command output can exceed the value in this row.

[-volume-blocks-footprint-percent <percent>] - Volume Data Footprint Percent
If this parameter is specified, the command displays information only about the volumes whose data blocks use the specified percentage of space in the aggregate.
If this parameter is specified, the command displays information only about the volumes whose file system metadata uses the specified amount of space in the aggregate.

This field includes the space used or reserved in the aggregate for metadata associated with this volume.

If this parameter is specified, the command displays information only about the volumes whose file system metadata uses the specified percentage of space in the aggregate.

If this parameter is specified, the command displays information only about the volumes whose delayed free blocks use the specified amount of space in the aggregate.

When Data ONTAP frees space in a volume, this space is not always immediately shown as free in the aggregate. This is because the operations to free the space in the aggregate are batched for increased performance. Blocks that are declared free in the FlexVol volume but which are not yet free in the aggregate are called "delayed free blocks" until the associated delayed free blocks are processed. For SnapMirror destinations, this row will have a value of 0 and will not be displayed.

If this parameter is specified, the command displays information only about the volumes that have the specified amount of blocks waiting to be freed in the aggregate. This space is called "delayed free blocks".

If this parameter is specified, the command displays information only about the volumes whose SnapMirror transfer uses the specified amount of space in the aggregate.

During a SnapMirror transfer, this row will include incoming SnapMirror data and SnapMirror-triggered delayed free blocks from previous SnapMirror transfers.

If this parameter is specified, the command displays information only about the volumes whose SnapMirror transfer uses the specified percentage of space in the aggregate.

If this parameter is specified, the command displays information only about the volumes whose guarantees use the specified amount of space in the aggregate.

This field includes the amount of space reserved by this volume in the aggregate for future writes. The amount of space reserved depends on the guarantee type (the provisioning mode) of the volume. For a "volume" guaranteed volume, this is the size of the volume minus the amount in the Volume Data Footprint row. For a "file" guaranteed volume, this is the sum of all of the space reserved for hole fills and overwrites in all of the space reserved files in the volume.

If this parameter is specified, the command displays information only about the volumes whose guarantees use the specified percentage of space in the aggregate.

If this parameter is specified, the command displays information only about the volumes that have file operation metadata using the specified amount of space in the aggregate.

This metadata is used by file move and copy operations. Although it is not returned as free space once the operations are complete, it can be reused by future file operations.

If this parameter is specified, the command displays information only about the volumes that have file operation metadata using the specified percentage of space in the aggregate.
[\texttt{-total-footprint \{<integer>\[KB\mid MB\mid GB\mid TB\mid PB\}\}}] - Total Footprint

If this parameter is specified, the command displays information only about the volumes which use the specified amount of space in the aggregate. This field is the sum of the other rows in this table.

[\texttt{-total-footprint-percent <percent>\}}] - Total Footprint Percent

If this parameter is specified, the command displays information only about the volumes which use the specified percentage of space in the aggregate.

[\texttt{-aggregate-size \{<integer>\[KB\mid MB\mid GB\mid TB\mid PB\}\}}] - Containing Aggregate Size

If this parameter is specified, the command displays information only about the volumes that are associated with an aggregate of the specified size.

\section*{Examples}

The following example displays information about all volumes in the system

\begin{verbatim}
cluster1::> volume show-footprint
Vserver : nodevs
Volume : vol0
 Feature                          Used    Used%

\textit{volume show-space} on page 1242
volume show-space

Display space usage for volume(s)

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The volume show-space command displays information about space usage within the volume. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays the following information about all volumes.
The volume show-space command is not supported for Infinite Volumes; however, the command displays information about Infinite Volume constituents as if the constituents were FlexVol volumes.

Parameters
{-fields <fieldname>, ...}
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance ]
If you specify the instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver
If this parameter and the -volume parameter are specified, the command displays detailed information about the specified volume. If this parameter is specified by itself, the command displays information about volumes on the specified Vserver.

[-volume <volume name>] - Volume Name
If this parameter and the -vserver parameter are specified, the command displays detailed information about the specified volume. If this parameter is specified by itself, the command displays information about all volumes matching the specified name.

[-volume-msid <integer>] - Volume MSID
If this parameter is specified, the command displays information only about the volume that has the specified MSID.

[-volume-dsid <integer>] - Volume DSID
If this parameter is specified, the command displays information only about the volume that has the specified DSID.

[-vserver-uuid <UUID>] - Vserver UUID
If this parameter is specified, the command displays information only about the volume on the vserver which has the specified UUID.

[-aggregate <aggregate name>] - Aggregate Name
If this parameter is specified, the command displays information only about the volumes that are associated with the specified aggregate.

[-aggregate-uuid <UUID>] - Aggregate UUID
If this parameter is specified, the command displays information only about the volumes on the aggregate which have the specified UUID.

[-hostname <text>] - Hostname
If this parameter is specified, the command displays information only about the volumes that belong to the specified host.
[-user-data {<integer>[KB|MB|GB|TB|PB]}] - User Data

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by user data in the volume.

This is the amount of data written to the volume via CIFS, NFS or SAN protocols plus the metadata (for example indirect blocks, directory blocks) directly associated with user files plus the space reserved in the volume for these files (hole and overwrite reserves). This is the same information displayed by running the Unix du command on the mount point.

[-user-data-percent <percent_no_limit>] - User Data Percent

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use by user data in the volume.

[-dedupe-metafiles {<integer>[KB|MB|GB|TB|PB]}] - Deduplication

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by deduplication metafiles in the volume.

[-dedupe-metafiles-percent <percent>] - Deduplication Percent

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use by deduplication metafiles in the volume.

[-dedupe-metafiles-temporary {<integer>[KB|MB|GB|TB|PB]}] - Temporary Deduplication

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by temporary deduplication metafiles in the volume.

[-dedupe-metafiles-temporary-percent <percent>] - Temporary Deduplication Percent

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use by temporary deduplication metafiles in the volume.

[-filesystem-metadata {<integer>[KB|MB|GB|TB|PB]}] - Filesystem Metadata

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by file system metadata in the volume.

[-filesystem-metadata-percent <percent>] - Filesystem Metadata Percent

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use by file system metadata in the volume.

[-snapmirror-metadata {<integer>[KB|MB|GB|TB|PB]}] - SnapMirror Metadata

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by SnapMirror metafiles in the volume.

Between SnapMirror transfers, some metadata is maintained to support storage-efficient transfers. During transfers, some additional space is used temporarily. This space is used in all SnapMirror destination volumes.

[-snapmirror-metadata-percent <percent>] - SnapMirror Metadata Percent

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use by SnapMirror metafiles inside the volume.

[-tape-backup-metadata {<integer>[KB|MB|GB|TB|PB]}] - Tape Backup Metadata

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by tape backup metafiles in the volume.

[-tape-backup-metadata-percent <percent>] - Tape Backup Metadata Percent

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use by tape backup metafiles in the volume.

[-quota-metafiles {<integer>[KB|MB|GB|TB|PB]}] - Quota Metadata

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by quota metafiles.
[\texttt{-quota-metafiles-percent <percent>}] - Quota Metadata Percent

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use by quota metafiles.

[\texttt{-inodes <integer> [KB|MB|GB|TB|PB]}] - Inodes

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by the inode metafile in the volume.

This is the amount of space required to store inodes in the file system and is proportional to the maximum number of files ever created in the volume. The inode file is not compacted or truncated, so if a large number of files are created and then deleted, the inode file does not shrink.

[\texttt{-inodes-percent <percent>}] - Inodes Percent

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use by the inode metafile in the volume.

[\texttt{-inodes-upgrade <integer> [KB|MB|GB|TB|PB]}] - Inodes Upgrade

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by the inode subsystem for the purpose of upgrading.

This is the amount of space required to store upgrading inodes in the file system and is proportional to the size of the inode metafile. Once the upgrade is complete, the space used by 'inodes' will be replaced with the space used for upgrade.

[\texttt{-inodes-upgrade-percent <percent>}] - Inodes Upgrade Percent

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use for upgrading the inode metafile in the volume.

[\texttt{-snapshot-reserve <integer> [KB|MB|GB|TB|PB]}] - Snapshot Reserve

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by the Snapshot reserve in the volume.

[\texttt{-snapshot-reserve-percent <percent>}] - Snapshot Reserve Percent

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use by the Snapshot reserve in the volume.

[\texttt{-snapshot-reserve-unusable <integer> [KB|MB|GB|TB|PB]}] - Snapshot Reserve Unusable

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space reserved but unusable in the volume.

Snapshot reserve can be diminished under certain conditions to accommodate volume metadata. Creating space in the volume will make this space available.

[\texttt{-snapshot-reserve-unusable-percent <integer>}] - Snapshot Reserve Unusable Percent

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space reserved but unusable.

[\texttt{-snapshot-spill <integer> [KB|MB|GB|TB|PB]}] - Snapshot Spill

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by their Snapshot spill.

If Snapshot used space exceeds the Snapshot reserve it is considered to spill out of the reserve. This space cannot be used by the active file system until Snapshots are deleted.

[\texttt{-snapshot-spill-percent <percent>}] - Snapshot Spill Percent

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use by the Snapshot spill.
[-performance-metadata <integer> [KB|MB|GB|TB|PB]] - Performance Metadata
If this parameter is specified, the command displays information only about the volume or volumes that have
the specified amount of space in use for performance optimization in the volume.

[-performance-metadata-percent <percent>] - Performance Metadata Percent
If this parameter is specified, the command displays information only about the volume or volumes that have
the specified percentage of space in use for performance optimization in the volume.

[-total-used <integer> [KB|MB|GB|TB|PB]] - Total Used
If this parameter is specified, the command displays information only about the volume or volumes that have
the specified amount of space in use by the volume, including the space used by the Snapshot reserve.
This is equivalent to the used field in the output of the volume show command.

[-total-used-percent <percent_no_limit>] - Total Used Percent
If this parameter is specified, the command displays information only about the volume or volumes that have
the specified percentage of space in use by the volume, including the space used by the Snapshot reserve.

[-physical-used <integer> [KB|MB|GB|TB|PB]] - Total Physical Used Size
If this parameter is specified, the command displays information only about the volume or volumes that have
the specified amount of physical space in use by the volume.
This differs from total-used space by the space that is reserved for future writes. The value includes blocks
in use by Snapshot copies.

[-physical-used-percent <percent_no_limit>]] - Physical Used Percentage
If this parameter is specified, the command displays information only about the volume or volumes that have
the specified percentage of physical space in use in the volume based on volume size including the space
reserved for Snapshot copies.

Examples
The following example shows how to display details for all volumes.

```
cluster1::> volume show-space
Vserver : nodevs
Volume : vol0
Feature                                    Used      Used%
--------------------------------     ----------     -----
User Data                               163.4MB         3%
Filesystem Metadata                       172KB         0%
Inodes                                   2.93MB         0%
Snapshot Reserve                        292.9MB         5%
Total Used                              459.4MB         8%
Total Physical Used                     166.4MB         3%

Vserver : thevs
Volume : rootvol
Feature                                    Used      Used%
--------------------------------     ----------     -----
User Data                                 100KB         0%
Filesystem Metadata                        76KB         0%
Inodes                                     24KB         0%
Snapshot Reserve                            1MB         5%
Total Used                               1.20MB         6%
Total Physical Used                       200KB         1%
```

### volume size

Set/Display the size of the volume.

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.
**Description**
The `volume size` command allows the user to set or display the volume size. If `new-size` is not specified then the current volume size is displayed.

**Parameters**
- `vserver <vserver name>` - Vserver Name  
  This parameter can be used to specify the Vserver on which the volume is located.

- `volume <volume name>` - Volume Name  
  This parameter specifies the volume for which the user wants to set or display the size.

- `[-new-size <text>]` - [-][+]<New Size>  
  This optional parameter specifies the size of the volume. It can be used to set the volume size to a particular number or grow/shrink the size by a particular amount. The size is specified as a number (preceded with a sign for relative growth/shrinkage) followed by a unit designation: k (kilobytes), m (megabytes), g (gigabytes), or t (terabytes). If the unit designation is not specified, bytes are used as the unit, and the specified number is rounded up to the nearest 4 KB. The minimum size for a flexible volume is 20 MB, and the maximum size depends on hardware platform and free space in the containing aggregate. If the volume's space guarantee is currently disabled, its size cannot be increased. This parameter is not supported on Infinite Volumes that are managed by storage services.

**Examples**
The following example shows the size of a volume called vol1.

```
cluster1::> vol size vol1
      (volume size)
  vol size: Flexible volume 'vs1:vol1' has size 2g.
```

The following example sets the size of a volume called vol1 to 1GB.

```
cluster1::> vol size vol1 1g
      (volume size)
  vol size: Flexible volume 'vs1:vol1' size set to 1g.
```

The following example increases the size of a volume called vol1 by 500MB.

```
cluster1::> vol size vol1 +500m
      (volume size)
  vol size: Flexible volume 'vs1:vol1' size set to 1.49g.
```

The following example decreases the size of a volume called vol1 by 250MB.

```
cluster1::> vol size vol1 -250m
      (volume size)
  vol size: Flexible volume 'vs1:vol1' size set to 1.24g.
```

---

**volume transition-prepare-to-downgrade**
Verifies that there are no volumes actively transitioning from 7-mode to clustered Data ONTAP, and configures the transition feature for downgrade.

**Availability:** This command is available to cluster administrators at the `advanced` privilege level.
Description
The `volume transition-prepare-to-downgrade` command is used to verify that a volume is not currently being transitioned from 7-Mode to clustered Data ONTAP. This check must be done before reverting or downgrading a node.

Examples

volume unmount

Unmount a volume

Availability: This command is available to cluster and Vserver administrators at the `admin` privilege level.

Description
The `volume unmount` command unmounts a volume from its parent volume. The volume can be remounted at the same or a different location by using the `volume mount` command.

Parameters

- `-vserver <vserver name>` - Vserver Name
  This specifies the Vserver on which the volume is located.

- `-volume <volume name>` - Volume Name
  This specifies the volume that is to be unmounted.

Examples

The following example unmounts a volume named `vol2` on a Vserver named `vs0`:

```
node::> volume unmount -vserver vs0 -volume vol2
```

volume efficiency commands

Manage volume efficiency

The `volume efficiency` commands enable you to manage efficiency on volumes. The `stat` command is not supported on FlexGroups, FlexGroup constituents, or Infinite Volumes. The `volume efficiency` commands are not supported on FlexGroups, FlexGroup constituents, or Infinite Volumes that are managed by storage services.

volume efficiency check

Scrub efficiency metadata of a volume

Availability: This command is available to cluster and Vserver administrators at the `advanced` privilege level.

Description
This command verifies and updates the fingerprint database for the specified volume. This command is not supported on FlexGroups or Infinite Volumes that are managed by storage services.
Parameters

-vserver <vserver name> - Vserver Name
  Specifies the Vserver on which the volume is located.

  { -volume <volume name> - Volume Name
      Specifies the volume on which the verify operation needs to be started.
  }

  -path <vol/volume> - Volume Path
      Specifies the volume path on which the verify operation needs to be started.

  [-delete-checkpoint | -d {true|false}] - Delete Checkpoint
      Deletes existing checkpoint.

Examples

The following example runs volume efficiency check with delete checkpoint option turned on.

    cluster1:/> volume efficiency check -vserver vs1 -volume vol1 -delete-checkpoint true

volume efficiency modify

Modify the efficiency configuration of a volume

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

This command is used to set or modify the schedule, policy and various other efficiency configuration options on a volume. This command is not supported on FlexGroups, FlexGroup constituents, or Infinite Volumes that are managed by storage services.

Parameters

-vserver <vserver name> - Vserver Name
  This specifies the Vserver on which the volume is located.

  { -volume <volume name> - Volume Name
      This specifies the volume on which efficiency options need to be modified.
  }

  -path <vol/volume> - Volume Path
      This specifies the volume path on which efficiency options need to be modified.

  { [-schedule <text>] - Schedule
      This option is used to set and modify the schedule.
      schedule is [day_list][@hour_list] or [hour_list][@day_list] or - or auto or manual
      The day_list specifies the days of the week that an efficiency operation should run. It is a list of the first three letters of the day (sun, mon, tue, wed, thu, fri, sat), separated by a comma. Day ranges such as mon-fri can also be used. The default day_list is sun-sat. The names are not case sensitive.
      The hour_list specifies the hours of each scheduled day that an efficiency operation should run. The hour_list is from 0 to 23, separated by a comma. Hour ranges such as 8-17 are allowed. Step values can be used in conjunction with ranges (For example, 0-23/2 means every two hours in a day). The default hour_list is 0, i.e. at midnight of each scheduled day.
      When efficiency is enabled on a volume for the first time, an initial schedule is assigned to the volume. This initial schedule is sun-sat@0, which means run once every day at midnight.
      If "-" is specified, no schedule is set on the volume. The auto schedule string triggers an efficiency operation depending on the amount of new data written to the volume. The manual schedule string prevents SIS from
automatically triggering any operations and disables change-logging. This schedule string can only be used on SnapVault destination volumes. The use of this schedule is mainly desirable when inline compression is enabled on a SnapVault destination volume and background processing is not necessary.

Note that schedule and policy are mutually exclusive options.

- `[-policy <text>]` - Efficiency Policy Name
  This option is used to set an efficiency policy. The policy cannot be changed to the predefined `inline-only` policy when there is an active background operation on the volume.

  Note that schedule and policy are mutually exclusive options.

- `[-compression-type {none|secondary|adaptive}]` - Compression Type (privilege: advanced)
  This option is used to specify the size of compression group on the volume. The default value is determined based on the platform.

- `[-compression {true|false}]` - Compression
  This option is used to enable and disable compression. The default value is false.

- `[-inline-compression {true|false}]` - Inline Compression
  This option is used to enable and disable inline compression. Inline compression can be enabled only if `compression` is enabled. The default value is false.

  You can use the `inline-only` predefined efficiency policy to run inline compression without the need of any background efficiency operations.

- `[-idd {true|false}]` - (DEPRECATED)-Incompressible Data Detection
  This option is used to enable and disable incompressible data detection. It can be enabled only if `compression` is enabled. The default value is false.

  Note: This parameter is deprecated and may be removed in a future release of Data ONTAP.

- `[-quick-check-fsize <integer>]` - (DEPRECATED)-Compression Quick Check File Size
  This option is used to modify the minimum file size (in bytes) required to attempt Quick check on a file. The default value is 500MB.

  Note: This parameter is deprecated and may be removed in a future release of Data ONTAP.

- `[-inline-dedupe {true|false}]` - Inline Dedupe
  This option is used to enable and disable inline deduplication. The default value is false.

  You can use the `inline-only` predefined efficiency policy to run inline deduplication without the need of any background efficiency operations.

- `[-data-compaction {true|false}]` - Data Compaction
  This option is used to enable and disable data compaction. The default value is false.

### Examples

The following examples modify efficiency options on a volume.

```bash
cluster1::> volume efficiency modify -vserver vs1 -volume voll -schedule sun-sat@12

cluster1::> volume efficiency modify -vserver vs1 -volume voll -policy policy1

cluster1::> volume efficiency modify -vserver vs1 -volume voll -compression true -inline-compression true -idd true -inline-dedupe true -data-compaction true
```

Commands: Manual Page Reference
volume efficiency off

Disables efficiency on a volume

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The volume efficiency off command disables efficiency on a volume. This command is not supported on FlexGroups, FlexGroup constituents, or Infinite Volumes that are managed by storage services.

Parameters
-vserver <vserver name> - Vserver Name
   Specifies the Vserver on which the volume is located.

{ -volume <volume name> - Volume Name
            Specifies the name of the volume on which efficiency needs to be disabled.

| -path </vol/volume> } - Volume Path
            Specifies the volume path on which efficiency needs to be disabled.

Examples
The following examples disable efficiency on a volume:

```
cluster1::> volume efficiency off -vserver vs1 -volume vol1
cluster1::> volume efficiency off -vserver vs1 -path /vol/vol1
```

volume efficiency on

Enable efficiency on a volume

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The volume efficiency on command enables efficiency on a volume. The specified volume must be online. Efficiency operations will be started periodically according to a per volume schedule or policy. The volume efficiency modify command can be used to modify schedule and the volume efficiency policy modify command can be used to modify policy. You can also manually start an efficiency operation with the volume efficiency start command. This command is not supported on FlexGroups, FlexGroup constituents, or Infinite Volumes that are managed by storage services.

Parameters
-vserver <vserver name> - Vserver Name
   This specifies the Vserver on which the volume is located.

{ -volume <volume name> - Volume Name
            This specifies the name of the volume on which efficiency needs to be enabled.

| -path </vol/volume> } - Volume Path
            This specifies the volume path on which efficiency needs to be enabled.

Examples
The following examples enable efficiency on a volume.

```
```

volume efficiency prepare-to-downgrade

Identify any incompatible volumes or Snapshot copies before downgrade

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The volume efficiency prepare-to-downgrade command updates efficiency configurations and metadata to be compatible with releases before Data ONTAP 9.0.0. This command also disables the use of incompatible efficiency features.

Parameters

[-disable-feature-set <downgrade version>] - Data ONTAP Version

This parameter specifies the Data ONTAP version that introduced new volume efficiency feature set.

Examples

The following example disables the features introduced in Data ONTAP 8.3.1

```
cluster1::*> volume efficiency prepare-to-downgrade -disable-feature-set 8.3.1
```

The following example disables the features introduced in Data ONTAP 8.3.2.

```
cluster1::*> volume efficiency prepare-to-downgrade -disable-feature-set 8.3.2
```

The following example ignores offline volumes while disabling the features introduced in Data ONTAP 8.3.2.

```
cluster1::*> volume efficiency prepare-to-downgrade -disable-feature-set 8.3.2 -skip-offline-volumes true
```

The following example ignores offline volumes while disabling the features introduced in Data ONTAP 8.3.1.

```
cluster1::*> volume efficiency prepare-to-downgrade -disable-feature-set 8.3.1 -skip-offline-volumes true
```
**volume efficiency revert-to**

Reverts volume efficiency metadata

**Availability:** This command is available to cluster and Vserver administrators at the advanced privilege level.

**Description**
The `volume efficiency revert-to` command reverts the format of volume efficiency metadata for the volume to the given version of Data ONTAP.

**Parameters**

- **vserver <vserver name>** - Vserver Name
  This specifies the Vserver on which the volume is located.

{ -volume <volume name> - Volume Name
  This specifies the name of the volume for which volume efficiency metadata needs to be reverted.

| -path </vol/volume> | Volume Path
  This specifies the volume path for which volume efficiency metadata needs to be reverted.

[ -version <revert version> ] - Revert to Version
  Specifies the version of Data ONTAP to which the volume efficiency metadata needs to be formatted.

[ -delete | -d {true|false} ] - Delete Existing Metatile on Revert
  If set to true, this parameter specifies that the volume efficiency metadata be deleted instead of reverting its format. By default this parameter is set to false.

[ -clean-up | -c {true|false} ] - Delete Previously Downgraded Metatile
  If set to true, this parameter specifies that the volume efficiency metadata already reverted using `volume efficiency revert-to` be deleted. By default this parameter is set to false.

[ -revert-adaptive-compression {true|false} ] - Downgrade to minor version
  If set to true, this parameter specifies that the volume efficiency metadata needs to be reverted to minor version of Data ONTAP. By default this parameter is set to false.

[ -check-snapshot {true|false} ] - Revert ignore snapshots
  If set to false, this parameter specifies that the volume efficiency revert will not check for Snapshot copies created by previous releases of Data ONTAP. By default this parameter is set to true.

**Examples**
The following examples reverts volume efficiency metadata on a volume named vol1 located in vsrver vs1 to version 8.3.

```
cluster1::> volume efficiency revert-to -vserver vs1 -volume vol1 -version 8.3
```

```
cluster1::> volume efficiency revert-to -vserver vs1 -path /vol/vol1 -version 8.3
```

**volume efficiency show**

Display a list of volumes with efficiency

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.
Description

The volume efficiency show command displays the information about storage efficiency of volumes. The command output depends on the parameter or parameters specified. If no parameters are specified, the command displays the following information for all volumes with efficiency:

- Vserver: Vserver the volume belongs to.
- Volume: Name of the volume.
- State: Current state of efficiency on the volume (Enabled or Disabled).
- Status: Status of the efficiency on the volume. Following are the possible values:
  - Active: An efficiency operation is currently running.
  - Idle: There are no efficiency operations running.
  - Initializing: An efficiency operation is being initialized.
  - Undoing: Efficiency is being undone on the volume.
  - Pending: An efficiency operation is queued.
  - Downgrading: An efficiency operation necessary to downgrade the efficiency metafiles to a previous Data ONTAP release is active.
  - Disabled: Efficiency is disabled on the volume.
  Status is not supported for Infinite Volumes and will display a value of ":-".
- Progress: The progress of the current efficiency operation with information as to which stage of the efficiency process is currently in progress and how much data is processed for that stage. For example: "25 MB Scanned", "20 MB Searched", "500 KB (2%) Compressed", "40 MB (20%) Done", "30 MB Verified". Progress is not supported for Infinite Volumes and will display a value of ":-"

To display detailed information, run the command with the -l or -instance parameter. The detailed view provides all information in the previous list and the following additional information (fields not supported by Infinite Volumes will display a value of ":-"):

- Path: Volume Path.
- Compression: Current state of compression on the volume (Enabled or Disabled).
- Inline Compression: Current state of inline compression on the volume (Enabled or Disabled).
- Incompressible Data Detection: (DEPRECATED) Current state of Incompressible Data Detection on the volume (Enabled or Disabled).
- Compression Quick Check File Size: (DEPRECATED) Minimum file size (in bytes) to attempt Quick Check on a file. The default value is 500MB.
- Type: Type of volume (Regular or SnapVault).
- Schedule: The schedule of efficiency operation for the volume.
- Policy: Efficiency policy for the volume.
- Minimum Blocks Shared: The minimum number of adjacent blocks in a file that can be shared.
- Blocks Skipped Sharing: Blocks skipped sharing because of the minimum block share value. This parameter is not supported on Infinite Volumes.
- Last Operation State: Status of the last operation (Success or Failure). Not supported on Infinite Volumes.
• Last Successful Operation Begin: The time and date at which the last successful operation began. This parameter is not supported on Infinite Volumes.

• Last Successful Operation End: The time and date at which the last successful operation ended. This parameter is not supported on Infinite Volumes.

• Last Operation Begin: The time and date at which the last operation began. This parameter is not supported on Infinite Volumes.

• Last Operation End: The time and date at which the last operation ended. This parameter is not supported on Infinite Volumes.

• Last Operation Size: The size of the last operation. This parameter is not supported on Infinite Volumes.

• Last Operation Error: The error encountered by the last operation. This parameter is not supported on Infinite Volumes.

• Change Log Usage: The percentage of the change log that is used. This parameter is not supported on Infinite Volumes.

• Logical Data: The total logical data in the volume, and how much is reached compared to the deduplication logical data limit. This parameter is not supported on Infinite Volumes.

• Queued Job: The job that is queued. Following are the possible values:
  ◦ --: There are no queued jobs.
  ◦ scan: A job to process existing data is queued.
  ◦ start: A job to process newly added data is queued.
  ◦ check: A job to eliminate stale data from the fingerprint database is queued.
  ◦ downgrading: An efficiency operation necessary to downgrade the efficiency metafiles to a previous Data ONTAP release is queued.

• Stale Fingerprints: The percentage of stale entries in the fingerprint database. If this is greater than 20 percent a subsequent volume efficiency start operation triggers the verify operation, which might take a long time to complete. This parameter is not supported on Infinite Volumes.

• Inline Dedupe: Current state of inline deduplication on the volume (Enabled or Disabled).

• Inline Adaptive Data Compaction: Whether Inline Adaptive Data Compaction is enabled or disabled on the volume. When enabled, Data ONTAP combines data fragments to reduce on-disk block consumption.

You can specify additional parameters to display information that matches only those parameters. For example, to display information only about volumes with efficiency in Vserver vs1, run the command with the -vserver vs1 parameter.

No information is displayed for Infinite Volumes that are managed by storage services.

Parameters

{ [-fields <fieldname>, ...]  
  This specifies the fields that need to be displayed. The fields Vserver and volume name are the default fields.
  
  | [-i ]  
  This option displays detailed information about the volumes with efficiency.
  
  | [-instance ]}  
  If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver Name
  Displays information only for those volumes that match the specified Vserver.
[[-volume <volume name>]] - Volume Name
Displays information only for those volumes that match the specified volume.

[[-path /vol/volume]] - Volume Path
Displays information only for those volumes that match the specified volume path.

[[-state {Disabled|Enabled}]] - State
Displays information only for those volumes that match the specified state.

[[-op-status <Efficiency status>]] - Status
Displays information only for those volumes that match the specified operation status. This parameter is not supported on Infinite Volumes.

[[-progress <text>]] - Progress
Displays information only for those volumes that match the specified progress. This parameter is not supported on Infinite Volumes.

[[-type {Regular|SnapVault}]] - Type
Displays information only for those volumes that match the specified type of volume.

[[-schedule <text>]] - Schedule
Displays information only for those volumes that match the specified schedule.

[[-policy <text>]] - Efficiency Policy Name
Displays information only for those volumes that match the specified policy.

[[-compression-type {none|secondary|adaptive}]] - Compression Type (privilege: advanced)
Displays information about the type of compression on the volume [adaptive or secondary].

[[-blks-skipped-sharing <integer>]] - Blocks Skipped Sharing
Displays information only for those volumes that match the specified blocks skipped sharing. This parameter is not supported on Infinite Volumes.

[[-last-op-state <text>]] - Last Operation State
Displays information only for those volumes that match the specified last operation state. This parameter is not supported on Infinite Volumes.

[[-last-success-op-begin <Date>]] - Last Success Operation Begin
Displays information only for those volumes that match the specified last successful operation begin time. This parameter is not supported on Infinite Volumes.

[[-last-success-op-end <Date>]] - Last Success Operation End
Displays information only for those volumes that match the specified last successful operation end time. This parameter is not supported on Infinite Volumes.

[[-last-op-begin <Date>]] - Last Operation Begin
Displays information only for those volumes that match the specified last operation begin time. This parameter is not supported on Infinite Volumes.

[[-last-op-end <Date>]] - Last Operation End
Displays information only for those volumes that match the specified last operation end time. This parameter is not supported on Infinite Volumes.

[[-last-op-size <integer> {KB|MB|GB|TB|PB}]] - Last Operation Size
Displays information only for those volumes that match the specified last operation size. This parameter is not supported on Infinite Volumes.

[[-last-op-error <text>]] - Last Operation Error
Displays information only for those volumes that match the specified last operation error. This parameter is not supported on Infinite Volumes.
[-changelog-usage <percent_no_limit>] - Changelog Usage
Displays information only for those volumes that match the specified change log usage. This parameter is not supported on Infinite Volumes.

[-logical-data-size <integer> [KB|MB|GB|TB|PB]] - Logical Data Size
Displays information only for those volumes that match the specified logical data size. This parameter is not supported on Infinite Volumes.

[-logical-data-limit <integer> [KB|MB|GB|TB|PB]] - Logical Data Limit
Displays information only for those volumes that match the specified logical data limit. This parameter is not supported on Infinite Volumes.

[-logical-data-percent <percent_no_limit>] - Logical Data Percent
Displays information only for those volumes that match the specified logical data percentage. This parameter is not supported on Infinite Volumes.

[-queued-job <text>] - Queued Job
Displays information only for those volumes that match the specified number of queued jobs. This parameter is not supported on Infinite Volumes.

[-stale-fingerprint-percentage <integer>] - Stale Fingerprint Percentage
Displays information only for those volumes that match the specified stale fingerprint percentage. This parameter is not supported on Infinite Volumes.

[-compression {true|false}] - Compression
Displays information only for those volumes that match the specified compression setting.

[-inline-compression {true|false}] - Inline Compression
Displays information only for those volumes that match the specified inline compression setting.

[-idd {true|false}] - (DEPRECATED)-Incompressible Data Detection
Note: This parameter is deprecated and may be removed in a future release of Data ONTAP.
Displays information only for those volumes that match the specified idd setting. This parameter is not supported on Infinite Volumes.

[-is-constituent {true|false}] - Constituent Volume
Displays information only for those volumes that either are or are not constituents of a Infinite Volume, depending on the value provided.

[-quick-check-fsize <integer>] - (DEPRECATED)-Compression Quick Check File Size
Note: This parameter is deprecated and may be removed in a future release of Data ONTAP.
Displays information only for those volumes that match the specified quick-check file size setting. This parameter is not supported on Infinite Volumes.

[-inline-dedupe {true|false}] - Inline Dedupe
Displays information only for those volumes that match the specified inline deduplication setting.

[-data-compaction {true|false}] - Data Compaction
Displays information only for those volumes that match the specified data compaction setting.

Examples
The following example displays information about all volumes with efficiency on the Vserver named vs1:

```
cluster1::> volume efficiency show -vserver vs1
Vserver  Volume  State  Status        Progress
----------  --------  ------  ------------  ------------
vs1        vol11   Enabled  Idle        Idle for 22:37:53
vs1        vol12   Enabled  Idle        Idle for 22:37:53
```
The following example displays detailed information about a volume named vol1 on a Vserver named vs1:

```
cluster1::> volume efficiency show -vserver vs1 -volume vol1
Vserver Name: vs1
Volume Name: vol1
Volume Path: /vol/vol1
State: Enabled
Status: Idle
Progress: Idle for 00:00:14
Type: Regular
Schedule: sun-sat@0
Efficiency Policy Name: -
Blocks Skipped Sharing: 0
Last Operation State: Success
Last Success Operation Begin: Mon Nov 15 20:13:26 UTC 2010
Last Success Operation End: Mon Nov 15 20:13:26 UTC 2010
Last Operation Begin: Mon Nov 15 20:13:26 UTC 2010
Last Operation End: Mon Nov 15 20:13:26 UTC 2010
Last Operation Size: 0.00B
Last Operation Error: -
Change Log Usage: 0%
Logical Data Size: 156KB
Logical Data Limit: 50.00TB
Logical Data Percent: 0%
Queued Job: -
Stale Fingerprint Percentage: 0
Compression: false
Inline Compression: false
Incompressible Data Detection: false
Constituent Volume: false
Compression Quick Check File Size: 524288000
Inline Dedupe: false
Data Compaction: false
```

`volume efficiency start` on page 1258

**volume efficiency start**

Starts efficiency operation on a volume

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**

Use the `volume efficiency start` command to start an efficiency operation. The volume must be online and have efficiency enabled. If there is an efficiency operation already active on the volume, this command fails.

When the `volume efficiency start` command is issued, a checkpoint is created at the end of each stage or sub-stage, or on an hourly basis in the gathering phase. If at any point the `volume efficiency start` operation is stopped, the system can restart the efficiency operation from the execution state saved in the checkpoint. The `delete-checkpoint` parameter can be used to delete the existing checkpoint and restart a fresh efficiency operation. The checkpoint corresponding to gathering has a validity period of 24 hours. If the user knows that significant changes have not been made on the volume, then such a gatherer checkpoint whose validity has expired can be used with the help of the `use-checkpoint` parameter. There is no time restriction for checkpoints of other stages.

This command is not supported on FlexGroups, FlexGroup constituents, or Infinite Volumes that are managed by storage services.
When the volume is configured to use the *inline-only* efficiency policy, the system will stop monitoring changes to the data for the purpose of running background efficiency operations. The background deduplication operations will be disabled. The user can still execute compression specific efficiency operation with `-scan-old-data` and `-compression` parameters to compress the existing data on the volume.

**Parameters**

`-vserver <vserver name>` - Vserver Name

Specifies the Vserver on which the volume is located.

`{-volume <volume name> - Volume Name` 

Specifies the name of the volume.

`| -path <vol/volume> } - Volume Path` 

Specifies the complete path of the volume.

`[-scan-old-data | -s [true]] - Scan Old Data` 

This option scans the file system and processes all existing data. It prompts for user confirmation before proceeding. Use the force option to suppress this confirmation.

`{ [-use-checkpoint | -p [true]] - Use Checkpoint (if scanning old data)` 

Use the checkpoint when scanning existing data. Valid only if `scan-old-data` parameter is true.

`| [-delete-checkpoint | -d [true]] } - Delete Checkpoint` 

Deletes the existing checkpoint and restarts a new volume efficiency start operation.

`[-qos-policy <sis_qos>] - QoS Policy` 

Specifies the qos-policy, which indicates how the efficiency operations are throttled. This option can be configured to be `background` or `best-effort`. Default value is `best-effort`. If `background` is specified, the efficiency operations are run with minimum or no impact on the data serving client operations. If `best-effort` is specified, the efficiency operations might have some impact on the data serving client operations.

`[-compression | -C [true]] - Start Compression (if scanning old data) (privilege: advanced)` 

Compresses existing data. Deduplication is not run unless the dedupe option is also specified. Valid only if `scan-old-data` parameter is true.

`[-dedupe | -D [true]] - Start Deduplication (if scanning old data) (privilege: advanced)` 

Dedupe existing data on disk. Similarly, compression is not run unless the compression option is also specified. Valid only if `scan-old-data` parameter is true.

`[-build-metadata | -m [true]] - Build metadata without sharing (if scanning old data)` 

Builds deduplication metadata by scanning the entire file system. You will not achieve any space savings with this option. Once the metadata is built, existing data can be shared with newly written data on subsequent deduplication runs.

`[-scan-all | -o [true]] - Scan all the data without shared block optimization (if scanning old data)` 

Scans the entire file system and processes the shared blocks also. You may be able to achieve additional space savings using this option. Where as, by default the option `-scan-old-data` saves some time by skipping the shared blocks.

`[-shared-blocks | -u [true]] - Compress Shared Blocks (if scanning old data) (privilege: advanced)` 

Compresses the Compression Groups that have shared blocks created by deduplication or cloning data. Valid only if `scan-old-data` parameter is true.

`[-snapshot-blocks | -b [true]] - Compress Blocks In Snapshots (if scanning old data) (privilege: advanced)` 

Compresses data blocks locked in a Snapshot copy. Valid only if `scan-old-data` parameter is true.
[-queue | -q [true]] - Operation Should Be Queued

Queues an efficiency operation. It will be queued only if an operation is already in progress. Valid only if scan-old-data is false.

[-force | -f [true]] - Force Operation

Suppresses all confirmation messages.

[-skip-zero-replacement | -z [true]] - Skip Zero block detection and replacement (privilege: advanced)

Skip the zero block detection and replacement during the gatherer scan. Valid only if scan-old-data parameter is true.

Examples

The following examples start efficiency on a volume:

```
cluster1::> volume efficiency start -volume vol1 -vserver vs1
```

```
cluster1::> volume efficiency start -scan-old-data -volume vol1 -vserver vs1
```

```
cluster1::> volume efficiency start -volume vol1 -vserver vs1 -queue -delete-checkpoint
```

volume efficiency stat

Show volume efficiency statistics

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The volume efficiency stat command displays efficiency statistics. This command is not supported on Infinite Volumes. The output depends on the parameters specified with the command. If no parameters are specified, the command displays the following efficiency statistics fields for all the volumes:

- Vserver: The Vserver that the volume belongs to.
- Volume Name: Name of the volume.
- Inline Compression Attempts: Number of inline compression attempts done.
- Inline Incompressible CGs: Number of compression groups that cannot be compressed by inline compression.

To display detailed information, run the command with -instance parameter.

Parameters

```
[-fields <fieldname>, ...]
```

This specifies the fields that need to be displayed. The Vserver and volume name are the default fields.

```
[-instance]
```

If you specify the -instance parameter, the command displays detailed information about all fields.

```
[-vserver <vserver name>] - Vserver Name
```

Displays statistics only for those volume(s) that match the specified Vserver.

```
[-volume <volume name>] - Volume Name
```

Displays statistics only for those volume(s) that match the specified volume name.

```
[-path <vol/volume>] - Volume Path
```

Displays statistics only for those volume(s) that match the specified volume path.
[-b [true]] - Display In Blocks
Displays usage size in 4k block counts.

[-num-compressed-inline <integer>] - Inline Compression Attempts
Displays statistics only for those volume(s) that match the specified number of Compression Groups attempted inline.

Examples
The following example displays default efficiency statistics for all the volumes.

```
class1::> volume efficiency stat
Vserver: vs1
Volume: vol2
Inline Compression Attempts: 0
Inline Incompressible CGs: 0
Vserver: vs1
Volume: vol3
Inline Compression Attempts: 0
Inline Incompressible CGs: 0
```

At the diagnostic level, the output displays the information below.

```
class1::*> volume efficiency stat
Vserver Volume Allocated Saving %Saved
-------- -------- ----------- -------- -------
vs0 vol10 16284324 KB 4680 KB 0%
vs1 vol11 4376500 KB 18684 KB 3%
vs1 vol12 3458716 KB 0 KB 0%
vs1 vol13 965296 KB 308 KB 0%

volume efficiency stop

Stop efficiency operation on a volume

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
Use the `volume efficiency stop` command to stop an efficiency operation. This command is not supported on FlexGroups, FlexGroup constituents, or Infinite Volumes that are managed by storage services.

Parameters
- `vserver <vserver name>` - Vserver Name
  This specifies the Vserver on which the volume is located.

  - `volume <volume name>` - Volume Name
    This specifies the name of the volume on which efficiency operation needs to be stopped.

  - `path <vol/volume>` - Volume Path
    This specifies the volume path on which efficiency operation needs to be stopped.

  - `all | -a [true]` - Stop All Operations
    This specifies both active and queued efficiency operations to be aborted.

Examples
The following examples stop efficiency on a volume.

- `cluster1::> volume efficiency stop -vserver vs1 -volume vol1`
- `cluster1::> volume efficiency stop -vserver vs1 -volume vol1 -all`

volume efficiency undo

Undo efficiency on a volume

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The command `volume efficiency undo` removes volume efficiency on a volume by undoing compression, undoing compaction and removing all the block sharing relationships, and cleaning up any volume efficiency specific data structures.
Any efficiency operations on the volume must be disabled before issuing this command. The volume efficiency configuration is deleted when the undo process completes. The command is used to revert a volume to an earlier version of Data ONTAP where some of the efficiency features are not supported. During this revert not all efficiencies needs to be undone but only those gained by that particular feature (for example, compaction), which is not supported in the earlier version.

This command is not supported on FlexGroups that are managed by storage services.

**Parameters**

- `vserver <vserver name>` - *Vserver Name*
  
  This specifies the Vserver on which the volume is located.

- `volume <volume name>` - *Volume Name*
  
  This specifies the volume name.

- `path </vol/volume>` - *Volume Path*
  
  This specifies the volume path.

- `compression [true]` - *Decompress Data in the Volume*
  
  Undo the effects of compression. This requires efficiency to be disabled (by performing `volume efficiency off`).

- `dedupe [true]` - *Undo Block Sharing in the Volume*
  
  Undo the effects of deduplication. This requires efficiency to be disabled (by performing `volume efficiency off`).

- `inode <integer>` - *Inode Number to Undo Sharing*
  
  Remove the block sharings from a specified inode. This parameter is not supported on Infinite Volumes.

- `undo-type {all|wrong}` - *Selective Undo*
  
  This specifies to remove either all or only invalid block sharing. When `all` is used, all block sharings are removed. When `wrong` is used, only invalid sharings present in the volume are removed. When used along with `log` option, it logs information about all or wrong block sharings without sharing removal.

- `log [true]` - *Only Log Incorrect Savings*
  
  If specified, information about invalid block sharing relationships will only be logged. Invalid sharings will not be removed. This parameter is only valid when the parameter `undo-type` is specified as `wrong`.

- `data-compaction [true]` - *Undo Data Compaction in the Volume*
  
  Undo the effects of data compaction.

**Examples**

The following are examples of how to use efficiency undo.

To undo deduplication savings, but not compaction or compression savings in a volume name `vol1` on a Vserver named `vs1`:

```
cluster1::> volume efficiency undo -vserver vs1 -volume vol1
```

To rewrite compressed blocks and undo compression savings in a volume name `vol1` on a Vserver named `vs1`:

```
cluster1::> volume efficiency undo -vserver vs1 -volume vol1 -compression
```

To rewrite compressed and deduped blocks without any efficiency in a volume name `vol1` on a Vserver named `vs1`:

```
cluster1::> volume efficiency undo -vserver vs1 -volume vol1 -dedup -compression
```

To rewrite compacted blocks in a volume name `vol1` on an SVM named `vs1`:

```
```

volume efficiency off on page 1251

volume efficiency policy commands

Manage efficiency policies

The volume efficiency policy commands enable you to manage efficiency policies.

volume efficiency policy create

Create an efficiency policy

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The volume efficiency policy create creates an efficiency policy.

Parameters

-vserver <vserver name> - Vserver

Specifies the Vserver on which the volume is located.

-policy <text> - Efficiency Policy Name

This specifies the policy name.

[-type <Efficiency policy type>] - Policy Type

This specifies the policy type. The policy type defines when the volume using this policy will start processing a changelog. There are two possible values:

• threshold means changelog processing occurs when the changelog reaches a certain percentage.
• scheduled means changelog processing will be triggered by time.

The default value is scheduled.

[-schedule <text>] - Job Schedule Name

This specifies the job schedule. Use job schedule commands to manage job schedules. Only cron job schedules are supported.

[-duration <text>] - Duration

This specifies the duration that an efficiency operation can run (in hours). The possible values are "-" or a number between 1 and 999 inclusive. Default value is "-", which means no duration.

[-start-threshold-percent <percent>] - Threshold Percentage

The percentage at which the changelog will be processed. The percentage is checked on an hourly basis. The default value is 20. Valid only if -type parameter is set as threshold.

[-qos-policy <Efficiency QoS policy>] - QoS Policy

This specifies how the efficiency operations are throttled. This option can be configured to be background or best-effort. Default value is best-effort. If background is specified, the efficiency operations are run with minimum or no impact on the data serving client operations. If best-effort is specified, the efficiency operations might have some impact on the data serving client operations.

[-enabled {true|false}] - Enabled

This specifies whether the policy is enabled or not. The policy is enabled by default.
[-comment <text>] - Comment

User specified comment.

Examples
The following example creates an efficiency policy.

```
cluster1::> volume efficiency policy create -vserver vs1 -policy policy1 -schedule daily -duration 100
```

Related references

`job schedule` on page 144

volume efficiency policy delete

Delete an efficiency policy

Availability: This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

Description
The `volume efficiency policy delete` command deletes an efficiency policy. An efficiency policy can be deleted only when it is not associated with any volume. The pre-defined policies `default` and `inline-only` cannot be deleted.

Parameters

- `vserver <vserver name>` - Vserver
  
  This specifies the Vserver on which the volume is located.

- `policy <text>` - Efficiency Policy Name
  
  This specifies the policy name.

Examples

The following example deletes an efficiency policy:

```
cluster1::> volume efficiency policy delete -vserver vs1 -policy policy1
```

volume efficiency policy modify

Modify an efficiency policy

Availability: This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

Description

The `volume efficiency policy modify` command can be used to modify the policy attributes. The attributes of the `inline-only` predefined policy cannot be modified.

Parameters

- `vserver <vserver name>` - Vserver
  
  This specifies the Vserver on which the volume is located.

- `policy <text>` - Efficiency Policy Name
  
  This specifies the policy name.
Policy Type

This specifies the policy type. The policy type defines when the volume using this policy will start processing a changelog. There are two possible values:

- **threshold** means changelog processing occurs when the changelog reaches a certain percentage.
- **scheduled** means changelog processing will be triggered by time.

The default value is **scheduled**.

Job Schedule Name

This specifies the job schedule. Use `job schedule show` to show all the jobs.

Duration

This specifies the duration that an efficiency operation can run in hours. The possible value is between 1 and 999 inclusive.

Threshold Percentage

The percentage at which the changelog will be processed. The percentage is checked on an hourly basis. The default value is 20. Valid only if `-type` parameter is set as `threshold`.

QoS Policy

This specifies how the efficiency operations are throttled. This option can be configured to be `background` or `best-effort`. Default value is `best-effort`. If `background` is specified, the efficiency operations are run with minimum or no impact on the data serving client operations. If `best-effort` is specified, the efficiency operations might have some impact on the data serving client operations.

Enabled

This specifies whether the policy is enabled or not. Default value is true.

Comment

User specified comment.

Examples

The following example modifies efficiency policy.

```
cluster1::> volume efficiency policy modify -policy policy1 -schedule hourly
```

Related references

`job schedule show` on page 145

volume efficiency policy show

Show efficiency policies

Availability: This command is available to cluster and Vserver administrators at the `admin` privilege level.

Description

The `volume efficiency policy show` command displays information about efficiency policies. By default, the command displays the following information about all policies:

- **Vserver**: Name of the Vserver that the policy belongs to.
- **Policy Name**: Efficiency policy name.
- **Job Schedule**: Job schedule name.
• Duration (Hours): The duration in hours that the efficiency operation can run.

• Enable: Whether the policy is enabled or not.

• Comment: User specified comment.

You can specify additional parameters to select the displayed information. For example, to display efficiency policies only with duration 5 hours, run the command with the `-duration 5` parameter.

The pre-defined policies *default* and *inline-only* are available when all the nodes in the cluster are running Data ONTAP version 8.3 or later.

The *inline-only* pre-defined policy must be used when the user wants to use the inline compression feature without any regularly scheduled or manually started background storage efficiency operations. When a volume is configured to use the *inline-only* efficiency policy, the system will stop monitoring changes to the data for running the background efficiency operations on the volume. Volumes cannot be configured with the *inline-only* policy if there is a currently active background efficiency operation.

**Parameters**

```bash
[-fields <fieldname>, ...]  
Selects the fields to be displayed. Vserver and policy are the default fields (see example).

[-instance ]]  
If this parameter is specified, the command displays information about all entries.

[-vserver <vserver name>] - Vserver  
Selects information about the policies that match the specified Vserver.

[-policy <text>] - Efficiency Policy Name  
Selects information about the policies that match the specified policy name.

[-type <Efficiency policy type>] - Policy Type  
Selects information about the policies that match the specified policy type. There are two possible values - `threshold` and `scheduled`.

[-schedule <text>] - Job Schedule Name  
Selects information about the policies that match the specified schedule.

[-duration <text>] - Duration  
Selects information about the policies that match the specified duration hours.

[-start-threshold-percent <percent>] - Threshold Percentage  
Selects information about the policies that match the specified start-threshold-percent. Valid only if `-type` parameter is set as `threshold`.

[-qos-policy <Efficiency QoS policy>] - QoS Policy  
Selects information about the policies that match the specified throttling method. The values can be `background` or `best-effort`.

[-enabled {true|false}] - Enabled  
Selects information about the policies that have the specified enabled setting.

[-comment <text>] - Comment  
Selects information about the policies that match the specified comment.

[-policy-owner {cluster-admin|vserver-admin}] - Owner of the Policy  
Selects information about the policies that match the specified owner. The values can be `cluster-admin` or `vserver-admin`.
```
**Examples**

The following example shows all the efficiency policies with the matching Vserver vs1.

```
cluster1::> volume efficiency policy show -vserver vs1

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Policy</th>
<th>Job</th>
<th>Duration</th>
<th>QoS Policy</th>
<th>Enabled</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>

</tr>
<tr>
<td>vs1</td>
<td>policy1</td>
<td>-</td>
</tr>
</tbody>
</table>
```

3 entries were displayed.

---

**volume clone commands**

Manage FlexClones

**volume clone create**

Create a FlexClone volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The `volume clone create` command creates a FlexClone volume on the aggregate containing the specified parent volume. This command is only supported for flexible volumes. The maximum volume clone hierarchy depth is 500 and the default depth is 60. You can optionally specify the following attributes for the new FlexClone volume:

- Vserver on which the parent volume resides
- Name of the FlexClone parent snapshot
- Junction path where FlexClone volume should be mounted
- State of the junction path
- Space guarantee style (none, volume or file)
- Comment
- Whether the `volume clone create` command runs as a foreground or background process

**Parameters**

`-vserver <vserver name>` - Vserver Name

This specifies the Vserver on which the parent volume resides. If only one data Vserver exists, you do not need to specify this parameter.
-flexclone <volume name> - FlexClone Volume
This specifies the name of the FlexClone volume. The name must be unique within the hosting Vserver.

[-type {RW|DP}] - FlexClone Type
This parameter specifies the type of FlexClone volume. A read-only FlexClone volume is created if you specify the type as DP; otherwise a read-write FlexClone volume is created.

[-parent-vserver <vserver name>] - FlexClone Parent Vserver (privilege: advanced)
This specifies the name of the Vserver to which the FlexClone parent volume belongs.

[-parent-volume -b <volume name>] - FlexClone Parent Volume
This specifies the name of parent volume from which the FlexClone clone volume is derived.

[-parent-snapshot <snapshot name>] - FlexClone Parent Snapshot
This specifies the name of the parent snapshot from which the FlexClone clone volume is derived.

[-junction-path <junction path>] - Junction Path
This specifies the junction path at which the new FlexClone clone volume should be mounted.

[-junction-active {true|false}] - Junction Active
This optionally specifies whether the volume's junction path is active. The default setting is true. If the junction path is inactive, the volume does not appear in the Vserver's namespace. This parameter is available only at the advanced privilege level and higher.

[-space-guarantee | -s {none|volume}] - Space Guarantee Style
This optionally specifies the space-reservation policy for the FlexClone volume. A value of volume reserves space on the aggregate for the entire volume. A value of none reserves no space on the aggregate, meaning that writes can fail if the aggregate runs out of space. The default setting is inherited from the parent volume.

[-comment <text>] - Comment
This optionally specifies a comment for the FlexClone volume.

[-foreground {true|false}] - Foreground Process
This optionally specifies whether the FlexClone volume create operation runs as a foreground process. The default setting is true (that is, the operation runs in the foreground).

[-qos-policy-group <text>] - QoS Policy Group Name
This parameter optionally specifies which QoS policy group to apply to the FlexClone volume. The policy group defines measurable service level objectives (SLOs) that apply to the storage objects with which the policy group is associated. If you do not assign a policy group to the FlexClone volume, the system does not monitor and control the traffic to the volume.

[-caching-policy <text>] - Caching Policy Name
This optionally specifies the caching policy to apply to the volume. A caching policy defines how the system caches this volume's data in Flash Cache modules. If a caching policy is not assigned to this volume, the system uses the caching policy that is assigned to the containing Vserver. If a caching policy is not assigned to the containing Vserver, the system uses the default cluster-wide policy. This parameter is not supported on Infinite Volumes. The available caching policies are:

- none - Does not cache any user data or metadata blocks.
- auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
- meta - Read caches only metadata blocks.
- random_read - Read caches all metadata and randomly read user data blocks.
- random_read_write - Read caches all metadata, randomly read and randomly written user data blocks.
- all_read - Read caches all metadata, randomly read, and sequentially read user data blocks.
- all_read_random_write - Read caches all metadata, randomly read, sequentially read and randomly written user data.
- all - Read caches all data blocks read and written. It does not do any write caching.
- no_read_random_write - Write caches all randomly overwritten user data blocks. It does not do any read caching.
- meta_random_write - Read caches all metadata and write caches randomly overwritten user data blocks.
- random_read_write_random_write - Read caches all metadata, randomly read and randomly written user data blocks. It also write caches randomly overwritten user data blocks.
- all_read_random_write - Read caches all metadata, randomly read, and sequentially read user data blocks. It also write caches randomly overwritten user data blocks.
- all_read_random_write_random_write - Read caches all metadata, randomly read, sequentially read and randomly written user data. It also write caches randomly overwritten user data blocks.
- all_random_write - Read caches all data blocks read and written. It also write caches randomly overwritten user data blocks.

Note that in a caching-policy name, a hyphen (-) separates read and write policies. Default caching-policy is auto.

\[-vserver-dr-protection {protected unprotected} \] - Vserver DR Protection

This optionally specifies whether the volume should be protected by Vserver level SnapMirror. This parameter is applicable only if the Vserver is the source of a Vserver level SnapMirror relationship. By default the clone volume will inherit this value from the parent volume. This parameter is not supported on Infinite Volumes.

\[-uid <integer> \] - Volume-Level UID

This parameter optionally specifies a volume-level user ID (UID). All files and directories in a FlexClone volume will inherit this UID.

\[-gid <integer> \] - Volume-Level GID

This parameter optionally specifies a volume-level group ID (GID). All files and directories in a FlexClone volume will inherit this GID.

**Examples**

**volume clone show**

Display a list of FlexClones

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The `volume clone show` command displays information about FlexClone clone volumes. This command is only supported for flexible volumes. By default, the command displays the following information about all FlexClone volume clones:

- Vserver name
- FlexClone volume name
- Parent volume name
- Parent snapshot name
• Whether a FlexClone volume is online or offline

To display detailed information about all FlexClone volumes, run the command with the `-instance` parameter.

**Parameters**

```bash
([-fields <fieldname>, ...]
  Selects the fields to be displayed.

| [-estimate ]
  Displays an estimate of the free disk space required in the aggregate to split the indicated clone volume from its underlying parent volume. The value reported may differ from the space actually required to perform the split, especially if the clone volume is changing when the split is being performed.

| [-instance ]
  Displays detailed information about FlexClone volumes. If `-flexclone` is also specified, the command displays detailed information about the FlexClone volume.

[-vserver <vserver name>] - Vserver Name
  Selects summary information for the FlexClone volumes on the specified Vserver. If `-flexclone` is also specified, the command displays detailed information about the specified FlexClone volume.

[-flexclone <volume name>] - FlexClone Volume
  Selects summary information for the specified FlexClone volume. If `-vserver` is also specified, the command displays detailed information about the specified FlexClone volume.

[-type {RW|DP}] - FlexClone Type
  Selects information for the specified type of FlexClone volume. The type can be specified as either read-only (DP) or read-write (RW).

[-parent-vserver <vserver name>] - FlexClone Parent Vserver (privilege: advanced)
  Selects summary information for the FlexClone volumes that are clone volumes in the specified parent Vserver.

[-parent-volume | -b <volume name>] - FlexClone Parent Volume
  Selects summary information for the FlexClone volumes that are clones of the specified parent volume.

[-parent-snapshot <snapshot name>] - FlexClone Parent Snapshot
  Selects summary information for the FlexClone volumes that are clones of the parent volume to which the specified snapshot belongs.

[-state {online|restricted|offline|force-online|force-offline|mixed}] - FlexClone Volume State
  Selects summary information for the FlexClone volumes that are in the specified state.

[-junction-path <junction path>] - Junction Path
  Selects summary information for the FlexClone volumes that have the specified junction path.

[-junction-active {true|false}] - Junction Active
  Selects summary information for the FlexClone volumes that have the specified junction path status.

[-space-guarantee |-s {none|volume}] - Space Guarantee Style
  If this parameter is specified, the command displays information only about the volumes that have the specified space-reservation policy.

[-space-guarantee-enabled {true|false}] - Space Guarantee In Effect
  Selects summary information for the FlexClone volumes that have the specified space-guarantee setting.

[-aggregate <aggregate name>] - FlexClone Aggregate
  Selects summary information for the FlexClone volumes that reside on the specified storage aggregate.
```
[-dsid <integer>] - FlexClone Data Set ID
Selects summary information for the FlexClone volumes that have the specified Data Set ID.

[-msid <integer>] - FlexClone Master Data Set ID
Selects summary information for the FlexClone volumes that have the specified Master Data Set ID.

[-size {<integer> [KB|MB|GB|TB|PB]}] - FlexClone Size
Selects summary information for the FlexClone volumes that have the specified size.

[-used {<integer> [KB|MB|GB|TB|PB]}] - Used Size
Selects summary information for the FlexClone volumes that have the specified amount of used space.

[-split-estimate {<integer> [KB|MB|GB|TB|PB]}] - Split Estimate
Selects summary information for the FlexClone volumes that require the specified amount of free disk space for splitting from the parent.

[-inodes-processed <integer>] - Inodes Processed
Selects summary information for the FlexClone volumes that have the specified number of Inodes processed for splitting the FlexClone volume from its parent volume.

[-inodes-total <integer>] - Total Inodes
Selects summary information for the FlexClone volumes that have the specified number of total Inodes.

[-inode-percentage-complete <integer>] - Inode Percentage Complete
Selects summary information for the FlexClone volumes that have specified percentage of Inodes processed for splitting the FlexClone volume from its parent volume.

[-blocks-scanned <integer>] - Blocks Scanned
Selects summary information for the FlexClone volumes that have the specified number of blocks scanned for splitting the FlexClone volume from its parent volume.

[-blocks-updated <integer>] - Blocks Updated
Selects summary information for the FlexClone volumes that have the specified number of blocks updated for after splitting the FlexClone volume from its parent volume.

[-comment <text>] - Comment
Selects summary information for the FlexClone volumes that have the specified comment.

[-qos-policy-group <text>] - QoS Policy Group Name
Selects summary information for the FlexClone volumes that have the specified QoS policy group.

[-caching-policy <text>] - Caching Policy Name
This optionally specifies the caching policy to apply to the volume. A caching policy defines how the system caches this volume's data in Flash Cache modules. If a caching policy is not assigned to this volume, the system uses the caching policy that is assigned to the containing Vserver. If a caching policy is not assigned to the containing Vserver, the system uses the default cluster-wide policy. This parameter is not supported on Infinite Volumes. The available caching policies are:

- none - Does not cache any user data or metadata blocks.
- auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
- meta - Read caches only metadata blocks.
- random_read - Read caches all metadata and randomly read user data blocks.
- random_read_write - Read caches all metadata, randomly read and randomly written user data blocks.
- all_read - Read caches all metadata, randomly read, and sequentially read user data blocks.
- all_read_random_write - Read caches all metadata, randomly read, sequentially read and randomly written user data.
- all - Read caches all data blocks read and written. It does not do any write caching.
- noread_random_write - Write caches all randomly overwritten user data blocks. It does not do any read caching.
- meta_random_write - Read caches all metadata and write caches randomly overwritten user data blocks.
- random_read_write_random_write - Read caches all metadata, randomly read and randomly written user data blocks. It also write caches randomly overwritten user data blocks.
- all_read_random_write - Read caches all metadata, randomly read, and sequentially read user data blocks. It also write caches randomly overwritten user data blocks.
- all_read_random_write_random_write - Read caches all metadata, randomly read, sequentially read and randomly written user data. It also write caches randomly overwritten user data blocks.
- all_random_write - Read caches all data blocks read and written. It also write caches randomly overwritten user data blocks.

Note that in a caching-policy name, a hyphen (-) separates read and write policies. Default caching-policy is auto.

- [parent_vol_type] - Parent volume type (privilege: advanced)
  Selects summary information for the FlexClone volumes that are clones of the parent volumes with the specified type.

- [flexclone_used_percent] - FlexClone Used Percentage
  Selects summary information for the FlexClone volumes that have the specified percentage of used space.

- [vserver_dr_protection protected|unprotected] - Vserver DR Protection
  Selects summary information for the FlexClone volumes that have the specified type of Vserver SnapMirror protection. This parameter is applicable only if the Vserver is the source of a Vserver level SnapMirror relationship.

- [block_percentage_complete] - Block Percentage Complete
  Selects summary information for the FlexClone volumes that have specified percentage of Blocks processed for splitting the FlexClone volume from its parent volume.

- [uid] - Volume-Level UID
  Selects summary information for the FlexClone volumes that are created with the specified volume-level UID.

- [gid] - Volume-Level GID
  Selects summary information for the FlexClone volumes that are created with the specified vol-level GID.

### Examples

#### volume clone split commands

Commands to manage FlexClone split

#### volume clone split estimate

Estimates the space required by the containing-aggregate to split the FlexClone volume

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.
Description
The `volume clone split estimate` command displays an estimate of the free disk space required in the aggregate to split the indicated clone volume from its underlying parent volume. The value reported might differ from the space actually required to perform the split, especially if the clone volume is changing when the split is being performed. This command is only supported for flexible volumes.

Parameters

`[-vserver <vserver name>] - Vserver Name`
This specifies the estimates for free disk space required for splitting FlexClone volumes residing on this Vserver. If the `-flexclone` option is also specified, then the command displays the free disk space estimate only for the specified FlexClone volume residing on the specified Vserver.

`[-flexclone <volume name>] - FlexClone Volume`
This specifies the free disk space estimate for splitting this FlexClone volume.

`[-type {RW|DP}] - FlexClone Type`
This parameter specifies the type of FlexClone volume. A read-only FlexClone volume is created if you specify the type as DP; otherwise a read-write FlexClone volume is created.

`[-parent-vserver <vserver name>] - FlexClone Parent Vserver (privilege: advanced)`
This specifies the free disk space estimates for splitting the FlexClone volumes that are clones in the specified parent vserver.

`[-parent-volume | -b <volume name>] - FlexClone Parent Volume`
This specifies the free disk space estimates for splitting the FlexClone volumes cloned off this parent volume.

`[-parent-snapshot <snapshot name>] - FlexClone Parent Snapshot`
This specifies the free disk space estimates for splitting the FlexClone volumes cloned off this parent snapshot.

`[-state {online|restricted|offline|force-online|force-offline|mixed}] - FlexClone Volume State`
This specifies the free disk space estimates for splitting the FlexClone volumes with the specified state.

`[-junction-path <junction path>] - Junction Path`
This specifies the free disk space estimates for splitting the FlexClone volumes mounted at this junction path.

`[-junction-active {true|false}] - Junction Active`
If this specified, the command displays the free disk space estimate for splitting the FlexClone volumes with the specified junction path status.

`[-space-guarantee | -s {none|volume}] - Space Guarantee Style`
This specifies the free disk space estimates for splitting the FlexClone volumes with the specified type of space guarantee.

`[-space-guarantee-enabled {true|false}] - Space Guarantee In Effect`
This specifies the free disk space estimates for splitting the FlexClone volumes with the specified state of space guarantee.

`[-aggregate <aggregate name>] - FlexClone Aggregate`
This specifies the free disk space estimates for splitting the FlexClone volumes residing on the specified aggregate.

`[-dsid <integer>] - FlexClone Data Set ID`
This specifies the free disk space estimates for splitting the FlexClone volume with the specified DSID (data set ID).

`[-msid <integer>] - FlexClone Master Data Set ID`
This specifies the free disk space estimates for splitting the FlexClone volumes with the specified MSID (master data set ID).
[-size {<integer> [KB|MB|GB|TB|PB]}] - FlexClone Size
This specifies the free disk space estimates for splitting FlexClone volumes with the specified size.

[-used {<integer> [KB|MB|GB|TB|PB]}] - Used Size
This specifies the free disk space estimates for splitting the FlexClone volumes with the specified amount of used disk space.

[-split-estimate {<integer> [KB|MB|GB|TB|PB]}] - Split Estimate
This specifies the free disk space estimates for splitting the FlexClone volumes which match with the specified free disk space estimate for splitting.

[-inodes-processed <integer>] - Inodes Processed
This specifies the free disk space estimates for splitting the FlexClone volumes for which the specified number of Inodes have been processed already.

[-inodes-total <integer>] - Total Inodes
This specifies the free disk space estimates for splitting the FlexClone volumes for which the specified total number of inodes need to be processed.

[-inode-percentage-complete <integer>] - Inode Percentage Complete
This specifies the free disk space estimates for splitting the FlexClone volumes for which the specified percentage of Inode processing has been completed.

[-blocks-scanned <integer>] - Blocks Scanned
This specifies the free disk space estimates for splitting the FlexClone volumes for which the specified number of blocks have been scanned.

[-blocks-updated <integer>] - Blocks Updated
This specifies the free disk space estimates for splitting the FlexClone volumes for which the specified number of blocks have been updated.

[-comment <text>] - Comment
This specifies the free disk space estimates for splitting the FlexClone volumes that have the specified value for the comment field.

[-qos-policy-group <text>] - QoS Policy Group Name
This parameter optionally specifies which QoS policy group to apply to the FlexClone volume. The policy group defines measurable service level objectives (SLOs) that apply to the storage objects with which the policy group is associated. If you do not assign a policy group to the FlexClone volume, the system does not monitor and control the traffic to the volume.

[-caching-policy <text>] - Caching Policy Name
This specifies the free disk space estimates for splitting the FlexClone volumes that are clones with the specified caching policy.

[-parent-vol-type <volAccessType>] - Parent volume type (privilege: advanced)
This specifies the free disk space estimates for splitting the FlexClone volumes that are clones of the parent volumes with the specified type.

[-flexclone-used-percent <percent>] - FlexClone Used Percentage
This specifies the free disk space estimates for splitting the FlexClone volumes that are clones with the specified percentage of used space.

[-vserver-dr-protection {protected|unprotected}] - Vserver DR Protection
This specifies the free disk space estimates for splitting the FlexClone volumes that are clones with the specified Vserver SnapMirror protection. This parameter is not supported on Infinite Volumes.
[-block-percentage-complete <integer>] - Block Percentage Complete
    This specifies the free disk space estimates for splitting the FlexClone volumes for which the specified percentage of Block processing has been completed.

[-uid <integer>] - Volume-Level UID
    This specifies the free disk space estimates for splitting the FlexClone volumes that are clones with the specified volume-level UID.

[-gid <integer>] - Volume-Level GID
    This specifies the free disk space estimates for splitting the FlexClone volumes that are clones with the specified volume-level GID.

Examples

Related references
    volume clone show on page 1271

volume clone split show
    Show the status of FlexClone split operations in-progress

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
    The volume clone split show command displays the progress information of all the active FlexClone volume splitting jobs. This command is only supported for flexible volumes. By default, this command displays the following information:
    • Vserver name
    • FlexClone volume name
    • Number of inodes processed during clone splitting
    • Total inodes to be processed during clone splitting
    • Percentage of inodes processed
    • Percentage of blocks processed
    • Total number of blocks scanned for clone splitting
    • Total number of blocks updated for clone splitting

If the -instance option is also specified, detailed information about all splitting jobs is displayed.

Parameters
    { [-fields <fieldname>, ...]  
      This specifies the fields to be displayed, for all the ongoing FlexClone splitting jobs.
    | [-instance]  
      This specifies the command to display detailed information about the ongoing FlexClone volume splitting jobs.
    | [-vserver <vserver name>] - Vserver Name
      Selects information about the ongoing FlexClone volume splitting jobs for all FlexClone volumes on this Vserver.
    | [-flexclone <volume name>] - FlexClone Volume
      Selects information about ongoing FlexClone volume splitting jobs for this FlexClone volume.
[-inodes-processed <integer>] - Inodes processed
Selects information about all the ongoing FlexClone splitting jobs which have the specified number of Inodes processed.

[-inodes-total <integer>] - Total Inodes
Selects information about all the ongoing FlexClone splitting jobs that have the specified number of total Inodes to be processed.

[-inode-percentage-complete <integer>] - Inode Percentage complete
Selects information about all the ongoing FlexClone splitting jobs that have the specified percentage of Inode processing completed.

[-block-percentage-complete <integer>] - Block Percentage complete
Selects information about all the ongoing FlexClone splitting jobs that have the specified percentage of Block processing completed.

[-blocks-scanned <integer>] - Blocks Scanned
Selects information about all the ongoing FlexClone splitting jobs that have the specified number of blocks scanned.

[-blocks-updated <integer>] - Blocks Updated
Selects information about all the ongoing FlexClone splitting jobs that have the specified number of blocks updated.

Examples

volume clone split start
Split a FlexClone from the parent volume

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The volume clone split start command starts a job to separate the FlexClone volume from the underlying parent volume. Both, the parent and the FlexClone volumes will be available for the duration of the split operation. After the job starts, you can stop it using the volume clone split stop command. You can also stop the job using the job stop command. You can monitor the current progress of the job using the volume clone split show and job show commands. This command is only supported for flexible volumes. This command is not supported on volumes that are being protected as part of a Vserver level SnapMirror.

Parameters
-vserver <vserver name> - Vserver Name
This specifies the Vserver that the FlexClone volume exists on.

-flexclone <volume name> - FlexClone Volume
This specifies the FlexClone volume that will be split from its parent volume.

[-foreground [true]] - Foreground Process
This specifies whether the clone splitting job will run as a foreground job. The default value of this option is true.

Examples

Related references
volume clone split stop on page 1279
volume clone split stop

Stop an ongoing FlexClone split job

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The `volume clone split stop` command stops the process of separating the FlexClone volume from its underlying parent volume, but does not lose any of the progress achieved while the split process was active. That is, all the clone volume blocks already separated from the parent volume remain separated. If you restart the split operation, splitting process begins from the beginning because no information about previously achieved progress is saved, but previously split blocks are not re-split. This command is only supported for flexible volumes.

Parameters
- `-vserver <vserver name>` - Vserver Name
  This specifies the Vserver that the FlexClone volume exists on.
- `-flexclone <volume name>` - FlexClone Volume
  This specifies the FlexClone volume whose separation from the parent volume will be stopped.

Examples

volume aggregate commands

Manage Infinite Volume aggregate operations

volume aggregate vacate

Move all Infinite Volume constituents from one aggregate to another.

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The `volume aggregate vacate` command moves all constituents belonging to a given Infinite Volume from the source aggregate to the destination aggregate.

The `volume aggregate vacate` command is only supported for Infinite Volumes.

Parameters
- `-vserver <vserver name>` - Vserver Name
  The name of the Vserver that owns the volume.
- `-volume <volume name>` - Volume Name
  The name of the volume.
- `-source-aggregate <aggregate name>` - Source Aggregate
  The source aggregate from which all Infinite Volume constituents are being moved.
- `-destination-aggregate <aggregate name>` - Destination Aggregate
  The destination aggregate to which the Infinite Volume constituents are being moved.
### foreground \ [-w \ (true|[false]) - Foreground Process

This specifies whether the operation runs as a foreground process. If this parameter is not specified, the default setting is false (the operation runs in the background). When set to true, the command will not return until the process completes.

#### Examples

The following example moves all constituents of Infinite Volume repo_vol from aggr1 to aggr2.

```plaintext
cluster1::> volume aggregate vacate -vserver vs0 -volume repo_vol -source-aggregate aggr1 -destination-aggregate aggr2
```

---

### volume file commands

File related commands

#### volume file compact-data

Apply Adaptive Data Compaction to a Snapshot copy of a file

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

The `volume file compact-data` command applies the Adaptive Data Compaction feature to the Snapshot copy of a file such that partially filled blocks from that file will merge and consume less storage space.

**Parameters**

- **-node \ <nodename> - Node**
  
  This parameter indicates the node name that the AWA instance runs on.

- **-vserver \ <vserver name> - Vserver Name**
  
  This specifies the Vserver in which the target file is located.

- **-file \ </vol/<volume name>/<file path>> - File Path**
  
  This specifies the complete file path. The Snapshot copy name can be specified as part of the path or by specifying the `snapshot` parameter.

- **[-volume <volume name>] - Volume Name**
  
  This specifies the volume in which the targeted file is located.

- **[-snapshot <snapshot name>] - Snapshot Copy Name**
  
  This specifies the Snapshot copy name in which the file will be compacted.

#### Examples

The following command applies the Adaptive Data Compaction feature to the Snapshot copy `snap1` of the file `/file1` in volume `vol1`:

```plaintext
cluster1::> volume file compact-data -vserver vs1 -volume vol1 -file /vol/vol1/file1 -snapshot snap1
```
volume file modify

Manage the association of a QoS policy group with a file

Availability: This command is available to cluster administrators at the admin privilege level.

Description
This command adds and removes files from QoS policy groups. QoS policy groups define measurable service level objectives (SLOs) that apply to the storage objects with which the policy group is associated. A QoS policy group associated with this file can be created, modified, and deleted. You cannot associate a file to a QoS policy group if a LUN was created from the file.

This command is not supported on FlexGroups or Infinite Volumes.

Parameters
-vserver <vserver name> - Vserver Managing Volume
This specifies the Vserver on which the volume (containing the file) resides.

-volume <volume name> - Volume Name
This specifies the name of the volume. The name must be unique within the hosting Vserver.

-file <text> - File Path
This specifies the actual path of the file with respect to the volume.

[-qos-policy-group <text>] - QoS Policy Group Name
This option associates the file with a QoS policy group. This policy group manages storage system resources to deliver your desired level of service. If you do not assign a policy to a file, the system will not monitor and control the traffic to it. To remove this file from a QoS policy group, enter the reserved keyword “none”.

[-caching-policy <text>] - Caching Policy Name
This optionally specifies the caching policy to apply to the file. A caching policy defines how the system caches this volume’s data in Flash Cache modules. If a caching policy is not assigned to this file, the system uses the caching policy that is assigned to the containing volume. If a caching policy is not assigned to the containing volume, the system uses the caching policy that is assigned to the containing Vserver. If a caching policy is not assigned to the containing Vserver, the system uses the default cluster-wide policy. The available caching policies are:

• none - Does not cache any user data or metadata blocks.
• auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
• meta - Read caches only metadata blocks.
• random_read - Read caches all metadata and randomly read user data blocks.
• random_read_write - Read caches all metadata, randomly read and randomly written user data blocks.
• all_read - Read caches all metadata, randomly read and sequentially read user data blocks.
• all_read_random_write - Read caches all metadata, randomly read, sequentially read, and randomly written user data.
• all - Read caches all data blocks read and written. It does not do any write caching.

Default caching-policy is auto.
volume file privileged-delete

Perform a privileged-delete operation on unexpired WORM files on a SnapLock enterprise volume

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The `volume file privileged-delete` command is used to perform a privileged-delete operation on unexpired WORM files on a SnapLock enterprise volume. The only built-in role that has access to the command is "vsadmin-snaplock".

Parameters
- `vserver <vserver name>` - Vserver
  Specifies the Vserver which hosts the SnapLock enterprise volume.
- `file </vol/<volume name>/<file path>>` - File Path
  Specifies the absolute path of the file to be deleted. The value begins with /vol/<volumename>.

Examples
The following example deletes the unexpired WORM file "/vol/vol1/wormfile". The file wormfile is stored in volume vol1 under Vserver vserv1.

```bash
vserver1::> volume file privileged-delete -file /vol/vol1/wormfile
```

volume file reservation

Get/Set the space reservation info for the named file.

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The `volume file reservation` command can be used to query the space reservation settings for the named file, or to modify those settings. This command is not supported on FlexGroups or Infinite Volumes. With no further modifiers, the command will report the current setting of the space reservation flag for a file. This tells whether or not space is reserved to fill holes in the file and to overwrite existing portions of the file that are also stored in a snapshot. For symlinks, the link is followed and the command operates on the link target.

Parameters
- `vserver <vserver name>` - Vserver Name
  Specifies the Vserver on which the volume is located. If only one data Vserver exists, you do not need to specify this parameter.
- `path </vol/<volume name>/<file path>>` - File Name
  Specifies the complete file path for which we want to get/set the space reservation settings.
[-is-enabled <text>] - enable | disable

Specifying enable or disable will turn the reservation setting on or off accordingly for the file.

Examples
The following example enables the file reservation setting for the file named file1. The file file1 is stored in volume testvol on Vserver vs0.

```
node::> file reservation -vserver vs0 /vol/testvol/file1 enable
Space reservations for file /vol/testvol/file1: on.
```

**volume file show-disk-usage**

Show disk usage of file

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
This command requires a path to a file in a volume and displays the following information:

- Vserver name
- Total bytes used by the file in kilobytes
- Full Path to the file

If not logged in as Vserver administrator, the command also requires a Vserver name. This command is not supported on an Infinite Volume.

**Note:** The "-instance" option provides the same result as the default as there are no extra fields to display.

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[[-h ]
```

If this parameter is specified, the command displays total bytes used by the file in human readable form.

```
[[-k ]
```

If this parameter is specified, the command displays total bytes used by the file in kilobytes.

```
[[-m ]
```

If this parameter is specified, the command displays total bytes used by the file in megabytes.

```
[[-u ]
```

If this parameter is specified, the command displays the unique bytes used by the file (bytes that are not shared with any other file in the volume due to deduplication or FlexClone files) in kilobytes.

```
[[-uh ]
```

If this parameter is specified, the command displays the unique bytes used by the file in human readable form.

```
[[-uk ]
```

If this parameter is specified, the command displays the unique bytes used by the file in kilobytes.

```
[[-um ]
```

If this parameter is specified, the command displays the unique bytes used by the file in megabytes.
If you specify the \texttt{-instance} parameter, the command displays detailed information about all fields.

\texttt{-vserver <vserver name>} - \texttt{Vserver}

This parameter is used to specify the Vserver that contains the file for which the command displays the total bytes used. It is required if not logged in as Vserver administrator.

\texttt{-path </vol/<volume name>/<file path>>} - \texttt{Full Path}

This required parameter is used to specify the path of the file for which the command displays the total bytes used.

\texttt{[-range | -r <<start offset>:<end offset>>]} - \texttt{Block Range}

If this parameter is specified, the command displays the total bytes used by the file in the specified block range.

### Examples

The following example displays the disk-usage of the file \texttt{file1.txt} in volume \texttt{/vol/root_vs0}.

```
cluster1::> volume file show-disk-usage -vserver vs0 -path /vol/root_vs0/file1.txt

Vserver          Total                  Path
--------         ------                 ----- 
vs0              1408KB                 /vol/root_vs0/file1.txt

cluster1::> volume file show-disk-usage -m -vserver vs0 -path /vol/root_vs0/file1.txt

Vserver          Total                  Path
--------         ------                 ----- 
vs0              1MB                    /vol/root_vs0/file1.txt

vs0::> volume file show-disk-usage -um -path /vol/root_vs0/file1.txt

Vserver       Total             Unique              Path
--------      -----             ------              ------- 
vs0           1MB               1MB                 /vol/root_vs0/file1.txt
```

### volume file show-filehandle

Show the file handle of a file

**Availability:** This command is available to \textit{cluster} and \textit{Vserver} administrators at the \textit{advanced} privilege level.

**Description**

This command requires a path to a file in a volume and displays the file handle information described below:

- Vserver name
- Path to the file
- File handle flags
- Snapshot ID of the file (snapid)
- File ID
- File handle generation number
- File system ID (fsid)
- Master data set ID (msid)
- Data set ID (dsid)

If not logged in as a Vserver administrator, the command also requires a Vserver name.
Parameters

\{[-fields <fieldname>, ...]\}

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

\{[-instance ]\}

If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver Managing Volume

This specifies the Vserver where the file resides.

[-path <text>] - Path to File

This specifies the path to the file.

---

**Examples**

The following example displays the file handle information of a file named file1.txt in the volume /vol/vol1.

```
cluster1::> volume file show-filehandle -vserver vs0 -path /vol/vol1/file1.txt

Vserver | Path
--------|-----------------|
vs0     | /vol/vol1/file1.txt

flags   | snapid | fileid | generation | fsid    | msid  | dsid
------- | ------ | ------ | ---------- | ------- | ------ | -------
0x0     | 0      | 0x60   | 0x206b6    | 0x402   | 0x8000402 | 0x402
```

---

**volume file show-inode**

Display file paths for a given inode

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

This command displays information about all the files having a given inode in a volume of a Vserver. If the -snapshot-id or -snapshot-name parameter is specified, the command displays file information from the Snapshot copy; otherwise, it displays the information from the active file system. The -vserver, -volume and -inode-number are mandatory parameters.

If no optional parameter is specified, the command displays the following fields for all the files having the given inode:

- Vserver Name
- Volume Name
- Inode Number
- File Path

The volume file show-inode command is only supported on flexible volumes and FlexGroup constituents.

**Parameters**

\{[-fields <fieldname>, ...]\}

If you specify the -fields parameter, the command output also includes the specified field or fields.

\{[-snapshot ]\}

If this parameter is specified, the command displays the following information:

- Vserver Name
If this parameter is specified, the command displays detailed information about the files matching the specified inode number. The following information is displayed:

- Vserver Name
- Volume Name
- Inode Number
- File Path
- Snapshot Name
- Snapshot ID
- File Name
- Parent Inode Number
- Parent Directory Cookie

-vserver <vserver name> - Vserver Name
This specifies the Vserver in which the volume or Snapshot copy is located.

-volume <volume name> - Volume Name
This specifies the volume in which the inode number is located.

-inode-number <integer> - Inode Number
This specifies the inode number whose information has to be retrieved.

{ [-snapshot-name <snapshot name>] - Snapshot Name
  If this parameter or -snapshot-id is specified, information about the files is retrieved from the Snapshot copy instead of the active file system.

[-snapshot-id <integer>] - Physical Snapshot ID
  If this parameter or -snapshot-name is specified, information about the files is retrieved from the Snapshot copy instead of the active file system.

[-file-path <text>] - File Path
  If this parameter is specified, the command displays information only about the files that match the specified file path.

[-file-name <text>] - File Name
  If this parameter is specified, the command displays information only about the files that match the specified file name.

[-parent-inode-number <integer>] - Parent Inode Number
  The inode number of the parent directory of the file associated with the inode. If this parameter is specified, the command displays information only about the files that match the specified parent inode number.
[-parent-dir-cookie <integer>] - Parent Directory Cookie

The index of the directory entry of the file in its parent directory tree. If this parameter is specified, the command displays information only about the files that match the specified parent directory cookie.

Examples

The following example displays information about all the files having the inode number 96 in the active file system of a volume named vol1 on a Vserver named vs1:

```
cluster1::> volume file show-inode -vserver vs1 -volume vol1 -inode-number 96
```

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Volume</th>
<th>Inode</th>
<th>File Path</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>
<td>vol1</td>
<td>96</td>
<td>/vol/vol1/file1</td>
</tr>
<tr>
<td>vs1</td>
<td>vol1</td>
<td>96</td>
<td>/vol/vol1/file2</td>
</tr>
<tr>
<td>vs1</td>
<td>vol1</td>
<td>96</td>
<td>/vol/vol1/A/file2</td>
</tr>
</tbody>
</table>

3 entries were displayed.

The following example displays information about all the files with inode number 96 in a Snapshot copy named mysnap. The Snapshot copy is present in a volume named vol1 on a Vserver named vs1:

```
cluster1::> volume file show-inode -vserver vs1 -volume vol1 -inode-number 96 -snapshot-name mysnap -snapshot
```

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Volume</th>
<th>Inode</th>
<th>Snapshot Name</th>
<th>Snapshot ID</th>
<th>File Path</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>
<td>vol1</td>
<td>96</td>
<td>mysnap</td>
<td>131</td>
<td>/vol/vol1/.snapshot/mysnap/file1</td>
</tr>
<tr>
<td>vs1</td>
<td>vol1</td>
<td>96</td>
<td>mysnap</td>
<td>131</td>
<td>/vol/vol1/.snapshot/mysnap/file2</td>
</tr>
</tbody>
</table>

2 entries were displayed.

The following example displays detailed information about all the files with inode number 96 in a Snapshot copy named mysnap. The Snapshot copy is present in a volume named vol1 on a Vserver named vs1:

```
cluster1::> volume file show-inode -vserver vs1 -volume vol1 -inode-number 96 -snapshot-name mysnap -instance
```

Vserver Name: vs1
Volume Name: vol1
Inode number: 96
File Path: /vol/vol1/.snapshot/mysnap/file1
Snapshot Name: mysnap
Physical Snapshot ID: 131
File Name: file1
Parent Inode Number: 64
Parent Directory Cookie: 2

Vserver Name: vs1
Volume Name: vol1
Inode number: 96
File Path: /vol/vol1/.snapshot/mysnap/file2
Snapshot Name: mysnap
Physical Snapshot ID: 131
File Name: file2
Parent Inode Number: 64
Parent Directory Cookie: 3

2 entries were displayed.

volume file clone commands

Manage File Clones

volume file commands
volume file clone autodelete

Enable/Disable autodelete

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The volume file clone autodelete command enables or disables the automatic deletion of a file or LUN clone. Newly created file and LUN clones are disabled for automatic deletion by default. This command is not supported on Infinite volumes.

Parameters
- \(-vserver <vserver name>\) - Vserver Name
  This specifies the Vserver on which the volume resides. If only one data Vserver exists, you do not need to specify this parameter.

- \([-volume <volume name>]\) - Volume Name
  This specifies the name of the volume in which the file or LUN is present.

- \(-clone-path <text>\) - Clone Path
  This specifies the path where clone resides. If you use the volume parameter, then specify the relative path to the file or LUN clone. Otherwise, specify the absolute path.

- \(-enable \{true|false\}\) - Enable or Disable Autodelete
  This parameter enables or disables the autodelete feature for the file or LUN clones in a specified volume if the clones are already added for automatic deletion. If you set the parameter to true, the specified file or LUN clones gets automatically deleted in the 'try' or 'disrupt' mode. If the value is false, the clones get automatically deleted only in the 'destroy' mode.

- \([-force \{true\}]\) - Force Enable or Disable Autodelete
  If \(-enable\) is true then this parameter forces automatic deletion of a specified file or LUN, or a file or LUN clone. If \(-enable\) is false then specifying this parameter disables autodeletion on a file or LUN - or a file or LUN clone - even if \(-commitment destroy\) is specified.

Examples
The following command enables for automatic deletion a LUN Clone named lun_clone contained in a volume named volume1. This volume is present on a Vserver named vs1.

```
cluster1::> volume file clone autodelete /vol/volume1/lun_clone -enable true -vserver vs1
```

The following command specifies the relative clone path when the volume parameter is specified in the command.

```
cluster1::> volume file clone autodelete lun_clone -enable true -vserver vs1 -volume volume1
```

volume file clone create

Create file or LUN full or sub file clone

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The volume file clone create command creates a clone of a file or a LUN. This command is not supported on Infinite Volumes. You can optionally specify the following parameters for the clone file creation process:

- Vserver in which the volume resides
File or LUN clones create a duplicate copy of another file or LUN, but don't require copying the data itself. This allows the clone operation to occur in constant time, taking the same amount of time to complete no matter the size of the file being cloned. This also means that clones require only a small amount of additional storage space because the clone shares the data with the source file or LUN.

Parameters

\[-vserver <vserver name>\] - Vserver Name
This specifies the Vserver in which the parent volume resides. If only one data Vserver exists, you do not need to specify this parameter.

\[-volume <volume name>\] - Volume
This specifies the name of volume in which a file or LUN is going to be cloned.

\[-source-path <text>\] - Source Path
This specifies the path to the file or LUN to be cloned relative to the specified volume.

\[-destination-path <text>\] - Destination Path
This specifies the path for the newly-created cloned file or LUN relative to the specified volume. If the file or LUN clone to be created is a whole file or LUN, the destination file or LUN must not exist. If the range parameter is specified, the destination file or LUN must exist. If the snapshot-name parameter is specified, this option is mandatory.

\[-snapshot-name | -s <snapshot name>\] - Source Snapshot
The name of the Snapshot copy to use as the source for the clone operation. If this value is not specified, the active filesystem will be used instead.

\{ [-range | -r <<source start block>:<destination start block>:<block length>>, ...\] - Block Range
This specifies the block range to be cloned. If the range is not specified, the entire file or LUN is cloned. The block range should be specified in the format s:d:n where s is the source start block number, d is the destination start block number, and n is the length in blocks to be cloned. The range of n should be from 1 to 32768 or 1 to 16777216 in case of clone from Active File System or Snapshot copy respectively. If this parameter is used in the path provided by the destination-path parameter must refer to a file or LUN which already exists. If either the source or destination are a LUN then the block size is measured in 512-byte LBA blocks. If neither the source nor destination are a LUN then the block size will be 4KB. If 512-byte sectors are used the source and destination offsets must have the same offset within 4KB blocks.
This option is most likely to be used by external automated systems in managing virtual disk configurations and not by human administrators.

\[-no-reserve | -o [true]]\] - Do not reserve clone
If this option is used, the clone file or LUN will not be guaranteed space in the underlying aggregate. While this out-of-space condition persists, writes to the clone file or LUN would fail. This option may be useful if few writes to the clone are expected to be needed, or to allow a file or LUN clone to be created under space-constrained conditions for recovery purposes. If this option is not specified the clone will inherit the space reservation properties from the source.
[-ignore-streams | -i [true]] - Ignore streams

This parameter specifies whether streams should be ignored during cloning of files or LUNs. If you set this parameter to false, the streams are ignored; otherwise, they are included in the clones. The default value is false.

[-ignore-locks | -k [true]] - Ignore locks

This parameter specifies whether byte-range locks and shared-mode locks on files or LUNs should be ignored during cloning. If you set this parameter to true, the locks are ignored; otherwise, clone operation fails if locks are present on files or LUNs. The default value is false.

[-overwrite-destination | -d [true]] - Overwrite Destination

Specify this parameter to overwrite the destination file, if it exists. The default is to fail the command if the destination exists.

[-qos-policy-group <text>] - QoS Policy Group Name

This optionally specifies which QoS policy group to apply to the file or LUN. This policy group defines measurable service level objectives (SLOs) that apply to the storage objects with which the policy group is associated. If you do not assign a policy group to a file or LUN, the system will not monitor and control the traffic to it. You cannot associate a file to a QoS policy group if a LUN was created from the file.

[-caching-policy <text>] - Caching Policy Name

This optionally specifies the caching policy to apply to the file. A caching policy defines how the system caches this volume’s data in Flash Cache modules. If a caching policy is not assigned to this file, the system uses the caching policy that is assigned to the containing volume. If a caching policy is not assigned to the containing volume, the system uses the caching policy that is assigned to the containing Vserver. If a caching policy is not assigned to the containing Vserver, the system uses the default cluster-wide policy. The available caching policies are:

- none - Does not cache any user data or metadata blocks.
- auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
- meta - Read caches only metadata blocks.
- random_read - Read caches all metadata and randomly read user data blocks.
- random_read_write - Read caches all metadata, randomly read and randomly written user data blocks.
- all_read - Read caches all metadata, randomly read and sequentially read user data blocks.
- all_read_random_write - Read caches all metadata, randomly read, sequentially read, and randomly written user data.
- all - Read caches all data blocks read and written. It does not do any write caching.

Default caching-policy is auto.

[-autodelete {true|false}] - Mark Clone for Autodeletion

This parameter marks the file or LUN clones created for auto deletion. When set to true, the file or LUN clones get automatically deleted when the volume runs out of space. The default value is false.

[-bypass-throttle {true|false}] - Bypass Throttle Checks (privilege: advanced)

This parameter specifies whether clone throttle checks should be skipped during clone creation. When set to true, clones are created without enforcing any clone throttle checks. The default value is false.

[-is-backup {true|false}] - Clones for Backup

This parameter is used to create backups, where divergence is expected on the source file, and no divergence is expected on the destination file. It is applicable only for full-file clones creates from Active File System volumes. The default value is false.
Examples
The following command creates a FlexClone file of the file named `myfile` contained in a volume named `vol`. The file `myfile` is located in the root directory of that volume. The cloned file `myfile_copy` resides in the root directory same volume.

```
cluster1::> volume file clone create -volume vol -source-path /myfile -destination-path /myfile_copy
```

The following command optionally associates the FlexClone file named `myfile_copy` with the `fast` QoS policy group and the caching policy named random-read.

```
cluster1::> volume file clone create -volume vol -source-path /myfile -destination-path /myfile_copy -qos-policy-group fast -caching-policy random-read
```

volume file clone show-autodelete

Show the autodelete status for a file or LUN clone

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `volume file clone show-autodelete` command displays the autodelete details of a file or LUN clone. The command displays the following information about a file or LUN clone:

- Vserver Name
- Clone Path
- Whether auto deletion of file or LUN clone is enabled

**Parameters**

```
{ [-fields <fieldname>,...] }  
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[[-instance ]]  
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
-vserver <vserver name> - Vserver Name
```

This specifies the Vserver to which the file or LUN clone belongs.

```
-clone-path <text> - Clone Path
```

This specifies the path of the file or LUN clone.

```
[-autodelete-enabled {true|false}] - Autodelete Enabled
```

If this parameter is true, the file or LUN clone gets automatically deleted in the 'try' or 'disrupt' mode. If the value is false, the clones get automatically deleted only in the 'destroy' mode.

**Examples**
The following example displays the autodelete information about a file or LUN clone.
volume file clone deletion commands

The deletion directory

volume file clone deletion add-extension

Add new supported file extensions to be deleted with clone delete

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The volume file clone deletion add-extension command can be used to add new supported file extensions for clone delete. This command is not supported on Infinite Volumes.

Parameters
-\texttt{-vserver <vserver name>} - Vserver Name
  Name of the vserver.
-\texttt{-volume <volume name>} - Volume Name
  Name of the volume.
-\texttt{-extensions <text>} - Supported Extensions for Clone Delete
  List of supported file extensions for clone delete.

Examples
The following example adds the new supported vmdk, vhd file extensions to volume \texttt{vol1} of vserver \texttt{vs1}.

\begin{verbatim}
cluster1::> volume file clone deletion add-extension -vserver vs1 -volume vol1 -extensions vmdk,vhd
\end{verbatim}

volume file clone deletion modify

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The volume file clone deletion modify command can be used to change the required minimum clone file size of a volume for clone delete. This is not applicable on Infinite volumes.

Parameters
-\texttt{-vserver <vserver name>} - Vserver Name
  Name of the vserver.
-\texttt{-volume <volume name>} - Volume Name
  Name of the volume.
-\texttt{[-minimum-size \{<integer>[KB|MB|GB|TB|PB]\}] - Minimum Size Required for Clone delete}
  Minimum clone file size required for clone delete.
Examples
The following example changes the required minimum file size to 100M for volume vol1 of vserver vs1.

```
cluster1:/> volume file clone deletion modify -volume vol1 -vserver vs1 -minimum-size 100M
```

**volume file clone deletion remove-extension**

Remove unsupported file extensions for clone delete

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The *volume file clone deletion remove-extension* command can be used to remove the existing file extensions that are no longer supported for clone delete. This command is not supported on Infinite Volumes.

**Parameters**
- `-vserver <vserver name>` - Vserver Name
  Name of the vserver.
- `-volume <volume name>` - Volume Name
  Name of the volume.
- `[-extensions <text>]` - Unsupported Extensions for Clone Delete
  List of unsupported file extensions for clone delete.

Examples
The following example removes the existing unsupported *vmdk*, *vhd* file extensions to volume *vol1* of vserver *vs1*.

```
cluster1:/> volume file clone deletion remove-extension -vserver vs1 -volume vol1 -extensions vmdk,vhd
```

**volume file clone deletion show**

Show the supported file extensions for clone delete

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The *volume file clone deletion show* command displays the following information for clone delete:

- Vserver Name
- Volume Name
- Minimum File Size Required for Clone Delete
- List of Supported File Extensions for Clone Delete

**Parameters**
`{ [-fields <fieldname>, ...] }

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.
If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-vserver <vserver name>]` - Vserver Name
Name of the vserver.

`[-volume <volume name>]` - Volume Name
Name of the volume.

`[-extensions <text>,...]` - Supported Extensions for Clone Delete
List of supported file extensions for Clone Delete.

`[-minimum-size <integer>[KB|MB|GB|TB|PB]]` - Minimum Size Required for Clone delete
Minimum file size required for Clone Delete.

### Examples

The following example displays the clone deletion information for all volumes of all vservers.

```
cluster1::> volume file clone deletion show
  Vserver            Volume                Minimum    Extensions
  -----------------   -------------------   -------    ----------------------
  vs0                 testvol                100B      vmdk, vhd, vhdx, vswp
  vs0_root                  0B      -
  vs1                 testvol                100G      vmdk, vhd, vhdx, vswp
  vs1_root                  0B      -
```

The following example displays the clone deletion information for volume `vol1` of vserver `vs1`.

```
cluster1::> volume file clone deletion show -vserver vs0 -volume testvol
  Vserver Name: vs0
  Volume Name: testvol
  Supported Extensions for Clone Delete: vmdk, vhd, vhdx, vswp
  Minimum Size Required for Clone delete: 100B
```

### volume file clone split commands

Manage file clone split operations

### volume file clone split load commands

Manage load due to file clone split operations

### volume file clone split load modify

Modify maximum split load on a node

**Availability:** This command is available to cluster and Vserver administrators at the `advanced` privilege level.

**Description**

The `volume file clone split load modify` command can be used to change the maximum split load (file or LUN clones) of a node.

**Parameters**

`-node {<nodename>|local} - Node Name`

Node name on which the new maximum split load is being applied.
[-max-split-load \{<integer>\[KB|MB|GB|TB|PB]\}] - Maximum Clone Split Load

This specifies the new maximum split load of a node. This is the amount of clone create load, the node can take at any point of time. If it crosses this limit, then the clone create requests will not be allowed, till the split load is less than maximum split load

Examples

The following example changes the new maximum limit to 10TB on node1.

```
cluster1::*> volume file clone split load*> modify -node clone-01 -max-split-load 100KB
```

volume file clone split load show

Show split load on a node

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The `volume file clone split load show` command displays the corresponding file or LUN clone split loads on nodes. If no parameters are specified, the command displays the following information:

- Node
- Max Split Load
- Current Split Load
- Token Reserved Load
- Allowable Split Load

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

| [-instance] |

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node \{<nodename>|local\}] - Node Name

Node on which the file or LUN Clone split load is displayed.

[-max-split-load \{<integer>\[KB|MB|GB|TB|PB]\}] - Maximum Clone Split Load

This specifies the maximum allowable split load on the node.

[-current-split-load \{<integer>\[KB|MB|GB|TB|PB]\}] - Current Clone Split Load

This specifies the current on going split load on the node.

[-token-reserved-load \{<integer>\[KB|MB|GB|TB|PB]\}] - Load Reserved for Clone Creation

This specifies the reserved split load of the node using the tokens.

[-allowable-split-load \{<integer>\[KB|MB|GB|TB|PB]\}] - Allowable Clone Split Load

This specifies the available split load of the node.

Examples

The following example displays the current and allowable file or LUN clone split load on a node.
volume file fingerprint commands

File fingerprint related commands

volume file fingerprint abort

Abort a file fingerprint operation

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The volume file fingerprint abort command aborts an in-progress fingerprint operation. This command only aborts the fingerprint operations that have not yet completed. This command takes session-id as input and aborts the fingerprint operation that is associated with that particular session-id.

Parameters

- **-session-id <integer>** - Session ID of Fingerprint Operation

  Specifies the session-id of the fingerprint operation that needs to be aborted. It is an unique identifier for the fingerprint operation. This session-id is returned when the fingerprint operation is started on a file.

Examples

The following example aborts the fingerprint operation identified by 17039361:

```
cluster1::> volume file fingerprint abort -session-id 17039361
```

volume file fingerprint dump

Display fingerprint of a file

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The volume file fingerprint dump command displays the following information given the -session-id of the fingerprint operation:

- Vserver:
  - The Vserver on which the file exists.
- Session-ID:
A unique identifier for the fingerprint operation. This session-id is returned when the fingerprint operation is started on a file. The session-id of the fingerprint operation can be used to get the progress of an ongoing fingerprint operation as well as the complete fingerprint output for the file once the operation is completed.

- **Volume:**
  The name of the volume on which the file resides.

- **Path:**
  The absolute path of the file on which the fingerprint is calculated. The value begins with `/vol/<volumename>`.

- **Data Fingerprint:**
  The digest value of data of the file. The fingerprint is base64 encoded. This field is not included if the scope is `metadata-only`.

- **Metadata Fingerprint:**
  The digest value of metadata of the file. The metadata fingerprint is calculated for file size, file ctime, file mtime, file crtime, file retention time, file uid, file gid, and file type. The fingerprint is base64 encoded. This field is not included if the scope is `data-only`.

- **Fingerprint Algorithm:**
  The digest algorithm which is used for the fingerprint computation. Fingerprint is computed using `md5` or `sha-256` digest algorithm.

- **Fingerprint Scope:**
  The scope of the file which is used for the fingerprint computation. Fingerprint is computed over `data-only`, `metadata-only`, or `data-and-metadata`.

- **Fingerprint Start Time:**
  The start time of the fingerprint computation in seconds since 1 January 1970 00:00:00 in GMT timezone.

- **Formatted Fingerprint Start Time:**
  The start time of the fingerprint computation in a human-readable format `<day> <month> <day of month> <hour>:<min>:<sec><year>` in GMT timezone.

- **Fingerprint Version:**
  The version of the fingerprint output format.

- **SnapLock License:**
  The status of the SnapLock license.

- **Vserver UUID:**
  A universal unique identifier for the Vserver on which the file exists.

- **Volume MSID:**
  The mirror set identifier of the volume where the file resides.

- **Volume DSID:**
  The data set identifier of the volume where the file resides.

- **Hostname:**
  The name of the storage system where the fingerprint operation is performed.

- **Filer ID:**
  The NVRAM identifier of the storage system.

- **Volume Containing Aggregate:**
  The name of the aggregate in which the volume resides.

- **Aggregate ID:**
  A universal unique identifier for the aggregate on which the volume resides.
A universal unique identifier for the aggregate containing the volume.

- **SnapLock System ComplianceClock:**
  The System ComplianceClock time in seconds since 1 January 1970 00:00:00 in GMT timezone if it is initialized.

- **Formatted SnapLock System ComplianceClock:**
  The System ComplianceClock time in a human-readable format <day> <month> <day of month> <hour>:<min>:<sec><year> in GMT timezone if it is initialized.

- **Volume SnapLock Type:**
  The type of the SnapLock volume. This value is only given for SnapLock volumes. Possible values are *compliance* and *enterprise*.

- **Volume ComplianceClock:**
  The volume ComplianceClock time in seconds since 1 January 1970 00:00:00 in GMT timezone. This has a value only for SnapLock volumes.

- **Formatted Volume ComplianceClock:**
  The volume ComplianceClock time in a human-readable format <day> <month> <day of month> <hour>:<min>:<sec><year> in GMT timezone. This has a value only for SnapLock volumes.

- **Volume Expiry Date:**
  The expiry date of the SnapLock volume in seconds since 1 January 1970 00:00:00 in GMT timezone. The volume expiry date can be in wraparound format.

- **Is Volume Expiry Date Wraparound:**
  The value is `true` if the volume expiry date is in wraparound format. The wraparound format indicates that dates after 19 January 2038 are mapped from 1 January 1970 through 31 December 2002 to 19 January 2038 through 19 January 2071.

- **Formatted Volume Expiry Date:**
  The expiry date of the SnapLock volume in a human-readable format <day> <month> <day of month> <hour>:<min>:<sec><year> in GMT timezone. The volume expiry date can be in wraparound format.

- **Filesystem ID:**
  The filesystem identifier of the volume on which the file resides.

- **File ID:**
  A unique number within the filesystem identifying the file.

- **File Type:**
  The type of the file. Possible values include: *worm*, *worm_appendable*, *worm_active_log*, *worm_log*, and *regular*.

- **File Size:**
  The size of the file in bytes.

- **Creation Time:**
  The creation time of the file in seconds since 1 January 1970 00:00:00 in GMT timezone.

- **Formatted Creation Time:**
  The creation time of the file in a human-readable format <day> <month> <day of month> <hour>:<min>:<sec><year> in GMT timezone.

- **Modification Time:**
  The last modification time of the file in seconds since 1 January 1970 00:00:00 in GMT timezone.

- **Formatted Modification Time:**
  The last modification time of the file in a human-readable format <day> <month> <day of month> <hour>:<min>:<sec><year> in GMT timezone.
• Changed Time:
The last changed time of the file attributes in seconds since 1 January 1970 00:00:00 in GMT timezone. Time is taken from the system clock for regular files and from the volume ComplianceClock for WORM files when they are committed. The changed time can be in wraparound format.

• Is Changed Time Wraparound:
The value is true if the last changed time of the file attributes is in wraparound format. The wraparound format indicates that dates after 19 January 2038 are mapped from 1 January 1970 through 31 December 2002 to 19 January 2038 through 19 January 2071.

• Formatted Changed Time:
The last changed time of the file attributes in a human-readable format <day> <month> <day of month> <hour>:<min>:<sec><year> in GMT timezone. The changed time can be in wraparound format.

• Retention Time:
The retention time of the files committed to WORM on SnapLock volumes in seconds since 1 January 1970 00:00:00 in GMT timezone. The retention time can be in wraparound format.

• Is Retention Time Wraparound:
The value is true if the retention time of the file is in wraparound format. The wraparound format indicates that dates after 19 January 2038 are mapped from 1 January 1970 through 31 December 2002 to 19 January 2038 through 19 January 2071.

• Formatted Retention Time:
The retention time of the files committed to WORM on SnapLock volumes in a human-readable format <day> <month> <day of month> <hour>:<min>:<sec><year> in GMT timezone. The retention time can be in wraparound format.

• Access Time:
The last access time of the regular files on SnapLock volumes and files on non-SnapLock volumes attributes in seconds since 1 January 1970 00:00:00 in GMT timezone.

• Formatted Access Time:
The last access time of the regular files on SnapLock volumes and files on non-SnapLock volumes attributes in a human-readable format <day> <month> <day of month> <hour>:<min>:<sec><year> in GMT timezone.

• Owner ID:
The integer identifier of the owner of the file.

• Group ID:
The integer identifier of the group owning the file.

• Owner SID:
The security identifier of the owner of the file when it has NTFS security style.

• Fingerprint End Time:
The end time of the fingerprint computation in seconds since 1 January 1970 00:00:00 in GMT timezone.

• Formatted Fingerprint End Time:
The end time of the fingerprint computation in a human-readable format <day> <month> <day of month> <hour>:<min>:<sec><year> in GMT timezone.

Parameters

{ [-fields <fieldname>, ...] }  
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[ [-instance ]]  
If you specify the -instance parameter, the command displays detailed information about all fields.
### -session-id <integer> - Session ID of Fingerprint Operation

Specifies the session-id of the fingerprint operation whose output is to be displayed. It is a unique identifier for the fingerprint operation. This session-id is returned when the fingerprint operation is started on a file.

#### Examples

The following example displays the fingerprint information of the fingerprint session identified by session-id 17039367:

```bash
cluster1::> volume file fingerprint dump -session-id 17039367
Vserver: vs1
Session-ID: 17039367
Volume: nfs_slc
Path: /vol/nfs_slc/worm
  Data Fingerprint: MOFJVevxNSJm3C/4Bn5oEYXH51CrudOzZKY4r5Cfyq=
  Metadata Fingerprint: 8iMjqJXiNcqgXT5XuRhLiEwIrJEihdMwSOhrexnjgmc=
  Fingerprint Algorithm: SHA256
  Fingerprint Scope: data-and-metadata
  Fingerprint Start Time: 1460612586
      Formatted Fingerprint Start Time: Thu Apr 14 05:43:06 GMT 2016
  Fingerprint Version: 3
  SnapLock License: available

```

---

**volume file fingerprint show**

Display fingerprint operation status.

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**

The `volume file fingerprint show` command returns information for one or several fingerprint operations. This command requires either `-session-id` or `-vserver` and `-volume`.
Parameters

{[-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[[-instance]]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-session-id <integer>] - Session ID of Fingerprint Operation

If this parameter is specified, the command returns the progress of the fingerprint operation of the specified session-id. The session-id is a unique identifier for the fingerprint operation that is returned when the fingerprint operation is started on a file.

[-vserver <vserver name>] - Vserver

If this parameter is specified, -volume must also be specified. When queried with -vserver and -volume, the command returns the progress of all the fingerprint operations running on that particular volume.

[-volume <volume name>] - Volume Name

If this parameter is specified, -vserver must also be specified. When queried with -vserver and -volume, the command returns the progress of all the fingerprint operations running on that particular volume.

[-file </vol/<volume name>/<file path>>] - File Path

If this parameter is specified, the command returns the progress of all fingerprint operations on the specified file.

[-operation-status {Unknown|In-Progress|Failed|Aborting|Completed}] - Operation Status

If this parameter is specified, the command returns the progress of all fingerprint operations with matching status value.

[-progress-percentage <integer>] - Progress Percentage

If this parameter is specified, the command returns the progress of all fingerprint operations with matching progress percentage value.

Examples

The following example displays the progress of all the fingerprint operations running on volume nfs_slc:

```
cluster1::> volume file fingerprint show -vserver vs0 -volume nfs_slc

<table>
<thead>
<tr>
<th>File-Path</th>
<th>Session-ID</th>
<th>Status</th>
<th>Progress</th>
</tr>
</thead>
<tbody>
<tr>
<td>/vol/nfs_slc/worm</td>
<td>17104897</td>
<td>Completed</td>
<td>100</td>
</tr>
<tr>
<td>/vol/nfs_slc/worm_appended</td>
<td>17104898</td>
<td>Completed</td>
<td>100</td>
</tr>
<tr>
<td>/vol/nfs_slc/regular</td>
<td>17104899</td>
<td>In-Progress</td>
<td>30</td>
</tr>
</tbody>
</table>

3 entries were displayed.
```

volume file fingerprint start

Start a file fingerprint computation on a file

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The volume file fingerprint start command starts the fingerprint computation on a file. The fingerprint computation is started on the file, and a session-id is returned. This session-id is an unique identifier for the fingerprint operation and can be used to get the progress of an ongoing fingerprint operation as well as the complete fingerprint output for the file once the operation is completed.
Parameters

-vserver <vserver name> - Vserver
  Specifies the name of the Vserver which owns the volume on which the file resides.

-file /vol/<volume name>/<file path> - Path
  Specifies the absolute path of the file on which fingerprint needs to be calculated. The value begins with /vol/ <volumename>.

[ -algorithm {MD5|SHA256} ] - Fingerprint Algorithm
  Specifies the digest algorithm which is used for the fingerprint computation.
  Fingerprint can be computed using one of the following digest algorithms:
  • md5
  • sha-256

[ -scope {data-and-metadata|data-only|metadata-only} ] - Fingerprint Scope
  Specifies the scope of the file which is used for the fingerprint computation.
  Fingerprint can be computed using one of the following scope:
  • data-only
  • metadata-only
  • data-and-metadata

Examples

The following example starts computing fingerprint over data and metadata for file /vol/nfs_slc/worm using md5 hash algorithm. The file /vol/nfs_slc/worm is stored in volume nfs_slc on Vserver vs0.

cluster1::> volume file fingerprint start -vserver vs0 -scope data-and-metadata -algorithm md5 -file /vol/nfs_slc/worm
File fingerprint operation is queued. Run "volume file fingerprint show -session-id 16973825" to view the fingerprint session status.

volume file retention commands

WORM file retention-related commands

volume file retention show

Display retention time of a WORM file.

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The volume file retention show command displays the retention time of a WORM file given -vserver and -file.

Parameters

[-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance]
  If you specify the -instance parameter, the command displays detailed information about all fields.
[-vserver <vserver name>] - Vserver Name
   Specifies the name of the Vserver which has the file.

[-file </vol/<volume name>/<file path>>] - File path
   Specifies the absolute path of the file. The value begins with /vol/<volumename>.

[-retention-time <integer>] - Retention Time of the File
   If this parameter is specified, the command returns the retention time of the WORM file if its retention time in
   seconds since 1 January 1970 00:00:00 matches the specified value.

[-formatted-retention-time <text>] - Formatted Retention Period
   If this parameter is specified, the command returns the retention time of the WORM file if its expiry date
   matches the specified value. The expiry date format is <day> <month> <day of month>
   <hour>:<min>:<sec><year> in GMT timezone taking care of wraparound. A value of infinite indicates
   that this file has infinite retention time.

[-is-wraparound {true|false}] - Is Retention Time Wraparound
   If this parameter is specified, the command returns the retention time of the WORM file if it has a matching –
   is-wraparound value. The value is true if the date represented in retention time is in wraparound format.
   The wraparound format indicates that dates after 19 January 2038 are mapped from 1 January 1970 through 31
   December 2002 to 19 January 2038 through 19 January 2071.

Examples
The following example displays the retention time of the file /vol/nfs_sle/f12:

```
cluster1:/> volume file retention show -vserver vs0 -file /vol/nfs_sle/f12
    Vserver : vs0
    Path : /vol/nfs_sle/f12
    Retention Time (Secs from Epoch) : 1439111404
    Formatted Retention Time : Sun Aug  9 09:10:04 GMT 2015
    Is Retention Time Wraparound : false
```

volume inode-upgrade commands
Manage volume inode upgrade

volume inode-upgrade prepare-to-downgrade
Prepare volume to downgrade to a release earlier than Data ONTAP 9.0.0

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The volume inode-upgrade prepare-to-downgrade command prepares volumes to downgrade to a release earlier than
Data ONTAP 9.0.0. It is used when there are still volumes in the middle of the inode upgrade process when revert is issued.

Parameters
-node {<nodename>|local} - Node Name
   This specifies the node on which the command will run. Default is the local node.

Examples
The following example prepares volumes to revert to an earlier release.
volume inode-upgrade resume

Resume suspended inode upgrade

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The `volume inode-upgrade resume` command resumes suspended inode upgrade process. The inode upgrade process may be suspended earlier due to performance reasons.

Parameters
- `-vserver <vserver name>` - VServer Name
  This specifies the Vserver on which the volume is located.
- `-volume <volume name>` - Volume Name
  This specifies the volume for which the inode upgrade process is to be resumed.

Examples
The following example resumes a volume upgrade process.

```
cluster1::> volume inode-upgrade resume -vserver vs0 -volume vol1
```

volume inode-upgrade show

Display Inode Upgrade Progress

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The `volume inode-upgrade show` command displays information about volumes in the middle of the inode upgrade process. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays the default fields about all volumes in the middle of the inode upgrade process. Default fields are vserver, volume, aggregate, status, scan-percent, remaining-time, space-needed, and scanner-progress.

Parameters
```
{{-fields <fieldname>,...}
| [-instance ]
| [-vserver <vserver name>] - Vserver
  If this parameter and the -volume parameter are specified, the command displays detailed information about the specified volume. If this parameter is specified by itself, the command displays information about volumes on the specified Vserver.
| [-volume <volume name>] - Volume
  If this parameter and the -vserver parameter are specified, the command displays detailed information about the specified volume. If this parameter is specified by itself, the command displays information about all volumes that match the specified name.
```
[-node <nodename>] - Node Name
If this parameter is specified, the command displays information only about the volume or volumes that are
located on the specified storage system.

[-vol-dsid <integer>] - Volume DSID
If this parameter is specified, the command displays information only about the volume or volumes that match
the specified data set ID.

[-vol-uuid <UUID>] - Volume UUID
If this parameter is specified, the command displays information only about the volume or volumes that match
the specified UUID.

[-volume-msid <integer>] - Volume MSID
If this parameter is specified, the command displays information only about the volume or volumes that match
the specified master data set ID.

[-vserver-uuid <UUID>] - Vserver UUID
If this parameter is specified, the command displays information only about the volume on the Vserver that
has the specified UUID.

[-aggregate <aggregate name>] - Aggregate Name
If this parameter is specified, the command displays information only about the volume or volumes that are
located on the specified storage aggregate.

[-aggregate-uuid <UUID>] - Aggregate UUID
If this parameter is specified, the command displays information only about the volume or volumes that are
located on the storage aggregate with the specified UUID.

[-status {pending|scanning|suspended-initializing|suspended|cleanup-pending|cleanup|cleanup-
done|suspended-aborting|suspended-removing|suspended-while-removing|suspended-ironing}] -
Upgrade Status
If this parameter is specified, the command displays information only about the volume or volumes that match
the specified inode upgrade status.

[-scan-percent <percent>] - Upgrade Scan Percent Complete
If this parameter is specified, the command displays information only about the volume or volumes that match
the specified inode upgrade progress percentage.

[-space-needed {<integer>{KB|MB|GB|TB|PB}}] - Space Needed to Complete Upgrade
If this parameter is specified, the command displays information only about the volume or volumes where the
space needed to complete the upgrade process match the specified size.

[-remaining-time [{<integer>h}|{<integer>m}|{<integer>s}>]} - Remaining Upgrade Time
If this parameter is specified, the command displays information only about the volume or volumes where the
remaining time to complete the inode upgrade process match the specified time.

[-scanner-progress <text>] - Scanner Progress
If this parameter is specified, the command displays information only about the volume or volumes where the
progress of the inode upgrade process match the input.

Examples
The following example displays information about all volumes in the middle of the inode upgrade process on the Vserver
named vs0:

volume inode-upgrade commands
Volume Move commands

Manage volume move operations

The volume move commands enable you to manage operations regarding moving a volume from one storage aggregate to another storage aggregate.

volume move abort

Stop a running volume move operation

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The "volume move abort" command sends an abort message to the volume move operation and returns immediately. The volume move operation might not abort immediately depending on the stage it is in. For example, if the volume move operation is in a cut-over or clean-up phase, the abort is ignored. You invoke the "volume move show" command to view the list of running volume move operations and monitor the progress of the abort operation. This command has the same behavior as the job stop -id <job-id> command where the job-id is the identifier of the volume move job.

Parameters

-vserver <vserver name> - Vserver Name
This specifies the Vserver on which the volume is located.

-volume <volume name> - Volume Name
This specifies the name of the volume being moved.

Examples

The following example aborts running volume move operation on volume vol1

```
cluster1::> volume move show
Vserver Volume State Move Phase Percent-Complete Time-To-Complete
--------- -------- -------------- -------------- --------------------------
vs0 vs0.voll alert cutover_hard_deferred 0% -
vs0 vs0.vol2 failed failed - -
2 entries were displayed.
```

```
cluster1::> volume move abort -vserver vs0 -volume voll
```

```
cluster1::> volume move show -vserver vs0 -volume voll 
vs0 voll "Volume move job stopped."
```

 job stop on page 133

**volume move modify**

Modify parameters for a running volume move operation

**Availability:** This command is available to cluster administrators at the *advanced* privilege level.

**Description**

The `volume move modify` command modifies the parameters used by the volume move operation in progress. These modified values can be verified by invoking the `volume move show` command. The volume move operation will use the modified cutover parameters in its next cutover attempt. Note that the modifications to the job are not applied if the move is in the "finishing" state.

**Parameters**

- `-vserver <vserver name>` - Vserver Name
  
  This specifies the Vserver on which the volume is located.

- `-volume <volume name>` - Volume Name
  
  This specifies the name of the volume being moved.

- `[-cutover-action {abort_on_failure|defer_on_failure|force|wait|retry_on_failure}]` - Specified Action For Cutover
  
  Specifies the action to be taken for cutover. If the effective cluster version is Data ONTAP 8.3 and later, the default is `retry_on_failure`; otherwise the default is `defer_on_failure`. If the `abort_on_failure` action is specified, the job will try to cutover until cutover attempts are exhausted. If it fails to cutover, it will cleanup and end the operation. If the `defer_on_failure` action is specified, the job will try to cutover until the cutover attempts are exhausted. If it fails to cutover, it will move into the "cutover_hard_deferred" state. The volume move job waits for a `volume move trigger-cutover` command to restart the cutover process. If the `force` action is specified, the job will try to cutover until the cutover attempts are exhausted and force the cutover at the expense of disrupting the clients. If the `wait` action is specified, when the job hits the decision point, it will not go into cutover automatically, instead it will wait for a `volume move trigger-cutover` command as the signal to try the cutover.

- `[-cutover-window <integer>]` - Specified Cutover Time Window
  
  This specifies the time interval in seconds to completely cutover operations from the original volume to the moved volume. The default value is 30 seconds. The range for valid input is from 30 to 300 seconds, inclusive.
Examples

The following example modifies the parameters for volume move operation on volume vol2.

```
cluster1::*> volume move show -vserver vs0 -volume vol2

volume move show

Show status of a volume moving from one aggregate to another aggregate

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The volume move show command displays information about volume moves in the cluster. By default, with no parameters, it only shows volume moves that have failed or are currently running. The command display output depends on the parameters passed. If -vserver and -volume are specified, the following information is displayed:

- Vserver Name: The Vserver on which the volume is located.
- Volume Name: The volume that is part of a completed or running volume move operation.
- Actual Completion Time: The date and time in the cluster time zone when the volume move completed.
- Bytes Remaining: The number of bytes remaining to be sent during volume move. This is an approximate number and lags the current status by a few minutes while the volume move is in operation.
- Specified Action for Cutover: The action to be taken for cutover or during cutover failure. This is the input given during the start of volume move or the value specified during a volume move modification.
- Specified Cutover Time Window: The time window in seconds given as an input for the cutover phase of volume move. This is the input given during the start of volume move or the value specified during a volume move modification.
- Job ID: The Job-ID of move job.
- Destination Node: The name of the node where the destination aggregate is present.
- Source Node: The name of the node where the source aggregate is present.
- Prior Issues Encountered: The latest issues or transient errors encountered causing the move operation to retry the data copy phase or the cutover phase.
• Move Initiated by Auto Balance Aggregate: The value "true" indicates the move is initiated by Auto Balance Aggregate feature.

• Destination Aggregate: The name of the aggregate to which the volume is moved.

• Detailed Status: The detail about any warnings, errors, and state of the move operation.

• Estimated Time of Completion: The approximate date and time in the cluster time zone when the entire volume move operation is expected to complete. Note that this time may keep increasing when the move goes into cutover-deferred mode. In those cases where the input for cutover-action is wait, during the data copy phase, the estimated time of completion will approximate the time to reach the cutover point and wait for user intervention.

• Managing Node: The node in the cluster on which the move job is or was running. This is usually on the node hosting the volume to be moved.

• Percentage Complete: The amount of work to move the volume completed thus far in terms of percentage.

• Move Phase: The phase of the move operation.

• Estimated Remaining Duration: The approximate amount of time in terms of days, hours, minutes and seconds remaining to complete the volume move.

• Replication Throughput: The current replication throughput of the move operation in terms of Kb/s, Mb/s or Gb/s.

• Duration of Move: The duration in days, hours and minutes for which the volume move was or is in progress.

• Source Aggregate: The name of the aggregate where the volume being moved originally resides or resided.

• Start Time of Move: The date and time in the cluster time zone when the volume move operation started.

• Move State: The state of the volume move at the time of issuing the command and the system gathering up the information about the move.

• Original Job ID: The job-id assigned when the job was first created. This value will only be populated when the original job-id differs from the current job-id.

Parameters

\{ [-fields <fieldname>, ...]  
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance ]  
If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver Name

This specifies the Vserver on which the volume is located. If this parameter and the -volume parameter are specified, the command displays detailed information about latest move performed on the specified volume. If this parameter is specified by itself, the command displays information about latest moves performed on volumes of the specified Vserver.

[-volume <volume name>] - Volume Name

This specifies the volume that is part of a completed or running volume move operation. If this parameter and the -vserver parameter are specified, the command displays detailed information about latest move performed on the specified volume. If this parameter is specified by itself, the command displays information about the latest move on all volumes matching the specified name.

[-actual-completion-time <Date>] - Actual Completion Time

If this parameter is specified, the command displays move operations that match the specified date and time in the cluster time zone when the volume move completed.
[-bytes-remaining {<integer> [KB|MB|GB|TB|PB]}] - Bytes Remaining
If this parameter is specified, the command displays move operations that match the specified number of bytes remaining to be sent during volume move.

[-cutover-action {abort_on_failure|defer_on_failure|force|wait|retry_on_failure}] - Specified Action For Cutover (privilege: advanced)
If this parameter is specified, the command displays move operations that match the specified action to be taken for cutover or during cutover failure.

[-cutover-window <integer>] - Specified Cutover Time Window (privilege: advanced)
If this parameter is specified, the command displays move operations that match the specified time window in seconds for the cutover phase of volume move.

[-destination-aggregate <aggregate name>] - Destination Aggregate
If this parameter is specified, the command displays move operations that match the specified name of the aggregate to which the volume is being moved.

[-destination-node <nodename>] - Destination Node (privilege: advanced)
If this parameter is specified, the command displays move operations that match the specified name of the node where the destination aggregate is present.

[-details <text>] - Detailed Status
If this parameter is specified, the command displays move operations that match the specified detail about any warnings, errors and state of the move operation.

[-estimated-completion-time <Date>] - Estimated Time of Completion
If this parameter is specified, the command displays move operations that match the specified date and time in the cluster time zone when the entire volume move operation is expected to complete.

[-job-id <integer>] - Job ID (privilege: advanced)
If this parameter is specified, the command displays move operations that match the specified Job-ID of the move job.

[-managing-node <nodename>] - Managing Node
If this parameter is specified, the command displays move operations that match the specified node in the cluster on which the move job is or was running.

[-percent-complete <percent>] - Percentage Complete
If this parameter is specified, the command displays move operations that match the specified amount of work to move the volume completed thus far in terms of percentage.

[-phase {queued|initializing|replicating|cutover|cutover_hard_deferred|cutover_soft_deferred|aborting|completed|cleaning_up|failed|restarting|finishing}] - Move Phase
If this parameter is specified, the command displays move operations that match the specified phase of the move operation.

[-prior-issues <text>] - Prior Issues Encountered (privilege: advanced)
If this parameter is specified, the command displays move operations that match the specified issues or transient errors encountered causing the move operation to retry the data copy phase or the cutover phase.

[-estimated-remaining-duration {<seconds> | [<d> days] <hh>:<mm>[::<ss>]]}] - Estimated Remaining Duration
If this parameter is specified, the command displays move operations that match the specified time.

[-replication-throughput <text>] - Replication Throughput
If this parameter is specified, the command displays move operations that match the specified replication throughput of the move operation in terms of Kb/s, Mb/s or Gb/s.
[-actual-duration <seconds>| [<d> days] <hh>:<mm> [:<ss>]]] - Duration of Move
    If this parameter is specified, the command displays move operations that match the specified duration for which the volume move was or is in progress.

[-source-aggregate <aggregate name>] - Source Aggregate
    If this parameter is specified, the command displays move operations that match the specified name of the aggregate where the volume being moved originally resides or resided.

[-source-node <nodename>] - Source Node (privilege: advanced)
    If this parameter is specified, the command displays move operations that match the specified name of the node where the source aggregate is present.

[-start-time <Date>] - Start Time of Move
    If this parameter is specified, the command displays move operations that match the specified date and time in the cluster time zone when the volume move operation started.

[-state {healthy|warning|alert|failed|done}] - Move State
    If this parameter is specified, the command displays move operations that match the specified state of the volume move operation.

[-moved-by-autobalance {true|false}] - Move Initiated by Auto Balance Aggregate (privilege: advanced)
    If this parameter is specified, the command displays move operations that match the specified value of this parameter.

[-original-job-id <integer>] - Original Job ID (privilege: advanced)
    If this parameter is specified, the command displays move operations that match the specified value of this parameter.

Examples
The following example lists status of volume move operation for a volume vol2 on a Vserver vs0

```
cluster1::> volume move show -vserver vs0 -volume vol2
    Vserver Name: vs0
    Volume Name: vol2
    Actual Completion Time: -
    Bytes Remaining: 6.37GB
    Destination Aggregate: cluster1_aggr2
    Detailed Status: Transferring data: 3.67GB sent.
    Estimated Time of Completion: Sat Jul 16 20:25:50 2011
    Managing Node: node1
    Percentage Complete: 36%
    Move Phase: replicating
    Estimated Remaining Duration: 00:01
    Replication Throughput: 61.08MB/s
    Duration of Move: 00:02
    Source Aggregate: cluster1_aggr1
    Move State: healthy
```

The following example lists status of volume move operation for a volume vol2 on a Vserver vs0 in advanced mode

```
cluster1::*> volume move show -vserver vs0 -volume vol2
    Vserver Name: vs0
    Volume Name: vol2
    Actual Completion Time: -
    Bytes Remaining: 156KB
    Specified Action For Cutover: wait
    Specified Cutover Time Window: 30
    Source Aggregate: cluster1_aggr1
    Destination Aggregate: cluster1_aggr2
    Destination Node: node2
```
Detailed Status: Cutover Deferred, Waiting for user intervention (2.04MB Sent)::Volume move job preparing transfer.
Estimated Time of Completion: -
Job ID: 265
Managing Node: node1
Percentage Complete: -
Move Phase: cutover_hard_deferred
Prior Issues Encountered: -
Estimated Remaining Duration: -
Replication Throughput: -
Duration of Move: 00:24:59
Source Aggregate: cluster1_aggr1
Source Node: node1
Move State: alert
Move Initiated by Auto Balance Aggregate: false
Original Job ID: -

The following example lists status of volume move operation for a volume vol2 on a Vserver vs0 in diagnostic mode:

```
cluster1::*> volume move show -vserver vs0 -volume vol2
Vserver Name: vs0
Volume Name: vol2
Volume Instance UUID: f9850e48-0c52-4884-ae9a-cfff7de13b57
Actual Completion Time: -
Bytes Remaining: 6.37GB
Bytes Sent: 3.67GB
Status Code: -
Completion String: -
Specified Action For Cutover: defer_on_failure
Specified Cutover Attempts: 3
Specified Cutover Time Window: 30
Time User Triggered Cutover: -
Time Move Job Last Entered Cutover: -
Cutovers Attempted: 0
Times Cutover Hard Deferred: 0
Times Cutover Soft Deferred: 0
Destination Aggregate: cluster1_aggr2
Destination Node: node2
Detailed Status: Transferring data: 3.67GB sent.
Estimated Time of Completion: Sat Jul 16 20:25:50 2011
Internal Progress of Move: Transferring data: 3.67GB sent.
Actual State of Job: MonitorTransfer
Job ID: 66
Job UUID: ca8aa4ae-b00a-11e0-bb4e-123478563412
Managing Node: node1
Percentage Complete: 36%
Move Phase: replicating
Prior Issues Encountered: -
Estimated Remaining Duration: 00:01
Replication Throughput: 61.08MB/s
Duration of Move: 00:02
Source Aggregate: cluster1_aggr1
Source Node: node1
Move State: healthy
Move Initiated by Auto Balance Aggregate: false
Bypass Replication Engine Throttling: false
Skip the Delta Calculation: false
Time Taken to Complete Cutover: -
Original Job ID: -
```

The following example lists status of volume move operation for a volume vol2 on a Vserver vs0:

```
cluster1::> volume move show -vserver vs0 -volume vol2
Vserver Name: vs0
Volume Name: vol2
Actual Completion Time: -
```
Bytes Remaining: 6.37GB
Destination Aggregate: cluster1_aggr2
Detailed Status: Transferring data: 3.67GB sent.
Estimated Time of Completion: Sat Jul 16 20:25:50 2011
Managing Node: node1
Percentage Complete: 36%
Move Phase: replicating
Estimated Remaining Duration: 00:01
Replication Throughput: 61.08MB/s
Duration of Move: 00:02
Source Aggregate: cluster1_aggr1
Move State: healthy

The following example lists status of volume move operation for a volume vol2 on a Vserver vs0 in advanced mode

```
cluster1::*> volume move show -vserver vs0 -volume vol2

Vserver Name: vs0
Volume Name: vol2
Actual Completion Time: -
Bytes Remaining: 156KB
Specified Action For Cutover: wait
Specified Cutover Time Window: 30
Destination Aggregate: cluster1_aggr2
Destination Node: node2
Detailed Status: Cutover Deferred, Waiting for user intervention (2.04MB Sent)::Volume move job preparing transfer.
Estimated Time of Completion: -
Job ID: 265
Managing Node: node1
Percentage Complete: -
Move Phase: cutover_hard_deferred
Prior Issues Encountered: -
Estimated Remaining Duration: -
Replication Throughput: -
Duration of Move: 00:24:59
Source Aggregate: cluster1_aggr1
Source Node: node1
Move State: alert
Move Initiated by Auto Balance Aggregate: false
Original Job ID: -
```

The following example lists status of running and failed volume move operations in the cluster.

```
cluster1::> volume move show

Vserver Volume State Move Phase Percent-Complete Time-To-Complete
--------- ---------- -------- ---------- ---------------- ----------------
vs0 s1 alert cutover_hard_deferred
98% 98% -
vs0 vol2 failed failed - -
```

The following example lists status of all the volume move operations in the cluster.

```
cluster1::> vol move show -phase *
(volume move show)
Vserver Volume State Move Phase Percent-Complete Time-To-Complete
--------- --------- ------ ---------- ---------------- ----------------
```
**volume move start**

Start moving a volume from one aggregate to another aggregate

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
The volume move start command moves a flexible volume from one storage aggregate to another. The destination aggregate can be located on the same node as the original aggregate or on a different node. The move occurs within the context of the same Vserver.

**Parameters**

- `-vserver <vserver name>` - Vserver Name
  This specifies the Vserver on which the volume is located.

- `-volume <volume name>` - Volume Name
  This specifies the volume that will be moved.

- `-destination-aggregate <aggregate name>` - Destination Aggregate
  This specifies the aggregate to which the volume will be moved.

- `[-cutover-window <integer>]` - Cutover time window in seconds (privilege: advanced)
  This specifies the time interval to completely cutover operations from the original volume to the moved volume. The default value is 30 seconds. The range for valid input is from 30 to 300 seconds, inclusive.

- `[-cutover-action {abort_on_failure|defer_on_failure|force|wait|retry_on_failure}]` - Action for Cutover (privilege: advanced)
  Specifies the action to be taken for cutover. If the effective cluster version is Data ONTAP 8.3 and later, the default is `retry_on_failure`; otherwise the default is `defer_on_failure`. If the `abort_on_failure` action is specified, the job tries to cutover until cutover attempts are exhausted. If it fails to cutover, it cleans up and ends the operation. If the `defer_on_failure` action is specified, the job tries to cutover until the cutover attempts are exhausted. If it fails to cutover, it moves into the "cutover deferred" state. The volume move job waits to issue a `volume move trigger-cutover` command to restart the cutover process. If the `force` action is specified, the job tries to cutover until the cutover attempts are exhausted and forces the cutover at the expense of disrupting the clients. If the `wait` action is specified, when the job hits the decision point, it does not go into cutover automatically, instead it waits to issue a `volume move trigger-cutover` command as the signal to try the cutover. Once cutover is manually triggered, the cutover action changes to `defer_on_failure`. If the `retry_on_failure` action is specified, the job retries to cutover indefinitely and it never enters a "hard-deferred" state. After exhausting cutover attempts, the move job waits one hour before trying to cutover again. Issue a `volume move trigger-cutover` command at any time to restart the cutover process.

- `[-perform-validation-only [true]]` - Performs validation checks only
  This is a boolean option allowing to perform pre-move validation checks for the intended volume. When set to `true`, the command only performs the checks without creating a move job. The default value is `false`. 

**Volume Move commands**

1315
[\textit{\textbf{[-foreground \(\text{true} | \text{false}\)]}}] - Foreground Process

This specifies whether the volume move operation runs as a foreground process. The default setting is \textit{false} (that is, the operation runs in the background). Note that using this parameter will not affect how long it takes for the operation to complete.

\begin{mdframed}
\textbf{Examples}

The following examples perform a validation-check for a volume named volume\textunderscore test on a Vserver named vs0 to determine if it can be moved to a destination-aggregate named dest\_aggr.

\begin{verbatim}
cluster1::> volume move start -vserver vs0 -volume volume\_test -destination-aggregate dest\_aggr -perform-validation-only true
Error: command failed: There is 2.54GB of available space on the aggregate dest\_aggr which is not enough to accommodate a volume.
cluster1::> volume move start -vserver vs0 -volume volume\_test -destination-aggregate dest\_aggr -perform-validation-only true
Validation succeeded.
\end{verbatim}

The following example performs a volume move start operation to move a volume named volume\textunderscore test on a Vserver name vs0 to a destination-aggregate named dest\_aggr.

\begin{verbatim}
cluster1::> volume move start -vserver vs0 -volume volume\_test -destination-aggregate dest\_aggr
[Job 267] Job is queued: Move "volume\_test" in Vserver "vs0" to aggregate "dest\_aggr".
Use the "volume move show -vserver vs0 -volume volume\_test" command to view the status of this operation.
\end{verbatim}
\end{mdframed}

\textbf{Related references}

\textit{volume move trigger-cutover} on page 1316

\textbf{volume move trigger-cutover}

Trigger cutover of a move job

\textbf{Availability}: This command is available to cluster administrators at the \textit{admin} privilege level.

\textbf{Description}

This command causes a replicating or deferred volume move job to attempt cutover. Unless the force option is set, cutover entry is not guaranteed.

\textbf{Parameters}

- \texttt{\textit{vserver <vserver name>}} - Vserver Name
  
  The Vserver on which the volume is located.

- \texttt{\textit{volume <volume name>}} - Volume Name
  
  The volume that is being moved.

\[\textit{[-force \{true\}]}\] - Force Cutover

If this parameter is specified, the cutover is done without confirming the operation - even if the operation could cause client I/O disruptions.
volume move recommend commands

The recommend directory

volume move recommend show

Display Move Recommendations

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

The `volume move recommend show` command displays moves that were recommended by the Auto Balance Aggregate feature.

Parameters

{-fields <fieldname>,...}

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

{-instance}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

{-vserver <vserver name> - Vserver Name}

If this parameter is specified, the display will be limited to only those recommendations with a Vserver that matches the specified value.

{-volume <volume name> - Volume Name}

If this parameter is specified, the display will be limited to only those recommendations with a volume that matches the specified value.

{-creation-time <MM/DD/YYYY HH:MM:SS> - Time Stamp of Recommendation}

If this parameter is specified, the display will be limited to only those recommendations with a creation-time that matches the specified value.

{-source-aggregate <aggregate name> - Unbalanced Aggregate Name}

If this parameter is specified, the display will be limited to only those recommendations with a source-aggregate that matches the specified value.

{-source-space-after <percent> - Space Free After Move (%)}

If this parameter is specified, the display will be limited to only those recommendations with a source-space-after that matches the specified value.

{-destination-aggregate <aggregate name> - Destination Aggregate Name}

If this parameter is specified, the display will be limited to only those recommendations with a destination-aggregate that matches the specified value.

{-destination-space-after <percent> - Space Bump After Move (%)}

If this parameter is specified, the display will be limited to only those recommendations with a destination-space-after that matches the specified value.

Examples

The following example displays information about the recommendations made by the Auto Balance Aggregate feature.
volume move target-aggr commands

Manage target aggregates for volume move

The volume move target-aggr command enables you to list the aggregates where a volume could be moved.

volume move target-aggr show

List target aggregates compatible for volume move

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The volume move target-aggr show displays information about compatible target aggregates for the specified volume to be moved to.

Parameters

{-fields <fieldname>, ...}
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

{-instance }}
If you specify the -instance parameter, the command displays detailed information about all fields.

{-vserver <vserver name>} - Vserver Name (Required field)
Selects information about compatible target aggregates on volumes of the specified Vserver.

{-volume <volume name>} - Volume Name (Required field)
Selects information about compatible target aggregates that have the specified volume name.

{-aggregate <aggregate name>} - Aggregate Name
Selects information about compatible target aggregates with the specified aggregate name (to which the volume might be moved).

{-availsize {<integer> [KB | MB | GB | TB | PB]}} - Available size
Selects information about compatible target aggregates that have the specified available size.

{-storagetype <text>} - Storage Type
Selects information about compatible target aggregates with the specified storage type. Examples of storage types are “ATA”, “BSAS”, “FCAL”, “LUN”, “SATA”, “SAS” and “SSD”.

Examples
The following example lists target aggregates compatible for moving a volume vol1 on a Vserver vs1.

```
cluster1::> volume move target-aggr show -vserver vs1 -volume vol1
Aggregate Name   Available Size   Storage Type
--------------   --------------   ------------
```

36%
volume qtree commands

Manage qtrees

volume qtree create

Create a new qtree

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command creates a qtree in the Vserver and volume you specify. You can create up to 4,994 qtrees per volume. This command is not supported on Infinite Volumes.

You can optionally specify the following attributes when creating a new qtree:

- Security style
- Opportunistic lock mode
- UNIX permissions
- Export Policy

Parameters

-vserver <vserver name> - Vserver Name
This specifies the name of the Vserver on which the volume containing the qtree belongs.

{ -volume <volume name> - Volume Name
This specifies the name of the volume that will contain the qtree you are creating.

-qtree <qtree name> - Qtree Name
This specifies the name of the qtree you are creating.

A qtree name cannot contain a forward slash (/). The qtree name cannot be more than 64 characters long.

-qtrees-path <qtree path> - Actual (Non-Junction) Qtree Path
The qtree path argument in the format /vol/<volume name>/<qtree name> can be specified instead of specifying volume and qtree as separate arguments.

[security-style <security style>] - Security Style
This optionally specifies the security style for the qtree, which determines how access to the qtree is controlled. The supported values are unix (for UNIX uid, gid and mode bits), ntfs (for CIFS ACLs), and mixed (for NFS and CIFS access). The unified security style, which applies only to Infinite Volumes, cannot be applied to a qtree. If you do not specify a security style for the qtree, it inherits the security style of its containing volume.

[-oplock-mode {enable|disable}] - Oplock Mode
This optionally specifies whether oplocks are enabled for the qtree. If you do not specify a value for this parameter, it inherits the oplock mode of its containing volume.
[-unix-permissions | -m <unix_perm>] - Unix Permissions

This optionally specifies the UNIX permissions for the qtree when the -security-style is set to unix or mixed. You can specify UNIX permissions either as a four-digit octal value (for example, 0700) or in the style of the UNIX ls command (for example, -rwxr-x--- ). For information on UNIX permissions, see the UNIX or Linux documentation. If you do not specify UNIX permissions for the qtree, it inherits the UNIX permissions of its containing volume.

[-export-policy <text>] - Export Policy

This optional parameter specifies the name of the export policy associated with the qtree. For information on export policies, see the documentation for the vserver export-policy create command. If you do not specify a value for this parameter, it inherits the export policy of its containing volume.

Examples

The following example creates a qtree named qtree1. The Vserver name is vs0 and the volume containing the qtree is named vol1. The qtree has a mixed security style. Its other attributes are inherited from volume vol1.

```
cluster1::> volume qtree create -vserver vs0 -volume vol1 -qtree qtree1 -security-style mixed
```

The following example uses a 7G-compatible command to create the qtree.

```
cluster1::> vserver context vs0
vs0::> qtree create /vol/vol1/qtree1
```

Related references

vserver export-policy create on page 1553

volume qtree delete

Delete a qtree

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

This command deletes a qtree. The length of time that it takes to delete a qtree depends on the number of directories and files it contains. You can monitor the progress of the delete operation by using the job show and job watch-progress commands, respectively. This command is not supported on Infinite Volumes.

The automatically created qtree in the volume - qtree0, listed in CLI output as "" - cannot be deleted.

Note: Quota rules associated with this qtree in all the quota policies will be deleted when you delete this qtree. Qtree deletion will not be allowed if Storage-level Access Guard (SLAG) is configured.

Parameters

- -vserver <vserver name> - Vserver Name

This specifies the name of the Vserver on which the volume containing the qtree belongs.

{ -volume <volume name> - Volume Name

This specifies the name of the volume containing the qtree to be deleted.

- qtree <qtree name> - Qtree Name

This specifies the name of the qtree to be deleted.
| -qtree-path <qtree_path> | Actual (Non-Junction) Qtree Path |

The qtree path argument in the format /vol/<volume name>/<qtree name> can be specified instead of specifying volume and qtree as separate arguments.

-force [true] - Force Delete (privilege: advanced)

This optionally forces the qtree delete operation to proceed when the qtree contains files. The default setting is false (that is, the qtree will not be deleted if it contains files). This parameter is available only at the advanced privilege and higher.

-foreground [true] - Foreground Process

This optionally specifies whether the qtree delete operation runs as a foreground process. The default setting is false (that is, the operation runs in the background).

Examples

The following example deletes a qtree named qtree4. The Vserver name is vs0 and the volume containing the qtree is named vol1.

```bash
cluster1::> volume qtree delete -vserver vs0 -volume vol1 -qtree qtree4
WARNING: Are you sure you want to delete qtree qtree4 in volume vol1 vserver vs0? {y|n}: y
[Job 38] Job is queued: Delete qtree qtree4 in volume vol1 vserver vs0.
```

**volume qtree modify**

Modify qtree attributes

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

This command allows you to modify the following attributes of an existing qtree in the given Vserver and volume:

- Security style
- Opportunistic lock mode
- UNIX permissions
- Export policy

This command is not supported by Infinite Volumes.

**Parameters**

- **vserver <vserver name>** - Vserver Name
  
  This specifies the name of the Vserver on which the volume containing the qtree belongs.

- **volume <volume name>** - Volume Name
  
  This specifies the name of the volume containing the qtree to be modified.

- **qtree <qtree name>** - Qtree Name
  
  This specifies the name of the qtree to be modified. You can modify the attributes of qtree0 (represented as "" in the CLI) by omitting the -qtree parameter from the command or by specifying the value "" for the -qtree parameter.
-qtree-path <qtree path> - Actual (Non-Junction) Qtree Path

The qtree path argument in the format /vol/<volume name>/<qtree name> can be specified instead of
specifying volume and qtree as separate arguments. The automatically created qtree0 can be represented
as /vol/<volume name>.

-security-style <security style> - Security Style

This optionally modifies the security style for the qtree. The supported values are unix (for UNIX uid, gid and
mode bits), ntfs (for CIFS ACLs), and mixed (for NFS and CIFS access). The unified security style,
which applies only to Infinite Volumes, cannot be applied to a qtree. Modifying a qtree's security style will not
affect any of the files in the other qtrees of this volume.

-oplock-mode {enable|disable} - Oplock Mode

This optionally modifies whether oplocks are enabled for the qtree.

Modifying qtree0's oplock mode will not affect any of the files in the other qtrees of this volume.

-unix-permissions <unix perm> - Unix Permissions

This optionally modifies the UNIX permissions for the qtree. You can specify UNIX permissions either as a
four-digit octal value (for example, 0700) or in the style of the UNIX ls command (for example, -rwxr-x---).
For information on UNIX permissions, see the UNIX or Linux documentation.

The unix permissions can be modified only for qtrees with unix or mixed security style.

-export-policy <text> - Export Policy

This optional parameter modifies the export policy associated with the qtree. If you do not specify an export
policy name, the qtree inherits the export policy of the containing volume. For information on export policy,
see the documentation for the vserver export-policy create command.

Examples

The following example modifies a qtree named qtree1. The Vserver name is vs0 and the volume containing the qtree is
named vol1. The qtree now has a UNIX security style and oplocks are enabled.

```
cluster1::> volume qtree modify -vserver vs0 -volume vol1 -qtree qtree1 -security-style unix -
oplocks enabled
```

vserver export-policy create on page 1553

volume qtree oplocks

Modify qtree oplock mode

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

This command allows you to display or modify the opportunistic lock mode of a qtree. This command is not supported on
Infinite Volumes.

Parameters

-vserver <vserver name> - Vserver Name

This specifies the name of the Vserver on which the volume containing the qtree belongs.

-volume <volume name> - Volume Name

This specifies the name of the volume containing the qtree.
-qtreenametext - Qtree Name

This specifies the name of the qtree for which the oplock mode is being displayed or modified.

|-qtreenamethext - Actual (Non-Junction) Qtree Path

The qtree path argument in the format /vol/<volume name>/<qtree name> can be specified instead of specifying volume and qtree as separate arguments. The automatically created qtree0 can be represented as /vol/<volume name>.

-oplock-modaltext - Oplock Mode

This specifies the new oplock mode of the qtree. If this parameter is not specified, then the current oplock mode of the qtree is displayed.

Modifying qtree0's oplock mode will not affect any of the files in the other qtrees of this volume.

Examples

The following example displays the oplock mode of a qtree called qtree1. The Vserver name is vs0 and the volume containing the qtree is named vol1.

```
cluster1::> volume qtree oplocks -vserver vs0 -volume vol1 -qtree qtree1
/vol/vol1/qtree1 has mixed security style and oplocks are disabled.
```

The following example modifies the oplock mode of a qtree called qtree2 to enabled. The Vserver name is vs0 and the volume containing the qtree is named vol1.

```
cluster1::> volume qtree oplocks -vserver vs0 -volume vol1 -qtree qtree2 -oplock-mode enable
```

The following example uses a 7G-compatible command to display and modify the oplock mode of a qtree.

```
cluster1::> vserver context vs0
vs0::> qtree oplocks /vol/vol1/qtree1
/vol/vol1/qtree1 has mixed security style and oplocks are disabled.
vs0::> qtree oplocks /vol/vol1/qtree2 enable
```

volume qtree rename

Rename an existing qtree

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

This command allows you to rename an existing qtree. This command is not supported on Infinite Volumes.

The automatically created qtree in the volume - qtree0, listed in CLI output as "" - cannot be renamed.

Parameters

-vserver <vserver nametext> - Vserver Name

This specifies the name of the Vserver on which the volume containing the qtree belongs.

{ -volume <volume nametext> - Volume Name

This specifies the name of the volume containing the qtree to be renamed.

-qtree <qtree nametext> - Qtree Name

This specifies the name of the qtree to be renamed.
The qtree path argument in the format /vol/<volume name>/<qtree name> can be specified instead of specifying volume and qtree as separate arguments.

**-newname <qtree name>** - Qtree New Name

This specifies the new name of the qtree. The new qtree name cannot contain a forward slash (/) and cannot be more than 64 characters long.

### Examples

The following example renames a qtree named qtree3 to qtree4. The Vserver name is vs0 and the volume containing the qtree is named vol1.

```bash
cluster1::> volume qtree rename -vserver vs0 -volume vol1 -qtree qtree3 -newname qtree4
```

### volume qtree security

Modify qtree security style

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

This command allows you to display or modify the security style of a qtree. This command is not supported on Infinite Volumes.

**Parameters**

- **-vserver <vserver name>** - Vserver Name
  
  This specifies the name of the Vserver on which the volume containing the qtree belongs.

- **-{ -volume <volume name>** - Volume Name
  
  This specifies the name of the volume containing the qtree.

- **-qtree <qtree name>** - Qtree Name
  
  This specifies the name of the qtree for which the security style is being displayed or modified.

- **-qtree-path <qtree path>** - Actual (Non-Junction) Qtree Path
  
  The qtree path argument in the format /vol/<volume name>/<qtree name> can be specified instead of specifying volume and qtree as separate arguments. The automatically created qtree0 can be represented as /vol/<volume name>.

- **[-security-style <security style>]** - Security Style
  
  This specifies the new security style of the qtree. If this parameter is not specified, then the current security style of the qtree is displayed. The supported values are *unix* (for UNIX uid, gid and mode bits), *ntfs* (for CIFS ACLs), and *mixed* (for NFS and CIFS access). The *unified* security style, which applies only to Infinite Volumes, cannot be applied to a qtree. Modifying a qtree's security style will not affect any of the files in the other qtrees of this volume.

### Examples

The following example displays the security style of a qtree called qtree1. The Vserver name is vs0 and the volume containing the qtree is named vol1.

```bash
cluster1::> volume qtree security -vserver vs0 -volume vol1 -qtree qtree1
/vol/vol1/qtree1 has mixed security style and oplocks are disabled.
```

The following example modifies the security style of a qtree called qtree2 to unix. The Vserver name is vs0 and the volume containing the qtree is named vol1.

```bash
cluster1::> volume qtree security -vserver vs0 -volume vol1 -qtree qtree2 -security-style unix
```
volume qtree security

The following example uses a 7G-compatible command to display and modify the security style of a qtree.

```bash
cluster1::> vserver context vs0
vs0::> qtree security /vol/vol1/qtree1
/vol/vol1/qtree1 has mixed security style and oplocks are disabled.
vs0::> qtree security /vol/vol1/qtree2 unix
```

**volume qtree show**

Display a list of qtrees

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

This command displays information about qtrees for online volumes. By default, the command displays the following information about all qtrees in the cluster:

- Vserver name
- Volume name
- Qtree name
- Security style (unix, ntfs, mixed or unified)
- Whether oplocks is enabled
- Status (normal or readonly)

The display will also include information about Qtree 0. When you create a volume, a special qtree referred to as "qtree0", also called the default qtree is automatically created for the volume. It represents all of the data stored in a volume that is not contained in a qtree. In the CLI output, qtree0 is denoted by empty quotation marks ("") and has the ID zero (0). The qtree called qtree0 cannot be manually created or deleted. This command is not supported on Infinite Volumes.

The qtree status indicates readonly for data protection and load sharing volumes.

To display detailed information about a single qtree, run the command with the -instance and -qtree parameters. The detailed view adds the following information:

- UNIX permissions
- Qtree ID
- Export policy
- Is Export Policy Inherited

**Parameters**

```bash
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```bash
[-exports]
```

Displays the following information about qtree exports:

- Vserver - The name of the Vserver the qtree belongs to
- Volume - The name of the volume the qtree resides on
- Qtree name - The name of the qtree
- Policy Name - The name of the export policy assigned to the qtree
- Is Export Policy Inherited - Whether the export policy assigned to the qtree is inherited

[-id]
Displays qtree IDs in addition to the default output.

[-instance]]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver Name
Selects information about the qtrees in the specified Vserver.

{-volume <volume name>} - Volume Name
Selects information about the qtrees in the specified volume.

[-qtree <qtree name>] - Qtree Name
Selects information about the qtrees that have the specified name.

[-qtree-path <qtree path>] - Actual (Non-Junction) Qtree Path
Selects information about the qtrees that have the specified path.

[-security-style <security style>] - Security Style
Selects information about the qtrees that have the specified security style. The unified security style, which applies only to Infinite Volumes, cannot be applied to a qtree.

[-oplock-mode {enable|disable}] - Oplock Mode
Selects information about the qtrees that have the specified oplock mode.

[-unix-permissions |-m <unix perm>] - Unix Permissions
Selects information about the qtrees that have the specified UNIX permissions.

[-qtree-id <integer>] - Qtree Id
Selects information about the qtrees that have the specified ID. A valid qtree ID is an integer from 0 to 4994. All qtree0 (automatically created) qtrees have an ID of zero (0).

[-status {normal|readonly}] - Qtree Status
Selects information about the qtrees that have the specified status.

[-export-policy <text>] - Export Policy
Selects information about the qtrees that use the specified export policy.

[-is-export-policy-inherited (true|false)] - Is Export Policy Inherited
Selects information about the qtrees that inherit (true) or not inherit (false) the export policy of containing volume.

Examples
The following example displays default information about all qtrees along with each qtree ID. Note that on vs0, no qtrees have been manually created, so only the automatically created qtrees referred to as qtree 0 are shown. On vs1, the volume named vs1_vol1 contains qtree 0 and two manually created qtrees, qtree1 and qtree2.

```
cluster1::> volume qtree show -id
Vserver  Volume       Qtree  Style  Oplocks   Status    Id
---------- ------------- ------ -------- ---------- -------- --
vs0       vs0_vol1    **     unix    enable    readonly 0
vs0       vs0_vol2    **     unix    enable    normal   0
vs0       vs0_vol3    **     unix    enable    readonly 0
vs0       vs0_vol4    **     unix    enable    readonly 0
```

Commands: Manual Page Reference
volume qtree statistics

Display qtree statistics

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

This command displays NFS and CIFS operations statistics for qtrees. Note that qtree statistics are available only when the volume containing the qtree is online. This command is not supported on Infinite Volumes.

Statistics are cumulative values from the time the volume is brought online or when the statistics have been reset by using the "volume qtree statistics-reset" command.

The command output depends on the parameters specified with the command. If no parameters are specified, the command displays the following statistics information about all qtrees:

• Vserver name
• Volume name
• Qtree name
• NFS operations
• CIFS operations

Note:

Qtree statistics are not persistent. If you restart a node, if a storage takeover and giveback occurs, or if the containing volume is set to offline and then online, qtree statistics are set to zero.

Parameters

{ [-fields <fieldname>, ...] 
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

  [-internal] (privilege: advanced) 
  If this parameter is specified, the output will also include the internal operation statistics. Internal operation is any operation on the qtree that originated within Data ONTAP software.

  [-no-reset] (privilege: advanced) 
  If this parameter is specified, the output will display the NFS and CIFS op statistics since the time the volume was online.

  [-no-reset-internal] (privilege: advanced) 
  If this parameter is specified, the output will also include the internal op statistics since the time the volume was online.

  [-instance ] 
  If you specify the -instance parameter, the command displays detailed information about all fields.

volume qtree commands
[-vserver <vserver name>] - Vserver Name
   If this parameter is specified, the command displays information about the qtrees on the specified Vserver.

{-volume <volume name>} - Volume Name
   If this parameter is specified, the command displays information about the qtrees on the specified volume.

[-qtree <qtree name>] - Qtree Name
   If this parameter is specified, the command displays information about the specified qtree.

[-qtree-path <qtree path>] - Actual (Non-Junction) Qtree Path
   The qtree path argument in the format /vol/<volume name>/<qtree name> can be specified instead of specifying volume and qtree as separate arguments. The automatically created qtree0 can be represented as /vol/<volume name>.

Examples
The following example displays statistics information for all qtrees on the Vserver named vs0.

