exit

Quit the CLI session

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The exit command ends the current CLI session.

Examples
The following example ends the current CLI session:

cluster1:~> exit
Goodbye

history

Show the history of commands for this CLI session

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.
**Description**
The `history` command displays the command history of the current CLI session. A numeric ID precedes each command. Use this number with the `redo` command to re-execute that history item.

**Examples**
The following example displays the command history of the current CLI session:

```
cluster1::> history
   1  vserver show
   2  man volume show
   3  volume delete -vserver vs0 -volume temporary2
   4  volume modify { -volume temp* } -state offline
cluster1::> redo 3
```

**Related references**
`redo` on page 2

**man**
Display the online manual pages

**Availability:** This command is available to cluster and Vserver administrators at the `admin` privilege level.

**Description**
The `man` command displays the manual page of the command you specify. If you do not specify a command, command displays the man page index.

**Parameters**

```
[<text>] - Valid CLI command
```

The command for which you'd like to see the manual page. The syntax of the command is the same as the command itself. The `man` command supports abbreviations and tab completion of the command name.

**Examples**
The following example displays the manual page for the `storage aggregate create` command.

```
cluster1::> man sto aggr cre
```

That example could also have been fully specified as:

```
cluster1::> man storage aggregate create
```

**redo**
Execute a previous command

**Availability:** This command is available to cluster and Vserver administrators at the `admin` privilege level.
**Description**
The redo command re-executes a command that has been executed previously in the current CLI session. Specify a previously run command using:

- A string that matches part of a previous command. For example, if the only `volume` command you have run is `volume show`, enter `redo vol` to re-execute the command.

- The numeric ID of a previous command, as listed by the `history` command. For example, enter `redo 4` to re-execute the fourth command in the history list.

- A negative offset from the end of the history list. For example, enter `redo -2` to re-execute the command that you ran two commands ago.

**Parameters**

```
<text> - String, Event Number, or Negative Offset
```

Use this parameter to specify a string, a numeric ID from the command history, or a negative number that identifies the command to be re-executed.

### Examples

The following example re-executes command number 10 in the command history:

```
cluster1::> redo 10
```

`history` on page 1

---

**ROWS**

Show/Set the rows for the CLI session

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**
The `rows` command displays the number of rows that can be displayed in the current CLI session before the interface pauses output. If you do not set this value, it adjusts automatically based on the actual height of your terminal. If the actual height is undefined, the default number of rows is 24.

Specify a number to set the number of rows that can be displayed. Setting this value manually disables auto-adjustment. Specify zero (0) to disable pausing.

You can also set this value using the `set -rows` command.

**Parameters**

```
<integer> - Number of Rows the Screen Can Display
```

Use this parameter to specify the number of rows your terminal can display.

### Examples

The following example displays the current number of rows, then resets the number of rows to 48:
**set**

Display/Set CLI session settings

**Availability:** This command is available to cluster and Vserver administrators at the *admin* privilege level.

**Description**
The `set` command changes attributes of the user interface.

**Parameters**

[-privilege *<PrivilegeLevel>]* - Privilege Level

Use this parameter to specify the privilege level of the command session. Possible values are

- *admin* - Used for routine system management commands
- *advanced* - Used for infrequent, dangerous, or complicated commands
- *diagnostic* - Used for detailed diagnostic commands that are used only by support personnel

[-confirmations *{on|off}*] - Confirmation Messages

Use this parameter with the value *on* to specify that the interface prompt for confirmation before executing potentially dangerous commands. Use this parameter with the value *off* to specify that the interface not prompt for confirmation, even before potentially dangerous commands execute. The default setting is *on*.

[-showallfields *{true|false}*] - Show All Fields

Use this parameter with the value *true* to specify that the interface display all field columns when displaying tabular output. Use this parameter with the value *false* to specify that the interface display only selected columns. The default setting is *false*.

[-showseparator *<text>*] - Show Separator

Use this parameter to specify the characters to use as the field separator. The field separator is used between field columns when *showallfields* is set to "true". The separator can be from one to three characters in length. When specifying the separator, enclose it in quotation marks (*"*). Set the separator to one or more spaces to disable this feature.

[-active-help *{true|false}*] - Active Help

Use this parameter with the value *true* to specify that pressing the question mark (*?*) key is sufficient to execute a help request. Use this parameter with the value *false* to specify that you must press the Return key after the question mark key to execute a help request. The default setting is *true*.

[-units *{auto|raw|B|KB|MB|GB|TB|PB}*] - Data Units

Use this parameter to specify the default units used when reporting data sizes. Possible values are:

- *auto* - Auto-scale data size for human-readable output
- *raw* - Bytes without unit designation
• B - Bytes
• KB - Kilobytes
• MB - Megabytes
• GB - Gigabytes
• TB - Terabytes
• PB - Petabytes

The default setting is auto.

[-rows <integer>] - Pagination Rows ('0' disables)
Use this parameter to specify the number of rows that can be displayed in the current CLI session before the interface pauses output. If you do not set this value, it adjusts automatically based on the actual height of your terminal. If the actual height is undefined, the default number of rows is 24.

Setting this value manually disables auto-adjustment. Specify zero (0) to disable pausing.
You can also set this value using the rows command.

[-vserver <text>] - Default Vserver
Use this parameter to specify the name of the Vserver to use as the default value for the -vserver parameter of commands.

[-node <text>] - Default Node
Use this parameter to specify the name of the node to use as the default value for the -node parameter of commands.

[-stop-on-error {true|false}] - Stop On Error
Use this parameter with the value true to specify that continuing commands should stop if they encounter an error. Use this parameter with the value false to specify that continuing commands should continue if they encounter an error.

[-prompt-timestamp {above|inline|none}] - Display Prompt Timestamp
Print the current date and time as a part of the prompt. The possible values are
• above - print the timestamp using the system timestamp format on the line above the remainder of the prompt.
• inline - print the timestamp using the system timestamp format at the beginning of the line with the remainder of the prompt.
• none - do not print the timestamp.

The default value is none.

Examples
The following example sets the privilege level to advanced.

```
cluster1::> set -privilege advanced
Warning: These advanced commands are potentially dangerous; use them only when directed to do so by NetApp personnel.
Do you wish to continue? (y or n): y
cluster1::*>
```

The following examples cause all columns to be shown in output rows, with a comma used as the field separator.
The following example shows how to create a prompt with a timestamp.

```
cluster1::> set -prompt-timestamp above

[2/25/2016 16:38:38]
cluster1::>
```

## top

Go to the top-level directory

**Availability:** This command is available to cluster and Vserver administrators at the `admin` privilege level.

### Description

The `top` command changes the current working directory of the command prompt to the top-level command directory.

### Examples

The following example returns the command prompt from the `storage aggregate` directory to the top-level directory:

```
cluster1::storage aggregate> top
cluster1::>
```

### Related references

- `storage aggregate` on page 770
Go up one directory

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The `up` command, which can also be specified as two dots (..), changes the current working directory of the command prompt to the directory that is up one level in the command hierarchy.

Examples
The following example takes the command prompt up one level from the storage aggregate directory:

```
cluster1::storage aggregate> up
cluster1::storage>
```

application commands

Display and manage applications

application create

(DEPRECATED)-Create an application

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
Note: This command is deprecated and may be removed in a future release of Data ONTAP.
This command creates an application from an application template. It provisions storage for the application and optionally performs additional configuration.

Parameters
-vserver <vserver name> - Vserver
The Vserver in which the application is created.

-application <text> - Application
The name for the application to create.

-application-template <text> - Application Template
The application template upon which to base creation of the application.
Application Template Customization Parameters

A comma separated list of parameter names and their values to customize the application template for the desired application. The specific parameters which may be used to customize an application vary depending on the specified application template.

For each template, there are both required and optional parameters. Attempting to execute the command without a required parameter will result in failure and a message identifying the missing parameter. Command line tab-completion provides lists of parameters and descriptions of the syntax required to specify the parameter values.

A parameter and its value is specified as: `parameter-name:parameter-value`. Multiple parameters are specified by separating them with a comma as: `parameter1-name:parameter1-value,parameter2-name:parameter2-value`. The correct syntax for specifying a parameter value depends on the type of the parameter.

Some parameters must be specified for multiple instances of the same type of object. These are specified using a zero-based array index to identify each unique object. These types of objects have sub-parameters that provide values for specific attributes of each object. A sub-parameter and its value for the Nth instance of an object is specified as: `object-type[n].sub-parameter-name:sub-parameter-value`.

Execute in the Foreground

A boolean value that determines if the application creation executes synchronously at the command prompt in the foreground or asynchronously in the background. If this parameter is not supplied, it defaults to true and the application creation is executed synchronously at the command prompt.

Examples

The following command creates application `app1` in Vserver `vs1` based on the `SAN` application template with 5 LUNs totaling 200 GB in size and maps the new application LUNs to initiator group `ig1`.

```
cluster1::> application create -vserver vs1 -application app1 -application-template SAN -
parameters os-type:linux,application-components[0].name:data,application-components[0].total-size:
200GB,application-components[0].lun-count:5,application-components[0].igroup-name:ig1
```

application delete

Delete an application

Availability: This command is available to `cluster` and `Vserver` administrators at the `advanced` privilege level.

Description

This command deletes an application.

Parameters

- `-vserver <vserver name>` - Vserver
  The Vserver from which to delete the application.

- `-application <text>` - Application
  The name of the application to delete.

- `[-foreground {true|false}]` - Execute in the Foreground
  A boolean value that determines if the application deletion executes synchronously at the command prompt in the foreground or asynchronously in the background. If this parameter is not supplied, it defaults to true and the application deletion is executed synchronously at the command prompt.

Examples

The following command deletes application `app1` from Vserver `vs1`. 

```
cluster1::> application delete -vserver vs1 -application app1
```
application modify

(DEPRECATED)-Modify properties of an application

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
This command modifies properties of an application. The user must specify the names of one or more existing application components of an existing application and properties to apply to those application components. The command fails and the application remains in its initial state unless all of the application components can be modified at once.

Parameters
-vserver <vserver name> - Vserver
The Vserver hosting the application.

-application <text> - Application
The name of the application to modify.

-application-components <Application Component>,... - Application Components
A list of application component names to modify.

[storage-service <text>] - Storage Service
The new storage service to use for the listed application components. The storage-service show command displays the available storage services.
If the current aggregates hosting the application components can accommodate the requested storage service, the application components are modified to use the new storage service.
If the current aggregates hosting the application components cannot accommodate the requested storage service, the command fails and all the specified application components continue with their existing storage services.
Modifying the storage service of application components results in modifying the associated QoS policies to reflect the new storage service. The contents of the application components continue to remain on the same storage elements.

[foreground {true|false}] - Execute in the Foreground
A boolean value that determines if the application modification executes synchronously at the command prompt in the foreground or asynchronously in the background. If this parameter is not supplied, it defaults to true and the application modification is executed synchronously at the command prompt.

Examples
The following command modifies application app1 in Vserver vs1 based on the BasicModify application template. Application components component1 and component2 are modified to use the extreme storage service.

cluster1::> application modify -vserver vs1 -application app1 -application-components component1,component2 -storage-service extreme

The following command modifies application app1 in Vserver vs1 based on the BasicModify application template. Application component component1 is modified to use the value storage service and application component component2 is modified to use the extreme storage service.

storage-service show on page 768

application show

Display applications

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command displays applications. An application groups storage objects to perform application-granular operations.

Parameters

{ [-fields <fieldname>,...] 
  Specifies fields that you want included in the output. You can use -fields ? to display the available fields.
  } [-instance ] 
  Specifies the display of all available fields for each selected application.

[-vserver <vserver name>] - Vserver
Selects applications belonging to Vservers that match the parameter value.

[-application <text>] - Application
Selects applications with names that match the parameter value.

Examples

cluster1::> application show
Vserver Application
--------- --------------------------------------------
vs1       app1
          app2
          app3
          app4
4 entries were displayed.

application show-detail

Display application details

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command displays storage and protocol elements of applications.

Parameters

{ [-fields <fieldname>,...] 
  Specifies fields that you want included in the output. You can use -fields ? to display the available fields.
}
[-instance ]
Specifies the display of all available fields for each selected application.

[-vserver <vserver name>] - Vserver
Selects elements of applications belonging to Vservers that match the parameter value.

[-application <text>] - Application
Selects elements of applications with an application name that matches the parameter value.

[-element-type {lun|lun-clone|nas|igroup}] - Type of Object
Selects application elements with type that matches the parameter value. Possible values are lun for application provisioned LUNs on SAN applications, lun-clone for auxiliary LUNs in SAN applications, igroup for protocol elements in SAN applications and nas for application provisioned storage and protocol information in NAS applications.

[-application-component <text>] - Application Component
Selects application elements which belong to the application component that matches the parameter value. Only application provisioned storage elements of type lun, nas can belong to application components.

[-element-name <text>] - Name of Object
Selects application elements with an element name that matches the parameter value.

[-application-template <text>] - Application Template
Selects application elements that belong to applications with templates that match the parameter value.

[-application-template-version <integer>] - Application Template Version
Selects application elements that belong to applications with template version that match the parameter value.

[-application-uuid <UUID>] - Application UUID
Selects application elements that belong to applications whose UUID matches the parameter value.

[-application-component-uuid <UUID>] - Application Component UUID
Selects application elements which belong to the application component whose UUID that matches the parameter value.

[-application-component-storage-service <text>] - Storage Service
Selects application elements which belong to the application component with a storage service that matches the parameter value.

[-nas-element-path <junction path>] - Volume Path
Selects application elements with a NAS element path that matches the parameter value. This field is valid only for elements of type nas.

[-nas-element-size {<integer> [KB|MB|GB|TB|PB]}] - Volume Size
Selects application elements with NAS element size that matches the parameter value. This field is valid only for elements of type nas.

[-cifs-share-name <Share>] - CIFS Share Name
Selects application elements with a CIFS share that matches the parameter value. This field is valid only for elements of type nas.

[-cifs-server-fqdn <text>] - CIFS Server Name
Selects application elements with a CIFS Server that matches the parameter value. This field is valid for only elements of type nas.

[-cifs-permissions <text>, ...] - CIFS User Permissions
Selects application elements with CIFS Permissions that matches the parameter value. This field is valid for only elements of type nas.
[-cifs-access-ips <IP Address>, ...] - Recommended LIFs for CIFS

Selects application elements with CIFS LIFs that matches the parameter value. This field is valid for only elements of type nas. The CIFS access IPs are recommended LIFs for CIFS access. If LIFs local to the volume are available, then these are recommended. If not, two remote LIFs are returned. Data can be accessed over other available LIFs but that is not recommended.

[-nfs-export-policy-name <export policy name>] - Export Policy Name

Selects application elements with an export policy name that matches the parameter value. This field is valid for only elements of type nas.

[-nfs-permissions <text>, ...] - NFS Permissions

Selects application elements with NFS permissions that matches the parameter value. This field is valid for only elements of type nas.

[-nfs-access-ips <IP Address>, ...] - Recommended LIFs for NFS

Selects application elements with NFS LIFs that matches the parameter value. This field is valid for only elements of type nas. The NFS access IPs are recommended LIFs for NFS access. If LIFs local to the volume are available, then these are recommended. If not, two remote LIFs are returned. Data can be accessed over other available LIFs but that is not recommended.

[-lun <text>] - LUN Name

Selects application elements with a LUN name that matches the parameter value. This field is valid for only elements of type lun and lun-clone.

[-lun-path <path>] - LUN Path

Selects application elements with LUN path that matches the parameter value. This field is valid for only elements of type lun and lun-clone.

[-serial <text>] - LUN Serial

Selects application elements with a LUN serial number that matches the parameter value. This field is valid for only elements of type lun and lun-clone.

[-lun-ids <integer>, ...] - LUN IDs

Selects application elements with LUN IDs that match the parameter value. This field is valid for only elements of type lun and lun-clone.

[-size {<integer> [KB|MB|GB|TB|PB]}] - Element Size

Selects application elements with a LUN size that matches the parameter value. This field is valid for only elements of type lun and lun-clone.

[-igroups <text>, ...] - Igroups

Selects application elements mapped to igroups with names that match the parameter value. This field is valid for only elements of type lun and lun-clone.

[-initiator <text>, ...] - Initiators

Selects application elements mapped to initiators that matches the parameter value. This field is valid for only elements of typeigroup.

[-is-protection-supported {true|false}] - Is Protection Supported

Selects applications with is-protection-supported flag that matches the parameter value. The is-protection-supported flag indicates if any type of protection is supported for the application.

[-is-protected {true|false}] - Is Application Protected

Selects applications with is-protected flag that matches the parameter value. The is-protected flag indicates if any type of protection is enabled for the application.

[-local-RPO <text>] - Local RPO

Selects applications with local-RPO that matches the parameter value.
[-local-RPO-description <text>] - Local RPO description
Selects applications with local-RPO-descriptions that match the parameter value. The local RPO description provides details about the local RPO associated with the application.

[-remote-RPO <text>] - Remote RPO
Selects applications with remote-RPO that matches the parameter value.

[-remote-RPO-description <text>] - Remote RPO description
Selects applications with remote-RPO-descriptions that match the parameter value. The remote RPO description provides details about the remote RPO associated with the application.

**application show-statistics**

Display application statistics

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.
Description
This command displays dynamic application statistics.

Parameters

{ [-fields <fieldname>, ...]
    Specifies fields that you want included in the output. You can use -fields ? to display the available fields.
    |
    | [ -instance ]
    | Specifies the display of all available fields for each selected application.
    
-vserver <vserver name> - Vserver
Selects applications belonging to Vservers that match the parameter value.

-application <text> - Application
Selects applications with names that match the parameter value.

-application-component <text> - Application Component
Selects application components with names that match the parameter value.

-application-uuid <UUID> - Application UUID
Selects applications with the unique identifier that match the parameter value.

-application-component-uuid <UUID> - Application Component UUID
Selects application components with the unique identifier that match the parameter value.

-storage-service <text> - Storage Service
Selects application components with storage services that match the parameter value.
This is the storage service chosen for the application component.

-space-provisioned {<integer>[KB|MB|GB|TB|PB]} - Provisioned Space
Selects applications with space provisioned that matches the parameter value.
This is the maximum space that can be consumed. In some cases, the provisioned space can be capped by the space available in the aggregate.

-space-used {<integer>[KB|MB|GB|TB|PB]} - Used Space
Selects applications with space used that matches the parameter value.
This is the space that would be actively used by the application or application component.

-space-used-excluding-reserves {<integer>[KB|MB|GB|TB|PB]} - Used Space Excluding Reserves
Selects applications with space used excluding reserves that matches the parameter value.
This is the space actively used excluding any space used from reserves.

-space-logical-used {<integer>[KB|MB|GB|TB|PB]} - Logical Used Space
Selects applications with logical space used that matches the parameter value.
This is the space actively used if there were no space efficiency technologies being employed.

-space-reserved-unused {<integer>[KB|MB|GB|TB|PB]} - Unused Reserved Space
Selects applications with unused reserved space that matches the parameter value.
This is the space that has been reserved but not used yet. It is not available to the user.

-space-available {<integer>[KB|MB|GB|TB|PB]} - Available Space
Selects applications with available space that matches the parameter value.
This is the space available to the user for any new writes. It does not include space already reserved for use earlier.
[-space-savings \(<integer>\) [KB|MB|GB|TB|PB]] - Saved Space
Selects applications with space savings that match the parameter value.
This is the space saved by using space efficiency technologies.

[-iops-per-tb \(<integer>] - IOPs Per TB
Selects applications with the number of total operations per TB that match the parameter value.
This is the cumulative total of input and output operations divided by the space-logical-used.

[-iops \(<integer>] - Total IOPs
Selects applications with the number of total operations that match the parameter value.
This is the cumulative total of input and output operations for the application.

[-snapshot-reserve \(<integer>\) [KB|MB|GB|TB|PB]] - Snapshot Reserve
Selects applications with the Snapshot reserve that matches the parameter value.
This is the space reserved exclusively for Snapshot usage. If Snapshot copies use more space than reserved, they will start to use space-available.

[-snapshot-used \(<integer>\) [KB|MB|GB|TB|PB]] - Snapshot Space Used
Selects applications with the space used for Snapshot copies that match the parameter value.
This is the total space used by Snapshot copies.

**application show-template**
Show the available application templates

**Availability:** This command is available to cluster administrators at the advanced privilege level.

**Description**
This command displays information about the application templates that can be used to provision applications.

**Parameters**

[-fields \(<fieldname>, \ldots\)]
If you specify the -fields \(<fieldname>, \ldots\) parameter, the command output also includes the specified field or fields. You can use -fields '?' to display the fields to specify.

[-instance]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-name \(<text>] - Template Name
Selects application templates that match the parameter value.
[-purpose {create|modify}] - Purpose
Selects application templates with a purpose that match the parameter value. The purpose of an application template indicates with application commands with which it can be used.

[-protocol {SAN|NAS}] - Access Protocol
Selects application templates with a protocol that match the parameter value. An application provides resources that are accessed through the protocol.

[-description <text>] - Description
Selects application templates with a description that match the parameter value.

[-missing-prerequisites <text>] - Missing Prerequisites
Selects application templates with missing prerequisites that match the parameter value. Missing prerequisites need to be met before the application template can be used to provision an application.

### application provisioning commands

Manage application provisioning

#### application provisioning revert-volume-qos

Convert the adaptive QoS policy to a traditional QoS policy

**Availability:** This command is available to *cluster administrators at the advanced privilege level.*

**Description**
This command prepares application volumes for a revert to the previous version of Data ONTAP. It converts adaptive QoS policies associated with application volumes to traditional QoS policies.

**Parameters**

- `-vserver <vserver name>` - Vserver Name
  The Vserver of the volume whose QoS policy is to be converted.

- `-volume <volume name>` - Volume Name
  The volume whose QoS policy is to be converted.

**Examples**

The following command reverts the adaptive QoS policy on volume `appl_group1_1` in Vserver `vs1` to a traditional QoS policy:
application provisioning config commands
Manage configuration for application provisioning

application provisioning config modify
Modify options for application provisioning

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
This command modifies the options for application provisioning operations.

Parameters
- `-is-mixed-storage-services-allowed {true | false}` - Is Mixed Storage Services Allowed
  Specifies whether mixed cost storage services are allowed for provisioning placement. If the value of this parameter is `false`, only the aggregates closest to the performance requirements of the storage service are used. If the value of this parameter is `true`, all aggregates with sufficient performance are considered. The initial value for option is `false`.

Examples
```
cluster1::*> application provisioning config modify -is-mixed-storage-services-allowed true
```

application provisioning config show
Display options for application provisioning

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
This command displays options for application provisioning.

Examples
```
cluster1::*> application provisioning config show
Is Mixed Storage Services Allowed: false
```

application snapshot commands
Manage application snapshots

application snapshot create
Create a snapshot for an application or protection group.

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.
Description
This command creates a Snapshot copy of a specified protection-group in a given application. Every application instance also acts as a protection-group and can be treated as one.

Parameters
-vserver <vserver name> - Vserver
This specifies the Vserver that contains the application on which the snapshot is to be created.

-application <text> - Application
This specifies the name of the application where a Snapshot is to be created.

[-protection-group <text>] - Protection Group
This specifies the name of the protection-group where a Snapshot is to be created. This field is optional, and if not specified, the application itself will be treated as the protection-group.

-snapshot <snapshot name> - Snapshot
This specifies the name of the Snapshot that is to be created.

[-snapshot-consistency-type {crash|application}] - Snapshot Consistency Type
This specifies whether the snapshot being created is application consistent or crash consistent.

[-comment <text>] - Comment
This specifies a comment to be added to a Snapshot copy at the time of creation.

Examples
The following example creates a Snapshot named snap1 on a application named myapp1 on a vserver named vs of a protection-group called myapp1.

```
cluster1::> application snapshot create -vserver vs -application myapp1 -protection-group myapp1 -snapshot snap1
```

application snapshot delete
Delete a snapshot belonging to an application or protection group.

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command deletes a Snapshot that belongs to a specified protection-group in a given application. Every application instance also acts as a protection-group and can be treated as one.

Parameters
-vserver <vserver name> - Vserver
This specifies the Vserver that contains the application on which the snapshot is to be deleted.

-application <text> - Application
This specifies the name of the application from which a Snapshot is to be deleted.

[-protection-group <text>] - Protection Group
This specifies the name of the protection-group where a Snapshot is to be deleted. This field is optional, and if not specified, the application itself will be treated as the protection-group.

-snapshot <snapshot name> - Snapshot
This specifies the name of the Snapshot that is to be deleted.
[-force \{true\}] - Force Delete

If this parameter is specified, the Snapshot copy is immediately deleted without generating any confirmation messages. Otherwise the operation generates confirmation messages.

Examples
The following example deletes a Snapshot named snap1 on a application named myapp1 on a vserver named vs of a protection-group called myapp1.

```
cluster1::> application snapshot delete -vserver vs -application myapp1 -protection-group myapp1 - snapshot snap1
```
Parameters
{[-fields <fieldname>,...]
  Specifies fields that you want included in the output. You can use -fields ? to display the available fields.
}[[-instance]]
  Specifies the display of all available fields for each selected application.
[-vserver <vserver name>] - Vserver
  Selects snapshots belonging to vservers that match the parameter value.
[-application <text>] - Application
  Selects snapshots with application names that match the parameter value.
[-protection-group <text>] - Protection Group
  Selects snapshots with protection-groups that match the parameter value.
[-snapshot <snapshot name>] - Snapshot
  Selects snapshots with names that match the parameter value.
[-create-time <Date>] - Creation Time
  Selects snapshots with creation times that match the parameter value.
[-protection-group-uuid <UUID>] - Protection Group UUID
  Selects applications with protection-group unique identifiers that match the parameter value.
[-application-uuid <UUID>] - Application UUID
  Selects snapshots with application unique identifiers that match the parameter value.
[-snapshot-consistency-type {crash|application}] - Snapshot Consistency Type
  Selects snapshots with snapshot types that match the parameter value. The type field is used to differentiate
  between application consistent and crash consistent snapshots.
[-comment <text>] - Comment
  Selects snapshots with comments that match the parameter value.
[-is-partial {true|false}] - Partial Snapshot
  Selects snapshots with partial attributes that match the parameter value. The is-partial field is used to identify
  if a snapshot does not exist on all application components. A partial snapshot is still a valid snapshot. It does
  not exist on all application components because application components were added after the snapshot was
  created.

Examples

cluster1::> application snapshot show
Vserver: vs
Application: myapp1
Protection Group: myapp1

<table>
<thead>
<tr>
<th>Snapshot</th>
<th>Create Time</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>myapp1_snapshot_1</td>
<td>Wed Dec 31 16:16:40</td>
<td>application</td>
</tr>
</tbody>
</table>

application volume commands

Display and manage application volumes
application volume remove

Remove a volume from an application

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
This command removes a volume from an application. If the volume is the only member volume of an application component, the application component is deleted. If there are no more application components in the application, the application is deleted.

Note: This command is provided to support downgrade and revert of Data ONTAP to versions prior to the support of applications. It should not be used for any other purpose.

Parameters
- vserver <vserver name> - Vserver
  The Vserver of the volume to remove from the application.

- application <text> - Application
  The name of the application from which to remove the volume.

- volume <volume name> - Volume
  The volume to remove from the application.

Examples

```
cluster1:*> application volume remove -vserver vs1 -application app1 -volume vol1
```

application volume show

Display application volumes

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
This command displays the volumes that are part of an application.

Parameters

{ [-fields <fieldname>, ...]
  Specifies fields that you want included in the output. You can use -fields ? to display the available fields.

  [-instance ]
  Specifies the display of all available fields for each selected volume.

  [-vserver <vserver name>] - Vserver
  Selects application volumes belonging to Vservers that match the parameter value.

  [-application <text>] - Application
  Selects application volumes that belong to an application that matches the parameter value.

  [-volume <volume name>] - Volume
  Selects application volumes whose name matches the parameter value.

  [-size {<integer> [KB|MB|GB|TB|PB]}] - Volume Size
  Selects application volumes whose size matches the parameter value.
[-state \{online|restricted|offline|force-online|force-offline|mixed\}] - Volume State

Selects application volumes whose state matches the parameter value.

[-application-component <text>] - Application Component

Selects application volumes that belong to application component that matches the parameter value.

**Examples**

```
cluster1::> application volume show
Vserver  Application  Volume       State
--------- ------------ ------------ -------
vs1       app1         vol1         online
          vol2         online
          vol3         online
          app2         vol4         online
          vol5         online
          vol6         online
vs2       app3         vol7         online
          vol8         online
          app4         vol9         online
          vol10        online
          vol11        online
          vol12        online
12 entries were displayed.
```

The example above displays the volumes of all applications in the cluster.

```
cluster1::> application volume show -vserver vs1 -application app1
Vserver  Application  Volume       State
--------- ------------ ------------ -------
vs1       app1         vol1         online
          vol2         online
          vol3         online
3 entries were displayed.
```

**autobalance commands**

The autobalance directory

**autobalance aggregate commands**

Auto Balance Aggregate

**autobalance aggregate show-aggregate-state**

Display the Auto Balance Aggregate state for an aggregate

**Availability:** This command is available to cluster administrators at the advanced privilege level.

**Description**

The autobalance aggregate show-aggregate-state command displays information about an aggregate state that is considered by the Auto Balance Aggregate feature.
Parameters

{[-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

[-instance ]
  If you specify the -instance parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node Name
  If this parameter is specified, the display will be limited to only those aggregates with a node that matches the specified value.

[-aggregate <aggregate name>] - Name of the Aggregate
  If this parameter is specified, the display will be limited to only that aggregate with a name that matches the specified value.

[-total-size {<integer>[KB|MB|GB|TB|PB]}] - Total Size of the Aggregate
  If this parameter is specified, the display will be limited to only those aggregates with a total-size that matches the specified value.

[-used-size {<integer>[KB|MB|GB|TB|PB]}] - Used Size of the Aggregate
  If this parameter is specified, the display will be limited to only those aggregates with a used-size that matches the specified value.

[-aggregate-unbalanced-threshold {<integer>[KB|MB|GB|TB|PB]}] - Threshold When Aggregate Is Considered Unbalanced
  If this parameter is specified, the display will be limited to only those aggregates with a threshold that matches the specified value.

[-outgoing-size {<integer>[KB|MB|GB|TB|PB]}] - Size of Outgoing Volumes in the Aggregate
  If this parameter is specified, the display will be limited to only those aggregates with an outgoing-size that matches the specified value. Outgoing size will be equal to the total size of the volumes that move away from each one of those aggregate.

[-incoming-size {<integer>[KB|MB|GB|TB|PB]}] - Size of Incoming Volumes in the Aggregate
  If this parameter is specified, the display will be limited to only those aggregates with an incoming-size that matches the specified value. Incoming size will be equal to the total size of the volumes that move towards to each one of those aggregates.

[-raidtype {raid tec|raid_dp|raid4}] - RAID Type
  If this parameter is specified, the display will be limited to only those aggregates with a raidtype that matches the specified value.

[-home-cluster <UUID>] - Home Cluster ID
  If this parameter is specified, the display will be limited to only those aggregates with a home-cluster ID that matches the specified value.

[-is-hybrid {true|false}] - Aggregate Is a Hybrid
  If this parameter is specified as true, the display will be limited to only hybrid aggregates. If the parameter is specified as false, the display will be limited to only non-hybrid aggregates.

[-is-incoming-volume-thin {true|false}] - An Incoming Volume Is Thin
  When you use thin provisioning for a volume, it can run out of space even if it has not yet consumed its nominal size and you should carefully monitor space utilization to avoid unexpected errors due to the volume running out of space. If this parameter is specified as true, the display will be limited to only those aggregates which are the target of a move of thin volume. If the parameter is specified as false, the display will be limited to only those aggregates which are not the target of a move of thin volume.
- Is Balanceable

If this parameter is specified as true, the display will be limited to only balanceable aggregates. If the parameter is specified as false, the display will be limited to only non-balanceable aggregates.

- Aggregate Is a Volume Move Target

If this parameter is specified as true, the display will be limited to only those aggregates which are target of a volume move. If the parameter is specified as false, the display will be limited to only those aggregates which are not the target of a volume move.

- Aggregate Attributes

If this parameter is specified, the display will be limited to only those aggregates with attributes that matches the specified values.

- Threshold When Aggregate Is Considered Balanced

If this parameter is specified, the display will be limited to only those aggregates which meet the specified threshold to be considered as balanced.

Examples

The following example displays information about the state for all aggregates in the cluster.

```
ccluster1::*> autobalance aggregate show-aggregate-state
Aggregate: aggr0
    Total Size: 4.78GB
    Used Size: 4.56GB
    Outgoing Size: 0B
    Incoming Size: 0B
    Aggregate Used Space Threshold: 3.34GB
    Aggregate Available Space Threshold: 1.91GB
    RAID Type: raid_dp
    Home Cluster ID: edf0379b-16da-11e6-aa3c-0050568558c2
    Attributes: CFO
                Excluded
                Mroot
Aggregate: aggr_1
    Total Size: 12.61GB
    Used Size: 111.6MB
    Outgoing Size: 0B
    Incoming Size: 0B
    Aggregate Used Space Threshold: 8.83GB
    Aggregate Available Space Threshold: 5.04GB
    RAID Type: raid4
    Home Cluster ID: edf0379b-16da-11e6-aa3c-0050568558c2
    Attributes: Excluded
```

The following example displays information about all entries of the aggregate state, for all aggregates in the cluster.

```
ccluster1::*> autobalance aggregate show-aggregate-state -instance
    Node Name: cluster-1-01
    Name of the Aggregate: aggr0
    Total Size of the Aggregate: 4.78GB
    Used Size of the Aggregate: 4.56GB
    Threshold When Aggregate Is Considered Unbalanced: 3.34GB
    Size of Outgoing Volumes in the Aggregate: 0B
    Size of Incoming Volumes in the Aggregate: 0B
    RAID Type: raid_dp
    Home Cluster ID: edf0379b-16da-11e6-aa3c-0050568558c2
    Aggregate Is a Hybrid: false
    An Incoming Volume Is Thin: false
    Is Balanceable: false
    Aggregate Attributes: CFO
                Excluded
                Mroot
    Threshold When Aggregate Is Considered Balanced: 1.91GB
```

Node Name: cluster-1-01
autobalance aggregate show-unbalanced-volume-state

Display the Auto Balance Aggregate state for a volume

**Availability:** This command is available to cluster administrators at the advanced privilege level.

**Description**
The `autobalance aggregate show-unbalanced-volume-state` command displays information about a volume that is considered by the Auto Balance Aggregate feature.

**Parameters**

```
{-fields <fieldname>, ...}
```
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
{-instance}
```
If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
{-node <nodename>|local} - Node Name
```
If this parameter is specified, the display will be limited to only those volumes with a node that matches the specified value.

```
{-DSID <integer>} - DSID of the Last Volume Queried
```
If this parameter is specified, the display will be limited to only those volumes with a DSID that matches the specified value.

```
{-aggregate <aggregate name>} - Aggregate
```
If this parameter is specified, the display will be limited to only those volumes with an aggregate name that matches the specified value.

```
{-volume-name <text>} - Name of the Volume
```
If this parameter is specified, the display will be limited to only that volume with a name that matches the specified value.

```
{-last-threshold-crossed-time <MM/DD/YYYY HH:MM:SS>} - Last Time Threshold Crossed
```
If this parameter is specified, the display will be limited to only those volumes with a threshold crossing time that matches the specified value.

```
{-last-placed-time <MM/DD/YYYY HH:MM:SS>} - Last Time Volume Was Moved
```
If this parameter is specified, the display will be limited to only those volumes with a last time they have been moved that matches the specified value.

```
{-is-moving {true|false}} - Is Volume Currently Moving
```
If this parameter is specified as true, the display will be limited to only the moving volumes. If the parameter is specified as false, the display will be limited to only the non-moving volumes.
[-is-quiesced {true|false}] - Is Volume Quiesced

If this parameter is specified as true, the display will be limited to only the quiesced volumes. If the parameter is specified as false, the display will be limited to only the non-quiesced volumes.

[-total-footprint (<integer> [KB|MB|GB|TB|PB])] - Total Size of the Volume

If this parameter is specified, the display will be limited to only those volumes with a total footprint that matches the specified value.

[-attributes <text>, ...] - Volume's Attributes

If this parameter is specified, the display will be limited to only those volumes with attributes that matches the specified value.

[-last-checked <MM/DD/YYYY HH:MM:SS>] - Last Time Volume State Was Checked

If this parameter is specified, the display will be limited to only those volumes with a last time their state was checked that matches the specified value.

Examples

The following example display information about all of the unbalanced volumes that the Auto Balance Aggregate feature is aware of.

```
cluster1::*> autobalance aggregate show-unbalanced-volume-state

  Last Checked On: 3/13/2014 14:32:01

  Volume: ro10
  Footprint: 20.20MB
  Last Time Over IOPS Threshold: 3/12/2014 16:20:18
  Last Placed: 3/11/2014 10:16:04
  Attributes: Over IOPS Threshold
              Stabilizing

  Volume: test
  Footprint: 20.20MB
  Last Time Over IOPS Threshold: 3/12/2014 16:20:18
  Last Placed: 3/11/2014 10:16:42
  Attributes: Over IOPS Threshold
              In Mirror
              Stabilizing
```

The following example displays all of the information that the Auto Balance Aggregate feature has collected for all of the unbalanced volumes it is aware of.

```
cluster1::*> autobalance aggregate show-unbalanced-volume-state -instance

  Node Name: cluster-1-01
  DSID of the Last Volume Queried: 1025
  Aggregate: aggr_1
  Name of the Volume: ro10
  Last Time Threshold Crossed: 3/12/2014 16:20:18
  Last Time Volume Was Moved: 3/11/2014 10:16:04
  Is Volume Currently Moving: false
  Is Volume Quiesced: false
  Total Size of the Volume: 20.20MB
  Volume's Attributes: Over IOPS Threshold
                      Stabilizing
  Last Time Volume State Was Checked: 3/13/2014 08:20:18

  Node Name: cluster-1-01
  DSID of the Last Volume Queried: 1026
  Aggregate: aggr_1
  Name of the Volume: test
  Last Time Threshold Crossed: 3/12/2014 16:20:18
  Last Time Volume Was Moved: 3/11/2014 10:16:42
  Is Volume Currently Moving: false
  Is Volume Quiesced: false
  Total Size of the Volume: 20.20MB
  Volume's Attributes: Over IOPS Threshold
```
autobalance aggregate config commands

Auto Balance Aggregate configuration

autobalance aggregate config modify

Modify the Auto Balance Aggregate feature configuration

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

The `autobalance aggregate config modify` command allows the user to customize the parameters that determine when volumes should be considered for automatic move or recommendation by the Auto Balance Aggregate feature.

Parameters

[-is-enabled {true|false}] - Is the Auto Balance Aggregate Feature Enabled

This specifies whether the Auto Balance Aggregate feature is enabled and running.

[-aggregate-unbalanced-threshold-percent <integer>] - Threshold When Aggregate Is Considered Unbalanced (%)

This specifies the space used threshold percentage that will cause the Auto Balance Aggregate feature to consider an aggregate as unbalanced.

[-aggregate-available-threshold-percent <integer>] - Threshold When Aggregate Is Considered Balanced (%)

This specifies the threshold percentage which will determine if an aggregate is a target destination for a move. The Auto Balance Aggregate feature will attempt to move volumes from an unbalanced aggregate until it is under this percentage.

Examples

The following example displays a modification for the default configuration of the Auto Balance Aggregate feature

```
cluster1::*> autobalance aggregate config show
  Is the Auto Balance Aggregate Feature Enabled: false
  Threshold When Aggregate Is Considered Unbalanced (%): 70
  Threshold When Aggregate Is Considered Balanced (%): 40

cluster1::*> autobalance aggregate config modify -is-enabled true

cluster1::*> autobalance aggregate config show
  Is the Auto Balance Aggregate Feature Enabled: true
  Threshold When Aggregate Is Considered Unbalanced (%): 70
  Threshold When Aggregate Is Considered Balanced (%): 40
```

At the diagnostic level, there are additional modifiable parameters.

```
cluster1::*> autobalance aggregate config show
  Is the Auto Balance Aggregate Feature Enabled: false
  Mode of the Auto Balance Aggregate Feature: recommend
  Polling Interval: 3600
  Threshold When Aggregate Is Considered Unbalanced (%): 70
  Threshold When Aggregate Is Considered Balanced (%): 40
  Volume Operations Threshold (IOPS): 100
  Volume Operations Threshold Not Exceeded for Duration: 24
  Volume Not Moved Again for Duration: 48
```
autobalance aggregate config show

Display the Auto Balance Aggregate feature configuration

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**
The `autobalance aggregate config show` command displays information about parameters that determine when volumes should be considered for automatic move or recommendation by the Auto Balance Aggregate feature.

**Examples**
The following example displays the default configuration for the Auto Balance Aggregate feature

```bash
cluster1::*> autobalance aggregate config show

  Is the Auto Balance Aggregate Feature Enabled: false
  Mode of the Auto Balance Aggregate Feature: auto
  Polling Interval: 4000
  Threshold When Aggregate Is Considered Unbalanced (%): 70
  Threshold When Aggregate Is Considered Balanced (%): 40
```

At the diagnostic level, the output displays the information below.

```bash
cluster1::*> autobalance aggregate config show

  Is the Auto Balance Aggregate Feature Enabled: false
  Mode of the Auto Balance Aggregate Feature: recommend
  Polling Interval: 3600
  Threshold When Aggregate Is Considered Unbalanced (%): 70
  Threshold When Aggregate Is Considered Balanced (%): 40
```

**autobalance volume commands**

The volume directory

**autobalance volume rebalance commands**

Rebalance Infinite Volume capacity across the cluster after files are created.

**autobalance volume rebalance show**

Display Auto Balance Volume progress for an Infinite Volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.
Description
The `autobalance volume rebalance show` command displays information about Auto Balance Volume operations for an Infinite Volume. The command output depends on the parameter or parameters specified with the command. The `autobalance volume rebalance show` command is only supported for Infinite Volumes.

Parameters

{ 

<table>
<thead>
<tr>
<th>[-fields &lt;fieldname&gt;, ...]</th>
</tr>
</thead>
<tbody>
<tr>
<td>This specifies the fields that need to be displayed.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>[-instance]</th>
</tr>
</thead>
<tbody>
<tr>
<td>If this parameter is specified, the command displays information about all entries.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>[-vserver &lt;vserver name&gt;] - Vserver</th>
</tr>
</thead>
<tbody>
<tr>
<td>If this parameter is specified, the command displays information about capacity balancing for each Infinite Volume and storage service on the specified Vserver.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>[-volume &lt;volume name&gt;] - Volume Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>If this parameter is specified, the command displays information about capacity balancing for each storage service on the specified Infinite Volume.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>[-storage-service &lt;storage service name&gt;] - Storage Service</th>
</tr>
</thead>
<tbody>
<tr>
<td>If this parameter is specified, the command displays information about capacity balancing for the specified storage-service.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>[-state &lt;Auto Balance Volume state&gt;] - State</th>
</tr>
</thead>
<tbody>
<tr>
<td>If this parameter is specified, the command displays information about operations in the specified state.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>[-progress &lt;text&gt;] - Progress</th>
</tr>
</thead>
<tbody>
<tr>
<td>If this parameter is specified, the command displays information about operations with the specified progress.</td>
</tr>
</tbody>
</table>

| [-transferred {<integer> [KB|MB|GB|TB|PB]}] - Amount Transferred |
|---------------------------------------------------------------|
| If this parameter is specified, the command displays information about operations with the specified amount already transferred. |

| [-target {<integer> [KB|MB|GB|TB|PB]}] - Target Amount |
|----------------------------------------------------------|
| If this parameter is specified, the command displays information about operations with the specified target amount of data to transfer. |

<table>
<thead>
<tr>
<th>[-transferred-percent &lt;percent_no_limit&gt;] - Percentage Transferred</th>
</tr>
</thead>
<tbody>
<tr>
<td>If this parameter is specified, the command displays information about operations with the specified percentage of the transfer complete.</td>
</tr>
</tbody>
</table>

Examples

The following example displays information about all operations on the Vserver named vs0:

```bash
cluster1:*> autobalance volume rebalance show -vserver vs1

  Vserver | Volume   | Storage Service | State  | Target     | Percent Transferred |
----------|----------|-----------------|--------|------------|---------------------|
 vs0      | repo_vol | -               | running| 36.44TB    | 8%                  |
```

The following example displays information about all operations on the `gold` storage service on the Infinite Volume named `repo_vol` on the Vserver named vs1:
**autobalance volume rebalance start**

Start Auto Balance Volume for an Infinite Volume

**Availability:** This command is available to cluster and Vserver administrators at the advanced privilege level.

**Description**
The `autobalance volume rebalance start` command allows the user to start Auto Balance Volume and rebalance the used data capacity in an Infinite Volume after files are created. Auto Balance Volume moves data between data constituents of an Infinite Volume. If the Infinite Volume uses storage services, Auto Balance Volume moves data between data constituents of a storage service in an Infinite Volume. Auto Balance Volume ensures that all data constituents in an Infinite Volume or all data constituents in a storage service of an Infinite Volume have similar amounts of used data capacity. The `autobalance volume rebalance start` command is only supported for Infinite Volumes.

**Parameters**

- `-vserver <vserver name>` - Vserver
  
  This specifies the Vserver on which the Infinite Volume to be rebalanced is located.

- `-volume <volume name>` - Volume Name
  
  This specifies the Infinite Volume to be rebalanced.

- `-storage-service <storage service name>` - Storage Service
  
  If the Infinite Volume uses storage services, the `storage-service` parameter is required to specify the storage service to be rebalanced. If the Infinite Volume does not use storage services, the `storage-service` parameter cannot be specified, and the entire Infinite Volume will be rebalanced.

  `[<-timeout <integer>]` - Requisition Timeout (seconds)

  The maximum number of seconds Auto Balance Volume will permit an operation to continue without moving files, before moving the operation to the complete state.

**Examples**
The following example starts rebalancing used capacity in the gold storage service for an Infinite Volume named vol:

```
cluster1::*> autobalance volume rebalance start
  -vserver vs0 -volume vol -storage-service gold
```

The following example starts rebalancing used capacity in an Infinite Volume named vol:

```
cluster1::*> autobalance volume rebalance start
  -vserver vs1 -volume vol
```

**autobalance volume rebalance stop**

Stop Auto Balance Volume for an Infinite Volume

**Availability:** This command is available to cluster and Vserver administrators at the advanced privilege level.
Description
The `autobalance volume rebalance stop` command allows the user to stop Auto Balance Volume. The `autobalance volume rebalance stop` command is only supported for Infinite Volumes.

Parameters
```
-vserver <vserver name> - Vserver
  This specifies the Vserver on which the Infinite Volume being rebalanced is located.
-volume <volume name> - Volume Name
  This specifies the Infinite Volume being rebalanced.
-storage-service <storage service name> - Storage Service
  If the Infinite Volume being rebalanced uses storage services, the `storage-service` parameter is required to specify the storage service being rebalanced. If the Infinite Volume being rebalanced does not use storage services, the `storage-service` parameter cannot be specified because the entire Infinite Volume is being rebalanced.
```

Examples
The following example stops rebalancing used capacity for the gold storage service for an Infinite Volume named vol:
```
cluster1::*> autobalance volume rebalance stop
  -vserver vs0 -volume vol -storage-service gold
```
The following example stops rebalancing used capacity for an Infinite Volume named vol:
```
cluster1::*> autobalance volume rebalance stop
  -vserver vs1 -volume vol
```

Cluster Commands

Manage clusters
The `cluster` commands enable you to create and manage Data ONTAP 8 clusters.

`cluster add-node`

Expand the cluster by discovering and adding new nodes

Availability: This command is available to `cluster` administrators at the `admin` privilege level.

Description
The `cluster add-node` command discovers and adds new nodes to the cluster. When the `-node-count` parameter is specified, the command attempts to add that many nodes to the cluster. The `-node-ip` parameter can be specified to directly add a node.

The `system node show-discovered` command displays all the nodes discovered on the local network.

Parameters
```
{ -node-count <integer> - Number of Nodes Being Added
  Number of nodes to be added to the cluster. If fewer nodes are discovered, all the discovered nodes are added to the cluster and the command will fail since there are fewer nodes than specified. If more nodes are found
```
than the number specified, the command will fail because there is no way to determine which nodes you intend to add to the cluster.

**Note:** The `-node-count` parameter is supported on non-shared architecture platforms only.

<table>
<thead>
<tr>
<th><code>-node-ip &lt;IP Address&gt;</code></th>
<th>Cluster IP Address of Node</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cluster IP address of the node to add. When this parameter is provided, the command directly adds the node.</td>
<td></td>
</tr>
</tbody>
</table>

| `-foreground {true|false}` | Foreground Process |
|-----------------------------|--------------------|
| When set to `false` the command runs in the background as a job. The default is `true`, which causes the command to return after the operation completes. |

<table>
<thead>
<tr>
<th><code>-allow-mixed-version-join [true]</code></th>
<th>Allow a node at a different version to join Cluster</th>
</tr>
</thead>
<tbody>
<tr>
<td>This parameter allows nodes with different, but compatible versions of Data ONTAP to be added to the cluster. A Data ONTAP best practice is to add nodes to the cluster that are of the same Data ONTAP version as the nodes in the cluster, but that may not always be possible.</td>
<td></td>
</tr>
</tbody>
</table>

### Examples

The following example adds a node using `-node-ip`:

```bash
cluster1::> cluster add-node -node-ip 192.168.1.5
```

The following example adds 3 nodes using `-node-count`:

```bash
cluster1::> cluster add-node -node-count 3
```

### Related references

- `system node show-discovered` on page 1193
- `cluster create` on page 35

### cluster create

Create a cluster

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**

The `cluster create` command creates a cluster with one node. Once you create the cluster, add additional nodes to the cluster by using the `cluster join` command.

Note that single-node clusters do not require configuring the cluster network. A cluster network interface must be configured before other nodes can join the cluster.

**Parameters**

<table>
<thead>
<tr>
<th><code>-license &lt;License Code V2&gt;</code></th>
<th>(DEPRECATED)-Base License</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use this optional parameter to specify the base license for the cluster. Obtain this value from your sales or support representative.</td>
<td></td>
</tr>
</tbody>
</table>

*Note: This parameter is deprecated and may be removed in a future release of Data ONTAP.*
-clustername <text> - Cluster Name

Use this parameter to specify the name of the cluster you are creating.

- The name must contain only the following characters: A-Z, a-z, 0-9, "," or ".".
- The first character must be one of the following characters: A-Z or a-z.
- The last character must be one of the following characters: A-Z, a-z or 0-9.
- The maximum supported length is 44 characters.
- The system reserves the following names: "all", "cluster", "local" and "localhost".

[-node-count <integer>] - Node Count

Use this parameter to specify the number of nodes in the cluster you are creating.

- -node-count parameter is supported on non-shared architecture platforms only.

Examples

The following example creates a cluster named cluster1

```
cluster1::> cluster create -clustername cluster1
```

The following example creates a cluster named cluster1 with node-count 4 on a non-shared architecture platform.

```
cluster1::> cluster create -clustername cluster1 -node-count 4
```

cluster join on page 36

cluster join

(DEPRECATED)-Join an existing cluster using the specified member's IP address or by cluster name

Availability: This command is available to cluster administrators at the admin privilege level.

Description

Note: This command is deprecated and may be removed in a future release of Data ONTAP. Use cluster add-node from a node in the cluster instead.

The cluster join command adds a node to an existing cluster. Use the cluster create command to create a cluster if one does not already exist.

Note that a cluster network interface must be configured for the cluster before other nodes can join the cluster.

Parameters

{-clusteripaddr <IP Address> - IP Address of a Cluster Interface from a Node in the Cluster

Use this parameter to specify the IP address of a cluster interface. This must be the IP address of a cluster interface of a node that is already in the cluster. This parameter is mutually exclusive with the -cluster-name parameter.
<table>
<thead>
<tr>
<th>-cluster-name &lt;text&gt;</th>
<th>Cluster Name of the Cluster to Join</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Deprecated. Use this parameter to specify the name of an existing cluster to join.</td>
</tr>
<tr>
<td>[-allow-mixed-version-join [true]]</td>
<td>Allow a node at a different version to join Cluster</td>
</tr>
<tr>
<td></td>
<td>This parameter allows nodes with different, but compatible versions of Data ONTAP to join the cluster. A Data ONTAP best practice is to join nodes to the cluster that are of the same Data ONTAP version as the nodes in the cluster, but that may not always be possible.</td>
</tr>
</tbody>
</table>

Examples

The following example joins the local node to a cluster. The IP address 192.0.2.66 is the address of a cluster interface of a node that already belongs to the cluster.

```
node::> cluster join -clusteripaddr 192.0.2.66
```

cluster modify

Modify cluster node membership attributes

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

The cluster modify command modifies the cluster attributes of a node, including its eligibility to participate in the cluster.

At the advanced privilege level, you can use the command to specify whether a node holds epsilon. Epsilon is an extra fractional vote that enables quorum to form using slightly weaker requirements. For example, two out of four eligible nodes are sufficient to form quorum if one of those two nodes holds epsilon.

Parameters

- **-node {<nodename>|local}** - Node
  
  Use this parameter to specify the name of the node to modify. If you do not specify a node, the command runs on the local node.

- **[-epsilon {true|false}]** - Epsilon
  
  Use this parameter with the value true to specify that the node holds Epsilon in the cluster. Use this parameter with the value false to specify that the node does not hold Epsilon in the cluster. In a cluster, only one node can be designated as Epsilon at any given time. You can designate a node as Epsilon to add weight to its voting in a cluster with an even number of nodes.

- **[-eligibility {true|false}]** - Eligibility
  
  Use this parameter with the value true to specify that the node is eligible to participate in the cluster. Use this parameter with the value false to specify that the node is not eligible to participate in the cluster.

  If you modify a node as ineligible to participate in the cluster, the command prompts you for confirmation before it runs.

- **[-skip-quorum-check-before-ineligible [true]]** - Skip Quorum Check Before Setting Node Ineligible
  
  If this parameter is specified, quorum checks will be skipped prior to setting a node ineligible. When setting a node to ineligible, the operation will continue even if there is a possible data outage due to a quorum issue.
Examples
This example modifies a node to make it eligible to participate in the cluster.

```
cluster1::*> cluster modify -node node3 -eligibility true
```

The following example removes epsilon from the node named node0 and adds it to the node named node1:

```
cluster1::*> cluster modify -node node0 -epsilon false
cluster1::*> cluster modify -node node1 -epsilon true
```

---

**cluster ping-cluster**

Ping remote cluster interfaces and perform RPC server check

**Availability:** This command is available to `cluster` administrators at the *advanced* privilege level.

**Description**
The `cluster ping-cluster` command probes network connectivity to remote cluster interfaces, and performs an RPC server check.

**Parameters**
- **-node `<nodename>`** - Node
  Use this parameter to send the ping from the node you specify.

- **[-use-sitelist {true|false}]** - Use Sitelist for Cluster Interfaces
  Use this parameter with the value `true` to specify that the command use the sitelist to determine any incomplete cluster IP information. Use this parameter with the value `false` to specify that the command not use the sitelist.

- **[-skip-rpccheck {true|false}]** - Skip RPC Server Check
  Use this parameter with the value `true` to specify that the command not perform the rpcinfo check of remote hosts. Use this parameter with the value `false` to specify that the command perform the rpcinfo check. The rpcinfo check checks the status of the RPC servers on the remote hosts. By default, the rpcinfo check runs on the program number of the portmapper. Use the `-rpc-prognum` parameter to override this default.

- **[-rpc-prognum `<integer>`]** - RPC Server to Check
  Use this parameter to override default behavior and run the rpcinfo check on the program number you specify. By default, the rpcinfo check runs on the program number of the portmapper.

---

**Examples**
The following example shows typical output for this command.

```
cluster1::*> cluster ping-cluster -node node1
Host is node1
Getting addresses from network interface table...
Local = 10.254.231.102  10.254.91.42
Remote = 10.254.42.25    10.254.16.228
Ping status:
....
Basic connectivity succeeds on 4 path(s)
Basic connectivity fails on 0 path(s)
................
Detected 1500 byte MTU on 4 path(s):
  Local 10.254.231.102 to Remote 10.254.16.228
  Local 10.254.231.102 to Remote 10.254.42.25
  Local 10.254.91.42 to Remote 10.254.16.228
  Local 10.254.91.42 to Remote 10.254.42.25
```
cluster setup

Setup wizard

Available: This command is available to cluster administrators at the admin privilege level.

Description

Note: Use of this command to join a node to an existing cluster is deprecated and might be removed in a future release of Data ONTAP. From a node in the cluster use the system node show-discovered command and then use the cluster add-node command.

The cluster setup command runs the cluster setup wizard, which can be used to either create a cluster or join a node to an existing cluster. When you run the cluster setup wizard, enter the appropriate information at the prompts. You will be asked to provide the following information to create a cluster:

• Node management interface port, IP address, netmask, default gateway
• Cluster name
• Cluster base license key
  Note: This parameter has been deprecated. It may be removed from a future release of Data ONTAP.
• Feature license keys
• Cluster administrator's password
• Cluster management interface port, IP address, netmask, default gateway
• DNS domain names
• Name server IP addresses
• Location

You will be asked to provide the following information to join a cluster:

• Node management interface port, IP address, netmask, default gateway
• Cluster IP address

The cluster management interface is used for managing the cluster. It provides one IP address to manage the cluster and will fail over to another node, if necessary. This is the preferred IP address for managing the cluster, but you can also manage the cluster by logging in to the node management IP address of a node in the cluster. Since the cluster management interface must be able to fail over, the port role for the interface must be "data" and typically the best choice for an IP address is one on the data network. The node management interface will not fail over, so an IP address on the management network and a port with the role "node management" is the best choice. Alternatively, you can assign an IP address on the data network to the cluster management interface - if that is better in your network topology - but the port must be a data port. The two examples below illustrate the cluster create and cluster join operations, respectively.

Examples

The following example shows the create option of cluster setup.
Welcome to the cluster setup wizard.

You can enter the following commands at any time:
"help" or "?" - if you want to have a question clarified,
"back" - if you want to change previously answered questions, and
"exit" or "quit" - if you want to quit the cluster setup wizard.
Any changes you made before quitting will be saved.

You can return to cluster setup at any time by typing "cluster setup".
To accept a default or omit a question, do not enter a value.

This system will send event messages and periodic reports to NetApp Technical Support. To disable this feature, enter autosupport modify -support disable within 24 hours.

Enabling AutoSupport can significantly speed problem determination and resolution should a problem occur on your system.
For further information on AutoSupport, see:
http://support.netapp.com/autosupport/

Type yes to confirm and continue {yes}: yes

Enter the node management interface port [e0c]:
Enter the node management interface IP address: 192.0.2.66
Enter the node management interface netmask: 255.255.255.192
Enter the node management interface default gateway: 192.0.2.1
The node management interface has been modified to use port e0c with IP address 192.0.2.66.
Use your web browser to complete cluster setup by accessing https://192.0.2.66

Otherwise, press Enter to complete cluster setup using the command line interface:

Do you want to create a new cluster or join an existing cluster? {create, join}: create

Do you intend for this node to be used as a single node cluster? {yes, no} [no]:

Existing cluster interface configuration found:

<table>
<thead>
<tr>
<th>Port</th>
<th>MTU</th>
<th>IP Address</th>
<th>Netmask</th>
</tr>
</thead>
<tbody>
<tr>
<td>e0a</td>
<td>9000</td>
<td>169.254.21.189</td>
<td>255.255.0.0</td>
</tr>
<tr>
<td>e0b</td>
<td>9000</td>
<td>169.254.29.73</td>
<td>255.255.0.0</td>
</tr>
</tbody>
</table>

Do you want to use this configuration? {yes, no} [yes]:

Enter the cluster administrator's (username "admin") password:
Retype the password:

Step 1 of 5: Create a Cluster
You can type "back", "exit", or "help" at any question.

Enter the cluster name: cluster1
Creating cluster1
Starting cluster support services .
Cluster cluster1 has been created.

Step 2 of 5: Add Feature License Keys
You can type "back", "exit", or "help" at any question.

Enter an additional license key []:

Step 3 of 5: Set Up a Vserver for Cluster Administration
You can type "back", "exit", or "help" at any question.
Enter the cluster management interface port [e0d]:
Enter the cluster management interface IP address: 192.0.2.60
Enter the cluster management interface netmask: 255.255.255.192
Enter the cluster management interface default gateway [192.0.2.1]:

A cluster management interface on port e0d with IP address 192.0.2.60 has been created. You can use this address to connect to and manage the cluster.

Enter the DNS domain names: data.example.com
Enter the name server IP addresses: 192.0.2.147
DNS lookup for the admin Vserver will use the data.example.com domain.

Step 4 of 5: Configure Storage Failover (SFO)
You can type "back", "exit", or "help" at any question.
SFO is licensed.
SFO will be enabled when the partner joins the cluster.

Step 5 of 5: Set Up the Node
You can type "back", "exit", or "help" at any question.

Where is the controller located []: Sunnyvale

Cluster "cluster1" has been created.

To complete cluster setup, you must join each additional node to the cluster by running "system node show-discovered" and "cluster add-node" from a node in the cluster.

To complete system configuration, you can use either OnCommand System Manager or the Data ONTAP command-line interface.

To access OnCommand System Manager, point your web browser to the cluster management IP address (https://192.0.2.60).
To access the command-line interface, connect to the cluster management IP address (for example, ssh admin@192.0.2.60).

cluster1::>

An example of using cluster setup to join a cluster is shown below.

node::> cluster setup

Welcome to the cluster setup wizard.

You can enter the following commands at any time:
"help" or "?" - if you want to have a question clarified,
"back" - if you want to change previously answered questions, and
"exit" or "quit" - if you want to quit the cluster setup wizard.
Any changes you made before quitting will be saved.

You can return to cluster setup at any time by typing "cluster setup".
To accept a default or omit a question, do not enter a value.

This system will send event messages and periodic reports to NetApp Technical Support. To disable this feature, enter autosupport modify -support disable within 24 hours.

Enabling AutoSupport can significantly speed problem determination and resolution should a problem occur on your system.
For further information on AutoSupport, see:
http://support.netapp.com/autosupport/

Type yes to confirm and continue {yes}: yes
Enter the node management interface port [e0c]:
Enter the node management interface IP address: 192.0.2.67
Enter the node management interface netmask: 255.255.255.192
Enter the node management interface default gateway: 192.0.2.1
A node management interface on port e0c with IP address 192.0.2.67 has been created.

Use your web browser to complete cluster setup by accessing
https://192.0.2.67

Otherwise, press Enter to complete cluster setup using the command line
interface:

Do you want to create a new cluster or join an existing cluster? {create, join}:
join

Existing cluster interface configuration found:

<table>
<thead>
<tr>
<th>Port</th>
<th>MTU</th>
<th>IP</th>
<th>Netmask</th>
</tr>
</thead>
<tbody>
<tr>
<td>e0a</td>
<td>9000</td>
<td>169.254.31.170</td>
<td>255.255.0.0</td>
</tr>
<tr>
<td>e0b</td>
<td>9000</td>
<td>169.254.115.61</td>
<td>255.255.0.0</td>
</tr>
</tbody>
</table>

Do you want to use this configuration? {yes, no} [yes]:

Step 1 of 3: Join an Existing Cluster
You can type "back", "exit", or "help" at any question.

Enter the IP address of an interface on the private cluster network from the
cluster you want to join: 169.254.115.8

Joining cluster at address 169.254.115.8

This node has joined the cluster cluster1.

Step 2 of 3: Configure Storage Failover (SFO)
You can type "back", "exit", or "help" at any question.

SFO is licensed.
SFO will be enabled when the partner joins the cluster.

Step 3 of 3: Set Up the Node
You can type "back", "exit", or "help" at any question.

This node has been joined to cluster "cluster1".

To complete cluster setup, you must join each additional node to the cluster
by running "system node show-discovered" and "cluster add-node" from a node in the cluster.

To complete system configuration, you can use either OnCommand System Manager
or the Data ONTAP command-line interface.

To access OnCommand System Manager, point your web browser to the cluster
management IP address (https://192.0.2.60).

To access the command-line interface, connect to the cluster management
IP address (for example, ssh admin@192.0.2.60).

cluster1:~>

cluster show

Display cluster node members

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The cluster show command displays information about the nodes in a cluster.

Parameters

[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-node <nodename>|local] - Node
Selects the nodes that match this parameter value.

[-node-uuid <UUID>] - UUID (privilege: advanced)
Selects the nodes that match this parameter value.

[-epsilon {true|false}] - Epsilon (privilege: advanced)
Selects the nodes that match this parameter value. In a cluster, only one node can be designated as Epsilon at any given time. You can designate a node as Epsilon to add weight to its voting in a cluster with an even number of nodes.

[-eligibility {true|false}] - Eligibility
Selects the nodes that match this parameter value (true means eligible to participate in the cluster).

[-health {true|false}] - Health
Selects the nodes that match this parameter value (true means online).

Examples
The following example displays information about all nodes in the cluster:

```
cluster1::> cluster show
          Node             Health  Eligibility
    -----------------      -------  ------------
    node0             true     true
    node1             true     true
    node2             true     true
    node3             true     true
```

The following example displays information about the node named node1:

```
cluster1::> cluster show -node node1
          Node: node1
          Eligibility: true
          Health: true
```
cluster unjoin

Unjoin or remove a node from the cluster

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The cluster unjoin command removes a node from a cluster.

Before you can remove a node from a cluster, you must shut down all of the node's shared resources, such as virtual interfaces to clients. If any of a node's shared resources are still active, the command fails. The failure message will display which active resources must be shut down before the node can be removed from the cluster.

Parameters
-node <nodename> - Node to unjoin
   Use this parameter to specify the name of the node to remove from the cluster.

[-skip-quorum-check-before-unjoin [true]] - Skip Quorum Check Before Unjoin
   If this parameter is specified, quorum checks will be skipped prior to the unjoin. The operation will continue even if there is a possible data outage due to a quorum issue.

[-skip-last-low-version-node-check [true]] - Skip the check that prevents unjoining the last low versioned node
   This parameter allows the node with lowest version of Data ONTAP to be unjoined from the cluster.

Examples
The following example shows how to remove the node named node4 from the cluster.

```
cluster1:~> cluster unjoin -node node4
```

The following example forcibly unjoins the node from the cluster:

```
cluster1:~> cluster unjoin -node node4 -force
```

cluster contact-info commands

Manage contact information for the cluster.

cluster contact-info modify

Modify contact information for the cluster

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The cluster contact-info modify command modifies contact information for the cluster administrators. If any values contain spaces, you must enclose those values in quotes.

Use the cluster contact-info show command to display contact information for the cluster administrators.
Parameters

[-primary-name <text>] - Name of Primary Contact
   Use this parameter to specify the name of the primary contact.

[-primary-phone <text>] - Phone Number of Primary Contact
   Use this parameter to specify the phone number of the primary contact.

[-primary-alt-phone <text>] - Alternate Phone Number of Primary Contact
   Use this parameter to specify the alternate phone number of the primary contact.

[-primary-email <text>] - Email Address or User ID of Primary Contact
   Use this parameter to specify the email address of the primary contact.

[-secondary-name <text>] - Name of Secondary Contact
   Use this parameter to specify the name of the secondary contact.

[-secondary-phone <text>] - Phone Number of Secondary Contact
   Use this parameter to specify the phone number of the secondary contact.

[-secondary-alt-phone <text>] - Alternate Phone Number of Secondary Contact
   Use this parameter to specify the alternate phone number of the secondary contact.

[-secondary-email <text>] - Email Address or User ID of Secondary Contact
   Use this parameter to specify the email address of the secondary contact.

[-business-name <text>] - Business Name
   Use this parameter to specify the name of the business responsible for this cluster.

[-address <text>] - Business Address
   Use this parameter to specify the street address of the business responsible for this cluster.

[-city <text>] - City Where Business Resides
   Use this parameter to specify the name of the city in which the business is located.

[-state <text>] - State Where Business Resides
   Use this parameter to specify the name of the state or province in which the business is located.

   Use this parameter to specify the 2-character country code of the country in which the business is located.

[-zip-code <text>] - Postal Code Where Business Resides
   Use this parameter to specify the postal or ZIP code area in which the business is located.

Examples

The following example changes the name and phone numbers of the secondary contact person for the cluster.

```
cluster1:/> cluster contact-info modify -secondary-name "John Doe" -secondary-phone 123.555.0156 -secondary-alt-phone 123.555.0178
```

The following example changes the mailing address of the business responsible for the cluster.

```
cluster1:/> cluster contact-info modify -address "123 Example Avenue" -city Exampleville -state "New Example" -zip-code 99999 -country US
```

Related references

**cluster contact-info show**

Display contact information for the cluster

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The `cluster contact-info show` command displays contact information for the cluster administrators.

**Examples**

The following example shows example output for this command.

```
cluster1::> cluster contact-info show

Name of Primary Contact : Richard Roe
Phone Number of Primary Contact : 123.555.0123
Alternate Phone Number of Primary Contact : 123.555.0145
Email Address or User Id of Primary Contact : roe@example.com
Name of Secondary Contact : John Doe
Phone Number of Secondary Contact : 123.555.0167
Alternate Phone Number of Secondary Contact : 123.555.0189
Email Address or User Id of Secondary Contact : doe@example.com
Business Name : Example Dot Com
Business Address : 123 Example Avenue
City Where Business Resides : Exampleville
State Where Business Resides : New Example
2-Character Country Code : US
Postal Code Where Business Resides : 99999
```

**cluster date commands**

Manage cluster's date and time setting

**cluster date modify**

Modify the current date and time for the nodes in the cluster

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The `cluster date modify` command sets the time zone, date, and time on every node in the cluster.

**Parameters**

[-timezone `<Area/Location Timezone>`] - Time Zone  
This parameter sets the timezone, specified in the Olson format.

[-date `{MM/DD/YYYY HH:MM:SS [+(|-)hh:mm]}`] - Date and Time  
This parameter sets the date and time, in the format MM/DD/YYYY HH:MM:SS.

This parameter sets the date and time information, in the format `[[[[cc][yy][mm]dd]hhmm[.ss]]].` The argument for setting the date and time is interpreted as follows:

- cc First 2 digits of the year (e.g., 20 for 2011).
- yy Last 2 digits of year (e.g., 10 for 2010).
- mm Numeric month, a number from 01 to 12.
• dd Day, a number from 01 to 31.
• hh Hour, a number from 00 to 23.
• mm Minute, a number from 00 to 59.
• ss Second, a number from 00 to 59.

If the first two digits of the year are omitted, and the last two digits are greater than 68, a date in the 1900s is used. Otherwise, a date in the 2000s is used. If all four digits of the year are omitted, the default is the current year. If the month or day is omitted, the default is the current month or day, respectively. If the seconds are omitted, the default is set to 00. The system automatically handles the time changes for Daylight Saving and Standard time, and for leap seconds and years.

This parameter sets the date and time information in Coordinated Universal Time (UTC), in the format [[[cc]yy]mm]dd]hhmm[ss]. -u is an alias for -utcdateandtime. The argument for setting the date and time is interpreted as follows:
• cc First 2 digits of the year (e.g., 20 for 2011).
• yy Last 2 digits of year (e.g., 10 for 2010).
• mm Numeric month, a number from 01 to 12.
• dd Day, a number from 01 to 31.
• hh Hour, a number from 00 to 23.
• mm Minute, a number from 00 to 59.
• ss Second, a number from 00 to 59.

If the first two digits of the year are omitted, and the last two digits are greater than 68, a date in the 1900s is used. Otherwise, a date in the 2000s is used. If all four digits of the year are omitted, the default is the current year. If the month or day is omitted, the default is the current month or day, respectively. If the seconds are omitted, the default is set to 00. Time changes for Daylight Saving and Standard time, and for leap seconds and years, are handled automatically.

Examples
The following example sets the date and time to January 1 2011, at 1:00 a.m.:

```
cluster1::> cluster date modify -date "01/01/2011 01:00:00"
```

The following example sets the date and time in the UTC format to May 22, 2011, at 09:25:00 a.m.:

```
cluster1::> cluster date modify -u 201105220925.00.
```

center> cluster date show
Display the current date and time for the nodes in the cluster

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The cluster date show command displays the time zone, date, and time settings for one or more nodes in the cluster. By default, the command displays date and time settings for all nodes in the cluster.
Parameters
{[-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

| [-utc ] |

Displays date and time information in Coordinated Universal Time (UTC).

| [-utcdate ] |

Displays date and time information in UTC.

| [-instance ] |

If you specify the `-instance` parameter, the command displays detailed information about all fields.

|-node (<nodename>|local)] - Node

Selects the nodes that match this parameter value.

|-timezone <Area/Location Timezone>] - Time Zone

Selects the nodes that match this parameter value (specified in the Olson format).

| [-date (MM/DD/YYYY HH:MM:SS [({+|-}hh:mm}]) ] - Date and Time |

Selects the nodes that match this parameter value.

| [-utc-date <MM/DD/YYYY HH:MM:SS>] - UTC Date and Time |

Selects the nodes that match this parameter value.

|-dateandtime <{[[[cc]yy]mm]dd}hhmm{.ss}> ] - Date and Time

Selects the nodes that match this parameter value (interpreted as follows):

- cc First 2 digits of the year (e.g., 20 for 2011).
- yy Last 2 digits of year (e.g., 11 for 2011).
- mm Numeric month, a number from 01 to 12.
- dd Day, a number from 01 to 31.
- hh Hour, a number from 00 to 23.
- mm Minute, a number from 00 to 59.
- ss Second, a number from 00 to 59.

| [-utcdateandtime | -u <{[[[cc]yy]mm]dd}hhmm{.ss}> ] - UTC Date and Time |

-u is used as an alias for -utcdateandtime. Selects the nodes that match this parameter value (interpreted as follows):

- cc First 2 digits of the year (e.g., 20 for 2011).
- yy Last 2 digits of year (e.g., 11 for 2011).
- mm Numeric month, a number from 01 to 12.
- dd Day, a number from 01 to 31.
- hh Hour, a number from 00 to 23.
- mm Minute, a number from 00 to 59.
- ss Second, a number from 00 to 59.
Examples
The following example displays the date and time settings for all nodes in the cluster:

```
cluster1::> cluster date show
+--------+-------------------+------------------+
<table>
<thead>
<tr>
<th>Node</th>
<th>Date</th>
<th>Timezone</th>
</tr>
</thead>
<tbody>
<tr>
<td>node0</td>
<td>10/06/2011 09:35:15</td>
<td>America/New_York</td>
</tr>
<tr>
<td>node1</td>
<td>10/06/2011 09:35:15</td>
<td>America/New_York</td>
</tr>
<tr>
<td>node2</td>
<td>10/06/2011 09:35:15</td>
<td>America/New_York</td>
</tr>
<tr>
<td>node3</td>
<td>10/06/2011 09:35:15</td>
<td>America/New_York</td>
</tr>
<tr>
<td>-------</td>
<td>-------------------</td>
<td>------------------</td>
</tr>
</tbody>
</table>
```

Manage the timezone zoneinfo files.
The zoneinfo directory

Manage the timezone zoneinfo files.

**cluster date zoneinfo load-from-uri**

Load timezone zoneinfo data

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The *cluster date zoneinfo load-from-uri* command loads a new set of timezone zoneinfo data to replace the version installed in the cluster. Releases of Data ONTAP software contain the timezone data that is current at the time of release. If a change is made to the timezone between Data ONTAP releases, then an update can be made to the release data. For instance, if a change is made to when daylight saving time is observed for a country then an update to cluster zoneinfo data may be required.

Only zoneinfo files provided by NetApp for use in Data ONTAP should be used with this command.

To update the zoneinfo database do the following:

- Download the required zoneinfo file from the NetApp support website.
- Place the file on a local web server accessible without password from the cluster.
- Execute the *cluster date zoneinfo load-from-uri* command, passing the Universal Resource Identifier (URI) of the file as parameter.

**Note:** The command need only be executed once for the cluster. The data will be distributed to each node of the cluster.

**Parameters**

- `-uri` *(ftp|http)://(hostname|IPv4 Address|'IPv6 Address')...* - URI of Timezone Zoneinfo Data

URI of the new zoneinfo file.

Examples
The following example loads a new version of the timezone zoneinfo database to the cluster:

```
cluster1::> cluster date zoneinfo load-from-uri http://www.example.com/ontap_zoneinfo.zip
```

Related references

- *cluster date zoneinfo show* on page 50
cluster date zoneinfo show

Display cluster timezone zoneinfo information

Availability: This command is available to cluster administrators at the admin privilege level.

Description
Display information about the current timezone zoneinfo data.

Examples
The following example shows the zoneinfo information for a cluster:

```bash
cluster1::> cluster date zoneinfo show
Cluster Zoneinfo Version: 2016f
```

cluster ha commands

Manage high-availability configuration

cluster ha modify

Modify high-availability configuration of cluster management services

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The `cluster ha modify` command enables or disables cluster high availability in a two-node cluster. Enable high availability when performing some procedures, such as replacing hardware.

Note: This command is required to enable high availability if the cluster only has two nodes. Do not run this command in a cluster that has three or more nodes.

Note: Cluster high availability for two-node clusters differs from the storage failover technology used between two nodes for storage high availability.

Parameters

[-configured (true|false)] - HA Configured
Use this parameter with the value `true` to enable high availability mode in the cluster. Use this parameter with the value `false` to disable high availability mode in the cluster.

Examples
The following example enables cluster high availability in a cluster.

```bash
cluster1::> cluster ha modify -configured true
```

cluster ha show

Show high-availability configuration status for the cluster

Availability: This command is available to cluster administrators at the admin privilege level.
The `cluster ha show` command displays the high-availability status of the cluster. Cluster high-availability mode applies only to two-node clusters.

**Examples**

The following example displays the high-availability status for a two-node cluster:

```bash
cluster1::> cluster ha show
High Availability Configured: true
```

### cluster identity commands

Manage the cluster's attributes, including name and serial number

#### cluster identity modify

Modify the cluster's attributes

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**

The `cluster identity modify` command changes a cluster's identity information.

**Parameters**

- `-name <Cluster name>` - Cluster Name
  
  Use this parameter to specify a new name for the cluster.
  
  - The name must contain only the following characters: A-Z, a-z, 0-9, "," or ".".
  - The first character must be one of the following characters: A-Z or a-z.
  - The last character must be one of the following characters: A-Z, a-z or 0-9.
  - The maximum supported length is 44 characters.
  - The system reserves the following names: "all", "cluster", "local" and "localhost".

- `-location <text>` - Cluster Location
  
  Use this parameter to specify the physical location of the cluster. For example, "Lab 5".

- `-contact <text>` - Cluster Contact
  
  Use this parameter to specify contact information for the cluster, such as a name or e-mail address.

**Examples**

The following example renames the current cluster to `cluster2`:

```bash
cluster1::> cluster identity modify -name cluster2
```

### cluster identity show

Display the cluster's attributes including Name, Serial Number, Cluster UUID, Location and Contact

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.
Description
The `cluster identity show` command displays the identity information of the cluster.

Examples
The following example displays the cluster's UUID, name, serial number, location and contact information:

```
cluster1::> cluster identity show
    Cluster UUID: 1cd8a442-86d1-11e0-ae1c-123478563412
    Cluster Name: cluster1
    Cluster Serial Number: 1-80-123456
    Cluster Location: Lab2
    Cluster Contact: jsmith@example.com
cluster1::>
```

The following example displays the cluster's UUID, name, serial number, location, contact information, and RDB UUID:

```
cluster1::> set -privilege diagnostic
    Warning: These diagnostic commands are for use by NetApp personnel only.
    Do you want to continue? [y|n]: y
cluster1::*> cluster identity show
    Cluster UUID: 1cd8a442-86d1-11e0-ae1c-123478563412
    Cluster Name: cluster1
    Cluster Serial Number: 1-80-123456
    Cluster Location: Lab2
    Cluster Contact: jsmith@example.com
    RDB UUID: 1cd8f3bf-86d1-11e0-ae1c-123478563412
cluster1::*>
```

cluster image commands
Manage cluster images for automated nondisruptive update

cluster image cancel-update
Cancel an update

Availability: This command is available to `cluster` administrators at the `admin` privilege level.

Description
The `cluster image cancel-update` command is used to cancel an update that is in either paused-by-user or paused-by-error state. The update cannot be canceled if it is not in a paused state.

Examples
The following example displays a cancel-update operation:

```
cluster1::> cluster image cancel-update
    Warning: The cancel operation can result in a mixed version
    cluster and/or mixed version HA pair. The cancel
    operation can take several minutes to complete.
    Do you want to proceed with the cancel operation? [y|n]: y
    Info: Canceling update. It may take a few minutes to finish canceling the update
```
cluster image pause-update

Pause an update

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The cluster image pause-update command is used to pause a currently running update. The update pauses at the next predefined pause point (for example, after validation, download to the boot device, takeover completion, or giveback completion) which might take some time to reach. When the update reaches the pause point, it transitions into the pause-by-user state.

Examples
The following example displays pause-update operation:

```
cluster1:/> cluster image pause-update
Info: Pausing update. It may take a few minutes to finish pausing the update
```

cluster image resume-update

Resume an update

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The cluster image resume-update command is used to resume an update that is currently paused in paused-by-user or paused-by-error state. If the update is not paused then an error is returned.

Parameters

[-ignore-post-update-checks-failures {true|false}] - Ignore Post-update-checks Phase Failures
(privacy: advanced)

Specifies whether the post update checks phase warnings and/or errors should be ignored. The default value is false.

Examples
The following example shows a resume-update operation:

```
cluster1:/> cluster image resume-update
Info: Resuming update...
```

cluster image show

Display currently running image information

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The cluster image show command displays information about the version of Data ONTAP that is running on each node and the date/time when it was installed. By default, the command displays the following information:
• Node name
• Current version
• Installation date and time

Parameters

{ [-fields <fieldname>, ...]  
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.
}

[ [-instance ]  
  If you specify the -instance parameter, the command displays detailed information about all fields.
]

[-node {<nodename>|local}] - Node
  Displays information about the specified node.

[-version <text>] - Current Version
  Displays information about the nodes running the specified version.

[-date <MM/DD/YYYY HH:MM:SS>] - Date Installed
  Displays information about the nodes with the specified installation date.

Examples

The following example displays information about currently running images on all nodes of the cluster:

```
cluster1::> cluster image show
  Current                        Installation
  Node                 Version                       Date
  ----------------     -----------------------       ------------
  node1                8.3                           -
  node2                8.3                           -
  2 entries were displayed.
```

**cluster image show-update-history**

Display the update history

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

The cluster image show-update-history command displays the update history for each node. By default, the command displays the following information:

• Status
• Package version
• Start time
• Completion time
• Component ID
• Previous version
• Updated version
Parameters

{[-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

[-instance ]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-component-id <text>] - Component ID

Displays updates for the specified component.

[-start-time <MM/DD/YYYY HH:MM:SS>] - Start Time

Displays updates with the specified start time.

[-package-version <text>] - Package Version

Displays updates for the specified package version.

[-status {successful|canceled|back-out}] - Status

Displays updates that completed with the specified status.

[-completion-time <MM/DD/YYYY HH:MM:SS>] - Completion Time

Displays updates with the specified completion time.

[-previous-version <text>] - Previous Version

Displays updates with the specified previous version.

[-updated-version <text>] - Updated Version

Displays updates with the specified updated version.

Examples

The following example displays history of automated nondisruptive updates:

```
cluster1::> cluster image show-update-history

Package    Start       Completion                           Previous  Updated

```

cluster image show-update-log

Display the update transaction log

Availability: This command is available to cluster administrators at the advanced privilege level.
Description
The `cluster image show-update-log` command displays detailed information about the currently running, or previously run nondisruptive updates. By default, the command displays the following information:

- Phase
- Transaction
- Transaction ID
- Component ID
- Time stamp
- Status

Parameters

`[-fields <fieldname>, ...]`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

`[-instance ]`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-trans-id <integer>]` - Transaction ID

Displays information for the step associated with the specified transaction ID.

`[-component-id {<nodename>|local}]` - Component ID

Displays information for steps associated with the specified component.

`[-phase {validation|prereq-updates|ontap-updates|package-management|default-phase|post-update-checks}]` - Transaction Phase

Displays information for steps associated with the specified update phase.

Displays information for steps associated with the specified transaction.

`[-timestamp <MM/DD/YYYY HH:MM:SS>]` - Timestamp

Displays information for steps associated with the specified timestamp.

`[-status {waiting|started|completed|paused-on-error|paused-by-user|pause-pending|cancel-pending|canceled|failed}]` - Status

Displays information for steps matching the specified status.

Examples

The following example displays information about automated nondisruptive update events:

```
cluster1:*> cluster image show-update-log

<table>
<thead>
<tr>
<th>Phase</th>
<th>Transaction</th>
<th>Trans Id</th>
<th>Component Id</th>
<th>Time Stamp</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>validation</td>
<td>initialize</td>
<td>50</td>
<td>MUM</td>
<td>2/18/2014 10:32:57</td>
<td>completed</td>
</tr>
<tr>

<td>52</td>
<td>node2</td>
<td>2/18/2014 10:32:53</td>
<td>completed</td>
</tr>
</tbody>
</table>
```
cluster image show-update-log-detail

Display detailed information about nondisruptive update events

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The cluster image show-update-log-detail command displays detailed information about the currently running and previously run nondisruptive update events. By default, the command displays the following information:

- Node
- Transaction ID
- Time stamp
- Destination node
- Task phase
- Task name
- Task status
- Message

Parameters
{[-fields <fieldname>, ...]
   If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

| [-instance ]
   If you specify the -instance parameter, the command displays detailed information about all fields.

| 13 entries were displayed. |
[-node {<nodename> | local}] - Node
Displays information only for the specified node.

[-task-id <integer>] - Task Id
Displays information only for the specified task ID.

[-posted-time <MM/DD/YYYY HH:MM:SS>] - Posted Time
Displays information that occurred at the specified time.