```
cluster1::> volume qtree statistics -vserver vs0

+-------------------------+-------------------------------+-------------------+-------------------+
| Vserver     | Volume   | Qtree   | NFS Ops | CIFS Ops |
|-------------------------|-------------------------------|-------------------|-------------------|
| vs0          | vol10   | qtree1  | 10876   | 2678     |
| vs0          | vol11   | qtree1a | 16543   | 0        |
| vs0          | vol2    | qtree2  | 0       | 0        |
| vs0          | vol2    | qtree2a | 0       | 0        |
+-------------------------+-------------------------------+-------------------+-------------------+
4 entries were displayed.
```

The following example displays statistics information for qtrees on Vserver vs0 that have NFS ops more than 15000.

```
cluster1::> volume qtree statistics -vserver vs0 -nfs-ops >15000

+-------------------------+-------------------------------+-------------------+-------------------+
| Vserver     | Volume   | Qtree   | NFS Ops | CIFS Ops |
|-------------------------|-------------------------------|-------------------|-------------------|
| vs0          | vol11   | qtree1a | 16543   | 0        |
+-------------------------+-------------------------------+-------------------+-------------------+
```

volume qtree statistics-reset
Reset qtree statistics in a volume

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command resets qtree statistics for all qtrees in a volume. This command is not supported on Infinite Volumes.

Parameters
-vserver <vserver name> - Vserver Name
   This specifies the name of the Vserver on which the volume containing the qtree belongs.

-volume <volume name> - Volume Name
   This specifies the name of the volume containing the qtrees whose statistics you want to reset.

Examples
The following example resets statistics for all qtrees on the volume named vol1 on the Vserver named vs0.
volume quota commands

Manage Quotas, Policies, Rules and Reports

volume quota modify

Modify quota state for volumes

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command allows you to modify the following quota attributes for one or more volumes:

- Quota state
- Whether quota exceeded messages are logged or not
- Frequency with which quota exceeded messages are logged

Modifications to the quota state for a volume creates a job to perform the quota state changes for that volume. You can monitor the progress of the job by using the job show and job watch-progress commands. This command is not supported on Infinite Volumes.

Parameters

-vserver <vserver name> - Vserver Name
This specifies the name of the Vserver on which the volume whose quota attributes you are modifying is located.

-volume <volume name> - Volume Name
This specifies the name of the volume whose quota attributes you are modifying.

[-state <quota_state>] - Quota State
This parameter optionally modifies the quota state to one of the following:

- off - This indicates that quotas be deactivated for the specified volume.
- on - This indicates that quotas be activated for the specified volume.
- resize - This indicates that the quota limits be resized according to the values specified in the quota policy assigned to the Vserver. Note that quotas must be activated first for a volume before a resize operation can be performed.

Both quota activation and quota resize operations apply the quota rules configured for the volume within the quota policy that is currently assigned to the Vserver. These quota rules are managed by using the commands in the volume quota policy rule menu. Quotas, when activated for a volume, go through an initialization process. As part of the quota initialization all the quota rules are applied to the volume. In addition, a filesystem scanner is started to scan the entire filesystem within the volume to bring the quota accounting and reporting up to date. The quota job finishes after the filesystem scanner is started on the volume. The quota state for the volume is initializing until the filesystem scanner finishes scanning the entire filesystem. After the scanning is complete, the quota state will be on.
When quotas are resized, the quota state is **resizing** until the resizing operation finishes. As part of this operation, the quota limits for quotas currently in effect are resized to the limits currently configured for the volume. After the quota resize operation finishes, the quota state will be **on**.

Quota state changes can also be performed using the commands *volume quota on*, *volume quota off* and *volume quota resize*.

**[-logging {on|off}] - Logging Messages**

This parameter optionally specifies whether quota exceeded syslog/EMS messages are logged in the system log messages. When it is set to **on**, quota exceeded messages are generated when the user exceeds the quota's disk limit or the file limit through a NFS/CIFS operation or any operation within the Data ONTAP software. When set to **off** no quota exceeded messages are generated. This parameter can be changed only after quotas are activated for a volume.

**[-logging-interval <text>] - Logging Interval**

This parameter optionally specifies a logging interval, which indicates the frequency with which quota exceeded messages are generated. You can specify a logging interval in the `<integer><suffix>` format, where suffix can be minutes (m), hours (h), or days (d), but not combinations thereof (in other words, 90m is a valid logging interval, but 1h30m is not a valid logging interval). You can modify the logging interval only when the logging is **on**. When quotas are first activated, the logging parameter is automatically set to **on**, and the logging interval set to 1h. If continuous logging is required, an interval of 0m should be specified. This parameter can be changed only after quotas are activated for a volume.

*Note:* quota message logging may not occur at exactly the same interval rate as specified by the user, especially for very small intervals. This is due to the behavior of the logging system that buffers messages instead of outputting them immediately. Setting the logging interval to 0m can cause lots of quota exceeded messages to be logged in the system log messages.

**[-foreground [true]] - Foreground Process**

This parameter optionally specifies whether the job created by quota state modify operation runs as a foreground process. The default setting is **false** (that is, the quota state modify operation runs in the background). When set to **true**, the command will not return until the job completes.

### Examples

The following example activates quotas on the volume named **vol1**, which exists on Vserver **vs0**.

```
cluster1::> volume quota modify -vserver vs0 -volume vol1 -state on
[Job 24] Job is queued: Quota ON Operation on vserver vs0 volume vol1.
```

The following example turns on quota message logging and sets the logging interval to 4 hours.

```
cluster1::> volume quota modify -vserver vs0 -volume vol1 -logging on -logging-interval 4h
```

The following example resizes quota limits on a volume.

```
cluster1::> volume quota modify -vserver vs0 -volume vol1 -state resize -foreground true
[Job 80] Job succeeded: Successful
```
volume quota off

Turn off quotas for volumes

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
This command creates a job to deactivate quotas for the specified volume. This command is not supported on Infinite Volumes. You can monitor the progress of the job by using the `job show` and `job watch-progress` commands.

**Parameters**
- **-vserver** `<vserver name>` - Vserver Name
  This specifies the name of the Vserver on which the volume is located.

- **-volume** `<volume name>` - Volume Name
  This specifies the name of the volume on which you are deactivating quotas.

[-**foreground** [true]] - Foreground Process
  This optionally specifies whether the job created for deactivating quotas runs as a foreground process. The default setting is false (that is, the operation runs in the background). When set to true, the command will not return until the job completes.

**Examples**
The following example deactivates quotas on the volume named `vol1`, which exists on Vserver `vs0`.

```
cluster1::> volume quota off -vserver vs0 -volume vol1
[Job 23] Job is queued: Quota OFF Operation on vserver vs0 volume vol1.
```

The following example uses a 7G-compatible command to deactivate quotas on the volume named `vol1` which exists on Vserver `vs0`.

```
cluster1::> vserver context vs0
vs0::> quota off vol1
```

volume quota on

Turn on quotas for volumes

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command creates a job to activate quotas for the specified volume. This command is not supported on Infinite Volumes. You can monitor the progress of the job by using the job show and job watch-progress commands.

Parameters

-vserver <vserver name> - Vserver Name
This specifies the name of the Vserver on which the volume is located.

-volume <volume name> - Volume Name
This specifies the name of the volume on which you are activating quotas.

-foreground | -w [true] - Foreground Process
This optionally specifies whether the job created for activating quotas runs as a foreground process. The default setting is false (that is, the operation runs in the background). When set to true, the command will not return until the job completes. The quota job finishes after the filesystem scanner is started. The quota state for the volume is initializing until the filesystem scanner finishes scanning the entire filesystem. After the scanning is complete, the quota state will be on.

Examples
The following example activates quotas on the volume named vol1, which exists on Vserver vs0.

```
cluster1::> volume quota on -vserver vs0 -volume vol1
[Job 23] Job is queued: Quota ON Operation on vserver vs0 volume vol1.
```

The following example uses a 7G-compatible command to activate quotas on the volume named vol1 which exists on Vserver vs0.

```
cluster1::> vserver context vs0
vs0::> quota on -w vol1
[Job 25] Job is queued: Quota ON Operation on vserver vs0 volume vol1.
[Job 25] Job succeeded: Successful
```

volume quota report

Display the quota report for volumes

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.
Description
This command displays the quota report for all volumes in each Vserver that are online and for which quotas are activated. Quota report includes the quota rules (default, explicit, and derived) in effect and the associated resource usage (disk space and files). If quotas are still initializing for a specific volume, that volume is not included. This command is not supported on Infinite Volumes.

This command displays the following information:

- Vserver name
- Volume name
- Index - This is a unique number within a volume assigned to each quota rule displayed in the quota report.
- Tree name - This field gives the name of the qtree if the quota rule is at the qtree level. It is empty if the quota rule is at the volume level.
- Quota type - Type of quota rule (tree or user or group).
- Quota target - This field gives the name of the target of the quota rule. For tree quota rules, it will be the qtree ID of the qtree. For user quota rules, it will be the UNIX user name or the Windows user name. For group quota rules, it will be the UNIX group name. For default rules (tree or user or group), this will display "*". If the UNIX user identifier, UNIX group identifier, or Windows security identifier no longer exists or if the identifier-to-name conversion fails, the target appears in numeric form.
- Quota target ID - This field gives the target of the quota rule in numeric form. For tree quota rules, it will be the qtree ID of the qtree. For group quota rules, it will be the UNIX group identifier. For UNIX user quota rules, it will be the UNIX user identifier. For Windows user quota rules, it will be the Windows security identifier in its native format. For default rules (tree or user or group), "*" will be displayed.
- Disk space used - For a default quota, the value is 0.
- Disk space limit
- Soft disk space limit
- Threshold for disk space limit
- Files used - For a default quota, the value is 0.
- File limit
- Soft file limit
- Quota specifier - For an explicit quota, this field shows how the quota target was configured by the administrator using the volume quota policy rule command. For a default quota, the field shows "*". For a derived tree quota, this field shows the qtree path. For a derived user and group quota, the field is either blank or "*".

The following parameters: -soft, -soft-limit-thresholds, -target-id, -thresholds, -fields and -instance display different set of fields listed above. For example, -soft will display the soft disk space limit and soft file limit apart from other information. Similarly -target-id will display the target in the numeric form.

A quota report is a resource intensive operation. If you run it on many volumes in the cluster, it might take a long time to complete. A more efficient way would be to view the quota report for a particular volume in a Vserver.

Depending upon the quota rules configured for a volume, the quota report for a single volume can be large. If you want to monitor the quota report entry for a particular tree/user/group repeatedly, find the index of that quota report entry and use the -index field to view only that quota report entry. See the examples section for an illustration.
Parameters
{
[-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields '?' to display the fields to specify.

[-soft]
If this parameter is specified, the command display will include the soft disk space limit and the soft file limit.

[-soft-limit-thresholds]
If this parameter is specified, the command display will include the soft disk space limit, threshold for disk space limit and soft file limit.

[-target-id]
If this parameter is specified, the command will display the target of a user or group quota rule in numeric form.

[-thresholds]
If this parameter is specified, the command display will include the threshold for disk space limit.

[-instance]
If you specify the -instance parameter, the command displays detailed information about all fields.

[vserver <vserver name>] - Vserver Name
If this parameter is specified, the command displays the quota report for volumes in the specified Vserver.

[-volume <volume name>] - Volume Name
If this parameter is specified, the command displays the quota report for the specified volume.

[-index <integer>] - Index
If this parameter is specified, the command displays the quota report for the quota rules that have the specified index.

[-tree <qtree name>] - Qtree Name
If this parameter is specified, the command displays the quota report for the quota rules that have the specified qtree name.

[-quota-type <text>] - Quota Type
If this parameter is specified, the command displays the quota report for the quota rules of the given type.

[-quota-target <text>, ...] - Quota Target
If this parameter is specified, the command displays the quota report for the quota rules that have the specified quota target.

[-quota-target-id <text>, ...] - Quota Target ID
If this parameter is specified, the command displays the quota report for the quota rules that have the specified quota target identifier.

[-disk-used <integer> [KB|MB|GB|TB|PB]] - Disk Space Used
If this parameter is specified, the command displays the quota report for the quota rules that have the specified disk space used value.

[-disk-limit <integer> [KB|MB|GB|TB|PB]] - Disk Space Limit
If this parameter is specified, the command displays the quota report for the quota rules that have the specified disk space limit.

[-files-used <integer>] - Files Used
If this parameter is specified, the command displays the quota report for the quota rules that have the specified files used value.
[-file-limit <integer>] - Files Limit
If this parameter is specified, the command displays the quota report for the quota rules that have the specified file limit.

[-threshold <integer> [KB|MB|GB|TB|PB]] - Disk Space Threshold
If this parameter is specified, the command displays the quota report for the quota rules that have the specified threshold for disk space limit.

[-soft-disk-limit <integer> [KB|MB|GB|TB|PB]] - Soft Disk Space Limit
If this parameter is specified, the command displays the quota report for the quota rules that have the specified soft disk space limit.

[-soft-file-limit <integer>] - Soft Files Limit
If this parameter is specified, the command displays the quota report for the quota rules that have the specified soft file limit.

[-quota-specifier <text>] - Quota Specifier
If this parameter is specified, the command displays the quota report for the quota rules that have the specified quota specifier.

[-path <text>] - Path
If this parameter is specified, the command will display the quota report for the quota rules that are applicable for the file in the specified path. The format of the path to the file should begin with /vol/<volume name>/. The quota rules that are applicable typically consists of the tree quota rule corresponding to the qtree in which the file resides within the volume, user quota rule at the volume and qtree level corresponding to the UNIX user identifier or the Windows security identifier associated with the file and the group quota rule at the volume and qtree level corresponding to the UNIX group identifier associated with the file.

Examples
The following example displays the quota report for all the volumes.

```
cluster1::> volume quota report
Vserver: vs0

The following example shows how to monitor the quota report for a particular user/tree/group. First, the quota report command is issued with `-instance` to see the index field for the quota report entry we are interested in. Next, the quota report is issued with the `-index` field specified to fetch only that particular quota report entry repeatedly to view the usage over time.

```
cluster1::> volume quota report -vserver vs0 -volume vol1 -quota-type user -quota-target john -tree q1 -instance
```

Vserver Name: vs0
Volume Name: vol1
Index: 10

volume quota resize

Resize quotas for volumes

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command resizes the quota limits for the quotas currently in effect for the specified volume. It creates a job to resize quotas. This command is not supported on Infinite Volumes. You can monitor the progress of the job by using the job show and job watch-progress commands.

Note: Quotas must be activated before quota limits can be resized.

Parameters

-vserver <vserver name> - Vserver Name
This specifies the name of the Vserver on which the volume is located.

-volume <volume name> - Volume Name
This specifies the name of the volume on which you are resizing the quota limits and threshold.
foreground [true] - Foreground Process

This optionally specifies whether the job created for resizing quotas runs as a foreground process. The default setting is false (that is, the operation runs in the background). When set to true, the command will not return until the job completes.

Examples

The following example resizes quotas on the volume named vol1, which exists on Vserver vs0.

```
cluster1::> volume quota resize -vserver vs0 -volume vol1
[Job 34] Job is queued: Quota RESIZE Operation on vserver vs0 volume vol1.
```

The following example uses a 7G-compatible command to resize quotas on the volume named vol1 which exists on Vserver vs0.

```
cluster1::> vserver context vs0
vs0::> quota resize vol1
[Job 35] Job is queued: Quota RESIZE Operation on vserver vs0 volume vol1.
```

volume quota show

Display quota state for volumes

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

This command displays information about quotas for online volumes. The command output depends on the parameters specified with the command. Quotas can only be administered on FlexVol volumes. This command is not supported on Infinite Volumes.

If no parameters are specified, the command displays the following information for all volumes:

• Vserver name
• Volume name
• Quota state - quota state for this volume. The possible values are as follows:
  ○ off - this state indicates that quotas are deactivated for the volume.
  ○ on - this state indicates that quotas are activated for the volume.
  ○ initializing - this state indicates that quotas are being initialized for the volume.
  ○ resizing - this state indicates that quota limits are being resized for the volume.
  ○ corrupt - this state indicates that quotas are corrupt for this volume.
• Scan status - percentage of the files in the volume scanned by the quota scanner that runs as part of activating quotas.
• Last error - most recently generated error message as part of the last quota operation (on or resize). Present only if an error has been generated.
To display detailed information about all volumes, run the command with the \texttt{-instance} parameter. The detailed view provides all of the information in the previous list and the following additional information:

- **Logging messages** - whether quota exceeded syslog/EMS messages are logged or not. For volumes where the quota logging parameter is set to \texttt{on}, quota exceeded messages are generated when a NFS/CIFS operation or any internal Data ONTAP operation is being prevented because the quota disk usage is exceeding the disk limit or the quota file usage is exceeding the file limit. For quotas where the logging parameter is set to \texttt{off}, no quota exceeded messages are generated.

- **Logging interval** - frequency with which quota exceeded messages are logged. This parameter only applies to volumes that have the logging parameter set to \texttt{on}.

- **Sub status** - additional status about quotas for this volume. Following are the possible values reported:
  - \texttt{upgrading} - this indicates that the quota metadata format is being upgraded from an older version to a newer version for the volume.
  - \texttt{setup} - this indicates that the quotas are being setup on the volume.
  - \texttt{transferring rules} - this indicates that the quota rules are being transferred to the volume.
  - \texttt{scanning} - this indicates that the quota filesystem scanner is currently running on the volume.
  - \texttt{finishing} - this indicates that the quota on or resize operation is in the final stage of the operation.
  - \texttt{done} - this indicates that the quota operation is finished.
  - \texttt{none} - this indicates that there is no additional status.

- **All errors** - collection of all the error messages generated as part of the last quota operation (\texttt{on} or \texttt{resize}) since the volume was online.

- **User quota enforced** (advanced privilege only) - indicates whether there are user quota rules being enforced.

- **Group quota enforced** (advanced privilege only) - indicates whether there are group quota rules being enforced.

- **Tree quota enforced** (advanced privilege only) - indicates whether there are tree quota rules being enforced.

**Parameters**

\{\texttt{-fields <fieldname>,...}\}

If you specify the \texttt{-fields <fieldname>,...} parameter, the command output also includes the specified field or fields. You can use \texttt{-fields ?} to display the fields to specify.

\{\texttt{-logmsg}\}

If this parameter is specified, the command displays whether quota exceeded messages are logged and the logging interval for the quota messages.

\{\texttt{-instance}\}

If you specify the \texttt{-instance} parameter, the command displays detailed information about all fields.

\texttt{-vserver <vserver name>} - Vserver Name

If this parameter is specified, the command displays information for the volumes in the specified Vserver.

\texttt{-volume <volume name>} - Volume Name

If this parameter is specified, the command displays information for the specified volume.

\texttt{-state <quota_state>} - Quota State

If this parameter is specified, the command displays information for the volumes that have the specified quota state.
[-scan-status <percent>] - Scan Status
If this parameter is specified, the command displays information about the volumes whose scan-status matches the specified percentage value. The scan status is displayed in the format [0-100]%.

[-logging (on|off)] - Logging Messages
If this parameter is specified, the command displays information about the volumes that have the specified logging setting.

[-logging-interval <text>] - Logging Interval
If this parameter is specified, the command displays information about the volumes that have the specified quota logging interval.

[-sub-status <text>] - Sub Quota Status
If this parameter is specified, the command displays information about the volumes that have the specified quota sub-status.

[-last-error <text>] - Last Quota Error Message
If this parameter is specified, the command displays information about the volumes whose last error matches the specified error message.

[-errors <text>] - Collection of Quota Errors
If this parameter is specified, the command displays information about the volumes whose collection of errors match the specified error message.

[-is-user-quota-enforced {true|false}] - User Quota enforced (privilege: advanced)
If this parameter is specified, the command displays information about the volumes that have the specified value for this field.

[-is-group-quota-enforced {true|false}] - Group Quota enforced (privilege: advanced)
If this parameter is specified, the command displays information about the volumes that have the specified value for this field.

[-is-tree-quota-enforced {true|false}] - Tree Quota enforced (privilege: advanced)
If this parameter is specified, the command displays information about the volumes that have the specified value for this field.

Examples
The following example displays information about all volumes on the Vserver named vs0.

cluster1::> volume quota show -vserver vs0

<table>
<thead>
<tr>

Vserver Name: vs0
Volume Name: vol1
Quota State: on
Scan Status: -
Logging Messages: on
Logging Interval: 1h
Sub Quota Status: none
Last Quota Error Message: second definition for user2 (type:user target:user2,user4 qtree:"").
Collection of Quota Errors: second definition for user1 (type:user target:user1,user3 qtree:"").
second definition for user2 (type:user target:user2,user4 qtree:"").
```

---

**volume quota policy commands**

Manage quota policies for a Vserver

**volume quota policy copy**

Copy a quota policy

**Availability:** This command is available to cluster and Vserver administrators at the `admin` privilege level.

**Description**

This command copies a quota policy and the rules it contains. This command is not supported on Infinite Volumes. You must enter the following information to copy a quota policy:

- Vserver name
- Policy name
- New policy name

**Parameters**

- `-vserver <vserver name> - Vserver`
  This parameter specifies the Vserver from which you are copying the quota policy.

- `-policy-name <text> - Policy Name`
  This parameter specifies the name of the quota policy you are copying.

- `-new-policy-name <text> - New Policy Name`
  This parameter specifies the name of the new quota policy you are copying to. The new name cannot have more than 32 characters.

**Examples**

The following example copies a quota policy named `quota_policy_0` on Vserver vs0. It is copied to `quota_policy_1`.

```
class1::> volume quota policy copy -vserver vs0 -policy-name quota_policy_0 -new-policy-name quota_policy_1
```
volume quota policy create

Create a quota policy

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
A quota policy is collection of quota rules for all the volumes in a specific Vserver. This command creates a quota policy for a specific Vserver. Multiple quota policies can be created for a Vserver, but only one of them can be assigned to the Vserver. A Vserver can have a maximum of five quota policies. If five quota policies already exist, the command fails and a quota policy must be deleted before another quota policy can be created. This command is not supported on Infinite Volumes.

When you turn on quotas for a volume, the quota rules to be enforced on that volume will be picked from the quota policy that is assigned to the Vserver containing that volume. The quota policy for clustered volumes is equivalent to the /etc/quotas file in 7G.

You must enter the following information to create a quota policy:

- Vserver name
- Policy name

Parameters
-vserver <vserver name> - Vserver
This parameter specifies the Vserver for which you are creating the quota policy. You can create a quota policy only for a data Vserver. Quota policies cannot be created for a node or admin Vserver.

-policy-name <text> - Policy Name
This parameter specifies the name of the quota policy you are creating. The quota policy name cannot be more than 32 characters long and must be unique within the Vserver.

Examples
The following example creates a quota policy named quota_policy_0 on Vserver vs0.

```
cluster1::> volume quota policy create -vserver vs0 -policy-name quota_policy_0
```

volume quota policy delete

Delete a quota policy

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command deletes a quota policy and all the rules it contains. The policy can be deleted only when it is not assigned to the Vserver. This command is not supported on Infinite Volumes. You must enter the following information to delete a quota policy:

- Vserver name
- Policy name

Parameters
-vserver <vserver name> - Vserver
This parameter specifies the Vserver containing the quota policy you want to delete.

-policy-name <text> - Policy Name
This parameter specifies the name of the quota policy you want to delete.
Examples
The following example deletes a quota policy named quota_policy_5 on Vserver vs0.

```
cluster1::> volume quota policy delete -vserver vs0 -policy-name quota_policy_5
```

volume quota policy rename

Rename a quota policy

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command renames a quota policy. This command is not supported on Infinite Volumes. You must enter the following information to rename a quota policy:

- Vserver name
- Policy name
- New policy name

Parameters
```
-vserver <vserver name> - Vserver
```
This parameter specifies the Vserver containing the quota policy you want to rename.

```
-policy-name <text> - Policy Name
```
This parameter specifies the name of the quota policy you are renaming.

```
-new-policy-name <text> - New Policy Name
```
This parameter specifies the new name of the quota policy. The new name cannot be more than 32 characters long.

Examples
The following example renames a quota policy named quota_policy_0 on Vserver vs0. The policy's new name is quota_policy_1.

```
cluster1::> volume quota policy rename -vserver vs0 -policy-name quota_policy_0 -new-policy-name quota_policy_1
```

volume quota policy show

Display the quota policies

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command displays information about quota policies. This command is not supported on Infinite Volumes. The command displays the following information about all quota policies:

- Vserver name
- Policy name
- When the policy was last modified
Parameters

{[-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance ]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver

If this parameter is specified, the command displays information about the quota policies for the specified Vserver.

[-policy-name <text>] - Policy Name

If this optional parameter is specified, the command displays information about quota policies that match the specified name.

[-last-modified <MM/DD/YYYY HH:MM:SS>] - Last Modified

If this optional parameter is specified, the command displays information about quota policies with the last modified time that match the given time.

Examples

The following example displays information about all quota policies.

cluster1::> volume quota policy show
Vserver            Policy Name           Last Modified
---------------    --------------------   ----------------
vs0                quota_policy_vs0       10/16/2008 17:40:05
vs1                quota_policy_vs1       10/16/2008 17:47:45
vs2                quota_policy_vs2       10/16/2008 17:44:13
vs3                quota_policy_vs3       10/16/2008 17:44:13
4 entries were displayed.

The following example displays information about all quota policies along with the policy ID in the diagnostic privilege.

cluster1::> set -privilege diagnostic
Warning: These diagnostic commands are for use by NetApp personnel only.
Do you wish to continue? (y or n): y

volume quota policy rule commands

Manage the rules for a quota policy

volume quota policy rule create

Create a new quota rule

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

This command creates a quota policy rule. This command is not supported on Infinite Volumes. You must enter the following information to create a quota policy rule:
You can optionally specify the following additional attributes for the quota policy rule:

- User mapping
- Hard disk limit
- Hard file limit
- Threshold for disk limit
- Soft disk limit
- Soft file limit

**Note:** For a new quota policy rule to get enforced on the volume, you should create the rule in the quota policy assigned to the Vserver. Additionally, a quota off and on or a quota resize operation must be done using the "volume quota modify" command.

### Parameters

- **-vserver <vserver name>** - Vserver
  
  This parameter specifies the Vserver containing the quota policy for which you are creating a rule.

- **-policy-name <text>** - Policy Name
  
  This parameter specifies the name of the quota policy in which you are creating a rule.

- **-volume <volume name>** - Volume Name
  
  This parameter specifies the name of the volume for which you are creating a rule.

- **-type {tree|user|group}** - Type
  
  This parameter specifies the quota target type of the rule you are creating.

- **-target <text>** - Target
  
  This parameter specifies the target to which the quota policy rule applies. For default quota rules, this parameter should be specified as "". For explicit tree quotas rules, this parameter should indicate the qtree name. For explicit user quota rules, this parameter can contain UNIX user name, UNIX user identifier, Windows user name, Windows Security Identifier or a path to an existing object within the volume. If a name contains a space, enclose the entire value in quotes. A UNIX user name cannot include a backslash (\) or an @ sign; user names with these characters are treated as Windows names. For multi-user quotas, this parameter can contain multiple user targets separated by a comma. For explicit group quota rules, this parameter can contain UNIX group name or UNIX group identifier or a path to an existing object within the volume. When a path is specified as the target, it should be of the format /vol/<vol-name>/<path to file from volume root> where the volume matches that of the -volume parameter.

- **-qtree <qtree name>** - Qtree Name
  
  This parameter specifies the name of the qtree to which the quota rule applies. This parameter is not applicable for tree type rules. For user or group type rules at the volume level, this parameter should contain "". 
[-user-mapping {on|off}] - User Mapping

This parameter optionally specifies if user mapping needs to be performed for a user quota rule. If this parameter is "on", the UNIX user name specified as the quota target will be mapped to the corresponding Windows user name or vice-versa and quota accounting will be performed for the users together. The mapping will be obtained as configured in "vserver name-mapping".

Note that this parameter can be specified only for quota policy rules of type user. A value of "on" can be specified for this parameter only if the quota target is a UNIX user name or a Windows user name and cannot be specified for multi-user quota targets.

[-disk-limit [<size>|-]] - Disk Limit

This parameter optionally specifies a hard limit for the disk space that can be consumed by the quota target. The default unit for the disk limit is assumed to be Kilobytes if no units are specified. When the hard disk space limit is reached, no additional disk space can be consumed by the specified target. The value that you specify for this parameter should be greater than or equal to the threshold and soft disk limit. A disk limit of unlimited can be specified with a "-" for this parameter or by not specifying this parameter and will be indicated by a "-". The maximum value is 1,125,899,906,842,620 KB, which is approximately 1,023 PB. The value should be a multiple of 4 KB. If it is not, this field can appear incorrect in quota reports. This happens because the field is always rounded up to the nearest multiple of 4 KB to match disk space limits, which are translated into 4-KB disk blocks. The value can be larger than the amount of disk space available in the volume.

[-file-limit [<integer>|-]] - Files Limit

This parameter optionally specifies a hard limit for the number of files permitted on the quota target. When the hard number of files limit is reached, no additional files can be created by the specified target. The value that you specify for this parameter should be greater than or equal to the soft file limit. A file limit of unlimited can be specified with a "-" for this parameter or by not specifying this parameter and will be indicated by a "-". The maximum value is 4,294,967,295.

[-threshold [<size>|-]] - Threshold for Disk Limit

This parameter optionally specifies the disk limit threshold for the quota target. The default unit for the disk limit threshold is assumed to be Kilobytes if no units are specified. When the disk limit threshold is exceeded, a console message, EMS events, and SNMP traps are generated. The value that you specify for this parameter should be greater than or equal to the soft disk limit and equal to or less than the disk limit. A threshold of unlimited can be specified with a "-" for this parameter or by not specifying this parameter and will be indicated by a "-". The maximum value is 1,125,899,906,842,620 KB, which is approximately 1,023 PB. The value should be a multiple of 4 KB. If it is not, this field can appear incorrect in quota reports. This happens because the field is always rounded up to the nearest multiple of 4 KB to match disk space limits, which are translated into 4-KB disk blocks.

[-soft-disk-limit [<size>|-]] - Soft Disk Limit

This parameter optionally specifies a soft limit for the disk space that can be consumed by the quota target. The soft disk limit indicates that the hard limit for the disk space will soon be exceeded. The default unit for the soft disk limit is assumed to be Kilobytes if no units are specified. When the soft limit for the disk space is exceeded, a console message, EMS events and SNMP traps are generated. The same happens when the disk space used goes below the specified limit. The value that you specify for this parameter should be equal to or less than the threshold and the disk limit. A soft disk limit of unlimited can be specified with a "-" for this parameter or by not specifying this parameter and will be indicated by a "-". The maximum value is 1,125,899,906,842,620 KB, which is approximately 1,023 PB. The value should be a multiple of 4 KB. If it is not, this field can appear incorrect in quota reports. This happens because the field is always rounded up to the nearest multiple of 4 KB to match disk space limits, which are translated into 4-KB disk blocks.

[-soft-file-limit [<integer>|-]] - Soft Files Limit

This parameter optionally specifies a soft limit for the number of files permitted on the quota target. The soft file limit indicates that the hard limit for the number of files will soon be exceeded. When the soft limit for the number of files is exceeded, a console message, EMS events and SNMP traps are generated. The same happens when the files used goes below the specified limit. The value that you specify for this parameter
should be equal to or less than the file limit. A soft file limit of unlimited can be specified with a "-" for this parameter or by not specifying this parameter and will be indicated by a "-". The maximum value is 4,294,967,295.

**Examples**

The following example creates a default tree quota rule for volume `vol0` in Vserver `vs0` and in the quota policy named `quota_policy_0`. This quota policy applies to all qtrees on volume `vol0`.

```bash
cluster1::> volume quota policy rule create -vserver vs0
      -policy-name quota_policy_0 -volume vol0 -type user -target ""
```

The following example creates a quota policy rule for volume `vol0` in Vserver `vs0` and in the quota policy named `quota_policy_0`. This quota policy applies to the UNIX user `myuser` for a qtree named `qtree1` on volume `vol0` with a disk limit of 20 Gigabytes, soft disk limit of 15.4 Gigabytes and threshold limit of 15.4 Gigabytes. User mapping is turned on for this rule.

```bash
cluster1::> volume quota policy rule create -vserver vs0
      -policy-name quota_policy_0 -volume vol0 -type user -target myuser
      -qtree qtree1 -user-mapping on -disk-limit 20GB -soft-disk-limit 15.4GB
      -threshold 15.4GB
```

The following example creates a quota policy rule for volume `vol0` in Vserver `vs0` and in the quota policy named `quota_policy_0`. This quota policy applies to the Windows user `DOMXYZ\myuser` for a qtree named `qtree1` on volume `vol0` with a file limit of 40000 and a soft file limit of 26500. User mapping is turned on for this rule.

```bash
cluster1::> volume quota policy rule create -vserver vs0
      -policy-name quota_policy_0 -volume vol0 -type user -target DOMXYZ\myuser
      -qtree qtree1 -user-mapping on -file-limit 40000 -soft-file-limit 26500
```

The following example creates a quota policy rule for volume `vol0` in Vserver `vs0` and in the quota policy named `quota_policy_0`. This quota policy applies to the UNIX user identifier `12345` for a qtree named `qtree1` on volume `vol0`.

```bash
cluster1::> volume quota policy rule create -vserver vs0
      -policy-name quota_policy_0 -volume vol0 -type user -target 12345
      -qtree qtree1
```

The following example creates a quota policy rule for volume `vol0` in Vserver `vs0` and in the quota policy named `quota_policy_0`. This quota policy applies to the Windows Security Identifier `S-123-456-789` for a qtree named `qtree1` on volume `vol0`.

```bash
cluster1::> volume quota policy rule create -vserver vs0
      -policy-name quota_policy_0 -volume vol0 -type user -target S-123-456-789
      -qtree qtree1
```

The following example creates a quota policy rule for volume `vol0` in Vserver `vs0` and in the quota policy named `quota_policy_0`. This quota policy applies to the UNIX group `engr` for a qtree named `qtree1` on volume `vol0`.

```bash
cluster1::> volume quota policy rule create -vserver vs0
      -policy-name quota_policy_0 -volume vol0 -type group -target engr
      -qtree qtree1
```

The following example creates a quota policy rule for volume `vol0` in Vserver `vs0` and in the quota policy named `quota_policy_0`. This quota policy applies to the user who is the owner of the file `/vol/vol0/qtree1/file1.txt` for qtree `qtree1` on volume `vol0`.

```bash
cluster1::> volume quota policy rule create -vserver vs0
      -policy-name quota_policy_0 -volume vol0 -type user -target domxyz\myuser
      -qtree qtree1
```

```bash
cluster1::> volume quota policy rule create -vserver vs0
      -policy-name quota_policy_0 -volume vol0 -type user -target S-123-456-789
      -qtree qtree1
```

```bash
cluster1::> volume quota policy rule create -vserver vs0
      -policy-name quota_policy_0 -volume vol0 -type group -target engr
      -qtree qtree1
```

```bash
cluster1::> volume quota policy rule create -vserver vs0
      -policy-name quota_policy_0 -volume vol0 -type user -target domxyz\myuser
      -qtree qtree1
```
cluster1::> volume quota policy rule create -vserver vs0 -policy-name quota_policy_0 -volume vol0 -type user -target /vol/vol0/qtree1/file1.txt -qtree qtree1

The following example creates a quota policy rule for volume vol0 in Vserver vs0 and in the quota policy named quota_policy_0. This quota policy applies to the users specified in the target for qtree qtree1 on volume vol0.

cluster1::> volume quota policy rule create -vserver vs0 -policy-name quota_policy_0 -volume vol0 -type user -target user1,DOMXYZ\user2,23457,S-126-098-567,/vol/vol0/qtree1/file2.txt -qtree qtree1

volume quota policy rule delete

Delete an existing quota rule

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The volume quota policy rule delete command deletes a quota policy rule. This command is not supported on Infinite Volumes. You must enter the following information to delete a quota policy rule:

• Vserver name
• Quota policy name
• Volume name
• Quota target type
• Target to which the rule applies
• Qtree to which the rule applies

Note: If the rule being deleted belongs to the quota policy that is currently assigned to the Vserver, enforcement of the rule on the volume must be terminated by performing a quota off and on or a quota resize operation using the "volume quota modify" command.

Parameters

-vserver <vserver name> - Vserver
This parameter specifies the Vserver containing the quota policy for which you are deleting a rule.

-policy-name <text> - Policy Name
This parameter specifies the name of the quota policy in which you are deleting a rule.

-volume <volume name> - Volume Name
This parameter specifies the name of the volume for which you are deleting a rule.

-type {tree|user|group} - Type
This parameter specifies the quota target type for the rule.

-target <text> - Target
This parameter specifies the target to which the quota policy rule applies.
-qtree <qtree name> - Qtree Name

This parameter specifies the name of the qtree for which you are deleting a rule.

Examples
The following example deletes a quota policy rule on Vserver vs1 for the quota policy named quota_policy_1. This quota policy applies to the group named engr for the qtree named qtree1 on volume vol1.

cluster1::> volume quota policy rule delete -vserver vs1
   -policy-name quota_policy_1 -volume vol1 -type group -target engr
   -qtree qtree1

volume quota modify on page 1329

volume quota policy rule modify

Modify an existing quota rule

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command can be used to modify the following attributes of a quota policy rule:

- User mapping
- Hard disk limit
- Hard file limit
- Threshold for disk limit
- Soft disk limit
- Soft file limit

Note: If the rule being modified belongs to the quota policy that is currently assigned to the Vserver, rule enforcement on the volume must be enabled by performing a quota off and on or a quota resize operation using the "volume quota modify" command.

This command is not supported on Infinite Volumes.

Parameters
-vserver <vserver name> - Vserver
This parameter specifies the Vserver containing the quota policy for which you are modifying a rule.

-policy-name <text> - Policy Name
This parameter specifies the name of the quota policy in which you are modifying a rule.

-volume <volume name> - Volume Name
This parameter specifies the name of the volume for which you are modifying a rule.

-type {tree|user|group} - Type
This parameter specifies the quota target type for the rule you are modifying.

-target <text> - Target
This parameter specifies the target to which the quota policy rule applies. If the target is a user, the user ID or username must be the same one that was used to create the quota. The same restriction is there for both group ID or groupname and Windows SID or Windows account name.
-qtree <qtree name> - Qtree Name

This parameter specifies the name of the qtree to which the quota policy rule applies.

[--user-mapping {on|off}] - User Mapping

This parameter optionally modifies the user mapping for a user quota rule. The value for this parameter can be modified only for quota policy rules of type user. A value of "on" can be specified for this parameter only if the quota target is a unix user name or a Windows user name and cannot be specified for multi-user quota targets. If this parameter is "on", the unix user name specified as the quota target will be mapped to the corresponding Windows user name or vice-versa and quota accounting will be performed for the users together.

[--disk-limit [<size>|-]] - Disk Limit

This parameter optionally modifies the hard limit for the disk space that can consumed by the quota target. The default unit for the disk limit is assumed to be Kilobytes if no units are specified. The value that you specify for this parameter should be greater than or equal to the threshold and soft disk limit. A disk limit of unlimited can be specified with a "-" for this parameter.

[--file-limit [<integer>|-]] - Files Limit

This parameter optionally modifies the hard limit for the number of files permitted on the quota target. The value that you specify for this parameter should be greater than or equal to the soft file limit. A file limit of unlimited can be specified with a "-" for this parameter.

[--threshold [<size>|-]] - Threshold for Disk Limit

This parameter optionally modifies the disk limit threshold for the quota target. The default unit for the disk limit threshold is assumed to be Kilobytes if no units are specified. The value that you specify for this parameter should be greater than or equal to the soft disk limit and equal to or less than the disk limit. A threshold limit of unlimited can be specified with a "-" for this parameter.

[--soft-disk-limit [<size>|-]] - Soft Disk Limit

This parameter optionally modifies the soft limit for the disk space that can be consumed by the quota target. The default unit for the soft disk limit is assumed to be Kilobytes if no units are specified. The value that you specify for this parameter should be equal to or less than the threshold and the disk limit. A soft disk limit of unlimited can be specified with a "-" for this parameter.

[--soft-file-limit [<integer>|-]] - Soft Files Limit

This parameter optionally modifies the soft limit for the number of files permitted on the quota target. The value that you specify for this parameter should be equal to or less than the file limit. A soft file limit of unlimited can be specified with a "-" for this parameter.

Examples

The following example modifies a quota policy rule for the quota policy named quota_policy_0. This quota policy exists on Vserver vs0 and applies to the user named myuser for qtree named qtree1 on volume vol0. The user mapping is turned on, the hard disk limit is set to 20 GB and the hard file limit is set to 100,000 files.

```
cluster1::> volume quota policy rule modify -vserver vs0
   -policy-name quota_policy_0 -volume vol0 -type user -target myuser
   -qtree qtree1 -user-mapping on -disk-limit 20GB -file-limit 100000
```

volume quota modify on page 1329

volume quota policy rule show

Display the quota rules

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.
**Description**
This command displays the following information about quota policy rules by default.

- Vserver name
- Quota policy name
- Volume name
- Type of quota policy rule
- Target of the quota policy rule
- Qtree name
- User mapping
- Hard disk limit
- Soft disk limit
- Hard file limit
- Soft file limit
- Threshold for disk limit

This command is not supported on Infinite Volumes.

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance]
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[-vserver <vserver name>] - Vserver
```

If this parameter is specified, the command displays information about quota rules for the quotas contained on volumes on the specified Vserver.

```
[-policy-name <text>] - Policy Name
```

If this parameter is specified, the command displays information about quota rules for the specified quota policy.

```
[-volume <volume name>] - Volume Name
```

If this parameter is specified, the command displays information about quota rules for the quota policy associated with the specified volume.

```
[-type {tree|user|group}] - Type
```

If this parameter is specified, the command displays information about quota rules for the specified quota type.

```
[-target <text>] - Target
```

If this parameter is specified, the command displays information about quota rules for the specified target.

```
[-qtree <qtree name>] - Qtree Name
```

If this parameter is specified, the command displays information about quota rules for the specified qtree.

```
[-user-mapping {on|off}] - User Mapping
```

If this parameter is specified, the command displays information about quota rules having the specified user-mapping value.
[-disk-limit (<size> | -)] - Disk Limit
If this parameter is specified, the command displays information about quota rules having the specified hard
disk limit.

[-file-limit (<integer> | -)] - Files Limit
If this parameter is specified, the command displays information about quota rules having the specified hard
file limit.

[-threshold (<size> | -)] - Threshold for Disk Limit
If this parameter is specified, the command displays information about quota rules having the specified disk
limit threshold.

[-soft-disk-limit (<size> | -)] - Soft Disk Limit
If this parameter is specified, the command displays information about quota rules having the specified soft
disk limit.

[-soft-file-limit (<integer> | -)] - Soft Files Limit
If this parameter is specified, the command displays information about quota rules having the specified soft
file limit.

Examples
The following example displays information about all the quota policy rules in a cluster. There is one user rule that exists
on Vserver vs0 for the quota policy named quota_policy_0. This quota policy applies to the user named myuser for qtree
named qtree0 on volume vol0.

```
cluster1::> volume quota policy rule show
Vserver: vs0      Policy: quota_policy_0           Volume: vol0

User       Disk     Disk   Files    Files
Type   Target  Qtree  Mapping   Limit    Limit   Limit    Limit  Threshold
-----  ------  ------ ------- -------  -------  ------  -------  ---------
tree   myuser  qtree0 on         20GB     18GB  100000    80000       16GB
```

volume quota policy rule count commands
Display count of quota rules

volume quota policy rule count show
Display count of quota rules

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command displays various counts of quota policy rules defined within a quota policy. By default, the subtotal for each
volume is displayed. Optionally, the command can provide the total rule count across the entire quota policy or detailed
subtotals organized by qtree and quota rule type.

Parameters
{-fields <fieldname>, ...}
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified
field or fields. You can use `-fields ?' to display the fields to specify.

| [-detail] |
Displays rule count subtotals for each quota rule type. The subtotals for each type are computed for a specific
volume and qtree.
Displays rule count subtotals in hierarchical format with subtotals at the quota policy, volume, qtree, and quota rule type levels.

Displays the total rule count for each Vserver and quota policy.

Displays detailed information about all fields.

Displays quota rule counts for the specified Vserver.

Displays quota rule counts for the specified quota policy.

Displays quota rule counts for the specified volume.

Displays quota rule counts for the specified qtree.

Displays quota rule counts for the specified quota rule type.

Subtotal of rules matching the given Vserver, quota policy, volume, qtree, and quota rule type. If specified as input, only matching totals are displayed.

Subtotal of rules matching the given Vserver, quota policy, volume, and qtree. All quota rule types are included. If specified as input, only matching totals are displayed.

Subtotal of rules matching the given Vserver, quota policy, volume, and quota rule type. All qtrees are included. If specified as input, only matching totals are displayed.

Subtotal of rules matching the given Vserver, quota policy, and volume. All qtrees and quota rule types are included. If specified as input, only matching totals are displayed.

Subtotal of rules matching the given Vserver, quota policy, and quota rule type. All volumes and qtrees are included. If specified as input, only matching totals are displayed.

Total rule count matching the given Vserver and quota policy. All volumes, qtrees, and quota rule types are included. If specified as input, only matching totals are displayed.

The following example shows quota rule counts for Vserver vs0, quota policy default. The total number of rules in quota policy default is 7500. There are two volumes with quota rules configured. Volume volume0 has a total of 1000 rules, and volume1 has a total of 6500 rules.

```
cluster1::> volume quota policy rule count show -vserver vs0 -policy-name default
Vserver: vs0          Policy: default
          Rule     Count
Volume
```
volume reallocation commands

Commands for measuring and optimizing data layout

volume reallocation measure

Start reallocate measure job

Availability: This command is available to cluster administrators at the admin privilege level.

Description
Performs a measure-only reallocation check on a LUN, file, or volume. At the end of each check, the system logs the optimization results in the Event Message System (EMS). If you use the logfile, the system records detailed information about the LUN, file, or volume layout in the log file. To view previous measure-only reallocation checks, use the volume reallocation show command.

Note: This command is not supported for FlexGroups, FlexGroup Constituents, Infinite Volumes, or Infinite Volume constituents.

Parameters
-vserver <vserver name> - Vserver
  Specifies the Vserver.
-path <text> - Path
  Specifies the path of the reallocation for a LUN, file, or volume.

{ [-interval | -i <text>] - Interval Schedule
  Specifies the reallocation scan interval in
  • m for minutes
  • h for hours
  • d for days
  For example, 30m is a 30 minute interval. The countdown to the next scan begins after the first scan is complete.
  The default interval is 24 hours.

  | [-once | -o [true]] - Once
  Specifies that the job runs once and then is automatically removed from the system when set to true. If you use this command without specifying this parameter, its effective value is false and the reallocation scan runs as scheduled. If you enter this parameter without a value, it is set to true and a reallocation scan runs once.

[-logpath | -l <text>] - Log Path
  Specifies the path for reallocation logs.
[-threshold | -t <integer>] - Threshold

Specifies the threshold when a LUN, file, or volume is considered unoptimized and a reallocation should be performed. Once the threshold is reached, the system creates a diagnostic message that indicates that a reallocation might improve performance.

The threshold range is from 3 (the layout is moderately optimized) to 10 (the layout is not optimal). The threshold default is 4.

Examples

```
cluster1::> volume reallocation measure -path /vol/vol2 -once
[Job 167] Job is queued: Reallocation Job.
```

Related references

`volume reallocation show` on page 1359

volume reallocation off

Disable reallocate jobs

Availability: This command is available to `cluster` administrators at the `admin` privilege level.

Description

Disables all reallocation jobs globally in a cluster. After you use this command, you cannot start or restart any reallocation jobs. All jobs that are executing when you use this command are stopped. You must use the `reallocate on` command to enable or restart reallocation jobs globally in a cluster.

Note: This command is not supported for FlexGroups, FlexGroup constituents, Infinite Volumes, or Infinite Volume constituents.

Examples

```
cluster1::> volume reallocation off
```

Related references

`volume reallocation on` on page 1356

volume reallocation on

Enable reallocate jobs

Availability: This command is available to `cluster` administrators at the `admin` privilege level.

Description

Globally enables all reallocation jobs in a cluster. You must globally enable reallocation scans in the cluster before you can run a scan or schedule regular scans. Reallocation scans are disabled by default.

Note: This command is not supported for FlexGroups, FlexGroup constituents, Infinite Volumes, or Infinite Volume constituents.
volume reallocation quiesce

Quiesce reallocate job

Availability: This command is available to cluster administrators at the admin privilege level.

Description
Temporarily stops any reallocation jobs that are in progress. When you use this command, the persistent state is saved. You can use the `volume reallocation restart` command to restart a job that is quiesced.

There is no limit to how long a job can remain in the quiesced state.

Note: This command is not supported for FlexGroups, FlexGroup constituents, Infinite Volumes, or Infinite Volume constituents.

Parameters
- `vserver <vserver name>` - Vserver
  Specifies the Vserver.
- `path <text>` - Path
  Specifies the file path of the LUN, file, or volume that you want to stop temporarily.

Examples
```
cluster1::> volume reallocation quiesce /vol/vol2
2 entries were acted on.
```

Related references
`volume reallocation restart` on page 1357

volume reallocation restart

Restart reallocate job

Availability: This command is available to cluster administrators at the admin privilege level.

Description
Starts a reallocation job. Use this command to start a quiesced (temporarily stopped) job or a scheduled scan that is idle.

Note: This command is not supported on FlexGroups, FlexGroup constituents, or Infinite Volumes.

Parameters
- `vserver <vserver name>` - Vserver
  Specifies the Vserver.
- `path <text>` - Path
  Specifies the file path of the LUN, file, or volume on which you want to restart reallocation scans.
[-ignore-checkpoint | -i [true]] - Ignore Checkpoint

Restarts the job at the beginning when set to true. If you use this command without specifying this parameter, its effective value is false and the job starts the scan at the point where it stopped. If you specify this parameter without a value, it is set to true and the scan restarts at the beginning.

Examples

cluster1::> volume reallocation restart /vol/vol2
2 entries were acted on.

volume reallocation schedule

Modify schedule of reallocate job

Availability: This command is available to cluster administrators at the admin privilege level.

Description
Schedules a reallocation scan for an existing reallocation job. If the reallocation job does not exist, use the volume reallocation start command to define a reallocation job.

You can delete an existing reallocation scan schedule. However, if you do this, the job’s scan interval reverts to the schedule that was defined for it when the job was created with the volume reallocation start command.

Note: This command is not supported for FlexGroups, FlexGroup constituents, Infinite Volumes, or Infinite Volume constituents.

Parameters
- -vserver <vserver name> - Vserver
  Specifies the Vserver.
- -path <text> - Path
  Specifies the path of the reallocation for a LUN, file, or volume.
- [-del | -d [true]] - Delete
  Deletes an existing reallocation schedule when set to true. If you use this command without specifying this parameter, its effective value is false and the reallocation schedule is not deleted. If you specify this parameter without a value, it is set to true and the reallocation schedule is deleted.
- [-cron | -s <text>] - Cron Schedule
  Specifies the schedule with the following four fields in sequence. Use a space between field values. Enclose the values in double quotes.
  • minute is a value from 0 to 59.
  • hour is a value from 0 (midnight) to 23 (11:00 p.m.).
  • day of week is a value from 0 (Sunday) to 6 (Saturday).
  • day of month is a value from 1 to 31.

  Note: If you specify 31 as the value for the day of month, reallocation scans will not run in any months with fewer than 31 days.

Use an asterisk "*" as a wildcard to indicate every value for that field. For example, an * in the day of month field means every day of the month. You cannot use the wildcard in the minute field.

You can enter a number, a range, or a comma-separated list of values for a field.
volume reallocation commands

Examples

```
cluster1::> volume reallocation schedule -s "0 23 6 *" /vol/db/lun1
```

Related references

volume reallocation start on page 1360

volume reallocation show

Show reallocate job status

Availability: This command is available to cluster administrators at the admin privilege level.

Description
Displays the status of a reallocation scan, including the state, schedule, interval, optimization, and log files. If you do not specify the path for a particular reallocation scan, then the command displays all the reallocation scans.

Parameters

```
[-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-v]

Specify this parameter to display the output in a verbose format.

[-instance]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>]

Specify this parameter to display reallocation scans that match the Vserver that you specify.

[-path <text>]

Specify this parameter to display reallocation scans that match the path that you specify.

[-threshold | -t <integer>]

Specify this parameter to display reallocation scans that match the threshold that you specify.

[-id <integer>]

Specify this parameter to display reallocation scans that match the reallocation job ID that you specify.

[-description <text>]

Specify this parameter to display reallocation scans that match the text description that you specify.

[-state {Initial|Queued|Running|Waiting|Pausing|Paused|Quitting|Success|Failure|Reschedule|Error|Quit|Dead|Unknown|Restart|Dormant}]

Specify this parameter to display reallocation jobs that match the state that you specify.

[-progress <text>]

Specify this parameter to list the running reallocation jobs whose progress indicator matches the text that you provide. For example, if you specify "Starting ..." as the text string for the progress option, then the system lists all of the jobs that are starting.

[-schedule <job_schedule>]

Specify this parameter to display reallocation scans that match the schedule name that you specify. If you want a list of all job schedules, use the job schedule show command.
[-global-status <text>] - Global State of Scans

Specify this parameter to indicate if reallocation scans are on or off globally. You must type either of the following text strings:

• "Reallocation scans are on"
• "Reallocation scans are off"

Examples

cluster1::> volume reallocation show
Vserver     Description                 Schedule        State
-------     -----------                 --------        -----  
Reallocation scans are on
vs0         /vol/vol2,space-optimized   reallocate_1d   Queued

job schedule show on page 145

volume reallocation start

Start reallocate job

Availability: This command is available to cluster administrators at the admin privilege level.

Description

Begins a reallocation scan on a LUN, file, or volume when you specify the path. If a volume has several small files that would benefit from periodic optimization, specify the /vol/volname.

Before performing a reallocation scan, the reallocation job normally performs a check of the current layout optimization. If the current layout optimization is less than the threshold, then the system does not perform a reallocation on the LUN, file, or volume.

You can define the reallocation scan job so that it runs at a specific interval, or you can use the volume reallocation schedule command to schedule reallocation jobs.

Note: This command is not supported for FlexGroups, FlexGroup constituents, Infinite Volumes, or Infinite Volume constituents.

Parameters

-vserver <vserver name> - Vserver

Specifies the Vserver.

-path <text> - Path

Specifies the path of the reallocation for a LUN, file, or volume.

{-interval | -i <text>} - Interval Schedule

Specifies the reallocation scan interval in

• m for minutes
• h for hours
• d for days

For example, 30m is a 30 minute interval. The countdown to the next scan begins after the first scan is complete.
The default interval is 24 hours.

| [-once] [-o [true]] - Once
| Specifies that the job runs once and then is automatically removed from the system when set to true. If you use this command without specifying this parameter, its effective value is false and the reallocation scan runs as scheduled. If you enter this parameter without a value, it is set to true and a reallocation scan runs once.

| [-force] [-f [true]] - Force
| Performs a one-time full reallocation on a LUN, file, or volume when set to true. A forced reallocation rewrites blocks on a LUN, file, or volume unless the reallocation would result in worse performance. If you use this command without specifying this parameter, its effective value is false and a forced reallocation is not performed. If you specify this parameter without a value, it is set to true, and a forced reallocation is performed.

{ [-space-optimized] [-p [true]] - Space Optimized
| Specifies that snapshot blocks are not copied to save space when set to true. If you use this command without specifying this parameter, its effective value is false and snapshot blocks are copied. However, reads from snapshots might have a slightly higher latency. If you specify this parameter without a value, it is set to true and snapshot blocks are not copied. You cannot use the `space-optimized` option with the `unshare` option.

| [-unshare] [-u [true]] - Unshare Deduplicated Blocks
| Specifies that blocks that are shared by deduplication will be unshared. This option can help remove fragmentation caused on dense volumes. This may result in increased disk usage, especially for full reallocation. You cannot use the `unshare` option with the `space-optimized` option.

| [-threshold] [-t <integer>] - Threshold
| Specifies the threshold when a LUN, file, or volume is considered unoptimized and a reallocation should be performed. Once the threshold is reached, the system creates a diagnostic message that indicates that a reallocation might improve performance.

The threshold range is from 3 (the layout is moderately optimized) to 10 (the layout is not optimal). The threshold default is 4.

| [-no-check] [-n [true]] - No Threshold Check
| Does not check the current layout to determine if a reallocation is needed when set to true. If you use this command without specifying this parameter, its effective value is false and the system does check the current layout to determine if a reallocation is needed. If you specify this parameter without a value, it is set to true and the system does not check the current layout to determine if a reallocation is needed.

```
Examples

cluster1::> volume reallocation start -path /vol/vol2 -interval 30m
[Job 165] Job is queued: Reallocate Job.
```

`volume reallocation schedule` on page 1358

### volume reallocation stop

Stop reallocate job

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**

Stops and deletes any reallocation scans on a LUN, file, or volume. This command stops and deletes in-progress, scheduled, and quiesced scans.
Note: This command is not supported for FlexGroups, FlexGroup constituents, Infinite Volumes, or Infinite Volume constituents.

Parameters

-vserver <vserver name> - Vserver
  Specifies the Vserver.

-path <text> - Path
  Specifies the path of the reallocation for a LUN, file, or volume.

Examples

cluster1::> volume reallocation stop /vol/vol2
1 entry was deleted.

volume schedule-style commands

The schedule-style directory

volume schedule-style prepare-to-downgrade

Disables volume schedule style feature and sets schedule style to default (create-time)

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
This command will disable the volume schedule style feature and set schedule style to default (create-time).

Examples

The following example prepares the schedule-style on all volumes for revert/downgrade.

cluster1::*> volume schedule-style prepare-to-downgrade

Volume SnapLock Commands

Manages SnapLock attributes of a SnapLock volume

Manages SnapLock attributes in the system.

volume snaplock modify

Modify SnapLock attributes of a SnapLock volume

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The volume snaplock modify command modifies one or more SnapLock attributes of a SnapLock volume.

Parameters

-vserver <vserver name> - Vserver
  This specifies the vserver which owns the required SnapLock volume.
-volume <volume name> - Volume

This specifies the SnapLock volume whose attribute needs to be modified.

[-minimum-retention-period {{<integer> seconds|minutes|hours|days|months|years} | infinite}] - Minimum Retention Period

Specifies the minimum allowed retention period for files committed to WORM state on the volume. Any files committed with a retention period shorter than this minimum value, is assigned this minimum value.

If this option value is infinite, then every file committed to the volume will have a retention period that never expires.

Otherwise, the retention period is specified as a number followed by a suffix. The valid suffixes are seconds, minutes, hours, days, months, and years. For example, a value of 6months represents a retention period of 6 months. The maximum allowed retention period is 70 years. This option is not applicable while extending retention period of an already committed WORM file.

[-default-retention-period {{<integer> seconds|minutes|hours|days|months|years} | min | max | infinite}] - Default Retention Period

Specifies the default retention period that is applied to files while committing to WORM state without an associated retention period.

If this option value is min, then minimum-retention-period is used as the default retention period. If this option value is max, then maximum-retention-period is used as the default retention period. If this option value is infinite, then a retention period that never expires will be used as the default retention period.

The retention period can also be explicitly specified as a number followed by a suffix. The valid suffixes are seconds, minutes, hours, days, months, and years. For example, a value of 6months represents a retention period of 6 months. The maximum valid retention period is 70 years.

[-maximum-retention-period {{<integer> seconds|minutes|hours|days|months|years} | infinite}] - Maximum Retention Period

Specifies the maximum allowed retention period for files committed to WORM state on the volume. Any files committed with a retention period longer than this maximum value, is assigned this maximum value.

If this option value is infinite, then files that have retention period that never expires might be committed to the volume.

Otherwise, the retention period is specified as a number followed by a suffix. The valid suffixes are seconds, minutes, hours, days, months, and years. For example, a value of 6months represents a retention period of 6 months. The maximum allowed retention period is 70 years. This option is not applicable while extending retention period of an already committed WORM file.

[-autocommit-period {{<integer> hours} | none}] - Autocommit Period

Specifies the autocommit period for SnapLock volume. All files which are not modified for a period greater than the autocommit period of the volume are committed to WORM state.

The autocommit period option is specified as a number followed by a suffix. The valid suffix for autocommit period is hours. For example, a value of 2hours represents an autocommit period of 2 hours. The minimum allowed autocommit period is 2 hours and the maximum allowed autocommit period is 24 hours.

If this option value is none, then autocommit is disabled on the SnapLock volume.

[-privileged-delete {disabled|enabled|permanently-disabled}] - Privileged Delete

Specifies the privileged-delete attribute of a SnapLock volume. This parameter must be specified alone.

If it is set to enabled then the privileged-delete operation can be performed using the volume file privileged-delete command.

If it is set to disabled, then the privileged-delete operation is not supported.
Once it is set to \textit{permanently-disabled}, then neither the privileged-delete operation nor any change in the volume privileged-delete attribute is permitted.

\end{tabular}

\textbf{Related references} \\
\textit{volume file privileged-delete} on page 1282

\textbf{volume snaplock show} \\
Display SnapLock attributes of a SnapLock volume \\
\textbf{Availability:} This command is available to \textit{cluster} and \textit{Vserver} administrators at the \textit{admin} privilege level.

\textbf{Description} \\
The \texttt{volume snaplock show} command displays following information:

- Vserver name
- Volume name
- SnapLock Type of the volume
- Minimum retention period applicable of the volume
- Default retention period applicable of the volume
- Maximum retention period applicable of the volume
- Autocommit period of the volume
- Privileged Delete attribute of the volume
• Volume expiry time of the volume
• Volume ComplianceClock

This command is applicable only for SnapLock volumes.

Parameters
{
[ -fields <fieldname>, ... ]
   If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

[ -instance ]
   If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver
   If this parameter is specified, the command will display information for all the SnapLock volumes that match the specified -vserver value.

[-volume <volume name>] - Volume
   If this parameter is specified, the command will display information for the specified -volume value.

[-type {non-snaplock|compliance|enterprise}] - SnapLock Type
   If this parameter is specified, the command will display all the volumes that match the specified -type value.

[-minimum-retention-period {(<integer> seconds|minutes|hours|days|months|years) | infinite}] - Minimum Retention Period
   If this parameter is specified, the command will display all the volumes that match the specified -minimum-retention-period value.

[-default-retention-period {(<integer> seconds|minutes|hours|days|months|years) | min | max | infinite}] - Default Retention Period
   If this parameter is specified, the command will display all the volumes that match the specified -default-retention-period value.

[-maximum-retention-period {(<integer> seconds|minutes|hours|days|months|years) | infinite}] - Maximum Retention Period
   If this parameter is specified, the command will display all the volumes that match the specified -maximum-retention-period value.

[-autocommit-period {(<integer> hours) | none}] - Autocommit Period
   If this parameter is specified, the command will display all the volumes that match the specified -autocommit-period value.

[-privileged-delete {disabled|enabled|permanently-disabled}] - Privileged Delete
   If this parameter is specified, the command will display all the volumes that match the specified -privileged-delete value.

[-expiry-time <text>] - Expiry Time
   If this parameter is specified, the command will display all the volumes that match the specified -expiry-time value.

[-compliance-clock-time <text>] - ComplianceClock Time
   If this parameter is specified, the command will display all the volumes that match the specified -compliance-clock-time value.

Examples
The following command shows summary of SnapLock volumes on a vserver:
cluster1::> volume snaplock show
Vserver       Volume          SnapLock Type ComplianceClock Time
------------- --------------- ------------- -----------------------------------
vs1           vol_slc         compliance    Mon Jan 19 14:12:34 IST 2015 +05:30
vs1           vol_sle         enterprise    Mon Jan 19 14:12:34 IST 2015 +05:30
2 entries were displayed.
cluster1::>

The following commands lists the complete SnapLock attributes of two given SnapLock volumes:

```bash
cluster1::> volume snaplock show -vserver vs1 -volume vol_slc
Vserver Name: vs1
Volume Name: vol_slc
SnapLock Type: compliance
Minimum Retention Period: 1 years
Default Retention Period: max
Maximum Retention Period: 30 years
Autocommit Period: 12 hours
Privileged Delete: permanently-disabled
Expiry Time: Thu May 11 14:37:21 GMT 2017
ComplianceClock Time: Wed May 11 20:08:41 IST 2016 +05:30
```

```bash
cluster1::> volume snaplock show -vserver vs1 -volume vol_sle
Vserver Name: vs1
Volume Name: vol_sle
SnapLock Type: enterprise
Minimum Retention Period: 6 months
Default Retention Period: min
Maximum Retention Period: infinite
Autocommit Period: none
Privileged Delete: enabled
Expiry Time: infinite
ComplianceClock Time: Wed May 11 20:08:44 IST 2016 +05:30
```

## volume snapshot commands

**Manage snapshots**

The `volume snapshot` command enables you to manage volume Snapshot copies.

### volume snapshot compute-reclaimable

**Calculate the reclaimable space if specified snapshots are deleted**

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**

The `volume snapshot compute-reclaimable` command calculates the volume space that can be reclaimed if one or more specified Snapshot copies are deleted.

The command heavily uses system’s computational resources so it can reduce the performance for client requests and other system processes. Therefore, the queries that use queries that use query operators (`*`, `|`, etc.), are disabled for this command. You should not specify more than three Snapshot copies per query. Snapshot copies must be specified as a comma-separated list with no spaces after the commas.

This command is not supported on Infinite Volumes.
Parameters

`-vserver <vserver name>` - Vserver Name
This specifies the Vserver on which the volume is located.

`-volume <volume name>` - Volume Name
This specifies the volume for which reclaimable space is to be calculated.

`-snapshots <snapshot name>, ...` - List of Snapshots
This specifies one or more than one Snapshot copies that are to be considered for deletion. If you list more than one Snapshot copy, specify a comma-separated list with no spaces after the commas.

Examples

The following example calculates the space that can be reclaimed if the Snapshot copy named hourly.2008-01-10_1505 is deleted on a volume named vol3, which is a part of the Vserver named vs0:

```
cluster1::> volume snapshot compute-reclaimable -vserver vs0 -volume vol3 -snapshots hourly.2008-01-10_1505
```

volume snapshot create

Create a snapshot

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The `volume snapshot create` command creates a Snapshot copy of a specified volume.

Parameters

`-vserver <vserver name>` - Vserver
This specifies the Vserver that contains the volume on which the snapshot is to be created.

`-volume <volume name>` - Volume
This specifies the volume where a Snapshot copy is to be created.

`-snapshot <snapshot name>` - Snapshot
This specifies the name of the Snapshot copy that is to be created.

`[-comment <text>]` - Comment
This optionally specifies a comment for the Snapshot copy.

`[-foreground {true|false}]` - Foreground Process
If you use this option and select `false`, the Snapshot copy creation process runs in the background. If you use this option and select `true`, the Snapshot copy creation process runs in the foreground. This option applies only to Infinite Volumes, and is ignored for other volumes. The default is `true`.

`[-snapmirror-label <text>]` - Label for SnapMirror Operations
If you specify this option, the Snapshot copy is created with the SnapMirror Label that you specify. If this option is not specified, the Snapshot copy is created with no SnapMirror Label. The SnapMirror Label is used by the Vaulting subsystem when you back up Snapshot copies to the Vault Destination.

`[-expiry-time <MM/DD/YYYY HH:MM:SS>]` - Expiry Time
If you specify this option, the Snapshot copy is created with the expiry time that you specify. The expiry time indicates the time at which the Snapshot copy becomes eligible for deletion.
Examples
The following example creates a Snapshot copy named vol3_snap on a volume named vol3 on a Vserver named vs0. The Snapshot copy is given the comment "Single snapshot" and the operation runs in the background.

```
cluster1::> volume snapshot create -vserver vs0 -volume vol3 -snapshot vol3_snap -comment "Single snapshot" -foreground false
```

volume snapshot delete
Delete a snapshot

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `volume snapshot delete` command deletes a Snapshot copy from a specified volume.

**Parameters**
- `-vserver <vserver name>` - Vserver
  This specifies the Vserver that contains the volume on which the specified Snapshot copy is saved.
- `-volume <volume name>` - Volume
  This specifies the volume from which a Snapshot copy is to be deleted.
- `-snapshot <snapshot name>` - Snapshot
  This specifies the Snapshot copy that is to be deleted.
- `[-foreground {true|false}]` - Foreground Process
  If you use this option and set it to `false`, the delete operation runs as a background process. If you specify this option and set it to `true`, the operation runs as a foreground process. This option applies only to Infinite Volumes, and is ignored for other volumes. The default is `true`.
- `[-force [true]]` - Force Delete (privilege: advanced)
  If you use this switch, the Snapshot copy is immediately deleted without generating any confirmation messages. If you do not use this option the operation generates confirmation messages. Passing in a value of `true` is supported, but not required. The `force` switch is typically used for scripting applications where users cannot directly confirm the delete operation.
- `[-ignore-owners [true]]` - Ignore Snapshot Owners (privilege: advanced)
  If you use this switch, the command ignores other processes that might be accessing the Snapshot copy. If you do not use this option the operation exhibits default behavior and checks the owners tags before allowing the deletion to occur. Passing in a value of `true` is supported, but not required.

Examples
The following example deletes a Snapshot copy named vol3_daily from a volume named vol3 on a Vserver named vs0:

```
cluster1::> volume snapshot delete -vserver vs0 -volume vol3 -snapshot vol3_daily
```

volume snapshot modify
Modify snapshot attributes

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.
Description
The `volume snapshot modify` command enables you to change the text comment associated with a Snapshot copy. This command is not supported on Infinite Volumes.

Parameters
- `vserver <vserver name>` - Vserver
  This specifies the Vserver that contains the volume on which the specified Snapshot copy is saved.
- `volume <volume name>` - Volume
  This specifies the volume whose Snapshot copy is to be modified.
- `snapshot <snapshot name>` - Snapshot
  This specifies the Snapshot copy whose text comment is to be modified.
- `[-comment <text>]` - Comment
  This specifies the new comment for the Snapshot copy.
- `[-snapmirror-label <text>]` - Label for SnapMirror Operations
  This specifies the SnapMirror Label for the Snapshot copy. The SnapMirror Label is used by the Vaulting subsystem when you back up Snapshot copies to the Vault Destination. If an empty label (""") is specified, the existing label will be deleted.
- `[-expiry-time <MM/DD/YYYY HH:MM:SS>]` - Expiry Time
  This specifies the expiry time for the Snapshot copy. The expiry time indicates the time at which the Snapshot copy becomes eligible for deletion. If an expiry time of ("0") is specified, the existing expiry time will be deleted.

Examples
The following example modifies the comment of a Snapshot copy named vol3_snapshot of a volume named vol3 on a Vserver named vs0. The comment is changed to "Pre-upgrade snapshot".

```
cluster1::> volume snapshot modify -vserver vs0 -volume vol3 -snapshot vol3_snapshot -comment "Pre-upgrade snapshot"
```

`volume snapshot modify-snapshot-expiry-time`
Modify expiry time of a SnapLock Snapshot copy

Availability: This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

Description
The `volume snapshot modify-snapshot-expiry-time` extends snaplock expiry time of an existing Snapshot copy.

Parameters
- `vserver <vserver name>` - Vserver
  This specifies the Vserver that contains the volume on which the Snapshot copy is located.
- `volume <volume name>` - Volume
  This specifies the volume where a Snapshot copy is to be located.
- `snapshot <text>` - Snapshot
  This specifies the name of the Snapshot copy locked by SnapLock whose snaplock expiry time needs to be modified.
SnapLock Expiry Time

Specifies the new snaplock expiry that is applied to Snapshot copy locked by SnapLock.

If this option value is infinite, then a retention period that never expires is applied to the Snapshot copy.

Examples

The following example extends the retention period of a Snapshot copy snap1 to 03/03/2020 00:00:00:

```
cluster1::> volume snapshot modify-snaplock-expiry-time -vserver vs1 -volume v011 -snapshot snap1 -expiry-time "03/03/2020 00:00:00"
cluster1::>
```

The following example extends the retention period of a Snapshot copy snap2 to infinite:

```
cluster1::> volume snapshot modify-snaplock-expiry-time -vserver vs1 -volume v011 -snapshot snap2 -expiry-time infinite
cluster1::>
```

```
cluster1::> volume snapshot show -vserver vs1 -fields snaplock-expiry-time
vserver volume snapshot snaplock-expiry-time
------- ------ -------- ------------------------
vs1     v011   snap1    3/3/2020 00:00:00 +05:30
vs1     v011   snap2    infinite
```

volume snapshot partial-restore-file

Restore part of a file from a snapshot

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The volume snapshot partial-restore-file command enables you to restore a range of bytes in a file from the version of the file saved in the Snapshot copy. This command is intended to be used to restore particular pieces of LUNs and NFS or CIFS container files that are used by a host to store multiple sources of data. For example, a host may be storing multiple user databases in the same LUN. A partial file restore can be used to restore one of those databases in the LUN without touching other databases stored in the LUN. This command is not intended for restoring parts of normal user-level files that are stored in the volume. You should use volume snapshot restore-file command to restore normal user-level files. The volume for the partial-restore should be online during this operation.

This command is not supported on Infinite Volumes.

Parameters

-vserver <vserver name> - Vserver Name

This specifies the Vserver which contains the volume.

-[volume <volume name>] - Volume Name

This specifies the volume in which the Snapshot copy is saved.

-snapshot | -s <snapshot name> - Snapshot Name

This specifies the Snapshot copy which contains the version of file from which a range of bytes is restored.

The source file must be present in the Snapshot copy.
- **path <text>** - Filepath

  This specifies the relative path to the file which is partially restored from the Snapshot copy. You should specify the -volume option so that the file is searched and restored from the Snapshot copy of the specified volume. If you do not specify the -volume then the file is searched and restored from the Snapshot copy of the root volume. The destination file must be present in the active file system.

- **-start-byte <integer> - Starting Byte Offset (Multiple of 4096)**

  This specifies the starting byte offset in the file to partially restore. The first byte of the file is byte zero. The start byte must be a multiple of 4096. In addition, the start byte must not exceed the size of the source or destination file.

- **-byte-count <integer> - Number of Bytes to Restore (Multiple of 4096)**

  This specifies the total number of bytes to restore, beginning at the -start-byte value. The -byte-count option must be a multiple of 4096. The maximum number of bytes that can be restored is 16 MB. The byte count must not exceed the range of the source or destination file.

### Examples

The following example restores first 4096 bytes in the file foo.txt inside the volume vol3 from the Snapshot copy vol3_snap:

```
cluster1::> volume snapshot partial-restore-file -vserver vs0 -volume vol3

-snapshot vol3_snap -volume vol3 -path /foo.txt -start-byte 0 -byte-count 4096
```

### Related references

---

**volume snapshot prepare-for-revert**

Deletes multiple Snapshot copies of the current File System version.

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**

This command will delete all Snapshot copies that have the format used by the current version of Data ONTAP. It will fail if any Snapshot copy polices are enabled, or if any Snapshot copies have an owner.

**Note:** Snapshot policies must be disabled prior to running this command.

**Parameters**

- **-node <nodename> - Node**

  The name of the node.

### Examples

The following example prepares the Snapshot copies for revert.

```
cluster1:*> volume snapshot prepare-for-revert -node nodel
```
volume snapshot rename

Rename a snapshot

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The volume snapshot rename command renames a Snapshot copy.

Note: You cannot rename a Snapshot copy that is created as a reference copy during the execution of the volume move command.

This command is not supported on Infinite Volumes.

Parameters
-vserver <vserver name> - Vserver
This specifies the Vserver that contains the volume on which the specified Snapshot copy is to be renamed

-volume <volume name> - Volume
This specifies the volume that contains the Snapshot copy to be renamed.

-snapshot <snapshot name> - Snapshot
This specifies the Snapshot copy that is to be renamed.

-new-name <snapshot name> - Snapshot New Name
This specifies the new name for the Snapshot copy.

Examples
The following example renames a Snapshot copy named vol3_snap on a volume named vol3 and a Vserver named vs0. The Snapshot copy is renamed to vol3_snap_archive.

```
cluster1::> volume snapshot rename -vserver vs0 -volume vol3
-snapshot vol3_snap -new-name vol3_snap_archive
```

volume move on page 1306

volume snapshot restore

Restore the volume to a snapshot.

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The volume snapshot restore command restores a Snapshot copy to be the read-write parent volume for the volume family. This replaces the current working copy of the volume with the Snapshot copy that results in a loss of all changes made since the Snapshot copy was created.

Note: You should manually update all the SnapMirror relationships of a volume immediately after you restore its Snapshot copy. Not doing so can result in unusable SnapMirror relationships that must be deleted and re-created.

Before running this command on an Infinite Volume, unmount the volume. Any namespace mirror constituents present in the system are resynchronized to the restored Snapshot copy.
After the restore is complete, the size of the flexible volume will be set to either the current volume size or the snapshot size - whichever is greater.

**Parameters**

-vserver <vserver name> - Vserver

This specifies the Vserver that contains the volume on which the specified Snapshot copy to be restored is saved.

-volume <volume name> - Volume

This specifies the parent read-write volume whose Snapshot copy is to be restored to take its place.

-snapshot <snapshot name> - Snapshot

This specifies the Snapshot copy that is to be restored to be the read-write parent volume.

[--force [true]] - Force Restore

If you use this parameter, the Snapshot copy is restored even if the volume has one or more newer Snapshot copies which are currently used as reference Snapshot copy by SnapMirror. If a restore is done in this situation, this will cause future SnapMirror transfers to fail. The SnapMirror relationship may be repaired using "snapmirror resync" command if a common Snapshot copy is found between the source and destination volume. If there is no common Snapshot copy between the source and the destination volume, a baseline SnapMirror copy would be required.

[--preserve-lun-ids {true|false}] - Preserve LUN Identifiers

This option enables you to select whether the Snapshot copy restore needs to be non-disruptive to clients due to LUN identifiers changing. If you use this option and set it to true, or choose to not use this option at all, the volume snapshot restore command fails if the system determines that it cannot be non-disruptive with regards to LUN identifiers. If you use this option and set it to false the restore operation proceeds even if this might cause client-visible effects. In this case, administrators should take the LUNs offline before proceeding.

**Examples**

The following example restores a Snapshot copy named vol3_snap_archive to be the parent read-write volume for the volume family. The existing read-write volume is named vol3 and is located on a Vserver named vs0:

```
cluster1::> volume snapshot restore -vserver vs0 -volume vol3
   -snapshot vol3_snap_archive
```

**volume snapshot restore-file**

Restore a file from a snapshot

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The volume snapshot restore-file command enables you to restore a single file to a version saved in the Snapshot copy. You can restore a file over an existing copy of the file in the parent read-write volume or to a different location within the same parent read-write volume. If the destination file for the restore operation does not exist, a new file is created with the same version as the one saved in the Snapshot copy. If the destination file for the restore operation exists, then it is overwritten by the version from the Snapshot copy. This operation is used to restore normal user-level files and LUNs. The command also supports restoring normal user-level files with streams. The command fails if you try to restore directories (and their contents). During the restore operation the parent read-write volume should remain online. The command fails if the destination path for the restore operation is in a different volume than the source volume.

This command is not supported on Infinite Volumes.
Parameters

\[-vserver <vserver name>\] - Vserver Name

This specifies the Vserver which contains the volume.

\[-volume <volume name>\] - Volume Name

This specifies the volume which contains the specified Snapshot copy.

\[-snapshot | -s <snapshot name>\] - Snapshot Name

This specifies the Snapshot copy from which the file is restored.

\[-path <text>\] - Filepath

This specifies the relative path to the file which is restored from the Snapshot copy. You should specify the \[-volume\] option so that the file is searched and restored from the Snapshot copy of the specified volume. If you do not specify the \[-volume\] then the file is searched and restored from the Snapshot copy of the root volume.

\[-restore-path | -r <text>\] - Restore Filepath

This option specifies the destination location inside the volume where the file is restored. If you do not specify this option, the file is restored at the same location referred by \[-path\] option. If you specify \[-restore-path\] option, then it should refer to a relative path location within the same volume which contains the source file. If you do not specify \[-volume\] along with the relative path, the file is restored in the root volume.

\[-split-disabled [true]\] - Disable Space Efficient LUN Splitting

If you use this option and set it to \(true\), space efficient LUN clone split is not allowed during the restore operation. If you use this option and set it to \(false\) or do not use this option, then space efficient LUN clone split is allowed during the restore operation.

\[-ignore-streams [true]\] - Ignore Streams

If you use this parameter, the file is restored without its streams. By default, the streams are restored.

Examples

The following example restores a file \(foo.txt\) from the Snapshot copy \(vol3\_snap\) inside the volume \(vol3\) contained in a Vserver \(vs0\):

```
cluster1::> volume snapshot restore-file -vserver vs0 -volume vol3 -snapshot vol3_snap -path /foo.txt
```

volume snapshot show

Display a list of snapshots

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The \(volume\) \(snapshot\) \(show\) command displays information about Snapshot copies. The command output depends on the parameters specified with the command. If no parameters are specified, the command displays a table with the following information about all the available Snapshot copies:

- Vserver name
- Volume name
- Snapshot copy name
- State
- Size
• Percentage of total blocks in the parent volume
• Percentage of used blocks in the parent volume

To display a detailed list view with additional information, run the command and select the -instance view. In addition to the above mentioned information about the Snapshot copies, the detailed list view provides the following additional information:

• Creation time
• Snapshot busy
• List of the Snapshot copy's owners
• Comment associated with the Snapshot copy
• SnapMirror Label associated with the Snapshot copy
• 7-Mode Snapshot
• Constituent Snapshot
• Expiry Time
• SnapLock Expiry Time

At the advanced or higher privilege level the detailed view provides the following additional information:

• Snapshot copy's Dataset ID
• Snapshot copy's master Dataset ID
• Number of consistency points in the Snapshot copy
• Internal status of the Snapshot copy
• File system version
• File system block format
• Physical Snap ID
• Logical Snap ID
• Database record owner
• Snapshot tags
• Instance UUID
• Version UUID
• Node
• AFS used size
• Compression savings size
• Deduplication savings size
• Vbn0 savings size

Note: For Snapshot copies whose parent volume is a FlexGroup, some information is not available and empty values will be displayed. This information includes:

• State
• Size
• Percentage of total blocks in the parent volume
• Percentage of used blocks in the parent volume

All information is available for Snapshot copies whose parent volume is a FlexGroup Constituent.

At the admin and advanced privilege level, Snapshot copies whose parent volume is a FlexGroup Constituent are not displayed by default. To display these, run the command and set the is-constituent to true. At the diagnostic or higher privilege level, all Snapshot copies are displayed by default.

The list view is automatically enabled if a single Snapshot copy is specified by using the -vserver, -volume and -snapshot options together.

A preformatted query for displaying the time-related information is available by specifying the -time format specifier. This displays a table that contains the following fields for all the available Snapshot copies:

• Vserver name
• Volume name
• Snapshot copy name
• Creation time

By using the -fields option you can choose to print only the certain fields in the output. This presents the selected fields in a table view. This is ideal when you want additional information to be different from the information that is provided by the default table view, but would like it in a format which is visually easy to compare.

You can specify additional parameters to display the information that matches only those parameters. For example, to display information only about Snapshot copies of the load-sharing volumes, run the command with the -volume-type LS parameter. If you specify multiple filtering parameters, only those Snapshot copies that match all the specified parameters are displayed.

Parameters

[-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use ‘-fields ?’ to display the fields to specify.

[-time]
  If the -time format is specified, the command displays time related information about all entries.

[-instance]
  If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver
  If you use this parameter, the Snapshot copies located only on the specified Vserver will be displayed.

[-volume <volume name>] - Volume
  If you use this parameter only Snapshot copies located on the specified volume will be displayed.

[-snapshot <snapshot name>] - Snapshot
  If you use this parameter only Snapshot copies matching the specified name will be displayed.

[-dsid <integer>] - Snapshot Data Set ID (privilege: advanced)
  If this parameter is specified, the command displays information only about the Snapshot copy that has the specified data set ID.

[-msid <integer>] - Snapshot Master Data Set ID (privilege: advanced)
  If this parameter is specified, the command displays information only about the Snapshot copy that has the specified master data set ID.
[-create-time <Date>] - Creation Time
If this parameter is specified, the command displays information only about the Snapshot copies that match
the specified creation time.

[-busy {true|false}] - Snapshot Busy
If this parameter is specified, the command displays information only about the Snapshot copies that have the
specified busy status.

[-owners <text>, ...] - List of Owners
If this parameter is specified, the command displays information only about the Snapshot copies that are
owned by the specified list of owners.

[-size {<integer>[KB|MB|GB|TB|PB]}] - Snapshot Size
If this parameter is specified, the command displays information only about the Snapshot copies that have the
specified size. The size is specified as a character specifying the unit of measurement followed by a number
specifying the size in the mentioned unit of measurement: k (kilobytes), m (megabytes), g (gigabytes), or t
(terabytes). If the unit of measurement is not specified, bytes are used as the unit, and the specified number is
rounded up to the nearest 4 KB. You may also use an inequality such as >10 MB as input.

[-blocks <percent>] - Percentage of Total Blocks
If this parameter is specified, the command displays information only about the Snapshot copies that have the
specified percentage of total blocks on their parent volumes. You may also use an inequality such as >10 as
input.

[-usedblocks <percent>] - Percentage of Used Blocks
If this parameter is specified, the command displays information only about the Snapshot copies that have the
specified percentage of used blocks on their parent volumes. You may also use an inequality such as >10 as
input.

[-cpcount <integer>] - Consistency Point Count (privilege: advanced)
If this parameter is specified, the command displays information only about the Snapshot copies that have the
specified number of consistency points. You may also use an inequality such as <100 as input.

[-comment <text>] - Comment
If this parameter is specified, the command displays information only about the Snapshot copies that have the
specified comment text. You may also specify an inequality such as """" as input.

[-fs-version <text>] - File System Version (privilege: advanced)
If you use this parameter the only Snapshot copies displayed are those that were created when the file system
was of a specific release. This parameter is helpful especially when you need to upgrade to newer software
release and want to know the Snapshot copies that will be impacted by the upgrade process.

[-is-7-mode {true|false}] - 7-Mode Snapshot
If you use this parameter only those Snapshot copies which have the specified value are shown. This value is
true for the Snapshot copies that exist on the volume that was in 7-mode configuration and then transitioned
to a clustered configuration. In such a scenario, the volume is in a clustered configuration and the existing
Snapshot copies are still in the 7-mode configuration.

[-snapmirror-label <text>] - Label for SnapMirror Operations
If you use this parameter, only those Snapshot copies that have the specified SnapMirror Label value are
shown.

[-state {valid|invalid|partial}] - Snapshot State
If you use this parameter only those Snapshot copies which have the specified state will be shown.

[-is-constituent {true|false}] - Constituent Snapshot
If you use this parameter, only those Snapshot copies whose parent volume is a constituent volume of a
FlexGroup or an Infinite Volume will be shown.
[-node <nodename>] - Node (privilege: advanced)
If you use this parameter only those Snapshot copies that are located on the specified storage system are shown.

[-inode-version <integer>] - Snapshot Inofile Version (privilege: advanced)
If this parameter is specified, the command displays information only about the Snapshot copies whose inode files are at the specified version.

[-expiry-time <MM/DD/YYYY HH:MM:SS>] - Expiry Time
If you use this parameter only those Snapshot copies that have the specified expiry time are shown.

[-compression-type {none|secondary|adaptive}] - Compression Type (privilege: advanced)
If you use this parameter only those Snapshot copies that have the specified compression type are shown.

If you use this parameter only those Snapshot copies that have the specified snaplock expiry time are shown.

**Examples**
The following example displays default information about all Snapshot copies of a volume named vol1:

```
cluster1::> volume snapshot show -volume vol1
---Blocks---
Vserver  Volume   Snapshot                                  Size Total% Used%
-------- -------- ------------------------------------- -------- ------ ----- 
cluster1 vol1
one                                       68KB     0%   33%
two                                       72KB     0%   34%
2 entries were displayed.
```

The following example displays Snapshot copies which are older than 1 hour, limiting the output to wanted fields:

```
cluster1::> volume snapshot show -create-time <1h -fields create-time, size
vserver  volume snapshot create-time              size
-------- ------ -------- ------------------------ ----
cluster1 vol1   one      Mon Nov 17 10:23:42 2014 68KB
cluster1 vol1   two      Mon Nov 17 10:23:44 2014 72KB
2 entries were displayed.
```

The following example displays detailed information about a specific Snapshot copy, using the 'snap' alias:

```
cluster1::> snap show -volume vol1 -snapshot one -instance
Vserver: cluster1
Volume: vol1
Snapshot: one
Snapshot Data Set ID: 4294968322
Snapshot Master Data Set ID: 6442451970
Creation Time: Mon Nov 17 10:23:42 2014
Snapshot Busy: false
List of Owners: -
Snapshot Size: 68KB
Percentage of Total Blocks: 0%
Percentage of Used Blocks: 33%
Consistency Point Count: 4
Comment: -
File System Version: 9.0
7-Mode Snapshot: false
Label for SnapMirror Operations: -
Constituent Snapshot: false
Node: node1
Snapshot Inofile Version: 3
Expiry Time: -
SnapLock Expiry Time: -
```

1378 Commands: Manual Page Reference
volume snapshot show-delta

Computes delta between two Snapshot copies

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The volume snapshot show-delta command returns the number of bytes that changed between two Snapshot copies or a Snapshot copy and the active filesystem. This is calculated from the number of blocks that differ multiplied by the block size. The command also shows the time elapsed between the Snapshot copies in seconds.

Queries that use query operators (*, |, etc.) are disabled for this command to avoid performance degradation for client requests. This command is not supported on Infinite Volumes.

Parameters

-vserver <vserver name> - Vserver Name

This specifies the Vserver on which the volume is located.

-volume <volume name> - Volume Name

This specifies the volume for which the delta is to be calculated.

-snapshot1 <snapshot name> - First Snapshot Name

This specifies the first Snapshot copy for the comparison.

[-snapshot2 <snapshot name>] - Second Snapshot Name

This specifies the second Snapshot copy for the comparison. If the field is not specified, it is assumed to be the Active File System.

Examples

The following example shows the bytes changed and the time separating the two Snapshots copies:

```
cluster1::> volume snapshot show-delta -vserver vs0 -volume vol2 -snapshot1 one snapshot2 two
A total of 139264 bytes (34 blocks) are different. Elapsed time between the Snapshot copies: 1s.
```

volume snapshot autodelete commands

Manage snapshot autodelete settings

The volume snapshot autodelete command enables you to manage the Snapshot autodelete settings.

volume snapshot autodelete modify

Modify autodelete settings

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The volume snapshot autodelete modify command enables you to modify Snapshot autodelete and LUN or file clone autodelete policy settings. Based on the defined policy, automatic deletion of Snapshot copies and LUN or file clones is triggered. Automatic deletion of Snapshot copies and LUN or file clones is useful when you want to automatically reclaim space consumed by the Snapshot copies and LUN or file clones from the volume when it is low in available space. LUN or file clone autodelete follows Snapshot copy autodelete. This command works only on a read-write parent volume. You cannot setup automatic Snapshot copy deletion and automatic LUN or file clone deletion for Infinite Volumes and read-only volumes.
Parameters

-vserver <vserver name> - Vserver Name
This specifies the Vserver on which the volume is located.

-volume <volume name> - Volume Name
This specifies the volume whose autodelete policy has to be modified.

[-enabled {true|false}] - Enabled
This option specifies whether automatic deletion of Snapshot copies and LUN or file clones is enabled or disabled. If set to true, automatic deletion of Snapshot copies and LUN or file clones is enabled. If set to false, automatic deletion of Snapshot copies and LUN or file clones is disabled.

[-commitment {try|disrupt|destroy}] - Commitment
This option specifies which Snapshot copies and LUN or file clones can be automatically deleted to reclaim back space.
When set to try, the Snapshot copies which are not locked by any application and the LUN or file clones which are not configured as preserved are deleted.
When set to disrupt, the Snapshot copies which are not locked by data backing functionalities (such as volume clones, LUN clones and file clones) and LUN or file clones which are not configured as preserved are deleted. In the disrupt mode, the Snapshot copies locked by data protection utilities such as Snapmirror and Volume Move can be deleted. If such a locked Snapshot copy is deleted during the data transfer, the transfer is aborted.
When set to destroy, the Snapshot copies locked by the data backing functionalities are deleted. In addition, all the LUN or file clones in the volume are deleted.

[-defer-delete {scheduled|user_created|prefix|none}] - Defer Delete
This option determines the order in which Snapshot copies can be deleted.
Possible values are as follows:
• When set to scheduled, scheduled Snapshot copies are the last to be deleted.
• When set to user_created, user Snapshot copies are the last to be deleted.
• When set to prefix, Snapshot copies matching a certain prefix are the last to be deleted.
• When set to none, no defer deletion order is honored.
This option is not applicable for LUN or file clones.

[-delete-order {newest_first|oldest_first}] - Delete Order
This option specifies if the oldest Snapshot copy and the oldest LUN or file clone or the newest Snapshot copy and the newest LUN or file clone are deleted first.

[-defer-delete-prefix <text>] - Defer Delete Prefix
This option specifies the prefix string for the -defer-delete prefix parameter. The option is not applicable for LUN or file clones.

[-target-free-space <percent>] - Target Free Space
This option specifies the free space percentage at which the automatic deletion of Snapshot copies and LUN or file clones must stop. Depending on the -trigger Snapshot copies and LUN or file clones are deleted until you reach the target free space percentage.

[-trigger {volume|snap_reserve| (DEPRECATED)-space_reserve}] - Trigger
This option specifies the condition which starts the automatic deletion of Snapshot copies and LUN or file clones.
Setting this option to volume triggers automatic deletion of Snapshot copies and LUN or file clones when the volume reaches threshold capacity and the volume space reserved for Snapshot copies is exceeded.
Setting the option to snap_reserve triggers automatic deletion of Snapshot copies and LUN or file clones when the space reserved for Snapshot copies reaches threshold capacity.
Setting the option to (DEPRECATED) `space_reserve` triggers automatic deletion of Snapshot copies when reserved space in the volume reaches threshold capacity and the volume space reserved for Snapshot copies is exceeded.

**Note:** The option `space_reserve` is deprecated.

The threshold capacity is determined by the size of the volume as follows:

- If the volume size is less than 20 GB, the autodelete threshold is 85%.
- If the volume size is equal to or greater than 20 GB and less than 100 GB, the autodelete threshold is 90%.
- If the volume size is equal to or greater than 100 GB and less than 500 GB, the autodelete threshold is 92%.
- If the volume size is equal to or greater than 500 GB and less than 1 TB, the autodelete threshold is 95%.
- If the volume size is equal to or greater than 1 TB, the autodelete threshold is 98%.

`[-destroy-list <text>]` - Destroy List

This option specifies a comma separated list of data backing functions which are affected if the automatic deletion of the Snapshot copy backing that service is triggered. The possible values for this option are `lun_clone, fileclone, lun_clone, sfsr, vol_clone, cifs_share, or none`. Except `none`, all the other options can be combined as a comma separated list. Note that "lun_clone", "file_clone" and "sfsr" individually are not valid values. Only pairs "lun_clone, file_clone" and "lun_clone, sfsr" are supported.

If you specify `vol_clone`, the cloned volume backed by the Snapshot copy is deleted.

If you specify `lun_clone`, and the LUN is in the process of being cloned when autodelete is triggered, the cloning operation is aborted. Any access to this LUN will result in an error being reported to the client.

If you specify `file_clone`, and the file cloning operation is in progress when autodelete is triggered, the cloning operation is aborted. Any access to this file will result in an error being reported to the client.

If you specify `sfsr`, and the file restore is in progress when autodelete is triggered, the restore operation is aborted.

If the Snapshot copy is locked either by a `lun_clone` or `file_clone` or both, the `-destroy-list` must be set to `lun_clone, file_clone`.

If the Snapshot copy is locked either by a `lun_clone` or `sfsr` operation or both, the `-destroy-list` must be set to `lun_clone, file_clone`. The options `file_clone` and `sfsr` are equivalent to each other.

If you set `-destroy-list` to `lun_clone, file_clone` and the Snapshot copy is backing a file clone or `sfsr` operation, both the operations are aborted. This is also the case when you set `-destroy-list` to `lun_clone, sfsr`.

LUN or file clone autodelete is applicable only if `-destroy-list` contains `lun_clone` and `file_clone`.

Examples

The following example enables Snapshot autodelete and sets the trigger to `snap_reserve` for volume `vol3` which is part of the Vserver `vs0`:

```
cluster1::> volume snapshot autodelete modify -vserver vs0 -volume vol3 -enabled true -trigger snap_reserve
```

The following example enables Snapshot autodelete and LUN or file clone autodelete for volume `vol3` which is part of the Vserver `vs0`:

```
cluster1::> volume snapshot autodelete modify -vserver vs0 -volume vol3 -enabled true -trigger volume -commitment try -delete-order oldest_first -destroy-list lun_clone, file_clone
```
volume snapshot autodelete show

Display autodelete settings

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The volume snapshot autodelete show command displays information about Snapshot autodelete policies. The command output depends on the parameters specified with the command. If no parameters are specified, the command displays a table with the following information about all the available Snapshot autodelete policies:

- Vserver name
- Volume name
- Option name
- Option value

To display a detailed list view with additional information, run the command and select the -instance view. The detailed list view provides the following information:

- Vserver name
- Volume name
- Enabled
- Commitment
- Defer Delete
- Delete Order
- Defer Delete Prefix
- Target Free Space
- Trigger
- Destroy List
- Is Constituent Volume

By using the -fields option you can choose to print only the certain fields in the output. This presents the selected fields in a table view. This is ideal when you want additional information to be different from the information that is provided by the default table view, but would like it in a format which is visually easy to compare.

You can specify additional parameters to display the information that matches only those parameters. For example, to display information only about Snapshot autodelete policies which are enabled, run the command with -enabled true parameter. If you specify multiple filtering parameters, only those policies that match all the specified parameters are displayed.

Parameters

(-fields <fieldname>, ...)

This option allows you to print only certain fields in the output.

(-instance)

This option allows you to print a detailed list view.
[-vserver <vserver name>] - Vserver Name
   If this parameter and the -volume parameter are specified, the command displays detailed autodelete policy information about the specified volume. If this parameter is specified by itself, the command displays autodelete policy information about volumes on the specified Vserver.

[-volume <volume name>] - Volume Name
   If this parameter and the -vserver parameter are specified, the command displays detailed autodelete policy information about the specified volume. If this parameter is specified by itself, the command displays autodelete policy information about all volumes matching the specified name.

[-enabled {true|false}] - Enabled
   If this parameter is specified, the command displays information about autodelete policies that match the specified parameter value.

[-commitment {try|disrupt|destroy}] - Commitment
   If this parameter is specified, the command displays information about autodelete policies that match the specified commitment value.

[-defer-delete {scheduled|user_created|prefix|none}] - Defer Delete
   If this parameter is specified, the command displays information about autodelete policies that match the specified defer deletion criterion.

[-delete-order {newest_first|oldest_first}] - Delete Order
   If this parameter is specified, the command displays information about autodelete policies that match the specified deletion order.

[-defer-delete-prefix <text>] - Defer Delete Prefix
   If this parameter is specified, the command displays information about autodelete policies that match the prefix used for deferring deletion.

[-target-free-space <percent>] - Target Free Space
   If this parameter is specified, the command displays information about autodelete policies that match the specified target free space.

[-trigger {volume|snap_reserve|DEPRECATED-space_reserve}] - Trigger
   If this parameter is specified, the command displays information about autodelete policies that match the specified trigger condition.

[-destroy-list <text>] - Destroy List
   If this parameter is specified, the command displays information about autodelete policies that match the specified value.

[-is-constituent {true|false}] - Is Constituent Volume
   If this parameter is specified, the command displays information about autodelete policies for the constituent volumes of Infinite Volumes.

Examples
   The following example displays Snapshot autodelete policy settings for volume vol3 which is inside the Vserver vs0:

   cluster1::> volume snapshot autodelete show -vserver vs0 -volume vol3
<table>
<thead>
<tr>
<th>Vserver</th>
<th>Volume</th>
<th>Option Name</th>
<th>Option Value</th>
</tr>
</thead>
<tbody>
<tr>

<td>vol3</td>
<td>Enabled</td>
<td>false</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Commitment</td>
<td>try</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Trigger</td>
<td>volume</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Target Free Space</td>
<td>20%</td>
</tr>
</tbody>
</table>
volume snapshot policy commands

Manage snapshot policies

The `volume snapshot policy` command enables you to manage Snapshot scheduling policies.

volume snapshot policy add-schedule

Add a schedule to snapshot policy

Availability: This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

Description
The `volume snapshot policy add-schedule` command adds a schedule to a Snapshot policy. You can create a schedule by using the `job schedule cron create` or `job schedule interval create` commands.

Parameters

- `-vserver <vserver name>` - Vserver Name
  This specifies the Vserver on which a Snapshot policy schedule is to be added.

- `-policy <snapshot policy>` - Snapshot Policy Name
  This specifies the Snapshot policy to which a schedule is to be added.

- `-schedule <text>` - Schedule Name
  This specifies the schedule that is to be added to the Snapshot policy.

- `-count <integer>` - Maximum Snapshot Copies for Schedule
  This specifies the maximum number of Snapshot copies that can be taken by the specified schedule. The total count of all the Snapshot copies to be retained for the policy cannot be more than 255.

- `[prefix <text>]` - Snapshot Copy Name Prefix for Schedule
  This option specifies the prefix with which Snapshot copies will be created for the added schedule. Every schedule has only one prefix. Once a prefix gets associated with a schedule, you cannot update the prefix. If some prefix is already associated with the schedule and you do not specify this parameter, then the previously defined prefix is used. The command fails if you try to update an existing prefix for a schedule. If no prefix is associated with the schedule and you do not specify this parameter, then schedule name is be used as the prefix.

- `[snapmirror-label <text>]` - Label for SnapMirror Operations
  This specifies the SnapMirror Label identified with a Snapshot copy when it is created for the added schedule. The SnapMirror Label is used by the Vaulting subsystem when you back up Snapshot copies to the Vault Destination.

Examples

The following example adds a schedule named midnight to the Snapshot policy named `snappolicy_nightly` on Vserver vs0. The schedule can take a maximum of five Snapshot copies.

```bash
cluster1::> volume snapshot policy add-schedule -vserver vs0 -policy snappolicy_nightly -schedule midnight -count 5
```
volume snapshot policy create

Create a new snapshot policy

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The `volume snapshot policy create` command creates a Snapshot policy. A Snapshot policy includes at least one schedule, up to a maximum of five schedules, and a maximum number of Snapshot copies per schedule. You can create a schedule by using the `job schedule cron create` or `job schedule interval create` commands. When applied to a volume, the Snapshot policy specifies the schedule on which Snapshot copies are taken and the maximum number of Snapshot copies that each schedule can take. The total count of all the Snapshot copies to be retained for the policy cannot be more than 255.

**Parameters**

`-vserver <vserver name>` - Vserver Name

This specifies the Vserver on which the Snapshot policy is to be created.

`-policy <snapshot policy>` - Snapshot Policy Name

This specifies the Snapshot policy that is to be created.

`-enabled {true|false}` - Snapshot Policy Enabled

This specifies whether the Snapshot policy is enabled.

`[-comment <text>]` - Comment

This option specifies a text comment for the Snapshot policy.

`-schedule1 <text>` - Schedule1 Name

This specifies the name of the first schedule associated with the Snapshot policy.

`-count1 <integer>` - Maximum Snapshot Copies for Schedule1

This specifies the maximum number of Snapshot copies that can be taken by the first schedule.

`[-prefix1 <text>]` - Snapshot Copy Name Prefix for Schedule1

This option specifies the prefix associated with the first schedule. Every schedule has only one prefix. The command fails if you try to update an existing prefix. If you do not specify this parameter and there is no prefix associated with the schedule, the schedule name is used as the prefix. If you do not specify this parameter and there is already a prefix associated with the schedule from a previous invocation of the command, then that prefix is used.

`[-snapmirror-label1 <text>]` - Label for SnapMirror Operations for Schedule1

This specifies the SnapMirror Label of the first schedule associated with the Snapshot policy. Once specified, all Snapshot copies created for that schedule have the SnapMirror Label assigned to them. The SnapMirror Label is used by the Vaulting subsystem when you back up Snapshot copies to the Vault Destination.

`-schedule2 <text>` - Schedule2 Name

This option specifies the name of the second schedule associated with the Snapshot policy. If this parameter is specified, the `-count2` parameter must also be specified.

`-count2 <integer>` - Maximum Snapshot Copies for Schedule2

This option specifies the maximum number of Snapshot copies that can be taken by the second schedule. If this parameter is specified, the `-schedule2` parameter must also be specified.
[<-prefix2 <text>] - Snapshot Copy Name Prefix for Schedule2
This option specifies the prefix associated with the second schedule. If this parameter is specified, -
schedule2 and -count2 parameters must also be specified. Every schedule has only one prefix. The
command fails if you try to update an existing prefix. If you do not specify this parameter and there is no
prefix associated with the schedule, the schedule name is used as the prefix. If you do not specify this
parameter and there is already a prefix associated with the schedule from a previous invocation of the
command, then that prefix is used.

[<snapmirror-label2 <text>] - Label for SnapMirror Operations for Schedule2
This specifies the SnapMirror Label of the second schedule associated with the Snapshot policy. Once
specified, all Snapshot copies created for that schedule have the SnapMirror Label assigned to them. The
SnapMirror Label is used by the Vaulting subsystem when you back up Snapshot copies to the Vault
Destination.

[<-schedule3 <text>] - Schedule3 Name
This option specifies the name of the third schedule associated with the Snapshot policy. If this parameter is
specified, the -count3 parameter must also be specified.

[<-count3 <integer>] - Maximum Snapshot Copies for Schedule3
This option specifies the maximum number of Snapshot copies that can be taken by the third schedule. If this
parameter is specified, the -schedule3 parameter must also be specified.

[<-prefix3 <text>] - Snapshot Copy Name Prefix for Schedule3
This option specifies the prefix associated with the third schedule. If this parameter is specified, -schedule3
and -count3 parameters must also be specified. Every schedule has only one prefix. The command fails if
you try to update an existing prefix. If you do not specify this parameter and there is no prefix associated with
the schedule, the schedule name is used as the prefix. If you do not specify this parameter and there is already
a prefix associated with the schedule from a previous invocation of the command, then that prefix is used.

[<snapmirror-label3 <text>] - Label for SnapMirror Operations for Schedule3
This specifies the SnapMirror Label of the third schedule associated with the Snapshot policy. Once
specified, all Snapshot copies created for that schedule have the SnapMirror Label assigned to them. The
SnapMirror Label is used by the Vaulting subsystem when you back up Snapshot copies to the Vault
Destination.

[<-schedule4 <text>] - Schedule4 Name
This option specifies the name of the fourth schedule associated with the Snapshot policy. If this parameter is
specified, the -count4 parameter must also be specified.

[<-count4 <integer>] - Maximum Snapshot Copies for Schedule4
This option specifies the maximum number of Snapshot copies that can be taken by the fourth schedule. If this
parameter is specified, the -schedule4 parameter must also be specified.

[<-prefix4 <text>] - Snapshot Copy Name Prefix for Schedule4
This option specifies the prefix associated with the fourth schedule. If this parameter is specified, -
schedule4 and -count4 parameters must also be specified. Every schedule has only one prefix. The
command fails if you try to update an existing prefix. If you do not specify this parameter and there is no
prefix associated with the schedule, the schedule name is used as the prefix. If you do not specify this
parameter and there is already a prefix associated with the schedule from a previous invocation of the
command, then that prefix is used.

[<snapmirror-label4 <text>] - Label for SnapMirror Operations for Schedule4
This specifies the SnapMirror Label of the fourth schedule associated with the Snapshot policy. Once
specified, all Snapshot copies created for that schedule have the SnapMirror Label assigned to them. The
SnapMirror Label is used by the Vaulting subsystem when you back up Snapshot copies to the Vault
Destination.
This option specifies the name of the fifth schedule associated with the Snapshot policy. If this parameter is specified, the \(-c5\) parameter must also be specified.

\[-c5 <integer>] - Maximum Snapshot Copies for Schedule5

This option specifies the maximum number of Snapshot copies that can be taken by the fifth schedule. If this parameter is specified, the \(-s5\) parameter must also be specified.

\[-p5 <text>] - Snapshot Copy Name Prefix for Schedule5

This option specifies the prefix associated with the fifth schedule. If this parameter is specified, \(-s5\) and \(-c5\) parameters must also be specified. Every schedule has only one prefix. The command fails if you try to update an existing prefix. If you do not specify this parameter and there is no prefix associated with the schedule, the schedule name is be used as the prefix. If you do not specify this parameter and there is already a prefix associated with the schedule from a previous invocation of the command, then that prefix is used.

\[-s5 <text>] - Label for SnapMirror Operations for Schedule5

This specifies the SnapMirror Label of the fifth schedule associated with the Snapshot policy. Once specified, all Snapshot copies created for that schedule have the SnapMirror Label assigned to them. The SnapMirror Label is used by the Vaulting subsystem when you back up Snapshot copies to the Vault Destination.

Examples

The following example creates a Snapshot policy named snappolicy_4hrs on a Vserver named vs0. The policy runs on a single schedule named 4hrs with a prefix every_4_hour and has a maximum number of five Snapshot copies.

```
cluster1::> volume snapshot policy create -vserver vs0 -policy snappolicy_4hrs -schedule 4hrs -count 5 -prefix every_4_hour
```

volume snapshot policy delete

Delete a snapshot policy

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The `volume snapshot policy delete` command deletes a Snapshot policy.

Parameters

-\(-vserver <vserver name>\) - Vserver Name

This specifies the Vserver on which the Snapshot policy is to be deleted.

-\(-policy <snapshot policy>\) - Snapshot Policy Name

This specifies the Snapshot policy that is to be deleted.

Examples

The following example deletes a Snapshot policy named snappolicy_hourly on Vserver vs0:

```
cluster1::> volume snapshot policy delete -vserver vs0 -policy snappolicy_hourly
```
volume snapshot policy modify

Modify a snapshot policy

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The volume snapshot policy modify command enables you to modify the description associated with a Snapshot policy and whether the policy is enabled or disabled.

Parameters
- vserver <vserver name> - Vserver Name
  This specifies the Vserver on which the Snapshot policy is to be modified.

- policy <snapshot policy> - Snapshot Policy Name
  This specifies the Snapshot policy that is to be modified.

[ -enabled {true|false} ] - Snapshot Policy Enabled
  This optionally specifies whether the Snapshot policy is enabled.

[ -comment <text> ] - Comment
  This specifies the comment text for the Snapshot policy.

[ -snapmirror-labels <text> , ... ] - Label for SnapMirror Operations
  This optionally specifies a comma separated list of SnapMirror labels that are applied to the schedules in the Snapshot policy. Each label in the list applies to only one schedule in the Snapshot policy (maximum of 5 SnapMirror labels), the first label applying to the first schedule, the second label applying to the second schedule, and so on. You can have a maximum of five SnapMirror labels, which corresponds to the maximum number of schedules a Snapshot policy can have. If an empty string ("") is specified, the existing labels will be deleted from all the schedules.

Examples
The following example changes the description of a Snapshot policy named snappolicy_wknd on Vserver vs0 to "Runs only on weekends":

```
cluster1::> volume snapshot policy modify -vserver vs0 -policy snappolicy_wknd -comment "Runs only on weekends"
```

volume snapshot policy modify-schedule

Modify a schedule within snapshot policy

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The volume snapshot policy modify-schedule command modifies the maximum number of Snapshot copies that can be taken by a Snapshot policy's schedule.

Parameters
- vserver <vserver name> - Vserver Name
  This specifies the Vserver on which a Snapshot policy schedule is to be modified.

- policy <snapshot policy> - Snapshot Policy Name
  This specifies the Snapshot policy whose schedule is to be modified.
-schedule <text> - Schedule Name
This specifies the schedule that is to be modified.

[-newcount <integer>] - Maximum Snapshot Copies for Schedule
This specifies the maximum number of Snapshot copies that can be taken by the specified schedule. The total count of all the Snapshot copies to be retained for the policy cannot be more than 255.

[-newsnapmirror-label <text>] - Label for SnapMirror Operations
This specifies the SnapMirror Label identified with a Snapshot copy when it is created for the specified schedule. The SnapMirror Label is used by the Vaulting subsystem when you back up Snapshot copies to the Vault Destination. If an empty label ("") is specified, the existing label will be deleted.

Examples
The following example changes the maximum number of Snapshot copies from five to four for a schedule named midnight on a Snapshot policy named snappolicy_nightly on Vserver vs0:

```
cluster1::> volume snapshot policy modify-schedule -vserver vs0 -policy snappolicy_nightly -schedule midnight -newcount 4
```

**volume snapshot policy remove-schedule**
Remove a schedule from snapshot policy

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `volume snapshot policy remove-schedule` command removes a schedule from a Snapshot policy.

**Parameters**

-vserver <vserver name> - Vserver Name
This specifies the Vserver on which a Snapshot policy schedule is to be removed.

-policy <snapshot policy> - Snapshot Policy Name
This specifies the Snapshot policy from which a schedule is to be removed.

-schedule <text> - Schedule Name
This specifies the schedule that is to be removed from the Snapshot policy.

Examples
The following example removes a schedule named hourly from a Snapshot policy named snappolicy_daily on Vserver vs0:

```
cluster1::> volume snapshot policy remove-schedule -vserver vs0 -policy snappolicy_daily -schedule hourly
```

**volume snapshot policy show**
Show snapshot policies

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `volume snapshot policy show` command displays the following information about Snapshot policies:

- Vserver name
- Snapshot policy name
- Number of schedules in the policy
- Comment for the policy
- Individual schedule names
- Maximum number of Snapshot copies associated with each schedule
- Snapshot copy name prefixes for the schedules
- SnapMirror Labels associated with the schedules

Parameters

```
[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified
field or fields. You can use '-fields ?' to display the fields to specify.
```

```
[-revert-incompatible ] (privilege: advanced)
If this parameter is specified, the command displays Snapshot policies that are not supported in Data ONTAP
8.2. The total Snapshot copy count in the policy needs to be reduced to be equal to or less than the supported
count for the revert operation to succeed.
```

```
[-instance ]
If you specify the -instance parameter, the command displays detailed information about all fields.
```

```
[-vserver <vserver name>] - Vserver Name
If this parameter is specified, the command displays Snapshot policies on the specified Vserver.
```

```
[-policy <snapshot policy>] - Snapshot Policy Name
If this parameter is specified, the command displays detailed information about the specified Snapshot policy.
```

```
[-enabled {true|false}] - Snapshot Policy Enabled
If this parameter is specified, the command displays detailed information only about the Snapshot policy or
policies that have the specified enabled value.
```

```
[-comment <text>] - Comment
If this parameter is specified, the command displays information only about the Snapshot policy or policies
that have the specified comment.
```

```
[-total-schedules <integer>] - Total Number of Schedules in This Policy
If this parameter is specified, the command displays information only about the Snapshot policy or policies
that have the specified total number of schedules.
```

```
[-schedules <text>, ...] - Schedule Name
If this parameter is specified, the command displays information only about the Snapshot policy or policies
that have the specified list of schedules.
```

```
[-counts <integer>, ...] - Maximum Snapshots for the Schedule
If this parameter is specified, the command displays information only about the Snapshot policy or policies
that have the specified list of maximum numbers of Snapshot copies per schedule.
```

```
[-prefixes <text>, ...] - Prefix Name
If this parameter is specified, the command displays information only about the Snapshot policy or policies
that have the specified list of prefixes.
```

Commands: Manual Page Reference
[-snapmirror-labels <text>, ...] - Label for SnapMirror Operations

If this parameter is specified, the command displays information only about the Snapshot policies that have the specified SnapMirror Label. When you specify a list of SnapMirror labels, the command displays all the Snapshot policies that contain any of the SnapMirror Labels specified in the list.

[-policy-owner <text>] - Owner of the policy

If this parameter is specified, the command displays information only about the Snapshot policies that have the specified policy owner.

[-total-count <integer>] - Total Number of Snapshots in This Policy

If this parameter is specified, the command displays information only about the Snapshot policies that have the specified total number of Snapshot copies.

Examples

The following example displays information about all Snapshot policies:

```
cluster1::> volume snapshot policy show
Vserver: cm
Number of Is
Policy Name              Schedules Enabled Comment
------------------------ --------- ------- ----------------------------------
default                          3 false   Default policy with hourly, daily & weekly schedules.

```

volume transition-convert-dir commands

Manage conversion of a 7-mode directory into a Cluster-mode
volume transition-convert-dir show

Display 7-Mode directories being converted

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description

The `volume transition-convert-dir show` command displays information about ongoing directory copy conversion operations.

Parameters

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance]
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[-vserver <vserver name>]
```

- Vserver Name
  Displays summary information about the ongoing copy conversions of directories for the volumes in the specified Vserver.

```
[-volume <volume name>]
```

- Volume Name
  Displays summary information about the ongoing copy conversions of directories that are occurring on the specified volume.

```
[-path <text>]
```

- Directory Being Converted
  Displays summary information for the ongoing copy conversions of directories that have the specified directory path to convert.

```
[-job-id <integer>]
```

- Convert Job ID
  Displays summary information for the ongoing copy conversions of directories that have the specified job ID.

```
[-state {Initial|Queued|Running|Waiting|Pausing|Paused|Quitting|Success|Failure|Reschedule|
   Error|Quit|Dead|Unknown|Restart|Dormant}]
```

- Operation State
  Displays summary information for the copy conversions of directories that have the specified job state.

```
[-bytes-total <integer>]
```

- Bytes Total
  Displays summary information for copy conversions which have the estimated number of bytes of directory content to convert.

```
[-bytes-completed <integer>]
```

- Bytes Completed
  Displays summary information for copy conversions which have the estimated number of bytes of directory content that have completed conversion. The value of this field will be updated approximately once per minute.

Examples

The following example illustrates how to show directory conversions for a volume:

```
cluster1::*> volume transition-convert-dir show -volume voll
Vserver  Volume  Convert Job ID  Directory-path  State
----------  ---------  ----------------  ------------
vs0        voll       151 /data/large_dir  Running
```

Commands: Manual Page Reference
volume transition-convert-dir start

Start converting a 7-Mode directory to Cluster-mode

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The `volume transition-convert-dir start` command moves the directory entries in an existing directory to a new temporary directory and then replaces the existing directory with the temporary directory. This command only has a use for directories that were created in a non-Unicode format on a 7-Mode storage system and then transitioned to clustered Data ONTAP by using a SnapMirror relationship of type TDP. This command converts the directories to the Unicode format in a way that is less likely to disrupt the operation of the Data ONTAP systems than the existing directory conversion mechanisms. The temporary directory is visible from clients. Attempting to manipulate the directory being copied or the temporary directory might result in expected side-effects and should be avoided.

Parameters
- `vserver <vserver name>` - Vserver Name
  Specifies the Vserver on which the volume is located.
- `volume <volume name>` - Volume Name
  Specifies the volume in which the directory to be converted is located.
- `path <file path>` - Directory Path
  Specifies the path to the directory to be converted from the root of the volume specified with the `-volume` parameter. The root directory of a volume might not be converted using this command. Also, the path must not have a symbolic link as the last component in the path.

Examples
The following example shows how to start a 7-mode directory conversion for a given path in a volume:

```
cluster1:~*> volume transition-convert-dir start -vserver vs0 -volume vol1 -path /data/large_dir
```

Vserver Commands

Manage Vservers

The `vserver` commands enable you to manage Vservers and their attributes, including the configuration of the CIFS and NFS protocols, export policies, name mappings between CIFS and NFS users, and network services.

vserver add-aggregates

Add aggregates to the Vserver

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The `vserver add-aggregates` command adds aggregates to the Vserver.
Parameters

-vserver <vserver> - Vserver
   Specifies the Vserver for which aggregates have to be added.

-aggregates <aggregate name>, ... - List of Aggregates to Be Added
   Specifies the list of aggregates to add to the Vserver. The root aggregates should not be specified in this list because though the command will return success, volumes cannot be created on root aggregates. In a MetroCluster configuration, this command does not honor the remote cluster's aggregates.

Examples
The following example illustrates how to add aggregates aggr1 and aggr2 to a Vserver named vs.example.com:

   cluster1::> vserver add-aggregates -vserver vs.example.com -aggregates aggr1,aggr2

vserver add-protocols
Add protocols to the Vserver

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The vserver add-protocols command adds given protocols to a specified Vserver.

Parameters

-vserver <vserver> - Vserver
   This specifies the Vserver that is to be modified.

-protocols {nfs|cifs|fcp|iscsi|ndmp}, ... - Protocols
   This parameter specifies the list of protocols to be allowed to run on the Vserver. Possible values include nfs, cifs, fcp, and iscsi, and ndmp.

Examples
The following example shows adding protocol 'cifs' to a vserver named vs0.example.com.

   cluster1::> vserver add-protocols -vserver vs0.example.com -protocols cifs

vserver context
Set Vserver context

Availability: This command is available to cluster administrators at the admin privilege level.

Description
Cluster administrators can use the vserver context command to login to a specified Vserver with a specified Vserver user name. All subsequent commands will be issued in the context of that Vserver. The role of the cluster administrator will be the same as that of the user name with which the Vserver context was set. The context is valid for the duration of the CLI or Web UI session in which it is specified. The exit command can be used to return to the original context.
Parameters

- `vserver <vserver>` - Vserver
  Use this parameter to specify the Vserver.

- `[-username <text>]` - Vserver Administrator User Name
  Use this parameter to specify a Vserver administrator user name for the context. The default value `vsadmin` is used if one is not specified.

Examples

The following example sets the CLI context to Vserver `vs0.example.com`. All subsequently issued commands will be executed in the context of that Vserver:

```bash
cluster1::> vserver context -vserver vs0.example.com
Info: Use 'exit' command to return.
vs0.example.com::>
```

Related references

`exit` on page 1

vserver create

Create a Vserver

Availability: This command is available to `cluster` administrators at the `admin` privilege level.

Description
The `vserver create` command creates a Vserver.

Parameters

- `vserver <vserver>` - Vserver
  This specifies the name of the Vserver that is to be created. Use a fully qualified domain name (FQDN) - for example, "data.example.com" - for the Vserver to ensure unique Vserver names across cluster leagues.

  **Note:** Maximum number of characters supported is 47, and 41 for a Vserver with subtype "sync-source". "all" is a reserved name and must not be used as a Vserver name.

- `[-subtype <vserver subtype>]` - Vserver Subtype
  This specifies the subtype of the Vserver being created. Possible values are:
  - default - For default data Vservers
  - dp-destination - For Data Protection destination Vservers
  - sync-source - For MetroCluster source Vservers
  - sync-destination - For MetroCluster destination Vservers

- `rootvolume <volume name>` - Root Volume
  This specifies the name of the Vserver's root volume, which is created when the Vserver is created. The size of the Vserver's root volume is 1GB

- `aggregate <aggregate name>` - Aggregate
  This specifies the storage aggregate that holds the Vserver's root volume.
  - Creating a root volume on the SnapLock aggregate is not supported.
• Creating a root volume of sync-source Vserver on the unmirrored aggregate is not supported.

-rootvolume-security-style <security style> - Root Volume Security Style
   This specifies the security style for the Vserver's root volume. Possible values include unix (for UNIX mode bits), ntfs (for CIFS ACLs), and mixed (for mixed NFS and CIFS access). Regardless of the security style, both NFS and CIFS clients can read from and write to the root volume. The unified security style, which applies only to Infinite Volumes, cannot be applied to a Vserver's root volume.

[-language <Language code>] - Default Volume Language Code
   This optionally specifies the default language encoding setting for the Vserver and its volumes. The recommended format is to append .UTF-8 for the language encoding values. For example, for the en_US language, the recommended format is en_US.UTF-8. The default setting is C.UTF-8.

[-snapshot-policy <snapshot policy>] - Snapshot Policy
   This optionally specifies the Snapshot policy for new volumes created on the Vserver. If no value is specified, the default Snapshot policy is used. You can use the -snapshot-policy parameter on the volume create or volume modify commands to set the Snapshot policy on a specific volume, regardless of its Vserver's Snapshot policy setting.

[-comment <text>] - Comment
   This optionally specifies a comment for the Vserver.

[-quota-policy <text>] - Quota Policy
   This optionally specifies a quota policy for the Vserver. This parameter is not supported on a Vserver with Infinite Volume.

[-is-repository {true|false}] - Is Vserver with Infinite Volume
   This specifies that the Vserver will contain an Infinite Volume.

[-caching-policy <text>] - Caching Policy Name
   This optionally specifies the caching policy to apply to the Vserver. A caching policy defines how the system caches this volume's data in Flash Cache modules. If a caching policy is not assigned to this Vserver, the system uses the default cluster-wide policy. The available caching policies are:
   • none - Does not cache any user data or metadata blocks.
   • auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
   • meta - Read caches only metadata blocks.
   • random_read - Read caches all metadata and randomly read user data blocks.
   • random_read_write - Read caches all metadata, randomly read and randomly written user data blocks.
   • all_read - Read caches all metadata, randomly read, and sequentially read user data blocks.
   • all_read_random_write - Read caches all metadata, randomly read, sequentially read, and randomly written user data.
   • all - Read caches all data blocks read and written. It does not do any write caching.
   Default caching-policy is auto.

[-ipspace <IPspace>] - IPspace Name
   This optionally specifies the IPspace the Vserver will be assigned to. If left unspecified, the Vserver will be assigned to the default IPspace.

[-foreground {true|false}] - Foreground Process
   This optionally specifies whether the Vserver create operation can be executed in the background. If nothing is specified, by default the Vserver create operation is executed in the foreground.
Examples
The following example creates a Vserver named vs0.example.com in the IPspace ipspace123. The Vserver’s root volume is named root_vs0 and is located on aggregate aggr0. The Vserver uses NIS for network information, a file for name mapping information, and the language is U.S. English:

```
cluster1::> vserver create -vserver vs0.example.com -ipspace ipspace123 -rootvolume root_vs0 -aggregate aggr0 -language en_US.UTF-8 -rootvolume-security-style mixed
```

- `volume modify` on page 1209

**vserver delete**
Delete an existing Vserver

**Availability:** This command is available to cluster administrators at the `admin` privilege level.

**Description**
The `vserver delete` command deletes a specified Vserver. If the Vserver is associated with one or more volumes, you must manually delete volumes (including root and mirror volumes) before you delete the Vserver. If the Vserver subtype is `dp-destination`, change the Vserver subtype to `default` by specifying the Vserver as the destination in the `snapmirror break` command before deleting the objects owned by the Vserver.

**Parameters**
- `-vserver <vserver>` - Vserver
  This specifies the Vserver that is to be deleted.
- `[-foreground {true|false}]` - Foreground Process
  This optionally specifies the Vserver delete operation can be executed in the background. If nothing is specified, by default the Vserver delete operation is executed in the foreground.

**Examples**
The following example deletes a Vserver named vs2.example.com:

```
cluster1::> vserver delete -vserver vs2.example.com
```

**vserver modify**
Modify a Vserver

**Availability:** This command is available to cluster administrators at the `admin` privilege level.
Description
The vserver modify command modifies the attributes of a specified Vserver. If the Vserver subtype is of type dp-destination, then only the -aggr-list parameter can be modified.

Parameters
-vserver <vserver> - Vserver
This specifies the Vserver that is to be modified.

[-language <Language code>] - Default Volume Language Code
This optional parameter specifies the default language encoding setting for the Vserver and its volumes. The recommended format is to append .UTF-8 for the language encoding values. For example, for the en_US language, the recommended format is en_US.UTF-8. The default setting is C.UTF-8. This field is not modifiable on a Vserver with Infinite Volume.

[-snapshot-policy <snapshot policy>] - Snapshot Policy
This optional parameter specifies the Snapshot policy for a Vserver being modified.

[-comment <text>] - Comment
This optional parameter specifies a comment for the Vserver.

[-quota-policy <text>] - Quota Policy
This optional parameter specifies a quota policy to be used for all volumes associated with a Vserver. You can create and configure multiple, different quota policies, but each Vserver must have one and only one associated quota policy. This parameter is not supported on a Vserver with Infinite Volume.

[-aggr-list <aggregate name>, ...] - List of Aggregates Assigned
This optional parameter specifies a confined list of aggregates on which volumes can be created for a Vserver by the Vserver administrator. But these aggregates do not become exclusive property of the Vserver, i.e. they might be assigned for use to other Vservers. If the value of this parameter is specified as ".", then the Vserver administrator cannot create any volumes for that Vserver. Note that the cluster administrator will still be able to create volumes on any aggregate and assign them to this Vserver.

[-max-volumes <unsigned32_or_unlimited>] - Limit on Maximum Number of Volumes allowed
This optional parameter specifies the maximum number of volumes that can be created for the Vserver, including the root volume. This value is not modifiable on a Vserver with Infinite Volume.

[-admin-state {running|stopped|starting|stopping}] - Vserver Admin State (privilege: advanced)
Use this parameter to set the admin state of the Vserver if the Vserver start or stop job fails. Possible values include running and stopped.

[-allowed-protocols {nfs|cifs|fcp|iscsi|ndmp}, ...] - Allowed Protocols
This optional parameter specifies the list of protocols to be allowed to run on the Vserver. When part of vserver-modify, this field should include the existing list along with the new protocol list to be added to prevent data disruptions. Possible values include nfs, cifs, fcp, iscsi, and ndmp. Possible values for a Vserver with Infinite Volume include nfs and cifs.

[-disallowed-protocols {nfs|cifs|fcp|iscsi|ndmp}, ...] - Disallowed Protocols
This optional parameter specifies the list of protocols to be disallowed to run on the Vserver. When part of vserver-modify, this field should include the existing list along with the new protocol list to be added to prevent data disruptions. Possible values include nfs, cifs, fcp, iscsi, and ndmp. Only the protocols configured for Vservers with Infinite Volume can be disallowed.

[-qos-policy-group <text>] - QoS Policy Group
This optionally specifies which QoS policy group to apply to the Vserver. This policy group defines measurable service level objectives (SLOs) that apply to the storage objects with which the policy group is associated. If you do not assign a policy group to a Vserver, the system will not monitor and control the traffic to it. To remove this Vserver from a policy group, enter the reserved keyword "none". This parameter is not supported on a Vserver with Infinite Volume.
[-caching-policy <text>] - Caching Policy Name

This optionally specifies the caching policy to apply to the Vserver. A caching policy defines how the system caches this volume's data in Flash Cache modules. If a caching policy is not assigned to this Vserver, the system uses the default cluster-wide policy. The available caching policies are:

- none - Does not cache any user data or metadata blocks.
- auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
- meta - Read caches only metadata blocks.
- random_read - Read caches all metadata and randomly read user data blocks.
- random_read_write - Read caches all metadata, randomly read and randomly written user data blocks.
- all_read - Read caches all metadata, randomly read, and sequentially read user data blocks.
- all_read_random_write - Read caches all metadata, randomly read, sequentially read, and randomly written user data.
- all - Read caches all data blocks read and written. It does not do any write caching.

Default caching-policy is auto.

[-foreground {true|false}] - Foreground Process

This optionally specifies whether the Vserver modify operation can be executed in the background. If nothing is specified, by default the Vserver modify operation is executed in the foreground.

Examples

The following example modifies the quota policy for a Vserver named vs0.example.com to pol1, specifies a Snapshot policy named daily, adds the comment "Sales team access".

```
cluster1::> vserver modify -vserver vs0.example.com -snapshot-policy daily
   `-comment "Sales team access" -quota-policy pol1
```

vserver prepare-for-revert

Prepares Vservers to be reverted

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

The vserver prepare-for-revert command prepares Vservers to be reverted to the previous version of Data ONTAP. It disables any operations that cannot be scheduled during revert.

Examples

The following example prepares all Vservers to be reverted.

```
cluster1::*> vserver prepare-for-revert
```
**vserver remove-aggregates**

Remove aggregates from the Vserver

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**
The `vserver remove-aggregates` command removes aggregates from the Vserver.

**Parameters**
- `-vserver <vserver>` - **Vserver**
  Specifies the Vserver from which aggregates have to be removed.
- `-aggregates <aggregate name>, ...` - **List of Aggregates to Be Removed**
  Specifies the list of aggregates to remove from the Vserver.

**Examples**
The following example illustrates how to remove aggregates `aggr1` and `aggr2` from a Vserver named `vs.example.com`:

```
cluster1::> vserver remove-aggregates -vserver vs.example.com -aggregates aggr1,aggr2
```

**vserver remove-protocols**

Remove protocols from the Vserver

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**
The `vserver remove-protocols` command removes the specified protocols from the specified Vserver. When you remove the protocols from a Vserver, the data access with respect to the removed protocols is disrupted.

**Parameters**
- `-vserver <vserver>` - **Vserver**
  Specifies the Vserver that is to be modified.
- `-protocols {nfs|cifs|fcp|iscsi|ndmp}, ...` - **Protocols**
  This parameter specifies the list of protocols to be removed on the Vserver. Possible values include `nfs`, `cifs`, `fcp`, `iscsi`, and `ndmp`.

**Examples**
The following example shows removing protocol `cifs` from a Vserver named `vs0.example.com`.

```
cluster1::> vserver remove-protocols -vserver vs0.example.com -protocols cifs
```
vserver rename

Rename a Vserver

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The vserver rename command renames the Vserver. If the vserver being renamed is participating in an Inter-cluster Vserver peer relationship, all the corresponding remote clusters will be updated with the new peer Vserver name.

Parameters
-vserver <text> - Vserver
   This specifies the Vserver that is to be renamed.

-newname <vserver> - New Vserver name (Use Fully Qualified Domain Name, For example: data.example.com)
   This specifies the Vserver's new name. The name must be a unique Vserver name in the cluster. Use a fully qualified domain name (FQDN) - for example, "data.example.com" - for the Vserver name to reduce name collisions in cluster leagues.

   Note: Maximum number of characters supported is 47, and 41 for a Vserver with subtype "sync-source".
   "all" is a reserved name and must not be used as a Vserver name.

-foreground {true|false} - Foreground Process
   This specifies whether the rename job will be run in foreground or background. By default, the job runs in foreground.

Examples
The following examples rename a Vserver named vs1.example.com as vs2.example.com, and then finally back to its original name:

(When there is no intercluster Vserver peer relationship with the vserver)
cluster1::> vserver rename -vserver vs1.example.com -newname vs2.example.com

(When there is at least one intercluster peer relationship with the Vserver)
cluster1::> vserver rename -vserver vs1.example.com -newname vs2.example.com
   [Job 277] Job succeeded: Vserver rename completed successfully

cluster1::> vserver rename -vserver vs2.example.com -newname vs1.example.com -foreground false
   [Job 278] Job is queued: Rename Vserver vs2.example.com to vs1.example.com.

vserver show

Display Vservers

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver show command displays the following information:
- Vserver name
- Vserver type (data, admin, node or system - detailed view only)
- Vserver subtype (default, dp-destination, sync-source, and sync-destination - detailed view only)
- Vserver universal unique identifier (detailed view only)
- Root volume name
- Aggregate on which the root volume is located
- Associated NIS domain
- Root volume security style (unix for UNIX mode bits, ntfs for CIFS ACLs, mixed for both (detailed view only), or unified (Infinite Volumes only))
- LDAP client
- Language (detailed view only)
- Snapshot policy (detailed view only)
- Comment text (detailed view only)
- Quota policy (detailed view only)
- Aggregate list (detailed view only)
- Maximum Volumes (detailed view only)
- Qos-policy-group (detailed view only)
- Config-lock (detailed view only)
- Admin state (running, stopped, starting, stopping, initializing, or deleting)
- Operational state (running, or stopped)
- Operational state stopped reason (sync-destination-and-switchover-not-done, or cluster-reboot-done, or admin-state-stopped)
- Allowed Protocols (nfs, cifs, fcp, iscsi, ndmp - detailed view only)
- Disallowed Protocols (nfs, cifs, fcp, iscsi, ndmp - detailed view only)
- Whether the Vserver is a Vserver with Infinite Volume (detailed view only)
- IPspace to which the Vserver belongs (detailed view only)
- Caching policy

**Parameters**

```bash
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```bash
[-protocols]
```

If this optional parameter is specified, the command displays the allowed and disallowed set of protocols for the Vserver(s).

```bash
[-instance]
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.
[-vserver <vserver>] - Vserver
If this parameter is specified, the command displays detailed information about the specified Vserver.

[-type <vserver type>] - Vserver Type
If this parameter is specified, the command displays information only about the Vserver or Vservers that have the specified Vserver type. Types include admin for the cluster-wide management Vserver, system for cluster-level communications in an IPspace, data for data serving Vserver, and node for node management Vserver.

[-subtype <vserver subtype>] - Vserver Subtype
If this parameter is specified, the command displays information only about the Vserver or Vservers that have the specified Vserver subtype. Types include:
  * default for default data Vserver
  * dp-destination for Data Protection destination Vserver.
  * sync-source for MetroCluster source Vserver,
  * sync-destination for MetroCluster destination Vserver.

[-uuid <UUID>] - Vserver UUID
If this parameter is specified, the command displays information only about the Vserver that match the specified UUID.

[-rootvolume <volume name>] - Root Volume
If this parameter is specified, the command displays information only about the Vserver or Vservers that have the specified root volume.

[-aggregate <aggregate name>] - Aggregate
If this parameter is specified, the command displays information only about the Vserver or Vservers that have their root volumes contained by the specified aggregate.

[-nisdomain <nis domain>] - NIS Domain
If this parameter is specified, the command displays information only about the Vserver or Vservers that use the specified NIS domain.

[-rootvolume-security-style <security style>] - Root Volume Security Style
If this parameter is specified, the command displays information only about the Vserver or Vservers that have the specified root-volume security style. The unified security style, which applies only to Infinite Volumes, cannot be applied to a Vserver's root volume.

[-ldap-client <text>] - LDAP Client
If this parameter is specified, the command displays information only about the Vserver or Vservers that use the specified LDAP client.

[-language <Language code>] - Default Volume Language Code
If this parameter is specified, the command displays information only about the Vserver or Vservers that use the specified language. To determine the available languages, enter "vserver show -language ?" at the clustershell command prompt and at the Vserver prompt.

[-snapshot-policy <snapshot policy>] - Snapshot Policy
If this parameter is specified, the command displays information only about the Vserver or Vservers that have the specified Snapshot policy.

[-comment <text>] - Comment
If this parameter is specified, the command displays information only about the Vserver or Vservers that match the specified comment.
[\text{-quota-policy <text>}] - Quota Policy
If this parameter is specified, the command displays information only about the Vserver or Vservers that use
the specified quota policy.

[\text{-aggr-list <aggregate name>, ...}] - List of Aggregates Assigned
If this parameter is specified, the command displays information only about the Vserver or Vservers to which
the specified aggregate(s) are assigned for use.

[\text{-max-volumes <unsigned32_or_unlimited>}] - Limit on Maximum Number of Volumes allowed
If this parameter is specified, the command displays information only about the Vserver or Vservers on which
the specified maximum volume count is configured.

[\text{-admin-state (running|stopped|starting|stopping)}] - Vserver Admin State
If this parameter is specified, the command displays information only about the Vserver or Vservers that
match the specified admin-state.

[\text{-operational-state (running|stopped)}] - Vserver Operational State
If this parameter is specified, the command displays information only about the Vserver or Vservers that
match the specified operational-state. This field determines the state of the Vserver LIFs. New LIFs created on
a Vserver, which is in running state, will be operationally up and the LIFs created on a Vserver, which is in
stopped state, will be operationally down.

[\text{-operational-state-stopped-reason \{sync destination and switchover is not done|cluster
reboot is done|admin state stopped| dp destination not started\}}] - Vserver Operational State
Stopped Reason
If this parameter is specified, the command displays information only about the Vserver or Vservers that are
operationally stopped due to the specified reason. This field indicates the reason for the operational-state of the
Vserver being stopped.

[\text{-allowed-protocols \{nfs|cifs|fcp|iscsi|ndmp\}, ...}] - Allowed Protocols
If this parameter is specified, the command displays information only about the Vserver or Vservers on which
the specified protocols are allowed to run.

[\text{-disallowed-protocols \{nfs|cifs|fcp|iscsi|ndmp\}, ...}] - Disallowed Protocols
If this parameter is specified, the command displays information only about the Vserver or Vservers on which
the specified protocols are disallowed to run.

[\text{-is-repository \{true|false\}}] - Is Vserver with Infinite Volume
If this parameter is specified, the command displays information only about the Vservers which have the
specified is-repository value. This will be true for Vservers with Infinite Volume.

[\text{-qos-policy-group <text>}] - QoS Policy Group
Display the Vservers that match the specified qos-policy-group.
A policy group defines measurable service level objectives (SLOs) that apply to the storage objects with which
the policy group is associated. If you do not assign a policy group to a Vserver, the system will not monitor
and control the traffic to it.

[\text{-caching-policy <text>}] - Caching Policy Name
Display the Vservers that match the specified caching-policy.
A caching policy defines the caching behavior of this Vserver at the Flash Cache level. If a caching policy is
not assigned to this Vserver, the system uses the default cluster-wide policy. The available caching policies are:
• none - Does not cache any user data or metadata blocks.
• auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly
  overwritten user data blocks.
- meta - Read caches only metadata blocks.
- random_read - Read caches all metadata and randomly read user data blocks.
- random_read_write - Read caches all metadata, randomly read, and randomly written user data blocks.
- all_read - Read caches all metadata, randomly read, and sequentially read user data blocks.
- all_read_random_write - Read caches all metadata, randomly read, sequentially read, and randomly written user data.
- all - Read caches all data blocks read and written. It does not do any write caching.

Default caching-policy is auto.

[-config-lock {true|false}] - Config Lock
This parameter specifies if the Vserver is locked or unlocked for modification. If the config-lock is set to true, then modifying the Vserver's configuration is not allowed.

[-ipspace <IPspace>] - IPspace Name
If this parameter is specified, the command displays information only about the Vservers that are assigned to the specified IPspace.

[-foreground {true|false}] - Foreground Process
This optionally specifies whether the Vserver show operation can be executed in the background. If nothing is specified, by default the Vserver show operation is executed in the foreground.

**Examples**
The following example displays information about all Vservers.

```
class1::> vserver show
non mcc setup:
Vserver Type Subtype Admin Operational Root
---------- ------- --------------- ----------- ----------- -----------
cluster admin - -
node1 node - -
vs0 data default running running root_vs1 aggr0
vs1 data dp-destination stopped stopped - -
4 entries were displayed.
```

```
mcc setup:
class1::> vserver show
Vserver Type Subtype Admin Operational Root
---------- ------- --------------- ----------- ----------- -----------
cluster admin - -
node1 node - -
vs2 data sync-source running running rv data_aggr
vs3-mc data sync-destination running stopped - -
4 entries were displayed.
```

**vserver show-aggregates**
Show details of aggregates in a Vserver

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.
Description
The `vserver show-aggregates` command displays the details of all the aggregates that are associated with Vservers. The aggregate details displayed are the aggregate name, state, available size, the type of aggregate and the SnapLock type.

Parameters
`{ [-fields <fieldname>, ...]`
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`| [-instance ]]`
If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-vserver <vserver>] - Vserver`
If this optional parameter is specified, the command displays the details of aggregates that are associated with the specified Vserver.

`[-aggregate <aggregate name>] - Aggregate`
If this optional parameter is specified, the command displays all of the Vservers configured with the specified aggregate.

Examples
The following example displays the aggregates configured for Vserver vs.

```
cluster1::> vserver show-aggregates -vserver vs
Available
Vserver        Aggregate      State         Size Type    SnapLock-Type
-------------- -------------- ------- ---------- ------- -------------
vs             aggr1          online     795.2MB hdd     non-snaplock
vs             aggr2          online     795.2MB hdd     non-snaplock
2 entries were displayed.
```

vserver show-protocols
Show protocols for Vserver

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The `vserver show-protocols` command displays the running protocols on a given Vserver.

Parameters
`{ [-fields <fieldname>, ...]`
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`| [-instance ]]`
If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-vserver <vserver>] - Vserver`
If this parameter is specified, the command displays the allowed set of protocols for the specified Vserver.

`[-protocol {nfs|cifs|fcp|iscsi|ndmp}, ...] - Protocols`
If this optional parameter is specified, the command displays all the Vservers configured with the specified protocols.
vserver start

Start a Vserver

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The vserver start command starts data access on a Vserver.

Parameters
-vserver <vserver> - Vserver
This specifies the name of the Vserver on which the data access is to be started. This operation is only supported on a data Vserver.

Note: The name must be of 47 characters length or less.

[-foreground true|false] - Foreground Process
This specifies if the vserver start command should be executed in the foreground or background. If you do not enter this parameter, it is set to true, and the vserver start command is executed in the foreground.

[-force true] - Force Vserver Start
In case of a MetroCluster configuration or Vserver disaster recovery, by using this parameter you can start the Vserver that is either locked (which prevents any configuration changes) or its partner Vserver is operationally running. If you do not enter this parameter, it is set to false.

Examples
The following example starts data access on Vserver vs0.example.com in the background.

cluster1::> vserver start -vserver vs0.example.com -foreground false

vserver stop

Stop a Vserver

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The vserver stop command stops data access on a Vserver.
### Parameters

**-vserver <vserver> - Vserver**

This specifies the name of the Vserver on which the data access is to be stopped. This operation is only supported on a data Vserver.

*Note:* The name must be of 47 characters length or less.

**[-foreground {true|false}] - Foreground Process**

This specifies if `vserver stop` command should be executed in the foreground or background. If you do not enter this parameter, it is set to `true`, and the `vserver stop` command is executed in the foreground.

### Examples

The following example stops data access on Vserver `vs0.example.com` in the background.

```
cluster1::> vserver stop -vserver vs0.example.com -foreground false
```

### vserver unlock

Unlock Vserver configuration

**Availability:** This command is available to `cluster` administrators at the `advanced` privilege level.

**Description**

The `vserver unlock` command revokes the administrative lock on the Vserver configuration. When a Vserver is unlocked, changes to the configuration are permitted. The unlock operation fails if the Vserver is not locked by the administrator or if it is locked by internal applications. If the Vserver fails to unlock due to an error condition, you can use the `-force` option.

**Parameters**

**-vserver <vserver> - Vserver**

The name of the Vserver that has to be unlocked.

**[ -force [true] ] - Force Unlock**

This option is specified to unlock the Vserver when the Vserver fails to unlock due to an error condition.

### Examples

The following example illustrates how to unlock the Vserver named `vs123.example.com`, forcefully:

```
cluster1::> vserver unlock -vserver vs123.example.com -force true
```

### vserver active-directory commands

Manage Active Directory

**vserver active-directory create**

Create an Active Directory account. If joining a domain, this command may take several minutes to complete.

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.
Description
The `vserver active-directory create` command creates an Active Directory account for a Vserver. When you create the Active Directory account, you must add it to an existing Windows Active Directory domain. When you enter this command, you are prompted to provide the credentials of a user account that has sufficient privileges to add computers to the `-ou` container within the `-domain` domain. The user account must have a password that cannot be empty. When joining a domain, this command may take several minutes to complete.

**Note:** Each Vserver can have only one Active Directory account.

Parameters

- `-vserver <vserver>` - Vserver
  This parameter specifies the name of the Vserver for which you want to create the Active Directory account. The Vserver must already exist.

- `-account-name <NetBIOS>` - Active Directory NetBIOS Name
  This parameter specifies the name of the Active Directory account (up to 15 characters).

- `-domain <TextNoCase>` - Fully Qualified Domain Name
  This parameter specifies the name of the Active Directory domain.

- `[ -ou <text>]` - Organizational Unit
  This parameter specifies the organizational unit within the Active Directory domain. By default, this parameter is set to `CN=Computers`. When specifying this parameter, specify only the organizational unit portion of the distinguished name. Data ONTAP appends the value provided for the required `-domain` parameter onto the value provided for `-ou` parameter to produce the Active Directory distinguished name, which is used when creating the Vserver’s Active Directory account in the domain.

Examples

The following example creates an Active Directory account `ADSERVER1` for Vserver `vs1` and domain `example.com`.

```
cluster1::> vserver active-directory create -vserver vs1 -account-name ADSERVER1 -domain example.com
```

In order to create an Active Directory machine account, you must supply the name and password of a Windows account with sufficient privileges to add computers to the "CN=Computers" container within the "example.com" domain.

Enter the user name: Administrator

Enter the password:

The following example creates an Active Directory account `ADSERVER2` for Vserver `vs2`, domain `example.com` and organizational unit `sample_ou`.

```
cluster1::> vserver active-directory create -vserver vs2 -account-name ADSERVER2 -domain example.com -ou OU=sample_ou
```

In order to create an Active Directory machine account, you must supply the name and password of a Windows account with sufficient privileges to add computers to the "OU=sample_ou" container within the "example.com" domain.

Enter the user name: Administrator

Enter the password:
vserver active-directory delete

Delete an Active Directory account

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver active-directory delete command deletes the Active Directory account for a specified Vserver.

Parameters
-vserver <vserver> - Vserver
This parameter specifies the Vserver for the Active Directory account you want to delete.

Examples
The following example deletes the Active Directory account for a Vserver named vs1:

```
cluster1::> vserver active-directory delete -vserver vs1
In order to delete an Active Directory machine account, you must supply the name and password of a Windows account with sufficient privileges to remove computers from the "example.com" domain.
Enter the user name: Administrator
Enter the password:
```

vserver active-directory modify

Modify the domain of an Active Directory account. If re-joining the current domain or joining a new one, this command may take several minutes to complete.

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver active-directory modify command modifies the domain of an Active Directory account. You can also re-join the current domain or join a new one. When joining a domain, this command may take several minutes to complete.

Parameters
-vserver <vserver> - Vserver
This parameter specifies the Vserver for the Active Directory account whose associated domain you want to modify.

[-domain <TextNoCase>] - Fully Qualified Domain Name
This parameter specifies the fully qualified name of the Active Directory domain to associate with the Active Directory account.

Examples
The following example modifies the Active Directory domain associated with Vserver vs1.

```
cluster1::> vserver active-directory modify -vserver vs1 -domain example.com
In order to create an Active Directory machine account, you must supply the name and password of a Windows account with sufficient privileges to add computers to the "CN=Computers" container within the "example.com" domain.
Enter the user name: administrator
```
vserver active-directory password-change

Change the domain account password for an Active Directory account

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver active-directory password-change command changes the domain account password for the specified Vserver's Active Directory account.

Parameters
-vserver <vserver> - Vserver
This parameter specifies the name of the Vserver associated with the Active Directory account whose domain account password you want to change.

Examples
The following example changes the password for the Active Directory account for a Vserver named vs1.

```
cluster1::> vserver active-directory password-change -vserver vs1
```

vserver active-directory password-reset

Reset the domain account password for an Active Directory account

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver active-directory password-reset command resets the domain account password for the Active Directory account. This may be required if the password stored along with the machine account in the Windows Active Directory domain is changed or reset without the Vserver's knowledge. The operation requires the credentials for a user with permission to reset the password in the organizational unit (OU) that contains the machine account.

Parameters
-vserver <vserver> - Vserver
This parameter specifies the name of the Vserver associated with the Active Directory account whose domain account password you want to reset.

Examples
The following example resets the password for the Active Directory account for a Vserver named vs1.

```
cluster1::> vserver active-directory password-reset -vserver vs1
Enter your user ID: Administrator
Enter your password:
```
vserver active-directory show

Display Active Directory accounts

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver active-directory show command displays information about Active Directory accounts. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all Active Directory accounts:

• Vserver name
• Active Directory account NetBIOS name
• Domain or workgroup name

You can specify the -fields parameter to specify which fields of information to display about Active Directory accounts. You can use -fields ? to display the valid values for the -fields parameter. In addition to the fields above, you can display the following fields:

• Fully-qualified domain name
• Organizational unit

You can specify additional parameters to display only information that matches those parameters. For instance, to display information only about Active Directory accounts that are in the Windows Active Directory domain named RUBY, run the command with the value of the -domain-workgroup parameter set to RUBY.

You can specify the -instance parameter to display all information for all Active Directory accounts in list form.

Parameters

[-fields <fieldname>, ...
 If you specify the -fields <fieldname>, ... parameter, the command only displays the fields that you specify.
][-instance ]
 If you specify the -instance parameter, the command displays detailed information about all entries.
[-vserver <vserver>] - Vserver
 If you specify this parameter, the command displays information only about the Active Directory account for the specified Vserver.
[-account-name <NetBIOS>] - Active Directory NetBIOS Name
 If you specify this parameter, the command displays information only for the Active Directory accounts that match the specified NetBIOS account name.
[-domain-workgroup <CIFS domain>] - NetBIOS Domain/Workgroup Name
 If you specify this parameter, the command displays information only for the Active Directory accounts that are in the specified NetBIOS domain or workgroup.

 Note: Workgroups are not supported in this release.
[-domain <TextNoCase>] - Fully Qualified Domain Name
 If you specify this parameter, the command displays information only for the Active Directory accounts that are in the specified domain.
[-ou <text>] - Organizational Unit
 If you specify this parameter, the command displays information only for the Active Directory accounts that are in the specified organizational unit.
[-auth-style \(\text{domain}[\text{workgroup}]\)] Authentication Style

If you specify this parameter, the command displays information only for the Active Directory accounts that are in the specified authentication style.

### Examples

The following example displays a subset of the information about all Active Directory accounts.

```bash
cluster1::> vserver active-directory show

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Account Name</th>
<th>Domain/Workgroup Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>
<td>ADSERVER1</td>
<td>EXAMPLE</td>
</tr>
</tbody>
</table>
```

The following example displays all information about all Active Directory Vservers in list form.

```bash
cluster1::> vserver active-directory show -instance

Vserver: vs1
Active Directory account NetBIOS Name: ADSERVER1
NetBIOS Domain/Workgroup Name: EXAMPLE
Fully Qualified Domain Name: EXAMPLE.COM
Organizational Unit: CN=Computers
```

### vserver check commands

The check directory

#### vserver check lif-multitenancy commands

The lif-multitenancy directory

#### vserver check lif-multitenancy run

Run check for LIF multitenancy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The run command checks the specified Vserver to verify that it has connectivity to the configured external servers providing services such as Active Directory, NIS, and DNS. The output can consist of three types of messages. Failure messages indicate that a Vserver does not have the connectivity required to a server exporting a service. Warning messages indicate configuration or operational issues that are possible causes of the failures. A success message is displayed if the Vserver has network connectivity to each of the configured servers for each service.

You can use this command to verify configuration changes such as creating a Vserver or changing the configured servers for one or more services. It is also useful for diagnosing operational problems that result from failures that could be caused by the inability to make network connections to configured servers.

The services that are checked are DNS, NIS, CIFS preferred domain controllers, CIFS discovered domain controllers, KDC, Active Directory, Admin, Password, LDAP, and LDAP preferred Active Directory.

Only a single run for a Vserver is allowed to run in a cluster. If multiple runs are attempted for a Vserver, a message will be displayed indicating that a run is already in progress.
For each service, this command will ping each configured server until a successful ping is completed. In certain circumstances where a subnet is offline or LIFs are operationally down, this command may take a long time to run. In order to show that forward progress is being made, an activity indicator of a '.' is displayed for each ping sent.

The following fields are reported in table format. Some fields may not be relevant to a type of message and will consist of the text "-":

- Vserver name
- Service external server is exporting
- Address of external server
- Connectivity to that external server
- More information describing the problem
- Suggestions to remediate the problems
- Success when there are no problems

### Parameters

**-vserver <vserver>** - Vserver

Use this parameter to specify the Vserver to check.

**[-verbose {true|false}]** - Show Positive and Negative Result (privilege: advanced)

When this parameter is specified the results of all connectivity tests will be displayed in the success and failure cases.

### Examples

This is an example of a successful run:

```
cluster1::> vserver check lif-multitenancy run -vserver vs0
...
SUCCESS: All external servers are reachable.
```

This is an example of a run with warnings and failures that need to be corrected:

```
cluster1::> vserver check lif-multitenancy run -vserver vs0

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Severity</th>
<th>Service</th>
<th>Address</th>
<th>LIF</th>
<th>Connected</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs0</td>
<td>warning</td>
<td>-</td>
<td>-</td>
<td>vs0_lif1</td>
<td>-</td>
<td></td>
</tr>
<tr>
<td>operationally</td>
<td></td>
<td></td>
<td></td>
<td>vs0_lif2</td>
<td>-</td>
<td></td>
</tr>
<tr>
<td>vs0</td>
<td>warning</td>
<td>-</td>
<td>-</td>
<td>vs0_lif3</td>
<td>-</td>
<td></td>
</tr>
<tr>
<td>operationally</td>
<td></td>
<td></td>
<td></td>
<td>vs0_lif4</td>
<td>-</td>
<td></td>
</tr>
<tr>
<td>vs0</td>
<td>failure</td>
<td>DNS</td>
<td>10.98.200.20</td>

<td>cache</td>
</tr>
<tr>
<td>vs0</td>
<td>failure</td>
<td>NIS domain</td>
<td>10.98.13.53</td>
<td>-</td>
<td>no</td>
<td>cache</td>
</tr>
</tbody>
</table>

Error: command failed: FAILURES FOUND.
You must correct these failures to avoid service disruptions in DOT 8.3 and above.
Corrective actions may include:
- removing decommissioned external servers from the vserver configuration
- restoring network interfaces that are down
- adding network interfaces or routes
- modifying the locations where network interfaces may reside (through
  adjusting failover groups/policies or changing the home-node or
At advanced privilege, additional information for messages at all severities is displayed.

```
cluster1::*> vserver check lif-multitenancy run -vserver vs0 -verbose true
.
.
Vserver         Severity Service            Address         LIF             Connected  Details

SUCCESS: All external servers are reachable.
```

**vserver check lif-multitenancy show**

Show the summary of the latest multitenancy network run

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

You can view summary information about the latest completed run, or the run in progress for a Vserver. It will show the following fields:

- **Vserver** - Name of Vserver that was checked for LIF connectivity
- **Start Time** - Date And Time the run was started
- **Status** - Not Started, In Progress, Complete, or Aborted
- **Success** - Yes if the run has a Status of Complete with no failures. No if the run has a status of Complete with one or more failures.
- **Updated** - The date and time the scan was last updated.

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance]
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[-vserver <vserver>] - Vserver
```

Selects the summary information matching the specified Vserver.

```
[-start-time <MM/DD/YYYY HH:MM:SS>] - Start Time
```

Selects the summary information matching the specified date and time the run was started

```
[-status {not started|in progress|complete|aborted}] - Run Status
```

Selects the summary information matching the specified status of the run.

```
[-success {yes|no}] - Successful Run
```

Selects the summary information matching the specified success or failure of the run.

```
[-updated <MM/DD/YYYY HH:MM:SS>] - Run Updated
```

Selects the summary information matching the last time the run was still in progress.
### Examples

This is what a successful run looks like:

```
cluster1::> vserver check lif-multitenancy show
Vserver  Start Time           Status        Success
-----------  -------------------  ------------  -------
vs0          7/16/2014 14:28:35 complete      yes
```

This is what a failed run looks like:

```
cluster1::> vserver check lif-multitenancy show
Vserver  Start Time           Status        Success
-----------  -------------------  ------------  -------
vs0          7/16/2014 14:40:55 complete      no
```

This is what specifying the Vserver looks like:

```
cluster1::> vserver check lif-multitenancy show -vserver vs0
Vserver: vs0
Start Time: 7/16/2014 14:40:55
Run Status: complete
Successful Run: no
```

Advanced privilege adds in the Updated field.

```
cluster1::*> vserver check lif-multitenancy show
Vserver  Start Time           Status        Success  Updated
-----------  -------------------  -----------  -------  -----------
vs0          7/16/2014 14:40:55 complete      no  7/16/2014 14:40:56
```

Diagnostic privilege adds in the Details field:

```
cluster1::*> vserver check lif-multitenancy show
Vserver  Start Time           Status        Success  Updated         Details
-----------  -------------------  -----------  -------  --------------  ---------
vs0          7/16/2014 14:40:55 complete      no  7/16/2014 14:40:56  exit code is 1
```

### `vserver check lif-multitenancy show-results`

Show the results of the latest multitenancy network run

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**

You can view detailed information about the latest completed run, or the run for a Vserver.
- Vserver - name of vserver run was for
- Severity - severity of the message which is failure, warning, or info.
- Service - name of service that is being checked for connectivity
- Address - address of server configured for the above service that is being
- LIF - the LIF a successful connectivity check to the above server was made from
- Connected - true if there is connectivity, false if there is not
- Status - additional information useful for resolving issues

Parameters

{-fields <fieldname>, ...}
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

{-instance}
If you specify the -instance parameter, the command displays detailed information about all fields.

-vserver <vserver> - Vserver
Selects the messages matching the specified Vserver.

-severity <text> - Severity
Selects the messages matching the specified severity of failure, warning, and info.

-service <text> - Service Name
Selects the messages matching the specified service.

-address <text> - Address of Server
Selects the messages matching the specified address.

-lif <lif-name> - Logical Interface
Selects the messages matching the specified LIF.

-connected {yes|no} - Vserver Connectivity
Selects the messages matching the specified connectivity.

-status <text> - Additional Information
Selects the messages matching the specified search criteria.

Examples

Runs that are successful will not have any content.

cluster1::> vserver check lif-multitenancy show-results -vserver vs0
This table is currently empty.

Successful runs made with -verbose true will show the LIF used to Ping the nework address from.

cluster1::> vserver check lif-multitenancy show-results -vserver vs0

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Severity</th>
<th>Service</th>
<th>Address</th>
<th>Logical Interface</th>
<th>Connected</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs0</td>
<td>info</td>
<td>DNS</td>
<td>10.98.200.20</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Successful runs made with -verbose true will show the LIF used to Ping the nework address from.

```
cluster1::> vserver check lif-multitenancy show-results -vserver vs0
Vserver    Severity  Service      Network      Logical
----------  --------  -----------  -----------  ---------  ---------- -------
vs0
   info      DNS          10.98.200.20
          info      NIS domain   10.98.13.53  vs0_lif1   yes        ping
```
2 entries were displayed.

Runs that fail display each failure that needs to be fixed.

```
cluster1::> vserver check lif-multitenancy show-results -vserver vs0
Vserver    Severity  Service      Network      Logical
----------  --------  -----------  -----------  ---------  ---------- -------
vs0
   warning  -            -            vs0_lif1   -          operationally down
   warning  -            -            vs0_lif2   -          operationally down
   failure  DNS          10.98.200.20
   failure  NIS domain   10.98.13.53  -          no         cache
```
4 entries were displayed.

### Vserver Audit Commands

Manage auditing of protocol requests that the Vserver services

The `vserver audit` commands enable you to manage auditing of protocol requests that the Vserver services.

`vserver audit create`

Create an audit configuration

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**

The `vserver audit create` command creates an audit configuration for a Vserver.

When you create an audit configuration, you can also specify the rotation method. By default, the audit log is rotated based on size.

You can use the time-based rotation parameters in any combination (`-rotate-schedule-month`, `-rotate-schedule-dayofweek`, `-rotate-schedule-day`, `-rotate-schedule-hour`, and `-rotate-schedule-minute`). The `-rotate-schedule-minute` parameter is mandatory. All other time-based rotation parameters are optional.

The rotation schedule is calculated by using all the time-related values. For example, if you specify only the `-rotate-schedule-minute` parameter, the audit log files are rotated based on the minutes specified on all days of the week, during all hours on all months of the year. If you specify only one or two time-based rotation parameters (say `-rotate-schedule-month` and `-rotate-schedule-minutes`), the log files are rotated based on the minute values that you specified on all days.
of the week, during all hours, but only during the specified months. For example, you can specify that the audit log is to be rotated during the months January, March, and August on all Mondays, Wednesdays, and Saturdays at 10:30.

If you specify values for both `-rotate-schedule-dayofweek` and `-rotate-schedule-day`, they are considered independently. For example if you specify `-rotate-schedule-dayofweek` as Friday and `-rotate-schedule-day` as 13 then the audit logs would be rotated on every Friday and on the 13th day of the specified month, not just on every Friday the 13th.

This command is not supported on a Vserver with Infinite Volume.

**Parameters**

`-vserver <vserver name>` - Vserver

This parameter specifies the name of the Vserver on which to create the audit configuration. The Vserver must already exist.

`-destination <text>` - Log Destination Path

This parameter specifies the audit log destination path where consolidated audit logs are stored. If the path is not valid, the command fails. The path can be up to 864 characters in length and must have read-write permissions.

`[-events {file-ops|cifs-logon-logoff|cap-staging|file-share|audit-policy-change|user-account|authorization-policy-change|security-group},...]` - Categories of Events to Audit

This parameter specifies the categories of events to be audited. Supported event categories are: file access events (both CIFS and NFS), CIFS logon and logoff events, Central Access Policy(CAP) staging events, File share events, Audit policy change events, Local User Account Management Events, Local Security Group Management Events and Authorization Policy Change Events. The corresponding parameter values are: `file-ops`, `cifs-logon-logoff`, `cap-staging`, `file-share`, `audit-policy-change`, `user-account`, `security-group` and `authorization-policy-change`. By default, `file-ops`, `cifs-logon-logoff` and `audit-policy-change` events are enabled. The support for `audit-policy-change` event can be modified from diag prompt using `vserver audit modify` command.

`[-format {xml|evtx}]` - Log Format

This parameter specifies the output format of the audit logs. The output format can be either Data ONTAP-specific XML or Microsoft Windows EVTIX log format. By default, the output format is EVTX.

`[-rotate-size <integer>[KB|MB|GB|TB|PB]]` - Log File Size Limit

This parameter specifies the audit log file size limit. By default, the audit log is rotated based on size. The default audit log size is 100 MB.

`[-rotate-schedule-month <cron_month>,...]` - Log Rotation Schedule: Month

This parameter specifies the monthly schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated during the months January, March, and August, or during all the months. Valid values are January, February, March, April, May, June, July, August, September, October, November, December, and all. Specify "all" to rotate the audit logs every month.

`[-rotate-schedule-dayofweek <cron_dayofweek>,...]` - Log Rotation Schedule: Day of Week

This parameter specifies the daily (day of the week) schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated on Tuesdays and Fridays, or during all the days of a week. Valid values are Sunday, Monday, Tuesday, Wednesday, Thursday, Friday, Saturday, and all. Specify "all" to rotate the audit logs every day.

`[-rotate-schedule-day <cron_dayofmonth>,...]` - Log Rotation Schedule: Day

This parameter specifies the day of the month schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated on the 10th and 20th days of a month, or all days of a month. Valid values range from 1 to 31.
[-rotate-schedule-hour <cron_hour>, ...] - Log Rotation Schedule: Hour

This parameter specifies the hourly schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated at 6 a.m. and 10 a.m. Valid values range from 0 (midnight) to 23 (11:00 p.m.). Specify “all” to rotate the audit logs every hour.

[-rotate-schedule-minute <cron_minute>, ...] - Log Rotation Schedule: Minute

This parameter specifies the minute schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated at the 30th minute. Valid values range from 0 to 59.

[-rotate-limit <integer>] - Log Files Rotation Limit

This parameter specifies the audit log files rotation limit. A value of 0 indicates that all the log files are retained. The default value is 0. For example, if you enter a value of 5, the last five audit logs are retained.

Examples

The following examples create an audit configuration for Vserver vs1 using size-based rotation.

```
cluster1::> vserver audit create -vserver vs1 -destination /audit_log -rotate-size 10MB -rotate-limit 5
```

The following example creates an audit configuration for Vserver vs1 using time-based rotation. The audit logs are rotated monthly, all days of the week, at 12:30.

```
cluster1::> vserver audit create -vserver vs1 -destination /audit_log -rotate-schedule-month all -rotate-schedule-dayofweek all -rotate-schedule-hour 12 -rotate-schedule-minute 30
```

The following example creates an audit configuration for Vserver vs1 using time-based rotation. The audit logs are rotated in January, March, May, July, September, and November on Monday, Wednesday, and Friday, at 6:15, 6:30, 6:45, 12:15, 12:30, 12:45, 18:15, 18:30, and 18:45. The last 6 audit logs are retained.

```
cluster1::> vserver audit create -vserver vs1 -destination /audit_log -rotate-schedule-month January, March, May, July, September, November -rotate-schedule-dayofweek Monday, Wednesday, Friday -rotate-schedule-hour 6,12,18 -rotate-schedule-minute 15,30,45 -rotate-limit 6
```

The following example creates an audit configuration for Vserver vs1 for auditing CIFS and NFS file access events in the output log format EVTIX.

```
cluster1::> vserver audit create -vserver vs1 -destination /audit_log -format evtx -events file-ops
```

vserver audit modify on page 1422

vserver audit delete

Delete audit configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver audit delete command deletes the audit configuration for a Vserver.

Parameters

-`vserver <vserver name>` - Vserver

This parameter specifies the name of the Vserver associated with the audit configuration to be deleted.
[-force [true]] - Force Delete (privilege: advanced)

This parameter is used to forcibly delete the audit configuration. By default the setting is false.

**Examples**
The following example deletes the audit configuration for Vserver vs1.

```
cluster1::> vserver audit delete -vserver vs1
```

**vserver audit disable**

Disable auditing

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**
The `vserver audit disable` command disables auditing for a Vserver.

**Parameters**

- `-vserver <vserver name>` - Vserver

  This parameter specifies the name of the Vserver for which auditing is to be disabled. The Vserver audit configuration must already exist.

**Examples**
The following example disables auditing for Vserver vs1.

```
cluster1::> vserver audit disable -vserver vs1
```

**vserver audit enable**

Enable auditing

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**
The `vserver audit enable` command enables auditing for a Vserver.

**Parameters**

- `-vserver <vserver name>` - Vserver

  This parameter specifies the name of the Vserver for which auditing is to be enabled. The Vserver audit configuration must already exist.

[-force [true]] - Force Enable (privilege: advanced)

This parameter is used to forcibly enable auditing. By default the setting is false.

**Examples**
The following example enables auditing for Vserver vs1.

```
cluster1::> vserver audit enable -vserver vs1
```
**vserver audit modify**

Modify the audit configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The `vserver audit modify` command modifies an audit configuration for a Vserver.

**Parameters**

`-vserver <vserver name>` - Vserver

This parameter specifies the name of the Vserver for which the audit configuration is to be modified. The Vserver audit configuration must already exist.

If you have configured time-based rotation, modifying one parameter of time-based rotation schedule does not affect the other parameters. For example, if the rotation schedule is set to run at Monday 12:30 a.m., and you modify the `-rotate-schedule-dayofweek` parameter to Monday, Wednesday, Friday, the new rotation-schedule rotates the audit logs on Monday, Wednesday, and Friday at 12:30 a.m. To clear time-based rotation parameters, you must explicitly set that portion to ".". Some time-based parameters can also be set to "all".

`[-destination <text>]` - Log Destination Path

This parameter specifies the audit log destination path where consolidated audit logs are stored. If the path is not valid, the command fails. The path can be up to 864 characters in length and must have read-write permissions.

`[-events {file-ops|cifs-logon-logoff|cap-staging|file-share|audit-policy-change|user-account|authorization-policy-change|security-group}, ...]` - Categories of Events to Audit

This parameter specifies the categories of events to be audited. Supported event categories are: file access events (both CIFS and NFS), CIFS logon and logoff events, Central Access Policy (CAP) staging events, File share events, Audit policy change events, Local User Account Management Events, Local Security Group Management Events and Authorization Policy Change Events. The corresponding parameter values are: `file-ops`, `cifs-logon-logoff`, `cap-staging`, `file-share`, `audit-policy-change`, `user-account`, `security-group`, and `authorization-policy-change`. By default, `file-ops`, `cifs-logon-logoff` and `audit-policy-change` events are enabled

`[-format {xml|evtx}]` - Log Format

This parameter specifies the output format of the audit logs. The output format can be either Data ONTAP-specific XML or Microsoft Windows EVTX log format. By default, the output format is EVTX.

`{ [-rotate-size (<integer> [KB|MB|GB|TB|PB])] }` - Log File Size Limit

This parameter specifies the audit log file size limit. By default, the audit log is rotated based on size. The default audit log size is 100 MB.

`{ [-rotate-schedule-month <cron_month>, ...] }` - Log Rotation Schedule: Month

This parameter specifies the monthly schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated during the months January, March, and August, or during all the months. Valid values are January, February, March, April, May, June, July, August, September, October, November, December, and all. Specify "all" to rotate the audit logs every month.

`{ [-rotate-schedule-dayofweek <cron_dayofweek>, ...] }` - Log Rotation Schedule: Day of Week

This parameter specifies the daily (day of the week) schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated on Tuesdays and Fridays, or during all the days of a week. Valid values are Sunday, Monday, Tuesday, Wednesday, Thursday, Friday, Saturday, and all. Specify "all" to rotate the audit logs every day.
[-rotate-schedule-day <cron_dayofmonth>, ...] - Log Rotation Schedule: Day

This parameter specifies the day of the month schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated on the 10th and 20th days of a month, or all days of a month. Valid values range from 1 to 31.

[-rotate-schedule-hour <cron_hour>, ...] - Log Rotation Schedule: Hour

This parameter specifies the hourly schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated at 6 a.m and 10 a.m. Valid values range from 0 (midnight) to 23 (11:00 p.m.). Specify "all" to rotate the audit logs every hour.

[-rotate-schedule-minute <cron_minute>, ...] - Log Rotation Schedule: Minute

This parameter specifies the minute schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated at the 30th minute. Valid values range from 0 to 59.

[-rotate-limit <integer>] - Log Files Rotation Limit

This parameter specifies the audit log files rotation limit. A value of 0 indicates that all the log files are retained. The default value is 0.

Examples

The following example modifies the rotate-size and rotate-limit field for Vserver vs1.

    cluster1::> vserver audit modify -vserver vs1 -rotate-size 10MB -rotate-limit 3

The following example modifies an audit configuration for Vserver vs1 using the time-based rotation method. The audit logs are rotated monthly, all days of the week, at 12:30.

    cluster1::> vserver audit modify -vserver vs1 -destination /audit_log -rotate-schedule-month all -rotate-schedule-dayofweek all -rotate-schedule-hour 12 -rotate-schedule-minute 30

The following example modifies an audit configuration for Vserver vs1 for auditing CIFS and NFS file access events in the output log format EVTX.

    cluster1::> vserver audit modify -vserver vs1 -format evtx -events file-ops

vserver audit rotate-log

Rotate audit log

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver audit rotate-log command rotates audit logs for a Vserver.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver for which audit logs are to be rotated. The Vserver audit configuration must already exist. Auditing must be enabled for the Vserver.

Examples

The following example rotates audit logs for Vserver vs1.

    cluster1::> vserver audit rotate-log -vserver vs1
vserver audit show

Display the audit configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver audit show command displays audit configuration information about Vservers. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all the Vservers:

- Vserver name
- Audit state
- Target directory

You can specify the -fields parameter to specify which audit configuration information to display about Vservers. You can specify additional parameters to display only information that matches those parameters. For instance, to display information about the log file rotation size of a Vserver whose value matches 10 MB, run the command with the -rotate-size 10MB parameter.

You can specify the -instance parameter to display audit configuration information for all Vservers in list form.

Parameters

[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command only displays the fields that you specify.

[-log-save-details]
You can specify the -log-save-details parameter to display the following information about all the Vservers:

- Vserver name
- Rotation file size
- Rotation schedules
- Rotation limit

[-instance]
If you specify the -instance parameter, the command displays detailed information about all entries.

[-vserver <vserver name>] - Vserver
If you specify this parameter, the command displays information about the specified Vserver.

[-state {true|false}] - Auditing State
If you specify this parameter, the command displays information about the Vservers that use the specified audit state value.

[-destination <text>] - Log Destination Path
If you specify this parameter, the command displays information about the Vservers that use the specified destination path.

[-events {file-ops|cifs-logon-logoff|cap-staging|file-share|audit-policy-change|user-account|authorization-policy-change|security-group}, ...] - Categories of Events to Audit
If you specify this parameter, the command displays information about the Vservers that use the specified category of events that are audited. Valid values are file-ops, cifs-logon-logoff, cap-staging,
file-share, audit-policy-change, user-account, security-group and authorization-policy-change. audit-policy-change will appear only in diag mode.

[-format {xml|evtx}]- Log Format
If you specify this parameter, the command displays information about the Vservers that use the specified log format.

[-rotate-size <integer> {KB|MB|GB|TB|PB}]- Log File Size Limit
If you specify this parameter, the command displays information about the Vservers that use the specified log file rotation size.

[-rotate-schedule-month <cron_month>, ...]- Log Rotation Schedule: Month
If you specify this parameter, the command displays information about the Vservers that use the specified month of the time-based log rotation scheme. Valid values are January, February, March, April, May, June, July, August, September, October, November, and December.

[-rotate-schedule-dayofweek <cron_dayofweek>, ...]- Log Rotation Schedule: Day of Week
If you specify this parameter, the command displays information about the Vservers that use the specified day of the week of the time-based log rotation scheme. Valid values are Sunday, Monday, Tuesday, Wednesday, Thursday, Friday, and Saturday.

[-rotate-schedule-day <cron_dayofmonth>, ...]- Log Rotation Schedule: Day
If you specify this parameter, the command displays information about the Vservers that use the specified day of the month of the time-based log rotation scheme. Valid values range from 1 to 31.

[-rotate-schedule-hour <cron_hour>, ...]- Log Rotation Schedule: Hour
If you specify this parameter, the command displays information about the Vservers that use the specified hour of the time-based log rotation scheme. Valid values range from 0 (midnight) to 23 (11:00 p.m.).

[-rotate-schedule-minute <cron_minute>, ...]- Log Rotation Schedule: Minute
If you specify this parameter, the command displays information about the Vservers that use the specified minute of the time-based log rotation scheme. Valid values range from 0 to 59.

[-rotate-schedule-description <text>]- Rotation Schedules
If you specify this parameter, the command displays information about the Vservers that use the specified rotation schedules. This field is derived from the rotate-time fields.

[-rotate-limit <integer>]- Log Files Rotation Limit
If you specify this parameter, the command displays information about the Vservers that use the specified rotation limit value.

Examples
The following example displays the name, audit state, event types, log format, and target directory for all Vservers.

```
cluster1::> vserver audit show
Vserver     State  Event Types Log Format Target Directory
----------- ------ ----------- ---------- ---------------------
vs1         false  file-ops    evtx       /audit_log
```

The following example displays the Vserver names and details about the audit log for all Vservers.

```
cluster1::> vserver audit show -log-save-details
Vserver     Rotation File Size Rotation Schedule        Limit
----------- --------- ------------------------ --------
vs1         100MB     -                        0
```

The following example displays in list form all audit configuration information about all Vservers.
vserver cifs commands

Manage the CIFS configuration of a Vserver

vserver cifs add-netbios-aliases

Add NetBIOS aliases for the CIFS server name

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs add-netbios-aliases command creates or adds a list of NetBIOS aliases for the CIFS server name.

Parameters
-vserver <vserver name> - Vserver
This parameter specifies the name of the Vserver for which NetBIOS alias are to be created or added.

-netbios-aliases <NetBIOS>, ... - List of NetBIOS Aliases
This parameter specifies one or more NetBIOS aliases to be added to an existing list of NetBIOS aliases. A new list of NetBIOS aliases is created if the list is currently empty.

Examples
The following example creates a new list of NetBIOS aliases for Vserver vs_a.

```bash
cluster1::> cifs show -display-netbios-aliases
Vserver: vs_a
    Server Name: CIFS_SERVER
    NetBIOS Aliases: -
cluster1::> cifs add-netbios-aliases -netbios-aliases alias_1,alias_2,alias_3
cluster1::> cifs show -display-netbios-aliases
Vserver: vs_a
    Server Name: CIFS_SERVER
    NetBIOS Aliases: ALIAS_1, ALIAS_2, ALIAS_3
```

The following example adds several NetBIOS aliases for the CIFS server CIFS_SERVER on Vserver vs_a.

```bash
cluster1::> cifs add-netbios-aliases -netbios-aliases alias_1,alias_2,alias_3
cluster1::> cifs show -display-netbios-aliases
Vserver: vs_a
    Server Name: CIFS_SERVER
    NetBIOS Aliases: ALIAS_1, ALIAS_2, ALIAS_3
```
vserver cifs create

Create a CIFS server

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver cifs create command creates a CIFS server on a Vserver. When you create the CIFS server, you can add it to an existing CIFS domain, or you can join it to a workgroup. When you add it to an existing CIFS domain, the storage system prompts you to provide the credentials of a user account that has sufficient privileges to add computers to the -ou container within the -domain domain. The user account must have a password that cannot be empty. If the new CIFS server is joining a domain, this command might take several minutes to complete.

Note: Each Vserver can have only one CIFS server.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver on which to create the CIFS server. The Vserver must already exist.

-cifs-server <NetBIOS> - CIFS Server NetBIOS Name

This parameter specifies the name of the CIFS server (up to 15 characters).

{-domain <TextNoCase> - Fully Qualified Domain Name

This parameter specifies the name of the Active Directory domain to associate with the CIFS server.

[-ou <text>] - Organizational Unit

This parameter specifies the organizational unit within the Active Directory domain to associate with the CIFS server. By default, this parameter is set to CN=Computers.

[-default-site <text>] - Default Site Used by LIFs Without Site Membership

This parameter specifies the site within the Active Directory domain to associate with the CIFS server if Data ONTAP cannot determine an appropriate site.

|-workgroup <NetBIOS> - Workgroup Name

This parameter specifies the name of the workgroup (up to 15 characters).

[-status-admin (down|up)] - CIFS Server Administrative Status

Use this parameter to specify whether the initial administrative status of the cifs server is up or down. The default setting is up.
CIFS Server Description

This optional parameter specifies a text comment for the server. CIFS clients can see this CIFS server
description when browsing servers on the network. The comment can be up to 48 characters long. If there is a
space in the descriptive remark or the path, you must enclose the entire string in quotation marks.

List of NetBIOS Aliases

This parameter specifies a list of NetBIOS aliases, which are alternate names to the CIFS server name.

Examples

The following example creates a CIFS server CIFSSERVER1 for Vserver vs1 and domain EXAMPLE.com:

```
cluster1::> vserver cifs create -vserver vs1 -cifs-server CIFSSERVER1 -domain EXAMPLE.com
```

In order to create an Active Directory machine account for the CIFS server, you
must supply the name and password of a Windows account with sufficient
privileges to add computers to the "CN=Computers" container within the
"EXAMPLE.com" domain.

Enter the user name: Administrator

Enter the password:

The following example creates a CIFS server CIFSSERVER1 for Vserver vs1 and workgroup Sales:

```
cluster1::> vserver cifs create -vserver vs1 -cifs-server CIFSSERVER1 -workgroup Sales
```

vserver cifs delete

Delete a CIFS server

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver cifs delete command deletes a CIFS server.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the Vserver for the CIFS server you want to delete.

Examples

The following example deletes the CIFS server from a Vserver named vs1:

```
cluster1::> vserver cifs delete -vserver vs1
```

vserver cifs modify

Modify a CIFS server

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver cifs modify command modifies the site within the Active Directory domain to associate with the CIFS server
if Data ONTAP cannot determine an appropriate site. You also can modify the name and ou of the CIFS server, join to a new
domain or a workgroup, or rejoin to current domain. When a CIFS server is joining a domain, this command might take several
minutes to complete.
Parameters
-vserver <vserver name> - Vserver

This parameter specifies the Vserver for the CIFS server whose associated site you want to modify.

[-cifs-server <NetBIOS>] - CIFS Server NetBIOS Name

This parameter specifies the name of the CIFS server (up to 15 characters). Before setting this parameter, the CIFS server must be stopped using the vserver cifs modify -status-admin down command. When the command completes successfully, the administrative status of the CIFS server is automatically set to up.

[-domain <TextNoCase>] - Fully Qualified Domain Name

This parameter specifies the fully qualified name of the Active Directory domain to associate with the CIFS server. Before setting this parameter, the CIFS server must be stopped using the vserver cifs modify -status-admin down command. When the command completes successfully, the administrative status of the CIFS server is automatically set to up.

[-ou <text>] - Organizational Unit

This parameter specifies the organization unit within the Active Directory domain to associate with the CIFS server. By default, this parameter is set to CN=Computers. Before setting this parameter, the CIFS server must be stopped using the vserver cifs modify -status-admin down command. When the command completes successfully, the administrative status of the CIFS server is automatically set to up. Modifications to this parameter are not supported for workgroup CIFS servers.

[-default-site <text>] - Default Site Used by LIFs Without Site Membership

This parameter specifies the site within the Active Directory domain to associate with the CIFS server if Data ONTAP cannot determine an appropriate site. Modifications to this parameter are not supported for workgroup CIFS servers.

[-workgroup <NetBIOS>] - Workgroup Name

This parameter specifies the name of the workgroup (up to 15 characters).

[-status-admin {down|up}] - CIFS Server Administrative Status

Use this parameter to modify the administrative status of the cifs server. Modify the administrator status to down to stop cifs access.

[-comment <text>] - CIFS Server Description

Use this parameter to modify the comment of the server.

Examples

The following example changes the default site and administrative status of the CIFS server associated with Vserver "vs1":

```
class1:~> vserver cifs modify -vserver vs1 -default-site default -status-admin up
```

The following example modifies the Active Directory domain and ou for the CIFS server associated with Vserver "vs1". The administrative status of the CIFS server must be set to "down" to proceed with Active Directory domain modification. If the command completes successfully, the administrative status is automatically set to "up".

```
class1:~> vserver cifs modify -vserver vs1 -domain example.com -ou ou-example_ou -cifs-server example -status-admin down
```

In order to create an Active Directory machine account for the CIFS server, you must supply the name and password of a Windows account with sufficient privileges to add computers to the "ou-example_ou" container within the "example.com" domain.

```
Enter the user name: administrator
```
Enter the password:

cluster1::>

The following example modifies the CIFS server associated with Vserver "vs1" from a domain to a workgroup. The administrative status of the CIFS server must be set to "down" for this command. If the command completes successfully, the administrative status is automatically set to "up".

cluster1::> vserver cifs modify -vserver vs1 -workgroup Sales -status-admin down

Warning: To enter workgroup mode, all domain-based features must be disabled and their configuration removed automatically by the system, including continuously-available shares, shadow copies, and AES. However, domain-configured share ACLs such as "EXAMPLE.COM\user\name" will not work properly, but cannot be removed by Data ONTAP. Remove these share ACLs as soon as possible using external tools after the command completes. If AES is enabled, you may be asked to supply the name and password of a Windows account with sufficient privileges to disable it in the "EXAMPLE.COM" domain.

Do you want to continue? {y|n}: y

cluster1::>

The following example modifies the CIFS server associated with Vserver "vs1" from a workgroup to a domain. The administrative status of the CIFS server must be set to "down" for this command. If the command completes successfully, the administrative status is automatically set to "up".

cluster1::> vserver cifs modify -vserver vs1 -domain example.com -status-admin down

In order to create an Active Directory machine account for the CIFS server, you must supply the name and password of a Windows account with sufficient privileges to add computers to the "ou=example_ou" container within the "example.com" domain.

Enter the user name: administrator

Enter the password:

cluster1::>

The following example modifies the CIFS server name associated with Vserver "vs1" from above example. The administrative status of the CIFS server must be set to "down" to proceed with Active Directory domain modification. If the command completes successfully, the administrative status is automatically set to "up" and there will be a job running to update related configurations.

cluster1::> vserver cifs modify -vserver vs1 -cifs-server new_example -status-admin down

In order to create an Active Directory machine account for the CIFS server, you must supply the name and password of a Windows account with sufficient privileges to add computers to the "ou=example_ou" container within the "example.com" domain.

Enter the user name: administrator

Enter the password:

Successfully queued CIFS Server Modify job [id: xx] for CIFS server "NEW_EXAMPLE". To view the status of the job, use the "job show -id <jobid>" command.

cluster1::>
vserver cifs nbtstat

Display NetBIOS information over TCP connection

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs nbtstat command displays information about NetBIOS over TCP (NBT) connections for the cluster. It displays the IP address associated with the interfaces, the IP addresses of the WINS servers in use, and information about the registered NetBIOS names for the cluster. You can use this command to troubleshoot NetBIOS name resolution problems.

Note: NetBIOS name service (NBNS) over IPv6 is not supported.

Parameters

[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance]]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node
If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified node.

[-vserver <vserver name>] - Vserver
If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified Vserver.

[-nbt-name <text>] - NBT Name
If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified NetBIOS name.

[-netbios-suffix <Hex String>] - NetBIOS Suffix
If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified NetBIOS suffix.

[-interface <IP Address>, ...] - Interfaces
If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified IP address.

[-wins-servers <IP Address>, ...] - Servers
If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified WINS servers.

[-server-state <text>, ...] - Server State (active, inactive)
If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified WINS server state. The following are possible values for this parameter:

• active
• inactive

[-nbt-scope <text>] - NBT Scope
If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified NetBIOS name scope.
[\text{-nbt-mode <text}>] - NBT Mode

If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified NetBIOS name service mode. The following are possible values for this parameter:

- 'p' - Point to Point
- 'h' - Hybrid
- 'm' - Mixed
- 'b' - Broadcast

[\text{-state <text}>] - State

If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified NetBIOS name registration state. The following are possible values for this parameter:

- must_register
- must_unregister
- wins
- broadcast
- name_released
- wins_conflict
- broadcast_conflict

[\text{-time-left <integer>}] - Time Left

If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified registration time left in minutes with the WINS server.

[\text{-type <text}>] - Type

If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified name registration type. The following are possible values for this parameter:

- registered
- active
- permanent
- group

Examples

The following example displays the NetBIOS name service information.

\begin{verbatim}
cluster1::> nbtstat
   (vserver cifs nbtstat)
   Vserver: vs1
   Node:    cluster1-01
   Interfaces:  10.10.10.32
                10.10.10.33
   Servers:   17.17.1.2  (active )
   NBT Scope:  [ ]
   NBT Mode:   [h]
   NBT Name     NetBIOS Suffix   State   Time Left   Type
   ------------------ ---------------  ---------  ----------
\end{verbatim}
vserver cifs prepare-to-downgrade

Restore the CIFS Configurations to Earlier Release of Data ONTAP Version

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**
The `vserver cifs prepare-to-downgrade` command restores the CIFS configurations for Data ONTAP based on the input parameter `disable-feature-set`.

**Parameters**

`-disable-feature-set <downgrade version>` - Data ONTAP Version

This parameter specifies the Data ONTAP release for which the CIFS configurations are restored. The value can be one of the following:

- 8.3.1 - Restores the CIFS configurations for Data ONTAP release 8.3.1. These features include:
  - FPolicy "close with read" filters from FPolicy events.
  - CIFS server options `-guest-unix-user` and `-is-admin-users-mapped-to-root-enabled`.
  - CIFS security option `is-smb-encryption-required`.
  - Storage-Level Access Guard (SLAG) for qtrees.
  - CIFS share property `encrypt-data`.
- 8.3.2 - Restores the CIFS configurations for Data ONTAP release 8.3.2. These features include:
  - CIFS server option `-grant-unix-group-perms-to-others`.
- 9.0.0 - Restores the CIFS configurations for Data ONTAP release 9.0.0. These features include:
  - Disable CIFS multichannel feature and close all multichannel connections.
  - Delete all the name-mapping entries that have a hostname or an address field configured.
  - Terminate all SMB 3.1 client connections.
  - Terminate all client connections that have large MTU negotiated.
  - Remove the symlink property `no-strict-security`.
  - Remove all symlink pathmap entries with locality `freelink`.
**Examples**

```
cluster1::*> vserver cifs prepare-to-downgrade -disable-feature-set 8.3.1

cluster1::*> vserver cifs prepare-to-downgrade -disable-feature-set 8.3.2

cluster1::*> vserver cifs prepare-to-downgrade -disable-feature-set 9.0.0
```

---

**vserver cifs remove-netbios-aliases**

Remove NetBIOS aliases

**Availability:** This command is available to cluster and Vserver administrators at the **admin** privilege level.

**Description**
The `vserver cifs remove-netbios-aliases` command deletes NetBIOS aliases for the CIFS server.

**Parameters**

- **-vserver `<vserver name>`**: Vserver
  
  This parameter specifies the name of the Vserver from which the list of NetBIOS aliases are deleted.

- **-netbios-aliases `<NetBIOS>`, ...**: List of NetBIOS Aliases
  
  This parameter specifies one or more NetBIOS aliases to be deleted. To delete all the NetBIOS aliases of a Vserver use `-`.

**Examples**
The following example deletes NetBIOS aliases for the CIFS server CIFS_SERVER on Vserver vs_a.

```
cluster1::> cifs show -display-netbios-aliases
Vserver: vs_a
  
  Server Name: CIFS_SERVER
  NetBIOS Aliases: ALIAS_1, ALIAS_2, ALIAS_3, ALIAS_4,
                 ALIAS_5, ALIAS_6, ALIAS_7

cluster1::> cifs remove-netbios-aliases -netbios-aliases alias_1,alias_3,alias_5
cluster1::> cifs show -display-netbios-aliases
Vserver: vs_a
  
  Server Name: CIFS_SERVER
  NetBIOS Aliases: ALIAS_2, ALIAS_4, ALIAS_6, ALIAS_7

cluster1::> cifs remove-netbios-aliases -netbios-aliases alias_7
cluster1::> cifs show -display-netbios-aliases
Vserver: vs_a
  
  Server Name: CIFS_SERVER
  NetBIOS Aliases: ALIAS_2, ALIAS_4, ALIAS_6

cluster1::> cifs remove-netbios-aliases -netbios-aliases -
```
vserver cifs repair-modify

Repair a partially-failed Vserver CIFS server modify operation

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
Use this `vserver cifs repair-modify -vserver <vserver name>` command when the background job created during a Vserver CIFS server modify operation fails.

Parameters
- `-vserver <vserver name>` - Vserver
  This parameter specifies a Vserver containing a configured CIFS server that has been modified.

Examples
The following example starts the CIFS server modify job on Vserver vs1 successfully:

```bash
cluster1::*> vserver cifs repair-modify -vserver vs1
Successfully queued CIFS Server Modify job [id: 10] for CIFS server "CIFSNAME1". To view the status of the job, use the "job show -id <jobid>" command.
```

The following example fails the command with specific error:

```bash
cluster1::*> vserver cifs repair-modify -vserver vs2
Error: Job Out of memory. Failed to queue CIFS Server Modify Job for CIFS server "CIFSNAME2". Retry the operation by running (privilege: advanced) "vserver cifs repair-modify -vserver vs2". Error: command failed: unable to save data
```

vserver cifs show

Display CIFS servers

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The `vserver cifs show` command displays information about CIFS servers. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all CIFS servers:

- Vserver name
• CIFS server NetBIOS name
• Domain or workgroup name
• Authentication style

You can specify the `-fields` parameter to specify which fields of information to display about CIFS servers. In addition to the fields above, you can display the following fields:
• Default site
• Fully-qualified domain name

You can specify additional parameters to display only information that matches those parameters. For instance, to display information only about CIFS servers that are in the CIFS domain named RUBY, run the command with the `-domain-workgroup RUBY` parameter.

You can specify the `-instance` parameter to display all information for all CIFS servers in list form.

**Parameters**

`[-fields <fieldname>, ...]`
If you specify the `-fields <fieldname>, ...` parameter, the command only displays the fields that you specify.

`[-display-netbios-aliases]`
If you specify this parameter, the command displays information about configured NetBIOS aliases.

`[-instance ]`
If you specify the `-instance` parameter, the command displays detailed information about all entries.

`[-vserver <vserver name>] - Vserver`
If you specify this parameter, the command displays information only about the CIFS servers for the specified Vserver.

`[-cifs-server <NetBIOS>] - CIFS Server NetBIOS Name`
If you specify this parameter, the command displays information only for CIFS servers that match the specified CIFS server NetBIOS name.

`[-domain-workgroup <CIFS domain>] - NetBIOS Domain/Workgroup Name`
If you specify this parameter, the command displays information only for CIFS servers that are in the specified NetBIOS domain or workgroup.

`[-domain <TextNoCase>] - Fully Qualified Domain Name`
If you specify this parameter, the command displays information only for CIFS servers that are in the specified domain.

`[-ou <text>] - Organizational Unit`
If you specify this parameter, the command displays information only for CIFS servers that are in the specified organizational unit.

`[-default-site <text>] - Default Site Used by LIFs Without Site Membership`
If you specify this parameter, the command displays information only for CIFS servers that have the specified default site.

`[-workgroup <NetBIOS>] - Workgroup Name`
If you specify this parameter, the command displays information only for CIFS servers that are in the specified workgroup.

`[-auth-style {domain|workgroup}] - Authentication Style`
If you specify this parameter, the command displays information only for CIFS servers that match the specified authentication style.
[-status-admin {down|up}] - CIFS Server Administrative Status

If you specify this parameter, the command displays information only for CIFS servers that match the specified administrative status.

[-comment <text>] - CIFS Server Description

If you specify this parameter, the command displays information only for CIFS servers that match the specified comment field.

[-netbios-aliases <NetBIOS>, ...] - List of NetBIOS Aliases

If you specify this parameter, the command displays information only for CIFS servers that have specified NetBIOS alias.

**Examples**

The following example displays a subset of the information about all CIFS servers:

```
cluster1::> vserver cifs show
```

```
<table>
<thead>
<tr>
<th>Vserver</th>
<th>Server Name</th>
<th>Domain/Workgroup</th>
<th>Authentication Style</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>
<td>CIFSSERVER1</td>
<td>EXAMPLE</td>
<td>domain</td>
</tr>
</tbody>
</table>
```

The following example displays all information about all CIFS-enabled Vservers in list form:

```
cluster1::> vserver cifs show -instance
```

```
Vserver: vs1
  CIFS Server NetBIOS Name: CIFSSERVER1
  NetBIOS Domain/Workgroup Name: EXAMPLE
  Fully Qualified Domain Name: EXAMPLE.COM
  Organizational Unit: CN=Computers
  Default Site Used by LIFs Without Site Membership:
    Workgroup Name: -
    Authentication Style: domain
  CIFS Server Administrative Status: up
  CIFS Server Description:
  List of NetBIOS Aliases: ALIAS_2, ALIAS_4, ALIAS_6
```

The following example displays the NetBIOS aliases for the CIFS server CIFSSERVER1

```
cluster1::> cifs show -display-netbios-aliases
```

```
Vserver: vs1
  Server Name: CIFSSERVER1
  NetBIOS Aliases: ALIAS_2, ALIAS_4, ALIAS_6
```

**vserver cifs start**

Start a CIFS server

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**

This command starts the CIFS server on the specified Vserver. The CIFS server must already exist. To create a CIFS server, run `vserver cifs create`. 

vserver cifs commands
**Parameters**

`-vserver <vserver name> - Vserver`

This parameter specifies a Vserver containing a configured CIFS server that has been stopped.

<table>
<thead>
<tr>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>The following example starts the CIFS server on Vserver vs1:</td>
</tr>
<tr>
<td><code>cluster1::&gt; cifs start -vserver vs1</code></td>
</tr>
</tbody>

`vserver cifs create` on page 1427

---

**vserver cifs stop**

Stop a CIFS server

**Availability:** This command is available to cluster and Vserver administrators at the `admin` privilege level.

**Description**

This command stops the CIFS server on the specified Vserver.

**Note:** Established sessions will be terminated and their open files closed. Workstations with cached data will not be able to save those changes, which could result in data loss.

**BranchCache Commands**

Manage CIFS BranchCache settings

The `vserver cifs branchcache` commands are used to manage the CIFS BranchCache service. BranchCache permits clients at a remote location to cache data locally to avoid repeated transfer of large data sets that are updated infrequently. CIFS BranchCache is disabled by default.

**vserver cifs branchcache create**

Create the CIFS BranchCache service

**Availability:** This command is available to cluster and Vserver administrators at the `admin` privilege level.

**Description**

The `vserver cifs branchcache create` command creates the configuration for computing and retrieving BranchCache hash data. Only a single instance of the BranchCache service can be created on a Vserver.

The `vserver cifs branchcache create` command is not supported for Vservers with Infinite Volume.
Parameters

-vserver <vserver name> - Vserver

This parameter specifies the CIFS-enabled Vserver on which you want to set up the BranchCache service.

[-versions {v1-enable|v2-enable|enable-all},... ] - Supported BranchCache Versions

This optional parameter specifies a list of versions of the BranchCache protocol that the storage system supports. The default is enable-all. This list can include one or more of the following:

- v1-enable - This option enables BranchCache Version 1.
- v2-enable - This option enables BranchCache Version 2.
- enable-all - This option enables all supported versions of BranchCache.

-hash-store-path <text> - Path to Hash Store

This parameter specifies an existing directory into which the hash data is stored. Read-only paths, such as snapshot directories, are not allowed.

[-hash-store-max-size <integer>[KB|MB|GB|TB|PB]} - Maximum Size of the Hash Store

This optional parameter specifies the maximum size to use for the hash data. If the size of the hash data exceeds this value, older hashes are deleted to make room for newer hashes. The default is 1 GB.

-server-key <text> - Encryption Key Used to Secure the Hashes

This optional parameter specifies a server key that the BranchCache service uses to prevent clients from impersonating the BranchCache server.

-operating-mode <BranchCache Mode> - CIFS BranchCache Operating Modes

This optional parameter specifies the mode in which the BranchCache service operates. The default is per-share. Possible values include:

- disable - This option disables the BranchCache service for the Vserver.
- all-shares - This option enables the BranchCache service for all the shares on this Vserver.
- per-share - This option enables the BranchCache service on a per-share basis. You can enable the BranchCache service on an existing share by adding the branchcache flag in the -share-properties parameter of the vserver cifs share modify command.

Examples

The following example creates the BranchCache service on the Vserver named vs1. The path to the hash store is /vs1_hash_store.

```
cluster1::> vserver cifs branchcache create -vserver vs1 -hash-store-path /vs1_hash_store
```

The following example creates the BranchCache service on the Vserver vs1. The path to the hash store is /vs_hash_store. The service is enabled on all the shares of the Vserver, supports BranchCache version 2, supports a maximum of 1 GB of BranchCache hashes, and secures the hashes using the key "vs1 secret".

```
cluster1::> vserver cifs branchcache create -vserver vs1 -hash-store-path /vs_hash_store -operating-mode all-shares -versions v2-enable -hash-store-max-size 1GB -server-key "vs1 secret"
```

vserver cifs share modify on page 1512
vserver cifs branchcache delete

Stop and remove the CIFS BranchCache service

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver cifs branchcache delete command stops and removes the Vserver BranchCache configuration.

The vserver cifs branchcache delete command is not supported for Vservers with Infinite Volume.

Parameters

- **vserver <vserver name>** - Vserver
  This parameter specifies the CIFS-enabled Vserver whose BranchCache configuration you want to remove.

- **flush-hashes {true|false}** - Delete Existing Hashes
  This parameter specifies whether to keep or delete all existing hashes after deleting the BranchCache service.

Examples

The following example stops and removes the BranchCache service on the Vserver vs1. It also deletes all existing hashes.

```
cluster1::> vserver cifs branchcache delete -flush-hashes true -vserver vs1
```

vserver cifs branchcache hash-create

Force CIFS BranchCache hash generation for the specified path or file

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver cifs branchcache hash-create command causes the BranchCache service to compute hashes for a single file, for a directory, or for all the files in a directory structure if you specify the -recurse option.

The vserver cifs branchcache hash-create command is not supported for Vservers with Infinite Volume.

Parameters

- **vserver <vserver name>** - Vserver
  This parameter specifies the CIFS-enabled Vserver on which the hash is computed.

- **path <text>** - Path of File or Directory to Hash
  This parameter specifies the path of the directory or file for which hashes are to be computed. If a file is specified, the hashes are computed on the whole file. If a directory is specified, hashes are computed on all files within the directory.

- **recurse {true|false}** - Process All Files in the Directory Recursively
  If this option is set to true and the **path** parameter specifies a directory, hashes are computed recursively for all directories in the path.

Examples

The following example creates hashes for the file "report.doc":

```
cluster1::> vserver cifs branchcache hash-create -vserver vs1 -path /repository/report.doc -recurse false
```
The following example creates hashes for all the files in the directory "repository":

```
cluster1::> vserver cifs branchcache hash-create -vserver vs1 -path /repository -recurse false
```

The following example recursively creates hashes for all the files and directories inside the directory "documents":

```
cluster1::> vserver cifs branchcache hash-create -vserver vs1 -path /documents -recurse true
```

### vserver cifs branchcache hash-flush

Flush all generated BranchCache hashes

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The `vserver cifs branchcache hash-flush` command deletes all hash data from the configured hash store.

The `vserver cifs branchcache hash-flush` command is not supported for Vservers with Infinite Volume.

**Parameters**

- `-vserver <vserver name>` - Vserver
  
  This parameter specifies the CIFS-enabled Vserver whose hash data is to be deleted.

**Examples**

The following example flushes all the hashes for Vserver vs1:

```
cluster1::> vserver cifs branchcache hash-flush -vserver vs1
```

### vserver cifs branchcache modify

Modify the CIFS BranchCache service settings

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The `vserver cifs branchcache modify` command modifies the configuration for computing and retrieving BranchCache hash data.

The `vserver cifs branchcache modify` command is not supported for Vservers with Infinite Volume.

**Parameters**

- `-vserver <vserver name>` - Vserver
  
  This parameter specifies the CIFS-enabled Vserver whose BranchCache service is to be modified.

- `[-versions {v1-enable|v2-enable|enable-all},...]` - Supported BranchCache Versions
  
  This optional parameter specifies a list of versions of the BranchCache protocol that the storage system supports. The default is `enable-all`. This list can include one or more of the following:

  - v1-enable - This option enables BranchCache Version 1.
  - v2-enable - This option enables BranchCache Version 2.
  - enable-all - This option enables all supported versions of BranchCache.
-operating-mode <BranchCache Mode> - CIFS BranchCache Operating Modes

This optional parameter specifies the mode in which the BranchCache service operates. The default is per-share. Possible values include:

- disable - This option disables the BranchCache service for the Vserver.
- all-shares - This option enables the BranchCache service for all the shares on this Vserver.
- per-share - This option enables the BranchCache service on a per-share basis. You can enable the BranchCache service on an existing share by adding the branchcache flag in the -share-properties parameter of the vserver cifs share modify command.

-hash-store-max-size (<integer> [KB|MB|GB|TB|PB]) - Maximum Size of the Hash Store

This optional parameter specifies the maximum size to use for the hash data. If the size of the hash data exceeds this value, older hashes are deleted to make room for newer hashes. The default is 1 GB.

-flush-hashes {true|false} - Delete Existing Hashes

This parameter specifies whether to keep or delete all the existing hashes. This must be set to true when modifying the server key.

-hash-store-path <text> - Path to Hash Store

This parameter specifies an existing directory into which the hash data is stored. Read-only paths, such as snapshot directories, are not allowed.

-server-key <text> - Encryption Key Used to Secure the Hashes

This optional parameter specifies a server key that the BranchCache service uses to prevent clients from impersonating the BranchCache server. If you specify this parameter, all existing hashes for the Vserver are deleted.

Examples

The following example modifies the BranchCache service on the Vserver named vs1. The path to the hash store is /vs1_hash_store_2, the server key used to secure the hashes is set to "new vserver secret", all existing hashes are removed, the service supports all BranchCache versions, and is enabled on a per-share basis.

```
class1::> vserver cifs branchcache modify -vserver vs1 -hash-store-path /vs1_hash_store_2 -server-key "new vserver secret" -flush-hashes true -versions enable-all -operating-mode per-share
```

The following example modifies the BranchCache service on the Vserver vs1. The service is enabled on all the shares of the Vserver, supports BranchCache version 1, and supports a maximum of 1 TB of BranchCache hashes.

```
class1::> vserver cifs branchcache modify -vserver vs1 -operating-mode all-shares -versions v1-enable -hash-store-max-size 1TB
```

vserver cifs branchcache show

Display the CIFS BranchCache service status and settings

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver cifs branchcache show command displays information about the BranchCache configuration for the Vserver. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information:
- Operating Mode
- Allowed Versions
- Maximum Size
- Path

You can specify additional parameters to display only information that matches those parameters.

**Parameters**

```
{-fields <fieldname>,...}
```

If you specify the -fields <fieldname>, ... parameter, the command displays only the fields that you specify.

```
{-instance}
```

If you specify the -instance parameter, the command displays detailed information about all entries.

```
-vserver <vserver name> - Vserver
```

If you specify this parameter, the command displays information for the specified Vserver.

```
-versions {v1-enable|v2-enable|enable-all},... - Supported BranchCache Versions
```

If you specify this parameter, the command displays information for the Vservers that support the specified BranchCache versions.

```
-hash-store-path <text> - Path to Hash Store
```

If you specify this parameter, the command displays information for Vservers that store their hashes at the specified location.

```
-hash-store-max-size {<integer>[KB|MB|GB|TB|PB]} - Maximum Size of the Hash Store
```

If you specify this parameter, the command displays information for Vservers that have a maximum hash store size that is set to the specified value.

```
-server-key <text> - Encryption Key Used to Secure the Hashes
```

If you specify this parameter, the command displays information for Vservers that have the specified server key.

```
-operating-mode <BranchCache Mode> - CIFS BranchCache Operating Modes
```

If you specify this parameter, the command displays information for Vservers whose BranchCache configuration operates in the specified mode.

**Examples**

The following example displays a subset of the information about the BranchCache service in the cluster.

```
cluster1::> vserver cifs branchcache show

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Operating Mode</th>
<th>Allowed Versions</th>
<th>Max Size</th>
<th>Path</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>
<td>per_share</td>
<td>enable_all</td>
<td>1GB</td>
<td>/hash_dir/</td>
</tr>
</tbody>
</table>
```

The following example displays all information about all the Vservers with BranchCache configurations.

```
cluster1::> vserver cifs show -instance

  Vserver: vs1
Supported Versions of BranchCache: enable_all
  Path to Hash Store: /hash_dir/
Maximum Size of the Hash Store: 1GB
Encryption Key Used to Secure the Hashes: asdad
  CIFS BranchCache Operating Modes: per_share
```
The following example displays information about BranchCache configurations that store the hash data at the location /branchcache_hash_store.

```
cluster1::> vserver cifs branchcache show -hash-store-path /branchcache_hash_store
```

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Mode</th>
<th>Versions</th>
<th>Size</th>
<th>Path</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>
<td>per_share</td>
<td>enable_all</td>
<td>1GB</td>
<td>/branchcache_hash_store</td>
</tr>
</tbody>
</table>

```vserver cifs character-mapping commands

Manage character mappings for invalid characters
```

```vserver cifs character-mapping create

Create character mapping on a volume

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The `vserver cifs character-mapping create` command creates the CIFS character mapping for the specified volume on a particular Vserver.

Note: Choose target characters in the "Private Use Area" of Unicode in the following range: U+E0000...U+F8FF.

Caution: The target Unicode characters must not appear in existing file names; otherwise, unwanted character mappings would occur, resulting in clients being unable to access mapped files. For example, if ":" is mapped to ":" but "." appears in files normally, a Windows client using the mapped share to access a file named "a-b" would have its request mapped to the NFS name "a:b", which is not the desired file.

The `vserver cifs character-mapping create` command is not supported for FlexGroups or Vservers with Infinite Volume.

Parameters
- `vserver <vserver name>` - Vserver
  This parameter specifies the Vserver on which a volume is located for which you are creating the character mapping. If only one data Vserver exists, you do not need to specify this parameter.

- `volume <volume name>` - Volume Name
  This parameter specifies the name of the volume for which you are creating the character mapping.

- `mapping <text>, .. - Character Mapping`
  This parameter specifies the mapping of the invalid CIFS filename characters to valid CIFS filename characters. The mapping consists of a list of source-target character pairs separated by ".". The characters are Unicode characters entered using hexadecimal digits. For example: 3C:E03C.

  Note: The permissible Unicode character set for source mapping is: 0x01-0x19, 0x5C, 0x3A, 0x2A, 0x3F, 0x22, 0x3C, 0x3E, 0xB1.

Examples
The following example creates a character mapping for a volume vol1 on Vserver vs1.

```
cluster1::> vserver cifs character-mapping create -volume vol1 -mapping 3c:e17c, 3e:f17d, 2a:f745
cluster1::> vserver cifs character-mapping show
```

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Volume Name</th>
<th>Character Mapping</th>
</tr>
</thead>
</table>
vserver cifs character-mapping delete

Delete character mapping on a volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `vserver cifs character-mapping delete` command deletes the CIFS character mapping for the specified volume on a particular Vserver.

The `vserver cifs character-mapping delete` command is not supported for FlexGroups or Vservers with Infinite Volume.

**Parameters**
- `-vserver <vserver name>` - *Vserver*
  
  This parameter specifies the Vserver on which a Volume is located for which you are deleting the character mapping. If only one data Vserver exists, you do not need to specify this parameter.

- `-volume <volume name>` - *Volume Name*
  
  This parameter specifies the name of the volume for which you are deleting the character mapping.

**Examples**
The following example deletes all character mappings for a volume `vol1` on Vserver `vs1`.

```
cluster1::> vserver cifs character-mapping delete -volume vol1
```

vserver cifs character-mapping modify

Modify character mapping on a volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `vserver cifs character-mapping modify` command modifies the CIFS character mapping for the specified volume on a particular Vserver.

You can modify a particular volume’s character mapping by specifying the following two parameters in the modify command:

- Vserver associated with the volume
- Name of the Volume

**Note:** Choose target characters in the "Private Use Area" of Unicode in the following range: U+E0000...U+F8FF.

**Caution:** The target Unicode characters must not appear in existing file names; otherwise, unwanted character mappings would occur, resulting in clients being unable to access mapped files. For example, if ".:;" is mapped to ".:;" but ".:;" appears in files normally, a Windows client using the mapped share to access a file named "a-b" would have its request mapped to the NFS name "a:b", which is not the desired file.

The `vserver cifs character-mapping modify` command is not supported for FlexGroups or Vservers with Infinite Volume.
Parameters
-vserver <vserver name> - Vserver
This parameter specifies the Vserver on which a Volume is located for which you are modifying the character mapping. If only one data Vserver exists, you do not need to specify this parameter.

-volume <volume name> - Volume Name
This parameter specifies the name of the volume for which you are modifying the character mapping.

[-mapping <text>, ...] - Character Mapping
This parameter specifies the mapping of the invalid CIFS filename characters to valid CIFS filename characters. The mapping consists of a list of source-target character pairs separated by ":". The characters are Unicode characters entered using hexadecimal digits. For example: 3C:E03C.

Note: The permissible Unicode character set for source mapping is: 0x01-0x19, 0x5C, 0x3A, 0x2A, 0x3F, 0x22, 0x3C, 0x3E, 0x7C, 0xB1.

Examples
The following example modifies a character mapping for a volume vol1 on Vserver vs1.

```
cluster1::> vserver cifs character-mapping modify -volume vol1 -mapping 3c:e17d, 3e:f17e, 2a:f746
cluster1::> vserver cifs character-mapping show
```

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Volume Name</th>
<th>Character Mapping</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>
<td>vol1</td>
<td>3c:e17d, 3e:f17e, 2a:f746</td>
</tr>
</tbody>
</table>

vserver cifs character-mapping show
Display character mapping on volumes

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs character-mapping show command displays information about character mapping configured for volumes. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about character mapping configured for volumes:

- Vserver name
- Volume name
- Character mapping

Parameters
{ [-fields <fieldname>, ...]}
If you specify this parameter, the command displays only the fields that you specify.

[-instance]
If you specify the -instance parameter, the command displays detailed information about all entries.

[-vserver <vserver name>] - Vserver
If you specify this parameter, the command displays information about character mapping configured for all the volumes that belong to the specified Vserver.
[-volume <volume name>] - Volume Name
    If you specify this parameter, the command displays information about the character mapping configured for all the volumes that match the specified volume name.

[-mapping <text>, ...] - Character Mapping
    If you specify this parameter, the command displays information about the character mapping configured for all volumes that match the specified mapping.

Examples
The following example displays information about all character mappings configured for volumes

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Volume Name</th>
<th>Character Mapping</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>
<td>vol1</td>
<td>3c:e17d, 3e:f17e</td>
</tr>
</tbody>
</table>

vserver cifs connection commands
Manage CIFS connections

vserver cifs connection show
Displays established CIFS connections

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs connection show command displays information about established CIFS connections.

Parameters

[-fields <fieldname>, ...]
    Use this parameter to display only the specified fields

[-instance ]
    If you specify the -instance parameter, the command displays detailed information about all fields.

[-node <nodename> | local] - Node
    Use this parameter to display information about CIFS connections on the specified node.

[-vserver <vserver name>] - Vserver
    Use this parameter to display information about CIFS connections on the specified CIFS-enabled SVM.

[-connection-id <integer>] - Connection ID
    Use this parameter to display information about CIFS connections that match the specified connection ID.

[-session-id <integer>, ...] - Session ID
    Use this parameter to display information about CIFS connections that match the specified session ID.

[-workstation-ip <IP Address>] - Workstation IP Address
    Use this parameter to display information about CIFS connections that are established through the specified data LIF IP address.

[-workstation-port <integer>] - Workstation Port Number
    Use this parameter to display information about CIFS connections that are opened from the specified Port number.
[\texttt{-lif-ip <IP Address>}] - Incoming Data LIF IP Address

Use this parameter to display information about CIFS connections that are opened from the specified IP address.

[\texttt{-network-context-id <integer>}] - Network Context ID (privilege: advanced)

Use this parameter to display information about CIFS connections that match the specified network context ID.

**Examples**

The following example displays information about all CIFS connections:

```bash
cluster1::> vserver cifs connection show
Node: node1
Vserver: vs1
Connection Session                          Workstation
ID         IDs                Workstation IP Port        LIF IP
---------- ------------------ -------------- ----------- -----------
127834     1,2                172.17.193.172 15536       10.53.50.42
```

The following example displays information about a CIFS connection at advanced privilege level:

```bash
cluster1::*> vserver cifs connection show
Node: node1
Vserver: vs1
Connection Session                          Workstation             Network
ID         IDs                Workstation IP Port        LIF IP      Context ID
---------- ------------------ -------------- ----------- ----------- ----------
127834     1,2                172.17.193.172 15536       10.53.50.42 2
```

The following example displays information about a CIFS connection with session-id 1:

```bash
cluster1::*> vserver cifs connection show -session-id 1 -instance
Vserver: vs1
Node: node1
Connection ID: 127834
Session ID: 1
Workstation IP Address: 172.17.193.172
Workstation Port Number: 15536
Incoming Data LIF IP Address: 10.53.50.42
Network Context ID: 2
```

**vserver cifs domain commands**

Manage domain interaction

**vserver cifs domain discovered-servers commands**

Manage discovered servers

**vserver cifs domain discovered-servers reset-servers**

Reset and rediscover servers for a Vserver

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.
Description
The `vserver cifs domain discovered-servers reset-servers` command discards information the storage system has stored about domain controllers, LDAP, and NIS servers. After that, it begins the discovery process to reacquire current information about external servers. This command is not supported for workgroup CIFS servers.

Parameters

---vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver.

Examples

The following is an example use of this command. It produces no output.

```
cluster1::> vserver cifs domain discovered-servers reset-servers
cluster1::>
```

**vserver cifs domain discovered-servers show**

Display discovered server information

**Availability:** This command is available to cluster and Vserver administrators at the *admin* privilege level.

Description

The `vserver cifs domain discovered-servers show` command displays information about the discovered servers for the CIFS domains of one or more Vservers. Server displays are grouped by node and Vserver, and each group is preceded by the node and Vserver identification. Within each grouping, the server display is limited to those associated with the domain specified by the domain parameter, if it is present. This command is not supported for workgroup CIFS servers.

Parameters

```
[-fields <fieldname>, ...]  
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

| [-instance] |  
If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node
If you use this parameter, the command only displays servers for the specified node.

[-vserver <vserver name>] - Vserver
If you use this parameter, the command only displays servers for the specified Vserver.

[-domain <TextNoCase>] - Fully Qualified Domain Name
If you use this parameter, the command only displays servers in the specified domain.

[-type {Unknown|KERBEROS|MS-LDAP|MS-DC|LDAP|NIS}] - Server Type
If you use this parameter, the command only displays servers of the specified type.

[-name <text>] - Server Name
If you use this parameter, the command only displays servers the with the specified name. This can result in multiple lines because the same server may provide multiple services.

[-address <InetAddress>] - Server Address
If you use this parameter, the command only displays servers with the specified IP address. This can result in multiple lines because the same server may provide multiple services.
```
[-preference {unknown|preferred|favored|adequate}] - Preference
  If you use this parameter, the command only displays servers of the specified preference level.

[-status {OK| unavailable| slow| expired| undetermined| unreachable}] - Status
  If you use this parameter, the command only displays servers of the specified status.

  If you use this parameter, the command only displays servers with the specified functional level.

[-is-dc-read-only {true|false}] - Is DC Read Only
  If this parameter is set to true, the command only displays servers with read only domain controller. If set to false, the command only displays servers with writable domain controller.

[-protocol-version <CIFS Dialects>] - Negotiated SMB Protocol Version
  If you use this parameter, the command only displays servers with the specified negotiated SMB protocol version.

Examples

The following example display shows the information provided by this command.

```
cluster1::> vserver cifs domain discovered-servers show
Node: node1
Vserver: vs1
Domain Name     Type     Preference  DC-Name         DC-Address      Status
--------------- -------- ---------- --------------- --------------- ---------
""              NIS      preferred  192.168.10.222  192.168.10.222  OK
example.com    MS-LDAP  adequate   DC-1            192.168.192.24  OK
example.com    MS-LDAP  adequate   DC-2            192.168.192.25  OK
example.com    MS-DC    adequate   DC-1            192.168.192.24  OK
example.com    MS-DC    adequate   DC-2            192.168.192.25  OK
5 entries were displayed.
```

vserver cifs domain name-mapping-search commands

Manage the list of trusted domains for name-mapping search

vserver cifs domain name-mapping-search add

Add to the list of trusted domains for name-mapping

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs domain name-mapping-search add command adds one or more trusted domains to the list of trusted domains to be used in preference to all others by the specified Vserver for looking up Windows user names when performing Windows user to UNIX user name-mapping. If a list already exists for the specified vserver, the new list is merged with the existing list. This command is not supported for workgroup CIFS servers.

Parameters

-vserver <vserver name> - Vserver
  This parameter specifies the name of the Vserver for which you want to add trusted domains.

-trusted-domains <domain name>, ... - Trusted Domains
  This parameter specifies a comma-delimited list of fully-qualified domain names of the trusted domains for the home domain.
Examples
The following example adds two trusted domains (cifs1.example.com and cifs2.example.com) to the preferred list used by Vserver vs1:

```
cluster1::> vserver cifs domain name-mapping-search add -vserver vs1 -trusted-domains
cifs1.example.com, cifs2.example.com
```

vserver cifs domain name-mapping-search modify
Modify the list of trusted domains for name-mapping search

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs domain name-mapping-search modify command modifies the current list of trusted domains to be used in preference to all others by the specified Vserver to lookup Windows user names when performing Windows user to UNIX user name-mapping. The new list overwrites the existing list. This command is not supported for workgroup CIFS servers.

Parameters
-vserver <vserver name> - Vserver
This parameter specifies the name of the Vserver for which you want to modify the trusted domain list.

-trusted-domains <domain name>,... - Trusted Domains
This parameter specifies a comma-delimited list of fully qualified domain names of the trusted domains of the home domain.

Examples
The following example modifies the trusted domain list used by Vserver vs1:

```
cluster1::> vserver cifs domain name-mapping-search modify -vserver vs1 -trusted-domains
cifs3.example.com
```

vserver cifs domain name-mapping-search remove
Remove from the list of trusted domains for name-mapping search

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs domain name-mapping-search remove command removes one or more trusted domains from the list used by the specified Vserver to lookup Windows user names when performing Windows user to UNIX user name-mapping. If a list of trusted domains is not provided, the entire trusted domain list for the specified Vserver is removed. This command is not supported for workgroup CIFS servers.

Parameters
-vserver <vserver name> - Vserver
This parameter specifies the name of the Vserver from which you want to remove trusted domains.

[[-trusted-domains <domain name>,...]] - Trusted Domains
This parameter specifies a comma-delimited list of trusted domains of the home domain.
Examples
The following example removes two trusted domains from the list used by Vserver vs1:

```
cluster1::> vserver cifs domain name-mapping-search remove -trusted-domains cifsl.example.com,
cifss.example.com
```

tsvserver cifs domain name-mapping-search show

Display the list of trusted domains for name-mapping searches

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver cifs domain name-mapping-search show` command displays information about trusted domains of the home domain by Vserver.

**Parameters**

```
{ [-fields <fieldname>, ...]
    If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

    [-instance ]
    If you specify the -instance parameter, the command displays detailed information about all fields.

    [-vserver <vserver name>]- Vserver
    This parameter specifies the name of the Vserver for which you want to display information about the trusted domains.

    [-trusted-domains <domain name>, ...] - Trusted domains
    This parameter specifies a comma-delimited list of fully qualified domain names of trusted domains for which you want to display information.
```

Examples
The following example displays information about all preferred trusted domains:

```
cluster1::> vserver cifs domain name-mapping-search show
Vserver         Trusted Domains
--------------  ----------------------------------
vservr_1        CIFS1.EXAMPLE.COM
```

vserver cifs domain password commands

Manage domain account password configuration for a CIFS server

vserver cifs domain password change

Generate a new password for the CIFS server's machine account and change it in the Windows Active Directory domain.

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver cifs domain password change` changes the domain account password for a CIFS server. This command is not supported for workgroup CIFS servers.
Parameters
-\texttt{vserver \textit{vserver\ name}} - Vserver

This parameter specifies the name of the Vserver for whose CIFS server you want to change the domain account password.

Examples
The following example changes the password for the CIFS server on a Vserver named vs1.

\begin{verbatim}
cluster1::> vserver cifs domain password change -vserver vs1
cluster1::>
\end{verbatim}

\textbf{vserver cifs domain password reset}

Reset the CIFS server's machine account password in the Windows Active Directory domain.

\textbf{Availability:} This command is available to \textit{cluster} and \textit{Vserver} administrators at the \textit{admin} privilege level.

\textbf{Description}
The \texttt{vserver cifs domain password reset} command resets the domain account password for a CIFS server. This may be required if the password stored along with the machine account in the Windows Active Directory domain is changed or reset without the Vserver's knowledge. The operation requires the credentials for a user with permission to reset the password in the organizational unit (OU) that the machine account is a member of. This command is not supported for workgroup CIFS servers.

Parameters
-\texttt{vserver \textit{vserver\ name}} - Vserver

This parameter specifies the name of the Vserver for whose CIFS server you want to reset the domain account password.

Examples
The following example resets the password for the CIFS server on a Vserver named vs1.

\begin{verbatim}
cluster1::> vserver cifs domain password reset -vserver vs1
Enter your user ID: Administrator
Enter your password:
cluster1::>
\end{verbatim}

\textbf{vserver cifs domain password schedule commands}

The schedule directory

\textit{vserver cifs domain password schedule modify}

Modify the domain account password change schedule

\textbf{Availability:} This command is available to \textit{cluster} and \textit{Vserver} administrators at the \textit{admin} privilege level.

\textbf{Description}
The \texttt{vserver cifs domain password schedule modify} command enables you to modify a domain account password change schedule for a CIFS server. This command is not supported for workgroup CIFS servers.
Parameters

-vserver <vserver name> - Vserver

This specifies the name of the Vserver containing the CIFS server for which you want to change the domain account password.

[-is-schedule-enabled {true|false}] - Is Password Change Schedule Enabled

This specifies whether the domain account password change schedule is enabled.

[-schedule-weekly-interval <integer>] - Interval in Weeks for Password Change Schedule

This specifies the number of weeks after which the scheduled domain account password change must occur.

[-schedule-randomized-minute <integer>] - Minutes Within Which Schedule Start Can be Randomized

This specifies the minutes within which the scheduled domain account password change must begin.

[-schedule-day-of-week <cron_dayofweek>] - Day of Week for Password Change Schedule

This sets the day of week when the scheduled domain account password change occurs.

[-schedule-time-of-day <HH:MM:SS>] - Start Time for Password Change Schedule

This sets the time in HH:MM:SS at which the scheduled domain account password change starts.

Examples

The following example enables the domain account password change schedule and configures it to run at any time between 23:00:00 to 00:59:00 (one hour before midnight to one hour after midnight) on every 4th Sunday.

```
cluster1::> vserver cifs domain password schedule modify -is-schedule-enabled true -schedule-randomized-minute 120 -schedule-weekly-interval 4 -schedule-time-of-day 23:00:00 -schedule-day-of-week sunday
```

vserver cifs domain password schedule show

Display the domain account password change schedule

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver cifs domain password schedule show command displays the domain account password change schedule configuration. It displays the following fields:

- Vserver: Vserver for which the schedule is configured
- Schedule Enabled: Whether the schedule is enabled or disabled for this Vserver
- Schedule Interval: Weeks after which the password change schedule occurs again for this Vserver
- Schedule Randomized Within: Minutes within which the schedule must begin for this Vserver
- Schedule: Password change schedule currently set on this Vserver
- Last Successful Password Change/Reset Time: Time at which the last password change or reset happened successfully on this Vserver
- Warning: Warning message, applicable only when the change password job is deleted with the feature still enabled on this Vserver

Parameters

{ [-fields <fieldname>,...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.
If you specify the `-instance` parameter, the command displays detailed information about all fields.

`-vserver <vserver name>` - Vserver

If you specify this parameter, the command displays information for the specified Vserver.

`-is-schedule-enabled {true|false}` - Is Password Change Schedule Enabled

If you specify this parameter, the command displays information for all the Vservers on which the is-schedule-enabled value applies.

`-schedule-weekly-interval <integer>` - Interval in Weeks for Password Change Schedule

If you specify this parameter, the command displays information for all the Vservers on which the schedule-weekly-interval value applies.

`-schedule-randomized-minute <integer>` - Minutes Within Which Schedule Start Can be Randomized

If you specify this parameter, the command displays information for all the Vservers on which the schedule-randomized-minute value applies.

`-schedule-last-changed <text>` - Last Successful Password Change/Reset Time

If you specify this parameter, the command displays information for all the Vservers on which the schedule-last-changed value applies.

`-schedule-description <text>` - Schedule Description

If you specify this parameter, the command displays information for all the Vservers on which the schedule-description value applies.

`-schedule-warn-msg <text>` - Warning Message in Case Job Is Deleted

If you specify this parameter, the command displays information for all the Vservers on which the schedule-warn-msg value applies.

### Examples

The following example shows the domain account password change schedule configuration when the password change feature is enabled for Vserver vs1.

```
classcode1::> vserver cifs domain password schedule show

Vserver: vs1
Schedule Enabled: true
Schedule Interval: 4 week
Schedule Randomized Within: 120 min
  Schedule: Fri@23:00
  Last Changed At: Thu Apr 4 02:35:23 2013
```

The following example shows the domain account password change schedule configuration when the password change job has been accidently deleted.

```
classcode1::> vserver cifs domain password schedule show

Vserver: vs1
Schedule Enabled: true
Schedule Interval: 4 week
Schedule Randomized Within: 120 min
  Schedule: Fri@23:00
  Last Changed At: Thu Apr 4 02:35:23 2013
Warning: Password change job was deleted. Re-enable the password change schedule.
```
vserver cifs domain preferred-dc commands

Manage preferred domain controllers

vserver cifs domain preferred-dc add

Add to a list of preferred domain controllers

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs domain preferred-dc add command adds one or more domain controllers to be used in preference to all others by the specified Vserver for interactions with the specified domain. If a list already exists for the specified domain, the new list is merged with the existing list. This command is not supported for workgroup CIFS servers.

Note: Each Vserver discovers domain controllers and attempts to sort them internally based on real-world performance. Therefore it should not be necessary to create a preferred list of domain controllers under most circumstances.

Parameters
-vserver <vserver name> - Vserver
This parameter specifies the name of the Vserver for which you want to add preferred domain controllers.

-domain <TextNoCase> - Fully Qualified Domain Name
This parameter specifies the fully-qualified name of the domain that the domain controllers belong to.

-preferred-dc <InetAddress>, ... - Preferred Domain Controllers
This parameter specifies a comma-delimited list of IP addresses for domain controllers that belong to the domain specified in the -domain parameter.

Examples
The following example adds two domain controllers (192.168.0.100 and 192.168.0.101) to the preferred list used by Vserver vs1 when connecting to the example.com domain:

    cluster1::> vserver cifs domain preferred-dc add -vserver vs1 -domain example.com -preferred-dc 192.168.0.100,192.168.0.101

vserver cifs domain preferred-dc remove

Remove from a list of preferred domain controllers

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs domain preferred-dc remove command removes one or more domain controllers from the list used by the specified Vserver for interactions with the specified domain. If a list of preferred domain controllers is not provided, the entire list for the specified domain is removed. This command is not supported for workgroup CIFS servers.

Parameters
-vserver <vserver name> - Vserver
This parameter specifies the name of the Vserver from which you want to remove preferred domain controllers.

-domain <TextNoCase> - Fully Qualified Domain Name
This parameter specifies the fully-qualified name of the domain that the domain controllers belong to.
[-preferred-dc <InetAddress>, ...] - Preferred Domain Controllers

This parameter specifies a comma-delimited list of IP addresses for domain controllers that belong to the domain specified in the -domain parameter.

**Examples**

The following example removes one domain controller (192.168.0.101) from the preferred list used by Vserver vs1 when connecting to the example.com domain:

```
cluster1::> vserver cifs domain preferred-dc remove -vserver vs1 -domain example.com -preferred-dc 192.168.0.101
```

**vserver cifs domain preferred-dc show**

Display a list of preferred domain controllers

**Availability**: This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The vserver cifs domain preferred-dc show command displays lists of preferred domain controllers by Vserver and domain.

**Parameters**

{-fields <fieldname>, ...}

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance ] |

If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver

This parameter specifies the name of the Vserver for which you want to display preferred domain controllers.

[-domain <TextNoCase>] - Fully Qualified Domain Name

This parameter specifies the fully-qualified name of the domain of the domain controllers to display.

[-preferred-dc <InetAddress>, ...] - Preferred Domain Controllers

This parameter specifies a comma-delimited list of IP addresses for domain controllers to display.

**Examples**

The following example displays all preferred domain controllers for all Vservers:

```
cluster1::> vserver cifs domain preferred-dc show
Vserver         Domain Name                   Preferred Domain Controllers
-------------- ----------------------------- ----------------------------------
vs1            example.com                   192.168.0.100, 192.168.0.101
```

**vserver cifs domain trusts commands**

Manage discovered trusted domains

**vserver cifs domain trusts rediscover**

Reset and rediscover trusted domains for a Vserver

**Availability**: This command is available to cluster and Vserver administrators at the admin privilege level.
Description
The `vserver cifs domain trusts rediscover` command discards information the Vserver has stored about trusted domains. After that, it begins the discovery process to reacquire current information about trusted domains. This command is not supported for workgroup CIFS servers.

Parameters
`-vserver <vserver name>` - Vserver
This parameter specifies the name of the Vserver.

Examples
The following example redisCOVERs trusted domains. It produces no output.

```
cluster1::> vserver cifs domain trusts rediscover
```

`vserver cifs domain trusts show`
Display discovered trusted domain information

Availability: This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

Description
The `vserver cifs domain trusts show` command displays information about the trusted domains for the CIFS home domain of one or more Vservers. The displayed trusted domain information is grouped by node and Vserver, and each group is preceded by the node and Vserver identification. This command is not supported for workgroup CIFS servers.

Parameters
`{[-fields <fieldname>,...]|[-instance]|[-node <nodename>|local]|[-vserver <vserver name>]|[-home-domain <domain name>]|[-trusted-domain <domain name>,...]} - Node
`Vserver
`Home Domain Name
`Trusted Domain Name
If you specify the `-fields` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.
If you specify the `-instance` parameter, the command displays detailed information about all fields.
If you use this parameter, the command displays information only about trusted domains of the home domains for the specified node.
If you use this parameter, the command displays information only about trusted domains of the specified Vserver.
If you use this parameter, the command displays information only about trusted domains of the home domain with the specified name.
If you use this parameter, the command displays information only about trusted domains with the specified name.

Examples
The following example displays information about all the bidirectional trusted domains for node-01 and vserver_1.
vserver cifs domain trusts show -node node-01 -vserver vserver_1

Node: node-01
Vserver: vserver_1

<table>
<thead>
<tr>
<th>Home Domain</th>
<th>Trusted Domain</th>
</tr>
</thead>
<tbody>
<tr>
<td>EXAMPLE.COM</td>
<td>CIFS1.EXAMPLE.COM,</td>
</tr>
<tr>
<td></td>
<td>CIFS2.EXAMPLE.COM</td>
</tr>
</tbody>
</table>

vserver cifs group-policy commands

Manage group policies

vserver cifs group-policy modify

Change group policy configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs group-policy modify command modifies the group policy configuration of a CIFS server. This command is not supported for workgroup CIFS servers.

Parameters
-vserver <vserver name> - Vserver
This parameter specifies the Vserver whose group policy configuration you want to modify.

-status {enabled|disabled} - Group Policy Status
This parameter specifies whether the CIFS-enabled Vserver's group policy is enabled or disabled.

Examples
The following example enables the group policy for CIFS-enabled Vserver vs1.

class1::> vserver cifs group-policy modify -vserver vs1 -status enabled

vserver cifs group-policy show

Show group policy configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs group-policy show command displays information about group policy configuration for CIFS-enabled Vserver. It displays all or a subset of the group policy configuration matching the criteria that you specify.

Parameters
{ [-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?' to display the fields to specify.
  | [-instance ]
  If you specify the -instance parameter, the command displays detailed information about all fields.
[-vserver <vserver name>] - Vserver

If you specify this parameter, the command displays group policy configuration only for the Vserver that you specify.

[-status {enabled|disabled}] - Group Policy Status

If you specify this parameter, the command displays group policy configuration only for the Vservers that match the status you specify.

Examples

The following example displays group policy configuration for all Vservers:

```
cluster1:~> vserver cifs group-policy show
Vserver      GPO Status
--------------  ----------
vs1           disabled
```

vserver cifs group-policy show-applied

Show currently applied group policy setting

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The `vserver cifs group-policy show-applied` command displays information about group policies assigned to a Vserver. It displays all or a subset of the group policy information matching the criteria that you specify.

If you do not specify any parameters, the command displays the following information about all group policies applied to Vservers in the cluster:

- GPO Name: Specifies the name of the Group Policy object.
- Level: Specifies the level in which the Group Policy is configured. It could be either site level, domain level, or OU level.
- Status: Specifies whether or not this Group Policy object is enabled.

Advanced Audit Settings:

- Object Access:
- Central Access Policy Staging: Specifies the type of events to be audited for central access policy staging. Possible values are:
  - none - Do not audit.
  - success - Audit only success events.
  - failure - Audit only failure events.
  - both - Audit both success and failure events.

Registry Settings:

- Refresh Time Interval: Specifies how often the Group Policy is updated.
- Refresh Random Offset: Specifies a random time that is added to the refresh interval to prevent all clients from requesting Group Policy updates at the same time.
- Hash Publication Mode for BranchCache: Specifies the hash generation mode used to generate hashes for data stored in shared folders on which BranchCache is enabled, which is then provided to clients. Possible values are:
- **per-share** - Allow hash publication only for shared folders on which BranchCache is enabled.
- **disabled** - Disallow hash publication on all shared folders.
- **all-shares** - Allow hash publication for all shared folders.

- **Hash Version Support for BranchCache:** Specifies the version supported by the BranchCache hash generation service. Possible values are:
  - **all-versions** - Both versions 1 and 2 (V1 and V2).
  - **version1** - Version 1 (V1).
  - **version2** - Version 2 (V2).

**Security Settings:**

- **Event Audit and Event Log:**
- **Audit Logon Events:** Specifies the type of logon events to be audited. Possible values are:
  - **none** - Do not audit.
  - **success** - Audit only success events.
  - **failure** - Audit only failure events.
  - **both** - Audit both success and failure events.

- **Audit Object Access:** Specifies the type of object access to be audited. Possible values are:
  - **none** - Do not audit.
  - **success** - Audit only success events.
  - **failure** - Audit only failure events.
  - **both** - Audit both success and failure events.

- **Log Retention Method:** Specifies the audit log retention method. Possible values are:
  - **overwrite-as-needed** - Overwrite the event log when size of the log file exceeds the maximum log size.
  - **overwrite-by-days** - Not supported.
  - **do-not-overwrite** - Do not overwrite the event log.

- **Max Log Size:** Specifies the maximum size of the audit log. This size is displayed in kbytes.

- **File Security:** Specifies a list of files or directories on which file security is applied.

- **Kerberos:**
  - **Max Clock Skew:** Specifies maximum tolerance in hours for computer clock synchronization.
  - **Max Ticket Age:** Specifies maximum lifetime in minutes for user ticket.
  - **Max Renew Age:** Specifies maximum lifetime in days for user ticket renewal.

- **Privilege Rights:**
  - **Take Ownership:** List of users and groups that have the right to take ownership of any securable object in the system.
  - **Security Privilege:** List of users and groups that can specify auditing options for object access of individual resources, such as files, folders, and Active Directory objects.
- Change Notify: List of users and groups that can traverse directory trees even though the users and groups might not have permissions on the traversed directory.

- Registry Values:

- Signing Required: Specifies whether SMB signing is on or off.

- Restrict Anonymous:

  - No enumeration of Security Account Manager (SAM) accounts: This security setting determines what additional permissions are granted for anonymous connections to the computer. This option displays as 'no-enumeration' in Data ONTAP if enabled.

  - No enumeration of SAM accounts and shares: This security setting determines whether anonymous enumeration of SAM accounts and shares is allowed. This option displays as 'no-enumeration' in Data ONTAP if enabled.

  - Restrict anonymous access to shares and named pipes: This security setting restricts anonymous access to shares and pipes. This option displays as 'no-access' in Data ONTAP if enabled.

- Combined restriction for anonymous user: The combined restriction for the anonymous user is derived from the above three settings:
  - If 'no-access' is enabled, 'Combined restriction for anonymous user' is set to 'no-access'. The anonymous user is denied access to the specified shares and named pipes, and cannot use enumeration of SAM accounts and shares.
  - If 'no-enumeration' is enabled and 'no-access' is disabled, 'Combined restriction for anonymous user' is set to 'no-enumeration'. The anonymous user has access to the specified shares and named pipes, but cannot use enumeration of SAM accounts and shares.
  - If 'no-enumeration' is disabled and 'no-access' is disabled, 'Combined restriction for anonymous user' is set to 'no-restriction'. The anonymous user has full access and can use enumeration.

- Restricted Groups:

- List of restricted groups. For more information on each group, refer to the man page for the "vserver cifs group-policy restricted-group show-applied" command. Each group specifies two properties for restricted groups. The "Members" list defines who belongs and who does not belong to the restricted group. The "MemberOf" list ensures that the restricted group is added to the groups listed in "MemberOf" field. A group can be a member of groups other than those listed in "MembersOf" section.

Central Access Policy Settings:

- Policies:
  - Specifies a list of central access policies. Central access policies and rules determine access permissions for multiple files on the Vserver.

Parameters

`{ [-fields <fieldname>, ...]`

If you specify the -fields <fieldname>, ... parameter, the command only displays the fields that you specify.

`[-instance ]`

If you specify the -instance parameter, the command displays detailed information about all entries.

`[-vserver <vserver name>] - Vserver`

If you specify this parameter, the command displays only group policy information that has been applied to the Vserver you specify.

`[-gpo-index <integer>] - GPO Index`

If you specify this parameter, the command displays only group policy information at gpo-index.
Examples

The following example displays all group policy information about all group policies that have been applied to a Vserver:

cluster1::> vserver cifs group-policy show-applied
Vserver: vs1
-------------------------------------
GPO Name: Default Domain Policy
  Level: Domain
  Status: enabled
Advanced Audit Settings:
  Object Access:
    Central Access Policy Staging: failure
Registry Settings:
  Refresh Time Interval: 22
  Refresh Random Offset: 8
  Hash Publication Mode for BranchCache: per-share
  Hash Version Support for BranchCache: all-versions
Security Settings:
  Event Audit and Event Log:
    Audit Logon Events: none
    Audit Object Access: success
    Log Retention Method: overwrite-as-needed
    Max Log Size: 16384
  File Security:
    /vol1/home
    /vol1/dir1
  Kerberos:
    Max Clock Skew: 5
    Max Ticket Age: 10
    Max Renew Age: 7
Privilege Rights:
  Take Ownership: usr1, usr2
  Security Privilege: usr1, usr2
  Change Notify: usr1, usr2
Registry Values:
  Signing Required: false
Restrict Anonymous:
  No enumeration of SAM accounts: true
  No enumeration of SAM accounts and shares: false
  Restrict anonymous access to shares and named pipes: true
  Combined restriction for anonymous user: no-access
Restricted Groups:

2 entries were displayed.

vserver cifs group-policy show-defined

Show applicable group policy settings defined in Active Directory

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs group-policy show-defined command displays information about group policies that have been defined in Active Directory. It displays all or a subset of the group policy configuration matching the criteria that you specify.

If you do not specify any parameters, the command displays the following information about all group policies defined in Active Directory:

- **GPO Name**: Specifies the name of the Group Policy object.
- **Level**: Specifies the level in which the Group Policy is configured. It could be either site level, domain level, or OU level.
- **Status**: Specifies whether or not this Group Policy object is enabled.

Advanced Audit Settings:

- **Object Access**:

  - **Central Access Policy Staging**: Specifies the type of events to be audited for central access policy staging. Possible values are:
    - none - Do not audit.
    - success - Audit only success events.
    - failure - Audit only failure events.
    - both - Audit both success and failure events.

Registry Settings:

- **Refresh Time Interval**: Specifies how often the Group Policy is updated.
- **Refresh Random Offset**: Specifies a random time that is added to the refresh interval to prevent all clients from requesting Group Policy updates at the same time.
- **Hash Publication Mode for BranchCache**: Specifies the hash generation mode used to generate hashes for data stored in shared folders on which BranchCache is enabled, which is then provided to clients. Possible values are:
  - per-share - Allow hash publication only for shared folders on which BranchCache is enabled.
  - disabled - Disallow hash publication on all shared folders.
  - all-shares - Allow hash publication for all shared folders.
• Hash Version Support for BranchCache: Specifies the version supported by the BranchCache hash generation service. Possible values are:
  ◦ all-versions - Both versions 1 and 2 (V1 and V2).
  ◦ version1 - Version 1 (V1).
  ◦ version2 - Version 2 (V2).

Security Settings:
• Event Audit and Event Log:
  • Audit Logon Events: Specifies the type of logon events to be audited. Possible values are:
    ◦ none - Do not audit.
    ◦ success - Audit only success events.
    ◦ failure - Audit only failure events.
    ◦ both - Audit both success and failure events.
  
  • Audit Object Access: Specifies the type of object access to be audited. Possible values are:
    ◦ none - Do not audit.
    ◦ success - Audit only success events.
    ◦ failure - Audit only failure events.
    ◦ both - Audit both success and failure events.
  
  • Log Retention Method: Specifies the audit log retention method. Possible values are:
    ◦ overwrite-as-needed - Overwrite the event log when size of the log file exceeds the maximum log size.
    ◦ overwrite-by-days - Not supported.
    ◦ do-not-overwrite - Do not overwrite the event log.
  
• Max Log Size: Specifies the maximum size of the audit log. This size is displayed in kbytes.
• File Security: Specifies a list of files or directories on which file security is to be applied.
• Kerberos:
  • Max Clock Skew: Specifies maximum tolerance in hours for computer clock synchronization.
  
• Max Ticket Age: Specifies maximum lifetime in minutes for user ticket.
• Max Renew Age: Specifies maximum lifetime in days for user ticket renewal.
• Privilege Rights:
  • Take Ownership: List of users and groups that have the right to take ownership of any securable object in the system.
  
• Security Privilege: List of users and groups that can specify auditing options for object access of individual resources, such as files, folders, and Active Directory objects.
  
• Change Notify: List of users and groups that can traverse directory trees even though the users and groups might not have permissions on the traversed directory.
  
• Registry Values:
• Signing Required: Specifies whether SMB signing is on or off.
• Restrict Anonymous:

• No enumeration of Security Account Manager (SAM) accounts: This security setting determines what additional permissions are granted for anonymous connections to the computer. This option displays as 'no-enumeration' in Data ONTAP if enabled.

• No enumeration of SAM accounts and shares: This security setting determines whether anonymous enumeration of SAM accounts and shares is allowed. This option displays as 'no-enumeration' in Data ONTAP if enabled.

• Restrict anonymous access to shares and named pipes: This security setting restricts anonymous access to shares and pipes. This option displays as 'no-access' in Data ONTAP if enabled.

• Combined restriction for anonymous user: The combined restriction for the anonymous user is derived from the above three settings:
  ◦ If 'no-access' is enabled, 'Combined restriction for anonymous user' is set to 'no-access'. The anonymous user is denied access to the specified shares and named pipes, and cannot use enumeration of SAM accounts and shares.
  ◦ If 'no-enumeration' is enabled and 'no-access' is disabled, 'Combined restriction for anonymous user' is set to 'no-enumeration'. The anonymous user has access to the specified shares and named pipes, but cannot use enumeration of SAM accounts and shares.
  ◦ If 'no-enumeration' is disabled and 'no-access' is disabled, 'Combined restriction for anonymous user' is set to 'no-restriction'. The anonymous user has full access and can use enumeration.

• Restricted Groups:

• List of restricted groups. For more information on each group, refer to the man page for the "vserver cifs group-policy restricted-group show-defined" command. Each group specifies two properties for restricted groups. The "Members" list defines who belongs and who does not belong to the restricted group. The "MemberOf" list ensures that the restricted group is added to the groups listed in "MemberOf" field. A group can be a member of groups other than those listed in "MembersOf" section.

Central Access Policy Settings:

• Policies:
  ◦ Specifies a list of central access policies. Central access policies and rules determine access permissions for multiple files on the Vserver.

Parameters

{-fields <fieldname>,...}

If you specify the -fields <fieldname>, ... parameter, the command only displays the fields that you specify.

{-instance ]}

If you specify the -instance parameter, the command displays detailed information about all entries.

[-vserver <vserver name>] - Vserver

If you specify this parameter, the command displays only group policy information that has been defined in Active Directory for the Vserver that you specify.

[-gpo-index <integer>] - GPO Index

If you specify this parameter, the command displays only group policy information at gpo-index.

Examples

The following example displays all group policy information for all group policies that have been defined in Active Directory:
cluster1::> vserver cifs group-policy show-defined

Vserver: vs1  
----------------------------------------
GPO Name: Default Domain Policy  
Level: Domain  
Status: enabled

vserver cifs group-policy update

Apply group policy settings defined in Active Directory

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver cifs group-policy update` command applies the group-policy settings defined in Active Directory for the given Vserver. This command is not supported for workgroup CIFS servers.

**Parameters**
- `vserver <vserver name>` - Vserver Name
  This parameter specifies the CIFS-enabled Vserver to which the group-policy settings be applied.
- `[-force-reapply-all-settings {true|false}]` - Force Re-apply All Settings
  This parameter specifies whether to ignore all processing optimizations and re-apply all settings. The default is false.

**Examples**
The following example applies the group-policy settings defined in Active Directory for Vserver vs1.

```
cluster1::> vserver cifs group-policy update -vserver vs1 -force-reapply-all-settings true
```
- Modification time
- Member rules

**Parameters**

```
[-fields <fieldname>, ...]  
If you specify the -fields <fieldname>, ... parameter, the command only displays the fields that you specify.

[-instance ]]  
If you specify the -instance parameter, the command displays detailed information about all entries.

[-vserver <vserver name>)] - Vserver  
If you specify this parameter, the command displays information only for central access policies for the specified Vserver.

[-name <TextNoCase>] - Name  
If you specify this parameter, the command displays information only for central access policies that match the specified name.

[-sid <windows sid>] - Identifier  
If you specify this parameter, the command displays information only for central access policies that match the specified SID.

[-description <text>] - Description  
If you specify this parameter, the command displays information only for central access policies that match the specified description.

[-ctime <Date>] - Creation Time  
If you specify this parameter, the command displays information only for central access policies that match the specified creation time.

[-mtime <Date>] - Modification Time  
If you specify this parameter, the command displays information only for central access policies that match the specified modification time.

[-rules <TextNoCase>, ...] - Central Access Rules  
If you specify this parameter, the command displays information only for central access policies that match the specified member rules.
```

**Examples**

The following example displays information for all central access policies:

```
cluster1::> vserver cifs group-policy central-access-policy show-applied

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Name</th>
<th>SID</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>
<td>p1</td>
<td>S-1-17-3386172923-1132988875-3044899393-3993546205</td>

2 entries were displayed.
```
vserver cifs group-policy central-access-policy show-defined

Show applicable central access policies defined in the Active Directory

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver cifs group-policy central-access-policy show-defined command displays information about the central access policies that are defined in the Active Directory. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all CIFS servers:

- Vserver name
- Name of the central access policy
- SID
- Description
- Creation time
- Modification time
- Member rules

Parameters

[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command only displays the fields that you specify.

[-instance]
If you specify the -instance parameter, the command displays detailed information about all entries.

[-vserver <vserver name>] - Vserver
If you specify this parameter, the command displays information only for central access policies for the specified Vserver.

[-name <TextNoCase>] - Name
If you specify this parameter, the command displays information only for central access policies that match the specified name.

[-sid <windows sid>] - Identifier
If you specify this parameter, the command displays information only for central access policies that match the specified SID.

[-description <text>] - Description
If you specify this parameter, the command displays information only for central access policies that match the specified description.

[-ctime <Date>] - Creation Time
If you specify this parameter, the command displays information only for central access policies that match the specified creation time.

[-mtime <Date>] - Modification Time
If you specify this parameter, the command displays information only for central access policies that match the specified modification time.
**[-rules <TextNoCase>, ...] - Central Access Rules**

If you specify this parameter, the command displays information only for central access policies that match the specified member rules.

**Examples**

The following example displays information for all central access policies:

```
cluster1::> vserver cifs group-policy central-access-policy show-defined

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Name</th>
<th>SID</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>
<td>p1</td>
<td>S-1-17-3386172923-1132988875-3044489393-3993546205</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Description: policy #1</td>
</tr>
<tr>

```

**vserver cifs group-policy central-access-rule commands**

Manage central access rule

**vserver cifs group-policy central-access-rule show-applied**

Show currently applied central access rules

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The `vserver cifs group-policy central-access-rule show-applied` command displays information about the central access rules assigned to Vservers. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all CIFS servers:

- Vserver name
- Name of the central access rule
- Description
- Creation time
- Modification time
- Current permissions
- Proposed permissions
- Target resources

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command only displays the fields that you specify.
If you specify the -instance parameter, the command displays detailed information about all entries.

[vserver <vserver name>] - Vserver
If you specify this parameter, the command displays information only for central access rules for the specified Vserver.

[name <TextNoCase>] - Name
If you specify this parameter, the command displays information only for central access rules that match the specified name.

description <text>] - Description
If you specify this parameter, the command displays information only for central access rules that match the specified description.

[ctime <Date>] - Creation Time
If you specify this parameter, the command displays information only for central access rules that match the specified creation time.

[time <Date>] - Modification Time
If you specify this parameter, the command displays information only for central access rules that match the specified modification time.

[effective <text>] - Effective Security Policy
If you specify this parameter, the command displays information only for central access rules that match the specified effective security policy.

[proposed <text>] - Proposed Security Policy
If you specify this parameter, the command displays information only for central access rules that match the specified proposed security policy.

[resource <text>] - Resource Condition
If you specify this parameter, the command displays information only for central access rules that match the specified resource condition.

Examples
The following example displays information for all central access rules:

cluster1::> vserver cifs group-policy central-access-rule show-applied
Vserver    Name
---------- --------------------
vs1        r1
    Description: rule #1
    Creation Time: Tue Oct 22 09:33:48 2013
    Modification Time: Tue Oct 22 09:33:48 2013
    Proposed Permissions: O:SYG:SYD:(A;;FA;;;OW) (A;;FA;;;BA) (A;;FA;;;SY)
vs1        r2
    Description: rule #2
    Creation Time: Tue Oct 22 10:27:57 2013
    Modification Time: Tue Oct 22 10:27:57 2013
    Proposed Permissions: O:SYG:SYD:(A;;FA;;;OW) (A;;FA;;;BA) (A;;FA;;;SY)
2 entries were displayed.
vserver cifs group-policy central-access-rule show-defined

Show applicable central access rules defined in the Active Directory

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The `vserver cifs group-policy central-access-rule show-defined` command displays information about the central access rules that are defined in the Active Directory. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all CIFS servers:

- Vserver name
- Name of the central access rule
- Description
- Creation time
- Modification time
- Current permissions
- Proposed permissions
- Target resources

Parameters

`{-fields <fieldname>, ...}`

If you specify the `-fields <fieldname>, ...` parameter, the command only displays the fields that you specify.

`{-instance}`

If you specify the `-instance` parameter, the command displays detailed information about all entries.

`{-vserver <vserver name>}` - Vserver

If you specify this parameter, the command displays information only for central access rules for the specified Vserver.

`{-name <TextNoCase>}` - Name

If you specify this parameter, the command displays information only for central access rules that match the specified name.

`{-description <text>}` - Description

If you specify this parameter, the command displays information only for central access rules that match the specified description.

`{-ctime <Date>}` - Creation Time

If you specify this parameter, the command displays information only for central access rules that match the specified creation time.

`{-mtime <Date>}` - Modification Time

If you specify this parameter, the command displays information only for central access rules that match the specified modification time.

`{-effective <text>}` - Effective Security Policy

If you specify this parameter, the command displays information only for central access rules that match the specified effective security policy.
-proposed <text> - Proposed Security Policy
   If you specify this parameter, the command displays information only for central access rules that match the specified proposed security policy.

-resource <text> - Resource Condition
   If you specify this parameter, the command displays information only for central access rules that match the specified resource condition.

Examples

The following example displays information for all central access rules:

```bash
cluster1::> vserver cifs group-policy central-access-rule show-defined
Vserver    Name
---------- ------------------------
vs1        r1
   Description: rule #1
   Creation Time: Tue Oct 22 09:33:48 2013
   Modification Time: Tue Oct 22 09:33:48 2013
vs1        r2
   Description: rule #2
   Creation Time: Tue Oct 22 10:27:57 2013
   Modification Time: Tue Oct 22 10:27:57 2013
```

2 entries were displayed.

vserver cifs group-policy restricted-group commands

- Manage restricted group

vserver cifs group-policy restricted-group show-applied

- Show the applied restricted-group settings.

   Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

   Description
   The vserver cifs group-policy restricted-group show-applied command displays settings of all the restricted groups applied to a Vserver.
   
   If you do not specify any parameters, the command displays the following information about all the restricted groups applied to all the Vservers in the cluster.
   
   - Group Policy Name: Specifies the name of the group policy.
   - Version: Specifies the version of the group policy.
   - Link: Specifies the level in which the group policy is configured. Possible values are:
     - Local: Group policy is configured in Data ONTAP.
     - Site: Group policy is configured at the site level in the Domain Controller.
     - Domain: Group policy is configured at the domain level in the Domain Controller.
     - OrganizationalUnit: Group policy is configured at the OU level in the Domain controller.
     - RSOP: Resultant set of policies derived from all the group policies defined at various levels.
• Group Name: Specifies the name of a restricted group.
• Members: Specifies users and groups who belong to and who do not belong to the restricted group.
• MemberOf: Specifies list of groups to which the restricted group is added. A group can be a member of groups other than the groups listed here.

Parameters

[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use ‘-fields ?’ to display the fields to specify.

[-instance]]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver
If this parameter is specified, the command displays the restricted-group information that has been applied to the specified Vserver.

[-index <integer>] - Index
If this parameter is specified, the command displays the specified index for the group policy in the restricted group. The restricted-group information for the group policy at the specified index.

[-group-name <text>] - Group Name
If this parameter is specified, the command displays the restricted-group information for the specified group name.

[-group-policy-name <text>] - Group Policy Name
If this parameter is specified, the command displays the restricted-group information for the specified group policy name.

[-uuid <UUID>] - UUID
If this parameter is specified, the command displays the restricted-group information for the specified UUID of the group policy.

[-version <integer>] - Version
If this parameter is specified, the command displays the restricted-group information for the specified version of the group policy.

[-link {Local|Site|Domain|OrganizationalUnit|RSOP}] - Link Type
If this parameter is specified, the command displays the restricted-group information for the specified link for the group policy.

[-members <gpoUserGroup>, ...] - Members, List of Users/groups
If this parameter is specified, the command displays the restricted-group information for the specified members of users and groups.

[-member-of <gpoUserGroup>, ...] - MemberOf, List of Groups
If this parameter is specified, the command displays the restricted-group information for the specified member of the group.

Examples
The following example displays information about all restricted groups that have been applied to a Vserver.

cluster1::> vserver cifs group-policy restricted-group show-applied
Vserver: vs_1
----------
vserver cifs group-policy restricted-group show-defined

Show the defined restricted-group settings.

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The `vserver cifs group-policy restricted-group show-defined` command displays settings of all the restricted groups defined in Domain Controller for a Vserver.

If you do not specify any parameters, the command displays the following information about all the restricted groups defined in Domain Controller for all the Vservers in the cluster.

- **Group Policy Name:** Specifies the name of the group policy.
- **Version:** Specifies the version of the group policy.
- **Link:** Specifies the level in which the group policy is configured. Possible values are:
  - Local: Group policy is configured in Data ONTAP.
  - Site: Group policy is configured at the site level in the Domain Controller.
  - Domain: Group policy is configured at the domain level in the Domain Controller.
  - OrganizationalUnit: Group policy is configured at the OU level in the Domain Controller.
  - RSOP: Resultant set of policies derived from all the group policies defined at various levels.
- **Group Name:** Specifies the name of a restricted group.
- **Members:** Specifies users and groups who belong to and who do not belong to the restricted group.
- **MemberOf:** Specifies list of groups to which the restricted group is added. A group can be a member of groups other than the groups listed here.

**Parameters**

`{-fields <fieldname>, ...}`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`{-instance}`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`{-vserver <vserver name>} - Vserver`

If this parameter is specified, the command displays the restricted-group information that is defined in Domain Controller for the specified Vserver.
[-index <integer>] - Index
   If this parameter is specified, the command displays the specified index for the group policy in the restricted
group. The restricted-group information for the group policy at the specified index.

[-group-name <text>] - Group Name
   If this parameter is specified, the command displays the restricted-group information for the specified group
name.

[-group-policy-name <text>] - Group Policy Name
   If this parameter is specified, the command displays the restricted-group information for the specified group
policy name.

[-uuid <UUID>] - UUID
   If this parameter is specified, the command displays the restricted-group information for the specified UUID
of the group policy.

[-version <integer>] - Version
   If this parameter is specified, the command displays the restricted-group information for the specified version
of the group policy.

[-link {Local|Site|Domain|OrganizationalUnit|RSOP}] - Link Type
   If this parameter is specified, the command displays the restricted-group information for the specified link for
the group policy.

[-members <gpoUserGroup>, ...] - Members, List of Users/groups
   If this parameter is specified, the command displays the restricted-group information for the specified
members of users and groups.

[-member-of <gpoUserGroup>, ...] - MemberOf, List of Groups
   If this parameter is specified, the command displays the restricted-group information for the specified member
of the group.

Examples

The following example displays information about all restricted groups that are defined in Domain Controller for a
Vserver.

cluster1::> vserver cifs group-policy restricted-group show-defined
Vserver: vs_1
------------

Group Policy Name: gpo1
   Version: 16
   Link: OrganizationalUnit
   Group Name: grp1
   Members: usr1
   MemberOf: GPO\g9

Group Policy Name: Resultant Set of Policy
   Version: 0
   Link: RSOP
   Group Name: grp1
   Members: usr1
   MemberOf: GPO\g9

vserver cifs home-directory commands
   Manage home directories
vserver cifs home-directory modify

Modify attributes of CIFS home directories

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs home-directory modify command modifies the CIFS home directory configuration for a CIFS server. To use the home directory options (-is-home-dirs-access-for-admin-enabled or/and -is-home-dirs-access-for-public-enabled), a home directory share must be configured with a dynamic share pattern preceded by a tilde(~). Valid dynamic share patterns are ~%w and ~%d~%w. The pattern %u is not supported with these options.

Parameters
-vserver <vserver> - Vserver
This parameter specifies the name of the CIFS server for which you want to modify the CIFS home directory configuration.

[-is-home-dirs-access-for-admin-enabled {true|false}] - Is Home Directory Access for Admin Enabled
This optional parameter specifies whether a user with Windows administrative privileges can connect to another user's home directory. The default value for this parameter is true.

[-is-home-dirs-access-for-public-enabled {true|false}] - Is Home Directory Access for Public Enabled
(privilege: advanced)
This optional parameter specifies whether any user can connect to another user's home directory. The default value for this parameter is false.

Examples
The following example modifies the CIFS home directory configuration for the Vserver "vs1". It enables users with Windows administrative privileges to connect to another user's home directory, and enables any user to connect to another user's home directory.

cluster1::> vserver cifs home-directory modify -vserver vs1 -is-home-dirs-access-for-admin-enabled true -is-home-dirs-access-for-public-enabled true

The following example shows the usage of the share creation pattern ~%d~%w.

cluster1::> vserver cifs share create -vserver vs1 -share-name ~%d~%w -path %d/%w -share-properties homedirectory

The following example shows the usage of the share creation pattern ~%w.

cluster1::> vserver cifs share create -vserver vs1 -share-name ~%w -path %d/%w -share-properties homedirectory

vserver cifs home-directory show

Display home directory configurations

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.
Description
The vserver cifs home-directory show command displays the CIFS home directory configuration for one or more Vservers.

Parameters

[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance ]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver>] - Vserver
If you specify this parameter, the command displays CIFS home directory configuration for the specified Vserver.

[-is-home-dirs-access-for-admin-enabled {true|false}] - Is Home Directory Access for Admin Enabled
If you specify this parameter, the command displays home directory configuration for CIFS servers that have the specified setting.

[-is-home-dirs-access-for-public-enabled {true|false}] - Is Home Directory Access for Public Enabled
( privilege: advanced)
If you specify this parameter, the command displays home directory configuration for CIFS servers that have the specified setting.

Examples
The following example lists the CIFS home directory configuration for a Vserver on the cluster.

```
cluster1::> vserver cifs home-directory show -vserver vs1
Vserver: vs1
Is Home Directory Access for Admin Enabled: true
```

At the advanced privilege level or above, the output displays the information below:

```
cluster1::*> vserver cifs options show
Vserver: vs1
Is Home Directory Access for Admin Enabled: true
Is Home Directory Access for Public Enabled: false
```

vserver cifs home-directory show-user
Display the Home Directory Path for a User

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs home-directory show-user command prints the path of a user’s CIFS home directory. Use this command if multiple CIFS home directory paths exist and you want to see which path holds the user’s CIFS home directory.

Parameters

[-fields <fieldname>, ...]
If you specify this parameter, the command displays only the fields that you specify.
If you specify the -instance parameter, the command displays detailed information about all entries.

**vserver <vserver>** - Vserver

Use this required parameter to specify the Vserver that contains the home directory of the user specified with the required -username parameter.

**username <text>** - User Name

Use this required parameter to locate the home directory of the specified user. You must enter this parameter in the following format: user, domain/user or cifs_server_name/user.

**-path <text>** - Path

If you specify this parameter, the command displays information about the user's home directory with the specified path.

**-share-name <text>** - Share Name

If you specify this parameter, the command displays information about the user's home directory with the specified home-directory share.

### Examples

The following command displays information about the home directory of user gpo\rpuser1 belonging to Vserver vs1.

```
cluster1::> vserver cifs home-directory show-user -vserver vs1 -username gpo\rpuser1

Vserver : vs1
Username : GPO/rpuser1
---------------------------------------------------------   ----------------------------------
ShareName                               Home Dir Path
-------------------------------------   ----------------------------------
root                                    /home/rpuser1
rpuser1                                 /home/rpuser1
~GPO~rpuser1                            /home/GPO/rpuser1
```

The following command displays information about the home directory of user gpo\rpuser1 belonging to Vserver vs1 at share path /home/rpuser1.

```
cluster1::> vserver cifs home-directory show-user -vserver vs1 -username gpo\rpuser1 -path /home/rpuser1

Vserver : vs1
Username : GPO/rpuser1
ShareName                               Home Directory Path
-------------------------------------   ----------------------------------
root                                    /home/rpuser1
rpuser1                                 /home/rpuser1
2 entries were displayed.
```

The following command displays information about the home directory of user gpo\rpuser1 belonging to Vserver vs1 at share ~GPO~rpuser1.

```
cluster1::> vserver cifs home-directory show-user -vserver vs1 -username gpo\rpuser1 -share-name ~GPO~rpuser1

Vserver : vs1
Username : GPO/rpuser1
ShareName                               Home Directory Path
-------------------------------------   ----------------------------------
~GPO~rpuser1                            /home/GPO/rpuser1
```
vserver cifs home-directory search-path commands

Manage the list of paths used to find home directories

vserver cifs home-directory search-path add

Add a home directory search path

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs home-directory search-path add command adds a search path to a CIFS home directory configuration.

Parameters
-vserver <vserver name> - Vserver
     This parameter specifies the CIFS-enabled Vserver containing the CIFS home directory configuration to which you want to add the search path.

-path <text> - Path
     This parameter specifies the search path you want to add.

Examples
The following example adds the path /home1 to the CIFS home directory configuration on Vserver vs1.

cluster1::> vserver cifs home-directory search-path add -vserver vs1 -path /home1

vserver cifs home-directory search-path remove

Remove a home directory search path

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs home-directory search-path remove command removes a search path from a CIFS home directory configuration.

Parameters
-vserver <vserver name> - Vserver
     This parameter specifies the CIFS-enabled Vserver containing the CIFS home directory configuration from which you want to remove the search path.

-path <text> - Path
     This parameter specifies the search path you want to remove.

Examples
The following example removes the path /home1 from the CIFS home directory configuration on Vserver vs1.

cluster1::> vserver cifs home-directory search-path remove -vserver vs1 -path /home1
vserver cifs home-directory search-path reorder

Change the search path order used to find a match

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs home-directory search-path reorder command moves a search path to a new position in the search path order in the CIFS home directory configuration for the CIFS-enabled Vserver.

Parameters
-vserver <vserver name> - Vserver
This parameter specifies the CIFS enabled Vserver for which you want to reorder searches.

-path <text> - Path
This parameter specifies the search path you want to move.

-to-position <integer> - Target Position
This parameter specifies the new position of the search path in the search path order.

Examples
The following example moves the search path /home1 to position 1 in the search path order for the CIFS home directory configuration on Vserver vs1.

cluster1::> vserver cifs home-directory search-path reorder -vserver vs1 -path /home1 -to-position 1

vserver cifs home-directory search-path show

Display home directory search paths

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs home-directory search-path show command displays information about the search paths that are in the home directory configuration for the CIFS-enabled Vservers.

Parameters
[-fields <fieldname>,...]
If you specify this parameter, the command only displays the fields that you specify.

[-instance ]
If you specify the -instance parameter, the command displays detailed information about all entries.

[-vserver <vserver name>] - Vserver
If you specify this parameter, the command displays home directory configuration for the CIFS-enabled Vserver that you specify.

[-path <text>] - Path
If you specify this parameter, the command displays information only for the search path that you specify.

Examples
The following example displays information about search paths for all CIFS home directories on all CIFS-enabled Vservers:
vserver cifs options commands

Manage CIFS options

vserver cifs options modify

Modify CIFS options

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs options modify command modifies CIFS options for a CIFS server.

Parameters
-vserver <vserver name> - Vserver
This parameter specifies the name of the CIFS server for which you want to modify CIFS options.

-[default-unix-user <text>] - Default UNIX User
This optional parameter specifies the name of the default UNIX user for the CIFS server.

-[read-grants-exec {enabled|disabled}] - Read Grants Exec for Mode Bits
This optional parameter specifies whether the CIFS server does read grant execution for mode bits.

-[wins-servers <InetAddress>, ...] - Windows Internet Name Service (WINS) Addresses
This optional parameter specifies a list of Windows Internet Name Server (WINS) addresses for the CIFS server. You must specify the WINS servers using an IP address. You can enter multiple WINS addresses as a comma-delimited list.

Note: Use an IPv4 address because WINS over IPv6 is not supported.

-[smb2-enabled {true|false}] - Enable all SMB2 Protocols (privilege: advanced)
This optional parameter specifies whether the CIFS server negotiates the SMB 2 version of the CIFS protocol. The default value for this parameter is true. This parameter is not supported for Vservers with Infinite Volume.

-[smb3-enabled {true|false}] - Enable SMB3 Protocol (privilege: advanced)
This optional parameter specifies whether the CIFS server negotiates the SMB 3 version of the CIFS protocol. The default value for this parameter is true. This parameter is not supported for Vservers with Infinite Volume.

-[smb31-enabled {true|false}] - Enable SMB3.1 Protocol (privilege: advanced)
This optional parameter specifies whether the CIFS server negotiates the SMB 3.1 version of the CIFS protocol. The default value for this parameter is true. This parameter is not supported for Vservers with Infinite Volume.

-[max-mpx <integer>] - Maximum Simultaneous Operations per TCP Connection (privilege: advanced)
This optional parameter specifies the maximum number of simultaneous operations the CIFS server reports it can process per TCP connection.

-[shadowcopy-dir-depth <integer>] - Maximum Depth of Directories to Shadow Copy (privilege: advanced)
This optional parameter specifies the maximum depth of directories on which to create shadow copies in the CIFS server. The default for this parameter is 5. The value 0 indicates that all sub-directories should be shadow copied. This parameter is not supported for Vservers with Infinite Volume and workgroup CIFS servers.
[-copy-offload-enabled \{true|false\}] - Enable Copy Offload Feature (privilege: advanced)

This optional parameter enables the Copy Offload feature in the CIFS server. If set to false, the Copy Offload feature is disabled. The default for this parameter is true. This parameter is not supported for Vservers with Infinite Volume.

[-is-copy-offload-direct-copy-enabled \{true|false\}] - Is Direct-copy Copy Offload Mechanism Enabled (privilege: advanced)

This optional parameter enables the direct-copy mechanism for ODX copy offload in the CIFS server. If set to false, the direct-copy mechanism is disabled. The default for this parameter is true. This parameter is not supported for Vservers with Infinite Volume.

The direct-copy mechanism increases the performance of the copy offload operation when Windows clients try to open the source file of a copy in a mode that prevents the file being changed while the copy is in progress. If turned off, regular copy offloading takes place.

[-default-unix-group <text>] - Default UNIX Group

This optional parameter specifies the name of the default UNIX group for the CIFS server. If you do not specify a default UNIX group, the CIFS ACL to NFSv4 ACL translation may result in incomplete NFSv4 ACL information. This parameter is not supported by Vservers with FlexVol volumes.

[-shadowcopy-enabled \{true|false\}] - Enable Shadow Copy Feature (VSS) (privilege: advanced)

This optional parameter enables the Shadow Copy (VSS) feature in the CIFS server when set to true. The VSS feature is disabled when set to false. The default for this parameter is true. This parameter is not supported for Vservers with Infinite Volume and workgroup CIFS servers.

[-is-referral-enabled \{true|false\}] - Refer Clients to More Optimal LIFs (privilege: advanced)

This optional parameter specifies whether the CIFS server automatically refers clients to a data LIF local to the node which hosts the root of the requested share. The default value for this parameter is false. This parameter is not supported for Vservers with Infinite Volume.

[-is-local-auth-enabled \{true|false\}] - Is Local User Authentication Enabled (privilege: advanced)

This optional parameter specifies whether local user authentication is enabled for the CIFS server.

[-is-local-users-and-groups-enabled \{true|false\}] - Is Local Users and Groups Enabled (privilege: advanced)

This optional parameter specifies whether the local users and groups feature is enabled for the CIFS server.

[-is-use-junctions-as-reparse-points-enabled \{true|false\}] - Is Reparse Point Support Enabled (privilege: advanced)

This optional parameter specifies whether the CIFS server exposes junction points to Windows clients as reparse points. The default value for this parameter is true. This parameter is only active if the client has negotiated use of the SMB 2 or SMB 3 protocol. This parameter is not supported for Vservers with Infinite Volume.

[-is-exportpolicy-enabled \{true|false\}] - Is Export Policies for CIFS Enabled (privilege: advanced)

This optional parameter specifies whether the CIFS server uses export policies to control client access. The default value for this parameter is false.

[-is-unix-nt-acl-enabled \{true|false\}] - Is NT ACLs on UNIX Security-style Volumes Enabled (privilege: advanced)

This optional parameter specifies whether the CIFS server has the NT ACLs enabled on UNIX security-style volumes. The default value for this parameter is true.

[-is-trusted-domain-enum-search-enabled \{true|false\}] - Is Enumeration of Trusted Domain and Search Capability Enabled (privilege: advanced)

This optional parameter specifies whether the CIFS server supports enumeration of bidirectional trusted domains. It also supports the search in all the bidirectional trusted domains when performing Windows user lookups for UNIX user to Windows user name mapping. The default value is true. This parameter is not supported for workgroup CIFS servers.
[-client-session-timeout <integer>] - Idle Timeout Before CIFS Session Disconnect (secs)
   This optional parameter specifies the amount of idle time (in seconds) before a CIFS session is disconnected. The default value for this parameter is 900 seconds.

[-is-dac-enabled {true|false}] - Is Dynamic Access Control (DAC) Enabled (privilege: advanced)
   This optional parameter enables the Dynamic Access Control (DAC) feature in the CIFS server when set to true. The DAC feature is disabled when set to false. The default for this parameter is false. This parameter is not supported for Vservers with Infinite Volume and workgroup CIFS servers.

[-restrict-anonymous {no-restriction|no-enumeration|no-access}] - Restrictions for Anonymous User (privilege: advanced)
   This optional parameter controls the access restrictions of non-authenticated sessions and applies the restrictions for the anonymous user based on the permitted values. The default value for this parameter is no-restriction. Permitted values for this option are:
   - no-restriction - This option specifies no access restriction for anonymous users (default).
   - no-enumeration - This option specifies that only enumeration is restricted.
   - no-access - This option specifies that access is restricted for anonymous users.

[-is-read-only-delete-enabled {enabled|disabled}] - Is Deletion of Read-Only Files Enabled
   This optional parameter controls deletion of read-only files and directories. NTFS delete semantics forbid deletion of a file or directory when the read-only attribute is set. UNIX delete semantics ignore it, focusing instead on parent directory permissions, which some applications require. This option is used to select the desired behavior. By default this option is disabled, yielding NTFS behavior.

[-file-system-sector-size {512|4096 (in bytes)}] - Size of File System Sector Reported to SMB Clients (bytes) (privilege: advanced)
   This optional parameter specifies the size of file system sector reported to SMB clients (in bytes). The default value for this parameter is 4096. Valid values are 512 and 4096.

[-is-fake-open-enabled {true|false}] - Is Fake Open Support Enabled (privilege: advanced)
   This optional parameter specifies whether the CIFS server supports fake open requests. This parameter allows you to optimize the open and close requests coming from SMB 2 clients. The default value for this parameter is true.

[-is-unix-extensions-enabled {true|false}] - Is UNIX Extensions Enabled (privilege: advanced)
   When set to true, this optional parameter enables the UNIX Extensions feature in the CIFS server. If set to false, the UNIX Extensions feature is disabled. The default for this parameter is false. UNIX Extensions allows POSIX/UNIX style security to be displayed through the CIFS protocol.

[-is-search-short-names-enabled {true|false}] - Is Search Short Names Support Enabled (privilege: advanced)
   This optional parameter specifies whether the CIFS server supports searching short names. A search query with this option enabled will try to match 8.3 file names along with long file names. The default value for this parameter is false.

[-is-advanced-sparse-file-support-enabled {true|false}] - Is Advanced Sparse File Support Enabled (privilege: advanced)
   This optional parameter specifies whether the CIFS server supports the advanced sparse file capabilities. This allows CIFS clients to query the allocated ranges of a file and to write zeroes or free data blocks for ranges of a file.

[-guest-unix-user <text>] - Map the Guest User to Valid UNIX User (privilege: advanced)
   This optional parameter specifies that an unauthenticated user coming from any untrusted domain can be mapped to a specified UNIX user for the CIFS server. If the CIFS server cannot authenticate the user against a domain controller for the home domain or a trusted domain or the local database, and this option is enabled,
the CIFS server considers the user as a guest user and maps the user to the specified UNIX user. The UNIX user must be a valid user.

[-smb1-max-buffer-size <integer>] - Maximum Buffer Size Used for SMB1 Message (privilege: advanced)
This optional parameter specifies the maximum buffer size used for an SMB 1 message that the CIFS Server can receive. If the LARGE_READ or LARGE_WRITE capability is negotiated during session setup, then 'Read' or 'Write' SMB 1 operations are allowed to exceed the configured 'smb1-max-buffer-size' value. This parameter does not have any effect on SMB 2 or SMB 3 buffer size. The default value for this parameter is 65535. The supported range for this parameter is 4356 through 65535.

[-max-same-user-sessions-per-connection <integer>] - Maximum Same User Sessions per TCP Connection (privilege: advanced)
This optional parameter specifies the maximum number of CIFS sessions that can be set up by the same user per TCP connection. The default value of this parameter is 2050. The maximum value of this parameter is 4294967295.

[-max-same-tree-connect-per-session <integer>] - Maximum Same Tree Connect per Session (privilege: advanced)
This optional parameter specifies the maximum number of CIFS tree connects to the same share per CIFS session. The default value of this parameter is 50. The maximum value of this parameter is 4294967295.

[-max-opens-same-file-per-tree <integer>] - Maximum Opens on Same File per Tree (privilege: advanced)
This optional parameter specifies the maximum number of existing opens on the same file per CIFS tree. The default value of this parameter is 800. The maximum value of this parameter is 4294967295.

[-max-watches-set-per-tree <integer>] - Maximum Watches Set per Tree (privilege: advanced)
This optional parameter specifies the maximum number of watches, also known as change notifies, that can be set per CIFS tree. Tree here refers to a share connect from a single client. The default value of this parameter is 100. The maximum value of this parameter is 4294967295.

[-is-admin-users-mapped-to-root-enabled {true|false}] - Map Administrators to UNIX User 'root' (privilege: advanced)
If this optional parameter is set to true, Windows users who are members of the "BUILTIN\Administrators" group are mapped to UNIX user 'root' unless a user who is a member of this group is explicitly mapped to a UNIX user. If a Windows user is a member of the "BUILTIN\Administrators" group and an explicit user mapping exists for that user, the explicit name mapping takes precedence. If this parameter is set to false, users that are members of the "BUILTIN\Administrators" group are not mapped to UNIX 'root'. The default value for this parameter is true.

[-is-advertise-dfs-enabled {true|false}] - (DEPRECATED)-Enable DFS Referral Advertisement (privilege: advanced)
This optional parameter specifies whether to advertise DFS referral of the CIFS protocol. The default value for this parameter is false. This option is not applicable to SMB 1.

Note: This parameter is deprecated and may be removed in a future release of Data ONTAP. The functionality provided by this parameter is now controlled by the -symlink-properties parameter instead.

[-is-path-component-cache-enabled {true|false}] - Is Path Component Cache Enabled (privilege: advanced)
This optional parameter specifies whether the path component cache is enabled. The default value for this parameter is true.

[-win-name-for-null-user <TextNoCase>] - Map Null User to Windows User or Group (privilege: advanced)
This optional parameter specifies a valid Windows user or group name that will be added to the CIFS credentials for a NULL user Session.
[-is-hide-dotfiles-enabled {true|false}] - Is Hide Dot Files Enabled (privilege: advanced)
This optional parameter specifies whether the CIFS server supports hiding dot files. Directory enumeration with this option enabled hides files and directories that begin with a dot ("."). The default value for this parameter is false.

[-is-client-version-reporting-enabled {true|false}] - Is Client Version Reporting Enabled (privilege: advanced)
If this parameter is set to true, CIFS client version tracking information is collected by AutoSupport. The default value of this parameter is true.

[-is-client-dup-detection-enabled {true|false}] - Is Client Duplicate Session Detection Enabled (privilege: advanced)
This optional parameter specifies whether the CIFS server supports duplicate session detection. Duplicate sessions that come from the same client with VcNumber of zero with this option enabled will be closed, and is only applicable for SMB 1.0 clients. The default value for this parameter is true.

[-grant-unix-group-perms-to-others {true|false}] - Grant UNIX Group Permissions to Others (privilege: advanced)
This optional parameter specifies whether the incoming CIFS user who is not the owner of the file, can be granted the group permission. If the CIFS incoming user is not the owner of UNIX security-style file and this option is set to true, then at all times the file's "group" permissions are granted. If the CIFS incoming user is not the owner of UNIX security-style file and this option is set to false, then the normal UNIX rules are applicable to grant the permissions. The default value of this parameter is false.

[-is-large-mtu-enabled {true|false}] - Is Large MTU Enabled (privilege: advanced)
This optional parameter specifies whether the CIFS server supports the SMB 2.1 "large MTU" feature. The default value for this parameter is false. This parameter is not supported for Vservers with Infinite Volume.

[-is-netbios-over-tcp-enabled {true|false}] - Is NetBIOS over TCP (port 139) Enabled (privilege: advanced)
This optional parameter specifies whether the CIFS server supports the NetBIOS over TCP (port 139) feature. The default value for this parameter is true.

[-is-nbns-enabled {true|false}] - Is NBNS over UDP (port 137) Enabled (privilege: advanced)
This optional parameter specifies whether the CIFS server supports the NBNS protocol. The default value for this parameter is false.

### Examples
The following example modifies CIFS options for the Vserver "vs1". It changes the default UNIX user, disables read grants exec, disables SMB2.x, changes maximum multiplex count to 1124, changes the file system sector size reported to SMB clients to 512, disables the direct-copy offload mechanism for ODX copy offload, enables the UNIX Extensions feature, disables fake open requests changes WINS servers to 192.168.11.112 and changes the client session timeout to 6000.

```
cluster1::> vserver cifs options modify -vserver vs1
   -default-unix-user pcuser -read-grants-exec disabled
   -smb2-enabled false -max-mpx 1124 -file-system-sector-size 512
   -is-advanced-sparse-file-support-enabled true -is-copy-offload-direct-copy-enabled false
   -is-unix-extensions-enabled true -is-fake-open-enabled false
   -wins-servers 192.168.11.112 -client-session-timeout 6000
```

The following example modifies CIFS options for the Vserver "vs1". It enables the advanced sparse file support.

```
cluster1::> vserver cifs options modify -vserver vs1
   -is-advanced-sparse-file-support-enabled true
```
The following example modifies CIFS options for the Vserver "vs1". It modifies limits for maximum opens on the same file, max sessions by the same user, max tree connects per session, and max watches set.

```
cluster1::> vserver cifs options modify -vserver vs1
-max-same-user-sessions-per-connection 100
-max-same-tree-connect-per-session 100
-max-opens-same-file-per-tree 150
-max-watches-set-per-tree 200
```

The following example modifies CIFS options for the Vserver "vs1". It modifies the option to disable the path component cache.

```
cluster1::> vserver cifs options modify -vserver vs1
-is-path-component-cache-enabled false
```

The following example modifies CIFS options for the Vserver "vs1". It modifies the option to disable CIFS client version tracking.

```
cluster1::> vserver cifs options modify -vserver vs1
-is-client-version-reporting-enabled false
```

The following example modifies CIFS option for the Vserver "vs1". It modifies the option to enable granting of UNIX group permissions to others.

```
cluster1::> vserver cifs options modify -vserver vs1
-grant-unix-group-perms-to-others true
```

---

vserver cifs options show

Display CIFS options

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The vserver cifs options show command displays the CIFS configuration options for one or more Vservers.

**Parameters**

- `[-fields <fieldname>,...]
  - If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.
- `[-instance ]`
  - If you specify the -instance parameter, the command displays detailed information about all fields.
- `[-vserver <vserver name>] - Vserver`
  - If you specify this parameter, the command only displays CIFS options for the specified Vserver.
- `[-default-unix-user <text>] - Default UNIX User`
  - If you specify this parameter, the command displays options for CIFS server with the specified UNIX user.
[-read-grants-exec {enabled|disabled}] - Read Grants Exec for Mode Bits
If this parameter is set to enabled, the command displays options for CIFS servers that grant execution access when granting read access using mode bits. If set to disabled, the command displays options for CIFS servers that do not grant execution access when granting read access using mode bits.

[-wins-servers <InetAddress>, ...] - Windows Internet Name Service (WINS) Addresses
If you specify this parameter, the command displays CIFS options only for CIFS servers that use the specified Windows Internet Name Server (WINS) addresses.

[-smb2-enabled {true|false}] - Enable all SMB2 Protocols (privilege: advanced)
If this parameter is set to true, the command displays options for CIFS servers where SMB 2 version of the CIFS protocol is negotiated. If set to false, the command displays options for CIFS servers where SMB 2 version of the CIFS protocol is not negotiated.

[-smb3-enabled {true|false}] - Enable SMB3 Protocol (privilege: advanced)
If this parameter is set to true, the command displays options for CIFS servers where SMB 3 version of the CIFS protocol is negotiated. If set to false, the command displays options for CIFS servers where SMB 3 version of the CIFS protocol is not negotiated.

[-smb31-enabled {true|false}] - Enable SMB3.1 Protocol (privilege: advanced)
If this parameter is set to true, the command displays options for CIFS servers where SMB 3.1 version of the CIFS protocol is negotiated. If set to false, the command displays options for CIFS servers where SMB 3.1 version of the CIFS protocol is not negotiated.

[-max-mpx <integer>] - Maximum Simultaneous Operations per TCP Connection (privilege: advanced)
If you specify this parameter, the command displays options for CIFS server with the specified maximum number of simultaneous operations the CIFS server can process per TCP connection.

[-shadowcopy-dir-depth <integer>] - Maximum Depth of Directories to Shadow Copy (privilege: advanced)
If you specify this parameter, the command displays options for CIFS servers that are configured with the specified depth of directories on which to create shadow copies.

[-copy-offload-enabled {true|false}] - Enable Copy Offload Feature (privilege: advanced)
If set to true, this command displays options only for CIFS servers where the Copy Offload feature is enabled. If set to false, options are displayed for CIFS servers where the Copy Offload feature is disabled.

[-is-copy-offload-direct-copy-enabled {true|false}] - Is Direct-copy Copy Offload Mechanism Enabled (privilege: advanced)
If set to true, this command displays options only for CIFS servers where the direct-copy mechanism for ODX Copy Offload is enabled. If set to false, options are displayed for CIFS servers where the direct-copy offload mechanism is disabled. The direct-copy mechanism increases the performance of the copy offload operation when Windows clients try to open the source file of a copy in a mode that prevents the file being changed while the copy is in progress. If turned off, regular copy offloading takes place.

[-default-unix-group <text>] - Default UNIX Group
If you specify this parameter, the command displays options for CIFS server with the specified default UNIX group.

[-shadowcopy-enabled {true|false}] - Enable Shadow Copy Feature (VSS) (privilege: advanced)
If set to true, this command displays options only for CIFS servers where the Shadow Copy (VSS) feature is enabled. If set to false, options are displayed for CIFS servers where the Shadow Copy (VSS) feature is disabled.

[-is-referral-enabled {true|false}] - Refer Clients to More Optimal LIFs (privilege: advanced)
If set to true, the command displays options for the CIFS server where the CIFS server automatically refers clients to a data LIF local to the node which hosts the root of the requested share. If set to false, the command displays options for the CIFS server where the mechanism, to automatically refer the clients to data LIF local to the node which hosts the root of the requested share, is disabled.
[-is-local-auth-enabled {true|false}] - Is Local User Authentication Enabled (privilege: advanced)
If this parameter is set to true, the command displays CIFS options only for CIFS servers where local user authentication is enabled. If set to false, the command displays options for CIFS servers where local user authentication is disabled.

[-is-local-users-and-groups-enabled {true|false}] - Is Local Users and Groups Enabled (privilege: advanced)
If this parameter is set to true, the command displays CIFS options only for CIFS servers where the local users and groups feature is enabled. If set to false, the command displays options for CIFS servers where the local users and groups feature is disabled.

[-is-use-junctions-as-reparse-points-enabled {true|false}] - Is Reparse Point Support Enabled (privilege: advanced)
If you specify this parameter, the command only displays CIFS options for Vservers which have the specified reparse point setting.

[-is-exportpolicy-enabled {true|false}] - Is Export Policies for CIFS Enabled (privilege: advanced)
If you specify this parameter, the command only displays CIFS options for Vservers which have the specified export policy setting.

[-is-unix-nt-acl-enabled {true|false}] - Is NT ACLs on UNIX Security-style Volumes Enabled (privilege: advanced)
If this parameter is set to true, the command only displays CIFS options for Vservers that have the NT ACLs on UNIX security-style volumes enabled. If set to false, the command displays options for Vservers that have the NT ACLs on UNIX security-style volumes disabled.

[-is-trusted-domain-enum-search-enabled {true|false}] - Is Enumeration of Trusted Domain and Search Capability Enabled (privilege: advanced)
If this parameter is set to true, the command displays CIFS options only for CIFS servers that support enumeration of bidirectional trusted domains and that support searching in all bidirectional trusted domains when performing Windows user lookups for UNIX user to Windows user name mapping. If set to false, the command displays options for CIFS servers that do not support enumeration of bidirectional trusted domains.

[-client-session-timeout <integer>] - Idle Timeout Before CIFS Session Disconnect (secs)
If you specify this parameter, the command displays options only for CIFS servers that are configured with the specified client session timeout value (in seconds).

[-is-dac-enabled {true|false}] - Is Dynamic Access Control (DAC) Enabled (privilege: advanced)
If set to true, this command displays options only for CIFS servers where the Dynamic Access Control (DAC) feature is enabled. If set to false, options are displayed for CIFS servers where the Dynamic Access Control (DAC) feature is disabled.

[-restrict-anonymous {no-restriction|no-enumeration|no-access}] - Restrictions for Anonymous User (privilege: advanced)
If you specify this parameter, the command displays CIFS options only for CIFS servers that have the specified permitted value for the anonymous user. Permitted values for this option are:

• no-restriction - There is no access restriction for anonymous users.
• no-enumeration - Only enumeration is restricted.
• no-access - Access is restricted for anonymous users.

[-is-read-only-delete-enabled {enabled|disabled}] - Is Deletion of Read-Only Files Enabled
If you specify this parameter, the command displays options only for CIFS servers that have the specified is-read-only-delete-enabled setting.
[-file-system-sector-size {512|4096 (in bytes)}] - Size of File System Sector Reported to SMB Clients (bytes) (privilege: advanced)

If you specify this parameter, the command displays options only for CIFS servers that are configured with the specified file system sector size (in bytes).

[-is-fake-open-enabled {true|false}] - Is Fake Open Support Enabled (privilege: advanced)

If you set this parameter to true, the command displays options for CIFS servers where fake open is enabled. If set to false, the command displays options for CIFS servers where fake open is disabled.

[-is-unix-extensions-enabled {true|false}] - Is UNIX Extensions Enabled (privilege: advanced)

If set to true, this command displays options only for CIFS servers where the UNIX Extensions feature is enabled. If set to false, options are displayed for CIFS servers where the UNIX Extensions feature is disabled. UNIX Extensions allows POSIX/UNIX style security to be displayed through the CIFS protocol.

[-is-search-short-names-enabled {true|false}] - Is Search Short Names Support Enabled (privilege: advanced)

If you set this parameter to true, the command displays options for CIFS servers where search short names is enabled. If set to false, the command displays options for CIFS servers where search short names is disabled.

[-is-advanced-sparse-file-support-enabled {true|false}] - Is Advanced Sparse File Support Enabled (privilege: advanced)

If set to true, the command displays options for CIFS servers where the advanced sparse file capabilities for CIFS are enabled. If set to false, options are displayed for CIFS servers where the advanced sparse file capabilities for CIFS are disabled.

[-guest-unix-user <text>] - Map the Guest User to Valid UNIX User (privilege: advanced)

If you specify this parameter, the command displays options for CIFS server with the specified guest UNIX user.

[-smb1-max-buffer-size <integer>] - Maximum Buffer Size Used for SMB1 Message (privilege: advanced)

If you specify this parameter, the command displays options only for CIFS servers that are configured with the specified maximum buffer size value.

[-max-same-user-sessions-per-connection <integer>] - Maximum Same User Sessions per TCP Connection (privilege: advanced)

If you specify this parameter, the command displays options only for CIFS server that are configured with the specified maximum same user session per connection.

[-max-same-tree-connect-per-session <integer>] - Maximum Same Tree Connect per Session (privilege: advanced)

If you specify this parameter, the command displays options only for CIFS server that are configured with the specified maximum same tree connects per session.

[-max-opens-same-file-per-tree <integer>] - Maximum Opens on Same File per Tree (privilege: advanced)

If you specify this parameter, the command displays options only for CIFS server that are configured with the specified maximum opens on same file per tree.

[-max-watches-set-per-tree <integer>] - Maximum Watches Set per Tree (privilege: advanced)

If you specify this parameter, the command displays options only for CIFS server that are configured with the specified maximum watches set per tree. Tree here refers to a share connect from a single client.

[-is-admin-users-mapped-to-root-enabled {true|false}] - Map Administrators to UNIX User 'root' (privilege: advanced)

If you set this parameter to true, the command displays options for CIFS servers where members of "BUILTIN \Administrators" group are mapped to UNIX user 'root'. If set to false, the command displays options for CIFS servers where members of the "BUILTIN\Administrators" group are not mapped to UNIX user 'root'.
[-is-advertise-dfs-enabled {true|false}] - (DEPRECATED) Enable DFS Referral Advertisement (privilege: advanced)

If this parameter is set to true, the command displays CIFS options only for CIFS servers where DFS referral advertisement is enabled. If set to false, the command displays options for CIFS servers where DFS referral advertisement is disabled. This option is not applicable to SMB 1.0.

Note: This parameter is deprecated and may be removed in a future release of Data ONTAP. The functionality provided by this parameter is now controlled by the -symlink-properties parameter instead.

[-is-path-component-cache-enabled {true|false}] - Is Path Component Cache Enabled (privilege: advanced)

If this parameter is set to true, the command displays options for CIFS servers where the path component cache is enabled. If set to false, the command displays options for CIFS servers where the path component cache is disabled.

[-is-hide-dotfiles-enabled {true|false}] - Is Hide Dot Files Enabled (privilege: advanced)

When set to true, this optional parameter enables the Hide Dot Files feature in the CIFS server. If set to false, the Hide Dot Files feature is disabled. The default value for this parameter is false.

[-is-client-version-reporting-enabled {true|false}] - Is Client Version Reporting Enabled (privilege: advanced)

If this parameter is set to true, the command displays options for CIFS servers where CIFS client version tracking is enabled. If set to false, the command displays options for CIFS servers where CIFS client version tracking is disabled.

[-is-client-dup-detection-enabled {true|false}] - Is Client Duplicate Session Detection Enabled (privilege: advanced)

If this parameter is set to true, the command displays options for CIFS servers where client duplicate session detection is enabled. If set to false, the command displays options for CIFS servers where client duplicate session detection is not enabled.

[-grant-unix-group-perms-to-others {true|false}] - Grant UNIX Group Permissions to Others (privilege: advanced)

If this parameter is set to true, the command displays CIFS options only for CIFS servers where grant unix group permissions to others feature is enabled. If set to false, the command displays options for CIFS servers where grant unix group permissions to others feature is disabled.

[-is-large-mtu-enabled {true|false}] - Is Large MTU Enabled (privilege: advanced)

If you specify this parameter, the command displays options only for CIFS servers that are configured to support the SMB 2.1 "Large MTU" feature.

[-is-netbios-over-tcp-enabled {true|false}] - Is NetBIOS over TCP (port 139) Enabled (privilege: advanced)

If you specify this parameter, the command displays options only for CIFS servers that are configured to support the NetBIOS over TCP (port 139) feature.

[-is-nbns-enabled {true|false}] - Is NBNS over UDP (port 137) Enabled (privilege: advanced)

If you specify this parameter, the command displays CIFS options only for CIFS servers that use the specified setting for the NBNS protocol.

Examples

The following example lists CIFS options for a Vserver on the cluster.
At the advanced level, the output displays the information below.

```
cluster1::*> vserver cifs options show
Vserver: vs1

Client Session Timeout: 900
Copy Offload Enabled: true
Default Unix Group: -
Default Unix User: pcuser
Guest Unix User: -
Are Administrators mapped to 'root': true
Is Advanced Sparse File Support Enabled: true
Direct-Copy Copy Offload Enabled: true
Export Policies Enabled: false
Grant Unix Group Permissions to Others: true
Is Advertise DFS Enabled: true
Is Client Duplicate Session Detection Enabled: true
Is Client Version Reporting Enabled: true
Is DAC Enabled: false
Is Fake Open Support Enabled: true
Is Hide Dot Files Support Enabled: false
Is Large MTU Enabled: true
Is Local Auth Enabled: true
Is Local Users and Groups Enabled: true
Is NetBIOS over TCP (port 139) Enabled: true
Is Referral Enabled: false
Is Search Short Names Support Enabled: false
Is Trusted Domain Enumeration And Search Enabled: true
Is UNIX Extensions Enabled: false
Is Use Junction as Reparse Point Enabled: true
Max Multiplex Count: 255
Max Same User Session Per Connection: 50
Max Same Tree Connect Per Session: 50
Max Opens Same File Per Tree: 800
Max Watches Set Per Tree: 100
NBNS Interfaces : -
Is Path Component Cache Enabled: true
NT ACLs on UNIX Security Style Volumes Enabled: true
Read Grants Exec: disabled
Read Only Delete: disabled
Reported File System Sector Size: 4096
Restrict Anonymous: no-restriction
Shadowcopy Dir Depth: 5
Shadowcopy Enabled: true
Max Buffer Size for SMB1 Message: 65535
SMB2 Enabled: true
SMB3 Enabled: true
SMB3.1 Enabled: true
Map Null User to Windows User or Group: cifsGroup
WINS Servers: -
```

At the diagnostic level, the output displays the information below.

```
cluster1::*> vserver cifs options show
Vserver: vs1

Client Session Timeout: 900
Copy Offload Enabled: true
Default Unix Group: -
Default Unix User: pcuser
Guest Unix User: -
Read Grants Exec: disabled
WINS Servers: -
```
### vserver cifs security commands

Manage CIFS security settings

### vserver cifs security modify

Modify CIFS security settings

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The vserver cifs security modify command modifies CIFS server security settings.

**Parameters**

- `-vserver <vserver name>` - Vserver

  This parameter specifies the name of the Vserver whose CIFS security settings you want to modify.

---

</tbody>
</table>
**[-kerberos-clock-skew <integer>] - Maximum Allowed Kerberos Clock Skew**
This parameter specifies the maximum allowed Kerberos ticket clock skew in minutes. The default is 5 minutes.

**[-kerberos-ticket-age <integer>] - Kerberos Ticket Lifetime**
This parameter specifies the Kerberos ticket lifetime in hours. The default is 10 hours.

**[-kerberos-renew-age <integer>] - Maximum Kerberos Ticket Renewal Days**
This parameter specifies the maximum Kerberos ticket renewal lifetime in days. The default is 7 days.

**[-kerberos-kdc-timeout <integer>] - Timeout for Kerberos KDC Connections (Secs)**
This parameter specifies the timeout for sockets on KDCs after which all KDCs are marked as unreachable. The default is 3 seconds.

**[is-signing-required {true|false}] - Require Signing for Incoming CIFS Traffic**
This parameter specifies whether signing is required for incoming CIFS traffic. The default is false.

**[is-password-complexity-required {true|false}] - Require Password Complexity for Local User Accounts**
This parameter specifies whether password complexity is required for CIFS local users. If this parameter is set to true, password complexity is required. If the value is set to false, password complexity is not required. The default is true for CIFS servers.

**[use-start-tls-for-ad-ldap {true|false}] - Use start_tls For AD LDAP Connections**
This parameter specifies whether to use Start TLS over AD LDAP connections. When enabled, the communication between the Data ONTAP LDAP Client and the LDAP Server will be encrypted using Start TLS. Start TLS is a mechanism to provide secure communication by using the TLS/SSL protocols. If you do not specify this parameter, the default is false.

**[is-aes-encryption-enabled {true|false}] - Is AES-128 and AES-256 Encryption for Kerberos Enabled**
This parameter specifies whether to use Kerberos AES-128 and AES-256 encryption types for authentication. When enabled and depending on negotiation with the KDC service, it is possible for authentication operations to utilize these encryption types. If you do not specify this parameter, the default is false.

**[-lm-compatibility-level {lm-ntlm-ntlmv2-krb|ntlm-ntlmv2-krb|ntlmv2-krb|krb}] - LM Compatibility Level**
This parameter specifies the LM compatibility level. The default is "lm-ntlm-ntlmv2-krb" (LM, NTLM, NTLMv2 and Kerberos).

**[is-smb-encryption-required {true|false}] - Require SMB Encryption for Incoming CIFS Traffic**
This parameter specifies whether SMB encryption is required when accessing shares in the Vserver. When enabled and depending on negotiation during session setup, it is possible that data transfers between the client and the server are made secure by encrypting the SMB traffic. If you do not specify this parameter, the default is false.

**[-session-security-for-ad-ldap {none|sign|seal}] - Client Session Security**
This parameter specifies the level of security to be used for LDAP communications. If you do not specify this parameter, the default is none.

LDAP Client Session Security can be one of the following:

- none - No Signing or Sealing.
- sign - Sign LDAP traffic.
- seal - Seal and Sign LDAP traffic.

### Examples
The following example makes the following changes: the Kerberos clock skew is set to 3 minutes, the Kerberos ticket lifetime to 8 hours and it makes signing required for Vserver "vs1".
vserver cifs security modify -vserver vs1 -kerberos-clock-skew 3 -kerberos-ticket-age 8 -is-signing-required true

vserver cifs security show

Vserver: vs1

vserver cifs security show

Display CIFS security settings

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver cifs security show command displays information about CIFS server security settings.

Parameters

[-fields <fieldname>, ...]

If you specify the -fields parameter, the command only displays the fields that you specify.

[-instance]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver

This parameter specifies the name of the Vserver whose CIFS security settings you want to display.

[-kerberos-clock-skew <integer>] - Maximum Allowed Kerberos Clock Skew

If this parameter is specified, the command displays information only about the security settings that match the specified Kerberos ticket clock skew.

[-kerberos-ticket-age <integer>] - Kerberos Ticket Lifetime

If this parameter is specified, the command displays information only about the security settings that match the specified Kerberos ticket age.

[-kerberos-renew-age <integer>] - Maximum Kerberos Ticket Renewal Days

If this parameter is specified, the command displays information only about the security settings that match the specified Kerberos renewal age.

[-kerberos-kdc-timeout <integer>] - Timeout for Kerberos KDC Connections (Secs)

If this parameter is specified, the command displays information only about the security settings that match the specified Kerberos KDC timeout.
[-realm <text>] - Kerberos Realm
If this parameter is specified, the command displays information only about the security settings that match the specified Kerberos realm.

[-kdc-ip <text>, ...] - KDC IP Address
If this parameter is specified, the command displays information only about the security settings that match the specified KDC IP address.

[-kdc-name <text>, ...] - KDC Name
If this parameter is specified, the command displays information only about the security settings that match the specified KDC name.

[-site <text>, ...] - KDC Site
If this parameter is specified, the command displays information only about the security settings that match the specified Windows site.

[-is-signing-required {true|false}] - Require Signing for Incoming CIFS Traffic
This parameter specifies whether signing is required for incoming CIFS traffic. If this parameter is specified, the command displays information only about the security settings that match the specified value for is-signing-required.

[-is-password-complexity-required {true|false}] - Require Password Complexity for Local User Accounts
If this parameter is set to true, the command displays CIFS security configuration information only for CIFS servers where password complexity for local user accounts is required. If set to false, the command displays security configuration information for CIFS servers where password complexity for local user accounts is not required.

[-use-start-tls-for-ad-ldap {true|false}] - Use start_tls For AD LDAP Connections
If this parameter is set to true, the command displays CIFS security configuration information only for CIFS servers where Start TLS is used for communication with the AD LDAP Server. If set to false, the command displays CIFS security configuration information only for CIFS servers where Start TLS is not used for communication with the AD LDAP Server.

[-is-aes-encryption-enabled {true|false}] - Is AES-128 and AES-256 Encryption for Kerberos Enabled
If this parameter is set to true, the command displays CIFS security configuration information only for CIFS servers where AES-128 and AES-256 encryption types for Kerberos are enabled. If set to false, the command displays security configuration information for CIFS servers where AES-128 and AES-256 encryption types for Kerberos are disabled.

[-lm-compatibility-level {lm-ntlm-ntlmv2-krb|ntlm-ntlmv2-krb|ntlmv2-krb|krb}] - LM Compatibility Level
If this parameter is specified, the command displays information only about the security settings that match the specified LM compatibility level.

[-is-smb-encryption-required {true|false}] - Require SMB Encryption for Incoming CIFS Traffic
If this parameter is set to true, the command displays CIFS security configuration information only for CIFS servers where SMB encryption is required. If set to false, the command displays security configuration information for CIFS servers where SMB encryption is not required.

[-session-security-for-ad-ldap {none|sign|seal}] - Client Session Security
If this parameter is set to seal, the command displays CIFS security configuration information only for CIFS servers where both signing and sealing are required for LDAP communications. If set to sign, the command displays security configuration information for CIFS servers where only signing is required for LDAP communications. If set to none, the command displays security configuration information for CIFS servers where no security is required for LDAP communications.

**Examples**
The following example displays CIFS server security settings.
cluster1::> vserver cifs security show

CIFS session Commands

Manage CIFS sessions

The vserver cifs session commands are used to manage established CIFS sessions and their attributes.

vserver cifs session close

Close an open CIFS session

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver cifs session close command closes the specified CIFS sessions.

Parameters

- **-node** `<nodename>|local` - Node
  
  If you specify this parameter, the command will close all the opened CIFS sessions on the specified node.

- **-vserver** `<vserver name>` - Vserver
  
  If you specify this parameter, the command will close all the opened CIFS sessions on the specified CIFS-enabled Vserver.

- **-session-id** `<integer>` - Session ID
  
  If you specify this parameter, the command will close the open CIFS session that matches the specified session ID.

- **[-connection-id** `<integer>`] - Connection ID
  
  If you specify this parameter, the command will close all the opened CIFS sessions that match the specified connection ID.
[-lif-address <IP Address>] - Incoming Data LIF IP Address
If you specify this parameter, the command will close all the opened CIFS sessions that are established through the specified data LIF IP address.

[-address <IP Address>] - Workstation IP address
If you specify this parameter, the command will close all the opened CIFS sessions that are opened from the specified IP address.

[-auth-mechanism <Authentication Mechanism>] - Authentication Mechanism
If you specify this parameter, the command will close all the opened CIFS sessions that used the specified authentication mechanism. The authentication mechanism can include one of the following:

- NTLMv1 - NTLMv1 authentication mechanism
- NTLMv2 - NTLMv2 authentication mechanism
- Kerberos - Kerberos authentication mechanism
- Anonymous - Anonymous authentication mechanism

[-windows-user <TextNoCase>] - Windows User
If you specify this parameter, the command will close all the opened CIFS sessions that are established for the specified CIFS user. The acceptable format for CIFS user is [domain]\user.

[-unix-user <text>] - UNIX User
If you specify this parameter, the command will close all the opened CIFS sessions that are established for the specified UNIX user.

[-protocol-version <CIFS Dialects>] - Protocol Version
If you specify this parameter, the command will close all the opened CIFS sessions that are established over the specified version of CIFS protocol. The protocol version can include one of the following:

- SMB1 - SMB 1.0
- SMB2 - SMB 2.0
- SMB2_1 - SMB 2.1
- SMB3 - SMB 3.0
- SMB3_1 - SMB 3.1

[-continuously-available <CIFS Open File Protection>] - Continuously Available
If you specify this parameter, the command will close all the opened CIFS sessions with open files that have the specified level of continuously available protection. The open files are "continuously available" if they are opened from an SMB 3 client through a share with the "continuously_available" property set. These open files are capable of non-disruptively recovering from takeover and giveback as well as general aggregate relocation between partners in a high-availability relationship. This is in addition to the traditional SMB 2 capability allowing clients to recover from LIF migration and other brief network interruptions.

**Note:** The CA protection levels depict the continuous availability at the connection level so it might not be accurate for a session if the connection has multiple sessions. Streams opened through a continuously available share are permitted, but are not currently made continuously available. Directories may be opened through a continuously available share, but, by design, will not appear continuously available as clients do not open them that way. These protection levels are applicable to the sessions on read/write volumes residing on storage failover aggregates.

The continuously available status can be one of the following:

- No - The session contains one or more open file but none of them are continuously available.
• Yes - The session contains one or more open files and all of them are continuously available.
• Partial - The session contains at least one continuously available open file but other open files that are not.

[\[-is-session-signed\] \{true\}false\}] - Is Session Signed
If you specify this parameter, the command will close all the opened CIFS sessions that are established with the specified SMB signing option.

[\[-smb-encryption-status\] \{unencrypted\}encrypted\]partially-encrypted\}] - SMB Encryption Status
If you specify this parameter, the command will close all the opened CIFS sessions that are established over the specified SMB encryption status.
The SMB encryption status can be one of the following:
• unencrypted - The CIFS session is not encrypted.
• encrypted - The CIFS session is fully encrypted. Vserver level encryption is enabled and encryption happens for the entire session.
• partially-encrypted - The CIFS session is partially encrypted. Share level encryption is enabled and encryption is initiated when the tree-connect occurs.

Examples
The following example closes all open CIFS sessions on all the nodes with protocol-version SMB2:

```
cluster1::> cifs session close -node * -protocol-version SMB2
2 entries were acted on.
```

The following example closes all open CIFS sessions for all Vservers on node node1:

```
cluster1::> cifs session close -node node1 -vserver *
3 entries were acted on.
```

**vserver cifs session show**
Display established CIFS sessions

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `vserver cifs session show` command displays information about established CIFS sessions. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all CIFS sessions:

• Node name
• Vserver name
• CIFS connection ID
• CIFS session ID
• Workstation IP address
• CIFS user name
• CIFS open files
• Session idle time
You can specify additional parameters to display only information that matches those parameters. For example, to display information only about CIFS sessions established on connection ID 2012, run the command with the `-connection-id` parameter set to 2012.

**Parameters**

```
[-fields <fieldname>,...]
If you specify this parameter, the command only displays the fields that you specify.

[-show-win-unix-creds]
If you specify this parameter along with a valid session-id, the command displays Windows and UNIX credentials along with the detailed information about matching CIFS sessions.

[-instance]
If you specify this parameter, the command displays detailed information about matching CIFS sessions.

[-node <nodename>|local] - Node
If you specify this parameter, the command displays information about the CIFS sessions on the specified node.

[-vserver <vserver name>] - Vserver
If you specify this parameter, the command displays information about CIFS sessions on the specified CIFS-enabled Vserver.

[-session-id <integer>] - Session ID
If you specify this parameter, the command displays information about the CIFS session that match the specified session ID.

[-connection-id <integer>] - Connection ID
If you specify this parameter, the command displays information about CIFS sessions that match the specified connection ID.

[-lif-address <IP Address>] - Incoming Data LIF IP Address
If you specify this parameter, the command displays information about CIFS sessions that are established through the specified data LIF IP address.

[-address <IP Address>] - Workstation IP address
If you specify this parameter, the command displays information about CIFS sessions that are opened from the specified IP address.

[-auth-mechanism <Authentication Mechanism>] - Authentication Mechanism
If you specify this parameter, the command displays information about CIFS sessions that used the specified authentication mechanism. The authentication mechanism can include one of the following:

- None - Could not authenticate
- NTLMv1 - NTLMv1 authentication mechanism
- NTLMv2 - NTLMv2 authentication mechanism
- Kerberos - Kerberos authentication mechanism
- Anonymous - Anonymous authentication mechanism

[-windows-user <TextNoCase>] - Windows User
If you specify this parameter, the command displays information about CIFS sessions that are established for the specified CIFS user. The acceptable format for CIFS user is [domain]user.

[-unix-user <text>] - UNIX User
If you specify this parameter, the command displays information about CIFS sessions that are established for the specified UNIX user.
[-shares <integer>] - Open Shares
If you specify this parameter, the command displays information about CIFS sessions that have the specified
number of CIFS shares opened.

[-files <integer>] - Open Files
If you specify this parameter, the command displays information about CIFS sessions that have the specified
number of regular CIFS files opened.

[-other <integer>] - Open Other
If you specify this parameter, the command displays information about CIFS sessions that have the specified
number of special CIFS files opened such as streams or directories.

[-connected-time <elapsed>] - Connected Time
If you specify this parameter, the command displays information about CIFS sessions that are established for
the specified time duration.

[-idle-time <elapsed>] - Idle Time
If you specify this parameter, the command displays information about CIFS sessions on which there is no
activity for the specified time duration.

[-protocol-version <CIFS Dialects>] - Protocol Version
If you specify this parameter, the command displays information about CIFS sessions that are established over
the specified version of CIFS protocol. The protocol version can include one of the following:

• SMB1 - SMB 1.0
• SMB2 - SMB 2.0
• SMB2_1 - SMB 2.1
• SMB3 - SMB 3.0
• SMB3_1 - SMB 3.1

[-continuously-available <CIFS Open File Protection>] - Continuously Available
If you specify this parameter, the command displays information about CIFS sessions with open files that have
the specified level of continuously available protection. The open files are "continuously available" if they are
opened from an SMB 3 client through a share with the "continuously_available" property set. These open files
are capable of non-disruptively recovering from takeover and giveback as well as general aggregate relocation
between partners in a high-availability relationship. This is in addition to the traditional SMB 2 capability
allowing clients to recover from LIF migration and other brief network interruptions.

Note: The CA protection levels depict the continuous availability at the connection level so it might not be
accurate for a session if the connection has multiple sessions. Streams opened through a continuously
available share are permitted, but are not currently made continuously available. Directories may be opened
through a continuously available share, but, by design, will not appear continuously available as clients do
not open them that way. These protection levels are applicable to the sessions on read/write volumes
residing on storage failover aggregates.

The continuously available status can be one of the following:

• No - The session contains one or more open file but none of them are continuously available.
• Yes - The session contains one or more open files and all of them are continuously available.
• Partial - The session contains at least one continuously available open file but other open files that are not.

[-is-session-signed (true|false)] - Is Session Signed
If you specify this parameter, the command displays information about CIFS sessions that are established with
the specified SMB signing option.
[-user-type {local-user|domain-user|guest-user|anonymous-user}] - User Authenticated as
If you specify this parameter, the command displays information about CIFS sessions that are established for the specified user type. The user type can include one of the following:

- local-user - Authenticated as a local CIFS user
- domain-user - Authenticated as a domain user
- guest-user - Authenticated as a guest user
- anonymous-user - Authenticated as an anonymous or null user

[-netbios-name <text>] - NetBIOS Name
If you specify this parameter, the command displays information about CIFS sessions that are established with the specified NetBIOS Name.

[-smb-encryption-status {unencrypted|encrypted|partially-encrypted}] - SMB Encryption Status
If you specify this parameter, the command displays information about CIFS sessions that are established with the specified SMB encryption status.

The SMB encryption status can be one of the following:

- unencrypted - The CIFS session is not encrypted.
- encrypted - The CIFS session is fully encrypted. Vserver level encryption is enabled and encryption happens for the entire session.
- partially-encrypted - The CIFS session is partially encrypted. Share level encryption is enabled and encryption is initiated when the tree-connect occurs.

[-connection-count <integer>] - Connection Count
If you specify this parameter, the command displays information about CIFS sessions that have the specified number of CIFS connections.

### Examples
The following example displays information about all CIFS sessions:

```
cluster1::> vserver cifs session show
Node:    node1
Vserver: vs1
Connection Session                                        Open            Idle        Connection
ID         ID      Workstation      Windows User         Files            Time             Count
---------- ------- ---------------- ---------------- --------- --------------- -----------------
127834     1       172.17.193.172   Administrator       2             22s                 4
```

The following example displays information about a CIFS session with session-id 1.