[-msg-seq-no <integer>] - Message Sequence
Displays information only for the specified message sequence number.

[-current-pid <integer>] - Process ID
Displays information only for the specified process ID.

[-destination <text>] - Task Target node
Displays information only for the specified destination node.

[-ndu-phase {validation | prereq-updates | ontap-updates | package-management | default-phase | post-update-checks}] - Update phase
Displays information only for the specified phase.

Displays information only for the specified task name.

[-status {created | ready-to-run | running | completed | failed | pause_req | paused | paused-error | cancel_req | canceled | resume_req | default_status}] - Status Of Task
Displays information only for items with the specified status.

[-message <text>] - Update Log Message
Displays information only for items with the specified message.

[-msg-type <text>] - Type of Message
Displays information only for items with the specified message type.

[-src-info <text>] - Source Information
Displays information only for items for the specified source.

Examples
The following example displays detailed information automated nondisruptive updates:

```
cluster1::*> cluster image show-update-log-detail

```
cluster image show-update-progress

Display the update progress

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The `cluster image show-update-progress` command displays information about the current state of an update. By default, the command displays the following information:

- Update phase
- Status
- Estimated Duration
- Elapsed Duration

**Parameters**

```bash
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```bash
[-instance]
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```bash
[-ndu-phase {validation|prereq-updates|ontap-updates|package-management|default-phase|post-update-checks}] - Update Phase
```

Displays information about the specified update phase.

```bash
[-phase-status {in-progress|waiting|paused-by-user|paused-on-error|completed|canceled|failed|pause-pending|cancel-pending}] - Phase Status
```

Displays information about progress matching the specified phase status.

```bash
[-phase-duration <text>] - Phase Duration
```

Displays information about progress matching the specified phase duration.

```bash
[-phase-comments <text>] - Phase Comments
```

Displays information about progress matching the specified phase comments.

```bash
[-elapsed-duration (<seconds> | [<d> days] <hh>:<mm>[::<ss>]])] - Elapsed duration of the phase
```

Displays information about progress matching the specified elapsed duration.

```bash
[-estimated-duration (<seconds> | [<d> days] <hh>:<mm>[::<ss>]])] - Estimated duration of the phase
```

Displays information about progress matching the specified estimated duration.

```bash
[-phase-description <text>] - Phase Description
```

Displays information about progress matching the specified phase description.

```bash
[-subsystem-name <text>] - Subsystem Name
```

Displays information about progress matching the specified subsystem name.

```bash
[-subsystem-status <text>] - Subsystem Status
```

Displays information about progress matching the specified subsystem status.
Displays information about progress matching the specified subsystem details.

Displays information about progress matching the specified subsystem action.

### Examples

The following example shows the automated nondisruptive update of two nodes, nodeA and nodeB. In this case, nodeA's update is waiting, nodeB's update is in progress. nodeB's giveback operation is in progress.

```
cluster1::> cluster image show-update-progress
```

<table>
<thead>

</table>
**cluster image update**

Manage an update

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The *cluster image update* command is used to initiate a Data ONTAP update. The update is preceded by a validation of the cluster to ensure that any issues that might affect the update are identified. There are two types of updates of a cluster. A rolling update updates Data ONTAP one HA pair at a time. This type of update is performed for clusters with fewer than eight nodes or when the `-force-rolling` option is specified for clusters with eight or more nodes. A batch update is used for clusters of eight or more nodes, and performs updates of multiple HA pairs at the same time.

There are predefined points in the update when the update can be paused (either by the user or by an error). These pause points occur after validation, after download to the boot device, after takeover has completed, and after giveback has completed.

**Parameters**

- `-version <text>` - Update Version
  - Specifies the Data ONTAP version to use to update the cluster.

- `[-nodes <nodename>|local], ...` - Node
  - Specifies the nodes that are to be updated. This parameter is not supported for updates of MetroCluster configurations and for two-stage upgrades.

- `[--estimate-only [true]]` - Estimate Only
  - Creates a report of the steps that occur during the update without actually doing them.

- `[--pause-after {none|all}]` - Update Pause
  - Specifies that the update should pause at each predefined pause points (for example, after validation, after download to the boot device, after takeover, and after giveback) during the update.

- `[--ignore-validation-warning {true|false}]` - Ignore Validation
  - Specifies that the update should proceed even if the validation reports warnings.

- `[--skip-confirmation {true|false}]` - Skip Confirmation
  - Specifies that a validation that does not detect any error issues should not ask the user to confirm the update but simply proceed with the update.

- `[--force-rolling [true]]` - Force Rolling Update
  - This option is used for clusters with eight or more nodes to specify that a rolling update (one HA pair at a time) should be done. This parameter is not supported for two-node MetroCluster.

- `[--stabilize-minutes <integer>]` - Minutes to stabilize
  - Specifies the number of minutes that the update should wait after a takeover or giveback is completed. This allows time for the clients to recover from the pause in I/O that occurs during takeover and giveback. This parameter is not supported for two-pack MetroCluster.

**Examples**

The following example shows the update operation:
cluster image update -version 8.3

It can take several minutes to complete validation...

Pre-update Check          Status      Error-Action
----------------------------------------------
CIFS status                OK
Cluster health status      OK
Cluster quorum status      OK

Starting update...

cluster image validate

Validates the cluster's update eligibility

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The cluster image validate command checks for issues within the cluster that might lead to problems during the update.

Parameters
[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-version <text>] - Update Version
Specifies the Data ONTAP version to use to validate the cluster.

[-rolling [true]] - Rolling Update
Specify this optional parameter on a cluster with eight or more nodes to perform a rolling-update check. The default is to perform a batch-update check.

Note: This parameter is only supported on a cluster with eight or more nodes, and is not supported for two-node MetroCluster.

[-nodes {<nodename>|local}, ...] - Nodes
Specifies the nodes that are to be validated. This parameter is not supported for MetroCluster configurations and for two-stage upgrades.

Examples
The following example shows the validate operation:

cluster1::> cluster image validate -version 8.3

It can take several minutes to complete validation...

Pre-update Check          Status      Error-Action
----------------------------------------------
CIFS status                OK
Cluster health status      OK
cluster image package commands

Manage the cluster image package repository

cluster image package delete

Remove a package from the cluster image package repository

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The cluster image package delete command deletes the specified version of the package from the package repository. The associated information about the package is also deleted from the update database.

Parameters

- **-version <text>** - Version To Be Deleted
  
  Specifies the package version that is to be deleted.

Examples

The following example deletes the package with version 8.3:

```
cluster1::> cluster image package delete -version 8.3
Package Delete Operation Completed Successfully
```

cluster image package get

Fetch a package file from a URL into the cluster image package repository

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The cluster image package get command fetches a Data ONTAP package file specified by the URL into the cluster. The package is stored in the cluster package repository and the information from the package is stored in the update database.

Parameters

- **-url <text>** - Package URL
  
  Specifies the URL from which to get the package.

Examples

The following example displays how to get a package from a URL:
cluster image package show-repository

Display information about packages available in the cluster image package repository

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The cluster image package show-repository command displays the package versions that are in the cluster package repository. By default, the command displays the following information:

- Package version

Parameters

{ [-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

|-detail ]
This parameter specifies that detailed information should be displayed.

|-instance ]
If you specify the -instance parameter, the command displays detailed information about all fields.

|-download-ver <text>] - Downloaded Version
Displays packages with the specified download version.

|-component-name <text>, ...] - Component Name
Displays packages for the specified component.

|-component-version <text>, ...] - Component Version
Displays packages with the specified component version.

|-package-build-time <MM/DD/YYYY HH:MM:SS>] - Package Build Time
Displays packages with the specified build time.

Examples
The following example displays the packages in the cluster package repository:

```
cluster1::> cluster image package show-repository
Package Version Package Build Time
----------------- ------------------
8.3             9/12/2014 10:27:33
```

cluster kernel-service commands

Display and manage the cluster kernel services

Commands and methods used to manage the distributed kernel services of the cluster.
cluster kernel-service show

Display cluster service state in the kernel

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The cluster kernel-service show command displays the following information from the master node for each node in the cluster:

- Node name
- The quorum status of that node
- The availability status of that node
- The operational status of that node

Parameters

{ [-fields <fieldname>, ...]  
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance ]  
If you specify the -instance parameter, the command displays detailed information about all fields.

[-master-node <nodename>|local] - Node  
The node in the cluster where the information be being reported from. If this parameter is not specified, the command displays information about all nodes in the cluster.

[-cluster-node <text>] - Cluster Node  
The node in the cluster that the information listed is regarding. If this parameter is specified, the command displays information only about the nodes with the specified state value.

[-status-quorum {out of quorum|in quorum}] - Quorum Status  
The quorum status of the node specified by -cluster-node. If this parameter is specified, the command displays information only about the nodes with the specified state value.

[-status-avail {false|true|unknown}] - Availability Status  
The availability status of the node specified by -cluster-node. If this parameter is specified, the command displays information only about the nodes with the specified state value.

[-status-oper {unknown|operational|not-operational}] - Operational Status  
The operational status of the node specified by -cluster-node. If this parameter is specified, the command displays information only about the nodes with the specified state value.

Examples
The following example displays information about all nodes in the cluster:

cluster1::*> cluster kernel-service show
Master          Cluster           Quorum        Availability  Operational
Node            Node             Status        Status        Status
----------------- ----------------- ------------- ------------- -----------
c1-01            c1-01            in-quorum     true          operational
cluster1-01
2 entries were displayed.

cluster1::*> cluster kernel-service show -instance
          Master Node: c1-01
cluster log-forwarding commands

Manage the cluster’s log forwarding configuration

cluster log-forwarding create

Create a log forwarding destination

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The cluster log-forwarding create command creates log forwarding destinations for remote logging.

Parameters
-destination <Remote InetAddress> - Destination Host
   Host name or IPv4 or IPv6 address of the server to forward the logs to.

[-port <integer>] - Destination Port
   The port that the destination server listen on.

[-protocol {udp-unencrypted|tcp-unencrypted|tcp-encrypted}] - Log Forwarding Protocol
   The protocols are used for sending messages to the destination. The protocols can be one of the following values:
   • udp-unencrypted - User Datagram Protocol with no security
   • tcp-unencrypted - Transmission Control Protocol with no security
   • tcp-encrypted - Transmission Control Protocol with Transport Layer Security (TLS)

[–verify-server {true|false}] - Verify Destination Server Identity
   When this parameter is set to true, the identity of the log forwarding destination is verified by validating its certificate. The value can be set to true only when the tcp-encrypted value is selected in the protocol field. When this value is true the remote server might be validated by OCSP. The OCSP validation for cluster logs is controlled with the security config ocsp enable -app audit_log and security config ocsp disable -app audit_log.

[-facility <Syslog Facility>] - Syslog Facility
   The syslog facility to use for the forwarded logs.

[-force {true}] - Skip the Connectivity Test
   Normally, the cluster log-forwarding create command checks that the destination is reachable via an ICMP ping, and fails if it is not reachable. Setting this value to true bypasses the ping check so that the destination can be configured when it is unreachable.
cluster log-forwarding delete

Delete a log forwarding destination

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The `cluster log-forwarding delete` command deletes log forwarding destinations for remote logging.

Parameters
- `-destination <Remote InetAddress>` - Destination Host
  Host name or IPv4 or IPv6 address of the server to delete the forwarding entry for.
- `-port <integer>` - Destination Port
  The port that the destination server listen on.

Examples
This example deletes the forwarding of all logs to the server at address 1.1.1.1, port 514.

```
cluster1::> cluster log-forwarding delete -destination 1.1.1.1 -port 514
```

cluster log-forwarding modify

Modify log forwarding destination settings

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The `cluster log-forwarding modify` command modifies log forwarding destinations for remote logging.

Parameters
- `-destination <Remote InetAddress>` - Destination Host
  The host name or IPv4 or IPv6 address of the server to be modified.
- `-port <integer>` - Destination Port
  The port that the destination servers listen on.
- `[-verify-server {true|false}]` - Verify Destination Server Identity
  When this parameter is set to true, the identity of the log forwarding destination is verified by validating its certificate. The value can be set to true only when the `tcp-encrypted` value is selected in the protocol field. When this value is true the remote server might be validated by OCSP. The OCSP validation for cluster logs is controlled with the `security config ocsp enable -app audit_log` and `security config ocsp disable -app audit_log`.
- `[-facility <Syslog Facility>]` - Syslog Facility
  The syslog facility to use for the forwarded logs.
Examples
This example modifies the facility of audit logs that are forwarded to the destination server at address 192.168.0.1, port 514.

```bash
cluster1::> cluster log-forwarding modify -destination 192.168.0.1 -port 514 -facility local1
```

**cluster log-forwarding show**

Display log forwarding destinations

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The `cluster log-forwarding show` command displays log forwarding information:

- Destination (IPv4/IPv6/hostname)
- Port number
- List of log classes
- Facility

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance]
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[-destination <Remote InetAddress>] - Destination Host
```

If this optional parameter is specified, the command displays information about the forwarding destinations with the specified host name, IPv4 or IPv6 address.

```
[-port <integer>] - Destination Port
```

If this optional parameter is specified, the command displays information about the forwarding destinations with the specified ports.

```
[-protocol {udp-unencrypted|tcp-unencrypted|tcp-encrypted}] - Log Forwarding Protocol
```

If this optional parameter is specified, the command displays information about the forwarding destinations with the specified protocols.

```
[-verify-server (true|false)] - Verify Destination Server Identity
```

If this optional parameter is specified, the command displays information about the forwarding destinations with the specified verify-server values.

```
[-facility <Syslog Facility>] - Syslog Facility
```

If this optional parameter is specified, the command displays information about the forwarding destinations with the specified facility.
Examples

```
cluster-1::> cluster log-forwarding show
```

**cluster peer commands**

Manage cluster peer relationships

**cluster peer create**

Create a new cluster peer relationship

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**

The `cluster peer create` command establishes a peer relationship between two clusters. Cluster peering enables independent clusters to coordinate and exchange data.

Before creating a new cluster peer relationship, make sure that both clusters are individually healthy and that there are no other peer relationships between the two clusters that might interfere with the new relationship.

You can create a cluster peer relationship using the IPv4 or IPv6 protocol. You may not use both protocols within a single relationship.

Use the `cluster show` and `cluster peer show` commands on each cluster to display health, peering eligibility, and peering information about the two clusters.

**Parameters**

```
[-peer-addrs <Remote InetAddress>, ...] - Remote Intercluster Addresses
```

Use this parameter to specify the names or IP addresses of the logical interfaces used for intercluster communication. Separate the addresses with commas.

The addresses you provide here are associated with the remote cluster until you modify or delete the relationship, regardless of whether the addresses are valid. Make sure to provide addresses which you know will remain available on the remote cluster. You can use the hostnames of the remote cluster's intercluster addresses, the IP addresses of the remote cluster's intercluster LIFs or both.

```
[-username <text>] - Remote User Name
```

Use this optional parameter to specify a username that runs a reciprocal `cluster peer create` command on the peered cluster. If you choose not to use the reciprocal creation option, by not supplying a username for reciprocal creation, you must run `cluster peer create` again on the remote cluster to complete the peering relationship.

If you specify the username for the remote cluster, you will be prompted to enter the associated remote password. These credentials are not stored, they are used only during creation to authenticate with the remote cluster and to enable the remote cluster to authorize the peering request. The provided username's profile must have access to the console application in the remote cluster.

Use the `security login role show` and `security login show` commands on each cluster to find user names and their privilege levels.
[-no-authentication [true]] - Do Not Use Authentication

Use this optional parameter when omitting the -username parameter to indicate that you will create an unauthenticated peering relationship.

[-timeout <integer>] - Operation Timeout (seconds) (privilege: advanced)

Use this optional parameter to specify a timeout value for peer communications. Specify the value in seconds. The default timeout value is 60 seconds.

[-address-family {ipv4|ipv6}] - Address Family of Relationship

Use this optional parameter to specify the address family of the cluster peer relationship. The default is based on existing relationships, existing local intercluster LIFs belonging to a particular address-family, and the addresses supplied to the cluster peer create command.

[-offer-expiration {MM/DD/YYYY HH:MM:SS | {1..7}days | {1..168}hours}] - Passphrase Match Deadline

Specifying cluster peer create normally creates an offer to establish authentication with a cluster that is a potential cluster peer to this cluster. Such offers expire unless they are accepted within some definite time. Use this optional parameter to specify the date and time at which this offer should expire, the time after which the offer will no longer be accepted.

[-rpc-connect-timeout <integer>] - Timeout for RPC Connect (seconds) (privilege: advanced)

Use this optional parameter to specify a timeout value for the RPC connect during peer communications. Specify the value in seconds. The default timeout value is 10 seconds.

[-update-ping-timeout <integer>] - Timeout for Update Pings (seconds) (privilege: advanced)

Use this optional parameter to specify a timeout value for pings while updating remote cluster information. Specify the value in seconds. The default timeout value is 5 seconds. This parameter applies only to cluster peer relationships using the IPv4 protocol.

[-ipspace <IPspace>] - IPspace for the Relationship

Use this optional parameter to specify the IPspace within which the cluster peering relationship is to operate. The default is to use the 'Default' IPspace.

[-local-name <Cluster name>] - Peer Cluster Local Name

Use this optional parameter to specify a unique local name to identify the remote cluster that is being peered. The local name must conform to the same rules as a cluster name. The default value is the remote cluster name.

[-generate-passphrase [true]] - Use System-Generated passphrase

Use this optional parameter alone to create cluster peer offer for the unidentified clusters or use it along with -peer-addrs option to automatically generate the passphrase for the cluster peer operation with the peer cluster.

[-initial-allowed-vserver-peers <Vserver Name>, ...] - Vservers allowed for auto peering

Use this optional parameter to specify the list of Vservers for which reciprocal Vserver peering with peer cluster should be enabled. Upon the time of successful peering, Vserver peer permission entries will be created for the peer cluster for the specified list of Vservers.

Examples

This example creates a peer relationship between cluster1 and cluster2. This reciprocal create executes the create command on both the local cluster and the remote cluster. The cluster peer create command can use the hostnames of cluster2's intercluster addresses, the IP addresses of cluster2's intercluster LIFs, or both. Note that the admin user's password was typed at the prompt, but was not displayed.

```
cluster1::> cluster peer create -peer-addrs cluster2-d2,10.98.234.246 -username admin
Remote Password:
cluster1::> cluster peer show -instance
```
### Cluster Peer Relationship Example

This example shows coordinated peer creation. The `cluster peer create` command was issued locally on each cluster. This does not require you to provide the username and password for the remote cluster. There is a password prompt, but if you are logged in as the admin user, you may simply press enter.

```bash
cluster1::> cluster peer create -peer-addrs cluster2-d2, 10.98.234.246 -no-authentication
Remote Password:
```

**NOTICE:** Addition of the local cluster information to the remote cluster has failed with the following error: not authorized for that command. You may need to repeat this command on the remote cluster.

```bash
cluster1::> cluster peer show
```

<table>
<thead>
<tr>
<th>Peer Cluster Name</th>
<th>Cluster Serial Number</th>
<th>Availability</th>
<th>Authentication</th>
</tr>
</thead>
<tbody>
<tr>
<td>cluster2</td>
<td>1-80-123456</td>
<td>Available</td>
<td>absent</td>
</tr>
</tbody>
</table>

```bash
cluster2::> cluster peer create -peer-addrs cluster1-d2 -no-authentication
Remote Password:
```

**NOTICE:** Addition of the local cluster information to the remote cluster has failed with the following error: not authorized for that command. You may need to repeat this command on the remote cluster.

```bash
cluster2::> cluster peer show
```

<table>
<thead>
<tr>
<th>Peer Cluster Name</th>
<th>Cluster Serial Number</th>
<th>Availability</th>
<th>Authentication</th>
</tr>
</thead>
<tbody>
<tr>
<td>cluster1</td>
<td>1-80-654321</td>
<td>Available</td>
<td>absent</td>
</tr>
</tbody>
</table>

This example shows a reciprocal cluster peer create over IPv6 addresses, that establishes a cluster peer relationship with an IPv6 address family.

```bash
cluster1::> cluster peer create -peer-addrs FD20:8B1E:B255:C222:6A17:0BBD:E92C:4523 -username admin
Remote Password:
```

```bash
cluster1::> cluster peer show -instance
```

<table>
<thead>
<tr>
<th>Address Family of Relationship</th>
<th>Peer Cluster Name</th>
<th>Remote Intercluster Addresses</th>
<th>Availability of the Remote Cluster</th>
<th>Remote Cluster Name</th>
<th>Active IP Addresses</th>
<th>Cluster Serial Number</th>
<th>Authentication Status Administrative</th>
<th>Authentication Status Operational</th>
<th>Last Update Time</th>
<th>IPspace for the Relationship</th>
<th>Guidance for When Encryption Should Be Used</th>
</tr>
</thead>
</table>

This example shows creation of an authenticated peering relationship. It is an example of using the coordinated method to create a cluster peer relationship. The `cluster peer create` command is issued locally on each cluster. Before executing this pair of commands, a passphrase to be used with the commands is chosen and given at the prompts. The passphrase can be any text; it is prompted for twice on each cluster, and all four copies of the passphrase must agree. The
The passphrase does not echo on the screen. The passphrase must be longer than the minimum length as specified by the `cluster peer policy` on both clusters.

```
cluster1::> cluster peer create -peer-addrs cluster2-d2, 10.98.234.246
```

Enter the passphrase:
Enter the passphrase again:

Notice: Now use the same passphrase in the "cluster peer create" command in the other cluster.

```
cluster1::> cluster peer show
Peer Cluster Name         Cluster Serial Number Availability   Authentication
------------------------- --------------------- -------------- --------------
cluster2                  -                     Unavailable    pending

cruster2::> cluster peer create -peer-addrs cluster1-d2
```

Enter the passphrase:
Enter the passphrase again:

```
cluster2::> cluster peer show
Peer Cluster Name         Cluster Serial Number Availability   Authentication
------------------------- --------------------- -------------- --------------
cluster1                  1-80-654321           Available      ok
```

This example creates a peer relationship between cluster1 and cluster2. This reciprocal create executes the `create` command on both the local cluster and the remote cluster. The `cluster peer create` command can use the hostnames of cluster2's intercluster addresses, the IP addresses of cluster2's intercluster LIF's or both. Note that the admin user's password was typed at the prompt, but was not displayed. The `-local-name` parameter is specified to create a local name used to identify the peer cluster in cases where the name of the peer cluster is not unique or not descriptive.

```
cluster1::> create -peer-addrs 10.98.191.193 -username admin -local-name locallyUniqueName
```

```
cluster1::> cluster peer show
Peer Cluster Name         Cluster Serial Number Availability   Authentication
------------------------- --------------------- -------------- --------------
locallyUniqueName                1-80-000011           Available      absent
```

```
cluster1::> cluster peer show -instance
Peer Cluster Name: locallyUniqueName
Remote Intercluster Addresses: 10.98.191.193
Available of the Remote Cluster: Available
Remote Cluster Name: cluster2
Active IP Addresses: 10.98.191.193
Cluster Serial Number: 1-80-000011
Address Family of Relationship: ipv4
Authentication Status Administrative: no-authentication
Authentication Status Operational: absent
Last Update Time: 02/05 21:05:41
IPspace for the Relationship: Default
Guidance for when Encryption Should Be Used: never
```

The following example create a peer relationship between cluster1 and cluster2 using system-generated passphrases:

```
cluster1::> cluster peer create -peer-addrs 10.98.191.193 -generate-passphrase
```

```
Passphrase: UCa+6lRVICeL/gq1WrK7ShR
Peer Cluster Name: cluster2
Expiration Time: 6/7/2017 09:16:10 +5:30
Intercluster LIF IP: 10.140.106.185
```

Warning: make a note of the passphrase - it cannot be displayed again.

```
cluster1::> cluster peer show
Peer Cluster Name         Cluster Serial Number Availability   Authentication
------------------------- --------------------- -------------- --------------
cluster2                  -                     Unavailable    pending
```

cluster peer commands
The following example creates a cluster peer offer from cluster1 for an anonymous cluster using system-generated passphrase with offer expiration period of two days and the cluster2 uses the offer from cluster2 with the system-generated passphrase:

```bash
cluster1::> cluster peer create -generate-passphrase -offer-expiration 2days
```

```
Passphrase: UCa+6lRVICxEl/gq1WzK7ShR
Peer Cluster Name: Clus_7ShR (temporary generated)
Initial Allowed Vserver Peers: -
Expiration Time: 6/9/2017 08:16:10 +5:30
Intercluster LIF IP: 10.140.106.185
```

Warning: make a note of the passphrase - it cannot be displayed again.

```bash
cluster1::> cluster peer show
```

```
Clus_7ShR                  -                     Unidentified   pending
```

```bash
cluster2::> cluster peer create -peer-addrs 10.140.106.185
Enter the passphrase:
```

Clusters cluster1 and cluster2 are peered.

Cluster "cluster1" creates an offer with `initial-allowed-vserver-peers` option set to Vservers "vs1" and "vs2". And the peer cluster "cluster2" uses the offer and creates peer relationship with cluster1, upon the successful peer relationship establishment, Vserver peer permission entries are created for the Vservers "vs1" and "vs2" in cluster "cluster1" for the peer cluster "cluster2". The following example describes the usage of `initial-allowed-vserver-peers` option in the cluster peer creation workflow:

```bash
cluster1::> cluster peer create -generate-passphrase -initial-allowed-vserver-peers vs1,vs2
```

```
Passphrase: UCa+6lRVICxEl/gq1WzK7ShR
Peer Cluster Name: Clus_7ShR (temporary generated)
Initial Allowed Vserver Peers: vs1,vs2
Expiration Time: 6/7/2017 09:16:10 +5:30
Intercluster LIF IP: 10.140.106.185
```

Warning: make a note of the passphrase - it cannot be displayed again.

```bash
cluster1::> cluster peer show
```

```
Clus_7ShR                  -                     Unidentified   pending
```

```bash
cluster2::> cluster peer create -peer-addrs 10.140.106.185
Enter the passphrase:
```

Clusters cluster1 and cluster2 are peered.
cluster peer delete

Delete a cluster peer relationship

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
The `cluster peer delete` command removes a peering relationship. It removes the relationship records, state data, and all associated jobs.

Before removing the relationship, the command verifies that no resources depend on the relationship. For example, if any SnapMirror relationships exist, the command denies the request to delete the peering relationship. You must remove all dependencies for the deletion to succeed. The `cluster peer delete` command removes only the local instance of the peer relationship. An administrator in the peer cluster must use the `cluster peer delete` command there as well to completely remove the relationship.

**Parameters**
- `cluster <text>` - Peer Cluster Name

  Use this parameter to specify the peering relationship to delete by specifying the name of the peered cluster.

**Examples**
This example shows a failed deletion due to a SnapMirror dependency.

```
cluster2::> cluster peer delete -cluster cluster1
Error: command failed: Unable to delete peer relationship. Reason: A SnapMirror source exists in this cluster
```

cluster peer modify

Modify cluster peer relationships

**Availability:** This command is available to cluster administrators at the admin privilege level.
The `cluster peer modify` command modifies the attributes of a peering relationship. When you modify a peer relationship and specify `-peer-addrs`, all of the remote addresses must respond, must be intercluster addresses, and must belong to the remote cluster that is being modified; or the modification request is denied.

**Parameters**

- `-cluster <text>` - Peer Cluster Name
  Use this parameter to specify the peering relationship to modify by specifying the name of the peered cluster.

- `-peer-addrs <Remote InetAddress>,...` - Remote Intercluster Addresses
  Use this parameter to specify the names or IP addresses of the logical interfaces used for intercluster communication. Separate the addresses with commas. The list of addresses you provide replaces the existing list of addresses.

- `-address-family {ipv4|ipv6}` - Address Family of Relationship
  Use this parameter to specify the address family of the names specified with the peer-addrs parameter.

- `-timeout <integer>` - Operation Timeout (seconds) (privilege: advanced)
  Use this parameter to specify a timeout value for peer communications. Specify the value in seconds.

- `-auth-status-admin {no-authentication|revoked|use-authentication}` - Authentication Status Administrative
  Use this parameter to adjust the authentication in use for the peer relationship. The defined values for this field are as follows.
  
  • no-authentication - The cluster peer relationship uses no authentication.
  
  • use-authentication - The cluster peer relationship is to be authenticated. After you use this value, you will be prompted for a passphrase to be used in determining a new authentication key, just as in the authenticated `cluster peer create` command or you can use the option `generate-passphrase` to automatically generate the passphrase.
  
  • revoked - The cluster peer relationship is no longer to be trusted. Peering communication with this cluster peer is suspended until the two clusters set their `auth-status-admin` attributes either both to `no-authentication` or both to `use-authentication`.

  Changes should be reflected on both clusters involved in a peering relationship.

- `-rpc-connect-timeout <integer>` - Timeout for RPC Connect (seconds) (privilege: advanced)
  Use this optional parameter to specify a timeout value for the RPC connect during peer communications. Specify the value in seconds.

- `-update-ping-timeout <integer>` - Timeout for Update Pings (seconds) (privilege: advanced)
  Use this optional parameter to specify a timeout value for pings while updating remote cluster information. Specify the value in seconds. This parameter applies only to cluster peer relationships using the IPv4 protocol.

- `-ipspace <IPspace>` - IPspace for the Relationship
  Use this optional parameter to specify that cluster peering communication for this remote cluster is to be done using local intercluster LIFs that are on ports in the named IPspace.

- `-generate-passphrase [true]` - Use System-Generated passphrase
  Use this optional parameter along with `-auth-status-admin` option's `use-authentication` to automatically generate the passphrase which can be used for cluster peer operation.

**Examples**

This example modifies the peering relationship to use a new IP address in the remote cluster for intercluster communications and revoke authentication.
View existing cluster peer configuration using following command:

```shell
cluster1::> cluster peer show -instance
```

<table>
<thead>
<tr>
<th>Peer Cluster Name:</th>
<th>cluster2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote Intercluster Addresses:</td>
<td>cluster2-d2, 10.98.234.246</td>
</tr>
<tr>
<td>Availability of the Remote Cluster:</td>
<td>Available</td>
</tr>
<tr>
<td>Remote Cluster Name:</td>
<td>cluster2</td>
</tr>
<tr>
<td>Active IP Addresses:</td>
<td>10.98.234.246, 10.98.234.243</td>
</tr>
<tr>
<td>Cluster Serial Number:</td>
<td>1-80-123456</td>
</tr>
<tr>
<td>Remote Cluster Nodes:</td>
<td>cluster2-01, cluster2-02</td>
</tr>
<tr>
<td>Remote Cluster Health:</td>
<td>true</td>
</tr>
<tr>
<td>Unreachable Local Nodes:</td>
<td>-</td>
</tr>
<tr>
<td>Address Family of Relationship:</td>
<td>ipv4</td>
</tr>
<tr>
<td>Authentication Status Administrative:</td>
<td>use-authentication</td>
</tr>
<tr>
<td>Authentication Status Operational:</td>
<td>ok</td>
</tr>
<tr>
<td>Last Update Time:</td>
<td>02/05 21:05:41</td>
</tr>
<tr>
<td>IPspace for the Relationship:</td>
<td>Default</td>
</tr>
<tr>
<td>Guidance for when Encryption Should Be Used:</td>
<td>as-possible</td>
</tr>
</tbody>
</table>

Modify the cluster peer configuration using following command:

```shell
cluster1::> cluster peer modify -cluster cluster2 -peer-addrs cluster2-d2,10.98.234.264 -auth-status-admin revoked
```

Warning: This will discard the authentication key.

Warning: You are removing authentication from the peering relationship with cluster "cluster2". Use the "cluster peer modify" command on cluster "cluster2" with the "-auth-status-admin no-authentication" parameter to complete authentication removal from the peering relationship.

Do you want to continue? (y|n): y

The following example modifies the peering relationship to use authentication with -generate-passphrase option.

```shell
cluster1::> cluster peer modify -cluster cluster2 -auth-status-admin use-authentication -generate-passphrase
```

Notice: Use the below system-generated passphrase in the "cluster peer modify" command in the other cluster.

```
Passphrase: UCa+6lRVICXeL/gq1WrK7ShR
Expiration Time: 6/7/2017 09:16:10 +5:30
Peer Cluster Name: cluster2
```

Warning: make a note of the passphrase - it cannot be displayed again.

Until then, the operational authentication state of the relationship remains as "pending".

```shell
cluster1::> cluster peer offer show
```

<table>
<thead>
<tr>
<th>Peer Cluster Name</th>
<th>Authentication Creation</th>
<th>Expiration</th>
<th>Vserver Peers</th>
</tr>
</thead>
<tbody>
<tr>
<td>cluster2</td>
<td>ok-and-offer</td>
<td>6/7/2017 08:16:10</td>
<td>6/7/2017 09:16:10</td>
</tr>
</tbody>
</table>

Modify cluster peer relationship in cluster2 with use-authentication option and use the auto-generated passphrase.

```shell
cluster2::> cluster peer modify -cluster cluster2 -auth-status-admin use-authentication
```
Notice: Use a auto-generated passphrase or choose a passphrase of 8 or more characters. To ensure the authenticity of the peering relationship, use a phrase or sequence of characters that would be hard to guess.

Enter the passphrase:
Confirm the passphrase:

cluster peer modify-local-name

Modify the local name for a cluster peer

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The cluster peer modify-local-name command modifies the local name for a remote cluster. The new local name must be unique among all the local names for the remote clusters with which this cluster is peered.

Parameters

-name <text> - Cluster Peer Name
Use this parameter to specify the existing local name for a peer cluster.

-new-name <Cluster name> - Cluster Peer Local Name
Use this parameter to specify the new local name of the peer cluster. The new local name must conform to the same rules as a cluster name.

Examples

cluster2::> cluster peer modify-local-name -name cluster1 -new-name cluster1A

cluster identity modify on page 51

cluster peer ping

Initiate intercluster connectivity test

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The cluster peer ping command displays the status of the network mesh used by the peering relationship. The command checks the network connection to each remote IP address known by the cluster. This includes all intercluster addresses. It is possible for a known address to be not present during the ping. These addresses are not checked, but the absence is temporary.

The most useful parameters for diagnosing problems are -count and -packet-size. Use the -count and -packet-size parameters to diagnose problems similarly to how you use them with the standard ping utility.

To display network connection status within a cluster, use the network ping command.

78

Commands: Manual Page Reference
Parameters

{-fields <fieldname>, ...
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?' to display the fields to specify.

[-instance ]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-originating-node (<nodename>|local)] - Node that Initiates Ping
Use this parameter to send the ping from the node you specify.

[-destination-cluster <Cluster name>] - Cluster to Ping
Use this parameter to specify the peer cluster you wish to ping.

[-destination-node <Peer Node Name>] - Node to Ping in Destination Cluster
Use this parameter to specify a specific node in the destination cluster to ping.

[-ip-address <IP Address>] - Active IP Address
Use this parameter to specify the active IP address you wish to ping.

[-count <integer>] - Ping Count
Use this parameter to specify the number of requests to be sent to the destination.

[-status {unknown_node|internal_error|unreachable|session_reachable|interface_reachable}] - Status of Ping Operation
Use this parameter to display only ping results that have the status you specify.

[-timeout <integer>] - Ping Timeout in Seconds
Use this parameter to specify a timeout value in seconds for the ping operation.

[-packet-size <integer>] - Size of Packet
Use this parameter to specify the number of data bytes to be sent in the ping packet.

[-ttl <integer>] - Time to Live/ Number of Hops
Use this parameter to specify the maximum number of network hops a packet may make before it is considered a failure.

[-response-time <double>] - Response Time (ms)
Use this parameter to display only nodes that have the response time (in milliseconds) that you specify. This parameter is most useful when specified with a range of values, such as >500

Examples

This example shows a ping of cluster1 and cluster2 from cluster2. All nodes are reachable.

<table>
<thead>
<tr>
<th>Node: node1</th>
<th>Destination Cluster: cluster2</th>
</tr>
</thead>
<tbody>
<tr>
<td>node1</td>
<td>10.98.228.230</td>
</tr>
<tr>
<td>node2</td>
<td>10.98.228.234</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Node: node1</th>
<th>Destination Cluster: cluster2</th>
</tr>
</thead>
<tbody>
<tr>
<td>node3</td>
<td>10.98.229.22</td>
</tr>
<tr>
<td>node4</td>
<td>10.98.229.29</td>
</tr>
</tbody>
</table>

network ping on page 309

cluster peer show

Display peer cluster information

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The cluster peer show command displays information about the peering relationships between the current cluster and other clusters. Cluster peering enables independent clusters to coordinate and exchange data.

Parameters

{ [-fields <fieldname>, ... ]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance ]]|
  If you specify the -instance parameter, the command displays detailed information about all fields.

[-cluster <text>] - Peer Cluster Name
  Selects the peered clusters that match this parameter value.

[-cluster-uuid <UUID>] - Cluster UUID (privilege: advanced)
  Selects the peered clusters that match this parameter value.

[-peer-addrs <Remote InetAddress>, ...] - Remote Intercluster Addresses
  Selects the peered clusters that match this parameter value (remote-host name or IP address).

[-availability <availability>] - Availability of the Remote Cluster
  Selects the peered clusters that match this parameter value. This parameter can have four different values:
  • Available - The peer cluster availability status will be Available only if all the nodes in the local cluster are able to contact all the nodes in the remote cluster.
  • Partial - The peer cluster availability status will be Partial only if some nodes in the local cluster are not able to contact some or all nodes in the peer cluster.
  • Unavailable - The peer cluster availability status will be Unavailable only if all the nodes in the local cluster are not able to contact any node in the peer cluster.
  • Pending - The peer cluster availability status will be Pending while the system is creating in-memory health data.
  • Unidentified - The peer cluster availability status will be Unidentified if the cluster peer offer is created for an anonymous cluster and is unused. When the offer is used, then the availability will get changed to any of the above mentioned status.

Note: If one or more nodes in the local cluster are offline or unreachable, then those nodes are not used to determine the availability status for the remote nodes.
[-rcluster <text>] - Remote Cluster Name
Selects the peered clusters that match this parameter value.

[-ip-addrs <Remote InetAddress>, ...] - Active IP Addresses
Selects the peered clusters that match this parameter value.

[-serialnumber <Cluster Serial Number>] - Cluster Serial Number
Selects the peered clusters that match this parameter value.

[-remote-cluster-nodes <text>, ...] - Remote Cluster Nodes
Selects the peered clusters that match this parameter value.

[-remote-cluster-health {true|false}] - Remote Cluster Health
Selects the peered clusters that match this parameter value.
  • true - This means that there is cluster quorum in the peer cluster.
  • false - This means that there is no cluster quorum in the peer cluster.

[-unreachable-local-nodes <text>, ...] - Unreachable Local Nodes
Selects the peered clusters that match this parameter value.

[-timeout <integer>] - Operation Timeout (seconds) (privilege: advanced)
Selects the peered clusters that match this parameter value.

[-address-family {ipv4|ipv6}] - Address Family of Relationship
Selects the peered clusters that have a relationship established using this protocol.

[-auth-status-admin {no-authentication|revoked|use-authentication}] - Authentication Status Administrative
Selects the peered clusters that match this parameter value, which must be chosen from the following values.
  • no-authentication - The cluster peer relationship uses no authentication.
  • use-authentication - The cluster peer relationship is authenticated.
  • revoked - The cluster peer relationship is revoked until agreement can be reached.

[-auth-status-operational {ok|absent|pending|expired|revoked|declined|refused|ok-and-offer|absent-but-offer|revoked-but-offer|key-mismatch|intent-mismatch|incapable}] - Authentication Status Operational
Selects the peered clusters that match this parameter value, which must be one of the following values.
  • ok - The clusters both use authentication and they have agreed on an authentication key.
  • absent - The clusters agree not to use authentication.
  • pending - This cluster has made an outstanding offer to authenticate with the other cluster, but agreement has not yet been reached.
  • expired - This cluster’s offer to authenticate with the other cluster expired before agreement was reached.
  • revoked - This cluster has revoked any prior authentication agreement.
  • declined - The other cluster has revoked the authentication agreement and is declining to communicate with this cluster.
  • refused - The other cluster actively refuses the communication attempts, perhaps because its part of the peering relationship has been deleted.
  • ok-and-offer - The clusters agree on an authentication key and are using it. In addition, this cluster has made an outstanding offer to re-authenticate with the other cluster.
- absent-but-offer - The clusters currently agree that neither side requires authentication of the other, but this cluster has made an outstanding offer to authenticate.
- revoked-but-offer - This cluster has revoked any authentication agreement, but it has made an outstanding offer to authenticate.
- intent-mismatch - The two clusters disagree on whether authentication is required.
- key-mismatch - The two clusters both believe that they are authenticated, but one of the shared secrets has become corrupted.
- incapable - The other cluster is no longer running a version of Data ONTAP that supports authenticated cluster peering.

[-rpc-connect-timeout <integer>] - Timeout for RPC Connect (privilege: advanced)
Selects the peered clusters that match this parameter value.

[-update-ping-timeout <integer>] - Timeout for Update Pings (privilege: advanced)
Selects the peered clusters that match this parameter value.

[-last-updated <MM/DD/YYYY HH:MM:SS>] - Last Update Time
Selects the peered clusters that match this parameter value.

[-ip-space <IPspace>] - IPspace for the Relationship
Selects the peered clusters whose relationships are to cross the named local IPspace. The default value is the IPspace name "Default". In relationships created before ONTAP 8.3.1, the initial value is "-" and is not updated to "Default" until an action is taken on a cluster peer relationship, such as creating, modifying, or deleting a relationship.

**Examples**

This example shows the output of the cluster peer show command when all nodes in the local cluster are able to contact all nodes in the remote peer cluster. Additionally, the peer relationship is authenticated and operating correctly.

```
cluster1::> cluster peer show
Peer Cluster Name         Cluster Serial Number Availability   Authentication
------------------------- --------------------- -------------- --------------
cluster2                  1-80-123456           Available      ok
```

Detailed information for this scenario is shown below.

```
cluster1::> cluster peer show -instance
Peer Cluster Name: cluster2
Remote Intercluster Addresses: cluster2-d2, 10.98.234.246
Availability of the Remote Cluster: Available
Remote Cluster Name: cluster2
Active IP Addresses: 10.98.234.246, 10.98.234.243
Cluster Serial Number: 1-80-123456
Remote Cluster Nodes: cluster2-01, cluster2-02
Remote Cluster Health: true
Unreachable Local Nodes: -
Address Family of Relationship: ipv4
Authentication Status Administrative: use-authentication
Authentication Status Operational: ok
Last Update Time: 02/05 21:05:41
IPspace for the Relationship: Default
```

This example shows the output of the cluster peer show command when some nodes in the local cluster are not able to contact some or all of the nodes in the remote peer cluster.
cluster1::> cluster peer show
Peer Cluster Name         Cluster Serial Number Availability   Authentication
------------------------- --------------------- -------------- --------------
cluster2                  1-80-123456           Available      ok

Detailed information for this scenario is shown below.

cluster1::> cluster peer show -instance

Peer Cluster Name: cluster2
Remote Intercluster Addresses: cluster2-d2, 10.98.234.246
Availability of the Remote Cluster: Partial
Remote Cluster Name: cluster2
Active IP Addresses: 10.98.234.246, 10.98.234.243
Cluster Serial Number: 1-80-123456
Remote Cluster Nodes: cluster2-01, cluster2-02
Remote Cluster Health: false
Unreachable Local Nodes: -
Address Family of Relationship: ipv4
Authentication Status Administrative: use-authentication
Authentication Status Operational: ok
Last Update Time: 02/05 21:05:41
IPspace for the Relationship: Default

This example shows the output of the cluster peer show command when some nodes in the local cluster cannot be contacted from the node where the command is executed, but all the other nodes including node on which command is executed are able to contact all nodes in the remote peer cluster.

cluster1::> cluster peer show
Peer Cluster Name         Cluster Serial Number Availability   Authentication
------------------------- --------------------- -------------- --------------
cluster2                  1-80-123456           Available      ok

Detailed information for this scenario is shown below.

cluster1::> cluster peer show -instance

Peer Cluster Name: cluster2
Remote Intercluster Addresses: cluster2-d2, 10.98.234.246
Availability of the Remote Cluster: Available
Remote Cluster Name: cluster2
Active IP Addresses: 10.98.234.246, 10.98.234.243
Cluster Serial Number: 1-80-123456
Remote Cluster Nodes: cluster2-01, cluster2-02
Remote Cluster Health: true
Unreachable Local Nodes: cluster1-01
Address Family of Relationship: ipv4
Authentication Status Administrative: use-authentication
Authentication Status Operational: ok

IPspace for the Relationship: Default

This example shows the output of the cluster peer show command when some nodes in the local cluster cannot be contacted from the node where the command is executed, and the node on which command is executed is also not able to contact the remote peer cluster.

cluster1::> cluster peer show
Peer Cluster Name         Cluster Serial Number Availability   Authentication
------------------------- --------------------- -------------- --------------
cluster2                  1-80-123456           Unavailable    ok

Detailed information for this scenario is shown below.
This example shows the output of the `cluster peer show` command when all the nodes in the local cluster are not able to contact any nodes in the remote peer cluster.

```
cluster1::> cluster peer show
         Peer Cluster Name         Cluster Serial Number Availability   Authentication
------------------------- --------------------- -------------- --------------
cluster2                  1-80-123456           Unavailable    ok
```

Detailed information for this scenario is shown below.

```
cluster1::> cluster peer show -instance
         Peer Cluster Name: cluster2
         Remote Intercluster Addresses: cluster2-d2, 10.98.234.246
         Availability of the Remote Cluster: Unavailable
         Remote Cluster Name: cluster2
         Active IP Addresses: 10.98.234.246, 10.98.234.243
         Cluster Serial Number: 1-80-123456
         Remote Cluster Nodes: cluster2-01, cluster2-02
         Remote Cluster Health: -
         Unreachable Local Nodes: cluster1-01
         Address Family of Relationship: ipv4
         Authentication Status Administrative: use-authentication
         Authentication Status Operational: ok
         Last Update Time: 02/05 21:05:41
         IPspace for the Relationship: Default
```

This example shows the output of the `cluster peer show` command while the system is creating in-memory health data.

```
cluster1::> cluster peer show
         Peer Cluster Name         Cluster Serial Number Availability   Authentication
------------------------- --------------------- -------------- --------------
cluster2                  1-80-123456           Pending        ok
```

Detailed information for this scenario is shown below.

```
cluster1::> cluster peer show -instance
         Peer Cluster Name: cluster2
         Remote Intercluster Addresses: cluster2-d2, 10.98.234.246
         Availability of the Remote Cluster: Pending
         Remote Cluster Name: cluster2

---

Cluster Peer Connection Commands

The connection directory

The `cluster peer connection` commands provide you with the ability to observe, and to some extent manage, the connections created on behalf of cluster peering, both for control and data access.

**cluster peer connection show**

Show current peering connections for a cluster

Availability: This command is available to cluster administrators at the *admin* privilege level.

**Description**

The `cluster peer connection show` command displays information about the current TCP connections and how they are supporting the set of peering relationships.

**Parameters**

```bash
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```bash
[-instance]
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```bash
[-cluster-name <text>] - Remote Cluster
```

Selects the connections associated with the named peered cluster.

```bash
[-node {<nodename>|local}] - Node
```

Selects the connections hosted by the given node.

```bash
[-connection-type {mgmt-client|mgmt-server|data}] - Cluster Peering Connection Type
```

Selects the connections of the named type. This parameter can have one of three different values:

- Mgmt-client - Management-plane client connections, created so that this node may make management-plane requests of other nodes.
- Mgmt-server - Management-plane server connections, over which this node services requests made by other nodes' mgmt-client connections.
- Data - Connections made between data-planes of different nodes.

```bash
[-index <integer>] - Index of Connection
```

Selects the connections with the given index value.

```bash
[-cluster-uuid <UUID>] - Cluster UUID (privilege: advanced)
```

Selects the connections to the cluster with the given cluster UUID.
[auth-status-admin {no-authentication|revoked|use-authentication}] - Authentication Status Administrative

Selects connections to the peered clusters whose intended authentication matches this parameter value.

[auth-status-operational {ok|absent|pending|expired|revoked|declined|refused|ok-and-offer|absent-but-offer|revoked-but-offer|key-mismatch|intent-mismatch|incapable}] - Authentication Status Operational

Selects connections to the peered clusters whose authentication state matches this parameter value.

[authenticated {true|false}] - Authenticated

Selects connections that have been authenticated, or not, according to this parameter value.

[port <integer>] - Network Port

Selects the connections that match this parameter value.

[idle {[<integer>h][<integer>m][<integer>s]}] - Idle Time

Selects the connections whose idle times match this parameter value.

[address <IP Address>] - Remote Network Address

Selects the connections that have this parameter value as the remote network address.

Examples

This example shows the output of the cluster peer connection show command.

```
cluster1::> cluster peer connection show
Cluster Node               Connection Type  Auth  Encrypt Idle  Remote Address
------- -----------------  ---------------  ----- ------- ----  --------------
cluster2                      Authentication: ok
  node1
    data  true  true   6s    10.10.10.100
    data  true  true   7s    10.10.10.100
    data  true  true   20s   10.10.10.100
    data  true  true   11s   10.10.10.100
    data  true  true   7s    10.10.10.100
    data  true  true   7s    10.10.10.100
    data  true  true   11s   10.10.10.200
    data  true  true   11s   10.10.10.200
    data  true  true   48s   10.10.10.200
    data  true  true   48s   10.10.10.200
    data  true  true   37s   10.10.10.200
    data  true  true   37s   10.10.10.200

12 entries were displayed.
```

cluster peer health commands

The health directory

cluster peer health show

Check peer cluster health

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The cluster peer health show command displays information about the health of the nodes in peer clusters from the perspective of the nodes in the local cluster. The command obtains health information by performing connectivity and status probes of each peer cluster’s nodes from each node in the local cluster.

To enable quick access to remote cluster health information, remote cluster health status is periodically checked and cached. These cached results enable users and system features to quickly assess the availability of remote resources. By default, this
command accesses cached results. Use the \texttt{\textendash bypass\textendash cache true} option to force a current, non-cached check of remote cluster health.

### Parameters

\texttt{\{ [-fields <fieldname>, ...]}

If you specify the \texttt{-fields <fieldname>, ...} parameter, the command output also includes the specified field or fields. You can use `\texttt{-fields ?}` to display the fields to specify.

\texttt{\} [-instance]}

If you specify the \texttt{-instance} parameter, the command displays detailed information about all fields.

\texttt{-originating\textendash node <nodename>|local]} - Local Node

Selects the node that matches this parameter value.

\texttt{-destination\textendash cluster <Cluster name>} - Peer Cluster

Selects the cluster that matches this parameter value.

\texttt{-destination\textendash node <Peer Node Name>} - Peer Node

Selects the node that matches this parameter value.

\texttt{-destination\textendash cluster\textendash uuid <UUID>]} - Peer UUID

Selects the cluster that matches this parameter value.

\texttt{-data\textendash ping (unknown\_node|internal\_error|unreachable|session\_reachable|interface\_reachable)]}

- Status of Data Ping Operation

Selects the nodes that match this parameter value.

\texttt{-icmp\_ping (unknown\_node|internal\_error|unreachable|session\_reachable|interface\_reachable)]}

- Status of ICMP Ping Operation

Selects the nodes that match this parameter value.

\texttt{-node\_health (true|false)]} - RDB Health of the Node

Selects the nodes that match this parameter value (\texttt{true} means healthy).

\texttt{-cluster\_health (true|false)]} - Cluster Health

Selects the nodes that match this parameter value (\texttt{true} means healthy).

\texttt{-availability (true|false)]} - Communication Indicator

Selects the nodes that match this parameter value (\texttt{true} means communicating).

\texttt{-bypass\textendash cache (true|false)]} - Bypass Cache and Determine Health

Bypasses cached results to determine current cluster health (\texttt{true} means bypass the cache). Cached results may not be current, but they are displayed more quickly.

\texttt{-last\_updated <MM/DD/YYYY HH:MM:SS>]} - Last Update Time

Selects the nodes that match this parameter value.

### Examples

The following example shows typical output for this command in a cluster of two nodes that has a peer cluster of two nodes.

```
cluster1::> cluster peer health show
Node          Cluster-Name       Node-Name  Ping-Status               RDB-Health Cluster-Health Availability
---------- --------------------------- --------- --------------- ---------------
node1        cluster2            node3      Data: interface_reachable true      true            true
             Data: interface_reachable
         ```
The following example shows detailed health information for node3 in cluster2 from the perspective of node1 in cluster1.

```
class1::> cluster peer health show -originating-node node1 -destination-cluster cluster2 -destination-node node3 -instance
```

Local Node: node1
Peer Cluster: cluster2
Peer Node: node3
Peer UUID: 5e4befb2-1f36-11d0-98c9-123476563412
Status of Data Ping Operation: interface_reachable
Status of ICMP Ping Operation: interface_reachable
RDB health of the node: true
Cluster Health: true
Communication Indicator: true
Last Update Time: 02/06 18:58:38

### Cluster Peer Offer Commands

Manage offers to authenticate cluster peer relationships

The `cluster peer offer` commands provide you with the ability to manage the authentication offers that can be created by the `cluster peer create` and `cluster peer modify` commands.

**Related references**

- `cluster peer create` on page 70
- `cluster peer modify` on page 75

**cluster peer offer cancel**

Cancel the outstanding offer to authenticate with a peer cluster

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**

The `cluster peer offer cancel` command cancels an outstanding offer to authenticate with a potentially peered cluster. After the command completes, the given cluster can no longer establish authentication using the given authentication offer.

**Parameters**

- `--cluster <text>` - Peer Cluster Name

  Use this parameter to specify which offer should be cancelled, by specifying the name of the cluster to which the offer is extended.

**Examples**

The following example cancels the authentication offer to cluster2.

```
cluster1::> cluster peer offer cancel --cluster cluster2
```
cluster peer offer modify

Modify an outstanding offer to authenticate with a peer cluster

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The `cluster peer offer modify` command modifies the outstanding offer to authenticate with a potentially peered cluster. Every authentication offer has an expiration time, after which the offer will no longer be honored. This command is used to change that expiration time. To cancel the offer outright, use the `cluster peer offer cancel` command instead.

Parameters
- `-cluster <text>` - Peer Cluster Name
  Use this parameter to specify the offer to be modified by indicating the name of the cluster to which it has been extended.

- `[-offer-expiration (MM/DD/YYYY HH:MM:SS | {1..7}days | {1..168}hours)]` - Authentication Offer Expiration Time
  Use this parameter to specify the new expiration time for the offer.

- `[-initial-allowed-vserver-peers <Vserver Name>, ...]` - Vservers Initially Allowed for Peering
  Use this optional parameter to specify the list of Vservers for which reciprocal Vserver peering with peer cluster should be enabled.

Examples
This example modifies the expiration time for the authentication offer to push it out by an hour.

```
cluster1::> cluster peer offer show
Peer Cluster Name   Authentication Creation            Expiration
------------------- -------------- ------------------- -------------------
cluster2            absent_but_offer
cluster1::> cluster peer offer modify -cluster cluster2 -offer-expiration "7/23/2013 16:45:47"
cluster1::> cluster peer offer show
Peer Cluster Name   Authentication Creation            Expiration
------------------- -------------- ------------------- -------------------
cluster2            absent_but_offer
```

Related references
- `cluster peer offer cancel` on page 91

cluster peer offer show

Display outstanding offers to authenticate with a peer cluster

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The `cluster peer offer show` command displays information about authentication offers still pending with potential peer clusters. By default, the command displays information about all unexpired offers made by the local cluster.

To display detailed information about a specific offer, run the command with the `-cluster` parameter.
Parameters

[-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

[-instance]]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-cluster <text>] - Peer Cluster Name

Selects the offer that matches this parameter value.

[-auth-status-operational {ok|absent|pending|expired|revoked|declined|refused|ok-and-offer|absent-but-offer|revoked-but-offer|key-mismatch|intent-mismatch|incapable}] - Authentication Status Operational

Selects the offers that match this parameter value.

[-offer-creation <MM/DD/YYYY HH:MM:SS>] - Authentication Offer Creation Time

Selects the offers that match this parameter value.

[-offer-expiration {MM/DD/YYYY HH:MM:SS | {1..7}days | {1..168}hours}] - Authentication Offer Expiration Time

Selects the offers that match this parameter value.

[-initial-allowed-vserver-peers <Vserver Name>, ...] - Vservers Initially Allowed for Peering

Selects the offers that match this parameter value.

[-offer-creator <text>] - Authentication Offer Creator

Selects the offers that match this parameter value.

Examples

The following example displays information about the outstanding authentication offers:

```
cluster1::> cluster peer offer show
Peer Cluster Name       Authentication Creation            Expiration          Vserver Peers
----------------------- -------------- ------------------- ------------------- --------------
```

cluster peer policy commands

Manage the policy configuration of the cross-cluster relationship facility

cluster peer policy modify

Modify the policy configuration for the cluster peering service

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The cluster peer policy modify command modifies the prevailing policy settings. One setting governs whether unauthenticated cluster peer relationships can exist. The other setting specifies a minimum length for passphrases.

Parameters

[-is-unauthenticated-access-permitted {true|false}] - Is Unauthenticated Cluster Peer Access Permitted

Use this parameter to specify whether unauthenticated peering relationships are allowed to exist. Setting the parameter value to true allows such relationships to exist. Setting the value to false prevents both the creation of unauthenticated peering relationships as well as the modification of existing peering relationships.
to be unauthenticated. Setting the value to false is not possible if the cluster currently is in any unauthenticated relationships.

\[-passphrase-minlength <integer>] - Passphrase Length Minimum

Use this parameter to specify a minimum length for passphrases as given to the \texttt{cluster peer create} or \texttt{cluster peer modify} commands in the future. The default value for this parameter is 8.

\begin{verbatim}
Examples
This example modifies the peering policy to disallow unauthenticated intercluster communications.

cluster1::> cluster peer policy show
Is Unauthenticated Cluster Peer Communication Permitted: true
                        Minimum Length for a Passphrase: 8

cluster1::> cluster peer policy modify -is-unauthenticated-access-permitted false

cluster1::> cluster peer policy show
Is Unauthenticated Cluster Peer Communication Permitted: false
                        Minimum Length for a Passphrase: 8
\end{verbatim}

Related references
\texttt{cluster peer create} on page 70
\texttt{cluster peer modify} on page 75

\textbf{cluster peer policy show}

Display the policy configuration for the cluster peering service

\textbf{Availability}: This command is available to cluster administrators at the admin privilege level.

\textbf{Description}
The \texttt{cluster peer policy show} command displays the prevailing cluster peer authentication policy. There are two policies at present: one to control whether any cluster peer relationships can be unauthenticated, and one to control the minimum length for a passphrase. If the policy is set to preclude unauthenticated peering relationships, then unauthenticated relationships cannot be created inadvertently. Passphrases of less than the minimum length may not be used. By default, this minimum length is set to 8, so passphrases must be 8 characters long or longer.

\begin{verbatim}
Examples
This example shows the cluster peer policy when unauthenticated relationships may not be created inadvertently.

cluster1::> cluster peer policy show
Is Unauthenticated Cluster Peer Communication Permitted: false
                        Minimum Length for a Passphrase: 9
\end{verbatim}

\textbf{cluster quorum-service commands}

Manage the quorum options of the cluster

\textbf{cluster quorum-service options commands}
The options directory
cluster quorum-service options modify

Modify the settings for cluster quorum-service

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The `cluster quorum-service options modify` command modifies the values of cluster quorum services options.

Parameters

`[-ignore-quorum-warning-confirmations {true|false}]` - Whether or Not Warnings Are Enabled

Specifies whether cluster quorum warnings and confirmations should be ignored when cluster operations could negatively impact cluster quorum:

- Halting a node (`system node halt`)
- Rebooting a node (`system node reboot`)
- Issuing a planned takeover (`storage failover takeover`)

The default setting is false.

Examples

The following example shows the usage of this command:

```
cluster1::> set advanced
Warning: These advanced commands are potentially dangerous; use them only when directed to do so by NetApp personnel.
Do you want to continue? {y|n}: y
cluster1::*> cluster quorum-service options modify -ignore-quorum-warning-confirmations true
```

cluster quorum-service options show

Display the settings for cluster quorum-service

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The `cluster quorum-service options show` command displays the values of cluster quorum services options.

Examples

The following example demonstrates showing the state of ignore-quorum-warning-confirmations when it is false and true.

```
cluster1::*> set advanced
Warning: These advanced commands are potentially dangerous; use them only when directed to do so by NetApp personnel.
Do you want to continue? {y|n}: y
```

cluster quorum-service commands
cluster ring commands

Display information about cluster replication rings

cluster ring show

Display cluster node member's replication rings

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The cluster ring show command displays a cluster's ring-replication status. Support personnel might ask you to run this command to assist with troubleshooting.

Parameters

{[-fields <fieldname>, ...]
   If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance ]
   If you specify the -instance parameter, the command displays detailed information about all fields.

[-node <nodename>|local] - Node
   Selects the rings that match this parameter value.

[-unitname {mgmt|vldb|vifmgr|bcomd|crs|availd}] - Unit Name
   Selects the rings that match this parameter value. Possible values are:
   • mgmt - The management application
   • vldb - The volume location database
   • vifmgr - The virtual-interface manager
   • bcomd - The SAN management daemon
   • crs - The configuration replication service

[-online {master|secondary|offline}] - Status
   Selects the rings that match this parameter value.

[-epoch <integer>] - Epoch
   Selects the rings that match this parameter value.

[-master <nodename>] - Master Node
   Selects the rings that match this parameter value.

[-local <nodename>] - Local Node
   Selects the rings that match this parameter value.
[\texttt{-db-epoch \textless integer\textgreater}] - DB Epoch

Selects the rings that match this parameter value.

[\texttt{-db-trnxs \textless integer\textgreater}] - DB Transaction

Selects the rings that match this parameter value.

[\texttt{-num-online \textless integer\textgreater}] - Number Online

Selects the rings that match this parameter value.

[\texttt{-rdb-uuid \textless UUID\textgreater}] - RDB UUID

Selects the rings that match this parameter value.

**Examples**

The following example displays information about all replication rings in a two-node cluster:

```
cluster1:*> cluster ring show

       Node UnitName Epoch  DB Epoch  DB Trnxs Master    Online
--------- -------- -------- -------- -------- --------- ---------
node0    mgmt     1        1068     node0     master
node0    vldb     1        98       node0     master
node0    vifmgr   1        350      node0     master
node0    bcomd    1        56       node0     master
node0    crs      1        88       node0     master
node0    mgmt     1        1068     node0     master
node0    vldb     1        98       node0     master
node0    vifmgr   1        350      node0     master
node0    bcomd    1        56       node0     master
node0    crs      1        88       node0     master
10 entries were displayed.
```

**Cluster Statistics Commands**

The statistics directory

The cluster statistics command displays statistics of Data ONTAP 8 systems.

**cluster statistics show**

Display cluster-wide statistics

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The cluster statistics show command displays the following information. Each item lists the current value and, if applicable, the change (delta) from the previous reported value.

- CPU busy percentage
- Average of CPU busy percentage (advanced privilege level only)
- Total number of NFS and CIFS operations
- Number of NFS operations
- Number of CIFS operations
- Number of cache operations (advanced privilege level only)
- Total amount of network data received (advanced privilege level only)
- Total amount of network data sent (advanced privilege level only)
- Number of packets received (advanced privilege level only)
- Number of packets sent (advanced privilege level only)
- Busy percentage for the data network
- Amount of data received on the data network
- Amount of data sent on the data network
- Busy percentage for the cluster network
- Amount of data received on the cluster network
- Amount of data sent on the cluster network
- Amount of data read from disk
- Amount of data written to disk

At the diagnostic privilege level, the command displays the following information:

- Average of CPU busy percentage
- CPU busy percentage
- Total number of operations
- Number of NFS operations
- Number of CIFS operations
- Number of Fcache operations
- Number of SpinFS operations
- Total amount of network traffic received
- Total amount of network traffic sent
- Percentage of data-network utilization
- Amount of data-network traffic received
- Amount of data-network traffic sent
- Percentage of cluster-network utilization
- Amount of cluster-network traffic received
- Amount of cluster-network traffic sent
- Amount of data read from disk
- Amount of data written to disk
- Number of packets received
- Number of packets sent

**Examples**

The following example displays cluster statistics:
cluster time-service commands

Manage cluster time services

cluster time-service ntp commands

Manage cluster Network Time Protocol (NTP) service

cluster time-service ntp security commands

The security directory

cluster time-service ntp security modify

Modify NTP security settings

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The cluster time-service ntp security modify command allows setting of security parameters related to the Network Time Protocol (NTP) subsystem.

Parameters
[-is-query-enabled {true | false}] - Is Querying of NTP Server Enabled?

Setting this parameter to true allows querying of the NTP subsystem from systems external to the cluster. For example, querying a node using the standard "ntpq" command can be enabled by this command. The default setting is false to protect against possible security vulnerabilities. If querying of the NTP subsystem is disabled, the cluster time-service ntp status show command can be used to obtain similar information. Although querying of the NTP subsystem from external hosts can be disabled with this command, executing a local query to the localhost address is always enabled.

Examples
The following example enables the querying of the NTP subsystem from clients external to the cluster:

```
cluster1:~> cluster time-service ntp security modify -is-query-enabled true
```

cluster time-service commands
Related references

*cluster time-service ntp status show* on page 104

---

**cluster time-service ntp security show**

Display NTP security settings

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**

The `cluster time-service ntp security show` command displays the configuration of security features related to the Network Time Protocol (NTP) subsystem.

**Examples**

The following example displays the NTP security configuration of the cluster:

```
cluster1::> cluster time-service ntp security show
External queries enabled?: true
```

---

**cluster time-service ntp server commands**

The server directory

---

**cluster time-service ntp server create**

Add a NTP Server

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The `cluster time-service ntp server create` command associates the cluster with an external network time server for time correction and adjustment by using the Network Time Protocol (NTP).

The command resolves the time server host name to an IP address and performs several validation checks. If an error is detected during validation, it is reported.

The validation checks performed by this command include the following:

- The NTP replies to an NTP query with the specified protocol version.
- The NTP reply indicates that the external time server is synchronized to another time server.
- The distance and dispersion of the NTP reply from the "root" or source clock are within the required limits.

**Parameters**

```
-server <text> - NTP Server Host Name, IPv4 or IPv6 Address
```

This specifies the host name or IP address of the external NTP server that is to be associated with the cluster for time correction and adjustment.
[version {3|4|auto}] - NTP Version for Server (default: auto)

This optionally specifies the NTP protocol version that should be used for communicating with the external
NTP server. If the external NTP server does not support the specified protocol version, time exchange cannot
take place.

The supported values for this parameter include the following:

• 3 - Use NTP protocol version 3, which is based on Internet Standard Request For Comments (RFC) #1305.

• 4 - Use NTP protocol version 4, which is based on Internet Standard RFC #5905.

• auto - Have Data ONTAP select the NTP protocol version.

The default setting is auto.

[is-preferred {true|false}] - Is Preferred NTP Server (default: false) (privilege: advanced)

This optionally specifies whether the external NTP server is the primary time source for correcting and
adjusting the cluster time. The responses from this source will be used unless its time is outside the accepted
selection range.

The default setting is false.

You use this parameter when a high quality radio (or GPS) based time server is being used with a set of non-
radio based backup time servers.

Examples

The following example associates the cluster with an NTP server named ntp1.example.com.

```
cluster1::> cluster time-service ntp server create -server ntp1.example.com
```

cluster time-service ntp server delete

Delete a NTP Server

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The cluster time-service ntp server delete command removes the association between the cluster and an external
network time server that uses the Network Time Protocol (NTP).

Parameters

- server <text> - NTP Server Host Name, IPv4 or IPv6 Address

This specifies the host name or IP address of an existing external NTP server that the cluster will disassociate
from.

Examples

The following example disassociates an NTP server named ntp2.example.com from the cluster:

```
cluster1::> cluster time-service ntp server delete -server ntp2.example.com
```

cluster time-service ntp server modify

Modify NTP Server Options

Availability: This command is available to cluster administrators at the admin privilege level.
Description
The `cluster time-service ntp server modify` command modifies the configuration of an existing external network time server that uses the Network Time Protocol (NTP) for time correction and adjustment.

Parameters
- `-server <text>` - NTP Server Host Name, IPv4 or IPv6 Address
  This specifies the host name or IP address of an existing external NTP server that is to be modified.

- `[-version {3|4|auto}]` - NTP Version for Server (default: auto)
  This optionally specifies the NTP protocol version that should be used for communicating with the external NTP server. If the external NTP server does not support the specified protocol version, time exchange cannot take place.

  The supported values for this parameter include the following:
  - 3 - Use NTP protocol version 3, which is based on Internet Standard Request For Comments (RFC) #1305.
  - 4 - Use NTP protocol version 4, which is based on Internet Standard RFC #5905.
  - auto - Have Data ONTAP select the NTP protocol version.

  The default setting is auto.

- `[-is-preferred {true|false}]` - Is Preferred NTP Server (default: false) (privilege: advanced)
  This optionally specifies whether the external NTP server is the primary time source for correcting and adjusting the cluster time. The responses from this source will be used unless its time is outside the accepted selection range.

  The default setting is false.

  You use this parameter when a high quality radio (or GPS) based time server is being used with a set of non-radio based backup time servers.

  This parameter is available only at the advanced privilege level and higher.

Examples
The following example modifies the NTP version of an NTP server named ntp1.example.com. The NTP version is changed to 4.

```
cluster1::> cluster time-service ntp server modify -server ntp1.example.com -version 4
```

`cluster time-service ntp server reset`
Reset NTP server list to a default selection

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The `cluster time-service ntp server reset` command replaces the current configuration with one of the selected configurations.

If none or more than one time service configuration is selected, the command will fail.

Parameters
- `[-use-public {true|false}]` - Reset Server List to Public Identified Defaults (default: false)
  When set to true, this specifies that the public NTP server list used by Data ONTAP should replace the current configuration.
The default setting is `false`.

**Examples**
The following example replaces the current time service configuration with the default public NTP server list that is used by Data ONTAP.

```
cluster1::> cluster time-service ntp server reset -use-public true
```

**cluster time-service ntp server show**
Display a list of NTP Servers

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**
The `cluster time-service ntp server show` command displays the association between the cluster and external network time servers that use the Network Time Protocol (NTP).

**Parameters**

```
[-fields <fieldname>, ...]
If you specify the `-fields <fieldname>, ...` parameter, the command only displays the fields that you specify. For example: `-fields server,version`.

[-instance]
If the `-instance` parameter is specified, the command displays all the available field information.

[-server <text>] - NTP Server Host Name, IPv4 or IPv6 Address
If this parameter is specified, the command displays the external NTP servers that match the specified server name or IP address.

[-version (3|4|auto)] - NTP Version for Server (default: auto)
If this parameter is specified, the command displays the external NTP servers that use the specified NTP version.

[-is-preferred (true|false)] - Is Preferred NTP Server (default: false) (privilege: advanced)
If this parameter is specified, the command displays the external NTP server or servers that match the specified preferred server status.

[-is-public (true|false)] - Is Public NTP Server Default (privilege: advanced)
If this parameter is specified, the command displays the information for the external NTP servers that are either on the NTP server list defined by Data ONTAP (`true`) or not on the list (`false`).

**Examples**
The following example displays information about all external NTP time servers that are associated with the cluster:

```
cluster1::> cluster time-service ntp server show
Server               Version
--------------------  -----------
ntp1.example.com     auto
ntp2.example.com     auto
```

**cluster time-service ntp status commands**
The status directory
cluster time-service ntp status show

Display status of the node’s NTP client

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The cluster time-service ntp status show command displays the status of the associations between the cluster and external network time servers that use the Network Time Protocol (NTP).

Parameters

[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance]]
If this parameter is specified, the command displays detailed information about all entries.

[-node {<nodename>|local}] - Node
If this parameter is specified, the command displays information related to associations on the specified node.

[-server <text>] - NTP Server Host Name, IPv4 or IPv6 Address
If this parameter is specified, the command displays information about the associations related to the specified NTP server. The server should be specified as it is configured in the cluster time-service ntp server show command.

[-server-address <IP Address>] - Server IP Address
If this parameter is specified, the command displays information about the associations related to the NTP server with the specified IP address.

[-is-peer-reachable {true|false}] - Is Peer Reachable and Responding to Polls?
If this parameter is specified as true, the command displays information about associations with the NTP servers that have been successfully polled.

[-is-peer-selected {true|false}] - Is Peer Selected as Clock Source?
If this parameter is specified as true, the command displays information about associations with the NTP servers that have been selected as the current clock source.

[-selection-state <State of NTP Peer Selection>] - State of Server Selection
If this parameter is specified, the command displays information about associations with the specified selection state.

[-selection-state-text <text>] - Description of Server Selection State
If this parameter is specified, the command displays information about associations with the specified selection state description.

[-poll-interval <integer>] - Poll Interval (secs)
If this parameter is specified, the command displays information about associations that have the specified polling interval.

[-time-last-poll <integer>] - Time from Last Poll (secs)
If this parameter is specified, the command displays information about associations that are polled at the specified time.

[-offset <double>] - Offset from Server Time (ms)
If this parameter is specified, the command displays information about associations with the specified offset from the NTP server.
[\texttt{-delay <double>}] - Delay Time to Server (ms)
If this parameter is specified, the command displays information about associations with the specified travelling time to the NTP server.

[\texttt{-jitter <double>}] - Maximum Offset Error (ms)
If this parameter is specified, the command displays information about associations with the specified offset error from the NTP server.

[\texttt{-reachability <Hex String>}] - Reachability of Server
If this parameter is specified, the command displays information about associations with the specified reachability to the NTP server. Reachability is specified as a hexbyte that has a bit to represent the success of each of the last eight polls of the specified server. A set bit represents a successful poll. The least significant bit represents the most recent poll, the next most significant bit the poll before that, and so on.

[\texttt{-server-stratum <integer>}] - Stratum of Server Clock
If this parameter is specified, the command displays information about associations with NTP servers with the specified clock stratum.

[\texttt{-server-reference <text>}] - Reference Clock at Server
If this parameter is specified, the command displays information about associations with NTP servers using the specified clock as reference.

[\texttt{-reported-errors <NTP Peer and Packet Errors>, ...}] - Reported Packet and Peer Errors
If this parameter is specified, the command displays information about associations with the specified errors.

\section*{Examples}
The following example displays the status of the NTP associations of the cluster:

\begin{verbatim}
cluster-1::*>cluster time-service ntp status show
Node: node-1
Server                  Reachable  Selection State                Offset (ms)
----------------------- ---------  ------------------------------ ------------
ntp1.eng.netapp.com          true  Currently Selected Server            39.122
ntp2.eng.netapp.com          true  Candidate Server                     37.786
2 entries were displayed.
\end{verbatim}

The following example displays the status of the association with the specified external NTP server:

\begin{verbatim}
cluster-1::*>cluster time-service ntp status show -instance -server ntp1.example.com
Node: node-1
NTP Server Host Name, IPv4 or IPv6 Address: ntp1.example.com
Server IP Address: 10.56.32.33
Is Peer Reachable and Responding to Polls?: true
Is Peer Selected as Clock Source?: true
State of Server Selection: sys_peer
Description of Server Selection State: Currently Selected Server
Poll Interval (secs): 64
  Time from Last Poll (secs): 1
  Offset from Server Time (ms): 26.736
  Delay Time to Server (ms): 61.772
  Maximum Offset Error (ms): 3.064
  Reachability of Server: 01
  Stratum of Server Clock: 2
  Reference Clock at Server: 10.56.68.21
  Reported Packet and Peer Errors: -
\end{verbatim}

\section*{Related references}
\textit{cluster time-service ntp server show} on page 103
Event Commands

Manage system events

The event commands enable you to work with system events and set up notifications.

event catalog commands

View the event catalog.

event catalog show

Display event definitions

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The event catalog show command displays information about events in the catalog. By default, this command displays the following information:

• Message name of the event
• Severity of the event
• SNMP trap type of the event

To display detailed information about a specific event, run the command with the -message-name parameter, and specify the name of the event. The detailed view adds the following information:

• Full description of the event
• Action to be taken to address the event
• Event's deprecation status

You can specify additional parameters to limit output to the information that matches those parameters. For example, to display information only about events with an event name that begins with raid, enter the command with the -message-name raid* parameter. The parameter value can either be a specific text string or a wildcard pattern.

Alternatively, an event filter can also be specified to limit the output events.

Parameters

{ [-fields <fieldname>,...]  
    If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.
  
  [-instance ]  
    If you specify the -instance parameter, the command displays detailed information about all fields.

  [-message-name <Message Name>] - Message Name  
    Selects the events that match this parameter value.

  [-filter-name <text>] - Filter Name  
    Selects the events that match this parameter value. The parameter value indicates an existing filter name that, when applied permits the inclusion of the listed events.}
[-severity {EMERGENCY|ALERT|ERROR|NOTICE|INFORMATIONAL|DEBUG}] - Severity

Selects the events that match this parameter value.

[-description <text>] - Description

Selects the events that match this parameter value.

[-action <text>] - Corrective Action

Selects the events that match this parameter value.

[-snmp-trap-type {Standard|Built-in|Severity-based}] - SNMP Trap Type

Selects the events that match this parameter value. The parameter value describes the type of SNMP trap associated with the event. The value can be one of the following: Standard trap type events are those defined in the RFCs. Built-in trap types are those that are NetApp Enterprise traps specific to events. The remaining events are considered to have Severity-based SNMP trap types.

[-deprecated {true|false}] - Is Deprecated

Selects the events that match this parameter value. The parameter value indicates whether the event is deprecated or not.

**Note:** Deprecated events may be removed in a future release of Data ONTAP.

### Examples

The following example displays the event catalog:

```
cluster1::> event filter show -filter-name filter1
Filter Name  Rule   Rule          Message Name  SNMP Trap Type  Severity
-----------  ------  ------------  ----------------  ---------------  --------
filter1      1      include  zapi.*       *              *         
2 entries were displayed.

cluster1::> event catalog show -filter-name filter1
Message                          Severity         SNMP Trap Type
-------------------------------- ---------------- -----------------
zapi.killed                      NOTICE           Severity-based
zapi.method.notfound             NOTICE           Severity-based
zapi.sf.up.ready                 INFORMATIONAL  Severity-based
zapi.snapshot.success            NOTICE           Severity-based
zapi.streamout.noMethod          NOTICE           Severity-based
5 entries were displayed.
```

```
cluster1::> event catalog show -message-name zsm.* -filter-name filter1
There are no entries matching your query.

cluster1::> event catalog show -message-name zapi.* -filter-name filter1
Message                          Severity         SNMP Trap Type
-------------------------------- ---------------- -----------------
zapi.method.notfound             NOTICE           Severity-based
zapi.sf.up.ready                 INFORMATIONAL  Severity-based
zapi.streamout.noMethod          NOTICE           Severity-based
4 entries were displayed.
```

```
cluster1::> event catalog show -message-name CR.*
Message                          Severity         SNMP Trap Type
-------------------------------- ---------------- -----------------
CR.Corrupt.Redir.Deleted         INFORMATIONAL  Severity-based
CR.Dangling.Redir.Deleted        INFORMATIONAL  Severity-based
CR.Data.File.Inaccessible        NOTICE           Severity-based
CR.Del.CrptStreamRedir.Failed    NOTICE           Severity-based
CR.Del.Dangling.Redir.Failed     NOTICE           Severity-based
CR.Del.DangStreamRedir.Failed    NOTICE           Severity-based
```

**event catalog commands**

107
event config commands

Configure the mail server settings used for notifications

event config force-sync

Synchronize a node's EMS configuration with the cluster wide EMS configuration

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

The event config force-sync command forces a node's EMS configuration to be synchronized with the cluster wide EMS configuration. The configuration is automatically synchronized among all nodes in the cluster, but in rare cases a node may not be updated. This command simplifies the recovery from this issue.

The following example shows where this command is useful: An email destination is configured for all CRITICAL level event occurrences. When the event is generated, all nodes generate an email except one. This command forces that node to refresh a stale configuration.

Parameters

[-node {<nodename> | local}] - Node

The node parameter specifies which controller will be synchronized.
**event config modify**

Modify log configuration parameters

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

Use the `event config modify` command to configure event notification and logging for the cluster.

**Parameters**

**[-mail-from <mail address>]** - Mail From

Use this parameter to configure the email address from which email notifications will be sent. You can configure the cluster to send email notifications when specific events occur. Use the `event route add-destinations` and `event destination create` commands to configure email destinations for events.

**[-mail-server <text>]** - Mail Server (SMTP)

Use this parameter to configure the name or IP address of the SMTP server used by the cluster when sending email notification of events.

**[-suppression {on|off}]** - Event Throttling/Suppression (privilege: advanced)

Use this parameter to configure whether event suppression algorithms are enabled ("on") or disabled ("off"). The event processing system implements several algorithms to throttle events. The documentation for `event show-suppression` command describes the suppression algorithms in detail.

**Note:** The suppression parameter can disable both autosuppression and duplicate suppression, but timer suppression cannot be disabled.

**[-console {on|off}]** - Console Logging (privilege: advanced)

Use this parameter to configure whether events are displayed on the console port ("on") or not displayed("off").

**[-proxy-url <text>]** - HTTP/HTTPS Proxy URL

If your organization uses a proxy, use this parameter to specify an HTTP or HTTPS proxy for rest-api type EMS notification destinations. The URL must start with an http:// prefix. HTTPS connections to a proxy are not supported. To specify a URL that contains a question mark, press ESC followed by the "?".

**[-proxy-user <text>]** - User Name for HTTP/HTTPS Proxy

If authentication is required, use this parameter to specify the user name for the HTTP or HTTPS proxy server specified by the `-proxy-url` parameter. Use the `event config set-proxy-password` command to set the password used for this user name.

**Examples**

The following command sets the "Mail From" address for event notifications to "admin@example.com" and the "Mail Server" to "mail.example.com":

```
cluster1::> event config modify -mailfrom admin@example.com -mailserver mail.example.com
```

The following command configures a proxy that requires authentication:

```
cluster1::> event config modify -proxy-url http://proxy.example.com:8080 -proxy-user-name admin
cluster1::> event config set-proxy-password
Enter the password:
Confirm the password:
```

The following example turns on event suppression and console logging:
Related references

- `event route add-destinations` on page 144
- `event destination create` on page 111
- `event log show` on page 129
- `event config set-proxy-password` on page 110

**event config set-proxy-password**

Modify password for proxy server

**Availability:** This command is available to cluster administrators at the `admin` privilege level.

**Description**

Use the `event config set-proxy-password` command to set the password for authenticated access to an HTTP or HTTPS proxy being used for EMS notifications. This password is used with the user name you specify using the `event config modify -proxy-user` command to send EMS messages to REST API destinations via the proxy you specify using the `event config modify -proxy-url` command. If you enter the command without parameters, the command prompts you for a password and for a confirmation of that password. Enter the same password at both prompts. The password is not displayed.

**Examples**

The following example shows successful execution of this command:

```
cluster1::> event config set-proxy-password
Enter the password:
Confirm the password:
```

**event config show**

Display log configuration parameters

**Availability:** This command is available to cluster administrators at the `admin` privilege level.

**Description**

The `event config show` command displays information about the configuration of event notification and event logging for the cluster.

"Mail From" is the email address that the event notification system uses as the "From" address for email notifications.

"Mail Server" is the name or IP address of the SMTP server that the event notification system uses to send email notification of events.

"Proxy URL" is the HTTP or HTTPS proxy server URL used by rest-api type EMS notification destinations if your organization uses a proxy.

"Proxy User Name" is the user name for the HTTP or HTTPS proxy server if authentication is required.

"Suppression" indicates whether event suppression algorithms are enabled ("on") or disabled ("off"). The event processing system implements several algorithms to throttle events.

**Note:** The suppression parameter can disable both autosuppression and duplicate suppression, but not timer suppression.

"Console" indicates whether events are displayed on the console port ("on") or not displayed("off").
**Examples**

The following example displays the configuration of event notification for the cluster:

```
cluster1::> event config show
Mail From: admin@example.com
Mail Server: mail.example.com
Proxy URL: -
Proxy User Name: -
```

The following example displays the configuration of event notification with HTTP or HTTPS proxy:

```
cluster1::> event config show
Mail From: admin@example.com
Mail Server: mail.example.com
Proxy URL: http://proxy.example.com:3128
Proxy User Name: admin
```

At the diagnostic level, the output displays the following information:

```
cluster1::*> event config show
Mail From: admin@example.com
Mail Server: mail.example.com
Suppression: on
Console: on
Max Target Log Size: 5242880
Max Filter Count: 50
Max Filter Rule Count: 128
Max Destination Count: 20
Max Notification Count: 20
Filter Exempt from Suppression: no_info_debug_events
Duplicate Suppression Duration (secs): 120
Log Rotation Size (bytes): 40MB
```

---

**event destination commands**

(DEPRECATED)-Manage route destinations, for example e-mail or snmp

**event destination create**

(DEPRECATED)-Create an event destination

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

**Note:** This command has been deprecated. It may be removed from a future release of Data ONTAP. Instead, use the "event notification destination" command set.

The *event destination create* command creates a new event destination. An event destination is a list of addresses that receive event notifications. These addresses can be e-mail addresses, SNMP trap hosts, and syslog servers. Event destinations are used by event routes. Event routes describe which events generate notifications, and event destinations describe where to send those notifications.

When you create a destination, you can add e-mail addresses, SNMP trap hosts, and syslog hosts to the definition of the destination. Once the destination is fully defined, use the *event route add-destinations* command to associate the destination with event routes so that notifications of those events are sent to the recipients in the destination.

To see the current list of all destinations and their recipients, use the *event destination show* command.

There are several default destinations provided for your use.
• allevents - A useful destination for all system events, though no events are routed to this destination by default.

• asup - Events routed to this destination trigger AutoSupport(tm). Only use this destination to send notifications to technical support. See system node autosupport for more information.

• criticals - A useful destination for critical events though no events are routed to this destination by default.