```
cluster1::> vserver cifs session show -session-id 1 -instance
Node:    node1
Vserver: vs1
Session ID: 1
Connection ID: 127834
Incoming Data LIF IP Address: 10.53.13.224
Workstation: 172.17.193.172
Authentication Mechanism: NTLMv2
Windows User: CIFSQA\Administrator
UNIX User: root
Open Shares: 2
Open Files: 2
Open Other: 0
Connected Time: 2d 17h 58m 5s
Idle Time: 22s
```
CIFS session file Commands

Manage opened files over CIFS

The `vserver cifs session file` commands are used to manage open CIFS files and their attributes.

**vserver cifs session file close**

Close an open CIFS file

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**
The `vserver cifs session file close` command closes the specified open CIFS file.

**Parameters**

- `node {<nodename>|local}` - **Node**
  If you specify this parameter, the command will close all the opened CIFS files on the specified node.

- `vserver <vserver name>` - **Vserver**
  If you specify this parameter, the command will close all the opened CIFS files on the specified CIFS-enabled Vserver.

- `file-id <integer>` - **File ID**
  If you specify this parameter, the command will close the opened CIFS file that matches the specified file ID.

- `[-connection-id <integer>]` - **Connection ID**
  If you specify this parameter, the command will close all the opened CIFS files connected on the specified connection ID.

- `[-session-id <integer>]` - **Session ID**
  If you specify this parameter, the command will close all the opened CIFS files connected on the specified session ID.

**Examples**
The following example closes all the opened CIFS files that are connected to the data LIFs of Vserver vs1 on the node node1:

```bash
cluster1::> vserver cifs session file close -node node1 -vserver vs1
5 entries were acted on.
```

The following example closes all the opened CIFS files on all the nodes with the file-id 1:

```bash
cluster1::> vserver cifs session file close -node * -file-id 1
2 entries were acted on.
```
vserver cifs session file show

Display opened CIFS files

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs session file show command displays information about all open CIFS files. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all open CIFS files:

- Node name
- Vserver name
- CIFS connection ID
- CIFS session ID
- CIFS file ID
- CIFS file type
- CIFS file open mode
- CIFS file hosting volume
- CIFS share name
- CIFS file path
- Continuously available protection level

You can specify additional parameters to display only information that matches those parameters. For example, to display information only about CIFS files opened on connection ID 2012, run the command with the -connection-id parameter set to 2012.

Parameters

[-fields <fieldname>,...]
If you specify this parameter, the command only displays the fields that you specify.

[-instance]
If you specify this parameter, the command displays detailed information about matching open CIFS files.

[-node <nodename>|local] - Node
If you specify this parameter, the command displays information about the open CIFS files on the specified node.

[-vserver <vserver name>] - Vserver
If you specify this parameter, the command displays information about open CIFS files on the specified CIFS-enabled Vserver.

[-file-id <integer>] - File ID
If you specify this parameter, the command displays information about the open CIFS file that match the specified file ID.

[-connection-id <integer>] - Connection ID
If you specify this parameter, the command displays information about open CIFS files that are opened on the specified connection ID.
If you specify this parameter, the command displays information about the CIFS file that are opened on the specified session ID.

If you specify this parameter, the command displays information about CIFS files opened through a session that have the specified number of CIFS connections.

If you specify this parameter, the command displays information about opened CIFS files that are of the specified file type. The file type can be any of these: Regular, Symlink, Stream, or Directory.

If you specify this parameter, the command displays information about CIFS files that are opened with the specified mode. The open mode can include one or more of the following:

- R - This property specifies that the file is opened for read.
- W - This property specifies that the file is opened for write.
- D - This property specifies that the file is opened for delete.

The open mode can have multiple values specified as a list with no commas.

If you specify this parameter, the command displays information about open CIFS files that reside on the specified aggregate.

If you specify this parameter, the command displays information about open CIFS files that reside on the specified volume.

If you specify this parameter, the command displays information about CIFS files that are opened over the specified CIFS share.

If you specify this parameter, the command displays information about open CIFS files that match the specified CIFS file path.

If you specify this parameter, the command displays information about open CIFS files that are opened with the specified share mode. The share mode can include one or more of the following:

- R - This property specifies that the file is shared for read.
- W - This property specifies that the file is shared for write.
- D - This property specifies that the file is shared for delete.

The share mode can have multiple values specified as a list with no commas.

If you specify this parameter, the command displays information about open CIFS files that have the specified number of range locks.

If you specify this parameter, the command displays information about open CIFS files with or without continuously available protection. The open files are "continuously available" if they are opened from an SMB 3 client through a share with the "continuously_available" property set. These open files are capable of non-disruptively recovering from takeover and giveback as well as general aggregate relocation between partners in
a high-availability relationship. Streams opened through a continuously available share are permitted, but are not currently made continuously available. Directories may be opened through a continuously available share, but, by design, will not appear continuously available as clients do not open them that way. These protection levels are applicable to the files on read/write volumes residing on storage failover aggregates.

The continuously available status can be one of the following:

- No - The open file is not continuously available.
- Yes - The open file is continuously available.

`[-reconnected <text>]` - Reconnected

If you specify this parameter, the command displays information about open CIFS files that have the specified reconnected state. The reconnected state can be one of the following:

- No - The open file is not reconnected.
- Yes - The open file is reconnected.

### Examples

The following example displays information about all open CIFS files:

```
cluster1::> vserver cifs session file show
Node: node1
Vserver: vs1
Connection: 2192
Session: 1
Connection Count: 4
File    File      Open Hosting                               Continuously
ID      Type      Mode Volume          Share                 Available
------- --------- ---- --------------- --------------------- ------------
7       Regular   rw   rootvs1         rootca                Yes
Path: \win8b8.txt
```

The following example displays information about a CIFS file with file-id 7.

```
cluster1::> vserver cifs session file show -file-id 7 -instance
Node: node1
Vserver: vs1
File ID: 7
Connection ID: 2192
Session ID: 1
Connection count: 4
File Type: Regular
Open Mode: rw
Aggregate Hosting File: aggr1
Volume Hosting File: rootvs1
CIFS Share: rootca
Path from CIFS Share: \win8b8.txt
Share Mode: rd
Range Locks: 0
Continuously Available: Yes
Reconnected: No
```

### Share Commands

Manage CIFS shares

The `vserver cifs share` commands are used to manage CIFS shares and their attributes.
vserver cifs share create

Create a CIFS share

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs share create command creates a CIFS share.

Parameters
-vserver <vserver name> - Vserver
This parameter specifies the CIFS-enabled Vserver on which you want to create a CIFS share.

-share-name <Share> - Share
This parameter specifies the name of the CIFS share that you want to create. A share name can be up to 256 characters long. If this is a home directory share (designated as such by specifying the homedirectory on the -share-properties parameter), you can include %w (Windows user name), %u (UNIX user name) and %d (domain name) variables in any combination with this parameter to generate shares dynamically, with the resultant share names based on the authenticating user's Windows user name, UNIX user name, and/or Windows domain name. If the share is used by administrators to connect to other users' home directory (the option is-home-dirs-access-for-admin-enabled is set to true) or by a user to connect to other users' home directory (the option is-home-dirs-access-for-public-enabled is set to true), the dynamic share pattern must be preceded by a tilde (~).

-path <text> - Path
This parameter specifies the path to the CIFS share. This path must exist in a volume. A directory path name can be up to 256 characters long. If there is a space in the path name, you must enclose the entire string in quotation marks (for example, '/new volume/mount here'). If this is a home directory share as specified by value of home directory on the -share-properties parameter, you can make the path name dynamic by specifying the %w (Windows user name), %u (UNIX user name), or %d (domain name) variables or any of their combination as a part of the value of this parameter.

[-share-properties <share properties>, ...] - Share Properties
This optional parameter specifies a list of properties for the share. The list can include one or more of the following:

- homedirectory - This property specifies that the share and path names are dynamic. Specify this value for a home directory share. In a home directory share, Data ONTAP can dynamically generate the share's name and path by substituting %w, %u, and %d variables with the corresponding Windows user name, UNIX user name, and domain, respectively, specified as the value of the -share-name and -path parameters. For instance, if a dynamic share is defined with a name of %d_%w, a user logged on as barbara from a domain named FIN sees the share as FIN_barbara. Using the homedirectory value specifies that the share and path names are dynamically expanded. This property cannot be added or removed after share creation.

- oplocks - This property specifies that the share uses opportunistic locks, also known as client-side caching. Oplocks are enabled on shares by default; however, some applications do not work well when oplocks are enabled. In particular, database applications such as Microsoft Access are vulnerable to corruption when oplocks are enabled. An advantage of shares is that a single path can be shared multiple times, with each share having different properties. For instance, if a path named /dept/finance contains both a database and other types of files, you can create two shares to it, one with oplocks disabled for safe database access and one with oplocks enabled for client-side caching.

- browsable - This property allows Windows clients to browse the share. This is the default initial property for all shares.

- showsnapshot - This property specifies that Snapshot copies can be viewed and traversed by clients.
- changenotify - This property specifies that the share supports ChangeNotify requests. For shares on a Vserver with FlexVol volumes, this is a default initial property. For shares on a Vserver with Infinite Volume, the changenotify property is not set by default, and setting it requires the advanced privilege level. When the changenotify property is set for a share on a Vserver with Infinite Volume, change notifications are not sent for changes to file attributes and timestamps.

- attributecache - This property enables the file attribute caching on the CIFS share in order to provide faster access of attributes over SMB 1.0.
  
  **Note:** For certain workloads, stale file attribute data could be delivered to a client.

- continuously-available - This property permits SMB clients that support it to open files in a persistent manner. Files opened this way are protected from disruptive events, such as failover and giveback. This option is not supported for Vservers with Infinite Volume and workgroup CIFS servers.

- branchcache - This property specifies that the share allows clients to request BranchCache hashes on the files within this share. This option is useful only if you specify per-share as the operating mode in the CIFS BranchCache configuration, and also specify the "oplocks" share property. This option is not supported for Vservers with Infinite Volume.

- access-based-enumeration - This property specifies that Access Based Enumeration is enabled on this share. ABE-filtered shared folders are visible to a user based on that individual user's access rights, preventing the display of folders or other shared resources that the user does not have rights to access.

- namespace-caching - This property specifies that the SMB clients connecting to this share can cache the directory enumeration results returned by the CIFS servers.

- encrypt-data - This property specifies that SMB encryption must be used when accessing this share. Clients that do not support encryption will not be able to access this share.

- show-previous-versions - This property specifies that the previous version can be viewed and restored from the client. This property is enabled by default.

- symlink-properties (enable|hide|read-only|symlinks|symlinks-and-widelinks|disable), ...] - Symlink Properties

This optional parameter specifies how the storage system presents UNIX symbolic links (symlinks) to CIFS clients. The default value for this parameter is "symlinks". The list can include one or more of the following:

- enable (DEPRECATED*) - This property enables both local symlinks and wide links for read-write access. DFS advertisements are generated for both local symlinks and wide links even if the CIFS option -is-advertise-dfs-enabled is set to false.

- hide (DEPRECATED*) - This property hides symlinks. DFS advertisements are generated if the CIFS option -is-advertise-dfs-enabled is set to true.

- read-only (DEPRECATED*) - This property enables symlinks for read-only access.

- symlinks - This property enables local symlinks for read-write access. DFS advertisements are not generated even if the CIFS option -is-advertise-dfs-enabled is set to true.

- symlinks-and-widelinks – This property enables both local symlinks and wide links for read-write access. DFS advertisements are generated for both local symlinks and wide links even if the CIFS option -is-advertise-dfs-enabled is set to false.

- disable - This property disables symlinks and wide links. DFS advertisements are not generated even if the CIFS option -is-advertise-dfs-enabled is set to true.

- no-strict-security (OBSOLETE)- This property enables clients to follow symlinks outside share boundaries.
**Note:** *The enable, hide, and read-only parameters are deprecated and may be removed in a future release of Data ONTAP.*

**Note:** The no_strict_security setting does not apply to wide links.

\[-file-umask <Octal Integer>] - File Mode Creation Mask

This optional parameter specifies the default UNIX umask for new files created on the share.

\[-dir-umask <Octal Integer>] - Directory Mode Creation Mask

This optional parameter specifies the default UNIX umask for new directories created on the share.

\[-comment <text>] - Share Comment

This optional parameter specifies a text comment for the share that is made available to Windows clients. The comment can be up to 256 characters long. If there is a space in the descriptive remark or the path, you must enclose the entire string in quotation marks (for example, "This is engineering's share.").

\[-attribute-cache-ttl {<[<integer>h] [<integer>m] [<integer>s]>}] - File Attribute Cache Lifetime

This optional parameter specifies the lifetime for the attribute cache share property, which you specify as the value of the -share-properties parameter.

**Note:** This value is useful only if you specify attributecache as a share property.

\[-offline-files {none|manual|documents|programs}] - Offline Files

This optional parameter allows Windows clients to cache data on this share. The actual caching behavior depends upon the Windows client. The value can be one of the following:

- none - Disallows Windows clients from caching any files on this share.
- manual - Allows users on Windows clients to manually select files to be cached.
- documents - Allows Windows clients to cache user documents that are used by the user for offline access.
- programs - Allows Windows clients to cache programs that are used by the user for offline access and may use those files in an offline mode even if the share is available.

\[-vscan-fileop-profile {no-scan|standard|strict|writes-only}] - Vscan File-Operations Profile

This optional parameter controls which operations trigger virus scans. The value can be one of the following:

- no-scan: Virus scans are never triggered for this share.
- standard: Virus scans can be triggered by open, close, and rename operations. This is the default profile.
- strict: Virus scans can be triggered by open, read, close, and rename operations.
- writes-only: Virus scans can be triggered only when a file that has been modified is closed.

\[-max-connections-per-share <integer>] - Maximum Tree Connections on Share

This optional parameter specifies the maximum number of simultaneous connections on the new share. This limit is at the node level, not the Vserver or cluster level. The default for this parameter is 4294967295. The value 4294967295 indicates no limit. The allowed range for this parameter is (1 through 4294967295).

\[-force-group-for-create <text>] - UNIX Group for File Create

This optional parameter specifies that all files that CIFS users create in a specific share belong to the same group (also called the "force-group"). The "force-group" must be a predefined group in the UNIX group database. This setting has no effect unless the security style of the volume is UNIX or mixed security style. If "force-group" has been specified for a share, the following becomes true for the share:

- Primary GID of the CIFS users who access this share is temporarily changed to the GID of the "force-group".
All files in this share that CIFS users create belong to the same "force-group", regardless of the primary GID of the file owner.

**Examples**

The following example creates a CIFS share named SALES_SHARE on a Vserver named vs1. The path to the share is /sales.

```bash
cluster1::> vserver cifs share create -vserver vs1 -share-name SALES_SHARE -path /sales -symlink-properties enable
```

The following example creates a CIFS share named SALES_SHARE on a Vserver named vs1. The path to the share is /sales and the share uses opportunistic locks (client-side caching), the share can be browsed by Windows clients, and a notification is generated when a change occurs.

```bash
cluster1::> vserver cifs share create -vserver vs1 -share-name SALES_SHARE -path /sales -share-properties browsable,changenotify,oplocks, show-previous-versions
```

The following example creates a CIFS share named DOCUMENTS on a Vserver named vs1. The path to the share is /documents and the share uses opportunistic locks (client-side caching), a notification is generated when a change occurs, and the share allows clients to ask for BranchCache hashes for files in the share.

```bash
cluster1::> vserver cifs share create -vserver vs1 -share-name DOCUMENTS -path /documents -share-properties branchcache,changenotify,oplocks
```

The following example creates a CIFS share named DOCUMENTS on a Vserver named vs1. The path to the share is /documents and the share uses opportunistic locks (client-side caching), a notification is generated when a change occurs, and the share allows clients to cache (client-side caching) user documents on this share.

```bash
cluster1::> vserver cifs share create -vserver vs1 -share-name DOCUMENTS -path /documents -share-properties changenotify,oplocks -offline-files documents
```

The following example creates a home directory share on a Vserver named vs1. The path to the share has a %d and %w combination.

```bash
cluster1::> vserver cifs share create -vserver vs1 -share-name %d%w -path %d/%w -share-properties homedirectory
```

The following example creates a home directory share on a Vserver vs1 to be used with the home directory options is-home-dirs-access-for-admin-enabled and/or is-home-dirs-access-for-public-enabled. The path to the share has a %d and %w combination.

```bash
cluster1::> vserver cifs share create -share-name ~%d~%w -path %d/%w -share-properties homedirectory -vserver vs1
```

---

**vserver cifs share delete**

Delete a CIFS share

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The *vserver cifs share delete* command deletes a CIFS share.
Parameters

-vserver <vserver name> - Vserver

This parameter specifies the Vserver from which you want to delete a CIFS share.

-share-name <Share> - Share

This parameter specifies the name of the CIFS share you want to delete.

Examples

The following example deletes a CIFS share named share1 from a Vserver named vs1.

```
cluster1::> vserver cifs share delete -vserver vs1 -share-name share1
```

vserver cifs share modify

Modify a CIFS share

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver cifs share modify command modifies a CIFS share.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the CIFS-enabled Vserver containing the CIFS share you want to modify.

-share-name <Share> - Share

This parameter specifies the name of the CIFS share that you want to create. A share name can be up to 256 characters long. If this is a home directory share (designated as such by specifying the homedirectory on the -share-properties parameter), you can include %w (Windows user name), %u (UNIX user name) and %d (Windows domain name) variables in any combination with this parameter to generate shares dynamically, with the resultant share names based on the authenticating user's Windows user name, UNIX user name, and/or Windows domain name.

[-path <text>] - Path

This parameter specifies the path to the CIFS share. This path must exist in a volume. A directory path name can be up to 256 characters long. If there is a space in the path name, you must enclose the entire string in quotation marks (for example, "\new volume/mount here"). If this is a homedirectory share as specified by value of home directory on the -share-properties parameter, a dynamic path name must be specified using %w (Windows user name), %u (UNIX user name), or %d (domain name) variables or any of their combination as a part of the value of this parameter.

[-symlink-properties {enable|hide|read-only|symlinks|symlinks-and-widelinks|disable},...] - Symlink Properties

This optional parameter specifies how the storage system presents UNIX symbolic links (symlinks) to CIFS clients. The list can include one or more of the following:

- enable (DEPRECATED*) - This property enables both local symlinks and wide links for read-write access. DFS advertisements are generated for both local symlinks and wide links even if the CIFS option -is-advertise-dfs-enabled is set to false.
- hide (DEPRECATED*) - This property hides symlinks. DFS advertisements are generated if the CIFS option -is-advertise-dfs-enabled is set to true.
- read-only (DEPRECATED*) - This property enables symlinks for read-only access.
• symlinks - This property enables local symlinks for read-write access. DFS advertisements are not generated even if the CIFS option -is-advertise-dfs-enabled is set to true.

• symlinks-and-widelinks – This property enables both local symlinks and wide links for read-write access. DFS advertisements are generated for both local symlinks and wide links even if the CIFS option -is-advertise-dfs-enabled is set to false.

• disable - This property disables symlinks and wide links. DFS advertisements are not generated even if the CIFS option -is-advertise-dfs-enabled is set to true.

• no-strict-security (OBSOLETE)- This property enables clients to follow symlinks outside share boundaries.

Note: The read_only setting does not apply to wide links.

Note: * The enable, hide, and read-only parameters are deprecated and may be removed in a future release of Data ONTAP.

Note: The no_strict_security setting does not apply to wide links.

[-file-umask <Octal Integer>] - File Mode Creation Mask
This optional parameter specifies the default UNIX umask for new files created on the share.

[-dir-umask <Octal Integer>] - Directory Mode Creation Mask
This optional parameter specifies the default UNIX umask for new directories created on the share.

[-comment <text>] - Share Comment
This optional parameter specifies a text comment for the share that is made available to Windows clients. The comment can be up to 256 characters long. If there is a space in the descriptive remark or the path, you must enclose the entire string in quotation marks (for example, "This is engineering's share.").

[-attribute-cache-ttl <[<integer>h][<integer>m][<integer>s]> ] - File Attribute Cache Lifetime
This optional parameter specifies the lifetime for the attribute cache share property, which you specify as the value of the -share-properties parameter.

Note: This value is useful only if you specify attributecache as a share property.

[-offline-files {none|manual|documents|programs}] - Offline Files
This optional parameter allows Windows clients to cache data on this share. The actual caching behavior depends upon the Windows client. The value can be one of the following:

• none - Disallows Windows clients from caching any files on this share.

• manual - Allows users on Windows clients to manually select files to be cached.

• documents - Allows Windows clients to cache user documents that are used by the user for offline access.

• programs - Allows Windows clients to cache programs that are used by the user for offline access and may use those files in an offline mode even if the share is available.

[-vscan-fileop-profile {no-scan|standard|strict|writes-only}] - Vscan File-Operations Profile
This optional parameter controls which operations trigger virus scans. The value can be one of the following:

• no-scan: Virus scans are never triggered for this share.

• standard: Virus scans can be triggered by open, close, and rename operations. This is the default profile.

• strict: Virus scans can be triggered by open, read, close, and rename operations.

• writes-only: Virus scans can be triggered only when a file that has been modified is closed.
[\text{-max-connections-per-share \text{<integer>}}] - Maximum Tree Connections on Share

This optional parameter specifies a maximum number of simultaneous connections to the share. This limit is at the node level, not the Vserver or cluster level. The default for this parameter is 4294967295. The value 4294967295 indicates no limit. The allowed range for this parameter is (1 through 4294967295).

[\text{-force-group-for-create \text{text>}}] - UNIX Group for File Create

This optional parameter specifies that all files that CIFS users create in a specific share belong to the same group (also called the "force-group"). The "force-group" must be a predefined group in the UNIX group database. This setting has no effect unless the security style of the volume is UNIX or mixed security style. You can disable this option by passing a null string "".

**Examples**

The following example modifies a CIFS share named SALES_SHARE on a Vserver named vs1. The share uses opportunistic locks. The file mask is set to 644 and the directory mask to 777.

```
cluster1::> vserver cifs share modify -vserver vs1 -share-name SALES_SHARE -symlink-properties hide -file-umask 644 -dir-umask 777
```

The following example modifies a CIFS share named SALES_SHARE on a Vserver named vs1. The path to the share is /sales and the share uses opportunistic locks (client-side caching), the share can be browsed by Windows clients, and a notification is not generated when a change occurs.

```
cluster1::> vserver cifs share modify -vserver vs1 -share-name SALES_SHARE -path /sales -share-properties oplocks,browsable
```

The following example modifies a CIFS share named DOCUMENTS on a Vserver named vs1. The share uses opportunistic locks (client-side caching), a notification is generated when a change occurs, and the share allows clients to ask for BranchCache hashes for files in the share.

```
cluster1::> vserver cifs share modify -vserver vs1 -share-name DOCUMENTS -share-properties branchcache,changenotify,oplocks
```

The following example modifies a CIFS share named DOCUMENTS on a Vserver named vs1. The share uses opportunistic locks (client-side caching), a notification is generated when a change occurs, and the share allows clients to cache (client-side caching) user documents on this share.

```
cluster1::> vserver cifs share modify -vserver vs1 -share-name DOCUMENTS -share-properties changenotify,oplocks -offline-files documents
```

The following example modifies a CIFS share named DOCUMENTS on a Vserver named vs1. The optional parameter "force-group-for-create" can be disabled by passing the null string as parameter to "force-group-for-create" option.

```
cluster1::> cifs share modify -vserver vs1 -share-name DOCUMENTS -force-group-for-create ""
```

**vserver cifs share show**

Display CIFS shares

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The \text{vserver cifs share show} command displays information about CIFS shares. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all CIFS shares:

- Vserver name
• CIFS share name
• Path
• Share properties
• Comment

You can specify additional parameters to display only information that matches those parameters. For example, to display information only about CIFS shares that use dynamic shares, run the command with the `-share-properties dynamicshare` parameter.

**Parameters**

`{ [-fields <fieldname>, ...]`

If you specify this parameter, the command only displays the fields that you specify.

`| [-shadowcopy]`

If you specify this parameter, the command displays information only about CIFS shadow copy shares.

`| [-umask]`

If you specify this parameter, the command displays file and directory masks for CIFS shares.

`| [-instance]}`

If you specify this parameter, the command displays detailed information about all CIFS shares.

`[-vserver <vserver name>] - Vserver`

If you specify this parameter, the command displays information only about CIFS shares on the specified CIFS-enabled Vserver.

`[-share-name <Share>] - Share`

If you specify this parameter, the command displays information only about the CIFS share or shares that match the specified name.

`[-cifs-server <NetBIOS>] - CIFS Server NetBIOS Name`

If you specify this parameter, the command displays information only about the CIFS share or shares that use the CIFS-enabled Vserver with the specified CIFS server name.

`[-path <text>] - Path`

If you specify this parameter, the command displays information only about the CIFS share or shares that have the specified path.

`[-share-properties <share properties>, ...] - Share Properties`

If you specify this parameter, the command displays information only about the CIFS share or shares that have the specified share properties.

`[-symlink-properties {enable|hide|read-only|symlinks|symlinks-and-widelinks|disable}, ...] - Symlink Properties`

If you specify this parameter, the command displays information only about the CIFS share or shares that have the specified symbolic link properties.

`[-file-umask <Octal Integer>] - File Mode Creation Mask`

If you specify this parameter, the command displays information only about the CIFS share or shares that use the specified file mask.

`[-dir-umask <Octal Integer>] - Directory Mode Creation Mask`

If you specify this parameter, the command displays information only about the CIFS share or shares that use the specified directory mask.
If you specify this parameter, the command displays information only about the CIFS share or shares that have
the specified comment.

[-acl <text>, ...] - Share ACL
If you specify this parameter, the command displays information only about the CIFS share or shares that have
the specified ACL.

[-attribute-cache-ttl <[<integer>h] [<integer>m] [<integer>s]>] - File Attribute Cache Lifetime
If you specify this parameter, the command displays information only about the CIFS share or shares that have
the specified attribute-cache-ttl for attribute cache.

[-volume <volume name>] - Volume Name
If you specify this parameter, the command displays information only about the CIFS shares that are present in
this volume.

[-offline-files {none|manual|documents|programs}] - Offline Files
If you specify this parameter, the command displays information only about the CIFS shares that have the
specified Offline Files properties.

[-vscan-fileop-profile {no-scan|standard|strict|writes-only}] - Vscan File-Operations Profile
If you specify this parameter, the command displays information only about the CIFS shares that have the
specified Vscan fileop profile.

[-max-connections-per-share <integer>] - Maximum Tree Connections on Share
If you specify this parameter, the command displays information only about the CIFS shares that have the
specified maximum connections per share configured.

[-force-group-for-create <text>] - UNIX Group for File Create
This optional parameter displays information about the CIFS shares that have the specified "force-group"
parameter configured.

Examples
The following example displays information about all CIFS shares:

The following example displays information about a CIFS share named SALES_SHARE on a Vserver named vs1.
vserver cifs share properties commands

Manage share properties

vserver cifs share properties add

Add to the list of share properties

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs share properties add command adds share properties to the list of share properties of an existing CIFS share. You can add one or more share properties. You can add additional share properties at any time by rerunning this command. Any share properties that you have previously specified will remain in effect and newly added properties are appended to the existing list of share properties.

Parameters
-vserver <vserver name> - Vserver
   This parameter specifies the name of the Vserver containing the CIFS share whose share properties you want to add.
-share-name <Share> - Share
   This parameter specifies the name of the CIFS share.
-share-properties <share properties>, ... - Share Properties
   This parameter specifies the list of share properties you want to add to the CIFS share. The share properties can be one or more of the following:
   • oplocks - This property specifies that the share uses opportunistic locks, also known as client-side caching. This is a default initial property for all shares; however, some applications do not work well when oplocks are enabled. In particular, database applications such as Microsoft Access are vulnerable to corruption when oplocks are enabled. An advantage of shares is that a single path can be shared multiple times, with each share having different properties. For instance, if a path named /dept/finance contains both a database and other types of files, you can create two shares to it, one with oplocks disabled for safe database access and one with oplocks enabled for client-side caching.
   • browsable - This property allows Windows clients to browse the share. This is a default initial property for all shares.
   • showsnapshot - This property specifies that Snapshot copies can be viewed and traversed by clients.
   • changenotify - This property specifies that the share supports Change Notify requests. For shares on a Vserver with FlexVol volumes, this is a default initial property. For shares on a Vserver with Infinite Volume, the changenotify property is not set by default, and setting it requires the advanced privilege level. When the changenotify property is set for a share on a Vserver with Infinite Volume, change notifications are not sent for changes to file attributes and timestamps.
   • attributecache - This property enables the file attribute caching on the CIFS share in order to provide faster access of attributes over SMB 1.0.

Note: For certain workloads, stale file attribute data could be delivered to a client.
• continuously-available - This property permits SMB clients that support it to open files in a persistent manner. Files opened this way are protected from disruptive events, such as failover and giveback. This option is not supported for Vservers with Infinite Volume and workgroup CIFS servers.

• branchcache - This property specifies that the share allows clients to request BranchCache hashes on the files within this share. This option is useful only if you specify "per-share" as the operating mode in the CIFS BranchCache configuration, and also specify the "oplocks" share property. This option is not supported for Vservers with Infinite Volume.

• access-based-enumeration - This property specifies that Access Based Enumeration(ABE) is enabled on this share. ABE-filtered shared folders are visible to a user based on that individual user's access rights, preventing the display of folders or other shared resources that the user does not have rights to access.

• namespace-caching - This property specifies that the SMB clients connecting to this share can cache the directory enumeration results returned by the CIFS servers.

• encrypt-data - This property specifies that SMB encryption must be used when accessing this share. Clients that do not support encryption will not be able to access this share.

• show-previous-versions - This property specifies that the previous version can be viewed and restored from the client. This property is enabled by default.

Note: The oplock, browsable, changenotify and show-previous-versions share properties are assigned to a share by default. If you have removed them from a share, you can use the vserver cifs share properties add command to add these properties to the share.

Examples

The following example adds the "showsnapshot" and "changenotify" properties to a share named "sh1".

```
cluster1::> vserver cifs share properties add -vserver vs1 -share-name sh1 -share-properties showsnapshot,changenotify
```

vserver cifs share properties remove

Remove from the list of share properties

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver cifs share properties remove command removes share properties from the list of share properties of an existing CIFS share. You can remove one or more share properties. You can remove additional share properties at any time by rerunning this command. Any existing share properties that you do not remove remain in effect.

Parameters

-`vserver <vserver name>` - Vserver
  This parameter specifies the name of the Vserver containing the CIFS share whose share properties you want to remove.

-`share-name <Share>` - Share
  This parameter specifies the name of the CIFS share.

-`share-properties <share properties>, ...` - Share Properties
  This parameter specifies the list of share properties you want to remove from the CIFS share. The share properties can be one or more of the following:
• oplocks - This property specifies that the share uses opportunistic locks, also known as client-side caching. Oplocks are enabled on shares by default; however, some applications do not work well when oplocks are enabled. In particular, database applications such as Microsoft Access are vulnerable to corruption when oplocks are enabled. An advantage of shares is that a single path can be shared multiple times, with each share having different properties. For instance, if a path named /dept/finance contains both a database and other types of files, you can create two shares to it, one with oplocks disabled for safe database access and one with oplocks enabled for client-side caching.

• browsable - This property allows Windows clients to browse the share.

• showsnapshot - This property specifies that Snapshot copies can be viewed and traversed by clients.

• changenotify - This property specifies that the share supports Change Notify requests. For shares on a Vserver with FlexVol volumes, this is a default initial property. For shares on a Vserver with Infinite Volume, the changenotify property is not set by default, and setting it requires the advanced privilege level. When the changenotify property is set for a share on a Vserver with Infinite Volume, change notifications are not sent for changes to file attributes and timestamps.

• attributecache - This property enables the file attribute caching on the CIFS share in order to provide faster access of attributes over SMB 1.0.

    Note: For certain workloads, stale file attribute data could be delivered to a client.

• continuously-available - This property permits SMB clients that support it to open files in a persistent manner. Files opened this way are protected from disruptive events, such as failover and giveback. This option is not supported for Vservers with Infinite Volume and workgroup CIFS servers.

• branchcache - This property specifies that the share allows clients to request BranchCache hashes on the files within this share. This option is useful only if you specify "per-share" as the operating mode in the CIFS BranchCache configuration, and also specify the "oplocks" share property. This option is not supported for Vservers with Infinite Volume.

• access-based-enumeration - This property specifies that Access Based Enumeration(ABE) is enabled on this share. ABE-filtered shared folders are visible to a user based on that individual user's access rights, preventing the display of folders or other shared resources that the user does not have rights to access.

• namespace-caching - This property specifies that the SMB clients connecting to this share can cache the directory enumeration results returned by the CIFS servers.

• encrypt-data - This property specifies that SMB encryption must be used when accessing this share. Clients that do not support encryption will not be able to access this share.

• show-previous-versions - This property specifies that the previous version can be viewed and restored from the client. This property is enabled by default.

Examples
The following example removes "showsnapshot" and " changenotify " properties to a share named "sh1".

cluster1::> vserver cifs share properties remove -vserver vs1 -share-name sh1 -share-properties showsnapshot,changenotify

vserver cifs share properties show
Display share properties

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.
Description
The vserver cifs share properties show command displays the CIFS share properties.

Parameters

{ [-fields <fieldname>, ...] 
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.
  } 

[[-instance]]
  If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver
  This optional parameter specifies the name of the Vserver containing the CIFS share for which you want to display share properties.

[-share-name <Share>] - Share
  If you specify this parameter, the command displays share properties only for the CIFS share that you specify.

[-share-properties <share properties>, ...] - Share Properties
  If you specify this parameter, the command displays share properties only for CIFS shares using the properties you specify. The share properties can be one or more of the following:

  • homedirectory - This property specifies that the share and path names are dynamic. Specify this value for a home directory share. In a home directory share, the share's name and path can be generated by substituting %w and %d variables with the corresponding user's name and domain, respectively, specified as the value of the -share-name and -path parameters. For instance, if a dynamic share is defined with a name of %d_%w, a user logged on as barbara from a domain named FIN sees the share as FIN_barbara. Using the homedirectory value specifies that the share and path names are dynamically expanded.

  • oplocks - This property specifies that the share uses opportunistic locks, also known as client-side caching.

  • browsable - This property allows Windows clients to browse the share.

  • showsnapshot - This property specifies that Snapshot copies can be viewed and traversed by clients.

  • changenotify - This property specifies that the share supports Change Notify requests.

  • attributecache - This property enables the file attribute caching on the CIFS share in order to provide faster access of attributes over SMB 1.0.

  • continuously-available - This property permits SMB clients that support it to open files in a persistent manner. Files opened this way are protected from disruptive events, such as failover and giveback. This attribute is not supported for workgroup CIFS servers.

  • branchcache - This property specifies that the share allows clients to request BranchCache hashes on the files within this share. This option is useful only if you specify "per-share" as the operating mode in the CIFS BranchCache configuration, and also specify the "oplocks" share property.

  • shadowcopy - This property specifies that the share is pointing to a shadow copy. This attribute cannot be added nor removed from a share.

  • access-based-enumeration - This property specifies that Access Based Enumeration is enabled on this share. ABE-filtered shared folders are visible to a user based on that individual user's access rights, preventing the display of folders or other shared resources that the user does not have rights to access.

  • namespace-caching - This property specifies that the SMB clients connecting to this share can cache the directory enumeration results returned by the CIFS servers.

Note: For certain workloads, stale file attribute data could be delivered to a client.
• encrypt-data - This property specifies that SMB encryption must be used when accessing this share. Clients that do not support encryption will not be able to access this share.

• show-previous-versions - This property specifies that the previous version can be viewed and restored from the client. This property is enabled by default.

### Examples

The following example displays share properties for shares in Vserver vs1.

```bash
cluster1::> vserver cifs share properties show

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Share</th>
<th>Properties</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>
<td>abc</td>
<td>oplocks, browsable, changenotify, show-previous-versions</td>
</tr>
<tr>
<td>vs1</td>
<td>admin$</td>
<td>browsable</td>
</tr>
<tr>
<td>vs1</td>
<td>ipc$</td>
<td>browsable, oplocks</td>
</tr>
<tr>
<td>vs1</td>
<td>sh1</td>
<td>browsable, changenotify, show-previous-versions</td>
</tr>
</tbody>
</table>

4 entries were displayed.
```

### vserver cifs share access-control commands

The access-control directory

### vserver cifs share access-control create

Create an access control list

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver cifs share access-control create` command adds a user or group to a CIFS share's ACL.

**Parameters**

- `-vserver <vserver name>` - Vserver
  This parameter specifies the name of the Vserver containing the CIFS share.

- `-share <Share>` - Share Name
  This parameter specifies the name of the CIFS share.

- `-user-or-group <TextNoCase>` - User/Group Name
  This parameter specifies the user or group to add to the CIFS share's access control list. If you specify the user name, you must include the user's domain using the format "domain\username". The user-or-group parameter is case-insensitive text.

- `[-user-group-type (windows|unix-user|unix-group)]` - User or Group Type
  This parameter specifies the type of the user or group to add to the CIFS share's access control list. The default type is windows. The user-group-type can be one of the following:
  - windows
  - unix-user
  - unix-group
-permission <access rights> - Access Type

This parameter specifies the permissions for the user or group. The permissions can be one of the following:

- No_access
- Read
- Change
- Full_Control

Examples

The following example adds the windows group "Everyone" with "Full_Control" permission to the access control list of the share "vol3".

```
vs1::> vserver cifs share access-control create -share vol3 -user-or-group Everyone -user-group-type windows -permission Full_Control
```

The following example adds the unix-user "pcuser" and unix-group "daemon" with "read" permission to the access control list of the share "vol3".

```
vs1::> vserver cifs share access-control create -share vol3 -user-or-group pcuser -user-group-type unix-user -permission read
vs1::> vserver cifs share access-control create -share vol3 -user-or-group daemon -user-group-type unix-group -permission read
```

vserver cifs share access-control delete

Delete an access control list

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver cifs share access-control delete command deletes a user or group from a CIFS share's ACL.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver containing the CIFS share.

-share <Share> - Share Name

This parameter specifies the name of the CIFS share.

-user-or-group <TextNoCase> - User/Group Name

This parameter specifies the user or group to delete from the CIFS share's access control list. If you specify a user name, you must include the user's domain using the format "domain\username". The user-or-group parameter is case-insensitive text.

[-user-group-type {windows|unix-user|unix-group}] - User or Group Type

This parameter specifies the type of the user or group to delete from the CIFS share's access control list. The default type is windows. The user-group-type can be one of the following:

- windows
- unix-user
Examples
The following example deletes the group "Everyone" for the access control list of share "vol3".

```
vs1:/> vserver cifs share access-control delete -share vol3 -user-or-group Everyone
```

**vserver cifs share access-control modify**

Modify an access control list

**Availability:** This command is available to cluster and Vserver administrators at the `admin` privilege level.

**Description**
The `vserver cifs share access-control modify` command modifies the permissions of a user or group in a CIFS share's ACL.

**Parameters**

- `-vserver <vserver name>` - Vserver
  
  This parameter specifies the name of the Vserver containing the CIFS share whose ACL you want to modify.

- `-share <Share>` - Share Name
  
  This parameter specifies the name of the CIFS share whose ACL you want to modify.

- `-user-or-group <TextNoCase>` - User/Group Name
  
  This parameter specifies the user or group to modify. If you specify the user name, you must include the user's domain using the format "domain\username". The user-or-group parameter is case-insensitive text.

- `[-user-group-type {windows|unix-user|unix-group}]` - User or Group Type
  
  This parameter specifies the type of the user or group to modify. The default type is windows. The user-group-type can be one of the following:
  
  - windows
  - unix-user
  - unix-group

- `[-permission <access rights>]` - Access Type
  
  This parameter specifies the permissions for the user or group. The permissions can be one of the following:
  
  - No_access
  - Read
  - Change
  - Full_Control

**Examples**
The following example modifies the access control list for a share named "vol3". It changes the permission for the windows group "Everyone" to "Full_Control".
vserver cifs share access-control modify -share vol3 -user-or-group Everyone -user-group-type windows -permission Full_Control

The following example modifies the access control list for a share named "vol3". It changes the permission for the unix-user "pcuser" and unix-group "daemon" to "change".

vserver cifs share access-control modify -share vol3 -user-or-group pcuser -user-group-type unix-user -permission change
vserver cifs share access-control modify -share vol3 -user-or-group daemon -user-group-type unix-group -permission change

vserver cifs share access-control show
Display access control lists on CIFS shares

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs share access-control show command displays the ACLs of CIFS shares.

Parameters
{-fields <fieldname>, ...}
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

{-instance}
If you specify the -instance parameter, the command displays detailed information about all fields.

{-vserver <vserver name> } - Vserver
This optional parameter specifies the name of the Vserver containing the share for which you want to display the access control list.

{-share <Share> } - Share Name
This optional parameter specifies the name of the CIFS share for which you want to display the access control list.

{-user-or-group <TextNoCase> } - User/Group Name
If you specify this optional parameter, the command displays only access control lists for the CIFS shares that have ACLs matching the specified user or group.

{-user-group-type {windows|unix-user|unix-group} } - User or Group Type
If you specify this optional parameter, the command displays only access control lists for the CIFS shares that have ACLs matching the specified user-group-type. The user-group-type can be one of the following:

- windows
- unix-user
- unix-group

{-permission <access rights> } - Access Type
If you specify this optional parameter, the command displays only access control lists for the CIFS shares that have ACLs matching the specified permission. The permissions can be one of the following:

- No_access
Read
Change
Full_Control

[-winsid <windows sid>] - Windows SID

If you specify this optional parameter, the command displays only access control lists for the CIFS shares that have ACLs matching the specified Windows SID.

**Examples**
The following example displays all the ACLs for shares in Vserver vs1.

```bash
vs1::> vserver cifs share access-control show
Vserver | Share | User/Group | Type | Access
---------|-------|------------|------|-------
    vs1 | vol3  | CIFSQA\administrator | windows | Read
    vs1 | vol3  | Everyone | windows | Full_Control
    vs1 | vol3  | pcuser | unix-user | Read
    vs1 | vol3  | daemon | unix-group | Read
```

**vserver cifs superuser commands**

(DEPRECATED) Manage superuser permissions on CIFS accounts

**vserver cifs superuser create**

Adds superuser permissions to a CIFS account

**Availability:** This command is available to cluster and Vserver administrators at the advanced privilege level.

**Description**
The `vserver cifs superuser create` command elevates the privileges of the specified domain account in this Vserver to superuser. With superuser privileges, Data ONTAP bypasses some of the security checks. This command is not supported for workgroup CIFS servers.

**Parameters**
- `vserver <vserver name>` - Vserver
  Vserver name.
- `domain <CIFS domain>` - Domain
  The domain name of accountname.
- `accountname <CIFS account>` - User
  The domain account to which you want to give superuser privileges.

**Examples**
The following example shows how to elevate ExampleUser in EXAMPLE domain to superuser for a Vserver vs1.

```bash
vs1::> vserver cifs superuser create -domain EXAMPLE -accountname ExampleUser -vserver vs1
```
vserver cifs superuser delete

Deletes superuser permissions from a CIFS account

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The vserver cifs superuser delete command removes the superuser privileges for the specified domain account in this Vserver. With superuser privileges, Data ONTAP bypasses some of the security checks.

Parameters
-vserver <vserver name> - Vserver
Vserver name.
-domain <CIFS domain> - Domain
The domain name of accountname.
-accountname <CIFS account> - User
The domain account name you want to remove superuser privileges.

Examples
The following example shows how to remove superuser privileges for ExampleUser in EXAMPLE domain for a Vserver vs1.

v1::> vserver cifs superuser delete -domain EXAMPLE -accountname ExampleUser -vserver vs1

vserver cifs superuser show

Display superuser permissions for CIFS accounts

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The vserver cifs superuser show command displays all account names with superuser privileges. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following superuser information for all CIFS servers:

• Vserver name
• CIFS server NetBIOS name
• Domain
• Account Name

Parameters

{-fields <fieldname>,...}
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

{ -instance }
If you specify the -instance parameter, the command displays detailed information about all fields.

{-vserver <vserver name>} - Vserver
If you specify this parameter, the command displays superuser information of only the specified Vservers.
[domain <CIFS domain>] - Domain
If you specify this parameter, the command displays superuser information of only for accounts that are in the specified domain.

[-accountname <CIFS account>] - User
If you specify this parameter, the command displays superuser information of only the CIFS servers with the specified superuser account.

[-cifs-server <NetBIOS>] - CIFS Server NetBIOS Name
If you specify this parameter, the command displays superuser information of only the Vservers with specified CIFS server name.

Examples
The following example displays superuser information of all Vservers.

```
vs1::> vserver cifs superuser show

<table>
<thead>
<tr>
<th>Vserver</th>
<th>CIFS Server</th>
<th>Domain</th>
<th>Account Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>

vserver cifs symlink commands
Manage symbolic and wide links

vserver cifs symlink create
Create a symlink path mapping

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The `vserver cifs symlink create` command creates a symbolic link mapping for CIFS. A mapping consists of a Vserver name, a UNIX (NFS) path, a CIFS share name, and a CIFS path. You can also specify a CIFS server name and whether the CIFS symbolic link is a local link, a free link (obsolete), or wide link. A local symbolic link maps to the local CIFS share. A free symbolic link can map anywhere on the local server. A wide symbolic link maps to any CIFS share on the network. If the target share is a Home Directory, then the -home-directory field must be set to true for correct processing.

Parameters
- `vserver <vserver name>` - Vserver
  This parameter specifies the Vserver on which you want to create the mapping.
- `unix-path <text>` - UNIX Path
  This parameter specifies the UNIX (NFS) path for the mapping.
  **Note:** It must begin and end with a forward slash (/).
- `share-name <Share>` - CIFS Share
  This parameter specifies the CIFS share for the mapping.
- `cifs-path <TextNoCase>` - CIFS Path
  This parameter specifies the CIFS path for the mapping. Note that this value is specified by using a UNIX-style path.
  **Note:** It must begin and end with a forward slash (/).
[-cifs-server <TextNoCase>] - Remote NetBIOS Server Name

This parameter specifies a new CIFS server DNS name, IP address, or NetBIOS name for the mapping.

[-locality (local|widelink)] - Local or Wide Symlink

This parameter specifies whether the CIFS symbolic link is a local link, a free link (obsolete), or wide link. A local symbolic link maps to the local CIFS share. A free symbolic link can map anywhere on the local server. A wide symbolic link maps to any CIFS share on the network. The default setting is local. The free link option is obsolete.

[-home-directory {true|false}] - Home Directory

This parameter specifies whether the target share is a home directory. The default value is false.

**Note:** This field must be set to true when the target share is a Home Directory for correct processing.

### Examples

The following example creates a symbolic link mapping on a Vserver named vs1. It has the UNIX path /sales/, the CIFS share name SALES_SHARE, and the CIFS path /mycompany/sales/.

```
cluster1::> vserver cifs symlink create -vserver vs1
   -unix-path /sales/ -share-name SALES_SHARE -cifs-path "/*/mycompany/sales/*"
```

The following example creates a symbolic link mapping on a Vserver named vs1. It has the UNIX path /example/, the CIFS share name EXAMPLE_SHARE, the CIFS path /mycompany/example/, the CIFS server IP address, and is a wide link.

```
cluster1::> vserver cifs symlink create -vserver vs1 -unix-path /example/ -share-name EXAMPLE_SHARE
   -cifs-path "/*/mycompany/example/*" -cifs-server CIFSSERVER1 -locality widelink
```

### vserver cifs symlink delete

Delete a symlink path mapping

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**

The `vserver cifs symlink delete` command deletes a symbolic link mapping for CIFS.

**Parameters**

- `-vserver <vserver name>` - Vserver

  This specifies the Vserver on which the symbolic link mapping is located.

- `-unix-path <text>` - UNIX Path

  This specifies the UNIX (NFS) path of the mapping that you want to delete.

### Examples

The following example deletes a symbolic link mapping to a UNIX path /example/ from a Vserver named vs1:

```
cluster1::> vserver cifs symlink delete -vserver vs1 -unix-path /example/
```

### vserver cifs symlink modify

Modify a symlink path mapping

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.
Description
The `vserver cifs symlink modify` command modifies the CIFS share name, CIFS path, CIFS server name, or locality of a symbolic link mapping. It can also be used to modify the value of `-home-directory` field.

Parameters
- **-vserver <vserver name>** - Vserver
  This parameter specifies the Vserver on which the symbolic link mapping is located.
- **-unix-path <text>** - UNIX Path
  This parameter specifies the UNIX (NFS) path of the mapping that you want to modify.
  **Note:** It must begin and end with a forward slash (/).
- **[-share-name <Share>]** - CIFS Share
  This parameter specifies a new CIFS share name for the mapping.
- **[-cifs-path <TextNoCase>]** - CIFS Path
  This parameter specifies a new CIFS path for the mapping. Note that this value is specified by using a UNIX-style path.
  **Note:** It must begin and end with a forward slash (/).
- **[-cifs-server <TextNoCase>]** - Remote NetBIOS Server Name
  This parameter specifies a new CIFS server DNS name, IP address, or NetBIOS name for the mapping.
- **[-locality {local|widelink}]** - Local or Wide Symlink
  This parameter specifies a new locality for the mapping. A local symbolic link maps to the local CIFS share. A free symbolic link can map anywhere on the local server. A wide symbolic link maps to any CIFS share on the network. The default setting is `local`. The free link option is obsolete.
- **[-home-directory {true|false}]** - Home Directory
  This parameter specifies whether the new target share is a home directory.
  **Note:** This field must be set to true when the target share is a Home Directory for correct processing.

Examples
The following example modifies the symbolic link mapping to a UNIX path `/example/` on a Vserver named `vs1`. The mapping is modified to use the CIFS path `/mycompany/example/`.

```
cluster1::> vserver cifs symlink modify -vserver vs1 -unix-path /example/ -cifs-path "/mycompany/example/
```

The following example modifies the symbolic link mapping to a UNIX path `/example/` on a Vserver named `vs1`. The mapping is modified to use the CIFS share name `EXAMPLE_SHARE`, the CIFS path `/mycompany/example/`, on the CIFS server `cifs.example.com`, and to be a wide link.

```
cluster1::> vserver cifs symlink modify -vserver vs1 -unix-path /example/ -share-name EXAMPLE_SHARE -cifs-path "/mycompany/example/" -cifs-server cifs.example.com -locality widelink
```

**vserver cifs symlink show**
Show symlink path mappings

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.
Description
The `vserver cifs symlink show` command displays the following information about symbolic link mappings for CIFS:

- Vserver
- UNIX (NFS) path
- The DNS name, IP address, or NetBIOS name of the CIFS server
- CIFS share name
- CIFS path
- Whether the locality of the CIFS server is a local, free, or wide link. (A local symbolic link maps to the local CIFS share. A free symbolic link can map anywhere on the local server. A wide symbolic link maps to any CIFS share on the network. The free link option is deprecated and may be removed in a future release of Data ONTAP.)

Parameters

`{ [ -fields <fieldname>, ... ]}
` If you specify the `-fields <fieldname>, ...` parameter, the command only displays the fields that you specify.

`[ -instance ]`
If you specify the `-instance` parameter, the command displays detailed information about all entries.

`[ -vserver <vserver name> ] - Vserver`
If you specify this parameter, the command displays information about symbolic link mappings on the specified Vserver.

`[ -unix-path <text> ] - UNIX Path`
If you specify this parameter, the command displays information only about the symbolic link mapping that uses the specified UNIX (NFS) path.

`[ -share-name <Share> ] - CIFS Share`
If you specify this parameter, the command displays information only about the symbolic link mapping or mappings that use the specified CIFS share.

`[ -cifs-path <TextNoCase> ] - CIFS Path`
If you specify this parameter, the command displays information only about the symbolic link mapping that uses the specified CIFS path.

`[ -cifs-server <TextNoCase> ] - Remote NetBIOS Server Name`
If you specify this parameter, the command displays information only about the symbolic link mapping that uses the specified CIFS server.

`[ -locality {local|widelink} ] - Local or Wide Symlink`
If you specify this parameter, the command displays information only about the symbolic link mappings that have the specified locality.

`[ -home-directory {true|false} ] - Home Directory`
If you specify this parameter, the command displays information only about the symbolic link mappings that have the target share as a home directory (if true) or as a static CIFS share (if false).

Examples
The following example displays information about all symbolic link mappings for CIFS:
vserver cifs symlink commands

Manage local users, groups, and privileges

vserver cifs symlink show

Vserver    Unix Path  CIFS Server         CIFS Share  CIFS Path          Locality
---------- ---------- ------------------- ----------- ------------------ --------
vs1        /hr/       192.0.2.160         HR_SHARE    /mycompany/hr/     widelink
vs1        /sales/    WINDATA             SALES_SHARE /mycompany/sales/ local
vs1        /web/      cifs.example.com    WEB_SHARE   /mycompany/web/    widelink
3 entries were displayed.

The following example displays information about all symbolic link mappings that are wide links:

vserver cifs symlink show -locality widelink

Vserver    Unix Path  CIFS Server         CIFS Share  CIFS Path       Locality
---------- ---------- ------------------- ----------- --------------- --------
vs1        /hr/       192.0.2.160         HR_SHARE    /mycompany/hr/  widelink
vs1        /web/      cifs.example.com    WEB_SHARE   /mycompany/web/ widelink
2 entries were displayed.

vserver cifs users-and-groups commands

Manage local users, groups, and privileges

vserver cifs users-and-groups update-names

Update the names of Active Directory users and groups

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The vserver cifs users-and-groups update-names command updates the names of Active Directory users and groups that are registered in local databases on the cluster and reports the status of the update operations. This is done so that objects that were renamed in the Active Directory can be properly displayed and configured in the local databases.

Parameters
-vserver <vserver name> - Vserver
If you specify this parameter, the command will only be performed within the scope of the Vserver that matches the specified Vserver name.

{ -display-failed-only {true|false} } - Display Only Failures
If you set this parameter to true, the command displays only the Active Directory users and groups that failed to update. If set to false, the command displays only the Active Directory users and groups that successfully updated.

{ -suppress-all-output {true|false} } - Suppress All Output
If you set this parameter to true, the command does not display information about the status of the updates of Active Directory users and groups. To display information about the status of the updates, set this parameter to false or do not specify this parameter in the command.

Examples
The following example updates the names of Active Directory users and groups associated with Vserver "vs1". In the last case, there is a dependent chain of names that needs to be updated.

vserver cifs users-and-groups update-names -vserver vs1

Vserver: vs1
SID: S-1-5-21-123456789-234565432-987654321-12345
Domain: EXAMPLE1
Out-of-date Name: dom_user1
Updated Name: dom_user2
Status: Successfully updated
vserver cifs users-and-groups local-group commands

Manage local groups

vserver cifs users-and-groups local-group add-members

Add members to a local group

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver cifs users-and-groups local-group add-members command adds members to a local group.

Parameters

-vserver <vserver name> - Vserver

This specifies the name of the Vserver.

-group-name <CIFS name> - Group Name

This specifies the name of the local group.

-member-names <CIFS name>, ... - Names of Users or Active Directory Groups to be Added

This specifies the list of local users, Active Directory users, or Active Directory groups to be added to a particular local group.

Examples

The following example adds a local user "CIFS_SERVER\loc_usr1" and an Active Directory group "CIFS_SERVER \dom_grp2" to the local group "CIFS_SERVER\g1".

cluster1::> vserver cifs users-and-groups local-group add-members -vserver vs1 -group-name CIFS_SERVER\g1 -member-names CIFS_SERVER\loc_usr1, AD_DOMAIN\dom_grp2

vserver cifs users-and-groups local-group create

Create a local group

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.
**Description**

The `vserver cifs users-and-groups local-group create` command creates a local group and optionally sets the description of that local group. The group name must meet the following criteria:

- The group name length must not exceed 256 characters.
- The group name cannot be terminated by a period.
- The group name cannot include commas.
- The group name cannot include any of the following printable characters: ", /, [ ], :, <, >, +, =, ;, ?, *, @
- The group name cannot include characters in the ASCII range 1-31, which are non-printable.

**Parameters**

- `-vserver <vserver name>` - **Vserver**
  This specifies the name of the Vserver.

- `-group-name <CIFS name>` - **Group Name**
  This specifies the name of the local group.

- `[-description <TextNoCase>]` - **Description**
  This specifies a description for this local group. If the description contains a space, enclose the parameter in quotation marks.

**Examples**

The following example creates a local group "CIFS_SERVER\g1" associated with Vserver "vs1".

```
cluster1::> vserver cifs users-and-groups local-group create -vserver vs1 -group-name CIFS_SERVER \g1
```

**vserver cifs users-and-groups local-group delete**

Delete a local group

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The `vserver cifs users-and-groups local-group delete` command deletes a local group. Removing a local group removes its membership records.

**Parameters**

- `-vserver <vserver name>` - **Vserver**
  This specifies the name of the Vserver.

- `-group-name <CIFS name>` - **Group Name**
  This specifies the name of the local group to delete.

**Examples**

The following example deletes the local group "CIFS_SERVER\g1" associated with Vserver "vs1".

```
cluster1::> vserver cifs users-and-groups local-group delete -vserver vs1 -group-name CIFS_SERVER \g1
```
vserver cifs users-and-groups local-group modify

Modify a local group

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs users-and-groups local-group modify command modifies the description of a local group.

Parameters
-vserver <vserver name> - Vserver
   This specifies the name of the Vserver.

-group-name <CIFS name> - Group Name
   This specifies the name of the local group.

[-description <TextNoCase>] - Description
   This specifies a description for this local group. If the description contains a space, enclose the parameter in quotation marks.

Examples
The following example modifies the description of the local group "CIFS_SERVER\g1" associated with Vserver "vs1".

cluster1::> vserver cifs users-and-groups local-group modify -vserver vs1 -group-name CIFS_SERVER\g1 -description "Example Description"

vserver cifs users-and-groups local-group remove-members

Remove members from a local group

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs users-and-groups local-group remove-members command removes members from a local group.

Parameters
-vserver <vserver name> - Vserver
   This specifies the name of the Vserver.

-group-name <CIFS name> - Group Name
   This specifies the name of the local group.

-member-names <CIFS name>, ... - Names of Users or Active Directory Groups to be Removed
   This specifies the list of local users, Active Directory users, or Active Directory groups to be removed from a particular local group.

Examples
The following example removes the local users "CIFS_SERVER\u1" and "CIFS_SERVER\u2" from the local group "CIFS_SERVER\g1".
vserver cifs users-and-groups local-group rename

Rename a local group

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs users-and-groups local-group rename command renames a local group. The new group name must remain in the same domain as the old group name. The new group name must meet the following criteria:

• The group name length must not exceed 256 characters.
• The group name cannot be terminated by a period.
• The group name cannot include commas.
• The group name cannot include any of the following printable characters: "", /, [ ], :, |, <, >, +, =, ;, ?, *, @
• The group name cannot include characters in the ASCII range 1-31, which are non-printable.

Parameters
-vserver <vserver name> - Vserver
This specifies the name of the Vserver.

-group-name <CIFS name> - Group Name
This specifies the local group's name.

-new-group-name <CIFS name> - New Group Name
This specifies the local group's new name.

Examples
The following example renames the local group "CIFS_SERVER\g_old" to "CIFS_SERVER\g_new" on Vserver "vs1".

cluster1::> vserver cifs users-and-groups local-group rename -group-name CIFS_SERVER\g_old -new-group-name CIFS_SERVER\g_new -vserver vs1

vserver cifs users-and-groups local-group show

Display local groups

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs users-and-groups local-group show command displays local groups.

Parameters
{{-fields <fieldname>, ...}}
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.
| [-instance ] |
If you specify the -instance parameter, the command displays detailed information about all fields.

|--vserver <vserver name> | Vserver |
If this parameter is specified, the command displays information only about local groups that match the specified Vserver name.

|--group-name <CIFS name> | Group Name |
If this parameter is specified, the command displays information only about local groups that match the specified group name.

|--description <TextNoCase> | Description |
If this parameter is specified, the command displays information only about local groups that match the specified description.

**Examples**
The following example displays all local groups associated with Vserver "vs1".

```
cluster1::> vserver cifs users-and-groups local-group show -vserver vs1
<table>
<thead>
<tr>
<th>Vserver</th>
<th>Group Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>
<td>BUILTIN\Administrators</td>
<td>Built-in Administrators group</td>
</tr>
<tr>
<td>vs1</td>
<td>BUILTIN\Backup Operators</td>
<td>Backup Operators group</td>
</tr>
<tr>
<td>vs1</td>
<td>BUILTIN\Power Users</td>
<td>Restricted administrative privileges</td>
</tr>
<tr>
<td>vs1</td>
<td>BUILTIN\Users</td>
<td>All users</td>
</tr>
<tr>
<td>vs1</td>
<td>CIFS_SERVER\g1</td>
<td></td>
</tr>
<tr>
<td>vs1</td>
<td>CIFS_SERVER\g2</td>
<td></td>
</tr>
</tbody>
</table>
6 entries were displayed.
```

**vserver cifs users-and-groups local-group show-members**
Display local groups' members

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver cifs users-and-groups local-group show-members` command displays members of a local group. The members can be local or Active Directory users or groups.

**Parameters**

|--fields <fieldname>, ... |
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

|--instance ] |
If you specify the -instance parameter, the command displays detailed information about all fields.

|--vserver <vserver name> | Vserver |
If this parameter is specified, the command displays group members of local groups that match the specified Vserver name.

|--group-name <CIFS name> | Group Name |
If this parameter is specified, the command displays group members of local groups that match the specified group name.

|--member <CIFS name>, ... | Member Name |
If this parameter is specified, the command displays group members that match the specified member name. The name can be that of a local user, Active Directory user, or Active Directory group.
Examples
The following example displays members of local groups associated with Vserver "vs1".

```
cluster1::> vserver cifs users-and-groups local-group show-members -vserver vs1
Vserver | Group Name                   | Members
---------|-----------------------------|-----------------------------
         | BUILTIN\Administrators      | AD_DOMAIN\Domain Admins
         | AD_DOMAIN\dom_grp1         | AD_DOMAIN\dom_usr1
         | BUILTIN\Users               | AD_DOMAIN\Domain Users
         | CIFS_SERVER\g1             | CIFS_SERVER\u1
```
6 entries were displayed.

vserver cifs users-and-groups privilege commands

Manage privileges

vserver cifs users-and-groups privilege add-privilege

Add local privileges to a user or group

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs users-and-groups privilege add-privilege command adds privileges to a local or Active Directory user or group.

Parameters
- `-vserver <vserver name>` - Vserver
  This specifies the name of the Vserver.
- `-user-or-group-name <CIFS name>` - User or Group Name
  This specifies the name of the local or Active Directory user or group.
- `-privileges <Privilege>, ...` - Privileges
  This specifies the list of privileges to be associated with this user or group.

Examples
The following example adds the privileges "SeTcbPrivilege" and "SeTakeOwnershipPrivilege" to the user "CIFS_SERVER\u1".

```
cluster1::> vserver cifs users-and-groups privilege add-privilege -vserver vs1 -user-or-group-name CIFS_SERVER\u1 -privileges SeTcbPrivilege,SeTakeOwnershipPrivilege
```

vserver cifs users-and-groups privilege remove-privilege

Remove privileges from a user or group

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs users-and-groups privilege remove-privilege command removes privileges from a local or Active Directory user or group. This command creates a new or modifies an existing privilege entry.
Parameters

- **vserver <vserver name>** - Vserver
  
  This specifies the name of the Vserver.

- **user-or-group-name <CIFS name>** - User or Group Name
  
  This specifies the name of the local or Active Directory user or group.

- **privileges <Privilege>, ...** - Privileges
  
  This specifies the list of privileges to be removed from this user or group.

Examples

The following example removes the previously added "SeTcbPrivilege" and "SeTakeOwnershipPrivilege" privileges from the user "CIFS_SERVER\u1".

```bash
cluster1::> vserver cifs users-and-groups privilege show
Vserver    User or Group Name    Privileges
----------- ---------------------------- -------------------
vs1        CIFS_SERVER\u1         SeTcbPrivilege
           SeTakeOwnershipPrivilege
cluster1::> vserver cifs users-and-groups privilege remove-privilege -vserver vs1 -user-or-group-name CIFS_SERVER\u1 -privileges SeTcbPrivilege,SeTakeOwnershipPrivilege
cluster1::> vserver cifs users-and-groups privilege show
Vserver    User or Group Name    Privileges
----------- ---------------------------- -------------------
vs1        CIFS_SERVER\u1         -
```

The following example removes "SeBackupPrivilege" from the group "BUILTIN\Administrators".

```bash
cluster1::> vserver cifs users-and-groups privilege show
This table is currently empty.
cluster1::> vserver cifs users-and-groups privilege remove-privilege -vserver vs1 -user-or-group-name BUILTIN\Administrators -privileges SeBackupPrivilege
cluster1::> vserver cifs users-and-groups privilege show
Vserver    User or Group Name    Privileges
----------- ---------------------------- -------------------
vs1        BUILTIN\Administrators SeRestorePrivilege
           SeSecurityPrivilege
           SeTakeOwnershipPrivilege
```

### vserver cifs users-and-groups privilege reset-privilege

Reset local privileges for a user or group

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The **vserver cifs users-and-groups privilege reset-privilege** command resets privileges of a local or Active Directory user or group.

**Parameters**

- **vserver <vserver name>** - Vserver
  
  This specifies the name of the Vserver.

- **user-or-group-name <CIFS name>** - User or Group Name
  
  This specifies the name of the local or Active Directory user or group.
Examples

The following example resets the privileges for the local user "CIFS_SERVER\u1". This operation removes the privilege entry, if any, associated with the local user "CIFS_SERVER\u1".

```
cluster1::> vserver cifs users-and-groups privilege show
Vserver        User or Group Name           Privileges
-------------- ---------------------------- -------------------
vs1            CIFS_SERVER\u1               SeTakeOwnershipPrivilege
                 SeRestorePrivilege
cluster1::> vserver cifs users-and-groups privilege reset-privilege -vserver vs1 -user-or-group-name CIFS_SERVER\u1
cluster1::> vserver cifs users-and-groups privilege show
This table is currently empty.
```

The following example resets the privileges for the group "BUILTIN\Administrators", effectively removing the privilege entry.

```
cluster1::> vserver cifs users-and-groups privilege show
Vserver        User or Group Name           Privileges
-------------- ---------------------------- -------------------
vs1            BUILTIN\Administrators       SeRestorePrivilege
                 SeSecurityPrivilege
                 SeTakeOwnershipPrivilege
cluster1::> vserver cifs users-and-groups privilege reset-privilege -vserver vs1 -user-or-group-name BUILTIN\Administrators
cluster1::> vserver cifs users-and-groups privilege show
This table is currently empty.
```

### vserver cifs users-and-groups privilege show

Display privileges

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**
The `vserver cifs users-and-groups privilege show` command displays privilege overrides assigned to local or Active Directory users or groups.

**Parameters**

```bash
{-fields <fieldname>, ...}
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```bash
{-instance}
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```bash
{-vserver <vserver name> - Vserver}
```

If this parameter is specified, the command displays information only about privilege overrides assigned to local or Active Directory users or groups that match the specified Vserver name.

```bash
{-user-or-group-name <CIFS name> - User or Group Name}
```

If this parameter is specified, the command displays information only about privilege overrides assigned to local or Active Directory users or groups that match the specified user name or group name.
[-privileges <Privilege>, ...] - Privileges

If this parameter is specified, the command displays information only about privilege overrides assigned to local or Active Directory users or groups that match the specified privileges.

### Examples

The following example displays all privileges explicitly associated with local or Active Directory users or groups for Vserver "vs1".

```
cluster1::> vserver cifs users-and-groups privilege show -vserver vs1
Vserver        User or Group Name           Privileges
-------------- ---------------------------- -------------------
vs1            BUILTIN\Administrators       SeTakeOwnershipPrivilege
               SeRestorePrivilege
```

### vserver cifs users-and-groups local-user commands

Manage local users

### vserver cifs users-and-groups local-user create

Create a local user

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The `vserver cifs users-and-groups local-user create` command creates a local user and optionally sets the attributes for that local user. The command prompts for the local user's password.

The user name must meet the following criteria:

- The user name length must not exceed 20 characters.
- The user name cannot be terminated by a period.
- The user name cannot include commas.
- The user name cannot include any of the following printable characters: ", /, [ ], :,[, ]:,|,<,>,+,=,?,*, @
- The user name cannot include characters in the ASCII range 1-31, which are non-printable.

The password must meet the following criteria:

- The password must be at least six characters in length.
- The password must not contain user account name.
- The password must not contain user account name.
- The password must contain characters from three of the following four categories:
  - English uppercase characters (A through Z)
  - English lowercase characters (a through z)
  - Base 10 digits (0 through 9)
  - Special characters: ~, !, @, #, ^, &, * , -, +, =, \, |, (, ), [ , ], :, ;, " , ', <, >, , ., ?, /

**Parameters**

- **-vserver <server name>** - Vserver

  This specifies the name of the Vserver.
- **-user-name <CIFS name>** - User Name
  This specifies the user name.

- **-full-name <TextNoCase>** - Full Name
  This specifies the user's full name. If the full name contains a space, enclose the full name within double quotation marks.

- **-description <TextNoCase>** - Description
  This specifies a description for this local user. If the description contains a space, enclose the parameter in quotation marks.

- **-is-account-disabled {true|false}** - Is Account Disabled
  This specifies whether the user account is enabled or disabled. Set this parameter to true to disable the account. Set this parameter to false to enable the account. If this parameter is not specified, the default is to enable the user account.

### Examples
The following example creates a local user "CIFS_SERVER\u1" associated with Vserver "vs1".

```bash
cluster1::> vserver cifs users-and-groups local-user create -vserver vs1 -user-name CIFS_SERVER\u1
Enter the password:
Confirm the password:
```

### vserver cifs users-and-groups local-user delete
Delete a local user.

**Availability:** This command is available to cluster and Vserver administrators at the **admin** privilege level.

**Description**
The `vserver cifs users-and-groups local-user delete` command deletes a local user. Upon deletion, all membership entries for this local user are deleted.

**Parameters**

- **-vserver <vserver name>** - Vserver
  This specifies the name of the Vserver.

- **-user-name <CIFS name>** - User Name
  This specifies the user name.

### Examples
The following example deletes the local user "CIFS_SERVER\u1" associated with Vserver "vs1".

```bash
cluster1::> vserver cifs users-and-groups local-user show-membership
(Vserver cifs users-and-groups local-user show-membership)
Vserver | User Name                       | Membership
---------|---------------------------------|------------------------
vs1      | CIFS_SERVER\Administrator       | BUILTIN\Administrators |
        | CIFS_SERVER\u1                  | CIFS_SERVER\g1        |
2 entries were displayed.
cluster1::> vserver cifs users-and-groups local-user delete -vserver vs1 -user-name CIFS_SERVER\u1
```
vserver cifs users-and-groups local-user modify

Modify a local user

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `vserver cifs users-and-groups local-user modify` command modifies attributes of a local user.

**Parameters**

- `-vserver <vserver name>` - *Vserver*
  This specifies the name of the Vserver.

- `-user-name <CIFS name>` - *User Name*
  This specifies the user name.

- `-full-name <TextNoCase>` - *Full Name*
  This specifies the user's full name. If the full name contains a space in the name, enclose it within double quotation marks.

- `-description <TextNoCase>` - *Description*
  This specifies a description for this local user. If the description contains a space, enclose the parameter in quotation marks.

- `-is-account-disabled {true|false}` - *Is Account Disabled*
  This specifies if the user account is enabled or disabled. Set this parameter to true to disable the account. Set this parameter to false to enable the account.

**Examples**
The following example modifies the full name of the local user "CIFS_SERVER\u1".

```
cluster1::> vserver cifs users-and-groups local-user modify -user-name CIFS_SERVER\u1 -full-name "John Smith" -vserver vs1
```

vserver cifs users-and-groups local-user rename

Rename a local user

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `vserver cifs users-and-groups local-user rename` command renames a local user. The new user name must remain in the same domain as the old user name.

The new user name must meet the following criteria:

- The user name length must not exceed 20 characters.
- The user name cannot be terminated by a period.
- The user name cannot include commas.
• The user name cannot include any of the following printable characters: ",, /, [, ], :, |, <, >, +, =, ;, ?, *, @

• The user name cannot include characters in the ASCII range 1-31, which are non-printable.

Parameters
- **\vserver <vserver name>** - Vserver
  This specifies the name of the Vserver.

- **-user-name <CIFS name>** - User Name
  This specifies the user name.

- **-new-user-name <CIFS name>** - New User Name
  This specifies the new user name.

Examples
The following example renames the local user "CIFS_SERVER\u_old" to "CIFS_SERVER\u_new" on Vserver "vs1".

```
cluster1::> vserver cifs users-and-groups local-user rename -user-name CIFS_SERVER\u_old -new-user-name CIFS_SERVER\u_new -vserver vs1
```

**vserver cifs users-and-groups local-user set-password**

Set a password for a local user

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The *vserver cifs users-and-groups local-user set-password* command sets the password for the specified local user. The password must meet the following criteria:

• The password must be at least six characters in length.

• The password must not contain user account name.

• The password must contain characters from three of the following four categories:
  ◦ English uppercase characters (A through Z)
  ◦ English lowercase characters (a through z)
  ◦ Base 10 digits (0 through 9)
  ◦ Special characters: ~, !, @, #, $, %, ^, &, *, _, -, +, =, `", |, (, ), [`, [`, :., ;, ", ', <, >, .., ?, /

Parameters
- **\vserver <vserver name>** - Vserver
  This specifies the name of the Vserver.

- **-user-name <CIFS name>** - User Name
  This specifies the user name.

Examples
The following example sets the password for the local user "CIFS_SERVER\u1" associated with Vserver "vs1".
cluster1::> vserver cifs users-and-groups local-user set-password -user-name CIFS_SERVER\1 -vserver vs1

Enter the new password:
Confirm the new password:

The following example attempts to set the password but fails because the password did not meet password complexity requirements.

cluster1::> vserver cifs users-and-groups local-user set-password -user-name CIFS_SERVER\1 -vserver vs1

Enter the new password:
Confirm the new password:

Error: command failed: The password does not meet the password complexity requirements. Refer to the man page for details.

text

vserver cifs users-and-groups local-user show
Display local users

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs users-and-groups local-user show command displays local users and their attributes.

Parameters

[-fields <fieldname>,...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

[-instance]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver
If this parameter is specified, the command displays information only about local users that match the specified Vserver name.

[-user-name <CIFS name>] - User Name
If this parameter is specified, the command displays information only about local users that match the specified user name.

[-full-name <TextNoCase>] - Full Name
If this parameter is specified, the command displays information only about local users that match the specified full name.

[-description <TextNoCase>] - Description
If this parameter is specified, the command displays information only about local users that match the specified description.

[-is-account-disabled {true|false}] - Is Account Disabled
If this parameter is specified, the command displays information only about local users that match the status specified.

Examples
The following example displays information about all local users.
vserver cifs users-and-groups local-user show-membership

Display local users' membership information

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs users-and-groups local-user show-membership command displays the membership of local users.

Parameters
{-fields <fieldname>, ...}
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver
If this parameter is specified, the command displays local user membership information for local users that are associated with the specified Vserver.

[-user-name <CIFS name>] - User Name
If this parameter is specified, the command displays local user membership information for a local user that matches the specified user name.

[-membership <CIFS name>, ...] - Local Group That This User is a Member of
If this parameter is specified, the command displays local user membership information for the local group of which this local user is a member.

Examples
The following example displays the membership information of all local users; user "CIFS_SERVER\Administrator" is a member of "BUILTIN\Administrators" group, and "CIFS_SERVER\u1" is a member of "CIFS_SERVER\g1" group.

vserver config-replication commands

The Vserver configuration replication directory
vserver config-replication pause

Temporarily pause Vserver configuration replication

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
Vserver domain locking functionality locks the Vserver while Vserver DM is recording configuration baseline. This command aborts the ongoing baseline generation activity, unlocks the Vserver and temporarily pauses configuration replication for the Vserver. Command confirmations has to be enabled to execute this command. The time at which replication resumes is displayed after successful completion of the command. Configuration changes made after executing this command is not replicated to the partner cluster. If a disaster occurs during this time, the configuration changes made are lost. Replication can be manually resumed by executing the vserver config replication resume command.

Parameters
-vserver <vserver name> - Vserver name

Examples

cluster::> vserver config replication pause -vserver vs1
Vserver configuration replication will be paused, then automatically resumed after five minutes.
Manually resume configuration replication by running the "vserver config replication resume -vserver vs1" command.
Do you want to continue ? {y|n}: y
Vserver configuration replication is paused and will be resumed at: 5/24/2014 06:11:23

vserver config-replication resume

Resume Vserver configuration replication

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
This command resumes configuration replication of the Vserver which was temporarily paused by using vserver config replication pause command. Successful completion of the command ensures that configuration replication has been resumed for the Vserver.

Parameters
-vserver <vserver name> - Vserver name

Examples

cluster::> vserver config replication resume -vserver vs1
**vserver config-replication show**

Display Vserver configuration replication resume time

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**
The `vserver config-replication show` command displays the time at which the configuration replication resumes for the Vserver.

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance]
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[-vserver <vserver>] - Vserver
```

If you specify this parameter, the command displays resume time for the specified Vserver.

```
[-resume-time <MM/DD/YYYY HH:MM:SS>] - Replication resume time
```

If you specify this parameter, the command displays Vservers whose configuration replications are resumed at the specified resume time.

**Examples**

```
cluster::> vserver config-replication show
Replication
Vserver       Resume Time
-----------   ------------------
vs1           12/9/2014 03:18:48
```

**vserver data-policy commands**

Manage data policy

**vserver data-policy export**

Display a data policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `vserver-data policy export` command displays the current data policy for a Vserver with Infinite Volume.
Parameters
-vserver <vserver name> - Vserver Name

This specifies the Vserver with Infinite Volume for which the data policy will be displayed.

Examples
The following example shows the current data policy.

cluster1::> vserver data-policy export -vserver vs1

```
{ "ruleset_format_version" : "1.0",
 "rules" : [ 
  { "rule_label" : "default",
    "rule_id" : "ec17a05f-7785-11e1-baf4-123478563412",
    "rule_epoch" : { "epoch_reference" : "ctime" },
    "rule_epochs" : [ 
      { "local" : { 
        "metadata" : { 
          "storageservice" : "-"
        }
      }
    ]
  }
]}
```

vserver data-policy import

Import a data policy

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver data-policy import command sets a new data policy for a Vserver with Infinite Volume. After entering the command, you are prompted to type or paste the content of the new data policy. When you are done, press ENTER on a blank line.

Parameters
-vserver <vserver name> - Vserver Name

This specifies the Vserver with Infinite Volume for which the data policy will be changed.

Examples
The following examples attempt to change the Vserver data policy, first with bad content, and then with an acceptable data policy.

```
cluster1::> vserver data-policy import -vserver vs1
Enter the contents of the file data policy for Vserver "vs1":
Press <Enter> when done
{ "foo" : "bar" }
Error: command failed: Data Policy validation failed: 'ruleset_format_version' is a required field.
```

```
cluster1::> vserver data-policy import -vserver vs1
Enter the contents of the file data policy for Vserver "vs1":
Press <Enter> when done
```
vserver data-policy validate

Validate a data policy without import

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `vserver data-policy validate` command checks a data policy for errors, without modifying the data policy for the Vserver with Infinite Volume.

**Parameters**

`-vserver <vserver name>` - Vserver Name

This specifies the Vserver with Infinite Volume for which the data policy will be validated.

**Examples**
The following examples show first a problem with a given data policy, and then an example of a valid data policy.

```
cluster1::> vserver data-policy validate -vserver vs1
Enter the contents of the file data policy for Vserver "vs1":
Press <Enter> when done

{ "foo" : "bar" }

Error: command failed: Data Policy validation failed: 'ruleset_format_version' is a required field.
```

```
cluster1::> vserver data-policy validate -vserver vs1
Enter the contents of the file data policy for Vserver "vs1":
Press <Enter> when done

{ "ruleset_format_version" : "1.0",
  "rules" : [
    { "rule_label" : "default",
      "rule_id" : "ec17a05f-7785-11e1-baf4-123478563412",
      "rule_scope" : [],
      "rule_epoch" : { "epoch_reference" : "ctime" },
      "rule_epochs" : { "0" : { "local" : { "metadata" : { "storageservice" : "-" } } } } }]
}
```
vserver export-policy commands

Manage export policies and rules

vserver export-policy check-access

Given a Volume And/or a Qtree, Check to See If the Client Is Allowed Access

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver export-policy check-access command checks whether a specific client is allowed access to a specific export path. This enables you to test export policies to ensure they work as intended and to troubleshoot client access issues.

The command takes the volume name (and optionally the qtree name) as input and computes the export path for the volume/qtree. It evaluates the export policy rules that apply for each path component and displays the policy name, policy owner, policy rule index and access rights for that path component. If no export policy rule matches the specified client IP address access is denied and the policy rule index will be set to 0. The output gives a clear view on how the export policy rules are evaluated and helps narrow down the policy and (where applicable) the specific rule in the policy that grants or denies access. This command is not supported on Infinite Volumes.

Parameters

{-fields <fieldname>, ...}
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use ‘-fields ?’ to display the fields to specify.

{-instance }
If you specify the -instance parameter, the command displays detailed information about all fields.

-vserver <vserver name> - Vserver
This parameter specifies the name of the Vserver in which the export policy resides.

-volume <volume name> - Volume Name
This parameter specifies the name of the volume that you want to check export access for. To check export access for a qtree use the -qtree parameter. The -qtree parameter is optional. If you specify the -qtree parameter, you must provide the name of the volume containing the qtree. If you do not specify the -qtree parameter, export access will be checked only for the volume.

-client-ip <IP Address> - Client Address
This parameter specifies the IP address of the client that you want to check export access for.

-authentication-method <authentication method> - Authentication Method
This parameter specifies the authentication method of the client that is attempting access. Possible values include the following:

• sys - The authentication method used by the client is AUTH_SYS.
• krb5 - The authentication method used by the client is Kerberos v5.
• krb5i - The authentication method used by the client is Kerberos v5 with integrity service.
• krb5p - The authentication method used by the client is Kerberos v5 with privacy service.
• ntlm - The authentication method used by the client is CIFS NTLM.
• none - The authentication method used by the client is not explicitly listed in the list of values in the
  rorule.

-protocol <Client Access Protocol> - Protocol
  This parameter specifies the protocol that the client is using when attempting to access the exported path.
  Possible values include the following:
  • nfs3 - The NFSv3 protocol
  • nfs4 - The NFSv4 protocol
  • cifs - The CIFS protocol
  • flexcache - The FlexCache protocol

-access-type {read|read-write} - Access Rights to Check for
  This parameter specifies the type of access you want to check for. Possible values are read for read-only access
  and read-write for read-write access.

[-qtree <qtree name>] - Name of the Qtree
  This optional parameter specifies the qtree in the volume that is part of the exported path. If you specify this
  parameter, you must also provide the name of the volume the qtree belongs to.

[-path <text>] - Path
  Selects the entries in the output that match the specified path value. This field describes the junction-path path
  component encountered when evaluating the export policies starting from the root (/) of the Vserver.

[-policy <text>] - Export Policy
  Selects the entries in the output that match the specified policy value. This field describes the export policy
  that is in effect for the path encountered so far when evaluating the export policies starting from the root (/)
  of the vserver.

[-policy-owner <text>] - Export Policy Owner
  Selects the entries in the output that match the specified policy owner value. This field describes the owner of
  the export policy that is in effect for the path encountered so far when evaluating the export policies starting
  from the root (/) of the vserver. The owner of the export policy could be a volume or a qtree.

[-policy-owner-type {volume|qtree}] - Type of Export Policy Owner
  Selects the entries in the output that match the specified type of the owner of an export policy. Possible values
  include the following:
  • volume - The owner of the export policy is a volume
  • qtree - The owner of the export policy is a qtree

[-rule-index <integer>] - Export Policy Rule Index
  Selects the entries in the output that match the specified export policy rule index. This field describes the rule
  index of the rule in the export policy that grants or denies access. If the value of the rule index is 0 it implies
  none of the client match strings provided in the rules of the export policy matched the specified IP address of
  the client.

[-access {read|read-write}] - Access Rights
  Selects the entries in the output that match the specified access value. This field describes the access rights to
  the path. Possible values include the following:
  • read - Read access is granted
- **read-write** - Read-write access is granted
- **denied** - Requested access is denied

**[-partial-rule-match (true|false)] - Did a Subset of the Rules Match?**

Selects the entries in the output that match if a partially matched subset of rules in the export policy were used to grant access to the client.

**[-clientmatch <text>] - Client Match Spec**

Selects the entries in the output that match the specified clientmatch string. The clientmatch string denotes the string that resulted in a rule match for the specified client IP address.

### Examples

The following examples of the `vserver export-policy check-access` command display various possible results for client export access checks.

```
cluster1::> vserver export-policy check-access -vserver vs1 -client-ip 10.22.32.42 -volume flex_vol -authentication-method sys -protocol nfs3 -access-type read
Policy    Policy       Rule
Path                          Policy     Owner     Owner Type  Index Access
----------------------------- ---------- --------- ---------- ------ ----------
/                             default    vs1_root  volume          1 read
/dir1                         default    vs1_root  volume          1 read
/dir1/dir2                     default    vs1_root  volume          1 read
/dir1/dir2/flex1               data       flex_vol  volume         10 read
4 entries were displayed.
```

```
cluster1::> vserver export-policy check-access -vserver vs1 -client-ip 10.22.32.42 -volume flex_vol -authentication-method sys -protocol nfs3 -access-type read-write
Policy    Policy       Rule
Path                          Policy     Owner     Owner Type  Index Access
----------------------------- ---------- --------- ---------- ------ ----------
/                             default    vs1_root  volume          1 read
/dir1                         default    vs1_root  volume          1 read
/dir1/dir2                     default    vs1_root  volume          1 read
/dir1/dir2/flex1               data       flex_vol  volume         10 read-write
4 entries were displayed.
```

```
cluster1::> vserver export-policy check-access -vserver vs1 -client-ip 10.22.32.42 -volume flex_vol -authentication-method sys -protocol nfs3 -access-type read-write -qtree qt1
Policy    Policy       Rule
Path                          Policy     Owner     Owner Type  Index Access
----------------------------- ---------- --------- ---------- ------ ----------
/                             default    vs1_root  volume          1 read
/dir1                         default    vs1_root  volume          1 read
/dir1/dir2                     default    vs1_root  volume          1 read
/dir1/dir2/flex1               data       flex_vol  volume         10 read
/dir1/dir2/flex1/qt1           primarynames qt1       qtree           0 denied
5 entries were displayed.
```

```
cluster1::> vserver export-policy check-access -vserver vs1 -client-ip 10.22.32.42 -volume flex_vol -authentication-method ntlm -protocol cifs -access-type read-write -qtree qt1
Policy    Policy       Rule
Path                          Policy     Owner     Owner Type  Index Access
----------------------------- ---------- --------- ---------- ------ ----------
/                             default    vs1_root  volume          1 read
/dir1                         default    vs1_root  volume          1 read
/dir1/dir2                     default    vs1_root  volume          1 read
/dir1/dir2/flex1               data       flex_vol  volume         10 read
/dir1/dir2/flex1/qt1           primarynames qt1       qtree           2 denied
5 entries were displayed.
```
vserver export-policy copy

Copy an export policy

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver export-policy copy command creates a copy of an export policy on the same or a different Vserver. The command fails if an export policy with the specified new name already exists on the target Vserver.

Parameters
-vserver <vserver name> - Vserver
  This parameter specifies the Vserver on which the export policy that you want to copy is located.

-policyname <export policy name> - Policy Name
  This parameter specifies the export policy that you want to copy.

-newvserver <vserver name> - New Vserver
  This parameter specifies the Vserver to which you want to copy the export policy.

-newpolicyname <export policy name> - New Export Policy Name
  This parameter specifies the name of the new policy.

Examples
The following example copies an existing policy named read_only_expolicy located on a Vserver named vs0 to a new policy named default_expolicy located on a Vserver named vs1.

```
vs1::> vserver export-policy copy -vserver vs0 -policyname read_only_expolicy -newvserver vs1 -newpolicyname default_expolicy
```

vserver export-policy create

Create a rule set

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver export-policy create command creates an export policy. You can use the vserver export-policy rule create command to add rules to a policy. Each cluster has an empty default export policy with the ID 0. This default export policy does not contain any rules. You cannot delete the default export policy, but you can rename or modify it.

Parameters
-vserver <vserver name> - Vserver
  This parameter specifies the Vserver on which you want to create the export policy.

-policyname <export policy name> - Policy Name
  This parameter specifies the export policy that you want to create.

Examples
The following example creates an export policy named read_only_expolicy on a Vserver named vs0:

```
vs1::> vserver export-policy create -vserver vs0 -policyname read_only_expolicy
```
Related references

vserver export-policy rule create on page 1565

vserver export-policy delete

Delete a rule set

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver export-policy delete command deletes an export policy. You cannot delete the default policy (named default) for a Vserver unless you delete the Vserver.

Parameters
- `vserver <vserver name> - Vserver`
  This parameter specifies the Vserver on which the export policy that you want to delete is located.
- `policyname <export policy name> - Policy Name`
  This parameter specifies the export policy that you want to delete.

Examples
The following example deletes an export policy named test_expolicy from a Vserver named vs0:

```
v1::> vserver export-policy delete -vserver vs0 -policyname test_expolicy
```

vserver export-policy rename

Rename an export policy

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver export-policy rename command renames an export policy.

Parameters
- `vserver <vserver name> - Vserver`
  This parameter specifies the Vserver on which the export policy is located.
- `policyname <export policy name> - Policy Name`
  This parameter specifies the export policy that you want to rename.
- `newpolicyname <export policy name> - New Export Policy Name`
  This parameter specifies the new name of the export policy.

Examples
The following example renames an export policy named user_expolicy with the name read_only_expolicy on a Vserver named vs0:

```
v1::> vserver export-policy rename -vserver vs0 -policyname user_expolicy -newpolicyname read_only_expolicy
```
vserver export-policy show

Display a list of rule sets

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver export-policy show command displays the following information:

• Vserver name
• Export policy name
• Policy ID (diagnostic privilege level only)

Parameters
{ [-fields <fieldname>, ...] }  
If you specify the -fields parameter, the command only displays the fields that you specify.

| [-instance ] |  
If you specify the -instance parameter, the command displays detailed information about all entries.

|--vserver <vserver name> | - Vserver
If you specify this parameter, the command displays a list of export policies that are located on the Vserver that you specify.

|--policyname <export policy name> | - Policy Name
If you specify this parameter, the command displays only the export policy or sets that match the specified name.

Examples
The following example displays a list of all export policies:

```
vs1::> vserver export-policy show
VServer       Policy Name
-------------- -------------------
vs0            default_expolicy
vs0            read_only_expolicy
vs1            default_expolicy
vs1            test_expolicy
4 entries were displayed.
```

vserver export-policy access-cache commands

The access-cache directory

vserver export-policy access-cache config commands

The config directory

vserver export-policy access-cache config modify

Modify exports access cache configuration

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.
Description
The `vserver export-policy access-cache config modify` command modifies access cache timeout values per Vserver. Modifying these values from any node updates the values on all the nodes in the cluster. The modified values persist across reboots.

Parameters

-vserver <vserver name> - Vserver
This parameter specifies the Vserver name for which the timeout values need to be modified.

-ttl-positive <integer> - TTL For Positive Entries (Secs)
This parameter specifies the duration after which positive access cache entries will be refreshed upon client access.

-ttl-negative <integer> - TTL For Negative Entries (Secs)
This parameter specifies the duration after which negative access cache entries will be refreshed upon client access.

-harvest-timeout <integer> - Harvest Timeout (Secs)
This parameter specifies the time period after which Data ONTAP deletes unused entries in the access cache.

Examples
The following command sets the positive TTL value to 36000 seconds, the negative TTL value to 3600 seconds, and the harvest timeout value to 43200 seconds for Vserver ‘vs0’:

```
cluster1::*> vserver export-policy access-cache config modify -ttl-positive 36000 -ttl-negative 3600 -harvest-timeout 43200
cluster1::*> vserver export-policy access-cache config show -vserver vs0
Vserver: vs0
  TTL For Positive Entries (secs): 36000
  TTL For Negative Entries (secs): 3600
  TTL For Entries with Failure (secs): 1
  Harvest Timeout (secs): 43200
```

vserver export-policy access-cache config modify-all-vservers
Modify exports access cache configuration for all Vservers

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The `vserver export-policy access-cache config modify-all-vservers` command modifies access cache timeout values for all Vservers. Modifying these values from any node updates the values on all the nodes in the cluster. The modified values persist across reboots.

Note: This command is not supported in a cluster with effective cluster version of Data ONTAP 9.0.0 or later. The access cache settings are modified on a per-Vserver basis starting Data ONTAP 9.0.0. See the `vserver export-policy access-cache config modify` command.

Parameters

-ttl-positive <integer> - TTL For Positive Entries (Secs)
This parameter specifies the duration after which positive access cache entries will be refreshed when the client accesses.
[-ttl-negative <integer>] - TTL For Negative Entries (Secs)

This parameter specifies the duration after which negative access cache entries will be refreshed when the client accesses.

[-harvest-timeout <integer>] - Harvest Timeout (Secs)

This parameter specifies the time period after which Data ONTAP deletes unused entries in the access cache.

### Examples

The following command sets the positive TTL value to 36000 seconds, the negative TTL value to 3600 seconds, and the harvest timeout value to 43200 seconds for all Vservers in a cluster where the effective cluster version is earlier than Data ONTAP 9.0.0.

```
cluster1::*> vserver export-policy access-cache config modify-all-vservers -ttl-positive 36000 -ttl-negative 3600 -harvest-timeout 43200
```

```
cluster1::*> vserver export-policy access-cache config show-all-vservers
TTL For Positive Entries (secs): 36000
TTL For Negative Entries (secs): 3600
Harvest Timeout (secs): 43200
```

### Related references

[vserver export-policy access-cache config modify on page 1555](#)

**vserver export-policy access-cache config show**

Display exports access cache configuration

**Availability:** This command is available to cluster and Vserver administrators at the advanced privilege level.

**Description**

The `vserver export-policy access-cache config show` command displays the timeout attributes related to the exports access cache. The access cache maintains export rules applicable to a client that is accessing the volume or qtree. The command output displays the following timeout parameters and their values for each Vserver:

- **TTL for Positive Entries:** This is the TTL for positive entries in the access cache. During client access, if the TTL for the access cache entry that is allowing access has expired, that access cache entry will be refreshed. While the refresh is in progress, client access will be evaluated with the existing information in the access cache entry.

- **TTL for Negative Entries:** This is the TTL for negative entries in the access cache. During client access, if the TTL for the access cache entry that is denying access has expired, that access cache entry will be refreshed. While the refresh is in progress, client access will be evaluated with the existing information in the access cache entry.

- **TTL for Entries with Failure:** This is the TTL for access cache entries for which a failure was encountered while trying to get matching rules.

- **Harvest Timeout:** If Data ONTAP does not use an entry that is stored in the access cache for this period of time, it deletes the entry.

**Parameters**

- **[-fields <fieldname>, ...]**
  
  If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?' to display the fields to specify.

- **[-instance ]**
  
  If you specify the `-instance` parameter, the command displays detailed information about all fields.
[[-vserver <vserver name>]] - Vserver

If this parameter is specified, the command displays the timeout values for the specified Vserver.

[[-ttl-positive <integer>]] - TTL For Positive Entries (Secs)

If this parameter is specified, the command displays the timeout values for Vservers whose ttl-positive matches the provided value.

[[-ttl-negative <integer>]] - TTL For Negative Entries (Secs)

If this parameter is specified, the command displays the timeout values for Vservers whose ttl-negative matches the provided value.

[[-harvest-timeout <integer>]] - Harvest Timeout (Secs)

If this parameter is specified, the command displays the timeout values for Vservers whose harvest-timeout matches the provided value.

### Examples

The following command displays the exports access cache timeout values for all Vservers in the cluster:

```
cluster1::*> vserver export-policy access-cache config show
Vserver TTL Positive TTL Negative TTL Failure Harvest Timeout
-------- ------------- ------------ ----------- ---------------
vs0          300            60           1            3600
vs1           3600          3600           5            3600
2 entries were displayed.
```

**vserver export-policy access-cache config show-all-vservers**

Display exports access cache configuration for all Vservers

**Availability:** This command is available to cluster administrators at the advanced privilege level.

**Description**

The vserver export-policy access-cache config show-all-vservers command displays the timeout attributes related to the exports access cache. The access cache maintains export rules applicable to a client that is accessing the volume or qtree. Data ONTAP obtains the access cache timeout values from the node where you run the command. The command output displays the following timeout parameters and their values:

- **TTL for Positive Entries:** This is the TTL for positive entries in the access cache. During client access, if the TTL for the access cache entry that is allowing access has expired, that access cache entry will be refreshed. While the refresh is in progress, client access will be evaluated with the existing information in the access cache entry.

- **TTL for Negative Entries:** This is the TTL for negative entries in the access cache. During client access, if the TTL for the access cache entry that is denying access has expired, that access cache entry will be refreshed. While the refresh is in progress, client access will be evaluated with the existing information in the access cache entry.

- **Harvest Timeout:** If Data ONTAP does not use an entry that is stored in the access cache for this period of time, it deletes the entry.

**Note:** This command is not supported in a cluster with effective cluster version of Data ONTAP 9.0.0 or later. The access cache settings are stored on a per-Vserver basis starting Data ONTAP 9.0.0. See the vserver export-policy access-cache config show command.

### Examples

The following command displays the exports access cache timeout values for all Vservers in a cluster where the effective cluster version is earlier than Data ONTAP 9.0.0:

**vserver export-policy netgroup commands**

The netgroup directory

**vserver export-policy netgroup check-membership**

Check to see if the client is a member of the netgroup

**Availability:** This command is available to **cluster** and **Vserver** administrators at the **admin** privilege level.

**Description**

The `vserver export-policy netgroup check-membership` command determines if the client IP address is a member of the netgroup. Data ONTAP can determine the membership information only after it has fully loaded the netgroup into the cache. Until then, while the reverse lookup scan algorithm might find a match, both DNS round robin and DNS aliases prevent ruling out non-matches. You can use the `vserver export-policy netgroup queue show` command to monitor the loading of the netgroup.

**Parameters**

- `-vserver <vserver name>` - **Vserver**
  
  This parameter specifies the name of the Vserver whose netgroup you want to check for client membership.

- `-netgroup <text>` - **Name of the Netgroup**
  
  This parameter specifies the name of the netgroup that you want to check for client membership.

- `-client-ip <IP Address>` - **Client Address**
  
  This parameter specifies the IP address of the client whose netgroup membership you want to check.

**Examples**

The following examples of the `vserver export-policy netgroup check-membership` command display various possible results for client membership checks.

```bash
cluster1::*> vserver export-policy netgroup check-membership -vserver vs1 -netgroup mercury -client-ip 172.17.16.72
Client 172.17.16.72 is a member of netgroup "mercury" for Vserver "vs1" with state "reverse lookup scan".

cluster1::*> vserver export-policy netgroup check-membership -vserver vs1 -netgroup mercury -client-ip 172.17.16.72
Client 172.17.16.72 is a member of netgroup "mercury" for Vserver "vs1" with state "cache".

cluster1::*> vserver export-policy netgroup check-membership -vserver vs1 -netgroup mercury -client-ip 172.17.16.14
Client 172.17.16.14 is not a member of netgroup "mercury" for Vserver "vs1".

cluster1::*> vserver export-policy netgroup check-membership -vserver vs1 -netgroup big -client-ip 172.17.16.69
Cannot yet determine the membership of client 172.17.16.69 in netgroup "big" for Vserver "vs1". Try again when the netgroup is loaded in the cache.
```

vserver export-policy netgroup queue show on page 1561

vserver export-policy netgroup cache commands

The cache directory

vserver export-policy netgroup cache show

Show the Netgroup Cache

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver export-policy netgroup cache show command displays the contents of the export policy netgroup cache for a Vserver. Entries shown here correspond to the caches used to evaluate client membership in a netgroup. To show the netgroup cache, you must specify the following item:

- Vserver: The name of the Vserver whose netgroup cache you want to display.

The following information is displayed per cache entry:

- Vserver name: The name of the Vserver.
- Netgroup name: The name of the netgroup.
- State of the cache entry: The state of the cache entry. There are four possible values:
  - initializing: The cache entry is being populated for the first time.
  - ready: Processing of the cache entry is complete and it is ready to be used.
  - not-found: The netgroup could not be found.
  - abandoned: The cache entry has been abandoned.
- Total number of hosts in the netgroup cache: The number of host names retrieved from the name service in mapping the netgroup to a list of hosts.
- How long it took to expand the netgroup: How long it took to expand the netgroup the last time in the queue.
- Entry is refreshing: If the entry is a complete miss or refresh.
- Next refresh time: When the next refresh is scheduled to take place.
- Netgroup by host state: Boolean state indicating if netgroup-by-host feature is used for resolving netgroup membership check.
- Number of IP addresses cached: Number of client IP addresses that are matched for the netgroup. The count includes both positive and negative results.
Parameters

`{[-fields <fieldname>, ...]`  
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

`[-instance]`  
If you specify the `-instance` parameter, the command displays detailed information about all fields.

`-vserver <vserver name> - Vserver`  
If you specify this parameter, the command displays the netgroup cache information only if the Vserver name matches the specified value.

`[-netgroup <text>] - Name of the Netgroup`  
If you specify this parameter, the command displays the netgroup cache information only if the netgroup name matches the specified value.

`[-cache-state {initializing | ready | not-found | abandoned}] - State of the Cache Entry`  
If you specify this parameter, the command displays the netgroup cache information only if the netgroup cache state matches the specified value.

`[-total-hosts <integer>] - Total Number of Hosts in the Netgroup`  
If you specify this parameter, the command displays the netgroup cache information only if the netgroup record's count of host names matches the specified value.

`[-expansion-duration <[[<hours>:]<minutes>:]<seconds>>] - Expansion Duration`  
If you specify this parameter, the command displays the netgroup cache information only if the netgroup record expansion time matches the specified value.

`[-is-refreshing {true | false}] - Is Entry Refreshing?`  
If you specify this parameter, the command displays the netgroup cache information only if the netgroup record refreshing state matches the specified value.

`[-time-next-refresh <Date>] - Next Refresh Time`  
If you specify this parameter, the command displays the netgroup cache information only if the time of the next scheduled refresh matches the specified value.

`[-num-ip-addrs-cache <integer>] - Number of Cached IP Addresses`  
If you specify this parameter, the command displays the netgroup cache information only if the number of cached IP addresses matches the specified value.

Examples

The following example displays the netgroup cache for the Vserver vs1 and the netgroup netgroup1:

```
cluster1::> vserver export-policy netgroup cache show -vserver vs1 -netgroup netgroup1
Vserver Netgroup State
-------- --------- ------------
vs1 netgroup1 Ready
```

`vserver export-policy netgroup queue commands`

The queue directory

`vserver export-policy netgroup queue show`

Show the Netgroup Processing Queue

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

vserver export-policy commands
Description
The `vserver export-policy netgroup queue show` command displays the ongoing processing of the netgroup cache for a node. Entries shown here are not used to evaluate client membership in a netgroup. The following information is displayed per queue entry:

- **Vserver name**: The name of the Vserver.
- **Netgroup name**: The name of the netgroup.
- **Age of entry in the queue**: How long the entry has been in the queue.
- **Queue state**: The state of the entry in the queue. There are three possible values:
  - `running`: The entry is currently being processed.
  - `waiting`: The entry is waiting to be processed.
  - `retrying`: The entry is waiting to be reprocessed.

Note that as the `vserver export-policy netgroup queue show` command is not atomic. Several queue entries might show up in the 'running' state.

- **Number of times retried in the queue**: The number of times was the entry was taken off of the netgroup processing queue and added back on it.
- **Total number of hosts in the netgroup**: The number of host names retrieved from the name service in mapping the netgroup to a list of hosts.

Parameters
```
[-fields <fieldname>, ...]  # If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

[-instance]                  # If you specify the -instance parameter, the command displays detailed information about all fields.

][-vserver <vserver name>]   # Vserver
  If you specify this parameter, the command displays the netgroup cache information only if the Vserver name matches the specified value.

][-netgroup <text>]          # Name of the Netgroup
  If you specify this parameter, the command displays the netgroup cache information only if the netgroup name matches the specified value.

][-queue-state {waiting|running|retrying}] # State of Entry in the Queue
  If you specify this parameter, the command displays the netgroup cache information only if the netgroup queue state matches the specified value.

][-age {<hours>[:]<minutes>[:]<seconds>}] # Age of Entry in the Queue
  If you specify this parameter, the command displays the netgroup cache information only if the age of when the netgroup record was put on the netgroup processing queue matches the specified value.

][-retries-on-queue <integer>] # Number of Retries on the Queue
  If you specify this parameter, the command displays the netgroup cache information only if, during a refresh, the number of times the netgroup record has been put back on the netgroup processing queue matches the specified value.

][-total-hosts <integer>]    # Total Number of Hosts in the Netgroup
  If you specify this parameter, the command displays the netgroup cache information only if the netgroup record's count of hosts matches the specified value.
```
Examples
The following example displays the netgroup queue:

```
cluster1:/> vserver export-policy netgroup queue show

Vserver   Netgroup   State         Age on     Total Hosts
---------- ---------- --------- --------- ---------
testvs1    test-netgr retrying     0:0:47     12441

testvs1    test       waiting     0:01:35         -
```

vserver export-policy cache commands

Manage the export-policy cache

vserver export-policy cache flush

Flush the Export Caches

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
The `vserver export-policy cache flush` command clears out the contents of the export policy caches for a Vserver. You might need to flush the caches to allow the changes to immediately take effect for your NFS clients because of:

- A change to your export policy rules.
- Modifying a host name record in a name server (i.e., local hosts or DNS).
- Modifying a PTR record in a DNS server (i.e., reverse DNS lookup).
- Modifying the entries in a netgroup in a name server (i.e., local netgroup, LDAP, or NIS).
- Recovering from a network outage that resulted in a netgroup being partially expanded.

To flush the caches, you must specify the following items:

- **Vserver:** either a specific Vserver or use "*" to flush all of them.

You can optionally specify the following items:

- **Node:** if flushing the `access` cache, you can also specify which node to flush it on.
- **Cache to flush:** by default all but `showmount` will be flushed.

Note that the `showmount` cache is not used to determine NFS client access and as such is only flushable explicitly.

**Parameters**

```
vserver <vserver name> - Vserver
   This parameter specifies the name of the Vserver on which you want to flush the caches.

[-node <nodename>] - Node
   This parameter specifies the name of the Vserver on which you want to flush the access cache.

[-cache {all|access|host|id|name|netgroup|showmount|ip}] - Cache Name
   This parameter specifies the name of the cache which you want to flush. Possible values include the following:
   - all - All caches but showmount. This is the default.
   - access - The export-policy rules access cache.
```

vserver export-policy commands
• **host** - The host name to IP cache.
• **id** - The ID to credential cache.
• **ip** - The IP to host name cache.
• **name** - The name to ID cache.
• **netgroup** - The netgroup cache.
• **showmount** - The showmount caches.

### Examples
The following example flushes the access cache on a Vserver named vs0:
```
cluster1::> vserver export-policy cache flush -vserver vs0 -cache access
```

---

**vserver export-policy rule commands**

Manage export rules

**vserver export-policy rule add-clientmatches**

Add list of clientmatch strings to an existing rule

**Availability:** This command is available to cluster and Vserver administrators at the *admin* privilege level.

**Description**
The `vserver export-policy rule add-clientmatches` command adds a list of strings to the clientmatch field of a specified export rule in a policy. This command only operates on the clientmatch field; to modify other fields in a rule use the `vserver export-policy modify` command.

**Parameters**
- `-vserver <vserver name>` - Vserver
  - This parameter specifies the Vserver on which the export policy is located.
- `-policyname <export policy name>` - Policy Name
  - This parameter specifies the name of the export policy containing the export rule to which you want to add additional clientmatch strings.
- `-ruleindex <integer>` - Rule Index
  - This parameter specifies the index number of the export rule to which you want to add additional clientmatch strings. To view a list of rules with their index numbers, use the `vserver export-policy rule show` command.
- `-clientmatches <text>` - List of Clientmatch Strings to Add
  - This parameter specifies list of the match strings specifying the client or clients to add to the export rule. Duplicate match strings will not be created and the list may not contain duplicates entries. Match strings from the clientmatches list are added to the clientmatch field if the match string is not identical to one of the strings already in the clientmatch field. You can specify the match string in any of the following formats:
    - As a hostname; for instance, host1
    - As an IPv4 address; for instance, 10.1.12.24
    - As an IPv6 address; for instance, fd20:8b1e:b255:4071::100:1
- As an IPv4 address with a subnet mask expressed as a number of bits; for instance, 10.1.12.10/4
- As an IPv6 address with a subnet mask expressed as a number of bits; for instance, fd20:8b1e:b255:4071::/64
- As an IPv4 address with a network mask; for instance, 10.1.16.0/255.255.255.0
- As a netgroup, with the netgroup name preceded by the @ character; for instance, @eng
- As a domain name preceded by the . character; for instance, .example.com

Note: Entering an IP address range, such as 10.1.12.10-10.1.12.70, is not allowed. Entries in this format are interpreted as a text string and treated as a hostname.

### Examples

The following example adds match strings "2.2.2.2" and "3.3.3.3" to the clientmatch field of the export rule with index number 3 in an export policy named default_expolicy on a Vserver named vs0.

```
cluster1:/> vserver export-policy rule add-clientmatches -vserver vs0 -policyname default_expolicy -ruleindex 3 -clientmatches "2.2.2.2,3.3.3.3"
```

---

**vserver export-policy rule create**

Create a rule

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The `vserver export-policy rule create` command creates an export rule and adds it to a policy. To create an export rule, you must specify the following items:

- Vserver
- Export policy
- Clients that match the rule
- Read-only access rule
- Read-write access rule

You can optionally specify the following items:

- Index number; that is, the location of the export rule in the policy
- Access protocol
- Anonymous ID
- Superuser security type
- Whether suid access is enabled
- Whether creation of devices is enabled
- Whether UNIX-type permissions changes on NTFS (Windows) volumes are prohibited or allowed when the request originates from an NFS client (advanced privilege and higher only)
• Whether ownership changes are restricted or not (advanced privilege and higher only)

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the Vserver on which the export policy is located.

-policyname <export policy name> - Policy Name

This parameter specifies the name of the export policy to which you want to add the new export rule. The export policy must already exist. To create an export policy, see the vserver export-policy create command.

-[ruleindex <integer>] - Rule Index

This optional parameter specifies the index number of the export rule that you want to create. If you specify an index number that already matches a rule, the index number of the existing rule is incremented, as are the index numbers of all subsequent rules, either to the end of the list or to an open space in the list. If you do not specify an index number, the new rule is placed at the end of the policy's list.

-[protocol <Client Access Protocol>, ...] - Access Protocol

This optional parameter specifies the list of access protocols for which you want to apply the export rule. Possible values include the following:

• any - Any current or future access protocol
• nfs - Any current or future version of NFS
• nfs3 - The NFSv3 protocol
• nfs4 - The NFSv4 protocol
• cifs - The CIFS protocol
• flexcache - The FlexCache protocol

You can specify a comma-separated list of multiple access protocols for an export rule. If you specify the protocol as any, you cannot specify any other protocols in the list. If you do not specify this parameter, the value defaults to any. If you enable NFSv4 or CIFS, you will not be able to apply the policy to which this rule belongs to a FlexGroup, as FlexGroups do not support NFSv4 or CIFS protocol access.

-clientmatch <text> - List of Client Match Hostnames, IP Addresses, Netgroups, or Domains

This parameter specifies list of the match strings specifying the client or clients to which the export rule applies. Duplicate match strings in the same rule are not allowed. You can specify the match string in any of the following formats:

• As a hostname; for instance, host1
• As an IPv4 address; for instance, 10.1.12.24
• As an IPv6 address; for instance, fd20:8b1e:b255:4071::100:1
• As an IPv4 address with a subnet mask expressed as a number of bits; for instance, 10.1.12.10/4
• As an IPv6 address with a subnet mask expressed as a number of bits; for instance, fd20:8b1e:b255:4071::/64
• As an IPv4 address with a network mask; for instance, 10.1.16.0/255.255.255.0
• As a netgroup, with the netgroup name preceded by the @ character; for instance, @eng
• As a domain name preceded by the . character; for instance, .example.com
Note: Entering an IP address range, such as 10.1.12.10-10.1.12.70, is not allowed. Entries in this format are interpreted as a text string and treated as a hostname.

-rorule <authentication method>, ... - RO Access Rule
This parameter specifies the security type for read-only access to volumes that use the export rule. Possible values include the following:

• **sys** - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is AUTH_SYS. The effective security type of the incoming request (to be used subsequently in evaluation of rrule/superuser) becomes sys.

• **krb5** - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is Kerberos v5. The effective security type of the incoming request (to be used subsequently in evaluation of rrule/superuser) becomes krb5.

• **krb5i** - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is Kerberos v5 with integrity service. The effective security type of the incoming request (to be used subsequently in evaluation of rrule/superuser) becomes krb5i.

• **krb5p** - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is Kerberos v5 with privacy service. The effective security type of the incoming request (to be used subsequently in evaluation of rrule/superuser) becomes krb5p.

• **ntlm** - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is CIFS NTLM. The effective security type of the incoming request (to be used subsequently in evaluation of rrule/superuser) becomes ntlm.

• **any** - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume regardless of the security type of that incoming request. The effective security type of the incoming request (to be used subsequently in evaluation of rrule/superuser) remains the same as the security type of the incoming request.

  **Note:** If the security type of the incoming request is AUTH_NONE, read access will be granted to that incoming request as an anonymous user.

• **none** - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume as an anonymous user if the security type of that incoming request is not explicitly listed in the list of values in the rorule. The effective security type of the incoming request (to be used subsequently in evaluation of rrule/superuser) becomes none.

• **never** - For an incoming request from a client matching the clientmatch criteria, do not allow any access to the volume regardless of the security type of that incoming request.

You can specify a comma-separated list of multiple security types for an export rule. If you specify the security type as any or never, you cannot specify any other security types.

  **Note:** For an incoming request from a client matching the clientmatch criteria, if the security type doesn’t match any of the values listed in rorule (as explained above), access will be denied to that incoming request.

-rrule <authentication method>, ... - RW Access Rule
This parameter specifies the security type for read-write access to volumes that use the export rule. Possible values include the following:

• **sys** - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the effective security type (determined from rorule) of that incoming request is AUTH_SYS.

• **krb5** - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the effective security type (determined from rorule) of that incoming request is Kerberos v5.
• **krb5i** - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the effective security type (determined from rorule) of that incoming request is Kerberos v5 with integrity service.

• **krb5p** - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the effective security type (determined from rorule) of that incoming request is Kerberos v5 with privacy service.

• **ntlm** - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the effective security type (determined from rorule) of that incoming request is CIFS NTLM.

• **any** - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume regardless of the effective security type (determined from rorule) of that incoming request.

  **Note:** If the effective security type (determined from rorule) of the incoming request is none, write access will be granted to that incoming request as an anonymous user.

• **none** - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume as an anonymous user if the effective security type (determined from rorule) of that incoming request is none.

• **never** - For an incoming request from a client matching the clientmatch criteria, do not allow write access to the volume regardless of the effective security type (determined from rorule) of that incoming request.

You can specify a comma-separated list of multiple security types for an export rule. If you specify the security type as **any** or **never**, you cannot specify any other security types.

  **Note:** For an incoming request from a client matching the clientmatch criteria, if the effective security type (determined by rorule) doesn't match any of the values listed in rwrule (as explained above), write access will be denied to that incoming request.

[-anon <text>] - User ID To Which Anonymous Users Are Mapped

This parameter specifies a UNIX user ID or user name that the user credentials are mapped to when evaluation of rorule or superuser parameters result in user being mapped to the anonymous user. The default setting of this parameter is 65534. NFS clients typically associate user ID 65534 with the user name nobody. In clustered Data ONTAP, this user ID is associated with the user pcuser. To disable access by any client with a user ID of 0, specify a value of 65535 which is associated with the user nobody.

[-superuser <authentication method>,...] - Superuser Security Types

This parameter specifies a security type for superuser access to files. The default setting of this parameter is **none**. Possible values include the following:

• **sys** - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume if the effective security type (determined from rorule) of that incoming request is AUTH_SYS.

• **krb5** - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume if the effective security type (determined from rorule) of that incoming request is Kerberos v5.

• **krb5i** - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume if the effective security type (determined from rorule) of that incoming request is Kerberos v5 with integrity service.

• **krb5p** - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume if the effective security type (determined from rorule) of that incoming request is Kerberos v5 with privacy service.
ntlm - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume if the effective security type (determined from rorule) of that incoming request is CIFS NTLM.

any - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume regardless of the effective security type (determined by rorule) of that incoming request.

Note: If the effective security type (determined from rorule) of the incoming request is none, access will be granted to that incoming request as an anonymous user.

none - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow access to the volume as an anonymous user if the effective security type (determined from rorule) of that incoming request is none.

You can specify a comma-separated list of multiple security types for superuser access. If you specify the security type as any, you cannot specify any other security types.

Note: For an incoming request from a client matching the clientmatch criteria and with the user ID 0, if the effective security type doesn't match any of the values listed in superuser (as explained above), the user ID is mapped to anonymous user.

[-allow-suid {true|false}] - Honor SetUID Bits in SETATTR

This parameter specifies whether set user ID (suid) and set group ID (sgid) access is enabled by the export rule. The default setting is true.

[-allow-dev {true|false}] - Allow Creation of Devices

This parameter specifies whether the creation of devices is enabled by the export rule. The default setting is true.

[-ntfs-unix-security-ops {ignore|fail}] - NTFS Unix Security Options (privilege: advanced)

This parameter specifies whether UNIX-type permissions changes on NTFS (Windows) volumes are prohibited (fail) or allowed (ignore) when the request originates from an NFS client. The default setting is fail.

[-chown-mode {restricted|unrestricted}] - Change Ownership Mode (privilege: advanced)

This parameter specifies who is allowed to change the ownership mode of a file. The default setting is restricted. The allowed values are:

• restricted - Only root may change the ownership of the file.
• unrestricted - Non-root users may change ownership of files that they own.

Examples

The following example creates an export rule with index number 1 in an export policy named read_only_expolicy on a Vserver named vs0. The rule matches all clients in the domains named example.com or example.net. The rule enables all access protocols. It enables read-only access by any matching client and requires authentication by AUTH_SYS, NTLM, or Kerberos 5 for read-write access. Clients with the UNIX user ID zero are mapped to user ID 65534 (which normally maps to the user name nobody). It does not enable suid and sgid access or the creation of devices.

```
cluster1::> vserver export-policy rule create -vserver vs0 -policyname read_only_expolicy -ruleindex 1 -protocol any -clientmatch ".example.com,.example.net" -rorule any -rrule "ntlm,krb5,sys" -anon 65534 -allow-suid false -allow-dev false
```
vserver export-policy rule delete

Delete a rule

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver export-policy rule delete command deletes an export rule from a policy. You can specify the export rule by specifying its index number in the policy. When you delete a rule, the other rules in the policy are not automatically renumbered or reordered. You can use the vserver export-policy rule setindex command to reorder the rules in a rule set.

Parameters
- vserver <vserver name> - Vserver
  This parameter specifies the Vserver which contains the export policy.

- policymame <export policy name> - Policy Name
  This parameter specifies the export policy from which you want to delete a rule.

- ruleindex <integer> - Rule Index
  This parameter specifies the index number of the rule that you want to delete. You can use the vserver export-policy rule show command to view a list of rules with their index numbers.

Examples
The following example deletes an export rule with the index number 5 from an export policy named rs1 on a Vserver named vs0:

```bash
cluster1:/> vserver export-policy rule delete -vserver vs0
-policyname read_only_expolicy -ruleindex 5
```

vserver export-policy rule modify

Modify a rule

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver export-policy rule modify command modifies a specified export rule in a policy. This command cannot change the position of a rule in a policy; to reorder rules in a policy, use the vserver export-policy rule setindex command. Duplicate match strings in the same rule are not allowed. You can use this command to change the following attributes of an export rule:

- Access protocol
- Client match specification
- Read-only access rule
- Read-write access rule
• Anonymous ID
• Superuser security type
• Whether suid access is enabled
• Whether creation of devices is enabled
• Whether UNIX-type permissions changes on NTFS (Windows) volumes are prohibited or allowed when the request originates from an NFS client (advanced privilege and higher only)
• Whether ownership changes are restricted or not (advanced privilege and higher only)

Parameters

-vserver <vserver name> - Vserver
This parameter specifies the Vserver on which the export policy is located.

-policyname <export policy name> - Policy Name
This parameter specifies the name of the export policy containing the export rule that you want to modify.

-ruleindex <integer> - Rule Index
This parameter specifies the index number of the export rule that you want to modify. To view a list of rules with their index numbers, use the vserver export-policy rule show command.

-protocol <Client Access Protocol>, ... - Access Protocol
This optional parameter specifies the list of access protocols for which you want to apply the export rule. Possible values include the following:
  • any - Any current or future access protocol
  • nfs - Any current or future version of NFS
  • nfs3 - The NFSv3 protocol
  • nfs4 - The NFSv4 protocol
  • cifs - The CIFS protocol
  • flexcache - The FlexCache protocol

You can specify a comma-separated list of multiple access protocols for an export rule. If you specify the protocol as any, you cannot specify any other protocols in the list. If you do not specify this parameter, the value defaults to any. If you enable NFSv4 or CIFS, you will not be able to apply the policy to which this rule belongs to a FlexGroup, as FlexGroups do not support NFSv4 or CIFS protocol access.

-clientmatch <text> - List of Client Match Hostnames, IP Addresses, Netgroups, or Domains
This parameter specifies list of the match strings specifying the client or clients to which the export rule applies. You can specify the match string in any of the following formats:
  • As a hostname; for instance, host1
  • As an IPv4 address; for instance, 10.1.12.24
  • As an IPv6 address; for instance, fd20:8b1e:b255:4071::100:1
  • As an IPv4 address with a subnet mask expressed as a number of bits; for instance, 10.1.12.10/4
  • As an IPv6 address with a subnet mask expressed as a number of bits; for instance, fd20:8b1e:b255:4071::/64
  • As an IPv4 address with a network mask; for instance, 10.1.16.0/255.255.255.0
• As a netgroup, with the netgroup name preceded by the @ character; for instance, @eng

• As a domain name preceded by the . character; for instance, .example.com

Note: Entering an IP address range, such as 10.1.12.10-10.1.12.70, is not allowed. Entries in this format are interpreted as a text string and treated as a hostname.

[-rorule <authentication method>, ...] - RO Access Rule

This parameter modifies the security type for read-only access to volumes that use the export rule. Possible values include the following:

• sys - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is AUTH_SYS. The effective security type of the incoming request (to be used subsequently in evaluation of rrule/superuser) becomes sys.

• krb5 - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is Kerberos v5. The effective security type of the incoming request (to be used subsequently in evaluation of rrule/superuser) becomes krb5.

• krb5i - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is Kerberos v5 with integrity service. The effective security type of the incoming request (to be used subsequently in evaluation of rrule/superuser) becomes krb5i.

• krb5p - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is Kerberos v5 with privacy service. The effective security type of the incoming request (to be used subsequently in evaluation of rrule/superuser) becomes krb5p.

• ntlm - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is CIFS NTLM. The effective security type of the incoming request (to be used subsequently in evaluation of rrule/superuser) becomes ntlm.

• any - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume regardless of the security type of that incoming request. The effective security type of the incoming request (to be used subsequently in evaluation of rrule/superuser) remains the same as the security type of the incoming request.

   Note: If the security type of the incoming request is AUTH_NONE, read access will be granted to that incoming request as an anonymous user.

• none - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume as an anonymous user if the security type of that incoming request is not explicitly listed in the list of values in the rorule. The effective security type of the incoming request (to be used subsequently in evaluation of rrule/superuser) becomes none.

• never - For an incoming request from a client matching the clientmatch criteria, do not allow any access to the volume regardless of the security type of that incoming request.

You can specify a comma-separated list of multiple security types for an export rule. If you specify the security type as any or never, you cannot specify any other security types.

   Note: For an incoming request from a client matching the clientmatch criteria, if the security type doesn't match any of the values listed in rorule (as explained above), access will be denied to that incoming request.

[-rrule <authentication method>, ...] - RW Access Rule

This parameter modifies the security type for read-write access to volumes that use the export rule. Possible values include the following:
- For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the effective security type (determined from rorule) of that incoming request is AUTH_SYS.

- For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the effective security type (determined from rorule) of that incoming request is Kerberos v5.

- For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the effective security type (determined from rorule) of that incoming request is Kerberos v5 with integrity service.

- For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the effective security type (determined from rorule) of that incoming request is Kerberos v5 with privacy service.

- For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the effective security type (determined from rorule) of that incoming request is CIFS NTLM.

- For an incoming request from a client matching the clientmatch criteria, allow write access to the volume regardless of the effective security type (determined from rorule) of that incoming request.

  Note: If the effective security type (determined from rorule) of the incoming request is none, write access will be granted to that incoming request as an anonymous user.

- For an incoming request from a client matching the clientmatch criteria, allow write access to the volume as an anonymous user if the effective security type (determined from rorule) of that incoming request is none.

- For an incoming request from a client matching the clientmatch criteria, do not allow write access to the volume regardless of the effective security type (determined from rorule) of that incoming request.

You can specify a comma-separated list of multiple security types for an export rule. If you specify the security type as any or never, you cannot specify any other security types.

  Note: For an incoming request from a client matching the clientmatch criteria, if the effective security type (determined by rorule) doesn't match any of the values listed in rwrule (as explained above), write access will be denied to that incoming request.

[-anon <text>] - User ID To Which Anonymous Users Are Mapped

This parameter specifies a UNIX user ID or user name that the user credentials are mapped to when evaluation of rorule or superuser parameters result in user being mapped to the anonymous user. The default setting of this parameter is 65534, which is normally associated with the user name nobody. The following notes apply to the use of this parameter:

- To disable access by any client with a user ID of 0, specify a value of 65535.

[-superuser <authentication method>,...] - Superuser Security Types

This parameter specifies a security type for superuser access to files. The default setting of this parameter is none. Possible values include the following:

- For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume if the effective security type (determined from rorule) of that incoming request is AUTH_SYS.

- For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume if the effective security type (determined from rorule) of that incoming request is Kerberos v5.

- For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume if the effective security type (determined from rorule) of that incoming request is Kerberos v5 with integrity service.
• *krb5p* - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume if the effective security type (determined from rorule) of that incoming request is Kerberos v5 with privacy service.

• *ntlm* - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume if the effective security type (determined from rorule) of that incoming request is CIFS NTLM.

• *any* - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume regardless of the effective security type (determined by rorule) of that incoming request.

  **Note:** If the effective security type (determined from rorule) of the incoming request is none, access will be granted to that incoming request as an anonymous user.

• *none* - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow access to the volume as an anonymous user if the effective security type (determined from rorule) of that incoming request is none.

You can specify a comma-separated list of multiple security types for superuser access. If you specify the security type as *any*, you cannot specify any other security types.

  **Note:** For an incoming request from a client matching the clientmatch criteria and with the user ID 0, if the effective security type doesn't match any of the values listed in superuser (as explained above), the user ID is mapped to anonymous user.

[-allow-suid *(true|false)*) - Honor SetUID Bits in SETATTR

This parameter specifies whether set user ID (suid) and set group ID (sgid) access is enabled by the export rule. The default setting is *true*.

[-allow-dev *(true|false)*) - Allow Creation of Devices

This parameter specifies whether the creation of devices is enabled by the export rule. The default setting is *true*.

[-ntfs-unix-security-ops *(ignore|fail)*) - NTFS Unix Security Options (privilege: advanced)

This parameter specifies whether UNIX-type permissions changes on NTFS (Windows) volumes are prohibited (with value *fail*) or allowed (with value *ignore*) when the request originates from an NFS client. The default setting is *fail*. This parameter is only used if you set the NTFS UNIX security option for the Vserver to *use-export-policy*; otherwise, it has no effect.

[-chown-mode *(restricted|unrestricted)*) - Change Ownership Mode (privilege: advanced)

This parameter specifies who is authorized to change the ownership mode of a file. The default setting is *restricted*. This parameter is only used if you set the change ownership mode option for the Vserver to *use-export-policy*; otherwise, it has no effect. The allowed values are:

- *restricted* - Only root user can change the ownership of the file.
- *unrestricted* - Non-root users can change ownership of files that they own.

**Examples**

The following example modifies the export rule with index number 3 in an export policy named default_expolicy on a Vserver named vs0. The rule is modified to match any clients in the netgroups named group1 or group2 to enable NFSv2 and CIFS support, to enable read-only access by any matching client, to require authentication by NTLM or Kerberos 5 for read-write access, and to enable suid and sgid access.

```bash
cluster1::> vserver export-policy rule modify -vserver vs0 -policyname default_expolicy -ruleindex 3 -protocol "nfs2,cifs" -clientmatch "@group1, @group2" -rorule any -rwrule "ntlm,krb5" -allow-suid true
```
vserver export-policy rule remove-clientmatches

Remove list of clientmatch strings from an existing rule

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver export-policy rule remove-clientmatches` command removes a list of strings from the clientmatch field of a specified export rule in a policy. This command only operates on the clientmatch field; to modify other fields in a rule use the `vserver export-policy modify` command.

**Parameters**
- `-vserver <vserver name>` - Vserver
  This parameter specifies the Vserver on which the export policy is located.

- `-policyname <export policy name>` - Policy Name
  This parameter specifies the name of the export policy containing the export rule from which you want to remove clientmatch strings.

- `-ruleindex <integer>` - Rule Index
  This parameter specifies the index number of the export rule from which you want to remove clientmatch strings. To view a list of rules with their index numbers, use the `vserver export-policy rule show` command.

- `-clientmatches <text>` - List of Clientmatch Strings to Remove
  This parameter specifies list of the match strings specifying the client or clients to remove from the export rule. Match strings are removed from the clientmatch field if the match string is identical to one of the elements in the clientmatches list. If all match strings are removed from the clientmatch field the entire export rule is deleted. You can specify the match string in any of the following formats:
  - As a hostname; for instance, host1
  - As an IPv4 address; for instance, 10.1.12.24
  - As an IPv6 address; for instance, fd20:8b1e:b255:4071::100:1
  - As an IPv4 address with a subnet mask expressed as a number of bits; for instance, 10.1.12.10/4
  - As an IPv6 address with a subnet mask expressed as a number of bits; for instance, fd20:8b1e:b255:4071::/64
  - As an IPv4 address with a network mask; for instance, 10.1.16.0/255.255.255.0
  - As a netgroup, with the netgroup name preceded by the @ character; for instance, @eng
  - As a domain name preceded by the . character; for instance, .example.com

  **Note:** Entering an IP address range, such as 10.1.12.10-10.1.12.70, is not allowed. Entries in this format are interpreted as a text string and treated as a hostname.

**Examples**
The following example removes match strings "2.2.2.2" and "3.3.3.3" from the clientmatch field of the export rule with index number 3 in an export policy named default_expolicy on a Vserver named vs0.
vserver export-policy rule setindex

Move a rule to a specified index

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver export-policy rule setindex command modifies the index number of the specified export rule. If the new index number is already in use, the command reorders the list to accommodate it. If the existing index is given a higher index number (that is, later in the list), the command decrements the index numbers of rules between the moved rule and moved-to rule; otherwise, the command increments the index numbers between the moved-to rule and the existing rule.

You can use the vserver export-policy rule show command to view a list of rules with their index numbers.

Parameters

-vserver <vserver name> - Vserver
  This parameter specifies the Vserver on which the export policy is located.

-policyname <export policy name> - Policy Name
  This parameter specifies the export policy that contains the rule whose index number you want to modify.

-ruleindex <integer> - Rule Index
  This parameter specifies the index number of the rule that you want to move.

-newruleindex <integer> - Index
  This parameter specifies the new index number for the rule.

Examples

The following example changes the index number of a rule at index number 5 to index number 3 in an export policy named rs1 on a Vserver named vs0:

cluster1::> vserver export-policy rule setindex -vserver vs0 -policyname read_only_policy -ruleindex 5 -newruleindex 3

Related references

vserver export-policy rule show on page 1576

vserver export-policy rule show

Display a list of rules

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver export-policy rule show command displays information about export rules. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information:
• Vserver name
• Export policy name
• Export rule index number
• Access protocol
• Client match
• Read-only access rule
• Read-write access rule

To display detailed information about a specific export rule, run the command with the \texttt{-vserver}, \texttt{-policyname}, and \texttt{-ruleindex} parameters. The detailed view provides all of the information in the previous list and the following additional information:

• Anonymous ID
• Superuser security type
• Whether set user ID (suid) and set group ID (sgid) access is enabled
• Whether creation of devices is enabled
• NTFS security settings
• Change ownership mode

You can specify additional parameters to display only the information that matches those parameters. For example, to display information only about export rules that have a read-write rule value of never, run the command with the \texttt{-rwrule never} parameter.

\textbf{Parameters}

\begin{itemize}
\item \texttt{\{-fields <fieldname>, ...\}}
  \begin{itemize}
  \item If you specify the \texttt{-fields} parameter, the command only displays the fields that you specify.
  \end{itemize}
\item \texttt{\{-instance\}}
  \begin{itemize}
  \item If you specify the \texttt{-instance} parameter, the command displays detailed information about all entries.
  \end{itemize}
\item \texttt{\{-vserver <vserver name>\}} - Vserver
  \begin{itemize}
  \item If you specify this parameter, the \texttt{-policyname} parameter, and the \texttt{-ruleindex} parameter, the command displays detailed information about the specified export rule. If you specify this parameter by itself, the command displays information only about the export rules on the specified Vserver.
  \end{itemize}
\item \texttt{\{-policyname <export policy name>\}} - Policy Name
  \begin{itemize}
  \item If you specify this parameter, the \texttt{-vserver} parameter, and the \texttt{-ruleindex} parameter, the command displays detailed information about the specified export rule. If you specify this parameter by itself, the command displays information only about the export rules on the specified policy.
  \end{itemize}
\item \texttt{\{-ruleindex <integer>\}} - Rule Index
  \begin{itemize}
  \item If you specify this parameter, the \texttt{-vserver} parameter, and the \texttt{-policyname} parameter, the command displays detailed information about the specified export rule. If you specify this parameter by itself, the command displays information only about the export rules that have the specified index number.
  \end{itemize}
\item \texttt{\{-protocol <Client Access Protocol>, ...\}} - Access Protocol
  \begin{itemize}
  \item If you specify this parameter, the command displays information only about the export rules that have the specified access protocol or protocols. Possible values include the following:
  \begin{itemize}
  \item \texttt{any} - Any current or future access protocol
  \end{itemize}
  \end{itemize}
\end{itemize}
- Any current or future version of NFS
- The NFSv3 protocol
- The NFSv4 protocol
- The CIFS protocol
- The FlexCache protocol

You can specify a comma-separated list of multiple access protocols for an export rule. If you specify the protocol as any, you cannot specify any other protocols in the list.

[-clientmatch <text>] - List of Client Match Hostnames, IP Addresses, Netgroups, or Domains

If you specify this parameter, the command displays information only about the export rules that have a clientmatch list containing all of the strings in the specified client match. You can specify the match as a list of strings in any of the following formats:

- As a hostname; for instance, host1
- As an IPv4 address; for instance, 10.1.12.24
- As an IPv6 address; for instance, fd20:8b1e:b255:4071::100:1
- As an IPv4 address with a subnet mask expressed as a number of bits; for instance, 10.1.12.10/4
- As an IPv6 address with a subnet mask expressed as a number of bits; for instance, fd20:8b1e:b255:4071::/64
- As an IPv4 address with a network mask; for instance, 10.1.16.0/255.255.255.0
- As a netgroup, with the netgroup name preceded by the @ character; for instance, @eng
- As a domain name preceded by the . character; for instance, .example.com

[-rrule <authentication method>, ...] - RO Access Rule

If you specify this parameter, the command displays information only about the export rule or rules that have the specified read-only rule. Possible values include the following:

- sys - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is AUTH_SYS. The effective security type of the incoming request (to be used subsequently in evaluation of rrule/superuser) becomes sys.
- krb5 - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is Kerberos v5. The effective security type of the incoming request (to be used subsequently in evaluation of rrule/superuser) becomes krb5.
- krb5i - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is Kerberos v5 with integrity service. The effective security type of the incoming request (to be used subsequently in evaluation of rrule/superuser) becomes krb5i.
- krb5p - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is Kerberos v5 with privacy service. The effective security type of the incoming request (to be used subsequently in evaluation of rrule/superuser) becomes krb5p.
- ntlm - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is CIFS NTLM. The effective security type of the incoming request (to be used subsequently in evaluation of rrule/superuser) becomes ntlm.
• **any** - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume regardless of the security type of that incoming request. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) remains the same as the security type of the incoming request.

  **Note:** If the security type of the incoming request is AUTH_NONE, read access will be granted to that incoming request as an anonymous user.

• **none** - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume as an anonymous user if the security type of that incoming request is not explicitly listed in the list of values in the rorule. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes none.

• **never** - For an incoming request from a client matching the clientmatch criteria, do not allow any access to the volume regardless of the security type of that incoming request.

You can specify a comma-separated list of multiple security types for an export rule. If you specify the security type as *any* or *never*, you cannot specify any other security types.

  **Note:** For an incoming request from a client matching the clientmatch criteria, if the security type doesn’t match any of the values listed in rorule (as explained above), access will be denied to that incoming request.

[-rwrule <authentication method>,...] - RW Access Rule

If you specify this parameter, the command displays information only about the export rule or rules that have the specified read-write rule. Possible values include the following:

• **sys** - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the effective security type (determined from rorule) of that incoming request is AUTH_SYS.

• **krb5** - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the effective security type (determined from rorule) of that incoming request is Kerberos 5.

• **krb5i** - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the security type of that incoming request is Kerberos v5 with integrity service. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes krb5i.

• **krb5p** - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the security type of that incoming request is Kerberos v5 with privacy service. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes krb5p.

• **ntlm** - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the effective security type (determined from rorule) of that incoming request is CIFS NTLM.

• **any** - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume regardless of the effective security type (determined from rorule) of that incoming request.

  **Note:** If the effective security type (determined from rorule) of the incoming request is none, write access will be granted to that incoming request as an anonymous user.

• **none** - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume as an anonymous user if the effective security type (determined from rorule) of that incoming request is none.

• **never** - For an incoming request from a client matching the clientmatch criteria, do not allow write access to the volume regardless of the effective security type (determined from rorule) of that incoming request.

You can specify a comma-separated list of multiple security types for an export rule. If you specify the security type as *any* or *never*, you cannot specify any other security types.
**Note:** For an incoming request from a client matching the clientmatch criteria, if the effective security type (determined by rorule) doesn't match any of the values listed in rwrule (as explained above), write access will be denied to that incoming request.

[-anon <text>] - User ID To Which Anonymous Users Are Mapped

If you specify this parameter, the command displays information only about the export rule or rules that have the specified anonymous ID.

[-superuser <authentication method>, ...] - Superuser Security Types

If you specify this parameter, the command displays information only about the export rule or rules that have the specified superuser security type. Possible values include the following:

- **sys**: For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume if the effective security type (determined from rorule) of that incoming request is AUTH_SYS.

- **krb5**: For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume if the effective security type (determined from rorule) of that incoming request is Kerberos v5.

- **krb5i**: For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is Kerberos v5 with integrity service. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes krb5i.

- **krb5p**: For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is Kerberos v5 with privacy service. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes krb5p.

- **ntlm**: For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume if the effective security type (determined from rorule) of that incoming request is CIFS NTLM.

- **any**: For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume regardless of the effective security type (determined by rorule) of that incoming request.

  **Note:** If the effective security type (determined from rorule) of the incoming request is none, access will be granted to that incoming request as an anonymous user.

- **none**: For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow access to the volume as an anonymous user if the effective security type (determined from rorule) of that incoming request is none.

- **never**: For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow access to the volume as an anonymous user regardless of the effective security type (determined from rorule) of that incoming request.

  **Note:** Only export rules that were created in an earlier release can have the superuser parameter set to the security type *never*.

You can specify a comma-separated list of multiple security types for superuser access. If you specify the security type as *any*, you cannot specify any other security types.

**Note:** For an incoming request from a client matching the clientmatch criteria and with the user ID 0, if the effective security type doesn't match any of the values listed in superuser (as explained above), the user ID is mapped to anonymous user.
[-allow-suid {true|false}] - Honor SetUID Bits in SETATTR
If you specify this parameter, the command displays information only about the export rule or rules that have
the specified setting for set user ID (suid) and set group ID (sgid) access.

[-allow-dev {true|false}] - Allow Creation of Devices
If you specify this parameter, the command displays information only about the export rule or rules that have
the specified setting for the creation of devices.

[-ntfs-unix-security-ops {ignore|fail}] - NTFS Unix Security Options (privilege: advanced)
If you have specified this parameter for a particular export policy rule, then the command displays information
about the UNIX security options that apply to that export policy rule. The setting can either prohibit (with value
fail) or allow (with value ignore) UNIX-type permissions changes on NTFS (Windows) volumes
when the request originates from an NFS client. If the Vserver NTFS UNIX security option is set to fail or
allow for the Vserver, then this parameter is overridden.

[-ntfs-unix-security-ops-vs {fail|ignore|use-export-policy}] - Vserver NTFS Unix Security Options
(privilege: advanced)
If you specify this parameter, the command displays information about the UNIX security options that apply
to all volumes in this Vserver. The setting can prohibit (with value fail) or allow (with value ignore)
UNIX-type permissions changes on NTFS (Windows) volumes when the request originates from an NFS
client, or you can set it to use-export-policy. If you set this parameter to fail or allow, this parameter
overrides the individual UNIX security options set for the export policy rules. If you set this parameter to
use-export-policy, the UNIX security options associated with the respective export policy rule is used.

[-chown-mode {restricted|unrestricted}] - Change Ownership Mode (privilege: advanced)
If you have specified this parameter for a particular export policy rule, then the command displays information
about the change ownership mode that applies to that export-policy rule. The setting can either allow only the
root (with value restricted) or all users (with value unrestricted) to change ownership of the files that
they own. If the Vserver NTFS change ownership mode is set to restricted or unrestricted for the Vserver, then
this parameter is overridden.

[-chown-mode-vs {restricted|unrestricted|use-export-policy}] - Vserver Change Ownership Mode
(privilege: advanced)
If you specify this parameter, the command displays information about the change ownership mode that
applies to all volumes in this Vserver. The setting can allow only the root (with value restricted) or all
users (with value unrestricted) to change ownership of the files that they own, or you can set it to use-
export-policy. If you set this parameter to restricted or unrestricted, this parameter overrides the
individual change ownership mode set for the export policy rules. If you set this parameter to use-export-
policy, the change ownership mode associated with the respective export policy rule is used.

### Examples
The following example displays information about all export rules:

<table>
<thead>
<tr>

**vserver fcp commands**

Manage the FCP service on a Vserver

Commands used for managing the FCP service configuration of a Vserver.

**vserver fcp create**

Create FCP service configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

This command creates an FCP service for a Vserver. An FCP service must be licensed before you can manage FCP services. If the FCP service is not licensed, the FCP command returns an error.

When you create an FCP service on a Vserver, the Vserver has the following configuration defaults:

- The administrative status of the FCP service is *up*.
- The FCP command automatically generates a unique World Wide Node Name (WWNN) unless you specify one.

The format for a WWNN is `XX:XX:XX:XX:XX:XX:XX:XX` where `X` is a hexadecimal digit. When selecting a new WWNN, use the following format to fit with the registered names: `2X:XX:00:a0:98:XX:XX:XX` where `XX` is some integral value. If your unique WWNN does not match this format, use the `-f` parameter. To modify a target-name, use the *vserver fcp modify* command. The default value is *up*.

**Parameters**

- **-vserver <Vserver Name>** - Vserver Name
  - Specifies the Vserver for the FCP service.

- **[-target-name <text>]** - Target Name (privilege: advanced)
  - Specifies the World Wide Node Name (WWNN). The format for a WWNN is `XX:XX:XX:XX:XX:XX:XX:XX` where `X` is a hexadecimal digit.

- **[-status-admin {down|up}]** - Administrative Status
  - Specifies the administrative status of the FCP service of a Vserver. If you set this parameter to *up*, the FCP service will accept login requests from FCP initiators. If you set this parameter to *down*, FCP initiators will not be allowed to log in.

- **[-force | -f [true]]** - Force (privilege: advanced)
  - Allows you to use a World Wide Node Name outside the Vendor's registered namespace. If you use this parameter without a value, it is set to *true*, and the command does not prompt you when the WWNN is outside the Vendor's registered namespace.

**Examples**

```
cluster1::> vserver fcp create -vserver vs_1
```

**Related references**

*vserver fcp modify* on page 1583
vserver fcp delete
Delete FCP service configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
Deletes an FCP service of a Vserver. Before you can delete an FCP service, the administration status must be down. Use the vserver fcp modify command to change the administration status.

Parameters
-vserver <Vserver Name> - Vserver Name
   Specifies the Vserver for the FCP service.

Examples
   cluster1::> vserver fcp delete -vserver vs_1

Related references
   vserver fcp modify on page 1583

vserver fcp modify
Modify FCP service configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command modifies an FCP service configuration on a Vserver.

If the target name provided is outside the vendor's namespace, the user must verify that the target name is unique outside the cluster. The vendor cannot verify that the target name is unique outside the cluster if the vendor did not generate the target name.

Parameters
-vserver <Vserver Name> - Vserver Name
   Specifies the Vserver for the FCP service.

-[target-name <text>] - Target Name (privilege: advanced)
   Specifies the World Wide Node Name (WWNN). The format for a WWNN is XX:XX:XX:XX:XX:XX:XX:XX where X is a hexadecimal digit.

-[status-admin {down|up}] - Administrative Status
   Specifies the administrative status of the FCP service of a Vserver. If you set this parameter to up, the FCP service begins to accept login requests from FCP initiators. If you set this parameter to down, FCP initiators cannot log in.

-[force | f [true]] - Force (privilege: advanced)
   Allows you to use a World Wide Node Name outside the Vendor's registered namespace. If you use this parameter without a value, it is set to true, and the command does not prompt you when the WWNN is outside the Vendor's registered namespace.
vserver fcp show

Display FCP service configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
Displays the current status of the FCP service in a cluster.

Parameters

{-fields <fieldname>, ...}
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

[-instance ]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver Name
Use this parameter to display the FCP services that match the Vserver that you specify.

[-target-name <text>] - Target Name
Use this parameter to display the FCP service that matches the target name that you specify.

[-status-admin {down|up}] - Administrative Status
Use this parameter to display the FCP services that match the administrative status that you specify.

Examples

cluster1::> vserver fcp show

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Target Name</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs0</td>
<td>20:00:00:a0:98:0c:b0:eb</td>
<td>up</td>
</tr>
<tr>
<td>vs2</td>
<td>20:01:00:a0:98:0c:b0:eb</td>
<td>up</td>
</tr>
</tbody>
</table>

2 entries were displayed.

vserver fcp start

Starts the FCP service

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command starts the FCP service of a Vserver. When you start the FCP service, the logical interfaces are brought online. You must have a license before you can start the FCP service. Use system license add to enable the FCP license.

Parameters

-vserver <Vserver Name> - Vserver Name
Specifies the Vserver for the FCP service.
Examples

```
cluster1::> vserver fcp start -vserver vs_1
   (vserver fcp start)
```

Related references

*system license add* on page 1023

**vserver fcp stop**

Stops the FCP service

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

This command stops the FCP service of a Vserver. When you stop the FCP service, the operation status of all FCP logical interfaces in the Vserver will be *down*.

**Parameters**

- `vserver <Vserver Name>` - Vserver Name

  Specifies the Vserver for the FCP service.

**Examples**

```
cluster1::> vserver fcp stop -vserver vs_1
   (vserver fcp stop)
```

**vserver fcp interface commands**

The interface directory

Commands used for managing FCP data logical interfaces for a Vserver.

**vserver fcp interface show**

Display configuration information for an FCP interface

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

This command displays FCP logical interface information. If you do not specify a Vserver, the command displays all of the FCP data interfaces of a cluster.

**Parameters**

`[-fields <fieldname>, ...]`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

`[-instance]`

If you specify the `-instance` parameter, the command displays detailed information about all fields.
- `vserver <Vserver Name>` - Vserver
  Use this parameter with other options to display information about FCP logical interfaces scoped to the specified Vserver.

- `lif <lif-name>` - Logical Interface
  Use this parameter to display FCP logical interfaces that match the names of logical interfaces that you specify. You can provide a partial logical interface name, and press tab to complete the name or the closest match.

- `wwpn <text>` - WWPN
  Use this parameter to display FCP logical interfaces that match the World Wide Port Name (WWPN) that you specify.

- `wwnn <text>` - WWNN
  Use this parameter to display FCP logical interfaces that match the World Wide Node Name (WWNN) that you specify.

- `status-admin {up|down}` - Administrative Status
  Specifies the configured status of the FCP logical interface. If you set this parameter to `up` the command displays all FCP logical interfaces with the administrative status of `up` If you set this parameter to `down` the command displays all the FCP logical interfaces with the administrative status of `down`.

- `status-oper {up|down}` - Operational Status
  Specifies the current status of the FCP logical interface. If you set this parameter to `up` the command displays all the FCP logical interfaces with the operational status of `up` If you set this parameter to `down` the command displays all the FCP logical interfaces with the operational status of `down`.

- `status-extended <text>` - Extended Status
  Use this parameter to display more detailed information on the status of the FCP logical interface that you specify.

- `port-address <Hex Integer>` - Host Port Address
  Use this parameter to display FCP logical interfaces that match the host port address that you specify.

- `curr-node <nodename>` - Current Node
  Use this parameter to display FCP logical interfaces that are on the node that you specify.

- `curr-port {<netport>|<ifgrp>}` - Current Port
  Use this parameter to display FCP logical interfaces that are on the port that you specify.

- `is-home {true|false}` - Is Home
  Specifies whether the node hosting the FCP interface is the initially configured node. If you use this command without using this parameter, it is set to true, and the command displays all FCP interfaces that are on the initially configured node.

- `relative-port-id <integer>` - Relative Port ID
  Use this parameter to display FCP logical interfaces that match the relative target port ID that you specify. The system assigns each LIF and target portal group a relative target port ID that is Vserver unique. You cannot change this ID.

### Examples

<table>
<thead>
<tr>
<th>Logical Vserver</th>

vserver fcp ping-igroup commands

The FCP ping igroup directory

Command for performing a connectivity check (ping) between the FCP initiators of an initiator group (igroup) and the FCP LIFs for which they are configured.

vserver fcp ping-igroup show

Ping FCP by Igroup

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command performs a connectivity check (ping) between the FCP initiators of an igroup and the FCP LIFs for which they are configured.

Parameters

{ [-fields <fieldname>, ...] If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance} If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver
Use this parameter to select the Vservers that contain initiators and FCP LIFs.

[-igroup <text>] - Igroup Name
Use this parameter to select the FCP initiators that belong to the specified igroup and FCP LIFs that belong to the portset that is bound to the igroup. If the igroup is not bound to a portset, then the default portset (all FCP LIFs in the Vserver), is used.

[-wwpn <text>] - FCP initiator WWPN
Use this parameter to select the FCP initiator WWPN.

[-lif <text>] - LIF Name
Use this parameter to limit the test to a subset of the FCP LIFs available for the igroup.

[-portset <text>] - Portset
Use this parameter to select igroups bound to the specified portset.

[-node <nodename>] - Node
Use this parameter to select the nodes that contain the specified FCP LIFs.

[-status {unknown|reachable|not-reachable|not-zoned|cannot-ping-same-wwpn|fcp-service-busy|lif-is-down|zone-info-not-available}] - Ping Status
Use this parameter to select the status of FCP ping command.

[-ext-status {logged-in|not-logged_in|not-in-fabric}] - Extended Status
Use this parameter to select the extended status of FCP ping command.

[-check-fabric [true]] - Query Fabric Records (privilege: advanced)
Use this parameter to query the unzoned name server for the FCP initiator WWPN.
vserver fcp initiator commands

The initiator directory
Commands for managing the active initiators for an FCP service.

vserver fcp initiator show

Display FCP initiators currently connected

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command displays information about FCP initiators that are currently logged in.

If you do not specify a Vserver, the command displays all initiators logged into all FCP Vservers within a cluster. If you specify a Vserver but not a logical interface, the command displays information about all initiators connected to all logical interfaces within the specified Vserver.

If an initiator belongs to an initiator group or has a World Wide Port Name (WWPN) alias, the command displays this information.

Parameters

\[-fields <fieldname>, ...\]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

\[-instance\]
If you specify the -instance parameter, the command displays detailed information about all fields.

\[-vserver <Vserver Name>\] - Vserver
Use this parameter to display the FCP initiators logged into the Vserver that you specify.

\[-lif <lif-name>\] - Logical Interface
Use this parameter to display the FCP initiators that match the logical interfaces that you specify.

\[-wwpn <text>\] - Initiator WWPN
Use this parameter to display the FCP initiators that matches the World Wide Port Name (WWPN) that you specify.

\[-port-address <Hex Integer>\] - Port Address
Use this parameter to display FCP initiators that match the port address that you specify.

\[-wwnn <text>\] - Initiator WWNN
Use this parameter to display the FCP initiator that matches the World Wide Node Name (WWNN) that you specify.
[-alias <text>, ...] - Initiator WWPN Alias

Use this parameter to display the FCP initiator that matches the alias name that you specify.

[-igroup <text>, ...] - Igroup Name

Use this parameter to display the FCP initiator that matches the initiator group that you specify.

Examples

```
cluster1::> vserver fcp initiator show
Logical  Initiator  Initiator
Vserver  Interface  WWNN          WWPN          Igroup
--------- ---------- -------------- ------------- -------------------------
vs1       vs1.fcp   2f:a2:00:a0:98:0b:56:13
           2f:a2:00:a0:98:0b:56:15
           igroup1
```

vserver fcp ping-initiator commands

The ping directory

Command for performing a connectivity check (ping) between FCP initiators and FCP LIFs.

vserver fcp ping-initiator show

Ping FCP initiator

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command performs a connectivity check (ping) between FCP initiators and FCP LIFs.

Parameters

{ [-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

[-instance]
  If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver
  Use this parameter to select the Vservers that contain FCP initiators and FCP LIFs.

[-wwpn <text>] - Remote WWPN
  Use this parameter to select the remote WWPN (most likely, FCP initiator).

[-lif <text>] - LIF Name
  Use this parameter to limit the test to a subset of the FCP LIFs available for the igroup.

[-check-fabric [true]] - Query Fabric Records (privilege: advanced)
  Use this parameter to query the unzoned name server for the FCP initiator WWPN.

[-node <nodename>] - Node
  Use this parameter to select the nodes that contain the specified FCP LIFs.

[-status {unknown|reachable|not-reachable|not-zoned|cannot-ping-same-wwpn|fcp-service-busy|lif-is-down|zone-info-not-available}] - Ping Status
  Use this parameter to select the result of FCP ping command.
[-ext-status \{logged-in|not-logged_in|not-in-fabric\}] - Extended Status

Use this parameter to select the extended result of FCP ping command.

---

**vserver fcp portname commands**

The portname directory

Commands used for managing the World Wide Port Names (WWPN) of FCP data logical interfaces in a Vserver.

**vserver fcp portname set**

Assigns a new WWPN to a FCP adapter

**Availability:** This command is available to cluster and Vserver administrators at the advanced privilege level.

**Description**

This command assigns a new World Wide Port Name (WWPN) to a logical interface. The administration status of logical interface must be down before you can change the WWPN.

Use the `network interface modify` to change the administration status of the logical interface.

**Parameters**

- `-vserver <Vserver Name>` - Vserver
  
  Specifies the Vserver.

- `-lif <lif-name>` - Logical Interface
  
  Specifies the logical interface to which you want to assign a new WWPN.

- `-wwpn <text>` - FCP Adapter WWPN
  
  Specifies the WWPN that you want to change.

- `[-force | -f [true]]` - Force
  
  Allows you to use a WWPN that is not in the format 2X:XX:0a:09:80:XX:XX:XX when set to true. If you use this parameter without a value, it is set to true, and the command does not prompt you when the WWNN does not follow this format.

### Examples

```
cluster1::*> vserver fcp portname set -vserver vs_1 -lif vs_1.fcp -wwpn 2f:a2:00:a0:98:0b:56:13
```

**Related references**

`network interface modify` on page 287
vserver fcp portname show

Display WWPN for FCP logical interfaces

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command displays a list of World Wide Port Names (WWPN) that are used by the FCP logical interfaces.

Parameters

{ [-fields <fieldname>, ...] 
    If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.
}

[[-instance]]
If you specify the -instance parameter, the command displays detailed information about all fields.

[vserver <Vserver Name>] - Vserver
Use this parameter to display a list of FCP logical interfaces and their WWPNs that match the Vserver name you specify.

[-lif <lif-name>] - Logical Interface
Use this parameter to display a list of FCP logical interfaces and their WWPNs that match the logical interface that you specify. You can use wildcards in the logical interface to display a specific group of logical interfaces.

[-wwpn <text>] - WWPN
Use this parameter to display a list of FCP logical interfaces and their WWPNs that match the WWPN that you specify. You can use wildcards in the WWPN to display a specific group of WWPNs.

vserver fcp wwn commands

The wwn directory

vserver fcp wwn blacklist commands

Manage blacklisted WWNs

The vserver fcp wwn blacklist commands manage blacklisted WWNs.

A blacklisted WWN is a WWN that is prohibited for use as either a fiber channel protocol service WWNN or a fiber channel data LIF WWPN.
vserver fcp wwn blacklist show
Displays the blacklisted WWNs

**Availability:** This command is available to cluster administrators at the advanced privilege level.

**Description**
This command displays WWNs that have been blacklisted from re-use.
A blacklisted WWN is a WWN that is prohibited for use as either a fiber channel protocol service WWNN or a fiber channel data LIF WWPN.

**Parameters**

[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use ‘-fields ?’ to display the fields to specify.

|-instance]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-wwn <text>] - World Wide Name
Selects the blacklisted WWNs that match the parameter value.

[-vserver <Vserver Name>] - Vserver Name
Selects the blacklisted WWNs that were previously assigned to the Vserver(s) that match the parameter value.

**Examples**

<table>
<thead>
<tr>
<th>01:02:03:04:05:06:07:08</th>
<th>vs1</th>
</tr>

vserver fcp wwpn-alias commands
The wwpn-alias directory
Commands used for managing the WWPN Aliases of active initiators for an FCP service.

vserver fcp wwpn-alias remove
Removes an alias for a World Wide Port Name of an initiator.

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
This command removes an alias from a World Wide Port Name (WWPN).

**Parameters**

- -vserver <Vserver Name> - Vserver Name
  Specifies the Vserver.

{ -alias | -a <text>, ... - Initiator WWPN Alias
  Specifies the alias of the WWPN that you want to remove.
vserver fcp wwpn-alias remove

Specifies the WWPN.

Examples

```
cluster1::> vserver fcp wwpn-alias remove -vserver vs_1 -wwpn 2f:a0:00:a0:98:0b:56:13
```

On Vserver vs_1, removes all the aliases on WWPN 2f:a0:00:a0:98:0b:56:13.

```
cluster1::> vserver fcp wwpn-alias remove -vserver vs_1 -alias my_alias
```

vserver fcp wwpn-alias set

Set an alias for a World Wide Port Name of an initiator that might login to the target.

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

This command creates a new alias for a World Wide Port Name (WWPN). You can create multiple aliases for a WWPN, but you cannot use the same alias for multiple WWPNs.

An alias name is a case-sensitive name that must contain one to 32 characters. Spaces are not allowed.

Parameters

- `-vserver <Vserver Name>` - Vserver Name
  Specifies the Vserver.

- `-alias | -a <text>` - Initiator WWPN Alias
  Specifies the alias of the WWPN.

- `-wwpn | -w <FC WWN>` - Initiator WWPN
  Specifies the WWPN.

[-`force | -f [true]` - Force
  Allows you to override a WWPN associated with an existing alias with a newly specified WWPN. If you use this parameter without a value, it is set to true, and the command does not prompt you when you override an existing alias.

Examples

```
cluster1::> vserver fcp wwpn-alias set -vserver vs_1 -alias my_alias -wwpn 2f:a0:00:a0:98:0b:56:13
```

vserver fcp wwpn-alias show

Displays a list of the WWPN aliases configured for initiators

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

This command displays aliases associated with World Wide Port Names (WWPN).

Note: You can also use these commands to display WWPN aliases:
• `lun igroup show`
• `lun igroup create`
• `lun igroup add`
• `lun igroup remove`
• `vserver fcp show`

## Parameters

\[ [-\text{fields <fieldname>}, ...] \]

If you specify the `\text{-fields <fieldname>, ...}` parameter, the command output also includes the specified field or fields. You can use `\text{-fields ?}` to display the fields to specify.

\[ [-\text{instance}] \]

If you specify the `\text{-instance}` parameter, the command displays detailed information about all fields.

\[ [-\text{vserver <Vserver Name>} - \text{Vserver Name}] \]

Use this parameter to display a list of WWPNs and the associated aliases that match the Vserver name that you specify.

\[ [-\text{alias} | -a <text>] - \text{Initiator WWPN Alias} \]

Use this parameter to display the WWPN that matches the alias that you specify.

\[ [-\text{wwpn} | -w <FC WWN>] - \text{Initiator WWPN} \]

Use this parameter to display a list of aliases that match the WWPN that you specify.

### Examples

```
cluster1::> vserver fcp wwpn-alias show
Initiator               Initiator
Vserver   WWPN                    Alias
--------- ----------------------- ------------------
vs1       2f:a0:00:a0:98:0b:56:13 my_alias
```

## vserver fpolicy commands

Manage FPolicy

### vserver fpolicy disable

Disable a policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.
Description
The `vserver fpolicy disable` command disables an FPolicy policy for the specified Vserver.

**Note:** This command is not supported for a Vserver with Infinite Volume.

Parameters
-vserver <Vserver Name> - Vserver
This parameter specifies the name of the Vserver on which you want to disable an FPolicy policy.

-policy-name <Policy name> - Policy
This parameter specifies the name of the FPolicy policy you want to disable.

Examples
The following command disables an FPolicy policy.

```
cluster1::> vserver fpolicy show
Vserver                 Policy Name                    Sequence  Status   Engine
----------------------- ------------------------------ --------  -------  -----
vs1.example.com         vs1_pol                               -  off      native
vs2.example.com         vs2_pol                               5  on       external
2 entries were displayed.
cluster1::> vserver fpolicy disable -vserver vs2.example.com -policy-name vs2_pol
cluster1::> vserver fpolicy show
Vserver                 Policy Name                    Sequence  Status   Engine
----------------------- ------------------------------ --------  -------  -----
vs1.example.com         vs1_pol                               -  off      native
vs2.example.com         vs2_pol                               -  off      external
2 entries were displayed.
```

**vserver fpolicy enable**

Enable a policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description
The `vserver fpolicy enable` command enables FPolicy policies for the specified Vserver and sets their sequence (priority). The sequence is used when multiple policies have subscribed to the same file access event. To modify the sequence number of a policy, the administrator must disable the policy (if it is enabled) and then use this command to enable it with the new sequence number. Policies that use the *native* engine configuration will have a higher priority than policies for any other engine, regardless of the sequence number assigned to them.

**Note:** This command is not supported for a Vserver with Infinite Volume.

Parameters
-vserver <Vserver Name> - Vserver
This parameter specifies the name of the Vserver on which you want to enable an FPolicy policy. The Vserver administrator can enable FPolicy policies created within the scope of the Vserver and can also enable an FPolicy policy created by the cluster administrator. The cluster administrator can enable FPolicy policies for any Vserver but cannot enable them with a scope of cluster. The scope is determined at a Vserver level.

-policy-name <Policy name> - Policy
This parameter specifies the name of the FPolicy policy you want to enable.
-sequence-number <integer> - Policy Sequence Number

This parameter specifies the sequence number which will be assigned to the policy.

### Examples

The following command enables an FPolicy policy.

```
cluster1::> vserver fpolicy show
Vserver   Policy Name     Sequence Status   Engine
----------------------- ------------------------------ --------  ------  ------
vs1.example.com         vs1_pol                               -  off    native
vs2.example.com         vs2_pol                               -  off    external
2 entries were displayed.
```

```
cluster1::> vserver fpolicy enable -vserver vs2.example.com -policy-name vs2_pol -sequence-number 5
```

```
cluster1::> vserver fpolicy show
Vserver   Policy Name     Sequence Status   Engine
----------------------- ------------------------------ --------  ------  ------
vs1.example.com         vs1_pol                               -  off    native
vs2.example.com         vs2_pol                               5  on       external
2 entries were displayed.
```

### vserver fpolicy engine-connect

Establish a connection to FPolicy server

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**

The `vserver fpolicy engine-connect` command connects an FPolicy server to a specified node. Connecting the FPolicy server to a node enables FPolicy processing, providing the FPolicy configuration is complete. Before connecting an FPolicy server to a node, you must configure FPolicy by completing the following tasks:

- Create an FPolicy event
- Create an FPolicy external engine
- Create an FPolicy policy
- Create a scope for the FPolicy policy

**Note:** The FPolicy event and external engine must be attached to the FPolicy policy.

**Note:** The FPolicy policy should be enabled.

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**

- `-node <nodename> | local` - Node
  
  This parameter specifies the node that you want to connect to the FPolicy server. The value local specifies the current node.

- `-vserver <Vserver Name>` - Vserver
  
  This parameter specifies the Vserver that you want to connect to the specified FPolicy server using the specified FPolicy policy.
-policy-name <Policy name> - Policy
This parameter specifies the name of the FPolicy policy that is attached to an external engine.

-server <IP Address> - Server
This parameter specifies the FPolicy server to which you want to connect the node. The specified server must be present in the external engine configuration of the above specified policy.

Examples
The following example connects an FPolicy server.

```
cluster1::> vserver fpolicy engine-connect -node FPolicy-01 -vserver vs1.example.com -policy-name p -server 1.1.1.1
cluster1::> vserver fpolicy show
```

<table>
<thead>
<tr>
<th>FPolicy</th>
<th>Policy</th>
<th>Node</th>
<th>Server</th>
<th>Server-status</th>
<th>Server-type</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1.example.com</td>
<td>p</td>
<td>FPolicy-01</td>
<td>1.1.1.1</td>
<td>connected</td>
<td>primary</td>
</tr>
</tbody>
</table>

vserver fpolicy engine-disconnect
Terminate connection to FPolicy server

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver fpolicy engine-disconnect command disconnects an FPolicy server from a specified node.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters
-node {<nodename>|local} - Node
This parameter specifies the node that you want to disconnect from the FPolicy server. The value local specifies the current node.

-vserver <Vserver Name> - Vserver
This parameter specifies the Vserver that you want to disconnect from the specified FPolicy server with the specified attached FPolicy policy.

-policy-name <Policy name> - Policy
This parameter specifies the name of the FPolicy policy that is attached with an external engine.

-server <IP Address> - Server
This parameter specifies the FPolicy server you want to disconnect. The specified server must be present in the external engine configuration of the above specified FPolicy policy.

Examples
The following example disconnects an FPolicy server.

```
cluster1::> vserver fpolicy engine-disconnect -node FPolicy-01 -vserver vs1.example.com -policy-name p -server 1.1.1.1
```
vserver fpolicy prepare-to-downgrade

Restore the FPolicy configuration to Earlier Release of Data ONTAP

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The vserver fpolicy prepare-to-downgrade command restores the FPolicy configurations for Data ONTAP based on the input parameter disable-feature-set.

Parameters
-disable-feature-set <downgrade version> - Data ONTAP Version

This parameter specifies the Data ONTAP version that introduced the new FPolicy features and needs to be restored. The value can be one of the following:

- 9.0.0 - Disables the FPolicy features introduced in Data ONTAP release 9.0.0. These features include:
  - FPolicy filters for setattr operation.
  - FPolicy filter exclude-directory for directory operations.
  - FPolicy Async Resiliency feature.
  - FPolicy "Monitor Objects With No Extension" feature.

Examples

cluster1::*> vserver fpolicy prepare-to-downgrade -disable-feature-set 9.0.0

vserver fpolicy show

Display all policies with status

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver fpolicy show command displays status information about all FPolicy policies in the Vserver. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all FPolicy policies:

- Vserver name
- Policy name
- Sequence number
- Status
You can specify the `-fields` parameter to specify which fields of information to display about FPolicy policies.

You can specify the `-instance` parameter to display information for all FPolicy policies in a list format.

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**

| `-fields <fieldname>, ...` | If you specify the `-fields <fieldname>, ...` parameter, the command only displays the fields that you specify.
|---------------------------|--------------------------------------------------|
| `-instance`              | If you specify the `-instance` parameter, the command displays detailed information about all entries.
| `-vserver <Vserver Name>` | Vserver
| If you specify this parameter, the command displays information only about the FPolicy policies for the specified Vserver.
| `-policy-name <Policy name>` | Policy
| If you specify this parameter, the command displays information only about the FPolicy policy that you specify.
| `-sequence-number <integer>` | Sequence Number
| If you specify this parameter, the command displays information only about the FPolicy policy or policies that use the specified sequence-number.
| `-status {on|off}` | Status
| If you specify this parameter, the command displays information only about the FPolicy policy or policies that use the specified status.
| `-engine <Engine name>` | FPolicy Engine
| If you specify this parameter, the command displays information only about the FPolicy policy or policies that use the specified engine.

**Examples**

The following example displays the information about FPolicy policies on the cluster using the `vserver fpolicy show` command.

```
cluster1::> vserver fpolicy show

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Policy Name</th>
<th>Sequence Number</th>
<th>Status</th>
<th>Engine</th>
</tr>
</thead>
<tbody>
<tr>
<td>FPolicy</td>
<td>cserver_policy</td>
<td>-</td>
<td>off</td>
<td>eng1</td>
</tr>
<tr>
<td>vs1.example.com</td>
<td>vlp1</td>
<td>-</td>
<td>off</td>
<td>eng2</td>
</tr>
<tr>
<td>vs1.example.com</td>
<td>vlp2</td>
<td>-</td>
<td>off</td>
<td>native</td>
</tr>
<tr>
<td>vs1.example.com</td>
<td>cserver_policy</td>
<td>-</td>
<td>off</td>
<td>native</td>
</tr>
<tr>
<td>vs2.example.com</td>
<td>vlp1</td>
<td>3</td>
<td>on</td>
<td>native</td>
</tr>
<tr>
<td>vs2.example.com</td>
<td>vlp2</td>
<td>1</td>
<td>on</td>
<td>eng3</td>
</tr>
<tr>
<td>vs2.example.com</td>
<td>cserver_policy</td>
<td>2</td>
<td>on</td>
<td>eng1</td>
</tr>
</tbody>
</table>
8 entries were displayed.
```

**vserver fpolicy show-enabled**

Display all enabled policies

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.
Description

The vserver fpolicy show-enabled command displays information about all enabled policies in the Vserver. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all FPolicy policies:

- Vserver name
- Policy name
- Priority

You can specify the -fields parameter to specify which fields of information to display about FPolicy policies.

You can specify the -instance parameter to display information for all FPolicy policies in a list format.

**Note:** This command is not supported for a Vserver with Infinite Volume.

Parameters

```bash
[-fields <fieldname>, ...]
```

If you specify the -fields <fieldname>, ... parameter, the command only displays the fields that you specify.

```bash
[-instance]
```

If you specify the -instance parameter, the command displays detailed information about all entries.

```bash
[-vserver <vserver>] - Vserver
```

If you specify this parameter, the command displays information only about the FPolicy policies for the specified Vserver.

```bash
[-policy-name <Policy name>] - Policy Name
```

If you specify this parameter, the command displays information only about the FPolicy policy that you specify.

```bash
[-priority <text>] - Policy Priority
```

If you specify this parameter, the command displays information only about the FPolicy policies with the policy priority that you specify.

Examples

The following example displays the information about enabled FPolicy policies on the cluster.

```
cluster1::> vserver fpolicy show-enabled
Vserver     Policy Name      Priority
----------------------- ------------------ ------
vs1.example.com pol_native    native
vs1.example.com pol_native2   native
vs1.example.com poll          2
vs1.example.com po12         4
```

**vserver fpolicy show-engine**

Display FPolicy server status

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.
Description
The `vserver fpolicy show-engine` command displays status information for all FPolicy external engines or displays status information only for FPolicy servers for a specified Vserver. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information for all FPolicy servers:

- Vserver name
- Node name
- FPolicy policy name
- FPolicy server IP Address
- FPolicy server status
- FPolicy server type

You can specify the `-fields` parameter to specify which fields of information to display about FPolicy servers. You can specify specific parameters to display only information that matches those parameters. For instance, to display information only about all FPolicy servers (external engines) that are connected, run the command with the `-fields` parameter set to server and `-server-status` parameter set to connected.

You can specify the `-instance` parameter to display all information for all policies in the list form.

**Note:** This command is not supported for a Vserver with Infinite Volume.

Parameters

```
[-fields <fieldname>, ...]
```
If you specify the `-fields <fieldname>, ...` parameter, the command only displays the fields that you specify.

```
[-instance]
```
If you specify the `-instance` parameter, the command displays detailed information about all entries.

```
-node <nodename>|local]
```
If you specify this parameter, the command displays information only about the FPolicy external engine attached to the specified node.

```
-vserver <Vserver Name>
```
If you specify this parameter, the command displays information only about the FPolicy server for the specified Vserver.

```
-policy-name <Policy name>
```
If you specify this parameter, the command displays information only about the FPolicy servers that are attached with the specified policy.

```
-server <IP Address>
```
If you specify this parameter, the command displays information only about the FPolicy servers that you specify.

```
-server-status <Status>
```
If you specify this parameter, the command displays information only about the FPolicy servers that have the specified status.

```
-server-type <Server Type>
```
If you specify this parameter, the command displays information only about the FPolicy servers that have the specified server type.
[-connected-since <MM/DD/YYYY HH:MM:SS>] - Time FPolicy Server was Connected

If you specify this parameter, the command displays information only about the FPolicy servers that have been connected since the specified time.

[-disconnected-since <MM/DD/YYYY HH:MM:SS>] - Time FPolicy Server was Disconnected

If you specify this parameter, the command displays information only about the FPolicy servers that have been disconnected since the specified time.

[-disconnect-reason <text>] - Reason for FPolicy Server Disconnection

If you specify this parameter, the command displays information only about the FPolicy servers that are disconnected because of the specified reason.

[-disconnect-reason-id <integer>] - ID for FPolicy Server Disconnection

If you specify this parameter, the command displays information about the FPolicy servers that are disconnected because of the specified disconnect reason ID. There is a unique ID associated with each disconnect reason, which can be used to identify the reason for FPolicy server disconnection.

[-session-id <text>] - Session ID

If you specify this parameter, the command displays information about the FPolicy server that is connected with the specified session ID. There is a unique session ID associated with each connection to FPolicy server, which can be used to identify the established connection.

Examples

This example displays information about all FPolicy servers (external engines).

```
cluster1::> vserver fpolicy show-engine
FPolicy Vserver Policy Node Server Server- Server-
---------- --------------- ----------- ------- -------- -------
vs2.example.com vs2_pol FPolicy-01 9.9.9.9 connected primary
vs1.example.com vs1_pol FPolicy-01 1.1.1.1 connected primary
2 entries were displayed.
```

This example displays information only about all connected FPolicy servers (external engines).

```
cluster1::> vserver fpolicy show-engine -fields server -server-status connected
node vserver policy-name server
---------- ---------- ------- -------
FPolicy-01 vs1.example.com vs1_pol 1.1.1.1
```

This example displays information about an FPolicy server.

```
cluster1::> vserver fpolicy show-engine -server 10.72.204.118 -instance

Node: fpol-01
Vserver: vserver_1.example.com
Policy: pol_cifs
Server: 10.72.204.118
Server Status: disconnected
Server Type: primary
Time FPolicy Server was Connected: -
Time FPolicy Server was Disconnected: 2/5/2013 05:06:22
Reason for FPolicy Server Disconnection: TCP Connection to FPolicy server failed.
ID for FPolicy Server Disconnection: 9307
Session ID: 
```
vserver fpolicy show-passthrough-read-connection

Display connection status for FPolicy passthrough-read

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver fpolicy show-passthrough-read-connection command displays the status of the passthrough-read connection from all FPolicy servers. Passthrough-read is a way to read data for offline files without restoring the files to primary storage. If you do not specify any parameters, the command displays following information about the passthrough-read connection from FPolicy servers:

- Vserver name
- FPolicy policy name
- Node name
- FPolicy server IP address
- Passthrough-read connection status

You can specify the -fields parameter to specify which fields of information to display. In addition to the fields above, you can display the following fields:

- Session ID of the control channel
- Time passthrough-read channel was connected
- Time passthrough-read channel was disconnected
- Reason for passthrough-read channel disconnection

You can specify the -instance parameter to display information for all passthrough-read connections in the list form.

Parameters

[-fields <fieldname>, ...]  
If you specify the -fields <fieldname>, ... parameter, the command only displays the fields that you specify.

[-instance]  
If you specify the -instance parameter, the command displays detailed information about all entries.

[-node <nodename> | local] - Node

If you specify this parameter, the command displays information only about the passthrough-read connections on the specified node.

[-vserver <Vserver Name>] - Vserver

If you specify this parameter, the command displays information only about the passthrough-read connections for the specified Vserver.

[-policy-name <Policy name>] - Policy

If you specify this parameter, the command displays information only about the passthrough-read connections that are attached with the specified FPolicy policy.

[-server <IP Address>] - Server

If you specify this parameter, the command displays information only about the passthrough-read connections from the specified FPolicy server.
[-control-session-id <text>] - Session ID of the Control Channel
If you specify this parameter, the command displays information only about the passthrough-read connections that are connected with the specified control session ID. The passthrough-read connection is attached to a control connection that has a unique control session ID.

[-server-status <Status of fpolicy passthrough-read connection>] - Server Status
If you specify this parameter, the command displays information only about the passthrough-read connections that have the specified status.

[-connected-since <MM/DD/YYYY HH:MM:SS>] - Time Channel Was Connected
If you specify this parameter, the command displays information only about the passthrough-read connections that have the specified connection time.

[-disconnected-since <MM/DD/YYYY HH:MM:SS>] - Time Channel Was Disconnected
If you specify this parameter, the command displays information only about the passthrough-read connections that have the specified disconnection time.

[-disconnect-reason <Reason for fpolicy passthrough-read disconnection>] - Reason for Disconnection
If you specify this parameter, the command displays information only about the passthrough-read connections that are disconnected because of the specified disconnect reason.

Examples
This example displays information about passthrough-read connections from all FPolicy servers.

cluster1::> vserver fpolicy show-passthrough-read-connection
+-------------+------------+------------+----------+
<table>
<thead>
<tr>
<th>FPolicy</th>
<th>Server</th>
<th>Vserver</th>
<th>Policy Name</th>
</tr>

</tbody>
</table>
+-------------+------------+------------+----------+

This example displays information about passthrough-read connections from FPolicy servers configured in an FPolicy policy.

cluster1::> vserver fpolicy show-passthrough-read-connection -policy-name pol_cifs_1 -instance

Node: FPolicy-01
Vserver: vs1.example.com
Policy: pol_cifs_1
Server: 2.2.2.2
Session ID of the Control Channel: 8ce0f012e-2502-11e3-8d84-23478563412
Server Status: connected
Time Passthrough Read Channel was Connected: 9/24/2013 10:17:45
vserver fpolicy policy commands

Manage FPolicy policies

vserver fpolicy policy create

Create a policy

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver fpolicy policy create command creates an FPolicy policy. You must create an FPolicy event name before creating an FPolicy policy. If you are using an external FPolicy server, you must also create an FPolicy engine before creating a policy.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters
-vserver <Vserver Name> - Vserver
This parameter specifies the name of the Vserver on which you want to create an FPolicy policy.

-policy-name <Policy name> - Policy
This parameter specifies the name of the FPolicy policy that you want to create. An FPolicy policy name can be up to 256 characters long and is a string that can only contain any combination of ASCII-range alphanumeric characters (a-z, A-Z, 0-9), "_" and ".".

-events <Event name>, ... - Events to Monitor
This parameter specifies a list of events to monitor for the FPolicy policy. All the events in the event list should be created by the administrator of the specified Vserver or the cluster administrator. The events must already exist. Create events using the fpolicy policy event create command.

-engine <Engine name> - FPolicy Engine
This parameter specifies an external engine for this FPolicy policy. An external engine contains information required by the node to send notifications to an FPolicy server. The Vserver administrator of the specified Vserver or the cluster administrator creates the external engine prior to creating the FPolicy policy. If this parameter is not specified, the default native external engine is used. The native external engine is internal to Data ONTAP and is used if you want to configure native file blocking and you do not want to use an external FPolicy server.

-is-mandatory {true|false} - Is Mandatory Screening Required
This parameter specifies what action to take on a file access event in a case when all primary and secondary servers are down or no response is received from the FPolicy servers within a given timeout period. When this parameter is set to true, file access events will be denied under these circumstances. To allow file access events under these circumstances, set this parameter to false. By default, it is true.

-allow-privileged-access {yes|no} - Allow Privileged Access
This parameter specifies privileged access for FPolicy servers. It is used to specify whether privileged access is required for FPolicy servers. Privileged access is used when the FPolicy server requires direct access to the cluster nodes. With this option set to yes, FPolicy servers can access files on the cluster using a separate data channel with privileged access. By default, it is no.
[-privileged-user-name <text>] - User Name for Privileged Access

This parameter specifies the privileged user name. It is used to specify the privileged user name for accessing files on the cluster using a separate data channel with privileged access. The input for this field should be in "domain\user name" format. If -allow-privileged-access is set to no, any value set for this field is ignored.

[-is-passthrough-read-enabled (true|false)] - Is Passthrough Read Enabled

This parameter specifies whether passthrough-read should be allowed for FPolicy servers registered for the policy. Passthrough-read is a way to read data for offline files without restoring the files to primary storage. Offline files are the files which have been moved to secondary storage. If passthrough-read is enabled, the FPolicy server provides the data for the file over a separate channel instead of restoring the file to primary storage. By default, this parameter is false.

**Examples**

The following example creates an FPolicy policy.

```bash
cluster1::> vserver fpolicy policy create -vserver vs1.example.com -policy-name vs1_pol -events cserver_evt,v1e1 -engine native -is-mandatory true -allow-privileged-access no -is-passthrough-read-enabled false

cluster1::> vserver fpolicy policy show -vserver vs1.example.com -policy-name vs1_pol

Vserver: vs1.example.com
Policy Name: vs1_pol
Events to Monitor: cserver_evt, v1e1
FPolicy Engine: native
Is Mandatory Screening Required: true
Allow Privileged Access: no
User Name for Privileged Access: -
Is Passthrough Read Enabled: false
```

**vserver fpolicy policy delete**

Delete a policy

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The vserver fpolicy policy delete command deletes an FPolicy policy.

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**

- `-vserver <Vserver Name>` - Vserver
  
  This parameter specifies the name of the Vserver from which you want to delete the FPolicy policy.

- `-policy-name <Policy name>` - Policy
  
  This parameter specifies the name of the FPolicy policy that you want to delete.

**Examples**

The following example deletes an FPolicy policy.
vserver fpolicy policy modify

Modify a policy

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver fpolicy policy modify command modifies an FPolicy policy.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters
-vserver <Vserver Name> - Vserver
This parameter specifies the name of the Vserver on which you want to modify an FPolicy policy.

-policy-name <Policy name> - Policy
This parameter specifies the name of the FPolicy policy that you want to modify. An FPolicy policy name can be up to 256 characters long and is a string that can only contain any combination of ASCII-range alphanumeric characters (a-z, A-Z, 0-9), \_ and ".".

-evts <Event name>, ... - Events to Monitor
This parameter specifies a list of events to monitor for the FPolicy policy. All the events in the event list should be created by the administrator of the specified Vserver or the cluster administrator. The events must already exist. Create events using the fpolicy policy event create command.

-engine <Engine name> - FPolicy Engine
This parameter specifies an external engine for this FPolicy policy. An external engine contains information required by the node to send notifications to an FPolicy server. The Vserver administrator of the specified Vserver or the cluster administrator creates the external engine prior to modifying the FPolicy policy. If this parameter is not specified, the default native external engine is used. The native external engine is internal to Data ONTAP and is used if you want to configure native file blocking and you do not want to use an external FPolicy server.

-is-mandatory {true|false} - Is Mandatory Screening Required
This parameter specifies what action to take on a file access event in a case when all primary and secondary servers are down or no response is received from the FPolicy servers within a given timeout period. When this parameter is set to true, file access events will be denied under these circumstances. To allow file access events under these circumstances, set this parameter to false. By default, it is true.

-allow-privileged-access {yes|no} - Allow Privileged Access
This parameter specifies privileged access for FPolicy servers. It is used to specify whether privileged access is required for FPolicy servers. Privileged access is used when the FPolicy server requires direct access to the cluster nodes. With this option set to yes, FPolicy servers can access files on the cluster using a separate data channel with privileged access. By default, it is no.

-privileged-user-name <text> - User Name for Privileged Access
This parameter specifies the privileged user name. It is used to specify the privileged user name for accessing files on the cluster using a separate data channel with privileged access. The input for this field should be in "domain\user name" format. If -allow-privileged-access is set to no, any value set for this field is ignored.
[-is-passthrough-read-enabled {true|false}] - Is Passthrough Read Enabled

This parameter specifies whether passthrough-read should be allowed for FPolicy servers registered for the policy. Passthrough-read is a way to read data for offline files without restoring the files to primary storage. Offline files are the files which have been moved to secondary storage. If passthrough-read is enabled, the FPolicy server provides the data for the file over a separate channel instead of restoring the file to primary storage. By default, this parameter is false.

Examples

The following example modifies an FPolicy policy.

```bash
cluster1::> vserver fpolicy policy modify -vserver vs1.example.com -policy-name vs1_pol -events
cserver_evt,v1e1
-engine native -is-mandatory true -allow-privileged-access no -is-passthrough-read-enabled false

cluster1::> vserver fpolicy policy show -vserver vs1.example.com -policy-name vs1_pol

Vserver: vs1.example.com
Policy Name: vs1_pol
Events to Monitor: cserver_evt, v1e1
FPolicy Engine: native
Is Mandatory Screening Required: true
Allow Privileged Access: no
User Name for Privileged Access: -
Is Passthrough Read Enabled: false
```

vserver fpolicy policy show

Display policy configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver fpolicy policy show command displays information about all FPolicy policies belonging to the Vserver. Any Vserver administrator can see FPolicy policies associated with their Vserver as well as policies created by the cluster administrator. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all FPolicy policies:

- Vserver name
- Policy name
- Events to monitor
- FPolicy engine
- Is mandatory screening required
- Allow privileged access
- User name for privileged access

You can specify the -fields parameter to specify which fields of information to display about FPolicy policies. You can specify additional parameters to display only information that matches those parameters. For example, to display information only about FPolicy policies where the FPolicy server requires privileged access, run the command with the -fields parameter set to policy-name (no "-".) and -allow-privileged-access parameter set to yes.
You can specify the `\-instance` parameter to display all information for all policies in the list form.

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command only displays the fields that you specify.

```
[-instance ]
```

If you specify the `-instance` parameter, the command displays detailed information about all entries.

```
[-vserver <Vserver Name>] - Vserver
```

If you specify this parameter, the command displays information only about the FPolicy policies for the specified Vserver. FPolicy policies created by the cluster administrator are visible for all Vservers.

```
[-policy-name <Policy name>] - Policy
```

If you specify this parameter, the command displays information only about the FPolicy policy that you specify.

```
[-events <Event name>, ...] - Events to Monitor
```

If you specify this parameter, the command displays information only about the FPolicy policy or policies that use the specified event or events.

```
[-engine <Engine name>] - FPolicy Engine
```

If you specify this parameter, the command displays information only about the FPolicy policy or policies that use the specified engine.

```
[-is-mandatory {true|false}] - Is Mandatory Screening Required
```

If you specify this parameter, the command displays information only about the FPolicy policy or policies that use the specified mandatory attribute.

```
[-allow-privileged-access {yes|no}] - Allow Privileged Access
```

If you specify this parameter, the command displays information only about the FPolicy policy or policies that use the specified privileged access.

```
[-privileged-user-name <text>] - User Name for Privileged Access
```

If you specify this parameter, the command displays information only about the FPolicy policy or policies that use the specified privileged user name.

```
[-is-passthrough-read-enabled {true|false}] - Is Passthrough Read Enabled
```

If you specify this parameter, the command displays information only about the FPolicy policies that use the specified passthrough-read setting.

**Examples**

The following example displays the information about FPolicy policies on the cluster using the `vserver fpolicy policy show` command.

```
cluster1::> vserver fpolicy policy show
Vserver         Policy       Events     Engine         Is Mandatory  PrivAccess
--------------- -----------  ---------- -------------  ------------  ----------
Cluster         cserver_pol  cserver_   cserver_eng    true          yes
evt
vs1.example.com p            r          n              true          no
cs2.example.com cserver_pol  cserver_   cserver_eng    true          yes
```

vs vserver fpolicy commands
The following example displays FPolicy policy name information about all Vserver FPolicy policies with the `-allow-privileged-access` parameter set to "yes".

```
cluster1::> vserver fpolicy policy show -fields policy-name -allow-privileged-access yes
vserver         policy-name
--------------- -----------
Cluster         cserver_pol
vs1.example.com cserver_pol
vs2.example.com cserver_pol
3 entries were displayed.
```

### vserver fpolicy policy external-engine commands

Manage FPolicy external engine

#### vserver fpolicy policy external-engine create

Create an external engine

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**
The `vserver fpolicy policy external-engine create` command creates an FPolicy external engine. The cluster uses the external engine to hold configuration information that it needs in order to send notification information to the FPolicy servers. It specifies the primary servers and secondary servers to which the cluster will send notifications. It also specifies FPolicy server related configuration information.

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**

- **-vserver `<Vserver Name>`** - Vserver
  
  This parameter specifies the name of the Vserver on which you want to create an FPolicy external engine.

- **-engine-name `<Engine name>`** - Engine
  
  This parameter specifies the name of the FPolicy external engine that you want to create. An external engine name can be up to 256 characters long. An external engine name is a string that can only contain any combination of ASCII-range alphanumeric characters (a-z, A-Z, 0-9), ",", ",", and ".".

- **-primary-servers `<IP Address>`,...** - Primary FPolicy Servers
  
  This parameter specifies a list of IP addresses for the primary FPolicy servers to which you want the external engine you create to apply. The `-primary-servers` parameter is used to specify a list of servers to which to send file access events for a given FPolicy policy. When an administrator configures multiple servers as primary servers, notifications are sent to the FPolicy servers in a round-robin fashion.

- **-port `<integer>`** - Port Number of FPolicy Service
  
  This parameter specifies the port number for the FPolicy service.
[-secondary-servers <IP Address>, ...] - Secondary FPolicy Servers

This parameter specifies a list of IP addresses for the secondary FPolicy servers to which you want the external engine you create to apply. Secondary servers will be used only when all the primary servers are not reachable. When an administrator configures multiple servers as secondary servers, notifications are sent to FPolicy server in a round-robin fashion. By default, no secondary server is selected.

[-extern-engine-type <External Engine Type>] - External Engine Type

This parameter specifies the type of the external engine. This specifies how the FPolicy server should behave, synchronously or asynchronously. By default, it is synchronous in nature. When set to synchronous, after sending a notification to the external FPolicy server, request processing does not continue until after receiving a response from the FPolicy server. At that point request flow either continues or processing results in denial, depending on whether the response from the FPolicy server permits the requested action. When set to asynchronous, after sending a notification to the external FPolicy server, file request processing continues.

-ssl-option (no-auth|server-auth|mutual-auth) - SSL Option for External Communication

This parameter specifies the SSL option for external communication with the FPolicy server. Possible values include the following:

- no-auth : When set to no-auth, no authentication takes place. The communication link is established over the TCP protocol.
- server-auth : When set to server-auth, only the FPolicy server is authenticated by the Vserver. With this option, before creating the FPolicy external engine, the administrator must install the public certificate of the certificate authority (CA) that signed the FPolicy server certificate.
- mutual-auth : When set to mutual-auth, mutual authentication takes place between the Vserver and the FPolicy server, i.e. authentication of the FPolicy server by the Vserver along with authentication of the Vserver by the FPolicy server. With this option, before creating the FPolicy external engine, the administrator must install the public certificate of the certificate authority (CA) that signed the FPolicy server certificate along with the public certificate and key file for authentication of the Vserver.

The public certificate of certificate authority (CA) that is used to sign the FPolicy server certificate is installed using the security_certificate_install command with -type set to client_ca. The private key and public certificate required for authentication of the Vserver is installed using the security_certificate_install command with -type set to server.

[-reqs-cancel-timeout <[<integer>h][<integer>m][<integer>s]>] - Timeout for Canceling a Request (privilege: advanced)

This parameter specifies the timeout for canceling a request. It is used to specify the time interval in which the node waits for a response from the FPolicy server. Beyond this timeout, a cancel request is sent to the FPolicy server to cancel the pending request. The request is then sent to an alternate FPolicy server that is registered for the policy. This timeout helps in handling a FPolicy server that is not responding, which can improve CIFS/NFS client response. Also, this feature can help in releasing of system resources since the request is moved from a down/bad FPolicy server to an alternate FPolicy server. The value for this field must be between 0s and 100s. By default, it is 20s.

[-reqs-abort-timeout <[<integer>h][<integer>m][<integer>s]>] - Timeout for Aborting a Request (privilege: advanced)

This parameter specifies the timeout for aborting a request. The value for this field must be between 0s and 200s. By default, it is 40s.

[-status-req-interval <[<integer>h][<integer>m][<integer>s]>] - Interval for Sending Status Requests (privilege: advanced)

This parameter specifies the interval for sending status requests. It is used to specify the interval after which a status request will be send to the FPolicy server. The value for this field must be between 0s and 50s. By default, it is 10s.
[-max-connection-retries <integer>] - Max Reconnect Attempt (privilege: advanced)
This parameter specifies the maximum number of attempts to reconnect to the FPolicy server from a Vserver. It is used to specify the number of times a broken connection will be retried. The value for this field must be between 0 and 20. By default, it is 5.

[-max-server-reqs <integer>] - Maximum Outstanding Requests for FPolicy Server (privilege: advanced)
This parameter specifies the maximum number of outstanding requests for the FPolicy server. It is used to specify maximum outstanding requests that will be queued up for the FPolicy server. The value for this field must be between 1 and 10000. By default, it is 50.

[-server-progress-timeout <[<integer>h][<integer>m][<integer>s]>] - Timeout for Disconnecting Non-responsive Server (privilege: advanced)
This parameter specifies the timeout for disconnecting non-responsive FPolicy servers. It is used to specify the time interval after which the connection to the FPolicy server is terminated. This happens only when the FPolicy server's queue contains the maximum allowed number of requests that it can hold in its queue and no response is received within this timeout. The maximum allowed number of requests is either 50 (the default) or the number specified by the -max-server-reqs parameter. The value for this field must be between 1s and 100s. By default, it is 60s.

[-keep-alive-interval <[<integer>h][<integer>m][<integer>s]>] - Interval for Sending Keep-Alive Messages (privilege: advanced)
This parameter specifies the interval in hours (h), minutes (m), or seconds (s) at which keep-alive messages are sent to the FPolicy server. Keep-alive messages are used to detect half-open connections. The range of supported values for this field is 10 through 600 (h, m, or s). Alternatively, the value can be set to 0, which disables keep-alive messages and prevents them from being sent to the FPolicy servers. The default value for this field is 120s.

[-certificate-common-name <FQDN or Custom Common Name>] - FQDN or Custom Common Name
This parameter specifies the certificate name as a fully qualified domain name (FQDN) or custom common name. The certificate is used if SSL authentication between the Vserver and the FPolicy server is configured.

[-certificate-serial <text>] - Serial Number of Certificate
This parameter specifies the serial number of the certificate used for authentication if SSL authentication between the Vserver and the FPolicy server is configured.

[-certificate-ca <text>] - Certificate Authority
This parameter specifies the certificate authority (CA) name of the certificate used for authentication if SSL authentication between the Vserver and the FPolicy server is configured.

[-recv-buffer-size <integer>] - Receive Buffer Size (privilege: advanced)
This parameter specifies the receive buffer size of the connected socket for the FPolicy server. The default value is set to 256 kilobytes (Kb). When the value is set to 0, the size of the receive buffer is set to a value defined by the system. For example, if the default receive buffer size of the socket is 65536 bytes, by setting the tunable value to 0, the socket buffer size is set to 65536 bytes. You can use any non-default value to set the size (in bytes) of the receive buffer.

[-send-buffer-size <integer>] - Send Buffer Size (privilege: advanced)
This parameter specifies the send buffer size of the connected socket for the FPolicy server. The default value is set to 256 kilobytes (Kb). When the value is set to 0, the size of the send buffer is set to a value defined by the system. For example, if the default send buffer size of the socket is set to 65536 bytes, by setting the tunable value to 0, the socket buffer size is set to 65536 bytes. You can use any non-default value to set the size (in bytes) of the send buffer.

[-session-timeout <[<integer>h][<integer>m][<integer>s]>] - Session ID Purge Timeout During Reconnection (privilege: advanced)
This parameter specifies the interval after which a new session ID is sent to the FPolicy server during reconnection attempts. The value for this field must be between 0s and 200s. The default value is set to 10 seconds. If the connection between the storage controller and the FPolicy server is terminated and
reconnection is made within the -session-timeout interval, the old session ID is sent to FPolicy server so that it can send responses for old notifications.

[-is-resiliency-enabled {true|false}] - Is Resiliency Feature Enabled
This parameter specifies whether the resiliency feature is enabled. When this parameter is set to true and all the primary and secondary servers are down, or no response is received from the FPolicy servers, file access events are stored inside the storage controller under the specified -resiliency-directory-path. To deny the file access events from being stored under these circumstances, set this parameter to false. By default, it is false.

[-resiliency-max-retention-duration <[<integer>h][<integer>m][<integer>s]>] - Maximum Notification Retention Duration
This parameter specifies the duration for which the notifications are written to files inside the storage controller during network outage. The value for this field must be between 0s and 600s. By default, it is set to 180s.

[-resiliency-directory-path <text>] - Directory for Notification Storage
This parameter specifies the directory path under the -vserver namespace, where notifications are stored in the files whenever network outage happens.

Examples
The following example creates an FPolicy external engine.

```
cluster1::> vserver fpolicy policy external-engine create -vserver vs1.example.com -engine-name new_engine -primary-servers 1.1.1.1 -port 10 -secondary-servers 2.2.2.2 -ssl-option mutual-auth -extern-engine-type synchronous -certificate-serial 8DDE112A114D1FBC -certificate-common-name Sample1-FPolicy-Client -certificate-ca TASample1

cluster1::> vserver fpolicy policy external-engine show -vserver vs1.example.com -engine-name new_engine
```

Vserver: vs1.example.com
Engine: new_engine
Primary FPolicy Servers: 1.1.1.1
Port Number of FPolicy Service: 10
Secondary FPolicy Servers: 2.2.2.2
External Engine Type: synchronous
SSL Option for External Communication: mutual-auth
FQDN or Custom Common Name: Sample1-FPolicy-Client
Serial Number: 8DDE112A114D1FBC
Certificate Authority: TASample1

security certificate install on page 394

vserver fpolicy policy external-engine delete
Delete an external engine

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver fpolicy policy external-engine delete command deletes an FPolicy external engine.

Note: This command is not supported for a Vserver with Infinite Volume.
Parameters

- `vserver <Vserver Name>` - Vserver
  This parameter specifies the Vserver from which you want to delete an FPolicy external engine.

- `engine-name <Engine name>` - Engine
  This parameter specifies the name of the FPolicy external engine you want to delete.

Examples

The following example deletes an FPolicy external engine.

```bash
cluster1::> vserver fpolicy policy external-engine show -vserver vs1.example.com -engine-name new_engine
Vserver: vs1.example.com
   Engine: new_engine
       Primary FPolicy Servers: 1.1.1.1
           Port Number of FPolicy Service: 10
       Secondary FPolicy Servers: 2.2.2.2
             External Engine Type: synchronous
   SSL Option for External Communication: mutual-auth
       FQDN or Custom Common Name: Sample1-FPolicy-Client
         Serial Number: 8DDE112A114D1FBC
      Certificate Authority: TASample1

cluster1::> vserver fpolicy policy external-engine delete -vserver vs1.example.com -engine-name new_engine
```

vserver fpolicy policy external-engine modify

Modify an external engine

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver fpolicy policy external-engine modify command modifies an FPolicy external engine. The cluster uses the external engine to hold configuration information that it needs in order to send notification information to the FPolicy servers. It specifies the primary servers and secondary servers to which the cluster will send notifications. It also specifies FPolicy server related configuration information.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters

- `vserver <Vserver Name>` - Vserver
  This parameter specifies the name of the Vserver on which you want to modify an FPolicy external engine.

- `engine-name <Engine name>` - Engine
  This parameter specifies the name of the FPolicy external engine that you want to modify. An external engine name can be up to 256 characters long. An external engine name is a string that can only contain any combination of ASCII-range alphanumerical characters (a-z, A-Z, 0-9), "_", and ".".

- `[-primary-servers <IP Address>, ...]` - Primary FPolicy Servers
  This parameter specifies a list of IP addresses for the primary FPolicy servers to which you want the external engine you modify to apply. The `primary-servers` parameter is used to specify a list of servers to which to send file access events for a given FPolicy policy. When an administrator configures multiple servers as primary servers, notifications are sent to the FPolicy servers in a round-robin fashion.
[-port <integer>] - Port Number of FPolicy Service
This parameter specifies the port number for the FPolicy service.

[-secondary-servers <IP Address>, ...] - Secondary FPolicy Servers
This parameter specifies a list of IP addresses for the secondary FPolicy servers to which you want the external engine you modify to apply. Secondary servers will be used only when all the primary servers are not reachable. When an administrator configures multiple servers as secondary servers, notifications are sent to FPolicy server in a round-robin fashion. By default, no secondary server is selected.

[-extern-engine-type <External Engine Type>] - External Engine Type
This parameter specifies the type of the external engine. This specifies how the FPolicy server should behave, synchronously or asynchronously. By default, it is synchronous in nature. When set to synchronous, after sending a notification to the external FPolicy server, request processing does not continue until after receiving a response from the FPolicy server. At that point request flow either continues or processing results in denial, depending on whether the response from the FPolicy server permits the requested action. When set to asynchronous, after sending a notification to the external FPolicy server, file request processing continues.

[-ssl-option {no-auth|server-auth|mutual-auth}] - SSL Option for External Communication
This parameter specifies the SSL option for external communication with the FPolicy server. Possible values include the following:

- no-auth : When set to no-auth, no authentication takes place. The communication link is established over the TCP protocol.
- server-auth : When set to server-auth, only the FPolicy server is authenticated by the Vserver. With this option, before creating the FPolicy external engine, the administrator must install the public certificate of the certificate authority (CA) that signed the FPolicy server certificate.
- mutual-auth : When set to mutual-auth, mutual authentication takes place between the Vserver and the FPolicy server, i.e., authentication of the FPolicy server by the Vserver along with authentication of the Vserver by the FPolicy server. With this option, before creating the FPolicy external engine, the administrator must install the public certificate of the certificate authority (CA) that signed the FPolicy server certificate along with the public certificate and key file for authentication of the Vserver.

The public certificate of certificate authority (CA) that is used to sign the FPolicy server certificate is installed using the security certificate install command with -type set to client_ca. The private key and public certificate required for authentication of the Vserver is installed using the security certificate install command with -type set to server.

[-reqs-cancel-timeout <[<integer>h] [<integer>m] [<integer>s]>] - Timeout for Canceling a Request (privilege: advanced)
This parameter specifies the timeout for canceling a request. It is used to specify the time interval in which the node waits for a response from the FPolicy server. Beyond this timeout, a cancel request is sent to the FPolicy server to cancel the pending request. The request is then sent to an alternate FPolicy server that is registered for the policy. This timeout helps in handling a FPolicy server that is not responding, which can improve CIFS/NFS client response. Also, this feature can help in releasing of system resources since the request is moved from a down/bad FPolicy server to an alternate FPolicy server. The value for this field must be between 0s and 100s. By default, it is 20s.

[-reqs-abort-timeout <[<integer>h] [<integer>m] [<integer>s]>] - Timeout for Aborting a Request (privilege: advanced)
This parameter specifies the timeout for aborting a request. The value for this field must be between 0s and 200s. By default, it is 40s.
--status-req-interval <[<integer>h][<integer>m][<integer>s]>] - Interval for Sending Status Requests (privilege: advanced)

This parameter specifies the interval for sending status requests. It is used to specify the interval after which a status request will be sent to the FPolicy server. The value for this field must be between 0s and 50s. By default, it is 10s.

--max-connection-retries <integer> - Max Reconnect Attempt (privilege: advanced)

This parameter specifies the maximum number of attempts to reconnect to the FPolicy server from a Vserver. It is used to specify the number of times a broken connection will be retried. The value for this field must be between 0 and 20. By default, it is 5.

--max-server-reqs <integer> - Maximum Outstanding Requests for FPolicy Server (privilege: advanced)

This parameter specifies the maximum number of outstanding requests for the FPolicy server. It is used to specify the maximum outstanding requests that will be queued up for the FPolicy server. The value for this field must be between 1 and 10000. By default, it is 50.

--server-progress-timeout <[<integer>h][<integer>m][<integer>s]>] - Timeout for Disconnecting Non-responsive Server (privilege: advanced)

This parameter specifies the timeout for disconnecting non-responsive FPolicy servers. It is used to specify the time interval after which the connection to the FPolicy server is terminated. This happens only when the FPolicy server's queue contains the maximum allowed number of requests that it can hold in its queue and no response is received within this timeout. The maximum allowed number of requests is either 50 (the default) or the number specified by the --max-server-reqs parameter. The value for this field must be between 1s and 100s. By default, it is 60s.

--keep-alive-interval <[<integer>h][<integer>m][<integer>s]>] - Interval for Sending Keep-Alive Messages (privilege: advanced)

This parameter specifies the interval in hours (h), minutes (m), or seconds (s) at which keep-alive messages are sent to the FPolicy server. Keep-alive messages are used to detect half-open connections. The range of supported values for this field is 10 through 600 (h, m, or s). Alternatively, the value can be set to 0, which disables keep-alive messages and prevents them from being sent to the FPolicy servers. The default value for this field is 120s.

--certificate-common-name <FQDN or Custom Common Name> - FQDN or Custom Common Name

This parameter specifies the certificate name as a fully qualified domain name (FQDN) or custom common name. The certificate is used if SSL authentication between the Vserver and the FPolicy server is configured.

--certificate-serial <text> - Serial Number of Certificate

This parameter specifies the serial number of the certificate used for authentication if SSL authentication between the Vserver and the FPolicy server is configured.

--certificate-ca <text> - Certificate Authority

This parameter specifies the certificate authority (CA) name of the certificate used for authentication if SSL authentication between the Vserver and the FPolicy server is configured.

--recv-buffer-size <integer> - Receive Buffer Size (privilege: advanced)

This parameter specifies the receive buffer size of the connected socket for the FPolicy server. The default value is set to 256 kilobytes (Kb). When the value is set to 0, the size of the receive buffer is set to a value defined by the system. For example, if the default receive buffer size of the socket is 65536 bytes, by setting the tunable value to 0, the socket buffer size is set to 65536 bytes. You can use any non-default value to set the size (in bytes) of the receive buffer.

--send-buffer-size <integer> - Send Buffer Size (privilege: advanced)

This parameter specifies the send buffer size of the connected socket for the FPolicy server. The default value is set to 256 kilobytes (Kb). When the value is set to 0, the size of the send buffer is set to a value defined by the system. For example, if the default send buffer size of the socket is set to 65536 bytes, by setting the tunable value to 0, the socket buffer size is set to 65536 bytes. You can use any non-default value to set the size (in bytes) of the send buffer.
- `session-timeout` `<integer>h</integer> `<integer>m</integer> `<integer>s>` - Session ID Purge Timeout During Reconnection (privilege: advanced)
  This parameter specifies the interval after which a new session ID is sent to the FPolicy server during reconnection attempts. The value for this field must be between 0s and 200s. The default value is set to 10 seconds. If the connection between the storage controller and the FPolicy server is terminated and reconnection is made within the `session-timeout` interval, the old session ID is sent to FPolicy server so that it can send responses for old notifications.

- `is-resiliency-enabled` `{true|false}` - Is Resiliency Feature Enabled
  This parameter specifies whether the resiliency feature is enabled. When this parameter is set to `true` and all the primary and secondary servers are down, or no response is received from the FPolicy servers, file access events are stored inside the storage controller under the specified `resiliency-directory-path`. To deny the file access events from being stored under these circumstances, set this parameter to `false`. By default, it is `false`.

- `resiliency-max-retention-duration` `<integer>h</integer> `<integer>m</integer> `<integer>s>` - Maximum Notification Retention Duration
  This parameter specifies the duration for which the notifications are written to files inside the storage controller during network outage. The value for this field must be between 0s and 600s. By default, it is set to 180s.

- `resiliency-directory-path` `<text>` - Directory for Notification Storage
  This parameter specifies the directory path under the `-vserver` namespace, where notifications are stored in the files whenever network outage happens.

### Examples

The following example modifies an FPolicy external engine.

```
cluster1::> vserver fpolicy policy external-engine modify -vserver vs1.example.com -engine-name new_engine -primary-servers 1.1.1.1 -port 10 -secondary-servers 2.2.2.2
cluster1::> vserver fpolicy policy external-engine show -vserver vs1.example.com -engine-name new_engine

Vserver: vs1.example.com
  Engine: new_engine
  Primary FPolicy Servers: 1.1.1.1
  Port Number of FPolicy Service: 10
  Secondary FPolicy Servers: 2.2.2.2
  External Engine Type: synchronous
  SSL Option for External Communication: mutual-auth
  FQDN or Custom Common Name: Sample1-FPolicy-Client
  Certificate Authority: TASample1
```

The following example shows how to modify `-recv-buffer-size` and `-send-buffer-size` to a non-default value of 0.

```
cluster1::*> vserver fpolicy policy external-engine modify -vserver vs1.example.com -engine-name new_engine -recv-buffer-size 0 -send-buffer-size 0
```

vserver fpolicy policy external-engine show

Display external engines

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver fpolicy policy external-engine show command displays information about all FPolicy external engines belonging to the Vserver. Any Vserver administrator can see FPolicy external engines associated to their Vserver as well as external engines created by cluster administrator. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all FPolicy external engines:

- Vserver name
- FPolicy external engine name
- List of primary FPolicy servers
- List of secondary FPolicy servers
- Port number for FPolicy service
- FPolicy external engine type

You can specify the -fields parameter to specify which fields of information to display about FPolicy external engines. You can specify additional parameters to display only information that matches those parameters. For instance, to display information only about all external engines where the -port parameter is set to 9, run the command with the -field parameter set to engine-name and -port parameter set to 9.

You can specify the -instance parameter to display all information for all policies in a list format.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters

{-fields <fieldname>, ...} If you specify the -fields <fieldname>, ... parameter, the command only displays the fields that you specify.

{-instance} If you specify the -instance parameter, the command displays detailed information about all entries.

{-vserver <Vserver Name>} - Vserver

If you specify this parameter, the command displays information only about the FPolicy external engines for the specified Vserver. FPolicy external engines that the cluster administrator creates are visible in all Vservers.

{-engine-name <Engine name>} - Engine

If you specify this parameter, the command displays information only about the FPolicy external engine that you specify.

{-primary-servers <IP Address>, ...} - Primary FPolicy Servers

If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified IP addresses as primary FPolicy servers.

{-port <integer>} - Port Number of FPolicy Service

If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified port for the FPolicy service.
[-secondary-servers <IP Address>, ...] - Secondary FPolicy Servers
   If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified IP addresses as secondary FPolicy servers.

[-extern-engine-type <External Engine Type>] - External Engine Type
   If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified external engine type.

[-ssl-option {no-auth|server-auth|mutual-auth}] - SSL Option for External Communication
   If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified SSL option.

[-reqs-cancel-timeout <[<integer>h] [<integer>m] [<integer>s]>] - Timeout for Canceling a Request (privilege: advanced)
   If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified timeout for canceling a request.

[-reqs-abort-timeout <[<integer>h] [<integer>m] [<integer>s]>] - Timeout for Aborting a Request (privilege: advanced)
   If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified timeout for aborting a request.

[-status-req-interval <[<integer>h] [<integer>m] [<integer>s]>] - Interval for Sending Status Requests (privilege: advanced)
   If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified interval for sending status requests.

[-max-connection-retries <integer>] - Max Reconnect Attempt (privilege: advanced)
   If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified maximum reconnect attempts.

[-max-server-reqs <integer>] - Maximum Outstanding Requests for FPolicy Server (privilege: advanced)
   If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified FPolicy server maximum outstanding requests.

[-server-progress-timeout <[<integer>h] [<integer>m] [<integer>s]>] - Timeout for Disconnecting Non-responsive Server (privilege: advanced)
   If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified timeout for disconnecting non-responsive server.

[-keep-alive-interval <[<integer>h] [<integer>m] [<integer>s]>] - Interval for Sending Keep-Alive Messages (privilege: advanced)
   If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified keep-alive interval.

[-certificate-common-name <FQDN or Custom Common Name>] - FQDN or Custom Common Name
   If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified certificate common name.

[-certificate-serial <text>] - Serial Number of Certificate
   If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified certificate serial number.

[-certificate-ca <text>] - Certificate Authority
   If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified certificate authority name.
[-recv-buffer-size <integer>] - Receive Buffer Size (privilege: advanced)
  If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified receive buffer size.

[-send-buffer-size <integer>] - Send Buffer Size (privilege: advanced)
  If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified send buffer size.

[-session-timeout <[<integer>h][<integer>m][<integer>s]>] - Session ID Purge Timeout During Reconnection (privilege: advanced)
  If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified session timeout.

[-is-resiliency-enabled {true|false}] - Is Resiliency Feature Enabled
  If you specify this parameter set to true, the command displays information only about the FPolicy external engine or engines that has the resiliency feature enabled.

[-resiliency-max-retention-duration <[<integer>h][<integer>m][<integer>s]>] - Maximum Notification Retention Duration
  If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified network outage duration.

[-resiliency-directory-path <text>] - Directory for Notification Storage
  If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified directory path.

Examples

The following example displays the information about the configured external engines using the vserver fpolicy policy external-engine show command.

```
cluster1::> vserver fpolicy policy external-engine show
Vserver                          Engine         Primary        Secondary       Port Engine Type
-------------------------------- -------------- -------------- ------------------ --------------
Cluster                          cserver_eng   9.9.9.9        -                   9 synchronous
vs1.example.com                  cserver_eng   9.9.9.9        -                   9 synchronous
vs1.example.com v1n1             1.1.1.1        2.2.2.2        1 synchronous
vs2.example.com                  cserver_eng   9.9.9.9        -                   9 synchronous
vs2.example.com v2n1             3.3.3.3        5.5.5.5        2 synchronous
5 entries were displayed.
```

The following example displays the information about all Vserver FPolicy external engines with the -port parameter set to 9.

```
cluster1::> vserver fpolicy policy external-engine show -fields engine-name -port 9
vserver - engine-name
-------------------------------- --------------
Cluster                          cserver_eng
vs1.example.com                  cserver_eng
vs2.example.com                  cserver_eng
3 entries were displayed.
```

The following example displays the values of all the advanced-level parameters for the external engine v1n1 in Vserver vs1.example.com.

```
```
vserver fpolicy policy scope commands

Manage policy scope for FPolicy

vserver fpolicy policy scope create

Create scope

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver fpolicy policy scope create command creates an FPolicy scope for an FPolicy policy. A scope defines the boundaries on which the FPolicy policy will apply. The Vserver is the basic scope boundary. When you create a scope for an FPolicy policy, you must define the FPolicy policy to which it will apply and you must designate to which Vserver you want to apply the scope. There are a number of parameters that further restrict the scope within the specified Vserver. You can restrict the scope by specifying what to include in the scope. Or you can restrict the scope by specifying what to exclude from the scope. For example, you can restrict the scope by specifying which volumes to include using the -volumes-to-include parameter or which volumes to exclude using the -volumes-to-exclude parameter. Once you apply a scope to an enabled policy, policy event checks get applied to the scope defined by this command.

Note: There are special considerations for the scope for a cluster FPolicy policy. The cluster FPolicy policy is a policy that the cluster administrator creates for the admin Vserver. If the cluster administrator also creates the scope for that cluster FPolicy policy, a Vserver administrator cannot create a scope for that same policy. However, if the cluster administrator does not create a scope for the cluster FPolicy policy, then any Vserver administrator can create the scope for that cluster policy. In the event that the Vserver administrator creates a scope for that cluster FPolicy policy, the cluster administrator cannot subsequently create a cluster scope for that same cluster policy. This is because the cluster administrator cannot override the scope for the same cluster policy.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters

-vserver <Vserver Name> - Vserver

This parameter specifies the name of the Vserver on which you want to create an FPolicy policy scope.
-policy-name <Policy name> - Policy
This parameter specifies the name of the FPolicy policy for which you want to create the scope.

-shares-to-include <Share name>, ... - Shares to Include
This parameter specifies a list of shares for file access monitoring. With this option, the administrator provides a list of shares, separated by commas. For file access events relative to the specified shares and file operations monitored by the FPolicy policy, a notification is generated. The -shares-to-include parameter can contain regular expressions and can include metacharacters such as "?" and "*".

Note: When a share is included in the -shares-to-include parameter and the parent volume of the share is included in the -volumes-to-exclude parameter, -volumes-to-exclude has precedence over -shares-to-include.

-shares-to-exclude <Share name>, ... - Shares to Exclude
This parameter specifies a list of shares to exclude from file access monitoring. With this option, the administrator provides a list of shares, separated by commas. When a share is specified in the -shares-to-exclude parameter, no notification is sent for files accessed relative to that share. The -shares-to-exclude parameter can contain regular expressions and can include metacharacters such as "?" and "*".

-volumes-to-include <volume name>, ... - Volumes to Include
This parameter specifies a list of volumes for file access monitoring. With this option, the administrator provides a list of volumes, separated by commas. For file access events within the volume and file operations monitored by the FPolicy policy, a notification is generated. The -volumes-to-include parameter can contain regular expressions and can include metacharacters such as "?" and "*".

Note: When a share is included in the -shares-to-include parameter and the parent volume of the share is included in the -volumes-to-exclude parameter, -volumes-to-exclude has precedence over -shares-to-include. Similarly, when an export policy is included in the -export-policies-to-include parameter and the parent volume of the export-policy is included in the -volumes-to-exclude parameter, -volumes-to-exclude has precedence over -export-policies-to-include.

-export-policies-to-include <FPolicy export policy>, ... - Export Policies to Include
This parameter specifies a list of export policies for file access monitoring. With this option, the administrator provides a list of export policies, separated by commas. For file access events within an export policy and file operations monitored by the FPolicy policy, a notification is generated. The -export-policies-to-include parameter can contain regular expressions and can include metacharacters such as "?" and "*".

Note: When an export policy is included in the -export-policies-to-include parameter and the parent volume of the export policy is included in the -volumes-to-exclude parameter, -volumes-to-exclude has precedence over -export-policies-to-include.

-export-policies-to-exclude <FPolicy export policy>, ... - Export Policies to Exclude
This parameter specifies a list of export policies to exclude from file access monitoring. With this option, the administrator provides a list of export policies, separated by commas, for which no file access notifications are sent. The -export-policies-exclude parameter can contain regular expressions and can include metacharacters such as "?" and ".".

-file-extensions-to-include <File extension>, ... - File Extensions to Include
This parameter specifies a list of file extensions, separated by commas, for a given FPolicy policy for which FPolicy processing is required. Any file access to files with the same extensions included in the -file-extensions-to-include parameter is monitored.
extensions-to-include parameter generates a notification. The -file-extensions-to-include parameter can contain regular expressions and can include metacharacters such as "?".

[-file-extensions-to-exclude <File extension>, ...] - File Extensions to Exclude
This parameter specifies a list of file extensions, separated by commas, for a given FPolicy policy for which FPolicy processing will be excluded. Using the exclude list, the administrator can request notification for all extensions except those in the excluded list. Any file access to files with the same extensions included in the -file-extensions-to-exclude parameter does not generate a notification. The -file-extensions-to-exclude parameter can contain regular expressions and can include metacharacters such as "?".

Note: An administrator can specify both -file-extensions-to-include and -file-extensions-to-exclude lists. The -file-extensions-to-exclude parameter is checked first before the -file-extensions-to-include parameter is checked.

[-is-file-extension-check-on-directories-enabled {true|false}] - Is File Extension Check on Directories Enabled (privilege: advanced)
This parameter specifies whether the file name extension checks apply to directory objects as well. If this parameter is set to true, the directory objects are subjected to same extension checks as regular files. If this parameter is set to false, the directory names are not matched for extensions and notifications would be sent for directories even if their name extensions do not match. By default, it is false.

[-is-monitoring-of-objects-with-no-extension-enabled {true|false}] - Is Monitoring of Objects with No Extension Enabled (privilege: advanced)
This parameter specifies whether the extension checks apply to objects with no extension as well. If this parameter is set to true, the objects with no extension are also monitored along with the objects with extension. By default, it is false.

Note: This parameter is ignored when file-extensions-to-include and file-extensions-to-exclude lists are empty.

Examples
The following example creates an FPolicy policy scope.

```
cluster1::> vserver fpolicy policy scope create
-vserver vs1.example.com
-policy-name vs1_pol
-file-extensions-to-include flv, wmv, mp3, mp4

cluster1::> vserver fpolicy policy scope show
Vserver   Policy       Extensions             Extensions
Name      Name         Included              Excluded
---------- ---------- ----------------- -----------------
Cluster   cserver_pol  txt                  mp3, wmv
vs1.example.com vs1_pol flv, wmv, mp3, mp4  cpp, c, h, txt
2 entries were displayed.
```

vserver fpolicy policy scope delete
Delete scope

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The `vserver fpolicy policy scope delete` command deletes an FPolicy policy scope.
Note: This command is not supported for a Vserver with Infinite Volume.

Parameters
-vserver <Vserver Name> - Vserver
This parameter specifies the name of the Vserver from which you want to delete the FPolicy policy scope.

-policy-name <Policy name> - Policy
This parameter specifies the name of the FPolicy policy for which you want to delete the scope.

Examples
The following example deletes a scope of an FPolicy policy.

```
cluster1::> vserver fpolicy policy scope delete -vserver vs1.example.com -policy-name vs1_pol
```

vserver fpolicy policy scope modify
Modify scope

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver fpolicy policy scope modify command modifies an FPolicy scope for an FPolicy policy. A scope defines the boundaries on which the FPolicy policy will apply. The Vserver is the basic scope boundary. When you modify a scope for an FPolicy policy, you must define the FPolicy policy to which it will apply and you must designate to which Vserver you want to apply the scope. There are a number of parameters that further restrict the scope within the specified Vserver. You can restrict the scope by specifying what to include in the scope. Or you can restrict the scope by specifying what to exclude from the scope. For example, you can restrict the scope by specifying which volumes to include using the -volumes-to-include parameter or which volumes to exclude using the -volumes-to-exclude parameter. Once you apply a scope to an enabled policy, policy event checks get applied to the scope defined by this command.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters
-vserver <Vserver Name> - Vserver
This parameter specifies the name of the Vserver on which you want to modify an FPolicy policy scope.

-policy-name <Policy name> - Policy
This parameter specifies the name of the FPolicy policy for which you want to modify the scope.

-<shares-to-include <Share name>, ...> - Shares to Include
This parameter specifies a list of shares for file access monitoring. With this option, the administrator provides a list of shares, separated by commas. For file access events relative to the specified shares and file operations monitored by the FPolicy policy, a notification is generated. The -shares-to-include parameter can contain regular expressions and can include metacharacters such as "?" and "."

Note: When a share is included in the -shares-to-include parameter and the parent volume of the share is included in the -volumes-to-exclude parameter, -volumes-to-exclude has precedence over -shares-to-include.

-<shares-to-exclude <Share name>, ...> - Shares to Exclude
This parameter specifies a list of shares to exclude from file access monitoring. With this option, the administrator provides a list of shares, separated by commas. When a share is specified in the -shares-to-
exclude parameter, no notification is sent for files accessed relative to that share. The -shares-to-exclude parameter can contain regular expressions and can include metacharacters such as "?" and "*".

[-volumes-to-include <volume name>, ...] - Volumes to Include
This parameter specifies a list of volumes for file access monitoring. With this option, the administrator provides a list of volumes, separated by commas. For file access events within the volume and file operations monitored by the FPolicy policy, a notification is generated. The -volumes-to-include parameter can contain regular expressions and can include metacharacters such as "?" and "*".

[-volumes-to-exclude <volume name>, ...] - Volumes to Exclude
This parameter specifies a list of volumes to exclude from file access monitoring. With this option, the administrator provides a list of volumes, separated by commas, for which no file access notifications are generated. The -volumes-to-exclude parameter can contain regular expressions and can include metacharacters such as "?" and "*".

**Note:** When a share is included in the -shares-to-include parameter and the parent volume of the share is included in the -volumes-to-exclude parameter, -volumes-to-exclude has precedence over -shares-to-include. Similarly, when an export policy is included in the -export-policies-to-include parameter and the parent volume of the export-policy is included in the -volumes-to-exclude parameter, -volumes-to-exclude has precedence over -export-policies-to-include.

[-export-policies-to-include <FPolicy export policy>, ...] - Export Policies to Include
This parameter specifies a list of export policies for file access monitoring. With this option, the administrator provides a list of export policies, separated by commas. For file access events within an export policy and file operations monitored by the FPolicy policy, a notification is generated. The -export-policies-to_include parameter can contain regular expressions and can include metacharacters such as "?" and "*".

**Note:** When an export policy is included in the -export-policies-to-include parameter and the parent volume of the export policy is included in the -volumes-to-exclude parameter, -volumes-to-exclude has precedence over -export-policies-to-include.

[-export-policies-to-exclude <FPolicy export policy>, ...] - Export Policies to Exclude
This parameter specifies a list of export policies to exclude from file access monitoring. With this option, the administrator provides a list of export policies, separated by commas, for which no file access notification is sent. The -export-policies-exclude parameter can contain regular expressions and can include metacharacters such as "?" and "*".

[-file-extensions-to-include <File extension>, ...] - File Extensions to Include
This parameter specifies a list of file extensions, separated by commas, for a given FPolicy policy for which FPolicy processing is required. Any file access to files with the same extensions included in the -file-extensions-to-include parameter generates a notification. The -file-extensions-to-include parameter can contain regular expressions and can include metacharacters such as "?".

[-file-extensions-to-exclude <File extension>, ...] - File Extensions to Exclude
This parameter specifies a list of file extensions, separated by commas, for a given FPolicy policy for which FPolicy processing will be excluded. Using the exclude list, the administrator can request notification for all extensions except those in the excluded list. Any file access to files with the same extensions included in the -file-extensions-to-exclude parameter does not generate a notification. The -file-extensions-to-exclude parameter can contain regular expressions and can include metacharacters such as "?".

**Note:** An administrator can specify both -file-extensions-to-include and -file-extensions-to-exclude lists. The -file-extensions-to-exclude parameter is checked first before the -file-extensions-to-exclude parameter is checked.

[-is-file-extension-check-on-directories-enabled {true|false}] - Is File Extension Check on Directories Enabled (privilege: advanced)
This parameter specifies whether the file name extension checks apply to directory objects as well. If this parameter is set to true, the directory objects are subjected to same extension checks as regular files. If this
parameter is set to false, the directory names are not matched for extensions and notifications would be sent for directories even if their name extensions do not match. By default, it is false.

[-is-monitoring-of-objects-with-no-extension-enabled (true|false)] - Is Monitoring of Objects with No Extension Enabled (privilege: advanced)

This parameter specifies whether the extension checks apply to objects with no extension as well. If this parameter is set to true, the objects with no extension are also monitored along with the objects with extension. By default, it is false.

Note: This parameter is ignored when file-extensions-to-include and file-extensions-to-exclude lists are empty.

Examples

The following example modifies an FPolicy policy scope.

```
cluster1::> vserver fpolicy policy scope modify -vserver vs1.example.com
-flv,wmv,mp3,mp4
-policy-name vs1_pol
-file-extensions-to-include
-file-extensions-to-exclude cpp,c,h,txt
```

```
cluster1::> vserver fpolicy policy scope show
Vserver  Policy  Extensions  Extensions
Name     Name     Included  Excluded
----------  ---------  ------------  ------------
vs1.example.com vs1_pol  flv, wmv, mp3, mp4  cpp, c, h, txt
```

2 entries were displayed.

vserver fpolicy policy scope show

Display scope

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver fpolicy policy scope show command displays scope information about all FPolicy policies belonging to the Vserver. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all FPolicy scopes:

- Vserver name
- Policy name
- The file extensions to include
- The file extensions to exclude

You can use the -fields parameter to specify which fields of information to display about FPolicy scopes. In addition to the fields above, you can display the following fields:

- The shares to include
- The shares to exclude
- The volumes to include
- The volumes to exclude
• The export policies to include
• The export policies to exclude
• Whether file extension check on directories is enabled
• Whether monitoring of objects with no extension is enabled

You can specify specific parameters to display only information that matches those parameters. For example, to display scope information only about all FPolicy policies where the `-file-extensions-to-include` parameter is set to txt, run the command with the `-fields` parameter set to policy-name and `-file-extensions-to-include` parameter set to txt.

You can specify the `-instance` parameter to display scope information for all FPolicy policies in a list format.

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**

```bash
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command only displays the fields that you specify.

```bash
[-instance]
```

If you specify the `-instance` parameter, the command displays detailed information about all entries.

```bash
[-vserver <Vserver Name>]
```

If you specify this parameter, the command displays scope information only about the FPolicy policies for the specified Vserver.

```bash
[-policy-name <Policy name>]
```

If you specify this parameter, the command displays information only about the specified FPolicy policy.

```bash
[-shares-to-include <Share name>, ...]
```

If you specify this parameter, the command displays scope information only about the FPolicy policy or policies that use the specified share or shares in the include list.

```bash
[-shares-to-exclude <Share name>, ...]
```

If you specify this parameter, the command displays scope information only about the FPolicy policy or policies that use the specified share or shares in the exclude list.

```bash
[-volumes-to-include <volume name>, ...]
```

If you specify this parameter, the command displays scope information only about the FPolicy policy or policies that use the specified volume or volumes in the include list.

```bash
[-volumes-to-exclude <volume name>, ...]
```

If you specify this parameter, the command displays scope information only about the FPolicy policy or policies that use the specified volume or volumes in the exclude list.

```bash
[-export-policies-to-include <FPolicy export policy>, ...]
```

If you specify this parameter, the command displays scope information only about the FPolicy policy or policies that use the specified export policy or policies in the include list.

```bash
[-export-policies-to-exclude <FPolicy export policy>, ...]
```

If you specify this parameter, the command displays scope information only about the FPolicy policy or policies that use the specified export policy or policies in the exclude list.

```bash
[-file-extensions-to-include <File extension>, ...]
```

If you specify this parameter, the command displays scope information only about the FPolicy policy or policies that use the specified file extension or extensions in the include list.
[-file-extensions-to-exclude <file extension>, ...] - File Extensions to Exclude

If you specify this parameter, the command displays scope information only about the FPolicy policy or policies that use the specified file extension or extensions in exclude list.

[-is-file-extension-check-on-directories-enabled {true|false}] - Is File Extension Check on Directories Enabled (privilege: advanced)

If you specify this parameter, the command displays scope information only about the FPolicy policy or policies that use the specified file extension check on directories. If set to true, the command displays information about scopes where file extension checks on directories is enabled. If set to false, the command displays information about scopes where file extension checks on directories is disabled.

[-is-monitoring-of-objects-with-no-extension-enabled {true|false}] - Is Monitoring of Objects with No Extension Enabled (privilege: advanced)

If you specify this parameter, the command displays scope information only about the FPolicy policy or policies that use the specified monitoring of objects with no extension setting. If set to true, the command displays information about scope of policy or policies for which monitoring of objects with no extension is enabled.

Examples

The following example displays scope information about FPolicy policies.

```
cluster1::> vserver fpolicy policy scope show

Vserver         Policy                  Extensions           Extensions
Name             Name                Included             Excluded
----------------- ------------------- -------------------- -------------------
Cluster          cserver_pol         -                    -
vs1.example.com   p                   -                    -
vs1.example.com   vs1_pol             mp3                  -
3 entries were displayed.
```

vserver fpolicy policy event commands

Manage policy event for FPolicy

vserver fpolicy policy event create

Create an event

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver fpolicy policy event create command creates an FPolicy event. An event describes what to monitor. An event can contain protocol, file operations, filters, and volume operation event types. In the FPolicy configuration, an event is attached to an FPolicy policy. You can attach the same event to one or more policies.

Note: This command is not supported for a Vserver with Infinite Volume.

Note: Three parameters have dependency rules: -protocol, -files-operations and -filters. The following combinations are supported:

- Both -protocol and -file-operations
- All of -protocol, -file-operations and -filters
- Specify none of three
**Parameters**

- **vserver <Vserver Name> - Vserver**
  
  This parameter specifies the name of the Vserver on which you want to create an FPolicy event.

- **event-name <Event name> - Event**
  
  This parameter specifies the name of the FPolicy event that you want to create. An event name can be up to 256 characters long. An event name value is a string that can only contain any combination of ASCII-range alphanumeric characters (a-z, A-Z, 0-9), "_" and ".".

[-protocol <Protocol>] - Protocol

  This parameter specifies the protocol name for which the event will be created. By default, no protocol is selected. The value of this parameter must be one of the following:

  • *cifs* - This specifies that the event is for the CIFS protocol.
  
  • *nfsv3* - This specifies that the event is for the NFSv3 protocol.
  
  • *nfsv4* - This specifies that the event is for the NFSv4 protocol.

  **Note:** If you specify -protocol, then you must also specify a valid value for the -file-operations parameter.

[-file-operations <File Operation>, ...] - File Operations

  This parameter specifies a list of file operations for the FPolicy event. The event will check the operations specified in this list from all client requests using the protocol specified in the -protocol parameter. The list can include one or more of the following operations:

  • *close* - File close operations.
  
  • *create* - File create operations.
  
  • *create_dir* - Directory create operations.
  
  • *delete* - File delete operations.
  
  • *delete_dir* - Directory delete operations.
  
  • *getattr* - Get attribute operations.
  
  • *link* - Link operations.
  
  • *lookup* - Lookup operations.
  
  • *open* - File open operations.
  
  • *read* - File read operations.
  
  • *write* - File write operations.
  
  • *rename* - File rename operations.
  
  • *rename_dir* - Directory rename operations.
  
  • *setattr* - Set attribute operations.
  
  • *symlink* - Symbolic link operations.

  **Note:** If you specify -file-operations then you must specify a valid protocol in the -protocol parameter.
[-filters <Filter>, ...] - Filters

This parameter specifies a list of filters of given file operation or operations for the protocol specified in the -protocol parameter. The values in the -filters parameter are used to filter client requests. The list can include one or more of the following:

- **monitor-ads** - Filter the client request for alternate data stream.
- **close-with-modification** - Filter the client request for close with modification.
- **close-without-modification** - Filter the client request for close without modification.
- **close-with-read** - Filter the client request for close with read.
- **first-read** - Filter the client request for first read.
- **first-write** - Filter the client request for first write.
- **offline-bit** - Filter the client request for offline bit set. Setting this filter, FPolicy server receives notification only when offline files are accessed.
- **open-with-delete-intent** - Filter the client request for open with delete intent. Setting this filter, FPolicy server receives notification only when an attempt is made to open a file with the intent to delete it. This is used by file systems when the FILE_DELETE_ON_CLOSE flag is specified.
- **open-with-write-intent** - Filter the client request for open with write intent. Setting this filter, FPolicy server receives notification only when an attempt is made to open a file with the intent to write something in it.
- **write-with-size-change** - Filter the client request for write with size change.
- **setattr-with-owner-change** - Filter the client setattr requests for changing owner of a file or directory.
- **setattr-with-group-change** - Filter the client setattr requests for changing group of a file or directory.
- **setattr-with-sacl-change** - Filter the client setattr requests for changing sacl on a file or directory.
- **setattr-with-dacl-change** - Filter the client setattr requests for changing dacl on a file or directory.
- **setattr-with-modify-time-change** - Filter the client setattr requests for changing the modification time of a file or directory.
- **setattr-with-access-time-change** - Filter the client setattr requests for changing the access time of a file or directory.
- **setattr-with-creation-time-change** - Filter the client setattr requests for changing the creation time of a file or directory.
- **setattr-with-mode-change** - Filter the client setattr requests for changing the mode bits on a file or directory.
- **setattr-with-size-change** - Filter the client setattr requests for changing the size of a file.
- **setattr-with-allocation-size-change** - Filter the client setattr requests for changing the allocation size of a file.
- **exclude-directory** - Filter the client requests for directory operations. When this filter is specified, directory operations are not monitored.

**Note:** If you specify a value for the -filters parameter, then you must also specify valid values for the -file-operations and -protocol parameters.
[-volume-operation \texttt{(true|false)}] - Send Volume Operation Notifications

This parameter specifies whether volume operations generate notifications for the FPolicy event. If this field is set to \texttt{true} then FPolicy sends notifications when volumes are mounted or unmounted. By default, it is \texttt{false}.

### Examples
The following example creates an FPolicy event.

```bash
cluster1::> vserver fpolicy policy event create -vserver vs1.example.com -event-name cifs_event -protocol cifs -file-operations open,close,read,write -volume-operation true
```

```bash
cluster1::> vserver fpolicy policy event show -vserver vs1.example.com -event-name cifs_event
```

```
Vserver: vs1.example.com
Event Name: cifs_event
Protocol: cifs
File Operations: open, close, read, write
Filters: first-read, offline-bit
Volume Operation: true
```

### vserver fpolicy policy event delete
Delete an event

**Availability:** This command is available to \textit{cluster} and \textit{Vserver} administrators at the \textit{admin} privilege level.

**Description**
The `vserver fpolicy policy event delete` command deletes an FPolicy event.

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**
- \texttt{-vserver <Vserver Name> - Vserver}
  This parameter specifies the Vserver from which you want to delete an FPolicy event.
- \texttt{-event-name <Event name> - Event}
  This parameter specifies the name of the FPolicy event you want to delete.

**Examples**
The following example deletes an FPolicy event.

```bash
cluster1::> vserver fpolicy policy event delete -vserver vs1.example.com -event-name cifs_event
```

### vserver fpolicy policy event modify
Modify an event

**Availability:** This command is available to \textit{cluster} and \textit{Vserver} administrators at the \textit{admin} privilege level.
Description
The vserver fpolicy policy event modify command modifies an FPolicy event. An event describes what to monitor. An event can contain protocol, file operations, filters, and volume operation event types. In the FPolicy configuration, an event is attached to an FPolicy policy. You can attach the same event to one or more policies. You can modify an event while it is attached to an FPolicy policy. Any changes to the event take effect immediately.

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Note:** Three parameters have dependency rules: `-protocol`, `-files-operations` and `-filters`. The following combinations are supported:

- Both `-protocol` and `-file-operations`
- All of `-protocol`, `-file-operations` and `-filters`
- Specify none of three

Parameters

**-vserver <Vserver Name> - Vserver**
This parameter specifies the name of the Vserver on which you want to modify an FPolicy event.

**-event-name <Event name> - Event**
This parameter specifies the name of the FPolicy event that you want to modify. An event name can be up to 256 characters long. An event name value is a string that can only contain any combination of ASCII-range alphanumeric characters (a-z, A-Z, 0-9), "_" and ".".

**[-protocol <Protocol>] - Protocol**
This parameter specifies the protocol name for which the event will be modified. By default, no protocol is selected. The value of this parameter must be one of the following:

- `cifs` - This specifies that the event is for the CIFS protocol.
- `nfsv3` - This specifies that the event is for the NFSv3 protocol.
- `nfsv4` - This specifies that the event is for the NFSv4 protocol.

**Note:** If you specify `-protocol`, then you must also specify a valid value for the `-file-operations` parameter.

**[-file-operations <File Operation>, ...] - File Operations**
This parameter specifies a list of file operations for the FPolicy event. The event will check the operations specified in this list from all client requests using the protocol specified in the `-protocol` parameter. The list can include one or more of the following operations:

- `close` - File close operations.
- `create` - File create operations.
- `create_dir` - Directory create operations.
- `delete` - File delete operations.
- `delete_dir` - Directory delete operations.
- `getattr` - Get attribute operations.
- `link` - Link operations.
- `lookup` - Lookup operations.
• **open** - File open operations.
• **read** - File read operations.
• **write** - File write operations.
• **rename** - File rename operations.
• **rename_dir** - Directory rename operations.
• **setattr** - Set attribute operations.
• **symlink** - Symbolic link operations.

**Note:** If you specify `-file-operations` then you must specify a valid protocol in the `-protocol` parameter.

`[-filters <Filter>, ...] - Filters`

This parameter specifies a list of filters of given file operation or operations for the protocol specified in the `-protocol` parameter. The values in the `-filters` parameter are used to filter client requests. The list can include one or more of the following:

• **monitor-ads** - Filter the client request for alternate data stream.
• **close-with-modification** - Filter the client request for close with modification.
• **close-without-modification** - Filter the client request for close without modification.
• **close-with-read** - Filter the client request for close with read.
• **first-read** - Filter the client request for first read.
• **first-write** - Filter the client request for first write.
• **offline-bit** - Filter the client request for offline bit set. Setting this filter, FPolicy server receives notification only when offline files are accessed.
• **open-with-delete-intent** - Filter the client request for open with delete intent. Setting this filter, FPolicy server receives notification only when an attempt is made to open a file with the intent to delete it. This is used by file systems when the FILE_DELETE_ON_CLOSE flag is specified.
• **open-with-write-intent** - Filter the client request for open with write intent. Setting this filter, FPolicy server receives notification only when an attempt is made to open a file with the intent to write something in it.
• **write-with-size-change** - Filter the client request for write with size change.
• **setattr-with-owner-change** - Filter the client setattr requests for changing owner of a file or directory.
• **setattr-with-group-change** - Filter the client setattr requests for changing group of a file or directory.
• **setattr-with-sacl-change** - Filter the client setattr requests for changing sacl on a file or directory.
• **setattr-with-dacl-change** - Filter the client setattr requests for changing dacl on a file or directory.
• **setattr-with-modify-time-change** - Filter the client setattr requests for changing the modification time of a file or directory.
• **setattr-with-access-time-change** - Filter the client setattr requests for changing the access time of a file or directory.
• `setattr-with-creation-time-change` - Filter the client setattr requests for changing the creation time of a file or directory.

• `setattr-with-mode-change` - Filter the client setattr requests for changing the mode bits on a file or directory.

• `setattr-with-size-change` - Filter the client setattr requests for changing the size of a file.

• `setattr-with-allocation-size-change` - Filter the client setattr requests for changing the allocation size of a file.

• `exclude-directory` - Filter the client requests for directory operations. When this filter is specified directory operations are not monitored.

  **Note**: If you specify a value for the `-filters` parameter, then you must also specify valid values for the `-file-operations` and `-protocol` parameters.

[-`volume-operation` `{true|false}`] - Send Volume Operation Notifications

This parameter specifies whether volume operations generate notifications for the FPolicy event. If this field is set to `true` then FPolicy sends notifications when volumes are mounted or unmounted. By default, it is `false`.

### Examples

The following example modifies an FPolicy event.

```bash
cluster1::> vserver fpolicy policy event modify -vserver vs1.example.com -event-name cifs_event -protocol cifs -filters first-read,offline-bit -file-operations open,close,read,write -volume-operation true

cluster1::> vserver fpolicy policy event show -vserver vs1.example.com -event-name cifs_event

Vserver: vs1.example.com
Event Name: cifs_event
Protocol: cifs
File Operations: open, close, read, write
Filters: first-read, offline-bit
Volume Operation: true
```

### vserver fpolicy policy event show

Display events

**Availability**: This command is available to cluster and Vserver administrators at the `admin` privilege level.

**Description**

The `vserver fpolicy policy event show` command displays information about all FPolicy events belonging to the Vserver. Any Vserver administrator can see FPolicy events associated with their Vserver as well as FPolicy events created by the cluster administrator. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all FPolicy events:

• Vserver name

• FPolicy event name

• Protocol name
• List of file operations
• List of filters
• Volume operation

You can specify the -fields parameter to specify which fields of information to display about FPolicy events. You can specify additional parameters to display only information that matches those parameters. For example, to display information only about all CIFS events configured with the -volume-operation field set, run the command with the -fields parameter set to -event-name event-name -protocol cifs -volume-operation yes.

You can specify the -instance parameter to display all information for all policies in a list format.

**Note:** This command is not supported for a Vserver with Infinite Volume.

### Parameters

[-fields <fieldname>,...]
If you specify the -fields <fieldname>, ... parameter, the command only displays the fields that you specify.

[[-instance]]
If you specify the -instance parameter, the command displays detailed information about all entries.

[-vserver <Vserver Name>] - Vserver
If you specify this parameter, the command displays information only about the FPolicy events for the specified Vserver. Events created on the admin Vserver by the cluster administrator are visible in all Vservers.

[-event-name <Event name>] - Event
If you specify this parameter, the command displays information only about the FPolicy event that matches the specified event name.

[-protocol <Protocol>] - Protocol
If you specify this parameter, the command displays information only about the FPolicy event or events that use the specified protocol.

[-file-operations <File Operation>,...] - File Operations
If you specify this parameter, the command displays information only about the FPolicy event or events that use the specified file operation or operations.

[-filters <Filter>,...] - Filters
If you specify this parameter, the command displays information only about the FPolicy event or events that use the specified filter or filters.

[-volume-operation {true|false}] - Send Volume Operation Notifications
If this field is set to true, then FPolicy displays information about those events for which it sends notifications when volumes are mounted or unmounted. If you set this parameter to true, the command displays information about events where the -volume-operation parameter is set true and volume operations such as mount and unmount are monitored. If you set this parameter to false, the command displays information about events where volume operations are not monitored.

### Examples

The following example displays the information about all Vserver FPolicy policy events.

```bash
cluster1::> vserver fpolicy policy event show

<table>
<thead>
<tr>

vserver group-mapping commands
The group-mapping directory

vserver group-mapping create
Create a group mapping
Availability: This command is available to cluster and Vserver administrators at the admin privilege level.
Description
The vserver group-mapping create command creates a group mapping. Group mappings are applied in the order in
which they occur in the priority list; for example, a group mapping that occurs at position 2 in the priority list is applied before a
group mapping that occurs at position 3. Each mapping direction (Kerberos-to-UNIX, Windows-to-UNIX, and UNIX-toWindows) has its own priority list. Data ONTAP prevents you from creating two group mappings with the same pattern.
Patterns can be expressed as POSIX regular expressions. For information about regular expressions, see the UNIX reference
page for regex(7).
Each Vserver can have up to 1024 group mappings in each direction.
The vserver group-mapping create command is not supported on Vservers with FlexVol volumes.
Note: If you are using the CLI, you must delimit all regular expressions with double quotation marks ("). For instance, to
enter the regular expression (.+) in the CLI, type "(.+)" at the command prompt. To add a "?" to the expression, press ESC
followed by the "?".

Parameters
-vserver <vserver name> - Vserver

This parameter specifies the Vserver on which you want to create the group mapping.
-direction {krb-unix|win-unix|unix-win} - Name Mapping Direction

This parameter specifies the direction of the group mapping. Possible values are krb-unix for a Kerberos-toUNIX group mapping, win-unix for a Windows-to-UNIX group mapping, and unix-win for a UNIX-toWindows group mapping.

1636

Commands: Manual Page Reference


-position <integer> - Position
This parameter specifies the group mapping's position in the priority list. Specify the position as a positive integer.

Note: If you want to create a new group mapping at a position that is already occupied in the priority list, use the vserver group-mapping insert command instead of the vserver group-mapping create command.

-pattern <text> - Pattern
This parameter specifies the pattern you want to match. Refer to the command description section for details. The pattern can be up to 256 characters in length.

-replacement <text> - Replacement
This parameter specifies the replacement pattern. The replacement pattern can be up to 256 characters in length.

Examples
The following example creates a group mapping on a Vserver named vs1. The mapping is from UNIX to Windows at position 5 in the priority list. The mapping maps the pattern cifs to the replacement EXAMPLE\Domain Groups.

```
cluster1::> vserver group-mapping create -vserver vs1 -direction unix-win -position 5 -pattern cifs -replacement "EXAMPLE\Domain Groups"
```

Related references

vserver group-mapping delete
Delete a group mapping

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver group-mapping delete command deletes a group mapping.

The vserver group-mapping delete command is not supported on Vservers with FlexVol volumes.

Parameters
- vserver <vserver name> - Vserver
  This parameter specifies the Vserver from which you want to delete the group mapping.

- direction {krb-unix|win-unix|unix-win} - Name Mapping Direction
  This parameter specifies the direction of the group mapping that you want to delete.

- position <integer> - Position
  This parameter specifies the position of the group mapping that you want to delete. Specify the position as a positive integer.

Examples
The following example deletes a group mapping on a Vserver named vs1. The group mapping is from UNIX to Windows and is at position 5.

```
cluster1::> vserver group-mapping delete -vserver vs1 -direction unix-win -position 5
```
vserver group-mapping insert
Create a group mapping at a specified position
Availability: This command is available to cluster and Vserver administrators at the admin privilege level.
Description
The vserver group-mapping insert command creates a group mapping at a specified position in the priority list. The
command rearranges the list as needed to accommodate the new entry. For instance, if you have a priority list of five mappings
and insert a new mapping at position 3, the mapping previously at position 3 is moved to position 4, the mapping previously at
position 4 is moved to position 5, and the mapping previously at position 5 is moved to position 6. Each mapping direction
(Kerberos-to-UNIX, Windows-to-UNIX, and UNIX-to-Windows) has its own priority list.
You can specify patterns as POSIX regular expressions. For information about regular expressions, see the UNIX reference page
for regex(7).
Each Vserver can have up to 1024 group mappings in each direction.
The vserver group-mapping insert command is not supported on Vservers with FlexVol volumes.
Note: If you are using the CLI, you must delimit all regular expressions with double quotation marks ("). For instance, to
enter the regular expression (.+) in the CLI, type "(.+)" at the command prompt. To add a "?" to the expression, press ESC
followed by the "?".

Parameters
-vserver <vserver name> - Vserver

This parameter specifies the Vserver on which you want to create the group mapping.
-direction {krb-unix|win-unix|unix-win} - Name Mapping Direction

This parameter specifies the direction of the group mapping. Possible values are krb-unix for a Kerberos-toUNIX group mapping, win-unix for a Windows-to-UNIX group mapping, and unix-win for a UNIX-toWindows group mapping.
-position <integer> - Position

This parameter specifies the position in the priority list at which you want to insert the new group mapping.
Specify a position as a positive integer.
-pattern <text> - Pattern

This parameter specifies the pattern you want to match. Refer to the command description section for details.
The pattern can be up to 256 characters in length.
-replacement <text> - Replacement

This parameter specifies the replacement pattern. The replacement pattern can be up to 256 characters in
length.
Examples
The following example creates a group mapping on a Vserver named vs1. It is a group mapping from Kerberos to UNIX.
It is inserted into the priority list at position 2. The group mapping maps any principal in the Kerberos realm
SEC.EXAMPLE.COM to the UNIX group name corresponding to the principal's base name with any instance names
removed; for example, artists/admin@SEC.EXAMPLE.COM is mapped to artists.
cluster1::> vserver group-mapping insert -vserver vs1 -direction krb-unix -position 2 -pattern
"([^@/]+)(/[^@]+)?@SEC.EXAMPLE.COM" -replacement "\1"

1638

Commands: Manual Page Reference


**vserver group-mapping modify**

Modify a group mapping's pattern, replacement pattern, or both

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The `vserver group-mapping modify` command modifies the pattern, the replacement pattern, or both of a specified group mapping.

You can specify patterns as POSIX regular expressions. For information about regular expressions, see the UNIX reference page for `regex(7)`.

Each Vserver can have up to 1024 group mappings in each direction.

The `vserver group-mapping modify` command is not supported on Vservers with FlexVol volumes.

**Note:** If you are using the CLI, you must delimit all regular expressions with double quotation marks ("."). For instance, to enter the regular expression (.+) in the CLI, type "(.+)", at the command prompt. To add a "?" to the expression, press ESC followed by the "?".

**Parameters**

- `-vserver <vserver name>` - Vserver
  This parameter specifies the Vserver on which you want to modify the group mapping.

- `-direction {krb-unix|win-unix|unix-win}` - Name Mapping Direction
  This parameter specifies the direction of the group mapping. Possible values are `krb-unix` for a Kerberos-to-UNIX group mapping, `win-unix` for a Windows-to-UNIX group mapping, and `unix-win` for a UNIX-to-Windows group mapping.

- `-position <integer>` - Position
  This parameter specifies the group mapping's position in the priority list. A position is specified as a positive integer. Each mapping direction (Kerberos-to-UNIX, Windows-to-UNIX, and UNIX-to-Windows) has its own priority list.

- `[ -pattern <text>]` - Pattern
  This parameter specifies the pattern you want to match. Refer to the command description section for details. The pattern can be up to 256 characters in length.

- `[ -replacement <text>]` - Replacement
  This parameter specifies the replacement pattern. The replacement pattern can be up to 256 characters in length.

**Examples**

The following example modifies the group mapping on the Vserver named vs1 and direction win-unix, at position 3. The pattern to be matched is changed to "EXAMPLE\(.+\)".

```bash
cluster1::> vserver group-mapping modify -vserver vs1 -direction win-unix -position 3 -pattern "EXAMPLE\\\(.+\)"
```

**vserver group-mapping show**

Display group mappings

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.
Description
The `vserver group-mapping show` command displays information about group mappings. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all group mappings:

- Vserver name
- Direction of the mapping (krb-unix for Kerberos-to-UNIX, win-unix for Windows-to-UNIX, or unix-win for UNIX-to-Windows)
- Position of the mapping in the priority list
- Pattern to be matched
- Replacement pattern

You can specify additional parameters to display only information that matches those parameters. For instance, to display information only about Kerberos-to-UNIX group mappings, run the command with the `-direction krb-unix` parameter.

The `vserver group-mapping show` command is not supported on Vservers with FlexVol volumes.

Parameters

```bash
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```bash
[-instance]
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```bash
[-vserver <vserver name>] - Vserver
```

If you specify this parameter, the command displays information only about the group mapping or mappings that match the specified Vserver.

```bash
[-direction {krb-unix|win-unix|unix-win}] - Name Mapping Direction
```

If you specify this parameter, the command displays information only about the group mapping or mappings that have the specified mapping direction.

```bash
[-position <integer>] - Position
```

If you specify this parameter, the command displays information only about the group mapping that has the specified position in the priority list.

```bash
[-pattern <text>] - Pattern
```

If you specify this parameter, the command displays information only about the group mapping or mappings that use the specified matching pattern. The pattern can be up to 256 characters in length. Refer to the command description section for details.

```bash
[-replacement <text>] - Replacement
```

If you specify this parameter, the command displays information only about the group mapping or mappings that use the specified replacement pattern.

Examples

The following example displays information about all group mappings:

```bash
cluster1::> vserver group-mapping show
Vserver       Direction  Position
----------------- -------- -------
vs1           win-unix  1         Pattern: EXAMPLE\artists
               Replacement: nobody
```

1640 Commands: Manual Page Reference
### vserver group-mapping swap

Exchange the positions of two group mappings.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `vserver group-mapping swap` command exchanges the positions of two group mappings in the priority list.

The `vserver group-mapping swap` command is not supported on Vservers with FlexVol volumes.

**Parameters**

- `--vserver <vserver name>` - *Vserver*
  This parameter specifies the Vserver on which the group mappings are located.

- `--direction {krb-unix|win-unix|unix-win}` - *Name Mapping Direction*
  This parameter specifies the direction of the group mappings that you want to exchange. Each mapping direction (Kerberos-to-UNIX, Windows-to-UNIX, and UNIX-to-Windows) has its own priority list.

- `--position <integer>` - *Position*
  This parameter specifies the position in the priority list of the first group mapping that you want to exchange. Specify a position as a positive integer.

- `--with-position <integer>` - *Position of an existing group mapping entry in the list of group mappings for this Vserver. This entry will be swapped with the entry at 'position'.*
  This parameter specifies the position in the priority list of the second group mapping that you want to exchange. Specify a position as a positive integer.

**Examples**
The following example exchanges the positions of two group mappings on a Vserver named vs1. The group mappings have the direction Windows-to-UNIX. The group mappings are exchanged between positions 2 and 4.

```bash
cluster1::> vserver group-mapping swap --vserver vs1 --direction win-unix --position 2 --with-position 4
```

### vserver iscsi commands

Manage the iSCSI services on a Vserver.

Commands used to manage the iSCSI service of a Vserver.

#### vserver iscsi create

Create a Vserver's iSCSI service.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
This command creates an iSCSI target for a specified Vserver. By default the system creates a default iSCSI target name with the status-admin set to enabled. Until you create an iSCSI service, iSCSI initiators cannot log into the Vserver.
Parameters

-vserver <Vserver Name> - Vserver

Specifies the Vserver for the iSCSI service.

[-target-name <text>] - Target Name (privilege: advanced)

Specifies an iSCSI target name of a Vserver. This name is unique and is not case sensitive. The target name must conform to this format iqn.1995-08.com.example:string and follow these rules:

- Contains up to 223 bytes.
- Contains alphanumeric characters. The period ".", hyphen "-", and colon ":" are acceptable.
- Does not contain the underscore character "_".

[-target-alias <text>] - Target Alias

Specifies an iSCSI target alias name of a Vserver. The maximum number of characters for an alias name is 128. The alias default name is the Vserver name.

[-status-admin {down|up}] - Administrative Status

Specifies the administrative status of the iSCSI service of a Vserver. If you set this parameter to up, the command creates an iSCSI service with the administrative status of up. If you set this parameter to down, the command creates an iSCSI service with the administrative status of down.

[-max-error-recovery-level <integer>] - Max Error Recovery Level (privilege: advanced)

Specifies the maximum error recovery level allowed by the iSCSI service. You can specify 0, 1, or 2, or you can accept the default. The default is zero. The actual error recovery level depends on the negotiated error recovery level between the initiator and the iSCSI target when the session is created.

- 0 - Session failure recovery
- 1 - Digest failure recovery
- 2 - Connection failure recovery

[-retain-timeout <integer>] - RFC3720 DefaultTime2Retain Value (in sec) (privilege: advanced)

Specifies the wait time before an active task reassignment is possible after an unexpected connection termination. For example, a value of 0 means that the connection or task state is immediately discarded by the target. The default is 20 seconds.

[-login-timeout <integer>] - Login Phase Duration (in sec) (privilege: advanced)

Specifies the login phase duration. The default is 15 seconds.

[-max-conn-per-session <integer>] - Max Connections per Session (privilege: advanced)

Specifies the maximum number of connections per session that a target can accept. The default is 4 connections.

[-max-ios-per-session <integer>] - Max Commands per Session (privilege: advanced)

Specifies the maximum number of commands per session that a target can accept. The default is 128 commands per session.

[-tcp-window-size <integer>] - TCP Receive Window Size (in bytes) (privilege: advanced)

Specifies the TCP receive window size (in bytes). The default is 131,400 bytes.

[-force | -f [true]] - Allow Non-Vendor Target Name (privilege: advanced)

Force the command to accept a target name that would normally be rejected as invalid.
**vserver iscsi delete**

Delete a Vserver's iSCSI service

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
This command deletes the iSCSI service from a Vserver.

**Note:** You must first disable the service with the command `vserver iscsi modify` with "-status-admin down" before you can delete the service.

**Parameters**
- `-vserver <Vserver Name>` - *Vserver*
  
  Specifies the Vserver for the iSCSI service.

**Examples**
```
cluster1::> vserver iscsi delete -vserver vs_1
```

**Related references**

`vserver iscsi modify` on page 1643

**vserver iscsi modify**

Modify a Vserver's iSCSI service

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
This command modifies the configuration for an iSCSI service.

Modifications take effect immediately after you execute the command. Making modifications to your service can result in traffic loss on a live system. Call technical support if you are unsure of the possible consequences.

**Parameters**
- `-vserver <Vserver Name>` - *Vserver*
  
  Specifies the Vserver for the iSCSI service.

- `[ -target-name <text> ]` - *Target Name* (privilege: advanced)
  
  Specifies an iSCSI target name of a Vserver. This name is unique and is not case sensitive. The target name must conform to this format *iqn.1995-08.com.example:string* and follow these rules:
  
  - Contains up to 223 bytes.
  - Contains alphanumeric characters. The period ".", hyphen "-", and colon ":" are acceptable.
  - Does not contain the underscore character "_".

  **Note:** The iSCSI service must be down in order to change the target name.
[-target-alias <text>] - Target Alias
  Specifies the new target alias of the iSCSI service.

[-clear | -c [true]] - Clear the Target Alias
  Clears the current target alias from the iSCSI service configuration.

[-status-admin (down|up)] - Administrative Status
  Specifies the configured administrative status of a service. If you set this parameter to up, the iSCSI service begins to accept login requests from iSCSI initiators. If you set this parameter to down, iSCSI initiators cannot log in.

[-max-error-recovery-level <integer>] - Max Error Recovery Level (privilege: advanced)
  Specifies the maximum error recovery level the iSCSI service negotiates with iSCSI initiators during login phase.
  • 0 - Session failure recovery
  • 1 - Digest failure recovery
  • 2 - Connection failure recovery

[-retain-timeout <integer>] - RFC3720 DefaultTime2Retain Value (in sec) (privilege: advanced)
  Specifies the wait time before active task reassignment is possible after an unexpected connection termination. For example, a value of 0 means that the connection or task state is immediately discarded by the target.

[-login-timeout <integer>] - Login Phase Duration (in sec) (privilege: advanced)
  Specifies maximum time the login phase remains active until the iSCSI target terminates the connection.

[-max-conn-per-session <integer>] - Max Connections per Session (privilege: advanced)
  Specifies the maximum number of connections per session that the iSCSI target can accept.

[-max-ios-per-session <integer>] - Max Commands per Session (privilege: advanced)
  Specifies the maximum number of commands per session that the iSCSI target can accept.

[-tcp-window-size <integer>] - TCP Receive Window Size (in bytes) (privilege: advanced)
  Specifies the TCP receive window size (in bytes).
  A change to the TCP receive window size value takes effect for all network interfaces when you restart the iSCSI service for the Vserver as follows:

  vserver iscsi stop -vserver <vserver name>
  vserver iscsi start -vserver <vserver name>

  If you change an individual network interface from up to down back to up, as follows, the new value for TCP receive window size takes effect for that network interface:

  network interface modify -vserver <vserver name> -lif <LIF name> -status-admin down
  network interface modify -vserver <vserver name> -lif <LIF name> -status-admin up

[-force | -f [true]] - Allow Non-Vendor Target Name (privilege: advanced)
  Force the command to accept a target name that would normally be rejected as invalid.

**Examples**
  Specifies the TCP receive window size (in bytes).
  A change to the TCP receive window size value takes effect for all network interfaces when you restart the iSCSI service for the Vserver as follows:
vserver iscsi stop -vserver <vserver name>
vserver iscsi start -vserver <vserver name>

If you change an individual network interface from up to down back to up, as follows, the new value for TCP receive window size takes effect for that network interface:

network interface modify -vserver <vserver name> -lif <LIF name> -status-admin down
network interface modify -vserver <vserver name> -lif <LIF name> -status-admin up

cluster1::> vserver iscsi modify -vserver vs_1 -status-admin down

vserver iscsi show

Display a Vserver's iSCSI configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command displays the current configuration of the iSCSI service.

Parameters

\{-fields <fieldname>, ...\}  
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

\{-instance\}  
If you specify the -instance parameter, the command displays detailed information about all fields.

-vserver <Vserver Name> - Vserver  
Selects the iSCSI services for the Vserver that matches the parameter value.

-target-name <text> - Target Name  
Selects the iSCSI services with a target name that matches the parameter value.

-target-alias <text> - Target Alias  
Selects the iSCSI services with a target alias that matches the parameter value.

-status-admin {down|up} - Administrative Status  
Selects the iSCSI services with a configured status that matches the parameter value.

-max-error-recovery-level <integer> - Max Error Recovery Level (privilege: advanced)  
Selects the iSCSI services with a maximum error recovery level that matches the parameter value.

-retain-timeout <integer> - RFC3720 DefaultTime2Retain Value (in sec) (privilege: advanced)  
Selects the iSCSI services with a wait time that matches the parameter value. The wait time is the amount of time before active task reassignment is possible after an unexpected connection termination.

-login-timeout <integer> - Login Phase Duration (in sec) (privilege: advanced)  
Selects the iSCSI services with a login phase duration that matches the parameter value.

### vserver iscsi start

Starts the iSCSI service

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.
Description
This command starts the iSCSI service of a Vserver. You can also use `vserver iscsi modify` with "-status-admin up".

Parameters
-vserver <Vserver Name> - Vserver
Specifies the Vserver for the iSCSI service.

Examples

```
cluster1::> vserver iscsi start -vserver vs_1
```

Related references

- `vserver iscsi modify` on page 1643

vserver iscsi stop

Stops the iSCSI service

Availability: This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

Description
Stops the iSCSI service of a Vserver. This command shuts down all active iSCSI sessions and stops any new iSCSI sessions. You can also use `vserver iscsi modify` with "-status-admin down".

Parameters
-vserver <Vserver Name> - Vserver
Specifies the Vserver for the iSCSI service.

Examples

```
cluster1::> vserver iscsi stop -vserver vs_1
```

Related references

- `vserver iscsi modify` on page 1643

vserver iscsi connection commands

The connection directory
Commands used for managing iSCSI connections.

vserver iscsi connection show

Display active iSCSI connections

Availability: This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

Description
This command displays iSCSI connection information within a session. If you do not specify a connection, the command displays all information for all connections.

An active iSCSI session can contain one or multiple iSCSI connections. If an iSCSI connection has not completed the iSCSI login sequence, the iSCSI session might not contain iSCSI connections.
This command gives real-time status of connection activity. You can use the parameters header-digest-enabled and data-digest-enabled to troubleshoot performance problems.

Parameters

\{-fields <fieldname>, ...\}

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

\{-instance\}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

\{-vserver <Vserver Name>\} - Vserver

Use this parameter to display iSCSI connections that match the Vserver that you specify.

\{-tpgroup <text>\} - Target Portal Group

Use this parameter to display iSCSI connections that match the target portal group that you specify.

\{-tsih <integer>\} - Target Session ID

Use this parameter to display iSCSI connections that match the target session ID that you specify.

\{-connection-id <integer>\} - Connection ID

Use this parameter to display iSCSI connections that match the connection ID that you specify.

\{-connection-state <iSCSI Connection State>\} - Connection State

Use this parameter to display iSCSI connections that match the connection state you specify.

\{-has-session {true|false}\} - Connection Has session

Specifies if a session is established for a connection. If you enter this command using the parameter without a value, it is set to true, and the command displays all connections that have an established session. If you set this parameter to false, the command displays all connections that do not have established sessions.

\{-lif <text>\} - Logical interface

Use this parameter to display iSCSI connections that match the logical interface that you specify.

\{-tpgroup-tag <integer>\} - Target Portal Group Tag

Use this parameter to display iSCSI connections that use the target portal group tag that you specify.

\{-local-address <text>\} - Local IP Address

Use this parameter to display iSCSI connections that use the local IP address that you specify.

\{-local-ip-port <integer>\} - Local TCP Port

Use this parameter to display iSCSI connections that use the local TCP port that you specify.

\{-authentication-method {CHAP|deny|none}\} - Authentication Type

Use this parameter to display iSCSI connections that match the authentication type that you specify. CHAP requires password validation. Deny does not allow connections. None allows all connections.

\{-data-digest-enabled {true|false}\} - Data Digest Enabled

Specifies if data digest is enabled for a connection. If you enter this command using the parameter without a value, it is set to true, and the command displays all connections that support data digest. If you set this parameter to false, the command displays all connections that do not support data digest.

\{-header-digest-enabled {true|false}\} - Header Digest Enabled

Specifies if header digest is supported. If you enter this command using the parameter without a value, it is set to true, and the command shows all connections that support header digest. If you set this parameter to false, the command displays all connections that do not support header digest.
[-rcv-window-size <integer>] - TCP/IP Recv Size
Use this parameter to display iSCSI connections that match the specified negotiated size of the TCP/IP receive window in bytes.

[-initiator-mdsl <integer>] - Initiator Max Recv Data Length
Use this parameter to display iSCSI connections that match the maximum length of message that the initiator can receive.

[-remote-address <text>] - Remote IP address
Use the parameter to display iSCSI connections that match the IP address of the initiator that you specify.

[-remote-ip-port <integer>] - Remote TCP Port
Use this parameter to display iSCSI connections that match the specified TCP port of initiator that you specify.

[-target-mdsl <integer>] - Target Max Recv Data Length
Use this parameter to display iSCSI connections that match the maximum message size that a target can receive.

Examples

```
cluster1::> vserver iscsi connection show -vserver vs1

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Tpgroup</th>
<th>Conn</th>
<th>TSIH</th>
<th>Local Address</th>
<th>Remote Address</th>
<th>TCP Recv Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>
<td>vs1.iscsi</td>
<td>6</td>
<td>0</td>
<td>10.63.8.163</td>
<td>10.60.141.65</td>
<td>131400</td>
</tr>
<tr>
<td>vs1</td>
<td>vs1.iscsi</td>
<td>7</td>
<td>0</td>
<td>10.63.8.163</td>
<td>10.62.8.75</td>
<td>131400</td>
</tr>
</tbody>
</table>

2 entries were displayed.
```

vserver iscsi connection shutdown
Shut down a connection on a node

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
This command shuts down a specified iSCSI connection within a session. If you want to shut down all iSCSI connections in a session, use the vserver iscsi session shutdown command.

Parameters
-vserver <Vserver Name> - Vserver
Specifies the Vserver.

-tpgroup <text> - Target Portal Group
Specifies the target portal group that contains the connection you want to shut down.

-tsih <integer> - Target Session ID
Specifies the target session ID that you want to shut down.

-connection-id <integer> - Connection ID
Specifies the connection ID that you want to shut down.

Examples
```
cluster1::*> vserver iscsi connection shutdown -vserver vs_1 -tpgroup tpgroup_1 -tsih 4 -connection-id 0
```
vserver iscsi command commands

The command directory

Commands used to manage active iSCSI commands.

vserver iscsi command show

Display active iSCSI commands

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command displays the status of active iSCSI commands in an iSCSI session. If you specify an iSCSI command ID, the command shows what commands are active in a session and is useful for initiator debugging.

Parameters
[[-fields <fieldname>, ...]  
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance ]]  
If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver  
Use this parameter to display a list of active iSCSI commands that match the Vserver name that you specify.

[-tpgroup <text>] - Target Portal Group  
Use this parameter to display a list of active iSCSI commands that are within the target portal group.

[-tsih <integer>] - Target Session ID  
Use this parameter to display a list of active iSCSI commands that match the target session ID handle that you specify.

[-command-id <integer>] - Command ID  
Use this parameter to display a list of active iSCSI commands that match the command ID that you specify.

[-initiator-name <text>] - Initiator Name  
Use this parameter to display a list of active iSCSI commands that match the initiator name that you specify.

[-initiator-alias <text>] - Initiator Alias  
Use this parameter to display a list of active iSCSI commands that match the initiator alias that you specify.

[-isid <text>] - Initiator Session ID  
Use this parameter to display a list of active iSCSI commands that match the initiator session ID that you specify.

[-command-sub-id <integer>] - Command Sub ID  
Use this parameter to display a list of active iSCSI commands that match the command sub ID that you specify.

[-command-state <iSCSI Command States>] - Command State  
Use this parameter to display a list of active iSCSI commands that match the command state that you specify.
[-command-type {Sequenced|Imm_Taskmgmt|Imm_Other}] - Command Type

If you use this parameter, the command displays a list of active iSCSI commands that contains the specified command type. The command types indicate:

- "Sequenced" -- the system processes the commands in sequence
- "Imm_Taskmgmt" -- the system processes the commands immediately
- "Imm_Other" -- the system processes the commands as queued

Examples

cluster1::> vserver iscsi command show -instance -vserver vs_1

Vserver: vs_1
Target Portal Group Name: tpgroup_1
Target Session ID: 2
Command ID: 20797
Initiator Name: iqn.1993-08.org.debian:01:fa752b8a5a3a
Initiator Alias: alias_1
Initiator Session ID: 00:02:3d:01:00:00
Command Sub ID: 20797
Command State: Scsicdb_Waiting_STLayer
Command Type: Sequenced

vserver iscsi initiator commands

The initiator directory

Commands used for managing the initiators connected to SAN targets.

vserver iscsi initiator show

Display iSCSI initiators currently connected

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

This command displays a list of active initiators currently connected to a specified Vserver.

Parameters

{ [-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

  [-instance]
  If you specify the -instance parameter, the command displays detailed information about all fields.

  [-vserver <Vserver Name>] - Vserver
  Use this parameter to display the active initiators that match the Vserver that you specify.

  [-tpgroup <text>] - Target Portal Group
  Use this parameter to display the active initiators that match the name of the target portal group that you specify.

  [-tsih <integer>] - Target Session ID
  Use this parameter to display the active initiators that match the target session ID you that specify.

  [-initiator-name <text>] - Initiator Name
  Use this parameter to display the active initiators that match the initiator name that you specify.}
[-initiator-alias <text>] - Initiator Alias
   Use this parameter to display the active initiators that match the alias name that you specify.

[-tpgroup-tag <integer>] - TPGroup Tag
   Use this parameter to display the active initiators that match the target portal group tag that you specify.

[-isid <text>] - Initiator Session ID
   Use this parameter to display the active initiators that match the initiator session ID that you specify.

[-igroup <text>,...] - Igroup Name
   Use this parameter to display the active initiators that match the initiator group that you specify.

Examples

```
cluster1::> vserver iscsi initiator show -vserver vs_1
  Tpgroup  Initiator
   Vserver Name     TSIH Name                  ISID              IGroup
------- -------- ---- --------------------- ----------------- -----------------
   vs_1    vs_1.iscsi  6 iqn.1994-05.com.redhat:6ed6dfb0489e00:02:3d:03:00:00 -
   vs_1    vs_1.iscsi  7 iqn.1993-08.org.debian:01:fa752b8a5a3a00:02:3d:01:00:00 igroup_1
2 entries were displayed.
```

vserver iscsi interface commands

The interface directory
Commands used to manage iSCSI data logical interfaces.

vserver iscsi interface disable

Disable the specified interfaces for iSCSI service

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command disables the specified logical interfaces for an iSCSI service. Once disabled, all subsequent attempts to establish new iSCSI connections over the logical interface will fail.

Parameters
-vserver <Vserver Name> - Vserver
   Specifies the Vserver.

{-lif <lif-name>, ... - Logical Interface
   Specifies the logical interfaces on a Vserver you want to disable.

-all | -a [true]} - All
   Specifies that all logical interfaces on the Vserver are disabled.

-force | -f [true] - Force
   When set to true, forces the termination of any active iSCSI sessions without prompting you for a confirmation.

Examples

```
cluster1::> vserver iscsi interface disable -vserver vs_1 -lif vs_1.iscsi
```

vserver iscsi interface enable

Enable the specified interfaces for iSCSI service

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command enables specified logical interfaces for iSCSI Vserver service. Once enabled, your system accepts new iSCSI connections and services iSCSI requests over the newly enabled logical interfaces.

Parameters
-vserver <Vserver Name> - Vserver
  Specifies the Vserver.

{lif <lif-name>, ... - Logical Interface
  Specifies the logical interfaces on a Vserver that you want to enable.

| -all | -a \{true\} | - All
  When set to true, all logical interfaces are enabled. If you use this parameter without a value, it is set to true, and the command enables all logical interfaces.

Examples

cluster1::> vserver iscsi interface enable -vserver vs_1 -lif vs_1.iscsi

vserver iscsi interface modify

Modify network interfaces used for iSCSI connectivity

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The vserver iscsi interface modify command modifies the iSCSI specific configuration for an iSCSI LIF.

Parameters
-vserver <Vserver Name> - Vserver
  Specifies the Vserver.

-lif <lif-name> - Logical Interface
  Use this parameter to specify the logical interface on a Vserver that you want to modify.

[-sendtargets-fqdn <text>] - iSCSI Discovery SendTargets FQDN
  Use this parameter to specify the Fully Qualified Domain Name (FQDN) to return during an iSCSI Discovery SendTargets operation. To clear the FQDN, set this parameter to "". If unset, the IP address of the LIF is used in iSCSI SendTargets discovery.
  This is not part of iSNS and will not affect the iSNS configuration.

Examples

The following example modifies the sendtargets-fqdn of the iSCSI LIF vs1_iscsi1 for Vserver vs1 to myhost.example.com.

cluster1::> vserver iscsi interface modify -vserver vs1 -lif vs1_iscsi1 -sendtargets_fqdn myhost.example.com
vserver iscsi interface show

Show network interfaces used for iSCSI connectivity

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command shows the iSCSI logical interfaces for a specified Vserver. If you do not specify any of the parameters, the command displays all of the interfaces on a Vserver.

Parameters

\-[fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

\-[instance]
If you specify the -instance parameter, the command displays detailed information about all fields.

\-[vserver <Vserver Name>] - Vserver
Use this parameter to display iSCSI logical interfaces that match the Vserver that you specify.

\-[lif <lif-name>] - Logical Interface
Use this parameter to display iSCSI logical interfaces that that you specify.

\-[status-admin {up|down}] - Administrative Status
Specifies the configured status of the logical interface. If you set this parameter to up, the command displays all iSCSI logical interfaces with the administrative status of up. If you set this parameter to down, the command displays all the iSCSI logical interfaces with the administrative status of down.

\-[status-oper {up|down}] - Operational Status
Specifies the current status of the logical interface. If you set this parameter to up, the command displays all the iSCSI logical interfaces with the operational status of up. If you set this parameter to down, the command displays all the iSCSI logical interfaces with the operational status of down.

\-[enabled {true|false}] - Enabled
Specifies if this logical unit is enabled for iSCSI service. If you enter this command without a parameter, its effective value is true, and the command displays all the enabled iSCSI logical interfaces.

\-[address <IP Address>] - IP Address
Use this parameter to display iSCSI logical interfaces that match the IP address that you specify.

\-[ip-port <integer>] - IP Port Number
Use this parameter to display iSCSI logical interfaces that match IP port number for the logical interface that you specify.

\-[curr-node <nodename>] - Current Node
Use this parameter to display iSCSI logical interfaces that match current node that you specify.

\-[curr-port (<netport>|<ifgrp>)] - Current Port
Use this parameter to display iSCSI logical interfaces that match specified current physical port that you specify.

\-[is-home {true|false}] - Is Home
Specifies if the node hosting the logical interface is the initially configured node. If you use this command without using this parameter, it is set to true, and the command displays all iSCSI interfaces that are on the initially configured node.
[tpgroup <text>] - TPGroup Name
Use this parameter to display iSCSI logical interfaces that match the target portal group name that you specify.

[tpgroup-tag] - TPGroup Tag
Use this parameter to display iSCSI logical interfaces that match the target portal group tag that you specify.

[relative-port-id <integer>] - Relative Port ID
Use this parameter to display the iSCSI logical interface that matches the relative target port ID that you specify. The system assigns each logical interface and target portal group a relative target port ID that is Vserver unique. You cannot change this ID.

[sendtargets-fqdn <text>] - iSCSI Discovery SendTargets FQDN (privilege: advanced)
Use this parameter to display the iSCSI logical interfaces that match the iSCSI Discovery SendTargets Fully Qualified Domain Name (FQDN) that you specify.

Examples
The following example displays information for logical interfaces on Vserver vs_1.

```
cluster1::> vserver iscsi interface show -vserver vs_1
Logical         Status     IP              Curr        Curr
Vserver    Interface  TPGT Admin/Oper Address         Node        Port Enabled
---------- ---------- ---- ---------- --------------- ----------- ---- -------
vs_1       vs_1.iscsi 1027   up/up    10.63.8.165     node1       e0c  true
vs_1       vs_1.iscsi2 1028   up/up    10.63.8.166     node1       e0c  true
2 entries were displayed.
```

The following example displays the logical interface vs_1.iscsi with the relative target port ID of 1.

```
cluster1::> vserver iscsi interface show -vserver vs_1 -relative-port-id 1
Logical         Status     IP              Curr        Curr
Vserver    Interface  TPGT Admin/Oper Address         Node        Port Enabled
---------- ---------- ---- ---------- --------------- ----------- ---- -------
vs_1       vs_1.iscsi 1027   up/up    10.63.8.165     node1       e0c  true
```

vserver iscsi interface accesslist commands
The accesslist directory
Commands used to manage iSCSI accesslists.

vserver iscsi interface accesslist add
Add the iSCSI LIFs to the accesslist of the specified initiator

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command adds network interfaces to an access list for a specified initiator. An access list ensures that an initiator only logs in with IP addresses associated with the interfaces defined in the access list.

You can restrict an initiator to certain network interfaces to improve performance and security. Access lists are useful where a particular initiator cannot access all of the network interfaces on a node.

Access list policies are based on the interface name. The accesslist rules are:

- If you disable the network interface for iSCSI through the vserver iscsi interface disable command, for example, the network interface is not accessible to any initiator regardless of any access lists in effect.
- If an initiator does not have an access list, that initiator can access any iSCSI-enabled network interface.
• If an initiator has an access list, that initiator can only login to network interfaces in its access list. Additionally, the initiator cannot discover any IP addresses that are not on this access list. If an initiator sends an iSCSI sendtargets request, the node responds with a list of IP addresses for iSCSI data logical interfaces that are in its access list.

• If an initiator does not have an access list, you automatically create an access list when you issue the `vserver iscsi interface accesslist add` command.

• If you remove all the interfaces from the access list of an initiator with the `vserver iscsi interface accesslist remove` command, the accesslist is also deleted.

• Creating or modifying access list requires that initiator log out and log back in before changes take effect.

When you use the add or remove commands, the system warns you if an iSCSI session could be affected.

  **Note:** You will not affect any iSCSI sessions if you use the `-a` parameter when adding or removing all interfaces.

**Parameters**

`-vserver <Vserver Name>` - *Vserver*

  Specifies the Vserver name.

`-initiator-name <text>` - *Initiator Name*

  Specifies the initiator you want to add to the access list.

`{-lif <lif-name>, ...}` - *Logical Interface*

  Specifies the lif you want to add to an access list.

`| -all | -a <true>` - *All*

  If you use this parameter without a value, it is set to true, and the command adds all iSCSI data logical interfaces for a vserver to an initiator's accesslist. If the initiator does not have an accesslist, the system creates a new accesslist.

`[-force | -f <true>]` - *Force*

  If you use this parameter without a value, it is set to true, and the command does not prompt you when an active iSCSI service or any active iSCSI data logical interfaces could be affected. If you do not use this parameter, the command prompts for confirmation if the iSCSI service is active or if any active data logical interfaces would be affected.

**Examples**

```
cluster1::> vserver iscsi interface accesslist add -vserver vs_1 -initiator-name iqn.1992-08.com.example:abcdefg -a
```

**Related references**

`vserver iscsi interface disable` on page 1652

`vserver iscsi interface accesslist remove` on page 1656

**vserver iscsi interface accesslist remove**

Remove the iSCSI LIFs from the accesslist of the specified initiator

**Availability:** This command is available to cluster and Vserver administrators at the *admin* privilege level.

**Description**

This command removes network interfaces from an access list for a specified initiator. The system removes the access list when the list is empty. When you remove a network interface from an initiator, this action could result in the shutdown of active sessions.
Parameters
- `vserver <Vserver Name>` - Vserver
  Specifies the Vserver name.

- `initiator-name <text>` - Initiator Name
  Specifies the initiator that you want to remove logical interfaces from.

{ `-lif <lif-name>`,...} - Logical Interface
  Specifies the logical interface you want to remove.

| `-all` | `-a [true]` | All
  If you use this parameter without a value, it is set to true, and the command removes all of the iSCSI data logical interfaces from an initiator's accesslist. If you remove all the network interfaces from an access list, the system removes the access list.

[-force | `-f [true]`] - Force
  If you use this parameter without a value, it is set to true, and the command does not prompt you when an active iSCSI service or any active iSCSI data logical interfaces could be affected. If you do not use this parameter, the command prompts for confirmation if the iSCSI service is active or if any active data logical interfaces would be affected.

Examples
```
cluster1:/> vserver iscsi interface accesslist remove -vserver vs_1 -initiator-name iqn.1992-08.com.example:abcdefg -a
```

vserver iscsi interface accesslist show

Show accesslist of the initiators for iSCSI connectivity

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command displays an access list for an initiator. An access list is a list of logical interfaces that an initiator can use for iSCSI logins. The system records the access lists as part of the node configuration and preserves the access lists during reboots.

Parameters
{ `-fields <fieldname>, ...` }
  If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

| `-instance` |
  If you specify the `instance` parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver
  Use this parameter to display the access lists that match the Vserver name that you specify.

[-initiator-name <text>] - Initiator Name
  Use this parameter to display the access lists that match the initiator that you specify.

[-lif <lif-name>] - Logical Interface
  Use this parameter to display the access lists that match the logical interface that you specify.
### Examples

4 entries were displayed.

### vserver iscsi isns commands

The isns directory

#### vserver iscsi isns create

Configure the iSNS service for the Vserver

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**

This command creates and starts an iSNS service with the IP address of the iSNS server.

**Note:** A Vserver management LIF must exist before you can create an iSNS service. This LIF is used to communicate with the iSNS server. To create a Vserver management LIF, use the `network interface create` command, with `-role data` and `-data-protocol none`.

**Parameters**

- **-vserver `<Vserver Name>`** - Vserver Name
  
  Specifies the Vserver for the iSNS service that you want to create.

- **-address `<IP Address>`** - iSNS Server IP Address

  Specifies the IP address of the iSNS server. Both IPv4 and IPv6 address families are supported. The address family must be the same as that of the vserver management LIF.

  **Note:** A default route must exist for the specified vserver. To create a route, use the `network routing-groups route create` command. To view existing routes, use the `network routing-groups route show` command.

- **[-status-admin {down|up}]** - Administrative Status

  Specifies the administrative status of the iSNS service of a Vserver. If you set this parameter to up, the iSNS service starts for the Vserver and registers with the configured iSNS server. If you set this parameter to down, the Vserver loses its ability to register with the iSNS server and to be discovered by iSNS clients.

- **[-force [true]]** - Force

  `vserver iscsi isns create` fails if vserver management LIF is not configured. When you set this option to "true," you create an iSNS service on a Vserver even if the vserver does not have a vserver management LIF.

#### Examples

```bash
cluster1::> vserver iscsi isns create -vserver vs_1 -address 10.60.1.1 -status-admin up
```

Creates the iSNS service for Vserver vs_1 using the IPv4 address.
Related references

- network routing-groups route create on page 346
- network routing-groups route show on page 347
- network interface create on page 281

vserver iscsi isns delete

Remove the iSNS service for the Vserver

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

This command deletes the iSNS service for the Vserver.

Parameters

- `vserver <Vserver Name>` - Vserver Name
  
  Specifies the Vserver for the iSNS service that you want to delete.

Examples

```
cluster1::> vserver iscsi isns delete -vserver vs_1
```

vserver iscsi isns modify

Modify the iSNS service for the Vserver

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

This command modifies the configuration of an iSNS service. Modifications take effect immediately after you execute the command.

Parameters

- `vserver <Vserver Name>` - Vserver Name
  
  Specifies the Vserver for the iSNS service that you want to modify.

- `[-address <IP Address>]` - iSNS Server IP Address
  
  Specifies the IP address of the iSNS server. Both IPv4 and IPv6 address families are supported. The address family must be the same as that of the vserver management LIF.

  **Note:** A default route must exist for the specified vserver. To create a route, use the `network routing-groups route create` command. To view existing routes, use the `network routing-groups route show` command.

- `[-status-admin {down|up}]` - Administrative Status
  
  Specifies the administrative status of the iSNS service of a Vserver. If you set this parameter to up, the iSNS service starts for the Vserver, and registers with the configured iSNS server. If you set this parameter to down, the Vserver loses its ability to register with the iSNS server and to be discovered by iSNS clients.
[-force [true]] - Force

vserver iscsi isns modify fails to modify the iSNS server address if vserver management LIF is not configured. When you set this option to "true," you can modify the iSNS service on a Vserver even if the vserver does not have a vserver management LIF.

Examples

cluster1::> iscsi isns modify -vserver vs_1 -status-admin up

Related references

network routing-groups route create on page 346
network routing-groups route show on page 347

vserver iscsi isns show

Show iSNS service configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

Shows the iSNS service configuration.

Parameters

{[-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance ]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver Name

Use this parameter to display the iSNS services that match the Vserver name that you specify.

[-address <IP Address>] - iSNS Server IP Address

Use this parameter to display the iSNS services that match the IP address of the iSNS server that you specify.

[-status-admin (down|up)] - Administrative Status

Use this parameter to display the iSNS services that match the configured status of the service that you specify.

[-entity-id <text>] - iSNS Server Entity Id

Use this parameter to display the iSNS services that match the configured iSNS server entity-id that you specify.

[-last-successful-update <MM/DD/YYYY HH:MM:SS>] - Last Successful Update

Use this parameter to display the iSNS services that match the time of the last successful attempt.

[-last-update-attempt <MM/DD/YYYY HH:MM:SS>] - Last Update Attempt

Use this parameter to display the iSNS services that match the time of the last update attempt.

[-last-update-result <isnsErrors>] - Last Update Result

Use this parameter to display the iSNS services that match the result of the last update attempt.
Examples

```
cluster1::> vserver iscsi isns show    
Vserver   iSNS Server Entity Identifier   iSNS Server IP Address   iSNS Status
---------- ------------------------------- ---------------------- -----------
iscsi_vs   isns:00000044                   10.229.136.188         up
```

Displays the output of the show command for all Vservers in a cluster.

```
cluster1::> vserver iscsi isns show -instance
Vserver Name: vs1
iSNS Server IP Address: 10.72.19.11
Administrative Status: up
iSNS Server Entity Id: isns.0000001c
Last Successful Update: 11/12/2011 10:18:45
Last Update Attempt: 11/12/2011 10:18:45
Last Update Result: iSNS_Ok

Vserver Name: vs2
iSNS Server IP Address: 10.72.16.13
Administrative Status: up
iSNS Server Entity Id: isns.0000001b
Last Successful Update: 11/12/2011 13:38:05
Last Update Attempt: 11/12/2011 13:38:05
Last Update Result: iSNS_Ok
```

2 entries were displayed.

vserver iscsi isns start

Starts the iSNS service

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**

Starts the iSNS service. Once you start the iSNS service, the Vserver automatically register with the iSNS server.

**Parameters**

```
-vserver <Vserver Name> - Vserver Name
```

Specifies the Vserver for the iSNS service that you want to start.

Examples

```
cluster1::> vserver iscsi isns start -vserver vs_1
```

vserver iscsi isns stop

Stops the iSNS service

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**

Stops the iSNS service. Once you stop the iSNS service, the Vserver loses the ability to register with the iSNS server and to be discovered by iSNS clients.
**Parameters**

`-vserver <Vserver Name>` - Vserver Name

Specifies the Vserver for the iSNS service that you want to stop.

<table>
<thead>
<tr>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>cluster1::&gt; vserver iscsi isns stop -vserver vs_1</td>
</tr>
</tbody>
</table>

**vserver iscsi isns update**

Force update of registered iSNS information

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

Forces an update of the registration information with the iSNS server. Normally, the system checks for iSNS configuration changes on the Vserver every few minutes and automatically sends updates to the iSNS server.

**Parameters**

`-vserver <Vserver Name>` - Vserver Name

Specifies the Vserver for the iSNS service that you want to update.

<table>
<thead>
<tr>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>cluster1::&gt; vserver iscsi isns update -vserver vs_1</td>
</tr>
</tbody>
</table>

**vserver iscsi session commands**

The session directory

**vserver iscsi session show**

Display iSCSI sessions

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

This command displays iSCSI session information. If you do not specify the target session ID (TSIH), the command displays all session information for the specified Vserver. If a Vserver is not specified, the command displays all session information in the cluster. Use the `vserver iscsi connection show` command to display connection information. Use the `vserver iscsi session parameter show` command to show the parameters used when creating the session.

You can use session information for troubleshooting performance problems.

An iSCSI session can have one or multiple connections. Typically a session has at least one connection.

Most of the parameters are read-only. However, some parameters can be modified with the `vserver iscsi modify` command.

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.
If you specify the `--instance` parameter, the command displays detailed information about all fields.

`--vserver <Vserver Name>` - Vserver
Use this parameter to display iSCSI session information that matches the Vserver name that you specify.

`--tpgroup <text>` - Target Portal Group
Use this parameter to display iSCSI session information that matches the target portal group name that you specify.

`--tsih <integer>` - Target Session ID
Use this parameter to display iSCSI session information that matches the target session ID that you specify.

`--max-ios-per-session <integer>` - Max Commands per Session
Use this parameter to display iSCSI session information that matches the maximum commands per session count you specify.

`--data-pdu-in-order {true|false}` - Data PDU in Order
Specifies if the data PDUs are in sequence order. If you enter this command without using this parameter, it is set to true, and the command displays all session information that supports PDUs in order. If you provide a false value, the command displays all session information that does not support PDUs in order.

`--data-sequence-in-order {true|false}` - Data Sequence in Order
Specifies if the data is in sequence order. If you enter this command without using this parameter, it is set to true, and the command displays all session information where data sequence is supported. If you provide a false value, the command displays all session information that does not support data sequence.

`--default-time-to,retain <integer>` - Default Time to Retain
Use this parameter to display session information that matches the retain time that you specify. This value specifies the amount of time before active reassignment is possible after an unexpected connection termination or a connection reset. A value of 0 means the connection task state is immediately discarded by the target.

`--default-time-to-wait <integer>` - Default Time to Wait
Use this parameter to display session information that matches the logout or active task assignment wait time that you specify. Wait time refers to the amount of time before attempting an explicit or implicit logout or active task assignment after an unexpected connection termination or connection reset.

`--error-recovery-level <integer>` - Error Recovery Level
Use this command to display session information that matches the error recovery level that you specify.

`--first-burst-length <integer>` - First Burst Length
Use this parameter to display session information that matches the first burst length that you specify. First burst length is the maximum amount of unsolicited data in bytes that can be sent during the execution of a single iSCSI packet. First burst length covers the total amount of immediate data and the unsolicited data-out PDU. The first burst length must not exceed the maximum burst length.

`--immediate-data-enabled {true|false}` - Immediate Data
Specifies if immediate data is supported. When immediate data is supported, the initiator can send immediate data. If you enter this command using the parameter without a value, it is set to true, and the command displays all session information that supports immediate data. If you provide a false value, the command displays all session information that does not support immediate data.

`--initiator-alias <text>` - Initiator Alias
Use this parameter to display iSCSI session information that matches the alias name of the initiator that you specify.

`--initial-r2t-enabled {true|false}` - Initial R2T Enabled
Specifies if the initiator supports Initial Ready to Transfer (R2T). R2T is the mechanism that allows the target to request the initiator for output data. If you enter this command using the parameter without a value, it is set
to true, and the command displays all session information that supports initial R2T data. If you provide a false value, the command displays all session information that does not support initial R2T data.

\[-initiator-name <text>\] - Initiator Name
Use this parameter to display the iSCSI session information that matches the initiator name that you specify.

\[-isid <text>\] - Initiator Session ID
Use this parameter to display iSCSI session information that matches the initiator session ID that you specify.

\[-max-burst-length <integer>\] - Max Burst Length for Session
Use this parameter to display iSCSI session information that matches the maximum burst length that you specify. Maximum burst length is the maximum iSCSI data payload in bytes for a data-in or solicited data-out sequence.

\[-max-connections <integer>\] - Max Connections for Session
Use this parameter to display iSCSI session information that matches the maximum number of connections that you specify.

\[-max-outstanding-r2t <integer>\] - Max Outstanding R2T for Session
Use this parameter to display iSCSI session information that matches the maximum number of outstanding R2T per task that you specify.

\[-session-type <iSCSI Session Type>\] - Session Type
Use this parameter to display iSCSI session information that matches the session type that you specify.

\[-tpgroup-tag <integer>\] - Target Portal Group Tag
Use this parameter to display iSCSI session information that matches the target portal group tag that you specify.

\[-connection-ids <integer>, ...\] - Active Connection IDs
Use this parameter to display iSCSI session information that matches the active connection IDs that you specify.

**Examples**

```
cluster1::> vserver iscsi session show -vserver vs_1

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Tpgroup</th>
<th>Initiator</th>
<th>Initiator</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>TSIH</td>
<td>ISID</td>
</tr>
<tr>
<td>---------</td>
<td>---------</td>
<td>--------------------------</td>
<td>-----------</td>
</tr>
<tr>
<td>vs_1</td>
<td>tpgroup_1</td>
<td>ign.1993-08.org.debian:01:fa752b8a5a3a</td>
<td>00:02:3d:01:00:00</td>
</tr>
<tr>
<td></td>
<td></td>
<td>initiator-alias</td>
<td></td>
</tr>
</tbody>
</table>

Displays session information for all sessions on Vserver vs_1.

**vserver iscsi session shutdown**

Shut down a session on a node

**Availability:** This command is available to cluster and Vserver administrators at the `advanced` privilege level.
Description
This command forces a shutdown of all connections in a session. If you want to shut down a single connection in a session, use the vserver iscsi connection shutdown command.

Parameters
-vserver <Vserver Name> - Vserver
Specifies the Vserver.

-tpgroup <text> - Target Portal Group
Specifies the target portal group that contains the session you want to shutdown.

-tsih <integer> - Target Session ID
Specifies the target session ID that you want to shut down.

Examples
cluster1::*> vserver iscsi session shutdown -vserver vs_1 -tpgroup tpgroup_1 -tsih 2

vserver iscsi session parameter commands
The parameter directory
Commands used for displaying parameters used for iSCSI sessions

vserver iscsi session parameter show
Display the parameters used to establish an iSCSI session
Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command displays session parameter information. This command is intended for troubleshooting performance problems.
Most of the parameters are read-only. However, some parameters can be modified with the vserver iscsi modify command.

Parameters
[[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.
]|[-instance]]
If you specify the -instance parameter, the command displays detailed information about all fields.
[-vserver <Vserver Name>] - Vserver
Use this parameter to display session information that matches the Vserver name that you specify.
[-tpgroup <text>] - Target Portal Group
Use this parameter to display session information that matches the target portal group name that you specify.
[-tsih <integer>] - Target Session ID
Use this parameter to display session information that matches the target session ID that you specify.
[-cmd-window-size <integer>] - Max Commands per Session
Use this parameter to display session information that matches the command window size that you specify.

[-data-pdu-in-order {true|false}] - Data PDU in Order
Use this parameter to display session information with the value of the Protocol Data Units (PDU) in order flag you specify. This parameter indicates if the data within a sequence can be in any order or must be in sequence. If you enter this command without using this parameter, it is set to true, and the command displays all session information that supports PDUs in order. If you provide a false value, the command displays all session information that does not support PDUs in order.

[-data-sequence-in-order {true|false}] - Data Sequence in Order
Use this parameter to display session information with the value of the data sequence in order flag that you specify. If you enter this command without using this parameter, it is set to true, and the command displays all session information that supports data sequence. If you set the values to false, the command displays all session information that does not support data sequence.

[-default-time-to-retain <integer>] - Default Time to Retain
Use this parameter to display session information that matches the retain time that you specify. This value specifies the amount of time before active reassignment is possible after an unexpected connection termination or a connection reset. A value of 0 means the connection task state is immediately discarded by the target.

[-default-time-to-wait <integer>] - Default Time to Wait
Use this parameter to display session information that matches the logout or active task assignment wait time that you specify. Wait time refers to the amount of time before attempting an explicit or implicit logout or active task assignment after an unexpected connection termination or connection reset.

[-error-recovery-level <integer>] - Error Recovery Level
Use this command to display session information that matches the error recovery level that you specify.

[-first-burst-length <integer>] - First Burst Length
Use this parameter to display session information that matches the first burst length that you specify. First burst length is the maximum amount of unsolicited data in bytes that can be sent during the execution of a single iSCSI packet. First burst length covers the total amount of immediate data and the unsolicited data-out PDU. The first burst length must not exceed the maximum burst length.

[-immediate-data-enabled {true|false}] - Immediate Data
Use this parameter to display session information with the value of the immediate data-enabled flag that you specify. If you enter this command without using this parameter, it is set to true, and the command displays all session information that supports immediate data. If you set the value to false, the command displays all session information that does not support immediate data.

[-initial-r2t-enabled {true|false}] - Initial R2T Enabled
Use this parameter to display session information with the value of the R2T data-enabled flag that you specify. If you enter this command without using this parameter, it is set to true, and the command displays all session information that supports R2T data. If you set the value to false, the command displays all session information that does not support R2T data.

[-initiator-alias <text>] - Initiator Alias
Use this parameter to display iSCSI session information that matches the initiator alias name you specify.

[-initiator-name <text>] - Initiator Name
Use this parameter to display iSCSI session information that matches the initiator name you specify.

[-isid <text>] - Initiator Session ID
Use this parameter to display iSCSI session information that matches the initiator session identifier you specify.
[-max-burst-length <integer>] - Max Burst Length for Session
Use this parameter to display iSCSI session information that matches the maximum burst length that you specify. Maximum burst length is the maximum iSCSI data payload in bytes for a data-in or solicited data-out sequence.

[-max-connections <integer>] - Max Connections for Session
Use this parameter to display iSCSI session information that matches the maximum number of connections that you specify.

[-max-outstanding-r2t <integer>] - Max Outstanding R2T for Session
Use this parameter to display iSCSI session information that matches the maximum number of outstanding R2T per task that you specify.

[-session-type <iSCSI Session Type>] - Session Type
Use this parameter to display iSCSI session information that matches the session type you specify.

[-tpgroup-tag <integer>] - Target Portal Group Tag
Use this parameter to display iSCSI session information that matches the target portal group tag you specify.

[-initiator-mrdsl <integer>, ...] - Initiator Max Recv Data Len
Use this parameter to display iSCSI session information that matches the initiator maximum receivable data segment length you specify. An iSCSI initiator declares the maximum data segment length in bytes it can receive in an iSCSI PDU during the iSCSI login phase.

[-target-mrdsl <integer>, ...] - Target Max Recv Data Len
Use this parameter to display iSCSI session information that matches the target maximum receivable data segment length you specify. An iSCSI target declares the maximum data segment length in bytes it can receive in an iSCSI PDU during the iSCSI login phase.

Examples

```bash
cluster1::> iscsi session parameter show -vserver vs_1
   Tpgroup      Max  Data PDU Data Seq Time 2 Time 2 Error   Imm   Initial
   Vserver Name    TSIH Conn In Order In Order Retain Wait   Rec Lvl Data  R2T
   ------- ------- ---- ---- -------- -------- ------ ------ ------- ----- -------
   vs_1    vs_1.iscsi 6    1 true     true          0      2       0 true  false
   vs_1    vs_1.iscsi 7    1 true     true          0      2       0 true  false
2 entries were displayed.
```

vserver iscsi security commands

The security directory
Commands used to manage iSCSI security configuration.

vserver iscsi security create

Create an iSCSI authentication configuration for an initiator

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command configures the security method for an iSCSI initiator on a Vserver. The outbound CHAP password and user name are optional. If you want mutual authentication, you need to configure both inbound and outbound CHAP passwords and user names.
You cannot use the same password for inbound and outbound settings.

**Parameters**

- **vserver <Vserver Name>** - Vserver
  
  Specifies the Vserver.

- **-initiator-name | -i <text>** - Initiator Name
  
  Specifies the initiator that you want to create a security method for. You can use either an iqn such as iqn.1995-08.com.example:string or eui such as eui.0123456789abcdef for the initiator.

- **-auth-type | -s {CHAP|deny|none}** - Authentication Type
  
  Specifies the authentication type:
  
  - CHAP - Authenticates using a CHAP user name and password.
  - none - The initiator can access the Vserver without authentication.
  - deny - The initiator cannot access the Vserver.

- **[-user-name | -n <text>]** - Inbound CHAP User Name
  
  Specifies the inbound CHAP user name. CHAP user names can be one to 128 bytes. A null user name is not allowed. If provided, you will be prompted to provide the corresponding inbound CHAP password.

- **[-outbound-user-name | -m <text>]** - Outbound CHAP User Name
  
  Specifies the outbound CHAP user name. CHAP user names can be one to 128 bytes. If provided, you will be prompted to enter the corresponding outbound CHAP password.

```
Examples

cluster1::> iscsi security create -initiator eui.0123456789abcdef -auth-type CHAP -user-name bob -outbound-user-name bob2

Password:
Outbound Password:
```

**vserver iscsi security default**

Configure the default authentication settings

**Availability:** This command is available to cluster and Vserver administrators at the **admin** privilege level.

**Description**

This command defines a default iSCSI authentication method for your Vserver. If you do not configure the initiator to use a user-defined authentication method, the system assigns the default authentication method automatically to the initiator. Use the `vserver iscsi security create` command if you want to configure a user-defined authentication method.

The outbound CHAP user name and password are optional. If you want a bi-directional handshake, provide the outbound user name and you will be prompted for the corresponding password.

You cannot use the same password for inbound and outbound settings.

**Parameters**

- **vserver <Vserver Name>** - Vserver
  
  Specifies the Vserver.

- **-auth-type | -s {CHAP|deny|none}** - Authentication Method
  
  Specifies the authentication type:
• CHAP - Authenticates using a CHAP user name and password.
• none - The initiator can access the Vserver without authentication.
• deny - The initiator cannot access the Vserver.

[-user-name | -n <text>] - Inbound CHAP User Name
   Specifies the inbound CHAP user name. CHAP user names can be one to 128 bytes. A null user name is not allowed. If provided, you will be prompted to provide the corresponding inbound CHAP password.

[-outbound-user-name | -m <text>] - Outbound CHAP User Name
   Specifies the outbound CHAP user name. CHAP user names can be one to 128 bytes. If provided, you will be prompted to enter the corresponding outbound CHAP password.

[[-clear-outbound [true]]] - Clear Outbound CHAP Parameters
   Removes the outbound user name and the outbound password information from the default authentication method. After you clear the outbound information, you no longer have a bi-directional handshake.

Examples

cluster1::> iscsi security default -vserver vs_1 -security chap -user-name bob -outbound-user-name bob_out
   Password:
   Outbound Password:

vserver iscsi security create on page 1667

vserver iscsi security delete

Delete the iSCSI authentication configuration for an initiator

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command removes the security settings for this initiator. The default authentication setting now applies to this initiator.

Parameters
- -vserver <Vserver Name> - Vserver
   Specifies the Vserver.
- -initiator-name | -i <text> - Initiator Name
   Specifies the initiator that you want to remove the authentication setting from.

Examples

cluster1::> iscsi security delete -vserver vs_1 -initiator iqn.1992-08.com.example:abcdefg

vserver iscsi security modify

Modify the iSCSI authentication configuration for an initiator

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.
Description
The command modifies an existing authentication method for an initiator. To delete the authentication setting for an initiator, use the `vserver iscsi security delete` command.

The outbound CHAP password and user name are optional. If you want a bi-directional handshake, you need to configure both inbound and outbound CHAP passwords and user names.

You do not need to know the inbound or outbound passwords to change them.

Parameters

- `--vserver <Vserver Name>` - Vserver
  Specifies the Vserver.

- `--initiator-name | -i <text>` - Initiator Name
  Specifies the initiator name that you want to modify the existing authentication method.

- `--auth-type | -s {CHAP|deny|none}` - Authentication Type
  Specifies the authentication type:
  - CHAP - Authenticates using a CHAP user name and password.
  - none - The initiator can access the Vserver without authentication.
  - deny - The initiator cannot access the Vserver.

- `--user-name | -n <text>` - Inbound CHAP User Name
  Specifies the inbound CHAP user name. CHAP user names can be one to 128 bytes. A null user name is not allowed. If provided, you will be prompted to provide the corresponding inbound CHAP password.

- `[-outbound-user-name | -m <text>]` - Outbound CHAP User Name
  Specifies the outbound CHAP user name. CHAP user names can be one to 128 bytes. If provided, you will be prompted to enter the corresponding outbound CHAP password.

- `[-clear-outbound [true]]` - Clear Outbound CHAP Parameters
  Removes the outbound user name and the outbound password information from the authentication method. After you clear the outbound information, you no longer have a bi-directional handshake.

Examples

```
cluster1::> vserver iscsi security modify --vserver vs_1 --initiator iqn.1992-08.com.example:abcdefg
--auth-type chap --user-name bob --outbound-user-name bob_out

Password:

Outbound Password:
```

`vserver iscsi security delete` on page 1669

vserver iscsi security show

Show the current iSCSI authentication configuration

Availability: This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

Description
This command displays the default authentication and all initiator-specific authentication information. Data ONTAP authentication overrides all other service authentication methods.
Parameters

{-fields <fieldname>, ...}

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

{-instance}

If you specify the -instance parameter, the command displays detailed information about all fields.

{-vserver <Vserver Name> } - Vserver

Use this parameter to display authentication information that matches the Vserver name that you specify.

{-initiator-name | -i <text> } - Initiator Name

Use this parameter to display authentication information that matches the initiator that you specify.

{-auth-type | -s {CHAP|deny|none}} - Authentication Type

Use this parameter to display authentication information that matches the authentication type that you specify.

{-user-name | -n <text> } - Inbound CHAP User Name

Use this parameter to display authentication information that matches the inbound CHAP user name that you specify.

{-outbound-user-name | -m <text> } - Outbound CHAP User Name

Use this parameter to display authentication information that matches the outbound CHAP user name that you specify.

{-auth-chap-policy <local>} - Authentication CHAP Policy

Use this parameter to display authentication information that matches the authentication CHAP policy that you specify.

Examples

cluster1::> iscsi security show -vserver vs_1

<table>
<thead>
<tr>
<th>Vserver</th>

vserver nfs commands

Manage the NFS configuration of a Vserver

vserver nfs create

Create an NFS configuration for a Vserver

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver nfs create command enables and configures a Vserver to serve NFS clients. The Vserver must already exist. An NFS-enabled Vserver is associated with an NIS domain.
Parameters
-vserver <vserver name> - Vserver
This parameter specifies the Vserver on which you want to create the NFS configuration.

-<access [true|false]> - General NFS Access
This optional parameter specifies whether to enable NFS access on the Vserver. The default setting is true.

-[rpcsec-ctx-high <integer>] - RPC GSS Context Cache High Water Mark (privilege: advanced)
This optional parameter specifies the maximum number of RPCSEC_GSS authentication contexts, which are used by Kerberos. The default setting is zero. See RFC 2203 for information about RPCSEC_GSS contexts.

-[rpcsec-ctx-idle <integer>] - RPC GSS Context Idle (privilege: advanced)
This optional parameter specifies, in seconds, the amount of time a RPCSEC_GSS context is permitted to remain unused before it is deleted. The default setting is zero seconds. See RFC 2203 for information about RPCSEC_GSS contexts.

-[v3 {enabled|disabled}] - NFS v3
This optional parameter specifies whether to enable access for NFSv3 clients. The default setting is enabled.

-[v4.0 {enabled|disabled}] - NFS v4.0
This optional parameter specifies whether to enable access for NFSv4.0 clients. The default setting is disabled. This parameter is not supported for Vservers with Infinite Volume.

-[udp {enabled|disabled}] - UDP Protocol
This optional parameter specifies whether to enable NFS access over UDP. The default setting is enabled. This parameter is not supported for Vservers with Infinite Volume.

-Note: Even if UDP is disabled, if TCP is enabled, the Vserver does not block NFSv3 traffic over UDP. By allowing this traffic, the storage system can process NFS_NULL ops that the Solaris automounter sends to determine if the storage system is alive. (Solaris sends these ops over UDP even if configured to use TCP.) To disallow access for certain clients, including over UDP, you can use export-policy rules. For more information, see the vserver export-policy rule create command.

-[tcp {enabled|disabled}] - TCP Protocol
This optional parameter specifies whether to enable NFS access over TCP. The default setting is enabled.

-[default-win-user <text>] - Default Windows User
This optional parameter specifies a list of default Windows users for the NFS server.

-[enable-ejukebox {true|false}] - Enable NFSv3 EJUKEBOX error (privilege: advanced)
This optional parameter specifies whether EJUKEBOX errors are enabled for NFSv3. The default setting is true.

-[v3-require-read-attributes {true|false}] - Require All NFSv3 Reads to Return Read Attributes (privilege: advanced)
This optional parameter specifies whether NFSv3 read operations are required to return read attributes. The default setting is false.

-[v3-fsid-change {enabled|disabled}] - Show Change in FSID as NFSv3 Clients Traverse Filesystems (privilege: advanced)
This optional parameter specifies whether Data ONTAP shows changes in file system identifiers (FSIDs) as NFSv3 clients traverse file systems. The default setting is enabled.

-[v3-connection-drop {enabled|disabled}] - Enable the Dropping of a Connection When an NFSv3 Request is Dropped (privilege: advanced)
This optional parameter specifies whether Data ONTAP allows to drop the connection when a NFSv3 request is dropped. The default setting is enabled.
[-ntfs-unix-security-ops {fail|ignore|use-export-policy}] - Vserver NTFS Unix Security Options (privilege: advanced)

This optional parameter specifies how NFSv3 security changes affect NTFS volumes. If you set this parameter to ignore, Data ONTAP ignores NFSv3 security changes. If you set this parameter to fail, this overrides the unix security options set in the relevant export rules. If you set this parameter to use_export_policy, Data ONTAP processes NFSv3 security changes in accordance with the relevant export rules. The default setting is use_export_policy at the time of creation.

[-chown-mode {restricted|unrestricted|use-export-policy}] - Vserver Change Ownership Mode (privilege: advanced)

This optional parameter specifies whether ownership of a file can be changed by superusers or by non-root users who currently own the file. If you set this parameter to restricted, the ownership of a file can be changed by superusers only. If you set this parameter to unrestricted, the ownership of a file can be changed by superusers and the current owner of the file. If you set this parameter to use-export-policy, the ownership of a file can be changed in accordance with the relevant export rules. The default setting is use-export-policy.

[-trace-enabled {true|false}] - NFS Response Trace Enabled (privilege: advanced)

This optional parameter specifies whether Data ONTAP logs NFS requests when they exceed the NFS response trigger time (see the trigger parameter). The default setting is false.

[-trigger <integer>] - NFS Response Trigger (in secs) (privilege: advanced)

This optional parameter specifies the amount of time, in seconds, after which Data ONTAP must log an NFS request if it has not completed (assuming the -trace-enabled option is true). The default setting is 60.

[-udp-max-xfer-size <integer>] - UDP Maximum Transfer Size (bytes) (privilege: advanced)

This optional parameter specifies the maximum transfer size (in bytes) that the NFS mount protocol will negotiate with the client for UDP transport. The range is 8192 to 57344. The default setting is 32768.

[-tcp-max-xfer-size <integer>] - TCP Maximum Transfer Size (bytes) (privilege: advanced)

This optional parameter specifies the maximum transfer size (in bytes) that the storage system negotiates with the client for TCP transport of data for NFSv3, and NFSv4.x protocols. The range is 8192 to 1048576. The default setting is 65536.

Note: Setting the parameter value greater than 65536 may cause performance degradation for existing connections using smaller values. Contact technical support for guidance.

[-v3-tcp-max-read-size <integer>] - NFSv3 TCP Maximum Read Size (bytes) (privilege: advanced)

This optional parameter specifies the maximum transfer size (in bytes) that the storage system negotiates with the client for TCP transport of data for NFSv3 read requests. The range is 8192 to 1048576. The default setting is 65536 when created.

Note: This parameter is deprecated and may be removed in a future release of Data ONTAP. Use the -tcp-max-xfer-size parameter instead.

[-v3-tcp-max-write-size <integer>] - NFSv3 TCP Maximum Write Size (bytes) (privilege: advanced)

This optional parameter specifies the maximum transfer size (in bytes) that the storage system negotiates with the client for TCP transport of data for NFSv3 write requests. The range is 8192 to 65536. The default setting is 65536 when created.

Note: This parameter is deprecated and may be removed in a future release of Data ONTAP. Use the -tcp-max-xfer-size parameter instead.

[-v4.0-acl {enabled|disabled}] - NFSv4.0 ACL Support

This optional parameter specifies whether Data ONTAP supports NFSv4.0 access control lists (ACLs). The default setting is disabled. This parameter is not supported for Vservers with Infinite Volume.
[-v4.0-read-delegation {enabled|disabled}] - NFSv4.0 Read Delegation Support
This optional parameter specifies whether Data ONTAP supports NFSv4.0 read delegations. The default setting is disabled. This parameter is not supported for Vservers with Infinite Volume.

[-v4.0-write-delegation {enabled|disabled}] - NFSv4.0 Write Delegation Support
This optional parameter specifies whether Data ONTAP supports NFSv4.0 write delegations. The default setting is disabled. This parameter is not supported for Vservers with Infinite Volume.