• pager - A useful destination for all events that are urgent enough to page a system administrator, though no events are routed to this destination by default.

• traphost - The default destination for all SNMP traps. You can also use the system snmp traphost add command to add SNMP recipients to the traphost default destination.

To add recipients to the default destinations, use the event destination modify command.

You should not create a destination that sends events to more than one type of recipient. Use separate destinations for e-mail, SNMP, and syslog activity. Also, use the traphost default destination for all SNMP activity. You must not create any other destination that sends traps to SNMP trap hosts. The traphost default destination is not required to be added to any event route.

Parameters
- **-name <text>** - Name
  This mandatory parameter specifies name of the event destination to create.

- **-mail <mail address>, ...** - Mail Destination
  Use this parameter to specify one or more e-mail addresses to which event notifications will be sent. For events to properly generate e-mail notifications, the event system must also be configured with an address and mail server from which to send mail. See event config modify for more information.

- **-snmp <Remote IP>, ...** - SNMP Destination
  To send traps to SNMP trap hosts, use this parameter with the host names or IP addresses of those trap hosts.

- **-syslog <Remote IP>, ...** - Syslog Destination
  Use this parameter with the host names or IP addresses of any remote syslog daemons to which syslog entries will be sent.

- **-syslog-facility <Syslog Facility>** - Syslog Facility
  This parameter optionally specifies a syslog facility with which the syslog is sent. Possible values for this parameter are default, local0, local1, local2, local3, local4, local5, local6, and local7. If you specify the default syslog facility, syslogs are tagged LOG_KERN or LOG_USER.

- **-snmp-community <text>** - SNMP Trap Community
  To specify an SNMP trap community, use this parameter with that string.

- **-hide-parameters {true|false}** - Hide Parameter Values?
  Use this parameter with the value "true" to hide event parameters by removing them from event notifications. This is useful to prevent sensitive information from being sent over non-secure channels.

Examples
The following example creates an event destination named support.email that e-mails events to the addresses supportmgr@example.com, techsupport@example.com, and oncall@example.com.

```
cluster1::> event destination create -name support.email -mail supportmgr@example.com,techsupport@example.com, oncall@example.com
```

This example creates an event destination named support.bucket01 that sends the notifications to a syslog host.

```
cluster1::> event destination create -name support.bucket01 -syslog loghost.example.com
```

- `event destination modify` on page 114

**event destination delete**

(DEPRECATED)-Delete an event destination

**Availability:** This command is available to cluster administrators at the `admin` privilege level.

**Description**

*Note:* This command has been deprecated. It may be removed from a future release of Data ONTAP. Instead, use the "event notification destination" command set.

The `event destination delete` command removes a specified destination from the list of valid destinations. An event destination is a list of addresses that receive event notifications. These addresses can be e-mail addresses, SNMP trap hosts, and syslog servers. Event destinations are used by event routes. Event routes describe which events generate notifications, and event destinations describe where to send those notifications.

Once you delete a destination, you will not be able to add that destination to any event route.

You will not be able to delete a destination if it is in use by any event routes. To remove a destination from all event routes, so that you can delete it, use the `event route remove-destinations -messagename * -destination name` command.

There are several default destinations that cannot be deleted:

- `allevents` - A useful destination for all system events, though no events are routed to this destination by default.
- `asup` - Events routed to this destination trigger AutoSupport(tm). Only use this destination to send notifications to technical support. See `system node autosupport` for more information.
- `critinals` - A useful destination for critical events though no events are routed to this destination by default.
- `pager` - A useful destination for all events that are urgent enough to page a system administrator, though no events are routed to this destination by default.
- `traphost` - The default destination for all SNMP traps. You can also use the `system snmp traphost delete` command to delete SNMP recipients from the traphost default destination.

To see the current list of all destinations, use the `event destination show` command. To add a new destination to the list, use the `event destination create` command.

**Parameters**

- `-name <text>` - Name

  This mandatory parameter specifies the event destination to delete.

**Examples**

The following example deletes an event destination named manager.pager:

```
cluster1::> event destination delete -name manager.pager
```
Related references

- `event route remove-destinations` on page 147

- `event destination create` on page 111

**event destination modify**

(DEPRECATED)-Modify an event destination

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

*Note:* This command has been deprecated. It may be removed from a future release of Data ONTAP. Instead, use the "event notification destination" command set.

The `event destination modify` command changes the definition of an existing event destination. An event destination is a list of addresses that receive event notifications. These addresses can be e-mail addresses, SNMP traphosts, and syslog servers. Event destinations are used by event routes. Event routes describe which events generate notifications, and event destinations describe where to send those notifications.

Modifying a parameter writes over the existing value of the parameter. To extend a parameter, make sure to include the current value of that parameter. For instance, to add an e-mail address to a destination, include all of the current e-mail addresses assigned to that destination along with the new address. To see the current definition of a destination, use the `event destination show -name name` command.

You must not create a destination that sends events to more than one type of recipient. Use separate destinations for e-mail, SNMP, and syslog activity. Also, use the traphost default destination for all SNMP activity. You should not create any other destination that sends to SNMP traphosts. The traphost default destination is not required to be added to any event route.

**Parameters**

- `-name <text>` - Name
  
  This mandatory parameter specifies name of the event destination to modify.

- `[-mail <mail address>, ...]` - Mail Destination
  
  Use this parameter to specify one or more e-mail addresses to which event notifications will be sent. For events to properly generate e-mail notifications, the event system must also be configured with an address and mail server from which to send mail. See `event config modify` for more information.

- `[-snmp <Remote IP>, ...]` - SNMP Destination
  
  To send traps to SNMP trap hosts, use this parameter with the host names or IP addresses of those trap hosts.

- `[-syslog <Remote IP>, ...]` - Syslog Destination
  
  Use this parameter with the host names or IP addresses of any remote syslog daemons to which syslog entries will be sent.

- `[-syslog-facility <Syslog Facility>]` - Syslog Facility
  
  This parameter optionally specifies a syslog facility with which the syslog is sent. Possible values for this parameter are default, local0, local1, local2, local3, local4, local5, local6, and local7. If you specify the default syslog facility, syslogs are tagged LOG_KERN or LOG_USER.

- `[-snmp-community <text>]` - SNMP Trap Community
  
  To specify an SNMP trap community, use this parameter with that string.
[--hide-parameters \{true\|false\}] - Hide Parameter Values?

Enter this parameter with the value "true" to hide event parameters by removing them from event notifications. This is useful to prevent sensitive information from being sent over non-secure channels. Enter it with the value "false" to turn off parameter hiding.

Examples

The following example modifies an event destination named snmp.hosts to send events to SNMP trap hosts named traphost1 and traphost2:

```
cluster1::> event destination modify -name snmp.hosts -snmp traphost1.example.com,traphost2.example.com
```

This example adds the e-mail address of a remote support facility to an existing list of e-mail recipients.

```
cluster1::> event destination show -name support
Name: support
  Mail Destination: support.hq@company.com
  SNMP Destination: -
  Syslog Destination: -
  Syslog Facility: -
  SNMP Trap Community: -
  Hide Parameter Values?: -
cluster1::> event destination modify -name support -mail support.hq@company.com,support.remote@company.com
cluster1::> event destination show -name support
Name: support
  Mail Destination: support.hq@company.com, support.remote@company.com
  SNMP Destination: -
  Syslog Destination: -
  Syslog Facility: -
  SNMP Trap Community: -
  Hide Parameter Values?: -
```

**event destination show**

(DEPRECATED)-Display event destinations

**Availability:** This command is available to cluster administrators at the *admin* privilege level.

**Description**

**Note:** This command has been deprecated. It may be removed from a future release of Data ONTAP. Instead, use the "event notification destination" command set.

The event destination show command displays information about configured event destinations. An event destination is a list of addresses that receive event notifications. These addresses can be e-mail addresses, SNMP trap hosts, and syslog servers. Event destinations are used by event routes. Event routes describe which events generate notifications, and event destinations describe where to send those notifications.

Default destinations:
- `allevents` - A useful destination for all system events, though no events are routed to this destination by default.
• asup - Events routed to this destination trigger AutoSupport(tm). Only use this destination to send notifications to technical support. See system node autosupport for more information.

• criticals - A useful destination for critical events although no events are routed to this destination by default.

• pager - A useful destination for all events that are urgent enough to page a system administrator, though no events are routed to this destination by default.

• traphost - The default destination for all SNMP traps. You can also use the system snmp traphost show command to view SNMP recipients for the traphost default destination.

To add recipients to the default destination, use the event destination modify command.

Note: While you can use both host names and IP addresses with parameters, only IP addresses are stored. Unless all DNS and reverse-DNS operations complete successfully, IP addresses might appear in command output.

Parameters

{ [-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?' to display the fields to specify.

  [-facility]
  Displays only the syslog destinations and syslog facilities.

  [-instance]
  If you specify the -instance parameter, the command displays detailed information about all fields.

  [-name <text>] - Name
  Selects the destinations that match this parameter value.

  [-mail <mail address>, ...] - Mail Destination
  Selects the destinations that match this parameter value.

  [-snmp <Remote IP>, ...] - SNMP Destination
  Selects the destinations that match this parameter value (SNMP trap hosts).

  [-syslog <Remote IP>, ...] - Syslog Destination
  Selects the destinations that match this parameter value (syslog event notification daemons).

  [-syslog-facility <Syslog Facility>] - Syslog Facility
  Selects the destinations that match this parameter value. Valid values are: default, local0, local1, local2, local3, local4, local5, local6, and local7.

  [-snmp-community <text>] - SNMP Trap Community
  Selects the destinations that match this parameter value.

  [-hide-parameters {true|false}] - Hide Parameter Values?
  Selects the destinations that match this parameter value (true selects destinations that do not receive full event parameters, false selects destinations that receive full event parameters). Event parameters may be hidden to prevent sensitive information from being sent over non-secure channels.

Examples

The following example displays information about all event destinations:

```
cluster1::> event destination show
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Mail Dest.</th>
<th>SNMP Dest.</th>
<th>Syslog Dest.</th>
<th>Hide Params</th>
</tr>
</thead>
<tbody>
<tr>
<td>allevents</td>
<td>-</td>
<td>-</td>
<td>logger.example.com</td>
<td></td>
</tr>
<tr>
<td>asup</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td></td>
</tr>
</tbody>
</table>

**event filter commands**

Create, delete and view event filters.

**event filter copy**

Copy an event filter

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
The event filter copy command copies an existing filter to a new filter. The new filter will be created with rules from the source filter. For more information, see the event filter create command.

**Parameters**

- **filter-name <text>** - Filter Name
  
  Use this mandatory parameter to specify the name of the event filter to copy.

- **new-filter-name <text>** - New Event Filter Name
  
  Use this mandatory parameter to specify the name of the new event filter to create and copy the rules.

**Examples**
The following example copies an existing event filter named emer-wafl-events to a new filter named filter1:

```
cluster1::> event filter show
Filter Name Rule Position Type Message Name SNMP Trap Type Severity
----------- ------ --------- ---------------------- -------------- --------
default-trap-events
  1 include *          * EMERGENCY, ALERT
  2 include *          * Standard, Built-in
emem-wafl-events
  1 include wafl.*    * EMERGENCY
  2 exclude *         * *
important-events
  1 include *         * EMERGENCY, ALERT
  2 include callhome.* * ERROR
```
cluster1::> event filter copy -filter-name emer-wafl-events -new-filter-name filter1

cluster1::> event filter show

Filter Name  Rule            Rule       Message Name           SNMP Trap Type  Severity
-----------  -------- --------- ---------------------- --------------- --------
          Position  Type
-----------  -------- --------- ---------------------- --------------- --------
default-trap-events
  1        include   *                      *               EMERGENCY, ALERT
  2        exclude   *                      *               *
emer-wafl-events
  1        include   wafl.*                 *               EMERGENCY
  2        exclude   *                      *               *
filter1
  1        include   wafl.*                 *               EMERGENCY
  2        exclude   *                      *               *
important-events
  1        include   callhome.*             *               ERROR
  2        exclude   *                      *               *
no-info-debug-events
  1        include   *                      *               EMERGENCY, ALERT, ERROR,
NOTICE
          Position  Type
-----------  -------- --------- ---------------------- --------------- --------
          
no-info-debug-events
  2        exclude   *                      *               *

12 entries were displayed.

Related references

=event filter create on page 118

**event filter create**

Create a new event filter.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The *event filter create* command creates a new event filter. An event filter is used to select the events of interest and is made up of one or more rules, each of which contains the following three fields:

- name - event (message) name.
- severity - event severity.
- snmp-trap-type - event SNMP trap type.

These fields are evaluated for a match using a logical "AND" operation: name AND severity AND SNMP trap type. Within a field, the specified values are evaluated with an implicit logical "OR" operation. So, if *-snmp-trap-type Standard, Built-in* is specified, then the event must match *Standard OR Built-in*. The wildcard matches all values for the field.

- Type - include or exclude. When an event matches an include rule, it will be included into the filter, whereas it will be excluded from the filter if it matches an exclude rule.

Rules are checked in the order they are listed for a filter, until a match is found. There is an implicit rule at the end that matches every event to be excluded. For more information, see the *event filter rule* command.
There are three system-defined event filters provided for your use:

- **default-trap-events** - This filter matches all ALERT and EMERGENCY events. It also matches all Standard, Built-in SNMP trap type events.
- **important-events** - This filter matches all ALERT and EMERGENCY events.
- **no-info-debug-events** - This filter matches all non-INFO and non-DEBUG messages (EMERGENCY, ALERT, ERROR and NOTICE).

The system-defined event filters cannot be modified or deleted.

**Parameters**

- `-filter-name <text>` - **Filter Name**

  Use this mandatory parameter to specify the name of the event filter to create. An event filter name is 2 to 64 characters long. Valid characters are the following ASCII characters: A-Z, a-z, 0-9, ",", and "،". The name must start and end with: A-Z, a-z, ",", or 0-9.

**Examples**

The following example creates an event filter named filter1:

```
cluster1::> event filter create -filter-name filter1
```

<table>
<thead>
<tr>
<th>Filter Name</th>
<th>Rule</th>
<th>Rule Type</th>
<th>Message Name</th>
<th>SNMP Trap Type</th>
<th>Severity</th>
</tr>
</thead>
<tbody>
<tr>
<td>default-trap-events</td>
<td>1</td>

**event filter delete**

Delete existing event filters

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The *event filter delete* command deletes an existing event filter, along with all its rules.

The system-defined event filters cannot be deleted.

For more information, see the *event filter create* command.
Parameters

- **-filter-name <text>** - Filter Name

Use this mandatory parameter to specify the name of the event filter to delete.

## Examples

The following example deletes an event filter named filter1:

```
cluster1::> event filter delete -filter-name filter1
```

<table>
<thead>
<tr>
<th>Filter Name</th>
<th>Message Name</th>
<th>SNMP Trap Type</th>
<th>Severity</th>
</tr>
</thead>
<tbody>
<tr>

### Related references

*event filter create* on page 118

### event filter rename

Rename an event filter

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The *event filter rename* command is used to rename an existing event filter.

There are system-defined event filters provided for your use. The system-defined event filters cannot be modified or deleted.

For more information, see the *event filter create* command.
Parameters

- **filter-name <text>** - Filter Name
  
  Use this mandatory parameter to specify the name of the event filter to rename.

- **new-filter-name <text>** - New Event Filter Name
  
  Use this mandatory parameter to specify the new name the event filter should be renamed to.

Examples

The following example renames an existing filter named filter1 as emer-wafl-events:

```bash
cluster1::> event filter show
Filter Name Rule     Rule      Message Name           SNMP Trap Type  Severity
Position Type
----------- -------- --------- ---------------------- --------------- --------
default-trap-events
1        include   *                      *               EMERGENCY, ALERT
2        include   *                      Standard, Built-in
3        exclude   *                      *               *
filter1
1        include   wafl.*                 *               EMERGENCY
2        exclude   *                      *               *
important-events
1        include   *                      *               EMERGENCY, ALERT
2        include   callhome.*             *               ERROR
3        exclude   *                      *               *
no-info-debug-events
1        include   *                      *               EMERGENCY, ALERT, ERROR,
NOTICE
1        include   *                      *               EMERGENCY, ALERT, ERROR,
2        exclude   *                      *               *
10 entries were displayed.
cluster1::> event filter rename -filter-name filter1 -new-filter-name emer-wafl-events

- [event filter create](#) on page 118

**event filter show**

Display the list of existing event filters.

**Availability:** This command is available to cluster administrators at the admin privilege level.
Description
The event filter show command displays all the event filters which are configured. An event filter is used to select the events of interest and is made up of one or more rules, each of which contains the following three fields:

- name - event (message) name.
- severity - event severity.
- snmp-trap-type - event SNMP trap type.

These fields are evaluated for a match using a logical "AND" operation: name AND severity AND SNMP trap type. Within a field, the specified values are evaluated with an implicit logical "OR" operation. So, if `snmp-trap-type Standard, Built-in` is specified, then the event must match `Standard OR Built-in`. The wildcard matches all values for the field.

- Type - include or exclude. When an event matches an include rule, it will be included into the filter, whereas it will be excluded from the filter if it matches an exclude rule.

Rules are checked in the order they are listed for a filter, until a match is found. There is an implicit rule at the end that matches every event to be excluded. For more information, see `event filter rule` command.

There are three system-defined event filters provided for your use:

- default-trap-events - This filter matches all ALERT and EMERGENCY events. It also matches all Standard, Built-in SNMP trap type events.
- important-events - This filter matches all ALERT and EMERGENCY events.
- no-info-debug-events - This filter matches all non-INFO and non-DEBUG messages (EMERGENCY, ALERT, ERROR and NOTICE).

The system-defined event filters cannot be modified or deleted.

Parameters

{-fields <fieldname>,...}  
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

{-instance}  
If you specify the `-instance` parameter, the command displays detailed information about all fields.

{-filter-name <text>} - Filter Name  
Selects the event filters that match this parameter value.

{-position <integer>} - Rule Position  
Selects the event filters that match this parameter value.

{-type {include|exclude}} - Rule Type  
Selects the event filters that match this parameter value. The rule types are as follows:

- include - Events matching this rule are included in the specified filter.
- exclude - Events matching this rule are excluded in the specified filter.

{-message-name <text>} - Message Name  
Selects the event filters that match this parameter value.

{-severity <text>,...} - Severity  
Selects the events that match this parameter value. Severity levels:

- EMERGENCY - Disruption.
- ALERT - Single point of failure.
• ERROR - Degradation.
• NOTICE - Information.
• INFORMATIONAL - Information.
• DEBUG - Debug information.
• * - Includes all severities.

\[-snmp-trap-type <text>, ...\] - SNMP Trap Type

Selects the event filters that match this parameter value. The SNMP trap types are as follows:

• Standard - Traps defined in RFCs.
• Built-in - Enterprise traps specific to events.
• Severity-based - Traps specific to events that do not belong to the above two types.
• * - Includes all SNMP trap types.

**Examples**

The following example displays the event filters:

```
cluster1::> event filter show
Filter Name             Rule     Rule      Message Name                   SNMP Trap Type       Severity
Position Type
----------- -------- --------- ---------------------- --------------- --------
default-trap-events  1 include  *                      *               EMERGENCY, ALERT
  2 include  *                      Standard, Built-in
      3 exclude  *                      *               *
important-events     1 include  *                      *               EMERGENCY, ALERT
      2 exclude  *                      *               *
no-info-debug-events  1 include  *                      *               EMERGENCY, ALERT, ERROR,
      2 exclude  *                      *               *
NOTICE               7 entries were displayed.
```

The following example displays the event filters queried on the SNMP trap type value "Standard":

```
cluster1::> event filter show -snmp-trap-type Standard
Filter Name             Rule     Rule      Message Name                   SNMP Trap Type       Severity
Position Type
----------- -------- --------- ---------------------- --------------- --------
default-trap-events  2 include  *                      Standard, Built-in
      3 exclude  *                      *               *
```

The following example displays the event filters with one or more rules that have no condition on the SNMP trap type. Note that the wildcard character has to be specified in double-quotes. Without double-quotes, output would be the same as not querying on the field.

```
cluster1::> event filter show -snmp-trap-type "*"
Filter Name             Rule     Rule      Message Name                   SNMP Trap Type       Severity
Position Type
----------- -------- --------- ---------------------- --------------- --------
default-trap-events  1 include  *                      *               EMERGENCY, ALERT
      3 exclude  *                      *               *
important-events     1 include  *                      *               EMERGENCY, ALERT
```

*event filter rule* on page 125

event filter test

Test an event filter

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The *event filter test* command is used to test an event filter. When specified with a message name, the command displays whether the message name is included or excluded from the filter. When specified without a message name, the command displays the number of events from the catalog that match the filter. For more information, see the *event filter create* command.

**Parameters**

*-filter-name <text>* - Filter Name

Use this mandatory parameter to specify the name of the event filter to test.

*[<message-name <Message Name>]* - Message Name

Use this optional parameter to specify the message name of the event to test against the filter.

**Examples**
The following example tests an event filter named err-wafl-no-scan-but-clone:

```
cluster1::> event filter show

<table>
<thead>
<tr>
<th>Filter Name</th>
<th>Rule</th>
<th>Rule</th>
<th>Message Name</th>
<th>SNMP Trap Type</th>
<th>Severity</th>
</tr>
</thead>
<tbody>
<tr>
<td>default-trap-events</td>
<td>1</td>
<td>include</td>
<td>*</td>
<td></td>
<td>EMERGENCY, ALERT</td>
</tr>
<tr>
<td></td>
<td>2</td>
<td>include</td>
<td>*</td>
<td>Standard, Built-in</td>
<td>*</td>
</tr>
<tr>
<td></td>
<td>3</td>
<td>exclude</td>
<td>*</td>
<td></td>
<td>*</td>
</tr>
<tr>
<td>err-wafl-no-scan-but-clone</td>
<td>1</td>
<td>include</td>
<td>wafl.scan.clone.*</td>
<td></td>
<td>*</td>
</tr>
<tr>
<td></td>
<td>2</td>
<td>exclude</td>
<td>wafl.scan.*</td>
<td></td>
<td>*</td>
</tr>
<tr>
<td></td>
<td>3</td>
<td>include</td>
<td>wafl.*</td>
<td></td>
<td>EMERGENCY, ALERT, ERROR</td>
</tr>
<tr>
<td></td>
<td>4</td>
<td>exclude</td>
<td>*</td>
<td></td>
<td>*</td>
</tr>
<tr>

event filter rule commands

Create and delete rules for a filter.

event filter rule add

Add a rule for an event filter

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The *event filter rule add* command adds a new rule to an existing event filter. See *event filter create* for more information on event filters and how to create a new event filter.

**Parameters**

- **-filter-name <text>** - Filter Name
  
  Use this mandatory parameter to specify the name of the event filter to add the rule. Rules cannot be added to system-defined event filters.

- **-[position <integer>]** - Rule Position
  
  Use this optional parameter to specify the position of the rule in the event filter. It should be in the range (1..n-1), where ‘n’ is the position of the last rule, which is an implicit rule. Rules are checked in the order they are listed for a filter, until a match is found.

- **-type {include|exclude}** - Rule Type
  
  Use this mandatory parameter to specify the type of the rule which determines whether to include or exclude the events that match this rule.

- **-[message-name <text>]** - Message Name
  
  Use this parameter to specify the message name of the event to include or exclude from the filter.

- **-[severity <text>,...]** - Severity
  
  Use this parameter to specify the list of severity values to match against the events. Enter multiple severities separated by a comma. To enter all severities, the wild card (*) can be used. The wild card cannot be specified with other severities. The default value is *.

- **-[snmp-trap-type <text>,...]** - SNMP Trap Type
  
  Use this parameter to specify the list of the SNMP trap type values to match against the events. Enter multiple SNMP trap types seperated by comma. To enter all SNMP trap types, the wild card (*) can be used. The wild card cannot be specified with other SNMP trap types. The default value is *.

**Examples**

The following example adds a rule to an existing event filter "emer-and-wafl": All events with severity EMERGENCY and message name starting with "wafl."*" are included in the filter. Not specifying the SNMP trap type implies a default value of ".". 

```bash
cluster1:> event filter test -filter-name err-wafl-no-scan-but-clone -message-name wafl.scan.clone.split.cantLock
The message-name "wafl.scan.clone.split.cantLock" is included in the given filter.

cluster1:> event filter test -filter-name err-wafl-no-scan-but-clone -message-name wafl.scan.layout.cantWrite
The message-name "wafl.scan.layout.cantWrite" is excluded from the given filter.
```
The following example adds a rule to the event filter "emer-and-waf1" at position 1: All events with severity ALERT and message name starting with "wafl.scan.*" are included in the filter.

```
cluster1::> event filter rule add -filter-name emer-and-waf1 -type include -message-name wafl.scan.* -position 1 -severity ALERT
```

The following example adds a rule to the event filter "emer-and-waf1" to include all "Standard" SNMP trap type events:

```
cluster1::> event filter rule add -filter-name emer-and-waf1 -type include -snmp-trap-type Standard
```

The following example adds a rule to the event filter "emer-and-waf1" to include all "Standard" SNMP trap type events:

```
cluster1::> event filter rule add -filter-name emer-and-waf1 -type include -snmp-trap-type Standard
```
event filter rule delete

Delete a rule for an event filter

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
The `event filter rule delete` command deletes a rule from an event filter. The position of all the rules following the deleted rule is updated to maintain a contiguous sequence. Use `event filter show` command to view the filters and the rules associated with them.

**Parameters**

- `-filter-name <text>` - Filter Name
  
  Use this mandatory parameter to specify the name of the event filter from which you want to delete the rule. Rules cannot be deleted from system-defined filters.

- `-position <integer>` - Rule Position
  
  Use this mandatory parameter to specify the position of the rule to delete from the filter. It should be in the range (1..n-1), where 'n' is the position of the last rule, which is an implicit rule.

**Examples**
The following example deletes a rule at position 2 from an existing event filter "emer-and-wafl":

```
cluster1::> event filter show
Filter Name  Rule     Rule      Message Name         SNMP Trap Type  Severity
-------- -------- --------- ---------------------- --------------- --------
default-trap-events
1        include   *                      *               EMERGENCY, ALERT
2        include   callhome.*           *               ERROR
3        exclude   *                      *               *
emer-and-wafl
1        include   wafl.scan.*          *               ALERT
2        include   wafl.*               *               EMERGENCY
3        include   *                      Standard        *
4        exclude   *                      *               *
important-events
1        include   *                      *               EMERGENCY, ALERT
2        include   callhome.*           *               ERROR
3        exclude   *                      *               *
no-info-debug-events
1        include   *                      *               EMERGENCY, ALERT, ERROR,
NOTICE
2        exclude   *                      *               *
12 entries were displayed.
cluster1::> event filter rule delete -filter-name emer-and-wafl -position 2
cluster1::> event filter show
Filter Name  Rule     Rule      Message Name         SNMP Trap Type  Severity
-------- -------- --------- ---------------------- --------------- --------

*event filter show* on page 121

**event filter rule reorder**

Modify the index of a rule for an event filter

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The *event filter rule reorder* command moves a rule to a new position in an existing event filter. Use *event filter show* command to display all the event filters and the rules associated with them.

**Parameters**

- **-filter-name <text>** - Filter Name
  
  Use this mandatory parameter to specify the name of the event filter from which you want to change the position of the rule. Rules from system-defined event filters cannot be modified.

- **-position <integer>** - Rule Position
  
  Use this mandatory parameter to specify the position of the rule you want to change. It should be in the range (1..n-1), where 'n' is the position of the last rule, which is an implicit rule.

- **-to-position <integer>** - New Rule Position
  
  Use this mandatory parameter to specify the new position to move the rule. It should be in the range (1..n-1), where 'n' is the position of the last rule, which is an implicit rule.

**Examples**

The following example changes the position of a rule from 1 to 2 from an existing event filter "$emerm-and-wafl$":

<table>
<thead>
<tr>
<th>Filter Name</th>
<th>Rule Type</th>
<th>Rule</th>
<th>Message Name</th>
<th>SNMP Trap Type</th>

*event filter show* on page 121

**event log commands**

Display the list of event occurrences

**event log show**

Display latest log events

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The *event log show* command displays the contents of the event log, which lists significant occurrences within the cluster. Use the *event catalog show* command to display information about events that can occur.

By default, the command displays EMERGENCY, ALERT and ERROR severity level events with the following information, with the most recent events listed first:

- The time at which the event occurred
- The node on which the event occurred
- The severity of the event
- The event's message
To display detailed information about events, use one or more of the optional parameters that affect how the command output is displayed and the amount of detail that is included. For example, to display all detailed event information, use the `-detail` parameter.

To display NOTICE, INFORMATIONAL or DEBUG severity level events, use the `-severity` parameter.

### Parameters

```bash
[-fields <fieldname>, ...]
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

[-detail]
Displays additional event information such as the sequence number of the event.

[-detailtime]
Displays detailed event information in reverse chronological order.

[-instance]
If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node
Displays a list of events for the node you specify. Use this parameter with the `-seqnum` parameter to display detailed information.

[-seqnum <Sequence Number>] - Sequence#
Selects the events that match this parameter value. Use with the `-node` parameter to display detailed information.

[-time <MM/DD/YYYY HH:MM:SS>] - Time
Selects the events that match this parameter value. Use the format: MM/DD/YYYY HH:MM:SS [+-HH:MM]. You can specify a time range by using the ".." operator between two time statements.

```
show -time "08/13/2010 05:55:00".."08/13/2010 06:10:00"
```

Comparative time values are relative to "now". For example, to display only events that occurred within the last minute:

```
show -time >1m
```

[-severity {EMERGENCY|ALERT|ERROR|NOTICE|INFORMATIONAL|DEBUG}] - Severity
Selects the events that match this parameter value. Severity levels are as follows:

- EMERGENCY - Disruption.
- ALERT - Single point of failure.
- ERROR - Degradation.
- NOTICE - Information.
- INFORMATIONAL - Information.
- DEBUG - Debug information.

To display all events, including ones with severity levels of NOTICE, INFORMATIONAL and DEBUG, specify severity as follows:

```
show -severity <=DEBUG
```
EMS Severity (privilege: advanced)

Selects the events that match this parameter value. Severity levels:

- **NODE_FAULT** - Data corruption has been detected or the node is unable to provide client service
- **SVC_FAULT** - A temporary loss of service, typically a transient software fault, has been detected
- **NODE_ERROR** - A hardware error that is not immediately fatal has been detected
- **SVC_ERROR** - A software error that is not immediately fatal has been detected
- **WARNING** - A high-priority message that does not indicate a fault
- **NOTICE** - A normal-priority message that does not indicate a fault
- **INFO** - A low-priority message that does not indicate a fault
- **DEBUG** - A debugging message
- **VAR** - A message with variable severity, selected at runtime.

**[-source <text>] - Source**

Selects the events that match this parameter value (typically a software module).

**[-message-name <Message Name>] - Message Name**

Selects the events that match this parameter value (string). Message names are descriptive, so filtering output by message name displays messages of a specific type.

**[-event <text>] - Event**

Selects the events that match this parameter value. The "event" field contains the full text of the event, including any parameters. For example, a wafl.vol.offline event will contain the name of the volume taken offline.

**[-kernel-generation-num <integer>] - Kernel Generation Number (privilege: advanced)**

Selects the events that match this parameter value. Only events that emanate from the kernel have kernel generation numbers.

**[-kernel-sequence-num <integer>] - Kernel Sequence Number (privilege: advanced)**

Selects the events that match this parameter value. Only events that emanate from the kernel have kernel sequence numbers.

**[-action <text>] - Corrective Action**

Selects the events that match this parameter value. The "action" field describes what steps, if any, you must take to remedy the situation.

**[-description <text>] - Description**

Selects the events that match this parameter value. The "description" field describes why the event was encountered and what it means.

**[-filter-name <text>] - Filter Name**

Selects the events that match this parameter value. Only events that were included by existing filters that match this value are displayed.

### Examples

Selects the events that match this parameter value. Use the format: MM/DD/YYYY HH:MM:SS [+- HH:MM]. You can specify a time range by using the ".." operator between two time statements.

```
show -time "08/13/2010 05:55:00".."08/13/2010 06:10:00"
```
Comparative time values are relative to "now". For example, to display only events that occurred within the last minute:

```
show -time >1m
```

Selects the events that match this parameter value. Severity levels are as follows:

- **EMERGENCY** - Disruption.
- **ALERT** - Single point of failure.
- **ERROR** - Degradation.
- **NOTICE** - Information.
- **INFORMATIONAL** - Information.
- **DEBUG** - Debug information.

To display all events, including ones with severity levels of NOTICE, INFORMATIONAL and DEBUG, specify severity as follows:

```
show -severity <=DEBUG
```

The following example displays the event log:

```
cluster1::> event log show
Time                Node             Severity      Event
------------------- ---------------- ------------- ------------------------
11/9/2015 13:54:19  node1            NOTICE        vifmgr.portup: A link up event was received on node node1, port e0a.
11/9/2015 13:54:19  node1            NOTICE        vifmgr.portup: A link up event was received on node node1, port e0d.
11/9/2015 13:54:19  node1            NOTICE        vifmgr.portup: A link up event was received on node node1, port e0c.
11/9/2015 13:54:19  node1            NOTICE        vifmgr.portup: A link up event was received on node node1, port e0b.
...
```

This example demonstrates how to use a range with the `-time` parameter to display all events that occurred during an extended time period. It displays all events that occurred between 1:45pm and 1:50pm on November 9, 2010.

```
cluster1::> event log show -time "11/9/2015 13:45:00".."11/9/2015 13:50:0"
```

The `-time` parameter also accepts values that are relative to "now". The following example displays events that occurred more than one hour ago:

```
cluster1::event log> show -time <1h
Time                Node             Severity      Event
------------------- ---------------- ------------- ------------------------
11/9/2015 13:02:03  node1            INFORMATIONAL monitor.globalStatus.ok: The system's global status is normal.
11/9/2015 13:02:03  node2            INFORMATIONAL monitor.globalStatus.ok: The system's global status is normal.
...
```

Severity levels sort in the order opposite to what you might expect. The following example displays all events that have a severity level of ERROR or more severe:

```
cluster1::> event log show -severity <ERROR
```

*event catalog show* on page 106

**event mailhistory commands**

(DEPRECATED)-Display the list of e-mailed events

**event mailhistory delete**

(DEPRECATED)-Delete an e-mail history record

**Availability**: This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

*Note*: This command has been deprecated. It may be removed from a future major release of Data ONTAP. Instead, use the "event notification history" command set.

The *event mailhistory delete* command deletes a record from the e-mail history. To delete a record, you must know which node contains the record, and the record's sequence number. Use the *event mailhistory show* command to view this information.

**Parameters**

- `-node <nodename> | local` - Node
  
  Use this parameter to specify the name of the node that contains the e-mail history record to delete.

- `-seqnum <Sequence Number>` - Sequence Number
  
  Use this parameter to specify the sequence number of the e-mail history record to delete.

**Examples**

The following example deletes all mail-history records on node1:

```
cluster1::> event mailhistory delete -node node1 -seqnum *
```

**Related references**

*event mailhistory show* on page 133

**event mailhistory show**

(DEPRECATED)-Display a list of e-mail history records

**Availability**: This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

*Note*: This command has been deprecated. It may be removed from a future release of Data ONTAP. Instead, use the "event notification history" command set.

The *event mailhistory show* command displays a list of the event notifications that have been e-mailed. The command output depends on the parameters you specify with the command. By default, the command displays basic information about all notification e-mails that were sent.

To display detailed information about a specific mail-history record, run the command with the `-seqnum` parameter.
Parameters

{[-fields <fieldname>, ...]
    If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

[-instance]}
    If you specify the -instance parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node
    Selects the mail-history records that match this parameter value.

[-seqnum <Sequence Number>] - Sequence Number
    Selects the mail-history records that match this parameter value.

[-message-name <Message Name>] - Message Name
    Selects the mail-history records that match this parameter value.

[-address <mail address>, ...] - Mail Address
    Selects the mail-history records that match this parameter value.

[-time <MM/DD/YYYY HH:MM:SS>] - Transmission Time
    Selects the mail-history records that match this parameter value.

[-message <text>] - Alert Message
    Selects the mail-history records that match this parameter value (text pattern).

[-previous-time <MM/DD/YYYY HH:MM:SS>] - Previous Transmission Time
    Selects the mail-history records that match this parameter value.

[-num-drops-since-previous <integer>] - Number of Drops Since Previous Transmission
    Selects the mail-history records that match this parameter value (number of event drops since last transmission).

Examples

The following example displays detailed information about the mail-history record with the sequence number 20520:

```
cluster1::> event mailhistory show -seqnum 20520
Sequence Number: 20520
Message Name: wafl.vol.full
Address: admin@example.com
Time: 10/1/2008 14:06:24
Node: node3
Previous Time: 5/31/2007 00:33:22
# Drops Since Prev: 0
Mail Message: wafl.vol.full: file system on volume
vol10@vserver:28558fe1-2462-1lda-85ab-
-000423bacd20 is full
```

**event notification commands**

Create, modify, delete and view event notifications.

**event notification create**

Create an event notification

Availability: This command is available to cluster administrators at the admin privilege level.
Description
The event notification create command is used to create a new notification of a set of events defined by an event filter to one or more notification destinations.

Parameters
- **filter-name** `<text>` - Filter Name
  
  Use this mandatory parameter to specify the name of the event filter. Events that are included in the event filter are forwarded to the destinations specified in the destinations parameter.
  
  The filter name passed to this command must be an existing filter. For more information, see the event filter create command.

- **destinations** `<text>`, ... - List of Event Notification Destinations
  
  Use this mandatory parameter to specify the list of destinations to which the notification should be forwarded. Enter multiple destinations separated by a comma.
  
  The destination passed to this command must be an existing destination. For more information, see the event destination create command.

Examples
The following example creates an event notification for filter name "filter1" to destinations "email_dest, snmp-traphost and syslog_dest":

```
cluster1::> event notification destination show
Name            Type        Params   Destination
--------------  ----------  ------   ---------------------
email_dest      email       false    test@example.com
snmp-traphost   snmp        true     10.27.12.1 (from "system snmp traphost")
syslog_dest     syslog      false    10.23.12.1
3 entries were displayed.

cluster1::> event filter show -filter-name filter1
Filter Name  Rule   Rule       Message Name              SNMP Trap Type  Severity
------------  -------  ---------- ---------------------- --------------- --------
filter1       1       exclude  callhome.bad.ram        *               *
              2       include   callhome.*              *               ALERT, ERROR
              3       exclude   *                      *               *
3 entries were displayed.

cluster1::> event notification create -filter-name filter1 -destinations email_dest, syslog_dest, snmp-traphost

cluster1::> event notification show
ID     Filter Name       Destinations
-----  ----------------  -----------------
1      filter1           email_dest, syslog_dest, snmp-traphost
```

**event notification delete**

Delete event notifications

**Availability:** This command is available to cluster administrators at the admin privilege level.
Description
The event notification delete command deletes an existing event notification.

Parameters
-ID <integer> - Event Notification ID
   Use this parameter to specify the ID of the notification to be deleted.

Examples
The following example shows the deletion of event notification with ID 1:

```
cluster1::> event notification show
  ID  Filter Name    Destinations
  ----  ------------  -----------------
    1    filter1      email_dest, syslog_dest, snmp-traphost

cluster1::> event notification delete -ID 1

cluster1::> event notification show
  This table is currently empty.
```

event notification modify

Modify event notifications

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The event notification modify command is used to modify an existing notification.

Parameters
-ID <integer> - Event Notification ID
   Use this mandatory parameter to specify the ID of the notification to be modified.

[-filter-name <text>] - Event Filter Name
   Use this parameter to specify the filter name to be modified.

[-destinations <text>,...] - List of Event Notification Destinations
   Use this parameter to specify the destinations to be modified. Enter multiple destinations separated by a comma.
   Provide the complete set of destinations to be modified. Individual destination cannot be added or removed.

Examples
The following example shows the modification of event notification with ID 1:

```
cluster1::> event notification show
  ID  Filter Name    Destinations
  ----  ------------  -----------------
    1    filter1      email_dest, syslog_dest, snmp-traphost

cluster1::> event notification modify -ID 1 -destinations email_dest, syslog_dest

cluster1::> event notification show
```
event notification show

Display event notifications

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**
The `event notification show` command is used to display the list of existing event notifications.

**Parameters**

* `[-fields <fieldname>, ...]`  
  If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

* `[-instance]`  
  If you specify the `-instance` parameter, the command displays detailed information about all fields.

* `[-ID <integer>]` - Event Notification ID
  Use this parameter to display the detailed information about the notification ID you specify.

* `[-filter-name <text>]` - Event Filter Name
  Use this parameter to display event notifications that use the filter-name you specify.

* `[-destinations <text>, ...]` - List of Event Notification Destinations
  Use this parameter to display event notifications that use the destinations you specify.

**Examples**
The following example displays the event notification:

```
cluster1::> event notification show
ID     Filter Name       Destinations
-----  ----------------  -----------------
1      filter1           email_dest, syslog_dest
```

event notification destination commands

Create, modify, delete, test and view event notification destinations.

**event notification destination create**

Create an event notification destination

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**
The `event notification destination create` command creates a new event notification destination of either email or syslog type.

The following system-defined notification destination is configured for your use:

* `snmp-traphost` - This destination reflects the configuration in "system snmp traphost".
Parameters

-name <text> - Destination Name

Use this mandatory parameter to specify the name of the notification destination that is to be created. An event notification destination name must be 2 to 64 characters long. Valid characters are the following ASCII characters: A-Z, a-z, 0-9, "_", and ".". The name must start and end with: A-Z, a-z, or 0-9.

-{email <mail address>} - Email Destination

Use this parameter to specify the email address to which event notifications will be sent. For events to properly generate email notifications, the event system must also be configured with an address and mail server from which the mail will be sent. See event config modify command for more information.

-syslog <text> - Syslog Destination

Use this parameter to specify syslog server host name or IP address to which syslog entries will be sent.

-rest-api-url <text> - REST API Server URL

Use this parameter to specify REST API server URL to which event notifications will be sent. Enter the full URL, which must start either with an http:// or https:// prefix. To specify a URL that contains a question mark, press ESC followed by the "?". If an https:// URL is specified, then Data ONTAP verifies the identity of the destination host by validating its certificate. If the Online Certificate Status Protocol (OCSP) is enabled for EMS, then Data ONTAP uses that protocol to determine the certificate's revocation status. Use the security config oscp show -application ems command to determine if the OCSP-based certificate revocation status check is enabled for EMS.

-[certificate-authority <text>] - Client Certificate Issuing CA

Use this parameter to specify the name of the certificate authority (CA) that signed the client certificate that will be sent in case mutual authentication with the REST API server is required.

There can be multiple client certificates installed for the admin vserver in the cluster, and this parameter, along with the certificate-serial parameter, uniquely identifies which one.

Use the security certificate show command to see the list of certificates installed in the cluster.

-[certificate-serial <text>] - Client Certificate Serial Number

Use this parameter to specify the serial number of the client certificate that will be sent in case mutual authentication with the REST API server is required.

Examples

The following example shows the creation of a new event notification destination of type email called "StorageAdminEmail":

```
cluster1::> event notification destination create -name StorageAdminEmail -email StorageAdmin@example.com
cluster1::> event notification destination show

Name          Type      Destination
-------------  ---------  ---------------------
StorageAdminEmail email    StorageAdmin@example.com
snmp-traphost   snmp      10.30.40.10 (from "system snmp traphost")
2 entries were displayed.
```

The following example shows the creation of a new event notification destination of type rest-api called "RestApi":

```
cluster1::> event notification destination create -name RestApi -rest-api-url https://rest.example.com/rest
-certIFICATE-authority cluster1-root-ca -certificate-serial 052213E60B7088
cluster1::> event notification destination show -name RestApi -instance

Destination Name: RestApi
```

event notification destination delete

Delete existing event destinations

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The event notification destination delete command deletes an event notification destination.

The following system-defined notification destination is configured for your use:
• snmp-traphost  - This destination reflects the configuration in "system snmp traphost". To remove snmp-traphost addresses, use the system snmp traphost command.

Parameters
-name <text>  - Destination Name

Use this mandatory parameter to specify the name of an event destination to be removed.

Examples
The following shows the examples of deleting event notification destinations:

    cluster1::> event notification destination show
    Name            Type        Destination
    ---------------  ----------  ---------------------
    StorageAdminEmail  email     StorageAdmin@example.com
    StorageAdminSyslog  syslog     example.com
    snmp-traphost  snmp        10.30.40.10 (from "system snmp traphost")
    3 entries were displayed.
    cluster1::> event notification destination delete -name StorageAdminEmail
    cluster1::> event notification destination show
    Name            Type        Destination
    ---------------  ----------  ---------------------
    StorageAdminSyslog  syslog     example.com
    snmp-traphost  snmp        10.30.40.10 (from "system snmp traphost")
    2 entries were displayed.
    cluster1::> event notification destination delete -name Storage*
    cluster1::> event notification destination show
    Name            Type        Destination
    ---------------  ----------  ---------------------
    snmp-traphost  snmp        10.30.40.10 (from "system snmp traphost")
    1 entries were displayed.
Related references

system snmp traphost on page 1348

event notification destination modify

Modify an event notification destination

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The event notification destination modify command modifies event notification destination.

The following system-defined notification destination is configured for your use:

• snmp-traphost - This destination reflects the configuration in "system snmp traphost". To modify traphost addresses, use the system snmp traphost command.

Parameters

-name <text> - Destination Name

Use this mandatory parameter to specify the name of an event notification destination to be modified. The name of the destination must already exist.

{ [-email <mail address>] - Email Destination

Use this parameter to specify a new value of email address to replace the current address in the event notification destination. The parameter is specified only when the event notification destination type is already "email". It is not allowed to specify the parameter for a destination that already has another type of destination address.

| [-syslog <text>] - Syslog Destination

Use this parameter to specify a new syslog server host name or IP address to replace the current address of the event notification destination. The parameter is specified only when the event notification destination type is already "syslog". It is not allowed to specify the parameter for a destination that already has another type of destination address.

| [-rest-api-url <text>] - REST API Server URL

Use this parameter to specify a new REST API server URL to replace the current address of the event notification destination. Enter the full URL, which must start either with an http:// or https:// prefix. To specify a URL that contains a question mark, press ESC followed by the "?". If an https:// URL is specified, then Data ONTAP verifies the identity of the destination host by validating its certificate. If the Online Certificate Status Protocol (OCSP) is enabled for EMS, then Data ONTAP uses that protocol to determine the certificate's revocation status. Use the security config oscp show -application ems command to determine if the OCSP-based certificate revocation status check is enabled for EMS. The parameter is specified only when the event notification destination type is already "rest-api". It is not allowed to specify the parameter for a destination that already has another type of destination address.

| [-certificate-authority <text>] - Client Certificate Issuing CA

Use this parameter to specify a new value of the certificate authority (CA) to replace the current value in the event notification destination. There can be multiple client certificates installed for the admin vserver in the cluster, and this parameter, along with the certificate-serial parameter, uniquely identifies which one. Use the security certificate show command to see the list of certificates installed in the cluster.

| [-certificate-serial <text>] - Client Certificate Serial Number

Use this parameter to specify a new serial number of the client certificate to replace the current value in the event notification destination.

Examples

The following example shows the modification of event notification destinations:
cluster1::> event notification destination show
Name          Type         Destination
--------------  ----------  ---------------------
StorageAdminEmail email       Storage@example.com
StorageAdminSyslog syslog      example.com
snmp-traphost   snmp        10.30.40.10 (from "system snmp traphost")
3 entries were displayed.
cluster1::> event notification destination modify -name StorageAdminEmail -email StorageAdmin@example.com
cluster1::> event notification destination show
Name          Type         Destination
--------------  ----------  ---------------------
StorageAdminEmail email       StorageAdmin@example.com
StorageAdminSyslog syslog      example.com
snmp-traphost   snmp        10.30.40.10 (from "system snmp traphost")
3 entries were displayed.

The following example shows how to clear the client certificate configuration when mutual authentication with the REST API server is no longer required:

cluster1::> event notification destination show -name RestApi -instance

Destination Name: RestApi
Type of Destination: rest-api
Destination Values: https://rest.example.com/rest
Client Certificate Issuing CA: cluster1-root-ca
Client Certificate Serial Number: 052213E60B7088
cluster-1::> event notification destination modify -name RestApi -certificate-authority - -
certificate-serial -
cluster-1::> event notification destination show -name RestApi -instance

Destination Name: RestApi
Type of Destination: rest-api
Destination Values: https://rest.example.com/rest
Client Certificate Issuing CA: -
Client Certificate Serial Number: -

Related references

security certificate show on page 469
system snmp traphost on page 1348

event notification destination show

Display event notification destinations

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The event notification destination show command displays event notification destinations. Note: In the case of a rest-api destination type, OCSP information is not included. It's available in security config ocsp show -app ems command.
Parameters

```bash
{-fields <fieldname>,...}
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```bash
{-instance}
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-name <text>] - Destination Name`

Use this optional parameter to display information of an event notification destination that has the specified name.

`[-type {snmp|email|syslog|rest-api}] - Type of Destination`

Use this optional parameter to display information of event notification destinations that have the specified destination type.

`[-destination <text>,...] - Destination`

Use this optional parameter to display information of event notification destinations that have the specified destination address. Enter multiple addresses separated by a comma.

`[-server-ca-present {true|false}] - Server CA Certificates Present?
```

Use this optional parameter to display information of event notification destinations that have the specified server-ca-present value. This field indicates whether there are certificates of the server-ca type exist in the system. If not, event messages will not be sent to a rest-api type destination having an HTTPS URL.

`[-certificate-authority <text>] - Client Certificate Issuing CA`

Use this optional parameter to display information of event notification destinations that have the specified certificate authority name.

`[-certificate-serial <text>] - Client Certificate Serial Number`

Use this optional parameter to display information of event notification destinations that have the specified certificate serial number.

`[-certificate-valid {true|false}] - Client Certificate Valid?
```

Use this optional parameter to display information of event notification destinations that have the specified certificate-valid value. This field indicates whether the client certificate specified by the certificate-authority and certificate-serial fields is valid. If not, and if the REST API server requires client authentication, event messages will not be sent to the server.

### Examples

The following shows examples of "event notification destination show":

```bash
cluster1::> event notification destination show
Name           Type          Destination
--------------  ----------  ---------------------
StorageAdminEmail email                StorageAdmin@example.com
StorageAdminSyslog  syslog          example.com
snmp-traphost     snmp          10.30.40.10 (from "system snmp traphost")
RestApi         rest-api    https://rest.example.com/rest
4 entries were displayed.
cluster1::> event notification destination show -type snmp -instance
  Destination Name: snmp-traphost
  Type of Destination: snmp
  Destination values: 10.30.40.10 (from "system snmp traphost")
```
event notification history commands

The history directory

event notification history show

Display latest events sent to destination

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The event notification history show command displays a list of event messages that have been sent to a notification destination. Information displayed by the command for each event is identical to that of the event log show command. This command displays events sent to a notification destination while the event log show command displays all events that have been logged.

Parameters

{ [-fields <fieldname>, ...] }  
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?' to display the fields to specify.

[ [ -instance ]]  
If you specify the -instance parameter, the command displays detailed information about all fields.

-destination <text> - Destination  
Specifies the destination to which event messages have been sent to be displayed.

[-node <nodename> | local] - Node  
Displays a list of events for the node you specify. Use this parameter with the -seqnum parameter to display detailed information.

[-seqnum <Sequence Number>] - Sequence#  
Selects the events that match this parameter value. Use with the -node parameter to display detailed information.

[-time <MM/DD/YYYY HH:MM:SS>] - Time  
Selects the events that match this parameter value. Use the format: MM/DD/YYYY HH:MM:SS [+-HH:MM]. You can specify a time range by using the ".." operator between two time statements.

[-severity {EMERGENCY | ALERT | ERROR | NOTICE | INFORMATIONAL | DEBUG}] - Severity  
Selects the events that match this parameter value. Severity levels are as follows:

- EMERGENCY - Disruption.
- ALERT - Single point of failure.
- ERROR - Degradation.
- NOTICE - Information.
- INFORMATIONAL - Information.
- DEBUG - Debug information.

[-message-name <Message Name>] - Message Name  
Selects the events that match this parameter value (string). Message names are descriptive, so filtering output by message name displays messages of a specific type.
[-event <text>] - Event

Selects the events that match this parameter value. This parameter is useful when entered with wildcards. The "event" field contains the full text of the event, including any parameters. For example, the wafl.vol.offline event displays the name of the volume that is taken offline.

Examples

The following example displays all the events which match "important-events" filter and forwarded to the "snmp-traphost" destination:

```
cluster1::> event filter show
Filter Name    Rule        Rule     Message Name         SNMP Trap Type      Severity
-------------- -------- --------- ---------------------- --------------- --------
default-trap-events 1 include   *                      *               EMERGENCY, ALERT
2 include   *                      Standard, Built-in
3 exclude   *                      *               *
important-events 1 include   *                      *               EMERGENCY, ALERT
2 include   callhome.*             *               ERROR
3 exclude   *                      *               *
no-info-debug-events 1 include   *                      *               EMERGENCY, ALERT, ERROR,
                        NOTICE

**event route commands**

(DEPRECATED)-Manage the mapping between events and destinations

**event route add-destinations**

(DEPRECATED)-Add destination(s) to an event definition

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

**Note:** This command has been deprecated. It may be removed from a future release of Data ONTAP. Instead, use the "event notification" command set.
The `event route add-destinations` command adds destinations to an event route. Any existing destinations assigned to the route are not removed.

The destinations you add must already exist. See the documentation for the `event destination create` command for information about creating destinations. To show all existing destinations and their attributes, use the `event destination show` command. To remove destinations from an event route, use the `event route remove-destinations` command.

You can use extended queries with such parameters as `-severity` and `-snmp-support` to specify multiple events that meet certain criteria. See examples below that show how to use extended queries.

**Parameters**

- `-message-name <Message Name>` - Message Name
  Specify the message name of the event you are modifying. You can use wildcards to specify a family of events or type of event.

- `[-severity {EMERGENCY|ALERT|ERROR|NOTICE|INFORMATIONAL|DEBUG}]` - Severity
  Use this optional parameter to specify a set of events that match this parameter value. You must use the `-message-name` parameter with wildcards to specify the family of events or type of events.

- `-destinations <Event Destination>, ...` - Destinations
  Specify a comma-separated list of destinations to which notifications for the named event are sent. These destinations will be added to any existing destinations assigned to this event route.

**Examples**

The following example specifies that all RAID events go to the destinations named support.email, mgr.email, and sreng.pager:

```
cluster1::> event route add-destinations -message-name raid* -destinations support.email,mgr.email,sreng.pager
```

The following example specifies that all alert, and emergency events go to the destination named test_dest:

```
cluster1::> event route add-destinations -message-name * -severity <=ALERT -destinations test_dest
```

The following example specifies that all alert events that support a SNMP trap go to the destination named traphost. In this example, because the `-snmp-support` parameter is specified as part of extended queries, the `-severity` parameter must also be specified in the extended queries:

```
cluster1::> event route add-destinations {-snmp-support true -severity ALERT} -destinations traphost
```

**Related references**

- `event destination create` on page 111
- `event destination show` on page 115
- `event route remove-destinations` on page 147

**event route modify**

(DEPRECATED)-Modify an event's destination, reporting threshold, or both

**Availability:** This command is available to cluster administrators at the admin privilege level.
Description

**Note:** This command has been deprecated. It may be removed from a future release of Data ONTAP. Instead, use the "event notification" command set.

Use the `event route modify` command to modify an event's destination, frequency threshold, and time threshold. The event's destination must already exist; see the documentation for the `event destination create` command for information about creating destinations. The frequency threshold and time threshold prevent multiple event notifications in a brief period of time.

You can use extended queries with such parameters as `-severity` and `-snmp-support` to specify multiple events that meet certain criteria. See examples provided in the `event route add-destinations` command manpage that show how to use extended queries.

The frequency threshold specifies the number of times an event occurs before a repeat notification of the event is sent; for instance, a frequency threshold of 5 indicates that a notification is sent every fifth time an event occurs. The time threshold specifies the number of seconds between notifications for an event; for instance, a time threshold of 120 indicates that a notification is sent only if it has been two minutes or more since the last notification for that event was sent.

If both the frequency threshold and time threshold are set, a notification is sent if either threshold is met. For instance, if the frequency threshold is set to 5 and the time threshold is set to 120, and the event occurs more than five times within two minutes, a notification is sent. If both thresholds are set to 0 (zero) or empty ("" or ""), there is no suppression of multiple event notifications.

**Parameters**

- **-message-name <Message Name> - Message Name**
  Specify the message name of the event you are modifying. You can use wildcards to specify a family of events or type of event.

- **[-severity {EMERGENCY|ALERT|ERROR|NOTICE|INFORMATIONAL|DEBUG}] - Severity**
  Use this optional parameter to specify a set of events that match this parameter value. You must use the `-message-name` parameter with wildcards to specify the family of events or type of events.

- **[-destinations <Event Destination>, ...] - Destinations**
  Use this optional parameter to specify a comma-separated list of destinations to which notifications for the named event are sent. Using this parameter replaces the current list of destinations with the list of destinations you specify. To add or remove individual destinations from the current list, use `event route add-destinations` or `event route remove-destinations`.

- **[-frequencythreshold <integer>] - Number of Drops Between Transmissions**
  Specifies the number of event notifications that must occur within the `timethreshold` period before a repeat notification is sent.

- **[-timethreshold <integer>] - Dropping Interval (Seconds) Between Transmissions**
  If multiple notifications of an event occur within this many seconds, only the first notification is sent. Multiple notifications will be sent during this time period only if the `frequencythreshold` quantity is exceeded.

**Examples**

The following example modifies all RAID events to send messages to a destination named "support.email", and specify that multiple messages should only be sent if and event occurs more than five times within 60 seconds.

```
cluster1::> event route modify -message-name raid* -destinations support.email -frequencythreshold 5 -timethreshold 60
```

`event route add-destinations` on page 144
event route remove-destinations

(DEPRECATED)-Remove destination(s) from an event definition

Availability: This command is available to cluster administrators at the admin privilege level.

Description

Note: This command has been deprecated. It may be removed from a future release of Data ONTAP. Instead, use the "event notification" command set.

The event route remove-destinations command can be used to remove existing destinations from an event route. This command removes only the specified destinations from the route, leaving any other destinations assigned to that route.

The named destinations are not deleted, just removed from the specified event route. To delete a destination entirely, use the event destination delete command. To show all existing destinations and their attributes, use the event destination show command.

You can use extended queries with such parameters as -severity and -snmp-support to specify multiple events that meet certain criteria. See examples provided in the event route add-destinations command manpage that show how to use extended queries.

Parameters

- message-name <Message Name> - Message Name
  Specify the message name of the event you are modifying. You can use wildcards to specify a family of events or type of event.

- [severity {EMERGENCY|ALERT|ERROR|NOTICE|INFORMATIONAL|DEBUG}] - Severity
  Use this optional parameter to specify a set of events that match this parameter value. You must use the -message-name parameter with wildcards to specify the family of events or type of events.

- destinations <Event Destination>, ... - Destinations
  Specify a comma-separated list of destinations to remove from the event's list of destinations.

Examples

The following example specifies that the destination named "mgr.email" should no longer receive notifications of RAID events.

    cluster1::> event route remove-destinations -message-name raid* -destinations mgr.email

event route show

(DEPRECATED)-Display event routes

Availability: This command is available to cluster administrators at the admin privilege level.
**Description**

*Note:* This command has been deprecated. It may be removed from a future release of Data ONTAP. Instead, use the "event catalog" command set.

This command displays information about event routes. Event routes describe which events generate notifications. A route specifies what to watch for, whom to notify, and what to do should a particular event occur. By default, the command displays the following information:

- Message name of the event
- Severity of the event
- Destinations for event notifications
- Frequency threshold for event notifications
- Time threshold for event notifications

To display detailed information about a specific event route, run the command with the `-message-name` parameter, and specify the name of the message. The detailed view adds the following information:

- Full description of the event
- Action to be taken to address the event

You can specify additional parameters to limit output to the information that matches those parameters. For example, to display information only about events with a message name that begins with "raid", run the command with the `-message-name raid*` parameter. You can enter either a specific text string or a wildcard pattern.

**Parameters**

```{-fields <fieldname>, ...}
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `?-fields ?` to display the fields to specify.

|{-instance }}
If you specify the `-instance` parameter, the command displays detailed information about all fields.

|--message-name <Message Name> - Message Name
Selects the event routes that match this parameter value.

|--severity (EMERGENCY|ALERT|ERROR|NOTICE|INFORMATIONAL|DEBUG) - Severity
Selects the event routes that match this parameter value. Valid values:

- EMERGENCY - Disruption
- ALERT - Single point of failure
- ERROR - Degradation
- NOTICE - Information
- INFORMATIONAL - Information
- DEBUG - Debug information

|--action <text> - Corrective Action
Selects the events that match this parameter value. This parameter is most useful when entered with wildcards. The "action" field describes what steps, if any, you must take to remedy the situation.
[-description <text>] - Description
Selects the events that match this parameter value. This parameter is most useful when entered with wildcards. The "description" field describes why the event was encountered and what it means.

[-snmp-support {true|false}] - Supports SNMP trap
Selects the event routes that match this parameter value.

[-destinations <Event Destination>, ...] - Destinations
Selects the event routes that match this parameter value. A destination is a list of email addresses, SNMP clients, and syslogs.

[-frequencythreshold <integer>] - Number of Drops Between Transmissions
Selects the event routes that match this parameter value (number of events since previous notification).

[-timethreshold <integer>] - Dropping Interval (Seconds) Between Transmissions
Selects the event routes that match this parameter value.

Examples
The following example displays information about all event routes:

```
cluster1::> event route show
Message               Severity     Destinations     Freq Threshold Threshd Time Threshold
--------------------- --------- -------------- ------- -------
admin.config.backup.  ERROR       allevents,pager  5       120
admin.config.changed INFO      allevents            0       0
admin.file.deleted   INFO      allevents            0       0
admin.login.failure  ERROR       pager,admin          4     300
```

**event snmphistory commands**

(DEPRECATED)-Display the list of SNMP-trap events

**event snmphistory delete**

(DEPRECATED)-Delete an SNMP trap history record

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

**Note:** This command has been deprecated. It may be removed from a future release of Data ONTAP. Instead, use the "event notification history" command set.

The event snmphistory delete command deletes an SNMP trap-history record. To delete a record, you will need to know which node generated the event, and you will need to know the sequence number of that event in the trap-history.

Use the event snmphistory show command to display a list of trap-history records and their sequence numbers.
Parameters

- **node** `<nodename>|local` - Node
  Use this parameter to specify the name of the node that contains the snmp history record to delete.

- **seqnum** `<Sequence Number>` - Sequence Number
  Use this parameter to specify the sequence number of the SNMP trap-history record to delete.

Examples

The following example deletes all SNMP trap-history records on node1:

```
cluster1::> event snmphistory delete -node node1 -seqnum *
```

Related references

`event snmphistory show` on page 150

**event snmphistory show**

(DEPRECATED)-Display a list of SNMP trap history records

**Availability:** This command is available to cluster administrators at the *admin* privilege level.

**Description**

**Note:** This command has been deprecated. It may be removed from a future release of Data ONTAP. Instead, use the "event notification history" command set.

The `event snmphistory show` command displays a list of event notifications that have been sent to SNMP traps. The command output depends on the parameters specified with the command. By default, the command displays general information about all trap-history records.

To display detailed information about a specific trap-history record, run the command with the `-seqnum` parameter.

**Parameters**

{ [-fields `<fieldname>` , ...] }  
If you specify the `-fields `<fieldname>` , ... parameter, the command output also includes the specified field or fields. You can use `-fields '?' to display the fields to specify.

| [-instance ] |
If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node `<nodename>|local`] - Node
Selects the trap-history records that match this parameter value (text pattern).

[-seqnum `<Sequence Number>`] - Sequence Number
Selects the trap-history records that match this parameter value (sequence number).

[-message-name `<Message Name>`] - Message Name
Selects the trap-history records that match this parameter value.

[-address `<text>` , ...] - SNMP Client Address
Selects the trap-history records that match this parameter value (IP address).

[-time `<MM/DD/YYYY HH:MM:SS>`] - Transmission Time
Selects the trap-history records that match this parameter value.

[-message `<text>`] - Alert Message
Selects the trap-history records that match this parameter value (text pattern).
event status commands

Display the status of events, including occurrences and drops

event status show

Display event status

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The event status show command summarizes information about occurrences of events. For detailed information about specific occurrences of events, use the event log show command.

Parameters

{ [-fields <fieldname>, ...]  
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

  [-instance]  
  If you specify the -instance parameter, the command displays detailed information about all fields.

  [-node <nodename> | local] - Node  
  Selects the event records that match this parameter value. Events are tracked on a node-by-node basis, rather than being rolled up cluster-wide.

  [-message-name <Message Name>] - Message Name  
  Selects the event records that match this parameter value. The message name is a short descriptive string. Filtering output by message name displays messages of a specific type.

  [-indications <integer>] - Number of Indications  
  Selects the event records that match this parameter value. This parameter is most useful when used with a range, such as using the range ">20" to display only events that have been posted more than 20 times.

  [-drops <integer>] - Number of Drops  
  Selects the event records that match this parameter value.

Examples

The following example displays information about all SNMP trap-history records:

```
cluster1::> event snmphistory show
Seq # Message Name          Address   Node  Time
----- --------------------- --------- ----- ------------------
12481 raid.mirror.restrict  10.0.2.20 node0 4/14/2008 15:11:04
12482 aggrcopy.dst.noMemory 10.0.2.20 node0 4/14/2008 14:52:54
12483 raid.mirror.restrict  10.0.2.21 node1 4/14/2008 14:41:04
```
[-last-time-occurred <MM/DD/YYYY HH:MM:SS>] - Last Indication Time
Selects the event records that match this parameter value.

[-last-time-dropped <MM/DD/YYYY HH:MM:SS>] - Last Suppressed Indication Time
Selects the event records that match this parameter value.

[-last-time-processed <MM/DD/YYYY HH:MM:SS>] - Last Processed Indication Time
Selects the event records that match this parameter value.

Selects the event records that match this parameter value.

[-last-hour-histogram <integer>, ...] - 60-minute Histogram (privilege: advanced)
Use this parameter with the -fields parameter to display the "last hour" histogram for each event type. The last hour histogram records the number of times each event occurred in the last hour. The histogram is divided into sixty buckets, and each bucket collects one minute's events. The buckets display with the most recent event first.

[-last-day-histogram <integer>, ...] - 24-hour Histogram (privilege: advanced)
Use this parameter with the -fields parameter to display the "last day" histogram for each event type. The last day histogram records the number of times each event occurred in the last day. The histogram is divided into 24 buckets, and each bucket collects one hour's events. The buckets display with the most recent event first.

[-last-week-histogram <integer>, ...] - 7-day Histogram (privilege: advanced)
Use this parameter with the -fields parameter to display the "last week" histogram for each event type. The last week histogram records the number of times each event occurred in the last week. The histogram is divided into 7 buckets, and each bucket collects one day's events. The buckets display with the most recent event first.

[-severity {NODE_FAULT|SVC_FAULT|NODE_ERROR|SVC_ERROR|WARNING|NOTICE|INFO|DEBUG|VAR}] - Severity
Selects events that have the event severity you specify. Severity levels sort with the most severe levels first. Severity levels:

- NODE_FAULT - The node has detected data corruption, or is unable to provide client service.
- SVC_FAULT - The node has detected a temporary loss of service. Typically, this is caused by a transient software fault.
- NODE_ERROR - The node has detected a hardware error that is not immediately fatal.
- SVC_ERROR - The node has detected a software error that is not immediately fatal.
- WARNING - A high-priority message that does not indicate a fault.
- NOTICE - A normal-priority message that does not indicate a fault.
- INFO - A low-priority message that does not indicate a fault.
- DEBUG - A debugging message. These messages are typically suppressed.
- VAR - These messages have variable severity. Severity level for these messages is selected at runtime.

The examples below illustrate how to query on severity.

Examples
The following example displays recent event-occurrence status for node1:
cluster1::> event status show -node node1

<table>
<thead>
<tr>
<th>Node</th>
<th>Message</th>
<th>Occurs</th>
<th>Drops</th>
<th>Last Time</th>

Job Commands

Manage jobs and job schedules

The job commands enable you to manage jobs and schedules. A job is defined as any asynchronous operation.

job delete

Delete a job

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The job delete command deletes a job. Use the job show command to view a list of running jobs that can be deleted.

Parameters

- id <integer> - Job ID
  The numeric ID of the job you want to delete. A job ID is a positive integer.

- [vserver <vserver name>] - Owning Vserver
  Use this parameter to specify the name of the Vserver that owns the job.

Examples

The following example deletes the job that has ID 99:

    cluster1::> job delete -id 99

Related references

  job show on page 155

job pause

Pause a job

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The job pause command pauses a job. Use the job resume command to resume a paused job. Use the job show command to view a list of running jobs that can be paused.

Parameters

- id <integer> - Job ID
  The numeric ID of the job you want to pause. A job ID is a positive integer.
job resume

Resume a job

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The job resume command resumes a job that was previously paused by using the job pause command. Use the job show command to view a list of paused jobs that can be resumed.

Parameters
-id <integer> - Job ID
The numeric ID of the paused job to be resumed. A job ID is a positive integer.

Examples
The following example resumes the paused job that has ID 183:

```
cluster1::> job resume -id 183
```

job show

Display a list of jobs

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The job show command displays information about jobs. By default, the command displays information about all current jobs. To display detailed information about a specific job, run the command with the -id parameter.
You can specify additional parameters to select information that matches the values you specify for those parameters. For example, to display information only about jobs running on a specific node, run the command with the `-node` parameter.

**Parameters**

{ [-fields <fieldname>, ...]
  
  If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

  [ -inprogress ]
  Displays the job ID, the job name, the owning Vserver, and the progress of the job.

  [ -jobstate ]
  Displays information about each job's state, including the queue state, whether the job was restarted, and when the job has completely timed out.

  [ -sched ]
  Displays the job ID, the job name, the owning Vserver, and the schedule on which the job runs.

  [ -times ]
  Displays the job ID, the job name, the owning Vserver, the time when the job was last queued, the time when the job was last started, and the time when the job most recently ended.

  [ -type ]
  Displays the job ID, the job name, the job type, and the job category.

  [ -jobuuid ] (privilege: advanced)
  Displays the job ID, the job name, the owning Vserver, and the job UUID.

  [ -instance ]
  If you specify the `-instance` parameter, the command displays detailed information about all fields.

  [ -id <integer> ] - Job ID
  Selects the jobs that match the ID or range of IDs that you specify.

  [ -vserver <vserver name> ] - Owning Vserver
  Selects jobs that are owned by the specified Vserver.

  [ -name <text> ] - Name
  Selects the jobs that match this parameter value.

  [ -description <text> ] - Description
  Selects the jobs that match this parameter value.

  [ -priority { Low| Medium| High| Exclusive } ] - Priority
  Selects the jobs that match this parameter value.

  [ -node <nodename> ] - Node
  Selects the jobs that match this parameter value.

  [ -affinity { Cluster| Node } ] - Affinity
  Selects the jobs that match this parameter value.

  [ -schedule <job_schedule> ] - Schedule
  Selects the jobs that match this parameter value.

  [ -queuetime <MM/DD HH:MM:SS> ] - Queue Time
  Selects the jobs that match this parameter value.

  [ -starttime <MM/DD HH:MM:SS> ] - Start Time
  Selects the jobs that match this parameter value.
[-endtime <MM/DD HH:MM:SS>] - End Time
Selects the jobs that match this parameter value.

[-dropdeadtime <MM/DD HH:MM:SS>] - Drop-dead Time
Selects the jobs that match this parameter value.

[-restarted {true|false}] - Restarted?
Selects the jobs that match this parameter value.

[-state {Initial|Queued|Running|Waiting|Pausing|Paused|Quitting|Success|Failure|Reschedule|Error|Quit|Dead|Unknown|Restart|Dormant}] - State
Selects the jobs that match this parameter value.

[-code <integer>] - Status Code
Selects the jobs that match this parameter value.

[-completion <text>] - Completion String
Selects the jobs that match this parameter value.

[-jobtype <text>] - Job Type
Selects the jobs that match this parameter value.

[-category <text>] - Job Category
Selects the jobs that match this parameter value.

[-uuid <UUID>] - UUID (privilege: advanced)
Selects the jobs that match this parameter value.

[-progress <text>] - Execution Progress
Selects the jobs that match this parameter value.

[-username <text>] - User Name
Selects the jobs that match this parameter value.

[-restart-is-delayed-by-module <text>] - Restart Is Delayed by Module
Selects jobs which are or were delayed by the specified module during the restart. For example: MCC_SWITCHBACK

### Examples
The following example displays information about all jobs on the node named node1:

```bash
cluster1::> job show -node node1
Owning
Job ID Name             Vserver   Node         State
------ ---------------- --------- ------------ ----------
308114 mirror-daily-3587206 node-vserver node1        Running
          Descr:Auto-replicate to 1 mirror(s)
308115 mirror-daily-3618985 node-vserver node1        Running
          Descr:Auto-replicate to 1 mirror(s)
308116 mirror-daily-3619010 node-vserver node1        Queued
          Descr:Auto-replicate to 1 mirror(s)
308117 mirror-daily-3749547 node-vserver node1        Queued
          Descr:Auto-replicate to 1 mirror(s)
4 entries were displayed.
```
job show-bynode

Display a list of jobs by node

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The job show-bynode command displays information about jobs on a per-node basis. The command output depends on the parameters specified with the command. If no parameters are specified, the command displays information about all jobs in the cluster that are currently owned by a node.

To display detailed information about a specific job, run the command with the -id parameter. The detailed view includes all of the default information plus additional items.

You can specify additional parameters to display only information that matches the values you specify for those parameters. For example, to display information only about jobs running on a specific node, run the command with the -node parameter.

Parameters

[-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?' to display the fields to specify.

[-instance ]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-node <nodename>|local] - Node

Use this parameter to display information only about the jobs that are associated with the node you specify.

[-id <integer>] - Job ID

Use this parameter to display information only about the jobs that match the ID or range of IDs you specify.

[-vserver <vserver name>] - Owning Vserver

Use this parameter with the name of a Vserver to display only jobs that are owned by that Vserver.

[-name <text>] - Name

Use this parameter to display information only about the jobs that match the job name you specify.

[-description <text>] - Description

Use this parameter to display information only about the jobs that match the description you specify.

[-affinity {Cluster|Node}] - Affinity

Use this parameter with an affinity value to display only jobs that match the affinity you specify.

[-username <text>] - User Name

Use this parameter with a username to display only jobs that are associated with that user.

Examples

The following example displays information about all jobs on a per-node basis:

```
node::> job show-bynode
 Owning   Affinity
 Node     Job ID Name           Vserver    
---------- --------- --------------- ---------- 
node0      1501   log-rotation node-vserver Cluster
Descr:logrotation job
node1      1498   log-rotation node-vserver Cluster
Descr:logrotation job
```
job show-cluster

Display a list of cluster jobs

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The job show-cluster command displays information about cluster-affiliated jobs. The command output depends on the parameters specified with the command. If no parameters are specified, the command displays information about all cluster-affiliated jobs.

To display detailed information about a specific job, run the command with the -id parameter. The detailed view includes all of the default information plus additional items.

You can specify additional parameters to display only information that matches the values you specify for those parameters. For example, to display information only about jobs running on a specific node, run the command with the -node parameter.

Parameters

\{-fields <fieldname>, ...
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

\[-instance \}
If you specify the -instance parameter, the command displays detailed information about all fields.

\[-id <integer>\] - Job ID
Use this parameter to display information only about the jobs that match the ID or range of IDs you specify.

\[-vserver <vserver name>\] - Owning Vserver
Use this parameter with the name of a Vserver to display only jobs that are owned by that Vserver.

\[-name <text>\] - Name
Use this parameter to display information only about the jobs that match the job name you specify.

\[-description <text>\] - Description
Use this parameter to display information only about the jobs that match the description you specify.

\[-priority {Low|Medium|High|Exclusive}\] - Priority
Use this parameter to display information only about the jobs that match the priority you specify.

\[-node <nodename>\] - Node
Use this parameter to display information only about the jobs that are associated with the node you specify.

\[-affinity {Cluster|Node}\] - Affinity
Use this parameter with an affinity value to display only jobs that match the affinity you specify.

\[-schedule <job_schedule>\] - Schedule
Use this parameter to display information only about the jobs that run on the schedule you specify.

\[-queuetime <MM/DD HH:MM:SS>\] - Queue Time
Use this parameter to display information only about the jobs that match the queue time you specify.
[-starttime <MM/DD HH:MM:SS>] - Start Time
  Use this parameter to display information only about the jobs that match the start time you specify.

[-endtime <MM/DD HH:MM:SS>] - End Time
  Use this parameter to display information only about the jobs that match the end time you specify.

[-dropdeadtime <MM/DD HH:MM:SS>] - Drop-dead Time
  Use this parameter to display information only about the jobs that match the final timeout time you specify.

[-restarted {true|false}] - Restarted?
  Use this parameter to display information only about the jobs that match the restart value you specify.

[-state {Initial|Queued|Running|Waiting|Pausing|Paused|Quitting|Success|Failure|Reschedule|Error|Quit|Dead|Unknown|Restart|Dormant}] - State
  Use this parameter to display information only about the jobs that match the job state you specify.

[-code <integer>] - Status Code
  Use this parameter to display information only about the jobs that match the status code you specify.

[-completion <text>] - Completion String
  Use this parameter to display information only about the jobs that match the completion text you specify.

[-jobtype <text>] - Job Type
  Use this parameter to display information only about the jobs that match the job type you specify.

[-category <text>] - Job Category
  Use this parameter to display information only about the jobs that match the job category you specify.

[-uuid <UUID>] - UUID
  Use this parameter to display information only about the jobs that match the UUID you specify.

[-username <text>] - User Name
  Use this parameter with a username to display only jobs that are associated with the user you specify.

Examples

The following example displays information about all cluster-affiliated jobs:

```
cluster1::> job show-cluster

<table>
<thead>
<tr>
<th>Job ID</th>
<th>Name</th>
<th>Owning Vserver</th>
<th>Node</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>305</td>
<td>Auto_Mirror</td>

</tbody>
</table>
```
job show-completed

Display a list of completed jobs

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The job show-completed command displays information about completed jobs. The command output depends on the parameters you specify with the command. If you do not use any parameters, the command displays information about all completed jobs.

To display detailed information about a specific job, run the command with the -id parameter. The detailed view includes all of the default information plus additional items.

You can specify additional parameters to display only information that matches those parameters. For instance, to display information only about jobs running on a specific node, run the command with the -node parameter.

Parameters

[-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

[-instance]}

If you specify the -instance parameter, the command displays detailed information about all fields.

[-id <integer>] - Job ID

Use this parameter to display information only about the jobs that match the ID or range of IDs you specify.

[-vserver <vserver name>] - Owning Vserver

Use this parameter with the name of a Vserver to display only jobs that are owned by that Vserver.

[-name <text>] - Name

Use this parameter to display information only about the jobs that match the name you specify.

[-description <text>] - Description

Use this parameter to display information only about the jobs that match the description you specify.

[-priority {Low|Medium|High|Exclusive}] - Priority

Use this parameter to display information only about the jobs that match the priority you specify.

[-node <nodename>] - Node

Use this parameter to display information only about the jobs that are associated with the node you specify.

[-affinity {Cluster|Node}] - Affinity

Use this parameter with an affinity value to display only jobs that match the affinity you specify.

[-schedule <job_schedule>] - Schedule

If you use this parameter, the command displays information only about the jobs that have the schedule you specify.

[-queuetime <MM/DD HH:MM:SS>] - Queue Time

If you use this parameter, the command displays information only about the jobs that have the queue time you specify.

[-starttime <MM/DD HH:MM:SS>] - Start Time

Use this parameter to display information only about the jobs that have the start time you specify.
[<endtime <MM/DD HH:MM:SS>] - End Time
Use this parameter to display information only about the jobs that have the end time you specify.

[<dropdeadtime <MM/DD HH:MM:SS>] - Drop-dead Time
Use this parameter to display information only about the jobs that time out at the time you specify.

[<restarted {true|false}] - Restarted?
Use this parameter to display information only about the jobs that match the restart value you specify.

[<state (Initial|Queued|Running|Waiting|Pausing|Paused|Quitting|Success|Failure|Reschedule|Error|Quit|Dead|Unknown|Restart|Dormant)] - State
Use this parameter to display information only about the jobs that match the job state you specify.

[<code <integer>] - Status Code
Use this parameter to display information only about the jobs that match the status code you specify.

[<completion <text>] - Completion String
Use this parameter to display information only about the jobs that match the completion text you specify.

[<jobtype <text>] - Job Type
Use this parameter to display information only about the jobs that match the job type you specify.

[<category <text>] - Job Category
Use this parameter to display information only about the jobs that match the job category you specify.

[<uuid <UUID>] - UUID
Use this parameter to display information only about the jobs that match the UUID you specify.

[<username <text>] - User Name
Use this parameter with a username to display only jobs that are associated with that user.

Examples
The following example displays information about all completed jobs:

<table>
<thead>
<tr>
<th>Job ID</th>
<th>Name</th>
<th>Vserver</th>
<th>End Time</th>
<th>Code</th>
<th>Completion String</th>
</tr>
</thead>
<tbody>
<tr>
<td>305</td>
<td>Auto_Mirror</td>
<td>node-vserver</td>
<td>10/10 08:07:05 0</td>
<td>Succeeded</td>
<td></td>
</tr>
<tr>
<td>6202</td>
<td>mirror-03_10</td>
<td>node-vserver</td>
<td>10/10 11:10:07 0</td>
<td></td>
<td></td>
</tr>
<tr>
<td>6203</td>
<td>mirror-04_10</td>
<td>node-vserver</td>
<td>10/10 12:10:09 0</td>
<td></td>
<td></td>
</tr>
<tr>
<td>6204</td>
<td>mirror-01_10</td>
<td>node-vserver</td>
<td>10/10 09:10:03 0</td>
<td></td>

</tr>
<tr>
<td>6206</td>
<td>mirror-05_10</td>
<td>node-vserver</td>
<td>10/10 05:10:04 0</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

job stop
Stop a job

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The job stop command stops a running job. A stopped job cannot be resumed. Use the job pause command to pause a job so that you can later resume it. Use the job show command to view a list of running jobs.
Parameters

- **-id <integer>** - Job ID
  The numeric ID of the job to stop. A job ID is a positive integer.

- **-vserver <vserver name>** - Owning Vserver
  Use this parameter to specify the name of the Vserver that owns the job.

Examples

The following example stops the job that has ID 101:

```
cluster1::> job stop -id 101
```

- `job pause` on page 154
- `job show` on page 155

job unclaim

Unclaim a cluster job

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `advanced` privilege level.

**Description**

The `job unclaim` command causes a cluster-affiliated job that is owned by an unavailable node to be unclaimed by that node. Another node in the cluster can then take ownership of the job. Use the `job show-cluster` command to obtain a list of cluster-affiliated jobs.

Parameters

- **-id <integer>** - Job ID
  Use this parameter to specify the ID number of the job to unclaim.

- **-vserver <vserver name>** - Owning Vserver
  Use this parameter to specify the name of the Vserver that owns the job.

Examples

The following example shows how to unclaim the cluster-affiliated job with the ID `27` that is owned by the Vserver `vs1`:

```
cluster1::*> job unclaim -vserver vs1 -id 27
```

Related references

- `job show-cluster` on page 159

job watch-progress

Watch the progress of a job

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.
Description
The `job watch-progress` command displays the progress of a job, and periodically updates that display. You can specify the frequency of the updates.

Parameters
- `--id <integer>` - Job ID
  
  Use this parameter to specify the numeric ID of the job to monitor.

- `[--vserver <vserver name>]` - Owning Vserver
  
  Use this parameter to specify the name of the Vserver that owns the job.

- `--interval <integer>` - Refresh Interval (seconds)
  
  Use this parameter to specify the number of seconds between updates.

Examples
The following example show how to monitor the progress of the job that has ID 222 on Vserver `vs0`. The progress display updates every 3 seconds.

```
cluster1::> job watch-progress --vserver vs0 --id 222 --interval 3
```

**job history commands**
The history directory

**job history show**
Display a history of jobs

Availability: This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

Description
The `job history show` command displays a history of completed jobs with newer entries displayed first. You can specify optional parameters to select information about job history items that match only those parameters. For example, to display information about jobs that were completed on February 27 at noon, run the command with `--endtime "02/27 12:00:00"`.

Parameters

- `{ [--fields <fieldname>, ...] }
  
  If you specify the `--fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `--fields ?` to display the fields to specify.

- `|--instance []`
  
  If you specify the `--instance` parameter, the command displays detailed information about all fields.

- `|--node [<nodename>|local]` - Node
  
  Selects the completed jobs that match this parameter value.

- `|--record <Sequence Number>` - Record ID
  
  Selects the completed jobs that match the record ID or range of record IDs you specify. Note that record IDs are unique for each node, not for the cluster as a whole. As a result, there can be two records with the same record ID within the cluster.

- `[--vserver <vserver name>]` - Owning Vserver
  
  Selects the completed jobs that are owned by the Vserver you specify.
[-id <integer>] - Job ID
Selects the completed jobs that match this parameter value.

[-endtime <MM/DD HH:MM:SS>] - End Time
Selects jobs that completed at the time you specify. This parameter is most useful when used with a range of times.

[-starttime <MM/DD HH:MM:SS>] - Start Time
Selects completed jobs that were started at the time you specify. This parameter is most useful when used with a range of times.

[-name <text>] - Name
Selects the completed jobs that match this parameter value.

[-description <text>] - Description
Selects the completed jobs that match this parameter value.

[-code <integer>] - Status Code
Selects the completed jobs that match this parameter value. Each job defines its own status codes. The completion text is more informative, but support technicians may request this numeric code.