[-v4-fsid-change {enabled|disabled}] - Show Change in FSID as NFSv4 Clients Traverse Filesystems (privilege: advanced)
This optional parameter specifies whether Data ONTAP shows changes in file system identifiers (FSIDs) as NFSv4 clients traverse file systems. The default setting is enabled.

Note: If users access the storage system using NFSv4 from Solaris 10 clients, you must set this option to disabled.

[-v4.0-referrals {enabled|disabled}] - NFSv4.0 Referral Support (privilege: advanced)
This optional parameter specifies whether Data ONTAP supports NFSv4.0 referrals. The default setting is disabled. You can set this parameter to enabled only if you also set the -v4-fsid-change to enabled. If clients accessing the node do not support NFSv4.0 referrals, set this option to disabled; otherwise, those clients will not be able to access the file system. This parameter is not supported for Vservers with Infinite Volume.

[-v4-id-domain <nfs domain>] - NFSv4 ID Mapping Domain
This optional parameter specifies the domain portion of the string form of user and group names as defined by the NFSv4 protocol. By default, the domain name is normally taken from the NIS domain or the DNS domain in use. However, the value of this parameter overrides the default. The domain name must be agreed upon by both the NFS client and the storage controller before NFSv4 operations can be executed. It is recommended that the domain be specified in the fully qualified domain name format.

[-v4-validate-symlinkdata {enabled|disabled}] - NFSv4 Validate UTF-8 Encoding of Symbolic Link Data (privilege: advanced)
This optional parameter specifies whether Data ONTAP validates the UTF-8 encoding of symbolic link data. The default setting is disabled.

[-v4-lease-seconds <integer>] - NFSv4 Lease Timeout Value (in secs) (privilege: advanced)
This optional parameter specifies the time period in which Data ONTAP irrevocably grants a lock to a client. By default, the lease period is 30 seconds. The minimum value is 10. The maximum value is one less than the value of the -v4-grace-seconds parameter.

[-v4-grace-seconds <integer>] - NFSv4 Grace Timeout Value (in secs)
This optional parameter specifies the time period in which clients attempt to reclaim their locking state from Data ONTAP during server recovery. By default, the grace period is 45 seconds. The minimum value is 1 more than the value of the -v4-lease-seconds parameter. The maximum value is 90.

[-v4-acl-preserve {enabled|disabled}] - Preserves and Modifies NFSv4 ACL (and NTFS File Permissions in Unified Security Style)
This optional parameter specifies if the NFSv4 ACL is preserved or dropped when chmod is performed. In unified security style, this parameter also specifies if NTFS file permissions are preserved or dropped when chmod, chgrp, or chown are performed. The default is enabled.

[-v4.1 {enabled|disabled}] - NFSv4.1 Minor Version Support
This optional parameter specifies whether to enable access for NFSv4.1 clients. The default setting is disabled.

-rquota {enabled|disabled} - Rquota Enable
This optional parameter specifies whether to enable rquota over NFS. The default setting is disabled. This parameter is not supported for Vservers with Infinite Volume.
[-v4.1-implementation-domain <nfs domain>] - NFSv4.1 Implementation ID Domain (privilege: advanced)
This optional parameter specifies the NFSv4.1 implementation domain.

[-v4.1-implementation-name <text>] - NFSv4.1 Implementation ID Name (privilege: advanced)
This optional parameter specifies the NFSv4.1 implementation name.

[-v4.1-implementation-date <Date>] - NFSv4.1 Implementation ID Date (privilege: advanced)
This optional parameter specifies the NFSv4.1 implementation date.

[-v4.1-pnfs {enabled|disabled}] - NFSv4.1 Parallel NFS Support
This optional parameter specifies whether Data ONTAP supports parallel NFS over NFSv4.1. The default setting is enabled.

[-v4.1-referrals {enabled|disabled}] - NFSv4.1 Referral Support (privilege: advanced)
This optional parameter specifies whether Data ONTAP supports NFSv4.1 referrals. The default setting is disabled. You can set this parameter to enabled only if you also set the -v4-fsid-change to enabled. If clients accessing the node do not support NFSv4.1 referrals, set this option to disabled; otherwise, those clients will not be able to access the file system. This parameter is not supported for Vservers with Infinite Volume.

[-v4.1-acl {enabled|disabled}] - NFSv4.1 ACL Support
This optional parameter specifies whether Data ONTAP supports NFSv4.1 access control lists (ACLs). The default setting is disabled.

[-vstorage {enabled|disabled}] - NFS vStorage Support
This optional parameter specifies whether to enable vstorage over NFS. The default setting is disabled. This parameter is not supported for Vservers with Infinite Volume.

[-v4-numeric-ids {enabled|disabled}] - NFSv4 Support for Numeric Owner IDs
This optional parameter specifies whether the support for numeric string identifiers in NFSv4 owner attributes is enabled. The default setting is enabled.

[-default-win-group <text>] - Default Windows Group
This optional parameter specifies a list of default Windows groups for the NFS server.

[-v4.1-read-delegation {enabled|disabled}] - NFSv4.1 Read Delegation Support
This optional parameter specifies whether Data ONTAP supports NFSv4.1 read delegations. The default setting is disabled. This parameter is not supported for Vservers with Infinite Volume.

[-v4.1-write-delegation {enabled|disabled}] - NFSv4.1 Write Delegation Support
This optional parameter specifies whether Data ONTAP supports NFSv4.1 write delegations. The default setting is disabled. This parameter is not supported for Vservers with Infinite Volume.

[-v4.x-session-num-slots <integer>] - Number of Slots in the NFSv4.x Session slot tables (privilege: advanced)
This optional parameter specifies the number of entries in the NFSv4.x session slot table. By default, the number of slots is 180. The maximum value is 2000.

[-v4.x-session-slot-reply-cache-size <integer>] - Size of the Reply that will be Cached in Each NFSv4.x Session Slot (in bytes) (privilege: advanced)
This optional parameter specifies the number of bytes of the reply that will be cached in each NFSv4.x session slot. By default, the size of the cached reply is 640 bytes. The maximum value is 4096.

[-v4-acl-max-aces <integer>] - Maximum Number of ACEs per ACL (privilege: advanced)
This optional parameter specifies the maximum number of ACEs in an NFSv4 ACL. The range is 192 to 1024. The default value is 400. Setting it to a value more than the default could cause performance problems for clients accessing files with NFSv4 ACLs.
[-mount-rootonly (enabled|disabled)] - NFS Mount Root Only
This optional parameter specifies whether the Vserver allows MOUNT protocol calls only from privileged ports (port numbers less than 1024). The default setting is enabled.

[-nfs-rootonly (enabled|disabled)] - NFS Root Only
This optional parameter specifies whether the Vserver allows NFS protocol calls only from privileged ports (port numbers less than 1024). The default setting is disabled.

[-auth-sys-extended-groups (enabled|disabled)] - AUTH_SYS Extended Groups Enabled (privilege: advanced)
This optional parameter specifies whether Data ONTAP supports fetching auxiliary groups from a name service rather than from the RPC header. The default setting is disabled.

[-extended-groups-limit <integer>] - AUTH_SYS and RPCSEC_GSS Auxiliary Groups Limit (privilege: advanced)
This optional parameter specifies the maximum number of auxiliary groups supported over RPC security flavors AUTH_SYS and RPCSEC_GSS in Data ONTAP. The range is 32 to 1024. The default value is 32.

[-validate-qtree-export (enabled|disabled)] - Validation of Qtree IDs for Qtree File Operations (privilege: advanced)
This optional parameter specifies whether clustered Data ONTAP performs an additional validation on qtree IDs. The default setting is enabled. This parameter is only effective when a qtree is assigned an export policy.

[-mountd-port <integer>] - NFS Mount Daemon Port (privilege: advanced)
This optional parameter specifies which port the NFS mount daemon (mountd) uses. The port numbers allowed are 635 (the default) and 1024 through 9999.

[-nlm-port <integer>] - Network Lock Manager Port (privilege: advanced)
This optional parameter specifies which port the network lock manager (NLM) uses. The port numbers allowed are 1024 through 9999. The default setting is 4045.

[-nsm-port <integer>] - Network Status Monitor Port (privilege: advanced)
This optional parameter specifies which port the network status monitor (NSM) uses. The port numbers allowed are 1024 through 9999. The default setting is 4046.

[-rquotad-port <integer>] - NFS Quota Daemon Port (privilege: advanced)
This optional parameter specifies which port the NFS quota daemon (rquotad) uses. The port numbers allowed are 1024 through 9999. The default setting is 4049.

[-permitted-enc-types <NFS Kerberos Encryption Type>, ...] - Permitted Kerberos Encryption Types
This optional parameter specifies the permitted encryption types for Kerberos over NFS. The default setting is des,des3,aes-128,aes-256.

[-showmount (enabled|disabled)] - Showmount Enabled
This optional parameter specifies whether to allow or disallow clients to see all the Vserver's NFS exports list using "showmount -e" command. The default setting is disabled.

[-name-service-lookup-protocol {TCP|UDP}] - Set the Protocol Used for Name Services Lookups for Exports
This optional parameter specifies the protocol to use for doing name service lookups. The allowed values are TCP and UDP. The default setting is UDP.

[-map-unknown-uid-to-default-windows-user (enable|disable)] - Map Unknown UID to Default Windows User (privilege: advanced)
If you enable this optional parameter, unknown UNIX users that do not have a name mapping to a Windows user are mapped to the configured default Windows user. This allows all unknown UNIX users access with the credentials of the default Windows user. If you disable it, all unknown UNIX users without name mapping are always denied access. By default, this parameter is enabled.
- `netgroup-dns-domain-search {enabled|disabled}` - DNS Domain Search Enabled During Netgroup Lookup (privilege: advanced)

  If you enable this optional parameter, during client access check evaluation in a netgroup, Data ONTAP performs an additional verification to ensure that the domain returned from DNS for that client is listed in the DNS configuration of the Vserver. This enables you to validate the domain when clients have the same short name in multiple domains. The default setting is enabled.

- `netgroup-trust-any-ns-switch-no-match {enabled|disabled}` - Trust No-Match Result from Any Name Service Switch Source During Netgroup Lookup (privilege: advanced)

  This optional parameter specifies if you can consider a no-match result from any netgroup ns-switch source to be authoritative. If this option is enabled, then a no-match response from any one of the netgroup ns-switch sources is deemed conclusive even if other sources could not be searched. The default setting is 'disabled', which causes all netgroup ns-switch sources to be consulted before a no-match result is deemed conclusive.

- `ntacl-display-permissive-perms {enabled|disabled}` - Display maximum NT ACL Permissions to NFS Client (privilege: advanced)

  This optional parameter controls the permissions that are displayed to NFSv3 and NFSv4 clients on a file or directory that has an NT ACL set. When true, the displayed permissions are based on the maximum access granted by the NT ACL to any user. When false, the displayed permissions are based on the minimum access granted by the NT ACL to any user. The default setting is false. This parameter is not supported for Vservers with Infinite Volume.

- `v3-ms-dos-client {enabled|disabled}` - NFSv3 MS-DOS Client Support

  This optional parameter specifies whether to enable access for NFSv3 MS-DOS clients. The default setting is disabled.

- `ignore-nt-acl-for-root {enabled|disabled}` - Ignore the NT ACL Check for NFS User 'root' (privilege: advanced)

  This optional parameter specifies whether Windows ACLs affect root access from NFS. If this option is enabled, root access from NFS ignores the NT ACL set on the file or directory. If auditing is enabled for the Vserver and there is no name-mapping present, then a default SMB credential (Builtin\administrator) is used for auditing, and an EMS warning is generated. The default setting is 'disabled', which causes NFS 'root' to be mapped to a Windows account, like any other NFS user.

- `cached-cred-positive-ttl <integer>` - Time To Live Value (in msecs) of a Positive Cached Credential (privilege: advanced)

  This optional parameter specifies the age of the positive cached credentials after which they will be cleared from the cache. The value specified must be from 60000 through 604800000. The default setting is 86400000.

- `cached-cred-negative-ttl <integer>` - Time To Live Value (in msecs) of a Negative Cached Credential (privilege: advanced)

  This optional parameter specifies the age of the negative cached credentials after which they will be cleared from the cache. The value specified must be from 60000 through 604800000. The default setting is 7200000.

- `skip-root-owner-write-perm-check {enabled|disabled}` - Skip Permission Check for NFS Write Calls from Root/Owner (privilege: advanced)

  This optional parameter specifies if permission checks are to be skipped for NFS WRITE calls from root/owner. For copying read-only files to a destination folder which has inheritable ACLs, this option must be enabled. Warning: When enabled, if an NFS client does not make use of an NFS ACCESS call to check for user-level permissions and then tries to write onto read-only files, the operation will succeed. The default setting is disabled.

- `v3-64bit-identifiers {enabled|disabled}` - Use 64 Bits for NFSv3 FSIDs and File IDs (privilege: advanced)

  This optional parameter specifies whether Data ONTAP uses 64 bits (instead of 32 bits) for file system identifiers (FSIDs) and file identifiers (file IDs) that are returned to NFSv3 clients. The default setting is disabled. When -v3-fsid-change is disabled, enable this parameter to avoid file ID collisions.
[-v4-inherited-acl-preserve {enabled|disabled}] - Ignore Client Specified Mode Bits and Preserve Inherited NFSv4 ACL When Creating New Files or Directories (privilege: advanced)

This optional parameter specifies whether the client-specified mode bits should be ignored and the inherited NFSv4 ACL should be preserved when creating new files or directories. The default setting is disabled.

[-v3-search-unconverted-filename {enabled|disabled}] - Lookup for the filename in unconverted language if converted language lookup fails (privilege: advanced)

This optional parameter specifies whether to continue the search with unconverted name while doing lookup in a directory.

Examples

The following example enables and configures NFS access on a Vserver named vs0. NFS access is enabled. The maximum number of RPCSEC_GSS authentication contexts is set to 5. The RPCSEC_GSS idle time is set to 360 seconds. Access is enabled for NFS v3 clients over both UDP and TCP.

```
cluster1::> vserver nfs create -vserver vs0 -access true -rpcsec-ctx-high 5 -rpcsec-ctx-idle 360 -v3 enabled -udp enabled -tcp enabled
```

vserver export-policy rule create on page 1565

vserver nfs delete

Delete the NFS configuration of a Vserver

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver nfs delete command deletes the NFS configuration of a specified Vserver. This command does not delete the Vserver itself, just its ability to serve NFS clients.

Note: If you delete a Vserver, the Vserver's NFS configuration is automatically deleted. Any Windows-to-UNIX or UNIX-to-Windows name mappings defined for the Vserver are also deleted because they require both the CIFS and NFS servers.

Parameters

-vserver <vserver name> - Vserver

This specifies the Vserver whose NFS configuration you want to delete.

Examples

The following example deletes the NFS configuration of a Vserver named vs2:

```
cluster1::> vserver nfs delete -vserver vs2
```

vserver nfs modify

Modify the NFS configuration of a Vserver

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver nfs modify command modifies the configuration of an NFS-enabled Vserver.
Parameters

-vserver <vserver name> - Vserver

This specifies the Vserver whose NFS configuration you want to modify.

[-access {true|false}] - General NFS Access

This optional parameter specifies whether NFS access is enabled on the Vserver.

[-rpcsec-ctx-high <integer>] - RPC GSS Context Cache High Water Mark (privilege: advanced)

This optional parameter specifies the maximum number of RPCSEC_GSS authentication contexts, which are used by Kerberos. The default setting is zero at the time of creation. See RFC 2203 for information about RPCSEC_GSS contexts.

[-rpcsec-ctx-idle <integer>] - RPC GSS Context Idle (privilege: advanced)

This optional parameter specifies, in seconds, the amount of time a RPCSEC_GSS context is permitted to remain unused before it is deleted. The default setting is zero seconds at the time of creation. See RFC 2203 for information about RPCSEC_GSS contexts.

[-v3 {enabled|disabled}] - NFS v3

This optional parameter specifies whether to enable access for NFS v3 clients.

[-v4.0 {enabled|disabled}] - NFS v4.0

This optional parameter specifies whether to enable access for NFSv4.0 clients. The default setting is enabled at the time of creation. This parameter is not supported for Vservers with Infinite Volume.

[-udp {enabled|disabled}] - UDP Protocol

This optional parameter specifies whether to enable NFS access over UDP. This value is not modifiable on a Vserver with Infinite Volume.

Note: Even if UDP is disabled, if TCP is enabled, the Vserver does not block NFSv3 traffic over UDP. By allowing this traffic, the storage system can process NFS_NULL ops that the Solaris automounter sends to determine if the storage system is alive. (Solaris sends these ops over UDP even if configured to use TCP.) To disallow access for certain clients, including over UDP, you can use export-policy rules. For more information, see the vserver export-policy rule create command.

[-tcp {enabled|disabled}] - TCP Protocol

This optional parameter specifies whether to enable NFS access over TCP.

[-default-win-user <text>] - Default Windows User

This optional parameter specifies a list of default Windows users for the NFS server.

[-enable-ejukebox {true|false}] - Enable NFSv3 EJUKEBOX error (privilege: advanced)

This optional parameter specifies whether EJUKEBOX errors are enabled for NFSv3. The default setting is true at the time of creation.

[-v3-require-read-attributes {true|false}] - Require All NFSv3 Reads to Return Read Attributes (privilege: advanced)

This optional parameter specifies whether NFSv3 read operations are required to return read attributes. The default setting is false at the time of creation.

[-v3-fsid-change {enabled|disabled}] - Show Change in FSID as NFSv3 Clients Traverse Filesystems (privilege: advanced)

This optional parameter specifies whether Data ONTAP shows changes in file system identifiers (FSIDs) as NFSv3 clients traverse file systems. If you change the value of this parameter, clients must remount any paths over which they are using NFSv3.

[-v3-connection-drop {enabled|disabled}] - Enable the Dropping of a Connection When an NFSv3 Request is Dropped (privilege: advanced)

This optional parameter specifies whether NFS v3 connection drop is enabled. The default setting is enabled at the time of creation.
[-ntfs-unix-security-ops {fail|ignore|use-export-policy}] - Vserver NTFS Unix Security Options
(privilege: advanced)
This optional parameter specifies how NFSv3 security changes affect NTFS volumes. If you set this parameter to ignore, Data ONTAP ignores NFSv3 security changes. If you set this parameter to fail, this overrides the unix security options set in the relevant export rules. If you set this parameter to use_export_policy, Data ONTAP processes NFSv3 security changes in accordance with the relevant export rules. The default setting is use_export_policy at the time of creation.

[-chown-mode {restricted|unrestricted|use-export-policy}] - Vserver Change Ownership Mode
(privilege: advanced)
This optional parameter specifies whether ownership of a file can be changed by superusers or by non-root users who currently own the file. If you set this parameter to restricted, the ownership of a file can be changed by superusers only. If you set this parameter to unrestricted, the ownership of a file can be changed by superusers and the current owner of the file. If you set this parameter to use_export_policy, the ownership of a file can be changed in accordance with the relevant export rules.

[-trace-enabled {true|false}] - NFS Response Trace Enabled (privilege: advanced)
This optional parameter specifies whether Data ONTAP logs NFS requests when they exceed the NFS response trigger time (see the trigger parameter). The default setting is false at the time of creation.

[-trigger <integer>] - NFS Response Trigger (in secs) (privilege: advanced)
This optional parameter specifies the amount of time, in seconds, after which Data ONTAP must log an NFS request if it has not completed (assuming the -trace-enabled option is set to true). The default setting is 60 at the time of creation.

[-udp-max-xfer-size <integer>] - UDP Maximum Transfer Size (bytes) (privilege: advanced)
This optional parameter specifies the maximum transfer size (in bytes) that the NFS mount protocol negotiates with the client for UDP transport. The range is 8192 to 57344. The default setting is 32768 at the time of creation.

[-tcp-max-xfer-size <integer>] - TCP Maximum Transfer Size (bytes) (privilege: advanced)
This optional parameter specifies the maximum transfer size (in bytes) that the storage system negotiates with the client for TCP transport of data for NFSv3 and NFSv4.x protocols. The range is 8192 to 1048576. The default setting is 65536 when created.

[-v3-tcp-max-read-size <integer>] - NFSv3 TCP Maximum Read Size (bytes) (privilege: advanced)
This optional parameter specifies the maximum transfer size (in bytes) that the storage system negotiates with the client for TCP transport of data for NFSv3 read requests. The range is 8192 to 1048576. The default setting is 65536 when created.

Note: This parameter is deprecated and may be removed in a future release of Data ONTAP. Use the -tcp-max-xfer-size parameter instead.

[-v3-tcp-max-write-size <integer>] - NFSv3 TCP Maximum Write Size (bytes) (privilege: advanced)
This optional parameter specifies the maximum transfer size (in bytes) that the storage system negotiates with the client for TCP transport of data for NFSv3 write requests. The range is 8192 to 65536. The default setting is 65536 when created.

Note: This parameter is deprecated and may be removed in a future release of Data ONTAP. Use the -tcp-max-xfer-size parameter instead.

[-v4.0-acl {enabled|disabled}] - NFSv4.0 ACL Support
This optional parameter specifies whether Data ONTAP supports NFSv4.0 access control lists (ACLs). The default setting is disabled when created. This parameter is not supported for Vservers with Infinite Volume.

[-v4.0-read-delegation {enabled|disabled}] - NFSv4.0 Read Delegation Support
This optional parameter specifies whether Data ONTAP supports NFSv4 read delegations. The default setting is disabled when created. This parameter is not supported for Vservers with Infinite Volume.
[-v4.0-write-delegation {enabled|disabled}] - NFSv4.0 Write Delegation Support

This optional parameter specifies whether Data ONTAP supports NFSv4 write delegations. The default setting is disabled when created. This parameter is not supported for Vservers with Infinite Volume.

[-v4-fsid-change {enabled|disabled}] - Show Change in FSID as NFSv4 Clients Traverse Filesystems

(privacy: advanced)

This optional parameter specifies whether Data ONTAP shows changes in file system identifiers (FSIDs) as NFSv4 clients traverse file systems. The default setting is enabled when created. If you change the value of this parameter, clients must remount any paths over which they are using NFSv4.

**Note:** If users access the storage system using NFSv4 from Solaris 10 clients, you must set this option to disabled.

[-v4.0-referrals {enabled|disabled}] - NFSv4.0 Referral Support (privacy: advanced)

This optional parameter specifies whether Data ONTAP supports NFSv4.0 referrals. The default setting is disabled when created. You can set this parameter to enabled only if the -v4-fsid-change option is also set to enabled. If clients accessing the node do not support NFSv4.0 referrals, set this option to disabled; otherwise, those clients will not be able to access the file system. This parameter is not supported for Vservers with Infinite Volume.

[-v4-id-domain <nfs domain>] - NFSv4 ID Mapping Domain

This optional parameter specifies the domain portion of the string form of user and group names as defined by the NFSv4 protocol. By default, the domain name is normally taken from the NIS domain or the DNS domain in use. However, the value of this parameter overrides the default. The domain name must be agreed upon by both the NFS client and the storage controller before NFSv4 operations can be executed. It is recommended that the domain be specified in the fully qualified domain name format.

[-v4-validate-symlinkdata {enabled|disabled}] - NFSv4 Validate UTF-8 Encoding of Symbolic Link Data

(privacy: advanced)

This optional parameter specifies whether Data ONTAP validates the UTF-8 encoding of symbolic link data. The default setting is disabled when created.

[-v4-lease-seconds <integer>] - NFSv4 Lease Timeout Value (in secs) (privacy: advanced)

This optional parameters specifies the time period in which Data ONTAP irrevocably grants a lock to a client. By default, the lease period is 30 seconds. The minimum value is 10. The maximum value is one less than the value of the -v4-grace-seconds parameter.

[-v4-grace-seconds <integer>] - NFSv4 Grace Timeout Value (in secs)

This optional parameter specifies the time period in which clients attempt to reclaim their locking state from Data ONTAP during server recovery. By default, the grace period is 45 seconds. The minimum value is 1 more than the value of the -v4-lease-seconds parameter. The maximum value is 90.

[-v4-acl-preserve {enabled|disabled}] - Preserves and Modifies NFSv4 ACL (and NTFS File Permissions in Unified Security Style)

This optional parameter specifies if the NFSv4 ACL is preserved or dropped when chmod is performed. In unified security style, this parameter also specifies if NTFS file permissions are preserved or dropped when chmod, chgrp, or chown are performed. The default is enabled.

[-v4.1 {enabled|disabled}] - NFSv4.1 Minor Version Support

This optional parameter specifies whether to enable access for NFSv4.1 clients. The default setting is enabled at the time of creation.

[-rquota {enabled|disabled}] - Rquota Enable

This optional parameter specifies whether to enable rquota over NFS. The default setting is disabled at the time of creation. This parameter is not supported for Vservers with Infinite Volume.

[-v4.1-implementation-domain <nfs domain>] - NFSv4.1 Implementation ID Domain (privacy: advanced)

This optional parameter specifies the NFSv4.1 implementation domain.
[\(-v4.1\)-implementation-name <text>] - NFSv4.1 Implementation ID Name (privilege: advanced)
This optional parameter specifies the NFSv4.1 implementation name.

[\(-v4.1\)-implementation-date <Date>] - NFSv4.1 Implementation ID Date (privilege: advanced)
This optional parameter specifies the NFSv4.1 implementation date.

[\(-v4.1\)-pfnfs {enabled|disabled}] - NFSv4.1 Parallel NFS Support
This optional parameter specifies whether to enable access for pNFS for NFSv4.1. The default setting is enabled at the time of creation.

[\(-v4.1\)-referrals {enabled|disabled}] - NFSv4.1 Referral Support (privilege: advanced)
This optional parameter specifies whether Data ONTAP supports NFSv4.1 referrals. The default setting is disabled when created. You can set this parameter to enabled only if the \(-v4-fsid-change\) option is also set to enabled. If clients accessing the node do not support NFSv4.1 referrals, set this option to disabled; otherwise, those clients will not be able to access the file system. This parameter is not supported for Vservers with Infinite Volume.

[\(-v4.1\)-acl {enabled|disabled}] - NFSv4.1 ACL Support
This optional parameter specifies whether Data ONTAP supports NFSv4.1 access control lists (ACLs). The default setting is disabled when created.

[\(-vstorage\) {enabled|disabled}] - NFS vStorage Support
This optional parameter specifies whether to enable vstorage over NFS. The default setting is disabled at the time of creation. This parameter is not supported for Vservers with Infinite Volume.

[\(-v4\)-numeric-ids {enabled|disabled}] - NFSv4 Support for Numeric Owner IDs
This optional parameter specifies whether to enable the support for numeric string identifiers in NFSv4 owner attributes. The default setting is enabled at the time of creation.

[\(-default-win-group <text>\)] - Default Windows Group
This optional parameter specifies a list of default Windows groups for the NFS server.

[\(-v4.1\)-read-delegation {enabled|disabled}] - NFSv4.1 Read Delegation Support
This optional parameter specifies whether Data ONTAP supports NFSv4.1 read delegations. The default setting is disabled when created. This parameter is not supported for Vservers with Infinite Volume.

[\(-v4.1\)-write-delegation {enabled|disabled}] - NFSv4.1 Write Delegation Support
This optional parameter specifies whether Data ONTAP supports NFSv4.1 write delegations. The default setting is disabled when created. This parameter is not supported for Vservers with Infinite Volume.

[\(-v4.x\)-session-num-slots <integer>] - Number of Slots in the NFSv4.x Session slot tables (privilege: advanced)
This optional parameter specifies the number of entries in the NFSv4.x session slot table. By default, the number of slots is 180. The maximum value is 2000.

[\(-v4.x\)-session-slot-reply-cache-size <integer>] - Size of the Reply that will be Cached in Each NFSv4.x Session Slot (in bytes) (privilege: advanced)
This optional parameter specifies the number of bytes of the reply that will be cached in each NFSv4.x session slot. By default, the size of the cached reply is 640 bytes. The maximum value is 4096.

[\(-v4\)-acl-max-aces <integer>] - Maximum Number of ACEs per ACL (privilege: advanced)
This optional parameter specifies the maximum number of ACEs in a NFSv4 ACL. The range is 192 to 1024. The default value is 400. Setting it to a value more than the default could cause performance problems for clients accessing files with NFSv4 ACLs.

[\(-mount-rootonly \{enabled|disabled\}\)] - NFS Mount Root Only
This optional parameter specifies whether the Vserver allows MOUNT protocol calls only from privileged ports (port numbers less than 1024). The default setting is enabled.
[-nfs-rootonly {enabled|disabled}] - NFS Root Only
This optional parameter specifies whether the Vserver allows NFS protocol calls only from privileged ports (port numbers less than 1024). The default setting is disabled.

[-auth-sys-extended-groups {enabled|disabled}] - AUTH_SYS Extended Groups Enabled (privilege: advanced)
This optional parameter specifies whether Data ONTAP supports fetching auxiliary groups from a name service rather than from the RPC header. The default setting is disabled.

[-extended-groups-limit <integer>] - AUTH_SYS and RPCSEC_GSS Auxiliary Groups Limit (privilege: advanced)
This optional parameter specifies the maximum number of auxiliary groups supported over RPC security flavors AUTH_SYS and RPCSEC_GSS in Data ONTAP. The range is 32 to 1024. The default value is 32.

[-validate-qtree-export {enabled|disabled}] - Validation of Qtree IDs for Qtree File Operations (privilege: advanced)
This optional parameter specifies whether clustered Data ONTAP performs an additional validation on qtree IDs. The default setting is enabled. This parameter is only effective when a qtree is assigned an export policy.

[-mountd-port <integer>] - NFS Mount Daemon Port (privilege: advanced)
This optional parameter specifies which port the NFS mount daemon (mountd) uses. The port numbers allowed are 635 (the default) and 1024 through 9999.

[-nlm-port <integer>] - Network Lock Manager Port (privilege: advanced)
This optional parameter specifies which port the network lock manager (NLM) uses. The port numbers allowed are 1024 through 9999. The default setting is 4045.

[-nsm-port <integer>] - Network Status Monitor Port (privilege: advanced)
This optional parameter specifies which port the network status monitor (NSM) uses. The port numbers allowed are 1024 through 9999. The default setting is 4046.

[-rquotad-port <integer>] - NFS Quota Daemon Port (privilege: advanced)
This optional parameter specifies which port the NFS quota daemon (rquotad) uses. The port numbers allowed are 1024 through 9999. The default setting is 4049.

[-permitted-enc-types <NFS Kerberos Encryption Type>, ...] - Permitted Kerberos Encryption Types
This optional parameter specifies the permitted encryption types for Kerberos over NFS. The default setting is des.des3.aes-128.aes-256.

[-showmount {enabled|disabled}] - Showmount Enabled
This optional parameter specifies whether to allow or disallow clients to see all the Vserver's NFS exports list using "showmount -e" command. The default setting is disabled.

[-name-service-lookup-protocol {TCP|UDP}] - Set the Protocol Used for Name Services Lookups for Exports
This optional parameter specifies the protocol to use for doing name service lookups. The allowed values are TCP and UDP. The default setting is UDP.

[-map-unknown-uid-to-default-windows-user {enable|disable}] - Map Unknown UID to Default Windows User (privilege: advanced)
If you enable this optional parameter, unknown UNIX users that do not have a name mapping to a Windows user are mapped to the configured default Windows user. This allows all unknown UNIX users access with the credentials of the default Windows user. If you disable it, all unknown UNIX users without name mapping are always denied access. By default, this parameter is enabled.

[-netgroup-dns-domain-search {enabled|disabled}] - DNS Domain Search Enabled During Netgroup Lookup (privilege: advanced)
If you enable this optional parameter, during client access check evaluation in a netgroup, Data ONTAP performs an additional verification to ensure that the domain returned from DNS for that client is listed in the
DNS configuration of the Vserver. This enables you to validate the domain when clients have the same short
name in multiple domains. The default setting is enabled.

[-netgroup-trust-any-ns-switch-no-match {enabled|disabled}] - Trust No-Match Result from Any Name
Service Switch Source During Netgroup Lookup (privilege: advanced)
This optional parameter specifies if you can consider a no-match result from any of the netgroup ns-switch
sources to be authoritative. If this option is enabled, then a no-match response from any of the netgroup ns-
switch sources is deemed conclusive even if other sources could not be searched. The default setting is
'disabled', which causes all netgroup ns-switch sources to be consulted before a no-match result is deemed
conclusive.

[-ntacl-display-permissive-perms {enabled|disabled}] - Display maximum NT ACL Permissions to NFS
Client (privilege: advanced)
This optional parameter controls the permissions that are displayed to NFSv3 and NFSv4 clients on a file or
directory that has an NT ACL set. When true, the displayed permissions are based on the maximum access
granted by the NT ACL to any user. When false, the displayed permissions are based on the minimum access
granted by the NT ACL to any user. The default setting is 'false'.

[-v3-ms-dos-client {enabled|disabled}] - NFSv3 MS-DOS Client Support
This optional parameter specifies whether to enable access for NFSv3 MS-DOS clients. The default setting is
disabled at the time of creation. This parameter is not supported for Vservers with Infinite Volume

[-ignore-nt-acl-for-root {enabled|disabled}] - Ignore the NT ACL Check for NFS User 'root' (privilege: advanced)
This optional parameter specifies whether Windows ACLs affect root access from NFS. If this option is
enabled, root access from NFS ignores the NT ACL set on the file or directory. If auditing is enabled for the
Vserver and there is no name-mapping present, then a default SMB credential (Builtin\administrator) is used
for auditing, and an EMS warning is generated. The default setting is 'disabled', which causes NFS 'root' to be
mapped to a Windows account, like any other NFS user.

[-cached-cred-positive-ttl <integer>] - Time To Live Value (in msecs) of a Positive Cached Credential
(privilege: advanced)
This optional parameter specifies the age of the positive cached credentials after which they will be cleared
from the cache. The value specified must be from 60000 through 604800000. The default setting is 86400000.

[-cached-cred-negative-ttl <integer>] - Time To Live Value (in msecs) of a Negative Cached Credential
(privilege: advanced)
This optional parameter specifies the age of the negative cached credentials after which they will be cleared
from the cache. The value specified must be from 60000 through 604800000. The default setting is 7200000.

[-skip-root-owner-write-perm-check {enabled|disabled}] - Skip Permission Check for NFS Write Calls
from Root/Owner (privilege: advanced)
This optional parameter specifies if permission checks are to be skipped for NFS WRITE calls from root/
owner. For copying read-only files to a destination folder which has inheritable ACLs, this option must be
enabled. Warning: When enabled, if an NFS client does not make use of an NFS ACCESS call to check for
user-level permissions and then tries to write onto read-only files, the operation will succeed. The default
setting is disabled.

[-v3-64bit-identifiers {enabled|disabled}] - Use 64 Bits for NFSv3 FSIDs and File IDs (privilege:
advanced)
This optional parameter specifies whether Data ONTAP uses 64 bits (instead of 32 bits) for file system
identifiers (FSIDs) and file identifiers (file IDs) that are returned to NFSv3 clients. If you change the value of
this parameter, clients must remount any paths over which they are using NFSv3. When -v3-fsid-change is
disabled, enable this parameter to avoid file ID collisions.
[-v4-inherited-acl-preserve {enabled|disabled}] - Ignore Client Specified Mode Bits and Preserve Inherited NFSv4 ACL When Creating New Files or Directories (privilege: advanced)

This optional parameter specifies whether the client-specified mode bits should be ignored and the inherited NFSv4 ACL should be preserved when creating new files or directories. The default setting is disabled.

[-v3-search-unconverted-filename {enabled|disabled}] - Lookup for the filename in unconverted language if converted language lookup fails (privilege: advanced)

This optional parameter specifies whether to continue the search with unconverted name while doing lookup in a directory.

Examples
The following example enables NFS access on a Vserver named vs0 for NFS clients that use NFS v3 over TCP:

```
cluster1::> vserver nfs modify -vserver vs0 -access true -v3 enabled -udp disabled -tcp enabled
```

vserver nfs off

Disable the NFS service of a Vserver

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver nfs off` command disables NFS access on a Vserver. The Vserver must already exist.

**Parameters**

- `vserver <vserver name>` - Vserver

  This parameter specifies the Vserver on which you want to disable NFS access.

**Examples**
The following example disables NFS access on a Vserver named vs0.

```
cluster1::> vserver nfs off -vserver vs0
```

vserver nfs on

Enable the NFS service of a Vserver

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver nfs on` command enables NFS access on a Vserver. The Vserver must already exist.

**Parameters**

- `vserver <vserver name>` - Vserver

  This parameter specifies the Vserver on which you want to enable NFS access.

**Examples**
The following example enables NFS access on a Vserver named vs0.

```
cluster1::> vserver nfs on -vserver vs0
```
vserver nfs prepare-for-v3-ms-dos-client-downgrade

Disable NFSv3 MS-DOS Client Support

**Availability:** This command is available to cluster administrators at the advanced privilege level.

**Description**
The `vserver nfs prepare-for-v3-ms-dos-client-downgrade` command verifies that the NFSv3 MS-DOS client setting is disabled on all Vservers and disables the NFSv3 MS-DOS client support capability on the cluster when downgrading Data ONTAP to a version that does not support NFSv3 MS-DOS clients.

**Examples**
The following example disables NFSv3 MS-DOS client support on the Vservers.

```
cluster1:/> vserver nfs prepare-for-v3-ms-dos-client-downgrade
```

vserver nfs show

Display the NFS configurations of Vservers

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver nfs show` command displays information about NFS-enabled Vservers. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays the following information about all NFS-enabled Vservers:

- Vserver name
- Whether general NFS access is enabled
- Whether access to NFSv3 clients is enabled
- Whether access to NFSv4 clients is enabled
- Whether NFS access over UDP is enabled
- Whether NFS access over TCP is enabled
- List of default Windows users (detailed view only)

You can specify additional parameters to display only information that matches those parameters. For instance, to display information only about Vservers that enable access over TCP, enter the command with the `-tcp-enable true` parameter.

**Parameters**

```
[[-fields <fieldname>, ...]  
 | [-krb-opts] (privilege: advanced)]
```

If you specify the `-fields` parameter, the command only displays the fields that you specify.

If you specify the parameter for `-instance`, the command shows detailed information about all NFS-enabled Vservers. Otherwise, if the `-krb-opts` parameter is specified, the command shows the following Kerberos-related information:
• Vserver name
• Maximum number of RPCSEC_GSS authentication contexts
• Time, in seconds, an RPCSEC_GSS context can remain idle before being deleted

Otherwise, if the -fields parameter is specified, the command shows information about all of the NFS-enabled Vservers that you specify as a comma-delimited list.

[[-instance ]]
If you specify the -instance parameter, the command displays detailed information about all entries.

[-vserver <vserver name>] - Vserver
If you specify this parameter, the command displays information only about the specified NFS-enabled Vserver.

[-access {true|false}] - General NFS Access
If you specify this parameter, the command displays information only about the NFS-enabled Vservers that have the specified general-access setting.

[-rpcsec-ctx-high <integer>] - RPC GSS Context Cache High Water Mark (privilege: advanced)
If you specify this parameter, the command displays information only about NFS-enabled Vservers that have the specified maximum number of RPCSEC_GSS authentication contexts.

[-rpcsec-ctx-idle <integer>] - RPC GSS Context Idle (privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers that have the specified timeout value for idle RPCSEC_GSS contexts.

[-v3 {enabled|disabled}] - NFS v3
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the v3 option matches the specified input.

[-v4.0 {enabled|disabled}] - NFS v4.0
If you specify this parameter, the command displays information only about NFS-enabled Vservers for which the v4.0 option matches the specified input.

[-udp {enabled|disabled}] - UDP Protocol
If you specify this parameter, the command displays information only about the NFS-enabled Vservers that have the specified NFS-over-UDP access setting.

[-tcp {enabled|disabled}] - TCP Protocol
If you specify this parameter, the command displays information only about the NFS-enabled Vservers that have the specified NFS-over-TCP setting.

[-default-win-user <text>] - Default Windows User
If you specify this parameter, the command displays information only about the NFS-enabled Vservers that have the specified list of default Windows users.

[-enable-ejukebox {true|false}] - Enable NFSv3 EJUKEBOX error (privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the enable-ejukebox option matches the specified input.

[-v3-require-read-attributes {true|false}] - Require All NFSv3 Reads to Return Read Attributes (privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which NFSv3 read operations are required or not required to return read attributes.
[--v3-fsid-change {enabled|disabled}] - Show Change in FSID as NFSv3 Clients Traverse Filesystems (privilege: advanced)
If you specify this parameter, the command displays information about changes in file system identifiers (FSIDs) as NFSv3 clients traverse file systems.

[--v3-connection-drop {enabled|disabled}] - Enable the Dropping of a Connection When an NFSv3 Request is Dropped (privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the v3-connection-drop option matches the specified input.

[--ntfs-unix-security-ops {fail|ignore|use-export-policy}] - Vserver NTFS Unix Security Options (privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the NTFS-UNIX security setting matches the specified input.

[--chown-mode {restricted|unrestricted|use-export-policy}] - Vserver Change Ownership Mode (privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the chown-mode setting matches the specified input.

[--trace-enabled {true|false}] - NFS Response Trace Enabled (privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the trace-enabled option matches the specified input.

[--trigger <integer>] - NFS Response Trigger (in secs) (privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers with the specified NFS response trigger time.

[--udp-max-xfer-size <integer>] - UDP Maximum Transfer Size (bytes) (privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers with the specified UDP maximum transfer size. The range is 8192 to 57344.

[--tcp-max-xfer-size <integer>] - TCP Maximum Transfer Size (bytes) (privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers with the specified TCP maximum transfer size. The range is 8192 to 1048576.

[--v3-tcp-max-read-size <integer>] - NFSv3 TCP Maximum Read Size (bytes) (privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers with the specified TCP maximum transfer size for NFSv3 read requests. The range is 8192 to 1048576.

Note: This parameter is deprecated and may be removed in a future release of Data ONTAP. Use the -tcp-max-xfer-size parameter instead.

[--v3-tcp-max-write-size <integer>] - NFSv3 TCP Maximum Write Size (bytes) (privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers with the specified TCP maximum transfer size for NFSv3 write requests. The range is 8192 to 65536.

Note: This parameter is deprecated and may be removed in a future release of Data ONTAP. Use the -tcp-max-xfer-size parameter instead.

[--v4.0-acl {enabled|disabled}] - NFSv4.0 ACL Support
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the v4.0-acl option matches the specified input.

[--v4.0-read-delegation {enabled|disabled}] - NFSv4.0 Read Delegation Support
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the v4.0-read-delegation option matches the specified input.
[-v4.0-write-delegation {enabled|disabled}] - NFSv4.0 Write Delegation Support
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the v4.0-write-delegation option matches the specified input.

[-v4-fsid-change {enabled|disabled}] - Show Change in FSID as NFSv4 Clients Traverse Filesystems
(privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the showing of NFSv4 file system identifier (FSID) changes has been enabled or disabled.

[-v4.0-referrals {enabled|disabled}] - NFSv4.0 Referral Support (privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the v4.0-referrals option matches the specified input.

[-v4-id-domain <nfs domain>] - NFSv4 ID Mapping Domain
If you specify this parameter, the command displays information only about the NFS-enabled Vservers having the specified domain name.

[-v4-validate-symlinkdata {enabled|disabled}] - NFSv4 Validate UTF-8 Encoding of Symbolic Link Data
(privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which validation of UTF-8 encoding of symbolic link data has been enabled or disabled.

[-v4-lease-seconds <integer>] - NFSv4 Lease Timeout Value (in secs) (privilege: advanced)
If you specify this parameter, it displays the locking lease period. It is expressed in seconds. Clients that have been inactive for a period equal or longer to the lease period may lose all their locking state on a node.

[-v4-grace-seconds <integer>] - NFSv4 Grace Timeout Value (in secs)
If you specify this parameter, it displays the grace period for clients to reclaim file locks after a server failure. The grace period is expressed in seconds.

[-v4-acl-preserve {enabled|disabled}] - Preserves and Modifies NFSv4 ACL (and NTFS File Permissions in Unified Security Style)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the v4-acl-preserve option matches the specified input.

[-v4.1 {enabled|disabled}] - NFSv4.1 Minor Version Support
If you specify this parameter, the command displays information only about NFS-enabled Vservers for which the v4.1 option matches the specified input.

[-rquota {enabled|disabled}] - Rquota Enable
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the rquota option matches the specified input.

[-v4.1-implementation-domain <nfs domain>] - NFSv4.1 Implementation ID Domain (privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the v4.1-implementation-domain option matches the specified input.

[-v4.1-implementation-name <text>] - NFSv4.1 Implementation ID Name (privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the v4.1-implementation-name option matches the specified input.

[-v4.1-implementation-date <Date>] - NFSv4.1 Implementation ID Date (privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the v4.1-implementation-date option matches the specified input.

[-v4.1-pnfs {enabled|disabled}] - NFSv4.1 Parallel NFS Support
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the v4.1-pnfs option matches the specified input.
[-v4.1-referrals {enabled|disabled}] - NFSv4.1 Referral Support (privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the v4.1-referrals option matches the specified input.

[-v4.1-acl {enabled|disabled}] - NFSv4.1 ACL Support
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the v4.1-acl option matches the specified input.

[-vstorage {enabled|disabled}] - NFS vStorage Support
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the vstorage option matches the specified input.

[-v4-numeric-ids {enabled|disabled}] - NFSv4 Support for Numeric Owner IDs
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the v4-numeric-ids option matches the specified input.

[-default-win-group <text>] - Default Windows Group
If you specify this parameter, the command displays information only about the NFS-enabled Vservers that have the specified list of default Windows groups.

[-v4.1-read-delegation {enabled|disabled}] - NFSv4.1 Read Delegation Support
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the v4.1-read-delegation option matches the specified input.

[-v4.1-write-delegation {enabled|disabled}] - NFSv4.1 Write Delegation Support
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the v4.1-write-delegation option matches the specified input.

[-v4.x-session-num-slots <integer>] - Number of Slots in the NFSv4.x Session slot tables (privilege: advanced)
If you specify this parameter, this command displays information only about the NFS-enabled Vservers for which the v4.x-session-num-slots option matches the specified input. The range is 1 to 2000.

[-v4.x-session-slot-reply-cache-size <integer>] - Size of the Reply that will be Cached in Each NFSv4.x Session Slot (in bytes) (privilege: advanced)
If you specify this parameter, this command displays information only about the NFS-enabled Vservers for which the v4.x-session-slot-reply-cache-size option matches the specified input. The cache size is expressed in bytes. The range is 512 to 4096.

[-v4-acl-max-aces <integer>] - Maximum Number of ACEs per ACL (privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the v4-acl-max-aces option matches the specified input.

[-mount-rootonly {enabled|disabled}] - NFS Mount Root Only
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the mount-rootonly option matches the specified input.

[-nfs-rootonly {enabled|disabled}] - NFS Root Only
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the nfs-rootonly option matches the specified input.

[-auth-sys-extended-groups {enabled|disabled}] - AUTH_SYS Extended Groups Enabled (privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the auth-sys-extended-groups option matches the specified input.
[-extended-groups-limit <integer>] - AUTH_SYS and RPCSEC_GSS Auxiliary Groups Limit (privilege: advanced)

If you specify this parameter, the command displays information about the NFS-enabled Vservers for which the extended-groups-limit option matches the specified input. The range is 32 to 1024.

[-validate-qtree-export [enabled|disabled]] - Validation of Qtree IDs for Qtree File Operations (privilege: advanced)

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which validate-qtree-export option matches the specified input.

[-mountd-port <integer>] - NFS Mount Daemon Port (privilege: advanced)

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the mountd-port option matches the specified input.

[-nlm-port <integer>] - Network Lock Manager Port (privilege: advanced)

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the nlm-port option matches the specified input.

[-nsm-port <integer>] - Network Status Monitor Port (privilege: advanced)

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the nsm-port option matches the specified input.

[-rquotad-port <integer>] - NFS Quota Daemon Port (privilege: advanced)

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the rquotad-port option matches the specified input.

[-permitted-enc-types <NFS Kerberos Encryption Type>, ...] - Permitted Kerberos Encryption Types

If you specify this parameter, the command displays only about the NFS-enabled Vservers for which permitted-enc-types option matches any of the following: des, des3, aes-128, aes-256.

[-showmount [enabled|disabled]] - Showmount Enabled

If you specify this parameter, the command displays information only about the NFS-enabled Vserver's for which the showmount option matches the specified input.

[-name-service-lookup-protocol {TCP|UDP}] - Set the Protocol Used for Name Services Lookups for Exports

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which -name-service-lookup-protocol matches the parameter.

[-map-unknown-uid-to-default-windows-user [enable|disable]] - Map Unknown UID to Default Windows User (privilege: advanced)

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which -map-unknown-uid-to-default-windows-user is enabled or disabled.

[-netgroup-dns-domain-search [enabled|disabled]] - DNS Domain Search Enabled During Netgroup Lookup (privilege: advanced)

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which -netgroup-dns-domain-search is enabled or disabled.

[-netgroup-trust-any-ns-switch-no-match [enabled|disabled]] - Trust No-Match Result from Any Name Service Switch Source During Netgroup Lookup (privilege: advanced)

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which -netgroup-trust-any-ns-switch-no-match is enabled or disabled.

[-ntacl-display-permissive-perms [enabled|disabled]] - Display maximum NT ACL Permissions to NFS Client (privilege: advanced)

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which -ntacl-display-permissive-perms matches the parameter.
[–v3-ms-dos-client {enabled|disabled}] - NFSv3 MS-DOS Client Support
If you specify this parameter, the command displays information only about NFS-enabled Vservers for which NFSv3 MS-DOS client support is enabled or disabled.

[–ignore-nt-acl-for-root {enabled|disabled}] - Ignore the NT ACL Check for NFS User 'root' (privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which –ignore-nt-acl-for-root is enabled or disabled.

[–cached-cred-positive-ttl <integer>] - Time To Live Value (in msecs) of a Positive Cached Credential (privilege: advanced)
If you specify this parameter, the command displays information about the NFS-enabled Vservers time to live value of the positive cached credentials.

[–cached-cred-negative-ttl <integer>] - Time To Live Value (in msecs) of a Negative Cached Credential (privilege: advanced)
If you specify this parameter, the command displays information about the NFS-enabled Vservers time to live value of the negative cached credentials.

[–skip-root-owner-write-perm-check {enabled|disabled}] - Skip Permission Check for NFS Write Calls from Root/Owner (privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which –skip-root-owner-write-perm-check is enabled or disabled.

[–v3-64bit-identifiers {enabled|disabled}] - Use 64 Bits for NFSv3 FSIDs and File IDs (privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which –v3-64bit-identifiers is enabled or disabled.

[–v4-inherited-acl-preserve {enabled|disabled}] - Ignore Client Specified Mode Bits and Preserve Inherited NFSv4 ACL When Creating New Files or Directories (privilege: advanced)
If you specify this parameter, the command displays information about the NFS-enabled Vservers for which –v4-inherited-acl-preserve matches the specified input.

[–v3-search-unconverted-filename {enabled|disabled}] - Lookup for the filename in unconverted language if converted language lookup fails (privilege: advanced)
If you specify this parameter, the command displays information about the NFS-enabled Vservers for which –v3-search-unconverted-filename matches the specified input.

**Examples**

The following example displays information about all NFS-enabled Vservers:

```
cluster1::> vserver nfs show
General Default
Vserver Access v3 v4 v4.1 UDP TCP Windows User
-------- ------- ------- ------- ------- ------- ------------
vs0       true   enabled disabled disabled enabled   enabled -
vs1       true   enabled disabled disabled enabled   enabled -
2 entries were displayed.
```

The following example displays Kerberos-related information about all NFS-enabled Vservers:

```
cluster1::>* vserver nfs show -krb-opts
Vserver Context High Context Idle
-------- -------------- --------------
vs0       30           30
vs1       30           30
2 entries were displayed.
```
vserver nfs start
Start the NFS service of a Vserver

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver nfs start command starts the NFS service on a Vserver to serve NFS clients. The Vserver must already exist.

Parameters
-vserver <vserver name> - Vserver
This parameter specifies the Vserver on which you want to start the NFS service.

Examples
The following example starts the NFS service on a Vserver named vs0.

```
cluster1::> vserver nfs start -vserver vs0
```

vserver nfs status
Display the status of the NFS service of a Vserver

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver nfs status command shows the status of NFS on a Vserver. The Vserver must already exist.

Parameters
-vserver <vserver name> - Vserver
This parameter specifies the Vserver for which you want to see the NFS status.

[-is-enabled {true|false}] - NFS Service Enabled
If you specify this optional parameter, the command displays whether NFS is enabled or not. This parameter is true if the NFS server is running.

Examples
The following example shows the status of NFS on a Vserver named vs0 for which NFS is enabled.

```
cluster1::> vserver nfs status -vserver vs0.
The NFS server is running.
```

vserver nfs stop
Stop the NFS service of a Vserver

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver nfs stop command stops the NFS service on a Vserver to serve NFS clients. The Vserver must already exist.
Parameters

-vserver <vserver name> - Vserver

   This parameter specifies the Vserver on which you want to stop the NFS service.

Examples

The following example stops the NFS service on a Vserver named vs0.

    cluster1::> vserver nfs stop -vserver vs0

vserver nfs kerberos commands

The kerberos directory

vserver nfs kerberos realm commands

Manage NFS Kerberos realm configurations

vserver nfs kerberos realm create

Create a Kerberos realm configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver nfs kerberos realm create command creates a Kerberos realm configuration.

Parameters

[-vserver <vserver name>] - Vserver

   This parameter specifies the Vserver associated with the Kerberos realm configuration that you want to create.

-realm <text> - Kerberos Realm

   This parameter specifies the name of the Kerberos realm for the configuration.

-kdc-vendor <Kerberos Key Distribution Center (KDC) Vendor> - KDC Vendor

   This optional parameter specifies the KDC vendor. Specify Microsoft if you are using a Microsoft Active Directory server; specify Other if you are using a UNIX server.

-kdc-ip <IP Address> - KDC IP Address

   This optional parameter specifies the IP address of the Kerberos Distribution Center (KDC) server.

[-kdc-port <integer>] - KDC Port

   This optional parameter specifies the port number of the KDC server. The default setting is 88.

[-clock-skew <integer>] - Clock Skew

   This optional parameter specifies how many seconds of clock skew between the clients and the server are permitted. The default setting is 300 seconds.

[-adserver-name <text>] - Active Directory Server Name

   This optional parameter specifies the name of an Active Directory server for the configuration. Use this parameter only if you specified the value of -kdc-vendor parameter as Microsoft.

[-adserver-ip <IP Address>] - Active Directory Server IP Address

   This optional parameter specifies the IP address of an Active Directory server for the configuration. Use this parameter only if you specified the value of the -kdc-vendor parameter as Microsoft.
[-comment <text>] - Comment

This optional parameter specifies a comment for the Kerberos realm configuration.

[-adminserver-ip <IP Address>] - Admin Server IP Address

This optional parameter specifies the IP address of the administrative server. Use this parameter only if you specified the value of -kdc-vendor parameter as Other. The default setting for this parameter is the KDC server's IP address as specified by the -kdc-ip parameter.

[-adminserver-port <integer>] - Admin Server Port

This optional parameter specifies the port number of the administrative server. The default setting is 749. Use this parameter only if you specified the value of -kdc-vendor parameter as Other.

[-passwordserver-ip <IP Address>] - Password Server IP Address

This optional parameter specifies the IP address of the password server. Use this parameter only if you specified the value of -kdc-vendor parameter as Other. The default setting for this parameter is the KDC server's IP address as specified by the -kdc-ip parameter.

[-passwordserver-port <integer>] - Password Server Port

This optional parameter specifies the port number of the password server. The default setting is 464. Use this parameter only if you specified the value of -kdc-vendor parameter as Other.

Examples

The following example creates a Kerberos realm named SEC.EXAMPLE.COM for the Vserver named AUTH. The permitted clock skew is 15 seconds. The KDC's IP address is 192.0.2.170 and its port is 88. The KDC vendor is Other (for a UNIX KDC). The administrative server's IP address is 192.0.2.170 and its port is 749. The password server's IP address is 192.0.2.170 and its port is 464.

```
cluster1::> vserver nfs kerberos realm create -vserver AUTH -realm SEC.EXAMPLE.COM -clock-skew 15 -kdc-ip 192.0.2.170 -kdc-port 88 -kdc-vendor Other -adminserver-ip 192.0.2.170 -adminserver-port 749 -passwordserver-ip 192.0.2.170 -passwordserver-port 464
```

vserver nfs kerberos realm delete

Delete a Kerberos realm configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver nfs kerberos realm delete command deletes a Kerberos realm configuration from the system.

Parameters

- vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver for the Kerberos realm configuration that you want to delete.

- realm <text> - Kerberos Realm

This parameter specifies the name of the Kerberos realm for the configuration.

Examples

The following example deletes the Kerberos realm SEC.EXAMPLE.COM from the Vserver named AUTH:

```
cluster1::> vserver nfs kerberos realm delete -vserver AUTH -realm SEC.EXAMPLE.COM
```
vserver nfs kerberos realm modify

Modify a Kerberos realm configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver nfs kerberos realm modify command modifies one or more attributes of a Kerberos realm configuration.

Parameters
-vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver for the Kerberos realm configuration that you want to modify.

-realm <text> - Kerberos Realm

This optional parameter specifies the name of a Kerberos realm for the configuration.

-kdc-vendor <Kerberos Key Distribution Center (KDC) Vendor> - KDC Vendor

This optional parameter specifies the KDC vendor. Specify Microsoft if you are using a Microsoft Active Directory server; specify Other if you are using a UNIX server.

-kdc-ip <IP Address> - KDC IP Address

This optional parameter specifies the IP address of the Kerberos Distribution Center (KDC) server.

-kdc-port <integer> - KDC Port

This optional parameter specifies the port number of the KDC server. The default setting at the time of creation is 88.

-clock-skew <integer> - Clock Skew

This optional parameter specifies how many seconds of clock-skew between server and the clients are permitted. The default setting at the time of creation is 300 seconds.

-adserver-name <text> - Active Directory Server Name

This optional parameter specifies the name of an Active Directory server for the configuration. Use this parameter if you specified the value of -kdc-vendor parameter as Microsoft.

-adserver-ip <IP Address> - Active Directory Server IP Address

This optional parameter specifies the IP address of an Active Directory server for the configuration. Use this parameter if you specified the value of the -kdc-vendor parameter as Microsoft.

-comment <text> - Comment

This optional parameter specifies a comment for the Kerberos realm configuration.

-adminserver-ip <IP Address> - Admin Server IP Address

This optional parameter specifies the IP address of the administrative server. Use this parameter if you specified the value of -kdc-vendor parameter as Other.

-adminserver-port <integer> - Admin Server Port

This optional parameter specifies the port number of the administrative server. The default setting at the time of creation is 749. Use this parameter if you specified the value of the -kdc-vendor parameter as Other.

-passwordserver-ip <IP Address> - Password Server IP Address

This optional parameter specifies the IP address of the password server. Use this parameter if you specified the value of -kdc-vendor parameter as Other.

-passwordserver-port <integer> - Password Server Port

This optional parameter specifies the port number of the password server. The default setting at the time of creation is 464. Use this parameter only if you specified the value of -kdc-vendor parameter as Other.
Examples
The following example modifies the Kerberos realm SEC.EXAMPLE.COM for the Vserver named AUTH to use a
Microsoft KDC server with the IP address 192.0.2.170 and an Active Directory server named
AUTH.SEC.EXAMPLE.COM with the IP address 192.0.2.170:

```
cluster1::> vserver nfs kerberos realm modify -vserver AUTH -realm SEC.EXAMPLE.COM -adserver-name AUTH.SEC.EXAMPLE.COM -adserver-ip 192.0.2.170 -kdc-ip 192.0.2.170 -kdc-vendor Microsoft
```

vserver nfs kerberos realm show
Display Kerberos realm configurations

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver nfs kerberos realm show command displays information about Kerberos realm configurations. The
command output depends on the parameters specified with the command. If you do not specify any parameters, the command
displays the following information about all Kerberos realm configurations:

- Vserver
- Kerberos realm name
- Active Directory server name
- Kerberos Distribution Center (KDC) vendor
- KDC IP address
- The permitted encryption types

Parameters

```
{ [-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?' to display the fields to specify.

[[-instance]]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver
If you specify this parameter, the command displays information only about the Kerberos realm configurations for the specified Vserver.

[-realm <text>] - Kerberos Realm
If you specify this parameter, the command displays information only about the Kerberos realm configurations that use the specified Kerberos realm.

[-kdc-vendor <Kerberos Key Distribution Center (KDC) Vendor>] - KDC Vendor
If you specify this parameter, the command displays information only about the Kerberos realm configurations that use the specified KDC vendor.

[-kdc-ip <IP Address>] - KDC IP Address
If you specify this parameter, the command displays information only about the Kerberos realm configurations that use the specified KDC IP address.
```
[-kdc-port <integer>] - KDC Port
If you specify this parameter, the command displays information only about the Kerberos realm configurations
that use the specified KDC port number.

[-clock-skew <integer>] - Clock Skew
If you specify this parameter, the command displays information only about the Kerberos realm configurations
that use the specified clock skew.

[-adserver-name <text>] - Active Directory Server Name
If you specify this parameter, the command displays information only about the Kerberos realm configurations
that use the Active Directory server that has the specified name.

[-adserver-ip <IP Address>] - Active Directory Server IP Address
If you specify this parameter, the command displays information only about the Kerberos realm configurations
that use the Active Directory server that has the specified IP address.

[-comment <text>] - Comment
If you specify this parameter, the command displays information only about the Kerberos realm configurations
that match the specified comment text.

[-adminserver-ip <IP Address>] - Admin Server IP Address
If you specify this parameter, the command displays information only about the Kerberos realm configurations
that use the specified administrative-server IP address.

[-adminserver-port <integer>] - Admin Server Port
If you specify this parameter, the command displays information only about the Kerberos realm configurations
that use the specified administrative-server port number.

[-passwordserver-ip <IP Address>] - Password Server IP Address
If you specify this parameter, the command displays information only about the Kerberos realm configurations
that use the specified password-server IP address.

[-passwordserver-port <integer>] - Password Server Port
If you specify this parameter, the command displays information only about the Kerberos realm configurations
that use the specified password-server port number.

[-permitted-enc-types <NFS Kerberos Encryption Type>, ...] - Permitted Encryption Types
If you specify this parameter, the command displays information only about the Kerberos realm configuration
that match the specified encryption types.

Examples
The following example displays information about all Kerberos realm configurations:

```
cluster1::> vserver nfs kerberos realm show

+---------------+-----------------+-----------------+---------+----------+
| Vserver       | Kerberos        | Active Directory| KDC     |
| Realm         |                 | Server Vendor   | Vendor  |
|               |                 | IP Address      | IP Address |
|---------------+-----------------+-----------------+---------+----------+
| AUTH          | SEC.EXAMPLE.COM | AUTH.SEC.EXAMPLE.COM | Microsoft | 192.0.2.170 |
```

vserver nfs kerberos interface commands

Manage the Kerberos interface configuration for an NFS server
vserver nfs kerberos interface disable

Disable NFS Kerberos on a LIF

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver nfs kerberos interface disable command disables NFS Kerberos on a logical interface.

Parameters
- vserver <vserver name> - Vserver
  This parameter specifies the Vserver in which the logical interface exists.
- lif <lif-name> - Logical Interface
  This parameter specifies the name of the logical interface on which you want to disable NFS Kerberos.
[-admin-username <text>] - Account Creation Username
  This optional parameter specifies the administrator user name.
[-admin-password <text>] - Account Creation Password
  This optional parameter specifies the administrator password.

Examples
The following example disables NFS Kerberos on a Vserver named vs0 and a logical interface named datalif1.

vs1::> vserver nfs kerberos interface disable -vserver vs0 -lif datalif1

vserver nfs kerberos interface enable

Enable NFS Kerberos on a LIF

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver nfs kerberos interface enable command enables NFS Kerberos on a logical interface.

Parameters
- vserver <vserver name> - Vserver
  This parameter specifies the Vserver in which the logical interface exists.
- lif <lif-name> - Logical Interface
  This parameter specifies the name of the logical interface on which you want to enable NFS Kerberos.
[-spn <text>] - Service Principal Name
  This optional parameter specifies the service principal name (SPN) for the logical interface you want to enable. This value must be in the form nfs/host_name@REALM, where host_name is the fully qualified host name of the Kerberos server, nfs is the service, and REALM is the name of the Kerberos realm (for instance, EXAMPLE.COM). Specify Kerberos realm name in uppercase.
[-admin-username <text>] - Account Creation Username
  This optional parameter specifies the administrator user name.
[-admin-password <text>] - Account Creation Password
  This optional parameter specifies the administrator password.
[\text{-keytab-uri} \{(ftp|http)://(hostname|IPv4 Address|'['IPv6 Address']')\ldots\}] - Load Keytab from URI

This optional parameter specifies loading a keytab file from the specified URI.

[\text{-ou <text>}] - Organizational Unit

This optional parameter specifies the organizational unit (OU) under which the Microsoft Active Directory server account will be created when you enable Kerberos using a realm for Microsoft KDC. If this parameter is not specified, the default OU is "CN=Computers".

**Examples**

The following example enables NFS Kerberos on a Vserver named vs0 and a logical interface named datalif1. The SPN is nfs/sec.example.com@AUTH.SEC.EXAMPLE.COM and the keytab file is loaded from ftp://ftp.example.com/keytab.

```
vserver nfs kerberos interface enable -vserver vs0 -lif datalif1 -spn nfs/sec.example.com@AUTH.SEC.EXAMPLE.COM -keytab-uri ftp://ftp.example.com/keytab
```

**vserver nfs kerberos interface modify**

Modify the Kerberos configuration of an NFS server

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The `vserver nfs kerberos interface modify` command modifies a Kerberos configuration for NFS. An NFS Kerberos configuration is associated with both a Vserver and a logical interface.

**Parameters**

- `\text{-vserver <vserver name>}` - Vserver
  This parameter specifies the Vserver associated with the NFS Kerberos configuration you want to modify.

- `\text{-lif <lif-name>}` - Logical Interface
  This parameter specifies the name of the logical interface associated with the NFS Kerberos configuration you want to modify.

- `\text{[-kerberos \{enabled|disabled\}]}` - Kerberos Enabled
  This optional parameter specifies whether to enable or disable Kerberos for NFS on the specified Vserver and logical interface. If you specify a value of `enable`, you must also specify the -spn parameter. The command prompts you for a user name and password for a Kerberos principal in the same realm as the principal specified by the -spn parameter; this principal must have permission to create or modify the principal specified by the -spn parameter.

- `\text{[-spn <text>]}` - Service Principal Name
  This optional parameter specifies the service principal name (SPN) of the Kerberos configuration you want to modify. If you specify a value of `enable` for the -kerberos parameter, you must also specify this parameter. This value must be in the form nfs/host_name@REALM, where host_name is the fully qualified host name of the Kerberos server, nfs is the service, and REALM is the name of the Kerberos realm (for instance, EXAMPLE.COM). Specify Kerberos realm names in uppercase.

- `\text{[-admin-username <text>]}` - Account Creation Username
  This optional parameter specifies the administrator user name.

- `\text{[-keytab-uri} \{(ftp|http)://(hostname|IPv4 Address|'['IPv6 Address']')\ldots\}]` - Load Keytab from URI
  This optional parameter specifies loading a keytab file from the specified URI.
This optional parameter specifies the organizational unit (OU) under which the Microsoft Active Directory server account will be created when you enable Kerberos using a realm for Microsoft KDC. If this parameter is not specified, the default OU is "CN=Computers".

Examples
The following example enables an NFS Kerberos configuration on a Vserver named vs0 and a logical interface named datalif1. The SPN is nfs/sec.example.com@AUTH.SEC.EXAMPLE.COM and the keytab file is loaded from ftp://ftp.example.com/keytab.

```
vs0::> vserver nfs kerberos interface modify -vserver vs0 -lif datalif1 -kerberos enabled -spn nfs/sec.example.com@AUTH.SEC.EXAMPLE.COM -keytab-uri ftp://ftp.example.com/keytab
```

vserver nfs kerberos interface show
Display the Kerberos configurations of NFS servers

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver nfs kerberos interface show command displays information about Kerberos configurations for NFS. The command output depends on the parameters specified with the command. If you do not specify any parameters, the command displays the following information about all Kerberos configurations for NFS:

- Vserver name
- Logical interface name
- Logical interface IP address
- Whether Kerberos is enabled or disabled
- The Kerberos service principal name (SPN)
- The permitted encryption types

You can specify additional parameters to display only information that matches those parameters. For instance, to display information only about Kerberos configurations for NFS that are enabled, run the command with the -kerberos enabled parameter.

Parameters
```
[[-fields <fieldname>, ...]
 |  
 |  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.
 |  
 |  
 |  
 |  
 |  [-instance]]
 |  
 |  If you specify the -instance parameter, the command displays detailed information about all fields.
 |  
 |  
 |  [-vserver <vserver name>] - Vserver
 |  
 |  If you specify this parameter and the -lif parameter, the command displays information only about the Kerberos configuration or configurations for NFS that are associated with the specified Vserver and logical interface.
```
[-lif <lif-name>] - Logical Interface
   If you specify this parameter and the -vserver parameter, the command displays information only about the Kerberos configuration or configurations for NFS that are associated with the specified logical interface and Vserver.

[-address <IP Address>] - IP Address
   If you specify this parameter, the command displays information only about the Kerberos configurations for NFS that are associated with the specified logical-interface IP address.

[-kerberos {enabled|disabled}] - Kerberos Enabled
   If you specify this parameter, the command displays information only about the Kerberos configurations for NFS that match the specified value.

[-spn <text>] - Service Principal Name
   If you specify this parameter, the command displays information only about the Kerberos configuration or configurations for NFS that match the specified SPN.

[-permitted-enc-types <NFS Kerberos Encryption Type>, ...] - Permitted Encryption Types
   If you specify this parameter, the command displays information only about the Kerberos configuration for NFS that matches the specified encryption types.

Examples
The following example displays information about the Kerberos configuration for NFS associated with the Vserver vs0 and the logical interface datalif1:

```
vs1:/> vserver nfs kerberos interface show -vserver vs0 -lif datalif1
  Vserver: vs1
  Logical Interface: datalif1
  IP Address: 192.0.2.130
  Kerberos Enabled: enabled
  Service Principal Name: nfs/sec.example.com@AUTH.SEC.EXAMPLE.COM
  Permitted Encryption Types: des,des3,aes-128,aes-256
```

vserver nfs pnfs commands
Manage pNFS Devices and its Mappings

pNFS Device Commands
The devices directory
The vserver nfs pnfs devices command enables users to manage pNFS devices and their properties, including their configuration and state of the cache in the Data ONTAP kernel. A pNFS Device is a logical representation of a volume and determines how a volume is exported to the pNFS clients. pNFS clients acquire layouts on pNFS devices, which enable them to access storage via optimal network paths. A pNFS device consists of information about the device itself and mappings that enable direct network access to the storage constituents for the device. The information related to pNFS devices is visible via commands vserver nfs pnfs devices show and vserver nfs pnfs devices mappings show. All the commands implemented under this directory are for troubleshooting purposes only and users are NOT expected to execute them without the supervision of the NetApp Support personnel.

Related references
vserver nfs pnfs devices show on page 1704
vserver nfs pnfs devices mappings show on page 1706
vserver nfs pnfs devices create

Create a new pNFS device and its mapping

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The vserver nfs pnfs devices create command creates a pNFS device for a given instance of a volume. The actual creation of pNFS devices is automatically done by the pNFS implementation in Data ONTAP kernel. The usage of this command might interfere with the functionality of the pNFS server. Thus, it is advised that this command not be used without supervision by technical support.

Parameters
[-global-device-table-id <integer>] - Global Device Mapping Table ID
This optional parameter specifies the unique identifier that the pNFS devices subsystem assigns to the device that corresponds to the MSID described below. The pNFS devices implementations keeps track of the global unique identifier that needs to be assigned to this device. It is expected that users need not specifically input the device identifier while creation.

-vserver <vserver name> - Vserver Name
This parameter specifies the Vserver to which the volumes belong.

-msid <integer> - Volume MSID
This parameter uniquely identifies the volume for which you are creating a pNFS device.

-striping-epoch <integer> - Striping Epoch
This optional parameter specifies the striping epoch identifier for a volume for which you are creating a pNFS device. For flexible volumes, the value is always 1.

-device-access <integer> - Device Access Flags
This optional parameter specifies the type of access that is given to the pNFS device that you are creating. If the value is 1, it means write access. If the value if 0, it means read access. By default, the device is created with write access.

-version <integer> - Device Version
This optional parameter specifies the version associated with the pNFS device identifier. By default, the version is set to 1.

[-generation-count <integer>] - Device Generation
This optional parameter specifies the generation count associated with the pNFS device identifier. If a device already exists, the existing device is invalidated and the generation number for the device is bumped. If a device does not already exist, a new device is created with generation number 1.

[create-time <MM/DD/YYYY HH:MM:SS>] - Device Creation Time
This optional parameter specifies the time at which the device is created. If the parameter is not specified, the time at which the device is created is stored along with the device.

[mapping-status {available|notavailable}] - Device Mapping Status
This optional parameter specifies if the mapping exists for a device. If the value is set to "available", the mappings will be created in the device mappings table. If the value is set to "notavailable", the mappings will not be created in the device mappings table.
vserver nfs pnfs devices delete

Delete a pNFS device

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The `vserver nfs pnfs devices delete` command deletes a unique pNFS device. The pNFS device to be deleted is identified by the unique device mapping identifier (mid) parameter passed to this operation. When this operation is successful, the device mappings corresponding to the device and the information corresponding to the device itself are removed. You can obtain the global mapping identifier from the list of devices using the command `vserver nfs pnfs devices show`.

Parameters
- `-global-device-table-id <integer>` - Global Device Mapping Table ID
  This parameter specifies the pNFS global device mapping identifier that uniquely identifies a pNFS device

Examples
The following example deletes the device information of a device with global mapping identifier value 2.

```
cluster1::> vserver nfs pnfs delete -mid 2
```

vserver nfs pnfs devices show

Display pNFS device information

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The `vserver nfs pnfs devices show` command displays a pNFS device for a given instance of a volume. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all pNFS devices:

- Vserver name
- The global device mapping identifier of the device
- The master data set ID (MSID) of the volume that leads to this device
- The mapping status of the device
- The generation number of the device

You can specify additional parameters to display only information that matches those parameters. For instance, to display information only about devices that are exported as write-only devices, enter the command with the `-access-flags 1` parameter.
Parameters

{[-fields <fieldname>, ...]}

If you specify the -fields parameter, the command only displays the fields that you specify.

{[-instance]}  
If you specify the -instance parameter, the command displays detailed information about all entries.

{-global-device-table-id <integer>} - Global Device Mapping Table ID

If you specify this parameter, the command displays information only about the unique identifier that the pNFS devices subsystem assigns to the device that is being output.

{-vserver <vserver name>} - Vserver Name

If you specify this parameter, the command displays information only about the Vserver that owns the volume represented by MSID.

{-msid <integer>} - Volume MSID

If you specify this parameter, the command displays information only about the volume or volumes that match the specified MSID.

{-striping-epoch <integer>} - Striping Epoch

If you specify this parameter, the command displays information only about the striping epoch identifier for a volume that serves as the basis for the pNFS device.

{-device-access <integer>} - Device Access Flags

If you specify this parameter, the command displays information only about access flags which specify the type of access that is given to the pNFS device. If the value is 1, it means write access. If the value is 0, it means read access.

{-version <integer>} - Device Version

If you specify this parameter, the command displays information only about pNFS devices that match the specified version number.

{-generation-count <integer>} - Device Generation

If you specify this parameter, the command displays information only about generation count associated with the pNFS device identifier.

{-create-time <MM/DD/YYYY HH:MM:SS>} - Device Creation Time

If you specify this parameter, the command displays information only about pNFS devices that were created at the specified time.

{-mapping-status {available|notavailable]} - Device Mapping Status

If you specify this parameter, the command displays information only about if the mapping exists for a device. If the value is set to "available", the mappings can be seen in the device mappings table. If the value is set to "notavailable", the mappings will not be seen in the device mappings table.

Examples

The following example displays the information of a device with global mapping identifier 6. The device corresponds to a volume with MSID 2147484673 on Vserver vs1. The device mappings corresponding to this device follow in the mappings table.

```
cluster1:*> vserver nfs pnfs devices show
Vserver Name  Mapping ID  Msid  Mapping Status  Generation
---------------  --------------- --------------- --------------- ---------------
vs1             1               2147484673         available       6
```

```
cluster1:*> vserver nfs pnfs devices mappings show
```
### Vserver Name Mapping ID Dsid LIF IP

### pNFS Device Cache Command

Manage pNFS Device Cache in N-blade

The vserver nfs pnfs devices cache command enables users to manage the pNFS device mappings cache present in the protocol stack of Data ONTAP kernel. The only supported action implemented is to flush the cache. This is to be mainly used for testing purposes only and users are NOT expected to use this without the supervision of NetApp support personnel.

**vserver nfs pnfs devices cache show**

Display the device cache

**Availability:** This command is available to cluster administrators at the advanced privilege level.

**Description**
The vserver nfs pnfs devices cache show command displays the device cache.

**Parameters**

- `[-fields <fieldname>, ...]`
  - If you specify the -fields parameter, the command only displays the fields that you specify.

- `[-instance ]`
  - If you specify the -instance parameter, the command displays detailed information about all entries.

- `[-node (<nodename>|local)] - Node`
  - If you specify this parameter, the command displays information only about the pNFS devices cache present on the node.

- `[-vserver <vserver name>] - Vserver Name`
  - If you specify this parameter, the command displays information only about the Vserver that has the pNFS devices cache.

**Examples**

**Related references**

vserver nfs pnfs devices mappings show on page 1706

### pNFS Device Mappings Command

Manage Device Mappings

The vserver nfs pnfs devices mappings command enables you to manage the pNFS device mappings corresponding to every pNFS device. The only supported action implemented for this command is to display the device mappings.

**vserver nfs pnfs devices mappings show**

Display the list of pNFS device mappings

**Availability:** This command is available to cluster and Vserver administrators at the advanced privilege level.
Description

The `vserver nfs pnfs devices show` command displays a pNFS device for a given instance of a volume. The command output depends on the parameter or parameters specified with the command. If you do not specify parameters, the command displays the following information about all pNFS devices:

- Vserver name
- The global device mapping identifier of the device
- The Data Set ID (DSID) of the constituent volume
- The LIF IP address that serves the constituent on the same controller.

You can specify additional parameters to display only information that matches those parameters. For instance, to display information only about devices that are exported as write-only devices, enter the command with the `--access-flags 1` parameter.

Parameters

```
[-fields <fieldname>, ...]  
If you specify the -fields parameter, the command only displays the fields that you specify.

[[-instance ]]  
If you specify the -instance parameter, the command displays detailed information about all entries.

[-vserver <vserver name>] - Vserver Name  
If you specify this parameter, the command displays information only about the Vserver that the mapping identifier and DSID belong to.

[-global-device-table-id <integer>] - Global Device Mapping Table ID  
This specifies the unique identifier that the pNFS devices subsystem assigns to the device whose mappings are being output.

[-dsid <integer>] - Constituent Volume DSID  
If you specify this parameter, the command displays information only about the volume or volumes that match the specified DSID.

[-lifip <IP Address>] - LIF IP Address  
If you specify this parameter, the command displays information only about the pNFS devices that match the specified LIF IP address.
```

Examples

The following example displays the device information of a device with global mapping identifier 6. The device corresponds to a volume with MSID 2147484673 on Vserver vs1. The device has one constituent with DSID 1025 and is served by the LIF with the IP address 10.53.4.14.

```
cluster1::*> vserver nfs pnfs devices* show
Vserver Name       Mapping ID      Msid            Mapping Status  Generation
------------------  --------------- --------------- --------------- --------------
vs1                1               2147484673      available       6

cluster1::*> vserver nfs pnfs devices mappings show
Vserver Name       Mapping ID      Dsid            Lif IP
------------------  --------------- --------------- --------------------
vs1                1               1025            10.53.4.14
```

vserver locks commands

Manage Client Locks

vserver locks break

Break file locks based on a set of criteria

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The vserver locks break command breaks one or more locks.

Parameters
{-vserver <vserver name> - Vserver
 This parameter specifies the Vserver containing the lock.

-volume <volume name> - Volume
 This parameter specifies the name of the volume containing the lock.

-lif <lif-name> - Logical Interface
 This parameter specifies the logical interface through which the lock was established.

-path <text> - Object Path
 This parameter specifies a path to the lock.

| -lockid <UUID> - Lock UUID
 This parameter specifies the universally unique identifier (UUID) for the lock. Queries and wildcard characters are not supported.

-owner-id <text> - Owner ID
 This parameter specifies an owner ID for a lock. This parameter must be used with the query notation { } exhibited in the second example.

-protocol <lock protocol> - Lock Protocol
 This parameter specifies the protocol that was used to establish a lock. This parameter must be used with the query notation { } exhibited in the second example.

-client-address <IP Address> - Client Address
 This parameter specifies a client address associated with a lock. This parameter must be used with the query notation { } exhibited in the second example.

-client-address-type {ipv4|ipv6|ipv6z} - Client Address Type
 This parameter specifies the type of ip address a client used to create its lock (ipv4, ipv6). This parameter must be used with the query notation { } exhibited in the second example.

Examples
The following example breaks the locks on all objects on the Vserver named vs0 in the volume named vol0, regardless of the paths to the locked objects and the logical interface through which the locks were established.
cluster1:*> vserver locks break -vserver vs0 -volume vol0 -path * -lif *
WARNING: Breaking file locks can cause applications to become unsynchronized and may lead to data corruption.
Do you want to continue? {y|n}: y
1 entry was acted on.

The vserver locks break command can also be issued using a query on the parameters available to the vserver locks show command. The following example breaks all NLM protocol lock objects locked by the client at address 12.34.56.78.

cluster1:*> vserver locks break { -protocol nlm -client-address 12.34.56.78 }
Warning: Breaking file locks can cause applications to become unsynchronized and may lead to data corruption.

vserver locks show

Display current list of locks

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver locks show command displays information about locks. A lock is a synchronization mechanism for enforcing limits on concurrent access to files where many clients can be accessing the same file at the same time. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about locks:

- Vserver name
- Volume name
- Object path
- Logical interface name
- Lock protocol
- Lock type
- Client

Parameters

{[-fields <fieldname>,...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?' to display the fields to specify.

[[-smb-attrs]]
If you specify the -smb-attrs parameter, the command displays information related to SMB2 and higher.

[[-instance]]
If you specify the -instance parameter, the command displays detailed information about all fields.

{[-vserver <vserver name>]-Vserver
If you specify this parameter, the command displays information about locks on the specified Vserver.

[-volume <volume name>]-Volume
If you specify this parameter, the command displays information about locks on the specified volume.
[-lif <lif-name>] - Logical Interface
If you specify this parameter, the command displays information about locks established through the specified logical interface.

[-path <text>] - Object Path
If you specify this parameter, the command displays information about locks at the specified path name.

[-lockid <UUID>] - Lock UUID
If you specify this parameter, the command displays information about the lock with the specified universally unique identifier (UUID).

[-is-constituent {true|false}] - Is Constituent Volume
If you specify this parameter, the command displays information only about volumes that either are or are not constituents of a FlexGroup, depending on the value provided. This field is false for constituents of an Infinite Volume.

[-protocol <lock protocol>] - Lock Protocol
If you specify this parameter, the command displays information about locks established through the specified protocol. Some of the valid protocols are:

- *cifs*: SMB locks
- *nlm*: NFS3 locks
- *nfsv4*: NFS4.0 locks
- *nfsv4.1*: NFS4.1 locks
- *crposix*: CrPosix locks for CREATE and LINK
- *fcache*: Delegations for 7-mode destination FlexCache volumes

[-type {byte-range|share-level|op-lock|delegation}] - Lock Type
If you specify this parameter, the command displays information about locks of the specified lock type. The four types of locks are:

- Byte-range locks: Lock only a portion of a file.
- Share locks: Represent opened files.
- Opportunistic locks: Control client-side caching over SMB.
- Delegations: Control client-side caching over NFSv4.

[-node <nodename>] - Node Holding Lock State
If you specify this parameter, the command displays information about all locks on the specified node.

[-lock-state <lock_state>] - Lock State
If you specify this parameter, the command displays information about the state of the lock. Some of the valid states are:

- *granted*: The lock is established.
- *revoking*: The server is currently coordinating with the client to change the state of this lock.
- *revoked*: The lock is undergoing revocation to be downgraded or released.
- *adjusted*: The lock is undergoing revocation to be replaced by a lock equal to or weaker than the current lock.
- *subsumed*: The lock is one of a set of locks that will replace a lock that is being revoked.
- **waiting**: The lock is waiting to be granted, because it conflicts with another lock.
- **denied**: The lock has been denied.
- **timeout**: The lock was waiting and has now timed out.
- **gone**: The lock is about to be released.
- **unused**: The lock is allocated but has not been processed into any state.

[-bytelock-offset <integer>] - Bytelock Starting Offset
If you specify this parameter, the command displays information about bytelocks with the specified offset value. This is the index in the file (in bytes) where the lock begins.

[-bytelock-length <integer>] - Number of Bytes Locked
If you specify this parameter, the command displays information about bytelocks with the specified length. This is the number of bytes that are locked by this particular lock.

[-bytelock-mandatory {true|false}] - Bytelock is Mandatory
If you specify this parameter, the command displays information only about mandatory bytelocks. A mandatory bytelock enforces the requirement of byte range locking on clients before accessing the associated range.

[-bytelock-exclusive {true|false}] - Bytelock is Exclusive
If you specify this parameter, the command displays information only about exclusive bytelocks. When an exclusive bytelock is granted, no other bytelock may be granted whose range overlaps it.

[-bytelock-super {true|false}] - Bytelock is Superlock
If you specify this parameter, the command displays information only about super-bytelocks. When a super-bytelock is granted, all other locks on that file are released, and no other operations will be allowed on that file.

[-bytelock-soft {true|false}] - Bytelock is Soft
If you specify this parameter, the command displays information only about softened bytelocks. An NFSv4 bytelock might become softened if the connection to the client is interrupted. Soft locks might be reclaimed if the client reconnects. However if another client requests a lock that conflicts with a soft lock, then the soft lock will be released.

[-oplock-level {exclusive|level2|batch|null|read-batch}] - Oplock Level
If you specify this parameter, the command displays information about locks with the specified oplock level. The oplock level determines which operations the client may cache locally. Those operations include opening, reading, writing, closing, and creating and destroying bytelocks on a file. The five valid oplock levels are:
- **batch**: The client may cache all operations on the file.
- **exclusive**: The client may cache reads and writes on the file.
- **read-batch**: The client may cache reads and opens on the file.
- **level2**: The client may cache reads on the file.
- **null**: The client may not cache any operations on the file.

[-sharelock-mode <share lock mode>] - Shared Lock Access Mode
If you specify this parameter, the command displays information about locks with the specified sharelock mode. The parameter has two components separated by a hyphen: the access mode followed by the share mode. The access mode specifies which operations the client is allowed to perform on the file. The share mode specifies which operations other clients are disallowed to perform. The two modes are a combination of one or more of these permissions:
• read
• write
• delete
• all
• none

For example, the sharelock mode `read_write-deny_delete` allows the client to read and write the file, and disallows other clients to delete the file. A special mode is `delete-on-close`, which specifies that the server will delete the file as soon as it is closed.

```
[-sharelock-soft {true|false}] - Shared Lock is Soft
```

If you specify this parameter, the command displays information only about softened sharelocks. A NFSv4 sharelock can become softened when the connection to the client is interrupted. If the client reconnects, it might reclaim the sharelock. However, if another client creates a sharelock that conflicts with the softened sharelock, the softened sharelock will be released.

```
[-delegation-type {read|write}] - Delegation Type
```

If you specify this parameter, the command displays information only about locks with the specified delegation-type setting. The delegation type determines which operations the client may cache locally. The two valid delegation types are:

• `read`: The client may cache reads on the file.
• `write`: The client may cache reads and writes on the file.

```
[-owner-id <text>] - Owner ID
```

If you specify this parameter, the command displays information only about locks with the specified owner ID. The owner ID is an opaque byte string generated by the server for each file lock request.

```
[-client-address <IP Address>] - Client Address
```

If you specify this parameter, the command displays information only about locks from the specified client IP address.

```
[-client-address-type {ipv4|ipv6|ipv6z}] - Client Address Type
```

If you specify this parameter, the command displays information only about locks corresponding to a certain IP address type. Please note that locks created over the NFSv4 or NFSv4.1 protocol cannot have their address types resolved. Valid options are:

• `ipv4`: Clients operating over an IPv4 interface.
• `ipv6`: Clients operating over an IPv6 interface.

```
[-smb-open-type {none|durable|persistent}] - SMB Open Type
```

If you specify this parameter, the command displays information only about locks with the specified SMB open type. Valid open types are

• `durable`: Durability is a feature of SMB2. A durable lock might become "disconnected" if the connection between the client and server is disrupted. A disconnected durable lock might be reconnected if the connection is reestablished.
• `persistent`: Persistence is a feature of SMB3. Persistent locks can become disconnected and later reconnected, like durable locks. Persistent locks are used to facilitate continuously available shares.
• `none`: The lock is neither durable nor persistent.
[-smb-connect-state <Lock Connect State>] - SMB Connect State

If you specify this parameter, the command displays information only about locks with the specified SMB connection state. Some of the valid states are:

- **connected**: This is the normal state of a SMB lock when the server and client are connected.
- **disconnected**: If a lock is durable or persistent, it might become disconnected if the connection between the server and its client is interrupted. Disconnected locks may later be reconnected if the connection is reestablished.

[-smb-expiration-time <integer>] - SMB Expiration Time (Secs)

If you specify this parameter, the command displays information only about locks with the specified SMB lock expiration time. When a lock is disconnected, **-smb-expiration-time** shows the time remaining until the lock expires. The server releases the lock after it expires.

[-smb-open-group-id <text>] - SMB Open Group ID

If you specify this parameter, the command displays information only about locks with the specified SMB open group identifier. This is an opaque byte string provided by the client as the SMB lease key when the lock is first established.

**Examples**

The following example displays default information about all locks:

```
cluster1::> vserver locks show

Vserver: vs0
Volume   Object Path               LIF         Protocol  Lock Type   Client
-------- ------------------------- ----------- --------- ----------- ----------
vol1     /vol1/notes.txt           node1_data1   cifs        share-level 192.168.1.5
Sharelock Mode: read_write-deny_delete
Oplock Level: read-batch
vol1     /vol1/notes1.txt          node1_data1   cifs        share-level 192.168.1.5
Sharelock Mode: read_write-deny_delete
Oplock Level: batch
vol1     /vol1                     node1_data2   cifs        share-level 192.168.1.5
Sharelock Mode: read-deny_delete
Oplock Level: read-batch
7 entries were displayed.
```

The following example displays the SMB related information about all locks:

```
cluster1::> vserver locks show -smb-attrs

Vserver: vs0
Volume   Object Path               LIF         Protocol  Lock Type   Client
-------- ------------------------- ----------- --------- ----------- ----------
vol1     /vol1/notes.txt           node1_data1   cifs        share-level 192.168.1.5
Sharelock Mode: read_write-deny_delete
Open Type: durable         Connect State: connected
Expiration Time (Secs): -
Open Group ID: 625e2ff46ee5df1194ba0050569d37047058909c00000000873d21070000000
Oplock Level: read-batch
Oplock Level: op-lock 192.168.1.5
Open Group ID: 625e2ff46ee5df1194ba0050569d37047058909c00000000873d21070000000
```

vserver locks commands
The following example displays default information about all locks in list form:

```
cluster1::> vserver locks show -instance

Vserver: vs0
Volume: vol1
Logical Interface: node1_data1
Object Path: /vol1/notes.txt
Lock UUID: 447db184-f801-11df-8bb5-00a098000e34
Lock Protocol: cifs
Lock Type: share-level
Node Holding Lock State: node1
Lock State: granted
Bytelock Starting Offset: -
Number of Bytes Locked: -
Bytelock is Mandatory: -
Bytelock is Exclusive: -
Bytelock is Superlock: -
Bytelock is Soft: -
Oplock Level: -
Shared Lock Access Mode: read_write-deny_delete
Shared Lock is Soft: false
Delegation Type: -
Client Address: 192.168.1.5
SMB Open Type: durable
SMB Connect State: connected
SMB Expiration Time (Secs): -
SMB Open Group ID: 625e2ff6e5df1194ba0050569d37047058909c00000000873d210700000000

Vserver: vs0
Volume: vol1
Logical Interface: node1_data1
Object Path: /vol1/notes.txt
Lock UUID: 447db185-f801-11df-8bb5-00a098000e34
Lock Protocol: cifs
Lock Type: op-lock
Node Holding Lock State: node1
Lock State: granted
Bytelock Starting Offset: -
Number of Bytes Locked: -
Bytelock is Mandatory: -
Bytelock is Exclusive: -
Bytelock is Superlock: -
Bytelock is Soft: -
```

7 entries were displayed.

Commands: Manual Page Reference
vserver name-mapping commands

The name-mapping directory

vserver name-mapping create

Create a name mapping

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver name-mapping create command creates a name mapping. Name mappings are applied in the order in which they occur in the priority list; for example, a name mapping that occurs at position 2 in the priority list is applied before a name mapping that occurs at position 3. Each mapping direction (Kerberos-to-UNIX, Windows-to-UNIX, and UNIX-to-Windows) has its own priority list. Data ONTAP prevents you from creating two name mappings with the same pattern.

Patterns can be expressed as POSIX regular expressions. For information about regular expressions, see the UNIX reference page for regex(7).

Each Vserver can have up to 1024 name mappings in each direction.

Note: If you are using the CLI, you must delimit all regular expressions with double quotation marks ("). For instance, to enter the regular expression ".+" in the CLI, type ".+(.+)" at the command prompt. To add a "?" to the expression, press ESC followed by the "?".
Parameters
-vserver <vserver name> - Vserver
   This parameter specifies the Vserver on which you want to create the name mapping.

-direction {krb-unix|win-unix|unix-win} - Direction
   This parameter specifies the direction of the name mapping. Possible values are krb-unix for a Kerberos-to-
   UNIX name mapping, win-unix for a Windows-to-UNIX name mapping, and unix-win for a UNIX-to-
   Windows name mapping.

-position <integer> - Position
   This parameter specifies the name mapping's position in the priority list. Specify the position as a positive
   integer.
   Note: If you want to create a new name mapping at a position that is already occupied in the priority list,
   use the vserver name-mapping insert command instead of the vserver name-mapping create command.

-pattern <text> - Pattern
   This parameter specifies the pattern you want to match. Refer to the command description section for details.
   The pattern can be up to 256 characters in length.

-replacement <text> - Replacement
   This parameter specifies the replacement pattern. The replacement pattern can be up to 256 characters in
   length.

  {[--address <IP Address/Mask>] - IP Address with Subnet Mask
   This optional parameter specifies the IP address that can be used to match the client's workstation IP address
   with the pattern.

  |[--hostname <text>] - Hostname
   This optional parameter specifies the hostname that can be used to match the corresponding client's
   workstation IP address with the list of IP addresses with the pattern.

Examples
The following example creates a name mapping on a Vserver named vs1. The mapping is from UNIX to Windows at
position 5 in the priority list. The mapping maps the pattern cifs to the replacement EXAMPLE\Domain Users.

```
cluster1::> vserver name-mapping create -vserver vs1 -direction unix-win -position 5 -pattern cifs
   -replacement "EXAMPLE\Domain Users -address 10.238.33.245/24"
cluster1::> vserver name-mapping create -vserver vs1 -direction unix-win -position 5 -pattern cifs
   -replacement "EXAMPLE\Domain Users -hostname google.com"
```

vserver name-mapping insert on page 1717

vserver name-mapping delete
Delete a name mapping

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver name-mapping delete command deletes a name mapping.
Parameters
-vserver <vserver name> - Vserver
This parameter specifies the Vserver from which you want to delete the name mapping.

-direction {krb-unix|win-unix|unix-win} - Direction
This parameter specifies the direction of the name mapping that you want to delete.

-position <integer> - Position
This parameter specifies the position of the name mapping that you want to delete. Specify the position as a positive integer.

Examples
The following example deletes a name mapping on a Vserver named vs1. The name mapping is from UNIX to Windows and is at position 5.

```
cluster1:> vserver name-mapping delete -vserver vs1 -direction unix-win -position 5
```

vserver name-mapping insert
Create a name mapping at a specified position

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver name-mapping insert command creates a name mapping at a specified position in the priority list. The command rearranges the list as needed to accommodate the new entry. For instance, if you have a priority list of five mappings and insert a new mapping at position 3, the mapping previously at position 3 is moved to position 4, the mapping previously at position 4 is moved to position 5, and the mapping previously at position 5 is moved to position 6. Each mapping direction (Kerberos-to-UNIX, Windows-to-UNIX, and UNIX-to-Windows) has its own priority list.

You can specify patterns as POSIX regular expressions. For information about regular expressions, see the UNIX reference page for regex(7).

Each Vserver can have up to 1024 name mappings in each direction.

Note: If you are using the CLI, you must delimit all regular expressions with double quotation marks ("), For instance, to enter the regular expression ".+" in the CLI, type "(.+)" at the command prompt. To add a "?" to the expression, press ESC followed by the "?".

Parameters
-vserver <vserver name> - Vserver
This parameter specifies the Vserver on which you want to create the name mapping.

-direction {krb-unix|win-unix|unix-win} - Direction
This parameter specifies the direction of the name mapping. Possible values are krb-unix for a Kerberos-to-UNIX name mapping, win-unix for a Windows-to-UNIX name mapping, and unix-win for a UNIX-to-Windows name mapping.

-position <integer> - Position
This parameter specifies the position in the priority list at which you want to insert the new name mapping. Specify a position as a positive integer.

-pattern <text> - Pattern
This parameter specifies the pattern you want to match. Refer to the command description section for details. The pattern can be up to 256 characters in length.
-replacement <text> - Replacement
This parameter specifies the replacement pattern. The replacement pattern can be up to 256 characters in length.

{ [ -address <IP Address/Mask> ] } - IP Address with Subnet Mask
This optional parameter specifies the IP address that can be used to match the client's workstation IP address with the pattern.

| [ -hostname <text> ] | - Hostname
This optional parameter specifies the hostname that can be used to match the corresponding client's workstation IP address with the list of IP addresses with the pattern.

Examples
The following example creates a name mapping on a Vserver named vs1. It is a user mapping from Kerberos to UNIX. It is inserted into the priority list at position 2. The name mapping maps any principal in the Kerberos realm SEC.EXAMPLE.COM to the UNIX user name corresponding to the principal's base name with any instance names removed; for example, tom/admin@SEC.EXAMPLE.COM is mapped to tom.

```bash
cluster1::> vserver name-mapping insert -vserver vs1 -direction krb-unix -position 2 -pattern "([^@/]+)(/[^[@]+)?@SEC.EXAMPLE.COM" -replacement "\1"
cluster1::> vserver name-mapping insert -vserver vs1 -direction krb-unix -position 3 -pattern "([^@/]+)(/[^[@]+)?@SEC.EXAMPLE.COM" -replacement "\1 -address 10.238.33.245/24
```

vserver name-mapping modify
Modify a name mapping's pattern, replacement pattern, or both

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver name-mapping modify command modifies the pattern, the replacement pattern, or both of a specified name mapping.

You can specify patterns as POSIX regular expressions. For information about regular expressions, see the UNIX reference page for regex(7).

Each Vserver can have up to 1024 name mappings in each direction.

Note: If you are using the CLI, you must delimit all regular expressions with double quotation marks ("). For instance, to enter the regular expression (\+) in the CLI, type "(\+)" at the command prompt. To add a "?" to the expression, press ESC followed by the "?".

Parameters
-vserver <vserver name> - Vserver
This parameter specifies the Vserver on which you want to modify the name mapping.

-direction { krb-unix|win-unix|unix-win } - Direction
This parameter specifies the direction of the name mapping. Possible values are krb-unix for a Kerberos-to-UNIX name mapping, win-unix for a Windows-to-UNIX name mapping, and unix-win for a UNIX-to-Windows name mapping.

-position <integer> - Position
This parameter specifies the name mapping's position in the priority list. A position is specified as a positive integer. Each mapping direction (Kerberos-to-UNIX, Windows-to-UNIX, and UNIX-to-Windows) has its own priority list.
[-pattern <text>] - Pattern
This parameter specifies the pattern you want to match. Refer to the command description section for details. The pattern can be up to 256 characters in length.

[-replacement <text>] - Replacement
This parameter specifies the replacement pattern. The replacement pattern can be up to 256 characters in length.

[[-address <IP Address/Mask>]] - IP Address with Subnet Mask
This optional parameter specifies the IP address that can be used to match the client's workstation IP address with the pattern.

[[-hostname <text>]] - Hostname
This optional parameter specifies the hostname that can be used to match the corresponding client's workstation IP address with the list of IP addresses with the pattern.

Examples
The following example modifies the name mapping on the Vserver named vs1 and direction win-unix, at position 3. The pattern to be matched is changed to "EXAMPLE\(.+)".

```
cluster1::> vserver name-mapping modify -vserver vs1 -direction win-unix -position 3 -pattern "EXAMPLE\(.+) -address 10.238.2.54/32"
cluster1::> vserver name-mapping modify -vserver vs1 -direction win-unix -position 3 -pattern "EXAMPLE\(.+) -hostname google.com"
```

vserver name-mapping refresh-hostname-ip
Refresh the IP addresses for configured hostnames

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The vserver name-mapping refresh-hostname-ip command will refresh the IP Address entries in the name-mapping configuration by resolving the hostname. If you run this command with no parameters, this will refresh the IP address entries for every hostname in the name-mapping configuration.

Parameters
-vserver <vserver> - Vserver
This parameter specifies the Vserver for which the hostname lookup needs to be done.

[-direction {krb-unix|win-unix|unix-win}] - Name Mapping Direction
This optional parameter specifies the direction of the name-mapping entry for the hostname lookup.

[-hostname <text>] - Hostname
This optional parameter specifies the hostname for which the lookup needs to be done.

Examples
```
cluster1::*> vserver name-mapping refresh-hostname-ip -vserver vs1 -direction win-unix -hostname google.com
```
vserver name-mapping show

Display name mappings

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver name-mapping show command displays information about name mappings. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all name mappings:

- Vserver name
- Direction of the mapping (krb-unix for Kerberos-to-UNIX, win-unix for Windows-to-UNIX, or unix-win for UNIX-to-Windows)
- Position of the mapping in the priority list
- Pattern to be matched
- Replacement pattern

You can specify additional parameters to display only information that matches those parameters. For instance, to display information only about Kerberos-to-UNIX name mappings, run the command with the -direction krb-unix parameter.

Parameters
{ [-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[ -instance ]
  If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name> ] - Vserver
  If you specify this parameter, the command displays information only about the name mapping or mappings that match the specified Vserver.

[-direction {krb-unix|win-unix|unix-win}] - Direction
  If you specify this parameter, the command displays information only about the name mapping or mappings that have the specified mapping direction.

[-position <integer>] - Position
  If you specify this parameter, the command displays information only about the name mapping that has the specified position in the priority list.

[-pattern <text>] - Pattern
  If you specify this parameter, the command displays information only about the name mapping or mappings that use the specified matching pattern. The pattern can be up to 256 characters in length. Refer to the command description section for details.

[-replacement <text>] - Replacement
  If you specify this parameter, the command displays information only about the name mapping or mappings that use the specified replacement pattern.

[-address <IP Address/Mask>] - IP Address with Subnet Mask
  If you specify this parameter, the command displays information only about the name mapping or mappings that use the specified IP address.
[-hostname <text>] - Hostname

If you specify this parameter, the command displays information only about the name mapping or mappings that use the specified hostname.

Examples
The following example displays information about all name mappings:

```
cluster1::> vserver name-mapping show
Vserver:   vs1
Direction: win-unix
Position   Hostname         IP Address/Mask
----------- ----------------- -----------------
1          google.com       -                  Pattern: EXAMPLE\administrator
            Replacement: nobody
2          -                10.238.2.34/32     Pattern: EXAMPLE\(.+)
            Replacement: _1
```

vserver name-mapping swap

Exchange the positions of two name mappings

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver name-mapping swap command exchanges the positions of two name mappings in the priority list.

Parameters

- **-vserver <server name>** - Vserver
  
  This parameter specifies the Vserver on which the name mappings are located.

- **-direction {krb-unix|win-unix|unix-win}** - Direction
  
  This parameter specifies the direction of the name mappings that you want to exchange. Each mapping direction (Kerberos-to-UNIX, Windows-to-UNIX, and UNIX-to-Windows) has its own priority list.

- **-position <integer>** - Position
  
  This parameter specifies the position in the priority list of the first name mapping that you want to exchange. Specify a position as a positive integer.

- **-with-position <integer>** - Position of an existing name mapping entry in the list of name mappings for this Vserver. This entry will be swapped with the entry at 'position'.
  
  This parameter specifies the position in the priority list of the second name mapping that you want to exchange. Specify a position as a positive integer.

Examples
The following example exchanges the positions of two name mappings on a Vserver named vs1. The name mappings have the direction Windows-to-UNIX. The name mappings are exchanged between positions 2 and 4.

```
cluster1::> vserver name-mapping swap -vserver vs1 -direction win-unix -position 2 -with-position 4
```

vserver peer commands

Create and manage Vserver peer relationships

The vserver peer commands enable you to create and manage Vserver peering relationships.
vserver peer accept

Accept a pending Vserver peer relationship

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The vserver peer accept command is used to accept the Vserver peer relationship between two Vservers. This command is used only for intercluster Vserver peer relationships.

Parameters
-vserver <vserver> - Vserver Name
  Specifies name of the local Vserver for which you want to accept the Vserver peer relationship.

-peer-vserver <vserver> - Peer Vserver Name
  Specifies name of the peer Vserver with which the Vserver peer relationship was initiated.

[-local-name <vserver>] - Peer Vserver Local Name
  Specifies the unique local name to identify the peer Vserver with which the Vserver peer relationship was initiated. The default value is the remote peer Vserver name.

Examples
The following example illustrates how to accept the Vserver peer relationship between Vservers pvs1.example.com residing on cluster2, and lvs1.example.com residing on cluster1.

cluster2::> vserver peer accept -vserver pvs1.example.com -peer-vserver lvs1.example.com

The following example illustrates how to accept the Vserver peer relationship between Vservers pvs1.example.com residing on cluster2, and pvs1.example.com residing on cluster1. During execution of vserver peer create command on peer cluster, peer Vserver name is locally refered by unique system generated name pvs1.example.com.1. Using vserver peer accept command specify the unique -local-name for peer Vserver.

cluster2::> vserver peer accept -vserver pvs1.example.com -peer-vserver pvs1.example.com.1 -local-name locallyUniqueName

vserver peer create

Create a new Vserver peer relationship

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The vserver peer create command creates a Vserver peer relationship between two Vservers residing on the same cluster or across two clusters. For intercluster Vserver peer relationships, the cluster administrator must accept or reject the relationship on the peer cluster.
Parameters

-vserver <vserver> - Vserver Name
   Specifies the name of the local Vserver.

-peer-vserver <vserver> - Peer Vserver Name
   Specifies the name of the peer Vserver with which you want to create the Vserver peer relationship.

[-peer-cluster <text>] - Peer Cluster Name
   Specifies the name of the peer cluster. If this is not specified, it is assumed that the peer Vserver resides on the same cluster.

-applications {snapmirror|file-copy|lun-copy},... - Peering Applications
   Specifies the applications for which the Vserver peer relationship is created.

[-local-name <vserver>] - Peer Vserver Local Name
   Specifies the unique local name to identify the peer Vserver with which you want to create the Vserver peer relationship. The default value is the remote peer Vserver name.

Examples

The following example illustrates how to create an intercluster Vserver peer relationship between Vserver lvs1.example.com, residing on cluster1, and pvs1.example.com, residing on cluster2. The relationship is created for SnapMirror.

cluster1::> vserver peer create -vserver lvs1.example.com -peer-vserver pvs1.example.com -peer-cluster cluster2 -applications snapmirror

The following example illustrates how to create an intercluster Vserver peer relationship between Vserver lvs1.example.com, residing on cluster1, and lvs1.example.com, residing on cluster2. The relationship is created for SnapMirror. The -local-name parameter is specified to create a local name used to identify the peer Vserver in cases where the name of the peer Vserver name is not uniquely referenced from local cluster.

cluster1::> vserver peer create -vserver lvs1.example.com -peer-vserver lvs1.example.com -peer-cluster cluster2 -applications snapmirror -local-name cluster2lvs1locallyUniqueName

cluster1::> vserver peer show
Peer    Peer    Peering
--------- --------- ---------------
 lvs1.example.com  lvs1.example.com  initiated  snapmirror

Here is an another example which creates an intracluster Vserver peer relationship.

cluster1::> vserver peer create -vserver lvs1.example.com -peer-vserver lvs2.example.com -applications snapmirror

Related references

vserver peer accept on page 1722
vserver peer delete

Delete a Vserver peer relationship

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**
The `vserver peer delete` command deletes the Vserver peer relationship between two Vservers.

**Parameters**
- `vserver <vserver>` - Vserver Name
  Specifies the local Vserver name for which you want to delete the Vserver peer relationship.
- `peer-vserver <vserver>` - Peer Vserver Name
  Specifies the peer Vserver name with which the Vserver peer relationship was established.
- `[force [true]]` - Force Delete
  Deletes the Vserver peer relationship even if the remote cluster is not accessible due to, for example, network connectivity issues.

**Examples**
The following example illustrates how to delete the Vserver peer relationship between two Vservers `lvs1.example.com` residing on `cluster1`, and `pvs1.example.com` residing on `cluster2`.

```
cluster1::> vserver peer delete -vserver lvs1.example.com -peer-vserver pvs1.example.com
```

**Related references**
- `vserver peer create` on page 1722

vserver peer modify

Modify a Vserver peer relationship

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**
The `vserver peer modify` command modifies applications of the Vserver peer relationship.

**Parameters**
- `vserver <vserver>` - Vserver Name
  Specifies name of the local Vserver for which you want to modify applications of the Vserver peer relationship.
- `peer-vserver <vserver>` - Peer Vserver Name
  Specifies name of the peer Vserver for which you want to modify applications of the Vserver peer relationship.
- `applications {snapmirror|file-copy|lun-copy}, ...` - Peering Applications
  Specifies the Vserver peer applications.
Examples
The following example illustrates how to modify applications that are part of the peer relationship between the Vservers lvs1.example.com residing on cluster1, and pvs1.example.com residing on cluster2.

```
cluster1::> vserver peer modify -vserver lvs1.example.com -peer-vserver pvs1.example.com -applications snapmirror
```

**vserver peer modify-local-name**
Modify the local name for a peer Vserver

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
The `vserver peer modify-local-name` command modifies the local name for a remote peer Vserver. The new local name must be unique.

**Parameters**
- `-peer-cluster <text>` - Peer Cluster
  Use this parameter to specify the peer cluster.
- `-peer-vserver <text>` - Remote Peer Vserver
  Use this parameter to specify the existing remote peer Vserver name.
- `-new-name <vserver>` - Remote Peer Vserver Local Name
  Use this parameter to specify the new local name of the peer Vserver. The new local name must conform to the same rules as a Vserver name.

```
cluster2::> vserver peer modify-local-name -peer-cluster cluster1 -peer-vserver vs51.example.com -new-name vs51_cluster1.example.com
```

**vserver peer reject**
Reject a Vserver peer relationship

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
The `vserver peer reject` command is used to reject the Vserver peer relationship between the two Vservers. This command is used only for an intercluster Vserver peer relationship.

**Parameters**
- `-vserver <vserver>` - Vserver Name
  Specifies the name of the local Vserver for which you want to reject the Vserver peer relationship.
-peer-vserver <vserver> - Peer Vserver Name

Specifies the name of the peer Vserver with which the Vserver peer relationship was initiated.

Examples

The following example illustrates how to reject the Vserver peer relationship between two Vservers `lvs1.example.com` residing on `cluster1`, and `pvs1.example.com` residing on `cluster2`.

```
cluster1::> vserver peer reject -vserver lvs1.example.com -peer-vserver pvs1.example.com
```

vserver peer repair-peer-name

Repair the peer vserver name that was not updated during the last rename operation

Availability: This command is available to `cluster` administrators at the `advanced` privilege level.

Description

Updates the peer Vserver name in remote peer clusters for the specified Vserver in the local cluster.

Parameters

- `--vserver <vserver>` - vserver
  
  Name of the Vserver in the local cluster. This name will be repaired on remote peer clusters.

Examples

The following example updates the peer-Vserver name across the peered clusters:

```
cluster1::*> vserver peer repair-peer-name --vserver vs1.example.com
Info: Command completed successfully
```

vserver peer resume

Resume a Vserver peer relationship

Availability: This command is available to `cluster` administrators at the `admin` privilege level.

Description

The `vserver peer resume` command resumes the Vserver peer relationship between two Vservers.

Parameters

- `--vserver <vserver>` - Vserver Name
  
  Specifies name of the local Vserver for which you want to resume the Vserver peer relationship.

- `--peer-vserver <vserver>` - Peer Vserver Name
  
  Specifies name of the peer Vserver with which you want to resume the Vserver peer relationship.
[-force [true]] - Force Resume

Resumes the Vserver peer relationship even if the remote cluster is not accessible due to, for example, network connectivity issues.

**Examples**
The following example illustrates resuming a Vserver peer relationship between two Vservers `lvs1.example.com` residing on `cluster1`, and `pvs1.example.com` residing on `cluster2`.

```
cluster1::> vserver peer resume -vserver lvs1.example.com -peer-vserver pvs1.example.com
```

**Related references**

*vserver peer suspend* on page 1730

**vserver peer show**

Display Vserver peer relationships

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The *vserver peer show* command displays the following information about Vserver peer relationships:

- Local Vserver name
- Peer Vserver name
- Local Vserver UUID
- Peer Vserver UUID
- Peer cluster name
- State of the peering relationship
- Applications
- Remote Vserver name

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance ]
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[-vserver <vserver>] - Local Vserver Name
```

If this parameter is specified, the command displays relationships that match the specified local Vserver.

```
[-peer-vserver <text>] - Peer Vserver Name
```

If this parameter is specified, the command displays relationships that match the specified peer Vserver.

```
[-peer-state (peered|pending|initializing|initiated|rejected|suspended|deleted)] - Peering State
```

If this parameter is specified, the command displays relationships that match the specified peer state.
[-applications snapmirror file-copy lun-copy, ...] - Peering Applications

If this parameter is specified, the command displays relationships that have the specified applications.

[-peer-cluster <text>] - Peer Cluster Name

If this parameter is specified, the command displays relationships that have the specified peer cluster name.

[-peer-vserver-uuid <UUID>] - Peer Vserver UUID (privilege: advanced)

If this parameter is specified, the command displays relationships that match the specified peer Vserver UUID.

[-vserver-uuid <UUID>] - Local Vserver UUID (privilege: advanced)

If this parameter is specified, the command displays relationships that match the specified local Vserver UUID.

[-remote-vserver-name <text>] - Remote Vserver Name

If this parameter is specified, the command displays relationships that match the specified remote Vserver.

### Examples

The following examples illustrate how to display Vserver peer relationships.

**Cluster administrator:**

```
cluster1::> vserver peer show
Peer        Peer                           Peering        Remote
Vserver     Vserver     State        Peer Cluster      Applications   Vserver
----------- ----------- ------------ ----------------- -------------- ---------
lvs1.example.com  lvs2.example.com  peered       cluster1          snapmirror   lvs2.example.com
lvs1.example.com  pvs1.example.com  peered       cluster2          snapmirror   pvs1.example.com
lvs2.example.com  lvs1.example.com  peered       cluster1          snapmirror   lvs1.example.com
lvs3.example.com  pvs1_cluster3.example.com  peered       cluster3          snapmirror   pvs1.example.com
lvs1.example.com  lvs1_cluster4.example.com  peered       cluster4          snapmirror
5 entries were displayed.
```

**Vserver administrator:**

```
vs11.example.com::> vserver peer show
Peer        Peer         Peering               Remote
Vserver     Vserver     State        Applications          Vserver
----------- ----------- ------------ --------------------- ----------
vs11.example.com  pvs21.example.com  peered       snapmirror            pvs21.example.com
vs11.example.com  vs12.example.com  peered       file-copy, snapmirror vs12.example.com
2 entries were displayed.
```

* vserver peer show-all on page 1729
vserver peer show-all

(DEPRECATED)-Display Vserver peer relationships in detail

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The vserver peer show-all command displays the following information about Vserver peer relationships:

- Local Vserver name
- Peer Vserver name
- Local Vserver UUID
- Peer Vserver UUID
- Peer cluster name
- Applications
- State of the peering relationship
- Remote Vserver name

Parameters

[-fields <fieldname>, ...]  
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance]  
If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver>] - Local Vserver Name
If this parameter is specified, the command displays relationships that match the specified local Vserver.

[-peer-vserver <text>] - Peer Vserver Name
If this parameter is specified, the command displays relationships that match the specified peer Vserver.

[-vserver-uuid <UUID>] - Local Vserver UUID (privilege: advanced)
If this parameter is specified, the command displays relationships that match the specified local Vserver UUID.

[-peer-vserver-uuid <UUID>] - Peer Vserver UUID (privilege: advanced)
If this parameter is specified, the command displays relationships that match the specified peer Vserver UUID.

[-peer-state {peered|pending|initializing|initiated|rejected|suspended|deleted}] - Peering State
If this parameter is specified, the command displays relationships that match the specified peer state.

[-applications {snapmirror|file-copy|lun-copy}, ...] - Peering Applications
If this parameter is specified, the command displays relationships that have the specified applications.

[-peer-cluster <text>] - Peer Cluster Name
If this parameter is specified, the command displays relationships that have the specified peer cluster name.

[-remote-vserver-name <text>] - Remote Vserver Name
If this parameter is specified, the command displays relationships that match the specified remote Vserver.
The following example illustrates how to display Vserver peer relationships.

```
cluster1::> vserver peer show-all

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Peer</th>
<th>Peering</th>
<th>Remote Vserver</th>
</tr>
</thead>
<tbody>
<tr>
<td>lvs1.example.com</td>
<td>lvs2.example.com</td>
<td>peered</td>
<td>snapmirror lvs2.example.com</td>
</tr>
<tr>
<td>lvs1.example.com</td>
<td>pvs1.example.com</td>
<td></td>
<td>snapmirror pvs1.example.com</td>
</tr>
<tr>
<td>lvs2.example.com</td>
<td>lvs1.example.com</td>
<td>peered</td>
<td>snapmirror lvs1.example.com</td>
</tr>
<tr>
<td>lvs3.example.com</td>
<td>pvs1_cluster3.example.com</td>
<td></td>
<td>snapmirror pvs1.example.com</td>
</tr>
<tr>
<td>lvs1.example.com</td>
<td>lvs1_cluster4.example.com</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

5 entries were displayed.
```

**vserver peer suspend**

Suspend a Vserver peer relationship

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**

The `vserver peer suspend` command suspends the Vserver peer relationship between two Vservers.

**Parameters**

- `-vserver <vserver>` - Vserver Name
  Specifies name of the local Vserver for which you want to suspend the Vserver peer relationship.

- `-peer-vserver <vserver>` - Peer Vserver Name
  Specifies name of the peer Vserver for which you want to suspend the Vserver peer relationship.

- `[-force [true]]` - Force Suspend
  Suspends the Vserver peer relationship even if the remote cluster is not accessible due to, for example, network connectivity issues.

**Examples**

The following example illustrates how to suspend the Vserver peer relationship between two Vservers `lvs1.example.com` residing on `cluster1`, and `pvs1.example.com` residing on `cluster2`.

```
cluster1::> vserver peer suspend -vserver lvs1.example.com -peer-vserver pvs1.example.com
```
vserver peer transition commands

Create and manage transition peer relationships.

The *vserver peer transition* commands enables you to create and manage transition peer relationships.

**vserver peer transition create**

Create a new transition peer relationship between a 7-Mode system and a Vserver.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The *vserver peer transition create* command creates a transition peer relationship between a 7-Mode system and a Vserver.

**Parameters**

- `-local-vserver <vserver name>` - Local Vserver name
  Specifies the name of the local Vserver.

- `-src-filer-name <text>` - Source 7-Mode system
  Specifies the name of the source 7-Mode system (hostname or IP address).

- `[-multi-path-address <text>]` - Additional address for source 7-Mode system
  Additional address (hostname or IP address) for the source 7-Mode system.

- `[-local-lifs <lif-name>, ...]` - List of Local LIFs
  List of LIFs to be used for this peering relationship. The LIF role can be data or node-mgmt or intercluster or cluster-mgmt.

**Examples**

The following example illustrates how to create a transition peer relationship between Vserver *vsl.example.com*, residing on *Cluster1*, and a 7-Mode system *src1.example.com*. We can also specify an additional multipath address *src1-e0d.example.com*, for load balancing and list of local LIFs *lif1, lif2* to be used.

```
Cluster1::> vserver peer transition create -vserver vsl.example.com -src-filer-name src1.example.com -multi-path-address src1-e0d.example.com
-llocal-lifs lif1, lif2
```

vserver peer transition delete

Delete a transition peer relationship.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.
Description

The `vserver peer transition delete` command deletes the transition peer relationship.

Parameters

- `--local-vserver <vserver name>` - Local Vserver name
  Specifies the name of the local Vserver.

- `--src-filer-name <text>` - Source 7-Mode system
  Specifies the name of the source 7-Mode system (hostname or IP address).

Examples

The following example illustrates how to delete the transition peer relationship between a Vserver `lvs1.example.com` residing on `cluster1`, and source 7-Mode system `src1.example.com`.

```
cluster1::> vserver peer transition delete --vserver lvs1.example.com --src-filer-name src1.example.com
```

`vserver peer transition modify`

Modify a transition peer relationship.

Availability: This command is available to `cluster` administrators at the `admin` privilege level.

Description

The `vserver peer transition modify` command is used to modify the multipath address or local LIFs of the transition peer relationship.

Parameters

- `--local-vserver <vserver name>` - Local Vserver name
  Specifies the name of the local Vserver.

- `--src-filer-name <text>` - Source 7-Mode system
  Specifies the name of the source 7-Mode system (hostname or IP address).

[-`--multi-path-address <text>`] - Additional address for source 7-Mode system
  Additional address (hostname or IP address) for the source 7-Mode system.

[-`--local-lifs <lif-name>`, ...] - List of Local LIFs
  List of LIFs to be used for this peering relationship. The LIF role can be data or node-mgmt or intercluster or cluster-mgmt.

Examples

The following example illustrates how to modify a transition peer relationship’s multipath address.

```
cluster1::> vserver peer transition modify --vserver vs1.example.com --src-filer-name src1.example.com --multi-path-address src1-e0b.example.com
```

The following example illustrates how to modify the local LIFs of a transition peer relationship.

vserver peer transition show

Display transition peer relationships.

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver peer transition show command displays the following information about transition peer transition relationships:

• Local Vserver name
• Source 7-Mode system
• Multi-path address
• Local LIFs

Parameters

{ [-fields <fieldname>, ...]  
 If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[ -instance ]  
 If you specify the -instance parameter, the command displays detailed information about all fields.

[ -local-vserver <vserver name> ] - Local Vserver name  
 If this parameter is specified, the command displays transition peer information about the specified local Vserver.

[ -src-filer-name <text> ] - Source 7-Mode system  
 If this parameter is specified, the command displays transition peer information about the specified source 7-Mode system.

[ -multi-path-address <text> ] - Additional address for source 7-Mode system  
 If this parameter is specified, the command displays information about the specified multipath-address.

[ -local-lifs <lif-name>, ... ] - List of Local LIFs  
 If this parameter is specified, the command displays information about the specified local LIFs.
Examples

```
cluster1::> vserver peer transition show
  Vserver  Source Filer  Multi Path Address    Local LIFs
  -------  ------------  -----------------     ----------------
 vs1.example.com                              lif1, lif2
 src1.example.com
 src1-e0b.example.com
```

**vserver san commands**

Manage SAN Vservers

Commands used for managing the SAN in-memory cache configuration of a Vserver.

**vserver san prepare-to-downgrade**

Restore the SAN Configurations to Earlier Release of Data ONTAP Version.

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

This command initiates the procedure to restore the configuration to Earlier Release of Data ONTAP Version.

As part of this command, capability for making SAN LIF offline if placed on the DR auxiliary partner as part of LIF placement in Metrocluster environment will be disabled.

**Parameters**

- `-feature-set <ClusterVersion>` - Disable the capability introduced in the Data ONTAP Version

  Specifies the DATA ONTAP Cluster Version from revert to.

**Examples**

```
cluster1::> vserver san prepare-to-downgrade -feature-set 8.3.1
```

**vserver security commands**

Manage ontap security

**vserver security file-directory commands**

Manage file security
vserver security file-directory apply

Apply security descriptors on files and directories defined in a policy to a Vserver

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver security file-directory apply command applies security settings to files and directories defined in a security policy of a Vserver.

Applying a security policy to a Vserver is the last step to creating and applying NTFS ACLs to files or folders. A security policy contains definitions for the security configuration of a file (or folder) or set of files (or, folders). The policy is a container for tasks. A task associates a file/folder path name to the security descriptor that needs to be set on the file/folder. Every task in a policy is uniquely identified by the file/folder path. A policy cannot have duplicate task entries. There can be only one task per path.

The steps to creating and applying NTFS ACLs are the following:

• Create an NTFS security descriptor.
• Add DACLs and SACLs to the NTFS security descriptor.
  Note: If you want to audit file and directory events, you must configure auditing on the Vserver in addition to adding the SACL to the security descriptor.
• Create a file/directory security policy. This step associates the policy with a Vserver.
• Create policy tasks.
  A policy task refers to a single operation to apply to a file (or folder) or to a set of files (or folders). Amongst other things, the task defines which security descriptor to apply to a path.
• Apply a policy to the associated Vserver.

The vserver security file-directory apply command is not supported for Vservers with Infinite Volume.

Parameters
-vserver <vserver name> - Vserver
  Specifies the Vserver that contains the path to which the security policy is applied.

-policy-name <Security policy name> - Policy Name
  Specifies the security policy to apply.

Examples
The following example applies a security policy named “p1” to Vserver vs0.

    cluster1::> vserver security file-directory apply -vserver vs0 -policy-name p1

vserver security file-directory remove-slag

Removes Storage-Level Access Guard

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.
**Description**

The `vserver security file-directory remove-slag` command removes Storage-Level Access Guard (SLAG) security from the specified volume or qtree path.

The `vserver security file-directory remove-slag` command is not supported for Vservers with Infinite Volume.

**Parameters**

- `vserver <vserver>` - Vserver
  
  Specifies the name of the Vserver that is associated with the volume or qtree path from where you want to remove SLAG.

- `path <text>` - Path
  
  Specifies the volume or qtree mounted junction path from which you want to remove SLAG security.

**Examples**

The following example removes SLAG security from the volume path "/vol1" on Vserver vs1.

```
cluster1::>vserver security file-directory show -vserver vs1 -path /vol1
Vserver: vs1
  File Path: /vol1
  Security Style: mixed
  Effective Style: unix
  DOS Attributes: 10
  DOS Attributes in Text: ----D---
  Expanded Dos Attributes: -
  Unix User Id: 0
  Unix Group Id: 0
  Unix Mode Bits: 755
  Unix Mode Bits in Text: rwxr-xr-x
  ACLs: Storage-Level Access Guard

Security
  (Applies to Directories):
    ALLOW-CIFS1\Administrator-0x1200a9
  DACL (Applies to Files):
    ALLOW-CIFS1\Administrator-0x1200a9
```

```
cluster1::>vserver security file-directory remove-slag -path /vol1 -vserver vs1
```

```
cluster1::>vserver security file-directory show -vserver vs1 -path /vol1
Vserver: vs1
  File Path: /vol1
  Security Style: mixed
  Effective Style: unix
  DOS Attributes: 10
  DOS Attributes in Text: ----D---
  Expanded Dos Attributes: -
  Unix User Id: 0
  Unix Group Id: 0
  Unix Mode Bits: 755
  Unix Mode Bits in Text: rwxr-xr-x
  ACLs: -
```

The following example removes SLAG security from the qtree path "/vol1/q1" on Vserver vs1.

```
cluster1::>vserver security file-directory show -vserver vs1 -path /vol1/q1
Vserver: vs1
  File Path: /vol1/q1
  Security Style: mixed
  Effective Style: unix
  DOS Attributes: 10
  DOS Attributes in Text: ----D---
  Expanded Dos Attributes: -
  Unix User Id: 0
  Unix Group Id: 0
```

```
cluster1::>vserver security file-directory remove-slag -path /vol1/q1 -vserver vs1
```

```
cluster1::>vserver security file-directory show -vserver vs1 -path /vol1/q1
Vserver: vs1
  File Path: /vol1/q1
  Security Style: mixed
  Effective Style: unix
  DOS Attributes: 10
  DOS Attributes in Text: ----D---
  Expanded Dos Attributes: -
  Unix User Id: 0
  Unix Group Id: 0
```
vserver security file-directory show

Display file/folder security information

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver file-directory show command displays file/folder security information. The command output depends on the parameter or parameters specified with the command.

The -vserver and -path parameters are required for this command. If you do not specify any of the optional parameters, the command displays all security information in list format for the specified path.

You can specify the -fields parameter to specify which fields of information to display about files and folders security.

You can specify the -instance parameter to display all the security information in list format.

Parameters

{ [-fields <fieldname>, ...] 
  If you specify the -fields <fieldname>, ... parameter, the command only displays the fields that you specify.

  [-instance] 
  If you specify the -instance parameter, the command displays detailed information about all entries.

-vserver <vserver> - Vserver

Use this required parameter to specify the Vserver that contains the path to the file or folder specified with the required -path parameter.

{ [-path <text>] - File Path

Use this field to specify the path of the file or folder for which you want to display security information. If the volume name is not specified in the path, the path is relative to the Vserver root volume. If the path’s last subcomponent has a wildcard (“*”), the output will display information for all files and directories below the parent path.

  Note: If you want to display information of a file or directory which contains wildcard (“*”) as its last sub-component, then provide the complete path inside "<path>".
For instance, vsserver security file-directory show -vserver vs1 -path "/vol1/*" will show ACL information for the directory named ":*", only.

<table>
<thead>
<tr>
<th>[-inode &lt;integer&gt;]</th>
<th>File Inode Number</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use this field to specify the inode number of the file or folder for which you want to display security information. If the volume name is not specified, inode is searched in the Vserver root volume.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>[-volume-name &lt;volume name&gt;]</th>
<th>Volume Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>If you specify this parameter, the command displays information about file and directory security only for files and directories where the specified path is relative to the specified volume. If this parameter is not specified, the Vserver root volume is taken as default.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>[-share-name &lt;Share&gt;]</th>
<th>Share Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>If you specify this parameter, the command displays information about file and directory security only for files and directories contained where the specified path is relative to the root of the specified share. If this parameter is not specified, the Vserver root volume is taken as default.</td>
<td></td>
</tr>
</tbody>
</table>

| [-lookup-names {true|false}] | SID to Name Lookups |
|-----------------------------|---------------------|
| If you specify this parameter, the command displays information about file and directory security for files and directories where the information about owner and group are stored as names. If set to false, the command displays information about file and directory security for files and directories where the information for owner and group are stored as SIDs. |

| [-expand-mask {true|false}] | Expand Bit Masks |
|-----------------------------|------------------|
| If you specify this parameter, the command displays information about file and directory security for files and directories where the hexadecimal bit mask entries are in expanded bit form. If set to false, the command displays information about file and directory security for files and directories where the hexadecimal bit mask entries are in collapsed form. |

| [-sddl {true|false}] | Display ACLs in SDDL Format |
|----------------------|----------------------------|
| If you specify this parameter, the command displays the ACL information for files and directories in Security Descriptor Definition Language (SDDL) format. If the file has effective-style as "unix" then this flag has no effect. |

<table>
<thead>
<tr>
<th>[-security-style &lt;security style&gt;]</th>
<th>Security Style</th>
</tr>
</thead>
<tbody>
<tr>
<td>If you specify this parameter, the command displays information about file and directory security only for files and directories with paths in volumes of the specified security style.</td>

<th>Expanded Dos Attributes</th>
</tr>
</thead>
<tbody>
<tr>
<td>If you specify this parameter, the command displays information about file and directory security only for files and directories with the specified extended DOS attributes. This parameter is useful only for files or directories where the -expand-mask is set to true.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>[-user-id &lt;user name&gt;]</th>
<th>UNIX User Id</th>
</tr>
</thead>
<tbody>
<tr>
<td>If you specify this parameter, the command displays information about file and directory security only for files and directories with the specified UNIX user ID.</td>
<td></td>
</tr>
</tbody>
</table>
[-group-id <group name>] - UNIX Group Id

If you specify this parameter, the command displays information about file and directory security only for files and directories with the specified UNIX group ID.

[-mode-bits <Octal Permission>] - UNIX Mode Bits

If you specify this parameter, the command displays information about file and directory security only for files and directories with the specified UNIX mode bits in Octal form.

[-text-mode-bits <text>] - UNIX Mode Bits in Text

If you specify this parameter, the command displays information about file and directory security only for files and directories with the specified UNIX mode bits in text form.

[-acls <Security acl>, ...] - ACLs

If you specify this parameter, the command displays information about file and directory security only for files and directories with the specified ACLs. If the specified path is a volume or qtree path and Storage-Level Access Guard (SLAG) is configured on the volume or qtree, this parameter displays the SLAG information. It also displays the Dynamic Access Control (DAC) policies if DAC is configured for the given file or directory path. The following ACL information can be entered:

- Type of ACL - NTFS or NFSV4
- Control bits in the security descriptors
- Owner - only in case of NTFS security descriptors
- Group - only in case of NTFS security descriptors
- Access Control Entries - discretionary access control list (DACL) and system access control list (SACL) access control entries (ACEs) in the ACL

Examples

The following example displays the security information about the path "/vol4" in Vserver vs1.

```
cluster1::> vserver security file-directory show -vserver vs1 -path /vol4
(vserver security file-directory show)

Vserver: vs1
File Path: /vol4
File Inode Number: 64
Security Style: ntfs
Effective Style: ntfs
DOS Attributes: 10
DOS Attributes in Text: ----D---
Expanded Dos Attributes: -
Unix User Id: 0
Unix Group Id: 0

vserver security file-directory ntfs commands

Manage NTFS security descriptors

vserver security file-directory ntfs create

Create an NTFS security descriptor

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver security file-directory ntfs create command creates an NTFS security descriptor to which you can add access control entries (ACEs) to the discretionary access control list (DACL) and the system access control list (SACL).

Creating an NTFS security descriptor is the first step in configuring and applying NTFS access control lists (ACLs) to files and folders residing within a namespace. Later, you will associate the security descriptor to a policy task.

You can create NTFS security descriptors for files and folders residing within FlexVol volumes with NTFS security-style or on NTFS security descriptors on mixed security-style volumes.

The steps to creating and applying NTFS ACLs are the following:

• Create an NTFS security descriptor.

• Add DACLs and SACLs to the NTFS security descriptor.

  Note: If you want to audit file and directory events, you must configure auditing on the Vserver in addition to adding a SACL to the security descriptor.

• Create a file/directory security policy.
  This step associates the policy with a Vserver.

• Create a policy task.
  A policy task refers to a single operation to apply to a file (or folder) or to a set of files (or folders). Amongst other things, the task defines which security descriptor to apply to a path.
- Apply a policy to the associated Vserver.

The `vserver security file-directory ntfs create` command is not supported for Vservers with Infinite Volume.

**Parameters**

`-vserver <vserver name> - Vserver`

Specifies the name of the Vserver on which to create the security descriptor.

`-ntfs-sd <ntfs sd name> - NTFS Security Descriptor Name`

Specifies the name of the security descriptor you want to create. After you create a security descriptor, you can add SACL and DACL access control entries (ACEs) to it.

**Note:** Every newly created security descriptor contains the 4 default DACL ACEs as mentioned below:

<table>
<thead>
<tr>
<th>Vserver: vserver1</th>
</tr>
</thead>
<tbody>
<tr>
<td>NTFS Security Descriptor Name: sd1</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>To</th>
<th>Account Name</th>
<th>Access</th>
<th>Access Rights</th>
</tr>
</thead>
<tbody>
<tr>
<td>folder, sub-folders, files</td>
<td>BUILTIN\Administrators</td>
<td>allow full-control</td>
<td>this-</td>
</tr>
<tr>
<td>folder, sub-folders, files</td>
<td>BUILTIN\Users</td>
<td>allow full-control</td>
<td>this-</td>
</tr>
<tr>
<td>folder, sub-folders, files</td>
<td>CREATOR OWNER</td>
<td>allow full-control</td>
<td>this-</td>
</tr>
<tr>
<td>folder, sub-folders, files</td>
<td>NT AUTHORITY\SYSTEM</td>
<td>allow full-control</td>
<td>this-</td>
</tr>
</tbody>
</table>

**[-owner <name or sid>] - Owner**

Specifies the owner of the security descriptor. You can specify the owner using either a user name or SID.

The owner of the security descriptor can modify the permissions on the file (or folder) or files (or folders) to which the security descriptor is applied and can give other users the right to take ownership of the object or objects to which the security descriptor is applied. You can use any of the following formats when specifying the value for this parameter:

- SID
- Domain\user-name
- user-name@Domain
- user-name@FQDN

**Note:** If you specify any of the three user name formats for the value of `-owner`, keep in mind that the value for the user name is case insensitive. The value for the user name is ignored for Storage-Level Access Guard (SLAG).

**[-group <name or sid>] - Primary Group (privilege: advanced)**

Specifies the owner group of the security descriptor. You can specify the owner group using either a group name or SID. You can use any of the following formats when specifying the value for this parameter:

- SID
- Domain\user-name
• user-name@Domain
• user-name@FQDN

**Note:** If you specify any of the three user name formats for the value of `-group`, keep in mind that the value for the user name is case insensitive. The value for the user name is ignored for SLAG.

`[-control-flags-raw <Hex Integer>]` - Raw Control Flags (privilege: advanced)

Specifies the control flags in the security descriptor.

**Note:** The value for the control flag is ignored for SLAG.

### Examples

Every newly created security descriptor contains the 4 default DACL ACEs as mentioned below:

<table>
<thead>
<tr>
<th>Vserver: vserv1</th>
<th>NTFS Security Descriptor Name: sdl</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Account Name</td>
</tr>
<tr>
<td>files</td>
<td>BUILTIN\Administrators</td>
</tr>
<tr>
<td>files</td>
<td>BUILTIN\Users</td>
</tr>
<tr>
<td>files</td>
<td>CREATOR OWNER</td>
</tr>
<tr>
<td>files</td>
<td>NT AUTHORITY\SYSTEM</td>
</tr>
</tbody>
</table>

The following example creates an NTFS security descriptor named “sd1” on Vserver “vs1” and assigns “DOMAIN\Administrator” as the security descriptor owner.

```shell
vserver security file-directory ntfs delete
```

Delete an NTFS security descriptor

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `vserver security file-directory ntfs delete` command deletes an NTFS security descriptor. Deleting a security descriptor also deletes all the contained DACL and SACL access control entries (ACEs).

The `vserver security file-directory ntfs delete` command is not supported for Vservers with Infinite Volume.

**Parameters**

- `-vserver <vserver name>` - Vserver

  Specifies the name of the Vserver that is associated with the security descriptor that you want to delete.
-ntfs-sd <ntfs sd name> - NTFS Security Descriptor Name

Specifies the name of the security descriptor to delete.

**Examples**
The following example deletes an NTFS security descriptor named "sd1" on Vserver vs1.

```
cluster1::> vserver security file-directory ntfs delete -ntfs-sd sd1 -vserver vs1
```

**vserver security file-directory ntfs modify**

Modify an NTFS security descriptor

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver security file-directory ntfs modify` command modifies an NTFS security descriptor. You can change the `-owner`, `-group` and `-control-flags-raw` of the security descriptor with this command.

The `vserver security file-directory ntfs modify` command is not supported for Vservers with Infinite Volume.

**Parameters**

- **-vserver <vserver name>** - Vserver
  
  Specifies the name of the Vserver associated with the security descriptor that you want to modify.

- **-ntfs-sd <ntfs sd name>** - NTFS Security Descriptor Name
  
  Specifies the name of the security descriptor that you want to modify.

- **[-owner <name or sid>]** - Owner
  
  Specifies the owner of the security descriptor. You can specify the owner using either the user name or SID.
  
  The owner of the security descriptor can modify the permissions on the file (or folder) or files (or folders) to which the security descriptor is applied and can give other users the right to take ownership of the object or objects to which the security descriptor is applied. You can use any of the following formats when specifying the value for this parameter:

  - SID
  - Domain\user-name
  - user-name@Domain
  - user-name@FQDN

  **Note:** If you specify any of the three user name formats for the value of `-owner`, keep in mind that the value for the user name is case insensitive. The value for the user name is ignored for Storage-Level Access Guard (SLAG).

- **[-group <name or sid>]** - Primary Group (privilege: advanced)
  
  Specifies the owner group of the security descriptor. You can specify the owner group using either a group name or SID. You can use any of the following formats when specifying the value for this parameter:

  - SID
  - Domain\user-name
  - user-name@Domain
- user-name@FQDN

**Note:** If you specify any of the three user name formats for the value of `-group`, keep in mind that the value for the user name is case insensitive. The value for the user name is ignored for SLAG.

---

**[-control-flags-raw <Hex Integer>] - Raw Control Flags (privilege: advanced)**

Specifies the control flags in the security descriptor to be modified.

**Note:** The value for the control flag is ignored for SLAG.

---

**Examples**

The following example modifies the owner of an NTFS security descriptor named "sd2" on Vserver vs1.

```
cluster1::> vserver security file-directory ntfs modify -ntfs-sd sd2 -vserver vs1 -owner domain\administrator
```

```
cluster1::> vserver security file-directory ntfs show -vserver vs1 -ntfs-sd sd2
Vserver: vs1
Security Descriptor Name: sd2
Owner of the Security Descriptor: DOMAIN\Administrator
```

---

**vserver security file-directory ntfs show**

Display an NTFS security descriptors

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**

The `vserver file-directory ntfs show` command displays information about the security descriptor. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays all information about all security descriptors defined on the cluster.

You can specify the `-fields` parameter to specify which fields of information to display about security descriptors.

You can specify the `-instance` parameter to display all the information about security descriptors in list format.

The `vserver security file-directory ntfs show` command is not supported for Vservers with Infinite Volume.

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command only displays the fields that you specify.

```
[-instance]
```

If you specify the `-instance` parameter, the command displays detailed information about all entries.

```
[-vserver <vserver name>] - Vserver
```

If you specify this parameter, the command displays information only about the security descriptors associated with the Vserver that you specify.

```
[-ntfs-sd <ntfs sd name>] - NTFS Security Descriptor Name
```

If you specify this parameter, the command displays information only about the security descriptors that you specify.

```
[-owner <name or sid>] - Owner
```

If you specify this parameter, the command displays information only about the security descriptors owned by the specified user name or SID.
[\textbf{-group <name or sid>}] - Primary Group (privilege: advanced)

If you specify this parameter, the command displays information only about the security descriptors associated with the owner group.

[\textbf{-control-flags-raw <Hex Integer>}] - Raw Control Flags (privilege: advanced)

If you specify this parameter, the command displays information only about the security descriptors associated with the control flags.

\begin{quote}
\textbf{Examples}

The following example displays information about an NTFS security descriptor named “sd2” on Vserver vs1.

\begin{verbatim}
cluster1::> vserver security file-directory ntfs show -vserver vs1 -ntfs-sd sd2
Vserver: vs1
Security Descriptor Name: sd2
Owner of the Security Descriptor: DOMAIN\Administrator
\end{verbatim}
\end{quote}

\textbf{vserver security file-directory ntfs dacl commands}

Manage NTFS file security DACLs

\textit{vserver security file-directory ntfs dacl add}

Add a DACL entry to NTFS security descriptor

\textbf{Availability:} This command is available to \textit{cluster} and Vserver administrators at the \textit{admin} privilege level.

\textbf{Description}

The \textit{vserver security file-directory ntfs dacl add} command adds access control entries (ACEs) into a security descriptor’s discretionary access control list (DACL).

If the security descriptor contains a DACL that has existing ACEs, the command adds the new ACE to the DACL. If the security descriptor does not contain a DACL, the command creates the DACL and adds the new ACE to it.

Adding a DACL entry to the security descriptor is the second step in configuring and applying ACLs to a file or folder. Before you can add a DACL entry to a security descriptor, you must first create the security descriptor.

The steps to creating and applying NTFS ACLs are the following:

- Create an NTFS security descriptor.
- Add DACLs and SACLs to the NTFS security descriptor.
  \textbf{Note:} If you want to audit file and directory events, you must configure auditing on the Vserver in addition to adding the SACL to the security descriptor.
- Create a file/directory security policy. This step associates the policy with a Vserver.
- Create policy tasks. A policy task refers to a single operation to apply to a file (or folder) or to a set of files (or folders). Amongst other things, the task defines which security descriptor to apply to a path.
- Apply a policy to the associated Vserver.

The \textit{vserver security file-directory ntfs dacl add} command is not supported for Vservers with Infinite Volume.
Parameters

-vserver <vserver name> - Vserver

Specifies the name of the Vserver associated with the security descriptor to which you want to add a discretionary access control entry (discretionary ACE).

-ntfs-sd <ntfs sd name> - NTFS Security Descriptor Name

Specifies the name of the security descriptor to which you want to add a discretionary access control entry.

-access-type {deny|allow} - Allow or Deny

Specifies whether the discretionary access control entry is an allow or deny type of access control.

-account <name or sid> - Account Name or SID

Specifies the account on which to apply the discretionary access control entry. You can specify the account by using a user name or SID. You can use any of the following formats when specifying the value for this parameter:

• SID

• Domain\user-name

• user-name@Domain

• user-name@FQDN

Note: If you specify any of the three user name formats for the value of -account, keep in mind that the value for the user name is case insensitive.

[-rights {no-access|full-control|modify|read-and-execute|read|write}] - DACL ACE's Access Rights

Specifies the right that you want to add for the account specified in the -account parameter. The -rights parameter is mutually exclusive with the -advanced-rights and -rights-raw parameter. If you specify the -rights parameter, you can only specify one value.

You can specify one of the following rights values:

• no-access

• full-control

• modify

• read-and-execute

• read

• write

[-advanced-rights <Advanced access right>,...] - DACL ACE's Advanced Access Rights

Specifies the advanced rights that you want to add for the account specified in the -account parameter. The -advanced-rights parameter is mutually exclusive with the -rights and -rights-raw parameter. You can specify more than one advanced-rights value by using a comma-delimited list.

You can specify one or more of the following advanced rights:

• read-data

• write-data

• append-data

• read-ea
-write-ea
-execute-file
-delete-child
-read-attr
-write-attr
-delete
-read-perm
-write-perm
-write-owner
-full-control

[-rights-raw <Hex Integer>] - DACL ACE’s Raw Access Rights (privilege: advanced)

Specifies the raw rights that you want to add for the account specified in the -account parameter. The
rights-raw parameter is mutually exclusive with the -advanced-rights and -rights parameter. Specify
the value as a hexadecimal integer, for example: 0xA10F or 0xb3ff etc.

[-apply-to {this-folder|sub-folders|files}, ...] - Apply DACL Entry

Specifies where to apply the discretionary access control entry. You can specify more than one value by using
a comma-delimited list.

You can specify one or more of the following values:

- this-folder
- sub-folder
- files

Note: Select one of the following combinations of values for the -apply-to parameter for Storage-Level
Access Guard (SLAG):

- this-folder, sub-folder, files
- this-folder, sub-folder
- files

If you specify an invalid -apply-to value, this security descriptor is removed from the associated Storage-
Level Access Guard (SLAG) security file-directory policy task.

Examples

The following example adds a DACL entry to the security descriptor named “sd1” on Vserver "vs1" for the "DOMAIN
\Administrator“ account.

```
cluster1::> vserver security file-directory ntfs dacl add -ntfs-sd sd1 -access-type deny -account DOMAIN\Administrator -rights full-control -apply-to this-folder -vserver vs1
cluster1::> vserver security file-directory ntfs dacl show -vserver vs1 -ntfs-sd sd1 -access-type deny -account domain\Administrator
Vserver: vs1
Security Descriptor Name: sd1
  Allow or Deny: deny
```
vserver security file-directory ntfs dacl modify

Modify an NTFS security descriptor DACL entry

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver security file-directory ntfs dacl modify command modifies parameters in an existing discretionary access control (DACL) entry.

You can unambiguously define which DACL entry to modify by specifying the following four parameters in the modify command:

- Vserver associated with the security descriptor that contains the DACL entry
- Name of the security descriptor that contains the DACL entry
- Whether the DACL is an allow or deny type of DACL entry
- The account name or SID to which the DACL is applied

You can modify the following parameters:
- -right,-advanced-rights,-rights-raw
- -apply-to

The vserver security file-directory ntfs dacl modify command is not supported for Vservers with Infinite Volume.

Parameters

-vserver <vserver name> - Vserver
   Specifies the name of the Vserver associated with the security descriptor containing the discretionary access control entry whose parameters you want to modify.

-ntfs-sd <ntfs sd name> - NTFS Security Descriptor Name
   Specifies the name of the security descriptor that contains the discretionary access control entry that you want to modify.

-access-type {deny|allow} - Allow or Deny
   Specifies whether the discretionary access control entry that you want to modify is an allow or deny type of access control.

-account <name or sid> - Account Name or SID
   Specifies the account associated with the discretionary access control entry you want to modify. You can specify the account by using a user name or SID. You can use any of the following formats when specifying the value for this parameter:
   - SID
   - Domain\user-name
   - user-name@Domain
• user-name@FQDN

**Note:** If you specify any of the three user name formats for the value of -account, keep in mind that the value for the user name is case insensitive.

```
[-rights {no-access|full-control|modify|read-and-execute|read|write}] - Access Rights
```

Specifies the right that you want to add for the account specified in the -account parameter. The -rights parameter is mutually exclusive with the -advanced-rights and -rights-raw parameter. If you specify the -rights parameter, you can only specify one value.

You can specify one of the following rights values:

- no-access
- full-control
- modify
- read-and-execute
- read
- write

```
[-rights-raw <Hex Integer>] - Raw Access Rights (privilege: advanced)
```

Specifies the raw rights that you want to add for the account specified in the -account parameter. The -rights-raw parameter is mutually exclusive with the -advanced-rights and -rights parameter. Specify the value as a hexadecimal integer, for example: 0xA10F or 0xB3ff etc.

```
[-advanced-rights <Advanced access right>, ...]] - Advanced Access Rights
```

Specifies the advanced rights that you want to add for the account specified in the -account parameter. The -advanced-rights parameter is mutually exclusive with the -rights and -rights-raw parameter. You can specify more than one advanced-rights value by using a comma-delimited list.

You can specify one or more of the following advanced rights:

- read-data
- write-data
- append-data
- read-ea
- write-ea
- execute-file
- delete-child
- read-attr
- write-attr
- delete
- read-perm
- write-perm
- write-owner
- full-control
[-apply-to \{this-folder|sub-folders|files\},...] - Apply DACL Entry

Specifies where to apply the discretionary access control entry. You can specify more than one value by using a comma-delimited list.

You can specify one or more of the following values:

- this-folder
- sub-folder
- files

**Note:** Select one of the following combinations of values for the -apply-to parameter for Storage-Level Access Guard (SLAG):

- this-folder, sub-folder, files
- this-folder, sub-folder
- files

If you specify an invalid -apply-to value, this security descriptor is removed from the associated Storage-Level Access Guard (SLAG) security file-directory policy task.

---

**Examples**

The following example modifies the -right and -apply-to parameters in the DACL entry associated to the security descriptor named “sd2” on Vserver vs1 for the ”BUILTIN\Administrators” account.

```bash
cluster1::> vserver security file-directory ntfs dacl modify -ntfs-sd sd2 -access-type allow -account BUILTIN\Administrators -vserver vs1 -rights modify -apply-to this-folder,sub-folders
cluster1::> vserver security file-directory ntfs dacl show -vserver vs1 -ntfs-sd sd2 -account BUILTIN\Administrators -instance

Vserver: vs1
Security Descriptor Name: sd2
Allow or Deny: allow
Account Name or SID: BUILTIN\Administrators
Access Rights: modify
Advanced Access Rights: -
  Apply To: this-folder, sub-folders
  Access Rights: modify
```

---

**vserver security file-directory ntfs dacl remove**

Remove a DACL entry from NTFS security descriptor.

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The `vserver security file-directory ntfs dacl remove` command removes a discretionary access control entry from a security descriptor.

You can unambiguously define which DACL entry to remove by specifying the following four parameters in the command:

- Vserver associated with the security descriptor that contains the DACL entry
- Name of the security descriptor that contains the DACL entry
- Whether the DACL is an allow or deny type of DACL entry
• The account name or SID to which the DACL is applied

The `vserver security file-directory ntfs dacl remove` command is not supported for Vservers with Infinite Volume.

**Parameters**

- `vserver <vserver name> - Vserver`
  
  Specifies the name of the Vserver associated with the security descriptor from which you want to remove a discretionary access control entry.

- `ntfs-sd <ntfs sd name> - NTFS Security Descriptor Name`
  
  Specifies the name of the security descriptor that contains the discretionary access control entry that you want to remove.

- `access-type {deny|allow} - Allow or Deny`
  
  Specifies whether the discretionary access control entry you want to remove is an allow or deny of access control.

- `account <name or sid> - Account Name or SID`
  
  Specifies the account name or SID associated with the discretionary access control entry that you want to remove.

**Examples**

The following example removes a DACL entry from the security descriptor named “sd2” with “allow” access type for the “BUILTIN\Administrators” account on Vserver vs1.

```
cluster1::> vserver security file-directory ntfs dacl remove -ntfs-sd sd2 -access-type allow -account BUILTIN\Administrators -vserver vs1
```

**vserver security file-directory ntfs dacl show**

Display NTFS security descriptor DACL entries

**Availability:** This command is available to `cluster` and Vserver administrators at the `admin` privilege level.

**Description**

The `vserver security file-directory ntfs dacl show` command displays information about all the discretionary access control entries in the Vserver. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all DACL entries:

- Vserver name
- Security descriptor
- List of DACL entries

You can specify the `-fields` parameter to specify which fields of information to display about DACL entries.

You can specify the `-instance` parameter to display all information about DACL entries in a list format.

The `vserver security file-directory ntfs dacl show` command is not supported for Vservers with Infinite Volume.

**Parameters**

{ `-fields <fieldname>, ...` }

If you specify the `-fields <fieldname>, ...` parameter, the command only displays the fields that you specify.
If you specify the -instance parameter, the command displays detailed information about all entries.

-\texttt{-vserver <vserver name>\textit{-} Vserver}
  
  If you specify this parameter, the command displays information only about discretionary access control entries associated with the specified Vserver.

-\texttt{-ntfs\_sd <ntfs\_sd name>\textit{-} NTFS Security Descriptor Name}
  
  If you specify this parameter, the command displays information only about the discretionary access control entries for the security descriptor that you specify.

-\texttt{-access\_type \{deny|allow\}\textit{-} Allow or Deny}
  
  If you specify this parameter, the command displays information only about the discretionary access control entries with the access type that you specify.

-\texttt{-account <name or sid>\textit{-} Account Name or SID}
  
  If you specify this parameter, the command displays information only about the discretionary access control entries associated with the account name or SID that you specify. You can use any of the following formats when specifying the value for this parameter:

  - SID
  - Domain\user-name
  - user-name@Domain
  - user-name@FQDN

  \textbf{Note:} If you specify any of the three user name formats for the value of -account, keep in mind that the value for the user name is case insensitive.

-\texttt{-rights \{no\_access|full\_control|modify|read\_and\_execute|read|write\}\textit{-} Access Rights}
  
  If you specify this parameter, the command displays information only about the discretionary access control entries with the user right that you specify. Only one value can be specified.

  You can specify one of the following rights values:

  - no-access
  - full-control
  - modify
  - read-and-execute
  - read
  - write

-\texttt{-rights\_raw \textit{Hex Integer}}\textit{- Raw Access Rights (privilege: advanced)}
  
  If you specify this parameter, the command displays information only about the discretionary access control entries with the advanced user rights that you specify. This value for this parameter is mutually exclusive with any other rights values. Specify the value as a hexadecimal integer, for example: 0xA10F or 0xb3ff etc.

-\texttt{-advanced\_rights \textit{Advanced access right}, \ldots}\textit{- Advanced Access Rights}
  
  If you specify this parameter, the command displays information only about the discretionary access control entries with the advanced user rights that you specify. You can specify more than one value by using a comma-delimited list.

  You can specify one or more of the following advanced rights:

  - read-data
- `write-data`
- `append-data`
- `read-ea`
- `write-ea`
- `execute-file`
- `delete-child`
- `read-attr`
- `write-attr`
- `delete`
- `read-perm`
- `write-perm`
- `write-owner`
- `full-control`

`[-apply-to {this-folder|sub-folders|files}, ...]` - Apply DACL Entry

If you specify this parameter, the command displays information only about the discretionary access control entries with the `applied-to` value or values that you specify. You can specify more than one value by using a comma-delimited list.

You can specify one or more of the following values:

- `this-folder`
- `sub-folder`
- `files`

`[-readable-access-rights <TextNoCase>]` - Access Rights

If you specify this parameter, the command displays information only the discretionary access control entries with the readable access rights that you specify.

### Examples

The following example shows information about a DACL entry.

```bash
cluster1:/> vservice security file-directory ntfs acl show
Vserver: vs1
NTFS Security Descriptor Name: sd2

<table>
<thead>
<tr>
<th>Account Name</th>
<th>Access Type</th>
<th>Access Rights</th>
<th>Apply To</th>
</tr>
</thead>
<tbody>
<tr>
<td>BUILTIN\Users</td>
<td>allow</td>
<td>full-control</td>
<td>this-folder, sub-folders, files</td>
</tr>
<tr>
<td>CREATOR OWNER</td>
<td>allow</td>
<td>full-control</td>
<td>this-folder, sub-folders, files</td>
</tr>
<tr>
<td>NT AUTHORITY\SYSTEM</td>
<td>allow</td>
<td>full-control</td>
<td>this-folder, sub-folders, files</td>
</tr>
</tbody>
</table>

3 entries were displayed.
```
**vserver security file-directory ntfs sacl commands**

Manage NTFS file security SACLs

**vserver security file-directory ntfs sacl add**

Add a SACL entry to NTFS security descriptor

**Availability:** This command is available to cluster and Vserver administrators at the `admin` privilege level.

**Description**

The `vserver security file-directory ntfs sacl add` command adds system access control list entries (ACEs) into a security descriptor’s system access control list (SACL).

If the security descriptor contains a SACL that has existing security ACEs, the command adds the new security ACE to the SACL. If the security descriptor does not contain a SACL, the command creates the SACL and adds the new security ACE to it.

Adding a SACL entry to the security descriptor is the second step in configuring and applying security ACLs to a file or folder. Before you can add a SACL entry to a security descriptor, you must first create the security descriptor.

The steps to creating and applying NTFS ACLs are the following:

- Create an NTFS security descriptor.
- Add DACL and SACL entries to the NTFS security descriptor.
  
  **Note:** If you want to audit file and directory events, you must configure auditing on the Vserver in addition to adding the SACL to the security descriptor.

- Create a file/directory security policy.
  
  This step associates the policy with a Vserver.

- Create policy tasks.
  
  A policy task refers to a single operation to apply to a file (or folder) or to a set of files (or folders). Amongst other things, the task defines which security descriptor to apply to a path.

- Apply a policy to the associated Vserver.

The `vserver security file-directory ntfs sacl add` command is not supported for Vservers with Infinite Volume.

**Parameters**

- `-vserver <vserver name>` - **Vserver**
  
  Specifies the name of the Vserver associated with the security descriptor to which you want to add a system access control list entry.

- `-ntfs-sd <ntfs sd name>` - **NTFS Security Descriptor Name**
  
  Specifies the name of the security descriptor to which you want to add a system access control list entry.

- `-access-type {failure|success}` - **Success or Failure**
  
  Specifies whether the system access control list entry that you want to add is a `failure` or `success` access audit type.

- `-account <name or sid>` - **Account Name or SID**
  
  Specifies the account on which to apply the system access control list entry. You can specify the account by using a user name or SID. You can use any of the following formats when specifying the value for this parameter:

  - SID
  - Domain\user-name
- **user-name@Domain**
- **user-name@FQDN**

**Note:** If you specify any of the three user name formats for the value of `-account`, keep in mind that the value for the user name is case insensitive.

docline

```
[-rights (no-access|full-control|modify|read-and-execute|read|write)] · Access Rights
```

Specifies the right that you want to add for the account specified in the `-account` parameter. The `-rights` parameter is mutually exclusive with the `-advanced-rights` and `-rights-raw` parameter. If you specify the `-rights` parameter, you can only specify one value.

You can specify one of the following rights values:
- no-access
- full-control
- modify
- read-and-execute
- read
- write

```
[-advanced-rights <Advanced access right>,...] · Advanced Access Rights
```

Specifies the advanced rights that you want to add for the account specified in the `-account` parameter. The `-advanced-rights` parameter is mutually exclusive with the `-rights` and `-rights-raw` parameter. You can specify more than one advanced-rights value by using a comma-delimited list.

You can specify one or more of the following advanced rights:
- read-data
- write-data
- append-data
- read-ea
- write-ea
- execute-file
- delete-child
- read-attr
- write-attr
- delete
- read-perm
- write-perm
- write-owner
- full-control
| [-rights-raw <Hex Integer>] - Raw Access Rights (privilege: advanced) |
|-----------------------------|-----------------------------|
| Specifies the raw rights that you want to add for the account specified in the -account parameter. The -rights-raw parameter is mutually exclusive with the -advanced-rights and -rights parameter. Specify the value as a hexadecimal integer, for example: 0xA10F or 0xb3ff etc. |

[-apply-to (this-folder|sub-folders|files),...] - Apply SACL To

Specifies where to apply the system access control list entry. You can specify more than one value by using a comma-delimited list.

You can specify one or more of the following values:

- this-folder
- sub-folder
- files

**Note:** Select one of the following combinations of values for the -apply-to parameter for Storage-Level Access Guard (SLAG):

- this-folder, sub-folder, files
- this-folder, sub-folder
- files

If you specify an invalid -apply-to value, this security descriptor is removed from the associated Storage-Level Access Guard (SLAG) security file-directory policy task.

### Examples

The following example adds a SACL entry to the security descriptor named “sd1” on Vserver vs1.

```
cluster1::> vserver security file-directory ntfs sacl add -ntfs-sd sd1 -access-type failure -account DOMAIN\Administrator -rights full-control -apply-to this-folder -vserver vs1
```

```
cluster1::> vserver security file-directory ntfs sacl show -vserver vs1 -ntfs-sd sd1 -access-type deny -account DOMAIN\Administrator
```

| Vserver: vs1 |
| Security Descriptor Name: sd1 |
| Access type for Specified Access Rights: failure |
| Account Name or SID: DOMAIN\Administrator |
| Access Rights: full-control |
| Advanced Access Rights: - |
| Apply To: this-folder |
| Access Rights: full-control |

### vserver security file-directory ntfs sacl modify

Modify an NTFS security descriptor SACL entry

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The vserver security file-directory ntfs sacl modify command modifies parameters in an existing system access control list entry.

You can unambiguously define which SACL entry to modify by specifying the following four parameters in the modify command:
You can modify the following parameters:

- -rights,-advanced-rights,-rights-raw
- -apply-to

The `vserver security file-directory ntfs sacl modify` command is not supported for Vservers with Infinite Volume.

**Parameters**

- **vserver <vserver name>** - Vserver
  Specifies the name of the Vserver associated with the security descriptor containing the system access control list entry whose fields you want to modify.

- **ntfs-sd <ntfs sd name>** - NTFS Security Descriptor Name
  Specifies the name of the security descriptor that contains the system access control list entry that you want to modify.

- **access-type {failure|success}** - Success or Failure
  Specifies whether the system access control list entry that you want to modify is a failure or success access audit type.

- **account <name or sid>** - Account Name or SID
  Specifies the account on which to apply the system access control list entry. You can specify the account by using a user name or SID. You can use any of the following formats when specifying the value for this parameter:
  - SID
  - Domain\user-name
  - user-name@Domain
  - user-name@FQDN
  
  **Note:** If you specify any of the three user name formats for the value of `-account`, keep in mind that the value for the user name is case insensitive.

- **[-rights {no-access|full-control|modify|read-and-execute|read|write}]** - Access Rights
  Specifies the right that you want to add for the account specified in the `-account` parameter. The `-rights` parameter is mutually exclusive with the `-advanced-rights` and `-rights-raw` parameter. If you specify the `-rights` parameter, you can only specify one value.
  
  You can specify one of the following rights values:
  - no-access
  - full-control
  - modify
  - read-and-execute
  - read
• write

<table>
<thead>
<tr>
<th>[-rights-raw &lt;Hex Integer&gt;] - Raw Access Rights (privilege: advanced)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the raw rights that you want to add for the account specified in the -account parameter. The -rights-raw parameter is mutually exclusive with the -advanced-rights and -rights parameter. Specify the value as a hexadecimal integer, for example: 0xA10F or 0xb3ff etc.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>[-advanced-rights &lt;Advanced access right&gt;, ...] - Advanced Access Rights</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the advanced rights that you want to add for the account specified in the -account parameter. The -advanced-rights parameter is mutually exclusive with the -rights and -rights-raw parameter. You can specify more than one advanced-rights value by using a comma-delimited list.</td>
</tr>
<tr>
<td>You can specify one or more of the following advanced rights:</td>
</tr>
<tr>
<td>• read-data</td>
</tr>
<tr>
<td>• write-data</td>
</tr>
<tr>
<td>• append-data</td>
</tr>
<tr>
<td>• read-ea</td>
</tr>
<tr>
<td>• write-ea</td>
</tr>
<tr>
<td>• execute-file</td>
</tr>
<tr>
<td>• delete-child</td>
</tr>
<tr>
<td>• read-attr</td>
</tr>
<tr>
<td>• write-attr</td>
</tr>
<tr>
<td>• delete</td>
</tr>
<tr>
<td>• read-perm</td>
</tr>
<tr>
<td>• write-perm</td>
</tr>
<tr>
<td>• write-owner</td>
</tr>
<tr>
<td>• full-control</td>
</tr>
</tbody>
</table>

| [-apply-to {this-folder|sub-folders|files}, ...] - Apply SACL To |
| --- |
| Specifies where to apply the system access control list entry. You can specify more than one value by using a comma-delimited list. |
| You can specify one or more of the following values: |
| • this-folder |
| • sub-folder |
| • files |

**Note:** Select one of the following combinations of values for the -apply-to parameter for Storage-Level Access Guard (SLAG):
| • this-folder, sub-folder, files |
| • this-folder, sub-folder |
| • files |
If you specify an invalid `-apply-to` value, this security descriptor is removed from the associated Storage-Level Access Guard (SLAG) security file-directory policy task.

### Examples

The following example modifies the rights and -apply-to fields in the SACL entry.

```bash
cluster1::> vserver security file-directory ntfs sacl modify -ntfs-sd sd2 -access-type success -account BUILTIN\Administrators -vserver vs1 -rights modify -apply-to this-folder, sub-folders

cluster1::> vserver security file-directory ntfs sacl show -vserver vs1 -ntfs-sd sd2 -account BUILTIN\Administrators -instance

Vserver: vs1
Security Descriptor Name: sd2
Access type for Specified Access Rights: success
   Account Name or SID: BUILTIN\Administrators
   Access Rights: modify
   Advanced Access Rights: -
   Apply To: this-folder, sub-folders
   Access Rights: modify
```

### vserver security file-directory ntfs sacl remove

Remove a SACL entry from NTFS security descriptor

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**

The `vserver security file-directory ntfs sacl remove` command removes a system access control list entry from a security descriptor.

You can unambiguously define which SACL entry to remove by specifying the following four parameters in the command:

- Vserver associated with the security descriptor that contains the SACL entry
- Name of the security descriptor that contains the system access control list entry
- Whether the SACL is a success or failure type of SACL entry
- The account name or SID to which the SACL is applied

The `vserver security file-directory ntfs sacl remove` command is not supported for Vservers with Infinite Volume.

**Parameters**

- `-vserver <vserver name>` - Vserver
  
  Specifies the name of the Vserver associated with the security descriptor from which you want to remove the system access control list entry.

- `-ntfs-sd <ntfs sd name>` - NTFS Security Descriptor Name
  
  Specifies the name of the security descriptor that contains the system access control list entry that you want to remove.

- `-access-type {failure|success}` - Success or Failure
  
  Specifies whether the system access control list entry that you want to remove is a `failure` or `success` access audit type.
-account <name or sid> - Account Name or SID
  Specifies the account name or SID associated with the system access control list entry that you want to remove.

**Examples**

The following example removes a SACL entry named “sd2” on Vserver vs1 with an access type of “success” associated with the “BUILTIN\Administrators” account.

```
cluster1::> vserver security file-directory ntfs sacl remove -ntfs-sd sd2 -access-type success -account BUILTIN\Administrators -vserver vs1
```

**vserver security file-directory ntfs sacl show**

Display NTFS security descriptor SACL entries

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The vserver security file-directory ntfs sacl show command displays information about all the system access control list entries in the Vserver. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all SACL entries:

- Vserver name
- Security descriptor
- List of SACL entries

You can specify the -fields parameter to specify which fields of information to display about SACL entries.

You can specify the -instance parameter to display all information about SACL entries in a list format.

The vserver security file-directory ntfs sacl show command is not supported for Vservers with Infinite Volume.

**Parameters**

```
{ [-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command only displays the fields that you specify.
  |
  [ -instance ]
  If you specify the -instance parameter, the command displays detailed information about all entries.
  |
  [-vserver <vserver name>] - Vserver
  If you specify this parameter, the command displays information only about system access control list entries associated with the specified Vserver.
  |
  [-ntfs-sd <ntfs sd name>] - NTFS Security Descriptor Name
  If you specify this parameter, the command displays information only about the system access control list entries for the security descriptor that you specify.
  |
  [-access-type {failure|success}] - Success or Failure
  If you specify this parameter, the command displays information only about the system access control list entries with the access type that you specify.
```

vserver security commands
[-account <name or sid>] - Account Name or SID
If you specify this parameter, the command displays information only about the system access control list entries associated with the account name or SID that you specify. You can use any of the following formats when specifying the value for this parameter:

- SID
- Domain\user-name
- user-name@Domain
- user-name@FQDN

Note: If you specify any of the three user name formats for the value of -account, keep in mind that the value for the user name is case insensitive.

[-rights {no-access|full-control|modify|read-and-execute|read|write}] - Access Rights
If you specify this parameter, the command displays information only about the system access control list entries with the user right that you specify. The value for this parameter is mutually exclusive with any other rights values. Only one value can be specified.

You can specify one of the following rights values:

- no-access
- full-control
- modify
- read-and-execute
- read
- write

[-rights-raw <Hex Integer>] - Raw Access Rights (privilege: advanced)
If you specify this parameter, the command displays information only about the system access control list entries with the advanced user rights that you specify. This value for this parameter is mutually exclusive with any other rights values. Specify the value as a hexadecimal integer, for example: 0xA10F or 0xb3ff etc.

[-advanced-rights <Advanced access right>,...] - Advanced Access Rights
If you specify this parameter, the command displays information only about the system access control list entries with the advanced user rights that you specify. You can specify more than one value by using a comma-delimited list.

You can specify one or more of the following advanced rights values:

- read-data
- write-data
- append-data
- read-ea
- write-ea
- execute-file
- delete-child
- read-attr
• write-attr
• delete
• read-perm
• write-perm
• write-owner
• full-control

[-apply-to {this-folder|sub-folders|files}, ...] - Apply SACL To
If you specify this parameter, the command displays information only about the system access control list entries with the -applied-to value or values that you specify. You can specify more than one value by using a comma-delimited list.

You can specify one or more of the following values:
• this-folder
• sub-folder
• files

[-readable-access-rights <TextNoCase>] - Access Rights
If you specify this parameter, the command displays information only about the system access control list entries with the readable access rights that you specify.

Examples
The following example shows a SACL entry.

```
class/1::> vserver security file-directory sacl show
    (vserver security file-directory ntfs sacl show)
Vserver: vs1
    NTFS Security Descriptor Name: sdi
    Account Name     Access   Access             Apply To
    ----------------- -------  -------            -----------
    domain\user      success  full-control      this-folder, sub-folders, files
```

vserver security file-directory policy commands
Manage file security policies

vserver security file-directory policy create
Create a file security policy

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver security file-directory policy create command creates a security policy for a Vserver. A policy acts as a container for various tasks where each task is a single entry that can be applied to a file/folder.

Creating a security policy is the third step in configuring and applying security ACLs to a file or folder. You will later add tasks to the security policy.
You cannot modify a security policy. If you want to apply a policy with the same settings to a different Vserver, you must create a new policy with the same configuration and apply it to the desired Vserver.

The steps to creating and applying NTFS ACLs are the following:

- Create an NTFS security descriptor.
- Add DACLS and SACLS to the NTFS security descriptor.
  
  **Note:** If you want to audit file and directory events, you must configure auditing on the Vserver in addition to adding SACLS to the security descriptor.
- Create a file/directory security policy. This step associates the policy with a Vserver.
- Create policy tasks.
  A policy task refers to a single operation to apply to a file (or folder) or to a set of files (or folders). Amongst other things, the task defines which security descriptor to apply to a path.
- Apply a policy to the associated Vserver.

The `vserver security file-directory policy create` command is not supported for Vservers with Infinite Volume.

### Parameters

- `vserver <vserver name>` - Vserver
  
  Specifies the name of the Vserver on which to create the security policy.

- `policy-name <Security policy name>` - Policy Name
  
  Specifies the name of the security policy.

### Examples

The following example creates a security policy named “policy1” on Vserver vs1.

```
cluster1::> vserver security file-directory policy create -policy-name policy1 -vserver vs1
cluster1::> vserver security file-directory policy show
Vserver          Policy Name
----------------- --------------
vs1              policy1
```

### vserver security file-directory policy delete

Delete a file security policy

**Availability:** This command is available to cluster and Vserver administrators at the `admin` privilege level.

**Description**

The `vserver security file-directory policy delete` command deletes a security policy from a Vserver.

The `vserver security file-directory policy delete` command is not supported for Vservers with Infinite Volume.

**Note:** Deleting a policy fails if a job is currently running for the specified policy.

### Parameters

- `vserver <vserver name>` - Vserver
  
  Specifies the name of the Vserver associated with the security policy that you want to delete.
-policy-name `<Security policy name>` - Policy Name

Specifies the name of the security policy you want to delete.

### Examples
The following example deletes a security policy named “policy1” from Vserver vs1.

```
cluster1::> vserver security file-directory policy delete -policy-name policy1 -vserver vs1
```

### vserver security file-directory policy show

Display file security policies

**Availability:** This command is available to `cluster` and Vserver administrators at the `admin` privilege level.

**Description**

The `vserver security file-directory policy show` command displays information about all security policies in the Vserver. The command output depends on the parameter or parameters specified with the command.

You can specify the `-fields` parameter to specify which fields of information to display about security policies.

You can specify the `-instance` parameter to display information for all security policies in a list format.

The `vserver security file-directory policy show` command is not supported for Vservers with Infinite Volume.

**Parameters**

```
{ [-fields <fieldname>,...] } 
| [-instance ] |
([-vserver <vserver name>]) - Vserver

If you specify this parameter, the command displays information only about security policies associated with the specified Vserver.

([-policy-name <Security policy name>]) - Policy Name

If you specify this parameter, the command displays information only about the security policy you specify.
```

### Examples
The following example displays information about the security policies on the cluster.

```
cluster1::> vserver security file-directory policy show
Vserver     Policy Name
----------     ----------
vs1           policy1
vs1           policy2
2 entries were displayed.
```

### vserver security file-directory policy task commands

Manage file security policy tasks
**vserver security file-directory policy task add**

Add a policy task

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `vserver security file-directory policy task add` command adds a single task entry to a security policy. A task refers to a single operation that can be done by a security policy to a file/folder.

Before you create a security policy task, you must first create a security policy and a security descriptor. You should also add DACL entries and SACL entries (if desired) to the security descriptor before you create the security policy task.

**Note:** You can add DACL and SACL entries to the security descriptor after you have associated it to a security policy task.

Creating a policy task is the fourth step in configuring and applying ACLs to a file or folder. When you create the policy task, you associate a security descriptor to it. You also associate the task to a security policy.

The steps to creating and applying NTFS ACLs are the following:

- Create an NTFS security descriptor.
- Add DACLS and SACLS to the NTFS security descriptor.
  
  **Note:** If you want to audit file and directory events, you must configure auditing on the Vserver in addition to adding SACLS to the Security Descriptor.

- Create a file/directory security policy.
  This step associates the policy with a Vserver.

- Create policy tasks.
  A policy task refers to a single operation to apply to a file (or folder) or to a set of files (or folders). Amongst other things, the task defines which security descriptor to apply to a path.
  
  **Note:** Adding a policy task fails if a job is currently running for the specified policy to which a task is being added.

- Apply a policy to the associated Vserver.

The `vserver security file-directory policy task add` command is not supported for Vservers with Infinite Volume.

**Parameters**

- `-vserver <vserver name>` - **Vserver**
  
  Specifies the Vserver associated with the security policy to which you want to add a task.

- `-policy-name <Security policy name>` - **Policy Name**
  
  Specifies the name of the security policy into which you want to add the task.

- `-path <text>` - **Path**
  
  Specifies the path of the file/folder on which to apply the security descriptor associated with this task.

- `[-index-num <integer>]` - **Position**
  
  Specifies the index number of a task. Tasks are applied in order. A task with a larger index value is applied after a task with a lower index number. If you do not specify this optional parameter, new tasks are applied to the end of the index list.

  The range of supported values is 1 through 9999. If there is a gap between the highest existing index number and the value entered for this parameter, the task with this number is considered to be the last task in the policy and is treated as having an index number of the previous highest index plus one.
Note: If you specify an index number that is already assigned to an existing task, index number will be auto arranged to highest index number in the table.

[-security-type {ntfs|nfsv4}] - Security Type of the File

Specifies whether the security descriptor associated with this task is an NTFS or a NFSv4 security descriptor type. If you do not specify a value for this optional parameter, the default is “ntfs”.

Note: The nfsv4 security descriptor type is not supported in this release. If you specify this optional parameter, you must enter ntfs for the -security-type value.

[-ntfs-mode {propagate|ignore|replace}] - Propagation Mode

Specifies how to propagate security settings to child subfolders and files. This setting determines how child files and/or folders contained within a parent folder inherit access control and audit information from the parent folder.

You can specify one of the three parameter values that correspond to three types of propagation modes:

• propagate - propagate inheritable permissions to all subfolders and files
• replace - replace existing permissions on all subfolders and files with inheritable permissions
• ignore - do not allow permissions on this file or folder to be replaced

Note: The ntfs-mode value is ignored for Storage-Level Access Guard (SLAG).

[-ntfs-sd <ntfs sd name>, ...] - NTFS Security Descriptor Name

Specifies the list of security descriptor names to apply to the path specified in the -path parameter.

[-access-control {file-directory|slag}] - Access Control Level

Specifies the access control of the task to be applied. Its value can be file-directory or slag, respectively. When its value is slag, the specified security descriptors with the task are applied for the volume or qtree. Otherwise, the security descriptors are applied on files and directories at the specified path. The default value is file-directory.

Examples

The following example adds a security policy task entry to the policy named “policy1” on Vserver vs1.

```
cluster1::> vserver security file-directory policy task add -vserver vs1 -policy-name policy1 -path / -access-control slag -security-type ntfs -ntfs-mode propagate -ntfs-sd sd -index-num 1
cluster1::> vserver security file-directory policy task add -vserver vs1 -policy-name policy2 -path /1 -security-type ntfs -ntfs-mode propagate -ntfs-sd sd1,sd2
cluster1::> vserver security file-directory policy task show

Vserver: vs1
Policy: policy1

<table>
<thead>
<tr>
<th>Index</th>
<th>File/Folder Path</th>

</table>
```
vserver security file-directory policy task modify

Modify policy tasks

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver security file-directory policy task modify command modifies a task entry in a security policy.

Note: Modifying a policy task fails if a job is currently running for the specified policy in which a task is being modified.

You can unambiguously define which task to modify by specifying the following three parameters in the modify command:

• Vserver associated with the task
• Name of the security policy that contains the task
• Name of the path to which the task is applied

You can modify the following parameters:

• -ntfs-mode
• -ntfs-sd
• -index-num

Note: The only security type supported in this Data ONTAP release is "ntfs"; therefore, you cannot modify the -security-type parameter.

The vserver security file-directory policy task modify command is not supported for Vservers with Infinite Volume.

Parameters
-vserver <vserver name> - Vserver
Specifies the Vserver associated with the security policy that contains the task you want to modify.

-policy-name <Security policy name> - Policy Name
Specifies the name of the security policy that contains the task you want to modify.

-path <text> - Path
Specifies the path of the file/folder associated with the task that you want to modify.

[-index-num <integer>] - Position
Specifies the index number of a task. Tasks are applied in order. A task with a larger index value is applied after a task with a lower index number. If you do not specify this optional parameter, new tasks are applied to the end of the index list.

The range of supported values is 1 through 9999. If there is a gap between the highest existing index number and the value entered for this parameter, the task with this number is considered to be the last task in the policy and is treated as having an index number of the previous highest index plus one.

Note: If you specify an index number that is already assigned to an existing task, the command fails when you attempt to create a duplicate entry.

[-security-type {ntfs|nfsv4}] - Security Type
Specifies whether the security descriptor in the task that you want to modify should be an NTFS security descriptor type or an NFSv4 security descriptor type. Default value is ntfs.

Note: The nfsv4 security descriptor type is not supported in this release. If you specify this optional parameter, you must enter ntfs for the -security-type value.
[\texttt{-ntfs-mode \{propagate\|ignore\|replace\}}] - NTFS Propagation Mode

Specifies how to propagate security settings to child subfolders and files. This setting determines how child files and/or folders contained within a parent folder inherit access control and audit information from the parent folder.

You can specify one of the three parameter values that correspond to three types of propagation modes:

- propagate - propagate inheritable permissions to all subfolders and files
- replace - replace existing permissions on all subfolders and files with inheritable permissions
- ignore - do not allow permissions on this file or folder to be replaced

[\texttt{-ntfs-sd <ntfs sd name>, ...}] - NTFS Security Descriptor Name

Specifies the list of security descriptor names to apply to the path specified in the \texttt{-path} parameter.

\textit{vserver security file-directory policy task remove}

Remove a policy task

\textbf{Availability}: This command is available to \textit{cluster} and \textit{Vserver} administrators at the \textit{admin} privilege level.

\textbf{Description}

The \textit{vserver security file-directory policy task remove} command removes a task entry from a security policy.

The \textit{vserver security file-directory policy task remove} command is not supported for Vservers with Infinite Volume.

\textbf{Note}: Removing a policy task fails if a job is currently running for the specified policy from which a task is being removed.

\textbf{Parameters}

- \texttt{\textbf{\textit{-vserver <vserver name>}} - Vserver}

  Specifies the Vserver associated with the security policy that contains the task you want to remove.

- \texttt{\textbf{\textit{-policy-name <Security policy name>}} - Policy Name}

  Specifies the name of the security policy that contains the task you want to remove.

- \texttt{\textbf{\textit{-path <text>}} - Path}

  Specifies the path of the file/folder associated with the task that you want to remove.
Examples
The following example removes a security policy task entry.

```bash
cluster1::> vserver security file-directory policy task remove -vserver vs1 -policy-name policy1 -path /
```

`vserver security file-directory policy task show`

Display policy tasks

 Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

 Description
The `vserver security file-directory policy task show` command displays information about all the task entries in the Vserver. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all task entries:

- Vserver name
- Policy name
- Task entries

The `vserver security file-directory policy task show` command is not supported for Vservers with Infinite Volume.

 Parameters

```bash
{-fields <fieldname>,...}  
If you specify the -fields <fieldname>, ... parameter, the command only displays the fields that you specify.
```

```bash
{-instance}
If you specify the -instance parameter, the command displays detailed information about all entries.
```

```bash
{-vserver <vserver name>} - Vserver
If you specify this parameter, the command displays information only tasks associated with the specified Vserver.
```

```bash
{-policy-name <Security policy name>} - Policy Name
If you specify this parameter, the command displays information only about tasks associated with the specified security policy.
```

```bash
{-index-num <integer>} - Position
If you specify this parameter, the command displays information only about tasks assigned the index number that you specify.
```

```bash
{-path <text>} - Path
If you specify this parameter, the command displays information only about tasks applied to the specified path.
```

```bash
{-security-type {ntfs| nfsv4}} - Security Type
If you specify this parameter, the command displays information only about tasks associated with the specified security type.
```

 Note: The nfsv4 security descriptor type is not supported in this release.
[-ntfs-mode \{propagate|ignore|replace\}] - NTFS Propagation Mode
If you specify this parameter, the command displays information only about tasks configured with the NTFS propagation mode that you specify.

[-ntfs-sd <ntfs sd name>, ...] - NTFS Security Descriptor Name
If you specify this parameter, the command displays information only about the policy tasks associated with the NTFS security descriptor that you specify.

[-access-control \{file-directory|slag\}] - Access Control Level
If you specify this parameter, the command displays information only about tasks associated to the access control.

Examples
The following example displays policy task entries for a policy named “policy1” on Vserver vs1.

```
cluster1::> vserver security file-directory policy task show -vserver vs1 -policy-name policy1
Vserver: vs1
Policy: policy1
Index  File/Folder  Access           Security  NTFS       NTFS Security
Path         Control          Type      Mode       Descriptor Name
-----  -----------  ---------------  --------  ---------- ---------------
1      /1           file-directory   ntfs      propagate  sd1, sd2
2      /2           file-directory   ntfs      ignore     -
2 entries were displayed.
```

vserver security file-directory job commands
Manage file security jobs

vserver security file-directory job show
Display a list of file security jobs

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver security file-directory job show command displays information about security file-directory jobs.

To display detailed information about a specific job, run the command with the -id parameter.

You can specify additional parameters to select information that matches the values you specify for those parameters. For example, to display information only about security file-directory jobs running on a specific node, run the command with the -node parameter.

Parameters
[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

[-inprogress ]
Displays the job ID, the job name, the owning Vserver, and the progress of the security file-directory job.
| [-jobstate] | Displays information about each job's state, including the queue state, whether the job was restarted and when the job has completely timed out. |
| [-sched] | Displays the job ID, the job name, the owning Vserver, and the schedule on which the security file-directory job runs. |
| [-times] | Displays the job ID, the job name, the owning Vserver, the time when the job was last queued, the time when the job was last started, and the time when the job most recently ended. |
| [-type] | Displays the job ID, the job name, the job type, and the job category. |
| [-jobuuid] (privilege: advanced) | Displays the job ID, the job name, the owning Vserver, and the job UUID. |
| [-instance}] | If you specify the -instance parameter, the command displays detailed information about all fields. |

[-id <integer>] - Job ID
Selects the jobs that match the ID or range of IDs that you specify.

[-vserver <vserver name>] - Owning Vserver
Selects jobs that are owned by the specified Vserver.

[-name <text>] - Name
Selects the jobs that match this parameter value.

[-description <text>] - Description
Selects the jobs that match this parameter value.

[-priority {Low|Medium|High|Exclusive}] - Priority
Selects the jobs that match this parameter value.

[-node <nodename>] - Node
Selects the jobs that match this parameter value.

[-affinity {Cluster|Node}] - Affinity
Selects the jobs that match this parameter value.

[-schedule <job_schedule>] - Schedule
Selects the jobs that match this parameter value.

[-queuetime <MM/DD HH:MM:SS>] - Queue Time
Selects the jobs that match this parameter value.

[-starttime <MM/DD HH:MM:SS>] - Start Time
Selects the jobs that match this parameter value.

[-endtime <MM/DD HH:MM:SS>] - End Time
Selects the jobs that match this parameter value.

[-dropdeadttime <MM/DD HH:MM:SS>] - Drop-dead Time
Selects the jobs that match this parameter value.

[-restarted {true|false}] - Restarted?
Selects the jobs that match this parameter value.
[-state (Initial|Queued|Running|Pausing|Paused|Quitting|Success|Failure|Reschedule|Error|Quit|Dead|Unknown|Restart|Dormant)] - State

Selects the jobs that match this parameter value.

[-code <integer>] - Status Code

Selects the jobs that match this parameter value.

[-completion <text>] - Completion String

Selects the jobs that match this parameter value.

[-jobtype <text>] - Job Type

Selects the jobs that match this parameter value.

[-category <text>] - Job Category

Selects the jobs that match this parameter value.

[-uuid <UUID>] - UUID

Selects the jobs that match this parameter value.

[-progress <text>] - Execution Progress

Selects the jobs that match this parameter value.

[-username <text>] - User Name

Selects the jobs that match this parameter value.

[-process <text>] - Process

Selects jobs with the specified process number.

Examples
The following example displays information about the file-directory security job.

```
cluster1::> vserver security file-directory apply -policy-name pol -vserver vs1
cluster1::> vserver security file-directory job show

<table>
<thead>
<tr>
<th>Job ID</th>
<th>Name</th>
<th>Vserver</th>
<th>Node</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>25</td>
<td>FSecurity Apply</td>
<td>vsim2.3</td>
<td>vsim2.3-01</td>
<td>Success</td>
</tr>
</tbody>
</table>

Description: File Directory Security Apply Job
```

vserver security trace commands
Manage security tracing

vserver security trace trace-result commands
Trace results can be seen here.

vserver security trace trace-result delete
Delete security trace results

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
Delete the specified security tracing event record.
The `vserver security trace trace-result delete` command is not supported for Vservers with Infinite Volume.

**Parameters**

- `-node {<nodename>|local}` - **Node**
  This specifies the cluster node on which the permission tracing event that you want to delete occurred.

- `-vserver <vserver name>` - **Vserver**
  This specifies the Vserver on which the permission tracing event that you want to delete occurred.

- `-seqnum <integer>` - **Sequence Number**
  This specifies the sequence number of the log entry to be deleted.

**Examples**

The following example deletes the security trace result record for the Vserver `vserver_1` on node `Node_1` whose sequence number is 999.

```
cluster1::> vserver security trace trace-result delete -vserver vserver_1 -node Node_1 -seqnum 999
```

**vserver security trace trace-result show**

Display security trace results

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**

The `vserver security trace trace-result show` command displays the list of security trace event records stored on the cluster. These records are generated in response to security trace filters that are created using the `vserver security trace filter create` command. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all the security trace events generated since the filter was enabled:

- Vserver name
- Cluster node name
- Security trace filter index number
- User name
- Security style
- Path
- Reason

You can specify additional parameters to display only information that match those parameters. For example, to display information about events that occurred for the user "guest", run the command with `--user-name` parameter set to `guest`.

The `vserver security trace trace-result show` command is not supported for Vservers with Infinite Volume.

**Parameters**

```
[[-fields <fieldname>, ...]
   If you specify this parameter, the command only displays the fields that you specify.
   |
   [-instance]]
   If you specify this parameter, the command displays detailed information about all security trace events.
```
[-node {<nodename>|local}] - Node
If you specify this parameter, the command displays information only about security trace events on the specified node.

[-vserver <vserver name>] - Vserver
If you specify this parameter, the command displays information only about security trace events on the specified Vserver.

[-seqnum <integer>] - Sequence Number
If you specify this parameter, the command displays information only about the security trace events with this sequence number.

[-keytime <Date>] - Time
If you specify this parameter, the command displays information only about security trace events that occurred at the specified time.

[-index <integer>] - Index of the Filter
If you specify this parameter, the command displays information only about security trace events that occurred as a result of the filter corresponding to the specified filter index number.

[-client-ip <IP Address>] - Client IP Address
If you specify this parameter, the command displays information only about security trace events that occurred as a result of file access from the specified client IP address.

[-path <TextNoCase>] - Path of the File Being Accessed
If you specify this parameter, the command displays information only about the security trace events that occurred as a result of file accesses to the specified path.

[-win-user <TextNoCase>] - Windows User Name
If you specify this parameter, the command displays information only about the security trace events that occurred as a result of file access by the specified Windows user.

[-security-style <security style>] - Effective Security Style On File
If you specify this parameter, the command displays information only about the security trace events that occurred on file systems with the specified security style. The allowed values for security style are the following:

- SECURITY_NONE - Security not Set
- SECURITY_UNIX_MODEBITS - UNIX and UNIX permissions
- SECURITY_UNIX_ACL - UNIX and NFSv4 ACL
- SECURITY_UNIX_SD - UNIX and NT ACL
- SECURITY_MIXED_MODEBITS - MIXED and UNIX permissions
- SECURITY_MIXED_ACL - MIXED and NFSv4 ACL
- SECURITY_MIXED_SD - MIXED and NT ACL
- SECURITY_NTFS_MODEBITS - NTFS and UNIX permissions
- SECURITY_NTFS_ACL - NTFS and NT ACL
- SECURITY_NTFS_SD - NTFS and NT ACL
- SECURITY_UNIX - UNIX
- SECURITY_MIXED - MIXED
- SECURITY_NTFS - NTFS
• SECURITY_MODEBITS - UNIX permissions
• SECURITY_ACL - ACL
• SECURITY_SD - SD

[-result <TextNoCase>] - Result of Security Checks

If you specify this parameter, the command displays information about the security trace events that have the specified result. Access to a file or a directory can be 'allowed' or 'denied'. Output from this command displays the result as a combination of the reason for allowing or denying access, the location where access is either allowed or denied, and the access right for which the file operation is allowed or denied.

The following are the reasons why an access can be allowed:

• Access is allowed because the operation is trusted and no security is configured
• Access is allowed because the user has UNIX root privileges
• Access is allowed because the user has UNIX owner privileges
• Access is allowed because UNIX implicit permission grants requested access
• Access is allowed because the CIFS user is owner
• Access is allowed because the user has take ownership privilege
• Access is allowed because there is no CIFS ACL
• Access is allowed because CIFS implicit permission grants requested access
• Access is allowed because the security descriptor is corrupted and the user is a member of the Administrators group
• Access is allowed because the ACL is corrupted and the user is a member of the Administrators group
• Access is allowed because the user has UNIX permissions
• Access is allowed because explicit ACE grants requested access
• Access is allowed because the user has audit privileges
• Access is allowed because the user has superuser credentials
• Access is allowed because inherited ACE grants requested access
• Access is allowed because storage-level access guard (SLAG) grants requested access
• Access is allowed because no central access policies applied
• Access is allowed because no central access policies could be applied from the corrupt SACL
• Access is allowed because matching central access policy could not be located
• Access is allowed because no central access rules apply to the object
• Access is allowed because skipped one or more corrupt central access rules
• Access is allowed because all evaluated central access rules grant access

The following are the reasons why an access can be denied:

• Access is denied by UNIX permissions
• Access is denied by an explicit ACE
• Access is denied. The requested permissions are not granted by the ACE
• Access is denied. The security descriptor is corrupted
• Access is denied. The ACL is corrupted
• Access is denied. The sticky bit is set on the parent directory and the user is not the owner of file or parent directory
• Access is denied. The owner can be changed only by root
• Access is denied. The UNIX permissions/uid/gid/NFSv4 ACL can be changed only by owner or root
• Access is denied. The GID can be set by owner to a member of its legal group list only if 'Owner can chown' is not set
• Access is denied. The file or the directory has readonly bit set
• Access is denied. There is no audit privilege
• Access is denied. Enforce DOS bits blocks the access
• Access is denied. Hidden attribute is set
• Access is denied by an inherited ACE
• Access is denied as the volume is readonly or directory is a snapshot
• Access is denied. System attribute is not set in the request
• Access is denied by the storage-level access guard (SLAG)
• Access is denied, file is infected
• Access is denied. Central access policy DB not ready
• Access is denied. Central access rule is corrupt
• Access is denied. Central access rule explicitly denied access
• Access is denied. Matching central access policy not found

The command or the location at which access was denied or allowed are as follows:
• while traversing the directory.
• while truncating the file.
• while creating the directory.
• while creating the file.
• while checking parent's mode bits during delete.
• while deleting the child.
• while checking for child-delete access on the parent.
• while reading security descriptor.
• while accessing the link.
• while creating the directory.
• while creating or writing the file.
• while opening existing file or directory.
• while setting the attributes.
• while traversing the directory.
• while reading the file.
• while reading the directory.
• while deleting the target during rename.
• while deleting the child during rename.
• while writing data in the parent during rename.
• while adding a directory during rename.
• while adding a file during rename.
• while updating the target directory during rename.
• while setting attributes.
• while writing to the file.
• while extending the coral file.
• while creating the vdisk file.
• while checking for stale locks before open.
• while deleting a file or a directory.
• while truncating a hidden file.
• while truncating a file.
• while truncating a system file.
• while appending to a file or setting a file attribute.
• while opening a file or directory for delete.
• while checking for permission on parent directory during create.

The access rights for which the file operation is allowed or denied are as follows:

• Append.
• Delete.
• Delete Child.
• Execute.
• Generic All.
• Generic Execute.
• Generic Read.
• Generic Write.
• Maximum Allowed.
• Read.
• Read Attributes.
- Read Control.
- Read EA.
- System Security.
- Synchronize.
- Write.
- Write Attributes.
- Write DAC.
- Write EA.
- Write Owner.
- None.

[-unix-user <TextNoCase>] - UNIX User Name

If you specify this parameter, the command displays information only about the security trace events that occurred as a result of file access by the specified UNIX user.

[-session-id <integer>] - CIFS Session ID

If you specify this parameter, the command displays information only about the security trace events that occurred as a result of file access by the specified CIFS session ID.

[-share-name <TextNoCase>] - Accessed CIFS Share Name

If you specify this parameter, the command displays information only about the security trace events that occurred as a result of file access by the specified CIFS share name.

### Examples

The following example displays information about security trace records:

```
cluster1::> vserver security trace trace-result show
Vserver: vserver_1
                  Node                     Index     Filter Details      Reason
----------------------- -------- --------------------- -------------------------
cluster1-01            1        Security Style: MIXED Access is allowed because Access is allowed because
                        and NT ACL            the user has UNIX root
                                grants requested access
                                while opening existing
                                file or directory.
                                Access is granted for: Access is granted for:
                                "Read Attributes"
                                Share: sh1
                                Path: /stk/bit
                                Win-User: cifs1\ administrator
                                Unix-User: root
                                Session-ID: 58455810

1 entries were displayed.
```

The following example displays information about security trace records for path /stk/bit/set:

```
cluster1::> vserver security trace trace-result show -path /stk/bit/set
Vserver: vserver_1
                  Node                     Index     Filter Details      Reason
----------------------- -------- --------------------- -------------------------
cluster1-01            1        Security Style: MIXED Access is allowed because
                        and UNIX permissions the user has UNIX root
                                grants requested access
                                while opening existing
                                file or directory.
                                Access is granted for: Access is granted for:
                                "Read Attributes"
                                Share: sh1
                                Path: /stk/bit
                                Win-User: cifs1\ administrator
                                Unix-User: root

vserver security trace filter create on page 1780

vserver security trace filter commands

Here we create a filter for tracing files and directories.

vserver security trace filter create

Create a security trace entry

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver security trace filter create command creates a security trace filter entry. This feature is currently supported for CIFS only and not supported for NFS.

The vserver security trace filter create command is not supported for Vservers with Infinite Volume.

Parameters

-vserver <vserver name> - Vserver

This specifies the name of the Vserver on which the permission trace is applied.

-index <integer> - Filter Index

This specifies the index number you want to assign to the trace filter. A maximum of 10 entries can be created. The allowed values for this parameter are 1 through 10.
[[-client-ip <IP Address>] - Client IP Address to Match
This specifies the IP Address from which the user is accessing the Vserver.

[-path <TextNoCase>] - Path
This specifies the path to which permission tracing is applied. The value can be the complete path, starting from the root of the share for CIFS or the root of the volume for NFS that the client is accessing, or the value can be a part of the path that the client is accessing. Use NFS style directory separators in the path value.

{ [-windows-name <TextNoCase>] - Windows User Name
This specifies the Windows user name to trace. You can use any of the following formats when specifying the value for this parameter:
  • user_name
  • domain\user_name

| [-unix-name <TextNoCase>] - UNIX User Name
This specifies the Unix user name to trace.

[-trace-allow {yes|no}] - Trace Allow Events
Security tracing can trace deny events and allow events. Deny event tracing is always ON by default. Allow events can optionally be traced. If set to yes, this option allows tracing of allow events. If set to no, allow events are not traced.

[-enabled {enabled|disabled}] - Filter Enabled
This specifies whether to enable or disable the filter. Filters are enabled by default.

[-time-enabled <integer>] - Minutes Filter is Enabled
This specifies a timeout for this filter, after which it is disabled.

Examples
The following example creates a security trace filter.

```
cluster1::> vserver security trace filter create -vserver vs0 -index 1 -time-enabled 120 -client-ip 10.72.205.207
```

The following examples create filters that include the -path option. If the client is accessing a file with the path `\server \sharename\dir1\dir2\dir3\file.txt`, a complete path starting from the root of the share or a partial path can be given as shown:

```
cluster1::> vserver security trace filter create -vserver vs0 -index 1 -path /dir1/dir2/dir3/file.txt
cluster1::> vserver security trace filter create -vserver vs0 -index 1 -path dir3/file.txt
```

vserver security trace filter delete
Delete a security trace entry

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The `vserver security trace filter delete` command deletes a security trace filter entry. This feature is currently supported for CIFS only and not supported for NFS.

The `vserver security trace filter delete` command is not supported for Vservers with Infinite Volume.
Parameters

\texttt{\textit{-vserver <vserver name>}} - Vserver

This specifies the name of the Vserver on which the tracing filter entry that you want to delete is applied.

\texttt{\textit{-index <integer>}} - Filter Index

This specifies the index number for the filter that you want to delete. You can display a list of the filter index numbers by using the \textit{vserver security trace filter show} command.

Examples

The following example deletes a security trace filter.

\begin{verbatim}
cluster1::> vserver security trace filter delete -vserver vs0 -index 1
\end{verbatim}

Related references

\textit{vserver security trace filter show} on page 1783

\textbf{vserver security trace filter modify}

Modify a security trace entry

\textbf{Availability:} This command is available to \textit{cluster} and \textit{Vserver} administrators at the \textit{admin} privilege level.

\textbf{Description}

The \textit{vserver security trace filter modify} command modifies a security trace filter entry. This feature is currently supported for CIFS only and not supported for NFS.

The \textit{vserver security trace filter modify} command is not supported for Vservers with Infinite Volume.

Parameters

\texttt{\textit{-vserver <vserver name>}} - Vserver

This specifies the name of the Vserver on which the permission trace is applied.

\texttt{\textit{-index <integer>}} - Filter Index

This specifies the index number for the filter. A maximum of 10 entries can be created. The allowed values for this parameter are 1 through 10.

\texttt{\textit{[\textit{-client-ip <IP Address>}]}} - Client IP Address to Match

This specifies the IP Address from which the user is accessing the Vserver.

\texttt{\textit{[\textit{-path <TextNoCase>}]}} - Path

This specifies the path to which permission tracing is applied. The value can be the complete path, starting from the root of the share for CIFS or the root of the volume for NFS that the client is accessing, or the value can be a part of the path that the client is accessing. Use NFS style directory separators in the path value.

\texttt{\textit{[\textit{[-windows-name <TextNoCase>]}} - Windows User Name

This specifies the Windows user name to trace. You can use any of the following formats when specifying the value for this parameter:

\begin{itemize}
  \item user_name
  \item domain\user_name
\end{itemize}

\texttt{\textit{[\textit{[-unix-name <TextNoCase>]}} - UNIX User Name

This specifies the Unix user name to trace.
[[-trace-allow {yes|no}] - Trace Allow Events
  Security tracing can trace deny events and allow events. Deny event tracing is always ON by default. Allow events can optionally be traced. If set to yes, this option allows tracing of allow events. If set to no, allow events are not traced.

[[-enabled {enabled|disabled}] - Filter Enabled
  This specifies whether to enable or disable the filter. Filters are enabled by default.

[[-time-enabled <integer>] - Minutes Filter is Enabled
  This specifies a timeout for this filter, after which it is disabled.

Examples
The following example modifies a security trace filter.

    cluster1::> vserver security trace filter modify -vserver vs0 -index 1 -time-enabled 120 -client-ip 10.72.205.207

The following examples modify filters that include the -path option. If the client is accessing a file with the path \server\sharename\dir1\dir2\dir3\file.txt, a complete path starting from the root of the share or a partial path can be given as shown:

    cluster1::> vserver security trace filter modify -vserver vs0 -index 1 -path /dir1/dir2/dir3/file.txt

    cluster1::> vserver security trace filter modify -vserver vs0 -index 1 -path dir3/file.txt

vserver security trace filter show
Display a security trace entry

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver security trace filter show command displays information about security trace filter entries. This feature is currently supported for CIFS only and not supported for NFS.

The vserver security trace filter show command is not supported for Vservers with Infinite Volume.

Parameters

{[[-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[[-instance]]
  If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver
  If you specify this parameter, the command displays permission tracing information only for filters applied to the specified Vserver.

[-index <integer>] - Filter Index
  If you specify this parameter, the command displays permission tracing information only for filters with the specified filter index number.
[<client-ip <IP Address>]] - Client IP Address to Match
If you specify this parameter, the command displays permission tracing information only for filters applied to
the specified client IP address.

[<path <TextNoCase>]] - Path
If you specify this parameter, the command displays permission tracing information only for filters applied to
the specified path.

[<windows-name <TextNoCase>]] - Windows User Name
If you specify this parameter, the command displays permission tracing information only for filters applied to
the specified Windows user name.

[<unix-name <TextNoCase>]] - UNIX User Name
If you specify this parameter, the command displays permission tracing information only for filters applied to
the specified UNIX user name.

[<trace-allow {yes|no}>] - Trace Allow Events
If you specify this parameter, the command displays information only about events that either trace or do not
trace allow events, depending on the value provided.

[<enabled {enabled|disabled}>] - Filter Enabled
If you specify this parameter, the command displays information only about filters that either are enabled or
disabled, depending on the value provided.

[<time-enabled <integer>]] - Minutes Filter is Enabled
If you specify this parameter, the command displays information only about filters that are disabled after the
specified minutes.

**Examples**
The following example displays security trace filters for Vserver vserver1.

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Index</th>
<th>Client-IP</th>
<th>Path</th>
<th>Trace-Allow</th>
<th>Windows-Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>vserver1</td>
<td>1</td>
<td>-</td>
<td>-</td>
<td>no</td>
<td>domain\user</td>
</tr>
<tr>
<td>vserver1</td>
<td>2</td>
<td>192.168.2.3</td>
<td>-</td>
<td>yes</td>
<td>-</td>
</tr>
<tr>
<td>vserver1</td>
<td>3</td>
<td>-</td>
<td>/dir1/dir2/file</td>
<td>no</td>
<td>domain\administrator</td>
</tr>
</tbody>
</table>

3 entries were displayed.

Manage Name Services

**vserver services name-service dns commands**
Manage DNS service
vserver services name-service dns create

Create a new DNS table entry

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver services name-service dns create command creates new DNS server mappings. DNS servers provide remote connection information, such as IP addresses, based on domain and system names.

Parameters
-vserver <vserver name> - Vserver
Use this parameter to specify the Vserver on which to create the new DNS server mapping.

-domains <text>, ... - Domains
Use this parameter to specify the domains of the Vserver. Separate multiple domains with commas.

-name-servers <IP Address>, ... - Name Servers
Use this parameter to specify the IP addresses of the DNS servers that provide name service for the domains in this DNS server mapping. Separate multiple addresses with commas.

[-state {enabled|disabled}] - (DEPRECATED)-Enable/Disable DNS

Note: This parameter has been deprecated and might be removed in a future version of Data ONTAP.
Use this parameter with the value enabled to specify that the DNS server mapping is active when it is created. Use this parameter with the value disabled to specify that the DNS server mapping is not active.

[-timeout <integer>] - Timeout (secs)
Use this parameter to specify a timeout value (in seconds) for queries to the name servers. The default value is 2 seconds.

[-attempts <integer>] - Maximum Attempts
Use this parameter to specify the number of attempts the Vserver should make when querying the DNS name servers. The default value is 1 attempt.

[-is-tld-query-enabled {true|false}] - Is TLD Query Enabled? (privilege: advanced)
Use this parameter to enable or disable top-level domain (TLD) queries. If the parameter is set to false, the resolver will not attempt to resolve a name that has no "." characters in it. The default value for this parameter is true.

[-require-source-address-match {true|false}] - Require Source and Reply IPs to Match (privilege: advanced)
Use this parameter to allow dns responses sourced from an IP that does not match where the vserver sent the request. If the parameter is set to false, the resolver will allow response from an IP other than the one to which the request was sent. The default value for this parameter is true.

[-require-packet-query-match {true|false}] - Require Packet Queries to Match (privilege: advanced)
Use this parameter to check if the query section of the reply packet is equal to that of the query packet. If the parameter is set to false, the resolver will not check if the query section of the reply packet is equal to that of the query packet. The default value for this parameter is true.

Examples
This example creates a new DNS server mapping for the Vserver vs0 in the domain example.com, specifying that 192.168.0.16 and 192.168.0.24 are the name servers for this domain.
vserver services name-service dns delete

Remove a DNS table entry

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The `vserver services name-service dns delete` command removes the DNS server mapping from a Vserver.

Deleting a DNS server mapping removes it permanently. If you delete a DNS server mapping, commands or jobs that do not use IP addresses do not succeed. To disable a DNS server mapping without deleting it, use the `vserver services name-service dns modify` command with the `-state disabled` parameter.

Parameters
- `-vserver <vserver name>` - Vserver
  Use this parameter to specify the Vserver whose DNS server mapping is deleted.

Examples
This example removes the DNS server mapping from the Vserver node1.

```
cluster1:/> vserver services name-service dns delete -vserver vs0
```

Related references
- `vserver services name-service dns modify` on page 1786

vserver services name-service dns modify

Change a DNS table entry

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
Use the `vserver services name-service dns modify` command to modify an existing DNS server mapping.

Use the `-state disabled` parameter to disable a DNS server mapping without deleting it. To permanently remove a mapping, use the `vserver services name-service dns delete` command.

Parameters
- `-vserver <vserver name>` - Vserver
  Use this parameter to specify the Vserver whose DNS mapping is modified.

  `-domains <text>, ...` - Domains
  Use this parameter to specify a domain for the Vserver.

  `-name-servers <IP Address>, ...` - Name Servers
  Use this parameter to specify the IP addresses of the DNS name servers for this Vserver.

  `-state {enabled|disabled}` - (DEPRECATED)-Enable/Disable DNS
  Note: This parameter has been deprecated and might be removed in a future version of Data ONTAP.
Use this parameter with the value enabled to specify that the DNS server mapping is active. Use this parameter with the value disabled to specify that the DNS server mapping is not active.

[-timeout <integer>] - Timeout (secs)
Use this parameter to specify a timeout value (in seconds) for queries to the DNS servers.

[-attempts <integer>] - Maximum Attempts
Use this parameter to specify the number of times to attempt queries to the DNS servers.

[-is-tld-query-enabled {true|false}] - Is TLD Query Enabled? (privilege: advanced)
Use this parameter to enable or disable top-level domain (TLD) queries. If the parameter is set to false, the resolver will not attempt to resolve a name that has no "." characters in it. The default value for this parameter is true.

[-require-source-address-match {true|false}] - Require Source and Reply IPs to Match (privilege: advanced)
Use this parameter to allow dns responses sourced from an IP that does not match where the vserver sent the request. If the parameter is set to false, the resolver will allow response from an IP other than the one to which the request was sent.

[-require-packet-query-match {true|false}] - Require Packet Queries to Match (privilege: advanced)
Use this parameter to check if the query section of the reply packet is equal to that of the query packet. If the parameter is set to false, the resolver will not check if the query section of the reply packet is equal to that of the query packet.

Examples
This example modifies the DNS server mapping for the domain example.com on the Vserver vs0, specifying that 10.0.0.1 and 10.0.0.2 are the name servers for this domain.

```
cluster1::> vserver services name-service dns modify -vserver vs0 -domains example.com -name-servers 10.0.0.1,10.0.0.2
```

The following example disables the DNS mapping for example.com on a Vserver named vs1:

```
cluster1::> vserver services name-service dns modify -vserver vs1 -domains example.com -state disabled
```

vserver services name-service dns show
Display DNS configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver services name-service dns show command displays information about DNS server mappings. DNS servers provide remote connection information, such as IP addresses, based on domain and system names.

Parameters

[[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?' to display the fields to specify.
If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-vserver <vserver name>]` - Vserver
Use this parameter to display information only about the DNS server mapping of the Vservers you specify.

`[-domains <text>, ...]` - Domains
Use this parameter to display information only about the DNS server mappings for Vservers in the domains you specify.

`[-name-servers <IP Address>, ...]` - Name Servers
Use this parameter to display information only about DNS server mappings that use the DNS name servers you specify.

`[-state {enabled|disabled}]` - (DEPRECATED)-Enable/Disable DNS

**Note:** This parameter has been deprecated and might be removed in a future version of Data ONTAP.
Use this parameter with the value `enabled` to display information only about the DNS server mappings that are active. Use this parameter with the value `disabled` to display information only about the DNS server mappings that are not active.

`[-timeout <integer>]` - Timeout (secs)
Use this parameter to display information only about DNS server mappings that have the timeout value you specify.

`[-attempts <integer>]` - Maximum Attempts
Use this parameter to display information only about DNS server mappings that make the maximum number of attempts you specify.

`[-is-tld-query-enabled {true|false}]` - Is TLD Query Enabled? (privilege: advanced)
Use this parameter to display information only about DNS server mappings that have the specified TLD query setting.

`[-require-source-address-match {true|false}]` - Require Source and Reply IPs to Match (privilege: advanced)
Use this parameter to display information only about DNS server mappings that have the specified setting to require the source address of the response packet to match the address where the vserver sent the request.

`[-require-packet-query-match {true|false}]` - Require Packet Queries to Match (privilege: advanced)
Use this parameter to display information only about DNS server mappings that have the specified setting to require the query section of the reply packet to match that of the query packet.

### Examples
The following example shows typical output from the command. Note that cluster1 uses different name servers for example.com.

```
cluster1::> vserver services name-service dns show

<table>
<thead>
<tr>
<th>Vserver</th>
<th>State</th>
<th>Domains</th>
<th>Servers</th>
</tr>
</thead>
<tbody>
<tr>
<td>node1</td>
<td>enabled</td>
<td>example.com</td>
<td>10.0.0.1, 10.0.0.2</td>
</tr>
<tr>
<td>node2</td>
<td>enabled</td>
<td>example.com, example2.com</td>
<td>10.0.0.1, 10.0.0.2</td>
</tr>
<tr>
<td>cluster1</td>
<td>enabled</td>
<td>example.com, example2.com</td>
<td>192.168.0.1, 192.168.0.2</td>
</tr>
</tbody>
</table>
```
vserver services name-service dns hosts commands

Manage local mapping for host names

vserver services name-service dns hosts create

Create a new host table entry

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

Use the vserver services name-service dns hosts create command to create new DNS host table entries. These entries map hostnames to IP addresses.

Parameters

- vserver <vserver name> - Vserver
  Use this parameter to specify the Vserver on which the host table entry will be created.

- address <IP Address> - IP Address
  Use this parameter to specify the IP address of the new host table entry.

- hostname <text> - Canonical Hostname
  Use this parameter to specify the full hostname for the new host table entry.

[ -aliases <text>, ... ] - Aliases
  Use this parameter to specify any aliases to include in the new host table entry. Separate multiple aliases with commas.

Examples

This example creates a new DNS host table entry for 10.0.0.17 on the vserver vs1, with the hostname test.example.com and the alias test.

|cluster1:|vserver services name-service dns hosts create -vserver vs1 -address 10.0.0.17 - hostname test.example.com -aliases test |

vserver services name-service dns hosts delete

Remove a host table entry

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

Use the vserver services name-service dns hosts delete command to delete DNS host table entries.

Parameters

- vserver <vserver name> - Vserver
  Use this parameter to specify the Vserver whose host table entry will be deleted.

- address <IP Address> - IP Address
  Use this parameter to specify the IP address of the host table entry to delete.

Examples

This example removes the DNS host table entry of 10.0.0.15 from the host table of the vserver vs1.

vserver services commands
vserver services name-service dns hosts delete

cluster1::> vserver services name-service dns hosts delete -vserver vs1 -address 10.0.0.16
1 entry was deleted.

vserver services name-service dns hosts modify

Modify hostname or aliases

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
Use the vserver services name-service dns hosts modify command to modify existing DNS host table entries.

Parameters
- **-vserver <vserver name>** - Vserver
  Use this parameter to specify the Vserver whose host table will be modified.
- **-address <IP Address>** - IP Address
  Use this parameter to specify the IP address of the host table entry to modify.
- **[-hostname <text>]** - Canonical Hostname
  Use this parameter to specify a full hostname for the host table entry.
- **[-aliases <text>, ...]** - Aliases
  Use this parameter to specify alternate hostnames for the host table entry.

Examples
This example changes the host table of vserver vs1 so that the hostname stored in the host table entry for 10.0.0.57 is pgh.example.com.

```
cluster1::> vserver services name-service dns hosts modify -vserver vs1 -address 10.0.0.57 -hostname pgh.example.com
1 entry was modified.
```

This example changes the host table of vserver vs1 to store the name loghost as an alternate hostname for IP address 10.0.0.5.

```
cluster1::> vserver services name-service dns hosts modify -vserver vs1 -address 10.0.0.5 -aliases loghost
1 entry was modified.
```

vserver services name-service dns hosts show

Display IP address to hostname mappings

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
Use the vserver services name-service dns hosts show command to display Domain Name System (DNS) host table entries. These entries map hostnames to IP addresses. Entries may also include alternate hostnames, known as aliases. Host table entries enable you to refer to other Internet hosts by a memorable name instead of by a numeric IP address. This host table is similar to the /etc/hosts file found on most UNIX style systems.
Parameters

{[-fields <fieldname>, ...]
    If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

[[-instance]]
    If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>]- Vserver
    Use this parameter to display information only about host table entries on the Vservers you specify.

[-address <IP Address>]- IP Address
    Use this parameter to display information only about host table entries that match the IP addresses you specify.

[-hostname <text>]- Canonical Hostname
    Use this parameter to display information only about host table entries that match the hostnames you specify.

[-aliases <text>, ...]- Aliases
    Use this parameter to display information only about host table entries that include the alternate hostnames you specify.

Examples

The following example shows a typical host table.

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Address</th>
<th>Hostname</th>
<th>Aliases</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>
<td>10.0.0.10</td>
<td>mail.example.com</td>
<td>mail, mailhost, snmp</td>
</tr>
<tr>
<td>vs1</td>
<td>10.0.0.15</td>
<td>ftp.example.com</td>
<td>ftp</td>
</tr>
<tr>
<td>vs1</td>
<td>10.0.0.16</td>
<td><a href="http://www.example.com">www.example.com</a></td>
<td>www</td>
</tr>
<tr>
<td>vs2</td>
<td>10.0.0.10</td>
<td>mail.example.com</td>
<td>mail, mailhost, snmp</td>
</tr>
<tr>
<td>vs2</td>
<td>10.0.0.15</td>
<td>ftp.example.com</td>
<td>ftp</td>
</tr>
<tr>
<td>vs2</td>
<td>10.0.0.16</td>
<td><a href="http://www.example.com">www.example.com</a></td>
<td>www</td>
</tr>
<tr>
<td>vs2</td>
<td>10.0.0.17</td>
<td>test.example.com</td>
<td></td>
</tr>
</tbody>
</table>

7 entries were displayed.

vserver services name-service dns dynamic-update commands

Manage Dynamic DNS Updates

vserver services name-service dns dynamic-update modify

Modify a Dynamic DNS Update Configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver services name-service dns dynamic-update modify command modifies the configuration for dynamic DNS updates for a Data Vserver.

Parameters

-vserver <vserver name> - Vserver
    Use this parameter to specify the Vserver for which you want to modify the dynamic DNS update configuration.
[-is-enabled (true|false)] - Is Dynamic DNS Update Enabled?
Use this parameter with value true to enable the dynamic DNS update feature. This field is set to false by default.

[-use-secure (true|false)] - Use Secure Dynamic Update?
Use this parameter with value true to enable secure dynamic DNS updates. This field is set to false by default.

[-vserver-fqdn <text>] - Vserver FQDN to Be Used for DNS Updates
Use this parameter to modify the Vserver FQDN to be used for dynamic DNS updates.

[-ttl </<integer>h] </<integer>m] </<integer>s> - Time to Live for DNS Updates (privilege: advanced)
Use this parameter to modify the Time to Live value for the dynamic DNS updates. The default value is set to 24 hours. The maximum supported value for TTL is 720 hours.

Examples
The following example enables the dynamic DNS update feature and modifies the FQDN to be used for dynamic DNS updates for the Vserver vs1, specifying vs1.abcd.com as the new FQDN.

```
cluster1::*> vserver services name-service dns dynamic-update modify -vserver vs1 -is-enabled true -vserver-fqdn vs1.abcd.com
```

The following example modifies the dynamic DNS updates configuration to only send secure updates to the DNS server configured for the Vserver vs1.

```
cluster1::*> vserver services name-service dns dynamic-update modify -vserver vs1 -is-enabled true -use-secure true
```

vserver services name-service dns dynamic-update prepare-to-downgrade
Disable the Dynamic DNS update feature to be compatible with releases earlier than Data ONTAP 8.3.1

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The vserver services name-service dns dynamic-update prepare-to-downgrade command disables the Dynamic DNS updates on all Vservers and removes all related configurations. This command is used to prepare for downgrading the system to a release earlier than Data ONTAP 8.3.1 only.

Examples
The following example disables the dynamic DNS updates feature.

```
cluster1::*> vserver services name-service dns dynamic-update prepare-to-downgrade
Warning: This command will disable dynamic DNS updates on all Vservers, remove all related configurations, and disable the dynamic DNS update feature. Use this command to prepare for downgrading the system to a release earlier than Data ONTAP 8.3.1 only.
Do you want to continue? {y|n}:
```
vserver services name-service dns dynamic-update show

Display Dynamic DNS Update Configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver services name-service dns dynamic-update show command shows the dynamic DNS update configuration related to the DNS server for a Vserver.

Parameters
{-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver
Use this parameter to display dynamic DNS update configuration for the Vservers you specify.

[-is-enabled {true|false}] - Is Dynamic DNS Update Enabled?
Use this parameter with value true to display information about dynamic DNS update configurations that are active.

[-use-secure {true|false}] - Use Secure Dynamic Update?
Use this parameter with value true to display information about dynamic DNS update configurations that are set to send secure dynamic updates only.

[-vserver-fqdn <text>] - Vserver FQDN to Be Used for DNS Updates
Use this parameter to display information about dynamic DNS update configurations that are set to send the dynamic updates with the FQDN you have specified.

[-ttl <[<integer>h][<integer>m][<integer>s]>] - Time to Live for DNS Updates (privilege: advanced)
If you specify this parameter, the command displays dynamic DNS update configurations having the specified Time to Live value.

Examples
The following example shows all information about dynamic DNS update configurations.

```
cluster1::*> vserver services name-service dns dynamic-update show
gupgclust-3::> dns dynamic-update show
Vserver    Is-Enabled Use-Secure Vserver FQDN    TTL
-------------------------------  ---------  -------- -------------- -------
vs1        true     false    vs1.abcd.com    24h
vs2        false    false    vs2.abcd.com    24h
2 entries were displayed.
```

vserver services name-service dns dynamic-update record commands

The Record Directory
vserver services name-service dns dynamic-update record add
Adds a New DNS Resource Record

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.
Description
The `vserver services name-service dns dynamic-update record add` command sends an update to add a new DNS resource record of an existing logical interface (LIF) of the Vserver to the configured DNS server.

Parameters
- `-vserver <vserver name>` - Vserver
  Use this parameter to specify the Vserver for which you want to add a resource record on the configured DNS server.

- `-lif <lif-name>` - Logical Interface
  Use this parameter to specify the Logical Interface(LIF) name for which you want to add a resource record on the configured DNS server.

Examples
The following example adds a resource record entry for the Logical Interface lif1 belonging to the Vserver vs1 to the configured DNS server.

```
cluster1::*> vserver services name-service dns dynamic-update record add -vserver vs1 -lif lif1
```

vserver services name-service dns dynamic-update record delete

Deletes a DNS Resource Record

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The `vserver services name-service dns dynamic-update record delete` command sends an update to remove an existing DNS resource record of the Logical Interface (LIF) of the Vserver from the configured DNS server.

Parameters
- `-vserver <vserver name>` - Vserver
  Use this parameter to specify the Vserver of which you want to delete a resource record from the configured DNS server.

{ -`-lif <lif-name>` - Logical Interface
  Use this parameter to specify the Logical Interface(LIF) name whose corresponding resource record you want to remove from the configured DNS server.

| `-address <IP Address>` | - IP Address
  Use this parameter to specify the IP address of the Logical Interface whose corresponding resource record you want to remove from the configured DNS server.

Examples
The following example removes a resource record entry of the Logical Interface lif1 belonging to the Vserver vs1 from the configured DNS server.

```
cluster1::*> vserver services name-service dns dynamic-update record delete -vserver vs1 -lif lif1
```

The following example removes a resource record entry of the Logical Interface whose address is 1.1.1.1 belonging to the Vserver vs1 from the configured DNS server.
vserver services name-service getxxbyyy commands

Execute getXXbyYY for the given command.

The vserver services name-service getxxbyyy command performs name lookups for a given Vserver. The underlying service for doing the lookup is selected based on the configured name service switch order.

vserver services name-service getxxbyyy getaddrinfo

Gets the IP address information by using the host name.

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The vserver services name-service getxxbyyy getaddrinfo gets the IP address information by using the host name for a given Vserver. The underlying service for doing the lookup is selected based on the configured name service switch order.

Parameters
- `node {<nodename>|local}` - Node Name
  Use this parameter to specify the node where the lookup will be performed

- `vserver <vserver name>` - Vserver Name
  Use this parameter to specify the Vserver where the lookup will be performed

- `hostname <text>` - Host Name
  Use this parameter to specify the Host Name for which the IP address information is needed

[[-`address-family {ipv4|ipv6|all}`] - Return Addresses for Family
  Use this parameter to specify the Address Family for which the IP address information is needed]

[[-`show-source {true|false}`] - Show Source used for Lookup
  Use this parameter to specify if source used for lookup needs to be displayed]

Examples
The following example requests address information for localhost

```bash
cluster1::*> vserver services name-service getxxbyyy getaddrinfo -node cluster1-01 -vserver vs1 -hostname localhost -address-family all -show-source true
Source used for Lookup: Files
Host name: localhost
Canonical name: localhost
IPv4 : 127.0.0.1
IPv6 : ::1
```

vserver services name-service getxxbyyy getgrbygid

Gets the group members by using the group identifier or GID.

Availability: This command is available to cluster administrators at the advanced privilege level.
Description
The `vserver services name-service getxbyy getgrbygid` gets the group members by using the group identifier or GID for a given Vserver. The underlying service for doing the lookup is selected based on the configured name service switch order.

Parameters
- `-node <nodename>|local` - Node Name
  Use this parameter to specify the node where the lookup will be performed
- `-vserver <vserver name>` - Vserver Name
  Use this parameter to specify the Vserver where the lookup will be performed
- `-groupID <integer>` - Group ID
  Use this parameter to specify the GroupID for which the members are requested
- `[-show-source {true|false}]` - Source used for Lookup
  Use this parameter to specify if source used for lookup needs to be displayed

Examples
The following example requests group information for the given groupid

```
cluster1::*> vserver services name-service getxbyy getgrbygid -node cluster1-01 -vserver vs1 -groupID 1
name: daemon
gid: 1
```

The following example requests group information for the given group name

```
vserver services name-service getxbyy getgrbyname
```

Gets the group members by using the group name.

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The `vserver services name-service getxbyy getgrbyname` gets the group members by using the group name.

Parameters
- `-node <nodename>|local` - Node Name
  Use this parameter to specify the node where the lookup will be performed
- `-vserver <vserver name>` - Vserver Name
  Use this parameter to specify the Vserver where the lookup will be performed
- `-groupname <text>` - Group Name
  Use this parameter to specify the Group Name for which the members are requested
- `[-show-source {true|false}]` - Source used for Lookup
  Use this parameter to specify if source used for lookup needs to be displayed

Examples
The following example requests group information for the given group name
vserver services name-service getxxbyyy getgrlist

Gets the group list by using the user name.

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**
The `vserver services name-service getxxbyyy getgrlist` gets the list of groups to which user belongs. This command will go through all the sources configured for the group database in the name servers ns-switch configuration.

**Parameters**
- **-node {<nodename>|local}** - Node Name
  Use this parameter to specify the node where the lookup will be performed
- **-vserver <vserver name>** - Vserver Name
  Use this parameter to specify the Vserver where the lookup will be performed
- **-username <text>** - User Name
  Use this parameter to retrieve the list of groups where the given user is a member
- **[-show-source {true|false}]** - Source used for Lookup
  Using this parameter as true, source is always displayed as Unknown.

**Examples**
The following example requests the grouplist for the given username

```
cluster1:~> vserver services name-service getxxbyyy getgrlist -node cluster1-01 -vserver vs1 -username root -show-source false
pw_name: root
Groups: 5
```
-ipaddress <IP Address> - IP Address
   Use this parameter to specify the IPv4/IPv6 address for which the host information is needed

[-show-source {true|false}] - Source used for Lookup
   Use this parameter to specify if source used for lookup needs to be displayed

**Examples**

The following example requests host information for the given IP address

```
cluster1::*> vserver services name-service getxxbyyy gethostbyaddr -node cluster1-01 -vserver vs1 -ipaddress 127.0.0.1 -show-source false
IP address: 127.0.0.1
Host name: localhost
```

**vserver services name-service getxxbyyy gethostbyname**

Gets the IP address information from host name.

**Availability:** This command is available to cluster administrators at the *advanced* privilege level.

**Description**
The `vserver services name-service getxxbyyy gethostbyname` gets the IP address by using the host name. The underlying service for doing the lookup is selected based on the configured name service switch order. When the lookup happens from the hosts file, only the first IP address is returned for a host configured with multiple IP addresses.

**Parameters**

- **-node \(<nodename>|local\) - Node Name**
  
  Node Use this parameter to specify the node where the lookup will be performed

- **-vserver \(<vserver name>\) - Vserver Name**
  
  Vserver Name Use this parameter to specify the Vserver where the lookup will be performed

- **-hostname \(<text>\) - Host Name**
  
  Use this parameter to specify the Hostname for which the IP address information is requested

[-show-source {true|false}] - Source used for Lookup
   Use this parameter to specify if source used for lookup needs to be displayed

**Examples**

The following example requests IP Address information from the given hostname

```
cluster1::*> vserver services name-service getxxbyyy gethostbyname -node cluster1-01 -vserver vs1 -hostname localhost -show-source false
Host name: localhost
Canonical name: localhost
IPv4: 127.0.0.1
```

**vserver services name-service getxxbyyy getnameinfo**

Gets the name information by using the IP address.

**Availability:** This command is available to cluster administrators at the *advanced* privilege level.
Description
The vserver services name-service getxxbyyy getnameinfo gets the host and service by using the socket address. The underlying service for doing the lookup is selected based on the configured name service switch order.

Parameters
- **node** (<nodename>|local) - Node Name
  Use this parameter to specify the node where the lookup will be performed
- **vserver** <vserver name> - Vserver Name
  Use this parameter to specify the Vserver where the lookup will be performed
- **ipaddress** <IP Address> - IP Address
  Use this parameter to specify IPv4/IPv6 address for which the name information is requested
- [-**show-source** (true|false)] - Source used for Lookup
  Use this parameter to specify if source used for lookup needs to be displayed

Examples
The following example gets the name information for the given IP Address

```
cluster1::*> vserver services name-service getxxbyyy getnameinfo -node cluster1-01 -vserver vs1 -ipaddress 127.0.0.1 -show-source false
IP address: 127.0.0.1
Host name: localhost
```

vserver services name-service getxxbyyy getpwbyname
Gets the password entry by using the user name.

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The vserver services name-service getxxbyyy getpwbyname gets the password entry by using the user name. The underlying service for doing the lookup is selected based on the configured name service switch order.

Parameters
- **node** (<nodename>|local) - Node Name
  Use this parameter to specify the node where the lookup will be performed
- **vserver** <vserver name> - Vserver Name
  Use this parameter to specify the Vserver where the lookup will be performed
- **username** <text> - User Name
  Use this parameter to specify the Username for which the password entry is requested
- [-**show-source** (true|false)] - Source used for Lookup
  Use this parameter to specify if source used for lookup needs to be displayed

Examples
The following example requests password entry from the given username

```
cluster1::*> vserver services name-service getxxbyyy getpwbyname -node cluster1-01 -vserver vs1 -username vsadmin -show-source true -use-rbac false
Source used for lookup: Files
pw_name: daemon
```
pw_passwd: *
pw_uid: 1, pw_gid: 1
pw_gecos: Owner of many system processes
pw_dir: /root
pw_shell: /usr/sbin/nologin

vserver services name-service getxxbyyy getpwbyuid

Gets the password entry by using the user identifier or UID.

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The vserver services name-service getxxbyyy getpwbyuid gets the password entry by using the user identifier or UID. The underlying service for doing the lookup is selected based on the configured name service switch order.

Parameters
- -node {<nodename>|local} - Node Name
  Use this parameter to specify the node where the lookup will be performed
- -vserver <vserver name> - Vserver Name
  Use this parameter to specify the Vserver where the lookup will be performed
- -userID <integer> - User ID
  Use this parameter to specify the UserID for whom the password entry is requested
[ -show-source {true|false}] - Source used for Lookup
  Use this parameter to specify if source used for lookup needs to be displayed

Examples
The following example requests password entry by using the user ID

```
  cluster1::*> vserver services name-service getxxbyyy getpwbyuid -node cluster1-01 -
vserver vs1 -userID 1001 -show-source true -use-rbac true
  Source used for Lookup: Files
  pw_name: vsadmin
  pw_passwd: $1$f7b22f688KihT1ptYgpEjcM4jfE60f0
  pw_uid: 1001
  pw_gid: 65533
  pw_gecos: User
  pw_dir: /var/home/vsadmin
  pw_shell: /sbin/ngsh
```

vserver services name-service getxxbyyy netgrp

Checks if a client is part of a netgroup.

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The vserver services name-service getxxbyyy netgrp checks if a client is part of a netgroup. The underlying service for doing the lookup is selected based on the configured name service switch order.
Parameters

- **node `<nodename>|local`** - Node Name
  Use this parameter to specify the node where the lookup will be performed

- **vserver `<vserver name>`** - Vserver Name
  Use this parameter to specify the Vserver where the lookup will be performed

- **netgroup `<text>`** - Netgroup Name
  Use this parameter to specify the Netgroup name

- **client-name `<text>`** - Client Name
  Use this parameter to specify the Client name for which the membership in a given netgroup needs to be checked

- **show-source {true|false}** - Source used for Lookup
  Use this parameter to specify if source used for lookup needs to be displayed

Examples

The following example checks if the given client is part of the given netgroup:

```bash
cluster1::*> vserver services name-service getxxbyyy netgrp -node cluster1-01 -vserver vs1 -netgroup net1 -client-name h1 -show-source false
h1 is a member of net1
```

vserver services name-service getxxbyyy netgrpbyhost

Check if a client is part of a netgroup using netgroup-by-host query

**Availability:** This command is available to cluster administrators at the advanced privilege level.

**Description**

The vserver services name-service getxxbyyy netgrpbyhost command checks whether a client is part of a netgroup using the netgroup.byhost map. The underlying service for doing the lookup is selected based on the configured name service switch order.

**Parameters**

- **node `<nodename>|local`** - Node Name
  Use this parameter to specify the node where the lookup will be performed.

- **vserver `<vserver name>`** - Vserver Name
  Use this parameter to specify the Vserver where the lookup will be performed.

- **netgroup `<text>`** - Netgroup Name
  Use this parameter to specify the netgroup name.

- **clientIP `<IP Address>`** - Client IP Address
  Use this parameter to specify the client IPv4/IPv6 address for which you want to check the membership in a given netgroup.

- **enable-domain-search-flag {true|false}** - Use DNS domain
  Use this parameter to specify whether you want to perform shortname host lookups in case the configured DNS search domains match the domain returned by the reverse lookup.

- **show-source {true|false}** - Source Used for Lookup
  Use this parameter to specify whether you want to display the source used for the lookup.
Examples
The following example checks whether the given client IP address is a member of the given netgroup:

```
cluster1::*> vserver services name-service getxxbyyy netgrpbyhost -node node1 -vserver vs1
-netgroup ng1 -clientIP 10.10.10.90
Hostname resolved to: dnshost.example.com
Success
```

vserver services name-service ldap commands
Manage LDAP configuration

vserver services name-service ldap create
Create an LDAP configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver services name-service ldap create command associates an LDAP client configuration with a Vserver.

Parameters
- `-vserver <Vserver Name> - Vserver`
  This parameter specifies the Vserver with which you want to associate the LDAP client configuration. A data Vserver or admin Vserver can be specified.

- `-client-config <text> - LDAP Client Configuration`
  This parameter specifies the name of the LDAP client configuration, defined under vserver services name-service ldap client, that you want to associate with the Vserver.

- `-client-enabled {true|false} - (DEPRECATED)-LDAP Client Enabled`
  
  Note: This parameter has been deprecated and might be removed in a future version of Data ONTAP.
  This parameter specifies whether the Vserver can use the LDAP configuration.

  Note: You must also include the 'ldap' method in the Vserver's `-ns-switch` and/or `-nm-switch` parameters before the Vserver uses an enabled LDAP configuration.

Examples
The following example associates the LDAP client configuration "corp" with the Vserver "vs1":

```
cluster1::> vserver services name-service ldap create -vserver vs1 -client-config corp
```

Related references
vserver services name-service ldap client on page 1804

vserver services name-service ldap delete
Delete an LDAP configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.
The `vserver services name-service ldap delete` command removes the LDAP configuration, which is an LDAP client configuration's association with a Vserver.

**Note:** Make sure that you remove 'ldap' from the Vserver's `-ns-switch` and `-nm-switch` parameters and test connectivity before deleting a working LDAP configuration.

### Parameters

- `-vserver <Vserver Name>` - **Vserver**
  
  This parameter specifies the Vserver from which you want to disassociate the LDAP client configuration. A data Vserver or admin Vserver can be specified.

### Examples

The following example disassociates the current LDAP client configuration from Vserver "vs1".

```
cluster1::> vserver services name-service ldap delete -vserver vs1
```

The `vserver services name-service ldap modify` command modifies an LDAP client configuration's association with a Vserver.

**Note:** Make sure that you remove 'ldap' from the Vserver's `-ns-switch` and `-nm-switch` configurations and test connectivity before disabling a working LDAP configuration.

### Parameters

- `-vserver <Vserver Name>` - **Vserver**
  
  This parameter specifies the Vserver with which you want to associate the LDAP client configuration. A data Vserver or admin Vserver can be specified.

- `[<client-config <text>]]` - **LDAP Client Configuration**
  
  This parameter specifies the name of the LDAP client configuration, defined under `vserver services name-service ldap client`, that you want to associate with the Vserver.

- `[<client-enabled {true|false}]` - **(DEPRECATED)-LDAP Client Enabled**
  
  **Note:** This parameter has been deprecated and might be removed in a future version of Data ONTAP. This parameter specifies whether the Vserver can use the LDAP configuration.

**Note:** You must also include the 'ldap' method in the Vserver's `-ns-switch` and/or `-nm-switch` parameters before the Vserver uses an enabled LDAP configuration.

### Examples

The following example modifies the LDAP client configuration used by Vserver "vs1" to "corpnew":

```
cluster1::> vserver services name-service ldap modify -vserver vs1 -client-config corpnew
```

vserver services name-service ldap client on page 1804

vserver services name-service ldap show

Display LDAP configurations

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver services name-service ldap show command displays information about LDAP configurations.

Parameters

[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

[-instance]]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>]- Vserver
If you specify this parameter, the command displays information about the LDAP configuration on the specified Vserver. A data Vserver or admin Vserver can be specified.

[-client-config <text>] - LDAP Client Configuration
If you specify this parameter, the command displays information about LDAP configurations using the specified client.

[-client-enabled {true|false}]- (DEPRECATED)-LDAP Client Enabled
Note: This parameter has been deprecated and might be removed in a future version of Data ONTAP.
If you specify this parameter, the command displays information about LDAP configurations with the matching client state.

Examples
The following example shows the LDAP configuration for Vserver "vs1":

```
cluster1:/> vserver services name-service ldap show -vserver vs1
Client        Client
-------------- ------------- -------
vs1            corp          true
```

vserver services name-service ldap client commands
Manage LDAP client configurations

vserver services name-service ldap client create
Create an LDAP client configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver services name-service ldap client create command creates an LDAP client configuration. A client configuration is associated with a Vserver using the vserver services name-service ldap commands.
Parameters

-vserver <Vserver Name> - Vserver
This parameter specifies the Vserver for which configuration is created. A data Vserver or admin Vserver can be specified.

-client-config <text> - Client Configuration Name
This parameter specifies the name that you would like to use to refer to the new LDAP client configuration.

{-servers <IP Address>, ...} - LDAP Server List
This parameter specifies the list of LDAP servers used when making LDAP connections using this client configuration. If you specify this parameter, you cannot specify the -ad-domain, -preferred-ad-servers or -bind-as-cifs-server parameters.

| -ad-domain <TextNoCase> | Active Directory Domain
This parameter specifies the name of the Active Directory domain used to discover LDAP servers for use by this client. This assumes that the Active Directory schema has been extended to act as a NIS replacement. If you use this parameter, you cannot specify the -servers parameter. However, you can specify a list of preferred servers using the -preferred-ad-servers parameter.

{-preferred-ad-servers <IP Address>, ...} - Preferred Active Directory Servers
This parameter specifies a list of LDAP servers that are preferred over those that are discovered in the domain specified in the -ad-domain parameter.

[-bind-as-cifs-server {true|false}] - Bind Using the Vserver's CIFS Credentials
This parameter specifies whether LDAP binds made using this client configuration use the Vserver's CIFS server credentials. If you do not specify this parameter, the default is false.

-schema <text> - Schema Template
This parameter specifies the name of the schema template the Vserver uses when making LDAP queries. You can view and modify the templates using the vserver services name-service ldap client schema command.

[-port <integer>] - LDAP Server Port
This parameter specifies the port that the LDAP client uses to connect to LDAP servers. If you do not specify this parameter, the default is port 389.

[-query-timeout <integer>] - Query Timeout (sec)
This parameter specifies the amount of time (in seconds) that the LDAP client waits for a query to complete. If you do not specify this parameter, the default is 3 seconds.

[-min-bind-level {anonymous|simple|sasl}] - Minimum Bind Authentication Level
This parameter specifies the lowest acceptable level of security the LDAP client uses to bind to an LDAP server. If you do not specify this parameter, the default is an anonymous bind.

[-bind-dn <ldap_dn>] - Bind DN (User)
This parameter specifies the user that binds to the LDAP servers. For Active Directory servers, specify the user in the account (DOMAIN\user) or principal (user@domain.com) form. Otherwise, specify the user in distinguished name (CN=user,DC=domain,DC=com) form. This parameter is ignored if -bind-as-cifs-server is set.

[-base-dn <ldap_dn>] - Base DN
This parameter specifies the default base DN for all searches, including user, group, and netgroup searches. For example, “DC=example,DC=com”. If you do not specify this parameter, the default is the root, specified by an empty (“”) set.
[-base-scope {base|onelevel|subtree}] - Base Search Scope
   This parameter specifies the default search scope for LDAP queries. Specify base to search just the named entry, onelevel to search entries immediately below the DN, or subtree to search the named DN entry and the entire subtree below the DN. If you do not specify this parameter, the scope is set to subtree by default.

[-user-dn <ldap_dn>] - User DN (privilege: advanced)
   This parameter specifies the user DN, which overrides the base DN for user lookups.
   Note: To specify multiple DNs, separate multiple DN entries with semicolons (;). If you configure multiple user or group DNs and a DN contains a semicolon, add an escape character (\) immediately before the semicolon or enclose the entire DN with quotation marks (").

[-user-scope {base|onelevel|subtree}] - User Search Scope (privilege: advanced)
   This parameter specifies the user search scope. If you do not specify this parameter, the scope is set to subtree by default.

[-group-dn <ldap_dn>] - Group DN (privilege: advanced)
   This parameter specifies the group DN, which overrides the base DN for group lookups.
   Note: To specify multiple DNs, separate multiple DN entries with semicolons (;). If you configure multiple user or group DNs and a DN contains a semicolon, add an escape character (\) immediately before the semicolon or enclose the entire DN with quotation marks (").

[-group-scope {base|onelevel|subtree}] - Group Search Scope (privilege: advanced)
   This parameter specifies the group search scope. If you do not specify this parameter, the scope is set to subtree by default.

[-netgroup-dn <ldap_dn>] - Netgroup DN (privilege: advanced)
   This parameter specifies the netgroup DN, which overrides the base DN netgroup lookups.
   Note: To specify multiple DNs, separate multiple DN entries with semicolons (;). If you configure multiple netgroup DNs and a DN contains a semicolon, add an escape character (\) immediately before the semicolon or enclose the entire DN with quotation marks (").

[-netgroup-scope {base|onelevel|subtree}] - Netgroup Search Scope (privilege: advanced)
   This parameter specifies the netgroup search scope. If you do not specify this parameter, the scope is set to subtree by default.

[-use-start-tls {true|false}] - Use start-tls Over LDAP Connections
   This parameter specifies whether to use Start TLS over LDAP connections. When enabled, the communication between the Data ONTAP LDAP Client and the LDAP Server will be encrypted using Start TLS. Start TLS is a mechanism to provide secure communication by using the TLS/SSL protocols. If you do not specify this parameter, the default is false.

[-is-netgroup-byhost-enabled {true|false}] - Enable Netgroup-By-Host Lookup (privilege: advanced)
   Use this parameter to enable or disable netgroup-by-host lookup. If your LDAP directory contains map structures equivalent to the netgroup.byhost map in NIS, enabling this feature greatly speeds up netgroup resolution queries over LDAP. By default this parameter is set to false.

[-netgroup-byhost-dn <ldap_dn>] - Netgroup-By-Host DN (privilege: advanced)
   This parameter specifies the netgroup-by-host DN, which overrides the base DN for netgroup-by-host lookups.
   Note: To specify multiple DNs, separate multiple DN entries with semicolons (;). If you configure multiple netgroup DNs and a DN contains a semicolon, add an escape character (\) immediately before the semicolon or enclose the entire DN with quotation marks (").

[-netgroup-byhost-scope {base|onelevel|subtree}] - Netgroup-By-Host Scope (privilege: advanced)
   This parameter specifies the netgroup-by-host search scope for LDAP queries. If you do not specify this parameter, the scope is set to subtree by default.
[\-session\-security \{none\|sign\|seal\}] - Client Session Security

This parameter specifies the level of security to be used for LDAP communications. If you do not specify this parameter, the default is none.

LDAP Client Session Security can be one of the following:

- none - No Signing or Sealing.
- sign - Sign LDAP traffic.
- seal - Seal and Sign LDAP traffic.

Examples

The following example creates an LDAP client configuration named corp that makes anonymous binds to 172.160.0.100 and 172.16.0.101 for Vserver vs1:

```
cluster1::> vserver services name-service ldap client create -vserver vs1 -client-config corp -servers 172.160.0.100,172.16.0.101
```

The following example creates an LDAP client configuration named corp that makes binds to 172.160.0.100 and 172.16.0.101 for Vserver vs1 for bind-dn diag:

```
cluster1::> vserver services name-service ldap client create -vserver vs1 -client-config corp -servers 172.160.0.100,172.16.0.101 -bind-dn diag
Please enter password:
Confirm password:
```

The following example creates an LDAP client configuration with multiple user DNs.

Note: The following commands are only available in advanced mode.

```
cluster1::*> vserver services ldap client create -vserver vs1 -client-config corp -servers 172.160.0.100,172.16.0.101 -user-dn "ou=People,dc=mypc,dc=example,dc=com; ou=People1,dc=mypc1,dc=example2,dc=com"
```

The following example creates an LDAP client configuration with multiple user DNs, one of them containing a semicolon

```
cluster1::*> vserver services ldap client create -vserver vs1 -client-config corp -servers 172.160.0.100,172.16.0.101 -user-dn "ou=People,dc=mypc,dc=example,dc=com\; ou=People1,dc=mypc1,dc=example2,dc=com"
```

The following example creates an LDAP client configuration with netgroup by host DN.

```
cluster1::*> vserver services ldap client create -vserver vs1 -client-config corp -servers 172.160.0.100,172.16.0.101 -user-dn "ou=People\;,dc=mypc,dc=example,dc=com\; ou=People1,dc=mypc1,dc=example2,dc=com"
```

**vserver services name-service ldap client delete**

Delete an LDAP client configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `vserver services name-service ldap client delete` command deletes an LDAP client configuration. A Vserver administrator can only delete configurations owned by the Vserver.

**Parameters**

- `-vserver <Vserver Name>` - *Vserver*
  
  This parameter specifies the name of the Vserver which owns the LDAP client you want to delete. A data Vserver or admin Vserver can be specified.

- `-client-config <text>` - *Client Configuration Name*
  
  This parameter specifies the name of the LDAP client configuration you want to delete.

**Examples**
The following example deletes an LDAP client configuration named `corp` owned by Vserver `vs1`:

```
cluster1::> vserver services name-service ldap client delete -vserver vs1 -client-config corp
```

**vserver services name-service ldap client modify**

Modify an LDAP client configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `vserver services name-service ldap client modify` command modifies an LDAP client configuration. A Vserver administrator can only modify only configurations owned by the Vserver.

**Parameters**

- `-vserver <Vserver Name>` - *Vserver*
  
  This parameter specifies the name of the Vserver which owns the LDAP client you want to modify. A data Vserver or admin Vserver can be specified.

- `-client-config <text>` - *Client Configuration Name*
  
  This parameter specifies the name of the LDAP client configuration.
[-servers <IP Address>, ...] - LDAP Server List
This parameter specifies the list of LDAP servers used when making LDAP connections using this client configuration. If you specify this parameter, you cannot specify the -ad-domain, -preferred-ad-servers or -bind-as-cifs-server parameters.

[-ad-domain <TextNoCase>] - Active Directory Domain
This parameter specifies the name of the Active Directory domain used to discover LDAP servers for use by this client. This assumes that the Active Directory schema has been extended to act as a NIS replacement. If you use this parameter, you cannot specify the -servers parameter. However, you can specify a list of preferred servers using the -preferred-ad-servers parameter.

[-preferred-ad-servers <IP Address>, ...] - Preferred Active Directory Servers
This parameter specifies a list of LDAP servers that are preferred over those that are discovered in the domain specified in the -ad-domain parameter.

[-bind-as-cifs-server {true|false}] - Bind Using the Vserver's CIFS Credentials
This parameter specifies whether or not LDAP binds made using this client configuration use the Vserver's CIFS server credentials. If you do not specify this parameter, the default is false.

[-schema <text>] - Schema Template
This parameter specifies the name of the schema template the Vserver uses when making LDAP queries. You can view and modify the templates using the vserver services name-service ldap client schema commands.

[-port <integer>] - LDAP Server Port
This parameter specifies the port that the LDAP client uses to connect to LDAP servers. If you do not specify this parameter, the default is port 389.

[-query-timeout <integer>] - Query Timeout (sec)
This parameter specifies the amount of time (in seconds) that the LDAP client waits for a query to complete. If you do not specify this parameter, the default is 3 seconds.

[-min-bind-level {anonymous|simple|sasl}] - Minimum Bind Authentication Level
This parameter specifies the lowest acceptable level of security the LDAP client uses to bind to an LDAP server. If you do not specify this parameter, the default is an anonymous bind.

[-bind-dn <ldap_dn>] - Bind DN (User)
This parameter specifies the user that binds to the LDAP servers. For Active Directory servers, specify the user in the account (DOMAIN\user) or principal (user@domain.com) form. Otherwise, specify the user in distinguished name (CN=user,DC=domain,DC=com) form. This parameter is ignored if -bind-as-cifs-server is set.

[-base-dn <ldap_dn>] - Base DN
This parameter specifies the default base DN for all searches, including user, group, and netgroup searches. For example, "DC=example,DC=com". If you do not specify this parameter, the default is the root, specified by an empty (""") set.

[-base-scope {base|onelevel|subtree}] - Base Search Scope
This parameter specifies the default search scope for LDAP queries. Specify base to search just the named entry, onelevel to search entries immediately below the DN, or subtree to search the named DN entry and the entire subtree below the DN. If you do not specify this parameter, the scope is set to subtree by default.

[-user-dn <ldap_dn>] - User DN (privilege: advanced)
This parameter specifies the user DN, which overrides the base DN for user lookups.

Note: To specify multiple DNs, separate multiple DN entries with semicolons (;). If you configure multiple user or group DNs and a DN contains a semicolon, add an escape character (\) immediately before the semicolon or enclose the entire DN with quotation marks (".

vserver services commands 1809
[-user-scope {base|onelevel|subtree}] - User Search Scope (privilege: advanced)

This parameter specifies the user search scope. If you do not specify this parameter, the scope is set to
subtree by default.

[-group-dn <ldap_dn>] - Group DN (privilege: advanced)

This parameter specifies the group DN, which overrides the base DN for group lookups.

Note: To specify multiple DNs, separate multiple DN entries with semicolons (;). If you configure multiple
user or group DNs and a DN contains a semicolon, add an escape character (\) immediately before the
semicolon or enclose the entire DN with quotation marks (").

[-group-scope {base|onelevel|subtree}] - Group Search Scope (privilege: advanced)

This parameter specifies the group search scope. If you do not specify this parameter, the scope is set to
subtree by default.

[-netgroup-dn <ldap_dn>] - Netgroup DN (privilege: advanced)

This parameter specifies the netgroup DN, which overrides the base DN netgroup lookups.

Note: To specify multiple DNs, separate multiple DN entries with semicolons (;). If you configure multiple
netgroup DNs and a DN contains a semicolon, add an escape character (\) immediately before the
semicolon or enclose the entire DN with quotation marks (").

[-netgroup-scope {base|onelevel|subtree}] - Netgroup Search Scope (privilege: advanced)

This parameter specifies the netgroup search scope. If you do not specify this parameter, the scope is set to
subtree by default.

[-use-start-tls {true|false}] - Use start-tls Over LDAP Connections

This parameter specifies whether or not to use Start TLS over LDAP connections. When enabled, the
communication between the Data ONTAP LDAP Client and the LDAP Server will be encrypted using Start
TLS. Start TLS is a mechanism to provide secure communication by using the TLS/SSL protocols. If you
do not specify this parameter, the default is false.

[-is-netgroup-byhost-enabled {true|false}] - Enable Netgroup-By-Host Lookup (privilege: advanced)

Use this parameter to enable or disable netgroup-by-host lookup. If your LDAP directory contains map
structures equivalent to the netgroup.byhost map in NIS, enabling this feature greatly speeds up netgroup
resolution over LDAP. By default this parameter is set to false.

[-netgroup-byhost-dn <ldap_dn>] - Netgroup-By-Host DN (privilege: advanced)

This parameter specifies the netgroup-by-host DN, which overrides the base DN for netgroup-by-host lookups.

Note: To specify multiple DNs, separate multiple DN entries with semicolons (;). If you configure multiple
netgroup DNs and a DN contains a semicolon, add an escape character (\) immediately before the
semicolon or enclose the entire DN with quotation marks (").

[-netgroup-byhost-scope {base|onelevel|subtree}] - Netgroup-By-Host Scope (privilege: advanced)

This parameter specifies the netgroup-by-host search scope for LDAP queries. If you do not specify this
parameter, the scope is set to subtree by default.

[-session-security {none|sign|seal}] - Client Session Security

This parameter specifies the level of security to be used for LDAP communications. If you do not specify this
parameter, the default is none.

LDAP Client Session Security can be one of the following:

- none - No Signing or Sealing.
- sign - Sign LDAP traffic.
- seal - Seal and Sign LDAP traffic.
Examples
The following example modifies an existing LDAP client configuration named corp owned by Vserver vs1 to require simple binds using the administrator@example.com account:

```
cluster1::> vserver services name-service ldap client modify -client-config corp -vserver vs1 -bind-dn administrator@example.com -min-bind-level simple
```

The following example modifies the user DN of an existing LDAP client configuration to contain multiple DNs separated by a semicolon.

```
cluster1::> vserver services ldap client modify -client-config corp -vserver vs1 -bind-dn administrator@example.com -user-dn "ou=People,dc=mypc,dc=example,dc=in; ou=People1,dc=mypc,dc=example2,dc=com" -min-bind-level simple
```

The following example demonstrates how you can use a semicolon as a valid character in a DN instead of a separator.

```
cluster1::> vserver services ldap client modify -client-config corp -vserver vs1 -bind-dn administrator@example.com -user-dn "ou=People\;,dc=mypc,dc=example,dc=com; ou=People1,dc=mypc,dc=example2,dc=com"
```

The following example modifies an existing LDAP client configuration with multiple user DNs, one of them containing a semicolon and a backslash.

```
cluster1::> vserver services ldap client modify -client-config corp -vserver vs1 -bind-dn administrator@example.com -user-dn "ou=People\;,dc=mypc,dc=example,dc=com\; ou=People1,dc=mypc,dc=example2,dc=com"
```

The following example modifies an existing LDAP client configuration with netgroup by host DN.

```
cluster1::> vserver services ldap client modify -client-config corp -vserver vs1 -client-config corp -netgroup-byhost-dn nisMapName="netgroup.byhost",dc=rfcbis,dc=com
```

`vserver services name-service ldap client modify-bind-password`
Modify Bind Password of an LDAP client configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `vserver services name-service ldap client modify-bind-password` command modifies bind-password of a given LDAP client configuration.
**Parameters**

[-vserver <Vserver Name>] - Vserver

This parameter specifies the name of the Vserver which owns the LDAP client you want to modify. A data Vserver or admin Vserver can be specified.

-client-config <text> - Client Configuration Name

This parameter specifies the name of the LDAP client configuration.

**Examples**

The following example modifies the password for a given LDAP client configuration

```
cluster1::> vserver services name-service ldap client modify-bind-password -client-config corp
Please enter password:
Confirm password:
```

**vserver services name-service ldap client show**

Display LDAP client configurations

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The `vserver services name-service ldap client show` command displays information about LDAP client configurations which a Vserver can be associated with. An LDAP client configuration created by a Vserver's administrator or by the cluster administrator for the Vserver is owned by the Vserver. A cluster-wide LDAP client configuration is created by a cluster administrator by specifying the admin Vserver's name as a value to the -vserver parameter. In addition to its owned LDAP client configurations, a Vserver can be associated with such cluster-wide LDAP client configurations.

**Parameters**

```
[-fields <fieldname>, ...] 
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance] 
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver

If you specify this parameter, the command displays all LDAP client configurations that can be associated with the specified Vserver. A data Vserver or admin Vserver can be specified.

[-client-config <text>] - Client Configuration Name

If you specify this parameter, the command displays information about the LDAP client configuration you specify.

[-servers <IP Address>, ...] - LDAP Server List

If you specify this parameter, the command displays LDAP client configurations using the specified list of servers.

[-ad-domain <TextNoCase>] - Active Directory Domain

If you specify this parameter, the command displays LDAP client configurations using the specified domain to discover their list of LDAP servers.

[-preferred-ad-servers <IP Address>, ...] - Preferred Active Directory Servers

If you specify this parameter, the command displays LDAP client configurations using the specified list of preferred servers.
[-bind-as-cifs-server [true|false]] - Bind Using the Vserver's CIFS Credentials
   If you specify this parameter, the command displays LDAP client configurations that bind using CIFS server credentials.

[-schema <text>] - Schema Template
   If you specify this parameter, the command displays LDAP client configurations using the specified schema.

[-port <integer>] - LDAP Server Port
   If you specify this parameter, the command displays LDAP client configurations using the specified server port.

[-query-timeout <integer>] - Query Timeout (sec)
   If you specify this parameter, the command displays LDAP client configurations using the specified query timeout (in seconds).

[-min-bind-level {anonymous|simple|sasl}] - Minimum Bind Authentication Level
   If you specify this parameter, the command displays LDAP client configurations using the specified minimum bind level.

[-bind-dn <ldap_dn>] - Bind DN (User)
   If you specify this parameter, the command displays LDAP client configurations using the specified bind DN.

[-base-dn <ldap_dn>] - Base DN
   If you specify this parameter, the command displays LDAP client configurations using the specified base DN.

[-base-scope {base|onelevel|subtree}] - Base Search Scope
   If you specify this parameter, the command displays LDAP client configurations using the specified base search scope.

[-user-dn <ldap_dn>] - User DN (privilege: advanced)
   If you specify this parameter, the command displays LDAP client configurations using the specified user DN.

[-user-scope {base|onelevel|subtree}] - User Search Scope (privilege: advanced)
   If you specify this parameter, the command displays LDAP client configurations using the specified user search scope.

[-group-dn <ldap_dn>] - Group DN (privilege: advanced)
   If you specify this parameter, the command displays LDAP client configurations using the specified group DN.

[-group-scope {base|onelevel|subtree}] - Group Search Scope (privilege: advanced)
   If you specify this parameter, the command displays LDAP client configurations using the specified group search scope.

[-netgroup-dn <ldap_dn>] - Netgroup DN (privilege: advanced)
   If you specify this parameter, the command displays LDAP client configurations using the specified netgroup DN.

[-netgroup-scope {base|onelevel|subtree}] - Netgroup Search Scope (privilege: advanced)
   If you specify this parameter, the command displays LDAP client configurations using the specified netgroup search scope.

[-is-owner [true|false]] - Vserver Owns Configuration
   If you set this parameter to true, the command displays LDAP client configurations with the Vservers which own them.

[-use-start-tls [true|false]] - Use start-tls Over LDAP Connections
   This parameter specifies whether or not to use Start TLS over LDAP connections. When enabled, the communication between the Data ONTAP LDAP Client and the LDAP Server will be encrypted using Start
TLS. Start TLS is a mechanism to provide secure communication by using the TLS/SSL protocols. If you do not specify this parameter, the default is false.

[-is-netgroup-byhost-enabled {true|false}] - Enable Netgroup-By-Host Lookup (privilege: advanced)
   If you set this parameter to true, the command displays LDAP client configurations for which netgroup-by-host lookup is enabled.

[-netgroup-byhost-dn <ldap_dn>] - Netgroup-By-Host DN (privilege: advanced)
   If you specify this parameter, the command displays LDAP client configurations using the specified netgroup-by-host DN.

[-netgroup-byhost-scope {base|onelevel|subtree}] - Netgroup-By-Host Scope (privilege: advanced)
   If you specify this parameter, the command displays LDAP client configurations using the specified netgroup-by-host search scope.

[-session-security {none|sign|seal}] - Client Session Security
   If this parameter is set to seal, the command displays LDAP client configurations where both signing and sealing are required for LDAP communications. If set to sign, the command displays LDAP client configurations where only signing is required for LDAP communications. If set to none, the command displays LDAP client configurations where no security is required for LDAP communications.

**Examples**
The following example shows a summary of all of the LDAP client configurations available for Vserver vs1:

```
cluster1::> vserver services name-service ldap show -vserver vs1

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Client</th>
<th>LDAP Servers</th>
<th>Active Directory</th>
<th>Domain</th>
<th>Schema</th>
<th>Min Bind Level</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>
<td>corp</td>
<td>172.16.0.100</td>
<td>-</td>
<td>RFC-2307</td>
<td>anonymous</td>
<td></td>
</tr>
<tr>
<td>vs1</td>

<td>172.16.0.200</td>
<td>-</td>
<td>RFC-2307</td>
<td>simple</td>
<td></td>
</tr>
</tbody>
</table>
```

**vserver services name-service ldap client schema commands**

Manage LDAP client schema templates
vserver services name-service ldap client schema copy

Copy an existing LDAP schema template

**Availability:** This command is available to cluster and Vserver administrators at the advanced privilege level.

**Description**
The vserver services name-service ldap client schema copy command creates a new LDAP schema template from an existing one. In addition to an owned LDAP schema template, a Vserver administrator can also copy a cluster-wide LDAP schema template that is owned by the admin Vserver.

**Parameters**

[-vserver <Vserver Name>] - Vserver
   This parameter specifies the Vserver for which you want to copy an existing LDAP schema template.

-<schema <text>> - Schema Template
   This parameter specifies the name of the existing schema template you want to copy.

-<new-schema-name <text>> - New Schema Template Name
   This parameter specifies the name of the schema template copy.

**Examples**
The following example creates a copy of the RFC-2307 schema template and names it corp-schema for Vserver "vs1":

1814
vserver services name-service ldap client schema delete

Delete an LDAP schema template

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

**Description**
The `vserver services name-service ldap client schema delete` command deletes an LDAP schema template. A Vserver administrator can only delete templates owned by the Vserver.

**Note:** You cannot delete the default schema templates.

**Parameters**

- `-vserver <Vserver Name>` - Vserver
  
  This parameter specifies the name of Vserver owning the LDAP schema template you want to delete.

- `-schema <text>` - Schema Template
  
  This parameter specifies the name of the schema template you want to delete.

**Examples**
The following example deletes a schema template named `corp-schema` owned by Vserver `vs1`:

```
calendar1::> vserver services name-service ldap client schema delete -vserver vs1 -schema corp-schema
```

vserver services name-service ldap client schema modify

Modify an LDAP schema template

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

**Description**
The `vserver services name-service ldap client schema modify` command modifies an existing LDAP schema template. You cannot modify the default schema templates. Create a copy of a default schema template using the `vserver services name-service ldap client schema copy` command, and then modify the copy. A Vserver administrator can only modify templates owned by the Vserver.

**Parameters**

- `-vserver <Vserver Name>` - Vserver
  
  This parameter specifies the name of the Vserver owning the LDAP schema template you want to modify.

- `-schema <text>` - Schema Template
  
  This parameter specifies the name of the schema template you want to modify.

- `-comment <text>` - Comment
  
  This parameter specifies a comment that describes the schema template.

- `-posix-account-object-class <text>` - RFC 2307 posixAccount Object Class
  
  This parameter specifies the RFC 2307 posixAccount object class name defined by the schema.

- `-posix-group-object-class <text>` - RFC 2307 posixGroup Object Class
  
  This parameter specifies the RFC 2307 posixGroup object class name defined by the schema.
[-nis-netgroup-object-class <text>] - RFC 2307 nisNetgroup Object Class
   This parameter specifies the RFC 2307 nisNetgroup object class name defined by the schema.

[-uid-attribute <text>] - RFC 2307 uid Attribute
   This parameter specifies the RFC 2307 uid attribute name defined by the schema.

[-uid-number-attribute <text>] - RFC 2307 uidNumber Attribute
   This parameter specifies the RFC 2307 uidNumber attribute name defined by the schema.

[-gid-number-attribute <text>] - RFC 2307 gidNumber Attribute
   This parameter specifies the RFC 2307 gidNumber attribute name defined by the schema.

[-cn-group-attribute <text>] - RFC 2307 cn (for Groups) Attribute
   This parameter specifies the RFC 2307 cn (for Groups) attribute name defined by the schema.

[-cn-netgroup-attribute <text>] - RFC 2307 cn (for Netgroups) Attribute
   This parameter specifies the RFC 2307 cn (for Netgroups) attribute name defined by the schema.

[-user-password-attribute <text>] - RFC 2307 userPassword Attribute
   This parameter specifies the RFC 2307 userPassword attribute name defined by the schema.

[-gecos-attribute <text>] - RFC 2307 gecos Attribute
   This parameter specifies the RFC 2307 gecos attribute name defined by the schema.

[-home-directory-attribute <text>] - RFC 2307 homeDirectory Attribute
   This parameter specifies the RFC 2307 homeDirectory attribute name defined by the schema.

[-login-shell-attribute <text>] - RFC 2307 loginShell Attribute
   This parameter specifies the RFC 2307 loginShell attribute name defined by the schema.

[-member-uid-attribute <text>] - RFC 2307 memberUid Attribute
   This parameter specifies the RFC 2307 memberUid attribute name defined by the schema.

[-member-nis-netgroup-attribute <text>] - RFC 2307 memberNisNetgroup Attribute
   This parameter specifies the RFC 2307 memberNisNetgroup attribute name defined by the schema.

[-nis-netgroup-triple-attribute <text>] - RFC 2307 nisNetgroupTriple Attribute
   This parameter specifies the RFC 2307 nisNetgroupTriple attribute name defined by the schema.

[-enable-rfc2307bis {true|false}] - Enable Support for Draft RFC 2307bis
   This parameter specifies whether RFC 2307bis is enabled for the schema.

[-group-of-unique-names-object-class <text>] - RFC 2307bis groupOfUniqueNames Object Class
   This parameter specifies the RFC 2307bis groupOfUniqueNames object class name defined by the schema.
   This parameter takes effect only when RFC 2307bis is enabled for the schema.

[-unique-member-attribute <text>] - RFC 2307bis uniqueMember Attribute
   This parameter specifies the RFC 2307bis uniqueMember attribute name defined by the schema. This parameter takes effect only when RFC 2307bis is enabled for the schema.

[-windows-to-unix-object-class <text>] - Data ONTAP Name Mapping windowsToUnix Object Class
   This parameter specifies the name mapping windowsToUnix object class name defined by the schema.

[-windows-account-attribute <text>] - Data ONTAP Name Mapping windowsAccount Attribute
   This parameter specifies the name mapping windowsAccount attribute name defined by the schema.

[-windows-to-unix-attribute <text>] - Data ONTAP Name Mapping windowsToUnix Attribute
   This parameter specifies the name mapping windowsToUnix attribute name defined by the schema.
[[-windows-to-unix-no-domain-prefix \{true|false\}\] - No Domain Prefix for windowsToUnix Name Mapping

This parameter specifies the name mapping windowsToUnixNoDomainPrefix setting defined by the schema.

[[-nis-object-class \text{\textless}text\textgreater]\] - RFC 2307 nisObject Object Class

This parameter specifies the nisObject class name defined by the schema. This parameter takes effect only when netgroup.byhost is enabled for the vservcer.

[[-nis-mapname-attribute \text{\textless}text\textgreater]\] - RFC 2307 nisMapName Attribute

This parameter specifies the nisMapName attribute name defined by the schema. This parameter takes effect only when netgroup.byhost is enabled for the vservcer.

[[-nis-mapentry-attribute \text{\textless}text\textgreater]\] - RFC 2307 nisMapEntry Attribute

This parameter specifies the nisMapEntry attribute name defined by the schema. This parameter takes effect only when netgroup.byhost is enabled for the vservcer.

### Examples

The following example modifies the schema template called corp-schema owned by Vserver vs1 to use User as the uid attribute name:

```
cluster1::> vserver services name-service ldap client schema modify -vserver vs1 -schema corp-schema -uid-attribute User
```

vserver services name-service ldap client schema show

Display LDAP schema templates

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The vserver services name-service ldap client schema show command shows information about LDAP schema templates which a Vserver can access. An LDAP schema template created by a Vserver's administrator or by the cluster administrator for the Vserver is owned by the Vserver. A cluster-wide LDAP schema template is created by a cluster administrator by specifying the admin Vserver's name as a value to the -vserver parameter. In addition to its owned LDAP schema templates, a Vserver can access such cluster-wide LDAP schema templates.

**Parameters**

{-fields \text{\textless}fieldname\textgreater, ...}

If you specify the -fields \text{\textless}fieldname\textgreater, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[[-instance]]

If you specify the -instance parameter, the command displays detailed information about all fields.

[[-vserver \text{\textless}Vserver Name\textgreater]\] - Vserver

If you specify this parameter, the command displays all LDAP schema templates that can be accessed by the specified Vserver.

[[-schema \text{\textless}text\textgreater]\] - Schema Template

If you specify this parameter, the command displays the schema template with the specified name.
[\-comment <text>] - Comment

If you specify this parameter, the command displays schema templates with the specified comment.

[\-posix-account-object-class <text>] - RFC 2307 posixAccount Object Class

If you specify this parameter, the command displays schema templates with the specified posixAccount object class.

[\-posix-group-object-class <text>] - RFC 2307 posixGroup Object Class

If you specify this parameter, the command displays schema templates with the specified posixGroup object class.

[\-nis-netgroup-object-class <text>] - RFC 2307 nisNetgroup Object Class

If you specify this parameter, the command displays schema templates with the specified nisNetgroup object class.

[\-uid-attribute <text>] - RFC 2307 uid Attribute

If you specify this parameter, the command displays schema templates with the specified uid attribute.

[\-uid-number-attribute <text>] - RFC 2307 uidNumber Attribute

If you specify this parameter, the command displays schema templates with the specified uidNumber attribute.

[\-gid-number-attribute <text>] - RFC 2307 gidNumber Attribute

If you specify this parameter, the command displays schema templates with the specified gidNumber attribute.

[\-cn-group-attribute <text>] - RFC 2307 cn (for Groups) Attribute

If you specify this parameter, the command displays schema templates with the specified cn (for Groups) attribute.

[\-cn-netgroup-attribute <text>] - RFC 2307 (for Netgroups) Attribute

If you specify this parameter, the command displays schema templates with the specified cn (for Netgroups) attribute.

[\-user-password-attribute <text>] - RFC 2307 userPassword Attribute

If you specify this parameter, the command displays schema templates with the specified userPassword attribute.

[\-gecos-attribute <text>] - RFC 2307 gecos Attribute

If you specify this parameter, the command displays schema templates with the specified gecos attribute.

[\-home-directory-attribute <text>] - RFC 2307 homeDirectory Attribute

If you specify this parameter, the command displays schema templates with the specified homeDirectory attribute.

[\-login-shell-attribute <text>] - RFC 2307 loginShell Attribute

If you specify this parameter, the command displays schema templates with the specified loginShell attribute.

[\-member-uid-attribute <text>] - RFC 2307 memberUid Attribute

If you specify this parameter, the command displays schema templates with the specified memberUid attribute.

[\-member-nis-netgroup-attribute <text>] - RFC 2307 memberNisNetgroup Attribute

If you specify this parameter, the command displays schema templates with the specified memberNisNetgroup attribute.

[\-nis-netgroup-triple-attribute <text>] - RFC 2307 nisNetgroupTriple Attribute

If you specify this parameter, the command displays schema templates with the specified nisNetgroupTriple attribute.

[\-enable-rfc2307bis \{true|false\}] - Enable Support for Draft RFC 2307bis

If you set this parameter to true, the command displays RFC 2307bis enabled LDAP schema templates.
[group-of-unique-names-object-class <text>] - RFC 2307bis groupOfUniqueNames Object Class
If you specify this parameter, the command displays schema templates with the specified
groupOfUniqueNames object class.

[unique-member-attribute <text>] - RFC 2307bis uniqueMember Attribute
If you specify this parameter, the command displays schema templates with the specified uniqueMember
attribute.

[windows-to-unix-object-class <text>] - Data ONTAP Name Mapping windowsToUnix Object Class
If you specify this parameter, the command displays schema templates with the specified windowsToUnix
object class.

[windows-account-attribute <text>] - Data ONTAP Name Mapping windowsAccount Attribute
If you specify this parameter, the command displays schema templates with the specified windowsAccount
attribute.

[windows-to-unix-attribute <text>] - Data ONTAP Name Mapping windowsToUnix Attribute
If you specify this parameter, the command displays schema templates with the specified windowsToUnix
attribute.

[windows-to-unix-no-domain-prefix {true|false}] - No Domain Prefix for windowsToUnix Name
Mapping
If you specify this parameter, the command displays schema templates with the specified
windowsToUnixNoDomainPrefix setting.

[is-owner {true|false}] - Vserver Owns Schema
If you set this parameter to true, the command displays LDAP schema templates with the Vservers which own
them.

[nis-object-class <text>] - RFC 2307 nisObject Object Class
If you specify this parameter, the command displays schema templates with the specified
nisObject attribute.

[nis-mapname-attribute <text>] - RFC 2307 nisMapName Attribute
If you specify this parameter, the command displays schema templates with the specified nisMapName
attribute.

[nis-mapentry-attribute <text>] - RFC 2307 nisMapEntry Attribute
If you specify this parameter, the command displays schema templates with the specified nisMapEntry
attribute.

Examples
The following example shows a summary of all of the default LDAP schema templates defined in the cluster:

```
cluster1::> vserver services name-service ldap client schema show
Vserver Schema Template Comment
-------- --------------- -------------------------------------------------------
cluster-node3 MS-AD-BIS       Schema based on Active Directory Identity Management for UNIX (read-only)
cluster-node3 AD-IDMU         Schema based on Active Directory Identity Management for UNIX (read-only)
cluster-node3 AD-SFU          Schema based on Active Directory Services for UNIX (read-only)
cluster-node3 RFC-2307        Schema based on RFC 2307 (read-only)
4 entries were displayed.
```

vserver services name-service netgroup commands
Manage local netgroups
vserver services name-service netgroup load

Load netgroup definitions from a URI

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The `vserver services name-service netgroup load` command loads netgroup definitions from a uniform resource identifier (URI) to a specified Vserver. You can load from a netgroup file at an FTP or a HTTP location (source URI) using the respective protocol.

Before Data ONTAP saves the new netgroup definitions, it checks that the netgroup file does not have any file structure issues, does not contain any syntax errors, and all entries comply with the following rules:

- A domain name consists of one or more labels separated by periods (.)
- A hostname is a valid domain name, IPv4 address, or IPv6 address.
- Valid characters for a label are all alphanumeric characters, underscore (_), and dash (-). A label may not begin or end with a dash.
- Valid characters for a username are all ASCII printable characters with the exception of whitespace, parentheses, and comma (,).
- Valid characters for a netgroup name are all alphanumeric characters, underscore (_), and dash (-). A netgroup name may not begin with a dash.
- A single line in the netgroup file may not exceed 4096 characters.

If the file is found to contain errors, Data ONTAP will issue an error to that effect and netgroup definitions will not be loaded into the specified Vserver. After correcting the error, reload the netgroup file into the specified Vserver.

Parameters

- `vserver <vserver name>` - Vserver
  This parameter specifies the Vserver for which you want to load netgroup definitions.

- `source { ftp|http://(hostname|IPv4 Address) ['[ 'IPv6 Address']'] ... }` - URI to Load from
  This parameter specifies the source URI from which you want to load netgroup definitions. You can load from a URI either using the FTP or the HTTP protocol.

- `-foreground {true|false}]` - Load Netgroup in the Foreground
  This parameter specifies whether the operation runs in the foreground. The default setting is true (the operation runs in foreground). When set to true, the command does not return until the operation completes.

- `-skip-hostname-validation [true]` - Skip Hostname Validation (privilege: advanced)
  If this parameter is specified, the hostname validation is skipped.

- `-skip-file-size-check [true]` - Skip File Size Check Before Download (privilege: advanced)
  If this parameter is specified, the file is downloaded without checking the file size. Use this parameter if the server does not supply the file size or does not provide an accurate value. This parameter can also be used to download a file greater than the default 5 MB size limit.

  **Note:** If this parameter is specified and the file is very large, the transfer may take a long time or fail due to disk space limitations.

Examples

The following example loads netgroup definitions into a Vserver named vs1 from the file netgroup1 at FTP location ftp:// ftp.example.com:
vserver services name-service netgroup status

Display local netgroup definitions status

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description

The vserver services name-service netgroup status command displays the status of local netgroup definitions across a cluster. This enables you to verify that netgroup definitions are consistent across all nodes that back a Vserver into which netgroup definitions have been loaded.

The command displays the following information:

- Vserver name
- Node name
- Load time for netgroup definitions
- Hash value of the netgroup definitions
- Hash value of the netgroup-by-host database

Parameters

{ [-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

  [-instance]}
  If you specify the -instance parameter, the command displays detailed information about all fields.

  [-vserver <vserver name>] - Vserver
  If you specify this parameter, the command displays the netgroup status only for the specified Vserver.

  [-node {<nodename>|local}] - Node
  If you specify this parameter, the command displays the netgroup status only for the specified node.

  [-timestamp <MM/DD/YYYY HH:MM:SS>] - Load Time
  If you specify this parameter, the command displays the status only for the netgroup definitions that were loaded at the specified time. Specify time in the format MM/DD/YYYY HH:MM:SS. Note that the load time stamps for identical definitions are different on different nodes, because each node downloads the definitions from the URI individually.

  [-hashvalue <text>] - Hash Value
  If you specify this parameter, command displays the status only for the netgroup definitions that have the specified hash value. Note that the primary purpose of the command is to verify that the definitions on all nodes have the same hash value, so querying on a specific hash value is not useful in most cases.

  [-hashvalue-byhost <text>] - Hash Value Byhost
  If you specify this parameter, the command displays the status only for the netgroup definitions that have the specified hash value for netgroup-by-host database. Note that the primary purpose of the command is to verify that the definitions on all nodes have the same hash value for netgroup-by-host database.
Examples

The following example displays the netgroup definition status for all Vservers:

```bash
cluster1::*> vserver services name-service netgroup status

+-----------+-------+-------------------+-------------------+--------------------+
| Vserver   | Node  | Load Time         | Hash Value        | Hash Value By-Host |
|-----------+-------+-------------------+-------------------+--------------------|
| vs1       | node1 | 9/20/2008 16:04:55| e6cb38ec1396a280c0d2b77e3a84eda2| e6cb38ec1396a280c0d2b77e3a84eda2 |
|           | node2 | 9/20/2008 16:04:53| e6cb38ec1396a280c0d2b77e3a84eda2| e6cb38ec1396a280c0d2b77e3a84eda2 |
| vs2       | node3 | 9/20/2008 16:06:26| c0d2b77e3a84eda2e6cb38ec1396a280| c0d2b77e3a84eda2e6cb38ec1396a280 |
|           | node4 | 9/20/2008 16:06:27| c0d2b77e3a84eda2e6cb38ec1396a280| c0d2b77e3a84eda2e6cb38ec1396a280 |
+-----------+-------+-------------------+-------------------+--------------------+
4 entries were displayed.
```

vserver services name-service netgroup file commands

Manage Local Netgroup Files

Managing local netgroup files

**vserver services name-service netgroup file delete**

Remove a local netgroup file

_Availability:_ This command is available to _cluster_ and _Vserver_ administrators at the _admin_ privilege level.

_Description_

The `vserver services name-service netgroup file delete` command deletes the local netgroup files for given Vservers.

_Parameters_

- `-vserver <vserver name>` - _Vserver_

  Use this parameter to specify the Vservers whose local netgroup file you want to delete. Separate multiple Vserver names with commas.

_Examples_

The following example deletes the local netgroup file for a Vserver named vs1.

```bash
cluster1::> vserver services netgroup file delete -vserver vs1
```

**vserver services name-service netgroup file show**

Display a local netgroup file

_Availability:_ This command is available to _cluster_ and _Vserver_ administrators at the _admin_ privilege level.

_Description_

The `vserver services netgroup file show` command displays the contents of the local netgroup file for the specified Vservers. All the entries under a given netgroup, specified in the Netgroup column of the command output, list the members of that netgroup. Each netgroup file specifies netgroups, which are sets of tuples. Each member of a netgroup is either the name of another netgroup, specified in the Member Netgroup column, or a specification of a tuple as follows: (Host, User, Domain) where Host, User, and Domain are character string names for the corresponding component. Any of the components of a tuple can either be empty to specify a wildcard value or a dash (-) to specify no valid value.
Parameters
{-fields <fieldname>,...}
If you specify the -fields fieldname, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

{-instance }
If you specify the -instance parameter, the command displays detailed information about all fields.

{-vserver <vserver name>} - Vserver
Use this parameter to display the local netgroup file contents for the Vservers you specify.

{-netgroup <text>} - Netgroup Name
If you specify this parameter, the command displays information about the netgroup you specify.

{-netgrpmemb <text>} - Member Netgroup
If you specify this parameter, the command displays information about the member netgroup you specify.

{-host <text>} - Member Host
If you specify this parameter, the command displays information about the host you specify.

{-user <text>} - Member User
If you specify this parameter, the command displays information about the user you specify.

{-domain <text>} - Member Domain
If you specify this parameter, the command displays information about the domain you specify.

Examples
The following example displays the netgroup file contents for the Vserver named vs1.

```
cluster1::> vserver services netgroup file show -vserver vs1
Member
Vserver Netgroup Netgroup Host User Domain
---------- -------- ----------- ------------- ------------ -------------------
vs1
netgrp1
   netgrp9 - - -
   h1       - d1
   h22      - d22
netgrp11 - - -
netgrp18 - - -
   h119     u4343 d34
netgrp8
   '-'     u88  '-'
```

vserver services name-service nis-domain commands
Manage Network Information Service domains

vserver services name-service nis-domain create
Create a NIS domain configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver services name-service nis-domain create command creates a configuration for an NIS domain. You can configure multiple NIS domains for a given Vserver, but only one NIS domain can be active on a Vserver at any given time. You can also configure more than one Vserver with the same NIS domain.
Parameters
-vserver <vserver name> - Vserver
Use this parameter to specify the Vserver on which the NIS domain configuration is created. A data Vserver or admin Vserver can be specified.

-domain <nis domain> - NIS Domain
Use this parameter to specify the NIS domain for which a configuration is created. Maximum Supported NIS Domain length: 64 characters.

-active {true|false} - (DEPRECATED)-Active Domain
Note: This parameter has been deprecated and might be removed in a future version of Data ONTAP. Use this parameter with the value true to specify that the NIS domain configuration is active when it is created. Use this parameter with the value false to specify that the NIS domain configuration is not active.

-servers <IP Address>, ... - NIS Server
Use this parameter to specify the IP addresses of NIS servers used by the NIS domain configuration. Separate multiple IP addresses with commas.

Examples
The following example creates an NIS domain configuration on the Vserver named vs0. The NIS domain is named nisdomain, is active upon creation, and uses an NIS server with the IP address 192.0.2.180.

cluster1::> vserver services name-service nis-domain create -vserver vs0 -domain nisdomain -active true -servers 192.0.2.180

vserver services name-service nis-domain delete
Delete a NIS domain configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver services name-service nis-domain delete command deletes an NIS domain configuration.

Deleting an NIS domain configuration removes it permanently. To disable a configuration without deleting it, use the vserver services name-service nis-domain modify command with the -active false parameter.

Parameters
-vserver <vserver name> - Vserver
Use this parameter to specify the Vserver from which the NIS domain configuration is deleted. A data Vserver or admin Vserver can be specified.

-domain <nis domain> - NIS Domain
Use this parameter to specify the NIS domain whose configuration is deleted.

Examples
The following example deletes the configuration of an NIS domain named testnisdomain from a Vserver named vs2:

cluster1::> vserver services name-service nis-domain delete -vserver vs2 -domain testnisdomain

Related references
vserver services name-service nis-domain modify on page 1825
vserver services name-service nis-domain modify

Modify a NIS domain configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
Use the vserver services name-service nis-domain modify command to modify the activity status and NIS server of an NIS domain configuration.

Use the -active false parameter to disable an NIS domain configuration without deleting it. To permanently remove a configuration, use the vserver services name-service nis-domain delete command.

Parameters
- vserver <vserver name> - Vserver
  Use this parameter to specify the Vserver whose NIS domain configuration is modified. A data Vserver or admin Vserver can be specified.

- domain <nis domain> - NIS Domain
  Use this parameter to specify the NIS domain whose configuration is modified.

[-active {true|false}] - (DEPRECATED)-Active Domain
  Note: This parameter has been deprecated and might be removed in a future version of Data ONTAP.
  Use this parameter with the value true to specify that the NIS domain configuration is active. Use this parameter with the value false to specify that the NIS domain configuration is not active.

[-servers <IP Address>, ...] - NIS Server
  Use this parameter to specify the IP addresses of NIS servers used by the the NIS domain configuration. Separate multiple IP addresses with commas.

Examples
The following example disables the configuration of an NIS domain named nisdomain on a Vserver named vs0:

```
cluster1::> vserver services name-service nis-domain modify -vserver vs0 -domain nisdomain -active false
```

Related references
vserver services name-service nis-domain delete on page 1824

vserver services name-service nis-domain show

Display NIS domain configurations

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver services name-service nis-domain show command displays information about NIS domain configurations.

Parameters
{ [-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use ‘-fields?’ to display the fields to specify.}
If you specify the `-instance` parameter, the command displays detailed information about all fields.

`vserver <vserver name>` - Vserver

Use this parameter to display information only about the NIS domain configurations of the Vservers you specify. Use this parameter with the `-domain` parameter to display information only about a particular NIS domain configuration on the Vserver you specify. A data Vserver or admin Vserver can be specified.

`-domain <nis domain>` - NIS Domain

Use this parameter to display information only about the NIS domain configurations that match the NIS domain name you specify. Use this parameter with the `-vserver` parameter to display information only about a particular NIS domain configuration on the Vserver you specify.

`-active {true|false}` - (DEPRECATED)-Active Domain

**Note:** This parameter has been deprecated and might be removed in a future version of Data ONTAP. Use this parameter with the value `true` to display information only about the NIS domain configurations that are active. Use this parameter with the value `false` to display information only about the NIS domain configurations that are not active.

`-servers <IP Address>, ...` - NIS Server

Use this parameter to display information only about the NIS domain configurations that use the NIS servers at the IP addresses you specify.

### Examples

The following example displays information about all NIS domain configurations:

```
cluster1::> vserver services name-service nis-domain show
Vserver       Domain        Active NIS Server
------------- ------------- --------------
node1         nisdomain     true   192.0.2.180
node2         nisdomain     true   10.0.2.15
node2         nisdomain     false  192.0.2.180
node3         testnisdomain true   192.0.2.128, 192.0.2.180
4 entries were displayed.
```

### vserver services name-service nis-domain show-bound

Display binding status of a NIS domain configuration

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**

The `vserver services name-service nis-domain show-bound` command displays binding information about NIS domain configurations.

**Parameters**

`{ [-fields <fieldname>, ...]` 

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

`| [-instance]` 

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`vserver <vserver name>` - Vserver

If you use this parameter, the command displays binding information only about the NIS domain configurations of the specified Vservers. Use this parameter with the `-domain` parameter to display binding information only about a particular NIS domain configuration on the Vserver you specify.
information only about a particular NIS domain configuration on the specified Vserver. A data Vserver or admin Vserver can be specified.

[-domain <nis domain>] - NIS Domain

If you use this parameter, the command displays binding information only about the NIS domain configurations that match the specified NIS domain name. Use this parameter with the -vserver parameter to display binding information only about a particular Vserver on the specified NIS domain name.

[-bound-servers <IP Address>,...] - Bound NIS Servers

If you use this parameter, the command displays NIS binding information only about the specified NIS servers.

### Examples

The following example displays binding information about all NIS domain configurations:

```
cluster1::> vserver services name-service nis-domain show-bound

Bound
Vserver   Domain              NIS Server
------------- ------------------- -----------------
vs1       testnisdomain1      192.0.2.180, 10.0.2.15
vs1       testnisdomain2      10.0.2.17
2 entries were displayed.
```

### vserver services name-service ns-switch commands

Manage Name Services Switch ordering

Manages name service switch configurations. Each name service switch entry specifies the order in which to lookup the name service sources, for a given Vserver and name service database. Each name service database contains some information regarding hosts, group, password, netgroup or name_map. Such a database comes from one or more name service sources such as files, DNS, LDAP or NIS.

**Note:** If a name service switch entry is deleted, default entry of 'files' will be used for the requested name service database except for hosts database for which default source list of 'files, dns' will used.

**Note:** If "files" is not specified as the default source for "passwd" or "group" database, ensure that default user and group entries for 'passwd' and 'group' respectively are present in the source configured. Default entries for passwd database: nobody, pcuser, root, sshd, toor, daemon, operator, bin, tty, kmem, games, news, man, smmsp, mailnull, bind, proxy, uucp, pop, www, admin, diag, autosupport. Default entries for group database: wheel, daemon, kmem, sys, tty, operator, mail, bin, news, man, games, ftp, staff, sshd, smmsp, mailnull, guest, bind, proxy, authpf, _pflogd, _dhcp, uucp, dialer, network, audit, www, antivirus, nogroup, nobody.

### vserver services name-service ns-switch create

Create a new Name Service Switch table entry

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The `vserver services name-service ns-switch create` command specifies the order in which to lookup the name service sources, for a given Vserver and name service database. Each name service database contains some information regarding hosts, group, password, netgroup or namemap. Such a database comes from one or more name service sources such as files, DNS, LDAP or NIS.

**Note:** The `vserver services name-service ns-switch` command provides the functionality of the `/etc/nsswitch.conf` file on UNIX systems. For more information, see the UNIX man page for nsswitch.conf(5).
Parameters

-vserver <vserver name> - Vserver
Use this parameter to specify the Vserver on which to create the new name service switch entry

-database [hosts|group|passwd|netgroup|namemap] - Name Service Switch Database
Name Service Switch Database Use this parameter to specify the name service database for which the order of the source lookup is being specified. This parameter can have the following values:

• hosts
• group
• passwd
• netgroup
• namemap

-sources [files|dns|ldap|nis], ... - Name Service Source Order
Name Service Source Order Use this parameter to specify the name service sources and the order in which to look them up for the specified Vserver and name service database. Each name service source in the list for this parameter must be one of the following:

• files
• dns
• ldap
• nis
Separate multiple name service sources with commas.

For each database specified with the -database parameter, one or more sources must be specified. The valid sources for each database type are shown in the following table:

<table>
<thead>
<tr>
<th>Database</th>
<th>Valid Sources</th>
</tr>
</thead>
<tbody>
<tr>
<td>hosts</td>
<td>files, dns</td>
</tr>
<tr>
<td></td>
<td>group</td>
</tr>
<tr>
<td>passwd</td>
<td>files, nis, ldap</td>
</tr>
<tr>
<td></td>
<td>netgroup</td>
</tr>
<tr>
<td>namemap</td>
<td>files, ldap</td>
</tr>
</tbody>
</table>

Note: If "files" is not specified as the default source for the "passwd" or "group" database, ensure that default user and group entries for the 'passwd' and 'group' respectively are present in the source configured. Default entries for "passwd" database: nobody, pcuser, root, sshd, toor, daemon, operator, bin, tty, kmem, games, news, man, smmsp, mailnull, bind, proxy, uucp, pop, www, admin, diag, autosupport. Default entries for "group" database: wheel, daemon, kmem, sys, tty, operator, mail, bin, news, man, games, ftp, staff, sshd, smmsp, mailnull, guest, bind, proxy, authpf, _pflogd, _dhcp, uucp, dialer, network, audit, www, antivirus, nogroup, nobody.

Examples

The following example creates name service source ordering for the hosts database on a Vserver named vs0. The order of looking up the sources is specified as files followed by DNS.
The following example creates the name service source ordering for the passwd database on a Vserver named vs1. The order of looking up the sources is specified as files, NIS and LDAP.

```bash
cluster1::> vserver services nameservice ns-switch create -vserver vs1 -database passwd -sources files,nis,ldap
```

### vserver services name-service ns-switch delete

Remove a Name Service Switch table entry

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**

Use the `vserver services name-service ns-switch delete` command to permanently remove an existing name service switch entry.

**Parameters**

- `-vserver <vserver name>` - Vserver
  
  Vserver Use this parameter to specify the Vserver for which to delete the name service switch entry.

- `-database {hosts|group|passwd|netgroup|namemap}` - Name Service Switch Database
  
  Name Service Switch Database Use this parameter to specify the name service database, of the Vserver, for which the name service switch entry is to be deleted. Following are the possible values for this parameter:

  - hosts
  - group
  - passwd
  - netgroup
  - name_map

**Examples**

The following example deletes the name service switch entry for the hosts database on a Vserver named vs0.

```bash
cluster1::> vserver services name-service ns-switch delete -vserver vs0 -database hosts.
```

The following example deletes the name service switch entry for the group database on a Vserver named vs1.

```bash
cluster1::> vserver services name-service ns-switch delete -vserver vs1 -database group.
```

### vserver services name-service ns-switch modify

Change a Name Service Switch table entry

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.
Description
Use the vserver services name-service ns-switch modify command to modify the order of looking up the name service sources, for an existing name service switch entry.

Parameters
-vserver <vserver name> - Vserver
Vserver Use this parameter to specify the Vserver on which to modify the name service switch entry. A data Vserver or admin Vserver can be specified.

-database {hosts|group|passwd|netgroup|namemap} - Name Service Switch Database
Name Service Switch Database Use this parameter to specify the name service database, of the given Vserver, for which to modify the name service switch entry. Following are the possible values for this parameter:
- hosts
- group
- passwd
- netgroup
- namemap

-sources {files|dns|ldap|nis}, ... - Name Service Source Order
Name Service Source Order Use this parameter to specify the name service sources and the order in which look up for the specified Vserver and name service database. Each name service source in the list for this parameter must be one of the following:
- files
- dns
- ldap
- nis

Separate multiple sources with commas.
For each database specified with the -database parameter, one or more sources must be specified. The valid sources for each database type are shown in the following table:

<table>
<thead>
<tr>
<th>Database</th>
<th>Valid Sources</th>
</tr>
</thead>
<tbody>
<tr>
<td>hosts</td>
<td>files, dns</td>
</tr>
<tr>
<td>group</td>
<td>files, nis, ldap</td>
</tr>
<tr>
<td>passwd</td>
<td>files, nis, ldap</td>
</tr>
<tr>
<td>netgroup</td>
<td>files, nis, ldap</td>
</tr>
<tr>
<td>namemap</td>
<td>files, ldap</td>
</tr>
</tbody>
</table>

Note: If "files" is not specified as the default source for the "passwd" or "group" database, ensure that default user and group entries for the 'passwd' and 'group' respectively are present in the source configured. Default entries for "passwd" database: nobody, pcuser, root, sshd, toor, daemon, operator, bin, tty, kmem, games, news, man, smmsp, mailnull, bind, proxy, uucp, pop, www, admin, diag, autosupport. Default entries for "group" database: wheel, daemon, kmem, sys, tty, operator, mail, bin, news, man, games, ftp, staff, sshd, smmsp, mailnull, guest, bind, proxy, authpf, _pflogd, _dhcp, uucp, dialer, network, audit, www, antivirus, nogroup, nobody.
Examples
The following example modifies the name service source ordering for the hosts database on a Vserver named vs0. The order of looking up the sources is changed to only DNS.

```
cluster1::> vserver services name-service ns-switch modify -vserver vs0 -database hosts -sources dns
```

The following example modifies the name service source ordering for the passwd database on a Vserver named vs1. The order of looking up the sources is changed to LDAP followed by NIS.

```
cluster1::> vserver services name-service ns-switch modify -vserver vs1 -database passwd -sources ldap,nis
```

**vserver services name-service ns-switch show**

Display Name Service Switch configuration

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
Use the `vserver services name-service ns-switch show` command to display information about one or more name service switch entries. A name service switch entry provides information about the order of looking up the name service sources, for a Vserver and name service database.

**Parameters**

```
[-fields <fieldname>, ...]
```
If you specify the -fields [fieldname], ... parameter, the command only displays the fields that you specify.

```
[-instance ]
```
If you specify the -instance parameter, the command displays detailed information about all entries.

```
[-vserver <vserver name>] - Vserver
```
Vserver Use this parameter to display only the name service switch entries for the Vserver you specify. A data Vserver or admin Vserver can be specified.

```
[-database {hosts|group|passwd|netgroup|namemap}] - Name Service Switch Database
```
Name Service Switch Database Use this parameter to display only the name service switch entries of the name service database type you specify. Following are the possible values for this parameter:

- hosts
- group
- passwd
- netgroup
- name_map

```
[-sources {files|dns|ldap|nis}, ...] - Name Service Source Order
```
Name Service Source Order Use this parameter to display only name service switch entries with the specified name service source order. Each name service source in the list for this parameter must be one of the following:

- files
- dns

vserver services commands
Separate multiple sources with commas.

**Examples**
The following example shows the output of the `vserver services name-service ns-switch show` command.

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Database</th>
<th>Source</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs0</td>
<td>hosts</td>
<td>files, dns</td>
</tr>
<tr>
<td>vs1</td>
<td>passwd</td>
<td>files, ldap, nis</td>
</tr>
</tbody>
</table>

2 entries were displayed.

**vserver services name-service remote-admin-auth commands**
The remote-admin-auth directory

**vserver services name-service remote-admin-auth prepare-to-downgrade**
Disable remote admin authentication feature to be compatible with releases earlier than Data ONTAP 8.3.1

**Availability:** This command is available to `cluster` administrators at the `advanced` privilege level.

**Description**
The `vserver services name-service remote-admin-auth prepare-to-downgrade` command will remove all LDAP and NIS configurations for the admin Vserver and disable the remote admin authentication feature. Use this command to prepare for downgrading the system to a release earlier than Data ONTAP 8.3.1.

**Examples**
The following example disables the remote admin authentication feature.

```
cluster1::*> vserver services name-service remote-admin-auth prepare-to-downgrade
Warning: This command will remove all LDAP and NIS configurations for the admin Vserver and disable the remote admin authentication feature. Use this command to prepare for downgrading the system to a release earlier than Data ONTAP 8.3.1.
Do you want to continue? [y|n]: y
```

**vserver services name-service unix-group commands**
Manage local UNIX group accounts

**vserver services name-service unix-group adduser**
Add a user to a local UNIX group

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.
Description
The `vserver services name-service unix-group adduser` command adds a user to a local UNIX group.

Parameters
- `vserver <vserver name>` - Vserver
  Use this parameter to specify the Vserver location of the local UNIX group to which the user is added.
- `name <text>` - Group Name
  Use this parameter to specify the local UNIX group to which to add the user.
- `username <text>` - Name of User
  Use this parameter to specify the user name to add to the local UNIX group.
- `[-skip-name-validation {true|false}]` - Skip Name Validation
  By default, Data ONTAP validates the name to ensure it complies with the following rules:
  • The name contains only these valid characters: 0 through 9, A through Z, a through z, "_", ",", and ".-".
  • The name does not start with the character ".-".
  • The name does not contain "$" except as the last character.
  If the parameter is set to `true`, the name validation is skipped.

Examples
The following example adds a user named tsmith to a local UNIX group named sales on a Vserver named vs0:

```
cluster1:/> vserver services name-service unix-group adduser -vserver vs0 -name sales -username tsmith
```

`vserver services name-service unix-group create`

Create a local UNIX group

Availability: This command is available to `cluster` and Vserver administrators at the `admin` privilege level.

Description
The `vserver services name-service unix-group create` command creates a local UNIX group on a Vserver. Use a local UNIX group for Windows-to-UNIX and UNIX-to-Windows group mappings.

Parameters
- `vserver <vserver name>` - Vserver
  Use this parameter to specify the Vserver on which to create the local UNIX group.
- `name <text>` - Group Name
  Use this parameter to specify the name of the group to create.
- `id <integer>` - Group ID
  Use this parameter to specify an ID number for the group.
- `[-skip-name-validation {true|false}]` - Skip Name Validation
  By default, Data ONTAP validates the name to ensure it complies with the following rules:
  • The name contains only valid characters: 0 through 9, A through Z, a through z, "_", ",", and ".-"
  • The name does not start with ".-"
• The name does not contain "$" except as the last character

If the parameter is set to true, the name validation is skipped.

**Examples**
The following example creates a group named sales on a Vserver named vs0. The group has the ID 94.

```bash
cluster1::> vserver services name-service unix-group create -vserver vs0 -name sales -id 94
```

**vserver services name-service unix-group delete**
Delete a local UNIX group

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver services name-service unix-group delete` command deletes a local UNIX group from a Vserver.

**Parameters**
- `vserver <vserver name>` - Vserver
  
  Use this parameter to specify the Vserver location of the local UNIX group to delete.

- `name <text>` - Group Name
  
  Use this parameter to specify the local UNIX group to delete.

**Examples**
The following example deletes a local UNIX group named testgroup from a Vserver named vs0:

```bash
cluster1::> vserver services name-service unix-group delete -vserver vs0 -name testgroup
```

**vserver services name-service unix-group deluser**
Delete a user from a local UNIX group

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver services name-service unix-group deluser` command removes a user from a local UNIX group.

**Parameters**
- `vserver <vserver name>` - Vserver
  
  Use this parameter to specify the Vserver location of the local UNIX group from which the user is removed.

- `name <text>` - Group Name
  
  Use this parameter to specify the local UNIX group from which to remove the user.

- `username <text>` - Name of User
  
  Use this parameter to specify the user name to remove from the local UNIX group.

**Examples**
The following example removes a user named testuser from a local UNIX group named sales on a Vserver named vs0:
vserver services name-service unix-group load-from-uri

Load one or more local UNIX groups from a URI

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver services name-service unix-group load-from-uri command loads UNIX groups from a universal resource identifier (URI). The URI must contain group information in the UNIX /etc/group format:

group_name:password:group_ID:comma_separated_list_of_users

The command discards the value of the password field.

Parameters

-vserver <vserver> - Vserver

Use this parameter to specify the Vserver on which to locate the local UNIX groups.

-uri {(ftp|http)://hostname|IPv4 Address|'[IPv6 Address]+'...} - URI to Load From

Use this parameter to specify the URI from which the command loads group information.

[-overwrite {true|false}] - Overwrite Entries

Use this parameter with the value true to specify that group information loaded from the URI should overwrite existing group information. The default value is false, specifying that group information loaded from the URI should not overwrite existing group information.

[-skip-name-validation {true|false}] - Skip Name Validation

By default, Data ONTAP validates the name to ensure it complies with the following rules:

- The name contains only valid characters: 0 through 9, A through Z, a through z, ".", ":", and "-"
- The name does not start with "-"
- The name does not contain "$" except as the last character

If the parameter is set to true, the name validation is skipped.

Examples

The following example loads group information from the URI ftp://ftp.example.com/groups onto a Vserver named vs0:

cluster1::> vserver services name-service unix-group load-from-uri -vserver vs0 -uri ftp://ftp.example.com/groups

vserver services name-service unix-group modify

Modify a local UNIX group

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

Use the vserver services name-service unix-group modify command to modify a local UNIX group's group ID.
Parameters

-vserver <vserver name> - Vserver

Use this parameter to specify the Vserver location of the local UNIX group to modify.

-name <text> - Group Name

Use this parameter to specify the name of the group to modify.

[-id <integer>] - Group ID

Use this parameter to specify an ID number for the group.

Examples

The following example changes a local UNIX group named sales on a Vserver named vs0 to have the group ID 100:

```
cluster1:/> vserver services name-service unix-group modify -vserver vs0 -group sales -id 100
```

vserver services name-service unix-group show

Display local UNIX groups

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver services name-service unix-group show command displays information about local UNIX groups.

Parameters

{ [-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-members ]

Use this parameter to display the list of users in each local UNIX group.

| [-instance ]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver

Use this parameter with the -name parameter to display information only about the local UNIX group you specify. Use this parameter without -name to display information only about the local UNIX groups that are located on the specified Vserver.

[-name <text>] - Group Name

Use this parameter with the -vserver parameter to display information only about the local UNIX group you specify. Use this parameter without -vserver to display information only about the local UNIX groups that match the name you specify.

[-id <integer>] - Group ID

Use this parameter to display information only about the local UNIX group that has the ID you specify.

[-users <text>, ...] - Users

Use this parameter to display information only about the local UNIX groups that include the user names you specify.

Examples

The following example displays information about all local UNIX groups, including lists of their users:
vserver services name-service unix-group max-limit commands

Manage Configuration Limits for UNIX-Group

vserver services name-service unix-group max-limit modify
Change Configuration Limits for UNIX-Group

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The vserver services name-service unix-group max-limit modify command enables you to modify maximum UNIX groups and group-members that can be configured on the system. This allows you to set certain limits to prevent performance issues due to service configurations using excessive resources.

Parameters
[-limit <integer>] - System Limit
This parameter specifies the maximum limit that you want to set for unix-group. The default setting for the limit is 32768. The supported range of values for this parameter is 0 to 65536.

Examples
The following example modifies the system-wide limit of the total number of UNIX groups and members that can be configured on the cluster.

vserver services name-service unix-group max-limit modify -limit 33792

vserver services name-service unix-group max-limit show
Display Configuration Limits for UNIX-Group

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The vserver services name-service unix-group max-limit show command displays information on UNIX group limits that are configurable with vserver services name-service unix-group max-limit modify command. The output will show the following:

- Limit: The configured limit on the total number of UNIX groups and group members configurable.
- Current Count: Total number of current entries for UNIX groups and group members.
Examples
The following example shows the limits and total number of current entries for UNIX group configuration:

```
cluster1::> vserver services name-service unix-group max-limit show
(vserver services name-service unix-group max-limit show)
Limit       Current Count
----------- --------------
400         3
```

vserver services name-service unix-user commands
Manage local UNIX user accounts

vserver services name-service unix-user create
Create a local UNIX user

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The `vserver services name-service unix-user create` command creates a local UNIX user on a Vserver. You can use local UNIX users for Windows-to-UNIX and UNIX-to-Windows name mappings.

Parameters
- `vserver <vserver name>` - Vserver
  This parameter specifies the Vserver on which you want to create the local unix user.
- `user <text>` - User Name
  This parameter specifies the user account that you want to create.
- `id <integer>` - User ID
  This parameter specifies an ID number for the user.
- `primary-gid <integer>` - Primary Group ID
  This parameter specifies the ID number of the user's primary group.
- `full-name <text>` - User's Full Name
  This parameter specifies the user's full name.
- `skip-name-validation {true|false}` - Skip Name Validation
  By default, Data ONTAP validates the name to ensure it complies with the following rules:
  - The name contains only valid characters: 0 through 9, A through Z, a through z, "_", ".", and "-"
  - The name does not start with "-"
  - The name does not contain "$" except as the last character
  If the parameter is set to true, the name validation is skipped.

Examples
The following example creates a local UNIX user named tsmith on a Vserver named vs0. The user has the ID 4219 and the primary group ID 100. The user's full name is Tom Smith.
vserver services name-service unix-user delete

Delete a local UNIX user

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `vserver services name-service unix-user delete` command deletes a local UNIX user from a Vserver.

**Parameters**

- `-vserver <vserver name>` - **Vserver**
  This parameter specifies the Vserver on which the local UNIX user is located.

- `-user <text>` - **User Name**
  This parameter specifies the user that you want to delete.

**Examples**
The following example deletes a local UNIX user named testuser from a Vserver named vs0:

```
vs1::> vserver services name-service unix-user delete -vserver vs0 -user testuser
```

vserver services name-service unix-user load-from-uri

Load one or more local UNIX users from a URI

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `vserver services name-service unix-user load-from-uri` command loads one or more UNIX users from a universal resource identifier (URI). The URI must contain user information in the UNIX /etc/passwd format: `user_name:password:user_ID:group_ID:full_name:home_directory:shell`. The command discards the value of the `password` field and of the fields after the `full_name` field (home_directory and shell).

**Parameters**

- `-vserver <vserver>` - **Vserver**
  This specifies the Vserver on which the local UNIX user or users are to be located.

- `-uri {ftp|http://(hostname|IPv4 Address|'['IPv6 Address']')}...` - **URI to Load From**
  This specifies the URI from which user information is to be loaded.

- `-overwrite {true|false}` - **Overwrite Entries**
  This optionally specifies whether user information from the URI overwrites existing user information. The default setting is *false*.

- `[-skip-name-validation {true|false}]` - **Skip Name Validation**
  By default, Data ONTAP validates the name to ensure it complies with the following rules:
  
  - The name contains only valid characters: 0 through 9, A through Z, a through z, ",", ":", and ":"
  - The name does not start with ":"
• The name does not contain "$" except as the last character

If the parameter is set to true, the name validation is skipped.

Examples
The following example loads user information from the URI ftp://ftp.example.com/users onto a Vserver named vs0:

```
node::> vserver services name-service unix-user load-from-uri -vserver vs0 -uri ftp://ftp.example.com/users
```

vserver services name-service unix-user modify
Modify a local UNIX user

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver services name-service unix-user modify command modifies a local UNIX user's ID, primary group ID, or full name.

Parameters
-vserver <vserver name> - Vserver
This parameter specifies the Vserver on which the local UNIX user is located.

-user <text> - User Name
This parameter specifies the user account that you want to modify.

[-id <integer>] - User ID
This optional parameter specifies an ID number for the user.

[-primary-gid <integer>] - Primary Group ID
This optional parameter specifies the ID number of the user's primary group.

[-full-name <text>] - User's Full Name
This optional parameter specifies the user's full name.

Examples
The following example modifies the local UNIX user named pjones on a Vserver named vs0. The user's primary group ID is changed to 100 and the user's full name is Peter Jones.

```
vs1::> vserver services name-service unix-user modify -vserver vs0 -user pjones -primary-gid 100 -full-name "Peter Jones"
```

vserver services name-service unix-user show
Display local UNIX users

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver services name-service unix-user show command displays information about local UNIX users. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all local UNIX users:

• Vserver name
• User name
• User ID
• Primary group ID
• Full name

Parameters

  {{-fields <fieldname>,...
     If you specify the -fields parameter, the command only displays the fields that you specify.
  |[-instance ]
     If you specify the -instance parameter, the command displays detailed information about all entries.
  [-vserver <vserver name>] - Vserver
     If you specify this parameter and the -user parameter, the command displays information only about the specified local UNIX user. If you specify this parameter by itself, the command displays information only about the local UNIX user or users that are located on the specified Vserver.
  [-user <text>] - User Name
     If you specify this parameter and the -vserver parameter, the command displays information only about the specified local UNIX user. If you specify this parameter by itself, the command displays information only about the local UNIX user or users that have the specified name.
  [-id <integer>] - User ID
     If you specify this parameter, the command displays information only about the local UNIX user that has the specified ID.
  [-primary-gid <integer>] - Primary Group ID
     If you specify this parameter, the command displays information only about the local UNIX user or users that have the specified primary group ID.
  [-full-name <text>] - User's Full Name
     If you specify this parameter, the command displays information only about the local UNIX user or users that match the specified name.

Examples

The following example displays information about all local UNIX users:

```
  vs1::> vserver services name-service unix-user show

  User   User   Group  Full
  Vserver Name     ID     ID     Name
  ---------- ---------- ------ ------ ----------------
  vs0      admin     100    100    administrator
  vs0      guest     1000   100    guest
  vs0      jdoe     4673    100    Jane Doe
  vs0      monitor   2000   100    monitor
  vs0      pjones    4236    100    Peter Jones
  vs0      root      10    100    root
  vs0      tsmith    3289    100    Tom Smith
```

vserver services name-service unix-user max-limit commands

Manage Configuration Limits for UNIX-User
vserver services name-service unix-user max-limit modify

Change Configuration Limits for UNIX-User

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

The `vserver services name-service unix-user max-limit modify` command enables you to modify maximum UNIX users that can be configured on the system. This allows you to set certain limits to prevent performance issues due to service configurations using excessive resources.

Parameters

[-limit <integer>] - System Limit

This parameter specifies the maximum limit that you want to set for unix-user. The default setting for the limit is 32768. The supported range of values for this parameter is 0 to 65536.

Examples

The following example modifies the system-wide limit of the total number of UNIX users that can be configured on the cluster.

```
vserver services name-service unix-user max-limit modify -limit 33792
```

vserver services name-service unix-user max-limit show

Display Configuration Limits for UNIX-User

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

The `vserver services name-service unix-user max-limit show` command displays information on UNIX user limits that are configurable with `vserver services name-service unix-user max-limit modify` command. The output will show the following:

- Limit: The configured limit on the total number of UNIX users configurable.
- Current Count: Total number of current entries for UNIX users configuration.

Examples

The following example shows the limits and total number of current entries for UNIX user configuration:

```
cluster1::> vserver services name-service unix-user max-limit show
 (vserver services name-service unix-user max-limit show)
 Limit    Current Count
----------  -----------
 400       3
```

vserver services name-service ypbind commands

The ypbind directory
vserver services name-service ypbind start

Start ypbind

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The vserver services name-service ypbind start starts the ypbind. NIS creation will fail if ypbind is stopped. This command starts ypbind on all the nodes in a cluster and is persistent across node reboots.

Examples
The following example starts ypbind:

```
vs1::> vserver services name-service ypbind start
```

vserver services name-service ypbind status

Current ypbind status

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The vserver services name-service ypbind status displays whether the ypbind is running or stopped.

Examples
The following example displays ypbind status:

```
vs1::> vserver services name-service ypbind status
Status: Running
```

vserver services name-service ypbind stop

Stop ypbind

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The vserver services name-service ypbind stop stops the ypbind. Command fails if NIS entries are present. This command stops ypbind on all the nodes in a cluster and is persistent across node reboots.

Examples
The following example stops ypbind:

```
vs1::> vserver services name-service ypbind stop
```

vserver services ndmp commands

Manage vserver scoped NDMP
**vserver services ndmp generate-password**

Generates NDMP password for a user

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

This command is used to generate NDMP password for a given user in the specified Vserver context. The generated NDMP password is based on the user's login password. For this reason regenerate it whenever the user's login password changes. This command fails if a user does not exist for the Vserver.

**Parameters**

{-fields <fieldname>, ...}

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

{-instance}

If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver

Specify the Vserver context for which password is to be generated.

[-user <text>] - User

Specify the user name for which the NDMP password needs to be generated.

[-password <text>] - Password

The generated NDMP password string that is used for authentication.

**Examples**

The following example shows the usage this command to generate NDMP password for a user belonging to a specific Vserver:

```bash
cluster1::> vserver services ndmp generate-password -vserver vserver1 -user user1
Vserver: vserver1
User: user1
Password: a9cCCUp32yjGmBiD
```

**vserver services ndmp kill**

Kill the specified NDMP session

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

This command terminates a specific NDMP session on a particular Vserver in the cluster.

**Parameters**

<text> - Session Identifier

Session ID of the NDMP session. A session-id is a string used to identify a particular NDMP session.

**Examples**

The following example shows how a specific NDMP session on the Vserver named vserver1 can be terminated:
vserver services ndmp kill-all

Kill all NDMP sessions

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

This command terminates all NDMP sessions on a particular Vserver in the cluster.

**Parameters**

- `-vserver <vserver name>` - Vserver
  
  Specifies the Vserver name in which all NDMP sessions that are to be terminated are running.

**Examples**

The following example shows how all NDMP sessions on the Vserver named vserver1 can be terminated:

```
cluster1::> vserver services ndmp kill-all -vserver vserver1
```

vserver services ndmp modify

Modify NDMP Properties

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

This command is used to change NDMP options on Vservers.

One or more of the options specified in the parameters section can be modified for a specific Vserver, by this command. A short description of each of the options is provided in the parameters section.

**Parameters**

- `-vserver <Vserver Name>` - Vserver
  
  This parameter specifies the name of the Vserver.

- `[-ignore-ctime-enabled {true|false}]` - Ignore Ctime
  
  This option, when *true*, allows user to exclude files with ctime changed from storage system' incremental dumps since other processes like virus scanning often alter the ctime of files. When this option is *false*, backup on the Vserver will include all files with a change or modified time later then the last dump in the previous level dump. The default value is *false*. This option is persistent across reboots.