[-progress <text>] - Progress String
Selects the completed jobs that match this parameter value.

[-completion <text>] - Completion String
Selects the completed jobs that match this parameter value.

[-jobuuid <UUID>] - Job UUID (privilege: advanced)
Selects the completed jobs that match this parameter value.

[-event-type {Idle|Running|Succeeded|Failed|Paused|Stopped|Deleted|Error}] - Event Type
Selects the completed jobs that match this parameter value.

[-event-time <MM/DD HH:MM:SS>] - Event Time
Selects the completed jobs that match this parameter value. This parameter is most useful when used with a range of times.

[-error-code <integer>] - Job Manager Error Code
Selects the completed jobs that match this parameter value.

[-error-text <text>] - Job Manager Error Text
Selects the completed jobs that match this parameter value.

[-username <text>] - User Name
Selects the completed jobs that match this parameter value.

Examples
The following example displays information about all completed jobs:

```
cluster1::> job history show

<table>
<thead>
<tr>
<th>Time</th>
<th>Node</th>
<th>Vserver</th>
<th>Name</th>
<th>Event</th>
<th>Job ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>08/23 08:58:24</td>
<td>node1</td>
<td>node1-vs</td>
<td>Vol Create</td>
<td>Succeeded</td>
<td>76</td>

job initstate commands

Display the initialization state of job managers

### job initstate show

Display init state for job managers

**Availability:** This command is available to **cluster** administrators at the advanced privilege level.

**Description**
The `job initstate show` command displays information about the initialization states of job-manager processes.

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify the `--fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `--fields ?` to display the fields to specify.

```
[-instance]
```

If you specify the `--instance` parameter, the command displays detailed information about all fields.

```
[-node [<nodename> | local]] - Node
```

Selects the nodes that match this parameter value.

```
[-process <process_name>] - Process Name
```

Selects the nodes that match this parameter value.

```
[-initialized {true | false}] - Initialized?
```

Selects the nodes that match this parameter value (true means initialized; false means not initialized).

```
[-cache-root <text>] - Cache Root
```

Selects the nodes that match this parameter value.
[-siteid <UUID>] - Site ID
Selects the nodes that match this parameter value.

[-hp-threads <integer>] - High Priority Threads
Selects the nodes that have the number of high-priority threads you specify.

[-mp-threads <integer>] - Medium Priority Threads
Selects the nodes that have the number of medium-priority threads you specify.

[-lp-threads <integer>] - Low Priority Threads
Selects the nodes that have the number of low-priority threads you specify.

[-tx-interval <integer>] - Transaction Interval
Selects the nodes that have the number of seconds you specify as their transaction interval.

[-initmsg <text>] - Initialization Message
Selects the nodes that match this parameter value.

[-thread-initmsg <text>] - Thread Initialization Message
Selects the nodes that match this parameter value. The thread initialization message contains information about thread status. If there is no information to communicate, this message is empty.

[-recovery-enabled {true|false}] - Job Failover Enabled?
Selects the nodes that match this parameter value (true means enabled, false means not enabled).

[-ex-threads <integer>] - Exclusive Priority Threads
Selects the nodes that match this parameter value.

Examples
The following example shows how to display general job-manager initialization-state information for a cluster.

```
cluster1:*> job initstate show
```

<table>
<thead>
<tr>
<th>Node</th>
<th>Process</th>
<th>Init?</th>
<th>HP Thr</th>
<th>MP Thr</th>
<th>LP Thr</th>
<th>EX Thr</th>
<th>TX Int</th>
<th>Failover?</th>
</tr>
</thead>
<tbody>
<tr>
<td>node1</td>
<td>mgwd</td>
<td>true</td>
<td>2</td>
<td>3</td>
<td>5</td>
<td>8</td>
<td>300</td>
<td>true</td>
</tr>
<tr>
<td>node2</td>
<td>mgwd</td>
<td>true</td>
<td>2</td>
<td>3</td>
<td>5</td>
<td>8</td>
<td>300</td>
<td>true</td>
</tr>
</tbody>
</table>

2 entries were displayed.

The following example shows how to display detailed job-manager initialization-state information for a node named node0.

```
cluster1:*> job initstate show -instance -node node0
```

Node: node0
Process Name: mgwd
Initialized?: true
Cache Root: /mroot/jm_cache
Site ID: 824e8f7d-f49-1d9-84af-00423b7352

Medium Priority Threads: 3
Low Priority Threads: 5
Transaction Interval: 300
Initialization Message: Initialized
Are Threads Running?: -
Job Failover Enabled?: true
Exclusive Priority Threads: 8

job private commands
Manage private jobs
job private delete

Delete a job

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description
The `job private delete` command deletes a private job. Private jobs are affiliated with a specific node and do not use any cluster facilities, such as the replicated database.

If you use this command on a job that does not support the delete operation, the command returns an error message.

Use the `job private show` command to view a list of private jobs that can be deleted.

Parameters
- `-node <nodename>|local` - Node
  Use this parameter to specify the node with which the private job is associated.
- `-id <integer>` - Job ID
  Use this parameter to specify the numeric ID of the private job to be deleted. A job ID is a positive integer.
- `[-vserver <vserver name>]` - Owning Vserver
  Use this parameter to specify the name of the Vserver that owns the job.

Examples
The following example shows how to delete the job that has ID 273 from the node named `node2`:

```
cluster1::*> job private delete -node node2 -id 273
```

Related references

`job private show` on page 169

job private pause

Pause a job

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description
The `job private pause` command pauses a private job. Private jobs are affiliated with a specific node and do not use any cluster facilities, such as the replicated database.

If you use this command to pause a job that does not support it, the command returns an error message.

Use the `job private resume` command to resume a paused private job.

Use the `job private show` command to view a list of private jobs.

Parameters
- `-node <nodename>|local` - Node
  Use this parameter to specify the node with which the private job is associated.
- `-id <integer>` - Job ID
  Use this parameter to specify the numeric ID of the paused private job to be paused. A job ID is a positive integer.
[\texttt{-vserver <vserver name>}] - Owning Vserver

Use this parameter to specify the name of the Vserver that owns the job.

### Examples

The following example pauses the private job that has ID 99 on the node node1:

```
cluster1::*> jobs private pause -node node1 -id 99
```

### Related references

### job private resume

Resume a job

**Availability:** This command is available to cluster and Vserver administrators at the \textit{advanced} privilege level.

**Description**

The \texttt{job private resume} command resumes a private job that was paused by using the \texttt{job private pause} command. Private jobs are affiliated with a specific node and do not use any cluster facilities, such as the replicated database.

Use the \texttt{job private show} command to view a list of paused private jobs that can be resumed.

**Parameters**

\begin{itemize}
\item \texttt{-node \{<nodename>|local\}} - Node
  
  Use this parameter to specify the node with which the paused private job is associated.

\item \texttt{-id <integer>} - Job ID
  
  Use this parameter to specify the numeric ID of the paused private job to be resumed. A job ID is a positive integer.
\end{itemize}

[\texttt{-vserver <vserver name>}] - Owning Vserver

Use this parameter to specify the name of the Vserver that owns the job.

### Examples

The following example resumes the paused private job that has ID 99 on a node named node2:

```
cluster1::*> job private resume -node node2 -id 99
```

### Related references

### job private show

Display a list of jobs

**Availability:** This command is available to cluster and Vserver administrators at the \textit{advanced} privilege level.
Description
The `job private show` command displays information about private jobs. Private jobs are affiliated with a specific node and do not use any cluster facilities, such as the replicated database.

Parameters

`{-fields <fieldname>, ...}`
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

`{-inprogress}`
Displays the job ID, name, owning Vserver, and progress of each private job.

`{-jobstate}`
Displays information about each private job's state, including the queue state, whether the job was restarted, and when the job has timed out.

`{-jobuuid}`
Displays the ID, name, owning Vserver, and UUID of each private job.

`{-sched}`
Displays the job ID, name, owning Vserver, and run schedule of each private job.

`{-times}`
Displays the queue time, start time, and end time of each private job.

`{-type}`
Displays the type and category of each private job.

`{-instance}]` 
If you specify the `-instance` parameter, the command displays detailed information about all fields.

`{-node {<nodename>|local] - Node
` Selects the private jobs that match this parameter value.

`{-id <integer>] - Job ID
` Selects the private jobs that match the ID or range of IDs that you specify.

`{-vserver <vserver name>] - Owning Vserver
` Selects the private jobs that match this parameter value.

`{-name <text>] - Name
` Selects the private jobs that match this parameter value.

`{-description <text>] - Description
` Selects the private jobs that match this parameter value.

`{-priority {Low|Medium|High|Exclusive]} - Priority
` Selects the private jobs that match this parameter value.

`{-schedule <job_schedule>] - Schedule
` Selects the private jobs that match this parameter value.

`{-queuetime <MM/DD HH:MM:SS>] - Queue Time
` Selects the private jobs that match this parameter value.

`{-starttime <MM/DD HH:MM:SS>] - Start Time
` Selects the private jobs that match this parameter value.

`{-endtime <MM/DD HH:MM:SS>] - End Time
` Selects the private jobs that match this parameter value.
[-dropdeadtime <MN/DD HH:MM:SS>] - Drop-dead Time
Selects the private jobs that match this parameter value.

[-restarted {true|false}] - Restarted?
Selects the private jobs that match this parameter value.

[-state {Initial|Queued|Running|Waiting|Pausing|Paused|Quitting|Success|Failure|Reschedule|Error|Quit|Dead|Unknown|Restart|Dormant}] - State
Selects the private jobs that match this parameter value.

[-code <integer>] - Status Code
Selects the private jobs that match this parameter value.

[-completion <text>] - Completion String
Selects the private jobs that match this parameter value.

[-jobtype <text>] - Job Type
Selects the private jobs that match this parameter value.

[-category <text>] - Job Category
Selects the private jobs that match this parameter value.

[-uuid <UUID>] - UUID
Selects the private jobs that match this parameter value.

[-progress <text>] - Execution Progress
Selects the private jobs that match this parameter value.

[-username <text>] - User Name
Selects the private jobs that match this parameter value.

Examples
The following example displays information about all private jobs on the local node:

```
cluster1::*> job private show -node local
Node: node1

<table>
<thead>
<tr>
<th>Job ID</th>
<th>Name</th>
<th>Owning Vserver</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>snap-hourly</td>
<td>cluster1</td>
<td>Queued</td>
</tr>
<tr>
<td>4</td>
<td>snap-daily</td>
<td>cluster1</td>
<td>Queued</td>
</tr>
<tr>
<td>5</td>
<td>snap-weekly</td>
<td>cluster1</td>
<td>Queued</td>
</tr>
<tr>
<td>6</td>
<td>sync task</td>
<td>cluster1</td>
<td>Queued</td>
</tr>
<tr>
<td>7</td>
<td>ldap-certs</td>
<td>cluster1</td>
<td>Queued</td>
</tr>
</tbody>
</table>
```

5 entries were displayed.

**job private show-completed**

Display a list of completed jobs

**Availability:** This command is available to cluster and Vserver administrators at the advanced privilege level.

**Description**
The `job private show-completed` command displays information about completed private jobs. Private jobs are affiliated with a specific node and do not use any cluster facilities, such as the replicated database.
Parameters

{[-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

|[-instance]]
  If you specify the -instance parameter, the command displays detailed information about all fields.

[-node [nodename|local] - Node
  Use this parameter to display information only about completed jobs that are associated with the node you specify.

[-id <integer>] - Job ID
  Use this parameter to display information only about completed jobs that have the ID you specify.

[-vserver vserver name] - Owning Vserver
  Use this parameter to display only completed jobs that are owned by the Vserver you specify.

[-name <text>] - Name
  Use this parameter to display information only about completed jobs that have the name you specify.

[-description <text>] - Description
  Use this parameter to display information only about completed jobs that have the description you specify.

[-priority {Low|Medium|High|Exclusive}] - Priority
  Use this parameter to display information only about completed jobs that have the priority you specify.

[-schedule <job_schedule>] - Schedule
  Use this parameter to display information only about completed jobs that have the schedule you specify.

[-queuetime <MM/DD HH:MM:SS>] - Queue Time
  Use this parameter to display information only about completed jobs that have the queue time you specify.

[-starttime <MM/DD HH:MM:SS>] - Start Time
  Use this parameter to display information only about completed jobs that have the start time you specify.

[-endtime <MM/DD HH:MM:SS>] - End Time
  Use this parameter to display information only about completed jobs that have the end time you specify.

[-dropdeadtime <MM/DD HH:MM:SS>] - Drop-dead Time
  Use this parameter to display information only about completed jobs that have the final timeout time you specify.

[-restarted {true|false}] - Restarted?
  Use this parameter to display information only about completed jobs that have the restart value you specify.

[-state {Initial|Queued|Running|Waiting|Pausing|Paused|Quitting|Success|Failure|Reschedule|Error|Quit|Dead|Unknown|Restart|Dormant}] - State
  Use this parameter to display information only about completed jobs that have the job state you specify.

[-code <integer>] - Status Code
  Use this parameter to display information only about completed jobs that have the status code you specify.

[-completion <text>] - Completion String
  Use this parameter to display information only about completed jobs that have the completion text you specify.

[-jobtype <text>] - Job Type
  Use this parameter to display information only about completed jobs that have the job type you specify.
[-category <text>] - Job Category
Use this parameter to display information only about completed jobs that have the job category you specify.

[-uuid <UUID>] - UUID
Use this parameter to display information only about completed jobs that have the UUID you specify.

[-username <text>] - User Name
Use this parameter to display information only about completed jobs that are associated with the user you specify.

Examples
The following example shows how to display information about all completed private jobs on the node named node1:

```
class cluster1::*> job private show-completed -node node1

Node: node1

+--------+------------+----------+--------+-------------------------------------+
| Job ID | Name       | Vserver  | End Time| Code      | Completion String                 |
+--------+------------+----------+--------+-------------------------------------+
| 1      | sync task  | node1    | 02/17 15:03:23 | 0 |                                  |
| 2      | load_balancing | node1 | 02/17 16:29:28 | 0 | DON_VIF_STATS                     |
| 3      | snap-hourly | node1    | 02/17 16:05:00 | 0 |                                  |
| 4      | snap-daily  | node1    | 02/17 00:10:00 | 0 |                                  |
| 5      | snap-weekly | node1    | 02/13 00:15:00 | 0 |                                  |
| 6      | Cross-Cluster Manager | node1 | 02/17 16:27:27 | 0 | complete                          |
| 7      | reconcile service policy | node1 | 02/17 15:03:12 | 0 |                                  |
+--------+------------+----------+--------+-------------------------------------+
```

7 entries were displayed.

job private stop
Stop a job

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The job private stop command stops a running private job. A private job is a job that is associated with a specific node and does not use cluster facilities. A stopped job cannot be restarted.

Parameters
- **-node {<nodename>|local}** - Node
  This specifies the node on which the job is running.

- **-id <integer>** - Job ID
  This specifies the numeric ID of the job that is to be stopped.

- **[-vserver <vserver name>]** - Owning Vserver
  Use this parameter to specify the name of the Vserver that owns the job.

Examples
The following example stops a private job with the ID 416 on a node named node0:

```
class cluster1::*> job private stop -node node0 -id 416
```

job private watch-progress
Watch the progress of a job

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.
**Description**

The `job private watch-progress` command displays and periodically updates the progress of a private job. A private job is a job that is associated with a specific node and does not use cluster facilities. You can specify the frequency of the progress updates.

**Parameters**

- **-node** `<nodename>|local` - Node
  
  This specifies the node on which the job is running.

- **-id** `<integer>` - Job ID
  
  This specifies the numeric ID of the job whose progress is to be monitored.

- **[-vserver <vserver name>]** - Owning Vserver
  
  Use this parameter to specify the Vserver with which the paused private job is associated. Use this parameter to specify the name of the Vserver that owns the job.

- **[-interval <integer>]** - Refresh Interval (seconds)
  
  This optionally specifies, in seconds, the frequency of the updates.

**Examples**

The following example monitors the progress of the private job that has ID 127 on a node named node1. The progress is updated every 2 seconds.

```
cluster1:*> job private watch-progress -node node1 -id 127 -interval 2
Queued
```

---

**job schedule commands**

Manage job schedules

**job schedule delete**

Delete a schedule

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The `job schedule delete` command deletes a schedule. Use the `job schedule show` command to display all current schedules.

You cannot delete any schedules that are in use by jobs. Use the `job schedule show-jobs` command to display jobs by schedule.

You cannot delete any schedules that are referenced by:

- Volume Snapshot copy policy entries
- SnapMirror entries
- SIS policy entries
- configuration backup settings

You must remove all references to a schedule before you can delete it. If you attempt to delete a schedule that is referenced, an error message will list which entries reference the schedule you want to delete. Use the `show` command for each of the items.
listed by the error message to display which entries reference the schedule. You may need to use the \texttt{-instance} parameter to display more detail.

\textbf{Parameters}

\texttt{[-cluster <Cluster name>] - Cluster}

This parameter specifies the name of the cluster on which you want to delete a schedule. By default, the schedule is deleted from the local cluster. In a MetroCluster configuration, the partner cluster can be specified if the local cluster is in switchover state.

\texttt{-name <text> - Schedule Name}

Use this parameter with the name of an existing schedule to specify the schedule you want to delete.

\textbf{Examples}

The following example deletes a schedule named overnightbackup:

\begin{verbatim}
cluster1::> job schedule delete -name overnightbackup
\end{verbatim}

\textbf{Related references}

\texttt{job schedule show} on page 175

\texttt{job schedule show-jobs} on page 176

\textbf{job schedule show}

Display a list of available schedules

\textbf{Availability:} This command is available to cluster and Vserver administrators at the \textit{admin} privilege level.

\textbf{Description}

The \texttt{job schedule show} command displays information about schedules.

\textbf{Parameters}

\begin{verbatim}
{ [-fields <fieldname>, ...]
  If you specify the \texttt{-fields <fieldname>, ...} parameter, the command output also includes the specified field or fields. You can use \texttt{-fields ?} to display the fields to specify.
  
  [-instance ]
  If you specify the \texttt{-instance} parameter, the command displays detailed information about all fields.

  [-cluster <Cluster name>] - Cluster
  Selects the schedules that match this parameter value.

  [-name <text>] - Schedule Name
  Selects the schedules that match this parameter value.

  [-type {cron|interval|builtin}] - Schedule Type
  Selects the schedules that match this parameter value.

  [-description <text>] - Description
  Selects the schedules that match this parameter value.
\end{verbatim}

\textbf{Examples}

The following example displays information about all schedules:
job schedule show-jobs

Display the list of jobs by schedule

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The job schedule show-jobs command displays information about jobs that are associated with schedules.

Parameters
([-fields <fieldname>, ...] If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?' to display the fields to specify.

| [-instance ]| If you specify the -instance parameter, the command displays detailed information about all fields.

[-name <text>] - Schedule Name
Use this parameter to display information only about the jobs that are associated with the schedule you specify.

[-affinity {Cluster|Node}] - Cluster / Node
Use this parameter to display information only about the jobs that match the affinity value you specify.

[-owner <text>] - Owner
Use this parameter to display information only about the jobs that are owned by the nodes you specify.

[-jobid <integer>] - ID
Use this parameter to display information only about the jobs that match the ID or range of IDs that you specify.

[-jobname <text>] - Job Name
Use this parameter to display information only about the jobs that match the name you specify.

Examples
The following example shows information about schedules that are associated with jobs:

<table>
<thead>
<tr>
<th>cluster1: &gt;&gt; job schedule show-jobs</th>
<th>Job ID</th>
<th>Job Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type</td>
<td>Owner</td>

<td>node2</td>
</tr>
<tr>
<td>weeklylog</td>
<td>Node</td>
<td>node3</td>
</tr>
</tbody>
</table>

5 entries were displayed.
job schedule cron commands

Manage cron-type job schedules

job schedule cron create

Create a cron schedule

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The job schedule cron create command creates a cron schedule. A cron schedule, like a UNIX cron job, runs at a specified time. You can also specify months, days of the month, or days of the week on which the schedule will run.

If you specify values for both days of the month and days of the week, they are considered independently. For example, a cron schedule with the day specification Friday, 13 runs every Friday and on the 13th day of each month, not just on every Friday the 13th.

Parameters
-cluster <Cluster name> - Cluster
  This parameter specifies the name of the cluster on which you want to create a cron schedule. By default, the schedule is created on the local cluster. In a MetroCluster configuration, the partner cluster can be specified if the local cluster is in switchover state.

-name <text> - Name
  Use this parameter to specify the name of the cron schedule that you want to create.

-month <cron_month>, ... - Month
  Use this parameter to specify months in which the schedule runs. Valid values are January, February, March, April, May, June, July, August, September, October, November, December, and all. Specify "all" to run the schedule every month.

-dayofweek <cron_dayofweek>, ... - Day of Week
  Use this parameter to specify days of the week on which the schedule runs. Valid values are Sunday, Monday, Tuesday, Thursday, Friday, and Saturday, and all. Specify "all" to run the schedule every day.

-day <cron_dayofmonth>, ... - Day
  Use this parameter to specify days of the month on which the schedule runs. Valid values range from 1 to 31.

-hour <cron_hour>, ... - Hour
  Use this parameter to specify the hours value of the time of day at which the schedule runs. Valid values range from 0 (midnight) to 23 (11:00 p.m.). Specify "all" to run the schedule every hour.

-minute <cron_minute>, ... - Minute
  Use this parameter to specify the minutes portion of the time of day at which the schedule runs. Valid values range from 0 to 59.

Examples
The following example creates a cron schedule named weekendcron that runs on weekend days (Saturday and Sunday) at 3:00 a.m.

```
cluster1::> job schedule cron create -name weekendcron -dayofweek "Saturday, Sunday" -hour 3 -minute 0
```
job schedule cron delete

Delete a cron schedule

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The job schedule cron delete command deletes a cron schedule. Use the job schedule cron show command to display all current cron schedules.

You cannot delete any cron schedules that are associated with jobs. Use the job schedule show-jobs command to display jobs by schedule.

Parameters

[-cluster <Cluster name>] - Cluster

This parameter specifies the name of the cluster on which you want to delete a cron schedule. By default, the schedule is deleted from the local cluster. In a MetroCluster configuration, the partner cluster can be specified if the local cluster is in switchover state.

-name <text> - Name

Use this parameter with the name of an existing cron schedule to specify the cron schedule that you want to delete.

Examples

The following example deletes a cron schedule named midnightcron:

```
cluster1::> job schedule cron delete -name midnightcron
```

Related references

- job schedule cron show on page 179
- job schedule show-jobs on page 176

job schedule cron modify

Modify a cron schedule

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The job schedule cron modify command modifies a cron schedule. A cron schedule, like a UNIX cron job, runs at a specified time. You can also specify months, days of the month, or days of the week on which the schedule runs. Use the job schedule cron show command to display all current cron schedules. See the documentation for job schedule cron show for more information about how cron schedules work.

Modifying one parameter of a cron schedule does not affect the other parameters. For example, if cron schedule is set to run at 3:15 AM, and you modify the "hour" parameter to 4, the schedule's new time will be 4:15am. To clear a parameter of the schedule's interval, you must explicitly set that portion to "0" or "-" Some parameters can also be set to "all".

Parameters

[-cluster <Cluster name>] - Cluster

Use this parameter to specify the cluster of an existing cron schedule you want to modify. The local cluster is provided as the default value. In a MetroCluster configuration, the partner cluster can be specified if the local cluster is in switchover state.
- **name <text>** - Name
  Use this parameter with the name of an existing cron schedule to specify the cron schedule you want to modify.

- **-month <cron_month>, ...** - Month
  Use this parameter to specify a new "month" value for the cron schedule. Valid values are January, February, March, April, May, June, July, August, September, October, November, December, or all. Specify "all" to run the schedule every month.

- **-dayofweek <cron_dayofweek>, ...** - Day of Week
  Use this parameter to specify a new "day of week" value for the cron schedule. Valid values include Sunday, Monday, Tuesday, Thursday, Friday, Saturday, or all. Specify "all" to run the schedule every day.

- **-day <cron_dayofmonth>, ...** - Day
  Use this parameter to specify a new "day of month" value for the cron schedule. Valid values range from 1 to 31.

- **-hour <cron_hour>, ...** - Hour
  Use this parameter to specify a new "hour of the day" value for the cron schedule. Valid values range from 0 (midnight) to 23 (11:00 p.m.), Specify "all" to run the schedule every hour.

- **-minute <cron_minute>, ...** - Minute
  Use this parameter to specify a new "minute of the hour" value for the cron schedule. Valid values range from 0 to 59.

**Examples**

The following example modifies a cron schedule named weekendcron so that it runs at 3:15 a.m.:

```
cluster1::> job schedule cron modify -name weekendcron -hour 3 -minute 15
```

**Related references**

*job schedule cron show* on page 179

**job schedule cron show**

Show cron schedules

**Availability:** This command is available to cluster and Vserver administrators at the *admin* privilege level.

**Description**

The `job schedule cron show` command displays information about cron schedules. A cron schedule runs a job at a specified time on specified days.

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance]
```

If you specify the `[-instance]` parameter, the command displays detailed information about all fields.

```
[-cluster <Cluster name>] - Cluster
```

Selects the cron schedules that match this parameter value.
[-name <text>] - Name
Selects the cron schedules that match this parameter value.

[-month <cron_month>, ...] - Month
Selects the cron schedules that match this parameter value. Valid values are January, February, March, April, May, June, July, August, September, October, November, December, or all.

[-dayofweek <cron_dayofweek>, ...] - Day of Week
Selects the cron schedules that match this parameter value. Valid values include Sunday, Monday, Tuesday, Wednesday, Thursday, Friday, Saturday, or all.

[-day <cron_dayofmonth>, ...] - Day
Selects the cron schedules that match this parameter value. Valid values range from 1 to 31.

[-hour <cron_hour>, ...] - Hour
Selects the cron schedules that match this parameter value.

[-minute <cron_minute>, ...] - Minute
Selects the cron schedules that match the minute or range of minutes that you specify.

[-description <text>] - Description
Selects the cron schedules that match this parameter value.

Examples
The following example displays information about all current cron schedules:

```
cluster1::> job schedule cron show
Cluster       Name        Description
------------- ----------- -----------------------------------------------------
cluster1
5min        @:00,:05,:10,:15,:20,:25,:30,:35,:40,:45,:50,:55
8hour       @2:15,10:15,18:15
weekly      Sun@0:15
```

The following example displays information about the cron schedule named weekly:

```
cluster1::> job schedule cron show -name weekly -instance
Cluster: cluster1
Name: weekly
Month: -
Day of Week: Sunday
Day: -
Hour: 0
Minute: 15
Description: Sun@0:15
```

job schedule interval commands
Manage interval-based job schedules

job schedule interval create
Create a schedule that runs on an interval

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.
Description
The job schedule interval create creates an interval schedule. An interval schedule runs jobs at specified intervals after the previous job finishes. For instance, if a job uses an interval schedule of 12 hours and takes 30 minutes to complete, the job runs at the following times:

- Day one at 8:00 a.m. (the job's initial run)
- Day one at 8:30 p.m.
- Day two at 9:00 a.m.
- Day two at 9:30 p.m.

Each of the numerical parameters of the interval must be a whole number. These parameters can be used individually, or combined to define complex time values. For example, use a value of 1 day, 12 hours to create an interval of 1.5 days.

Large parameter values are converted into larger units. For example, if you create a schedule with an interval of 36 hours, the job schedule interval show command will display it with an interval of 1 day 12 hours.

Parameters

[-cluster <Cluster name>] - Cluster
This parameter specifies the name of the cluster on which you want to create an interval schedule. By default, the schedule is created on the local cluster. In a MetroCluster configuration, the partner cluster can be specified if the local cluster is in switchover state.

- name <text> - Name
Use this parameter to specify the name of the interval schedule you want to create.

[-days <integer>] - Days
Use this parameter to specify the "days" portion of the schedule's interval. A day is one calendar day.

[-hours <integer>] - Hours
Use this parameter to specify the "hours" portion of the schedule's interval.

[-minutes <integer>] - Minutes
Use this parameter to specify the "minutes" portion of the schedule's interval.

[-seconds <integer>] - Seconds
Use this parameter to specify the "seconds" portion of the schedule's interval.

Examples
The following example creates an interval schedule named rollingdaily that runs six hours after the completion of the previous occurrence of the job:

cluster1:/> job schedule interval create -name rollingdaily -hours 6

Related references
- job schedule interval show on page 183

job schedule interval delete
Delete an interval schedule

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.
Description
The `job schedule interval delete` command deletes an interval schedule. Use the `job schedule interval show` command to display all current interval schedules.

You cannot delete interval schedules that are currently being run. Use the `job schedule show-jobs` command to display jobs by schedule.

Parameters

`[-cluster <Cluster name>] - Cluster`
This parameter specifies the name of the cluster on which you want to delete an interval schedule. By default, the schedule is deleted from the local cluster. In a MetroCluster configuration, the partner cluster can be specified if the local cluster is in switchover state.

`-name <text> - Name`
Use this parameter with the name of an existing interval schedule to specify the interval schedule you want to delete.

Examples

The following example deletes an interval schedule named rollingdaily:

```
cluster1::> job schedule interval delete -name rollingdaily
```

Related references

`job schedule interval show` on page 183
`job schedule show-jobs` on page 176

`job schedule interval modify`

Modify an interval schedule

Availability: This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

Description
The `job schedule interval modify` command modifies an interval schedule. An interval schedule runs jobs at a specified interval after the previous job finishes. Use the `job schedule interval show` command to display all current interval schedules. See the documentation of `job schedule interval show` for more information on how interval schedules work.

Modifying one parameter of a schedule's interval does not affect the other parameters. For example, if a schedule's interval is 1 day 12 hours, and you modify the "hours" parameter to 16, the schedule's new interval is 1 day 16 hours. To clear a parameter of the schedule's interval, you must explicitly set that parameter to "0" or ".".

Parameters

`[-cluster <Cluster name>] - Cluster`
Use this parameter to specify the cluster of an existing interval schedule you want to modify. The local cluster is provided as the default value. In a MetroCluster configuration, the partner cluster can be specified if the local cluster is in switchover state.

`-name <text> - Name`
Use this parameter with the name of an existing interval schedule to specify the interval schedule you want to modify.

`[-days <integer>] - Days`
Use this parameter to specify a different "days" value for the schedule's interval.
[-hours <integer>] - Hours
   Use this parameter to specify a different "hours" value for the schedule's interval.

[-minutes <integer>] - Minutes
   Use this parameter to specify a different "minutes" value for the schedule's interval.

[-seconds <integer>] - Seconds
   Use this parameter to specify a different "seconds" value for the schedule's interval.

Examples
The following example sets the schedule named rollingdaily to run every eight hours:

   cluster1::> job schedule interval modify -name rollingdaily -hours 8

Related references
   job schedule interval show on page 183

job schedule interval show
   Show interval schedules

   Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

   Description
   The job schedule interval show command displays information about interval schedules.

   Parameters
       
       [-fields <fieldname>, ...]
       If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

       [-instance]
       If you specify the -instance parameter, the command displays detailed information about all fields.

       [-cluster <Cluster name>] - Cluster
       Selects the interval schedules that match this parameter value.

       [-name <text>] - Name
       Selects the interval schedules that match this parameter value.

       [-days <integer>] - Days
       Selects the interval schedules that match the day value or range of values you specify.

       [-hours <integer>] - Hours
       Selects the interval schedules that match the hour value or range of values you specify.

       [-minutes <integer>] - Minutes
       Selects the interval schedules that match the minute value or range of values you specify.

       [-seconds <integer>] - Seconds
       Selects the interval schedules that match the second value or range of values you specify.

       [-description <text>] - Description
       Selects the interval schedules that match the description you specify.
Examples
The following example displays information about all interval schedules:

```
cluster1::> job schedule interval show
Cluster   Name        Description
------------- ----------- -----------------------------------------------------
cluster1   rollingdaily Every 8h
```

lun commands

Manage LUNs

Note: These commands are unsupported for a Vserver with Infinite Volume.

lun create

Create a new LUN

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command creates a new LUN of a specific size. You cannot create a LUN at a path that already exists. You must create LUNs at the root of a volume or qtree. You cannot create LUNs in the Vserver root volume.

You might find it useful to provide a meaningful path name for the LUN and containing volume. For example, you might choose a name that describes how the LUN is used, such as the name of the application, the type of data that it stores, or the user accessing the data. Examples are /vol/database/lun0, /vol/finance/lun1, and /vol/bill/lun2.

It is recommended that you distribute LUNs across the cluster.

When you can create a LUN, the size of the LUN could be larger than what you specified. The system generates a message if the size of the LUN is different from what you specified.

By default, when you create a LUN, it is online and it is space-reserved. Use the lun offline command to take a LUN offline. When you set space reserved to false, the LUN is non-space reserved.

Note: For non-space reserved LUNs, write operations to that LUN might fail due to insufficient disk space. As a result, the host application or operating system might crash.

Note: When you create a LUN from a file, that file cannot be deleted without deleting the LUN itself.

Note: This command is not supported for FlexGroups or Vservers with Infinite Volumes.

Parameters
-vserver <Vserver Name> - Vserver Name
    Specifies the Vserver.

{ -path <path> - LUN Path
    Specifies the path of the new LUN. The LUN path cannot contain any files. Examples of correct LUN paths are /vol/vol1/lun1 and /vol/vol1/qtree1/lun1.

| -volume <volume name> - Volume Name
    Specifies the volume that contains the new LUN.
[-qtreen<qtree name>] - Qtree Name
    Specifies the qtree that contains the new LUN.

-lun <text> - LUN Name
    Specifies the new LUN name. A LUN name is a case-sensitive name and has the following requirements:
    • Must contain one to 255 characters. Spaces are not allowed.
    • Can contain the letters A-Z, a-z, numbers 0-9, ",", ",", ",", ",", ",", and ",".

{ -size | -s <size> } - LUN Size
    Specifies the size of the LUN in bytes. You can specify a one-character multiplier suffix:
    • c (1 byte)
    • w (2 bytes)
    • B (512 bytes)
    • k (1024 bytes)
    • M (k*k bytes)
    • G (k*m bytes)
    • T (m*m bytes)

[-use-exact-size [true]] - Use Exact Size (privilege: advanced)
    Create the LUN using the exact value specified by the -size parameter instead of rounding the size to best fit
    the LUN geometry. Size of the LUN must be a multiple of 512 bytes.

-file-path | -f<text> - File Path
    Creates a LUN using the file path as the source.

[-foreign-disk <text>] - Foreign Disk Serial number (privilege: advanced)
    LUN is created with the same attributes (size, alignment, bytes per sector and so on) as the specified foreign
disk.

-prefix-size | -P <size> - Prefix Size (privilege: advanced)
    Specifies the size of the prefix stream for the new LUN.

-ostype | -t {vmware|hyper_v|windows_2008|windows_gpt|windows|linux|xen|solaris|soliris_efi|hpux|aix|netware|openvms} - OS Type
    Specifies the OS type for the new LUN. The OS types are:
    • aix - the LUN stores AIX data.
    • hpux - the LUN stores HP-UX data.
    • hyper_v - the LUN stores Windows Server 2008 or Windows Server 2012 Hyper-V data
    • linux - the LUN stores a Linux raw disk without a partition table.
    • netware - the LUN stores NetWare data.
    • openvms - the LUN stores Open-VMS data
    • solaris - the LUN stores Solaris raw disk in a single-slice partition.
    • soliris_efi - the LUN stores Solaris_EFI data.
    • vmware - the LUN stores VMware data
• windows - the LUN stores a raw disk type in a single-partition Windows disk using the Master Boot Record (MBR) partitioning style.
• windows_gpt - the LUN stores Windows data using the GUID Partition Type (GPT) partitioning style.
• windows_2008 - the LUN stores Windows data for Windows 2008 and 2012 systems.
• xen - the LUN stores Xen data

[-space-reserve {enabled|disabled}] - Space Reservation
Specifies whether the space reservation setting is enabled or disabled for the new LUN. If you set the parameter to enabled, the LUN is space-reserved. If you set the parameter to disabled, the LUN is non-space reserved. The default is enabled.

[-comment <text>] - Comment
A description for the LUN you want to create. If the comment string contains white space, you must enclose the comment string in double quotes. The limit is 254 characters.

[-space-allocation {enabled|disabled}] - Space Allocation
Specifies the value for the space allocation attribute of the LUN. The space allocation attribute determines if the LUN supports the SCSI Thin Provisioning features defined in the Logical Block Provisioning section of the SCSI SBC-3 standard.
Specifying enabled for this parameter enables support for the SCSI Thin Provisioning features.
Specifying disabled for this parameter disables support for the SCSI Thin Provisioning features.
Hosts and file systems that do not support SCSI Thin Provisioning should not enable space allocation.
The default is disabled.

[-class {regular|protocol-endpoint|vvol}] - Class
Specifies the class of the new LUN. The class types are:
• regular - the LUN is for normal blocks protocol access. This is the default value.
• protocol-endpoint - the LUN is a vvol protocol endpoint.
• vvol - the LUN is a vvol data LUN.

[-qos-policy-group <text>] - QoS Policy Group
This optionally specifies which QoS policy group to apply to the LUN. This policy group defines measurable service level objectives (SLOs) that apply to the storage objects with which the policy group is associated. If you do not assign a policy group to a LUN, the system will not monitor and control the traffic to it.

Note: If you specify this parameter for a LUN that you want to create from a file and that file belongs to a QoS policy group, Data ONTAP adds the LUN to the specified policy group and removes the file from its policy group. Both the file and the LUN that you created from the file cannot belong to QoS policy groups.

[-caching-policy <text>] - Caching Policy Name
This optionally specifies the caching policy to apply to the LUN. A caching policy defines how the system caches this volume's data in Flash Cache modules. If a caching policy is not assigned to this LUN, the system uses the caching policy that is assigned to the containing volume or Vserver. If a caching policy is not assigned to the containing volume or Vserver, the system uses the default cluster-wide policy. The available caching policies are:
• none - Does not cache any user data or metadata blocks.
• auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
• meta - Read caches only metadata blocks.
- random_read - Read caches all metadata and randomly read user data blocks.
- random_read_write - Read caches all metadata, randomly read and randomly written user data blocks.
- all_read - Read caches all metadata, randomly read and sequentially read user data blocks.
- all_read_random_write - Read caches all metadata, randomly read, sequentially read, and randomly written user data.
- all - Read caches all data blocks read and written. It does not do any write caching.
Default caching-policy is auto.

Examples

```bash
cluster1::> lun create -vserver vs1 -path /vol/vol1/lun1 -size 100M -ostype linux
```

**lun delete**

Delete the LUN

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

This command deletes a LUN from a specified Vserver and volume. If the LUN is mapped and online, the force option is required to delete it.

If a LUN is mapped to an initiator group, you can unmapped it by using the `lun unmap` command. If a LUN is online, you take it offline by using the `lun offline` command.

**Note:** If you create a LUN from a file, you cannot remove the file while the LUN is linked to it. If you want to remove the file, you must first delete the LUN. This command is not supported for a Vserver with Infinite Volume.

**Parameters**

- `-vserver <Vserver Name>` - Vserver Name
  Specifies the Vserver.
- `{ -path <path> }` - LUN Path
  Specifies the path of the LUN you want to delete. Examples of correct LUN paths are `/vol/vol1/lun1` and `/vol/vol1/qtree1/lun1`.
- `{ -volume <volume name> }` - Volume Name
  Specifies the volume that contains the LUN you want to delete.
- `[ -qtree <qtree name> ]` - Qtree Name
  Specifies the qtree that contains the LUN you want to delete.
- `-lun <text>}` - LUN Name
  Specifies the LUN that you want to delete.
- `[ -force | -f [true] ]` - Force Deletion of an Online and Mapped LUN
  Force deletion of an online LUN that is mapped to an initiator group.
- `[ -force-fenced [true] ]` - Force Deletion of a Fenced LUN
  Force deletion of a LUN that is currently fenced.
lun maxsize

Display the maximum possible size of a LUN on a given volume or qtree.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
This command returns the maximum size of LUNs for different OS types in a volume or qtree. The command also includes possible maximum size for LUNs with Snapshots or without Snapshots. You can specify the path of the volume or qtree to determine the maximum size of a LUN that you want to create within that volume or qtree.

If you do not specify a path, the command returns the maximum LUN size for each OS type for all volumes and qtrees in a cluster.

The available space in a volume can change over time which means that the size reported by `lun maxsize` can change as well. In addition, the maximum LUN size allowed in a `lun resize` command may be less than the size reported by `lun maxsize`.

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**

```bash
[-fields <fieldname>, ...]
If you specify the `--fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.
```

```bash
[instance]
If you specify the `--instance` parameter, the command displays detailed information about all fields.
```

```bash
[--vserver <Vserver Name>] Vserver Name
Specifies the Vserver.
```

```bash
[-path <qtree path>] Volume or Qtree Path
Specifies the path of the root volume or qtree. Examples of correct LUN paths are `/vol/vol1/lun1` and `/vol/vol1/qtree1/lun1`.
```

```bash
[[-volume <volume name>] Volume Name
Specifies the volume that contains the LUN you want to get the maximum size for.
```

```bash
[-qtree <qtree name>] Qtree Name
Specifies the qtree that contains the LUN you want to get the maximum size for.
```

```bash
[ostype | t {vmware|hyper_v|windows_2008|windows_gpt|windows|linux|xen|solaris|solaris_efi|hpux|aix|netware|openvms}] OS Type
Specifies OS type of the LUN. The OS types are:
```

- aix - the LUN stores AIX data.
- hpux - the LUN stores HP-UX data.
- hyper_v - the LUN stores Windows Server 2008 or Windows Server 2012 Hyper-V data
• linux - the LUN stores a Linux raw disk without a partition table.
• netware - the LUN stores NetWare data.
• openvms - the LUN stores Open-VMS data
• solaris - the LUN stores Solaris raw disk in a single-slice partition.
• solaris_efi - the LUN stores Solaris_EFI data.
• vmware - the LUN stores VMware data
• windows - the LUN stores a raw disk type in a single-partition Windows disk using the Master Boot Record (MBR) partitioning style.
• windows_gpt - the LUN stores Windows data using the GUID Partition Type (GPT) partitioning style.
• windows_2008 - the LUN stores Windows data for Windows 2008 and 2012 systems.
• xen - the LUN stores Xen data

[-complete-ss-reserve <size>] - With Complete Snapshot Reserve
Shows the maximum size possible of a LUN if you have the complete Snapshot reserve enabled.

[-ss-reserve <size>] - With Snapshot Reserve
Shows the maximum size possible of a LUN if you have the Snapshot reserve enabled.

[-without-ss-reserve <size>] - Without Snapshot Reserve
Shows the maximum size possible of a LUN if you have no Snapshot reserve enabled.

Examples

```bash
cluster1::> lun maxsize -volume vol0 -ostype netware

<table>
<thead>
<tr>
<th>Virtual Server</th>
<th>Volume</th>
<th>Qtree</th>
<th>OS Type</th>
<th>Without SS Reserve</th>
<th>With SS Reserve</th>
<th>Complete SS Reserve</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs0</td>
<td>vol0</td>
<td>&quot;&quot;</td>
<td>netware</td>
<td>45MB</td>
<td>45MB</td>
<td>45MB</td>
</tr>
</tbody>
</table>
```

Displays the maximum size of a LUN for the OS type netware.

```bash
cluster1::> lun maxsize

<table>
<thead>
<tr>
<th>Virtual Server</th>
<th>Volume</th>
<th>Qtree</th>
<th>OS Type</th>
<th>Without SS Reserve</th>

`lun resize` on page 193
lun modify

Modify a LUN

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command modifies LUN attributes. Because LUN modifications can result in data corruption or other problems, we recommend that you call technical support if you are unsure of the possible consequences of modifying a LUN.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters
-vserver <Vserver Name> - Vserver Name
  Specifies the Vserver.
{ -path <path> - LUN Path
  Specifies the path for the LUN you want to modify. Examples of correct LUN paths are /vol/vol1/lun1 and /vol/vol1/qtree1/lun1.
| -volume <volume name> - Volume Name
  Specifies the volume for the LUN you want to modify.
-qtree <qtree name> - Qtree Name
  Specifies the qtree for the LUN you want to modify.
-lun <text> - LUN Name
  Specifies the name for the LUN you want to modify. A LUN name is a case-sensitive name and has the following requirements:
  • Must contain one to 255 characters. Spaces are not allowed.
  • Can contain the letters A through Z, a through z, numbers 0 through 9, hyphen (-), underscore (_), right bracket (}), left bracket ({) and period (.).
  • Must start with a letter or number.
-[space-reserve {enabled|disabled}] - Space Reservation
  Specifies whether the space reservation setting is enabled or disabled for a LUN. If you set the parameter to enabled, the LUN is space-reserved. If you set the parameter to disabled, the LUN is non-space reserved. The default is enabled.
{ [-serial <text>] - Serial Number
  Specifies the serial number for the LUN you want to modify.
  The LUN serial number is a twelve-character alphanumeric string containing one or more of the following:
  • upper- and lower-case letters
  • numbers
  • the characters: &, <, >, /, -, #, $, %, *, +, =, @, [, !, ], ^, ~
  Some of the characters that are valid in a LUN serial number also have special meaning to the cluster shell command line:
• The question mark (?) activates the command line active help. In order to type a question mark as part of a LUN's serial number, it is necessary to disable active help with the command `set -active-help false`. Active help can later be re-enabled with the command `set -active-help true`.

• The number sign (#) indicates the beginning of a comment to the command line and will cause the remainder of the line to be ignored. To avoid this, enclose the serial number in double quotes (").

Alternatively, the `-serial-hex` parameter can be used to set the LUN serial number specifying the serial number encoded in hexadecimal form.

```
[-serial-hex <Hex String>] - Serial Number (Hex)
```

Specifies the serial number, encoded in hexadecimal form, for the LUN you want to modify. See the description of the `-serial` parameter for additional details.

```
[-comment <text>] - Comment
```

Specifies the comment for the LUN you want to modify.

```
[-space-allocation {enabled|disabled}] - Space Allocation
```

Specifies the new value for the space allocation attribute of the LUN. The space allocation attribute determines if the LUN supports the SCSI Thin Provisioning features defined in the Logical Block Provisioning section of the SCSI SBC-3 standard.

Specifying `enabled` for this parameter enables support for the SCSI Thin Provisioning features.

Specifying `disabled` for this parameter disables support for the SCSI Thin Provisioning features.

Hosts and file systems that do not support SCSI Thin Provisioning should not enable space allocation.

```
[-state {online|offline|nvfail|space-error|foreign-lun-error}] - State
```

Specifies the administrative state of a LUN. The options are:

- online
- offline

```
[-device-legacy-id <integer>] - Device Legacy ID
```

Specifies the device legacy ID for the LUN you want to modify.

```
[-device-binary-id <text>] - Device Binary ID
```

Specifies the device binary ID for the LUN you want to modify.

```
[-clear-binary-id [true]]] - Clear Device Binary ID
```

Clears the binary format of the optional device ID.

```
[-device-text-id <text>] - Device Text ID
```

Specifies the device text ID for the LUN you want to modify.

```
[-clear-text-id [true]]] - Clear Device Text ID
```

Clears the text format of the optional device ID.

```
[-qos-policy-group <text>] - QoS Policy Group
```

This optionally specifies which QoS policy group to apply to the lun. This policy group defines measurable service level objectives (SLOs) that apply to the storage objects with which the policy group is associated. If you do not assign a policy group to a lun, the system will not monitor and control the traffic to it. To remove this lun from a policy group, enter the reserved keyword "none".

```
[-caching-policy <text>] - Caching Policy Name
```

This optionally specifies the caching policy to apply to the LUN. A caching policy defines how the system caches this volume's data in Flash Cache modules. If a caching policy is not assigned to this LUN, the system uses the caching policy that is assigned to the containing volume or Vserver. If a caching policy is not assigned
to the containing volume or Vserver, the system uses the default cluster-wide policy. The available caching policies are:

- **none** - Does not cache any user data or metadata blocks.
- **auto** - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
- **meta** - Read caches only metadata blocks.
- **random_read** - Read caches all metadata and randomly read user data blocks.
- **random_read_write** - Read caches all metadata, randomly read and randomly written user data blocks.
- **all_read** - Read caches all metadata, randomly read and sequentially read user data blocks.
- **all_read_random_write** - Read caches all metadata, randomly read, sequentially read, and randomly written user data.
- **all** - Read caches all data blocks read and written. It does not do any write caching.

Default caching-policy is **auto**.

### Examples

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>lun modify -path /vol/vol1/lun1 -space-reserve disable</code></td>
<td>Disables the space reserve attribute for LUN /vol/vol1/lun1.</td>
</tr>
<tr>
<td><code>lun modify -path /vol/vol1/lun1 -state offline</code></td>
<td>Takes the LUN /vol/vol1/lun1 offline.</td>
</tr>
<tr>
<td><code>lun modify -path /vol/vol1/lun1 -comment &quot;new comment&quot;</code></td>
<td></td>
</tr>
</tbody>
</table>

### lun move-in-volume

Move a LUN within a volume

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
This command moves a LUN to a new path in the same volume or renames a LUN. If you are organizing LUNs in a qtree, the command moves a LUN from one qtree to another. You can perform a LUN move while the LUN is online and serving data. The process is non-disruptive. Use the `lun move start` command to move a LUN to a different volume within the same Vserver.

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**

- **-vserver <Vserver Name>** - Vserver Name
  
  Specifies the Vserver.

- **-path <path>** - LUN Path
  
  Specifies the path of the LUN you want to move. Examples of correct LUN paths are `/vol/vol1/lun1` and `/vol/vol1/qtree1/lun1`. |
| -volume <volume name> - Volume Name
   Specifies the volume of the LUN you want to move.

[-qtree <qtree name>] - Qtree Name
   Specifies the qtree of the LUN you want to move.

-lun <text> - LUN Name
   Specifies the name of the LUN that you want to move.

{ -new-path <path> - New LUN Path
   Specifies the new path of the LUN. Examples of correct LUN paths are /vol/vol1/lun1 and /vol/vol1/qtree1/lun1.

| [-new-qtree <qtree name>] - New Qtree Name
   Specifies the new qtree name that you want to move the LUN to.

-new-lun <text> - New LUN Name
   Specifies the new name of the LUN.

Examples

cluster1::> lun move-in-volume -vserver vs1 -volume vol1 -lun lun1 -new-lun newlun1

Renames lun1 to newlun1 on Vserver vs1 and volume vol1.

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Path</th>
<th>State</th>
<th>Mapped</th>
<th>Type</th>
<th>Size</th>
</tr>

lun move start on page 234

lun resize

Changes the size of the LUN to the input value size.

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command resizes a LUN. You can resize a LUN that is mapped and online. However, to prevent any potential problems, take the LUN offline before resizing it.

When you reduce the size of the LUN, the data in the LUN could be truncated. You will receive an error message if you reduce the size of the LUN. To avoid this error message, use the force parameter.

When you increase the size of a LUN, the maximum resize size is based on the initial geometry of the LUN and the currently available space in the volume. You will receive an error message if you exceed this limit. The lun show -instance command reports the "Maximum Resize Size" for a LUN based on the initial geometry. The lun maxsize command reports the
maximum LUN size based on the available space. The maximum size of the LUN is the smaller of the two limits issued by the
{lun show -instance} command or the {lun maxsize} command.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters
- {vserver <Vserver Name> - Vserver Name}
  Specifies the Vserver.

{ -path <path> - LUN Path}
  Specifies the path of the LUN that you want to resize. Examples of correct LUN paths are {/vol/vol1/lun1}
  and {/vol/vol1/qtree1/lun1}.

| -volume <volume name> - Volume Name
  Specifies the volume that contains the LUN that you want to resize.

[ -qtree <qtree name>] - Qtree Name
  Specifies the qtree that contains the LUN that you want to resize.

- {lun <text> - LUN Name}
  Specifies the LUN name that you want to resize.

[ -force | -f [true]] - Force Reduce LUN Size
  Overrides any warnings if you are reducing the size of the LUN. If you use this parameter without a value, it is
  set to true, and the command does not prompt you when reducing the size of a LUN would produce warnings.
  If you do not use this parameter, the command displays an error if reducing the size of a LUN would create a
  problem.

[ -size <size>] - New Size
  Specifies the new size of the LUN.
  • {c (1 byte)}
  • {w (2 bytes)}
  • {B (512 bytes)}
  • {k (1024 bytes)}
  • {M (k*k bytes)}
  • {G (k*m bytes)}
  • {T (m*m bytes)}

Examples

    cluster1::> lun resize -vserver vs1 -path /vol/vol1/lun1 -size 500M -force
    Resizes LUN /vol/vol1/lun1 on Vserver vs1 to 500M, overriding all warnings.

    cluster1::> lun resize -vserver vs1 -path /vol/vol1/lun1 -size +5m
    Adds 5M of space to LUN /vol/vol1/lun1 for a total of 15MB.
cluster1::> lun resize -vserver vs1 -path /vol/vol1/lun1 -size -10m

Error: command failed: Reducing LUN size without coordination with the host system may cause permanent data loss or corruption. Use the force flag to allow LUN size reduction.

cluster1::> lun resize -path /vol/vol1/lun1 -size -5m -f

cluster1::> lun show -vserver vs1 -volume vol1

- **lun show** on page 195
- **lun maxsize** on page 188

**lun show**

Display a list of LUNs

**Availability:** This command is available to cluster and Vserver administrators at the **admin** privilege level.

**Description**
The command displays information for LUNs. Use the **instance** parameter to display additional LUN details, such as serial number and space-reservation settings.

**Parameters**

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

| [-instance] |

If you specify the **-instance** parameter, the command displays detailed information about all fields.

| [-vserver <Vserver Name>] - Vserver Name

Selects the LUNs that match this parameter value.

| [-path <path>] - LUN Path

Selects the LUNs that match this parameter value. Examples of correct LUN paths are `/vol/vol1/lun1` and `/vol/vol1/qtree1/lun1`

| [-volume <volume name>] - Volume Name

Selects the LUNs that match this parameter value.

| [-qtree <qtree name>] - Qtree Name

Selects the LUNs that match this parameter value.

| [-lun <text>] - LUN Name

Selects the LUNs that match this parameter value.

| [-size | -s <size>] - LUN Size

Selects the LUNs that match this parameter value.

| [-prefix-size | -P <size>] - Prefix Size (privilege: advanced)

Selects the LUNs that match the prefix stream size that you specify.
[-ostype | -t {vmware|hyper_v|windows_2008|windows_gpt|windows|linux|xen|solaris|solaris_efi|hpux|aix|netware|openvms}] - OS Type
Selects the LUNs that match this parameter value. The operating system types are:
- aix - the LUN stores AIX data.
- hpux - the LUN stores HP-UX data.
- hyper_v - the LUN stores Windows Server 2008 or Windows Server 2012 Hyper-V data
- linux - the LUN stores a Linux raw disk without a partition table.
- netware - the LUN stores NetWare data.
- openvms - the LUN stores Open-VMS data
- solaris - the LUN stores Solaris raw disk in a single-slice partition.
- solaris_efi - the LUN stores Solaris_EFI data.
- vmware - the LUN stores VMware data
- windows - the LUN stores a raw disk type in a single-partition Windows disk using the Master Boot Record (MBR) partitioning style.
- windows_gpt - the LUN stores Windows data using the GUID Partition Type (GPT) partitioning style.
- xen - the LUN stores Xen data

[-space-reserve {enabled|disabled}] - Space Reservation
Selects the LUNs that match this parameter value. A value of enabled selects LUN that are space-reserved. A value of disabled select LUNs that are non-space reserved.

[-serial <text>] - Serial Number
Selects the LUNs that match this parameter value.
The LUN serial number is a twelve-character alphanumeric string containing one or more of the following:
- upper- and lower-case letters
- numbers
- the characters: &, <, >, /, #, $, %, *, +, =, ?, @, [ ], ^, ~

Some of the characters that are valid in a LUN serial number also have special meaning to the cluster shell command:
- The question mark (?) activates the command line active help. In order to type a question mark as part of a LUN's serial number, it is necessary to disable active help with the command set -active-help false. Active help can later be re-enabled with the command set -active-help true.
- The number sign (#) indicates the beginning of a comment to the command line and will cause the remainder of the line to be ignored. To avoid this, enclose the serial number in double quotes (").
- The less than (<), greater than (>), asterisk (*), and exclamation point (!) influence the query behavior of the command. To use these as characters in a LUN's serial query, you must first press escape (ESC). To use these characters to influence the query, enclose the serial number, or partial serial number, in double quotes ("), and apply <, >, *, or !, outside of the double quotes.

Alternatively, the -serial-hex parameter can be used to select LUNs using the serial number encoded in hexadecimal form.
[-serial-hex <Hex String>] - Serial Number (Hex)
Selects the LUNs that match this parameter value. This parameter applies to the LUN serial number encoded in hexadecimal form. See the description of the -serial parameter for additional details.

[-comment <text>] - Comment
Selects the LUNs that match this parameter value.

[-space-reserve-honored {true|false}] - Space Reservations Honored
Selects the LUNs that match this parameter value. A value of true select LUNs that have their space reservation honored by the container volume. A value of false displays the LUNs that are non-space reserved.

[-space-allocation {enabled|disabled}] - Space Allocation
Selects the LUNs that match this parameter value. The space allocation attribute determines if the LUN supports the SCSI Thin Provisioning features defined in the Logical Block Provisioning section of the SCSI SBC-3 standard.
Specifying enabled for this parameter selects LUNs with support enabled for the SCSI Thin Provisioning features.
Specifying disabled for this parameter selects LUNs with support disabled for the SCSI Thin Provisioning features.
Hosts and file systems that do not support SCSI Thin Provisioning should not enable space allocation.

[-state {online|offline|nvfail|space-error|foreign-lun-error}] - State
Selects the LUNs that match this parameter value. The states are:
• online- the LUN is online.
• offline- the LUN is administratively offline, or a more detailed offline reason is not available,
• foreign-lun-error- the LUN has been automatically taken offline due to a media error on the associated foreign LUN.
• nvfail- the LUN has been automatically taken offline due to an NVRAM failure.
• space-error- the LUN has been automatically taken offline due to insufficient space.

[-uuid <UUID>] - LUN UUID
Selects the LUNs that match this parameter value.

[-mapped {mapped|unmapped}] - Mapped
Selects the LUNs that match this parameter value. A value of mapped selects the LUNs that are mapped to an initiator group.

[-block-size <size>] - Block Size
Selects the LUNs that match this parameter value.

[-device-legacy-id <integer>] - Device Legacy ID
Selects the LUNs that match this parameter value.

[-device-binary-id <text>] - Device Binary ID
Selects the LUNs that match this parameter value.

[-device-text-id <text>] - Device Text ID
Selects the LUNs that match this parameter value.

[-read-only {true|false}] - Read Only
Selects the LUNs that match this parameter value.
[-restore-inaccessible {true|false}] - Fenced Due to Restore
Selects the LUNs that match the state you specify. A value of true means that a LUN is fenced for I/O and management due to a restore operation.

[-size-used <size>] - Used Size
Selects the LUNs that match this parameter value.

[-max-resize-size <size>] - Maximum Resize Size
Selects the LUNs that match this parameter value.

[-creation-timestamp <MM/DD/YYYY HH:MM:SS>] - Creation Time
Selects the LUNs that match this parameter value.

[-class {regular|protocol-endpoint|vvol}] - Class
Selects the LUNs that match this parameter value.

[-node <nodename>] - Node Hosting the LUN
Selects the LUNs that match this parameter value.

[-qos-policy-group <text>] - QoS Policy Group
Selects the LUNs that match this parameter value.
A policy group defines measurable service level objectives (SLOs) that apply to the storage objects with which the policy group is associated. If you do not assign a policy group to a lun, the system will not monitor and control the traffic to it.

[-caching-policy <text>] - Caching Policy Name
Display the LUNs that match the specified cache.
A caching policy defines the caching behavior of this LUN at the Flash Cache level. If a caching policy is not assigned to this LUN, the system uses the caching policy that is assigned to the containing volume or Vserver. If a caching policy is not assigned to the containing volume or Vserver, the system uses the default cluster-wide policy. The available caching policies are:

- none - Does not cache any user data or metadata blocks.
- auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
- meta - Read caches only metadata blocks.
- random_read - Read caches all metadata and randomly read user data blocks.
- random_read_write - Read caches all metadata, randomly read and randomly written user data blocks.
- all_read - Read caches all metadata, randomly read and sequentially read user data blocks.
- all_read_random_write - Read caches all metadata, randomly read, sequentially read, and randomly written user data.
- all - Read caches all data blocks read and written. It does not do any write caching.

Default caching-policy is auto.

[-is-clone {true|false}] - Clone
Selects the LUNs that match this parameter value.

[-is-clone-autodelete-enabled {true|false}] - Clone Autodelete Enabled
Selects the LUNs that match this parameter value.
[-inconsistent-import {true|false}] - Inconsistent Import

Selects the LUNs that match this parameter value. A value of true means that the import of this LUN is incomplete.

[-serial-7-mode <text>] - 7-mode Serial Number (privilege: advanced)

Selects the LUNs that match this parameter value.

LUNs transitioned from Data ONTAP 7-Mode are assigned new serial numbers for use with Clustered Data ONTAP. The original 7-Mode serial number is displayed in this field for reference.

[-application <text>] - Application

Selects the LUNs that are part of an application that matches the parameter value.

Examples

The following example displays details of the LUN at path /vol/vol1/lun1 in Vserver vs1.

```
cluster1::> lun show -vserver vs1 -path /vol/vol1/lun1 -instance
Vserver Name: vs1
LUN Path: /vol/vol1/lun1
Volume Name: vol1
Qtree Name: ""
LUN Name: lun1
LUN Size: 10MB
OS Type: linux
Space Reservation: disabled
Serial Number: wCVt1IlvQWv
Serial Number (Hex): 77435674315d496c76515776
Comment: new comment
Space Reservations Honored: false
Space Allocation: disabled
State: offline
LUN UUID: 76d2eb54-dd3f-494c-ad63-1995c1574753
Mapped: mapped
Block Size: 512
Device Legacy ID: -
Device Binary ID: -
Device Text ID: -
Read Only: false
Fenced Due to Restore: false
Used Size: 5MB
Maximum Resize Size: 64.00GB
Creation Time: 9/14/2016 13:55:09
Class: regular
Node Hosting the LUN: node1
QoS Policy Group: -
Caching Policy Name: -
Clone: false
Clone Autodelete Enabled: false
Inconsistent Import: false
Application: -
```

The following example displays information for the LUN with serial number 1r/wc+9Cpbls:

```
cluster1::> lun show -serial 1r/wc+9Cpbls
Vserver   Path                            State   Mapped   Type        Size
--------- ------------------------------- ------- -------- -------- --------
vs1       /vol/vol2/lun1                  online  mapped   linux        10MB
```

The following example displays all the LUNs on Vserver vs1 and volume vol1:

```
cluster1::> lun show -vserver vs1 -volume vol1
Vserver   Path                            State   Mapped   Type        Size
--------- ------------------------------- ------- -------- -------- --------
vs1       /vol/vol1/lun1                  offline mapped   linux        10MB
vs1       /vol/vol1/lun2                  online  mapped   windows   47.07MB
2 entries were displayed.
```
lun bind commands

The bind directory

Note: These commands are not supported for a Vserver with Infinite Volume.

lun bind create

Bind a VVol LUN to a protocol endpoint

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
This command creates a new binding between a protocol endpoint and a vvol LUN. If a binding between the specified endpoint and vvol already exists, the reference count for the binding is incremented by one.

Note: For optimal results, the protocol endpoint and vvol must be hosted by the same node in the cluster.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters
-vserver <Vserver Name> - Vserver name
   Specifies the name of the Vserver.

-protocol-endpoint-path <path> - Protocol Endpoint
   Specifies the path to the protocol endpoint. The specified LUN must already exist and be of class "protocol-endpoint". Examples of correct LUN paths are /vol/voll/lun1 and /vol/voll/qtree1/lun1.

-vvol-path <path> - VVol Path
   Specifies the path to the vvol. The specified LUN must already exist and be of the class "vvol". Examples of correct LUN paths are /vol/voll/lun1 and /vol/voll/qtree1/lun1.

Examples

cluster1:*> lun bind create -vserver vs1 -protocol-endpoint-path /vol/VV1/PE1 -vvol-path /vol/VV3/234ace

lun bind destroy

Unbind a VVol LUN from a protocol endpoint

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
Decrement the reference count of the binding between a protocol endpoint and vvol LUN. If the resulting reference count is zero, the binding is removed.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters
-vserver <Vserver Name> - Vserver name
   Specifies the Vserver.
-protocol-endpoint-path <path> - Protocol Endpoint
  Specifies the path of the protocol endpoint LUN. Examples of correct LUN paths are /vol/vol1/lun1 and /vol/vol1/qtree1/lun1.

-vvol-path <path> - VVol Path
  Specifies the path of the vvol LUN. Examples of correct LUN paths are /vol/vol1/lun1 and /vol/vol1/qtree1/lun1.

[-force [true]] - If true, unbind the Vvol completely even if the current reference count is greater than 1. The default is false.
  Completely remove the specified binding, regardless of the current reference count.

Examples

```
cluster1::*> lun bind destroy -protocol-endpoint-path /vol/VV2/PE2 -vvol-path /vol/VV2/30dfab -vserver vs1
```

**lun bind show**

Show list of Vvol bindings

**Availability:** This command is available to cluster and Vserver administrators at the advanced privilege level.

**Description**
Shows the configured VVol to protocol endpoint bindings.

  **Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**

{{[-fields <fieldname>, ...]}}
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

{{[-instance]}}
  If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver Name
  Selects the bindings that match this parameter value.

[-protocol-endpoint-msid <integer>] - PE MSID
  Selects the bindings that match this parameter value.

[-protocol-endpoint-vdisk-id <text>] - PE Vdisk ID
  Selects the bindings that match this parameter value.

[-vvol-msid <integer>] - VVol MSID
  Selects the bindings that match this parameter value.

[-vvol-vdisk-id <text>] - VVol Vdisk ID
  Selects the bindings that match this parameter value.

[-vserver-uuid <UUID>] - Vserver UUID
  Selects the bindings that match this parameter value.
[-protocol-endpoint-path <path>] - Protocol Endpoint
    Selects the bindings that match this parameter value. Examples of correct LUN paths are /vol/vol1/lun1 and /vol/vol1/qtree1/lun1.

[-protocol-endpoint-node <nodename>] - PE Node
    Selects the bindings that match this parameter value.

[-vvol-path <path>] - VVol
    Selects the bindings that match this parameter value. Examples of correct LUN paths are /vol/vol1/lun1 and /vol/vol1/qtree1/lun1.

[-vvol-node <nodename>] - VVol Node
    Selects the bindings that match this parameter value.

[-secondary-lun <Hex 64bit Integer>] - Secondary LUN
    Selects the bindings that match this parameter value.

[-is-optimal {true|false}] - Optimal binding
    Selects the bindings that match this parameter value.

[-reference-count <integer>] - Reference Count
    Selects the bindings that match this parameter value.

Manage Lun Copy Operations
Manage LUN copy operations

lun copy cancel
Cancel a LUN copy operation before the new LUN has been created

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The lun copy cancel command cancels an ongoing LUN copy operation prior to creation of the new LUN. The command fails if the LUN already exists at the destination path; in that case, use the lun delete command to delete the LUN at the destination path.

All data transfers will be halted.

Note: This is an advanced command because the preferred way to cancel a LUN copy operation is to wait until the new LUN becomes visible, and then use the lun delete command to delete the LUN.

Note: LUNs cannot be copied to or from a Vserver with Infinite Volume.
Parameters

\{-vserver <Vserver Name> - Vserver Name\}

Specifies the name of the Vserver that will host the destination LUN.

\{-destination-path <path> - Destination Path\}

Specifies the full path to the new LUN, in the format /vol/<volume>[/<qtree>]/<lun>.

Examples

```
cluster1::*> lun copy cancel -vserver vs1 -destination-path /vol/vol2/lun2
```

Related references

- lun delete on page 187

**lun copy modify**

Modify an ongoing LUN copy operation

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The lun copy modify command modifies the maximum throughput of an ongoing copy operation.

**Note:** LUNs cannot be copied to or from a Vserver with Infinite Volume.

Parameters

\{-vserver <Vserver Name> - Vserver Name\}

Specifies the name of the Vserver that will host the destination LUN.

\{-destination-path <path> - Destination Path\}

Specifies the full path to the new LUN, in the format /vol/<volume>[/<qtree>]/<lun>.

\{-max-throughput <integer>[KB|MB|GB|TB|PB] - Maximum Transfer Rate (per sec)\}

Specifies the maximum amount of data, in bytes, that can be transferred per second in support of this operation. This mechanism can be used to throttle a transfer, to reduce its impact on the performance of the source and destination nodes.

**Note:** The specified value will be rounded up to the nearest megabyte.

Examples

```
cluster1::> lun copy modify -vserver vs1 -destination-path /vol/vol2/lun2 -max-throughput 25MB
```

**lun copy pause**

Pause an ongoing LUN copy operation

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The lun copy pause command pauses an ongoing copy operation. Use the lun copy resume command to resume the copy operation.

**Note:** LUNs cannot be copied to or from a Vserver with Infinite Volume.
Parameters

\{-vserver \textit{<Vserver Name>} - Vserver Name\}

Specifies the name of the Vserver that will host the destination LUN.

\{-destination-path \textit{<path>} - Destination Path\}

Specifies the full path to the new LUN, in the format /vol/<volume>[/<qtree>]/<lun>.

Examples

```bash
cluster1::> lun copy pause -vserver vs1 -destination-path /vol/vol2/lun2
```

Related references

\textit{lun copy resume} on page 204

\textbf{lun copy resume}

Resume a paused LUN copy operation

\textbf{Availability:} This command is available to \textit{cluster} and \textit{Vserver} administrators at the \textit{admin} privilege level.

\textbf{Description}

The \texttt{lun copy resume} command resumes a paused copy operation.

\textbf{Note:} LUNs cannot be copied to or from a Vserver with Infinite Volume.

Parameters

\{-vserver \textit{<Vserver Name>} - Vserver Name\}

Specifies the name of the Vserver that will host the destination LUN.

\{-destination-path \textit{<path>} - Destination Path\}

Specifies the full path to the new LUN, in the format /vol/<volume>[/<qtree>]/<lun>.

Examples

```bash
cluster1::> lun copy resume -vserver vs1 -destination-path /vol/vol2/lun2
```

\textbf{lun copy show}

Display a list of LUNs currently being copied

\textbf{Availability:} This command is available to \textit{cluster} and \textit{Vserver} administrators at the \textit{admin} privilege level.

\textbf{Description}

The \texttt{lun copy show} command shows information about LUNs currently being copied in the cluster.

\textbf{Note:} This command is not supported for a Vserver with Infinite Volume.
Parameters

{[-fields <fieldname>, ...]}

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

{[-instance ]}

If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Destination Vserver Name

Selects LUN copy operations that match this parameter value.

[-destination-path <path>] - Destination Path

Selects LUN copy operations that match this parameter value.

[-source-vserver <vserver name>] - Source Vserver Name

Selects LUN copy operations that match this parameter value.

[-source-path <path>] - Source Path

Selects LUN copy operations that match this parameter value.

[-source-snapshot <snapshot name>] - Source Snapshot Name

Selects LUN copy operations that match this parameter value.

[-is-promoted-early {true|false}] - Is Destination Promoted Early

Selects LUN copy operations that match this parameter value.

[-max-throughput {<integer>[KB|MB|GB|TB|PB]}] - Maximum Transfer Rate (per sec)

Selects LUN copy operations that match this parameter value.

[-job-status {Preparing|Allocation-Map|Data|Destroying|Paused-Admin|Paused-Error|Complete|Destroyed}] - LUN Copy Status

Selects LUN copy operations that match this parameter value. The possible values are:

* Preparing - the LUN copy job is in Preparing status.
* Allocation-Map - the LUN copy job is in Allocating status.
* Data - the LUN copy job is in Moving Data status.
* Destroying - the LUN copy job is in Destroying status.
* Paused-Admin - the LUN copy job is in Paused By Admin status.
* Paused-Error - the LUN copy job is in Paused By Error status.
* Complete - the LUN copy job is in Complete status.
* Destroyed - the LUN copy job is in Destroyed status.

[-progress-percent <percent>] - LUN Copy Progress (%)

Selects LUN copy operations that match this parameter value.

[-elapsed-time <time_interval>] - Elapsed Time

Selects LUN copy operations that match this parameter value.

[-cutover-time <time_interval>] - Cutover Time

Selects LUN copy operations that match this parameter value.

[-is-snapshot-fenced {true|false}] - Is Snapshot Fenced

Selects LUN copy operations that match this parameter value.
Is Destination Ready

Selects LUN copy operations that match this parameter value.

Last Failure Reason

Selects LUN copy operations that match this parameter value.

Examples

lun copy start

Start copying a LUN from one volume to another within a cluster

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The lun copy start command initiates copying of a LUN from one volume to another. The destination volume can be located in the same Vserver as the source volume (intra-Vserver copy) or in a different Vserver (inter-Vserver).

Note: LUNs cannot be copied to or from a Vserver with Infinite Volume.

Note: A cluster administrator must first create a Vserver peering relationship using vserver peer create before initiating an inter-Vserver LUN copy operation.

Parameters

-vserver <Vserver Name> - Destination Vserver Name

Specifies the name of the Vserver that will host the new LUN.

|destination-path <path> - Destination Path

Specifies the full path to the new LUN, in the format /vol/<volume>/<qtree>/lun.

|source-path <path> - Source Path

Specifies the full path to the source LUN, in the format /vol/<volume>/<snapshot>/<qtree>/lun.
[-source-vserver <vserver name>] - Source Vserver Name

Optionally specifies the name of the Vserver hosting the LUN to be copied.

If this parameter is not specified, it is assumed that an intra-Vserver copy operation is being initiated. The source volume is expected to be in the same Vserver as the destination volume.

[-promote-early [true]] - Promote Early

Optionally specifies that the destination LUN needs to be promoted early.

If the destination is promoted early, the new LUN will be visible immediately. However, Snapshot copies of the volume containing the new LUN cannot be taken until the LUN copy operation reaches 'Moving Data' status.

If the destination is promoted late, the new LUN will be visible only after it has been fully framed. However, the LUN copy job will not block the creation of Snapshot copies of the volume containing the new LUN.

If this parameter is not specified, the destination LUN will be promoted late.

[-max-throughput (<integer> [KB|MB|GB|TB|PB])] - Maximum Transfer Rate (per sec)

Optionally specifies the maximum amount of data, in bytes, that can be transferred per second in support of this operation. This mechanism can be used to throttle a transfer, to reduce its impact on the performance of the source and destination nodes.

If this parameter is not specified, throttling is not applied to the data transfer.

**Note:** The specified value will be rounded up to the nearest megabyte.

### Examples

```
cluster1::> lun copy start -vserver vs2 -destination-path /vol/vol2/lun2 -source-vserver vs1 -source-path /vol/vol1/lun1
```

Starts an inter-Vserver copy of LUN *lun1* from volume *vol1* in Vserver *vs1* to *lun2* on volume *vol2* in Vserver *vs2*.

```
cluster1::> lun copy start -vserver vs1 -destination-path /vol/vol2/lun2 -source-path /vol/vol1/lun1
```

Starts an intra-Vserver copy of LUN *lun1* from volume *vol1* in Vserver *vs1* to *lun2* on volume *vol2* in Vserver *vs1*.

```
cluster1::> lun copy start -vserver vs1 -destination-path /vol/vol2/lun2 -source-path /vol/vol1/.snapshot/snap1/lun1
```

### lun igroup commands

Manage initiator groups
**lun igroup add**

Add initiators to an initiator group

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

This command adds initiators to an existing initiator group (igroup). You can add an initiator to an initiator group only if there are no LUN mapping conflicts. Mapping conflicts occur when an initiator is already paired with a LUN. If you attempt to run this command and there are LUN mapping conflicts, the command returns an error.

An initiator cannot be a member of two igroups of different OS types. For example, if you have an initiator that belongs to a Solaris igroup, the command does not allow you to add this initiator to an AIX igroup.

When you add FCP initiators, you can specify an alias instead of the initiator’s World Wide Port Name (WWPN) or the iSCSI Qualified name (IQN).

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**

- **-vserver <Vserver Name>** - Vserver Name
  
  Specifies the Vserver.

- **-igroup <text>** - Iggroup Name
  
  Specifies the initiator group to which you want to add a new initiator.

- **-initiator <text>, ...** - Initiators
  
  Specifies the initiator that you want to add. You can specify the WWPN, IQN, or alias of the initiator.

**Examples**

```
cluster1::> lun igroup add -vserver vs1 -igroup ig1 -initiator iqn.1992-08.com.mv.mvinitiator
```

**lun igroup bind**

Bind an existing initiator group to a given portset

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

This command binds an initiator group to a port set so the host knows which LIFs or TPGs to access. When you bind a port set to an igroup, the host knows which iSCSI or FCP LIF to access. If you do not bind an igroup to a port set, and you map a LUN to the igroup, then the initiators in the igroup can access the LUN on any port on the Vserver.

The initiator group cannot be bound to another port set when you use this command. If you attempt to bind a port set to an initiator group that is already bound to an existing port set, the command returns an error. You can only bind an initiator group to one port set at a time.

If the initiator group is bound, use the `lun igroup unbind` command to unbind the initiator group from the port set. After the initiator group is unbound, you can bind it to another port set.

You can only bind an initiator group to a non-empty port set.

**Note:** This command is not supported for a Vserver with Infinite Volume.
Parameters

-vserver <Vserver Name> - Vserver Name
   Specifies the Vserver.

-igroup <text> - Igroup Name
   Specifies the initiator group that you want to bind a port set to.

-portset <text> - Portset Binding Igroup
   Specifies the port set name that you want to bind an initiator group to.

Examples

cluster1::> lun igroup bind -vserver vs1 -igroup ig1 -portset-name ps1

Related references

lun igroup unbind on page 215

lun igroup create

Create a new initiator group

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

This command creates a new initiator group (igroup). Use igroups to control which hosts have access to specific LUNs. When you bind an igroup to a port set, a host in the igroup can access the LUNs only by connecting to the target ports in the port set.

When you create an igroup, you can add multiple existing initiators by specifying them in a list, separating them with commas. Later, you can add or remove initiators from the initiator group. Use the lun igroup add command to add initiators. Use the lun igroup remove command to remove an initiator. Unless the -initiator option is supplied, no initiators are added to a new igroup.

You can also bind a port set to an initiator when you create an initiator group. You can modify the port set binding of an initiator group by using the lun igroup bind command or the lun igroup unbind command.

The name you assign to an igroup is independent of the name of the host that is used by the host operating system, host files, or Domain Name Service (DNS). If you name an igroup aix1, for example, it is not mapped to the actual IP host name (DNS name) of the host.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters

-vserver <Vserver Name> - Vserver Name
   Specifies the Vserver.

-igroup <text> - Igroup Name
   Specifies the name of the new initiator group. An initiator group name is a case-sensitive name that must contain one to 96 characters. Spaces are not allowed.
   Note: It might be useful to provide meaningful names for igroups, ones that describe the hosts that can access the LUNs mapped to them.

[[-protocol <protocol_enum>]] - Protocol
   Specifies if the initiator group protocol is fcp, iscsi, or mixed.

| [-fcp | -f [true]] | FCP
   Specifies FCP as the protocol type of the new igroup.
| [\(-iscsi \mid -i \{true\}\)] - iSCSI  
  Specifies iSCSI as the protocol type of the new igroup.  

  | \(-ostype \mid -t \{solaris|windows|hpux|aix|linux|netware|vmware|openvms|xen|hyper_v\}\) - OS Type  
  Specifies the operating system type for the new initiator group. The operating system type indicates the type of host operating system used by all of the initiators in the igroup. All initiators in an igroup must be of the same operating system type. The operating system types of initiators are  
  - solaris  
  - windows  
  - hpux  
  - aix  
  - linux  
  - netware  
  - vmware  
  - openvms  
  - xen  
  - hyper_v  

  | \([-portset \mid -a <text>\)] - Portset Binding Igroup  
  Specifies that a port set is bound to the initiator.  

  | \(-initiator <text>, \ldots\) - Initiators  
  Specifies the initiators that are attached to the new initiator group. By default, no initiators are added to the new igroup.  

Examples

```
cluster1::> lun igroup create -vserver vs1 -igroup ig1 -protocol mixed -ostype linux -initiator iqn.2001-04.com.example:abc123
```

**lun igroup delete**

Delete an initiator group

*Availability*: This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

This command deletes an existing initiator group. By default, you cannot delete an initiator group if LUN maps for that initiator group exist. You need to unmap all the LUNs that are associated with that initiator group before you can delete the initiator group. Use the `lun unmap` command to remove LUNS from an initiator group.

You can specify the **force** option to delete an initiator group and remove existing LUN maps defined for that initiator group.
Note: This command is not supported for a Vserver with Infinite Volume.

Parameters
-vserver <Vserver Name> - Vserver Name
   Specifies the Vserver.
-igroup <text> - Igroup Name
   Specifies the initiator group that you want to delete.
[-force | -f [true]] - Force
   Deletes an initiator group and all associated LUN maps.

Examples
   cluster1::> lun igroup delete -vserver vs1 -igroup ig1

Related references
   lun mapping delete on page 226

lun igroup disable-aix-support

Disables SAN AIX support on the cluster

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
This command disables the SAN AIX support across the cluster (all Vservers and all AIX initiator groups). However, before you can disable SAN AIX support, you must remove all SAN AIX related objects from the cluster. You need to unmap all the LUNs that are associated with the AIX initiator groups. Then you need to delete all of the AIX initiator groups. Use the lun unmap command to remove LUNS from an initiator group. Use the igroup delete command to delete an initiator group.

Note: This command is not intended to be used in normal operation. Use only when you are downgrading to a release that does not support SAN AIX operation.

Examples
   cluster1::> lun igroup disable-aix-support

Related references
   lun mapping delete on page 226

lun igroup modify

Modify an existing initiator group

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command modifies an attribute for an initiator group. Currently, the only settable attribute is the operating system.

Note: This command is not supported for a Vserver with Infinite Volume.
Parameters

-vserver <Vserver Name> - Vserver Name
   Specifies the Vserver.

-igroup <text> - Igroup Name
   Specifies the initiator group whose attribute you want to modify.

[-ostype | -t {solaris|windows|hpux|aix|linux|netware|vmware|openvms|xen|hyper_v}] - OS Type
   Specifies the operating system that you want to modify. The operating system types of initiators are
   • solaris
   • windows
   • hpux
   • aix
   • linux
   • netware
   • vmware
   • openvms
   • xen
   • hyper_v

[-delete-on-unmap {true|false}] - Delete on Last Unmap
   Specifies if this initiator group will be deleted automatically when no longer used in a LUN mapping relationship.

Examples

cluster1::> lun igroup modify -vserver vs1 -igroup ig1 -ostype windows

lun igroup remove

Remove initiators from an initiator group

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

This command removes an initiator from an initiator group. You can only remove an initiator if no existing LUN maps are defined for that initiator group. You must unmap the LUNs from the initiator group with the lun unmap command before you can remove initiators from the initiator group.

You can use the force option to remove an initiator and associated LUN maps.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters

-vserver <Vserver Name> - Vserver Name
   Specifies the Vserver.
-igroup <text> - Igroup Name
   Specifies the initiator group from which you want to remove an initiator.

-initiator <text>, ... - Initiators
   Specifies the initiator name you want to remove. Use the WWPN, IQN or the alias of the initiator.

[-force | -f [true]] - Force
   Forcibly removes an initiator and any associated LUN maps.

Examples

cluster1::> lun igroup remove -vserver vs1 -igroup ig1 -initiator iqn.1992-08.com.mv.mvinitiator

Related references
lun mapping delete on page 226

lun igroup rename

Rename an existing initiator group

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command renames an existing initiator group. When you rename an initiator group, this action does not affect access to the LUNs mapped to the initiator group you want to rename.

An initiator group name is a case-sensitive name and must meet the following requirements:

- Must contain one to 96 characters. Spaces are not allowed.
- Can contain the letters A through Z, a through z, numbers 0 through 9, hyphen (-), underscore (_), colon (:), and period (.).
- Must start with a letter or number.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters
-vserver <Vserver Name> - Vserver Name
   Specifies the Vserver.

-igroup <text> - Igroup Name
   Specifies the initiator group you want to rename.

-new-name <text> - New Igroup Name
   Specifies the new name of the initiator group.

Examples

cluster1::> lun igroup rename -vserver vs1 -igroup ig1 -new-name ignew1

lun igroup show

Display a list of initiator groups

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.
Description
This command displays status information for initiator groups (igroup). By default, the command displays status for all initiator groups.

Parameters

{[-fields <fieldname>, ...]
   If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance ]
   If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver Name
   Specifies the Vserver.

[-igroup <text>] - Igroup Name
   Selects the initiator groups that match this parameter value.

[-protocol <protocol_enum>] - Protocol
   Selects the initiator groups that match this parameter value (FCP, iSCSI, or mixed).

[-ostype | -t {solaris|windows|hpux|aix|linux|netware|vmware|openvms|xen|hyper_v}] - OS Type
   Selects the initiator groups that match this parameter value. The operating system types are
   * solaris
   * windows
   * hpux
   * aix
   * linux
   * netware
   * vmware
   * openvms
   * xen
   * hyper_v

[-portset | -a <text>] - Portset Binding Igroup
   Selects the initiator groups that match this parameter value.

[-initiator <text>, ...] - Initiators
   Selects the initiator groups that match this parameter value.

[-uuid <UUID>] - Igroup UUID
   Selects the initiator groups that match this parameter value.

[-delete-on-unmap {true|false}] - Delete on Last Unmap
   Selects the initiator groups that match this parameter value. A value of true displays all the initiator groups that will be deleted automatically when they are no longer used in a LUN mapping relationship.
Examples

```
classifier1::> igroup show -instance
  Vserver Name: vs0
  Igroup Name: ig1
  Protocol: mixed
  OS Type: linux
  Portset Binding Igroup: -
    Igroup UUID: 358338ba-cfd6-11df-a9ab-123478563412
    Initiators: iqn.1992-08.com.mv:abc (not logged in)
  Vserver Name: vs0
  Igroup Name: ig2
  Protocol: mixed
  OS Type: linux
  Portset Binding Igroup: -
    Igroup UUID: 3fb136c7-cfd6-11df-a9ab-123478563412
    Initiators: -
  Vserver Name: vs1
  Igroup Name: ig1
  Protocol: mixed
  OS Type: windows
  Portset Binding Igroup: pl
    Igroup UUID: 03accf6b-d08c-11df-a9ab-123478563412
    Initiators: -
3 entries were displayed.
```

**lun igroup unbind**

Unbind an existing initiator group from a portset

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
This command unbinds an initiator group from a port set. When you unbind an initiator group from a port set, all of the initiators in the initiator group have access to all target LUNs on all network interfaces.

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**
- **-vserver <Vserver Name>** - Vserver Name
  Specifies the Vserver.
- **-igroup <text>** - Igroup Name
  Specifies the initiator group that you want to unbind from the port set.

**Examples**
```
classifier1::> lun igroup unbind -vserver vs1 -igroup ig1
```

**lun import commands**

Manage Foreign LUN Import

**Note:** These commands are not supported for a Vserver with Infinite Volume.
**lun import create**

Create an import relationship

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**
This command creates an import relationship between a specified LUN and a specified foreign disk so you can import the foreign disk data into a LUN.

The foreign disk must be marked as foreign using *storage disk set-foreign-lun* command before you can begin the import progress.

The LUN must be of the same size as the foreign disk.

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**

- **-vserver <Vserver Name>** - Vserver Name
  
  Specifies the Vserver that contains the LUN where you import data to from the foreign disk data.

- **-foreign-disk <text>** - Foreign Disk Serial Number
  
  Specifies the serial number of the Foreign Disk.

- **-path <path>** - LUN Path
  
  Specifies the path of the LUN where you want to import the data of the foreign disk to. Examples of correct LUN paths are */vol/vol1/lun1* and */vol/vol1/qtree1/lun1*.

**Examples**

```
cluster1::> lun import create -vserver vs1 -path /vol/dvol1/lun1 -foreign-disk 6000B5D0006A0000006A020E00040000
```

**Related references**

* storage disk set-foreign-lun* on page 888

**lun import delete**

Deletes the import relationship of the specified LUN or the specified foreign disk

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**
This command deletes the import relationship of a specified LUN or a specified foreign disk.

You cannot use this command if an import is in-progress between the foreign disk and the LUN unless you use the force option. The import has to either successfully completed or be stopped before deleting the import relationship.

You can use the *lun import stop* command to stop the data import, and then you delete the import relationship.

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**

- **-vserver <Vserver Name>** - Vserver Name
  
  Specifies the Vserver that contains the LUN that you want to delete the import relationship.
-path <path> - LUN Path
   Specifies the path of the LUN where you want to delete the import relationship. Examples of correct LUN
   paths are /vol/vol1/lun1 and /vol/vol1/qtree1/lun1.

-foreign-disk <text> - Foreign Disk Serial Number
   Specifies the serial number of the foreign disk.

-force (true|false) - Force Delete
   When set to true, stops the in progress data import.

---

Examples

```
cluster1::> lun import delete -vserver vs1 -path /vol/vol2/lun2
```

Deletes the import relationship of lun2 at the path /vol/vol2/lun2.

```
cluster1::> lun import delete -vserver vs0 -foreign-disk 6000B5D0006A0000006A020E00040000
```

Related references

- lun import stop on page 222

---

lun import pause

Pause the import for the specified LUN

**Availability:** This command is available to cluster administrators at the advanced privilege level.

**Description**

This command pauses the data import to a specified LUN.

This command does not reset all import checkpoints. To resume a paused import, use the lun import resume command to retart
from the last checkpoint taken before you paused the data import.

If you want to resume the data import from the beginning, use the lun import stop command. Then use the lun import start
command.

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**

- **-vserver <Vserver Name>** - Vserver Name
   Specifies the Vserver that contains the LUN you want to pause the data import to.

- **-path <path>** - LUN Path
   Specifies the path of the LUN you want to pause the data import to. Examples of correct LUN paths
   are /vol/vol1/lun1 and /vol/vol1/qtree1/lun1.

---

Examples

```
cluster1::> lun import pause -vserver vs1 -path /vol/vol2/lun2
```

---

lun import prepare-to-downgrade

Prepares LUN import to be downgraded

**Availability:** This command is available to cluster administrators at the advanced privilege level.

---
**Description**
This command prepares the cluster for a downgrade to a version of Data ONTAP earlier than 8.3.1 by disabling the online LUN import feature. Before using this command verify that all LUNs in an import relationships are offline by running `lun show`.

### Examples
```
cluster1::> lun import prepare-to-downgrade
```

**Related references**
- `lun show` on page 195

**lun import resume**
Resume the import for the specified LUN

**Availability:** This command is available to cluster administrators at the advanced privilege level.

### Description
Resumes the data import to a specified LUN.

The import starts from the last checkpoint taken before you paused the data import.

If you want to resume the data import from the beginning, use the `lun import stop` command. Then use the `lun import start` command.

**Note:** This command is not supported for a Vserver with Infinite Volume.

### Parameters
- `-vserver <Vserver Name>` - Vserver Name
  Specifies the Vserver that contains the LUN you want to resume the data import to.

- `-path <path>` - LUN Path
  Specifies the path of the LUN that you want to resume the data import to. Examples of correct LUN paths are `/vol/vol1/lun1` and `/vol/vol1/qtree1/lun1`.

### Examples
```
cluster1::> lun import resume -vserver vs1 -path /vol/vol2/lun2
```

**lun import show**
Display a list of import relationships

**Availability:** This command is available to cluster administrators at the advanced privilege level.

### Description
This command displays information about the import relationships.

**Note:** This command is not supported for a Vserver with Infinite Volume.

### Parameters
{-fields <fieldname>, ...}
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.
If you specify the `-instance` parameter, the command displays detailed information about all fields.

`-vserver <Vserver Name>` - Vserver Name
Displays import relationships for a specified Vserver.

`-foreign-disk <text>` - Foreign Disk Serial Number
Enables you to see the import relationship for a particular foreign disk with the specified serial number.

`-path <path>` - LUN Path
Enables you to see the import relationship for a particular LUN path. Examples of correct LUN paths are `/vol/vol1/lun1` and `/vol/vol1/qtree1/lun1`.

`-import-home-node {<nodename>|local}` - Import Home Node
Enables you to see the node that initially started the data import and where the I/O for the foreign disk is directed. If failover occurs, any in-progress data import restarts on the partner node.

`-import-current-node {<nodename}|local}` - Import Current Node
Displays the node that is currently importing data and where the I/O for the foreign disk is directed. During giveback and if the import home node is different from the current home node, import restarts on the initial node (import-home-node).

`-operation-in-progress {import|verify}` - Operation in Progress
Enables you to see the imports in progress or import verification in progress.

`-admin-state {stopped|started|paused}` - Admin State
Enables you to see the import relationships for a specified administrative state. For example, you can list all the imports that have started in a cluster.

`-operational-state {in_progress|failed|completed|stopped|paused}` - Operational State
Enables you to see the import relationships for a specified operational state. For example, you can list all the imports that have completed in a cluster.

`-percent-complete <integer>` - Percent Complete
Enables you to see the percentage of completion for both import and verification. If you want to see all the complete imports and verifications, you would specify 100.

`-imported-blocks <integer>` - Blocks Imported
Enables you to see the number of blocks that have been imported to the LUN.

`-compared-blocks <integer>` - Blocks Compared
Enables you to see the number of LUN and foreign disk blocks that have been compared.

`-total-blocks <integer>` - Total Blocks
Enables you to see the total number of blocks that must be imported to complete the data import to a LUN or the number of blocks that must be compared to complete the import verification.

`-estimated-remaining-duration {<seconds> | [<d> days] <hh>:<mm>:<ss>]}` - Estimated Remaining Duration
If this parameter is specified, the command displays import or verify operations that match the specified time.

`-failure-reason <text>` - Failure Reason
Selects LUN import operations that match this parameter value.

`-max-throughput-limit {<integer> [KB|MB|GB|TB|PB]}` - Maximum Throughput Limit (per sec)
Selects the LUN import operations that match this parameter value. This value is the throughput limit at which an import or verify will be throttled. By default, there is no throttling.
[-current-throughput \(<\text{integer}\) [KB|MB|GB|TB|PB]]\) - Current Throughput (per sec)

Selects the LUN import operations that match this parameter value. This value is the current throughput for an in-progress import or verify operation.

[-qos-policy-group <text>] - QoS Policy Group

Selects the LUN import operations that match this parameter value. This value is the QoS policy group associated with an import relationship.

**Examples**

```
cluster1::> lun import show
vserver foreign-disk path operation-in-
progress admin-state operational-state percent-complete
--------------------------------------------------
vs1 600085D00006A0000006A020E00040000 /vol/dvol1/lun1 import stopped stopped 0
vs1 60060480343631336433336538366537 /vol/vol1/lun1 import started failed 11
vs2 600085D00006A0000006A020E00040001 /vol/dvol1/lun2 verify started in_progress 5
```

Display information about all import relationships in the cluster

```
cluster1::> lun import show -instance

**lun import start**

Start the import for the specified LUN

**Availability:** This command is available to cluster administrators at the advanced privilege level.

**Description**

This command initiates the data import to a specified LUN.

You must use the lun import create command to create an import relationship between a LUN and a foreign disk before you can initiate the data import.

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**

-vserver <Vserver Name> - Vserver Name

Specifies the Vserver that contains the LUN you want to import data to.

-path <path> - LUN Path

Specifies the path of the LUN that you want to import data to. Examples of correct LUN paths are /vol/vol1/lun1 and /vol/vol1/qtree1/lun1.

**Examples**

```
cluster1::> lun import start -vserver vs1 -path /vol/vol2/lun2
```
lun import stop
Stop the import for the specified LUN

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
This command stops the data import into a specified LUN.

After you stop the data import and if you start the import again using lun import start command, then the import restarts from the beginning.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters
-vserver <Vserver Name> - Vserver Name
  Specifies the Vserver that contains the LUN you want to stop importing data to.

-path <path> - LUN Path
  Specifies the path of the LUN that you want to stop the data import to.

Examples
cluster1::> lun import stop -vserver vs1 -path /vol/vol2/lun2

Related references
lun import start on page 221

lun import throttle
Modify the max throughput limit for the specified import relationship

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
This command throttles the speed of the import for a given LUN by specifying a maximum throughput limit on the import.

Parameters
-vserver <Vserver Name> - Vserver Name
  Specifies the Vserver that contains the LUN to which data from the foreign disk is imported.

-path <path> - LUN Path
  Specifies the path of the LUN to which data from the foreign disk is imported. Examples of correct LUN paths are /vol/vol1/lun1 and /vol/vol1/qtree1/lun1.

-max-throughput-limit {<integer>[KB|MB|GB|TB|PB]} - Maximum Throughput Limit (per sec)
  Specifies the maximum amount of throughput to be allocated for processing import requests on the bound LUN. At the time of creation, the default is zero. A value of zero implies that import traffic is processed by the system at best effort rate along with on-going user I/O. A non-zero value indicates that import will be throttled at a rate which is at most the maximum throughput limit set.
lun import commands

Manage Foreign LUN import verify

**Note:** These commands are not supported for a Vserver with Infinite Volume.

### lun import verify start

Start the verification of the foreign disk and LUN data

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**

This command compares the LUN and the foreign disk block by block. You are not required to run this command; it is optional. Before you can do this verification process, the operation state must be stopped or completed. Use the `lun import show` command to determine the operation state.

If a block mismatch occurs, the verification process stops.

Verification must be done offline. Ensure the foreign disk and LUN cannot be accessed by a host. To prevent access of the LUN, the LUN should be taken offline administratively using the `lun offline` command.

**Note:** The specified LUN must be in an import relationship with a foreign disk before you can verify the data import.

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**

**-vserver <Vserver Name>** - Vserver Name

Specifies the Vserver that contains the LUN you want to compare block by block with the foreign disk.

**-path <path>** - LUN Path

Specifies the path of the LUN that you want to compare the foreign disk to. Examples of correct LUN paths are `/vol/vol1/lun1` and `/vol/vol1/qtree1/lun1`.

### Examples

```
cluster1::> lun import verify start -vserver vs1 -path /vol/vol1/lun1 -max-throughput-limit 3M
```

**Examples**

```
cluster1::> lun import verify start -vserver vs1 -path /vol/vol2/lun2
```

### lun import verify stop

Stop the verify for the specified LUN

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**

This command stops the block by block verification of the foreign disk and LUN data.

**Note:** This command is not supported for a Vserver with Infinite Volume.
Parameters

-vserver <Vserver Name> - Vserver Name
   Specifies the Vserver that contains the LUN you want to stop block by block comparison with the foreign disk.

-path <path> - LUN Path
   Specifies the path of the LUN that you want to stop the block by block comparison. Examples of correct LUN paths are /vol/vol1/lun1 and /vol/vol1/qtree1/lun1.

Examples

cluster1::> lun import verify stop -vserver vs1 -path /vol/vol2/lun2

lun mapping commands

Manage LUN Maps

lun mapping add-reporting-nodes

Add Reporting Nodes

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

This command is used before or after a data mobility event that modifies the owning node of the LUN to add the new optimized nodes to the specified LUN mapping’s reporting nodes.

For more information on managing reporting nodes in response to data mobility events, please see the Data ONTAP SAN Administration Guide.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters

-vserver <Vserver Name> - Vserver Name
   Specifies the name of the Vserver containing the LUN.

{ -path <path> - LUN Path
   Specifies the path of the LUN. Examples of correct LUN paths are /vol/vol1/lun1 and /vol/vol1/qtree1/lun1.

| -volume <volume name> - Volume Name
   Specifies the volume that contains the LUN.

| -qtree <qtree name> - Qtree Name
   Specifies the qtree that contains the LUN.

| -lun <text> - LUN Name
   Specifies the LUN name.

| -igroup | -g <text> - Igroup Name
   Specifies the igroup the LUN is mapped to.
-local-nodes {true} - Add Nodes for Current LUN Location

Add the current LUN owner node and HA partner to the LUN mapping's reporting nodes.

This option should be used after a LUN mobility event to restore optimized access to the LUN.

-destination-aggregate <aggregate name> - Add Nodes for Aggregate

Add the specified aggregate's owner node and HA partner to the LUN mapping's reporting nodes.

This option may be used prior to a LUN mobility event that changes the LUN's containing aggregate.

-destination-volume <volume name> - Add Nodes for Volume

Add the specified volume's owner node and HA partner to the LUN mapping's reporting nodes.

This option may be used prior to a LUN mobility event that changes the LUN's containing volume.

-all {true} - Add All Nodes (privilege: advanced)

Set the LUN mapping to report on all nodes in preparation for a revert to a previous version of Data ONTAP.

Examples

```
cluster1::> lun mapping add-reporting-nodes -vserver vs1 -path /vol/vol1/lun1 -igroup ig1
Add the current owner node and HA partner for the LUN mapping of /vol/vol1/lun1 to igroup ig1

cluster1::> lun mapping add-reporting-nodes -vserver vs1 -volume vol1 -lun * -igroup ig1 -destination-aggregate aggr2
```

lun mapping create

Map a LUN to an initiator group

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command maps a LUN to all of the initiators in an initiator group (igroup). After you map the LUN, the LUN is visible to all initiators in the igroup.

Data ONTAP ensures that there are no LUN map conflicts whether the LUN is offline or online. A LUN map conflict is a mapping that would violate either of the following rules:

- Each LUN can be mapped to an initiator only once. A LUN can be mapped to multiple igroups as long as each igroup has a distinct set of initiators.
- LUN IDs must be unique such that every initiator has a unique ID for each LUN to which it is mapped. If you map a LUN to an igroup, the LUN ID for that mapping cannot be reused by any of the initiators in that igroup.

In order to determine if a LUN ID is valid for a mapping, Data ONTAP checks each initiator in the igroup to make sure that the LUN ID is not used for another mapping that includes that initiator.

Note: Prior to mapping a LUN, you must have at least one iSCSI or FCP LIF provisioned on the LUN's owner node and high-availability partner node.

Note: This command is not supported for a Vserver with Infinite Volume.
Parameters

-vserver <Vserver Name> - Vserver Name

Specifies the Vserver that contains the LUN you want to map.

{-path <path> - LUN Path

Specifies the path of the LUN that you want to map. Examples of correct LUN paths are /vol/vol1/lun1 and /vol/vol1/qtree1/lun1.

- volume <volume name> - Volume Name

Specifies the volume that contains the LUN you want to map.

[-qtree <qtree name>] - Qtree Name

Specifies the qtree that contains the LUN you want to map.

-lun <text> - LUN Name

Specifies the LUN name that you want to map.

-igroup -g <text> - Igroup Name

Specifies the igroup that you want to map.

[-lun-id <integer>] - LUN ID

Specifies the LUN ID for the mapping. The LUN ID is specific to the mapping, not to the LUN itself. This is used by the initiators in the igroup as the Logical Unit Number for the initiator when accessing the storage.

[-additional-reporting-node <nodename>] - Additional Reporting Node (privilege: advanced)

Specifies an additional node to populate the -reporting-nodes list when creating the LUN mapping. The specified node's high availability partner will be automatically populated as well. Use this parameter when preferred data mobility destinations are known ahead of time and the appropriate paths can be pre-configured.

Examples

cluster1::> lun mapping create -vserver vs1 -path /vol/vol1/lun1 -igroup ig1 -lun-id 8

lun mapping delete

Unmap a LUN from an initiator group

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

This command unmaps a LUN from an initiator group. After you use this command, the LUN is not visible to any of the initiators in the initiator group.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters

-vserver <Vserver Name> - Vserver Name

Selects the LUN maps for the Vserver that matches the parameter value.

{-path <path> - LUN Path

Specifies the path of the LUN you want to unmapped. Examples of correct LUN paths are /vol/vol1/lun1 and /vol/vol1/qtree1/lun1.

- volume <volume name> - Volume Name

Specifies the volume of the LUN you want to unmapped.
-qtree <qtree name> - Qtree Name
  Specifies the qtree of the LUN you want to unmap.

-lun <text> - LUN Name
  Specifies the name of the LUN you want to unmap.

-igroup | -g <text> - Igroup Name
  Specifies the initiator group that you want to unmap the LUN from.

Examples

cluster1::> lun mapping delete -vserver vs1 -path /vol/vol1/lun1 -igroup ig1

lun mapping remove-reporting-nodes

Remove Reporting Nodes

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

This command is used after a data mobility event to remove reporting nodes that are no longer required for optimized access from the specified LUN mapping.

For more information on managing reporting nodes in response to data mobility events, please see the Data ONTAP SAN Administration Guide.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters

-vserver <Vserver Name> - Vserver Name
  Specifies the name of the Vserver containing the LUN.

{ -path <path> - LUN Path
  Specifies the path of the LUN. Examples of correct LUN paths are /vol/vol1/lun1 and /vol/vol1/qtree1/lun1.

-volume <volume name> - Volume Name
  Specifies the volume that contains the LUN.

[-qtree <qtree name>] - Qtree Name
  Specifies the qtree that contains the LUN.

-lun <text> - LUN Name
  Specifies the LUN name.

-igroup | -g <text> - Igroup Name
  Specifies the igroup the LUN is mapped to.

-remote-nodes [true] - Remove Remote Nodes for LUN Location
  If specified, remove all nodes other than the LUN's owner and HA partner from the LUN mapping's reporting nodes.
Examples

```
cluster1::> lun mapping remove-reporting-nodes -vserver vs1 -path /vol/vol1/lun1 -igroup ig1
```

**lun mapping show**

Lists the mappings between LUNs and initiator groups.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

This command lists the mappings between LUNs and initiator groups.

**Parameters**

{{[-fields <fieldname>,...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

| [-instance ]

If you specify the -instance parameter, the command displays detailed information about all fields.

|-vserver <Vserver Name> - Vserver Name

Selects the LUN maps for the Vserver that matches the parameter value.

| [ -path <path> ] - LUN Path

Selects the LUN maps for the LUN with the path that matches the parameter value. Examples of correct LUN paths are /vol/vol1/lun1 and /vol/vol1/qtree1/lun1.

| [-volume <volume name>] - Volume Name

Selects the LUN maps for the volumes that match the parameter value.

| [-qtree <qtree name>] - Qtree Name

Selects the LUN maps for the queue trees that match the parameter value.

| [-lun <text>] ] - LUN Name

Selects the LUN maps for the LUNs with a name that matches the parameter value.

| [-igroup | -g <text>] - Igroup Name

Selects the LUN maps for the igroup that matches the parameter value.

| [-ostype {solaris|windows|hpux|aix|linux|netware|vmware|openvms|xen|hyper_v}] - Igroup OS Type

Selects the LUN maps for the initiator groups with the OS type that matches the parameter value. The possible OS types are:

- **solaris** - the LUN stores Solaris raw disk in a single-slice partition.
- **windows** - the LUN stores a raw disk type in a single-partition Windows disk using the Master Boot Record (MBR) partitioning style.
- **hpux** - the LUN stores HP-UX data.
- **linux** - the LUN stores a Linux raw disk without a partition table.
- **netware** - the LUN stores NetWare data.
- **vmware** - the LUN stores VMware data.
• **openvms** - the LUN stores Open-VMS data.
• **xen** - the LUN stores Xen data.
• **hyper_v** - the LUN stores Windows Server 2008 or Windows Server 2012 Hyper-V data.

```markdown
[-protocol <protocol_enum>] - Igroup Protocol Type
Selects the LUN maps for initiator groups with a protocol that matches the parameter value. Possible values include FCP, iSCSI, or mixed.

[-lun-id <integer>] - LUN ID
Selects the LUN maps with a LUN ID that matches the parameter value.

[-portset <text>] - Portset Binding Igroup
Selects the LUN maps for initiator groups bound to the portset that matches the parameter value.

[-alua {true|false}] - ALUA
Selects the LUN maps with ALUA settings that match the parameter value.

[-initiators | -n <text>, ...] - Initiators
Selects the LUN maps for initiator groups containing the initiators that match the parameter value.

[-node <nodename>] - LUN Node
Selects the LUN maps for nodes that match the parameter value.

[-reporting-nodes <nodename>, ...] - Reporting Nodes
Selects the LUN maps that match the parameter value.
```

### Examples

```shell
cluster1::> lun mapping show
Vserver   Path                                      Igroup   LUN ID  Protocol
---------- ----------------------------------------  -------  ------  --------
vs1        /vol/vol1/lun1                            igroup1      10  mixed
vs1        /vol/vol1/lun1                            igroup2       4  mixed
vs1        /vol/vol5/lun1                            igroup3       6  mixed
vs1        /vol/vol5/lun2                            igroup3       1  mixed
4 entries were displayed.
```

### lun mapping show-initiator

Show the LUN mappings to a specific initiator

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

**Description**
The `lun mapping show-initiator` command lists the LUNs which are mapped to an initiator group which contains a specific initiator.

**Parameters**

```markdown
[-fields <fieldname>, ...]
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

[-instance]
If you specify the `-instance` parameter, the command displays detailed information about all fields.
```
[-vserver <Vserver Name>] - Vserver Name
Selects the LUN mappings for the vserver that you specify.

-<initiator text> - Initiator Name
Selects the LUN mappings for the initiator that you specify.

[-lun-id <integer>] - Logical Unit Number
Selects the LUN mappings with a LUN ID that you specify.

[-igroup <text>] - Igroup Name
Selects the LUN mappings for the initiator group that you specify.

[-path <path>] - LUN Path
Selects the LUN mappings for the LUN path that you specify.

[-node <nodename>] - LUN Node
Selects the LUN mappings for the LUNs which are being hosted on the node that you specify.

[-reporting-nodes <nodename>, ...] - Reporting Nodes
Selects the LUN mappings for the LUNs which have reporting nodes that you specify.

[-vserver-uuid <UUID>] - Vserver UUID
Selects the LUN mappings for the Vserver UUID that you specify.

[-igroup-uuid <UUID>] - Igroup UUID
Selects the LUN mappings for the initiator group UUID that you specify.

[-lun-uuid <UUID>] - LUN UUID
Selects the LUN mappings for the LUN UUID that you specify.

Examples
The following example displays the LUN mappings for initiator 20:10:0a:50:00:01:01:01 in Vserver vs1.

```
cluster1::> lun mapping show-initiator -vserver vs1 -initiator 20:10:0a:50:00:01:01:01
Vserver Initiator LUN ID Path                                IGroup
------- --------- ------ ----------------------------------- ----------------
vs1     20:10:0a:50:00:01:01:01                                igroup_1
0 /vol/igroup_1_1_vol/lun1                                      igroup_1
1 /vol/igroup_1_1_vol/lun3                                      igroup_1
2 /vol/igroup_1_2_vol/lun1                                      igroup_1
3 /vol/igroup_1_2_vol/lun3                                      igroup_1
5 /vol/igroup_1_2_vol/lun3                                      igroup_1
6 /vol/igroup_1_3_vol/lun1                                      igroup_1
8 /vol/igroup_1_3_vol/lun3                                      igroup_1
9 /vol/igroup_1_4_vol/lun1                                      igroup_1
11 /vol/igroup_1_4_vol/lun3                                     igroup_2
12 /vol/igroup_2_1_vol/lun1                                     igroup_2
14 /vol/igroup_2_1_vol/lun3                                     igroup_2
15 /vol/igroup_2_2_vol/lun1                                     igroup_2
17 /vol/igroup_2_2_vol/lun3                                     igroup_2
18 /vol/igroup_2_3_vol/lun1                                     igroup_2
20 /vol/igroup_2_3_vol/lun3                                     igroup_2
21 /vol/igroup_2_4_vol/lun1                                     igroup_2
22 /vol/igroup_2_4_vol/lun3                                     igroup_2
23 /vol/igroup_2_4_vol/lun3                                     igroup_2
16 entries were displayed.
```

Manage Lun Move Operations
Manage LUN move operations

Note: These commands are not supported for a Vserver with Infinite Volume.
lun move cancel

Cancel a LUN move operation before the new LUN has been created

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

**Description**
The `lun move cancel` command cancels an ongoing LUN move operation prior to creation of the new LUN. The command fails if the LUN already exists at the destination path; in that case, allow the current move operation to complete and then move it back using the `lun move start` command.

All data transfers will be halted. If the source LUN was quiesced, it will be restored to normal operation.

**Note:** This is an advanced command because the preferred way to cancel a LUN move operation is to wait until the new LUN becomes visible, and then move it back.

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**

- `-vserver <Vserver Name>` - *Vserver Name*
  Specifies the name of the Vserver that will host the destination LUN.

- `-destination-path <path>` - *Destination Path*
  Specifies the full path to the new LUN, in the format `/vol/<volume>[/<qtree>]/<lun>`.

**Examples**

```
cluster1::*> lun move cancel -vserver vs1 -destination-path /vol/vol2/lun2
```

**Related references**

`lun move start` on page 234

lun move modify

Modify an ongoing LUN move operation

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `lun move modify` command modifies the maximum throughput of an ongoing move operation.

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**

- `-vserver <Vserver Name>` - *Vserver Name*
  Specifies the name of the Vserver that will host the destination LUN.

- `-destination-path <path>` - *Destination Path*
  Specifies the full path to the new LUN, in the format `/vol/<volume>[/<qtree>]/<lun>`.

- `-max-throughput (<integer> [KB|MB|GB|TB|PB])` - *Maximum Transfer Rate (per sec)*
  Specifies the maximum amount of data, in bytes, that can be transferred per second in support of this operation. This mechanism can be used to throttle a transfer, to reduce its impact on the performance of the source and destination nodes.
**Note:** The specified value will be rounded up to the nearest megabyte.

### Examples

```
cluster1::> lun move modify -vserver vs1 -destination-path /vol/vol2/lun2 -max-throughput 25MB
```

---

**lun move pause**

Pause an ongoing LUN move operation

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The `lun move pause` command pauses an ongoing move operation. Use the `lun move resume` command to resume the move operation.

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**

- `-vserver <Vserver Name>` - Vserver Name
  
  Specifies the name of the Vserver that will host the destination LUN.

- `-destination-path <path>` - Destination Path
  
  Specifies the full path to the new LUN, in the format `/vol/<volume>[/<qtree>]/<lun>`.

### Examples

```
cluster1::> lun move pause -vserver vs1 -destination-path /vol/vol2/lun2
```

---

**Related references**

`lun move resume` on page 232

---

**lun move resume**

Resume a paused LUN move operation

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The `lun move resume` command resumes a paused move operation.

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**

- `-vserver <Vserver Name>` - Vserver Name
  
  Specifies the name of the Vserver that will host the destination LUN.

- `-destination-path <path>` - Destination Path
  
  Specifies the full path to the new LUN, in the format `/vol/<volume>[/<qtree>]/<lun>`.
Examples

```
cluster1::> lun move resume -vserver vs1 -destination-path /vol/vol2/lun2
```

**Related references**

**lun move show**

Display a list LUNs currently being moved

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The `lun move show` command shows information about LUNs currently being moved in the cluster.

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**

```
[ [-fields <fieldname>, ...]  
  If you specify the `--fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `--fields ?` to display the fields to specify.
]

[ [-instance]  
  If you specify the `--instance` parameter, the command displays detailed information about all fields.
]

[ [-vserver <Vserver Name>] - Vserver Name  
  Selects LUN move operations that match this parameter value.
]

[ [-destination-path <path>] - Destination Path  
  Selects LUN move operations that match this parameter value.
]

[ [-source-path <path>] - Source Path  
  Selects LUN move operations that match this parameter value.
]

[ [-is-promoted-late {true|false}] - Is Destination Promoted Late  
  Selects LUN move operations that match this parameter value.
]

[ [-max-throughput {<integer>[KB|MB|GB|TB|PB]}] - Maximum Transfer Rate (per sec)  
  Selects LUN move operations that match this parameter value.
]

[ [-job-status {Preparing|Allocation-Map|Data|Destroying|Paused-Admin|Paused-Error|Complete|Destroyed}] - LUN Move Status  
  Selects LUN move operations that match this parameter value. The possible values are:
    • `Preparing` - the LUN move job is in Preparing status.
    • `Allocation-Map` - the LUN move job is in Allocating status.
    • `Data` - the LUN move job is in Moving Data status.
    • `Destroying` - the LUN move job is in Destroying status.
    • `Paused-Admin` - the LUN move job is in Paused By Admin status.
    • `Paused-Error` - the LUN move job is in Paused By Error status.
```
• **Complete** - the LUN move job is in Complete status.

• **Destroyed** - the LUN move job is in Destroyed status.

[-progress-percent <percent>] - LUN Move Progress (%)

Selects LUN move operations that match this parameter value.

[-elapsed-time <time_interval>] - Elapsed Time

Selects LUN move operations that match this parameter value.

[-cutover-time <time_interval>] - Cutover Time

Selects LUN move operations that match this parameter value.

[-is-snapshot-fenced {true|false}] - Is Snapshot Fenced

Selects LUN move operations that match this parameter value.

[-is-destination-ready {true|false}] - Is Destination Ready

Selects LUN move operations that match this parameter value.

[-last-failure-reason <text>] - Last Failure Reason

Selects LUN move operations that match this parameter value.

### Examples

```
cluster1::> lun move show
Vserver  Destination Path                Status          Progress
--------- ------------------------------- --------------- --------
  vs1      /vol/vol2/lun1                  Data            35%
  vs1      /vol/vol2/lun2                  Complete        100%
2 entries were displayed.
```

The example above displays information about all the LUN move operations in the cluster.

```
cluster1::> lun move show -vserver vs1 -destination-path /vol/vol2/lun1 -instance

  Destination Vserver Name: vs1
  Destination Path: /vol/vol2/lun1
  Source Path: /vol/vol1/lun1
  Is Destination Promoted Early: false
  Maximum Transfer Rate (per sec): 0B
  LUN Move Status: Data
  LUN Move Progress (%): 35%
  Elapsed Time: 145s
  Cutover Time (secs): 0s
  Is Snapshot Fenced: true
  Is Destination Ready: true
  Last Failure Reason: -
```

### lun move start

Start moving a LUN from one volume to another within a Vserver

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The `lun move start` command initiates moving of a LUN from one volume to another. The destination volume can be located on the same node as the original volume or on a different node.

**Note:** Use `lun move-in-volume` command if you want to rename the LUN or move it within the same volume.

**Note:** This command does not support movement of LUNs that are created from files.
Note: This command is not supported for a Vserver with Infinite Volume.

Parameters

-vserver <Vserver Name> - Vserver Name

Specifies the name of the Vserver that will host the new LUN.

-destination-path <path> - Destination Path

Specifies the full path to the new LUN, in the format /vol/<volume>[/<qtree>]/<lun>.

-source-path <path> - Source Path

Specifies the full path to the source LUN, in the format /vol/<volume>[/<qtree>]/<lun>.

-promote-late [true] - Promote Late

Optionally specifies that the destination LUN needs to be promoted late.

If the destination is promoted early, the new LUN will be visible immediately. However, Snapshot copies of the volume containing the new LUN cannot be taken until the LUN move operation reaches 'Moving Data' status.

If the destination is promoted late, the new LUN will be visible only after it has been fully framed. However, the LUN move job will not block the creation of Snapshot copies of the volume containing the new LUN.

If this parameter is not specified, the destination LUN will be promoted early.

-max-throughput (<integer> [KB|MB|GB|TB|PB]) - Maximum Transfer Rate (per sec)

Optionally specifies the maximum amount of data, in bytes, that can be transferred per second in support of this operation. This mechanism can be used to throttle a transfer, to reduce its impact on the performance of the source and destination nodes.

If this parameter is not specified, throttling is not applied to the data transfer.

Note: The specified value will be rounded up to the nearest megabyte.

Examples

cluster1::> lun move start -vserver vs1 -destination-path /vol/vol2/lun2 -source-path /vol/vol1/lun1

lun persistent-reservation commands

Manage SCSI-2 and SCSI-3 persistent reservations

Commands used for managing persistent reservations on LUNs.

lun persistent-reservation clear

Clear the SCSI-3 persistent reservation information for a given LUN

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.
Description
Cleans the persistent reservation for the specified LUN.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters
-vserver <Vserver Name> - Vserver Name
  Specifies the Vserver.

{ -path <path> - LUN Path
  Specifies the path of the LUN. Examples of correct LUN paths are /vol/vol1/lun1 and /vol/vol1/qtree1/lun1.
}

-vvolume <volume name> - Volume Name
  Specifies the volume.

-lun <text> - LUN Name
  Specifies the name of the LUN.

[-qtree <qtree name>] - Qtree Name
  Specifies the qtree.

Examples

cluster1::*> lun persistent-reservation clear -vserver vs_1 -path /vol/vol_1/lun_1

lun persistent-reservation show

Display the current reservation information for a given LUN.

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
Displays reservation information for a specified LUN in a Vserver. Unlike other show commands, the user must specify the LUN.

Parameters

{ [-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.
}

[-instance]
  If you specify the -instance parameter, the command displays detailed information about all fields.

-vserver <Vserver Name> - Vserver Name
  Specifies the Vserver.

{ -path <path> - LUN Path
  Specifies the path of the LUN. Examples of correct LUN paths are /vol/vol1/lun1 and /vol/vol1/qtree1/lun1.
}

-vvolume <volume name> - Volume Name
  Specifies the volume.

-lun <text> - LUN Name
  Specifies the name of the LUN.
[-qtree <qtree name>] - Qtree Name
  Specifies the qtree.

[-scsi-revision {scsi2|scsi3}] - SCSI Revision
  Selects the reservations that match this parameter value.

[-entry-type {reservation|registration}] - Reservation or Registration
  Selects the reservations that match this parameter value.

[-protocol {fcp|iscsi}] - Protocol
  Selects the reservations that match this parameter value.

[-reservation-key <text>] - Reservation Key
  Selects the reservations that match this parameter value.

[-reservation-type-code <text>] - Reservation Type
  Selects the reservations that match this parameter value. The possible values for SCSI-3 reservations are:
  • write exclusive
  • exclusive access
  • write exclusive registrants only
  • exclusive access registrants only
  • write exclusive all registrants
  • exclusive access all registrants

  and for SCSI-2 are:
  • regular
  • third party

[-initiator-name <text>] - Initiator Name
  Selects the reservations that match this parameter value.

[-aptpl {true|false}] - Persist Through Power Loss
  Selects the reservations that match this parameter value. If true, the reservation will be preserved over a power loss. If false, it will not. This value is for SCSI-3 reservations only.

[-target-wwpn <text>] - FCP Target WWPN
  Selects the reservations that match the specified World Wide Port Name (WWPN).

[-isid <text>] - Initiator Session ID
  Selects the reservations that match this parameter value.

[-tpgroup-tag <integer>] - TPGroup Tag
  Selects the reservations that match the specified target portal group tag. The tag identifies the tpgroup the reservation was made over.

[-third-party-initiator-name <text>] - Third Party Initiator Name
  Selects the reservations that match this parameter value (the initiator name that the reservation was made for). This is specific to third party reservation types, which is indicated by reservation-type-code.
Examples

```
cluster1::*> lun persistent-reservation show -vserver vs_1 /vol/vol_1/lun_1
Key                     Protocol Type              Initiator Name
----------------------- -------- ----------------- ----------------------------
                      -------- ----------------- ----------------------------
APTPL: true
a0:00:00:00:00:00:00:01 iscsi    write exclusive   iqn.1993-08.org.debian:01:fa752b8a5a3a
a0:00:00:00:00:00:00:01 iscsi    -                 iqn.1993-08.org.debian:01:fa752b8a5a3a
2 entries were displayed.
```

lun portset commands

Manage portsets

lun portset add

Add iSCSI/FCP LIFs to a portset

**Availability:** This command is available to cluster and Vserver administrators at the `admin` privilege level.

**Description**
This command adds existing iSCSI and FCP LIFs to a port set. To create a new port set, use the `lun portset create` command.

Use the `network interface create` command to create new LIFs.

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**

- `-vserver <Vserver Name>` - Vserver Name
  - Specifies the Vserver.

- `-portset <text>` - Portset Name
  - Specifies the port set you want to add the LIFs to.

- `-port-name <port_name>, ...` - LIF or TPG Name
  - Specifies the LIF name you want to add to the port set.

**Examples**

```
cluster1::> portset add -vserver vs1 -portset ps1 -port-name lif1
```

Related references

- `lun portset create` on page 238
- `network interface create` on page 337

lun portset create

Creates a new portset

**Availability:** This command is available to cluster and Vserver administrators at the `admin` privilege level.
Description
This command creates a new port set for FCP and iSCSI. The port set name can include a maximum of 96 characters. You can add LIFs to the new port set. If you do not add a LIF to the port set, you create an empty port set. To add LIFs to an existing port set, use the `lun portset add` command.

After you create a port set, you must bind the port set to an igroup so the host knows which FC or iSCSI LIFs to access. If you do not bind an igroup to a port set, and you map a LUN to an igroup, then the initiators in the igroup can access the LUN on any LIF on the Vserver.

**Note:** You cannot bind an igroup to an empty port set because the initiators in the igroup would have no LIFs to access the LUN.

**Note:** This command is not supported for a Vserver with Infinite Volume.

Parameters

`-vserver <Vserver Name>` - Vserver Name

Specifies the Vserver.

`-portset <text>` - Portset Name

Specifies the name of the new port set. A port set name is a case-sensitive name that must contain one to 96 characters. Spaces are not allowed.

`[-port-name <port_name>, ...]` - LIF Or TPG Name

Specifies the name of the logical interface that you want to add to the portset you want to create.

`{ [-protocol {mixed|fcp|iscsi}] - Protocol }
` Specifies if the portset protocol type is `fcp`, `iscsi`, or `mixed`. The default is `mixed`.

`| [-fcp | -f [true]]` - FCP

Specifies FCP as the protocol type of the new port set.

`| [-iscsi | -i [true]]` - iSCSI

Specifies iSCSI as the protocol type of the new port set.

Examples

```
cluster1::> portset create -vserver vsl -portset ps1 -protocol mixed
```

Creates a port set `ps1` on Vserver `vsl` with the protocol type of `mixed`.

```
cluster1::> portset create -vserver vsl -portset iscsips -protocol iscsi
```

Creates a port set `iscsips` on Vserver `vsl` with the protocol type of `iscsi`.

```
cluster1::> portset create -vserver vsl -portset fcppc -protocol fcp
```

Creates a port set `fcppc` on Vserver `vsl` with the protocol type of `fcp`.

```
cluster1::> portset create -vserver vsl -portset ps2 -protocol mixed -port-name l11
```

`lun portset add` on page 238

lun portset commands
**lun portset delete**

Delete the portset

**Availability:** This command is available to cluster and Vserver administrators at the *admin* privilege level.

**Description**
This command deletes an existing port set. By default, you cannot delete a port set if it is bound to an initiator group. If a port set is bound to an initiator group, you can do one of the following:

- specify the **force** option to unbind the port set from the initiator group and delete the port set.
- use the **lun igroup unbind** command to unbind the port set from the initiator group. Then you can delete the port set.

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**
- **vserver <Vserver Name>** - Vserver Name
  Specifies the Vserver.
- **portset <text>** - Portset Name
  Specifies the port set you want to delete.
- **[-force | -f [true]]** - Force
  Forcibly unbinds the port set from the initiator group.

**Examples**

```
cluster1::> portset delete -vserver vs1 -portset ps1
```

**Related references**

*lun igroup unbind* on page 215

**lun portset remove**

Remove iSCSI/FCP LIFs from a portset

**Availability:** This command is available to cluster and Vserver administrators at the *admin* privilege level.

**Description**
This command removes a LIF from a port set.

You cannot remove the last LIF in a port set if the port set is bound to an initiator group (igroup). To remove the last LIF in a port set, use the **lun igroup unbind** command to unbind the port set from the igroup. Then you can remove the last LIF in the port set.

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**
- **vserver <Vserver Name>** - Vserver Name
  Specifies the Vserver.
- **portset <text>** - Portset Name
  Specifies the port set you want to remove a LIF from.
-port-name <port_name>, ... - LIF or TPG Name

Specifies the LIF name you want to remove from the port set.

Examples

```
cluster1::> port set remove -vserver vs1 -portset ps1 -port-name lif1
```

Related references

`lun igroup unbind` on page 215

lun portset show

Displays a list of portsets

Availability: This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

Description

This command displays the LIFs in a port set. By default, the command displays all LIFs in all port sets.

Parameters

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance]
```

If you specify the `[-instance]` parameter, the command displays detailed information about all fields.

```
[-vserver <Vserver Name>] - Vserver Name
Selects the port sets that match this parameter value.
```

```
[-portset <text>] - Portset Name
Selects the port sets that match this parameter value.
```

```
[-port-name <port_name>, ...] - LIF Or TPG Name
Selects the port sets that match this parameter value.
```

```
[-protocol {mixed|fcp|iscsi}] - Protocol
Selects the port sets that match this parameter value.
```

```
[-port-count <integer>] - Number Of Ports
Selects the port sets that match this parameter value.
```

```
[-igroups <igroup>, ...] - Bound To Igroups
Selects the port sets that match this parameter value.
```

Examples

```
cluster1::> lun portset show
Vserver  Portset  Protocol  Port Names  Igroups
--------- ---------- --------- --------------- ------------
vs1       ps0      mixed     lif1, lif2     igroup1
ps1       iscsi    lif3      igroup2
ps2       fcp      lif4      -
3 entries were displayed.
```

The example above displays all port sets.
lun portset show -port-count 0
Vserver  Portset      Protocol Port Names              Igroups
--------- ------------ -------- ----------------------- ------------
vs1       p1           iscsi    -                       -

The example above displays the port sets that contain zero LIFs.

lun portset show -protocol iscsi
Vserver  Portset      Protocol Port Names              Igroups
--------- ------------ -------- ----------------------- ------------
vs1       p1           iscsi    -                       -
vs1       iscsips      iscsi    lif1                    igroup1
2 entries were displayed.

The example above displays the port sets that have the iSCSI protocol.

lun portset show -port-name lif1
Vserver  Portset      Protocol Port Names              Igroups
--------- ------------ -------- ----------------------- ------------
vs1       iscsips      iscsi    lif1                    igroup1

lun transition commands
Manage LUN Transition from Data ONTAP 7-Mode

lun transition show
Display the status of LUN transition processing

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The lun transition show command displays information about the LUN transition processing status of volumes. If no parameters are specified, the command displays the following information about all volumes:

• Vserver name
• Volume name
• Transition status

Parameters

[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver Name
Selects the volumes in the specified Vserver.

[-volume <volume name>] - Volume Name
Selects the volumes with the specified name.

[-status {none|complete|failed|active}] - Transition Status
Selects the volumes that match the specified transition status. The possible status values are:
• **active** - The volume is in an active SnapMirror transition relationship and not yet transitioned.
• **complete** - LUN transition has completed for the volume.
• **failed** - LUN transition has failed for the volume.
• **none** - The volume did not contain LUNs to transition from Data ONTAP 7-Mode.

\[-vserver-uuid <UUID]\] - **Vserver UUID**
Selects the volumes in the Vserver that matches the specified UUID.

\[-node <nodename]\] - **Filer ID**
Selects the volumes that match the specified node.

### Examples

The following example displays LUN transition information for all volumes in a Vserver named vs1:

```bash
cluster1::*> lun transition show -vserver vs1
Vserver       Volume       Transition Status
-------------- -------------- -----------------
vs1           vol0         none
              vol1         complete
              vol2         failed
              vol3         active
4 entries were displayed.
```

### lun transition start

Start LUN Transition Processing

**Availability:** This command is available to cluster administrators at the `advanced` privilege level.

**Description**
The `lun transition start` command starts LUN transition for the specified volume. Normally, transition is started automatically when `snapmirror break` is issued for the volume, this command allows restarting in the event automatic transitioning was interrupted or failed.

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**

- **-vserver <Vserver Name>** - Vserver Name
  
  The name of the Vserver containing the volume. If only one data Vserver exists, you do not need to specify this parameter.

- **-volume <volume name>** - Volume Name
  
  The name of the volume to restart LUN transition.

### Examples

The following example starts LUN transition on a volume named `volume1` in a Vserver named `vs1`:

```bash
cluster1::*> lun transition start -vserver vs1 -volume volume1
```

---

lun transition commands 243

snapmirror break on page 593

lun transition 7-mode commands

The 7-mode directory

lun transition 7-mode delete

Delete an Untransitioned 7-Mode LUN

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The lun transition 7-mode delete command deletes an untransitioned LUN copied from a Data ONTAP 7-Mode system. This allows the admin to recover space from the volume for LUNs that may not be transitioned to clustered Data ONTAP without disrupting LUNs that have transitioned, for example, if the LUN is an unsupported OS type.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters
- vserver <Vserver Name> - Vserver Name
  This specifies the name of the Vserver from which the LUN is to be deleted. If only one data Vserver exists, you do not need to specify this parameter.
- path <path> - LUN Path
  This specifies the path to the LUN to delete.

Examples
The following example deletes the LUN /vol/vol1/lun1 in a Vserver named vs1:

cluster1:~*> lun transition 7-mode delete -vserver vs1 -path /vol/vol1/lun1

lun transition 7-mode show

Display the 7-Mode LUN Inventory

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The lun transition 7-mode show command displays information about LUNs copied from a Data ONTAP 7-Mode system. If no parameters are specified, the command displays the following information about all 7-Mode LUNs:

- Vserver name
- LUN path
- Operating system type
- Size
- Whether or not the LUN has been transitioned to clustered Data ONTAP

Note: This command is not supported for a Vserver with Infinite Volume.
Parameters

`{-fields <fieldname>, ...}`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

`{-instance}`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`{-vserver <Vserver Name>}` - Vserver Name

Selects the 7-Mode LUNs in the specified Vserver.

`{-path <path>}` - LUN Path

Selects the 7-Mode LUNs with the specified path.

`{-volume <volume name>}` - Volume Name

Selects the 7-Mode LUNs that match the specified volume.

`{-ostype <os_enum>}` - OS Type

Selects the 7-Mode LUNs that match the specified operating system type.

`{-size <size>}` - LUN Size

Selects the 7-Mode LUNs that match the specified size.

`{-prefix-size <size>}` - Prefix Stream Size

Selects the 7-Mode LUNs that match the specified prefix stream size.

`{-suffix-size <size>}` - Suffix Stream Size

Selects the 7-Mode LUNs that match the specified suffix stream size.

`{-serial <text>}` - Serial Number

Selects the 7-Mode LUNs that match the specified serial number for clustered Data ONTAP. LUNs where `is-transitioned` is `false` do not have a serial number assigned for clustered Data ONTAP.

`{-uuid <UUID>}` - UUID

Selects the 7-Mode LUNs that match the specified UUID for clustered Data ONTAP. LUNs where `is-transitioned` is `false` do not have a UUID assigned for clustered Data ONTAP.

`{-serial-7-mode <text>}` - 7-mode Serial Number

Selects the 7-Mode LUNs that match the specified serial number from 7-Mode.

`{-is-transitioned {true|false}}` - Transition Complete

Selects the 7-Mode LUNs that match the specified transition state. LUNs where this value is `true` have been transitioned and are available to be mapped for client access. LUNs where this value is `false` have not yet been transitioned and may not be mapped.

`{-vserver-uuid <UUID>}` - Vserver UUID

Selects the 7-Mode LUNs that match the specified Vserver UUID.

`{-node <nodename>}` - Node

Selects the 7-Mode LUNs that match the specified node name.

Examples

The following example displays a summary of all 7-Mode LUNs for the volume `vol1` in a Vserver named `vs1`:

```
cluster1::*> lun transition 7-mode show -vserver vs1 -volume vol1

Vserver   Path                         Type     Size   Transitioned
--------- ---------------------------- -------- ------ ------------
vs1       /vol/vol1/lun1               linux      10MB false
```

lun transition commands
The following example displays detailed information for the 7-Mode LUN /vol/vol1/lun2 in a Vserver named vs1:

```
cluster1:~> lun transition 7-mode show -vserver vs1 -path /vol/vol1/lun2
```

Vserver Name: vs1
LUN Path: /vol/vol1/lun2
Volume Name: vol1
OS Type: linux
LUN Size: 500MB
Prefix Stream Size: 0
Suffix Stream Size: 0
Serial Number: BCVvv$DLZu8g
UUID: f53d603b-9663-4567-9680-95c1a9cc6d9e
7-mode Serial Number: C4eqKotPI8Ui
Transition Complete: true
Vserver UUID: be4cc135-163f-11e3-931f-123478563412
Node: cluster-01

---

**metrocluster commands**

Manage MetroCluster

The **metrocluster** commands enable you to manage MetroCluster.

**metrocluster configure**

Configure MetroCluster and start DR mirroring for the node and its DR group

**Availability:** This command is available to **cluster** administrators at the **admin** privilege level.

**Description**

The **metrocluster configure** command creates a MetroCluster configuration on either all the nodes in both MetroCluster clusters or solely on nodes in a DR group. The command configures a HA partner, DR partner, and a DR auxiliary partner for the nodes and also starts NVRAM mirroring between the configured DR partner nodes.

In MetroCluster, a DR group is a group of four nodes, two in each of the MetroCluster clusters:

- In the local cluster, a node and its HA partner,
- In the peer cluster, a node and its HA partner. These nodes are DR partners to the nodes in the local cluster.

There can be several DR groups in the MetroCluster configuration. MetroCluster provides synchronous DR protection to all data sets belonging to nodes within a properly configured DR group.

Without the **-node** parameter, the **metrocluster configure** command configures all the DR groups in both the MetroCluster clusters.

With the **-node mynode** parameter, the command configures both the **mynode** node and its HA partner node from the local cluster, and its DR partner and DR auxiliary partner from the peer cluster.

Before running the **metrocluster configure** command, the aggregates and Vservers on each node must be prepared for the MetroCluster configuration. Each node should have:

- At least one non-root, mirrored aggregate of size greater than 10GB. This non-root aggregate should not have any volumes in it.
• No other non-root aggregates. Any other non-root, unmirrored aggregates and volumes should be deleted.
• No Vservers other than Vservers of type "node" or "admin." Any Vservers that are not of type "node" or "admin" should be deleted.
• A mirrored and healthy root aggregate.

After the command is successful all nodes in the local and remote clusters will have HA, DR, and DR auxiliary partners and NVRAM mirroring between the DR partners will be turned on. The same conditions apply for before running the `metrocluster configure -node mynode` command, except that only one DR group is configured.

**Parameters**

[-node-name \{<nodename>|local\}] - Node to Configure

This optional parameter specifies the name of a single node in the local cluster. The command creates MetroCluster configuration on the local node specified by this parameter and the three other nodes belonging to the same DR group.

[-refresh \{true|false\}] - Refresh Configuration (privilege: advanced)

This optional parameter specifies if the node partner configuration steps should be done again. Not specifying this parameter will cause the MetroCluster configuration to continue using the current node partner information.

[-allow-with-one-aggregate \{true|false\}] - Override the Two Data Aggregates Requirement (privilege: advanced)

This optional parameter specifies if MetroCluster configuration should be allowed with only one data aggregate in each cluster. This option has no effect if two or more aggregates are present.

**Examples**

The following example shows the creation of the MetroCluster configuration for a single DR group:

```
clusA::> metrocluster show
Cluster                         Configuration State    Mode
------------------------------ ---------------------- ------------------------
Local: clusA                  not-configured         --
Remote: clusB                  not-configured         --
clusA::> metrocluster node show
DR                               Configuration  DR
Group Cluster Node               State          Mirroring Mode
----- ------- ------------------ -------------- --------- --------------------
-     clusA   clusA-01           ready to configure
       -
clusA-02           ready to configure
       -
clusA-03           ready to configure
       -
clusA-04           ready to configure
       -
4 entries were displayed.
clusA::> metrocluster configure -node clusA-01
[Job 45] Job succeeded: Configure is successful
clusA::> metrocluster show
Cluster                         Configuration State    Mode
------------------------------ ---------------------- ------------------------
Local: clusA                  partially-configured   normal
Remote: clusB                  partially-configured   normal
clusA::> metrocluster node show
DR                               Configuration  DR
Group Cluster Node               State          Mirroring Mode
----- ------- ------------------ -------------- --------- --------------------
-     clusA   clusA-03           ready to configure
       -
clusA-04           ready to configure
       -
```

`metrocluster configure`
The following example shows the creation of the MetroCluster configuration for all DR groups:

```
clusA::> metrocluster show
Cluster                     Configuration State    Mode
------------------------------ ---------------------- ------------------------
Local: clusA                  not-configured         -
Remote: clusB                  not-configured         -

clusA::> metrocluster node show
DR Group Cluster Node               State          Mirroring Mode
----- ------- ------------------ -------------- --------- --------------------
-     clusA   clusA-01           ready to configure
clusA-02           ready to configure
clusA-03           ready to configure
clusA-04           ready to configure

4 entries were displayed.
```

```
clusA::> metrocluster configure
[Job 45] Job succeeded: Configure is successful
clusA::> metrocluster show
Cluster                     Configuration State    Mode
------------------------------ ---------------------- ------------------------

*metrocluster show* on page 250

**metrocluster heal**

Heal DR data aggregates and DR root aggregates

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The *metrocluster heal* command heals DR data aggregates and DR root aggregates in preparation for a DR switchback. You must issue this command twice to complete the two phases of the healing process: first to heal the aggregates by
resynchronizing the mirrored plexes and then to heal the root aggregates by switching them back to the disaster site. The DR partner nodes must be powered off and remote disk shelves must be powered on before running this command.

**Parameters**

- **phase** *(aggregates|root-aggregates)* - MetroCluster Healing Phase
  
  This parameter specifies the healing phase. The first phase, *aggregates*, heals aggregates by resynchronizing mirrored plexes. The second phase, *root-aggregates*, heals the root aggregates of partner nodes. Healing root aggregates switches them back to the disaster site, allowing the site to boot up.

- **-override-vetoes [true]** - Override All Soft Vetoes
  
  This optional parameter overrides almost all heal operation soft vetoes. If this optional parameter is set to true, the system overrides subsystem soft vetoes that might prevent the heal operation. Hard vetoes cannot be overridden and can still prevent the switchback operation.

**Examples**

The following example performs the healing of both the aggregates and root aggregates:

```
cluster1::> metrocluster heal -phase aggregates
[Job 136] Job succeeded: Heal Aggregates is successful
cluster1::> metrocluster heal -phase root-aggregates
[Job 137] Job succeeded: Heal Root Aggregates is successful
```

**metrocluster modify**

Modify MetroCluster configuration options

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

The `metrocluster modify` command modifies MetroCluster parameters for nodes in the MetroCluster configuration.

**Parameters**

- **-auto-switchover-failure-domain <MetroCluster AUSO Failure Domain>* - Cluster Level AUSO Option
  
  This parameter specifies configuration of the automatic switchover. Supported values are as follows:
  
  - auso-on-cluster-disaster - triggers an unplanned switchover if all nodes in a DR cluster are down.
  - auso-on-dr-group-disaster - triggers an unplanned switchover if both nodes of a DR group are down.
  - auso-disabled - automatic switchover is disabled.

  The default value is *auso-on-cluster-disaster*. It is set to default value if `metrocluster configure` command is issued.

  The auto-switchover failure domain is set to *auso-disabled* if the `metrocluster unconfigure` command is issued.

  This setting only affects the local cluster where the command is run.

- **-node-name (<nodename>|local)** - Node to Change the Option On
  
  This parameter is used to specify the node in the cluster for which the parameter needs to be modified.
[-automatic-switchover-onfailure [true]] - Node Level AUSO Option (privilege: advanced)

This parameter is used to enable automatic switchover on failure on a node when it is disabled because of internal errors. Possible value for this field is true. This option is available in diag mode and should be used only when warning ems message comes. All the nodes in MCC configuration must have this option enabled (the default state) to enable automatic switchover on failure.

Examples

The following example shows the output of Metrocluster modification done on a node:

```
clusA::*> metrocluster modify -node-name clusA-01 -node-object-limit on
[Job 168] Job succeeded: Modify is successful
clusA::*> metrocluster modify -node-name clusA-01 -automatic-switchover-onfailure false
[Job 308] Job succeeded: Modify is successful
clusA::> metrocluster modify -auto-switchover-failure-domain auso-on-cluster-disaster
[Job 308] Job succeeded: Modify is successful
```

**metrocluster show**

Display MetroCluster configuration information

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

The `metrocluster show` command displays configuration information for the pair of clusters configured in MetroCluster.

This command displays the following details about the local cluster and the DR partner cluster:

- **Configuration State:** This field specifies the configuration state of the cluster.
- **Mode:** This field specifies the operational mode of the cluster.
- **AUSO Failure Domain:** This field specifies the AUSO failure domain of the cluster.

**Parameters**

[-periodic-check-status ]

If this option is used the MetroCluster periodic check status is displayed.

**Examples**

The following example shows the output of the command before MetroCluster configuration is done:

```
clusA::> metrocluster show
Cluster                      Entry Name            State
------------------------------- ------------------   ---------------------
Local: clusA                 Configuration State  not-configured
                             Mode              -
Remote: clusB                AUSO Failure Domain -
```

`metrocluster show` on page 251
metrocluster switchback

Switch back storage and client access

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The metrocluster switchback command initiates the switchback of storage and client access from nodes in the DR site to their home nodes. The home nodes and storage shelves must be powered on and reachable by nodes in the DR site. The metrocluster heal -phase aggregates and metrocluster heal -phase root-aggregates commands must have successfully completed before running the metrocluster switchback command.

Parameters
[-override-vetoes | -f [true]] - Override All Soft Vetoes
This optional parameter overrides all switchback operation soft vetoes. If this optional parameter is used, the system overrides subsystem soft vetoes that might prevent the switchback operation. Hard vetoes cannot be overridden and can still prevent the switchover operation.

[-simulate [true]] - Simulate Switchback (privilege: advanced)
If this optional parameter is used, the system runs a simulation of the switchback operation to make sure all the prerequisites for the operation are met. This parameter cannot be used with switchback operations performed for switching back left-behind aggregates or for retrying a partially successful switchback.

Examples
The following is an example of how to start the switchback operation.

clusA::> metrocluster switchback

Related references
metrocluster heal on page 248

metrocluster switchover

Switch over storage and client access

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The metrocluster switchover command initiates the switchover of storage and client access from the source cluster to the disaster recovery (DR) site. This command is to be used after a disaster that renders all the nodes in the source cluster unreachable and powered off. It can also be used for negotiated switchover when the outage of the source cluster is anticipated as in cases such as disaster recovery testing or a site going offline for maintenance. If a switchover operation previously failed on certain nodes on the DR site then issuing the command retries the operation on all of those nodes.
Parameters

{[-simulate [true]] - Simulate Negotiated Switchover (privilege: advanced)

If this optional parameter is used, the system runs a simulation of the negotiated switchover operation to make sure all the prerequisites for the operation are met. This parameter cannot be used with switchover with the -forced-on-disaster parameter.

[-forced-on-disaster [true]] - Force Switchover on Disaster

This optional parameter forces a switchover on disaster. This parameter should be used if all the nodes on the disaster stricken site are powered off and unreachable. In the absence of this parameter, the command attempts to perform a negotiated switchover operation.

[-force-nvfail-all [true]] - Sets in-nvfailed-state on All Volumes (privilege: advanced)

If this parameter is used, the switchover command will set the in-nvfailed-state parameter to true for all volumes being switched over and will set the -dr-force-nvfail parameter to true for any volumes that do not already have it enabled. This parameter has no effect when performing a negotiated switchover.

[-retry-failed-nodes <Node name>, ...]] - Nodes to Switchover

This optional parameter takes the list of nodes that previously failed the switchover operation and it retries the switchover operation on each of the nodes. This parameter is applicable only for a switchover with the -forced-on-disaster parameter.

[-override-vetoes [true]] - Override All Soft Vetoes

This optional parameter overrides all switchover operation soft vetoes. If this parameter is used, the system overrides all subsystem soft vetoes that might prevent the switchover operation. Hard vetoes cannot be overridden and can still prevent the switchover operation.

Examples

When a disaster strikes one site, the metrocluster switchover command is issued on the disaster recovery site as follows:

```
cluster1::> metrocluster switchover -forced-on-disaster true
Warning: MetroCluster switchover is a Disaster Recovery operation that could cause some data loss. The cluster on the other site must either be prevented from serving data or be simply powered off (nodes and disk shelves)
The following nodes ( cluster1-01 cluster1-02 ) will participate in the switchover operation
Do you want to continue? [y|n]: y
Queued job. Use 'metrocluster operation show' to check status of the DR operation.
```

```
cluster1::> metrocluster switchover show
Operation: switchover
State: successful
Start time: 10/3/2013 22:11:47
End time: 10/3/2013 22:11:53
Errors: -
```

metrocluster check commands
Check MetroCluster configuration and display results

metrocluster check disable-periodic-check
Disable Periodic Check

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The metrocluster check disable-periodic-check command disables the periodic checking of the MetroCluster configuration.

After this command is run, the MetroCluster Check job will be prevented from periodically checking the configuration for errors.

Examples
clusA::> metrocluster check disable-periodic-check

Related references
metrocluster check enable-periodic-check on page 254

metrocluster check enable-periodic-check
Enable Periodic Check

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The metrocluster check enable-periodic-check command enables the periodic checking of the MetroCluster configuration.

After this command is run, the MetroCluster Check job will able to run in the background and periodically check the configuration for errors.

Examples
clusA::> metrocluster check enable-periodic-check

Related references
metrocluster check disable-periodic-check on page 254

metrocluster check run
Check the MetroCluster setup

Availability: This command is available to cluster administrators at the admin privilege level.
**Description**
The `metrocluster check run` command performs checks on the MetroCluster configuration and reports configuration errors if any.

To run this command, at least one DR group needs to be configured. The command checks the following parts of the configuration:

**Node Configuration:**
- `node-reachable`: This check verifies that the node is reachable.
- `metrocluster-ready`: This check verifies that the node is ready for MetroCluster configuration.
- `local-ha-partner`: This check verifies that the HA partner node is in the same cluster.
- `ha-mirroring-on`: This check verifies that HA mirroring for the node is configured.
- `symmetric-ha-relationship`: This check verifies that the relationship between the node and its HA partner is symmetric.
- `remote-dr-partner`: This check verifies that the DR partner node is in the remote cluster.
- `dr-mirroring-on`: This check verifies that DR mirroring for the node is configured.
- `symmetric-dr-relationship`: This check verifies that the relationship between the node and its DR partner is symmetric.
- `remote-dr-auxiliary-partner`: This check verifies that the DR auxiliary partner node is in the remote cluster.
- `symmetric-dr-auxiliary-relationship`: This check verifies that the relationship between the node and its DR auxiliary partner is symmetric.
- `storage-failover-enabled`: This check verifies that storage failover is enabled.
- `has-intercluster-lif`: This check verifies that the node has an intercluster LIF.
- `node-object-limit`: This check verifies that the node object limit option for the node is turned on.

**Aggregate Configuration:**
- `mirroring-status`: This check verifies that the aggregate is mirrored.
- `disk-pool-allocation`: This check verifies that the disks belonging to this aggregate have been correctly allocated to the right pools.

At the end of the check the command displays a summary of the results. This summary output can be viewed again by running `metrocluster check show`. If any of the rows in this output show any warnings more details can be viewed by running the `metrocluster check show` command for that component.

**Parameters**

`[-skip-dr-simulation {true|false}]` - Skip the DR Readiness Checks (privilege: advanced)

If this optional parameter is set to true, the switchover and switchback simulations are not run.

**Examples**
The following example shows the execution of the command when there are no warnings:

```bash
clusA::> metrocluster check run

<table>
<thead>
<tr>
<th>Component</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>nodes</td>
<td>ok</td>
</tr>
<tr>
<td>clusters</td>
<td>ok</td>
</tr>
<tr>
<td>lifs</td>
<td>ok</td>
</tr>
</tbody>
</table>
```
The following example shows the execution of the command when there are some warnings:

```
clusA::> metrocluster check run

+-------------------+--------+
| Component          | Result |
|--------------------+--------|
| nodes              | warning|
| clusters           | ok     |
| lifs               | ok     |
| config-replication | ok     |
| aggregates         | ok     |
|--------------------+--------|

5 entries were displayed.

Command completed. Use the "metrocluster check show -instance" command or sub-commands in "metrocluster check" directory for detailed results.
```

### `metrocluster check show`

Show the results of the last instance of MetroCluster check

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**

The `metrocluster check show` command displays the results of `metrocluster check run` command.

This command displays the high-level verification results for each of the components. If there are any errors for a component, running the show command for that component (for example `metrocluster check node show` or `metrocluster check aggregate show`) will display more information about the warning.

**Note:** Please note that this command does not run the checks but only displays the results of checks. To look at the latest results, run the `metrocluster check run` command and then run this command.

**Parameters**

- `[-fields <fieldname>, ...]`
  
  If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

- `[-instance]`
  
  If you specify the `-instance` parameter, the command displays detailed information about all fields.
[-timestamp <MM/DD/YYYY HH:MM:SS>] - Time of Check
   This is the time at which the metrocluster check run command was last run in this cluster and these results were produced. If this parameter is specified, only rows with this timestamp will be displayed.

[-component <MetroCluster Check Components>] - Name of the Component
   This is the name of the component. If this parameter is specified, only rows with this component will be displayed.

[-result {ok|warning|not-run|not-applicable}] - Result of the Check
   This is the result of the check for the component. If this parameter is specified, only rows with this result will be displayed.

[-additional-info <text>] - Additional Information/Recovery Steps
   This is the additional info for the verification for this component. This field will have detailed information about the warning and recovery steps. If this parameter is specified, only rows with this additional info will be displayed.

Examples
The following example shows the execution of the command when there are no warnings:

```
clusA::> metrocluster check show
Component           Result
------------------- ---------
nodes               ok
clusters            ok
lifs                ok
config-replication  ok
aggregates          ok
5 entries were displayed.
```

The following example shows the execution of the command when there are some warnings:

```
clusA::> metrocluster check show
Component           Result
------------------- ---------
nodes               warning
clusters            ok
lifs                ok
config-replication  ok
aggregates          ok
5 entries were displayed.
```

The following example shows the execution of the command with -instance option:

```
clusA::> metrocluster check show -instance
   Name of the Component: nodes
   Result of the Check: warning
   Additional Information/Recovery Steps:
   Name of the Component: cluster
   Result of the Check: ok
   Additional Information/Recovery Steps:
```

**metrocluster check aggregate commands**

The aggregate directory

**metrocluster check aggregate show**

Show results of MetroCluster check for aggregates

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The `metrocluster check aggregate show` command displays the results of aggregate checks performed by the `metrocluster check run` command.

The command verifies the following aspects of the configuration of all aggregates in MetroCluster:

- mirroring-status: This check verifies that the aggregate is mirrored.
- disk-pool-allocation: This check verifies that the disks belonging to this aggregate have been correctly allocated to the right pools.

Additional information about the warnings (if any) and recovery steps can be viewed by running the command with the `-instance` option.

**Parameters**

`[-fields <fieldname>, ...]`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

`[-instance]`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-node <Node name>] - Node Name`

This is the name of the node for which the check was run. If this parameter is specified, only rows with this node will be displayed.
[-aggregate <aggregate name>] - Name of the Aggregate
This is the name of the aggregate for which the check was run. If this parameter is specified, only rows with this aggregate will be displayed.

[-check <MetroCluster Aggregate Check>] - Type of Check
This is the type of the check performed. If this parameter is specified, only rows with this check will be displayed.

[-cluster <Cluster name>] - Name of Cluster
This is the name of the cluster the node belongs to. If this parameter is specified, only rows with this cluster will be displayed.

[-result {ok|warning|not-run|not-applicable}] - Result of the Check
This is the result of the check. If this parameter is specified, only rows with this result will be displayed.

[-additional-info <text>, ...] - Additional Information/Recovery Steps
This is additional information about the check. This field has more information and recovery steps for the warning. If this parameter is specified, only rows with this additional info will be displayed.

Examples
The following example shows the execution of the command in a MetroCluster configuration with two nodes per cluster:

**metrocluster check cluster commands**

The cluster directory

**`metrocluster check cluster show`**

Show results of MetroCluster check for the cluster components

**Availability:** This command is available to cluster administrators at the `admin` privilege level.

**Description**

The `metrocluster check cluster show` command displays the results of cluster checks performed by the `metrocluster check run` command.

The command displays the results of the following cluster configuration checks:

- `negotiated-switchover-ready`: This check verifies that the cluster is ready for a negotiated switchover operation.
- `switchback-ready`: This check verifies that the cluster is ready for a switchback operation.
- `job-schedules`: This check verifies that the job schedules between the local and remote clusters are consistent.
- `licenses`: This check verifies that the licenses between the local and remote clusters are consistent.
- `periodic-check-enabled`: This check verifies that the periodic MetroCluster Check Job is enabled.

Additional information about the warnings (if any) and recovery steps can be viewed by running the command with the `--instance` parameter.

**Parameters**

```
[-fields <fieldname>,...]

- If you specify the `--fields <fieldname>,...` parameter, the command output also includes the specified field or fields. You can use `--fields ?` to display the fields to specify.

|--instance]

- If you specify the `--instance` parameter, the command displays detailed information about all fields.

|--check {negotiated-switchover-ready|switchback-ready|job-schedules|licenses|periodic-check-enabled]} - Type of Check

- This is the type of the check performed. If this parameter is specified, only rows with this check will be displayed.

|--cluster <Cluster name>] - Cluster Name

- This is the name of the cluster the check results apply to. If this parameter is specified, only rows matching the specified cluster will be displayed.

|--result {ok|warning|not-run|not-applicable}] - Result of the Check

- This is the result of the check. If this parameter is specified, only rows with this result will be displayed.
```
This is additional information about the check. This field has more information and recovery steps for the warning. If this parameter is specified, only rows with this additional info will be displayed.

**Examples**

The following example shows the execution of the command in a MetroCluster configuration:

```plaintext
clusA::> metrocluster check cluster show

**metrocluster check config-replication commands**

Display MetroCluster check configuration replication status

**metrocluster check config-replication show**

Display MetroCluster config-replication status information

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
The `metrocluster check config-replication show` command displays the results of MetroCluster configuration replication.

The command verifies the following aspects of MetroCluster configuration replication:

- **Enabled:** Verifies that MetroCluster configuration replication is enabled on the cluster.
- **Running:** Verifies that MetroCluster configuration replication is running on the cluster.
- **Remote Heartbeat:** Verifies that the MetroCluster configuration replication heartbeat with the remote cluster is healthy.
- **Last Heartbeat Sent:** Prints the timestamp of the last MetroCluster configuration replication heartbeat sent to the remote cluster.
- **Last Heartbeat Received:** Prints the timestamp of the last MetroCluster configuration replication heartbeat received from the remote cluster.
- **Storage Status:** Verifies that MetroCluster configuration replication storage is healthy.
- **Storage In Use:** Prints the location of MetroCluster configuration replication storage.
- **Storage Remarks:** Prints the underlying root cause for non-healthy MetroCluster configuration storage.
- **Vserver Streams:** Verifies that MetroCluster configuration replication Vserver streams are healthy.
- **Cluster Streams:** Verifies that MetroCluster configuration replication Cluster streams are healthy.

Additional information about the warnings (if any) and recovery steps can be viewed by running the command with the -instance option.
Parameters

[-instance]

If you specify the -instance parameter, the command displays detailed information about all fields.

Examples

The following example shows the output of `metrocluster check config-replication show`:

```
clusA::metrocluster check config-replication> show
   Enabled: true
   Running: true
   Remote Heartbeat: ok
   Last Heartbeat Sent: 12/12/2013 14:24:59
   Last Heartbeat Received: 12/12/2013 14:25:00
   Storage Status: ok
   Storage In Use: Cluster-wide Volume: MDV_CRS_1bc7134a5ddf11e3b63f123478563412_A
   Storage Remarks: -
   Vserver Streams: ok
   Cluster Streams: ok
```

- `metrocluster check config-replication show-aggregate-eligibility` on page 264

**metrocluster check config-replication show-aggregate-eligibility**

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The `metrocluster check config-replication show-aggregate-eligibility` command displays the MetroCluster configuration replication aggregate eligibility.

Parameters

[-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance] |

If you specify the -instance parameter, the command displays detailed information about all fields.

[-aggregate <aggregate name>] - Aggregate

This is the aggregate name. If this parameter is specified, only rows with this aggregate will be displayed.

[-hosted-configuration-replication-volumes <volume name>, ...] - Currently Hosted Configuration Replication Volumes

This is the list of the configuration replication volumes hosted on this aggregate. If this parameter is specified, only rows with these configuration replication volumes will be displayed.

[-is-eligible-to-host-additional-volumes {true|false}] - Eligibility to Host Another Configuration Replication Volume

This is the eligibility of the aggregate to host additional configuration replication volumes. If this parameter is specified, only rows with this eligibility will be displayed.
[comment <text>] - Comment for Eligibility Status

This is a comment regarding the eligibility of the aggregate to host configuration replication volumes. If this parameter is specified, only rows with this comment will be displayed.

### Examples

The following example shows the execution of the command in a MetroCluster configuration with thirteen aggregates in the cluster:

```sh
clusA::metrocluster check config-replication> show-aggregate-eligibility
Aggregate    Hosted Config Replication Vols Eligible to Host Addl Vols Comments
------------- ------------------------------------------ ------------- ---------------
a0           -                                          false          Root Aggregate

metrocluster check lif commands

Display LIF placement check results in MetroCluster configuration

metrocluster check lif repair-placement

Repair LIF placement for the sync-source Vserver LIFs in the destination cluster

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The metrocluster check lif repair-placement command reruns LIF placement for those LIFs displayed by the metrocluster check lif show command. This command is expected to be run after the admin manually rectifies the LIF placement failures displayed in the metrocluster check lif show command output. The command is successful if the LIF placement rerun does not encounter any LIF placement failure. This is to be confirmed by subsequent running of the metrocluster check lif show command.

Parameters

-\vserver <Vserver Name> - sync-source Vserver Name

This is the name of the sync source Vserver that has LIF placement failures as reported by the metrocluster check lif show command. This input ensures that the command is run on the specified Vserver.

-\lif <lif-name> - Logical Interface Name

This is the Logical Interface name that belongs to the sync source Vserver that has a LIF placement failure in the destination cluster as reported by the metrocluster check lif show command. This input ensures that the command is run on the specified LIF only.

Examples

The following example shows the execution of the command with a sync source Vserver and a LIF specified:

```
clusA::> metrocluster check lif repair-placement -vserver vs1.example.com -lif fcplif1
Command completed. Run the "metrocluster check lif show" command for results.
clusA::> metrocluster check lif repair-placement -vserver vs1.example.com -lif iscsilif1
Command completed. Run the "metrocluster check lif show" command for results.
```

The following example shows the execution of the command with only a sync-source Vserver specified:

```
clusA::> metrocluster check lif repair-placement -vserver vs1.example.com
Command completed. Run the "metrocluster check lif show" command for results.
clusA::>
```

Related references

- metrocluster check lif show on page 267
**metrocluster check lif show**

Show results of MetroCluster check results for the data LIFs

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
The `metrocluster check lif show` command displays the LIF placement failures in the MetroCluster configuration.

The command verifies the following aspects of the LIF placements of all the data LIFs in Metrocluster:

- **lif-placed-on-dr-node:** This check verifies that the LIF is placed on DR partner node.
- **port-selection:** This check verifies that the LIF is placed on correct port.

The LIF placement failures are mostly fabric/network connectivity issues that require manual intervention. Once the connectivity issues are resolved manually, the admin is expected to run `metrocluster check lif repair-placement` command to resolve the LIF placement issues for the sync source Vserver.

Additional information about the warnings (if any) and recovery steps can be viewed by running the command with the `-instance` option.

**Parameters**

```plaintext
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```plaintext
[-instance]
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```plaintext
[-cluster <Cluster name>] - Cluster Name
```

This is the name of the cluster the LIF belongs to. If this parameter is specified, only rows with this cluster will be displayed.

```plaintext
[-cluster-uuid <UUID>] - Cluster UUID
```

This is the uuid of the cluster the LIF belongs to.

```plaintext
[-vserver <text>] - Name of the Vserver
```

This is the name of the Vserver in the MetroCluster configuration.

```plaintext
[-lif <lif-name>] - Name of the Lif
```

This is the name of the LIF.

```plaintext
[-check <MetroCluster LIF placement Check>] - Description
```

This is the type of the check performed. If this parameter is specified, only rows with this check will be displayed.

```plaintext
[-result {ok|warning|not-run|not-applicable}] - Result of the Check
```

This is the result of the check performed. If this parameter is specified, only rows with this result will be displayed.

```plaintext
[-additional-info <text>] - Additional Information/Recovery Steps
```

This is additional information about the check. This field has more information and recovery steps for the warning. If this parameter is specified, only rows with this additional info will be displayed.

**metrocluster check node commands**

The node directory

**metrocluster check node show**

Show results of MetroCluster check for nodes

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

The metrocluster check node show command displays the results of node checks performed by the metrocluster check run command.

The command displays the results of the following node configuration checks:

- node-reachable: This check verifies that the node is reachable.
- metrocluster-ready: This check verifies that the node is ready for MetroCluster configuration.
- local-ha-partner: This check verifies that the HA partner node is in the same cluster.
- ha-mirroring-on: This check verifies that HA mirroring for the node is configured.
- ha-mirroring-op-state: This check verifies that the HA mirroring operation is online.
- symmetric-ha-relationship: This check verifies that the relationship between the node and its HA partner is symmetric.
- remote-dr-partner: This check verifies that the DR partner node is in the remote cluster.
- dr-mirroring-on: This check verifies that DR mirroring for the node is configured.
- dr-mirroring-op-state: This check verifies that the DR mirroring operation is online.
- symmetric-dr-relationship: This check verifies that the relationship between the node and its DR partner is symmetric.
remote-dr-auxiliary-partner: This check verifies that the DR auxiliary partner node is in the remote cluster.

symmetric-dr-auxiliary-relationship: This check verifies that the relationship between the node and its DR auxiliary partner is symmetric.

storage-failover-enabled: This check verifies that storage failover is enabled.

has-intercluster-lif: This check verifies that the node has an intercluster LIF.

node-object-limit: This check verifies that the node object limit option for the node is turned on.

automatic-uso: This check verifies that the automatic USO option for the node is enabled.

Additional information about the warnings (if any) and recovery steps can be viewed by running the command with the –instance parameter.

Parameters

{[-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?' to display the fields to specify.

[-instance ]

If you specify the –instance parameter, the command displays detailed information about all fields.

[-node <Node name>] - Node Name
This is the name of the node for which the check was run. If this parameter is specified, only rows with this node will be displayed.

[-check <MetroCluster Node Check>] - Type of Check
This is the type of the check performed. If this parameter is specified, only rows with this check will be displayed.

[-cluster <Cluster name>] - Cluster Name
This is the name of the cluster the node belongs to. If this parameter is specified, only rows with this cluster will be displayed.

[-result {ok|warning|not-run|not-applicable}] - Result of the Check
This is the result of the check. If this parameter is specified, only rows with this result will be displayed.

[-additional-info <text>] - Additional Information/Recovery Steps
This is additional information about the check. This field has more information and recovery steps for the warning. If this parameter is specified, only rows with this additional info will be displayed.

Display configuration replication information

metrocluster config-replication cluster-storage-configuration commands
Display configuration replication storage configuration

metrocluster config-replication cluster-storage-configuration modify
Modify MetroCluster storage configuration information

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The metrocluster config-replication cluster-storage-configuration modify command modifies the configuration of storage used for configuration replication.

Parameters
[-disallowed-aggregates <aggregate name>, ...] - Disallowed Aggregates

Use this parameter to set the list of storage aggregates that are not available to host storage for configuration replication.

Examples
The following example disallows two aggregates named aggr1 and aggr2:

**metrocluster config-replication cluster-storage-configuration**

Display MetroCluster storage configuration information

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**
The `metrocluster config-replication cluster-storage-configuration show` command shows details of the configuration of the storage used for configuration replication.

The information displayed is the following:

- **Disallow Aggregates** - The list of storage aggregates that are configured as not allowed to host storage areas.
- **Auto-Repair** - Displays `true` if the automatic repair of storage areas used by configuration replication is enabled.
- **Auto-Recreate** - Displays `true` if the automatic recreation of storage volumes used by configuration replication is enabled.
- **Use Mirrored Aggregate** - Displays `true` if storage areas for configuration replication are to be hosted on a mirrored aggregate.

**Examples**
The following is an example of the `metrocluster config-replication cluster-storage-configuration show` command:

```
cluster1:~> metrocluster config-replication cluster-storage-configuration show

Disallow Aggregates: -
    Auto-Repair: true
    Auto-Recreate: true
Use Mirrored Aggregate: true
```

Display MetroCluster configuration synchronization status

**metrocluster config-replication resync-status show**

Display MetroCluster Configuration Resynchronization Status

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**
The `metrocluster config-replication resync-status show` command displays the state of the configuration synchronization operation between the two clusters in the MetroCluster configuration.
This command displays the following details about the local cluster and the peer cluster:

- **Source**: This is the source side whose configuration is being replicated to the destination side.
- **Destination**: This is the destination side where the configuration is being replicated to from the source side.
- **State**: This is the state of the synchronization operation.
- **% Complete**: This is completion percentage of the operation.

**Examples**

The following example shows the output of the command when synchronization is in progress:

```
clusterA::> metrocluster config-replication resync-status show
Source                  Destination             State       % Complete
----------------------- ----------------------- ----------- ----------
clusterA                clusterB                complete    -
clusterB                clusterA                complete    -
```

The following example shows the output of the command when synchronization from clusB to clusA is in progress:

```
clusA::> metrocluster config-replication resync-status show
Source                  Destination             State       % Complete
----------------------- ----------------------- ----------- ----------
clusterA                clusterB                complete    -
clusterB                clusterA                messaging   95
```

**metrocluster configuration-settings commands**

Configuration settings to set up MetroCluster

**metrocluster configuration-settings show-status**

Display the configuration settings status for a MetroCluster setup

**Availability**: This command is available to `cluster` administrators at the `admin` privilege level.

**Description**

The `metrocluster configuration-settings show-status` command displays the configuration settings status for nodes in a MetroCluster setup. If a DR group has not been created, then status for nodes in the local cluster only are displayed.

**Parameters**

```
[ [-fields <fieldname>, ...]
   If you specify the `-fields <fieldname>, ...` parameter, the command displays only the fields that you specify.

   [ [-instance ]]  
   If this parameter is specified, the command displays detailed information about all entries.
```

[--cluster-uuid <UUID>] - Cluster UUID
If this parameter is specified, the command displays detailed information about all nodes in the cluster
matching the specified cluster-uuid.

[--cluster <Cluster name>] - Cluster Name
If this parameter is specified, the command displays detailed information about all the nodes in the specified
cluster.

[--node <text>] - Node Name
If this parameter is specified, the command displays information for the matching nodes.

[--configuration-status <text>] - Configuration Settings Status
If this parameter is specified, the command displays detailed information about all nodes with the specified
configuration status.

[--config-error-info <text>] - Configuration Error Information
If this parameter is specified, the command displays detailed information about all nodes with the specified
configuration error information.

Examples
The following example shows the display of MetroCluster setup status:

Nodes do not have a valid platform-specific personality value (equivalent to HAOSC parameter on
non-Apollo platforms) for a MetroCluster setup.

    clusA::> metrocluster configuration-settings show-status
    Cluster       Node               Configuration Settings Status
    -------------------------- ------------------ --------------------------------
    clusA                      A1                 not a MetroCluster setup
    A2                 not a MetroCluster setup
    2 entries were displayed.