  Most WIN32 APIs are often unaware of the "last changed time", ctime, they often incorrectly set a later time for files, causing these files to be included in the Vserver's incremental dumps, making the incremental dump very large. This is partially defying the purpose of having incremental dumps, since one uses incremental dumps to speed up the backup by only dumping files that were truly changed since the last backup.

  The `-option-value` for this parameter should be true/false.
[-offset-map-enable \{true|false\}] - Enable Offset Map

This option is used to enable or disable generation of the inode offset map during NDMP based dump backups. The offset map is required to perform Enhanced Direct Access Restore (DAR) on the backup data. Enhanced DAR provides support for directory DAR and DAR of files with NT streams. The default value for this option is true. This option is persistent across reboots.

The -option-value for this parameter should be true/false.

[-tcpnodelay \{true|false\}] - Enable TCP Nodelay

Enables/Disables the TCPNODELAY configuration parameter for the socket between the Vserver and the DMA. When set to true, the Nagle algorithm is disabled and small packets are sent immediately rather than held and bundled with other small packets. This optimizes the system for response time rather than throughput.

This option becomes active when the next NDMP session starts. Existing sessions are unaffected. The default value for this option is false. This option is persistent across reboots.

The -option-value for this parameter should be true/false.

[-tcpwinsize \<integer\>] - TCP Window Size

This option can be used to change the TCP buffer size of the NDMP data connection. The minimum and maximum values are 8192(8K) and 262,144(256K), respectively. The default value for this option is 32768(32K).

This option is persistent across reboots.

The -option-value for this parameter should be a number between 8192(8K) and 262,144(256K).

[-data-port-range \<text\>] - Data Port Range

This option allows administrators to specify a port range on which the NDMP server can listen for data connections.

The format of this option is start_port - end_port start_port, end_port can have values between [1024-65535]; start_port must be lesser than or equal to end_port. If a valid range is specified, NDMP uses a port within that range to listen for data connections. A listen request fails if no ports in the specified range are free.

This option is modifiable only from the admin Vserver context and the said option is applicable for all the data Vservers and the admin Vserver. For example, if the value of the above option is set with 2000-3000, the same value will be applicable throughout the cluster. The value all implies that any available port can be used to listen for data connections. The default value for this option is all. This option is persistent across reboots.

The -option-value for this option should be in the format {<start_port>-<end_port> | all }- where start_port, end_port can have values between [1024-65535]; start_port must be lesser than or equal to end_port.

[-backup-log-enable \{true|false\}] - Enable Backup Log

Backup logging captures important events during dump/restore and records them in /mroot/etc/log/backup on the root volume. The option allows users to enable or disable this feature. The default value for this option is true. This option is persistent across reboots.

The -option-value for this parameter should be true/false.

[-per-qtree-exclude-enable \{true|false\}] - Enable per Qtree Exclusion

If this option is true, users can specify exclude list on a per qtree basis to be excluded from backup. This exclude list will override any values already present due to 'EXCLUDE' environment variable. The user can specify the exclusion list through a .exclude_list file which resides at the root of the qtree. The exclusion list can be a list of files or files that match a specified pattern. The default value for this option is false. This option is persistent across reboots.
The -option-value for this parameter should be true/false.

[-authtype <NDMP Authentication types>, ...] - Authentication Type

Allows the administrator to choose the authentication method. NDMP supports three authentication types: challenge, plaintext and plaintext_sso. The plaintext_sso authentication type is mutually exclusive with the other authentication types. By setting the authentication type as plaintext_sso, the actual password for the user can be used to authenticate instead of having to generate an NDMP specific password. The default of this option is challenge. This option is persistent across reboots.

The -option-value for this parameter can be {challenge | plaintext | plaintext_sso | challenge, plaintext | plaintext, challenge}.

[-debug-enable {true|false}] - Enable Debug (privilege: advanced)

This option enables debug logging for NDMP. Debug messages will be logged to the ndmpd log file /mroot/etc/log/mlog/ndmpd.log. The default value for this option is false. This option is persistent across reboots.

The -option-value for this parameter should be true/false.

[-debug-filter <text>] - Debug Filter (privilege: advanced)

This option controls the NDMP modules for which debug logging is to be enabled. option-value can take five values for this option: all, none, normal, backend or "filter-expression".

all enables debug logging for all modules.

none disables debug logging for all modules. It is equivalent to modify -vserver vserver_name -debug-enable false.

normal is a shortcut option that enables debug logging for all modules except verbose and io_loop. The equivalent filter string is all-verbose-io_loop.

backend is a shortcut option that enables debug logging for all modules except verbose, io_loop, ndmps and ndmpd. The equivalent filter string is all-verbose-io_loop-ndmps-ndmpd.

(filter-expression) is a combination of one or more modules for which debug logs needs to be enabled. Multiple module names can be combined using following operators:

• - to remove the given module from the list of specified modules in the filter string. For example the filter all-ndmpd will enable debug logging for all modules but not ndmpd.

• ^ to add the given module or modules to the list of modules specified in the filter string. For example the filter ndmpd^mover^data will enable debug logging for ndmpd, mover and data.

The possible module names and a brief description is given below:-

<table>
<thead>
<tr>
<th>Modules</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>verbose</td>
<td>verbose message</td>
</tr>
<tr>
<td>io</td>
<td>I/O process loop</td>
</tr>
<tr>
<td>io_loop</td>
<td>I/O process loop verbose messages</td>
</tr>
<tr>
<td>ndmps</td>
<td>NDMP service</td>
</tr>
<tr>
<td>ndmpd</td>
<td>NDMP Protocol</td>
</tr>
<tr>
<td>rpc</td>
<td>General RPC service</td>
</tr>
<tr>
<td>fdc_rpc</td>
<td>RPC to FC driver service</td>
</tr>
<tr>
<td>auth</td>
<td>Authentication</td>
</tr>
<tr>
<td>mover</td>
<td>NDMP MOVER (tape I/O)</td>
</tr>
<tr>
<td>data</td>
<td>NDMP DATA (backup/restore)</td>
</tr>
<tr>
<td>scsi</td>
<td>NDMP SCSI (robot/tape ops)</td>
</tr>
<tr>
<td>bkup_rpc</td>
<td>RPC to Backup service client</td>
</tr>
<tr>
<td>bkup_rpc_s</td>
<td>RPC to Backup service server</td>
</tr>
<tr>
<td>conf</td>
<td>Debug configure/reconfigure</td>
</tr>
</tbody>
</table>
The default value for this option is `none`. This option is persistent across reboots.

The `-option-value` for this parameter can be `{all | none | normal | backend | 'filter-expression'}`.

**[-dump-logical-find <text>]** - Enable Logical Find for Dump (privilege: advanced)

This option specifies whether to follow inode-file walk or tree walk for phase I of the dump. Choosing inode-file walk or tree walk affects the performance of the dump. This option can take following values:

If `default` is specified, then level 0 and incremental volume as well as qtree dumps will use inode walk. All the subtree dumps will use tree walk.

If `always` is specified, all dumps will follow treewalk.

A `comma-separated` list of values in any combination from the following list:

- `vol_baseline`: Level 0 full volume backup will follow treewalk.
- `vol_incr`: Incremental full volume backup will follow treewalk.
- `qtree_baseline`: Level 0 qtree backup will follow treewalk.
- `qtree_incr`: Incremental qtree backup will follow treewalk.

The default value for this option is `default`. This option is persistent across reboots.

The `-option-value` for this parameter could be `{default | always | 'vol_baseline' | 'vol_baseline,qtree_baseline' | ...}`.

**[-abort-on-disk-error {true|false}]** - Enable Abort on Disk Error (privilege: advanced)

If this option is `true`, dump will abort the backup operation on detection of irrecoverable data blocks in user files. If this option is `false`, dump will proceed with backup operation - even if irrecoverable data blocks in user files are detected. On detection of irrecoverable data blocks, dump will send a log message to DMA and also log an entry in `/mroot/etc/log/backup` file. The default value for this option is `false`. This option is persistent across reboots.

The `-option-value` for this parameter should be `true/false`.

**[-fh-dir-retry-interval <integer>]** - FH Throttle Value for Dir (privilege: advanced)

NDMP protocol sends back file history information for all directories in phase 3 of dump to DMA. In the presence of slow DMA or high latency networks, the amount of file history being generated exceeds the amount being consumed by the DMA. To handle a slow reader, a flow control mechanism is now introduced where file history generation is throttled when a DMA is slow in consuming them. The value for this option indicates how frequently should the file history be resent if it was throttled. The default value is 250 milliseconds. This option is persistent across reboots.

The `-option-value` for this parameter should be a number.

**[-fh-node-retry-interval <integer>]** - FH Throttle Value for Node (privilege: advanced)

NDMP protocol sends back file history information for all files in phase 4 of dump to DMA. In the presence of slow DMA or high latency networks, the amount of file history being generated exceeds the amount being consumed by the DMA. To handle slow reader conditions, a flow control mechanism is now introduced where file history generation is throttled when a DMA is slow in consuming them. The value for this option indicates
how frequently should the file history be resent if it was throttled. The default value is 250 milliseconds. This option is persistent across reboots.

The -option-value for this parameter should be a number.

[-restore-vm-cache-size <integer>] - Restore VM File Cache Size (privilege: advanced)

This option mandates the number of WAFL buffers pinned in memory by various meta-files used by logical restore. The minimum and maximum values are 4 and 1024, respectively. The default value for this option is 64. This option is persistent across reboots.

Depending on the value of this option, various meta-files are assigned a number of WAFL buffers that need to be pinned in memory.

<table>
<thead>
<tr>
<th>Meta-filename</th>
<th>Number of WAFL buffers to be pinned in memory</th>
</tr>
</thead>
<tbody>
<tr>
<td>dumpmap</td>
<td>ndmpd.restore.vm_cache_size</td>
</tr>
<tr>
<td>filemap</td>
<td>ndmpd.restore.vm_cache_size</td>
</tr>
<tr>
<td>aclfile_map</td>
<td>ndmpd.restore.vm_cache_size</td>
</tr>
<tr>
<td>inomap</td>
<td>ndmpd.restore.vm_cache_size / 2</td>
</tr>
<tr>
<td>basemap</td>
<td>ndmpd.restore.vm_cache_size / 2</td>
</tr>
<tr>
<td>filmap</td>
<td>ndmpd.restore.vm_cache_size / 2</td>
</tr>
<tr>
<td>revmap</td>
<td>ndmpd.restore.vm_cache_size / 2</td>
</tr>
<tr>
<td>clrimap</td>
<td>ndmpd.restore.vm_cache_size / 4</td>
</tr>
<tr>
<td>mfp_for_inotab</td>
<td>ndmpd.restore.vm_cache_size / 4</td>
</tr>
<tr>
<td>map</td>
<td>ndmpd.restore.vm_cache_size / 4</td>
</tr>
<tr>
<td>offsetfile_map</td>
<td>ndmpd.restore.vm_cache_size / 4</td>
</tr>
</tbody>
</table>

The -option-value for this parameter should be a number between 4 and 1024.

[-enable {true|false}] - Enable NDMP on Vserver

When the option is set to true, the NDMP daemon handles requests, and when set to false, the NDMP daemon does not handle requests. Enabling and disabling the option is equivalent to executing the following commands: vserver services ndmp on and vserver services ndmp off respectively. This option is persistent across reboots. The default value of this option is false.

The -option-value for this parameter is either true or false.

[-preferred-interface-role {cluster|data|node-mgmt|intercluster|cluster-mgmt}, ...] - Preferred Interface Role

This option allows the user to specify the preferred Logical Interface (LIF) role while establishing an NDMP data connection channel. The NDMP data server or the NDMP mover establishes a data channel from the node that owns the volume or the tape device respectively. This option is used on the node that owns the volume or the tape device. The order of IP addresses that are used to establish the data connection depends on the order of LIF roles specified in this option.

The default value for this option for the admin Vserver is intercluster, cluster-mgmt, node-mgmt

The default value for this option for a data Vserver is intercluster, data.

[-secondary-debug-filter <text>] - Secondary Debug Filter (privilege: advanced)

This option allows control on NDMP debug logging. This option takes a comma separated tag=value pairs. The supported tag is IPADDR which can be used to specify Vserver IP addresses for which NDMP debugging is required. If this option is set and the option debug-enable is set to true, then the debug-filter option is applicable to sessions whose control connection IP addresses match the IP addresses that are listed in the option. If this option is not set, the debug filter is applicable to all Vserver sessions. By default, this option does not have a value set.
[-is-secure-control-connection-enabled (true|false)] - Is Secure Control Connection Enabled

This option enables NDMP service to accept control connections over secure sockets on TCP port 30000. This option is persistent across reboots. The default value of this option is false.

Examples

The following example show how to enable NDMP on a Vserver and set authorization type to plaintext:

```
cluster1::> vserver services ndmp modify -vserver vs1 -enable true -authtype plaintext
cluster1::>
```

vserver services ndmp off

Disable NDMP service

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

This command is used to disable NDMP service on a specific Vserver.

Parameters

-vserver <Vserver Name> - Vserver

This parameter specifies the name of the Vserver.

Examples

The following example disables NDMP on a specific Vserver:

```
cluster1::> vserver services ndmp off -vserver vs1
```

vserver services ndmp on

Enable NDMP service

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

This command is used to enable NDMP service on a specific Vserver.

Parameters

-vserver <Vserver Name> - Vserver

This parameter specifies the name of the Vserver.

Examples

The following example enables NDMP service on a specific Vserver:

```
cluster1::> vserver services ndmp on -vserver vs1
```
vserver services ndmp probe

Display list of NDMP sessions

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The system services ndmp probe command displays diagnostic information about NDMP sessions belonging to a specific Vserver in the cluster. The following fields are displayed for each of the sessions:

- Vserver
- Session identifier
- NDMP version
- Session authorized
- Data state
- Data operation
- Data server halt reason
- Data server connect type
- Data server connect address
- Data server connect port
- Data bytes processed
- Mover state
- Mover mode
- Mover pause reason
- Mover halt reason
- Mover record size
- Mover record number
- Mover bytes moved
- Mover seek position
- Mover bytes left to read
- Mover window offset
- Mover window length
- Mover position
- Mover SetRecordSize flag
- Mover SetWindow flag
- Mover connect type
- Mover connect address
- Mover connect port
Parameters

[-vserver <vserver name>] - Vserver
    This parameter Specifies the Vserver context in which NDMP sessions are running.

[-session-id <text>] - Session Identifier
    If this parameter is specified, the command displays information about a specific NDMP session. A session-id
    is a string used to identify a particular NDMP session.

[-ndmp-version <integer>] - NDMP Version
    This parameter refers to the NDMP protocol version being used in the session.

[-session-authorized {true|false}] - Session Authorized
    This parameter indicates whether an NDMP session is authenticated or not.

[-data-state <component state>] - Data State
    This parameter identifies the current state of the data server's state machine.

[-data-operation <data operation>] - Data Operation
    This parameter identifies the data server's current operation.

[-data-halt-reason <halt reason>] - Data Server Halt Reason
    This parameter identifies the event that caused the data server state machine to enter the HALTED state.

[-data-con-addr-type <address type>] - Data Server Connect Type
    This parameter specifies the type of data connection established by the data server. The data connection can be
    established locally within a given system or between remote networked systems.

[-data-con-addr <text>] - Data Server Connect Address
    This parameter specifies the connection endpoint information for the data server's data connection.

[-data-con-port <integer>] - Data Server Connect Port
    This parameter specifies the TCP/IP port that the data server will use when establishing a data connection.
[-data-bytes-processed <integer>] - Data Bytes Processed
This parameter represents the cumulative number of data stream bytes transferred between the backup or recovery method and the data connection during the current data operation.

[-mover-state <component state>] - Mover State
This parameter identifies the current state of the NDMP tape server's mover state machine.

[-mover-mode <mover mode>] - Mover Mode
This parameter identifies the direction of the mover data transfer.

[-mover-pause-reason <pause reason>] - Mover Pause Reason
This parameter identifies the event that caused the mover state machine to enter the PAUSED state.

[-mover-halt-reason <halt reason>] - Mover Halt Reason
This parameter field identifies the event that caused the mover state machine to enter the HALTED state.

[-mover-record-size <integer>] - Mover Record Size
This parameter represents the current mover record size in bytes.

[-mover-record-num <integer>] - Mover Record Number
This parameter represents the last tape record processed by the mover.

[-mover-bytes-moved <integer>] - Mover Bytes Moved
This parameter represents the cumulative number of data stream bytes written to the data connection or the number of data stream bytes read from the data connection and written to the tape subsystem, depending on the mode of mover operation.

[-mover-seek-position <integer>] - Mover Seek Position
This parameter represents the data stream offset of the first byte the DMA requested the mover to transfer to the data connection during a mover read operation.

[-mover-bytes-left-to-read <integer>] - Mover Bytes Left to Read
This parameter represents the number of data bytes remaining to be transferred to the data connection to satisfy the current NDMP_MOVER_READ request.

[-mover-window-offset <integer>] - Mover Window Offset
This parameter represents the absolute offset of the first byte of the mover window within the overall data stream.

[-mover-window-length <integer>] - Mover Window Length
This parameter represents the length of the current mover window in bytes.

[-mover-position <integer>] - Mover Position
This parameter can be used to list only those sessions, whose mover position matches a specific value. Mover-position should be an integer.

[-mover-setrecordsize-flag {true|false}] - Mover SetRecordSize Flag
This parameter is used by the DMA to establish the record size used for mover-initiated tape read and write operations.

[-mover-setwindow-flag {true|false}] - Mover SetWindow Flag
This flag represents whether a mover window has been set or not. A mover window represents the portion of the overall backup stream that is accessible to the mover without intervening DMA tape manipulation.

[-mover-con-addr-type <address type>] - Mover Connect Type
This parameter specifies the type of data connection established by the mover. The data connection can be established locally within a given system or between remote networked systems.
[-mover-con-addr <text>] - Mover Connect Address
   This parameter specifies the endpoint address or addresses that the mover will use when establishing a data connection.

[-mover-con-port <integer>] - Mover Connect Port
   This parameter specifies the TCP/IP port that the mover will use when establishing a data connection.

[-eff-host <host type>] - Effective Host
   This parameter indicates the host context in which the NDMP session runs. The valid values are: PRIMARY or PARTNER.

[-client-addr <text>] - NDMP Client Address
   This parameter specifies the client's IP address.

[-client-port <integer>] - NDMP Client Port
   This parameter specifies the client's port number.

[-spt-device-id <text>] - SCSI Device ID
   This parameter specifies the SCSI device ID.

[-spt-ha <integer>] - SCSI Host Adapter
   This parameter specifies the SCSI host adapter.

[-spt-scsi-id <integer>] - SCSI Target ID
   This parameter specifies the SCSI target.

[-spt-scsi-lun <integer>] - SCSI LUN ID
   This parameter specifies the SCSI LUN ID.

[-tape-device <text>] - Tape Device
   This parameter specifies the name to identify the tape device.

[-tape-mode <mover mode>] - Tape Mode
   This parameter specifies the mode in which tapes are opened.

[-node {<nodename>|local}] - Node
   If this parameter is specified, the command displays information about the sessions running on the specified node only. Node should be a valid node name.

[-is-secure-control-connection {true|false}] - Is Secure Control Connection
   This parameter specifies whether the control connection is secure or not.

[-data-backup-mode <text>] - Data Backup Mode
   This parameter specifies whether the mode of data backup is Dump or SMTape.

[-data-path <text>] - Data Path
   This parameter specifies the path of data being backed up.

[-source-addr <text>] - NDMP Source Address
   This parameter specifies the control connection IP address of the NDMP session.

**Examples**

The following example displays diagnostic information about all the sessions in the cluster:

```
cluster1::> vserver services ndmp probe

   Vserver Name: vserver1
   Session Identifier: 1000:7445
   NDMP Version: 4
   Session Authorized: true
   Data State: IDLE
```
The following example displays diagnostic information of sessions associated with Vserver vserver1 only:

```
cluster1::> vserver services ndmp probe -vserver vserver1

  Vserver Name: vserver1
  Session Identifier: 1000:7445
  NDMP Version: 4
  Session Authorized: true
  Data State: IDLE
  Data Operation: NOACTION
  Data Server Halt Reason: NA
  ....
  ....
```

**vserver services ndmp show**

Display NDMP Properties

**Availability:** This command is available to cluster and Vserver administrators at the `admin` privilege level.

**Description**

This command is used to display NDMP options on Vservers.

A combination of parameters can be optionally specified so as to list only a subset of Vservers where specific values of NDMP options are met. A short description of each of the options is provided in the parameters section.

**Parameters**

```
[-fields <fieldname>, ...]
 If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance]
 If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>]
 If this parameter is specified, the command displays NDMP options for that Vserver alone.
```
[-maxversion <integer>] - NDMP Version

If this parameter is specified, the command displays NDMP options for Vservers where the highest NDMP protocol version supported matches the specified input value. The only supported value is 4.

[-ignore-ctime-enabled {true|false}] - Ignore Ctime

If this parameter is specified, the command displays NDMP options for Vservers, where the value for ignore-ctime-enabled matches the specified input value.

This option, when true, allows user to exclude files with ctime changed from storage system' incremental dumps since other processes like virus scanning often alter the ctime of files. When this option is false, backup on the Vserver will include all files with a change or modified time later then the last dump in the previous level dump. The default value is false. This option is persistent across reboots.

Most WIN32 APIs are often unaware of the "last changed time", ctime, they often incorrectly set a later time for files, causing these files to be included in the Vserver's incremental dumps, making the incremental dump very large. This is partially defying the purpose of having incremental dumps, since one uses incremental dumps to speed up the backup by only dumping files that were truly changed since the last backup.

The possible value for this parameter is either true or false.

[-offset-map-enable {true|false}] - Enable Offset Map

If this parameter is specified, the command displays NDMP options for Vservers, where the value for offset-map-enable matches the specified input value.

This option is used to enable or disable generation of the inode offset map during NDMP based dump backups. The offset map is required to perform Enhanced Direct Access Restore (DAR) on the backup data. Enhanced DAR provides support for directory DAR and DAR of files with NT streams. The default value for this option is true. This option is persistent across reboots.

The possible value for this parameter is either true or false.

[-tcpnodelay {true|false}] - Enable TCP Nodelay

If this parameter is specified, the command displays NDMP options for Vservers, where the value for tcpnodelay matches the specified input value.

This parameter Enables/Disables the TCPNODELAY configuration parameter for the socket between the Vserver and the DMA. When set to true, the Nagle algorithm is disabled and small packets are sent immediately rather than held and bundled with other small packets. This optimizes the system for response time rather than throughput.

This option becomes active when the next NDMP session starts. Existing sessions are unaffected. The default value for this option is false. This option is persistent across reboots.

The possible value for this parameter is either true or false.

[-tcpwinsize <integer>] - TCP Window Size

If this parameter is specified, the command displays NDMP options for Vservers, where the value for tcpwinsize matches the specified input value.

This option shows the TCP buffer size of the NDMP data connection. The minimum and maximum values are 8192(8K) and 262,144(256K), respectively. The default value for this option is 32768(32K).

This option is persistent across reboots.

The possible value for this parameter is a number between 8192(8K) and 262,144(256K).

[-data-port-range <text>] - Data Port Range

If this parameter is specified, the command displays NDMP options for Vservers, where the value for data-port-range matches the specified input value.

This option shows the port range on which the NDMP server can listen for data connections.
The format of this option is *start_port - end_port*. *start_port, end_port* can have values between [1024-65535]; *start_port* must be less than or equal to *end_port*. If a valid range is specified, NDMP uses a port within that range to listen for data connections. A listen request fails if no ports in the specified range are free.

This option is modifiable only from the admin Vserver context and the said option is applicable for all the data Vservers and the admin Vserver. For example, if the value of the above option is set with 2000-3000, the same value will be applicable throughout the cluster. The value *all* implies that any available port can be used to listen for data connections. The default value for this option is *all*. This option is persistent across reboots.

The value for this option is displayed in the format {<start_port>-<end port> | all }- where *start_port, end_port* can have values between [1024-65535]; *start_port* must be less than or equal to *end_port*.

```bash
[-backup-log-enable {true|false}] - Enable Backup Log
```

If this parameter is specified, the command displays NDMP options for Vservers, where the value for `backup-log-enable` matches the specified input value.

Backup logging captures important events during dump/restore and records them in `/mroot/etc/log/backup` on the root volume. The default value for this option is *true*. This option is persistent across reboots.

The possible value for this parameter is true/false.

```bash
[-per-qtree-exclude-enable {true|false}] - Enable per Qtree Exclusion
```

If this parameter is specified, the command displays NDMP options for Vservers, where the value for `per-qtree-exclude-enable` matches the specified input value.

If this option is *true*, users can specify exclude list on a per qtree basis to be excluded from backup. This exclude list will override any values already present due to 'EXCLUDE' environment variable. The user can specify the exclusion list through a `.exclude_list` file which resides at the root of the qtree. The exclusion list can be a list of files or files that match a specified pattern. The default value for this option is *false*. This option is persistent across reboots.

The possible value for this parameter is either true or false.

```bash
[-authtype <NDMP Authentication types>, ...] - Authentication Type
```

If this parameter is specified, the command displays NDMP options for Vservers, where the value for `authtype` matches the specified input value.

Allows the administrator to choose the authentication method. NDMP supports three authentication types: challenge, plaintext and plaintext_sso. The plaintext_sso authentication type is mutually exclusive with the other authentication types. By setting the authentication type as plaintext_sso, the actual password for the user can be used to authenticate instead of having to generate an NDMP specific password. The default of this option is `challenge`. This option is persistent across reboots.

The possible value for this parameter can be `{challenge | plaintext | plaintext_sso | challenge, plaintext | plaintext, challenge}`.

```bash
[-debug-enable {true|false}] - Enable Debug (privilege: advanced)
```

If this parameter is specified, the command displays NDMP options for Vservers, where the value for `debug-enable` matches the specified input value.

This option enables debug logging for NDMP. Debug messages will be logged to the `ndmpd log file / mroot/etc/log/mlog/ndmpd.log`. The default value for this option is *false*. This option is persistent across reboots.

The possible value for this parameter is either true or false.

```bash
[-debug-filter <text>] - Debug Filter (privilege: advanced)
```

If this parameter is specified, the command displays NDMP options for Vservers, where the value for `debug-filter` matches the specified input value.
This option controls the NDMP modules for which debug logging is to be enabled. option-value can take five values for this option: all, none, normal, backend or "filter-expression".

`all` enables debug logging for all modules.

`none` disables debug logging for all modules. It is equivalent to `modify -vserver vserver_name -debug-enable false`.

`normal` is a shortcut option that enables debug logging for all modules except verbose and io_loop. The equivalent filter string is all-verbose-io_loop.

`backend` is a short cut option that enables debug logging for all modules except verbose, io_loop, ndmps and ndmpp. The equivalent filter string is all-verbose-io_loop-ndmps-ndmpp.

`(filter-expression)` is a combination of one or more modules for which debug logs needs to be enabled. Multiple module names can be combined using following operators:

- `^` to add the given module or modules to the list of modules specified in the filter string. For example the filter ndmpp^mover^data will enable debug logging for ndmpp, mover and data.

The possible module names and a brief description is given below:

<table>
<thead>
<tr>
<th>Modules</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>verbose</td>
<td>verbose message</td>
</tr>
<tr>
<td>io</td>
<td>I/O process loop</td>
</tr>
<tr>
<td>io_loop</td>
<td>I/O process loop verbose messages</td>
</tr>
<tr>
<td>ndmps</td>
<td>NDMP service</td>
</tr>
<tr>
<td>ndmpp</td>
<td>NDMP Protocol</td>
</tr>
<tr>
<td>rpc</td>
<td>General RPC service</td>
</tr>
<tr>
<td>fdc_rpc</td>
<td>RPC to FC driver service</td>
</tr>
<tr>
<td>auth</td>
<td>Authentication</td>
</tr>
<tr>
<td>mover</td>
<td>NDMP MOVER (tape I/O)</td>
</tr>
<tr>
<td>data</td>
<td>NDMP DATA (backup/restore)</td>
</tr>
<tr>
<td>scsi</td>
<td>NDMP SCSI (robot/tape ops)</td>
</tr>
<tr>
<td>bkup_rpc</td>
<td>RPC to Backup service client</td>
</tr>
<tr>
<td>bkup_rpc_s</td>
<td>RPC to Backup service server</td>
</tr>
<tr>
<td>conf</td>
<td>Debug configure/reconfigure</td>
</tr>
<tr>
<td>dbblade</td>
<td>Dblade specific messages</td>
</tr>
<tr>
<td>timer</td>
<td>NDMP server timeout messages</td>
</tr>
<tr>
<td>vldb</td>
<td>VLDB service</td>
</tr>
<tr>
<td>smf</td>
<td>SMF Gateway messages</td>

<tr>
<td>common</td>
<td>NDMP common state</td>
</tr>
<tr>
<td>ext</td>
<td>NDMP extensions messages</td>
</tr>
<tr>
<td>ndmprpc</td>
<td>NDMP Mhost RPC server</td>
</tr>
</tbody>
</table>

The default value for this option is `none`. This option is persistent across reboots.

The possible value for this parameter can be `{all | none | normal | backend |'filter-expression'}`.

[<dump-logical-find <text>]] - Enable Logical Find for Dump (privilege: advanced)

If this parameter is specified, the command displays NDMP options for Vservers, where the value for `dump-logical-find` matches the specified input value.

This option specifies whether to follow inode-file walk or tree walk for phase I of the dump. Choosing node-file walk or tree walk affects the performance of the dump. This option can take following values:

- `default` is specified, then level 0 and incremental volume as well as qtree dumps will use inode walk. All the subtree dumps will use tree walk.
If *always* is specified, all dumps will follow treewalk.

A *comma-separated* list of values in any combination from the following list:

- **vol_baseline**: Level 0 full volume backup will follow treewalk.
- **vol_incr**: Incremental full volume backup will follow treewalk.
- **qtree_baseline**: Level 0 qtree backup will follow treewalk.
- **qtree_incr**: Incremental qtree backup will follow treewalk.

The default value for this option is *default*. This option is persistent across reboots.

The possible value for this parameter could be {default | always | 'vol_baseline' | 'vol_baseline,qtree_baseline' | ...}.

[-**abort-on-disk-error {true|false}**] - Enable Abort on Disk Error (privilege: advanced)

If this parameter is specified, the command displays NDMP options for Vservers, where the value for *abort-on-disk-error* matches the specified input value.

If this option is *true*, dump will abort the backup operation on detection of irrecoverable data blocks in user files. If this option is *false*, dump will proceed with backup operation - even if irrecoverable data blocks in user files are detected. On detection of irrecoverable data blocks, dump will send a log message to DMA and also log an entry in /mroot/etc/log/backup file. The default value for this option is *false*. This option is persistent across reboots.

The value for this parameter is either true or false.

[-**fh-dir-retry-interval <integer>**] - FH Throttle Value for Dir (privilege: advanced)

If this parameter is specified, the command displays NDMP options for Vservers, where the value for *fh-dir-retry-interval* matches the specified input value.

NDMP protocol sends back file history information for all directories in phase 3 of dump to DMA. In the presence of slow DMA or high latency networks, the amount of file history being generated exceeds the amount being consumed by the DMA. To handle a slow reader, a flow control mechanism is now introduced where file history generation is throttled when a DMA is slow in consuming them. The value for this option indicates how frequently should the file history be resent if it was throttled. The default value is 250 milliseconds. This option is persistent across reboots.

The value for this parameter is a number.

[-**fh-node-retry-interval <integer>**] - FH Throttle Value for Node (privilege: advanced)

If this parameter is specified, the command displays NDMP options for Vservers, where the value for *fh-node-retry-interval* matches the specified input value.

NDMP protocol sends back file history information for all files in phase 4 of dump to DMA. In the presence of slow DMA or high latency networks, the amount of file history being generated exceeds the amount being consumed by the DMA. To handle slow reader conditions, a flow control mechanism is now introduced where file history generation is throttled when a DMA is slow in consuming them. The value for this option indicates how frequently should the file history be resent if it was throttled. The default value is 250 milliseconds. This option is persistent across reboots.

The value for this parameter is a number.

[-**restore-vm-cache-size <integer>**] - Restore VM File Cache Size (privilege: advanced)

If this parameter is specified, the command displays NDMP options for Vservers, where the value for *restore-vm-cache-size* matches the specified input value.

This option mandates the number of WAFL buffers pinned in memory by various meta-files used by logical restore. The minimum and maximum values are 4 and 1024, respectively. The default value for this option is 64. This option is persistent across reboots.
Depending on the value of this option, various meta-files are assigned a number of WAFL buffers that need to be pinned in memory.

<table>
<thead>
<tr>
<th>Meta-filename</th>
<th>Number of WAFL buffers to be pinned in memory</th>
</tr>
</thead>
<tbody>
<tr>
<td>dumpmap</td>
<td>ndmpd.restore.vm_cache_size</td>
</tr>
<tr>
<td>filemap</td>
<td>ndmpd.restore.vm_cache_size</td>

<td>ndmpd.restore.vm_cache_size / 4</td>
</tr>
<tr>
<td>offsetfile_map</td>
<td>ndmpd.restore.vm_cache_size / 4</td>
</tr>
</tbody>
</table>

The possible value for this parameter is a number between 4 and 1024.

`[-enable {true|false}]` - Enable NDMP on Vserver

If this parameter is specified, the command displays NDMP options for Vservers, where the value for `enable` matches the specified input value.

When the option is set to `true`, the NDMP daemon handles requests, and when set to `false`, the NDMP daemon does not handle requests. Enabling and disabling the option is equivalent to executing the following commands: `vserver services ndmp on` and `vserver services ndmp off` respectively. This option is persistent across reboots. The default value of this option is `false`.

The value for this parameter is either true or false.

`[-preferred-interface-role {cluster|data|node-mgmt|intercluster|cluster-mgmt}, ...]` - Preferred Interface Role

If this parameter is specified, the command displays NDMP options for Vservers, where the value for `preferred-interface-role` matches the specified input value.

This option allows the user to specify the preferred Logical Interface (LIF) role while establishing an NDMP data connection channel. The NDMP data server or the NDMP mover establishes a data channel from the node that owns the volume or the tape device respectively. This option is used on the node that owns the volume or the tape device. The order of IP addresses that are used to establish the data connection depends on the order of LIF roles specified in this option.

The default value for this option for the admin Vserver is `intercluster, cluster-mgmt, node-mgmt`

The default value for this option for a data Vserver is `intercluster, data`.

`[-secondary-debug-filter <text>]` - Secondary Debug Filter (privilege: advanced)

If this parameter is specified, the command displays NDMP options for Vservers, where the value for `secondary-debug-filter` matches the specified input value.

This option allows control on NDMP debug logging. This option takes a comma separated tag=value pairs. The supported tag is `IPADDR` which can be used to specify Vserver IP addresses for which NDMP debugging is required. If this option is set and the option `debug-enable` is set to true, then the debug-filter option is applicable to sessions whose control connection IP addresses match the IP addresses that are listed in the option. If this option is not set, the debug filter is applicable to all Vserver sessions. By default, this option does not have a value set.
- `-is-secure-control-connection-enabled {true | false}` - Is Secure Control Connection Enabled

If this parameter is specified, the command displays NDMP options for Vservers, where the value for `is-secure-control-connection-enabled` matches the specified input value.

This option enables NDMP service to accept control connections over secure sockets on TCP port 30000. This option is persistent across reboots. The default value of this option is `false`.

**Examples**

The following example displays NDMP options for the Vserver(s).

```
cluster1::> vserver services ndmp show
VServer       Enabled   Authentication type
------------- --------- -------------------
ccluster       true      plaintext
vs1           true      plaintext
vs2           true      plaintext
3 entries were displayed.
cluster1::>
```

The following example displays detailed NDMP options for a Vserver.

```
cluster1::*> vserver services ndmp show -vserver vs1 -instance
Vserver: vs1
NDMP Version: 4
Ignore Ctime: false
Enable Offset Map: true
Enable TCP Nodelay: false
TCP Window Size: 32768
Data Port Range: all
Enable Backup Log: true
Enable per Qtree Exclusion: false
Authentication Type: plaintext
Enable Debug: false
Debug Filter: none
Enable Logical Find for Dump: default
Enable Abort on Disk Error: false
FH Throttle Value for Dir: 250
FH Throttle Value for Node: 250
Restore VM File Cache Size: 64
Enable Logging of VM Stats for Dump: false
Enable NDMP on Vserver: true
Preferred Interface Role: intercluster, data
Secondary Debug Filter: -
Is Secure Control Connection Enabled: false
```

**vserver services ndmp status**

Display list of NDMP sessions

**Availability:** This command is available to cluster and Vserver administrators at the `admin` privilege level.

**Description**

The `vserver services ndmp status` command lists NDMP sessions belonging to a specific Vserver in the cluster. By default it lists the following details about the active sessions:

- Vserver Name
- Session ID
A combination of parameters can be optionally supplied so as to list only those sessions which match specific conditions. A short description of each of the parameter is provided in the parameters section.

**Parameters**

\{ [-fields <fieldname>, ...] \}

This optional parameter specifies which all additional fields to display. Any combination of the following fields are valid:

- ndmp-version
- session-authorized
- data-state
- data-operation
- data-halt-reason
- data-con-addr-type
- data-con-addr
- data-con-port
- data-bytes-processed
- mover-state
- mover-mode
- mover-pause-reason
- mover-halt-reason
- mover-record-size
- mover-record-num
- mover-bytes-moved
- mover-seek-position
- mover-bytes-left-to-read
- mover-window-offset
- mover-window-length
- mover-position
- mover-setrecordsize-flag
- mover-setwindow-flag
- mover-con-addr-type
- mover-con-addr
- mover-con-port
- eff-host
- client-addr
- client-port

- spt-device-id
- spt-ha
- spt-scsi-id
- spt-scsi-lun
- tape-device
- tape-modes
- node
- is-secure-control-connection
- data-backup-mode
- data-path
- source-addr

```bash
[[-instance]]
```

If this parameter is specified, the command displays detailed information about all the active sessions.

```bash
[-vserver <vserver name>] - Vserver
```

Specifies the Vserver context in which NDMP sessions are running.

```bash
[-session-id <text>] - Session Identifier
```

If this parameter is specified, the command displays information about specific NDMP session. A session-id is a string used to identify a particular NDMP session.

```bash
[-ndmp-version <integer>] - NDMP Version
```

This parameter refers to the NDMP protocol version being used in the session.

```bash
[-session-authorized {true|false}] - Session Authorized
```

This field indicates whether an NDMP session is authenticated or not.

```bash
[-data-state <component state>] - Data State
```

This field identifies the current state of the data server's state machine.

```bash
[-data-operation <data operation>] - Data Operation
```

This field identifies the data server's current operation.

```bash
[-data-halt-reason <halt reason>] - Data Server Halt Reason
```

This field identifies the event that caused the data server state machine to enter the HALTED state.

```bash
[-data-con-addr-type <address type>] - Data Server Connect Type
```

This field specifies the type of data connection established by the data server. The data connection can be established locally within a given system or between remote networked systems.

```bash
[-data-con-addr <text>] - Data Server Connect Address
```

This specifies the connection endpoint information for the data server's data connection.

```bash
[-data-con-port <integer>] - Data Server Connect Port
```

This specifies the TCP/IP port that the data server will use when establishing a data connection.

```bash
[-data-bytes-processed <integer>] - Data Bytes Processed
```

This field represents the cumulative number of data stream bytes transferred between the backup or recovery method and the data connection during the current data operation.

```bash
[-mover-state <component state>] - Mover State
```

This parameter identifies the current state of the NDMP tape server's mover state machine.
[-mover-mode <mover mode>] - Mover Mode
This parameter identifies the direction of the mover data transfer.

[-mover-pause-reason <pause reason>] - Mover Pause Reason
This parameter identifies the event that caused the mover state machine to enter the PAUSED state.

[-mover-halt-reason <halt reason>] - Mover Halt Reason
This integer field identifies the event that caused the mover state machine to enter the HALTED state.

[-mover-record-size <integer>] - Mover Record Size
This field represents the current mover record size in bytes.

[-mover-record-num <integer>] - Mover Record Number
This field represents the last tape record processed by the mover.

[-mover-bytes-moved <integer>] - Mover Bytes Moved
This field represents the cumulative number of data stream bytes written to the data connection or the number of data stream bytes read from the data connection and written to the tape subsystem, depending on the mode of mover operation.

[-mover-seek-position <integer>] - Mover Seek Position
This field represents the data stream offset of the first byte the DMA requested the mover to transfer to the data connection during a mover read operation.

[-mover-bytes-left-to-read <integer>] - Mover Bytes Left to Read
This field represents the number of data bytes remaining to be transferred to the data connection to satisfy the current NDMP_MOVER_READ request.

[-mover-window-offset <integer>] - Mover Window Offset
This field represents the absolute offset of the first byte of the mover window within the overall data stream.

[-mover-window-length <integer>] - Mover Window Length
This field represents the length of the current mover window in bytes.

[-mover-position <integer>] - Mover Position
This parameter can be used to list only those sessions, whose mover position matches a specific value. Mover-position should be an integer.

[-mover-setrecordsize-flag {true|false}] - Mover SetRecordSize Flag
This field is used by the DMA to establish the record size used for mover-initiated tape read and write operations.

[-mover-setwindow-flag {true|false}] - Mover SetWindow Flag
This flag represents whether a mover window has been set or not. A mover window represents the portion of the overall backup stream that is accessible to the mover without intervening DMA tape manipulation.

[-mover-con-addr-type <address type>] - Mover Connect Type
This field specifies the type of data connection established by the mover. The data connection can be established locally within a given system or between remote networked systems.

[-mover-con-addr <text>] - Mover Connect Address
This specifies the endpoint address or addresses that the mover will use when establishing a data connection.

[-mover-con-port <integer>] - Mover Connect Port
This specifies the TCP/IP port that the mover will use when establishing a data connection.

[-eff-host <host type>] - Effective Host
This field indicates the host context in which the NDMP session runs. The valid values are: PRIMARY or PARTNER.
[<-client-addr <text>] - NDMP Client Address
   This parameter specifies the client's IP address.

[<-client-port <integer>] - NDMP Client Port
   This parameter specifies the client's port number.

[<-spt-device-id <text>] - SCSI Device ID
   This parameter specifies the SCSI device ID.

[<-spt-ha <integer>] - SCSI Host Adapter
   This parameter specifies the SCSI host adapter.

[<-spt-scsi-id <integer>] - SCSI Target ID
   This parameter specifies the SCSI target.

[<-spt-scsi-lun <integer>] - SCSI LUN ID
   This parameter specifies the SCSI LUN ID.

[<-tape-device <text>] - Tape Device
   This parameter specifies the name to identify the tape device.

[<-tape-mode <mover mode>] - Tape Mode
   This parameter specifies the mode in which tapes are opened.

[<-node {<nodename>|local}] - Node
   If this parameter is specified, the command displays information about the sessions running on the specified
   node only. Node should be a valid node name.

[<-is-secure-control-connection {true|false}] - Is Secure Control Connection
   This parameter specifies whether the control connection is secure or not.

[<-data-backup-mode <text>] - Data Backup Mode
   This parameter specifies whether the mode of data backup is Dump or SMTape.

[<-data-path <text>] - Data Path
   This parameter specifies the path of data being backed up.

[<-source-addr <text>] - NDMP Source Address
   This parameter specifies the control connection IP address of the NDMP session.

---

**Examples**

The following example displays all the NDMP sessions on the cluster:

```
cluster1::> vserver services ndmp status
          Session
  Vserver   Id
  --------   ---
vserver1   1000:7445
  vserver2   1000:7446
  vserver2   1000:7447
3 entries were displayed.
```

The following example shows how to display only the sessions running belonging to Vserver vserver2:

```
cluster1::> vserver services ndmp status -vserver vserver2
          Session
  Vserver   Id
  --------   ---
vserver2   1000:7446
```

vserver services commands
vserver services ndmp extensions commands

The extensions directory

vserver services ndmp extensions modify

Modify NDMP extension status

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
This command is used to enable/disable an NDMP extension in the Vserver-aware NDMP mode.

Parameters
[-is-extension-0x2050-enabled {true|false}] - Is Extension 0x2050 Enabled

If this parameter is specified, the command can be used to modify the status of the extension in the Vserver-aware mode.

Examples
The following example shows how to enable NDMP extension 0x2050 in the Vserver-aware NDMP mode of operation:

```
cluster1::> vserver services ndmp extension modify -is-extension-0x2050-enabled true
cluster1::>
```

vserver services ndmp extensions show

Display NDMP extension status

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
This command displays whether an NDMP extension is enabled in the Vserver-aware NDMP mode or not.

Examples
The following example shows how to check the status of NDMP extension 0x2050 in a cluster:

```
cluster1::> vserver services ndmp extension show
Is Extension 0x2050 Enabled: true
cluster1::>
```

vserver services ndmp log commands

The log directory
vserver services ndmp log start
Start logging for the specified NDMP session

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
This command is used to start logging on an active NDMP session on a vserver.

Parameters
- **-vserver <vserver name>** - Vserver
  This parameter specifies the name of the Vserver.

- **-session-id <text>** - Session Identifier
  This parameter specifies the NDMP session-id on which logging needs to be started.

- **-filter <text>** - Level Filter
  Use this parameter to specify the filter for a particular session ID. This parameter controls the NDMP modules for which logging is to be enabled. This parameter can take five values. They are as follow: *all, none, normal, backend* or *"filter-expression"*. The default value for this is *none*.

  - *all* turns on logging for all modules.
  - *none* disables logging for all modules.
  - *normal* is a short cut parameter that enables logging for all modules except *verbose* and *io_loop*. The equivalent filter string is *all-verbose-io_loop*
  - *backend* is a short cut parameter that enables logging for all modules except *verbose, io_loop, ndmps* and *ndmpd*. The equivalent filter string is *all-verbose-io_loop-ndmps-ndmpd*
  - *(filter-expression)* is a combination of one or more modules for which logs needs to be enabled. Multiple module names can be combined using following operators:
    - *-* to remove the given module from the list of specified modules in the filter string. For example the filter *all-ndmpp* will enable logging for all modules but not *ndmpp*.
    - *^* to add the given module or modules to the list of modules specified in the filter string. For example the filter *ndmpp^mover^data* will enable logging for *ndmpp, mover* and *data*.

The possible module names and a brief description is given below:

<table>
<thead>

</table>
The following example shows how to start logging on a specific NDMP session 1000:35512, running on vserver cluster1-01 with filter all.

```
carolinas*:~> vserver services ndmp log start -vserver cluster1-01 -session-id 1000:35512 -filter all
carolinas*:~>
```

**vserver services ndmp log stop**

Stop logging for the specified NDMP session

**Availability:** This command is available to cluster and Vserver administrators at the advanced privilege level.

**Description**

This command is used to stop logging on an active NDMP session on a vserver.

**Parameters**

- `-vserver <vserver name>` - Vserver
  
  This parameter specifies the name of the Vserver.

- `-session-id <text>` - Session Identifier
  
  This parameter specifies the NDMP session-id on which logging needs to be stopped.

**Examples**

The following example shows how to stop logging on a specific NDMP session 1000:35512, running on vserver cluster1-01.

```
carolinas*:~> vserver services ndmp log stop -vserver cluster1-01 -session-id 1000:35512
```
Description

The `vserver services ndmp restartable-backup delete` command deletes an NDMP restartable backup context. The `-force` flag can be used to forcibly destroy a NDMP restartable backup context.

Parameters

`-vserver <Vserver Name>` - Vserver
   This parameter specifies the name of the Vserver for which NDMP restartable backup context is to be deleted.

`-context-id <UUID>` - Context Identifier
   This parameter specifies the NDMP restartable backup context ID which needs to be deleted.

`[-force [true]]` - Force Delete (privilege: advanced)
   If this parameter is specified, the context is deleted even if there are internal errors.

Examples

The following example shows how to delete an NDMP restartable backup context:

```
cluster1::> vserver services restartable-backup delete -vserver cluster1-01 -context-id 0f8f5c44-d540-11e5-8c45-005056963504
cluster1::>
```

vserver services ndmp restartable-backup show

Display NDMP restartable backup contexts

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The `vserver services ndmp restartable-backup show` command lists the NDMP restartable backup contexts present in the cluster. By default it lists the following details about the context:

- Vserver Name
- Context Identifier
- Is Cleanup Pending?

A combination of parameters can be optionally supplied so as to list only those contexts which match specific conditions. A short description of each of the parameter is provided in the parameters section.

Parameters

`{ [-fields <fieldname>, ...]` If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

`[-instance]` If you specify the `-instance` parameter, the command displays detailed information about all fields.

`-vserver <Vserver Name>` - Vserver
   If this parameter is specified, the command displays NDMP restartable backup contexts that match the specified Vserver.

`-context-id <UUID>` - Context Identifier
   If this parameter is specified, the command displays NDMP restartable backup contexts where the value for `-context-id` matches the specified input value.
This parameter specifies the UUID of NDMP restartable backup contexts.

`[-volume <volume name>] - Volume Name`
If this parameter is specified, the command displays NDMP restartable backup contexts where the value for volume matches the specified input value.

This parameter specifies the volume path information

`[-is-cleanup-pending {true|false}] - Is Cleanup Pending?`
If this parameter is specified, the command displays NDMP restartable backup contexts where the value for -is-cleanup-pending matches the specified input value.

This parameter indicates whether the context is being deleted.

`[-engine-type <text>] - Backup Engine Type`
If this parameter is specified, the command displays NDMP restartable backup contexts where the value for engine-type matches the specified input value.

This parameter specifies the backup engine type.

`[-auto-snapshot {true|false}] - Is Snapshot Copy Auto-created?`
If this parameter is specified, the command displays NDMP restartable backup contexts where the value for auto-snapshot matches the specified input value.

This parameter indicates if the Snapshot copy was created by DUMP engine.

`[-no-acls {true|false}] - Is NO_ACLS Set? (privilege: advanced)`
If this parameter is specified, the command displays NDMP restartable backup contexts where the value for no-acls matches the specified input value.

This parameter specifies if NO_ACLS environment variable is set.

`[-dump-path <text>] - Dump Path`
If this parameter is specified, the command displays NDMP restartable backup contexts where the value for dumppath matches the specified input value.

This parameter represents the corresponding local volume path which is being backed up.

`[-backup-level <integer>] - Incremental Backup Level ID`
If this parameter is specified, the command displays NDMP restartable backup contexts where the value for backup-level matches the specified input value.

This parameter specifies the backup level.

`[-dump-date <integer>] - Dump Date (privilege: advanced)`
If this parameter is specified, the command displays NDMP restartable backup contexts where the value for dumpdate matches the specified input value.

This parameter specifies the dumpdate value in epoch.

`[-base-date <integer>] - Base Date (privilege: advanced)`
If this parameter is specified, the command displays NDMP restartable backup contexts where the value for basedate matches the specified input value.

This parameter specifies the basedate value in epoch.

`[-update-dump-dates {true|false}] - Dump Dates Require Update? (privilege: advanced)`
If this parameter is specified, the command displays NDMP restartable backup contexts where the value for update-dumpdates matches the specified input value.

This parameter indicates if dumpdates needs to be updated.
[-dump-name <text>] - Dump Name
    If this parameter is specified, the command displays NDMP restartable backup contexts where the value for dumpname matches the specified input value.
    This parameter indicates the name for the dump instance.

[-all-non-qtree {true|false}] - Is NON_QUOTA_QTREE Set? (privilege: advanced)
    If this parameter is specified, the command displays NDMP restartable backup contexts where the value for all-non-qtree matches the specified input value.
    This parameter indicates if NON_QUOTA_TREE environment variable is set.

[-print-options <integer>] - Backup Log Level (privilege: advanced)
    If this parameter is specified, the command displays NDMP restartable backup contexts where the value for print-options matches the specified input value.
    This parameter specifies the logging level during dump.

[-last-update <integer>] - Context Last Updated Time
    If this parameter is specified, the command displays NDMP restartable backup contexts where the value for last-update matches the specified input value.
    This parameter specifies the last time(in epoch) when the context was modified.

[-has-offset-map {true|false}] - Has Offset Map?
    If this parameter is specified, the command displays NDMP restartable backup contexts where the value for has-offset-map matches the specified input value.
    This parameter indicates if offset map is present in the backup image.

[-offset-verify {true|false}] - Offset Verify
    If this parameter is specified, the command displays NDMP restartable backup contexts where the value for offset-verify matches the specified input value.
    This parameter indicates if offset map is successfully verified during backup.

[-ndmp-env-keys <text>, ...] - NDMP Environment Keys (privilege: advanced)
    If this parameter is specified, the command displays NDMP restartable backup contexts where the value for ndmpenvkeys matches the specified input value.
    This parameter represents the list of NDMP environment variables set during backup.

[-ndmp-env-values <text>, ...] - NDMP Environment Values (privilege: advanced)
    If this parameter is specified, the command displays NDMP restartable backup contexts where the value for ndmpenvvalues matches the specified input value.
    This parameter represents the values set for the NDMP environment variables.

[-ndmp-env-count <integer>] - Count of NDMP Environment Variables (privilege: advanced)
    If this parameter is specified, the command displays NDMP restartable backup contexts where the value for ndmpenvcount matches the specified input value.
    This parameter represents the number of NDMP environment variables set during backup.

[-is-restartable {true|false}] - Is Context Restartable?
    If this parameter is specified, the command displays NDMP restartable backup contexts where the value for is-restartable matches the specified input value.
    This parameter indicates if the NDMP restartable backup context is restartable.
[--is-busy [true|false]] - Is Context Busy?
If this parameter is specified, the command displays NDMP restartable backup contexts where the value for is-busy matches the specified input value.
This parameter indicates if the NDMP restartable backup context is busy.

[--multi-subtree [true|false]] - Is MULTI_SUBTREE_NAMES Set? (privilege: advanced)
If this parameter is specified, the command displays NDMP restartable backup contexts where the value for multi-subtree matches the specified input value.
This parameter indicates if the NDMP environment variable MULTI_SUBTREE_NAMES is set.

[--logical-find [true|false]] - Is LOGICAL_FIND Set? (privilege: advanced)
If this parameter is specified, the command displays NDMP restartable backup contexts where the value for logical-find matches the specified input value.
This parameter indicates if the NDMP environment variable LOGICAL_FIND is set.

[--exclude-list <text>] - Is EXCLUDE Set? (privilege: advanced)
If this parameter is specified, the command displays NDMP restartable backup contexts where the value for exclude-list matches the specified input value.
This parameter represents the value of the the NDMP environment variable EXCLUDE.

[--restart-pass <integer>] - Restart Pass
If this parameter is specified, the command displays NDMP restartable backup contexts where the value for restart-pass matches the specified input value.
This parameter specifies the dump phase from which to restart.

[--backup-results <integer>] - Status of Backup
If this parameter is specified, the command displays NDMP restartable backup contexts where the value for backup-results matches the specified input value.
This parameter specifies the status of the backup.

[--snap-name <text>] - Snapshot Copy Name
If this parameter is specified, the command displays NDMP restartable backup contexts where the value for snap-name matches the specified input value.
This parameter specifies the name of the Snapshot copy.

[--is-dp-vol [true|false]] - Is DP Volume? (privilege: advanced)
If this parameter is specified, the command displays NDMP restartable backup contexts where the value for dp-vol matches the specified input value.
This parameter indicates if the volume specified in the NDMP restartable context is of type DP.

[--context-status <integer>] - State of the Context
If this parameter is specified, the command displays NDMP restartable backup contexts where the value for context-status matches the specified input value.
This parameter specifies the state of the NDMP restartable context.

Examples
The following example displays all the NDMP restartable contexts on the cluster:

```
cluster1::> vserver services ndmp restartable-backup show
Vserver | Context Identifier | Is Cleanup Pending?
-------- ------------------------------------ ---------------
        53a6760e-d245-11e5-a33b-005056bb2685 false
vserver1 68902360-d245-11e5-a33b-005056bb2685 true
```

1872 Commands: Manual Page Reference
Web Services Configuration

Manage web services

These commands manage the availability and authorization for all web services in the cluster.

vserver services web modify

Modify the configuration of web services

Availability: This command is available to cluster administrators at the admin privilege level.

Description

This command modifies the availability of the web services on Vservers. Only the services that are installed on every node in the cluster can be configured on Vservers whose type is not 'node'. Enabled services must include authorization configuration in the vserver services web access command for the services to be externally available.

Parameters

- `vserver <Vserver Name>` - Vserver
  Identifies a Vserver for hosting a specific web service.

- `name <text>` - Service Name
  Identifies the name of the web service.

- `[-enabled (true|false)]` - Enabled
  Defines the availability of a service on the Vserver. Disabled services are not accessible through the Vserver's network interfaces. This parameter's default value is dependent on the service. In general, services that provide commonly used features are enabled by default.

- `[-ssl-only (true|false)]` - SSL Only
  Defines the encryption enforcement policy for a service on the Vserver. Services for which this parameter is set to true support SSL only and cannot be used over unencrypted HTTP. The default for this value is 'false'.

Examples

The following command sets access to the web port to SSL only:

```
cluster1::> vserver services web modify -vserver vs1 -name portal -ssl-only true
```
**Related references**

*vserv*or*er services web access* on page 1875

**vserver services web show**

Display the current configuration of web services

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

This command displays the availability of the web services on Vservers. Only the services that are installed on every node in the cluster can be configured on Vservers whose type is not 'node'. Enabled services must include authorization configuration in the *vserver services web access* command for the services to be externally available.

**Parameters**

```bash
[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.
```

```bash
[-instance]
If you specify the -instance parameter, the command displays detailed information about all fields.
```

```bash
[-vserver <Vserver Name>]
Vserver
Identifies a Vserver for hosting a specific web service.
```

```bash
[-name <text>]
Service Name
Identifies the name of the web service.
```

```bash
[-type <vserver type>]
Type of Vserver
Identifies the type of Vserver on which the service is hosted.
```

```bash
[-version <text>]
Version of Web Service
Defines the version number of the service in the format of major.minor.patch.
```

```bash
[-description <text>]
Description of Web Service
Provides a short description of the web service.
```

```bash
[-long-description <text>]
Long Description of Web Service
Provides a long description of the web service.
```

```bash
[-requires <requirement>, ...]
Service Requirements
Defines the list of requirements that must be met for the service to be successfully executed. Requirements are defined as a service name, a comparison operator (<=), and a version number.
```

```bash
[-default-roles <text>, ...]
Default Authorized Roles
Defines the roles that are automatically granted access to the service in the *vserver services web access show* configuration.
```

```bash
[-enabled {true|false}]
Enabled
Defines the availability of a service on the Vserver. Disabled services are not accessible through the Vserver's network interfaces. This parameter's default value is dependent on the service. In general, services that provide commonly used features are enabled by default.
```

```bash
[-ssl-only {true|false}]
SSL Only
Defines the encryption enforcement policy for a service on the Vserver. Services for which this parameter is set to true support SSL only and cannot be used over unencrypted HTTP. The default for this value is 'false'.
```
Examples

This example displays the availability of the web services on the Vservers.

```bash
cluster1::vserver services web> show
Vserver | Type  | Service Name | Description                   | Enabled
---------|--------|--------------|--------------------------------|--------
cluster1 | admin  | cem          | OBSOLETE                      | true   
cluster1 | admin  | ontapi       | Remote Administrative API     | true   
cluster1 | admin  | portal       | Data ONTAP Web Services Portal| true   
n6070-8  | node   | cem          | OBSOLETE                      | true   
n6070-8  | node   | ontapi       | Remote Administrative API     | true   
n6070-8  | node   | portal       | Data ONTAP Web Services Portal| true   
n6070-8  | node   | spi          | Service Processor             | false  
n6070-8  | node   | supdiag      | Support Diagnostics           | true   
n6070-9  | node   | cem          | OBSOLETE                      | true   
n6070-9  | node   | ontapi       | Remote Administrative API     | true   
n6070-9  | node   | portal       | Data ONTAP Web Services Portal| true   
n6070-9  | node   | spi          | Service Processor             | false  
n6070-9  | node   | supdiag      | Support Diagnostics           | false  
```

13 entries were displayed.

Web Services Authorization

Manage the authorization for web services

These commands manage the user authorizations for web services in the cluster.

`vserver services web access create`

Authorize a new role for web service access

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**

This command authorizes roles to access the Vserver's web services. For the user to access services that require authentication, the user's roles, as defined by `security login show`, must be included in this configuration.

**Note:** Node Vserver services are authorized with the data Vserver's roles.

**Parameters**

- `-vserver <Vserver Name>` - Vserver
  
  Identifies a Vserver for hosting a specific web service.

- `-name <text>` - Service Name
  
  Identifies the name of the web service.

- `-role <text>` - Role Name
  
  Identifies the new role to be authorized for this service.
Examples
The following example authorizes the role auditor - created previously - for the web service:

```
cluster1::> vserver services web access create -name ontapi -role auditor
```

Related references
security login show on page 426

vserver services web access delete
Remove role authorization for web service access

Availability: This command is available to cluster administrators at the admin privilege level.

Description
This command removes the authorization of a role from the Vserver's web services. A service for which no roles are defined has a single role of 'none' automatically displayed in this configuration.

Note: Node Vserver services are authorized with the data Vserver's roles.

Parameters
-vserver <Vserver Name> - Vserver
Identifies a Vserver for hosting a specific web service.

-name <text> - Service Name
Identifies the name of the web service.

-role <text> - Role Name
Identifies the role whose authorization is to be removed. You cannot remove the authorization of the role 'none'. Use vserver services web access create to authorize access for the role.

Examples
The following example removes authorization for the role auditor for the web service:

```
cluster1::> vserver services web access delete -name ontapi -role auditor
```

Related references
vserver services web access create on page 1875

vserver services web access show
Display web service authorization for user roles

Availability: This command is available to cluster administrators at the admin privilege level.

Description
This command displays the roles that are authorized to access the Vserver's web services. For the user to access services that require authentication, the user's roles, as defined by security login show, must be included in this configuration.

Note: Node Vserver services are authorized with the data Vserver's roles.
Parameters
{[-fields <fieldname>, ...]
   If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

[-instance ]
   If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver
   Identifies a Vserver for hosting a specific web service.

[-name <text>] - Service Name
   Identifies the name of the web service.

[-role <text>] - Role Name
   Identifies a role assigned for accessing the service. A service without any authorizations has a role of 'none' assigned to it automatically.

[-type <vserver type>] - Type of Vserver
   Identifies the type of Vserver on which the service is hosted.

Examples
The following example displays the roles that are authorized to access the web services.

```
cluster1::vserver services web access> show
Vserver>Type>Service Name<Role
------------------------------------------------------
cluster1=admin>cem>none
cluster1=admin>ontapi>readonly
cluster1=admin>portal>none
cluster1=admin>spi>none
cluster1=admin>supdiag>none
va0>cluster>ontapi>admin
6 entries were displayed.
```

vserver smtape commands
The smtape directory

vserver smtape break
Make a restored volume read-write

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command breaks the relationship between the tape backup of a volume and a restored volume, changing the restored volume from read-only to read/write.
Parameters

-vserver <vserver name> - Vserver Name

Use this parameter to specify the Vserver name on which the volume is located.

-volume <volume name> - Volume Name

Use this parameter to specify the name of the read-only volume that needs to be changed into a read/writeable volume after an smtape restore.

Examples

Make the read-only volume datavol on Vserver vserver0 writeable after a restore.

```
cluster1::> vserver smtape break -vserver vserver0 -volume datavol
[Job 84] Job succeeded: SnapMirror Break Succeeded
```

SnapDiff RPC Server Commands

SnapDiff RPC server configuration commands

The vserver snapdiff-rpc-server commands help you manage the SnapDiff RPC Servers for a Vserver.

vserver snapdiff-rpc-server off

Stop the SnapDiff RPC server

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description

The vserver snapdiff-rpc-server off command turns the SnapDiff RPC server off.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the Vserver for which you want to turn the SnapDiff RPC server off.

Examples

The following example turns the SnapDiff RPC server off for a Vserver named vs0:

```
cluster1::> vserver snapdiff-rpc-server off -vserver vs0
```

vserver snapdiff-rpc-server on

Start the SnapDiff RPC Server

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description

The vserver snapdiff-rpc-server on command turns the SnapDiff RPC server on.
Parameters

-vserver <vserver name> - Vserver

This parameter specifies the Vserver for which you want to turn the SnapDiff RPC server on.

Examples

The following example enables the SnapDiff RPC server access for a Vserver named vs0:

```
cluster1::> vserver snapdiff-rpc-server on -vserver vs0
```

vserver snapdiff-rpc-server show

Display the SnapDiff RPC server configurations of Vservers

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description

The vserver snapdiff-rpc-server show command displays the state of the SnapDiff RPC server for all the Vservers. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays the following information about all the configured Vservers:

- Vserver name
- Whether SnapDiff RPC server access is enabled

You can specify additional parameters to display only the information that matches those parameters. For instance, to display the information only for the Vservers that have access enabled, enter the command with the -state on parameter.

Parameters

`[-fields <fieldname>, ...]`

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

`[-instance]`

If you specify the -instance parameter, the command displays detailed information about all fields.

`[-vserver <vserver name>] - Vserver`

If you specify this parameter, the command displays information only about the specified Vserver.

`[-state {on|off}] - SnapDiff RPC Server state`

If you specify this parameter, the command displays information only about the specified SnapDiff RPC server state.

Examples

The following example displays information about all the Vservers with SnapDiff RPC server configured:

```
cluster1::> vserver snapdiff-rpc-server show
Vserver   SnapDiff RPC Server State
----------- --------------------------
vs0        on
vs1        off
2 entries were displayed.
```
vserver vscan commands

Manage Vscan

vserver vscan disable

Disable Vscan on a Vserver

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver vscan disable command disables Vscan on a Vserver.

Note: This command is not supported on a Vserver with Infinite Volume.

Parameters
-vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver on which you want to disable Vscan.

Examples
The following example disables Vscan on Vserver vs1.

cluster1::> vserver vscan disable -vserver vs1
cluster1::> vserver vscan show -vserver vs1

Vserver: vs1
Vscan Status: off

vserver vscan enable

Enable Vscan on a Vserver

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver vscan enable command enables Vscan on a Vserver.

Note: This command is not supported on a Vserver with Infinite Volume.

Parameters
-vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver on which you want to enable Vscan. The Vscan configuration must already exist.

Examples
The following example enables Vscan on Vserver vs1.

cluster1::> vserver vscan enable -vserver vs1
cluster1::> vserver vscan show -vserver vs1
vserver vscan reset

Discard cached scan information

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver vscan reset command discards the cached information of the files that have been successfully scanned. After running this command, the files are scanned again when they are accessed.

Note: This command is not supported on a Vserver with Infinite Volume.

Parameters
-vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver for which you want to discard the cached information.

Examples
The following example discards the cached information of the successfully scanned files.

```
cluster1::> vserver vscan reset -vserver vs1
Warning: Running this command can cause performance degradation because files are scanned again when they are accessed.
Do you want to continue? {y|n}: y
cluster1::>
```

vserver vscan show

Display Vscan status

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver vscan show command displays Vscan status information of the Vservers. If you do not specify any parameters, the command displays the following information about all Vservers:

- Vserver name
- Vscan status

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters
{-fields <fieldname>,...}

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use ‘-fields ?’ to display the fields to specify.
If you specify the `-instance` parameter, the command displays detailed information about all fields.

`-vserver <vserver name>` - Vserver

If you specify this parameter, the command displays information only about the specified Vserver.

`-vscan-status {on|off}` - Vscan Status

If you specify this parameter, the command displays information only about the Vservers that have the specified status.

**Examples**

The following example displays the Vscan status information.

```
cluster1::> vserver vscan show
Vserver          Vscan Status
--------------   ------------
vs1              on
vs2              off
2 entries were displayed.
```

**vserver vscan show-events**

Display Vscan events

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `advanced` privilege level.

**Description**

The `vserver vscan show-events` command displays contents of the event log, which is generated by the cluster to capture important events. If you do not specify any parameters, the command displays the following information for all Vscan servers:

- Vserver name
- Node name
- Vscan server
- Event type
- Event time

You can specify the `-fields` parameter to specify which fields of information to display. In addition to the fields above, you can display the following fields:

- File path
- Vscan server vendor
- Vscan server version
- Disconnect reason
- Scan engine status code
- Vserver LIF used for connection
- Consecutive occurrence count

**Note:** This command is not supported for a Vserver with Infinite Volume.
Parameters

{-fields <fieldname>, ...}
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

{-instance}
If you specify the -instance parameter, the command displays detailed information about all fields.

{-node <nodename> | local} - Node
If you specify this parameter, the command displays information only about the events that have occurred on the specified node.

{-vserver <vserver name>} - Vserver
If you specify this parameter, the command displays information only about the events that have occurred for the specified Vserver.

{-event-time <MM/DD/YYYY HH:MM:SS>} - Event Log Time
If you specify this parameter, the command displays information only about the events that have occurred at the specified time.

{-server <IP Address>} - Server
If you specify this parameter, the command displays information only about the events that have occurred for the specified server.

{-event-type <event-type>} - Event Type
If you specify this parameter, the command displays information only about the events that are of the specified event type.

{-file-path <text>} - File Path
If you specify this parameter, the command displays information only about the events that have the specified file path.

{-vendor <text>} - Vscanner Vendor
If you specify this parameter, the command displays information only about the events that have the specified scan-engine vendor.

{-version <text>} - Vscanner Version
If you specify this parameter, the command displays information only about the events that have the specified scan-engine version.

{-disconnect-reason <reason>} - Server Disconnect Reason
If you specify this parameter, the command displays information only about the events that have the specified reason of the server disconnection.

{-lif <IP Address>} - Vserver LIF Used for Connection
If you specify this parameter, the command displays information only about the events that have the specified IP address, which is used for connecting clustered Data ONTAP with the Vscan server.

Examples

The following example displays all the events captured in the cluster:

```
cluster1:/> vserver vscan show-events
Vserver     Node            Server          Event Type        Event Time
----------- --------------- --------------- ----------------- -----------------
vs1         Cluster-01      192.168.1.1     file-infected     9/5/2014 11:37:38
```

vserver vscan commands
The following example displays detailed event information about all the infected files:

```
cluster1::*> vserver vscan show-events -event-type file-infected -instance

Node: Cluster-01
Vserver: vs1
Server: 192.168.1.1
Event Type: file-infected
File Path: \\
Vsscanner Vendor: mighty master anti-evil scanner
Vsscanner Version: 1.0
Server Disconnect Reason: -
Vserver LIF Used for Connection: 192.168.41.231
```

**Vserver Vscan Connection-status Commands**

Display connection status of Vscan servers

The vserver vscan connection-status commands display connection status of external virus-scanning servers, or "Vscan servers".

**vserver vscan connection-status show**

Display Vscan servers connection status summary

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The vserver vscan connection-status show command displays connection status summary of the external virus-scanning servers, or "Vscan servers" for a Vserver. If you do not specify any parameters, the command displays the following information for all Vservers:

- Vserver name
- Node name
- List of connected Vscan servers
- Connected count

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use ‘-fields ?’ to display the fields to specify.

```
[-instance]
```

If you specify the -instance parameter, the command displays detailed information about all fields.

```
[-node (<nodename> | local)] - Node
```

If you specify this parameter, the command displays information only about the Vscan servers attached to the specified node.
[-vserver <vserver name>] - Vserver
If you specify this parameter, the command displays information only about the Vscan servers for the specified Vserver.

[-servers <IP Address>, ...] - List of Connected Vscan Servers
If you specify this parameter, the command displays information only about the Vservers that have the specified server or servers.

[-connection-count <integer>] - Number of Connected Vscan Servers Serving the Vserver
If you specify this parameter, the command displays information only about the Vservers that have the specified connection count.

Examples
The following example displays connection-status summary for all Vservers.

```
cluster1::> vserver vscan connection-status show
Vserver     Node                Connected Server-Count Servers
----------- ------------------- ------------ -----------------------------
vs1         Cluster-01         2  1.1.1.1, 2.2.2.2
vs2         Cluster-01         0 -
2 entries were displayed.
```

vserver vscan connection-status show-all
Display Vscan servers connection status

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver vscan connection-status show-all command displays connection status information of the external virus-scanning servers, or "Vscan servers". If you do not specify any parameters, the command displays the following information for all Vscan servers:

- Vserver name
- Node name
- Vscan server
- Connection status
- Disconnect reason

You can specify the -fields parameter to specify which fields of information to display. In addition to the fields above, you can display the following fields:

- Server type
- Vscan server vendor
- Vscan server version
- Privileged user
- Vscan server connected since
- Vscan server disconnected since
• Vserver LIF used for connection

   **Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**

\[ \{-fields <fieldname>, ...\} \]
   If you specify the \(-fields <fieldname>, ...\) parameter, the command output also includes the specified field or fields. You can use \'-fields ?\' to display the fields to specify.

\[ \{-instance\} \]
   If you specify the \(-instance\) parameter, the command displays detailed information about all fields.

\[ \{-node <nodename>|local\}\] - Node
   If you specify this parameter, the command displays information only about the Vscan servers attached to the specified node.

\[ \{-vserver <vserver name>\}\] - Vserver
   If you specify this parameter, the command displays information only about the Vscan servers for the specified Vserver.

\[ \{-server <IP Address>\}\] - Server
   If you specify this parameter, the command displays information only about the Vscan server that you specify.

\[ \{-server-status <Status>\}\] - Server Status
   If you specify this parameter, the command displays information only about the Vscan servers that have the specified status.

\[ \{-server-type <Server type>\}\] - Server Type
   If you specify this parameter, the command displays information only about the Vscan servers that have the specified server type.

\[ \{-vendor <text>\}\] - Vscanner Vendor
   If you specify this parameter, the command displays information only about the Vscan servers that are running scan-engine of the specified vendor.

\[ \{-version <text>\}\] - Vscanner Version
   If you specify this parameter, the command displays information only about the Vscan servers that are running scan-engine of the specified version.

\[ \{-disconnect-reason <reason>\}\] - Server Disconnect Reason
   If you specify this parameter, the command displays information only about the Vscan servers that are disconnected because of the specified reason.

\[ \{-disconnected-since <MM/DD/YYYY HH:MM:SS>\}\] - Time When Vscanner Was Disconnected
   If you specify this parameter, the command displays information only about the Vscan servers that have been disconnected since the specified time.

\[ \{-privileged-user <text>\}\] - Privileged User Used for Connection
   If you specify this parameter, the command displays information only about the Vscan servers that are connected to clustered Data ONTAP using the specified privileged user.

\[ \{-connected-since <MM/DD/YYYY HH:MM:SS>\}\] - Time When Vscanner Was Connected
   If you specify this parameter, the command displays information only about the Vscan servers that have been connected since the specified time.

\[ \{-lif <IP Address>\}\] - Vserver LIF Used for Connection
   If you specify this parameter, the command displays information only about the Vscan servers that have used the specified IP address for connecting to clustered Data ONTAP.
**Examples**

The following example displays connection-status information about all Vscan servers.

```bash
cluster1::> vserver vscan connection-status show-all

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Node</th>
<th>Server</th>
<th>Status</th>
<th>Disconnect Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>
<td>Cluster-01</td>
<td>1.1.1.1</td>
<td>disconnected</td>
<td>remote-closed</td>
</tr>
<tr>
<td>vs1</td>
<td>Cluster-01</td>
<td>2.2.2.2</td>
<td>connected</td>
<td>-</td>
</tr>
<tr>
<td>vs2</td>
<td>Cluster-01</td>
<td>3.3.3.3</td>
<td>disconnected</td>
<td>no-data-lif</td>
</tr>
<tr>
<td>vs2</td>
<td>Cluster-01</td>
<td>4.4.4.4</td>
<td>disconnected</td>
<td>no-data-lif</td>
</tr>
</tbody>
</table>

4 entries were displayed.
```

The following example displays detailed connection-status information about all Vscan servers which are connected.

```bash
cluster1::> vserver vscan connection-status show-all -instance -server-status connected

Node: Cluster-01
Vserver: vs1
Server: 2.2.2.2
Server Status: connected
Server Type: primary
Vscanner Vendor: XYZ
Vscanner Version: 1.12.2
Server Disconnect Reason: -
Time When Server Was Disconnected: -
Privileged User Used for Connection: cifs\u2
Time When Server Was Connected: 6/3/2013 08:44:21
Vserver LIF Used for Connection: 10.238.41.223
```

**vserver vscan connection-status show-connected**

Display connection status of connected Vscan servers

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**

The `vserver vscan connection-status show-connected` command displays connection status information of the connected external virus-scanning servers, or "Vscan servers". If you do not specify any parameters, the command displays the following information for all Vscan servers:

- Vserver name
- Node name
- Vscan server
- Vscan server vendor
- Privileged user

You can specify the `-fields` parameter to specify which fields of information to display. In addition to the fields above, you can display the following fields:

- Server type
- Vscan server version
- Vscan server connected since
- Vserver LIF used for connection

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters

[[-fields <fieldname>, ...]
   If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified
   field or fields. You can use `-fields ?` to display the fields to specify.
]

[[-instance]]
   If you specify the -instance parameter, the command displays detailed information about all fields.

[-node <nodename>|local] - Node
   If you specify this parameter, the command displays information only about the Vscan servers attached to the
   specified node.

[-vserver <vserver name>] - Vserver
   If you specify this parameter, the command displays information only about the Vscan servers for the specified
   Vserver.

[-server <IP Address>] - Server
   If you specify this parameter, the command displays information only about the Vscan server that you specify.

[-vendor <text>] - Vscan Server Vendor
   If you specify this parameter, the command displays information only about the Vscan servers that are running
   scan-engine of the specified vendor.

[-version <text>] - Vscan Server Version
   If you specify this parameter, the command displays information only about the Vscan servers that are running
   scan-engine of the specified version.

[-privileged-user <text>] - Privileged User Used for Connection
   If you specify this parameter, the command displays information only about the Vscan servers that are
   connected to clustered Data ONTAP using the specified privileged user.

[-connected-since <MM/DD/YYYY HH:MM:SS>] - Time When Vscan Server Was Connected
   If you specify this parameter, the command displays information only about the Vscan servers that have been
   connected since the specified time.

[-server-type <Server type>] - Server Type
   If you specify this parameter, the command displays information only about the Vscan servers that have the
   specified server type.

[-lif <IP Address>] - Vserver LIF Used for Connection
   If you specify this parameter, the command displays information only about the Vscan servers that have used
   the specified IP address for connecting to clustered Data ONTAP.

Examples

The following example displays connection-status information about all connected Vscan servers.

```
cluster1::> vserver vscan connection-status show-connected
```

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Node</th>
<th>Server</th>
<th>Vendor</th>
<th>Privileged User</th>
</tr>
</thead>
</table>
The following example displays detailed connection-status information about connected Vscan servers which are running XYZ scan-engine.

```
cluster1::> vserver vscan connection-status show-connected -instance -vendor XYZ
```

Node: Cluster-01
Vserver: vs1
Server: 2.2.2.2
Vscanner Vendor: XYZ
Vscanner Version: 1.12
Privileged User Used for Connection: cifs\u2
Server Type: primary
Vserver LIF Used for Connection: 10.238.41.223

---

**vserver vscan connection-status show-not-connected**

Display connection status of Vscan servers which are allowed to connect but not yet connected

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The `vserver vscan connection-status show-not-connected` command displays connection status information of the external virus-scanning servers, or "Vscan servers" that are ready to accept connection but are not yet connected. This command could be useful for troubleshooting. If you do not specify any parameters, the command displays the following information for all Vscan servers:

- Vserver name
- Node name
- Vscan server
- Connection status
- Disconnect reason

You can specify the `-fields` parameter to specify which fields of information to display. In addition to the fields above, you can display the following fields:

- Server type
- Vscan server disconnected since

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance ]
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.
If you specify this parameter, the command displays information only about the Vscan servers attached to the specified node.

If you specify this parameter, the command displays information only about the Vscan servers for the specified Vserver.

If you specify this parameter, the command displays information only about the Vscan server that you specify.

If you specify this parameter, the command displays information only about the Vscan servers that have the specified status.

If you specify this parameter, the command displays information only about the Vscan servers that are disconnected because of the specified reason.

If you specify this parameter, the command displays information only about the Vscan servers that have been disconnected since the specified time.

If you specify this parameter, the command displays information only about the Vscan servers that have the specified server type.

Examples

The following example displays connection-status information about all Vscan servers which are ready to accept connection but not yet connected.

```
cluster1::> vserver vscan connection-status show-not-connected

Vserver  Node          Server      Connection    Disconnect
         -----------------  -----------------  -------------  ---------------
vs2      Cluster-01    3.3.3.3      disconnected  invalid-session-id
vs2      Cluster-01    4.4.4.4      disconnected  remote-closed

2 entries were displayed.
```

The following example displays detailed connection-status information about Vscan servers which are disconnected because the connection is remotely closed.

```
cluster1::> vserver vscan connection-status show-not-connected -instance
   -disconnect-reason remote-closed

  Node: Cluster-01
  Vserver: vs2
  Server: 4.4.4.4
  Server Status: disconnected
  Server Disconnect Reason: remote-closed
  Server Type: primary
```
vserver vscan on-access-policy commands

Manage Vscan On-Access policies

vserver vscan on-access-policy create

Create an On-Access policy

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver vscan on-access-policy create command creates an On-Access policy.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver on which you want to create an On-Access policy.

-policy-name <Policy name> - Policy

This parameter specifies the name of the On-Access policy that you want to create. An On-Access policy name can be up to 256 characters long and is a string that can only contain any combination of ASCII-range alphanumeric characters (a-z, A-Z, 0-9), "_", "," and ".".

-protocol <CIFS> - File-Access Protocol

This parameter specifies the protocol name for which the On-Access policy will be created. Currently only CIFS is supported.

[-filters {scan-ro-volume|scan-execute-access}, ...] - Filters

This parameter specifies a list of filters which can be used to define the scope of the On-Access policy more precisely. The list can include one or more of the following:

- scan-ro-volume - Enable scans for read-only volume.
- scan-execute-access - Scan only files opened with execute-access (CIFS only).

[-scan-mandatory {on|off}] - Mandatory Scan

This parameter specifies whether access to a file is allowed if there are no external virus-scanning servers available for virus scanning. By default, it is on.

[-max-file-size {<integer>[KB|MB|GB|TB|PB]}] - Max File Size Allowed for Scanning

This parameter specifies the maximum size of the file which will be considered for virus scanning. By default, it is 2GB.

[-paths-to-exclude <File path>, ...] - File Paths Not to Scan

This parameter specifies a list of paths, separated by commas, to exclude from virus scanning. This path is given from the root of the Vserver and can be up to 255 characters long. By default, no paths are excluded. CIFS protocol based On-Access policies must use "\" as the path separator. The path can be in one of the following forms:

- \dir1\dir2\name - This would match "\dir1\dir2\name" as well as "\dir1\dir2\name\...".
- \dir1\dir2\name - This would only match "\dir1\dir2\name\..".

Note: If you are using the CLI, you must delimit all paths with double quotation marks ("'). For instance, to add the paths "\vol\a\b1" and "\vol\a\b2" to the -paths-to-exclude in the CLI, type "\vol\a b \", "\vol\a,b\" at the command prompt. To add a "?" to the expression, press ESC followed by the "?".

vserver vscan commands
[-file-ext-to-exclude <File extension>, ...] - File Extensions Not to Scan
This parameter specifies a list of file extensions, separated by commas, to exclude from virus scanning. By default, no file extensions are excluded. Each file extension can be up to 16 characters long. The -file-ext-to-exclude supports wildcard patterns containing "*" and "?". Pattern matching is defined as:

• * - Matches any string, including the empty string. For example, *mp would match mp, mp3, mp4, mpeg etc.
• ? - Matches any single character. For example, *mp? would match mp3, mp4 but not mp and mpeg.

Note: If you are using the CLI, you must delimit all patterns with double quotation marks ("). For instance, to enter the pattern *mp in the CLI, type "*mp" at the command prompt. To add a "?" to the expression, press ESC followed by the "?".

[-file-ext-to-include <File extension>, ...] - File Extensions to Scan
This parameter specifies a list of file extensions, separated by commas, to include for virus scanning. By default it is *, which means all the file extensions are considered for virus scanning except those which match one of the patterns provided in -file-ext-to-exclude list. Each file extension can be up to 16 characters long. The -file-ext-to-include supports wildcard patterns containing "*" and "?". Pattern matching is defined as:

• * - Matches any string, including the empty string. For example, mp* would match mp, mp3, mp4, mpeg etc.
• ? - Matches any single character. For example, mp? would match mp3, mp4 but not mp and mpeg.

Note: If you are using the CLI, you must delimit all patterns with double quotation marks ("). For instance, to enter the pattern mp* in the CLI, type "mp*" at the command prompt. To add a "?" to the expression, press ESC followed by the "?".

Note: If you specify both -file-ext-to-include and -file-ext-to-exclude lists, then only those file extensions are considered for virus scanning which match one of the patterns provided in -file-ext-to-include list but do not match any of the patterns provided in -file-ext-to-exclude list.

[-scan-files-with-no-ext {true | false}] - Scan Files with No Extension
This parameter specifies if the files without any extension are considered for virus scanning or not. By default, it is true.

Examples
The following example creates an On-Access policy.

```bash
cluster1::> vserver vscan on-access-policy create -vserver vs1 -policy-name test -protocol CIFS -scan-mandatory on -filters scan-ro-volume -max-file-size 3GB -file-ext-to-exclude "mp3","txt" -file-ext-to-include "mp*","tx*" -paths-to-exclude "\vol\a b","\vol\a,b"
cluster1::> vserver vscan on-access-policy show -instance -vserver vs1 -policy-name test
Vserver: vs1
Policy: test
Policy Status: off
Policy Config Owner: vserver
File-Access Protocol: CIFS
Filters: scan-ro-volume
Mandatory Scan: on
Max File Size Allowed for Scanning: 3GB
File Paths Not to Scan: \vol\a b, \vol\a,b
File Extensions Not to Scan: mp3, txt
```
vserver vscan on-access-policy delete
Delete an On-Access policy

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver vscan on-access-policy delete command deletes an On-Access policy.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters
- vserver <vserver name> - Vserver
  This parameter specifies the name of the Vserver from which you want to delete an On-Access policy.

- policy-name <Policy name> - Policy
  This parameter specifies the name of the On-Access policy that you want to delete.

Examples
The following example deletes an On-Access policy.

    cluster1::> vserver vscan on-access-policy delete -vserver vs1 -policy-name test
    cluster1::> vserver vscan on-access-policy show -vserver vs1 -policy-name test
    There are no entries matching your query.

vserver vscan on-access-policy disable
Disable an On-Access policy

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver vscan on-access-policy disable command disable an On-Access policy for the specified Vserver.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters
- vserver <vserver name> - Vserver
  This parameter specifies the name of the Vserver on which you want to disable an On-Access policy. The Vserver administrator can disable On-Access policies created within the scope of the Vserver and can also disable an On-Access policy created by the cluster administrator. The cluster administrator can disable On-Access policies for any Vserver.

- policy-name <Policy name> - Policy
  This parameter specifies the name of the On-Access policy you want to disable.
Examples

The following command disable an On-Access policy on specified Vserver.

```bash
cluster1::> vserver vscan on-access-policy disable -vserver vs1 -policy-name new
cluster1::> vserver vscan on-access-policy show -instance -vserver vs1 -policy-name new
```

```
Vserver: vs1
Policy: new
    Policy Status: off
Policy Config Owner: vserver
File-Access Protocol: CIFS
    Filters: scan-ro-volume
    Mandatory Scan: on
Max File Size Allowed for Scanning: 4GB
    File-Paths Not to Scan: \vol\temp
    File-Extensions Not to Scan: txt
```

vserver vscan on-access-policy enable

Enable an On-Access policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The `vserver vscan on-access-policy enable` command enables an On-Access policy for the specified Vserver. Only one On-Access policy of a specific protocol can be enabled at one time.

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**

- `<vserver name>` - Vserver
  
  This parameter specifies the name of the Vserver on which you want to enable an On-Access policy. The Vserver administrator can enable On-Access policy created within the scope of the Vserver or the cluster. The cluster administrator can enable On-Access policy for any Vserver but cannot enable them with a scope of cluster. The scope is determined at a Vserver level.

- `<policy-name>` - Policy
  
  This parameter specifies the name of the On-Access policy you want to enable.

Examples

The following command enables an On-Access policy on specified Vserver.

```bash
cluster1::> vserver vscan on-access-policy enable -vserver vs1 -policy-name new
cluster1::> vserver vscan on-access-policy show -instance -vserver vs1 -policy-name new
```

```
Vserver: vs1
Policy: new
    Policy Status: on
Policy Config Owner: vserver
File-Access Protocol: CIFS
    Filters: scan-ro-volume
    Mandatory Scan: on
Max File Size Allowed for Scanning: 4GB
```
vserver vscan on-access-policy modify

Modify an On-Access policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `vserver vscan on-access-policy modify` command modifies an On-Access policy.

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**

- **-vserver <vserver name>** - Vserver
  
  This parameter specifies the name of the Vserver on which you want to modify an On-Access policy.

- **-policy-name <Policy name>** - Policy
  
  This parameter specifies the name of the On-Access policy that you want to modify.

- **[-filters {scan-ro-volume|scan-execute-access}, ...]** - Filters
  
  This parameter specifies a list of filters which can be used to define the scope of the On-Access policy more precisely. The list can include one or more of the following:
  
  - `scan-ro-volume` - Enable scans for read-only volume.
  - `scan-execute-access` - Scan only files opened with execute-access (CIFS only).

- **[-scan-mandatory {on|off}]** - Mandatory Scan
  
  This parameter specifies whether access to a file is allowed if there are no external virus-scanning servers available for virus scanning.

- **[-max-file-size {<integer>[KB|MB|GB|TB|PB]}]** - Max File Size Allowed for Scanning
  
  This parameter specifies the maximum size of the file which will be considered for virus scanning.

- **[-paths-to-exclude <File path>, ...]** - File Paths Not to Scan
  
  This parameter specifies a list of paths, separated by commas, to exclude from virus scanning. This path is given from the root of the Vserver and can be up to 255 characters long. CIFS protocol based On-Access policies must use "\" as the path separator. The path can be in one of the following forms:
  
  - "\dir1\dir2\name" - This would match "\dir1\dir2\name" as well as "\dir1\dir2\name\...".
  - "\dir1\dir2\name\" - This would only match "\dir1\dir2\name\...".

  **Note:** If you are using the CLI, you must delimit all paths with double quotation marks ("). For instance, to add the paths "\vol\a b" and "\vol\a,b\" to the -paths-to-exclude in the CLI, type "\vol\a b \", "\vol\a,b\" at the command prompt. To add a "?" to the expression, press ESC followed by the "?".

- **[-file-ext-to-exclude <File extension>, ...]** - File Extensions Not to Scan
  
  This parameter specifies a list of file extensions, separated by commas, to exclude from virus scanning. Each file extension can be up to 16 characters long. The -file-ext-to-exclude supports wildcard patterns containing "*" and "?". Pattern matching is defined as:
  
  - * - Matches any string, including the empty string. For example, *mp would match mp, mp3, mp4, mpeg etc.
•  ? - Matches any single character. For example, mp? would match mp3, mp4 but not mp and mpeg.

**Note:** If you are using the CLI, you must delimit all patterns with double quotation marks ("'). For instance, to enter the pattern mp* in the CLI, type "mp*" at the command prompt. To add a "?" to the expression, press ESC followed by the "?".

[-file-ext-to-include <File extension>, ...] - File Extensions to Scan

This parameter specifies a list of file extensions, separated by commas, to include for virus scanning. Each file extension can be up to 16 characters long. The `-file-ext-to-include` supports wildcard patterns containing "*" and "?". Pattern matching is defined as:

• * - Matches any string, including the empty string. For example, mp* would match mp, mp3, mp4, mpeg etc.

• ? - Matches any single character. For example, mp? would match mp3, mp4 but not mp and mpeg.

**Note:** If you are using the CLI, you must delimit all patterns with double quotation marks ("'). For instance, to enter the pattern mp* in the CLI, type "mp*" at the command prompt. To add a "?" to the expression, press ESC followed by the "?".

**Note:** If you specify both `-file-ext-to-include` and `-file-ext-to-exclude` lists, then only those file extensions are considered for virus scanning which match one of the patterns provided in `-file-ext-to-include` list but do not match any of the patterns provided in `-file-ext-to-exclude` list.

[-scan-files-with-no-ext {true|false}] - Scan Files with No Extension

This parameter specifies if the files without any extension are considered for virus scanning or not.

### Examples

The following example modifies an On-Access policy.

```bash
cluster1::> vserver vscan on-access-policy modify -vserver vs1 -policy-name test
    -protocol CIFS -scan-mandatory on -filters scan-ro-volume -max-file-size 10GB
    -file-ext-to-exclude "mp3" -file-ext-to-include "mp*" -scan-files-with-no-ext false
    -paths-to-exclude "\vol1\temp", "\vol2\a"

cluster1::> vserver vscan on-access-policy show -instance -vserver vs1 -policy-name test
```

| Vserver: vs1 |
| Policy: test |
| Policy Status: off |
| Policy Config Owner: vserver |
| File-Access Protocol: CIFS |
| Filters: scan-ro-volume |
| Mandatory Scan: off |
| Max File Size Allowed for Scanning: 10GB |
| File Paths Not to Scan: \vol1\temp, \vol2\a |
| File Extensions Not to Scan: mp3 |
| File Extensions to Scan: mp* |
| Scan Files with No Extension: false |

### vserver vscan on-access-policy show

Display On-Access policies

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.
Description

The `vserver vscan on-access-policy show` command displays information about the On-Access policies belonging to the Vserver. It also displays the current status in Vserver scope. If you do not specify any parameters, the command displays the following information about all On-Access policies:

- Vserver name
- Policy name
- Policy status
- Policy owner
- Protocol
- File paths to exclude
- File extensions to exclude

You can specify the `--fields` parameter to specify which fields of information to display about On-Access policies. In addition to the fields above, you can display the following fields:

- List of filters
- Mandatory scan
- Max file size
- File extensions to include
- Scan files without extension

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters

`{-fields <fieldname>,...}`

If you specify the `--fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `--fields ?` to display the fields to specify.

`{-instance}`

If you specify the `--instance` parameter, the command displays detailed information about all fields.

`{-vserver <vserver name>}` - Vserver

If you specify this parameter, the command displays information only about the On-Access policies for the specified Vserver.

`{-policy-name <Policy name>}` - Policy

If you specify this parameter, the command displays information only about the specified On-Access policy.

`{-policy-status {on|off}}` - Policy Status

If you specify this parameter, the command displays information only about the On-Access policies that have the specified status.

`{-owner <Configuration owner>}` - Policy Config Owner

If you specify this parameter, the command displays information only about the On-Access policies that have the specified owner.

`{-protocol <CIFS>}` - File-Access Protocol

If you specify this parameter, the command displays information only about the On-Access policies that have the specified protocol.
[-filters \{scan-ro-volume\|scan-execute-access\},...\} - Filters

If you specify this parameter, the command displays information only about the On-Access policies that have the specified filter or filters in the filter list.

[-scan-mandatory \{on\|off\}] - Mandatory Scan

If you specify this parameter, the command displays information only about the On-Access policies that have mandatory scanning enabled.

[-max-file-size \{<integer>\[KB\|MB\|GB\|TB\|PB\]\} - Max File Size Allowed for Scanning

If you specify this parameter, the command displays information only about the On-Access policies that have the specified max-file-size.

[.paths-to-exclude <File path>,...] - File Paths Not to Scan

If you specify this parameter, the command displays information only about the On-Access policies that have the specified path or paths in the exclude list.

[-file-ext-to-exclude <File extension>,...] - File Extensions Not to Scan

If you specify this parameter, the command displays information only about the On-Access policies that have the specified file extension or extensions in the exclude list.

[-file-ext-to-include <File extension>,...] - File Extensions to Scan

If you specify this parameter, the command displays information only about the On-Access policies that have the specified file extension or extensions in the include list.

[-scan-files-with-no-ext \{true\|false\}] - Scan Files with No Extension

If you specify this parameter, the command displays information only about the On-Access policies that have the specified value.

### Examples

The following example displays information about all On-Access policies.

```
cluster1::> vserver vsan on-access-policy show

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Policy</th>
<th>Policy</th>
<th>Protocol</th>
<th>Paths Excluded</th>
<th>Excluded</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cluster</td>

</tr>
</tbody>
</table>

4 entries were displayed.
```

The following example displays detailed information about an On-Access policy.

```
cluster1::> vserver vsan on-access-policy show -instance -vserver vs1 -policy-name new

Vserver: vs1
Policy: new
Policy Status: off
Policy Config Owner: vserver
File-Access Protocol: CIFS
Filters: scan-ro-volume
Mandatory Scan: on
Max File Size Allowed for Scanning: 4GB
File Paths Not to Scan: \vol\temp
File Extensions Not to Scan: txt
```
vserver vscan on-access-policy file-ext-to-include commands

Manage list of file extensions to be included in an On-Access policy

vserver vscan on-access-policy file-ext-to-include add

Add to the list of file extensions to include

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver vscan on-access-policy file-ext-to-include add command adds a file extension or list of file extensions to include for virus scanning to the specified policy.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters

- **vserver <vserver name>** - Vserver
  This parameter specifies the name of the Vserver containing the specified on-access policy to which you want to add a file extension or a list of file extensions to include for virus scanning.

- **policy-name <Policy name>** - Policy
  This parameter specifies the name of the on-access policy to which you want to add a file extension or a list of file extensions to include for virus scanning.

- **file-ext-to-include <File extension>, ...** - File Extensions to Scan
  This parameter specifies the file extension or a list of file extensions to include for virus scanning.

Examples

The following example adds a list of file extensions to include for virus scanning to the specified on-access policy.

```
cluster1::> vserver vscan on-access-policy file-ext-to-include add -vserver vs1 -policy-name policy1 -file-ext-to-include "mp*","tx*"
```

```
cluster1::> vserver vscan on-access-policy file-ext-to-include show -vserver vs1 -policy-name policy1
Vserver: vs1
Policy: policy1
File Extensions to Scan: mp*, tx*, wav
```

vserver vscan on-access-policy file-ext-to-include remove

Remove from the list of file extensions to include

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver vscan on-access-policy file-ext-to-include remove command removes a file extension or list of file extension that are included for virus scanning from the specified policy.
Note: This command is not supported for a Vserver with Infinite Volume.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver containing the specified on-access policy from which you want to remove a file extension or list of file extensions that are included for virus scanning.

-policy-name <Policy name> - Policy

This parameter specifies the name of the on-access policy from which you want to remove a file extension or a list of file extensions that are included for virus scanning.

-file-ext-to-include <File extension>, ... - File Extensions to Scan

This parameter specifies the file extension or a list of file extensions that you want to remove from the specified on-access policy.

Examples

The following example removes a list of file extensions from the specified on-access policy.

```
cluster1::> vserver vscan on-access-policy file-ext-to-include remove -vserver vs1  
-poly-name policy1 -file-ext-to-include "txt","wav"
```

```
cluster1::> vserver vscan on-access-policy file-ext-to-include show -vserver vs1  
-poly-name policy1

Vserver: vs1
Policy: policy1
File Extensions to Scan: mp*
```

vserver vscan on-access-policy file-ext-to-include show

Display list of file extensions to include

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver vscan on-access-policy file-ext-to-include show command displays the list of file extensions to include for virus scanning belonging to the Vserver. If you do not specify any parameters, the command displays the following information about all on access policies:

- Vserver name
- Policy name
- List of File-Extensions to Scan

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters

{ [-fields <fieldname>, ...]  
  If you specify the fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.
  | [-instance]  
  If you specify the -instance parameter, the command displays detailed information about all fields.}
[-vserver <vserver name>] - Vserver
If you specify this parameter, the command displays information only about the policies for the specified Vserver.

[-policy-name <Policy name>] - Policy
If you specify this parameter, the command displays information only about the specified policy.

[-file-ext-to-include <File extension>, ...] - File Extensions to Scan
If you specify this parameter, the command displays information only about the policies that have the specified file extensions that are included for virus scanning.

Examples
The following example displays the list of file extensions that are included for virus scanning for all policies.

```
cluster1::> vserver vscan on-access-policy file-ext-to-include show

Vserver          Policy Name       File-Ext Included
----------------- ----------------- --------------------------------------------
cluster1          default_CIFS      *
vs1               default_CIFS      *
vs1               policy1           mp*
vs1               policy3           doc*, xl*
vs2               default_CIFS      *
vs2               policy2           d*, m*, t*
6 entries were displayed.
```

vserver vscan on-access-policy file-ext-to-exclude commands
Manage list of file extensions to be excluded in an On-Access policy

vserver vscan on-access-policy file-ext-to-exclude add
Add to the list of file extensions to exclude

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver vscan on-access-policy file-ext-to-exclude add command adds a file extension or a list of file extensions that must be excluded from scanning to the specified policy name.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters
-vserver <vserver name> - Vserver
This parameter specifies the name of the Vserver containing the specified on-access policy to which you want to add a file extension or a list of file extensions that must be excluded from scanning.

-policy-name <Policy name> - Policy
This parameter specifies the name of the on-access policy to which you want to add a file extension or a list of file extensions that must be excluded from scanning.

-file-ext-to-exclude <File extension>, ... - File Extensions Not to Scan
This parameter specifies the file extension or a list of file extensions that must be excluded from scanning.
Examples

The following example adds a list of file extensions that must be excluded from scanning to the specified on-access policy:

```
cluster1::> vserver vscan on-access-policy file-ext-to-exclude add -vserver vs1
-policy-name policy1 -file-ext-to-exclude txt,mp4
cluster1::> vserver vscan on-access-policy file-ext-to-exclude show -vserver vs1
-policy-name policy1
  Vserver: vs1
  Policy: policy1
  File-Extensions Not to Scan: mp3, mp4, txt, wav
```

vserver vscan on-access-policy file-ext-to-exclude remove

Remove from the list of file extensions to exclude

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The `vserver vscan on-access-policy file-ext-to-exclude remove` command removes a file extension or a list of file extensions that are excluded from scanning from the specified policy name.

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**

- `vserver <vserver name>` - Vserver
  
  This parameter specifies the name of the Vserver containing the specified on-access policy from which you want to remove a file extension or a list of file extensions that are excluded from scanning.

- `policy-name <Policy name>` - Policy
  
  This parameter specifies the name of the on-access policy from which you want to remove a file extension or a list of file extensions that are excluded from scanning.

- `file-ext-to-exclude <File extension>,...` - File Extensions Not to Scan
  
  This parameter specifies the file extension or a list of file extensions that must be removed from the on-access policy.

Examples

The following example removes a list of file extensions that are to be excluded from scanning from the specified on-access policy:

```
cluster1::> vserver vscan on-access-policy file-ext-to-exclude remove -vserver vs1
-policy-name policy1 -file-ext-to-exclude mp3,txt
cluster1::> vserver vscan on-access-policy file-ext-to-exclude show -vserver vs1
-policy-name policy1
  Vserver: vs1
  Policy: policy1
  File-Extensions Not to Scan: mp4, wav
```
vserver vscan on-access-policy file-ext-to-exclude show

Display list of file extensions to exclude

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver vscan on-access-policy file-ext-to-exclude show command displays the list of file extensions that are excluded from scanning belonging to the Vserver. If you do not specify any parameters, the command displays the following information about all on-access policies:

• Vserver name
• Policy name
• List of File-Extensions to exclude

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters

{ [ -fields <fieldname>, ... ]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?' to display the fields to specify.

| [ -instance ] |
  If you specify the -instance parameter, the command displays detailed information about all fields.

[ -vserver <vserver name> ] - Vserver
  If you specify this parameter, the command displays information only about the policy names for the specified Vserver.

[ -policy-name <Policy name> ] - Policy
  If you specify this parameter, the command displays information only about the specified policy name.

[ -file-ext-to-exclude <File extension>, ... ] - File Extensions Not to Scan
  If you specify this parameter, the command displays information only about the policies that have the specified file extensions that are excluded from scanning.

Examples

The following example displays the list of file extensions that are excluded from scanning for all the policies:

```bash
cluster1:> vserver vscan on-access-policy file-ext-to-exclude show
Vserver       Policy Name       File-Ext Excluded
-------------- ----------------- --------------------------------------------
cluster1       default_CIFS      txt
vs1            default_CIFS      txt
vs1            policy1           mp4, wav
vs1            policy3           wmv
vs2            default_CIFS      txt
vs2            policy2           mp3
6 entries were displayed.
```

vserver vscan on-access-policy paths-to-exclude commands

Manage list of paths to be excluded in an On-Access policy
vserver vscan on-access-policy paths-to-exclude add

Add to the list of paths to exclude

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver vscan on-access-policy paths-to-exclude add command adds a path or a list of paths that must be excluded from scanning to the specified policy name.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters
-vserver <vserver name> - Vserver
This parameter specifies the name of the Vserver containing the specified on-access policy to which you want to add a path or a list of paths that must be excluded from scanning.

-policy-name <Policy name> - Policy
This parameter specifies the name of the on-access policy to which you want to add a path or a list of paths that must be excluded from scanning.

-paths-to-exclude <File path>, ... - Paths Not to Scan
This parameter specifies the path or list of paths that must be excluded from scanning.

Examples
The following example adds a list of paths that must be excluded from scanning to the specified on-access policy:

```
cluster1::> vserver vscan on-access-policy paths-to-exclude add -vserver vs1 -policy-name policy1 -paths-to-exclude \test\test2,\test\test3
cluster1::> vserver vscan on-access-policy paths-to-exclude show -vserver vs1 -policy-name policy1
Vserver: vs1
Policy: policy1
File-Paths Not to Scan: \test\test1, \test\test2, \test\test3
```

vserver vscan on-access-policy paths-to-exclude remove

Remove from the list of paths to exclude

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver vscan on-access-policy paths-to-exclude remove command removes a path or a list of paths that are excluded from scanning from the specified policy name.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters
-vserver <vserver name> - Vserver
This parameter specifies the name of the Vserver containing the specified on-access policy from which you want to remove a path or list of paths that are excluded from scanning.
-policy-name <Policy name> - Policy
   This parameter specifies the name of the on-access policy from which you want to remove a path or a list of
   paths that are excluded from scanning.

-paths-to-exclude <File path>, ... - Paths Not to Scan
   This parameter specifies the path or a list of paths that must be removed from the on-access policy.

Examples
The following example removes a list of paths that are excluded from scanning from the specified policy name:

```
cluster:> vserver vscan on-access-policy paths-to-exclude remove -vserver vs1
   -policy-name policy1 -paths-to-exclude \test\test2,\test\test3
cluster1:> vserver vscan on-access-policy paths-to-exclude show -vserver vs1
   -policy-name policy1
   Vserver: vs1
   Policy: policy1
   File-Paths Not to Scan: \test\test1
```

vserver vscan on-access-policy paths-to-exclude show
Display list of paths to exclude

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver vscan on-access-policy paths-to-exclude show` command displays the list of paths that are excluded
from scanning belonging to the Vserver. If you do not specify any parameters, the command displays the following information
about all on-access policies:

- Vserver name
- Policy name
- List of Paths to exclude

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**

```
[-fields <fieldname>, ...]
   If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified
   field or fields. You can use '-fields ?' to display the fields to specify.

[-instance]
   If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver
   If you specify this parameter, the command displays information only about the policy names for the specified
   Vserver.

[-policy-name <Policy name>] - Policy
   If you specify this parameter, the command displays information only about the specified policy name.

[-paths-to-exclude <File path>, ...] - File Paths Not to Scan
   If you specify this parameter, the command displays information only about the policies that have the specified
   paths that are excluded from scanning.
```
**Examples**

The following example displays the list of paths that are excluded from scanning for all the policies:

```bash
cluster1::> vserver vscan on-access-policy paths-to-exclude show
Vserver         Policy Name       Paths Excluded
--------------- ----------------- --------------------------------------------
cluster1        default_CIFS      \test\test1
vs1             default_CIFS      \test\test1
vs1             policy1           \test\test2,\test\test3
vs1             policy3           \test\test4
vs2             default_CIFS      \test\test1
vs2             policy2           \test\test5
6 entries were displayed.
```

**vserver vscan on-demand-task commands**

Manage Vscan On-Demand scans

**vserver vscan on-demand-task create**

Create an On-Demand task

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The `vserver vscan on-demand-task create` command creates an On-Demand task. The On-Demand task consists of a set of attributes that are used for configuring the scope of scanning. It also specifies the cron schedule at which the task should run.

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**

- `-vserver <vserver name>` - Vserver
  
  This parameter specifies the name of the Vserver on which you want to create an On-Demand task.

- `-task-name <text>` - Task Name
  
  This parameter specifies the name of the On-Demand task that you want to create. An On-Demand task name can be up to 256 characters long.

- `-scan-paths <text>, ...` - List of Scan Paths
  
  This parameter specifies a list of paths, separated by commas, for virus scanning. This path is given from the root of the Vserver using UNIX path delimiter "/".

- `-report-directory <text>` - Report Directory Path
  
  This parameter specifies a directory path where the On-Demand report file is created. Each run for a task creates a new file. The report directory path is given from the root of the Vserver using UNIX path delimiter "/".

- `[-schedule <text>]` - Job Schedule
  
  This parameter specifies the already existing cron schedule. The On-Demand task triggers virus scanning for the specified scan-paths at the time configured in the schedule.

**Note:** A Vserver can have only one scheduled task at a time.
- `max-file-size `<integer>`[KB|MB|GB|TB|PB]] - Max File Size Allowed for Scanning
  This parameter specifies the maximum size of the file that will be considered for virus scanning. By default, it is 10GB.

- `paths-to-exclude <text>` - File Paths Not to Scan
  This parameter specifies a list of paths, separated by commas, to exclude from virus scanning. This path is given from the root of the Vserver using UNIX path delimiter "/". By default, no paths are excluded. The path can be in one of the following forms:
  - `/dir1/dir2/name` - This would match "/dir1/dir2/name" as well as "/dir1/dir2/name/...".
  - `/dir1/dir2/name/` - This would only match "/dir1/dir2/name/...".

  **Note:** If you are using the CLI, you must delimit all paths with double quotation marks ("). For instance, to add the paths "/vol/a b/" and "/vol/a,b/" to the `paths-to-exclude` in the CLI, type "/vol/a b/","/vol/a,b/" at the command prompt.

- `file-ext-to-exclude <File extension>` - File Extensions Not to Scan
  This parameter specifies a list of file extensions, separated by commas, to exclude from virus scanning. By default, no file extensions are excluded. Each file extension can be up to 16 characters long. The `file-ext-to-exclude` supports wildcard patterns containing "*" and "?". Pattern matching is defined as:
  - * - Matches any string, including the empty string. For example, *mp matches mp, mp3, mp4, mpeg etc.
  - ? - Matches any single character. For example, mp? matches mp3, mp4 but not mp and mpeg.

  **Note:** If you are using the CLI, you must delimit all patterns with double quotation marks ("). For instance, to enter the pattern *mp* in the CLI, type "*mp*" at the command prompt. To add a "?" to the expression, press ESC followed by the "?".

- `file-ext-to-include <File extension>` - File Extensions to Scan
  This parameter specifies a list of file extensions, separated by commas, to include for virus scanning. By default it is *, which means all the file extensions are considered for virus scanning except those that match one of the patterns provided in `file-ext-to-exclude` list. Each file extension can be up to 16 characters long. The `file-ext-to-include` supports wildcard patterns containing "*" and "?". Pattern matching is defined as:
  - * - Matches any string, including the empty string. For example, *mp matches mp, mp3, mp4, mpeg etc.
  - ? - Matches any single character. For example, mp? matches mp3, mp4 but not mp and mpeg.

  **Note:** If you are using the CLI, you must delimit all patterns with double quotation marks ("). For instance, to enter the pattern *mp* in the CLI, type "*mp*" at the command prompt. To add a "?" to the expression, press ESC followed by the "?".

  **Note:** If you specify both `file-ext-to-include` and `file-ext-to-exclude` lists, then only those file extensions are considered for virus scanning which match one of the patterns provided in `file-ext-to-include` list but do not match any of the patterns provided in `file-ext-to-exclude` list.

- `scan-files-with-no-ext `<true|false>` - Scan Files with No Extension
  This parameter specifies if the files without any extension are considered for virus scanning or not. By default, it is true.

- `request-timeout `<[<integer>h]>[<integer>m][<integer>s]> - Request Service Timeout
  This parameter specifies the timeout value for a scan request. It is used to specify the time interval in which the node waits for a response from the Vscan server. Beyond this timeout period, the scan request is considered as failed. The value for this field must be between 10s and 1h. By default, it is 5m.
[-cross-junction {true|false}] - Cross Junction

This parameter specifies if the On-Demand task is allowed to cross volume junctions. If the parameter is set to false, crossing junctions is not allowed. By default, it is true.

[-directory-recursion {true|false}] - Directory Recursion

This parameter specifies if the On-Demand task is allowed to recursively scan through sub-directories. If the parameter is set to false, recursive scanning is not allowed. By default, it is true.

[-scan-priority {low|normal}] - Scan Priority

This parameter specifies the priority of the On-Demand scan requests generated by this task compared to On-Access scan requests. By default, it is low.

[-report-log-level {verbose|info|error}] - Report Log Level

This parameter specifies the log level of the On-Demand report. By default, it is info.

Examples

The following example creates an On-Demand task:

```
cluster1::> vserver vsan on-demand-task create -vserver vs1 -task-name t1
  -scan-paths "/vol1/","/vol2/cifs/" -report-directory "/report"
  -file-ext-to-include "vmdk?","mp*" -file-ext-to-exclude "mp3","mp4"
  -scan-files-with-no-ext false -request-timeout 2m -cross-junction false
  -directory-recursion true -scan-priority low -report-log-level verbose

[Job 126]: Vscan On-Demand job is queued. Use the "job show -id 126" command to view the status.
```

```
cluster1::> vserver vsan on-demand-task show -instance -vserver vs1 -task-name t1

  Vserver: vs1
  Task Name: t1
  List of Scan Paths: /vol1/, /vol2/cifs/
  Report Directory Path: /report
  Job Schedule: daily
  Max File Size Allowed for Scanning: 5GB
  File Paths Not to Scan: /vol1/cold-files/
  File Extensions Not to Scan: mp3, mp4
  File Extensions to Scan: vmdk, mp*
  Scan Files with No Extension: false
  Request Service Timeout: 2m
  Cross Junction: false
  Directory Recursion: true
  Scan Priority: low
  Report Log Level: verbose
```

vserver vsan on-demand-task delete

Delete an On-Demand task

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver vsan on-demand-task delete command deletes an On-Demand task.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver from which you want to delete an On-Demand task.
- **task-name <text>** - Task Name
  This parameter specifies the name of the On-Demand task that you want to delete.

### Examples
The following example deletes an On-Demand task:

```
cluster1::> vserver vsan on-demand-task delete -vserver vs1 -task-name t1
cluster1::> vserver vsan on-demand-task show -vserver vs1 -task-name t1
There are no entries matching your query.
```

---

**vserver vsan on-demand-task modify**

Modify an On-Demand task

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `vserver vsan on-demand-task modify` command modifies an On-Demand task. The On-Demand task consists of a set of attributes that are used for configuring the scope of scanning. It also specifies the cron schedule at which the task should run.

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**

- **-vserver <vserver name>** - Vserver
  This parameter specifies the name of the Vserver on which you want to modify an On-Demand task.

- **-task-name <text>** - Task Name
  This parameter specifies the name of the On-Demand task that you want to modify.

- **[-scan-paths <text>, ...]** - List of Scan Paths
  This parameter specifies a list of paths, separated by commas, for virus scanning. This path is given from the root of the Vserver using UNIX path delimiter "/".

- **[-report-directory <text>]** - Report Directory Path
  This parameter specifies a directory path where the On-Demand report file is created. Each run for a task creates a new file. The report directory path is given from the root of the Vserver using UNIX path delimiter "/".

- **[-schedule <text>]** - Job Schedule
  This parameter specifies the already existing cron schedule. The On-Demand task triggers virus scanning for the specified scan-paths at the time configured in the schedule. Providing empty schedule (""”) unschedules the task.

  **Note:** A Vserver can have only one scheduled task at a time.

- **[-max-file-size {<integer>[KB|MB|GB|TB|PB]}]** - Max File Size Allowed for Scanning
  This parameter specifies the maximum size of the file which will be considered for virus scanning.

- **[-paths-to-exclude <text>, ...]** - File Paths Not to Scan
  This parameter specifies a list of paths, separated by commas, to exclude from virus scanning. This path is given from the root of the Vserver using UNIX path delimiter "/". The path can be in one of the following forms:
• /dir1/dir2/name - This would match "/dir1/dir2/name" as well as "dir1/dir2/name/
...".
• /dir1/dir2/name/ - This would only match "/dir1/dir2/name/
...

Note: If you are using the CLI, you must delimit all paths with double quotation marks (".). For instance, to add the paths "/vol/a b/" and "/vol/a,b/" to the -paths-to-exclude in the CLI, type "/vol/a b/ ", "/vol/a,b/" at the command prompt.

[-file-ext-to-exclude <File extension>, ...] - File Extensions Not to Scan
This parameter specifies a list of file extensions, separated by commas, to exclude from virus scanning. Each file extension can be up to 16 characters long. The -file-ext-to-exclude supports wildcard patterns containing "*" and "?". Pattern matching is defined as:

• * - Matches any string, including the empty string. For example, mp* matches mp, mp3, mp4, mpeg etc.
• ? - Matches any single character. For example, mp? matches mp3, mp4 but not mp and mpeg.

Note: If you are using the CLI, you must delimit all patterns with double quotation marks ("."). For instance, to enter the pattern mp* in the CLI, type ":mp*" at the command prompt. To add a "?" to the expression, press ESC followed by the "?".

[-file-ext-to-include <File extension>, ...] - File Extensions to Scan
This parameter specifies a list of file extensions, separated by commas, to include for virus scanning. Each file extension can be up to 16 characters long. The -file-ext-to-include supports wildcard patterns containing "*" and "?". Pattern matching is defined as:

• * - Matches any string, including the empty string. For example, mp* matches mp, mp3, mp4, mpeg etc.
• ? - Matches any single character. For example, mp? matches mp3, mp4 but not mp and mpeg.

Note: If you are using the CLI, you must delimit all patterns with double quotation marks ("."). For instance, to enter the pattern mp* in the CLI, type ":mp*" at the command prompt. To add a "?" to the expression, press ESC followed by the "?".

Note: If you specify both -file-ext-to-include and -file-ext-to-exclude lists, then only those file extensions are considered for virus scanning which match one of the patterns provided in -file-ext-to-include list but do not match any of the patterns provided in -file-ext-to-exclude list.

[-scan-files-with-no-ext {true|false}] - Scan Files with No Extension
This parameter specifies if the files without any extension are considered for virus scanning or not.

[-request-timeout <[<integer>h][<integer>m][<integer>s]>] - Request Service Timeout
This parameter specifies the timeout value for a scan request. It is used to specify the time interval in which the node waits for a response from the Vscan server. Beyond this timeout period, the scan request is considered as failed. The value for this field must be between 10s and 1h.

[-cross-junction {true|false}] - Cross Junction
This parameter specifies if the On-Demand task is allowed to cross volume junctions. If the parameter is set to false, crossing junctions is not allowed.

[-directory-recursion {true|false}] - Directory Recursion
This parameter specifies if the On-Demand task is allowed to recursively scan through sub-directories. If the parameter is set to false, recursive scanning is not allowed.

[-scan-priority {low|normal}] - Scan Priority
This parameter specifies the priority of the On-Demand scan requests generated by this task compared to On-Access scan requests.

[-report-log-level {verbose|info|error}] - Report Log Level
This parameter specifies the log level of the On-Demand report.
Examples
The following example modifies an On-Demand task:

```
cluster1:>> vserver vscan on-demand-task modify -vserver vs1 -task-name t1
   -scan-paths "/vol3/", "/vol4/cifs/" -report-directory "/report-dir"
   -schedule custom -max-file-size 2GB -paths-to-exclude "/vol1/cold-files/
   -file-ext-to-include "*" -file-ext-to-exclude "mp3","mp4"
   -scan-files-with-no-ext true -request-timeout 1m -cross-junction true

[Job 136]: Vscan On-Demand job is queued. Use the "job show -id 136" command to view the status.
```

```
cluster1:>> vserver vscan on-demand-task show -instance -vserver vs1 -task-name t1

Vserver: vs1
Task Name: t1
List of Scan Paths: /vol3/, /vol4/cifs/
Report Directory Path: /report-dir
Job Schedule: custom
Max File Size Allowed for Scanning: 2GB
File Paths Not to Scan: /vol1/cold-files/
File Extensions Not to Scan: mp3, mp4
File Extensions to Scan: *
Scan Files with No Extension: true
Request Service Timeout: 1m
Cross Junction: true
Directory Recursion: true
Scan Priority: low
Report Log Level: verbose
```

```
vserver vscan on-demand-task run

Run an On-Demand task

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver vscan on-demand-task run command start virus scanning immediately for an On-Demand task.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters
-vserver <vserver name> - Vserver
This parameter specifies the name of the Vserver on which you want to start start virus scanning.

-task-name <text> - Task Name
This parameter specifies the name of the On-Demand task that you want to start virus scanning.

Examples
The following example starts virus scanning an On-Demand task:

```
cluster1:>> vserver vscan on-demand-task run -vserver vs1 -task-name t1
[Job 161]: Vscan On-Demand job is queued. Use the "job show -id 161" command to view the status.
```

vserver vscan commands
vserver vscan on-demand-task schedule

Schedule an On-Demand task

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The `vserver vscan on-demand-task schedule` command schedules an On-Demand task.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters

- `-vserver <vserver name>` - Vserver
  
  This parameter specifies the name of the Vserver on which you want to schedule an On-Demand task.

- `-task-name <text>` - Task Name
  
  This parameter specifies the name of the On-Demand task that you want to schedule.

- `-schedule <text>` - Schedule Name
  
  This parameter specifies the already existing cron schedule. The On-Demand task triggers virus scanning for the specified scan-paths at the time configured in the schedule.

  Note: A Vserver can have only one scheduled task at a time.

Examples

The following example schedules an On-Demand task:

```
cluster1::> vserver vscan on-demand-task schedule -vserver vs1 -task-name t1 -schedule daily
[Job 150]: Vscan On-Demand job is queued. Use the "job show -id 150" command to view the status.
```

```
cluster1::> vserver vscan on-demand-task show -instance -vserver vs1 -task-name t1

  Vserver: vs1
  Task Name: t1
  List of Scan Paths: /test
  Report Directory Path: /report
  Job Schedule: daily
  Max File Size Allowed for Scanning: 2GB
  File Paths Not to Scan: /vol1/cold-files/
  File Extensions Not to Scan: mp3, mp4
  File Extensions to Scan: *
  Scan Files with No Extension: true
  Request Service Timeout: 1m
  Cross Junction: true
  Directory Recursion: true
  Scan Priority: low
  Report Log Level: verbose
```

vserver vscan on-demand-task show

Display On-Demand tasks

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The `vserver vscan on-demand-task show` command displays information about the On-Demand tasks belonging to the Vserver. If you do not specify any parameters, the command displays the following information about all On-Demand tasks:
- Vserver name
- Task name
- Scan paths
- Report directory path
- Schedule

You can specify the `-fields` parameter to specify which fields of information to display about On-Demand tasks. In addition to the fields above, you can display the following fields:

- Max file size
- File paths to exclude
- File extensions to exclude
- File extensions to include
- Scan files without extension
- Scan timeout
- Cross junction
- Directory recursion
- Scan priority
- Report log level

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**

```bash
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```bash
[-instance]
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```bash
[-vserver <vserver name>] - Vserver
```

If you specify this parameter, the command displays information only about the On-Demand tasks for the specified Vserver.

```bash
[-task-name <text>] - Task Name
```

If you specify this parameter, the command displays information only about the specified On-Demand task.

```bash
[-scan-paths <text>, ...] - List of Scan Paths
```

If you specify this parameter, the command displays information only about the On-Demand tasks that have the specified path or paths in the scan-paths list.

```bash
[-report-directory <text>] - Report Directory Path
```

If you specify this parameter, the command displays information only about the On-Demand tasks that have the specified report-directory.

```bash
[-schedule <text>] - Job Schedule
```

If you specify this parameter, the command displays information only about the On-Demand tasks that have the specified schedule.
The following example displays information about all On-Demand tasks:

```
cluster1::> vserver vsan on-demand-task show
Vserver  Task Name  Scan Paths          Report
-------- -------- --------------------------
vs1      t1       /test                /report
vs2      t2       /, /test/            /report
t2 entries were displayed.
```

The following example displays detailed information about an On-Demand task:

```
cluster1::> vserver vsan on-demand-task show -instance -vserver vs1 -task-name t1
Vserver: vs1
  Task Name: t1
  List of Scan Paths: /test
```

Examples

The following example displays information about all On-Demand tasks:

```
cluster1::> vserver vsan on-demand-task show
Vserver  Task Name  Scan Paths          Report
-------- -------- --------------------------
vs1      t1       /test                /report
vs2      t2       /, /test/            /report
t2 entries were displayed.
```

The following example displays detailed information about an On-Demand task:

```
cluster1::> vserver vsan on-demand-task show -instance -vserver vs1 -task-name t1
Vserver: vs1
  Task Name: t1
  List of Scan Paths: /test
```
vserver vscan on-demand-task unschedule

Unschedule an On-Demand task

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver vscan on-demand-task unschedule command unschedules an On-Demand task.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters
-vserver <vserver name> - Vserver
   This parameter specifies the name of the Vserver on which you want to unschedule an On-Demand task.

-task-name <text> - Task Name
   This parameter specifies the name of the On-Demand task that you want to unschedule.

Examples
The following example unschedules an On-Demand task:

cluster1::> vserver vscan on-demand-task unschedule -vserver vs1 -task-name t1
cluster1::> vserver vscan on-demand-task show -instance -vserver vs1 -task-name t1

Vserver: vs1
Task Name: t1
List of Scan Paths: /test
Report Directory Path: /report
Job Schedule: -
Max File Size Allowed for Scanning: 2GB
File Paths Not to Scan: /vol1/cold-files/
File Extensions Not to Scan: mp3, mp4
File Extensions to Scan: *
Scan Files with No Extension: true
Request Service Timeout: 1m
Cross Junction: true
Directory Recursion: true
Scan Priority: low
Report Log Level: verbose

vserver vscan on-demand-task report commands

Manage Vscan On-Demand reports
vserver vscan on-demand-task report delete

Delete an On-Demand report

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver vscan on-demand-task report delete` command deletes an On-Demand report.

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**
- **-vserver <vserver name>** - Vserver
  
  This parameter specifies the name of the Vserver from which you want to delete an On-Demand report.

- **-task-name <text>** - Task Name
  
  This parameter specifies the name of the On-Demand task whose report you want to delete.

- **-report-file <text>** - Report File Path
  
  This parameter specifies the path of the report-file whose report record you want to delete.

- **[-delete-report-file {true|false}]** - Delete Report File Also
  
  This parameter specifies if the corresponding report file is also to be deleted. By default, it is false.

**Examples**
The following example deletes only On-Demand report record:

```
cluster1::> vserver vscan on-demand-task report delete -vserver vs1 -task-name t1
  -report-file /rep/avod_146_20150902_161439.log
cluster1::> vserver vscan on-demand-task report delete -vserver vs1 -task-name t1
  -report-file /rep/avod_146_20150902_161439.log
There are no entries matching your query.
```

The following example deletes an On-Demand report file along with the report record:

```
cluster1::> vserver vscan on-demand-task report delete -vserver vs1 -task-name t1
  -report-file /rep/avod_146_20150902_161439.log -delete-report-file true
cluster1::> vserver vscan on-demand-task report delete -vserver vs1 -task-name t1
  -report-file /rep/avod_146_20150902_161439.log -delete-report-file true
There are no entries matching your query.
```

vserver vscan on-demand-task report show

Display On-Demand reports

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver vscan on-demand-task report show` command displays information about the On-Demand reports belonging to the Vserver. A new report record is generated at the end of an On-Demand task run. If you do not specify any parameters, the command displays the following information about all On-Demand tasks:
You can specify the `-fields` parameter to specify which fields of information to display about On-Demand report. In addition to the fields above, you can display the following fields:

- Job ID
- Job duration
- Number of attempted scans
- Number of files skipped from scanning
- Number of already scanned files
- Number of successful scans
- Number of failed scans
- Number of timed-out scans
- Job start time
- Job end time

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**

[-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

[-instance ]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver

If you specify this parameter, the command displays information only about the On-Demand reports for the specified Vserver.

[-task-name <text>] - Task Name

If you specify this parameter, the command displays information only about the On-Demand reports for the specified task.

[-report-file <text>] - Report File Path

If you specify this parameter, the command displays information only about the On-Demand reports that have the specified report file-path.

[-job-id <integer>] - Job ID

If you specify this parameter, the command displays information only about the On-Demand reports that have the specified job ID.

[-job-duration <[<integer>h][<integer>m][<integer>s]>] - Job Duration

If you specify this parameter, the command displays information only about the On-Demand reports that have the specified value.
[-attempted-scans <integer>] - Number of Attempted Scans
If you specify this parameter, the command displays information only about the On-Demand reports that have the specified value.

[-skipped-scans <integer>] - Number of Files Skipped from Scanning
If you specify this parameter, the command displays information only about the On-Demand reports that have the specified value.

[-already-scanned-files <integer>] - Number of Already Scanned Files
If you specify this parameter, the command displays information only about the On-Demand reports that have the specified value.

[-successful-scans <integer>] - Number of Successful Scans
If you specify this parameter, the command displays information only about the On-Demand reports that have the specified value.

[-failed-scans <integer>] - Number of Failed Scans
If you specify this parameter, the command displays information only about the On-Demand reports that have the specified value.

[-timedout-scans <integer>] - Number of Timedout Scans
If you specify this parameter, the command displays information only about the On-Demand reports that have the specified value.

[-files-cleaned <integer>] - Number of Clean Files
If you specify this parameter, the command displays information only about the On-Demand reports that have the specified value.

[-files-infected <integer>] - Number of Infected Files
If you specify this parameter, the command displays information only about the On-Demand reports that have the specified value.

[-internal-error <integer>] - Number of Internal Error (privilege: advanced)
If you specify this parameter, the command displays information only about the On-Demand reports that have the specified value.

[-scan-retries <integer>] - Number of Scan Retries (privilege: advanced)
If you specify this parameter, the command displays information only about the On-Demand reports that have the specified value.

[-job-start-time <MM/DD/YYYY HH:MM:SS>] - Job Start Time
If you specify this parameter, the command displays information only about the On-Demand reports that have the specified value.

[-job-end-time <MM/DD/YYYY HH:MM:SS>] - Job End Time
If you specify this parameter, the command displays information only about the On-Demand reports that have the specified value.

Examples
The following example displays information about all On-Demand reports:

```
class1::> vscan on-demand-task report show
Files     Files
Vserver     Task Name   Report File Path                     Cleaned  Infected
----------- ----------  ---------------------------------- --------- ---------
vs1         t1          /rep/avod_146_20150902_161439.log       6240         5
```

1918 Commands: Manual Page Reference
The following example displays detailed information about an On-Demand task:

```
cluster1::> vscan on-demand-task report show -vserver vs1 -task-name t1
            -report-file /rep/avod_146_20150902_161439.log
```

Vserver: vs1
Task Name: t1
Report File Path: /rep/avod_146_20150902_161439.log
Job ID: 146
Job Duration: 76s
Number of Attempted Scans: 6245
Number of Files Skipped from Scanning: 1286
Number of Already Scanned Files: 987
Number of Successful Scans: 6245
Number of Failed Scans: 0
Number of Timedout Scans: 0
Number of Clean Files: 6240
Number of Infected Files: 5
Job Start Time: 9/2/2015 16:14:39
Job End Time: 9/2/2015 16:15:55

---

**vserver vscan scanner-pool commands**

Manage Vscan scanner pools

**vserver vscan scanner-pool apply-policy**

Apply scanner-policy to a scanner pool

*Availability:* This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

*Description*

The `vserver vscan scanner-pool apply-policy` command applies a scanner policy to the specified scanner pool on a specified Vserver.

*Note:* This command is not supported for a Vserver with Infinite Volume.

*Parameters*

-vserver `<vserver name>` - Vserver

This parameter specifies the name of the Vserver on which you want to apply the scanner policy. The Vserver administrator can apply the scanner policy to a scanner pool created within the scope of the Vserver or the cluster. The cluster administrator can apply the scanner policy to a scanner pool for any Vserver but cannot apply it within the scope of cluster. The scope is determined at a Vserver level.

-scanner-pool `<Scanner pool>` - Scanner Pool

This parameter specifies the name of the scanner pool.

-scanner-policy `<Scanner policy>` - Scanner Policy

This parameter specifies the scanner policy that you want to apply to the specified scanner pool on a Vserver. Currently only system policies are available. Available system policies are:

- *primary* - Makes it active always.
- **secondary** - Makes it active only when none of the primary external virus-scanning servers are connected.

- **idle** - Makes it inactive always.

**[-cluster <Cluster name>] - Cluster on Which Policy Is Applied**

This parameter specifies the name of the cluster on which you want to apply the scanner policy of a scanner pool. By default, it is applied on the local cluster. This parameter does not have any significance if the cluster is not in a DR relationship.

**Examples**

The following command applies a scanner policy to the specified scanner pool on a specified Vserver.

```bash
cluster1::> vserver vscan scanner-pool apply-policy -vserver vs1 -scanner-pool p1 -scanner-policy primary -cluster cluster2
```

```bash
cluster1::> vserver vscan scanner-pool show -vserver vs1 -scanner-pool p1

Vserver: vs1
Scanner Pool: p1
Applied Policy: primary
Current Status: on
Cluster on Which Policy Is Applied: cluster2
List of IPs of Allowed Vscan Servers: 1.1.1.1, 2.2.2.2
List of Privileged Users: cifs\u1, cifs\u2
```

**vserver vscan scanner-pool create**

Create a scanner pool

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The `vserver vscan scanner-pool create` command creates a Vscan scanner pool. Scanner pool is a set of attributes which are used to validate and manage connection between clustered Data ONTAP and external virus-scanning server, or "Vscan server". It also specifies other parameters which are used for connection management. After creating a scanner pool, a scanner-policy must be applied to it using the command `vserver vscan scanner-pool apply-policy`. The default applied policy is `idle`, which means the scanner pool is inactive.

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**

- **-vserver <vserver name>** - Vserver
  
  This parameter specifies the name of the Vserver on which you want to create a scanner pool.

- **-scanner-pool <Scanner pool>** - Scanner Pool
  
  This parameter specifies the name of the scanner pool. Scanner pool name can be up to 256 characters long and is a string that can only contain any combination of ASCII-range alphanumeric characters (a-z, A-Z, 0-9), ",", ",", and ",".

- **-hostnames <text>, ...** - List of Host Names of Allowed Vscan Servers
  
  This parameter specifies a list of host names or IP addresses of the Vscan servers which are allowed to connect to clustered Data ONTAP.
-privileged-users <Privileged user>, ... - List of Privileged Users

This parameter specifies a list of privileged users. A valid form of privileged user-name is "domain-name\user-name" and can be up to 256 characters long. Privileged user-names are stored and treated as case-insensitive strings. Virus scanners must use one of the registered privileged users for connecting to clustered Data ONTAP for exchanging virus-scanning protocol messages and to access file for scanning, remedying and quarantining operations.

[-request-timeout <[<integer>h] [<integer>m] [<integer>s]>] - Request Service Timeout (privilege: advanced)

This parameter specifies the timeout value for a scan request. It is used to specify the time interval in which the node waits for a response from the Vscan server. Beyond this timeout period, the file operation fails if the applicable On-Access policy has the value scan-mandatory as one of the values for the On-Access policy filter. The value for this field must be between 10s and 40s. By default, it is 30s.

[-scan-queue-timeout <[<integer>h] [<integer>m] [<integer>s]>] - Scan Queue Timeout (privilege: advanced)

This parameter specifies the timeout value for a scan request in scan-engine's queue. The value for this field must be between 10s and 30s. By default, it is 20s.

[-session-setup-timeout <[<integer>h] [<integer>m] [<integer>s]>] - Session Setup Timeout (privilege: advanced)

This parameter specifies the timeout value for a response for session-setup-message. The value for this field must be between 5s and 10s. By default, it is 10s.

[-session-teardown-timeout <[<integer>h] [<integer>m] [<integer>s]>] - Session Teardown Timeout (privilege: advanced)

This parameter specifies the timeout value for a response for session-teardown-message, or for any message to be received for a session-id, after the underlying connection has been disconnected. The value for this field must be between 5s and 10s. By default, it is 10s.

[-max-session-setup-retries <integer>] - Max Number of Consecutive Session Setup Attempts (privilege: advanced)

This parameter specifies the maximum number of consecutive session-setup attempts. The value for this field must be between 1 and 5. By default, it is 5.

Examples

The following example creates a scanner pool.

```
Cluster1::> vserver vsan scanner-pool create -vserver vs1 -scanner-pool SP
               -hostnames 1.1.1.1,vmwin204-27.fact.nb -privileged-users cifs\u1,cifs\u2
Cluster1::> vserver vsan scanner-pool show -vserver vs1 -scanner-pool SP

          Vserver: vs1
          Scanner Pool: SP
          Applied Policy: idle
          Current Status: off
          Cluster on Which Policy Is Applied: -
          Scanner Pool Config Owner: vserver
          List of IPs of Allowed Vscan Servers: 1.1.1.1, 10.72.204.27
          List of Host Names of Allowed Vscan Servers: 1.1.1.1, vmwin204-27.fact.nb
          List of Privileged Users: cifs\u1, cifs\u2
```

vserver vscan scanner-pool delete

Delete a scanner pool

**Availability:** This command is available to cluster and Vserver administrators at the *admin* privilege level.

**Description**
The `vserver vscan scanner-pool delete` command deletes a scanner pool.

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**
- `-vserver <vserver name>` - *Vserver*
  This parameter specifies the name of the Vserver from which you want to delete a scanner pool.
- `-scanner-pool <Scanner pool>` - *Scanner Pool*
  This parameter specifies the name of the scanner-pool that you want to delete.

**Examples**
The following example deletes a scanner pool.

```
cluster1::> vserver vscan scanner-pool delete -vserver vs1 -scanner-pool test
cluster1::> vserver vscan scanner-pool show -vserver vs1 -scanner-pool test
There are no entries matching your query.
```

vserver vscan scanner-pool modify

Modify a scanner pool

**Availability:** This command is available to cluster and Vserver administrators at the *admin* privilege level.

**Description**
The `vserver vscan scanner-pool modify` command modifies a Vscan scanner pool. Scanner pool is a set of attributes which are used to validate and manage connection between clustered Data ONTAP and external virus-scanning server, or "Vscan server". It also specifies other parameters which are used for connection management.

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**
- `-vserver <vserver name>` - *Vserver*
  This parameter specifies the name of the Vserver on which you want to modify a scanner pool.
- `-scanner-pool <Scanner pool>` - *Scanner Pool*
  This parameter specifies the name of the scanner pool. Scanner pool name can be up to 256 characters long and is a string that can only contain any combination of ASCII-range alphanumeric characters (a-z, A-Z, 0-9), ",", "," and ".".
- `[-hostnames <text>, ...]` - *List of Host Names of Allowed Vscan Servers*
  This parameter specifies a list of host names or IP addresses of the Vscan servers which are allowed to connect to clustered Data ONTAP.
[-privileged-users &lt;Privileged user&gt;,...] - List of Privileged Users

This parameter specifies a list of privileged users. A valid form of privileged user-name is "domain-name\user-name" and can be up to 256 characters long. Privileged user-names are stored and treated as case-insensitive strings. Virus scanners must use one of the registered privileged users for connecting to clustered Data ONTAP for exchanging virus-scanning protocol messages and to access file for scanning, remedying and quarantining operations.

[-request-timeout &lt;[<integer>h][<integer>m][<integer>s]&gt;] - Request Service Timeout (privilege: advanced)

This parameter specifies the timeout value for a scan request. It is used to specify the time interval in which the node waits for a response from the Vscan server. Beyond this timeout period, the file operation fails if the applicable On-Access policy has the value scan-mandatory as one of the values for the On-Access policy filter. The value for this field must be between 10s and 40s.

[-scan-queue-timeout &lt;[<integer>h][<integer>m][<integer>s]&gt;] - Scan Queue Timeout (privilege: advanced)

This parameter specifies the timeout value for a scan request in scan-engine's queue. The value for this field must be between 10s and 30s.

[-session-setup-timeout &lt;[<integer>h][<integer>m][<integer>s]&gt;] - Session Setup Timeout (privilege: advanced)

This parameter specifies the timeout value for a response for session-setup-message. The value for this field must be between 5s and 10s.

[-session-teardown-timeout &lt;[<integer>h][<integer>m][<integer>s]&gt;] - Session Teardown Timeout (privilege: advanced)

This parameter specifies the timeout value for a response for session-teardown-message, or for any message to be received for a session-id, after the underlying connection has been disconnected. The value for this field must be between 5s and 10s.

[-max-session-setup-retries &lt;integer&gt;] - Max Number of Consecutive Session Setup Attempts (privilege: advanced)

This parameter specifies the maximum number of consecutive session-setup attempts. The value for this field must be between 1 and 5.

Examples

The following example modifies a scanner pool.

```
Cluster1::> vserver vsan scanner-pool modify -vserver vs1 -scanner-pool SP
    -hostnames 2.2.2.2,vmwin204-29.fact.nb -privileged-users cifs\u3
```

Cluster1::> vserver vsan scanner-pool show -vserver vs1 -scanner-pool SP

```
Vserver: vs1
Scanner Pool: SP
Applied Policy: idle
Current Status: off
Cluster on Which Policy Is Applied: -
Scanner Pool Config Owner: vserver
List of IPs of Allowed Vscan Servers: 2.2.2.2, 10.72.204.29
List of Host Names of Allowed Vscan Servers: 2.2.2.2, vmwin204-29.fact.nb
List of Privileged Users: cifs\u3
```

vserver vsan scanner-pool resolve-hostnames

Resolve the hostnames configured in the scanner pool

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.
Description
The `vserver vscan scanner-pool resolve-hostnames` command resolves the host names configured in the scanner pool and update it with the IP addresses. This command also updates the active scanner pool configuration of the Vserver if the scanner pool is part of that. You must run this command for the scanner pool whose host name entry is modified in the DNS server.

**Note:** This command is not supported on a Vserver with Infinite Volume.

Parameters

- **-vserver `<vserver>` - Vserver**
  This parameter specifies the name of the Vserver for which you want to resolve host names.

- **-scanner-pool `<Scanner pool>` - Scanner Pool**
  This parameter specifies the name of the scanner pool for which you want to resolve host names.

Examples

The following example resolves the host names of a scanner pool:

```
cluster1::> vserver vscan scanner-pool resolve-hostnames -vserver vs1 -scanner-pool SP
cluster1::> vserver vscan scanner-pool show -vserver vs1 -scanner-pool SP
  Vserver: vs1
  Scanner Pool: SP
  Applied Policy: primary
  Current Status: on
  Cluster on Which Policy Is Applied: Cluster1
  Scanner Pool Config Owner: vserver
  List of IPs of Allowed Vscan Servers: 10.72.204.27, 10.72.204.29
  List of Host Names of Allowed Vscan Servers: vmwin204-27.fsct.nb, vmwin204-29.fsct.nb
  List of Privileged Users: cifs\u1, cifs\u2
```

`vserver vscan scanner-pool show`

Display scanner pools

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

Description

The `vserver vscan scanner-pool show` command displays information about the Vscan scanner pools belonging to the Vserver. It also displays the scanner policy applied to the scanner pool and its current status in Vserver scope. If you do not specify any parameters, the command displays the following information about all scanner pools:

- Vserver name
- Scanner pool
- Scanner pool owner
- Scanner policy
- Current status
- Cluster on which policy is applied
- List of servers
- List of host names
• List of privileged user

**Note:** This command is not supported for a Vserver with Infinite Volume.

### Parameters

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance]
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[-vserver <vserver name>] - Vserver
```

If you specify this parameter, the command displays information only about the scanner pools for the specified Vserver.

```
[-scanner-pool <Scanner pool>] - Scanner Pool
```

If you specify this parameter, the command displays information only about the specified scanner pool.

```
[-scanner-policy <Scanner policy>] - Applied Policy
```

If you specify this parameter, the command displays information only about the scanner pools for the specified scanner policy.

```
[-current-status {on|off}] - Current Status
```

If you specify this parameter, the command displays information only about the scanner pools that have the specified status.

```
[-cluster <Cluster name>] - Cluster on Which Policy Is Applied
```

If you specify this parameter, the command displays information only about the scanner pools that are applied to the specified cluster.

```
[-owner <Configuration owner>] - Scanner Pool Config Owner
```

If you specify this parameter, the command displays information only about the scanner pools that have the specified owner.

```
[-servers <IP Address>, ...] - List of IPs of Allowed Vscan Servers
```

If you specify this parameter, the command displays information only about the scanner pools that have the specified IP address or IP addresses.

```
[-hostnames <text>, ...] - List of Host Names of Allowed Vscan Servers
```

If you specify this parameter, the command displays information only about the scanner pools that have the specified host name or host names.

```
[-privileged-users <Privileged user>, ...] - List of Privileged Users
```

If you specify this parameter, the command displays information only about the scanner pools that have the specified privileged user or users.

```
[-request-timeout <[<integer>h][<integer>m][<integer>s]>] - Request Service Timeout (privilege: advanced)
```

If you specify this parameter, the command displays information only about the scanner pools that have the specified request-timeout.

```
[-scan-queue-timeout <[<integer>h][<integer>m][<integer>s]>] - Scan Queue Timeout (privilege: advanced)
```

If you specify this parameter, the command displays information only about the scanner pools that have the specified scan-queue-timeout.
[\textbf{-session-setup-timeout} \{<\text{integer}>h \ [<\text{integer}>m \ [<\text{integer}>s]>\}] - Session Setup Timeout (privilege: advanced)

If you specify this parameter, the command displays information only about the scanner pools that have the specified session-setup-timeout.

[\textbf{-session-teardown-timeout} \{<\text{integer}>h \ [<\text{integer}>m \ [<\text{integer}>s]>\}] - Session Teardown Timeout (privilege: advanced)

If you specify this parameter, the command displays information only about the scanner pools that have the specified session-teardown-timeout.

[\textbf{-max-session-setup-retries} \{\text{integer}\}] - Max Number of Consecutive Session Setup Attempts (privilege: advanced)

If you specify this parameter, the command displays information only about the scanner pools that have the specified max-session-setup-retries.

\textbf{Examples}

The following example displays information about all scanner pools.

\begin{verbatim}
Cluster1::> vserver vscan scanner-pool show

Vserver | Pool | Owner | Servers | Users   | Policy
---------|------|-------|---------|---------|-------
vs1      | p1   | vserv | 3.3.3.3 | cifs\u1, cifs\u2 | secondary
vs1      | SP   | vserv | 1.1.1.1, 10.72.204.27 | cifs\u1, cifs\u2 | primary

2 entries were displayed.
\end{verbatim}

The following example displays detailed information about one scanner pool.

\begin{verbatim}
Cluster1::> vserver vscan scanner-pool show -vserver vs1 -scanner-pool SP

Vserver: vs1
Scanner Pool: SP
Applied Policy: primary
Current Status: on
Cluster on Which Policy Is Applied: Cluster1
Scanner Pool Config Owner: vserv
List of IPs of Allowed Vscan Servers: 1.1.1.1, 10.72.204.27
List of Host Names of Allowed Vscan Servers: 1.1.1.1, vmwin204-27.fsct.nb
List of Privileged Users: cifs\u1, cifs\u2
\end{verbatim}

\textbf{vserver vscan scanner-pool show-active}

Display active scanner pools

\textbf{Availability:} This command is available to \textit{cluster} and \textit{Vserver} administrators at the \textit{admin} privilege level.

\textbf{Description}

The \texttt{vserver vscan scanner-pool show-active} command displays active scanner pool information available to the \textit{Vserver}. The active scanner pool configuration is derived by merging the information of the scanner pools which are currently active on a \textit{Vserver}. If you do not specify any parameters, the command displays the following information about all \textit{Vservers}:

- Vserver name
- List of scanner pools
• List of servers
• List of privileged user

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters

[-fields <fieldname>, ...]  
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]  
If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver  
If you specify this parameter, the command displays information only about the specified Vserver.

[-scanner-pools <Scanner pool>, ...] - List of Enabled Scanner Pools  
If you specify this parameter, the command displays information only about the Vservers that have the specified scanner pool or pools. A scanner pool becomes part of this list if it is active at this time.

[-servers <IP Address>, ...] - Merged List of IPs of Allowed Vscan Servers  
If you specify this parameter, the command displays information only about the Vservers that have the specified server or servers. Servers of all active scanner pools on a Vserver are merged to derive this effective server list.

[-privileged-users <Privileged user>, ...] - Merged List of Privileged Users  
If you specify this parameter, the command displays information only about the Vservers that have the specified privileged user or users. Privileged users of all active scanner pools on a Vserver are merged to derive this effective privileged user list.

[-request-timeout <[<integer>h][<integer>m][<integer>s]>] - Request Service Timeout (privilege: advanced)  
If you specify this parameter, the command displays information only about the Vservers that have the specified request-timeout. This is set to the maximum value of the request-timeout of all active scanner pools on a Vserver.

[-scan-queue-timeout <[<integer>h][<integer>m][<integer>s]>] - Scan Queue Timeout (privilege: advanced)  
If you specify this parameter, the command displays information only about the Vservers that have the specified scan-queue-timeout. This is set to the maximum value of the scan-queue-timeout of all active scanner pools on a Vserver.

[-session-setup-timeout <[<integer>h][<integer>m][<integer>s]>] - Session Setup Timeout (privilege: advanced)  
If you specify this parameter, the command displays information only about the Vservers that have the specified session-setup-timeout. This is set to the maximum value of the session-setup-timeout of all active scanner pools on a Vserver.

[-session-teardown-timeout <[<integer>h][<integer>m][<integer>s]>] - Session Teardown Timeout (privilege: advanced)  
If you specify this parameter, the command displays information only about the Vservers that have the specified session-teardown-timeout. This is set to the maximum value of the session-teardown-timeout of all active scanner pools on a Vserver.
[-max-session-setup-retries <integer>] - Max Number of Consecutive Session Setup Attempts (privilege: advanced)

If you specify this parameter, the command displays information only about the Vservers that have the specified max-session-setup-retries. This is set to the maximum number of the max-session-setup-retry of all active scanner pools on a Vserver.

Examples

The following example displays information about active scanner pool on all Vservers.

```
cluster1::> vserver vscan scanner-pool show
Vserver       Pool       Owner   Servers   Users       Policy
----------- ---------- ------- -------------------- --------------- ----------
Cluster       clus       cluster 5.5.5.5              cifs\u5          idle
vs1          new        vserver 1.1.1.1, 2.2.2.2     cifs\u1          primary
vs1          clus       cluster 5.5.5.5              cifs\u5          idle
vs1          p1         vserver 3.3.3.3              cifs\u4          primary
vs2          clus       cluster 5.5.5.5              cifs\u5          primary
vs2          p2         vserver 3.3.3.3, 4.4.4.4     cifs\u2          primary
6 entries were displayed.
cluster1::> vserver vscan scanner-pool show-active
VVserver     Scanner Pools      Servers                     Users
----------- ------------- --------------------------- ------------------------
vs1          new, p1       1.1.1.1, 2.2.2.2, 3.3.3.3   cifs\u1, cifs\u4
vs2          clus, p2      3.3.3.3, 4.4.4.4, 5.5.5.5   cifs\u2, cifs\u5
2 entries were displayed.
```

vserver vscan scanner-pool privileged-users commands

Manage list of privileged users of a scanner pool

vserver vscan scanner-pool privileged-users add

Add to the list of privileged users

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver vscan scanner-pool privileged-users add command adds one privileged users or list of privileged users to the specified scanner pool.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters

- `-vserver <vserver name>` - Vserver
  This parameter specifies the name of the Vserver containing the specified scanner pool on which you want to add a privileged user or users.

- `-scanner-pool <Scanner pool>` - Scanner Pool
  This parameter specifies the name of the scanner pool to which you want to add a privileged user or users.

- `-privileged-users <Privileged user>, ...` - List of Privileged Users
  This parameter specifies the privileged user or users that you want to add to the specified scanner pool.
**Examples**

The following example adds a list of privileged users to the specified scanner pool.

```
cluster1::> vserver vscan scanner-pool privileged-users add -vserver vs1
              -scanner-pool p1 -privileged-users cifs\u2,cifs\u3
cluster1::> vserver vscan scanner-pool privileged-users show -vserver vs1
              -scanner-pool p1
  Vserver: vs1
  Scanner Pool: p1
  List of Privileged Users: cifs\u1, cifs\u2, cifs\u3
```

vserver vscan scanner-pool privileged-users remove

Remove from the list of privileged users

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `vserver vscan scanner-pool privileged-users remove` command removes one privileged users or list of privileged users from the specified scanner pool. All the existing privileged users of a scanner pool cannot be removed.

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**
- `vserver <vserver name>` - Vserver
  This parameter specifies the name of the Vserver containing the specified scanner pool on which you want to remove a privileged user or users.

- `scanner-pool <Scanner pool>` - Scanner Pool
  This parameter specifies the name of the scanner pool from which you want to remove a privileged user or users.

- `privileged-users <Privileged user>, ...` - List of Privileged Users
  This parameter specifies the privileged user or users that you want to remove from the specified scanner pool.

**Examples**
The following example removes a list of privileged users from the specified scanner pool.

```
cluster1::> vserver vscan scanner-pool privileged-users remove -vserver vs1
              -scanner-pool p1 -privileged-users cifs\u2,cifs\u3
cluster1::> vserver vscan scanner-pool privileged-users show -vserver vs1
              -scanner-pool p1
  Vserver: vs1
  Scanner Pool: p1
  List of Privileged Users: cifs\u1
```
vserver vscan scanner-pool privileged-users show

Display list of privileged users

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The `vserver vscan scanner-pool privileged-users show` command displays the list of privileged users of the Vscan scanner pools belonging to the Vserver. If you do not specify any parameters, the command displays the following information about the scanner pools:

- Vserver name
- Scanner pool
- List of privileged users

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**

`[-fields <fieldname>, ...]`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

`[-instance]`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-vserver <vserver name>] - Vserver`

If you specify this parameter, the command displays information only about the scanner pools for the specified Vserver.

`[-scanner-pool <Scanner pool>] - Scanner Pool`

If you specify this parameter, the command displays information only for the specified scanner pool.

`[-privileged-users <Privileged user>, ...] - List of Privileged Users`

If you specify this parameter, the command displays information only about the scanner pools that have the specified privileged user or users.

**Examples**

The following example displays the list of privileged users of all scanner pools.

```bash
cluster1::> vserver vscan scanner-pool privileged-users show
Vserver     Scanner Pool    Privileged Users
------------ ------------- -------------------
Cluster     clus          cifs\u5
vs1         new           cifs\u7
vs1         clus          cifs\u5
vs1         p1            cifs\u1, cifs\u2
vs2         clus          cifs\u5
vs2         p2            cifs\u2
6 entries were displayed.
```

**vserver vscan scanner-pool servers commands**

Manage list of servers of a scanner pool
**vserver vscan scanner-pool servers add**

Add to the list of hostnames

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver vscan scanner-pool servers add` command adds one server or list of servers to the specified scanner pool.

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**
- `vserver <vserver name>` - Vserver
  This parameter specifies the name of the Vserver containing the specified scanner pool on which you want to add a server or servers.
- `scanner-pool <Scanner pool>` - Scanner Pool
  This parameter specifies the name of the scanner pool to which you want to add a server or servers.
- `hostnames <text>, ...` - List of Host Names for Vscan Servers
  This parameter specifies the host name or host names that you want to add to the specified scanner pool.

**Examples**
The following example adds a list of servers to the specified scanner pool.

```
Cluster1::> vserver vscan scanner-pool servers add -vserver vs1 -scanner-pool SP -hostnames 2.2.2.2, vmwin204-27.fsct.nb
Cluster1::> vserver vscan scanner-pool servers show -vserver vs1 -scanner-pool SP
Vserver: vs1
Scanner Pool: SP
List of IPs of Allowed Vscan Servers: 1.1.1.1, 2.2.2.2, 10.72.204.27
List of Host Names of Allowed Vscan Servers: 1.1.1.1, 2.2.2.2, vmwin204-27.fsct.nb
```

**vserver vscan scanner-pool servers remove**

Remove from the list of hostnames

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver vscan scanner-pool servers remove` command removes one server or list of servers from the specified scanner pool. All the existing servers of a scanner pool cannot be removed.

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**
- `vserver <vserver name>` - Vserver
  This parameter specifies the name of the Vserver containing the specified scanner pool on which you want to remove a server or servers.
-scanner-pool <Scanner pool> - Scanner Pool
This parameter specifies the name of the scanner pool from which you want to remove a server or servers.

-hostnames <text>, ... - List of hostnames for Vscan Servers
This parameter specifies the host name or host names that you want to remove from the specified scanner pool.

Examples
The following example removes a list of servers from the specified scanner pool.

```
Cluster1::> vserver vscan scanner-pool servers remove -vserver vs1 -scanner-pool SP -hostnames vmwin204-27.fsct.nb
Cluster1::> vserver vscan scanner-pool servers show -vserver vs1 -scanner-pool SP
Vserver: vs1
Scanner Pool: SP
List of IPs of Allowed Vscan Servers: 1.1.1.1, 2.2.2.2
List of Host Names of Allowed Vscan Servers: 1.1.1.1, 2.2.2.2
```

vserver vscan scanner-pool servers show
Display list of servers

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver vscan scanner-pool servers show command displays the list of servers of the Vscan scanner pools belonging to the Vserver. If you do not specify any parameters, the command displays the following information about all scanner pools:

- Vserver name
- Scanner pool
- List of servers

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters

```
[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use ‘-fields?’ to display the fields to specify.

[-instance]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver
If you specify this parameter, the command displays information only about the scanner pools for the specified Vserver.

[-scanner-pool <Scanner pool>] - Scanner Pool
If you specify this parameter, the command displays information only for the specified scanner pool.

[-servers <IP Address>, ...] - List of IPs of Allowed Vscan Servers
If you specify this parameter, the command displays information only about the scanner pools that have the specified IP address or IP addresses.
```
-hostnames <text>, ...] - List of Host Names of Allowed Vscan Servers

If you specify this parameter, the command displays information only about the scanner pools that have the specified host name or host names.

### Examples

The following example displays the list of servers of all scanner pools.

```
cluster1::> vserver vsan scanner-pool servers show
Vserver         Scanner Pool      Servers
--------------- ----------------- --------------------------------------------
vs1             SP                1.1.1.1, 10.72.204.27
vs2             p1                10.72.204.29
6 entries were displayed.
```

The following example displays the list of servers and host names of all scanner pools.

```
cluster1::> vserver vsan scanner-pool servers show -instance
Vserver: vs1
Scanner Pool: SP
List of IPs of Allowed Vscan Servers: 1.1.1.1, 10.72.204.27
List of Host Names of Allowed Vscan Servers: 1.1.1.1, vmwin204-27.fsct.nb

Vserver: vs2
Scanner Pool: p1
List of IPs of Allowed Vscan Servers: 10.72.204.29
List of Host Names of Allowed Vscan Servers: vmwin204-29.fsct.nb
2 entries were displayed.
```