MetroCluster setup uses FC links rather than IP link:

    clusA::> metrocluster configuration-settings show-status
    Cluster       Node               Configuration Settings Status
    -------------------------- ------------------ --------------------------------
    clusA                      A1                 not applicable for FC and SAS
    A2                 not applicable for FC and SAS
    2 entries were displayed.

Output of the command when MetroCluster setup uses IP links and before "metrocluster
configuration-settings dr-group create" command is run:

    clusA::> metrocluster configuration-settings show-status
    Cluster       Node               Configuration Settings Status
    -------------------------- ------------------ --------------------------------
    clusA                      A1                 ready for DR group create
    A2                 ready for DR group create
    2 entries were displayed.

Output of the command after "metrocluster configuration-settings dr-group create" command
is run:

    clusA::> metrocluster configuration-settings show-status
    Cluster       Node               Configuration Settings Status
    -------------------------- ------------------ ---------------------------------
**clusA**

<table>
<thead>
<tr>
<th>Node</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>A1</td>
<td>ready for interface create</td>
</tr>
<tr>
<td>A2</td>
<td>ready for interface create</td>
</tr>
</tbody>
</table>

**clusB**

<table>
<thead>
<tr>
<th>Node</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>B1</td>
<td>ready for interface create</td>
</tr>
<tr>
<td>B2</td>
<td>ready for interface create</td>
</tr>
</tbody>
</table>

4 entries were displayed.

Output of the command after "metrocluster configuration-settings interface create" command is run for every node:

```
clusA::> metrocluster configuration-settings show-status
+--------------------------+------------------+-----------------------------------+
<table>
<thead>
<tr>
<th>Cluster</th>
<th>Node</th>
<th>Configuration Settings Status</th>
</tr>
</thead>

**metrocluster configuration-settings connection commands**

Configure connections between partner nodes

**metrocluster configuration-settings connection check**

Check the network connections between partner nodes

**Availability:** This command is available to cluster administrators at the advanced privilege level.
Description
The `metrocluster configuration-settings connection check` command checks the settings of a MetroCluster over IP configuration.

This command is used for MetroCluster configurations that are connected through IP links.

Examples
The following example shows the output for the check command in MetroCluster over IP configurations:

```
clusA:*$> metrocluster configuration-settings connection check
[Job 68] Job succeeded: Connect is successful.
Begin connection check.
Start checking the partner cluster.
Check partner cluster: PASS.
Start checking the configuration settings.
Check configuration settings: PASS.
Start pinging the network endpoints from cluster "clusA".
Ping network endpoints: PASS.
Start pinging the network endpoints from cluster "clusB".
Ping network endpoints: PASS.
Start checking the network MTU sizes from cluster "clusA".
Check network MTU sizes: PASS.
Start checking the network MTU sizes from cluster "clusB".
Check network MTU sizes: PASS.
Start checking the network subnets from cluster "clusA".
Check network subnets: PASS.
Start checking the network subnets from cluster "clusB".
Check network subnets: PASS.
Start checking the storage daemons on cluster "clusA".
Check storage daemons: PASS.
Start checking the storage daemons on cluster "clusB".
Check storage daemons: PASS.
End of connection check.
```

`metrocluster configuration-settings connection connect`
Configure the network connections between partner nodes

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

Description
The `metrocluster configuration-settings connection connect` command configures the connections that mirror NV logs and access remote storage between partner nodes in a MetroCluster setup.

This command is used for MetroCluster setups that are connected though IP links. MetroCluster setups that are connected through FC links will configure the FC connections automatically.

The `metrocluster configuration-settings` commands are run in the following order to set up MetroCluster:

- `metrocluster configuration-settings dr-group create`,
- `metrocluster configuration-settings interface create`,
- `metrocluster configuration-settings connection connect`.

Before this command is run
- The DR groups must have been configured. Run the `metrocluster configuration-settings dr-group show` command to verify that every node is partnered in a DR group.
The network logical interfaces must have been configured on every node. Use the `metrocluster configuration-settings interface show` command to verify that every node has network logical interfaces configured to mirror NV logs and access remote storage.

After this command completes successfully, every node will:

- Have NV log mirroring configured and mirroring disabled. NV log mirroring will be enabled by the `metrocluster configure` command.
- Have access to remote storage. Use the `storage disk show -pool Pool1` command to view the remote disks that are hosted on DR partner nodes.

The DR groups and network logical interfaces that were configured by the `metrocluster configuration-settings` commands cannot be deleted after the connections have been configured. The `metrocluster configuration-settings connection disconnect` command must be run to remove the connections before the DR groups and network logical interfaces can be deleted.

**Examples**

The following example shows configuration of connections in a MetroCluster over IP setup:

```bash
CLUS::> metrocluster configuration-settings connection connect
[Job 269] Job succeeded: Connect is successful.
CLUS::> metrocluster configuration-settings connection show

- `metrocluster configuration-settings connection disconnect` on page 280

**metrocluster configuration-settings connection disconnect**

Tear down the network connections between partner nodes

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The `metrocluster configuration-settings connection disconnect` command removes the connections between nodes in a DR group that are used to mirror NV logs and access remote storage.

This command cannot be run if a node in the DR group has remote disks assigned to the node. The assigned ownership of remote disks can be removed by running the `storage disk removeowner` command.

The `metrocluster configuration-settings` commands are run in the following order to remove MetroCluster over IP configuration:

- `metrocluster configuration-settings connection disconnect`,
- `metrocluster configuration-settings interface delete`,
- `metrocluster configuration-settings dr-group delete`.

**Parameters**

- `-dr-group-id <integer>` - **DR Group ID**

  This parameter identifies the DR group to be disconnected.
Examples

The following example illustrates removal of connections in a four-node MetroCluster setup:

```
clusA::> metrocluster configuration-settings connection disconnect -dr-group-id 1
[Job 270] Job succeeded: Disconnect is successful.
clusA::> metrocluster configuration-settings show-status
Cluster          Node               Configuration Settings Status
------------------ ------------------ ---------------------------------

**metrocluster configuration-settings connection show**

Display the connections between partner nodes in a MetroCluster setup

**Availability:** This command is available to cluster administrators at the **admin** privilege level.

**Description**

The **metrocluster configuration-settings connection show** command displays the connection configuration information between the nodes in a MetroCluster setup.

**Parameters**

- **[-fields <fieldname>,...]**
  
  If you specify the **-fields <fieldname>,...** parameter, the command displays only the fields that you specify.

- **[-instance]**
  
  If this parameter is specified, the command displays detailed information about all entries.

- **[-dr-group-id <integer>] - DR Group ID**
  
  If this parameter is specified, the command displays information for the matching DR group.

- **[-cluster-uuid <UUID>] - Cluster UUID**
  
  If this parameter is specified, the command displays information for the matching cluster specified by uuid.

- **[-cluster <Cluster name>] - Cluster Name**
  
  If this parameter is specified, the command displays information for the matching cluster.

- **[-node-uuid <UUID>] - Node UUID**
  
  If this parameter is specified, the command displays information for the matching node specified by uuid.

- **[-node <text>] - Node Name**
  
  If this parameter is specified, the command displays information for the matching nodes.

- **[-home-port {<netport>|<ifgrp}>] - Home Port**
  
  If this parameter is specified, the command displays information for the matching home-port.

- **[-relationship-type <Roles of MetroCluster Nodes>] - Relationship Role Type**
  
  If this parameter is specified, the command displays information for the matching relationship-type.

- **[-source-address <IP Address>] - Source Network Address**
  
  If this parameter is specified, the command displays information for the matching source address.

- **[-destination-address <IP Address>] - Destination Network Address**
  
  If this parameter is specified, the command displays information for the matching destination address.
[<partner-cluster-uuid <UUID>] - Partner Cluster UUID
If this parameter is specified, the command displays information for the matching partner-cluster-uuid.

[<partner-node-uuid <UUID>] - Partner Node UUID
If this parameter is specified, the command displays information for the matching partner-node-uuid.

[<partner-node <text>] - Partner Node Name
If this parameter is specified, the command displays information for the matching partner-node.

[<partner-type <text>] - Partner Relationship Type
If this parameter is specified, the command displays information for the matching partner-type.

[<config-state <text>] - Configuration State
If this parameter is specified, the command displays information for the matching config-state.

[<config-error-info <text>] - Configuration Error Information
If this parameter is specified, the command displays information for the matching config-error-info.

metrocluster configuration-settings dr-group commands

Configure DR groups

**metrocluster configuration-settings dr-group create**

Create a DR group in a MetroCluster setup

**Availability:** This command is available to cluster administrators at the `admin` privilege level.

**Description**

The `metrocluster configuration-settings dr-group create` command partners the nodes that will comprise a DR group in a MetroCluster setup.

This command is used for MetroCluster setups that are connected through IP links. MetroCluster setups that are connected through FC links will configure DR groups automatically and do not require the `metrocluster configuration-settings` commands.

The `metrocluster configuration-settings` commands are run in the following order to set up MetroCluster:

- `metrocluster configuration-settings dr-group create`,
- `metrocluster configuration-settings interface create`,
- `metrocluster configuration-settings connection connect`.

Before running this command, cluster peering must be configured between the local and partner clusters. Run the `cluster peer show` command to verify that peering is available between the local and partner clusters.

This command configures a local node and a remote node as DR partner nodes. The command also configures the HA partner of the local node and the HA partner of the remote node as the other DR partner nodes in the DR group.

**Parameters**

- `partner-cluster <Cluster name>` - Partner Cluster Name
  
  Use this parameter to specify the name of the partner cluster.

- `local-node <nodename>|local` - Local Node Name
  
  Use this parameter to specify the name of a node in the local cluster.

- `remote-node <text>` - Remote Node Name
  
  Use this parameter to specify the name of a node in the partner cluster that is to be the DR partner of the specified local node.

**Examples**

The following example shows the creation of the MetroCluster DR group:
clusA::> metrocluster configuration-settings dr-group create -partner-cluster clusB -local-node A1 -remote-node B1
[Job 268] Job succeeded: DR Group Create is successful.

clusA::> metrocluster configuration-settings dr-group show
<table>

metrocluster configuration-settings dr-group delete

Delete a DR group in a MetroCluster setup

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The metrocluster configuration-settings dr-group delete command deletes a DR group and its node partnerships that were configured using the metrocluster configuration-settings dr-group create command.

This command cannot be run if the metrocluster configuration-settings interface create command has configured a network logical interface on a network port provisioned for MetroCluster. The metrocluster configuration-settings interface delete command must then be run to delete the network logical interfaces on every node in the DR group.

The metrocluster configuration-settings commands are run in the following order to remove the MetroCluster over IP configuration:

- metrocluster configuration-settings connection disconnect,
- metrocluster configuration-settings interface delete,
- metrocluster configuration-settings dr-group delete.
**Parameters**

- **-dr-group-id <integer> - Dr group Id**
  
  This parameter identifies the DR group to be deleted.

**Examples**

The following example shows the deletion of the MetroCluster DR group:

```
clusA::> metrocluster configuration-settings dr-group delete -dr-group-id 1
Warning: This command deletes the existing DR group relationship. Are you sure you want to proceed? [y|n]: y
[Job 279] Job succeeded: DR Group Delete is successful.
clusA::> metrocluster configuration-settings dr-group show
No DR groups exist.
clusA::> metrocluster configuration-settings show-status
Cluster Node Configuration Settings Status
-------------------------- ------------------ ---------------------------------
clusA A1 ready for DR group create
clusA A2 ready for DR group create
clusB B1 ready for DR group create
clusB B2 ready for DR group create
4 entries were displayed.
```

**metrocluster configuration-settings dr-group show**

Display the DR groups in a MetroCluster setup

**Availability:** This command is available to cluster administrators at the `admin` privilege level.

**Description**

The `metrocluster configuration-settings dr-group show` command displays the DR groups and their nodes.

**Parameters**

```
[[-fields <fieldname>,...]
    If you specify the `-fields <fieldname>,...` parameter, the command displays only the fields that you specify.

[[-instance]]
    If this parameter is specified, the command displays detailed information about all entries.

[[-dr-group-id <integer>] - DR Group ID
    If this parameter is specified, the command displays information for the matching DR group.

[[-cluster-uuid <UUID>] - Cluster UUID
    If this parameter is specified, the command displays information for the matching cluster uuid.
```

metrocluster configuration-settings commands
[-cluster <Cluster name>] - Cluster Name
If this parameter is specified, the command displays information for the specified cluster.

[-node-uuid <UUID>] - Node UUID
If this parameter is specified, the command displays information for the matching nodes uuid.

[-node <text>] - Node Name
If this parameter is specified, the command displays information for the matching nodes.

[-dr-partner-node-uuid <UUID>] - DR Partner Node UUID
If this parameter is specified, the command displays information for the matching DR partner node uuid.

[-dr-partner-node <text>] - DR Partner Node Name
If this parameter is specified, the command displays information for the matching DR partner nodes.

**Examples**
The following example illustrates the display of DR group configuration in a four-node MetroCluster setup:

```
clsA::> metrocluster configuration-settings dr-group show
<table>
<thead>
<tr>
<th>DR Group ID</th>
<th>Cluster</th>
<th>Node</th>
<th>DR Partner Node</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>clusA</td>
<td>A1</td>
<td>B1</td>
</tr>
<tr>
<td></td>
<td></td>
<td>A2</td>
<td>B2</td>
</tr>
<tr>
<td></td>
<td>clusB</td>
<td>B2</td>
<td>A2</td>
</tr>
<tr>
<td></td>
<td></td>
<td>B1</td>
<td>A1</td>
</tr>
</tbody>
</table>
4 entries were displayed.
```

**metrocluster configuration-settings interface commands**
Configure network logical interfaces

**metrocluster configuration-settings interface create**
Create a MetroCluster interface

*Availability:* This command is available to *cluster* administrators at the *admin* privilege level.

*Description*
The `metrocluster configuration-settings interface create` command configures the network logical interfaces that will be used on a node in a MetroCluster setup to mirror NV logs and access remote storage.

This command is used for MetroCluster setups that are connected through IP links. MetroCluster setups that are connected through FC links do not require the user to provision network logical interfaces to mirror NV logs and access remote storage.

The `metrocluster configuration-settings` commands are run in the following order to set up MetroCluster:

- `metrocluster configuration-settings dr-group create`,
- `metrocluster configuration-settings interface create`,
- `metrocluster configuration-settings connection connect`.

Before running this command, the node's DR group must be configured using the `metrocluster configuration-settings dr-group create` command. Run the `metrocluster configuration-settings dr-group show` command to verify that the node's DR group has been configured.
Parameters
- `cluster-name <Cluster name>` - Cluster Name
  Use this parameter to specify the name of the local or partner cluster.

- `home-node <text>` - Home Node
  Use this parameter to specify the home node in the cluster which hosts the interface.

- `home-port {<netport>|<ifgrp>}' - Home Port
  Use this parameter to specify the home port provisioned for MetroCluster.

- `address <IP Address>` - Network Address
  Use this parameter to specify the network address to be assigned to the home port.

- `netmask <Contiguous IP Mask>` - Netmask
  Use this parameter to specify the network mask to be assigned to the interface.

Examples
This example shows configuring logical interface on MetroCluster IP capable port:

```
clusA::> metrocluster configuration-settings interface create -cluster-name clusA -home-node A1 -home-port e0f -address 10.140.113.214 -netmask 255.255.192.0
[Job 281] Job succeeded: Interface Create is successful.
clusA::> metrocluster configuration-settings interface show
DR Group Cluster Node    Network Address Netmask         Gateway         State
----- ------- ------- --------------- --------------- --------------- ---------
1     clusA A1
      Home Port: e0f
      10.140.113.214  255.255.192.0   -               completed
Output after configuring all the interfaces:
clusA::> metrocluster configuration-settings interface show
DR Group Cluster Node    Network Address Netmask         Gateway         State
----- ------- ------- --------------- --------------- --------------- ---------
1     clusA A1
      Home Port: e0f

#### `metrocluster configuration-settings interface delete`

Delete a MetroCluster interface

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.
Description

The `metrocluster configuration-settings interface delete` command deletes the network logical interface that was configured on a network port provisioned for MetroCluster.

This command cannot be run if the `metrocluster configuration-settings connection connect` command has set up the connections between the nodes in a DR group. The `metrocluster configuration-settings connection disconnect` command must then be run to remove the connections.

The `metrocluster configuration-settings` commands are run in the following order to remove the MetroCluster over IP configuration:

- `metrocluster configuration-settings connection disconnect`
- `metrocluster configuration-settings interface delete`
- `metrocluster configuration-settings dr-group delete`

Parameters

- `-cluster-name <Cluster name>` - Cluster Name
  Use this parameter to specify the name of the local or partner cluster.

- `-home-node <text>` - Home Node
  Use this parameter to specify the home node in the cluster which hosts the interface.

- `-home-port {<netport>|<ifgrp>}` - Home Port
  Use this parameter to specify the home port provisioned for MetroCluster.

Examples

The following example shows the deletion of interface in a MetroCluster setup:

```
clusA::> metrocluster configuration-settings interface delete -cluster-name clusA -home-node A1 -home-port e0f
 [Job 271] Job succeeded: Interface Delete is successful.

clusA::> metrocluster configuration-settings interface show
DR Group Cluster Node    Network Address Netmask         Gateway         State
----- ------- ------- --------------- --------------- --------------- ---------
    1     clusA A1
        Home Port: e0g
           10.140.113.215  255.255.192.0   -               completed
        A2
           10.140.113.216  255.255.192.0   -               completed
        Home Port: e0f
           10.140.113.217  255.255.192.0   -               completed
clusB B2
        Home Port: e0f
           10.140.113.249  255.255.192.0   -               completed
        Home Port: e0g
           10.140.113.25  255.255.192.0   -               completed
        B1
           10.140.113.248  255.255.192.0   -               completed
4 entries were displayed.

clusA::> metrocluster configuration-settings show-status
Cluster Node            Configuration Settings Status
------------------------ ---------------------------------
clusA                   A1 ready for next interface create
                        A2 ready for connection connect
clusB                   B1 ready for connection connect
                        B2 ready for connection connect
```

metrocluster configuration-settings commands
Output of the command after deleting all the interfaces:

clusA::> metrocluster configuration-settings interface show
No interfaces exist.

clusA::> metrocluster configuration-settings show-status

metrocluster configuration-settings interface show

Display the network logical interfaces provisioned for MetroCluster

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The metrocluster configuration-settings interface show command displays the network logical interfaces that were provisioned for MetroCluster.

Parameters

- [-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command displays only the fields that you specify.
- [-instance ]
  If this parameter is specified, the command displays detailed information about all entries.
- [-dr-group-id <integer>] - DR Group ID
  If this parameter is specified, the command displays information for the matching DR group.
- [-cluster-uuid <UUID>] - Cluster UUID
  If this parameter is specified, the command displays information for the matching cluster specified by uuid.
- [-cluster <Cluster name>] - Cluster Name
  If this parameter is specified, the command displays information for the matching cluster.
- [-node-uuid <UUID>] - Node UUID
  If this parameter is specified, the command displays information for the matching nodes uuid.
- [-node <text>] - Node Name
  If this parameter is specified, the command displays information for the matching nodes.
[\-home-port \{<netport>|<ifgrp>\}] - Home Port

If this parameter is specified, all interfaces with home-port set to this value are displayed.

[\-address <IP Address>] - Network Address

If this parameter is specified, the command displays information for the matching network address.

[\-netmask <Contiguous IP Mask>] - Netmask

If this parameter is specified, all interfaces with netmask set to this value are displayed.

[\-gateway <IP Address>] - Gateway

If this parameter is specified, all interfaces with gateway set to this value are displayed.

[\-config-state <text>] - Configuration State

If this parameter is specified, all interfaces with this field set to the specified value are displayed.

[\-config-error-info <text>] - Configuration Error Information

If this parameter is specified, all interfaces with this field set to the specified value are displayed.

### Examples

The following example illustrates display of logical interfaces configured in a four-node MetroCluster setup:

```
clusA::> metrocluster configuration-settings interface show
DR Group Cluster Node    Network Address Netmask         Gateway         State
----- ------- ------- --------------- --------------- --------------- ---------
1     clusA A1           Home Port: e0f 10.140.113.214  255.255.192.0   -               completed
     Home Port: e0g 10.140.113.215  255.255.192.0   -               completed
     Home Port: e0f 10.140.113.216  255.255.192.0   -               completed
     Home Port: e0g 10.140.113.217  255.255.192.0   -               completed
clusB B2
     Home Port: e0f 10.140.113.249  255.255.192.0   -               completed
     Home Port: e0g 10.140.113.25  255.255.192.0   -               completed
     Home Port: e0f 10.140.113.218  255.255.192.0   -               completed
     Home Port: e0g 10.140.113.248  255.255.192.0   -               completed
8 entries were displayed.
```

### metrocluster interconnect commands

MetroCluster interconnect commands

### metrocluster interconnect adapter commands

Manage MetroCluster interconnect adapters

### metrocluster interconnect adapter modify

Modify MetroCluster interconnect adapter settings

**Availability:** This command is available to cluster administrators at the advanced privilege level.
**Description**
The `metrocluster interconnect adapter modify` command enables you to modify settings of the MetroCluster interconnect adapter.

**Parameters**

- **-node {<nodename>|local} - Node Name**
  This parameter specifies the node name.

- **-is-ood-enabled {true|false} - Is Out-of-Order Delivery Enabled?**
  This parameter specifies the out-of-order delivery setting on the adapter.

**Examples**
The following example enables out-of-order delivery for the port 'fcvi_device_0' on the node 'clusA-01':

```
clusA::*> metrocluster interconnect adapter modify -node clusA-01 -adapter-port-name fcvi_device_0 -is-ood-enabled true
```

**metrocluster interconnect adapter show**
Display MetroCluster interconnect adapter information

**Availability:** This command is available to cluster administrators at the `admin` privilege level.

**Description**
The `metrocluster interconnect adapter show` command displays interconnect adapter information for the nodes in a MetroCluster configuration.

This command displays the following details about the local node and the HA partner node:

- **Node:** This field specifies the name of the node in the cluster.
- **Adapter Name:** This field specifies the name of the interconnect adapter.
- **Adapter Type:** This field specifies the type of the interconnect adapter.
- **Link Status:** This field specifies the physical link status of the interconnect adapter.
- **Is OOD Enabled:** This field specifies the out-of-order delivery status of the interconnect adapter.
- **IP Address:** This field specifies the IP address assigned to the interconnect adapter.
- **Port Number:** This field specifies the port number of the interconnect adapter.

**Parameters**

{ [-fields <fieldname>, ...]  
  If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

| [-connectivity]  
  Displays the connectivity information from all the interconnect adapters to the connected nodes.

| [-switch]  
  Displays details of switches connected to all the interconnect adapters.}
|-connectivity-hidden (privilege: advanced)  
Displays additional connectivity information (IP address, Area ID, Port ID) from all the interconnect adapters to the connected nodes.

|-instance]  
If you specify the -instance parameter, the command displays detailed information about all fields.

|-node {<nodename> | local} - Node Name  
Displays information only about the interconnect adapters that are hosted by the specified node.

|-adapter <text> - Adapter  
Displays information only about the interconnect adapters that match the specified name.

|-port-name <text> - Port Name  
Displays information only about the interconnect adapters that host the specified port name.

|-type <text> - Adapter Type  
Displays information only about the interconnect adapters that match the specified adapter type.

|-physical-status <text> - Physical Status  
Displays information only about the interconnect adapters that match the specified physical status.

|-wwn <text> - Adapter Port World Wide Name  
Displays information only about the interconnect adapters that match the specified world wide name.

|-address <text> - IP Address  
Displays information only about the interconnect adapters that match the specified IP address.

|-firmware-version <text> - Firmware Version  
Displays information only about the interconnect adapters that match the specified firmware version.

|-link-speed <text> - Link Speed  
Displays information only about the interconnect adapters that match the specified link speed.

|-link-speed-neg-type <text> - Link Speed Negotiation Type  
Displays information only about the interconnect adapters that match the specified negotiated link speed type.

|-switch-name <text> - Switch Name  
Displays information only about the interconnect adapters that are connected to the specified switch.

|-switch-model <text> - Switch Model  
Displays information only about the interconnect adapters that are connected to the switch with the specified model.

|-switch-wwn <text> - Switch WWName  
Displays information only about the interconnect adapters that are connected to the switch with the specified world wide name.

|-switch-vendor <text> - Switch Vendor  
Displays information only about the interconnect adapters that are connected to the switch with the specified vendor.

|-switch-status <text> - Switch Status  
Displays information only about the interconnect adapters that are connected to the switch with the specified operational status.

|-switch-port-number <text> - Switch Port Number  
Displays information only about the interconnect adapters that are connected to the switch with the specified port number.
[-switch-port-wwpn <text>] - Switch Port WWPN
Displays information only about the interconnect adapters that are connected to the switch with the specified
word wide port name.

[-remote-adapter-name-list <text>,...]- Remote Adapter Name List
Displays information only about the interconnect adapters that are connected to the specified remote adapters.

[-remote-adapter-wwn-list <text>,...]- Remote Adapter WWName List
Displays information only about the interconnect adapters that are connected to the remote adapters with the
specified world wide names.

[-remote-adapter-address-list <text>,...]- Remote Adapter IP Address List
Displays information only about the interconnect adapters that are connected to the remote adapters with the
specified IP addresses.

[-remote-adapter-port-id-list <Hex Integer>,...]- Remote Adapter Port ID List
Displays information only about the interconnect adapters that are connected to the remote adapters with the
specified port IDs.

[-remote-adapter-domain-id-list <integer>,...]- Remote Adapter Domain ID List
Displays information only about the interconnect adapters that are connected to the remote adapters with the
specified domain IDs.

[-remote-adapter-area-id-list <integer>,...]- Remote Adapter Area ID List
Displays information only about the interconnect adapters that are connected to the remote adapters with the
specified Area IDs.

[-remote-partner-system-id-list <integer>,...]- Remote Partner System ID List
Displays information only about the interconnect adapters that are connected to the remote nodes with the
specified System IDs.

[-remote-partner-name-list ({<nodename>|local},...]- Remote Partner Name List
Displays information only about the interconnect adapters that are connected to the specified remote nodes.

[-is-ood-enabled {true|false}] - Is Out-of-Order Delivery Enabled?
Displays information only about the interconnect adapters that match the specified out-of-order delivery
setting.

Examples
The following example shows the output of the command during normal operation (neither cluster is in switchover state):

<table>
<thead>
<tr>
<th>Link</th>
<th>Is OOD</th>
</tr>
</thead>
<tbody>
<tr>
<td>Node</td>
<td>Adapter</td>
</tr>
<tr>
<td>------</td>
<td>---------</td>
</tr>
<tr>
<td>clusA-01</td>
<td>cxgb3_0</td>
</tr>
<tr>
<td>clusA-01</td>
<td>cxgb3_0</td>

```

metrocluster interconnect commands
**metrocluster interconnect mirror commands**

Manage MetroCluster interconnect mirrors

**metrocluster interconnect mirror show**

Display MetroCluster interconnect mirror information

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The `metrocluster interconnect mirror show` command displays NVRAM mirror information for the nodes configured in a MetroCluster.

This command displays the following details about the local node and the HA partner node:

- **Node:** This field specifies the name of the node in the cluster.
- **Partner Name:** This field specifies the name of the partner node.
- **Partner Type:** This field specifies the type of the partner.
- **Mirror Admin Status:** This field specifies the administrative status of the NVRAM mirror between partner nodes.
- **Mirror Oper Status:** This field specifies the operational status of the NVRAM mirror between partner nodes.
- **Adapter:** This field specifies the name of the interconnect adapter used for NVRAM mirroring.
- **Type:** This field specifies the type of the interconnect adapter used for NVRAM mirroring.
- **Status:** This field specifies the physical status of the interconnect adapter used for NVRAM mirroring.

**Parameters**

```bash
[-fields <fieldname>, ...]  # If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `?-fields ?` to display the fields to specify.

[-instance]  # If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node <nodename>|local] - Node Name  # If this parameter is specified, mirror details of the specified node are displayed.

[-partner-type {HA|DR|AUX}] - Partner Type  # If this parameter is specified, mirror details of the specified partner type are displayed.

[-adapter <text>] - Adapter  # If this parameter is specified, mirror details of the specified adapter are displayed.

[-type <text>] - Adapter Type  # If this parameter is specified, mirror details of the specified adapter type are displayed.

[-status <text>] - Status  # If this parameter is specified, mirror details of the adapter with the specified status are displayed.
```
[-mirror-oper-status {unknown|online|offline}] - Mirror Operational Status

If this parameter is specified, only mirror details with the specified operational status are displayed.

[-partner-name <text>] - Partner Name

If this parameter is specified, mirror details of the specified partner are displayed.

[-mirror-admin-status {enabled|disabled}] - Mirror Administrative Status

If this parameter is specified, only mirror details with the specified administrative status are displayed.

### Examples

The following example shows the output of the command during normal operation (neither cluster is in switchover state):

<table>
<thead>
<tr>
<th>Mirror Partner Name Type</th>
<th>Status</th>
<th>Adapter Type</th>
<th>Status</th>

---
**metrocluster interconnect mirror multipath commands**

Manage MetroCluster interconnect mirror multipath policy

**metrocluster interconnect mirror multipath show**

Display multipath information

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
The `metrocluster interconnect mirror multipath show` command displays the NVRAM mirror multipath policy for the nodes configured in a MetroCluster.

This command displays the following details about the local node and the HA partner node:

- **Node:** This field specifies the name of the node in the cluster.
- **Multipath Policy:** This field specifies the multipath policy used for NVRAM mirroring.

**Parameters**

```
[{-fields <fieldname>, ...}]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```[-instance]```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```[-node <nodename> | local] - Node Name```

If this parameter is specified, mirror details of the specified node are displayed.

```[-multipath-policy {no-mp|static-map|dynamic-map|round-robin}] - Multipath Policy```

If this parameter is specified, nodes with the specified multipath policy are displayed.

**Examples**
The following example shows the output of the command:

```
clusA:/> metrocluster interconnect mirror multipath show
Node                      Multipath Policy
----------------------------------------------
clusA-1                    static-map
clusA-2                    static-map
```

**metrocluster node commands**

Display MetroCluster nodes
**metrocluster node show**

Display MetroCluster node configuration information

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The `metrocluster node show` command displays configuration information for the nodes in the MetroCluster configuration.

**Parameters**

`[-fields <fieldname>, ...]`
- If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

`[-partners ]`
- If this option is used the MetroCluster node partnership view will be displayed.

`[-instance ]`
- If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-dr-group-id <integer>]` - DR Group ID
- If this parameter is specified, all nodes belonging to the specified DR group are displayed.

`[-cluster <Cluster name>]` - Cluster Name
- If this parameter is specified, all nodes belonging to the specified cluster are displayed.

`[-node <Node name>]` - Node Name
- If this parameter is specified, the specified node is displayed.

`[-ha-partner <Node name>]` - HA Partner Name
- If this parameter is specified, the node with the specified HA partner is displayed.

`[-dr-cluster <Cluster name>]` - DR Cluster Name
- If this parameter is specified, all nodes belonging to the specified cluster are displayed.

`[-dr-partner <Node name>]` - DR Partner Name
- If this parameter is specified, the node with the specified DR partner is displayed.

`[-dr-auxiliary <Node name>]` - DR Auxiliary Name
- If this parameter is specified, the node with the specified DR auxiliary partner is displayed.

`[-node-uuid <UUID>]` - Node UUID
- If this parameter is specified, the node with the specified Uuid is displayed.

`[-ha-partner-uuid <UUID>]` - HA Partner UUID
- If this parameter is specified, the nodes with the specified HA partner is displayed.

`[-dr-partner-uuid <UUID>]` - DR Partner UUID
- If this parameter is specified, the nodes with the specified DR partner is displayed.

`[-dr-auxiliary-uuid <UUID>]` - DR Auxiliary UUID
- If this parameter is specified, the node with the specified DR auxiliary partner is displayed.

`[-node-cluster-uuid <UUID>]` - Node Cluster UUID
- If this parameter is specified, all nodes belonging to the specified cluster are displayed.

`[-ha-partner-cluster-uuid <UUID>]` - HA Partner Cluster UUID
- If this parameter is specified, all nodes whose HA partner belong to the specified cluster are displayed.
[-dr-partner-cluster-uuid <UUID>] - DR Partner Cluster UUID
If this parameter is specified, all nodes whose DR partner belong to the specified cluster are displayed.

[-dr-auxiliary-cluster-uuid <UUID>] - DR Auxiliary Cluster UUID
If this parameter is specified, all nodes whose DR auxiliary partner belong to the specified cluster are displayed.

[-node-systemid <integer>] - Node System ID
If this parameter is specified, all nodes with the specified system ID are displayed.

[-ha-partner-systemid <integer>] - HA Partner System ID
If this parameter is specified, all nodes with an HA partner with the specified system ID are displayed.

[-dr-partner-systemid <integer>] - DR Partner System ID
If this parameter is specified, all nodes with a DR partner with the specified system ID are displayed.

[-dr-auxiliary-systemid <integer>] - DR Auxiliary System ID
If this parameter is specified, all nodes with a DR auxiliary partner with the specified system ID are displayed.

[-dr-mirroring-state <text>] - State of DR Mirroring Config
If this parameter is specified, all nodes with this field set to the specified value are displayed. This field specifies if the NVRAM mirroring to the DR partner is enabled through the \texttt{metrocluster configure} command. This field needs to be set to "enabled" for the DR mirroring to be active.

[-configuration-state <text>] - Configuration State of Node
If this parameter is specified, all nodes with this field set to the specified value are displayed.

[-additional-configuration-info <text>] - Additional Configuration Info
If this parameter is specified, all nodes with this field set to the specified value are displayed.

[-dr-operation-state <text>] - DR Operation State
If this parameter is specified, all nodes with this field set to the specified value are displayed.

[-dr-operation-time <integer>] - Time to Complete Operation (secs)
If this parameter is specified, all nodes with this field set to the specified value are displayed.

[-node-object-limit {on|off}] - Specifies if the Node Object Limits are Enforced
If this parameter is specified, all nodes with this field set to the specified value are displayed.

[-node-ha-partner <text>] - Node and its HA Partner
If this parameter is specified, all nodes with this field set to the specified value are displayed.

[-automatic-uso {true|false}] - Automatic USO (privilege: advanced)
If this parameter is specified, all nodes with this field set to the specified value are displayed.

\textbf{Examples}

The following example shows the output of the command before the MetroCluster configuration is done:

\begin{verbatim}
clusA::> metrocluster node show
DR Group Cluster Node          Configuration  DR
        ----        ----------        --------------        --------------
        -----        --------------        --------------
-        clusA        clusA-01        ready to configure
          -        clusA-02        ready to configure
          -        clusA-03        ready to configure
          -        clusA-04        ready to configure
4 entries were displayed.
\end{verbatim}
**clusA::> metrocluster node show -partners**

Node (HA Partner) DR Partner (DR Auxiliary)

<table>
<thead>
<tr>
<th>Cluster:</th>
<th>clusA -</th>
</tr>

### metrocluster operation commands

Display MetroCluster operation status

#### metrocluster operation show

Display details of the last MetroCluster operation

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The `metrocluster operation show` command displays information about the most recent MetroCluster operation run on the local cluster.

This command will display information about all MetroCluster commands except for the commands in the `metrocluster check` directory. This command will not display any information after MetroCluster has been completely unconfigured using the `metrocluster unconfigure` command.

**Examples**

The following example shows the output of `metrocluster operation show` after running a `metrocluster configure` command was successful:

```
clusA::> metrocluster operation show
     Operation: configure
     State: successful
     Start time: 2/15/2013 18:22:46
     End time: 2/15/2013 18:25:18
     Errors: -
```

### metrocluster operation history commands

The history directory

#### metrocluster operation history show

Display details of all MetroCluster operations

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.
Description
The `metrocluster operation history show` command displays information about all the MetroCluster operations run on the local cluster.

This command will display information about all MetroCluster commands except for the commands in the `metrocluster check` directory. This command will not display any information after MetroCluster has been completely unconfigured using the `metrocluster unconfigure` command.

Parameters

```
{ [-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

  [-instance ]
  If you specify the -instance parameter, the command displays detailed information about all fields.

  [-operation-uuid <UUID>] - Identifier for the Operation
  This is the UUID of the operation. If this parameter is specified, only the operation with this UUID is displayed.

  [-cluster <Cluster name>] - Cluster Where the Command Was Run
  This is the name of the cluster where the command was run. If this parameter is specified, only the operations that were run in this cluster are displayed.

  [-node-name <Node name>] - Node Where the Command Was run
  This is the name of the node where the command was run. If this parameter is specified, only the operations that were run on this node are displayed.

  [-operation <MetroCluster Operation Name>] - Name of the Operation
  This is the name of the operation. If this parameter is specified, only the operations with this name are displayed.

  [-start-time <MM/DD/YYYY HH:MM:SS>] - Start Time
  This is the time the operation started execution. If this parameter is specified, only the operations that were started at this time are displayed.

  [-state <MetroCluster Operation state>] - State of the Operation
  This is the state of the operation. If this parameter is specified, only the operations that are in this state are displayed.

  [-end-time <MM/DD/YYYY HH:MM:SS>] - End Time
  This is the time the operation completed. If this parameter is specified, only the operations that completed at this time are displayed.

  [-error-list <text>, ...] - Error List For the Operation
  This is the list of errors that were encountered during an operation's execution. If this parameter is specified, only the operations that have the matching errors are displayed.

  [-job-id <integer>] - Identifier for the Job
  This is the job id for the operation. If this parameter is specified, only the operation that has the matching job id displayed.
```

Examples

The following example shows the output of `metrocluster operation history show` after some MetroCluster operations have been performed:

```
metrocluster operation commands
305
```
clusA::> metrocluster operation history show

<table>
<thead>
<tr>
<th>Operation</th>
<th>State</th>
<th>Start time</th>
<th>End time</th>
</tr>
</thead>
</table>

2 entries were displayed.

**metrocluster vserver resync**

Resynchronize Vserver with it's partner Vserver

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
The `metrocluster vserver resync` command resynchronizes the Vserver with it's partner Vserver

**Parameters**
- `-cluster <Cluster name>` - Cluster Name
  - Name of the cluster where the Vserver belongs
- `-vserver <vserver>` - Vserver
  - Name of the Vserver to be resynchronized

**Examples**

```
cluster::> metrocluster vserver resync -cluster clus1 -vserver vs1
```

Related references

*metrocluster vserver show* on page 307

**metrocluster vserver show**

Display MetroCluster Vserver relationships

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
The `metrocluster vserver show` command displays configuration information for all pairs of Vservers in MetroCluster.

**Parameters**

- `[-fields <fieldname>,...]
  - The command output includes the specified field or fields
- `[-creation-time ] (privilege: advanced)```
  - Shows the last configuration modification time on the Vserver
- `[-instance ]`
  - If you specify the `-instance` parameter, the command displays detailed information about all fields.
- `-cluster <Cluster name>` - Cluster Name
  - Name of the cluster where the Vserver belongs
- `-vserver <vserver>` - Vserver
  - Name of the Vserver
- `[-partner-vserver <vserver>]` - Partner Vserver
  - Name of the partner Vserver
Configuration states include:

- **healthy**
- **unhealthy**
- **degraded** indicates that Vservers are not in sync
- **syncing** indicates that the Vserver configuration is being synchronized
- **replication-paused** indicates that the configuration replication was manually paused
- **pending-setup** indicates that partner Vserver creation is pending

**Corrective Action**
Corrective action which can be followed to successfully create the partner Vserver

**Creation Time on the source**
Last configuration modification time on the Vserver

**Is out of sync**
Indicates that the Vserver configuration replication is not in sync

**Configuration Resume Time**
Displays the resume time of the Vserver configuration replication

**Examples**

The following example shows the output of the command when partner Vservers are created

```
clusA::> metrocluster vserver show

Cluster: clusA
Vserver           Partner       Configuration
-------------------        ----------------------        -----------------
clusA               clusB             healthy
vs1                 vs1-mc             healthy

Cluster: clusB
Vserver           Partner       Configuration
-------------------        ----------------------        -----------------
clusB               clusA             healthy
3 entries were displayed.
```

The following example shows the output of the command when the partner Vserver creation is pending

```
clusA::> metrocluster vserver show

Cluster: clusA
Vserver           Partner       Configuration
-------------------        ----------------------        -----------------
clusA               clusB             healthy
vs1                 -                 pending-setup
Corrective Action: Create Ipspace ips1 on the partner cluster.
2 entries were displayed.
```
Network Commands

Manage physical and virtual network connections

The network commands enable you to manage the network interfaces in a cluster.

**network ping**

Ping

**Availability:** This command is available to cluster and Vserver administrators at the *admin* privilege level.

**Description**
The `network ping` command displays whether a remote address is reachable and responsive, the (if specified) number of transmitted and received packets, and their round-trip time. The command requires a source node or logical interface from where the ping will be run, and a destination IP address. You can specify the source node by name, or a logical interface and its Vserver.

**Parameters**

```
- node <nodename> - Node
  Use this parameter to send the ping from the node you specify.

- lif <lif-name> - Logical Interface
  Use this parameter to send the ping from the logical interface you specify.

-vserver <vserver> - Vserver
  Use this parameter to send the ping from the Vserver where the intended logical interface resides. The default value is the system Vserver for cluster administrators.

-use-source-port {true|false} - Use Source Port of Logical Interface (privilege: advanced)
  This parameter is only applicable when the `-lif` parameter is specified. When set to true, the ping packet will be sent out via the port which is currently hosting the IP address of the logical interface. Otherwise, the ping packet will be sent out via a port based on the routing table.

-destination <Remote InetAddress> - Destination
  Use this parameter to specify the remote internet address destination of the ping.

-show-detail | -s [true] - Show Detail Output
  Use this parameter to display detailed output about the ping.

-record-route | -R [true] - Record Route
  Use this parameter to display the route followed by the ping. You should set this option to false for pinging to succeed.

-verbose | -v [true] - Show All ICMP Packets
  Use this parameter to display all ICMP packets.

-packet-size <integer> - Packet Size
  Use this parameter to specify the number of data bytes to be sent in the ping packet. The default is 56 bytes, which is 64 ICMP data bytes total after 8 bytes of ICMP header data is added.
```
[-count <integer>] - Count
Use this parameter to specify the maximum number of ECHO_REQUESTS to be sent to the destination. The default is 20 requests. In the absence of the 'show-detail' option, ping reports that the destination is alive after receiving the first ECHO_REPLY response, independent of this value.

[-wait <integer>] - Packet Send Wait Time (secs)
Use this parameter to specify the number of seconds to wait between sending packets. The default is one second.

[-flood [true]] - Flood Ping (privilege: advanced)
Use this parameter to execute the command in flood mode. In flood mode, the command issues pings as fast as they are received, unless you specify a wait time.

[-disallow-fragmentation | -D [true]] - Disallow Packet Fragmentation
Use this parameter to prevent transport mechanisms from fragmenting ping packets in transit. Preventing fragmentation assures consistent packet size, making it easier to see transport bottlenecks.

[-wait-response <integer>] - Packet Response Wait Time (ms)
Use this parameter to specify the number of milliseconds to wait for each response packet. The default is 10000 milliseconds (10 seconds).

Examples
This example shows a ping from node xena to the destination server 10.98.16.164 with the server responding that it is up and running.

cluster11:~> network ping -node xena -destination 10.98.16.164
(network ping)
10.98.16.164 is alive

network ping6
Ping an IPv6 address

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The network ping6 command uses the ICMPv6 protocol's mandatory ICMP6_ECHO_REQUEST datagram to elicit an ICMP6_ECHO_REPLY from a host or gateway. ICMP6_ECHO_REQUEST datagrams ("pings") have an IPv6 header, and ICMPv6 header formatted as documented in RFC2463.

Parameters
{-node <nodename> - Node Name
Use this parameter to originate ping6 from the specified node.

|-lif <lif-name> - Logical Interface
Use this parameter to originate ping6 from the specified logical interface.

-vserver <vserver name> - Vserver Name
Use this parameter to originate ping6 from the specified Vserver. The default value is the system Vserver for cluster administrators.

-destination <Remote InetAddress> - Destination
Use this parameter to specify the IPv6 address of the destination node.
[-buffer-size | -b <integer>] - Socket Buffer Size
   Use this parameter to set the socket buffer size.

[-count | -c <integer>] - Max Requests to Send/Receive
   Use this parameter to specify the maximum number of requests and replies. The default value is 20.

[-reverse-lookup | -H [true]] - Reverse-lookup of IPv6 addresses
   Use this parameter to specify reverse-lookup of IPv6 addresses. Unless this parameter is specified, ping6
   command does not attempt reverse lookup.

[-interval | -i <integer>] - Wait between Packets (secs)
   Use this parameter to specify the delay time between packets in seconds. The default value is 1 second. This
   parameter is incompatible with the flood parameter.

[-preload | -l <integer>] - Send Packets as Fast as Possible (privilege: advanced)
   Use this parameter if preload is required. If specified, ping6 sends that many packets as fast as possible before
   falling into its normal mode of behaviour.

[-use-source-port (true|false)] - Use Source Port of Logical Interface (privilege: advanced)
   This parameter is only applicable when the -lif parameter is specified. When set to true, the ping packet will
   be sent out via the port which is currently hosting the IP address of the logical interface. Otherwise, the ping
   packet will be sent out via a port based on the routing table.

[-pattern | -p <text>] - Up to 16 'pad' Specified for Out Packet
   Use this parameter to fill the -16 'pad' bytes in the sent packet. This is useful for diagnosing data dependent
   problems in a network. For example, -pattern ff causes the sent packet to be filled with all ones.

[-packet-size <integer>] - Packet Size
   Use this parameter to specify the number of data bytes to be sent. The default is 56, which translates to 64
   ICMP data bytes when combined with the 8 bytes of ICMP header data.

[-verbose | -v [true]] - Show All ICMP Packets
   Use this parameter to get verbose output. Verbose output displays both source address and destination
   addresses. Received ICMP packets other than ECHO_RESPONSE are listed. This parameter can be used only
   in conjunction with the show-detail parameter.

[-show-detail | -s [true]] - Show Detail Output
   Use this parameter to display detailed output about the ping.

[-flood | -f [true]] - Flood Ping (privilege: advanced)
   Use this parameter to output packets as fast as they come back or one hundred times per second, whichever is
   more. For every ECHO_REQUEST sent a period "." is printed, while for every ECHO_REPLY received a
   backspace is printed. This provides a rapid display of how many packets are being dropped. This can be very
   hard on a network and should be used with caution.

[-disable-fragmentation | -D [true]] - Disable Fragmentation.
   Use this parameter to disallow fragmentation of the outgoing packets, if they do not fit in the Maximum
   Transmission Unit.

Examples

This example shows a ping6 from node 'node1' to the destination server ipv6.google.com with the server responding that
it is up and running.

```
cluster1:~> network ping6 -node node1 -destination ipv6.google.com
ipv6.google.com is alive.
```
network test-path

Test path performance between two nodes

**Availability:** This command is available to cluster administrators at the advanced privilege level.

**Description**

The `network test-path` command runs a performance test between two nodes. The command requires a source node, destination node, destination cluster, and application, or session type. All tests are run using intracluster or intercluster LIFs, depending on whether the test is between two nodes in the same cluster, or between nodes in peered clusters.

The test itself is different from most bandwidth test tools. It creates a "session" consisting of TCP connections between all possible paths between the nodes being tested. This is how internal Data ONTAP applications communicate between nodes. This means the test is using multiple paths, and thus the bandwidth reported might exceed the capacity of a single 10 Gb path.

**Parameters**

- `-source-node <nodename>|local` - Node Initiating Session
  
  Use this parameter to specify the node that initiates the test. Source-node parameter must be a member of the cluster in which the command is run.

- `-destination-cluster <Cluster name>` - Cluster Containing Passive Node
  
  Use this parameter to specify the destination cluster; the local cluster, or a peered cluster.

- `-destination-node <text>` - Remote Node in Destination Cluster
  
  Use this parameter to specify the destination node in the destination cluster

- `-session-type {AsyncMirrorLocal|AsyncMirrorRemote|RemoteDataTransfer}` - Type of Session to Test
  
  The session type parameter is used to mimic the application settings used. A session consists of multiple TCP connections.
  
  - AsyncMirrorLocal: settings used by SnapMirror between nodes in the same cluster
  - AsyncMirrorRemote: settings used by SnapMirror between nodes in different clusters
  - RemoteDataTransfer: settings used by Data ONTAP for remote data access between nodes in the same cluster

  The default session-type is AsyncMirrorRemote.

**Examples**

The following example runs a test between two nodes in the same cluster:

```bash
cluster1:*> network test-path -source-node node1 -destination-cluster cluster1 -destination-node node2

Test Duration: 10.65 secs
Send Throughput: 1092.65 MB/sec
Receive Throughput: 1092.65 MB/sec
MB Sent: 11633.69
MB Received: 11633.69
```

**network traceroute**

Traceroute

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The `network traceroute` command performs a network probe from a node to a specified IP address. The command requires a source node or logical interface and a destination IP address. You can specify the source node by name, or specify a logical interface and its Vserver. The traceroute is performed between the source and destination.

**Parameters**

```
{ -node <nodename> - Node
  Use this parameter to originate the traceroute from the node you specify.
  |
  -lif <lif-name> - Logical Interface
  Use this parameter to originate the traceroute from the specified network interface.
  -vserver <vserver> - LIF Owner
  Use this parameter to originate the traceroute from the Vserver where the intended logical interface resides.
  The default value is the system Vserver for cluster administrators.
  -destination <Remote InetAddress> - Destination
  Use this parameter to specify the remote internet address destination of the traceroute.
  [-maxttl | -m <integer>] - Maximum Number of Hops
  Use this parameter to specify the maximum number of hops (time-to-live) setting used by outgoing probe packets. The default is 30 hops.
  [-numeric | -n [true]] - Print Hop Numerically
  Use this parameter to print the hop addresses only numerically rather than symbolically and numerically.
  [-port <integer>] - Base UDP Port Number
  Use this parameter to specify the base UDP port number used in probes. The default is port 33434.
  [-packet-size <integer>] - Packet Size
  Use this parameter to specify the size of probe packets, in bytes.
  [-nqueries | -q <integer>] - Number of Queries
  Use this parameter to specify the number of probes per hop. The default is 3 probes.
  [-verbose | -v [true]] - Verbose Output
  Use this parameter to display all received ICMP packets, rather than just TIME_EXCEEDED and UNREACHABLE packets.
  [-waittime | -w <integer>] - Wait Between Packets (secs)
  Use this parameter to specify the time (in seconds) to wait for the response to a probe. The default is 5 seconds.
```
network traceroute6

traceroute6

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The network traceroute6 command performs a network probe from a node to a specified IPv6 address. The command requires a source node or logical interface, Vserver from where traceroute6 will originate and a destination IPv6 address. traceroute6 is performed between the source and destination.

Parameters
{-node <nodename> - Node
  Use this parameter to originate traceroute6 from the node you specify. This parameter is available only to cluster administrators.

| -lif <lif-name> - Logical Interface
  Use this parameter to originate traceroute6 from the logical interface you specify.

-vserver <vserver name> - LIF Owner
  Use this parameter to originate traceroute6 from the Vserver you specify. The default value is the system Vserver for cluster administrators.

-[-debug-mode | -d [true]] - Debug Mode
  Use this parameter to enable socket level debugging. The default value is false.

{-[icmp6 | -I [true]] - ICMP6 ECHO instead of UDP
  Use this parameter to specify the use of ICMP6 ECHO instead of UDP datagrams for the probes. The default value is false.

-[-udp | -U [true]] - UDP
  Use this parameter to specify the use of UDP datagrams for the probes. The default value is true.

-[-numeric | -n [true]] - Print Hops Numerically
  Use this parameter to print the hop addresses only numerically rather than symbolically and numerically. The default value is false.

-[-verbose | -v [true]] - Verbose Output
  Use this parameter to display all received ICMP packets, rather than just TIME_EXCEEDED and UNREACHABLE packets. The default value is false.

-[-first-hop | -f <integer>] - Number of Hops to Skip in Trace
  Use this parameter to specify the number of hops to skip in trace. The default value is 1.
[-gateway | -g <Remote InetAddress>] - Intermediate Gateway
Use this parameter to specify the intermediate gateway.

[-hop-limit | -m <integer>] - Maximum Number of Hops
Use this parameter to specify the maximum hop limit, up to 255. The default value is 64 hops.

[-port | -p <integer>] - Base UDP Port Number
Use this parameter to specify the base UDP port number used in probes. The default value is port 33434.

[-nqueries | -q <integer>] - Number of Queries
Use this parameter to specify the number of probes per hop. The default value is 3 probes.

[-wait-time | -w <integer>] - Wait Between Packets (secs)
Use this parameter to specify the delay time between probes in seconds. The default value is 5 seconds.

[-destination <Remote InetAddress>] - Destination
Use this parameter to specify the remote IPv6 address destination of traceroute6.

[-packet-size <integer>] - Packet Size
Use this parameter to specify the size of probe packets, in bytes. The default value is 16 bytes for ICMP6 ECHO and 12 bytes for UDP datagrams.

Examples
The following example shows traceroute6 from node node1 to the destination fd20:8b1e:b255:4071:d255:1fcd:a8cd:b9e8.

```
class1::> network traceroute6 -node node1 -vserver vs1
            -destination 3ffe:b00:c18:1::10
traceroute6 to 3ffe:b00:c18:1::10 (3ffe:b00:c18:1::10)
        from 2001:0db8:0000:f101::2,
             64 hops max, 12 byte packets
1  2001:0db8:0000:f101::1 4.249 ms  2.021 ms  0.864 ms
2  3ffe:2000:0:400::1  0.831 ms  0.579 ms
3  3ffe:2000:0:1::132  227.693 ms  227.596 ms  227.439 ms
4  3ffe:c00:8023:2b::2 229.028 ms  228.267 ms  231.891 ms
5  3ffe:2e00:e::c:3  227.929 ms  228.696 ms  228.558 ms
6  3ffe:b00:c18:1::10  227.702 ms 227.806 ms  227.439 ms
```

network arp commands
The arp directory

network arp create
Create static ARP entry

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The network arp create command creates a static ARP entry for a given Vserver. Statically created ARP entries will be stored permanently in the Vserver context and will be used by the network stack.
Parameters

-vserver <vserver name> - Vserver Name
Use this parameter to specify the name of the Vserver on which the ARP entry is created.

-remotehost <IP Address> - Remote IP Address
Use this parameter to specify the IP address to be added as an ARP entry.

-mac <MAC Address> - MAC Address
Use this parameter to specify the MAC address (Ethernet address) for the host specified with -remotehost. Specify the MAC address as six hex bytes separated by colons.

Examples

The following example creates a static ARP entry on Vserver vs1 for the remote host with the IP address 10.63.0.2 having MAC address 40:55:39:25:27:c1

cluster1::> network arp create -vserver vs1 -remotehost 10.63.0.2 -mac 40:55:39:25:27:c1

network arp delete

Delete static ARP entry

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The network arp delete command deletes static ARP entries from the Vserver and from the network stack.

Parameters
-vserver <vserver name> - Vserver Name
Use this parameter to specify the name of the Vserver from which the ARP entry is deleted.

-remotehost <IP Address> - Remote IP Address
Use this parameter to specify the IP address of the ARP entry being deleted.

Examples
The following example deletes the ARP entry for IP address 10.63.0.2 from the Vserver vs1.

cluster1::> network arp delete -vserver vs1 -remotehost 10.63.0.2

network arp show

Display static ARP entries

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The network arp show command displays static ARP entries present in a given Vserver. This command will not display dynamically learnt ARP entries in the network stack. Use the network arp active-entry show command to display dynamically learned ARP entries in the network stack.

Parameters

{ [-fields <fieldname>,...] }
Use this parameter to display only certain fields of the ARP table.
Use this parameter to display all the fields of the ARP table.

[vserver <vserver name>] - Vserver Name
Use this parameter to display ARP entries that are specific to a given Vserver.

[remotehost <IP Address>] - Remote IP Address
Use this parameter to display ARP entries for the specified IP address

[mac <MAC Address>] - MAC Address
Use this parameter to display ARP entry for the specified MAC address

[ipspace <IPspace>] - IPspace
Use this parameter to specify the IPspace associated with the Vserver

Examples
The following example displays static ARP entries from the Vserver vs1.

```
cluster1::> network arp show -vserver vs1
Vserver     Remote Host       MAC Address
------------ ----------------- -----------------
vs1          10.238.0.2        40:55:39:25:27:c1
```

network arp active-entry show on page 318

network arp active-entry commands
Manage active ARP entries

network arp active-entry delete
Delete active ARP entry from a System or Admin Vserver

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The `network arp active-entry delete` command deletes dynamically learned ARP entries from the network stack of a node. To delete statically configured ARP entries use the `network arp delete` command.

Parameters

- **node (<nodename>|local) - Node**
  Use this parameter to specify the name of the node in which the ARP entry is deleted.

- **vserver <vserver> - System or Admin Vserver Name**
  Use this parameter to specify the name of the Vserver in which the ARP entry is deleted. Only Vservers with a type of Admin or System have dynamically learned ARP entries.

- **subnet-group <IP Address/Mask> - Subnet Group Name**
  Use this parameter to specify the name of the routing group in which the ARP entry is deleted.

- **remotehost <text> - Remote IP Address**
  Use this parameter to specify the IP address to be deleted from the active ARP entries.
-port <text> - Port

Use this parameter to specify the name of the Port to be deleted from the active ARP entries.

**Examples**

The following example deletes the active ARP entry with an IP address of 10.224.64.1, subnet group of 0.0.0.0/0, port e0c on node node2 in the Admin Vserver cluster1:

```
cluster1::network arp active-entry*> delete -node cluster1-01 -vserver cluster1 -subnet-group 0.0.0.0/0 -remotehost 10.224.64.1 -port e0c
```

**Related references**

- [network arp delete](#) on page 316

**network arp active-entry show**

Display active ARP entries organized by Vserver

**Availability:** This command is available to cluster administrators at the advanced privilege level.

**Description**

The `network arp active-entry show` command displays ARP entries present in the network stack of the node. The entries includes both dynamically learned ARP entries and user configured static ARP entries.

**Parameters**

```
{{-fields <fieldname>,...}
    Use this parameter to display only certain fields of the active ARP table.

|[-instance ]}
    Use this parameter to display all the fields of the active ARP table.

[-node <nodename> [local]] - Node
    Use this parameter to display active ARP entries that are specific to a given node.

[-vserver <vserver>] - System or Admin Vserver Name
    Use this parameter to display active ARP entries that are specific to a given System or Admin Vserver. Data and Node Vservers will not have any active-arp entries.

[-subnet-group <IP Address/Mask>] - Subnet Group Name
    Use this parameter to display active ARP entries that are specific to a given subnet group.

[-remotehost <text>] - Remote IP Address
    Use this parameter to display active ARP entries for the specified IP address.

[-port <text>] - Port
    Use this parameter to display active ARP entries for the specified Port name.

[-mac <text>] - MAC Address
    Use this parameter to display the active ARP entry for the specified MAC address.

[-ipspace <IPspace>] - IPspace
    Use this parameter to specify the IPspace associated with the System or Admin Vserver.
```

**Examples**

The following example displays active ARP entries for the Admin Vserver cluster1:

```
```
network cloud commands

Manage cloud-based features

network cloud routing-table commands

Manage external routing tables

network cloud routing-table create

Create a new external routing table

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The network cloud routing-table create command creates a new external routing table.

Parameters
- route-table-id <text> - Route Table ID
  This parameter is used to provide the name of the external routing table to be created.

Examples
The following example creates an external routing table "eni-123456":

    cluster1::> network cloud routing-table create -route-table-id eni-123456

network cloud routing-table delete

Delete an existing external routing table

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The network cloud routing-table delete deletes an existing external routing table.

Parameters
- route-table-id <text> - Route Table ID
  This parameter is used to provide the name of an existing external routing table to be deleted.

Examples
The following example deletes the external routing table "eni-123456":

    cluster1::> network cloud routing-table delete -route-table-id eni-123456
network connections commands

The connections directory

network connections active commands

The active directory

network connections active show

Show the active connections in this cluster

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The network connections active show command displays information about active network connections.

Note: The results of this command set are refreshed independently every 30 seconds and might not reflect the immediate state of the system.

Parameters

{ [-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-print-ip-addresses ]
  Print IP addresses for remote hosts -- do not attempt to resolve the addresses to a hostname.

| [-instance ]
  If you specify the -instance parameter, the command displays detailed information about all fields.

[ -node {<nodename> | local}] - Node
  Selects the connections that match this parameter value.

[ -cid <Cid> ] - Connection ID
  Selects the connections that match this parameter value.

[ -vserver <vserver>] - Vserver
  Selects the connections that match this parameter value.

[ -lif-name <lif-name>] - Logical Interface Name
  Selects the connections that match this parameter value.

[ -local-address <IP Address>] - Local IP address
  Selects the connections that match this parameter value.

[ -local-port <integer>] - Local Port
  Selects the connections that match this parameter value.

[ -remote-ip <InetAddress>] - Remote IP Address
  Selects the connections that match this parameter value.
[-remote-host <Remote IP>] - Remote Host
Selects the connections that match this parameter value.

[-remote-port <integer>] - Remote Port
Selects the connections that match this parameter value.

[-proto {UDP|TCP}] - Protocol
Selects the connections that match this parameter value. Possible values are tcp (TCP), udp (UDP), and NA (not applicable).

[-lvid <integer>] - Logical Interface ID
Selects the connections that match this parameter value.

[-service <protocol service>] - Protocol Service
Selects the connections that match this parameter value. Possible values include: nfs, iscsi, and loopback.

[-lru {yes|no}] - Least Recently Used
Selects the connections that match this parameter value.

[-blocks-lb {true|false}] - Connection Blocks Load Balance Migrate
Selects the logical interfaces that are blocked (true) or not blocked (false) from migrating due to an active client connection.

**Examples**

The following example displays information about active network connections for the node named node0:

```
cluster1::> network connections active show node -node0

Vserver Interface Name       Name:Local Port  IP Address:Port   Protocol/Service
------- ---------------- ----------------- ----------------
node0  cluslif1:7070  192.0.2.253:48621 UDP/rclopcp
node0  cluslif1:7070  192.0.2.253:48622 UDP/rclopcp
node0  cluslif2:7070  192.0.2.250:48644 UDP/rclopcp
node0  cluslif1:7070  192.0.2.245:48621 UDP/rclopcp

```
network connections active show-clients

Show a count of the active connections by client

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The network connections active show-clients command displays information about client connections, including the client's IP address and the number of client connections.

Note: The results of this command set are refreshed independently every 30 seconds and might not reflect the immediate state of the system.

Parameters

[-fields <fieldname>, ...]  
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance]  
If you specify the -instance parameter, the command displays detailed information about all fields.

[-node <nodename> | local] - Node  
Use this parameter to display information only about the connections on the node you specify.

[-vserver <vserver>] - Vserver  
This parameter is used by the system to break down the output per vserver.

[-remote-address <Remote IP>] - Remote IP Address  
Use this parameter to display information only about the connections that use the remote IP address you specify.

[-count <integer>] - Client Count  
Use this parameter to only clients with the number of active client connections you specify.

Examples

The following example displays information about active client connections:

```
cluster1::> network connections active show-clients
Node    Vserver Name    Client IP Address     Count
------  --------------  -----------------     -----
node0   vs1             192.0.2.253                1
        vs2             192.0.2.252                2
        vs3             192.0.2.251                5
node1   vs1             192.0.2.250                1
        vs2             192.0.2.252                3
        customer.example.com       4
```

network connections active show-lifs

Show a count of the active connections by logical interface

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.
Description
The `network connections active show-lifs` command displays the number of active connections on each logical interface, organized by node and Vserver.

**Note:** The results of this command set are refreshed independently every 30 seconds and might not reflect the immediate state of the system.

Parameters

```
[-fields <fieldname>, ...]
```
If you specify the `--fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `--fields ?` to display the fields to specify.

```
[-instance]
```
If you specify the `--instance` parameter, the command displays detailed information about all fields.

```
[-node <nodename> | local] - Node
```
Use this parameter to display information only about the connections on the node you specify.

```
[-vserver <vserver>] - Vserver
```
Use this parameter to display information only about the connections that are using the node or Vserver you specify.

```
[-lif-name <lif-name>] - Logical Interface Name
```
Use this parameter to display information only about the connections that are using the logical interface you specify.

```
[-count <integer>] - Client Count
```
Use this parameter to display information only about logical interfaces with the number of active client connections you specify.

```
[-blocked-count <integer>] - (DEPRECATED)-Load Balancing Blocking Count
```
**Note:** This parameter has been deprecated and may be removed in a future version of Data ONTAP.
Use this parameter to display information only about data logical interfaces blocked from migrating and the connection that is blocking it.

Examples
The following example displays information about the servers and logical interfaces being used by all active connections:

```
cluster1::> network connections active show-lifs
```

```
<table>

```

At privilege levels above "admin", the command displays an extra column.
network connections active show-protocols

Show a count of the active connections by protocol

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The network connections active show-protocols command displays the number of active connections per protocol, organized by node.

Note: The results of this command set are refreshed independently every 30 seconds and might not reflect the immediate state of the system.

Parameters

\{-fields \<fieldname\>,...\}

If you specify the -fields \<fieldname\>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

\{-instance\}

If you specify the -instance parameter, the command displays detailed information about all fields.

\{-node \<nodename\>|local\}\ - Node

Use this parameter to display information only about the connections on the node you specify.

\{-vserver \<vserver\}\ - Vserver

This parameter is used by the system to break down the output per vserver.

\{-proto \{UDP|TCP\}\} - Protocol

Use this parameter to display information only about the connections that use the network protocol you specify. Possible values include tcp (TCP), udp (UDP), and NA (not applicable).

\{-count \<integer\}\ - Client Count

Use this parameter to display only protocols with the number of active client connections you specify.

Examples

The following example displays information about all network protocols being used by active connections:

```
cluster1::> network connections active show-protocols
Node    Vserver Name    Protocol    Count
-------- -------------- ----------- ------
node0    vs0            datalif1    3        0
node0    vs0            cluslif1    6        0
node0    vs0            cluslif2    5        2
node1    vs0            datalif2    3        0
node1    vs0            cluslif1    3        0
node1    vs0            cluslif2    5        0
node2    vs1            datalif2    1        0
node2    vs1            cluslif1    5        0
node2    vs1            cluslif2    3        2
node3    vs1            datalif1    1        0
node3    vs1            cluslif1    2        0
node3    vs1            cluslif2    1        0
```
network connections active show-services

Show a count of the active connections by service

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `network connections active show-services` command displays the number of active connections by protocol service, organized by node.

**Note:** The results of this command set are refreshed independently every 30 seconds and might not reflect the immediate state of the system.

**Parameters**

- `-fields <fieldname>, ...`
  - If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

- `[-instance]`
  - If you specify the `-instance` parameter, the command displays detailed information about all fields.

- `[node {<nodename>|local}] - Node`
  - Use this parameter to display information only about the connections on the node you specify.

- `[vserver <vserver>] - Vserver`
  - This parameter is used by the system to break down the output per vserver.

- `[service <protocol service>] - Protocol Service`
  - Use this parameter to display information only about the connections that use the protocol service you specify. Possible values include: nfs, iscsi, and loopback.

- `[count <integer>] - Client Count`
  - Use this parameter to display information only about protocol services with the number of active client connections you specify.

**Examples**
The following example displays information about all protocol services being used by active connections:

<table>
<thead>
<tr>
<th>Node</th>
<th>Vserver Name</th>
<th>Service</th>
<th>Count</th>
</tr>
</thead>
<tbody>
<tr>
<td>node0</td>

</tbody>
</table>
network connections listening commands

The listening directory

network connections listening show

Show the listening connections in this cluster

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The network connections listening show command displays information about network connections that are in an open and listening state.

Parameters

{ [-fields <fieldname>, ...] 
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

  [-instance ]
  If you specify the -instance parameter, the command displays detailed information about all fields.

  [-node <nodename>|local] - Node
  Selects the listening connections that match this parameter value.

  [-mgmt-cid <integer>] - Management Connection ID
  Selects the listening connections that match this parameter value.

  [-vserver <vserver>] - Vserver
  Selects the listening connections that match this parameter value.

  [-cid <integer>] - System Connection ID
  Selects the listening connections that match this parameter value.

  [-lif-name <lif-name>] - Logical Interface Name
  Selects the listening connections that match this parameter value.

  [-local-address <IP Address>] - Local IP Address
  Selects the listening connections that match this parameter value.

  [-local-port <integer>] - Local Port
  Selects the listening connections that match this parameter value.

  [-remote-ip <InetAddress>] - Remote IP Address
  Selects the listening connections that match this parameter value.

  [-remote-host <Remote IP>] - Remote Host
  Selects the listening connections that match this parameter value.

  [-remote-port <integer>] - Remote Port
  Selects the listening connections that match this parameter value.

  [-proto {UDP|TCP}] - Protocol
  Selects the listening connections that match this parameter value. Possible values include tcp (TCP), udp (UDP), and NA (not applicable).

  [-lifid <integer>] - Logical Interface ID
  Selects the listening connections that match this parameter value.
[-service <protocol service>] - Protocol Service
Selects the listening connections that match this parameter value. Possible values include: nfs, iscsi, and loopback.

[-lru {yes|no}] - Least Recently Used
Selects the listening connections that match this parameter value.

Examples

The following example displays information about all listening network connections:

```
cluster1::> network connections listening show
Vserver Name Interface Name:Local Port  Protocol/Service
------------ -------------------------- -----------------
node0 cluslif1:7700              UDP/rclopcp
node0 cluslif2:7700              UDP/rclopcp
node1 cluslif1:7700              UDP/rclopcp
node1 cluslif2:7700              UDP/rclopcp
node2 cluslif1:7700              UDP/rclopcp
node2 cluslif2:7700              UDP/rclopcp
node3 cluslif1:7700              UDP/rclopcp
node3 cluslif2:7700              UDP/rclopcp
8 entries were displayed.
```

The following example displays detailed information about listening network connections for the node named node0:

```
cluster1::> network connections listening show node0
Node: node0
Management Connection Id: 0
System Connection Id: 0
Vserver: vs0
Logical Interface Name: datalif1
  Local IP address: 192.0.2.130
  Local Port: 111
  Remote IP address: 
    Remote Port: 0
    Protocol: UDP
  Logical Interface Id: 1029
  Protocol Service: port_map
  least recently used: yes
Node: node0
Management Connection Id: 1
System Connection Id: 0
Server: vs0
Logical Interface Name: datalif2
  Local IP address: 192.0.2.131
  Local Port: 111
  Remote IP address: 
    Remote Port: 0
    Protocol: UDP
  Logical Interface Id: 1030
  Protocol Service: port_map
  least recently used: yes
```

network device-discovery commands

The device-discovery directory

network device-discovery show
Display device discovery information

Availability: This command is available to cluster administrators at the admin privilege level.
Description
The network device-discovery show command displays information about discovered devices. This information may be useful in determining the network topology or investigating connectivity issues. By default, the command displays the following information:

- Local interface
- Discovered device
- Discovered interface
- Discovered platform

Parameters

[-fields <fieldname>, ...]
Include the specified field or fields in the command output. Use `-fields ?` to display the valid fields.

[-instance]
Use this parameter to display detailed information about all fields.

[-node <nodename>] - Node
Displays the discovery ports that match the node name.

[-protocol {cdp|lldp}] - Protocol
Displays the devices that are discovered by the given protocol.

[-port <text>] - Port
Displays the discovery ports that match the physical network port. For example, e0a will display devices discovered on port e0a.

[-discovered-device <text>] - Discovered Device
Displays the discovered devices that match the discovered device name.

[-interface <text>] - Discovered Device Interface
Displays the discovered devices that match this interface port name. The format is dependent on the reporting device. For example: FastEthernet0/12

[-device-ip <IP Address>, ...] - Discovered Device IP Addresses
Displays the discovered devices that match the IP address(es). At present, only IPv4 addresses are included. It is recommended to use wildcards around the desired value.

[-platform <text>] - Discovered Device Platform
Displays the discovery ports that contain the platform of discovered devices. For example: N5K-C5010P-BF

[-version <text>] - Discovered Device Version
Displays the discovery ports that contain the version of discovered devices.

[-hold-time-remaining <integer>] - Discovered Device's Remaining Hold Time
Displays the discovered devices that match the remaining packet hold time in seconds. If an advertisement from the device isn't received before this time reaches zero, the entry will expire and be removed from the list. For example, "<120" will display discovered devices which will expire within the next 120 seconds.

[-capabilities {router|trans-bridge|source-route-bridge|switch|host|igmp|repeater|phone}, ...] - Discovered Device Capabilities
Displays the discovered devices that match the capability or capabilities. Possible values:

- "router" - Router
- "trans-bridge" - Trans Bridge
- "source-route-bridge" - Source Route Bridge
• "switch" - Switch
• "host" - Host
• "igmp" - IGMP
• "repeater" - Repeater
• "phone" - Phone

Examples

```
cluster1::> network device-discovery show

**network fcp commands**

The fcp directory

Commands used for managing FCP target adapters.

**network fcp adapter commands**

The adapter directory

Commands used for managing FCP adapters.

**network fcp adapter modify**

Modify the fcp adapter settings

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

Modifies the FCP target adapter information.

The adapter argument is in the form Xy or Xy_z where X and z are integers and y is a letter. An example is 4a or 4a_1.

You cannot bring an adapter offline until all logical interfaces connected to that adapter are offline. Use the *network interface modify* command to take your logical interfaces offline.

The speed option sets the Fibre Channel link speed of an adapter. You can set adapters that support:
By default, the link speed option is set to auto for auto negotiation. Setting the link speed to a specific value disables auto negotiation. Under certain conditions, a speed mismatch can prevent the adapter from coming online.

**Note:** The system reports the actual link speed with the "Data Link Rate (Gbit)" field in the output of `network fcp adapter show -instance`.

**Parameters**

- **-node**: `<nodename> | local` - Node
  - Specifies the node of the target adapter.

- **-adapter**: `<text>` - Adapter
  - Specifies the target adapter.

- **[-status-admin]** `{down | up}` - Administrative Status
  - Specifies the desired (administrative) status of the adapter. To view the actual operational status, run `network fcp adapter show -fields status-oper`.

- **[-speed]** `{1 | 2 | 4 | 8 | 10 | 16 | 32 | auto}` - Configured Speed
  - Specifies the adapter configuration speed in Gigabytes.

**Examples**

```bash
cluster1::> network fcp adapter modify -node node1 -adapter 0d -speed 2
```

**Related references**

`network fcp adapter show` on page 330
`network interface modify` on page 342

**network fcp adapter show**

Display FCP adapters

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**

Displays FCP target adapter information. You can also use this information to determine if adapters are active and online.

The adapter argument is in the form `Xy` or `Xy_z` where `X` and `z` are integers and `y` is a letter. An example is `4a` or `4a_1`.

**Parameters**

```
{[-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.
  | [-instance ]
  If you specify the -instance parameter, the command displays detailed information about all fields.
```
[-node \(<\text{nodename}>\ | \text{local}\)] - Node
If this parameter is specified, the command displays information only about the FCP target adapters that are present on the specified node.

[-adapter <text>] - Adapter
If this parameter is specified, the command displays information only about the FCP target adapters that match the specified name.

[-description <text>] - Description
If this parameter is specified, the command displays information only about the FCP target adapters that match the specified description.

[-physical-protocol \{\text{fibre-channel}|\text{ethernet}\}] - Physical Protocol
If this parameter is specified, the command displays information only about the FCP target adapters that match the specified physical protocol. Possible values are \text{fibre-channel} and \text{ethernet}.

[-max-speed \{1|2|4|8|10|16|32|auto\}] - Maximum Speed
If this parameter is specified, the command displays information only about the FCP target adapters that match the specified maximum speed.

[-status-admin \{\text{down}|\text{up}\}] - Administrative Status
If this parameter is specified, the command displays information only about the FCP target adapters that match the administrative state. Possible values are \text{up} and \text{down}.

[-status-oper <text>] - Operational Status
If this parameter is specified, the command displays information only about the FCP target adapters that match the specified operational status.

[-status-extended <text>] - Extended Status
If this parameter is specified, the command displays information only about the FCP target adapters that match the specified extended status.

[-portaddr \<\text{Hex Integer}\>] - Host Port Address
If this parameter is specified, the command displays information only about the FCP target adapters connected with the specified fabric port address.

[-firmware-rev <text>] - Firmware Revision
If this parameter is specified, the command displays information only about the FCP target adapters that match the specified firmware revision.

[-data-link-rate \<\text{integer}\>] - Data Link Rate (Gbit)
If this parameter is specified, the command displays information only about the FCP target adapters that match the specified data link rate.

[-fabric-established \{\text{true}|\text{false}\}] - Fabric Established
If this parameter is specified, the command displays information only about the FCP target adapters that match the specified fabric login establishment state.

[-fabric-name <text>] - Fabric Name
If this parameter is specified, the command displays information only about the FCP target adapters that are logged in to the fabric with the specified WWN.

[-conn-established \{\text{loop}|\text{ptp}\}] - Connection Established
If this parameter is specified, the command displays information only about the FCP target adapters that match the specified connection type. Possible values are \text{loop} and \text{ptp}.

[-is-conn-established \{\text{true}|\text{false}\}] - Is Connection Established
If this parameter is specified, the command displays information only about the FCP target adapters that match the specified connection established state.
[-media-type {loop|ptp|auto}] - Mediatype

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified configured media type. Possible values are loop, ptp, and auto.

[-speed {1|2|4|8|10|16|32|auto}] - Configured Speed

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified configured speed. If the adapter is set to auto-negotiate, then the value will be auto.

[-fc-wwnn <text>] - Adapter WWNN

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified world wide node name.

[-fc-wwpn <text>] - Adapter WWPN

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified world wide port name.

[-switch-port <text>] - Switch Port

If this parameter is specified, the command displays information only about the FCP target adapters that are connected to the specified switch port.

[-sfp-formfactor <text>] - Form Factor Of Transceiver

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified SFP form factor.

[-sfp-vendor-name <text>] - Vendor Name Of Transceiver

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified SFP vendor name.

[-sfp-part-number <text>] - Part Number Of Transceiver

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified SFP part number.

[-sfp-rev <text>] - Revision Of Transceiver

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified SFP revision number.

[-sfp-serial-number <text>] - Serial Number Of Transceiver

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified SFP serial number.

[-sfp-fc-speed-capabilities <text>] - FC Capabilities Of Transceiver

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified SFP speed capabilities.

[-sfp-vendor-oui <text>] - Vendor OUI Of Transceiver

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified SFP vendor OUI.

[-sfp-wavelength <integer>] - Wavelength In Nanometers

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified SFP wavelength.

[-sfp-date-code <text>] - Date Code Of Transceiver

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified SFP date code.

[-is-sfp-optical-transceiver-valid {true|false}] - Validity Of Transceiver

If this parameter is specified, the command displays information only about the FCP target adapters that match whether the SFP is installed and valid.
If this parameter is specified, the command displays information only about the FCP target adapters that match the specified SFP connector type.

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified SFP encoding.

If this parameter is specified, the command displays information only about the FCP target adapters that match whether the SFP diagnostics are internally calibrated or not.

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified observed SFP receive power.

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified SFP transmit power.

If this parameter is specified, the command displays information only about the FCP target adapters that match whether the observed SFP transmit power is within the valid range for the SFP.

Examples

```
cluster1::> fcp adapter show
Connection  Host
Node         Adapter Established Port Address
------------ ------- ----------- ------------
sti6280-021   0a      ptp         30012c
```

The example above displays information regarding FCP adapters within cluster1.

```
cluster1::> fcp adapter show -instance -node sti6280-021 -adapter 0a
Node: sti6280-021
Adapter: 0a
Description: Fibre Channel Target Adapter 0a (QLogic 2532 (2562), rev. 2, 8G)
Physical Protocol: fibre-channel
Maximum Speed: 8
Administrative Status: up
Operational Status: online
Extended Status: ADAPTER UP
Host Port Address: 30012c
Firmware Revision: 5.8.0
Data Link Rate (Gbit): 4
Fabric Established: true
Fabric Name: 20:14:54:7f:ee:54:b9:01
Connection Established: ptp
Mediatype: ptp
Configured Speed: auto
Adapter WWNN: 50:0a:09:80:8f:7f:8b:1c
Adapter WWPN: 50:0a:09:81:8f:7f:8b:1c
Switch Port: RTP-AG01-410B51:1/41
Form Factor Of Transceiver: SFP
Vendor Name Of Transceiver: OPNEXT, INC
Part Number Of Transceiver: TRS2000EN-SC01
Revision Of Transceiver: 0000
Serial Number Of Transceiver: T10864793
FC Capabilities Of Transceiver: 10 (Gbit/sec)
Vendor OUI Of Transceiver: 0:11:64
```
network fcp topology commands

The topology directory

network fcp topology show

FCP topology interconnect elements per adapter

Availability: This command is available to cluster administrators at the admin privilege level.

Description
Display FCP topology interconnect elements per adapter.

Parameters

{-fields <fieldname>, ...}
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

{-instance}
If you specify the -instance parameter, the command displays detailed information about all fields.

{-node <nodename> [local]} - Node
Use this parameter to select the interconnect elements for adapters that are located on the node that you specify.

{-adapter <text>} - Adapter
Use this parameter to select the interconnect elements for the specified adapter.

{-domain-id <integer>} - Domain Id
Use this parameter to select the interconnect elements with the specified domain identifier.

{-port-wwpn <text>} - Port WWPN
Use this parameter to select the interconnect elements with the specified port world wide name.

{-switch-name <text>} - Switch Name
Use this parameter to select the interconnect elements with the specified switch.

{-switch-vendor <text>} - Switch Vendor
Use this parameter to select the interconnect elements with the specified vendor.

{-switch-release <text>} - Switch Release
Use this parameter to select the interconnect elements with the specified release.

{-switch-wwn <text>} - Switch WWN
Use this parameter to select the interconnect elements with the specified world wide name.

{-port-count <integer>} - Port Count
Use this parameter to select the interconnect elements with the specified port count.
[-port-slot <text>] - Port Slot

Use this parameter to select the interconnect elements with the specified port slot.

[-port-state {Unknown|Online|Offline|Testing|Fault}] - Port State

Use this parameter to select the interconnect elements with the specified port state.

[-port-type {None|N-Port|NL-Port|FNL-Port|NX-Port|F-Port|FL-Port|E-Port|B-Port|TNP-Port|TF-Port|NV-Port|FV-Port|SD-Port|TE-Port|TL-Port}] - Port Type

Use this parameter to select the interconnect elements with the specified port type.

[-port-attached-wwpn <text>] - Attached Port WWPN

Use this parameter to select the interconnect elements with the specified attached wwpn.

[-port-attached-id <text>] - Attached Port Id

Use this parameter to select the interconnect elements with the specified attached id.

[-port-attached-visible <text>] - Visible

Use this parameter to select the interconnect elements with the specified visibility flag on attached port structure.

**Examples**

**network fcp zone commands**

The zone directory

**network fcp zone show**

Display the active zone set information

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

Displays the active zone set information.
Parameters

`[-fields <fieldname>, ...]`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

`[-instance ]`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-node <nodename> | local] - Node`

Use this parameter to select the active zone set information for adapters that located on the node name that you specify.

`[-adapter <text>] - Adapter`

Use this parameter to select the active zone set information for the specified adapter.

`[-zoneset-name <text>] - Zoneset Name`

Use this parameter to select the active zone set information for the specified zone set name.

`[-zone-name <text>] - Zone Name`

Use this parameter to select the active zone set information for the specified zone name.

`[-unique <integer>] - Unique`

A unique index for each zoneset record.

`[-type-name <text>] - Type Name`

Use this parameter to select the active zone set information with the specified symbolic type.

`[-type <integer>] - Type`

Use this parameter to select the active zone set information with the specified port type.

`[-port-id <Hex Integer>] - Member Port Id`

Use this parameter to select the active zone set information with the specified member port id.

`[-domain-id <integer>] - Member Domain Id`

Use this parameter to select the active zone set information with the specified member domain id.

`[-port <integer>] - Member Port`

Use this parameter to select the active zone set information with the specified member port.

`[-wwn <text>] - Member WWN`

Use this parameter to select the active zone set information with the specified member WWN.

`[-zone-count <integer>] - Zone Count`

Use this parameter to select the active zone set information with the specified number of zones.

`[-zone-member-count <integer>] - Zone Member Count`

Use this parameter to select the active zone set information with the specified number of zone members in a zone.

### Examples

```
cluster1::> network fcp adapter zone show

network interface commands

Manage logical interfaces

network interface create

Create a logical interface

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The network interface create command creates a logical interface (LIF).

Note: A logical interface is an IP address associated with a physical network port. For logical interfaces using NAS data protocols, the interface can fail over or be migrated to a different physical port in the event of component failures, thereby continuing to provide network access despite the component failure. Logical interfaces using SAN data protocols do not support migration or failover.

Note: On some cloud platforms, this operation might perform changes to the external route tables.

Parameters

-vserver <vserver> - Vserver Name

Use this parameter to specify the Vserver on which the LIF is created.

-lif <lif-name> - Logical Interface Name

Use this parameter to specify the name of the LIF that is created. For iSCSI and FC LIFs, the name cannot be more than 254 characters.

-role {cluster|data|node-mgmt|intercluster|cluster-mgmt} - Role

Use this parameter to specify the role of the LIF. LIFs can have one of five roles:

• Cluster LIFs, which provide communication among the nodes in a cluster
• Intercluster LIFs, which provide communication among peered clusters
• Data LIFs, which provide data access to NAS and SAN clients
• Node-management LIFs, which provide access to cluster management functionality
• Cluster-management LIFs, which provide access to cluster management functionality

LIFs with the cluster-management role behave as LIFs with the node-management role except that cluster-management LIFs can failover between nodes.

[-data-protocol {nfs|cifs|iscsi|fcp|fcache|none}, ...] - Data Protocol

Use this parameter to specify the list of data protocols that can be configured on the LIF. The supported protocols are NFS, CIFS, FlexCache, iSCSI, and FCP. NFS, CIFS, and FlexCache are available by default when you create a LIF. If you specify "none", the LIF does not support any data protocols. Also, none, iscsi, or fcp cannot be combined with any other protocols.

Note: The data-protocol field must be specified when the LIF is created and cannot be modified later.
-home-node <nodename> - Home Node
   Use this parameter to specify the LIF's home node. The home node is the node to which the LIF returns when
   the network interface revert command is run on the LIF.

-home-port {<netport>|<ifgrp>} - Home Port
   Use this parameter to specify the LIF's home port or interface group. The home port is the port or interface
   group to which the LIF returns when the network interface revert command is run on the LIF.

-address <IP Address> - Network Address
   Use this parameter to specify the LIF's IP address.
   Note: A cluster LIF cannot be on the same subnet as a management or data LIF.

   { -netmask <IP Address> - Netmask
      Use this parameter to specify the LIF's netmask.
   | -netmask-length <integer> - Bits in the Netmask
      Use this parameter to specify the length (in bits) of the LIF's netmask.
   | -auto {true|false} - IPv4 Link Local
      Use this parameter to specify whether IPv4 link local addressing is enabled for this LIF.
   | [-subnet-name <subnet name>] - Subnet Name
      Use this parameter to allocate the interface address from a subnet. If needed, a default route will be created for
      this subnet.

   [-status-admin {up|down}] - Administrative Status
   Use this parameter to specify whether the initial administrative status of the LIF is up or down. The default
   setting is up. The administrative status can differ from the operational status For example, if you specify the
   status as up but a network problem prevents the interface from functioning, the operational status remains as
down.

   [-failover-policy {system-defined|local-only|sfo-partner-only|disabled|broadcast-domain-wide}] - Failover Policy
   Use this parameter to specify the failover policy for the LIF.
   • system-defined - The system determines appropriate failover targets for the LIF. The default behavior is
     that failover targets are chosen from the LIF’s current hosting node and also from one other non-parter
     node when possible.
   • local-only - The LIF fails over to a port on the local or home node of the LIF.
   • sfo-partner-only - The LIF fails over to port on the home node or SFO partner only.
   • broadcast-domain-wide - The LIF fails over to a port in the same broadcast domain as the home port.
   • disabled - Failover is disabled for the LIF.
   The failover policy for cluster logical interfaces is local-only and cannot be changed. The default failover
   policy for data logical interfaces is system-defined. This value can be changed.
   Note: Logical interfaces for SAN protocols do not support failover. Thus, such interfaces will always show
   this parameter as disabled.

   [-firewall-policy <policy>] - Firewall Policy
   Use this parameter to specify the firewall policy for the LIF. A LIF can use a default firewall policy that
   corresponds to its role (management, cluster, intercluster, or data) or a custom firewall policy created by an
   administrator. View and modify existing firewall policies using the system services firewall policy
   show and system services firewall policy modify commands, respectively.
[-auto-revert {true|false}] - Auto Revert

Use this parameter to specify whether a data LIF is automatically reverted to its home node under certain circumstances. These circumstances include startup, when the status of the management database changes to either master or secondary, or when the network connection is made. The default setting is false. If you set the value of this parameter to true, load balancing migration capability of the data LIF is disabled (the –allow-lb-migrate parameter is set to false).

Note: Logical interfaces for SAN traffic do not support auto-revert. Thus, this parameter is always false on such interfaces.

[-dns-zone {<zone-name>|none}] - Fully Qualified DNS Zone Name

Use this parameter to specify a unique, fully qualified domain name of a DNS zone to which this data LIF is added. You can associate a data LIF with a single DNS zone. All data LIFs included in a zone must be on the same Vserver. If a LIF is not added to a DNS zone the data LIF is created with the value none.

[-listen-for-dns-query {true|false}] - DNS Query Listen Enable

Use this parameter to specify if the LIF has to listen for DNS queries. The default value for this parameter is true.

[-allow-lb-migrate {true|false}] - (DEPRECATED)-Load Balancing Migrate Allowed (privilege: advanced)

Note: This parameter has been deprecated and may be removed in a future version of Data ONTAP.
Use this parameter to specify whether load balancing migration is activated for this data LIF. The default value of this parameter is false. If you set the value of this parameter to true, automatic revert capability for this data LIF is disabled (the –auto-revert parameter is set to false). Also, data LIFs that migrate as a result of load balancing adhere to network interface failover rules.

Note: During times when a LIF is hosting active NFSv4, CIFS, or NRV connections, load balancing based LIF migrations between nodes will be temporarily disabled.

[-lb-weight {load|0..100}] - Load Balanced Weight (privilege: advanced)

Use this parameter to specify a load balancing weight for a data LIF. A valid numeric load balancing weight is any integer between 0 and 100. When you specify the same load balancing weight for all data LIFs in a DNS zone, client requests are uniformly distributed, similar to round-robin DNS. A data LIF with a low load balancing weight is made available for client requests less frequently than one that has a high load balancing weight. "load" is the default value of this parameter. If set to "load", node utilization statistics are used to dynamically assign the load balancing weight.

[-failover-group <failover-group>] - Failover Group Name

Use this parameter to specify the name of the failover group to associate with the LIF. Manage failover groups by using the network interface failover-groups command. Each broadcast domain has a default failover group which is created by the system automatically and has the same name as the broadcast domain. The failover group associated with the broadcast domain includes all ports in the broadcast domain. A logical interface's failover group is set to the failover group of the home port's broadcast domain by default, but this value can be modified.

Note: Logical interfaces for SAN protocols do not support failover. Thus, this parameter cannot be specified for such interfaces.

[-comment <text>] - Comment

Use this parameter to specify the comment to associate with the LIF.

[-force-subnet-association [true]] - Force the LIF's Subnet Association

This command will fail if the IP address falls within the address range of a named subnet. Set this to true to acquire the address from the named subnet and assign the subnet to the LIF.

[-is-dns-update-enabled {true|false}] - Is Dynamic DNS Update Enabled?

If this parameter is set to true, then dynamic DNS update is sent to the DNS server for the particular LIF entry if dynamic DNS updates are enabled for the corresponding Vserver. This field is set to true by default.
for both IPv4 and IPv6 LIFs. DNS Update is not supported on LIFs not configured with either the NFS or CIFS protocol.

Examples

The following example creates an IPv4 LIF named datalif1 and an IPv6 LIF named datalif2 on a Vserver named vs0. Their home node is node0 and home port is e0c. The failover policy broadcast-domain-wide is assigned to both LIFs. The firewall policy is data and the LIFs are automatically reverted to their home node at startup and under other circumstances. The datalif1 has the IP address 192.0.2.130 and netmask 255.255.255.128, and datalif2 has the IP address 3ffe:1::aaaa and netmask length of 64.

```
class1::> network interface create -vserver vs0 -lif datalif1 -role data -home-node node0 -home-port e0c -address 192.0.2.130 -netmask 255.255.255.128 -failover-policy broadcast-domain-wide -firewall-policy data -auto-revert true
class1::> network interface create -vserver vs0 -lif datalif2 -role data -home-node node0 -home-port e0c -address 3ffe:1::aaaa -netmask-length 64 -failover-policy broadcast-domain-wide -firewall-policy data -auto-revert true
```

network interface delete

Delete a logical interface

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The `network interface delete` command deletes a logical interface (LIF) from a Vserver. Only administratively down LIFs can be deleted. To make a LIF administratively down, use the `network interface modify` command to set the "status-admin" parameter to "down".

Note: If the LIF is configured for a SAN protocol and is part of a port set, the LIF must be removed from the port set before it can be deleted. To determine if a LIF is in a port set, use the `lun portset show` command. To remove the LIF from the port set, use the `lun portset remove` command.

Note: On some cloud platforms, this operation might perform changes to the external route tables.

Parameters

-`-vserver <vserver>` - Vserver Name
  
  Use this parameter to specify the Vserver on which the logical interface to be deleted is located.

-`-lif <lif-name>` - Logical Interface Name
  
  Use this parameter to specify the logical interface to delete.

Examples

The following example deletes a logical interface named cluslif3 that is located on a Vserver named vs0.

```
class1::> network interface delete -vserver vs0 -lif cluslif3
```
network interface migrate

Migrate a logical interface to a different port

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The `network interface migrate` command migrates a logical interface to a port or interface group on the node you specify.

**Note:** Manual migration of a logical interface can take up to 15 seconds to complete. Also, when you migrate a cluster logical interface, you must do so from the local node. Logical interface migration is a best-effort command, and can only be completed if the destination node and port are operational.

**Note:** Logical interfaces for SAN protocols do not support migration. Attempts to do so will result in an error.

**Note:** On some cloud platforms, this operation might perform changes to the external route tables.

**Parameters**
- `-vserver <vserver>` - Vserver Name
  Use this parameter to specify the Vserver that owns the logical interface that is to be migrated.
- `-lif <lif-name>` - Logical Interface Name
  Use this parameter to specify the logical interface that is to be migrated.
- `-destination-node <nodename>` - Destination Node
  Use this parameter to specify the node to which the logical interface is to be migrated.
- `[destination-port {<netport>|<ifgrp>]}]` - Destination Port
  Use this parameter to specify the port or interface group to which the logical interface is to be migrated.
- `[force [true]]` - Force Migrate Data LIF Flag (privilege: advanced)
  Use this parameter to force the migration operation.

**Examples**
The following example migrates a logical interface named datalif1 on a Vserver named vs0 to port e0c on a node named node2:

```
cluster1::> network interface migrate -vserver vs0 -lif datalif1 -dest-node node2 -dest-port e0c
```

network interface migrate-all

Migrate all data logical interfaces away from the specified node

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The `network interface migrate-all` command migrates all data logical interfaces from the node you specify.
**Note:** Manual migration of a logical interface can take up to 15 seconds to complete. Logical interface migration is a best-effort command and can only be completed if the destination node and port are operational. Logical interface migration requires that the logical interface be pre-configured with valid failover rules to facilitate failover to a remote node.

**Note:** Logical interfaces for SAN protocols do not support migration. Attempts to do so will result in an error.

**Note:** On some cloud platforms, this operation might perform changes to the external route tables.

### Parameters

- **-node <nodename>** - Node
  
  Use this parameter to specify the node from which all logical interfaces are migrated. Each data logical interface is migrated to another node in the cluster, assuming that the logical interface is configured with failover rules that specify an operational node and port.

- **[-port (<netport>|<ifgrp>)]** - Port
  
  Use this parameter to specify the port from which all logical interfaces are migrated. This option cannot be used with asynchronous migrations. If this parameter is not specified, then logical interfaces will be migrated away from all ports on the specified node.

### Examples

The following example migrates all data logical interfaces from the current (local) node.

```
cluster1::> network interface migrate-all -node local
```

### network interface modify

Modify a logical interface

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

The `network interface modify` command modifies attributes of a logical interface (LIF).

**Note:** You cannot modify some properties of an iSCSI or FCP LIF, such as `-home-node` or `-home-port`, if the LIF is in a port set. To modify these properties, first remove the LIF from the port set. To determine if a LIF is in a port set, use the `lun portset show` command. To remove the LIF from the port set, use the `lun portset remove` command.

**Note:** On some cloud platforms, this operation might perform changes to the external route tables.

### Parameters

- **-vserver <vserver>** - Vserver Name
  
  Use this parameter to specify the Vserver on which the LIF to be modified is located.

- **-lif <lif-name>** - Logical Interface Name
  
  Use this parameter to specify the name of the LIF that is to be modified

- **[-home-node <nodename>]** - Home Node
  
  Use this parameter to modify the LIF's home node. The home node is the node to which the LIF returns when the `network interface revert` command is run on that LIF.

- **[-home-port (<netport>|<ifgrp>)]** - Home Port
  
  Use this parameter to modify the LIF's home port. The home port is the port or interface group to which the LIF returns when the `network interface revert` command is run on that LIF.
**Note:** If you change this parameter for a cluster or management LIF, you must reboot the storage system to force the change to take effect.

`[-address <IP Address>]` - Network Address

Use this parameter to modify the LIF's IP address.

**Note:** A cluster LIF cannot be on the same subnet as a data or management LIF.

`{ [-netmask <IP Address>] - Netmask

Use this parameter to modify the LIF's netmask.}

`[-netmask-length <integer>] - Bits in the Netmask

Use this parameter to modify the length (in bits) of the LIF's netmask.

`[-subnet-name <subnet name>]` - Subnet Name

Use this parameter to allocate the interface address from a subnet. Modifying this parameter will cause a new IP address to be allocated and assigned to the interface.

`[-status-admin {up|down}]` - Administrative Status

Use this parameter to modify the administrative status of the LIF. The administrative status can differ from the operational status. For example, if you specify the status as `up` but a network problem prevents the interface from functioning, the operational status remains as `down`.

`[-failover-policy {system-defined|local-only|sfo-partner-only|disabled|broadcast-domain-wide}]` - Failover Policy

Use this parameter to modify the failover policy for the LIF.

- **system-defined** - The system determines appropriate failover targets for the LIF. The default behavior is that failover targets are chosen from the LIF's current hosting node and also from one other non-partner node when possible.
- **local-only** - The LIF fails over to a port on the local or home node of the LIF.
- **sfo-partner-only** - The LIF fails over to a port on the home node or SFO partner only.
- **broadcast-domain-wide** - The LIF fails over to a port in the same broadcast domain as the home port.
- **disabled** - Failover is disabled for the LIF.

**Note:** The failover policy for cluster logical interfaces is local-only and cannot be changed. The default failover policy for data logical interfaces is system-defined. This value can be changed.

**Note:** Logical interfaces for SAN protocols do not support failover. Thus, such interfaces always show this parameter as `disabled`.

`[-firewall-policy <policy>]` - Firewall Policy

Use this parameter to set the firewall policy for the LIF. A LIF can use a default firewall policy that corresponds to its role (management, cluster, or data) or a custom firewall policy created by an administrator. When using a custom policy, the interface will fallback on its role's default policy for unspecified services. View existing firewall policies with the "system services firewall policy show" command. Modify existing firewall policies with the "system services firewall policy modify" command.

`[-auto-revert {true|false}]` - Auto Revert

Use this parameter to modify whether a data LIF is reverted automatically to its home node under certain circumstances. These circumstances would include startup, when the status of the management database changes to either master or secondary, and when the network connection is made. The default setting is `false`. If you set the value of this parameter to `true`, the load balancing migration capability of the data LIF is disabled (the `allow-lb-migrate` parameter is set to `false`).
Note: Logical interfaces for SAN traffic do not support auto-revert. Thus, this parameter is always `false` on such interfaces.

`[-dns-zone <zone-name>|none]` - Fully Qualified DNS Zone Name
Use this parameter to modify the unique, fully qualified domain name of the DNS zone to which this data LIF belongs. You can associate a data LIF with a single DNS zone. All data LIFs included in a zone must be on the same Vserver. If you do not specify a value for this parameter, the data LIF is created with the value `none`.

`[-listen-for-dns-query {true|false}]` - DNS Query Listen Enable
Use this parameter to specify if the LIF has to listen for DNS queries. The default value for this parameter is `true`.

`[-allow-lb-migrate {true|false}]` - (DEPRECATED)-Load Balancing Migrate Allowed (privilege: advanced)

  Note: This parameter has been deprecated and may be removed in a future version of Data ONTAP.

Use this parameter to modify whether or not load balancing migration is enabled for this data LIF. The default value of this parameter is `false`. If you set the value of this parameter to `true`, the automatic revert capability of the data LIF is disabled (the `--auto-revert` parameter is set to `false`). Also, data LIFs that migrate as a result of load balancing adhere to network interface failover rules.

  Note: During times when a LIF is hosting active NFSv4, CIFS, or NRV connections, load balancing based LIF migrations between nodes will be temporarily disabled.

`[-lb-weight load|0..100]` - Load Balanced Weight (privilege: advanced)
Use this parameter to modify the load balancing weight of the data LIF. A valid load balancing weight is any integer between 1 and 100. If you specify the same load balancing weight for all data LIFs in a DNS zone, client requests are uniformly distributed, similar to round-robin DNS. A data LIF with a low load balancing weight is made available for client requests less frequently than one that has a high load balancing weight.

`[-failover-group <failover-group>]` - Failover Group Name
Use this parameter to modify the name of the failover group to associate with the network interface. Manage failover groups using the `network interface failover-groups` command. Each broadcast domain has a default failover group which is created by the system automatically and has the same name as the broadcast domain. The failover group associated with the broadcast domain includes all ports in the broadcast domain. A logical interface's failover group is set to the failover group of the home port's broadcast domain by default, but this value can be modified.

  Note: Logical interfaces for SAN protocols do not support failover. Thus, this parameter cannot be specified for such interfaces.

`[-comment <text>]` - Comment
Use this parameter to modify the comment associated with the LIF.

`[-force-subnet-association [true]]` - Force the LIF's Subnet Association
This command will fail if the IP address falls within the address range of a named subnet. Set this to true to acquire the address from the named subnet and assign the subnet to the LIF.

`[-is-dns-update-enabled {true|false}]` - Is Dynamic DNS Update Enabled?
If this parameter is set to `true`, then dynamic DNS update is sent to the DNS server for the particular LIF entry if dynamic DNS updates are enabled for the corresponding Vserver. This field is set to `true` by default for both IPv4 and IPv6 LIFs. DNS Update is not supported on LIFs not configured with either the NFS or CIFS protocol.

Examples
The following example modifies a LIF named datalif1 on a logical server named vs0. The LIF's netmask is modified to 255.255.255.128.

network interface rename

Rename a logical interface

Availability: This command is available to cluster administrators at the admin privilege level.

Description
Use the network interface rename command to change the name of an existing logical interface.

Parameters
- vserver <vserver> - Vserver Name
  Use this parameter to specify the Vserver on which the logical interface to rename is located.

- lif <lif-name> - Logical Interface Name
  Use this parameter to specify the name of the logical interface to rename.

- newname <text> - LIF
  Use this parameter to specify the new name of the logical interface. For iSCSI and FC LIFs, the name cannot be more than 254 characters.

Examples
The following example renames a cluster logical interface named cluslif1 to cluslif4 on a Vserver named vs0.

```
class1::> network interface rename -vserver vs0 -lif cluslif1 -newname cluslif4
```

network interface revert

Revert a logical interface to its home port

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The network interface revert command reverts a logical interface that is not currently on its home port to its home port, assuming that the home node and port are both operational. A logical interface’s home port is specified when the logical interface is created. Determine a logical interface’s home port by using the network interface show command.

Note: When you revert a cluster logical interface, you must do so from the local node.

Note: On some cloud platforms, this operation might perform changes to the external route tables.
Parameters

-vserver <vserver> - Vserver Name
   Use this parameter to specify the Vserver on which the logical interface to be reverted is located.

-lif <lif-name> - Logical Interface Name
   Use this parameter to specify the logical interface that is to be reverted.

   Note: Logical interfaces for SAN protocols are always home. Thus, this command has no effect on such interfaces. The same applies to logical interfaces for NAS protocols that are already home.

Examples

The following example returns any logical interfaces that are not currently on their home ports to their home ports.

   cluster1::> network interface revert -vserver * -lif *

network interface show

Display logical interfaces

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The network interface show command displays information about logical interfaces.

Running the command with the -failover parameter displays information relevant to logical interface failover rules.

Running the command with the -status parameter displays information relevant to logical interface operational status.

Running the command with the -by-ipspace parameter displays information relevant to logical interfaces on a specific IPspace.

See the examples for more information.

You can specify additional parameters to display only information that matches those parameters. For example, to display information only about logical interfaces whose operational status is down, run the command with the -status-oper down parameter.

Parameters

   [ -fields <fieldname>, ... ]
   If you specify the -fields <fieldname>, ... parameter, the command displays only the fields that you specify.

   [ -by-ipspace ]
   Use this parameter to display logical-interfaces sorted by IPspace and Vserver.

   [ -dns-zones ]
   Use this parameter to display logical-interfaces and whether the interface is associated with a Domain Name System (DNS) load balancing zone.

   [ -failover ]
   Use this parameter to display logical-interface failover information.

   [ -status ]
   Use this parameter to display detailed logical-interface status information.
[-instance]
Use this parameter to display all the fields for the specified logical-interfaces.

[-vserver <vserver>] - Vserver Name
Use this parameter to display information only about logical interfaces on the Vserver you specify.
Use this parameter plus the -lif parameter to display detailed information only about the logical interface you specify.

[-lif <lif-name>] - Logical Interface Name
Use this parameter to display information only about logical interfaces that match the name you specify.
Use this parameter with the -vserver parameter to display detailed information only about the logical interface you specify.

[-role {cluster|data|node-mgmt|intercluster|cluster-mgmt}] - Role
Use this parameter to display information only about logical interfaces that are associated with network ports that have the role you specify.

[-data-protocol {nfs|cifs|iscsi|fcp|fcache|none},...] - Data Protocol
Use this parameter to display information only about logical interfaces that have the enabled data protocols you specify.

[-home-node <nodename>] - Home Node
Use this parameter to display information only about logical interfaces that have the home node you specify.

[-home-port {<netport>|<ifgrp>}] - Home Port
Use this parameter to display information only about logical interfaces that have the home port or interface group you specify.

[-curr-node <nodename>] - Current Node
Use this parameter to display information only about logical interfaces that are currently located on the node you specify.

[-curr-port {<netport>|<ifgrp>}] - Current Port
Use this parameter to display information only about logical interfaces that are currently located on the port or interface group you specify.

[-status-oper {up|down}] - Operational Status
Use this parameter to display information only about logical interfaces that have the operational status you specify.

[-status-extended <text>] - Extended Status
Use this parameter to display information only about logical interfaces that match the extended status that you specify.

[-numeric-id <integer>] - Numeric ID (privilege: advanced)
Use this parameter to display information only about logical interfaces with the numeric ID (or range of IDs) you specify. The numeric ID is an integer that identifies the logical interface in the cluster.

[-is-home {true|false}] - Is Home
Use this parameter to display information only about logical interfaces that are (true) or are not (false) currently located on their home node and port.

[-address <IP Address>] - Network Address
Use this parameter to display information only about logical interfaces that match the IP address or address range you specify.

[-netmask <IP Address>] - Netmask
Use this parameter to display information only about logical interfaces that have the netmask you specify.
[-netmask-length <integer>] - Bits in the Netmask
   Use this parameter to display information only about logical interfaces with a netmask that has the number of
   bits you specify.

[-subnet-name <subnet name>] - Subnet Name
   Use this parameter to display the logical interfaces that matches the subnet name.

[-status-admin {up|down}] - Administrative Status
   Use this parameter to display information only about logical interfaces that have the administrative status you
   specify.

[-failover-policy {system-defined|local-only|sfo-partner-only|disabled|broadcast-domain-wide}] - Failover Policy
   Use this parameter to display information only about logical interfaces that use the failover policy you specify.

[-firewall-policy <policy>] - Firewall Policy
   Use this parameter to display information only about logical interfaces that use the firewall policies you
   specify.

[-auto-revert {true|false}] - Auto Revert
   Use this parameter to display information only about logical interfaces that have auto-revert setting you
   specify.

[-sticky {true|false}] - Sticky Flag (privilege: advanced)
   Use this parameter to display information only about logical interfaces that are "sticky". A sticky logical
   interface is one that has been manually migrated to another node and is not subject to auto-revert settings. A
   sticky logical interface remains at the migrated location until it is manually reverted or until it fails over to
   another node.

[-dns-zone <zone-name>|none] - Fully Qualified DNS Zone Name
   Use this parameter to display information only about logical interfaces in the specified DNS zone.

[-listen-for-dns-query {true|false}] - DNS Query Listen Enable
   Use this parameter to display information only about logical interfaces that have the DNS query listen value
   you specify.

[-allow-lb-migrate {true|false}] - (DEPRECATED)-Load Balancing Migrate Allowed (privilege: advanced)
   Note: This parameter has been deprecated and may be removed in a future version of Data ONTAP.
   Use this parameter to display information only about logical interfaces for which load balancing migration is
   activated (true) or not activated (false).

[-lb-weight {load|0..100}] - Load Balanced Weight (privilege: advanced)
   Use this parameter to display information only about logical interfaces that have the load balancing weight you
   specify.

[-failover-group <failover-group>] - Failover Group Name
   Use this parameter to display information only about logical interfaces that are in the failover group you
   specify. Logical interfaces in the same failover group are capable of failing over to the same set of ports.

[-wwpn <text>] - FCP WWPN
   Use this parameter to display information only about logical interfaces that have the Fibre Channel Protocol
   port identifier (World Wide Port Name) you specify.

[-address-family {ipv4|ipv6|ipv6z}] - Address family
   Use this parameter to view the address family that is in use on the interface. Only IPv4 and IPv6 non-zoned
   addresses can be configured. Configuration of IPv6z addresses is not allowed.

[-comment <text>] - Comment
   Use this parameter to display information only about logical interfaces that have the comment you specify.
Use this parameter to display information only about logical interfaces on the IPspace you specify.

Use this parameter to display information only about logical interfaces that have (true) or do not have (false) dynamic DNS updates enabled for them.

### Examples

The following example displays general information about all logical interfaces.

network interface start-cluster-check

Start the cluster check function

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**
The `network interface start-cluster-check` command initiates an accessibility check from every logical interface to every aggregate. Automatic checks run periodically, but this command manually initiates a check immediately.

This command produces no direct output. Any errors encountered during the check are reported in the event log. See the `event log show` command for more information.

**Examples**
This example shows an execution of this command, with all parameters and output.

```
cluster1::> network interface start-cluster-check
```

**Related references**
`event log show` on page 129

network interface capacity commands

The capacity directory

**network interface capacity show**

Display the number of IP data LIFs capable of being configured on the cluster.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The `network interface capacity show` command displays the number of IP LIFs of role *data* supported on the cluster, as well as the number of IP LIFs of role *data* currently configured on the cluster.

**Note:** The number of IP LIFs of role *data* that are supported on a node depends on the hardware platform and the Cluster's Data ONTAP version. If one or more nodes in the cluster cannot support additional LIFs, then none of the nodes in the cluster can support additional LIFs.

**Examples**
The following displays the IP data LIF capacity.

```
cluster1::> network interface capacity show
  IP Data LIF Supported Limit  IP Data LIF Count
  ---------------------------  ---------------
  1024                        256
```
network interface capacity details commands

The details directory

network interface capacity details show

Display details about the IP data LIFs capable of being configured on each node.

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

The network interface capacity details show command displays the number of IP LIFs of role data that can be configured on each node, the number of IP data LIFs of role data that are supported on each node, and the number of IP data LIFs of role data that are configured to be homed on each node.

Note: The number of IP LIFs of role data that are supported on a node depends on the hardware platform and the Cluster's Data ONTAP version. If one or more nodes in the cluster cannot support additional LIFs, then none of the nodes in the cluster can support additional LIFs.

Parameters

[-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-node <nodename> | local] - Node Name

Use this parameter to specify the node for which to obtain data LIF capacity.

[-capacity-for-node <integer>] - Number of IP data LIFs that can be configured on the node

This parameter specifies the number of IP LIFs of role data that can be configured on the node at the currently running Data ONTAP version. To view the version of a node, use the cluster image show command.

[-limit-for-node <integer>] - Number of IP data LIFs that are supported on the node

This parameter specifies the number of IP LIFs of role data that are supported on the node at the current effective cluster version (ECV). To view the version of a node, use the cluster image show command.

[-count-for-node <integer>] - Number of IP data LIFs that are assigned to the node

This parameter specifies the number of IP LIFs of role data currently configured to be homed on the node. To view LIFs homed on this node, use the network interface show -home-node command.

Examples

The following displays the IP data LIF capacity.

```
cluster1:/> network interface capacity details show

<table>
<thead>
<tr>
<th>Node</th>
<th>IP Data LIF Capacity</th>
<th>IP Data LIF Supported Limit</th>
<th>IP Data LIF Count</th>
</tr>
</thead>
<tbody>
<tr>
<td>node1</td>
<td>512</td>
<td>512</td>
<td>128</td>
</tr>
<tr>
<td>node2</td>
<td>512</td>
<td>512</td>
<td>128</td>
</tr>
</tbody>
</table>
```
**network interface check commands**

The check directory

**network interface check failover commands**

The failover directory

**network interface check failover show**

Discover if any LIFs might become inaccessible during a node outage, due to over-provisioning

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

This command identifies logical interfaces (LIFs) at risk of becoming inaccessible if their hosting nodes were to experience an outage. The source-nodes parameter is the only required input.

The tuple <destination-nodes, vserver-name, lif-name> is sufficient to uniquely identify a record in the returned listing. All fields other than source-nodes can be filtered on in the usual fashion. There are some examples of this filtering below.

**Parameters**

- `[-fields <fieldname>, ...]`
  - If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

- `[-instance]`
  - If you specify the `-instance` parameter, the command displays detailed information about all fields.

- `[-destination-nodes <nodename>, ...] - Set Of Nodes Over Capacity`
  - Use this parameter to display the nodes an at-risk LIF or LIFs could fail over to.

- `[-vserver-name <vserver>] - Vserver Name`
  - Use this parameter to display only LIFs on the Vserver you specify.

- `[-lif-name <lif-name>] - LIF Name`
  - Use this parameter to display at-risk information only about the LIF or LIFs whose name you specify.

- `[-source-nodes <nodename>, ...] - Nodes Going Down`
  - List of nodes to test. At-risk LIFs currently hosted on these nodes will be identified. The list should contain no more than half the nodes in the cluster.

- `[-over-amount <integer>] - Amount Capacity Exceeded`
  - Use this parameter to select only at-risk LIFs associated with a set of destination nodes whose amount over capacity matches the number you specify.

  Note that the number of LIFs considered to be at risk may be higher than the actual amount over capacity a given set of nodes is. Once a given set of nodes is determined to be potentially over capacity, all LIFs whose set of failover target nodes is an exact match are marked as at risk. The amount over capacity is an upper bound on the number LIFs which could become unhosted if LIFs were to fail over in a random order, each to a target randomly selected from that LIF's configured failover targets.

- `[-failover-group <failover-group>] - Failover Group Name`
  - Use this parameter to display information only about at-risk LIFs whose failover-group you specify.
Failover Policy

Use this parameter to display information only about at-risk LIFs whose failover-policy you specify.

Examples

The following example shows all the at-risk LIFs for a specific two-node outage in a six-node cluster.

```
cluster1::> network interface check failover show -source-nodes node1,node5
Destination Nodes: node2, node3, node4, node6
Amount Over Capacity: 2
Vserver Logical Interface Failover Group Failover Policy
------------------ ------------------- ---------------- ---------------------
vs0                 data1                Default          broadcast-domain-wide
                   data2                Default          broadcast-domain-wide
                   data3                Default          broadcast-domain-wide
vs1                 data1                Custom_Name      broadcast-domain-wide
```

The following example shows the same two-node outage scenario, but now with some filtering applied to the results.

```
cluster1::> network interface check failover show -source-nodes node1,node5 -destination-nodes node2,node3,node4,node6 -failover-group Def*
Destination Nodes: node2
Amount Over Capacity: 1
Vserver Logical Interface Failover Group Failover Policy
------------------ ------------------- ---------------- ---------------------
vs0                 data6                Default          sfo-partner-only
vs1                 data7                Default          sfo-partner-only
```

network interface dns-lb-stats commands

The dns-lb-stats directory

network interface dns-lb-stats show

Show the DNS load-balancer stats for this node

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description

The network interface dns-lb-stats show command displays the statistics for DNS load-balancing lookups for the zones belonging to the specified Vserver. These statistics represent the data for the Vserver on the local node. The following counts can be seen in the statistics output:

- success-count: Number of successful lookups.
- authoritative-count: Number of authoritative answers sent.
- nonauthoritative-count: Number of non authoritative answers sent.
- rr-set-missing-count: Number of times the RR set was missing.
• domain-missing-count : Number of times the domain was not be found.
• failure-count : Number of failed lookups.
• dropped-count : Number of lookups dropped.

Parameters

\{ [-fields <fieldname>, ...] \\
  \}  

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

\{| [-instance] \}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

\[-vserver <vserver>\] - Vserver

Use this parameter to display DNS load-balancer statistics only for the specified Vservers.

\[-zone <text>\] - DNS Zone

Use this parameter to display DNS load-balancer statistics only for the specified DNS zones.

\[-success-count <integer>\] - Successful Lookup Count

Use this parameter to display DNS load-balancer statistics only for the specified number of successful lookups.

\[-authoritative-count <integer>\] - Authoritative Answer Count

Use this parameter to display DNS load-balancer statistics only for the specified number of authoritative answers sent.

\[-nonauthoritative-count <integer>\] - Non Authoritative Answer Count

Use this parameter to display DNS load-balancer statistics only for the specified number of non-authoritative answers sent.

\[-rr-set-missing-count <integer>\] - RR Set Missing Count

Use this parameter to display DNS load-balancer statistics only for the specified number of times the RR set was missing.

\[-domain-missing-count <integer>\] - Name Missing Count

Use this parameter to display DNS load-balancer statistics only for the specified number of times the domain was not found.

\[-failure-count <integer>\] - Failed Lookup Count

Use this parameter to display DNS load-balancer statistics only for the specified number of failed lookups.

\[-dropped-count <integer>\] - Dropped Count

Use this parameter to display DNS load-balancer statistics only for the specified number of dropped lookups.

Examples

The following example displays stats for the zone "x.com".

<table>
<thead>
<tr>
<th>Vserver</th>
<th>DNS Zone</th>
<th>SUCCESS</th>
<th>AUTH</th>
<th>NOAUTH</th>
<th>NORR</th>
<th>NODOM</th>
<th>FAILED</th>
<th>DROP</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs2</td>
<td>x.com</td>
<td>5</td>
<td>5</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

network interface failover-groups commands

Manage logical interface failover group configuration
network interface failover-groups add-targets
Add failover targets to a failover group

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The network interface failover-groups add-targets command enables you to add a list of failover targets such as network ports, interface groups, or VLANs to an existing logical interface failover group.

Parameters
-vserver <vserver> - Vserver Name
Use this parameter to specify the name of the Vservers from which this failover group is accessible.

-failover-group <text> - Failover Group Name
Use this parameter to specify the failover group that you want to extend.

-targets <<node>:<port>>, ... - Failover Targets
Use this parameter to specify the failover targets such as network ports, interface groups, or VLANs you wish to add to the failover group.

Examples
This example shows the failover group "clyde" being extended to include additional failover targets.

```
cluster1::> network interface failover-group add-targets -vserver vsl -failover-group clyde -targets xena1:e0c, xena1:e0d-100, xena2:a0a
```

network interface failover-groups create
Create a new failover group

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The network interface failover-groups create command creates a grouping of failover targets for logical interfaces on one or more nodes. Use this command to add a new network port or interface group to an existing failover group.

Note: Interfaces for SAN protocols do not support failover. Such interfaces are not valid failover targets.

Parameters
-vserver <vserver> - Vserver Name
Use this parameter to specify the name of the Vservers from which this failover group is accessible.

-failover-group <text> - Failover Group Name
Use this parameter to specify the name of the logical interface failover group that you want to create.

-targets <<node>:<port>>, ... - Failover Targets
Use this parameter to specify the list of failover targets (network ports, interface groups, or VLANs on a node) belonging to this failover group.

Examples
The following example shows how to create a failover group named failover-group_2 containing ports e1e and e2e on node Xena.
network interface failover-groups delete

Delete a failover group

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The `network interface failover-groups delete` command deletes a logical interface failover group.

**Parameters**
- **-vserver** `<vserver>` - Vserver Name
  Use this parameter to specify the name of the Vservers from which this failover group is accessible.
- **-failover-group** `<text>` - Failover Group Name
  Use this parameter to specify the name of the logical interface failover group to be deleted.

**Examples**
The following example shows how to delete a failover group named failover-group_2.

```
cluster1::> network interface failover-groups delete -vserver vs1 -failover-group failover-group_2
```

network interface failover-groups modify

Modify a failover group

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The `network interface failover-groups modify` command enables you modify the list of network ports, interface groups, or VLANs belonging to an existing logical interface failover group. The specified list will overwrite the existing list of network ports, interface groups, and VLANs currently belonging to the logical interface failover group.

**Parameters**
- **-vserver** `<vserver>` - Vserver Name
  Use this parameter to specify the name of the Vserver(s) from which this failover group is accessible.
- **-failover-group** `<text>` - Failover Group Name
  Use this parameter to specify the failover group that you want to modify.
- **-targets** `<<node>:<port>>, ...` - Failover Targets
  Use this parameter to specify the network ports, interface groups, or VLANs you wish to now belong to the failover group.

**Examples**
This example shows the failover group "clyde" being modified to now contain the specified network ports.

```
cluster1::> network interface failover-group modify -vserver vs1 -failover-group clyde -targets xena1:e0c, xena1:e0d-100, xena2:a0a
```
network interface failover-groups remove-targets

Remove failover targets from a failover group

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The `network interface failover-groups remove-targets` command enables you to specify a list of failover targets such as network ports, interface groups, or VLANs to be removed from an existing logical interface failover group.

**Parameters**
- `vserver <vserver>` - Vserver Name
  
  Use this parameter to specify the name of the Vserver(s) from which this failover group is accessible.

- `failover-group <text>` - Failover Group Name
  
  Use this parameter to specify the failover group that you want to remove failover targets from.

- `targets <<node>:<port>>, ...` - Failover Targets
  
  Use this parameter to specify the failover targets such as network ports, interface groups, or VLANs you wish to remove from the failover group.

**Examples**
This example shows the failover targets xena1:e0c and xena1:e0d-100 being removed from the failover group "clyde".

```
cluster1::> network interface failover-group remote-targets -vserver vs1 -failover-group clyde -targets xena1:e0c, xena1:e0d-100, xena2:a0a
```

network interface failover-groups rename

Rename a logical interface failover Group

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The `network interface failover-groups rename` command enables you to rename an existing logical interface failover group.

**Parameters**
- `vserver <vserver>` - Vserver Name
  
  Use this parameter to specify the name of the Vservers from which this failover group is accessible.

- `failover-group <text>` - Failover Group Name
  
  Use this parameter to specify the failover group that you want to rename.

- `new-failover-group-name <text>` - New name
  
  Use this parameter to specify the new name of the failover group.

**Examples**
This example shows the failover group "clusterwide" being renamed "clyde".

```
cluster1::> network interface failover-group rename -failover -vserver vs1 -failover-group clusterwide -new-failover-group-name clyde
```
network interface failover-groups show

Display logical interface failover groups

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The network interface failover-groups show command displays information about logical interface failover groups.

Parameters

{ [-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance ]
  If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver>] - Vserver Name
  Use this parameter to display information only about the logical interface failover groups that have the target Vserver you specify.

[-failover-group <text>] - Failover Group Name
  Use this parameter to display information only about the logical interface failover groups you specify.

[-targets <node>:<port>, ...] - Failover Targets
  Use this parameter to display information only about the logical interface failover groups that have the failover target (physical port, interface group, or VLAN) you specify.

[-broadcast-domain <broadcast domain name>] - Broadcast Domain
  Use this parameter to display information only about the logical interface failover groups that have the broadcast domain you specify.

Examples

The following example displays information about all logical interface failover groups on a two node cluster.

```
cluster1::> network interface failover-groups show
  Failover
  Vserver          Group            Targets
  ---------------- ---------------- --------------------------------------------
  Cluster
  Cluster
  node1:e1a, node1:e2a,
  node2:e1a, node2:e2a,
  node1:e0M, node1:e0a,
  node1:e0b, node1:e0c,
  node1:e0d, node2:e0M,
  node2:e0a, node2:e0b,
  node2:e0c, node2:e0d
```

network interface lif-weights commands

The lif-weights directory
network interface lif-weights show

Show the load-balancer LIF weights

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description

The network interface lif-weights show command displays the weights assigned to each LIF in a DNS load-balancing zone in a Vserver.

Parameters

[-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver>] - Vserver

Use this parameter to display information only for the specified Vservers.

[-zone <text>] - DNS Zone

Use this parameter to display information only for the specified DNS zones.

[-address <IP Address>] - Network Address

Use this parameter to display information only for the specified IP addresses.

[-weight <double>] - Load Balancer Weight

Use this parameter to display information only for the specified load balancer weights

Examples

The following example displays LIF weights for vserver "vs1".

```
cluster1::> network interface lif-weights show -vserver vs1

<table>
<thead>
<tr>
<th>Vserver</th>
<th>DNS Zone</th>
<th>Network Address</th>
<th>Weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>
<td>a.com</td>
<td>4.4.4.4</td>
<td>12.4206</td>
</tr>
<tr>
<td></td>
<td>x.com</td>
<td>1.1.1.1</td>
<td>12.4206</td>
</tr>
<tr>
<td></td>
<td>x.com</td>
<td>10.72.46.236</td>
<td>12.4206</td>
</tr>
</tbody>
</table>

3 entries were displayed.
```

network ipspace commands

Manage IP Spaces

Network IPspace commands.

network ipspace create

Create a new IPspace

Availability: This command is available to cluster administrators at the admin privilege level.
Description
IPspaces are distinct IP address spaces in which Storage Virtual Machines (SVMs) reside. The "Cluster" IPspace and "Default" IPspace are created by default. You can create more custom IPspaces when you need your SVMs to have overlapping IP addresses, or you need more control over networking configurations for cluster peering. Please reference the "Network Management Guide" for the limit of how many custom IPspaces are supported on your system.

Parameters
- `ipspace <IPspace>` - IPspace name
  The name of the IPspace to be created.
  • The name must contain only the following characters: A-Z, a-z, 0-9, ","", "-" or ".".
  • The first character of each label, delimited by ",", must be one of the following characters: A-Z or a-z.
  • The last character of each label, delimited by ",", must be one of the following characters: A-Z, a-z or 0-9.
  • The maximum supported length is 47 characters.
  • The system reserves the following names: "all", "local" and "localhost".
  • The system provides the following IPspaces: "Cluster" and "Default".

Examples
The following example creates IPspace "ips1".
```
cluster1::> network ipspace create -name ips1
```

network ipspace delete
Delete an IPspace

Availability: This command is available to cluster administrators at the admin privilege level.

Description
Delete an IPspace that contains no ports or Vservers.

Parameters
- `ipspace <IPspace>` - IPspace name
  The name of the IPspace to be deleted. If the IPspace is associated with one or more logical-interfaces, you must delete them before you can delete the IPspace.

Examples
The following example deletes the IPspace "ips1".
```
cluster1::> network ipspace delete -ipspace ips1
```

network ipspace rename
Rename an IPspace

Availability: This command is available to cluster administrators at the admin privilege level.

Description
Rename an IPspace.
Parameters
-ipspace <IPspace> - IPspace name
  The name of the IPspace to be renamed.

-new-name <IPspace> - New Name
  The new name for the IPspace.

- The name must contain only the following characters: A-Z, a-z, 0-9, ".", "-" or "_".
- The first character of each label, delimited by ".", must be one of the following characters: A-Z or a-z.
- The last character of each label, delimited by ".", must be one of the following characters: A-Z, a-z or 0-9.
- The maximum supported length is 47 characters.
- The system reserves the following names: "all", "cluster", "local" and "localhost".

Examples
The following example renames IPspace "ips1" to "ips2".

cluster1::> network ipspace rename -ipspace ips1 -new-name ips2

network ipspace show
Display IPspace information

Availability: This command is available to cluster administrators at the admin privilege level.

Description
Display network IPspaces.

Parameters
[[-fields <fieldname>,...]
  Specify the fields to be displayed for each IPspace.
| [-instance]]
  Display all parameters of the IPspace objects.
[-ipspace <IPspace>] - IPspace name
  Display the names of the IPspaces.
[-ports <<node>:<port>>,...]] - Ports
  The list of network ports assigned to each IPspace.
[-broadcast-domains <broadcast domain name>,...]] - Broadcast Domains
  The list of broadcast domains that belong to the IPspace.
[-vservers <vserver name>,...] - Vservers
  The list of Vservers assigned to each IPspace.

Examples
The following example displays general information about IPspaces.

cluster1::> network ipspace show
  IPspace  Vserver List                  Broadcast Domains
  --------------------------------- ----------------------------------
  Cluster

network ndp commands
Manage Neighbor Discovery Protocol
Network Discovery Protocol commands.

network ndp default-router commands
Manage default router entries
NDP default router commands.

network ndp default-router delete-all
Delete default routers on a given IPspace
Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The network ndp default-router delete-all command deletes default router lists from the specified IPspace.

Parameters

-ipspace <IPspace> - IPspace Name
Use this parameter to specify the IPspace where the default routers are to be deleted.

Examples
The following example deletes default routers from IPspace ips1.

    cluster1::*> network ndp default-router delete-all -ipspace ips1

network ndp default-router show
Display default routers
Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The network ndp default-router show command displays Neighbor Discovery Protocol (NDP) default routers learned on a specified port.

Parameters

[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance]
If you specify the -instance parameter, the command displays detailed information about all fields.
[-node {<nodename>|local}] - Node
   Displays the NDP default routers from the specified node.

[-ipspace <IPspace>] - IPspace name
   Displays the NDP default routers from the specified IPspace.

[-port {<netport>|<ifgrp}>] - Port
   Displays the NDP default routers from the specified port.

[-router-addr <IP Address>] - Router Address
   Displays the default routers that have the specified IPv6 addresses.

[-flag {none|managed-address-DHCPv6|other-DHCPv6}] - Flag
   Displays the default routers that have the specified flag. The flag indicates whether addresses are available via
   DHCPv6 or other configuration information is available via DHCPv6.

[-expire-time {[<integer>d][<integer>h][<integer>m][<integer>s]|never|expired}] - Expire Time
   Displays the default routers that have the specified expire time.

Examples
The following example displays NDP default routers on local port e0f.

cluster1::*> network ndp default-router show -port e0f -node local

Node: node1
IPspace: Default
Port     Router Address             Flag            Expire Time
-------- -------------------------- --------------  --------------
e0f      fe80::5:73ff:fea0:107      none            0d0h23m9s

network ndp neighbor commands
Manage neighbor entries
Neighbor Discovery Protocol (NDP) neighbor commands.

network ndp neighbor create
Create a static NDP neighbor entry

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The network ndp neighbor create command creates a static Neighbor Discovery Protocol (NDP) neighbor entry within a
Vserver.

Parameters
- vserver <vserver name> - Vserver Name
   Use this parameter to specify the Vserver on which the NDP neighbor is to be created.

- neighbor <IP Address> - Neighbor Address
   Use this parameter to specify the neighbor's IPv6 address.

- mac-address <MAC Address> - MAC Address
   Use this parameter to specify the neighbor's MAC address.
network ndp neighbor delete

Delete a static NDP neighbor entry

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The network ndp neighbor delete command deletes a static Neighbor Discovery Protocol (NDP) neighbor from a Vserver.

Parameters
-vserver <vserver name> - Vserver Name
Use this parameter to specify the Vserver on which the NDP neighbor is to be deleted.

-neighbor <IP Address> - Neighbor Address
Use this parameter to specify the neighbor's IPv6 address.

Examples
The following example deletes a NDP neighbor entry within Vserver vs0.

cluster1:*> network ndp neighbor delete -vserver vs0 -neighbor 20:20::20

network ndp neighbor show

Display static NDP neighbor entries

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The network ndp neighbor show command displays a group of static Neighbor Discovery Protocol (NDP) neighbors within one or more Vservers. You can view static NDP neighbors within specified Vservers, neighbors with specified IPv6 address, and neighbors with specified MAC address.

Parameters
{ [-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

  [-instance ]
  If you specify the -instance parameter, the command displays detailed information about all fields.

  [-vserver <vserver name>] - Vserver Name
  Displays the static NDP neighbors that have the specified Vserver as their origin.

  [-neighbor <IP Address>] - Neighbor Address
  Displays the static NDP neighbors that have the specified IPv6 address.

Examples
The following example deletes a NDP neighbor entry within Vserver vs0.

cluster1:*> network ndp neighbor delete -vserver vs0 -neighbor 20:20::20
[-mac-address <MAC Address>] - MAC Address

Displays the static NDP neighbors that have the specified MAC address.

Examples
The following example displays all of the static NDP neighbors configured on Vserver vs0.

```
cluster1:*> network ndp neighbor show -vserver vs0
Vserver        Neighbor            MAC Address
------------------ ------------------------ -------------------
vs0             10:10::10              04:04:04:04:04:04
20:20::20              01:01:01:01:01:01
2 entries were displayed.
```

network ndp neighbor active-entry commands

Manage neighbor active entries
NDP active neighbor commands.

network ndp neighbor active-entry delete

Delete active neighbor entry from a System or Admin Vserver

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The `network ndp neighbor active-entry delete` command deletes a Network Discovery Protocol (NDP) neighbor entry on the specified port from a given Vserver's subnet group.

Parameters
- `-node (<nodename>|local)` - Node
  Use this parameter to specify the node on which the neighbor entry is to be deleted.
- `-vserver <vserver>` - System or Admin Vserver Name
  Use this parameter to specify the System or Admin Vserver on which the neighbor entry is to be deleted.
- `-subnet-group <IP Address/Mask>` - Subnet Group
  Use this parameter to specify the subnet group from which the neighbor entry is to be deleted.
- `-neighbor <IP Address>` - Neighbor
  Use this parameter to specify the IPv6 address of the neighbor entry which is to be deleted.
- `-port (<netport>|<ifgrp>)` - Port
  Use this parameter to specify the port on which the neighbor entry is to be deleted.

Examples
The following example deletes a neighbor entry from the Admin Vserver cluster1:

```
cluster1:*> network ndp neighbor active-entry delete -vserver cluster1 -node local -subnet-group ::/0 -neighbor fe80:4::5:73ff:fea0:107 -port e0d
```

network ndp neighbor active-entry show

Display active neighbor entries organized by Vserver

Availability: This command is available to cluster administrators at the advanced privilege level.
Description
The `network ndp neighbor active-entry show` command displays Network Discovery Protocol (NDP) neighbor cache entries on one or more nodes. You can view ndp neighbors within specified nodes and within specified System or Admin Vservers.

Parameters

`[-fields <fieldname>, ...]`
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

`[-verbose]`
Displays the expire time, state, is-router, and probe count fields.

`[-instance]`
If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-node {<nodename>|local}] - Node`
Displays the NDP neighbors from the specified node.

`[-vserver <vserver>] - System or Admin Vserver Name`
Displays the NDP neighbors from the specified System or Admin Vserver. Data and Node Vservers do not have dynamic NDP neighbors.

`[-subnet-group <IP Address/Mask>] - Subnet Group`
Displays the NDP neighbors in the specified subnet group.

`[-neighbor <IP Address>] - Neighbor`
Displays the NDP neighbors that have the specified IPv6 address.

`[-port {<netport>|<ifgrp}>] - Port`
Displays the NDP neighbors on the specified port.

`[-mac-address <MAC Address>] - MAC Address`
Displays the NDP neighbors have the specified MAC address.

`[-expire-time {[<integer>d]<integer>h]<integer>m]<integer>s|never|expired}] - Expire Time`
Displays the NDP neighbors have the specified expire time.

`[-state {<nostate|incomplete|reachable|stale|delay|probe|unknown>}] - State`
Displays the NDP neighbors in the specified state.

`[-is-router {true|false}] - Is Router`
Displays the NDP neighbor which is a router.

`[-probe-count <integer>] - Probe Count`
Displays the NDP neighbors with the specified probe count. Probe count is the number of times that this neighbor's MAC address has been queried.

`[-is-static {true|false}] - Is Static`
Displays the NDP neighbors which are statically configured.

Examples
The following example displays NDP neighbors on the Admin Vserver cluster1:

```
cluster1:/> network ndp neighbor active-entry show -vserver cluster1
```

```
Node: node1
Vserver: cluster1
Subnet Group: ::/0
Neighbor MAC Address Port
```

```
```
network ndp prefix commands

Manage prefix entries
NDP prefix commands.

network ndp prefix delete-all

Delete IPv6 prefixes on a given IPspace

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The network ndp prefix delete-all command deletes all prefixes learned from the specified IPspace.

Parameters
-ipspace <IPspace> - IPspace Name

Use this parameter to specify the IPspace where the IPv6 prefixes are to be deleted.

Examples
The following example deletes all IPv6 prefixes within IPspace ips1.

```
cluster1::*> network ndp prefix delete-all -ipspace ips1
```

network ndp prefix show

Display IPv6 prefixes

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The network ndp prefix show command displays IPv6 prefixes on one or more nodes.

Parameters

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use ‘-fields ?' to display the fields to specify.

-verbose ]
Displays the valid-lifetime, preferred-lifetime, origin and advertising-router fields.

[-instance ]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node
Displays the IPv6 prefixes from the specified node.

[-ipspace <IPspace>] - IPspace name
Displays the IPv6 prefixes from the specified IPspace.
[-port {<netport>|<ifgrp>} ] - Port
Displays the IPv6 prefixes on the specified port.

[-prefix <IP Address/Mask>] - Prefix
Displays the IPv6 prefixes with the specified prefix value.

[-flag {none|on-link|autonomous|on-link-autonomous}] - Flag
Displays the IPv6 prefixes with the specified flag. The flag indicates whether a prefix is on-link and whether it can be used in autonomous address configuration.

[-valid-lifetime {<unsigned integer>|infinity}] - Valid Lifetime
Displays the IPv6 prefixes having the specified valid lifetime in seconds.

[-preferred-lifetime {<unsigned integer>|infinity}] - Preferred Lifetime
Displays the IPv6 prefixes having the specified preferred lifetime in seconds.

[-expire-time {[<integer>d]<integer>h}|<integer>m}|<integer>s]}|never|expired]] - Expire Time
Displays the IPv6 prefixes having the specified expire time.

[-origin {router-advertise|renumber-request|static|kernel|unknown}] - Origin of the Prefix
Displays the IPv6 prefixes with the specified origin.

[-advertising-router <IP Address>, ...] - Router that Advertised the Prefix
Displays the IPv6 prefixes which are propagated by the specified router list.

Examples
The following example displays IPv6 prefixes on port e0f.

```
cluster1::*> network ndp prefix show -port e0f -node local
```

<table>
<thead>
<tr>
<th>Port</th>
<th>Prefix</th>
<th>Flag</th>
<th>Expire Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>e0f</td>
<td>fd20:8b1e:b255:814e::/64</td>
<td>on-link-autonomous</td>
<td>29d23h56m48s</td>
</tr>
</tbody>
</table>

network options commands
The options directory

network options cluster-health-notifications commands
The cluster-health-notifications directory

network options cluster-health-notifications modify
cluster health notification options

Availability: This command is available to cluster administrators at the admin privilege level.

Description
This command enables or disables cluster health notifications on the specified node.
Parameters

- **node [{<nodename>|local}] - Node**
  This parameter specifies the node for which the cluster health notification status will be modified.

[-enabled {true|false}] - Cluster Health Notifications Enabled
  Setting this parameter to true enables cluster health notification. Setting it to false disables cluster health notification.

### Examples

The following example modifies the cluster health notification status for a node:

```
cluster1::> network options cluster-health-notifications modify -node node1 -enabled true
```

network options cluster-health-notifications show

Display cluster health notification options

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

The `network options cluster-health-notifications show` command displays whether the node’s cluster health notifications are enabled.

**Parameters**

{{-fields <fieldname>, ...}}
  If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

{[-instance ]}
  If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename> | local}] - Node
  This parameter specifies the node for which the cluster health notification status will be displayed.

[-enabled {true|false}] - Cluster Health Notifications Enabled
  Selects the entries that match this parameter value.

### Examples

The following example displays the cluster health notification status for a node:

```
cluster1::> network options cluster-health-notifications show -node node1
Node: node1
Cluster Health Notifications Enabled: true
```

network options detect-switchless-cluster commands

Manage capability to automatically detect switchless cluster configurations
network options detect-switchless-cluster modify

Modify the status of switchless cluster detection

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
This command enables or disables the automatic detection of a switchless cluster. A switchless cluster consists of two nodes where the cluster ports are directly connected without a switch between them.

Parameters
[-enabled {true|false}] - Enable Switchless Cluster Detection

This parameter specifies whether switchless cluster detection is enabled or not. Setting this parameter to true enables switchless cluster detection.

Examples

The following example enables switchless cluster detection:
cluster1::*> network options detect-switchless-cluster modify -enabled true

network options detect-switchless-cluster show

Display the status of switchless cluster detection

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The network options detect-switchless-cluster show command displays whether switchless cluster detection is enabled.

Examples

The following example displays whether switchless cluster detection is enabled:
cluster1::*> network options detect-switchless-cluster show
Enable Detect Switchless Cluster: true

network options ipv6 commands

The ipv6 directory

network options ipv6 modify

Modify IPv6 options

Availability: This command is available to cluster administrators at the admin privilege level.

Description
This command sets the state of IPv6 options for the cluster.
Parameters

- `[-enabled [true]]` - IPv6 Enabled

  Setting this parameter to `true` enables IPv6 for the cluster. IPv6 cannot be disabled once it is enabled for the cluster. Call technical support for guidance regarding disabling IPv6.

- `[-is-ra-processing-enabled {true|false}]` - Router Advertisement (RA) Processing Enabled

  Setting this parameter to `true` enables cluster to process IPv6 router advertisements. Setting it to `false` disables router advertisement processing by the cluster.

Examples

The following example enables IPv6 for the cluster:
```
cluster1::> network options ipv6 modify -enabled true
```

The following example enables IPv6 Router Advertisement processing for the cluster:
```
cluster1::> network options ipv6 modify -is-ra-processing-enabled true
```

The following example disables IPv6 Router Advertisement processing for the cluster:
```
cluster1::> network options ipv6 modify -is-ra-processing-enabled false
```

network options ipv6 show

Display IPv6 options

Availability: This command is available to `cluster` administrators at the `admin` privilege level.

Description

This command displays the current state of IPv6 options for the cluster.

Examples

```
cluster1::> network options ipv6 show
IPv6 Enabled: false
Router Advertisement (RA) Processing Enabled: false
```

network options load-balancing commands

The network options load-balancing directory

network options load-balancing modify

Modify load balancing algorithm

Availability: This command is available to `cluster` administrators at the `advanced` privilege level.

Description

This command sets the state of geometric mean algorithm for load balancing.

Parameters

- `[-enable {true|false}]` - Geometric Mean Algorithm for load balancing

  Setting this parameter to `true` enables the geometric mean algorithm for load balancing. Setting it to `false` disables the geometric mean algorithm for the cluster.
Examples

The following example will enable the geometric mean algorithm for load balancing.
cluster1::> network options load-balancing modify -enable true

The following example will disable the geometric mean algorithm for load balancing.
cluster1::> network options load-balancing modify -enable false

network options load-balancing show

Display load balancing algorithm

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
This command displays the use of geometric mean load balancing algorithm.

Examples

cluster1::> network options load-balancing show
Geometric Mean Algorithm for load balancing: false

network options port-health-monitor commands

Manage port health monitor

network options port-health-monitor disable-monitors

Disable one or more port health monitors

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
This command disables the given port health monitors for the given IPspaces in the cluster.

Parameters

-ipspace <IPspace> - IPspace Name
  The name of the IPspace for which the specified port health monitors are disabled.

-health-monitors {l2-reachability|link-flapping|crc-errors|vswitch-link},... - List of Port Health Monitors to Disable
  The port health monitors to disable.

Examples

The following example disables the "l2_reachability" health monitor for the "Default" IPspace.

Note: The status of the "link_flapping" monitor is unaffected by the command.
network options port-health-monitor enable-monitors

Enable one or more port health monitors

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**
This command enables the given port health monitors for the given IPspaces in the cluster.

**Parameters**
- **-ipspace** `<IPspace>` - IPspace Name
  The name of the IPspace for which the specified port health monitors are enabled.
- **-health-monitors** `{l2-reachability|link-flapping|crc-errors|vswitch-link}, ...` - List of Port Health Monitors to Enable
  The port health monitors to enable. Upon enabling the `l2_reachability` health monitor, it runs in an "unpromoted" state. While in this state, the monitor does not mark any ports as unhealthy due to the `l2_reachability` health check. The monitor is promoted in the "Cluster" IPspace when the "Cluster" broadcast domain is found to have passed the `l2_reachability` health check. An EMS event called "vifmgr.hm.promoted" event is generated when the health monitor is promoted for the IPspace.

**Examples**
The following example enables the "l2_reachability" health monitor for the "Default" IPspace:

**Note:** The status of the "link_flapping" monitor is unaffected by the command.

```bash
cluster1::*> network options port-health-monitor show
  IPspace    Enabled Port Health Monitors
  ----------  -------------------------------------
  Cluster     l2_reachability,
              link_flapping
  Default     l2_reachability,
              link_flapping
  2 entries were displayed.
```
network options port-health-monitor modify

Modify port health monitors configuration

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
This command modifies the enabled port health monitors for the given IPspaces in the cluster.

Parameters
-ipspace <IPspace> - IPspace Name

The name of the IPspace for which enabled port health monitors are modified.

[-health-monitors {l2-reachability|link-flapping|crc-errors|vswitch-link}, ...] - List of Enabled Port Health Monitors

All of the port health monitors that you want to enable. This command enables any port health monitors in this list that are currently disabled, and it disables any currently enabled monitors that are not in this list. Upon enabling the l2_reachability health monitor, it runs in an "unpromoted" state. While in this state, the monitor does not mark any ports as unhealthy due to the l2_reachability health check. The monitor is promoted in the "Cluster" IPspace when the "Cluster" broadcast domain is found to have passed the l2_reachability health check. An EMS event called "vifmgr.hm.promoted" event is generated when the health monitor is promoted for the IPspace.

Examples
The following example modifies the port health monitor configuration of the "Default" IPspace such that only the "link_flapping" port health monitor is enabled. enabled for all IPspaces in the cluster.

Note: Only the specified monitor is enabled after the modify command is issued.

```
cluster1::*> network options port-health-monitor show
IPspace     Enabled Port Health Monitors
------------- ----------------------------
Cluster     l2_reachability, link_flapping
Default     l2_reachability, link_flapping
2 entries were displayed.
cluster1::*> network options port-health-monitor modify -ipspace Default -health-monitors link_flapping
cluster1::*> network options port-health-monitor show
IPspace     Enabled Port Health Monitors
------------- ----------------------------
Cluster     l2_reachability, link_flapping
Default     link_flapping
2 entries were displayed.
```
network options port-health-monitor show

Display port health monitors configuration

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
This command displays the enabled port health monitors for the IPspaces in the cluster.

Parameters

{ [-fields <fieldname>, ...] 
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[ -instance ]
  If you specify the -instance parameter, the command displays detailed information about all fields.

[-ipspace <IPspace>] - IPspace Name
  Displays the port health monitors that are enabled only for the given IPspace name.

[-health-monitors (l2-reachability|link-flapping|crc-errors|vswitch-link), ...] - List of Enabled Port Health Monitors
  Displays the IPspaces that have the given monitors enabled.

Examples

The following example lists all port health monitors that are enabled for all IPspaces in the cluster.

```
cluster1:*> network options port-health-monitor show
IPspace     Enabled Port Health Monitors
------------ ----------------------------
Cluster      l2_reachability, link_flapping
Default      l2_reachability, link_flapping
2 entries were displayed.
```

network options send-soa commands

Manage Send Start of Authority settings

network options send-soa modify

Modify Send SOA settings

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
This command sets the status of sending statement of authority record in the DNS response.

Parameters

[-enable {true|false}] - Enable sending SOA
  Setting this parameter to true enables sending the statement of authority (SOA) record in the DNS response.
  Setting it to false disables sending the statement of authority (SOA) record in the DNS response for the cluster.
Examples

The following example will enable the sending of statement of authority (SOA) in the DNS response.
cluster1::> network options send-soa modify -enable true

The following example will disable the sending of statement of authority (SOA) in the DNS response.
cluster1::> network options send-soa modify -enable false

network options send-soa show
Display Send SOA settings
Availability: This command is available to cluster administrators at the advanced privilege level.

Description
This command displays whether sending the statement of authority record (SOA) in the DNS response is enabled or not.

Examples

cluster1::> network options send-soa show
   Enable sending SOA: true

network options switchless-cluster commands
Manage switchless cluster options

network options switchless-cluster modify
Modify switchless cluster network options
Availability: This command is available to cluster administrators at the advanced privilege level.

Description
This command sets whether the cluster network is in switchless or switched mode. A switchless cluster is physically formed by connecting two nodes back-to-back, without a switch between them.

Parameters
[-enabled {true|false}] - Enable Switchless Cluster
This parameter specifies whether the switchless cluster is enabled or not. Setting this parameter to true enables the switchless cluster.

Examples

The following example enables the switchless cluster:
cluster1::*> network options switchless-cluster modify -enabled true
network options switchless-cluster show

Display switchless cluster network options

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The network options switchless-cluster show command displays the attributes of a switchless cluster.

Examples
The following example displays the attributes of the switchless cluster:
cluster1::*> network options switchless-cluster show
Enable Switchless Cluster: true

network port commands

Manage network ports

network port delete

Delete a network port

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The network port delete command deletes a network port that is no longer physically present on the storage system.

Parameters
-node {<nodename>|local} - Node
This specifies the node on which the port is located.

-port {<netport>|<ifgrp>} - Port
This specifies the port to delete.

Examples
The following example deletes port e0c from a node named node0. The command works only when the port does not physically exist on the storage system.

cluster1::> network port delete -node node0 -port e0c

network port modify

Modify network port attributes

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The network port modify command enables you to change the maximum transmission unit (MTU) setting, autonegotiation setting, administrative duplex mode, and administrative speed of a specified network port.
The MTU of ports that belong to broadcast-domains must be updated through the `broadcast-domain modify` command.

Modification of a port's IPspace will only work before a node is added to a cluster, when the cluster version is below Data ONTAP 8.3, or when the node is offline. To change the IPspace of a port once the node is in a Data ONTAP 8.3 cluster, the port should be added to a broadcast-domain that belongs to that IPspace.

**Parameters**

- **-node `<nodename> | local`** - *Node*
  
  Use this parameter to specify the node on which the port is located.

- **-port `<netport> | <ifgrp>`** - *Port*
  
  Use this parameter to specify the port that you want to modify.

- **[-mtu `<integer>`]** - *MTU*
  
  The port's MTU setting. The default setting for ports in the "Cluster" IPspace is 9000 bytes. All other ports use a default value of 1500 bytes.

- **[-autonegotiate-admin {true | false}]** - *Auto-Negotiation Administrative*
  
  Whether the port uses Ethernet autonegotiation to determine the highest speed and duplex mode that the port and its endpoint can support. The default setting when you create a port is `true`.

- **[-duplex-admin {auto | half | full}]** - *Duplex Mode Administrative*
  
  The administrative setting for the port's duplex mode. This is the duplex mode that you prefer the port to use. Depending on network limitations, the operational value can be different from the administrative setting. The default setting when you create a port is `full`.

- **[-speed-admin {auto | 10 | 100 | 1000 | 10000 | 25000 | 40000}]** - *Speed Administrative*
  
  The administrative speed setting, in megabits per second. This is the speed setting that you prefer the port to use. Depending on network limitations, the operational value can be lower than the administrative setting.

- **[-flowcontrol-admin {none | receive | send | full}]** - *Flow Control Administrative*
  
  The administrative flow control setting of the port. This is the flow control setting that you prefer the port to use. Depending on network and port limitations, the operational value can be different from the administrative setting.

- **[-up-admin {true | false}]** - *Up Administrative (privilege: advanced)*
  
  The administrative state of the port. If set to `true`, the port is used if it is operational. If set to `false`, the port is configured down.

- **[-ipspace `<IPspace>`]** - *IPspace Name*
  
  Use this parameter to specify the IPspace the network port is assigned to. Modification of a port's IPspace will only work before a node is added to a cluster, when the cluster version is below Data ONTAP 8.3, or when the node is offline. To change the IPspace of a port once the node is in a Data ONTAP 8.3 cluster, the port should be added to a broadcast-domain that belongs to that IPspace. If there is an inconsistency between the broadcast-domain and IPspace, this parameter can be set to bring the IPspace into alignment with the broadcast-domain.

- **[-ignore-health-status {true | false}]** - *Ignore Port Health Status (privilege: advanced)*
  
  Use this parameter to specify that the system ignore network port health status of the specified port for the purpose of hosting a logical interface.

**Examples**

The following example modifies port e0a on a node named node0 not to use auto-negotiation, to preferably use half duplex mode, and to preferably run at 100 Mbps.

```
cluster1::> network port modify -node node0 -port e0a -autonegotiate-admin false -duplex-admin half -speed-admin 100
```
network port show

Display network port attributes

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The network port show command displays information about network ports. The command output indicates any inactive links, and lists the reason for the inactive status.

Some parameters can have "administrative" and "operational" values. The administrative setting is the preferred value for that parameter, which is set when the port is created or modified. The operational value is the actual current value of that parameter. For example, if the network is underperforming due to network problems, the operational speed value can be lower than the administrative setting.

If the operational duplex mode and speed of a port cannot be determined (for instance, if the link is down), that port's status is listed as undef, meaning undefined.

Parameters

{-fields <fieldname>, ...}
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

{-health}
Use this parameter to display detailed health information for the specified network ports.

{-instance}
If you specify the -instance parameter, the command displays detailed information about all fields.

{-node <nodename>|local} - Node
Selects the network ports that match this parameter value. Use this parameter with the -port parameter to select a port.

{-port <netport>|<ifgrp>} - Port
Selects the network ports that match this parameter value. If you do not use this parameter, the command displays information about all network ports.

{-link off|up|down} - Link
Selects the network ports that match this parameter value.

{-mtu <integer>} - MTU
Selects the network ports that match this parameter value.

{-autonegotiate-admin {true|false}} - Auto-Negotiation Administrative
Selects the network ports that match this parameter value.

{-autonegotiate-oper {true|false}} - Auto-Negotiation Operational
Selects the network ports that match this parameter value.

{-duplex-admin {auto|half|full}} - Duplex Mode Administrative
Selects the network ports that match this parameter value.

{-duplex-oper {auto|half|full}} - Duplex Mode Operational
Selects the network ports that match this parameter value.

{-speed-admin {auto|10|100|1000|10000|25000|40000}} - Speed Administrative
Selects the network ports that match this parameter value.
[-speed-oper {auto|10|100|1000|25000|40000}] - Speed Operational
Selects the network ports that match this parameter value.

[-flowcontrol-admin {none|receive|send|full}] - Flow Control Administrative
Selects the network ports that match this parameter value.

[-flowcontrol-oper {none|receive|send|full}] - Flow Control Operational
Selects the network ports that match this parameter value.

[-mac <MAC Address>] - MAC Address
Selects the network ports that match this parameter value.

[-up-admin {true|false}] - Up Administrative (privilege: advanced)
Selects the network ports that match this parameter value.

[-type {physical|if-group|vlan}] - Port Type
Selects the network ports that match this parameter value.

[-ifgrp-node <nodename>] - Interface Group Parent Node
Selects the network ports that match this parameter value.

[-ifgrp-port (<netport>|<ifgrp>)] - Interface Group Parent Port
Selects the network ports that match this parameter value.

[-ifgrp-distr-func {mac|ip|sequential|port}] - Distribution Function
Selects the network ports that match this parameter value.

[-ifgrp-mode {multimode|multimode_lacp|singlemode}] - Create Policy
Selects the network ports that match this parameter value.

[-vlan-node <nodename>] - Parent VLAN Node
Selects the network ports that match this parameter value.

[-vlan-port (<netport>|<ifgrp>)] - Parent VLAN Port
Selects the network ports that match this parameter value.

[-vlan-tag <integer>] - VLAN Tag
Selects the network ports that match this parameter value.

[-remote-device-id <text>] - Remote Device ID
Selects the network ports that match this parameter value.

[-ipspace <IPspace>] - IPspace Name
Use this parameter to display information only about the ports that match the IPspace you specify.

[-broadcast-domain <broadcast domain name>] - Broadcast Domain
Use this parameter to display information only about the ports that match the broadcast-domain you specify.

[-mtu-admin <integer>] - MTU Administrative
Selects the network ports that match this parameter value.

[-health-status {healthy|degraded}] - Port Health Status
Use this parameter to display information only about the ports that match the health-status you specify.

[-ignore-health-status {true|false}] - Ignore Port Health Status
Use this parameter to display information only about the ports that match the ignore-health-status you specify.

[-health-degraded-reasons {l2-reachability|link-flapping|crc-errors|vswitch-link}, ...] - Port Health Degraded Reasons
Use this parameter to display information only about the ports that match the degraded-reason you specify.
Examples
The following example displays information about all network ports.

```
cluster1::> network port show

```

network port show-address-filter-info

Print the port's address filter information

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The `network port show-address-filter-info` command displays information about the port's address filter.

**Parameters**
```
[-fields <fieldname>, ...]
```
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.
If you specify the -instance parameter, the command displays detailed information about all fields.

- **node <nodename>** - Node
  Use this parameter to specify the node.

- **port {<netport>|<ifgrp>}** - Port
  Use this parameter to specify the port. For example, e0c.

- **-num-total <integer>** - Total Number Of Entries
  Use this parameter to specify the total number of entries.

- **-num-used <integer>** - Number Of Used Entries
  Use this parameter to specify the number of used entries.

- **-used-entries <text>, ...** - The Used Entries
  Use this parameter to list the used entries.

**Examples**

The following example displays information of the given port's address filter on the specified node of the cluster.

```
cluster1::*> network port show-address-filter-info -node local -port e0c
```

<table>
<thead>
<tr>

**Manage broadcast domains**

Manage broadcast domains

Network port broadcast-domain commands. A broadcast domain object is used to define a layer 2 broadcast domain network configuration. It is used to group the ports which belong to the same layer 2 network.

**network port broadcast-domain add-ports**

Add ports to a layer 2 broadcast domain

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

Add ports to a broadcast domain.

**Note:** The IPSpace of the ports added will be updated to the IPSpace of the broadcast-domain. The ports will be added to the failover-group of the broadcast-domain. The MTU of the ports will be updated to the MTU of the broadcast-domain.

**Parameters**

- **-ipspace <IPspace>** - IPspace Name
  The IPspace of the broadcast domain.

- **-broadcast-domain <broadcast domain name>** - Layer 2 Broadcast Domain
  The broadcast domain for this port assignment.
network port broadcast-domain create

Create a new layer 2 broadcast domain

Availability: This command is available to cluster administrators at the admin privilege level.

Description
Create a new broadcast domain.

Note: The IPSpace of the ports added will be updated to the IPSpace of the broadcast-domain. A failover-group will be generated containing the ports of the broadcast-domain. The MTU of all of the ports in the broadcast-domain will be updated to the MTU specified for the broadcast-domain.

Parameters
- `-ipspace <IPspace>` - IPspace Name
  The IPspace to which the new broadcast domain belongs.
- `-broadcast-domain <broadcast domain name>` - Layer 2 Broadcast Domain
  The name of the broadcast domain to be created. The name of the broadcast domain needs to be unique within the IPspace.
- `-mtu <integer>` - Configured MTU
  MTU of the broadcast domain.
- `[ports <<node>:<port>>, ...]` - Ports
  The network ports to be added to the broadcast domain. Ports need to be added to the broadcast domain before interfaces can be hosted on the port. By default, no port will be added to the broadcast domain.

Examples
The following example creates broadcast domain "mgmt" in IPspace "Default" with an MTU of 1500 and network ports e0c from node "gx1" and node "gx2".

```
cluster1::> network port broadcast-domain create -ipspace Default -broadcast-domain mgmt -mtu 1500 -ports gx1:e0c, gx2:e0c
```

network port broadcast-domain delete

Delete a layer 2 broadcast domain

Availability: This command is available to cluster administrators at the admin privilege level.

Description
Delete a broadcast domain that contains no ports.
Parameters
- `ipspace <IPspace>` - IPspace Name
  The IPspace to which the broadcast domain belongs
- `broadcast-domain <broadcast domain name>` - Layer 2 Broadcast Domain
  The name of the broadcast domain to be deleted.

Examples
The following example deletes the broadcast domain "mgmt" in IPspace "Default".
```
cluster1::network port broadcast-domain> delete -ipspace Default -broadcast-domain mgmt
```

network port broadcast-domain merge
Merges two layer 2 broadcast domains

Availability: This command is available to `cluster` administrators at the `admin` privilege level.

Description
Merges a broadcast domain into an existing broadcast domain.

Parameters
- `ipspace <IPspace>` - IPspace Name
  The IPspace of the broadcast domain.
- `broadcast-domain <broadcast domain name>` - Layer 2 Broadcast Domain
  The merging broadcast domain.
- `into-broadcast-domain <broadcast domain name>` - Merge with This Layer 2 Broadcast Domain
  The target broadcast domain for the merge operation.

Examples
The following example merges broadcast domain "bd-mgmt" in IPspace "Default" to broadcast domain "bd-data".
```
cluster1::network port broadcast-domain> merge -ipspace Default -broadcast-domain bd-mgmt -into-broadcast-domain bd-data
```

network port broadcast-domain modify
Modify a layer 2 broadcast domain

Availability: This command is available to `cluster` administrators at the `admin` privilege level.

Description
Modify a broadcast domain.

Parameters
- `ipspace <IPspace>` - IPspace Name
  The IPspace to which the broadcast domain belongs.
- `broadcast-domain <broadcast domain name>` - Layer 2 Broadcast Domain
  The name of the broadcast domain.
[-mtu <integer>] - Configured MTU

MTU of the broadcast domain.

Examples

The following example modifies the mtu attribute of broadcast domain "mgmt" in IPspace "Default" to 1500

```
cluster1::network port broadcast-domain*> modify -ipspace Default -broadcast-domain mgmt -mtu 1500
```

network port broadcast-domain remove-ports

Remove ports from a layer 2 broadcast domain

Availability: This command is available to cluster administrators at the admin privilege level.

Description

Remove port assignments from a broadcast domain.

Parameters

- `--ipspace <IPspace>` - IPspace Name
  The IPspace of the broadcast domain.

- `--broadcast-domain <broadcast domain name>` - Layer 2 Broadcast Domain
  The broadcast domain of the ports.

- `--ports <<node>:<port>>, ...` - List of ports
  The ports to removed from the broadcast-domain.

Examples

The following example removes port "e0d" on node "cluster1-1" and port "e0d" on node "cluster1-2" from broadcast domain "mgmt" in IPspace "Default".

```
cluster1::network port broadcast-domain> remove-ports --ipspace Default --broadcast-domain mgmt --ports cluster1-1:e0d, cluster1-2:e0d
```

network port broadcast-domain rename

Rename a layer 2 broadcast domain

Availability: This command is available to cluster administrators at the admin privilege level.

Description

Rename a broadcast domain.

Parameters

- `--ipspace <IPspace>` - IPspace Name
  The IPspace to which the broadcast domain belongs.

- `--broadcast-domain <broadcast domain name>` - Layer 2 Broadcast Domain
  The name of the broadcast domain.

- `--new-name <text>` - New Name
  The new name of the broadcast domain.
Examples
The following example renames the broadcast domain named "mgmt" to "mgmt2" in IPspace "Default".

```
cluster1::network port broadcast-domain> rename -ipspace Default -broadcast-domain mgmt -new-name mgmt2
```

**network port broadcast-domain show**

Display layer 2 broadcast domain information

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
Display broadcast domain information.

**Parameters**

```
{ [ -fields <fieldname>, ... ]
    If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.
}
[-instance ]
    If you specify the -instance parameter, the command displays detailed information about all fields.
[-ipspace <IPspace>] - IPspace Name
    Selects the broadcast domains that match the IPspace name.
[-broadcast-domain <broadcast domain name>] - Layer 2 Broadcast Domain
    Selects the broadcast domains that match the broadcast domain name.
[-mtu <integer>] - Configured MTU
    Selects the broadcast domains that match the MTU value. This field is the MTU that was configured by the user, which might be different from the operational MTU.
[-ports <<node>:<port>>, ...] - Ports
    Selects the broadcast domains that contain the network ports. For example, node1:e0a will display broadcast domains that contain node1:e0a network port.
[-port-update-status {complete|in-progress|error|overridden-while-offline}, ...] - Port Update Status
    Selects the broadcast domains that contain the network port status. For example, specifying "error" will display broadcast domains that contain "Error" network port status.
[-port-update-status-details <text>, ...] - Status Detail Description
    Selects the broadcast domains that contain the network port status detail text.
[-port-update-status-combined {complete|in-progress|error|overridden-while-offline}]- Combined Port Update Status
    Selects the broadcast domains that contain the combined network port status. For example, specifying "error" will display broadcast domains that contain a combined network port status of "Error".
[-failover-groups <failover-group>, ...] - Failover Groups
    Selects the broadcast domains that contain the failover groups.
[-subnet-names <subnet name>, ...] - Subnet Names
    Selects the broadcast domains that contain the subnet name or names.
```
Examples

The following example displays general information about broadcast domains.

```
cluster1::> network port broadcast-domain show
IPspace Broadcast
Name Domain Name MTU Port List Status Details
------- ----------- ------  ----------------------------- --------------
Cluster Cluster 9000 node1:e0a complete
node1:e0b complete
Default Default 1500 node1:e0c complete
node1:e0d complete
2 entries were displayed.
```

network port broadcast-domain split

Splits a layer 2 broadcast domain into two layer 2 broadcast domains.

Availability: This command is available to cluster administrators at the admin privilege level.

Description

Splits ports from a broadcast domain into a new broadcast domain.

The following restrictions apply to this command:

- If the ports are in a failover group, all ports in the failover group must be provided. Use `network interface failover-groups show` to see which ports are in failover groups.

- If the ports have LIFs associated with them, the LIFs cannot be part of a subnet's ranges and the LIF's `curr-port` and `home-port` must both be provided. Use `network interface show -fields subnet-name, home-node, home-port, curr-node, curr-port` to see which ports have LIFs associated with them and whether the LIFs are part of a subnet's ranges. Use `network subnet remove-ranges` with the LIF's IP address and `-force-update-lif-associations` set to true to remove the LIF's association with a subnet.

Parameters

- `--ipspace <IPspace>` - IPspace Name
  The IPspace of the broadcast domain.
- `--broadcast-domain <broadcast domain name>` - Layer 2 Broadcast Domain
  The broadcast domain to split.
- `--new-broadcast-domain <broadcast domain name>` - New Layer 2 Broadcast Domain Name
  The new broadcast domain.
- `--ports <node>:<port>, ...` - List of Ports
  The ports to be split from this broadcast domain.

Examples

The following example splits port "e0d" on node "cluster1-1" and port "e0d" on node "cluster1-2" from broadcast domain "bd-mgmt" in IPspace "Default" to broadcast domain "bd-data".

```
cluster1::> network port broadcast-domain split --ipspace Default --broadcast-domain bd-mgmt --new-broadcast-domain bd-data --ports cluster1-1:e0d, cluster1-2:e0d
```
network port ifgrp commands

Add a port to an interface group

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

The network port ifgrp add-port command adds a network port to a port interface group. The port interface group must already exist. You can create a port interface group by using the network port ifgrp create command.

The following restrictions apply to port interface groups:

- A port that is already a member of a port interface group cannot be added to another port interface group.
- Cluster ports and management ports cannot be in a port interface group.
- A port to which a logical interface is already bound cannot be added to a port interface group.
- A port that already has an assigned failover role cannot be added to a port interface group.
- A VLAN port cannot be added to a port interface group.
- A port which attaches to a VLAN cannot be added to a port interface group.
- An interface group port cannot be added to a port interface group.
- A port that is assigned to a broadcast domain cannot be added to a port interface group.
- All ports in a port interface group must be physically located on the same node.

**Parameters**

- **-node {<nodename>|local}** - Node
  The node on which the port interface group is located.

- **-ifgrp {<netport>|<ifgrp}>** - Interface Group Name
  The port interface group to which a port is to be added.

- **-port <netport>** - Specifies the name of port.
  The network port that is to be added to the port interface group.

**Examples**

The following example adds port e0c to port interface group a1a on a node named node1:

```
cluster1::> network port ifgrp add-port -node node1 -ifgrp a1a -port e0c
```

**Related references**

- network port ifgrp create on page 389
network port ifgrp create

Create a port interface group

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The network port ifgrp create command creates a port interface group. See the documentation for the network port ifgrp add-port command for a list of restrictions on creating port interface groups.

Parameters
- node <nodename>|local - Node
  The node on which the port interface group will be created.
- ifgrp <netport>|<ifgrp> - Interface Group Name
  The name of the port interface group that will be created. Port interface groups must be named using the syntax "a<number><letter>", where <number> is an integer in the range [0-999] without leading zeros and <letter> is a lowercase letter. For example, "a0a", "a0b", "a1c", and "a2a" are all valid port interface group names.
- distr-func {mac|ip|sequential|port} - Distribution Function
  The distribution function of the port interface group that will be created. Valid values are:
  - mac - Network traffic is distributed based on MAC addresses
  - ip - Network traffic is distributed based on IP addresses
  - sequential - Network traffic is distributed in round-robin fashion from the list of configured, available ports
  - port - Network traffic is distributed based on the transport layer (TCP/UDP) ports
- mode {multimode|multimode_lacp|singlemode} - Create Policy
  The create policy for the interface group that will be created. Valid values are:
  - multimode - Bundle multiple member ports of the interface group to act as a single trunked port
  - multimode_lacp - Bundle multiple member ports of the interface group using Link Aggregation Control Protocol
  - singlemode - Provide port redundancy using member ports of the interface group for failover

Examples
The following example creates a port interface group named a0a on node node0 with a distribution function of ip:

cluster1::> network port ifgrp create -node node0 -ifgrp a0a -distr-func ip -mode multimode

network port ifgrp delete

Destroy a port interface group

Availability: This command is available to cluster administrators at the admin privilege level.
**Description**  
The `network port ifgrp delete` command destroys a port interface group.

**Note:** When you delete an interface group port, it is automatically removed from failover rules and groups to which it belongs.

**Parameters**
- `-node <nodename> | local` - **Node**
  The node on which the port interface group is located.
- `-ifgrp <netport> | <ifgrp>` - **Interface Group Name**
  The port interface group that will be deleted.

**Examples**
The following example deletes port interface group `a0b` from a node named `node0`.

```
cluster1::> network port ifgrp delete -node node0 -ifgrp a0b
```

**network port ifgrp remove-port**
Remove a port from an interface group

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**
The `network port ifgrp remove-port` command removes a network port from a port interface group.

**Parameters**
- `-node <nodename> | local` - **Node**
  The node on which the port interface group is located.
- `-ifgrp <netport> | <ifgrp>` - **Interface Group Name**
  The port interface group from which a port will be removed.
- `-port <netport>` - **Specifies the name of port.**
  The network port that will be removed from the port interface group.

**Examples**
The following example removes port `e0d` from port interface group `a1a` on a node named `node1`:

```
cluster1::> network port ifgrp remove-port -node node1 -ifgrp a1a -port e0d
```

**network port ifgrp show**
Display port interface groups

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**
The `network port ifgrp show` command displays information about port interface groups. By default, it displays information about all port interface groups on all nodes in the cluster.
Parameters

\{[-fields <fieldname>, ...] \}

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

\{[-instance] \}

If you specify the -instance parameter, the command displays detailed information about all fields.

\{-node <nodename>|local\} - Node

Selects the port interface groups that match this parameter value. Use this parameter with the -ifgrp parameter to select information about a specific port interface group.

\{-ifgrp <netport>|<ifgrp>\} - Interface Group Name

Selects the port interface groups that match this parameter value. Use this parameter with the -node parameter, to select information about a specific port interface group.

\{-distr-func {mac|ip|sequential|port}\} - Distribution Function

Selects the port interface groups that match this parameter value.

\{-mode {multimode|multimode_lacp|singlemode}\} - Create Policy

Selects the port interface groups that match this parameter value.

\{-mac <MAC Address>\} - MAC Address

Selects the port interface groups that match this parameter value.

\{-activeports {full|partial|none}\} - Port Participation

Selects the port interface groups that match this parameter value. The value "partial" indicates that some but not all of the port interface group's ports are active. The value "full" indicates that all of the port interface group's ports are active.

\{-ports <netport>|<ifgrp>, ...\} - Network Ports

Selects the port interface groups that match this parameter value.

\{-up-ports <netport>|<ifgrp>, ...\} - Up Ports

Selects the port interface groups that match this parameter value. Displays only the ports that are up.

\{-down-ports <netport>|<ifgrp>, ...\} - Down Ports

Selects the port interface groups that match this parameter value. Displays only the ports that are down.

### Examples

The following example displays information about all port interface groups.

```
cluster1::> network port ifgrp show

<table>
<thead>
<tr>
<th>Node</th>
<th>ifgrp</th>
<th>Distribution</th>
<th>MAC Address</th>
<th>Active Ports</th>
<th>Ports</th>
</tr>
</thead>
<tbody>
<tr>
<td>node0</td>
<td>a0a</td>
<td>ip</td>
<td>b8:f8:7a:20:00</td>
<td>partial</td>
<td>e0c</td>
</tr>
<tr>
<td>node1</td>
<td>a1a</td>
<td>ip</td>
<td>07:26:60:02:00</td>
<td>full</td>
<td>e0d</td>
</tr>
</tbody>
</table>
```

network port vlan commands

The network port vlan directory
network port vlan create

Create a virtual LAN (VLAN)

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The network port vlan create command attaches a VLAN to a network port on a specified node.

Parameters
-node {<nodename>|local} - Node
  The node to which the VLAN is to be attached.
  
  Note: You cannot attach a VLAN to a cluster port.

  { -vlan-name {<netport>|<ifgrp>} - VLAN Name
    The name of the VLAN that is to be attached. This name should be a combination of the name of the port or interface group and the VLAN ID, with a hyphen between, such as "e1c-80".

  | -port {<netport>|<ifgrp>} - Associated Network Port
    The network port to which the VLAN is to be attached.

  -vlan-id <integer> - Network Switch VLAN Identifier
    The ID tag of the created VLAN.

Examples
This example shows how to create VLAN e1c-80 attached to network port e1c on node1.

  cluster1::> network port vlan create -node node1 -vlan-name e1c-80

network port vlan delete

Delete a virtual LAN (VLAN)

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The network port vlan delete command deletes a VLAN from a network port.

  Note: When you delete a VLAN port, it is automatically removed from all failover rules and groups that use it.

Parameters
-node {<nodename>|local} - Node
  The node from which the VLAN is to be deleted.

  { -vlan-name {<netport>|<ifgrp>} - VLAN Name
    The name of the VLAN that is to be deleted

  | -port {<netport>|<ifgrp>} - Associated Network Port
    The network port to which the VLAN is to be attached.

  -vlan-id <integer> - Network Switch VLAN Identifier
    The ID tag of the deleted VLAN.
network port vlan delete

This example shows how to delete VLAN e1c-80 from network port e1c on node1.

```
cluster1::> network port vlan delete -node node1 -vlan-name e1c-80
```

network port vlan show

Display virtual LANs (VLANs)

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
The `network port vlan show` command displays information about network ports that are attached to VLANs. The command output indicates any inactive links and lists the reason for the inactive status.

If the operational duplex mode and speed cannot be determined (for instance, if the link is down), they are listed as **undef**, meaning undefined.

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance]}
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[-node {<nodename>|local}] - Node
```

Selects the VLAN network ports that match this parameter value.

```
[-vlan-name {<netport>|<ifgrp>}] - VLAN Name
```

Selects the VLAN network ports that match this parameter value.

```
[-port {<netport>|<ifgrp>}] - Associated Network Port
```

Selects the VLAN network ports that match this parameter value. If neither this parameter nor `-name` are used, the command displays information about all network ports.

```
[-vlan-id <integer>] - Network Switch VLAN Identifier
```

Selects the VLAN network ports that match this parameter value.

```
[-mac <MAC Address>] - MAC address
```

Selects the VLAN network ports that match this parameter value.

**Examples**

```
cluster1::> network port vlan show
```

<table>
<thead>
<tr>
<th>Network</th>
<th>Network</th>
<th>Port</th>
<th>VLAN ID</th>
<th>MAC Address</th>
</tr>
</thead>
<tbody>
<tr>
<td>node1</td>
<td>elb-70</td>
<td>elb</td>
<td>70</td>
<td>00:15:17:76:7b:69</td>
</tr>
</tbody>
</table>

network qos-marking commands

The qos-marking directory
network qos-marking modify

Modify the QoS marking values

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The network qos-marking modify command modifies the QoS marking values for different protocols, for each IPspace.

Parameters
- `-ipspace <IPspace>` - IPspace name
  Use this parameter to specify the IPspace for which the QoS marking entry is to be modified.
- `-protocol <text>` - Protocol
  Use this parameter to specify the protocol for which the QoS marking entry is to be modified. The possible values are NFS, CIFS, iSCSI, SnapMirror, NDMP, FTP, HTTP-admin, HTTP-filesrv, SSH, Telnet, and SNMP.
- `[-dscp <integer>]` - DSCP Marking Value
  Use this parameter to specify the DSCP value. The possible values are 0 to 63.
- `[-is-enabled {true|false}]` - Is QoS Marking Enabled
  Use this parameter to enable or disable the QoS marking for the specified protocol and IPspace.

Examples
The following example modifies the QoS marking entry for the NFS protocol in the Default IPspace:

```
   cluster1::> network qos-marking modify -ipspace Default -protocol NFS -dscp 10 -is-enabled true
```

network qos-marking show

Display the QoS marking values

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The network qos-marking show command displays the QoS marking values for different protocols, for each IPspace.

Parameters
- `[-fields <fieldname>, ...]`  
  Use this parameter to display only certain fields of the QoS marking table.
- `[-instance ]`
  Use this parameter to display all the fields of the QoS marking table.
- `-ipspace <IPspace>` - IPspace name
  Use this parameter to display the QoS marking entries for the specified IPspace.
- `-protocol <text>` - Protocol
  Use this parameter to display the QoS marking entries for the specified protocol. The possible values are NFS, CIFS, iSCSI, SnapMirror, NDMP, FTP, HTTP-admin, HTTP-filesrv, SSH, Telnet, and SNMP.
- `[-dscp <integer>]` - DSCP Marking Value
  Use this parameter to display the QoS marking entries matching the specified DSCP value. The possible values are 0 to 63.
[\(-\text{is-enabled (true|false)}\)] - Is QoS Marking Enabled

Use this parameter to display the QoS marking entries matching the specified flag.

### Examples

The following example displays the QoS marking entries for the Default IPspace.

```
cluster1::> network qos-marking show -ipspace Default
IPspace             Protocol          DSCP  Enabled?
------------------- ----------------- -----  --------
Default
    CIFS                     10  false
    FTP                      48  false
    HTTP-admin              48  false
    HTTP-filesrv            10  false
    NDMP                     10  false
    NFS                      10  true
    SNMP                    48  false
    SSH                      48  false
    SnapMirror               10  false
    Telnet                  48  false
    iSCSI                    10  false
```

11 entries were displayed.

---

**network route commands**

Manage routing tables

Network route commands.

**network route create**

Create a static route

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**

The `network route create` command creates a static route within a Vserver.

**Parameters**

```
-vserver <vserver> - Vserver Name
```

Use this parameter to specify the Vserver on which the route is to be created.

```
-destination <IP Address/ Mask > - Destination/ Mask
```

Use this parameter to specify the IP address and subnet mask of the route's destination. The format for this value is: address, slash ("/"), mask. `0.0.0.0/0` is a valid destination value to create default IPv4 route. And `::/0` is a valid destination value to create default IPv6 route.

```
-gateway <IP Address> - Gateway
```

Use this parameter to specify the IP address of the gateway server leading to the route's destination.

```
-metric <integer> - Metric
```

Use this parameter to specify the metric of the route.

### Examples

The following example creates default routes within Vserver vs0 for IPv4 and IPv6.
network route delete

Delete a static route

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The network route delete command deletes a static route from a Vserver.

Parameters
-`-vserver <vserver>` - Vserver Name
  Use this parameter to specify the Vserver on which the route is to be deleted.

-`-destination <IP Address/Mask>` - Destination/Mask
  Use this parameter to specify the IP address and subnet mask of the route's destination. The format for this value is: address, slash (/), mask. For example, `0.0.0.0/0` is a correctly formatted value for the `-destination` parameter.

-`-gateway <IP Address>` - Gateway
  Use this parameter to specify the gateway on which the route is to be deleted.

Examples
The following example deletes a route within Vserver vs0 for destination 0.0.0.0/0.

```
cluster1::> network route delete -vserver vs0 -destination 0.0.0.0/0
```

network route show

Display static routes

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The network route show command displays a group of static routes within one or more Vservers. You can view routes within specified Vservers, routes with specified destinations, and routes with specified gateways.

Parameters

Parameters

```

{-fields <fieldname>, ...]

Use this parameter to display only certain fields of the routing tables.

[-instance ]

Use this parameter to display all fields of the routing tables.

[-vserver <vserver>] - Vserver Name

Use this parameter to display only routes that have the specified Vserver as their origin.

[-destination <IP Address/_mask>] - Destination/\_Mask

Use this parameter to display only routes that have the specified IP address and subnet mask as their destination. The format for this value is: address, slash (/), mask. The example below has `0.0.0.0/0` as a valid value for the `-destination` parameter.
```
[-gateway <IP Address>] - Gateway
Use this parameter to display only routes that have the specified IP address as their gateway.

[-metric <integer>] - Metric
Use this parameter to display only routes that have the specified metric.

[-ipspace <IPspace>] - IPspace Name
Use this parameter to optionally specify the IPspace associated with the Vserver. This parameter can be used in conjunction with the Vserver parameter in order to configure the same route across multiple Vservers within an IPspace.

[-address-family {ipv4|ipv6|ipv6z}] - Address family of the route
Use this parameter to display only the routes that have the specified address-family.

**Examples**
The following example displays information about all routing groups.

```
cluster1::> network route show
(network route show)
Server              Destination     Gateway         Metric
------------------- --------------- --------------- ----
node1                0.0.0.0/0       10.61.208.1     20
node2                0.0.0.0/0       10.61.208.1     20
vs0                  0.0.0.0/0       10.61.208.1     20
3 entries were displayed.
```

**network route show-lifs**
Show the Logical Interfaces for each route entry

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `network route show-lifs` command displays the association of static routes and Logical Interfaces (LIFs) within one or more Vservers. You can view routes within specified Vservers, routes with specified destinations, and routes with specified gateways.

**Parameters**

```
[-fields <fieldname>, ...] If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance] If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver>] - Vserver Name
Use this parameter to display only routes that have the specified Vserver as their origin.

[-destination <IP Address/Mask>] - Destination/Mask
Use this parameter to display only routes that have the specified IP address and subnet mask as their destination. The format for this value is: address, slash ("/"), mask. For example, 0.0.0.0/0 is a valid value for the -destination parameter.

[-gateway <IP Address>] - Gateway
Use this parameter to display only routes that have the specified IP address as their gateway.
```
[-lifs <lif-name>,...] - Logical Interfaces
  Use this parameter to display only the routes that are associated with the specified Logical Interfaces (LIFs).

[-address-family {ipv4|ipv6|ipv6z}] - Address Family
  Use this parameter to display only the routes that belong to specified address family.

network route active-entry commands
  Active routes
  Dynamic network route commands.

network route active-entry show
  Display active routes

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
  The network route active-entry show command displays installed routes on one or more nodes. You can view routes within specified nodes, within specified Vservers, routes in specified subnet groups, and routes with specified destinations.

Parameters
  { [-fields <fieldname>, ...]
    If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use 'FIELDS?' to display the fields to specify.

  [-verbose]
    Use this parameter to display the reference count, use, interface, and Path MTU fields.

  [-instance ]
    If you specify the -instance parameter, the command displays detailed information about all fields.

  [-vserver <vserver>] - Vserver Name
    Displays the routes that have the specified Vserver as their origin.

  [-node <nodename>|local] - Node
    Displays the routes from the specified node.

  [-address-type {ipv4|ipv6|ipv6z}] - Address Family
    Displays the routes that have the specified IP address type.

  [-subnet-group <IP Address/Netmask>] - Subnet Group
    Displays the group of routes that belong to the specified subnet. Routes within the specified subnet group are used first before the default set. The "default" subnet group is a system-provided set of default routes.

  [-destination <text>] - Destination
    Displays the routes that have the specified IP address or subnet as their destination. The format for the subnet is: <address>/<netmask>. IPv6 address includes the scope value after percentage ("%"). 0.0.0.0/0, 169.254.4.60, ff02::%e0a/32 and fe80::%e0a/32 are valid values for this parameter.

  [-interface <text>] - Interface Name
    Displays the routes that use the specified interface to transmit packets to the destination. A valid interface has the format of <netport>|<ifgrp>, such as "e0a", "e0a-1" and "a0a", or it can be a loopback interface, such as "lo" and "lo00".

  [-route-interface-address <text>] - Route Interface Address
    Displays the routes that use the specified IP address on the transmit interface.
[-gateway <text>] - Gateway
Displays the routes that have the specified gateway. The gateway can be an IP address, such as "10.10.2.1" and "fe80::1%lo", MAC address, such as "0:5:73:a0:1:7" or refer to a local link, such as "link#3".

[-metric <integer>] - Metric
Displays the routes that have the specified metric.

[-flags <text>] - Flags
Displays the routes that have the specified flags. The type string for "-flags" needs to be one or more of the following {U|G|H|R|D|S|1|2|L|C} in the order shown.
- U - Usable
- G - Gateway
- H - Host
- R - Reject
- D - Dynamic
- S - Static
- 1 - Protocol1
- 2 - Protocol2
- L - Llinfo
- C - Clone
Multiple values can be specified (for example: UHL).

[-reference-count <integer>] - Reference Count
Displays the routes that have the specified reference count in the system.

[-lookup-count <integer>] - Lookup Count
Displays the routes that have the specified use count (the count of lookups for the route).

[-path-mtu <integer>] - Path MTU
Displays the routes that have the specified path maximum transmission unit.

Examples
The following example displays active routes on all nodes in Vserver vs0 with subnet-group 10.10.10.0/24.

```
cluster1:*> network route active-entry show -vserver vs0 -subnet-group 10.10.10.0/24
(network route active-entry show)
Vserver: vs0
Node: node1
Subnet Group: 10.10.10.0/24
Destination          Gateway              Interface   Metric  Flags
----------------------  -------------------  ---------   ------  -----  
default                10.10.10.1           e0c              0  UGS

Vserver: vs0
Node: node2
Subnet Group: 10.10.10.0/24
Destination          Gateway              Interface   Metric  Flags
----------------------  -------------------  ---------   ------  -----  
default                10.10.10.1           e0c              0  UGS
2 entries were displayed.
```
network routing-groups create

(DEPRECATED)-Create a routing group

Availability: This command is available to cluster administrators at the admin privilege level.

Description

Note: This command has been deprecated and may be removed from a future version of Data ONTAP. Use the "network route" command set to configure routes instead.

The network routing-groups create command creates a group of static routes. After you have created a routing group, you can add routes to the group by using the network routing-groups route create command.

Parameters

-vserver <vserver> - Vserver Name

Specifies the node or Vserver on which the routing group will be created.

-routing-group <text> - Routing Group

Specifies the name of the routing group that you want to create.

-subnet <IP Address/Mask> - Address/Mask

Specifies the IP address and subnet mask of the routing group’s destination. The format for this value is: address, slash (“/”), mask. The example below has 192.0.2.165/24 as a valid value for the -subnet parameter.

-role {cluster|data|node-mgmt|intercluster|cluster-mgmt} - Role

Defines the role of the routing group. The routing group can be a cluster, data, node management, intercluster, or cluster management routing group. There is no default.

[-metric <integer>] - Metric

Specifies a hop count for the routing group that you are creating. The default is 20.

Examples

The following example creates a routing group for data from the Vserver node1 with an IP address of 192.0.2.165/24 to a destination server with the IP address of 192.0.2.166.

```
cluster1::network routing-groups> create -vserver node1 -routing-group 192.0.2.166 -subnet 192.0.2.165/24 -role data -metric 20
```

(DEPRECATED)-Delete a routing group

Availability: This command is available to cluster administrators at the admin privilege level.
The `network routing-groups delete` command deletes a specified group of static routes.

**Parameters**

- **-vserver <vserver>** - Vserver Name
  
  Specifies the node or Vserver from which the routing group will be deleted

- **-routing-group <text>** - Routing Group
  
  Specifies the name of the routing group that you want to delete.

**Examples**

The following example deletes a routing group from the Vserver node1 with an IP address of 192.0.2.165/24.

```
cluster1::network routing-groups> delete -vserver node1 -routing-group 192.0.2.165/24
```

**Related references**

`network interface delete` on page 340

**network routing-groups show**

(DEPRECATED)-Display routing groups

**Availability:** This command is available to cluster and Vserver administrators at the *admin* privilege level.

**Description**

**Note:** This command has been deprecated and may be removed from a future version of Data ONTAP. Use the "network route" command set to configure routes instead.

The `network routing-groups show` command displays a group of static routes. You can view routes originating from specified servers, and routes with specified names, roles, and number of hops.

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance]
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

- **-vserver <vserver>** - Vserver Name
  
  Use this parameter to display the routing groups within the specified vserver.

- **-routing-group <text>** - Routing Group
  
  Use this parameter to display the specified routing group.

- **-subnet <IP Address/Mask>** - Address/Mask
  
  Use this parameter to display the routing groups within the specified subnet. The format for this value is: address, slash (/), mask. The example below has **192.0.2.165/24** as a valid value for the `-subnet` parameter.
[-role {cluster|data|node-mgmt|intercluster|cluster-mgmt}] - Role
  Use this parameter to display the routing groups with the specified role.

[-metric <integer>] - Metric
  Use this parameter to display the routing groups with the specified metric.

[-address-family (ipv4|ipv6|ipv6z)] - Address Family
  Use this parameter to display the routing groups using the specified IP address family. Only IPv4 and IPv6 non-zoned addresses can be used as value for this parameter. IPv6z addresses should not be used.

Examples
The following example displays a routing group for data from the virtual server node1.

```
cluster1::> network routing-groups show -role data
Routing Group     Subnet           Role      Metric
-------- --------- ---------------- --------- -------
node1         d192.0.2.165/24 192.0.2.165/24 data      20
node2         d192.0.2.166/24 192.0.2.166/24 data      20
2 entries were displayed.
```

network routing-groups route commands
The network routing-groups route directory

network routing-groups route create
(DEPRECATED)-Create a static route

Availability: This command is available to cluster administrators at the admin privilege level.

Description
Note: This command has been deprecated and may be removed from a future version of Data ONTAP. Use the "network route" command set to configure routes instead.

The network routing-groups route create command creates a static route within a routing group. You can create routes originating from specified Vservers within a specified routing group, routes with specified gateways, and routes with a specified number of hops.

Parameters
-vserver <vserver> - Vserver Name
  Use this parameter to specify the node or Vserver on which the route is to be created.

-routiing-group <text> - Routing Group
  Use this parameter to specify the name of the routing group within which you want to create the new route.

-destination <IP Address/Mask> - Destination/Mask
  Use this parameter to specify the IP address and subnet mask of the route's destination. The format for this value is: address, slash (/"/"), mask. The example below has 0.0.0.0/0 as a valid value for the -destination parameter.

-gateway <IP Address> - Gateway
  Use this parameter to specify the IP address of the gateway server leading to the route's destination.

[-metric <integer>] - Metric
  Use this parameter to specify the hop count for the route you are creating. The default is 20 hops.
Examples
The following example creates a route within a routing group originating from Vserver node3.

```
cluster1::> network routing-groups route create -vserver node3 -routing-group d192.0.2.167/24 -
destination 0.0.0.0/0 -gateway 10.61.208.1 -metric 10
```

network routing-groups route delete
(DEPRECATED)-Delete a static route

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

*Note:* This command has been deprecated and may be removed from a future version of Data ONTAP. Use the "network route" command set to configure routes instead.

The `network routing-groups route delete` command deletes a static route from a routing group. You can delete routes originating from specified Vservers, and routes within specified routing groups.

**Parameters**

- `-vserver <vserver>` - Vserver Name
  Use this parameter to specify the node or Vserver from which the route will be deleted.

- `-routing-group <text>` - Routing Group
  Use this parameter to specify the name of the routing group within which you want to delete the route.

- `-destination <IP Address/Mask>` - Destination/Mask
  Use this parameter to specify the IP address and subnet mask of the route you want to delete. The format for this value is: address, slash (/), mask. For example, **0.0.0.0/0** is a correctly formatted value for the `-destination` parameter.

Examples
The following example deletes a route within routing group d192.0.2.167/24 originating from Vserver node3.

```
cluster1::> network routing-groups route delete -vserver node3 -routing-group d192.0.2.167/24 -
destination 0.0.0.0/0
```

network routing-groups route show
(DEPRECATED)-Display static routes

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

*Note:* This command has been deprecated and may be removed from a future version of Data ONTAP. Use the "network route" command set to configure routes instead.

The `network routing-groups route show` command displays a group of static routes within one or more routing groups. You can view routes originating from specified servers, routes within specified routing groups, routes with specified gateways, and routes with a specified number of hops.

network routing-groups commands 403
Parameters

{[-fields <fieldname>, ...]
     If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

[-instance ]
     If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver>] - Vserver Name
     Use this parameter to display the routes within the specified vserver.

[-routing-group <text>] - Routing Group
     Use this parameter to display the routes within the specified routing group.

[-destination <IP Address/Mask>] - Destination/Mask
     Use this parameter to display the routes with the specified destination IP address. The format for this value is: address, slash (/), mask. The example below has 0.0.0.0/0 as a valid value for the -destination parameter.

[-gateway <IP Address>] - Gateway
     Use this parameter to display the routes with the specified gateway.

[-metric <integer>] - Metric
     Use this parameter to display the routes with the specified metric.

[-address-family {ipv4|ipv6|ipv6z}] - Address Family
     Use this parameter to display the routes using the specified address family. Only IPv4 and IPv6 non-zoned addresses can be used for this parameter. IPv6z addresses should not be used.

Examples

The following example displays information about all routing groups.

```
cluster1::> network routing-groups route show
Routing Server Group             Destination      Gateway          Metric
-------- --------- ---------------- ---------------- -------
node1    d192.0.2.165/24       0.0.0.0/0        10.61.208.1      20
node2    d192.0.2.166/24       0.0.0.0/0        10.61.208.1      20
2 entries were displayed.
```

network subnet commands

The subnet directory

Network Subnet commands. These commands are used to define a subnet with its gateway and groups of IP addresses. The IP addresses can be used to create interfaces.

network subnet add-ranges

Add new address ranges to a subnet

Availability: This command is available to cluster administrators at the admin privilege level.

Description

Add new address ranges to a subnet.
Note: All addresses in a range must be the same address family (IPv4 or IPv6) and must have the same subnet mask. Ranges that overlap or are next to existing ranges will be merged with the existing ranges.

Parameters

- **-ipspace <IPspace>** - IPspace Name
  The IPspace in which the range resides.
- **-subnet-name <subnet name>** - Subnet Name
  The name of the subnet.
- **-ip-ranges (<ipaddr>|<ipaddr>-<ipaddr>), ...** - IP Ranges
  The list of ranges to add to the subnet.
- **[-force-update-lif-associations [true]]** - Force Update LIF Associations
  This command will fail if any service processor interfaces or network interfaces are using the IP addresses in the ranges provided. Using this parameter will associate any manually addressed interfaces with the subnet and will allow the command to succeed.

Examples

The following example allocates addresses for subnet s1 in IPspace Default.

```
cluster1::> network subnet add-ranges -ipspace Default -subnet-name s1
          -ip-ranges "10.98.1.20-10.98.1.30, 10.98.1.35, 10.98.1.40-10.98.1.49"
```

**network subnet create**

Create a new layer 3 subnet

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

Create a new subnet.

Parameters

- **[-ipspace <IPspace>]** - IPspace Name
  The IPspace to which the new subnet belongs.
- **-subnet-name <subnet name>** - Subnet Name
  The name of the subnet to be created. The name of the subnet needs to be unique within the IPspace.
- **-broadcast-domain <broadcast domain name>** - Broadcast Domain
  The broadcast domain to which the new subnet belongs.
- **-subnet <IP Address/Mask>** - Layer 3 Subnet
  The address and mask of the subnet.
- **[-gateway <IP Address>]** - Gateway
  The gateway of the subnet.
- **[-ip-ranges (<ipaddr>|<ipaddr>-<ipaddr>), ...]** - IP Addresses or IP Address Ranges
  The IP ranges associated with this subnet.
- **[-force-update-lif-associations [true]]** - Change the subnet association
  This command will fail if any service processor interfaces or network interfaces are using the IP addresses in the ranges provided. Using this parameter will associate any manually addressed interfaces with the subnet and will allow the command to succeed.
Examples
The following examples create subnets named \textit{s1} and \textit{s6} in IPspace \textit{Default}.

```
cluster1::> network subnet create -ipspace Default -broadcast-domain bd1 -subnet-name s1
           -subnet 192.168.1.0/24 -gateway 192.168.1.1 -ip-ranges "192.168.1.1-192.168.1.100,
           192.168.1.112, 192.168.1.145"
```

```
cluster1::> network subnet create -ipspace Default -broadcast-domain bd1 -subnet-name s6
           -subnet 3FFE::/64 -gateway 3FFE::1 -ip-ranges "3FFE::10-3FFE::20"
```

**network subnet delete**

Delete an existing subnet object

**Availability:** This command is available to \textit{cluster} administrators at the \textit{admin} privilege level.

**Description**
Delete a subnet that contains no ports.

**Parameters**
- \texttt{-ipspace \textit{<IPspace>}} - IPspace Name
  The IPspace to which the subnet belongs.
- \texttt{-subnet-name \textit{<subnet name>}} - Subnet Name
  The name of the subnet to be deleted.
- \texttt{[-force-update-lif-associations [true]]} - Change the subnet association
  This command will fail if the subnet has ranges containing any existing service processor interface or network
  interface IP addresses. Setting this value to true will remove the network interface associations with the subnet
  and allow the command to succeed. However, it will not affect service processor interfaces.

**Examples**
The following example deletes subnet \textit{s1} in IPspace \textit{Default}.
```
cluster1::> network subnet delete -ipspace Default -subnet-name s1
```

**network subnet modify**

Modify a layer 3 subnet

**Availability:** This command is available to \textit{cluster} administrators at the \textit{admin} privilege level.

**Description**
Modify a subnet.

**Parameters**
- \texttt{-ipspace \textit{<IPspace>}} - IPspace Name
  The IPspace to which the subnet belongs.
- \texttt{-subnet-name \textit{<subnet name>}} - Subnet Name
  The name of the subnet to modify.
[-subnet <IP Address/Mask>] - Layer 3 Subnet
The new address and mask of the subnet.

[-gateway <IP Address>] - Gateway
The new gateway address.

[-ip-ranges (<ipaddr>|<ipaddr>-<ipaddr>), ...] - IP Addresses or IP Address Ranges
The new IP ranges for this subnet.

[-force-update-lif-associations [true]] - Change the subnet association
This command will fail if any existing service processor interfaces or network interfaces are using IP addresses in the IP ranges being added. It will also fail if any existing service processor interfaces or network interfaces are using IP addresses in the IP ranges being removed. Using this parameter will associate the interfaces with the IP addresses in the ranges being added to the subnet. It will also remove the subnet's association with the interfaces with IP addresses in the IP ranges being removed and will allow the command to succeed.

Examples
The following example modifies the subnet address and gateway.

```
cluster1::> network subnet modify -ipspace Default -subnet-name s1 -subnet 192.168.2.0/24 -gateway 192.168.2.1
```

network subnet remove-ranges

Remove address ranges from a subnet

Availability: This command is available to cluster administrators at the admin privilege level.

Description
Remove address ranges from a subnet.

Parameters
-ipspace <IPspace> - IPspace Name
  The IPspace in which the range resides.

-subnet-name <subnet name> - Subnet Name
  The name of the subnet.

-ip-ranges (<ipaddr>|<ipaddr>-<ipaddr>), ... - IP Ranges
  IP ranges to remove.

[-force-update-lif-associations [true]] - Force Update LIF Associations
This command will fail if any existing service processor interfaces or network interfaces are using IP addresses in the ranges provided. Using this parameter will remove the subnet's association with those interfaces and allow the command to succeed.

Examples
The following example removes an address range with starting address of 10.98.1.1 from subnet s1 in IPspace Default.

```
cluster1::> network subnet remove-ranges -ipspace Default -subnet-name s1 -ip-ranges "10.98.1.1-10.98.1.30"
```
### network subnet rename

Rename a layer 3 subnet

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

Rename a Subnet.

**Parameters**

- **-ipspace <IPspace>** - IPspace Name
  The IPspace to which the subnet belongs.

- **-subnet-name <subnet name>** - Subnet Name
  The name of the subnet to rename.

- **-new-name <text>** - New Name
  The new name for the subnet.

**Examples**

The following example renames subnet s1 to s3.

```
cluster1::> network subnet rename -ipspace Default -subnet s1 -new-name s3
```

### network subnet show

Display subnet information

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

Display subnet information.

**Parameters**

- **[-fields <fieldname>, ...]**
  If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

- **[-instance]**
  If you specify the `-instance` parameter, the command displays detailed information about all fields.

- **[-ipspace <IPspace>]** - IPspace Name
  Selects the subnets that match the given IPspace name.

- **[-subnet-name <subnet name>]** - Subnet Name
  Selects the subnets that match the given subnet name.

- **[-broadcast-domain <broadcast domain name>]** - Broadcast Domain
  Selects the subnets that match the given broadcast domain name.

- **[-subnet <IP Address/Mask>]** - Layer 3 Subnet
  Selects the subnets that match the given address and mask.

- **[-gateway <IP Address>]** - Gateway
  Selects the subnets that match the given gateway address.
[-ip-ranges <ipaddr>|<ipaddr>--<ipaddr>, ...] - IP Addresses or IP Address Ranges

Selects the subnets that match the given IP range.

[-total-count <integer>] - Total Address Count

Selects the subnets that match the given total address count.

[-used-count <integer>] - Used Address Count

Selects the subnets that match the given number of addresses allocated.

[-available-count <integer>] - Available Address Count

Selects the subnets that match the given number of addresses available.

Examples

The following example displays general information about the subnets.

```
cluster1::> network subnet show
IPspace: Default
Subnet                     Broadcast           Avail/
Name      Subnet           Domain    Gateway        Total   Ranges
--------- ---------------- --------- --------------- --------- ---------------
s4        192.168.4.0/24   bd4       192.168.4.1        5/5    192.168.5.6-192.168.5.10
s6        192.168.6.0/24   bd4       192.168.6.1        5/5    192.168.6.6-192.168.6.10
IPspace: ips1
Subnet                     Broadcast           Avail/
Name      Subnet           Domain    Gateway        Total   Ranges
--------- ---------------- --------- --------------- --------- ---------------
s10       192.168.6.0/24   bd10      192.168.6.1        0/0    -
3 entries were displayed.
```

network tcpdump commands

Run tcpdump operations

Network tcpdump commands.

network tcpdump show

Show running tcpdump instances

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The network tcpdump show command shows currently running packet traces (via tcpdump) on a matching node.

Parameters

{ [-fields <fieldname>, ...] 
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

  [-instance ]
  If you specify the -instance parameter, the command displays detailed information about all fields.

  [-node <nodename> | local] - Node Name
  Use this parameter optionally to show the details of running packet traces on a matching node.

  [-port <netport> | <ifgrp> ] - Port
  Use this parameter optionally to show the details of running packet trace on a matching network interface. }
### Examples

The following example shows the details of running packet traces on nodes "node1" and "node2":

```
cluster1::> network tcpdump show
Node       Port
---------- --------
node1       e0a
node2       e0c
```

---

**network tcpdump start**

tcpdump start

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `network tcpdump start` command starts packet tracing (via tcpdump) with the given parameters.

**Parameters**
- `-node {<nodename>|local} - Node Name`
  Use this parameter to specify the node on which the packet trace should run.

- `-port {<netport>|<ifgrp>} - Port`
  Use this parameter to specify the network interface for packet tracing.

- `[-address <IP Address>] - IP Address`
  Use this parameter to optionally specify the address for packet tracing.

- `[-buffer-size <integer>] - Buffer Size in KB`
  Use this parameter to optionally specify the buffer size for packet tracing. The default buffer size is 4 KB.

- `[-protocol-port <integer>] - Protocol Port Number`
  Use this parameter to optionally specify the protocol port number for packet tracing.

- `[-file-size <integer>] - Trace File Size in MB`
  Use this parameter to optionally specify the trace file size for packet tracing. The default trace file size is 1 GB.

- `[-rolling-traces <integer>] - Number of Rolling Trace Files`
  Use this parameter to optionally specify the number of rolling trace files for packet tracing. The default number of rolling trace files is 2.

---

**Examples**
The following example starts packet tracing on node "node1" on Vserver "vs0" with address "10.98.16.164", network interface "e0c", buffer size "10 KB", and protocol port number "10000":

```
cluster1::> network tcpdump start -node node1
         -address 10.98.16.164 -port e0c -buffer-size 10 -protocol-port 10000
```
network tcpdump stop

Stop an active tcpdump trace

**Availability**: This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The `network tcpdump stop` command stops a running packet trace (via tcpdump) on a given network interface.

**Parameters**
- `-node {<nodename>|local}` - **Node Name**
  Use this parameter to specify the node on which the packet tracing must be stopped.
- `-port {<netport>|<ifgrp>}` - **Port**
  Use this parameter to specify the network interface on which the packet tracing must be stopped.

**Examples**
The following example stops a packet trace on network interface "e0a" from node "node1":

```
cluster1::> network tcpdump stop -node node1 -port e0a
```

---

network tcpdump trace commands

The trace directory

Network tcpdump trace commands.

network tcpdump trace delete

Delete a tcpdump tracefile

**Availability**: This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The `network tcpdump trace delete` command deletes the tcpdump trace file from a matching node.

**Parameters**
- `-node {<nodename>|local}` - **Node Name**
  Use this parameter to delete the tcpdump trace file from a matching node.
- `-trace-file <text>` - **Trace File**
  Use this parameter to specify the tcpdump trace file to be deleted.

**Examples**
The following example deletes the list of tcpdump trace files from node "node1" using wildcard pattern:

```
cluster1::> network tcpdump trace delete -node node1 -trace-file *
```
network tcpdump trace show

Show list of tcpdump trace files

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The `network tcpdump trace show` command shows the list of tcpdump trace files.

Parameters

{ [-fields <fieldname>, ...] }  If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

| [-instance] }  If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node <nodename> | local] - Node Name
Use this parameter to show the list of traces files of a matching node.

[-trace-file <text>] - Trace File
Use this parameter optionally to show the list of trace files with a matching trace-file name.

Examples
The following example shows the list of trace files on nodes "node1" and "node2":

```text
cluster1::> network tcpdump trace show
Node      Trace File
---------- ------------------------------
nodel     e0a_20170314_115624.trc0
node2     e0c_20170314_115624.trc0
```

network test-link commands

The test-link directory

network test-link run-test

Test link bandwidth

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The `network test-link run-test` command runs a performance test between two nodes. The command requires a source node, Vserver, and destination address.

Before executing the `network test-link run-test` command, the `network test-link start-server` command must be run to start a server on the node hosting the destination LIF. After all tests to that node are complete the `network test-link stop-server` command must be run to stop the server.

The test results are stored non-persistently and can be viewed using the `network test-link show` command. Results include input parameters, the bandwidth achieved, and the date and time of the test.
Parameters

- `node <nodename>|local` - Node Name
  
  Use this parameter to specify the node which initiates the test.

- `vserver <vserver>` - Vserver
  
  Use this parameter to specify the Vserver to access the destination LIF. DC (Data Channel) Vserver option is available only in an ONTAP Select or ONTAP Cloud cluster. It is a special vserver that hosts LIFs that are used to mirror data aggregates to partner node.

- `destination <Remote InetAddress>` - Destination
  
  Use this parameter to specify the destination IP address.

Examples

The following example runs a test between the cluster LIFs, including the start and stop of the server side of the test:

```
cluster1::*> network test-link start-server -node node1
cluster1::*> network test-link run-test -node node2 -vserver Cluster -destination 172.31.112.173
Node: node2
Vserver: Cluster
Destination: 172.31.112.173
Time of Test: 4/22/2016 15:33:18
MB/s: 41.2678
```

**network test-link show**

Display test results

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**

The `network test-link show` command displays the results of prior `network test-link run-test` commands.

The test results are stored non-persistently and can be viewed using the `network test-link show` command. Results include input parameters, the bandwidth achieved, and the date and time of the test.
Parameters

\{-fields \langlefieldname\>, ...\}

If you specify the \{-fields \langlefieldname\>, ...\} parameter, the command output also includes the specified field or fields. You can use \{-fields ?\} to display the fields to specify.

\{-instance\}

If you specify the \{-instance\} parameter, the command displays detailed information about all fields.

\{-node \langlenodename\>\} - Node

Selects the nodes that match this parameter value. Use this parameter to display the test results specific to a node. By default, the test results across all nodes are shown.

\{-vserver \langlevserver\>\} - Vserver

Use this parameter to display the test results specific to a Vserver. Use DC (Data Channel) Vserver option only in an ONTAP Select or ONTAP Cloud cluster to show network performance of links hosting DC LIFs. DC Vserver is a special Vserver that hosts LIFs that are used to mirror data aggregates to partner node.

\{-destination \langleRemote InetAddress\>\} - Destination

Use this parameter to display the test results associated with the specified destination.

\{-timestamp \langleMM/DD/YYYY HH:MM:SS\>\} - Time of Test

Use this parameter to display the test results with the specified timestamp.

\{-bandwidth \langledouble\>\} - MB/s

Use this parameter to display the test results only matching the specified bandwidth.

**Examples**

The following example runs a test between the cluster LIFs twice and then demonstrates the show command results:

```
cluster1::*> network test-link run-test -node node2 -vserver Cluster -destination 172.31.112.173

Node: node2
Vserver: Cluster
Destination: 172.31.112.173
Time of Test: 4/25/2016 10:37:52
MB/s: 29.9946

cluster1::*> network test-link run-test -node node2 -vserver Cluster -destination 172.31.112.173

Node: node2
Vserver: Cluster
Destination: 172.31.112.173
Time of Test: 4/25/2016 10:38:32
MB/s: 39.8192

network test-link start-server
Start server for bandwidth test

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The network test-link start-server command starts the server side of the network test-link test on the designated node.

Only one server at a time can be running for the network test-link command on a given node. If the network test-link start-server command is issued and a server is already running on the node, then the command is ignored, and the existing server continues to run.

The server started is listening on port 5201.

Parameters
- **-node** \(<nодename>|local\) - Node Name
  Use this parameter to specify the node where the server is to be started.

Examples
The following example starts a server:

```
cluster1::*> network test-link start-server -node node1
```

network test-link stop-server
Stop server for bandwidth test

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The network test-link stop-server command stops the network test-link server running on the designated node.

Parameters
- **-node** \(<nодename>|local\) - Node Name
  Use this parameter to specify the node where the server is to be stopped.

Examples
The following example starts a server and stops it:
network tuning commands

Manage network tuning options

network tuning icmp commands

Manage ICMP tuning setting

network tuning icmp modify

Modify ICMP tuning options

Availability: This command is available to cluster administrators at the admin privilege level.

Description

This command displays options which can be used to fine tune icmp protocol behavior.

Parameters

- `-node <nodename> | local` - Node
  
  Sets this parameter to indicate on which node the ICMP tuning options are modified.

- `-is-drop-redirect-enabled (true|false)` - Drop redirect ICMP
  
  Sets this parameter to drop redirect ICMP message.

- `-tx-icmp-limit <integer>` - Maximum number of ICMP packets sent per second
  
  Sets the maximum number of ICMP messages including TCP RSTs can be sent per second.

- `-redirect-timeout <integer>` - Maximum seconds for route redirect timeout
  
  Sets this parameter to indicate the number of seconds after which the route is deleted. Value of zero means infinity. The default value is 300 seconds.

Examples

```
cluster1::> network tuning icmp modify -node node1 -is-drop-redirect-enabled false
```

network tuning icmp show

Show ICMP tuning options

Availability: This command is available to cluster administrators at the admin privilege level.
Description
This command displays the current state of the ICMP tuning options for the given node.

Parameters

{ [-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

[[-instance]]
  Displays all ICMP tuning options.

[-node {<nodename> | local}] - Node
  Specifies the node for which the ICMP tuning options are displayed.

[-is-drop-redirect-enabled {true | false}] - Drop redirect ICMP
  Displays all entries that match the "is-drop-redirect-enabled" value.

[-tx-icmp-limit <integer>] - Maximum number of ICMP packets sent per second
  Displays all entries that match the "tx-icmp-limit" value.

[-redirect-timeout <integer>] - Maximum seconds for route redirect timeout
  Displays all the entries that match the "redirect-timeout" value.

Examples

```
cluster1::> network tuning icmp show
                     Drop Redirect Maximum ICMP                 Redirect Timeout
                     ICMP          Sends per Second  in Seconds
       ---- -------- ---------------- -------------  ----------------
node1     true     100             300
```

network tuning icmp6 commands
Manage ICMPv6 tuning setting

network tuning icmp6 modify
Modify ICMPv6 tuning options

Availability: This command is available to cluster administrators at the admin privilege level.

Description
This command displays options which can be used to fine tune icmpv6 protocol behavior.

Parameters

-node {<nodename> | local} - Node
  Sets this parameter to indicate on which node the ICMPv6 tuning options are modified.

[-is-v6-redirect-accepted {true | false}] - Accept redirects via ICMPv6
  Sets this parameter to indicate whether or not redirect ICMPv6 messages are accepted.

[-redirect-v6-timeout <integer>] - Maximum seconds for route redirect timeout
  Sets this parameter to indicate the number of seconds after which the route is deleted. Value of zero means infinity. The default value is 300 seconds.
Examples

cluster1::> network tuning icmp6 modify -node node1 -is-v6-redirect-accepted false

network tuning icmp6 show

Show ICMPv6 tuning options

Availability: This command is available to cluster administrators at the admin privilege level.

Description
This command displays the current state of the ICMPv6 tuning options for the given node.

Parameters
{-fields <fieldname>, ...}
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

-[-instance ]
Displays all ICMPv6 tuning options.

[-node <nodename> | local] - Node
Specifies the node for which the ICMPv6 tuning options are displayed.

[-is-v6-redirect-accepted {true | false}] - Accept redirects via ICMPv6
Displays all entries that match the "is-v6-redirect-accepted" value.

[-redirect-v6-timeout <integer>] - Maximum seconds for route redirect timeout
Displays all the entries that match the "redirect-v6-timeout" value.

Examples

cluster1::> network tuning icmp6 show

<table>
<thead>
<tr>
<th>Node</th>
<th>Accept Redirect</th>
<th>Redirect Timeout</th>
</tr>
</thead>
<tbody>
<tr>
<td>node1</td>
<td>true</td>
<td>300</td>

network tuning tcp commands

Manage TCP tuning setting

network tuning tcp modify

Modify TCP tuning options

Availability: This command is available to cluster administrators at the admin privilege level.

Description
This commands sets TCP tuning options on the node.
Parameters

- **node**: `<nodename>|local` - Node
  Indicates on which node the TCP tuning options will be modified.

- **is-path-mtu-discovery-enabled**: `{true|false}` - Path MTU discovery enabled
  Enables path MTU discovery feature.

- **is-rfc3465-enabled**: `{true|false}` - RFC3465 enabled
  Enables the RFC3465 feature.

- **max-cwnd-increment**: `<integer>` - Maximum congestion window segments incrementation
  Sets the maximum congestion window increment segments during slow start.

- **is-rfc3390-enabled**: `{true|false}` - RFC3390 enabled
  Enables the RFC3390 feature.

- **is-sack-enabled**: `{true|false}` - SACK support enabled
  Enables the selective ACK feature.

Examples

```
cluster1::> network tuning tcp modify -node node1 -is-path-mtu-discovery-enabled false
```

network tuning tcp show

Show TCP tuning options

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

This command displays the current state of the TCP tuning options for the given node.

Parameters

```
[[-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

| [-instance ]
  Displays all TCP tuning options.

[-node]: `<nodename>|local` - Node
  Specifies the node for which the TCP tuning options will be displayed.

[-is-path-mtu-discovery-enabled]: `{true|false}` - Path MTU discovery enabled
  Displays all entries that match the "is-path-mtu-discovery-enabled" value.

[-is-rfc3465-enabled]: `{true|false}` - RFC3465 enabled
  Displays all entries that match the "is-rfc3465-enabled" value.

[-max-cwnd-increment]: `<integer>` - Maximum congestion window segments incrementation
  Displays all entries that match the "max-cwnd-increment" value.

[-is-rfc3390-enabled]: `{true|false}` - RFC3390 enabled
  Displays all entries that match the "is-rfc3390-enabled" value.

[-is-sack-enabled]: `{true|false}` - SACK support enabled
  Displays all entries that match the "is-sack-enabled" value.
```
Examples

cluster1::> network tuning tcp show

Path MTU           Maximum                   Selective

protection-type commands

Manage Protection Types and RPOs

protection-type show

Display the supported protection types and available RPOs

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
This command displays the protection types available for application provisioning.

Parameters

{-fields <fieldname>,...}
   Specifies fields that you want included in the output. You can use -fields ? to display the available fields.

{-instance}
   Specifies the display of all available fields for each selected protection type.

{-vserver <vserver name>} - Vserver
   Selects the protection types of Vservers that match the parameter value.

{-protection-type {local|remote}} - Protection Type
   Selects the protection types that match the parameter value.

{-rpo-list <text>,...} - List of available RPOs
   Selects the protection types whose list of available RPOs matches the parameter value.

{-rpo-list-description <text>,...} - List of descriptions of available RPOs
   Selects the protection types whose list of description of available RPOs matches the parameter value.

{-description <text>} - Description of Protection Type
   Selects the protection types with a description that matches the parameter value.

Examples

The following example displays the protection types and the associated available RPOs for all Vservers in the cluster.

cluster1::*> protection-type show
Vserver Protection Type RPO List
------- -------------------
vs1
qos commands

QoS settings

qos adaptive-policy-group commands

The adaptive-policy-group directory

qos adaptive-policy-group create

Create an adaptive policy group

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The qos adaptive-policy-group create command creates a new adaptive policy group. After the adaptive policy group is created, you can assign one or more volumes to the policy. When a volume is assigned to an adaptive policy group, the maximum throughput QoS setting automatically adjusts based on volume used space or volume allocated space. QoS minimum throughput setting is calculated from the expected-iops parameter and volume allocated size. It is set only for the volumes that reside on AFF platforms.

After you create an adaptive policy group, use the volume create command or volume modify command to apply the adaptive policy group to a volume.

Parameters
- policy-group <text> - Name
  Specifies the name of the adaptive policy group. Adaptive policy group names must be unique and are restricted to 127 alphanumeric characters including underscores "_" and hyphens "-". Adaptive policy group names must start with an alphanumeric character. Use the qos adaptive-policy-group rename command to change the adaptive policy group name.

- vserver <vserver name> - Vserver
  Specifies the data Vserver to which this adaptive policy group belongs to. You can apply this adaptive policy group to only the storage objects contained in the specified Vserver. If the system has only one Vserver, then the command uses that Vserver by default.

- expected-iops {<integer>[IOPS/[GB|TB]]} (default: TB) - Expected IOPS
  Specifies the minimum expected IOPS per TB or GB allocated based on volume allocated size.

- peak-iops {<integer>[IOPS/[GB|TB]]} (default: TB) - Peak IOPS
  Specifies the maximum possible IOPS per TB or GB allocated based on volume allocated size or volume used size.

[-absolute-min-iops <qos_tput>] - Absolute Minimum IOPS
  Specifies the absolute minimum IOPS which is used as an override when the expected IOPS is less than this value. The default value is computed as follows:
if expected-iops >= 6144/TB, then absolute-min-iops = 1000IOPS; if expected-iops >= 2048/TB and expected-iops < 6144/TB, then absolute-min-iops = 500IOPS; if expected-iops >= 1/MB and expected-iops < 2048/TB, then absolute-min-iops = 75IOPS.

[-peak-iops-allocation {used-space|allocated-space}] - Peak IOPS Allocation

Specifies the peak IOPS allocation policy. The allocation policy is either allocated-space or used-space. When the peak-iops-allocation policy is set to allocated-space, the peak IOPS is calculated based on the size of the volume. When the peak-iops-allocation policy is set to used-space, the peak IOPS is calculated based on the amount of data stored in the volume taking into account storage efficiencies. The default value is used-space.

Examples

```
cluster1::> qos adaptive-policy-group create p1 -vserver vs1
              -expected-iops 100IOPS/TB -peak-iops 1000IOPS/TB
```

Creates the "p1" adaptive policy group which belongs to Vserver "vs1" with expected-iops of 100IOPS/TB and peak-iops of 1000IOPS/TB with default value for absolute-min-iops

```
cluster1::> qos adaptive-policy-group create p2 -vserver vs1
              -expected-iops 100IOPS/GB -peak-iops 1000IOPS/GB
              -absolute-min-iops 200IOPS
```

Related references

qos adaptive-policy-group rename on page 424

qos adaptive-policy-group delete

Delete an adaptive policy group

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The qos adaptive-policy-group delete command deletes an adaptive policy group from a cluster. You cannot delete a policy group if a QoS workload associated with a storage object is assigned to it unless you use the -force parameter. Using the -force parameter will delete all the QoS workloads for storage objects associated with the specified adaptive policy groups. Only user created adaptive policy groups can be deleted. Default adaptive policy groups are read only and cannot be deleted.

Parameters

-policy-group <text> - Name

Specifies the name of the adaptive policy group that you want to delete.

[-force [true]] - Force Delete Workloads for the QoS adaptive policy group (privilege: advanced)

Specifies whether to delete an adaptive policy group along with any underlying workloads.

Examples

The following example deletes "p1" adaptive policy group:

```
cluster1::> qos adaptive-policy-group delete p1
```

Deletes the "p1" adaptive policy group along with any underlying QoS workloads.
qos adaptive-policy-group modify

Modify an adaptive policy group

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The qos adaptive-policy-group modify command modifies an adaptive policy group.

Only user-created adaptive policy groups can be modified. Default adaptive policy groups are read-only and cannot be modified.

Parameters
- policy-group <text> - Name
  Specifies the name of the adaptive policy group. Adaptive policy group names must be unique and are restricted to 127 alphanumeric characters including underscores "_" and hyphens "-". Adaptive policy group names must start with an alphanumeric character. Use the qos adaptive-policy-group rename command to change the adaptive policy group name.

  [-expected-iops <integer> [IOPS/[GB|TB]] (default: TB)] - Expected IOPS
  Specifies the minimum expected IOPS per TB or GB allocated based on volume allocated size. QoS minimum throughput setting is calculated from the expected-iops parameter. It is set only for the volumes that reside on AFF platforms.

  [-peak-iops <integer> [IOPS/[GB|TB]] (default: TB)] - Peak IOPS
  Specifies the maximum possible IOPS per TB or GB allocated based on volume allocated size or volume used size.

  [-absolute-min-iops <qos_tput>] - Absolute Minimum IOPS
  Specifies the absolute minimum IOPS which is used as an override when the expected IOPS is less than this value. The default value is computed as follows:
  if expected-iops >= 6144/TB, then absolute-min-iops = 1000IOPS; if expected-iops >= 2048/TB and expected-iops < 6144/TB, then absolute-min-iops = 500IOPS; if expected-iops >= 1/MB and expected-iops < 2048/TB, then absolute-min-iops = 75IOPS.

  [-peak-iops-allocation {used-space|allocated-space}] - Peak IOPS Allocation
  Specifies the peak IOPS allocation policy. The allocation policy is either allocated-space or used-space. When the peak-iops-allocation policy is set to allocated-space, the peak IOPS is calculated based on the size of the volume. When the peak-iops-allocation policy is set to used-space, the peak IOPS is calculated based on the amount of data stored in the volume taking into account storage efficiencies. The default value is used-space.

Examples
The following example modifies the "p1" adaptive policy group with specified values.

```
cluster1::> qos adaptive-policy-group modify -policy-group p1
   -expected-iops 200IOPS/TB -peak-iops 2000IOPS/TB
   -absolute-min-iops 100IOPS
```

Related references
qos adaptive-policy-group rename on page 424
qos adaptive-policy-group rename

Rename an adaptive policy group

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The `qos adaptive-policy-group rename` command changes the name of an existing adaptive policy group.

**Parameters**
- `policy-group <text>` - Name
  Specifies the existing name of the adaptive policy group that you want to rename.
- `new-name <text>` - New adaptive policy group name
  Specifies the new name of the adaptive policy group. Adaptive policy group names must be unique and are restricted to 127 alphanumeric characters including underscores "_" and hyphens "-". Adaptive policy group names must start with an alphanumeric character.

**Examples**

```
cluster1::> qos adaptive-policy-group rename -policy-group p1 -new-name p1_new
```

qos adaptive-policy-group show

Display a list of adaptive policy groups

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The `qos adaptive-policy-group show` command shows the current settings of the adaptive policy groups on a cluster. You can view the list of adaptive policy groups and also the detailed information about a specific adaptive policy group.

**Parameters**

```
{ [ -fields <fieldname>, ... ]
  If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

  | [-instance ]
  If you specify the `-instance` parameter, the command displays detailed information about all fields.

  | [-policy-group <text>] - Name
  Selects the adaptive policy groups that match this parameter value.
  Adaptive policy groups define measurable service level objectives (SLOs) that adjust based on volume used space or volume allocated space.

  | [-vserver <vserver name>] - Vserver
  If this parameter is specified, the command displays information only about the adaptive policy groups with a matching vserver.

  | [-uuid <UUID>] - Uuid
  If this parameter is specified, the command displays information only about the adaptive policy groups with the specified UUID.
```
[-pgid <integer>] - ID
If this parameter is specified, the command displays information only about the adaptive policy groups that
match the given policy group ID, which is an integer that uniquely identifies the adaptive policy group.

[-expected-iops {<integer>[IOPS[/GB|TB]] (default: TB)}] - Expected IOPS
If this parameter is specified, the command displays information only about the adaptive policy groups with
the specified minimum expected IOPS per TB or GB.

[-peak-iops {<integer>[IOPS[/GB|TB]] (default: TB)}] - Peak IOPS
If this parameter is specified, the command displays information only about the adaptive policy groups with
the specified maximum possible IOPS per TB or GB.

[-absolute-min-iops <qos_tput>] - Absolute Minimum IOPS
If this parameter is specified, the command displays information only about the adaptive policy groups with
the specified absolute minimum IOPS.

[-peak-iops-allocation {used-space|allocated-space}] - Peak IOPS Allocation
If this parameter is specified, the command displays information only about the adaptive policy groups with
the specified peak IOPS allocation policy used to compute the maximum possible IOPS per TB or GB.

[-num-workloads <integer>] - Number of Workloads
If this parameter is specified, the command displays information only about the adaptive policy groups with
the specified number of workloads.

Examples
The example above displays all adaptive policy groups on the cluster.

```
cluster1::> qos adaptive-policy-group show
qos adaptive-policy-group show
Expected    Peak

```

qos policy-group commands
The policy-group directory

qos policy-group create
Create a policy group

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The qos policy-group create command creates a new policy group. You can use a QoS policy group to control a set of
storage objects known as "workloads" - LUNs, volumes, files, or Vservers. Policy groups define measurable service level
objectives (SLOs) that apply to the storage objects with which the policy group is associated.
After you create a policy group, you use the storage object create command or the storage object modify command to apply the policy group to a storage object.

Parameters

-policy-group <text> - Policy Group Name

Specifies the name of the policy group. Policy group names must be unique and are restricted to 127 alphanumeric characters including underscores "_" and hyphens "-". Policy group names must start with an alphanumeric character. You use the qos policy-group rename command to change the policy group name.

-vserver <vserver name> - Vserver

Specifies the data Vserver to which this policy group belongs. You can apply this policy group to only the storage objects contained in the specified Vserver. For example, if you want to apply this policy group to a volume, that volume must belong to the specified Vserver. Using this parameter does not apply the policy group's SLOs to the Vserver. You need to use the vserver modify command if you want to apply this policy group to the Vserver. If the system has only one Vserver, then the command uses that Vserver by default. QoS policy groups cannot belong to Vservers with Infinite Volume.

[-max-throughput <qos_tput>] - Maximum Throughput

Specifies the maximum throughput for the policy group. A maximum throughput limit specifies the throughput that the policy group must not exceed. It is specified in terms of IOPS or MB/s, or a combination of comma separated IOPS and MB/s. The range is one to infinity. A value of zero is accepted but is internally treated as infinity.

The values entered here are case-insensitive, and the units are base ten. There should be no space between the number and the units. The default value for max-throughput is infinity, which can be specified by the special value "INF". Note that there is no default unit - all numbers except zero require explicit specification of the units.

Two reserved keywords, "none" and "INF", are available for the situation that requires removal of a value, and the situation that needs to specify the maximum available value.

Examples of valid throughput specifications are: "100B/s", "10KB/s", "1gb/s", "500MB/s", "1tb/s", "100iops", "100iops,400KB/s", and "800KB/s,100iops"

[-min-throughput <qos_tput>] - Minimum Throughput

Specifies the minimum throughput for the policy group. A minimum throughput specifies the desired performance level for a policy group. It is specified in terms of IOPS.

The values entered here are case-insensitive, and the units are base ten. There should be no space between the number and the units. The default value for min-throughput is "0". The default unit is IOPS.

One reserved keyword, 'none' is available for the situation that requires removal of a value.

Examples of valid throughput specifications are: "100iops" and "100".

Examples

cluster1::> qos policy-group create p1 -vserver vs1

Creates the "p1" policy group which belongs to Vserver "vs1" with default policy values.

cluster1::> qos policy-group create p2 -vserver vs1 -max-throughput 500MB/s

Related references

qos policy-group rename on page 428
**qos policy-group delete**

Delete an existing QoS Policy Group

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The *qos policy-group delete* command deletes a policy group from a cluster. You cannot delete a policy group if a qos workload associated with storage object is assigned to it unless you use "-force". Using "-force" will delete all the qos workloads for storage objects associated with the specified policy groups.

You can only delete user-defined policy groups. You cannot delete preset policy groups.

**Parameters**

- `-policy-group <text>` - Policy Group Name
  
  Specifies the name of the policy group that you want to delete.

  Specifies whether to delete a policy group along with any underlying workloads.

**Examples**

```
cluster1::> qos policy-group delete p1
cluster1::> qos policy-group delete p1 -force
```

**qos policy-group modify**

Modify a policy group

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The *qos policy-group modify* command modifies a user-created policy group.

**Parameters**

- `-policy-group <text>` - Policy Group Name

  Specifies the name of the policy group that you want to modify.

- `[ -max-throughput <qos_tput> ]` - Maximum Throughput

  Specifies the maximum throughput for the policy group. A maximum throughput limit specifies the throughput that the policy group must not exceed. It is specified in terms of IOPS or MB/s, or a combination of comma separated IOPS and MB/s. The range is one to infinity. A value of zero is accepted but is internally treated as infinity.

  The values entered here are case-insensitive, and the units are base ten. There should be no space between the number and the units. The default value for max-throughput is infinity, which can be specified by the special value "INF". Note there is no default unit - all numbers except zero require explicit specification of the units.

  Two reserved keywords, "none" and "INF", are available for the situation that requires removal of a value, and the situation that needs to specify the maximum available value.

  Examples of valid throughput specifications are: "100B/s", "10KB/s", "1gb/s", "500MB/s", "1tb/s", and "100iops".

[-min-throughput <qos_tput>] - Minimum Throughput

Specifies the minimum throughput for the policy group. A minimum throughput specifies the desired performance level for a policy group. It is specified in terms of IOPS.

The values entered here are case-insensitive, and the units are base ten. There should be no space between the number and the units. The default value for min-throughput is "0". The default unit is IOPS.

One reserved keyword, 'none' is available for the situation that requires removal of a value.

Examples of valid throughput specifications are: "100iops" and "100".

```
Examples

cluster1::> qos policy-group modify pl -max-throughput 10IOPS
```

qos policy-group rename

Rename a policy group

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The qos policy-group rename command changes the name of an existing policy group.

Parameters

- **-policy-group <text>** - Policy Group Name
  
  Specifies the existing name of the policy group that you want to rename.

- **-new-name <text>** - New Policy Group Name
  
  Specifies the new name of the policy group. Policy group names must be unique and are restricted to 127 alphanumeric characters including underscores "_" and hyphens "-". Policy group names must start with an alphanumeric character.

```
Examples

cluster1::> qos policy-group rename -policy-group pl1 -new-name pl1_new
```

qos policy-group show

Display a list of policy groups

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The qos policy-group show command shows the current settings of the policy groups on a cluster. You can display a list of the policy groups and you can view detailed information about a specific policy group.

Parameters

{ [-fields <fieldname>, ...]  
  
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.  
  
  | [-instance ] |
  
  If you specify the -instance parameter, the command displays detailed information about all fields.  
}
[-policy-group <text>] - Policy Group Name
    Selects the policy groups that match this parameter value
    Policy groups define measurable service level objectives (SLOs) that apply to the storage objects with which
    the policy group is associated.

[-vserver <vserver name>] - Vserver
    Selects the policy groups that match this parameter value

[-uuid <UUID>] - Uuid
    Selects the policy groups that match this parameter value

[-class {preset|user-defined|system-defined|autovolume}] - Policy Group Class
    Selects the policy groups that match this parameter value

[-pgid <integer>] - Policy Group ID
    Selects the policy groups that match this parameter value
    This uniquely identifies the policy group

[-max-throughput <qos_tput>] - Maximum Throughput
    Selects the policy groups that match this parameter value
    A maximum throughput limit specifies the throughput (in IOPS or MB/s) that the policy group must not
    exceed.

[-min-throughput <qos_tput>] - Minimum Throughput
    Selects the policy groups that match this parameter value
    A minimum throughput specifies the desired performance level for a policy group.

[-num-workloads <integer>] - Number of Workloads
    Selects the policy groups that match this parameter value.

[-throughput-policy <text>] - Throughput Policy
    Selects the policy groups that match this parameter value. You can specify the throughput range in terms of
    IOPS or data rate. For example, 0-INF, 0-400IOPS, 0-200KB/s, 0-400MB/s.

**Examples**

```
cluster1::> qos policy-group show
Name             Vserver     Class        Wklds Throughput
---------------- ----------- ------------ ----- ------------
pg1              vs4         user-defined 0     0-200IOPS
pg2              vs0         user-defined 0     0-500IOPS
pg5              vs0         user-defined 0     0-300IOPS
pg6              vs0         user-defined 0     0-INF
4 entries were displayed.
```

**qos settings commands**

QoS settings

**qos settings cache commands**

Cache QoS settings
qos settings cache modify

Modify the cache policy

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The qos settings cache modify command modifies the existing default caching-policy. The list of caching policies can be obtained from the qos setting cache show -fields cache-setting command.

Parameters
- cache-setting <text> - Cache Policy Name
  Valid inputs to this parameter include any one of the listed caching-policies. This command is to be used together with the default parameter. If you use this parameter, the command modifies the specified caching-policy based on the default parameter.

[-default {true|false}] - Is Default?
Valid inputs to this parameter are true and false. Together with cache-setting, this parameter helps set or unset a caching-policy as default.

Examples

cluster1:~> qos settings cache modify -default true -cache-setting random_read_write-random_write

qos settings cache show

Display list of cache policies

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The qos settings cache show shows the current caching-policies, class to which they belong, the number of workloads associated with each of the policies, and whether or not they are set to default. The following external-cache policies are available:

- none - Does not cache any user data or metadata blocks.
- auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
- all - Read caches all data blocks read and written. It does not do any write caching.
- all-random_write - Read caches all data blocks read and written. It also write caches randomly overwritten user data blocks.
- all_read - Read caches all metadata, randomly read, and sequentially read user data blocks.
- all_read-random_write - Read caches all metadata, randomly read, and sequentially read user data blocks. It also write caches randomly overwritten user data blocks.
- all_random_write - Read caches all metadata, randomly read, sequentially read and randomly written user data blocks. It also write caches randomly overwritten user data blocks.
- all_random_write-random_write - Read caches all metadata, randomly read, sequentially read and randomly written user data blocks. It also write caches randomly overwritten user data blocks.
- meta - Read caches only metadata blocks.
- meta-random_write - Read caches all metadata and write caches randomly overwritten user data blocks.
• noread-random_write - Write caches all randomly overwritten user data blocks. It does not do any read caching.
• random_read - Read caches all metadata and randomly read user data blocks.
• random_read_write - Read caches all metadata, randomly read and randomly written user data blocks.
• random_read_write-random_write - Read caches all metadata, randomly read, and randomly written user data blocks. It also write caches randomly overwritten user data blocks.

Note: Note that in a caching-policy name, a hyphen (-) separates read and write caching policies.

Parameters

[-fields <fieldname>,...]

The input to this parameter is one of the following: {cache-setting|class|default|num-workloads}. If you use this parameter, the command displays information related to the specified input field.

[[-instance ]]}

If you use this parameter, the command displays information about the caching-policies in a list format.

[-cache-setting <text>] - Cache Policy Name

The input to this parameter is any one of the above listed caching-policies. If you use this parameter, the command displays information corresponding to the specified caching-policy.

[-class {preset|user-defined|system-defined|autovolume}] - Cache Policy Class

The input to this parameter is one of the following: {undefined|preset|user-defined|system-defined|autovolume}. If you use this parameter, the command displays information corresponding to the specified policy-group class.

[-default (true|false)] - Is Default?

The input to this parameter is true and false. If you use this parameter, the command displays information corresponding to entries that have the specified default value.

[-num-workloads <integer>] - Number Of Workloads With This Policy

The input to this parameter is an integer. If you use this parameter, the command displays information about policy-groups matching the specified number of workloads.

Examples

```
cluster1::> qos settings cache show
Policy Name   Class        Num Workloads   Default
-------------- -------------- ------------- -----
an             preset       0              false
all-random_write preset       0              false
all_read       preset       0              false
all_read-random_write preset   0              false
all_read_random_write preset   0              false
all_read_random_write-random_write preset   0              false
auto           preset       2              false
meta           preset       0              false
meta-random_write preset       0              false
none           preset       0              false
noread-random_write preset     0              false
random_read    preset       25             false
random_read_write preset       0              false
```
qos statistics commands

Qos Statistics

qos statistics characteristics commands

Policy Group characterization

qos statistics characteristics show

Display QoS policy group characterization

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The qos statistics characteristics show command displays data that characterizes the behavior of QoS policy groups.

The command displays the following data:

• The QoS policy group name (Policy Group)
• Input/output operations performed per second (IOPS)
• Throughput achieved in kilobytes per second (KB/s) or megabytes per second (MB/s) as appropriate (Throughput)
• Request size in bytes (B) (Request size)
• Read percentage from total I/O (Read)
• Concurrency, which indicates the number of concurrent users generating the I/O traffic (Concurrency)

The results displayed per iteration are sorted by IOPS. Each iteration starts with a row that displays the total IOPS used across all QoS policy groups. Other columns in this row are either totals or averages.

Parameters

[-node {<nodename> | local}] - Node

Selects the policy groups that match this parameter value. If you do not specify this parameter, the command displays data for the entire cluster.

[-iterations <integer>] - Number of Iterations

Specifies the number of times the display is refreshed before terminating. If you do not specify this parameter, the command iterates until interrupted by Ctrl-C.

{ [-rows <integer>] - Number of Rows in the Output

Specifies the number of busiest QoS policy groups to display. Valid values are from 1 to 20. The default value is 10.

[[-policy-group <text>]] - QoS Policy Group Name

Selects the QoS policy group whose name matches the specified value. If you do not specify this parameter, the command displays data for all QoS policy groups.
Specifies the display style. If true, the command clears the display after each data iteration. If false, the command displays each data iteration below the previous one. The default is false.

**Examples**

```
cluster1::> qos statistics characteristics show -iterations 100 -rows 4
Policy Group             IOPS      Throughput Request size  Read Concurrency
-------------------- -------- --------------- ------------  ---- -----------
   _total-                    31      304.00KB/s       10041B    0%          16
(System-Best-Effort        15           0KB/s           0B    0%           0
vol1                        11       44.00KB/s        4096B    0%          4
vol2                        4      256.00KB/s       65536B    0%          4
   _total-                    37      808.00KB/s       22361B    2%           3
(System-Best-Effort        15           0KB/s           0B    0%           0
vol2                       12      768.00KB/s       65536B    0%           9
vs1vol0                     8       32.00KB/s        4096B   12%           1
vol1                        2        8.00KB/s        4096B    0%           1
```

The example above displays the characteristics of the 4 QoS policy groups with the highest IOPS values and refreshes the display 100 times before terminating.

```
cluster1::> qos statistics characteristics show -iterations 100 -policy-group pg1
Policy Group             IOPS      Throughput Request size  Read Concurrency
-------------------- -------- --------------- ------------ ---- -----------
   _total-                   293        3.02MB/s       10783B  54%           0
pg1                       118      470.67KB/s        4096B 100%           0
   _total-                   181      478.14KB/s        2700B  65%           0
pg1                       117      469.33KB/s        4096B 100%           0
   _total-                   226      525.78KB/s        2382B  60%           1
pg1                       110      440.00KB/s        4096B 100%           1
   _total-                    233        1.67MB/s        7527B  49%           1
pg1                       112      446.67KB/s        4096B 100%           1
```

**qos statistics latency commands**

Latency breakdown

**qos statistics latency show**

Display latency breakdown data per QoS policy group

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The `qos statistics latency show` command displays the average latencies for QoS policy groups across the various Data ONTAP subsystems.

The command displays the following data:

- The QoS policy group name (Policy Group)
- Total latency observed per I/O operation (Latency)
- Latency observed per I/O operation in the Network subsystem (Network)
- Latency observed per I/O operation across the internally connected nodes in a Cluster (Cluster)
- Latency observed per I/O operation in the Data management subsystem (Data)
• Latency observed per I/O operation in the Storage subsystem (Disk)
• Latency observed per I/O operation in the QoS subsystem (QoS)
• Latency observed per I/O operation for NVRAM transfer (NVRAM)
• Latency observed per I/O operation for Object Store(Cloud) operations

The results displayed per iteration are sorted by the Latency field. Each iteration starts with a row that displays the average latency, in microseconds (us) or milliseconds (ms), observed across all QoS policy groups.

**Parameters**

[-node <nodename> | local] - Node

Selects the policy groups that match this parameter value. If you do not specify this parameter, the command displays data for the entire cluster.

[-iterations <integer>] - Number of Iterations

Specifies the number of times the display is refreshed before terminating. If you do not specify this parameter, the command iterates until interrupted by Ctrl-C.

[-rows <integer>] - Number of Rows in the Output

Specifies the number of busiest QoS policy groups to display. Valid values are from 1 to 20. The default value is 10.

[-policy-group <text>] - QoS Policy Group Name

Selects the QoS policy group whose name matches the specified value. If you do not specify this parameter, the command displays data for all QoS policy groups.

[-refresh-display {true|false}] - Toggle Screen Refresh Between Each Iteration

Specifies the display style. If true, the command clears the display after each data iteration. If false, the command displays each data iteration below the previous one. The default is false.

qos statistics performance commands

System performance

qos statistics performance show

Display system performance data per QoS policy group

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The qos statistics performance show command shows the current system performance levels that QoS policy groups are achieving.

The command displays the following data:

- The QoS policy group name (Policy Group)
- Input/output operations performed per second (IOPS)
- Throughput in kilobytes per second (KB/s) or megabytes per second (MB/s) as appropriate (Throughput)
- Latency observed per request in microseconds (us) or milliseconds (ms) as appropriate (Latency)

The results displayed per iteration are sorted by IOPS. Each iteration starts with a row that displays the total IOPS used across all QoS policy groups. Other columns in this row are either totals or averages.

Parameters

- `-node `<nodename>` | local` - Node

Selects the policy groups that match this parameter value. If you do not specify this parameter, the command displays data for the entire cluster.
Number of Iterations

Specifies the number of times the display is refreshed before terminating. If you do not specify this parameter, the command iterates until interrupted by Ctrl-C.

Number of Rows in the Output

Specifies the number of busiest QoS policy groups to display. Valid values are from 1 to 20. The default value is 10.

QoS Policy Group Name

Selects the QoS policy group whose name matches the specified value. If you do not specify this parameter, the command displays data for all QoS policy groups.

Toggle Screen Refresh Between Each Iteration

Specifies the display style. If true, the command clears the display after each data iteration. If false, the command displays each data iteration below the previous one. The default is false.

Examples

```
cluster1::> qos statistics performance show -iterations 100 -rows 4
Policy Group             IOPS      Throughput    Latency
-------------------- -------- --------------- ----------
  -total-                    79     1296.00KB/s   337.41ms
 System-Best-Effort        25           0KB/s        0ms
 vol1                       24       96.00KB/s   193.72ms
 vol2                       18     1152.00KB/s   750.98ms
 vs1vol0                    12       48.00KB/s   707.38ms
  -total-                   109        1.99MB/s   133.27ms
 System-Best-Effort        35           0KB/s        0ms
 vol2                       29        1.81MB/s   249.27ms
 vs1vol0                    24       96.00KB/s    48.32ms
 vol1                       21       84.00KB/s   292.30ms
```

The example above displays the system performance for the 4 QoS policy groups with the highest IOPS and it refreshes the display 100 times before terminating.

```
cluster1::> qos statistics performance show -iterations 100 -policy-group pg1
Policy Group             IOPS      Throughput    Latency

  -total-                  2720       10.62MB/s   858.00us
  pg1                      2720       10.62MB/s   858.00us
```

qos statistics resource commands

Resource utilization

qos statistics resource cpu commands

CPU utilization

qos statistics resource cpu show

Display CPU resource utilization data per QoS policy group

Availability: This command is available to cluster administrators at the admin privilege level.
**Description**

The `qos statistics resource cpu show` command displays the CPU utilization for QoS policy groups per node.

The command displays the following data:

- The QoS policy group name (Policy Group)
- CPU utilization observed in percentage (CPU)

The results displayed per iteration are sorted by total CPU utilization. Each iteration starts with a row that displays the total CPU utilization across all QoS policy groups.

**Parameters**

- **-node `<nodename>`** - Node
  
  Selects the policy groups that match this parameter value.

- **-iterations `<integer>`** - Number of Iterations
  
  Specifies the number of times the display is refreshed before terminating. If you do not specify this parameter, the command iterates until interrupted by Ctrl-C.

- **-rows `<integer>`** - Number of Rows in the Output
  
  Specifies the number of busiest QoS policy groups to display. Valid values are from 1 to 20. The default value is 10.

- **-policy-group `<text>`** - QoS Policy Group Name
  
  Selects the QoS policy group whose name matches the specified value. If you do not specify this parameter, the command displays data for all QoS policy groups.

- **-refresh-display (true|false)** - Toggle Screen Refresh Between Each Iteration
  
  Specifies the display style. If true, the command clears the display after each data iteration. If false, the command displays each data iteration below the previous one. The default is false.

**Examples**

```
cluster1::> qos statistics resource cpu show -node nodeA -iterations 100 -rows 3

<table>
<thead>
<tr>
<th>Policy Group</th>

qos statistics resource disk commands

Disk utilization

qos statistics resource disk show

Display disk resource utilization data per QoS policy group

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
The `qos statistics resource disk show` command displays the disk utilization for QoS policy groups per node. The disk utilization shows the percentage of time spent on the disk during read and write operations. The command displays disk utilization for system-defined policy groups; however, their disk utilization is not included in the total utilization. The command only supports hard disks.

The command displays the following data:

- The QoS policy group name (Policy Group)
- Disk utilization (Disk)
- The number of HDD data disks utilized (Number of HDD Disks)

The results displayed are sorted by total disk utilization. Each iteration starts with a row that displays the total disk utilization across all QoS policy groups.

**Parameters**

- `-node <nodename> | local` - Node
  Selects the policy groups that match this parameter value.

- `[-iterations <integer>]` - Number of Iterations
  Specifies the number of times the display is refreshed before terminating. If you do not specify this parameter, the command iterates until interrupted by Ctrl-C.

- `[-rows <integer>]` - Number of Rows in the Output
  Specifies the number of busiest QoS policy groups to display. Valid values are from 1 to 20. The default value is 10.

- `[-policy-group <text>]` - QoS Policy Group Name
  Selects the QoS policy group whose name matches the specified value. If you do not specify this parameter, the command displays data for all QoS policy groups.
-refresh-display (true|false) - Toggle Screen Refresh Between Each Iteration

Specifies the display style. If true, the command clears the display after each data iteration. If false, the command displays each data iteration below the previous one. The default is false.

### Examples

```
cluster1::> qos statistics resource disk show -node nodeA -iterations 100 -rows 3
Policy Group          Disk Number of HDD Disks
--------------------- ----- -------------------
-total-                40%                  27
pg1                    22%                   5
slow                   10%                  10
fast                    8%                  12
_System_Default        7%                  20
>Total-                42%                  27
pg1                    22%                   5
slow                   12%                  10
fast                    8%                  12
_System_Default        7%                  20
```

The example above displays the total disk utilization for the 3 QoS policy groups with the highest disk utilization and it refreshes the display 100 times before terminating.

```
cluster1::> qos statistics resource disk show -node local -iterations 100 -policy-group pg1
Policy Group          Disk Number of HDD Disks
--------------------- ----- -------------------
-total-                 3%                  10
pg1                     1%                  24
-total-                 3%                  10
pg1                     1%                  24
-total-                 3%                  10
pg1                     1%                  24
-total-                 3%                  10
pg1                     1%                  24
```

### qos statistics volume commands

The volume directory

### qos statistics volume characteristics commands

The characteristics directory

### qos statistics volume characteristics show

Display volume characteristics

**Availability**: This command is available to cluster administrators at the admin privilege level.

**Description**

The `qos statistics volume characteristics show` command displays data that characterizes the behavior of volumes.

The command displays the following data:

- QoS volume name (Workload)
- QoS workload ID (ID)
- Input/output operations per second (IOPS)
• Throughput achieved in kilobytes per second (KB/s) or megabytes per second (MB/s) as appropriate (Throughput)
• Request size in bytes (B) (Request size)
• Read percentage from total IOPS (Read)
• Concurrency, which indicates the number of concurrent users generating the I/O traffic (Concurrency)

The results displayed per iteration are sorted by IOPS. Each iteration starts with a row that displays the total IOPS used across all volumes. Other columns in this row are either totals or averages.

Parameters

[-node {<nodename>|local}] - Node

Selects the volumes that match this parameter value. If you do not specify this parameter, the command displays data for the entire cluster.

{ [-rows <integer>] - Number of Rows in the Output

Specifies the number of busiest QoS policy groups to display. The default setting is 10. The allowed range of values is 1 to 20.

| -vserver <vserver name> - Vserver Name

Specifies the Vserver to which the volume belongs.

-volume <volume name> - Volume Name

Selects the characteristic data that match this parameter value. Enter a complete volume name or press the <Tab> key to complete the name. Wildcard query characters are not supported.

[-iterations <integer>] - Number of Iterations

Specifies the number of times the display is refreshed before terminating. If you do not specify this parameter, the command iterates until interrupted by Ctrl-C.

[-refresh-display {true|false}] - Toggle Screen Refresh Between Each Iteration

Specifies the display style. If true, the command clears the display after each data iteration. If false, the command displays each data iteration below the previous one. The default is false.

[-show-flexgroup-as-constituents {true|false}] - Display Flexgroups as Constituents

If the parameter is specified and if the value is true, it will display data for FlexVols and Flexgroup Constituents. Otherwise it will display data for FlexVols and Flexgroups.

Examples

```
cluster1::> qos statistics volume characteristics show -iterations 100 -rows 3
Workload ID IOPS Throughput Request size Read Concurrency
---------- ---- -------------- ----------------- ----- ---- -------
-total- - 68 176.00KB/s 2650B 7% 8
vs1vol0-wid102 102 24 96.00KB/s 4096B 20% 13
vol_1-wid103 103 20 80.00KB/s 4096B 0% 12
vol_2-wid104 104 1 0KB/s 0B 0% 0
-total- - 157 528.00KB/s 3443B 3% 4
vol_2-wid104 104 48 192.00KB/s 4096B 0% 9
vol_1-wid103 103 43 172.00KB/s 4096B 0% 0
vs1vol0-wid102 102 41 164.00KB/s 4096B 14% 6
-total- - 274 1016.00KB/s 3797B 2% 2
vs1vol0-wid102 102 85 340.00KB/s 4096B 8% 4
vol_2-wid104 104 85 340.00KB/s 4096B 0% 1
vol_1-wid103 103 84 336.00KB/s 4096B 0% 3
```

The example above displays characteristics for the 3 volumes with the highest IOPS and it refreshes the display 100 times before terminating.
qos statistics volume latency commands

The latency directory

qos statistics volume latency show

Display latency breakdown data per volume

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The qos statistics volume latency show command displays the average latencies for volumes on Data ONTAP subsystems.

The command displays the following data:

- The QoS volume name (Workload)
- The QoS workload ID (ID)
- Total latency observed per I/O operation (Latency)
- Latency observed per I/O operation in the Network subsystem (Network)
- Latency observed per I/O operation across the internally connected nodes in a Cluster (Cluster)
- Latency observed per I/O operation in the Data management subsystem (Data)
- Latency observed per I/O operation in the Storage subsystem (Disk)
- Latency observed per I/O operation in the QoS subsystem (QoS)
- Latency observed per I/O operation for NVRAM transfer (NVRAM)
- Latency observed per I/O operation for Object Store(Cloud) operations

The results displayed per iteration are sorted by the total latency field. Each iteration starts with a row that displays the average latency, in microseconds (us) or milliseconds (ms) observed across all volumes.

Parameters

[-node {<nodename>|local}] - Node

Selects the volumes that match this parameter value. If you do not specify this parameter, the command displays data for the entire cluster.
Number of Rows in the Output

Specifies the number of busiest QoS policy groups to display. The default setting is 10. The allowed range of values is 1 to 20.

Vserver Name

Specifies the Vserver to which the volume belongs.

Volume Name

Selects the latency data that match this parameter value. Enter a complete volume name or press the <Tab> key to complete the name. Wildcard query characters are not supported.

Number of Iterations

Specifies the number of times that the command refreshes the display with updated data before terminating. If you do not specify this parameter, the command iterates until interrupted by Ctrl-C.

Toggle Screen Refresh Between Each Iteration

Specifies the display style. If true, the command clears the display after each data iteration. If false, the command displays each data iteration below the previous one. The default is false.

Display Flexgroups as Constituents

If the parameter is specified and if the value is true, it will display data for FlexVols and Flexgroup Constituents. Otherwise it will display data for FlexVols and Flexgroups.

Examples

```
cluster1::> qos statistics volume latency show -iterations 100 -rows 3

Workload   Cloud       ID    Latency   Network   Cluster       Data       Disk        QoS      NVRAM

         ------- ------ ------ -------- -------- ---------- ---------- ---------- -------- --------

```

The example above displays latencies for the 3 volumes with the highest latencies and it refreshes the display 100 times before terminating.
qos statistics volume performance commands

The performance directory

qos statistics volume performance show

Display system performance data per volume

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The qos statistics volume performance show command shows the current system performance that each volume is achieving.

The command displays the following data:

- The QoS volume name (Workload)
- The QoS workload ID (ID)
- Input/output operations performed per second (IOPS)
- Throughput in kilobytes per second (KB/s) or megabytes per second (MB/s) as appropriate (Throughput)
- Latency observed per request in microseconds (us) or milliseconds (ms) as appropriate (Latency)

The results displayed per iteration are sorted by IOPS. Each iteration starts with a row that displays the total IOPS used across all volumes. Other columns in this row are either totals or averages.

Parameters

[-node {<nodename>|local}] - Node
Selects the volumes that match this parameter value. If you do not specify this parameter, the command displays data for the entire cluster.

{ [-rows <integer>] - Number of Rows in the Output
Specifies the number of busiest QoS policy groups to display. The default setting is 10. The allowed range of values is 1 to 20.

| -vserver <vserver name> - Vserver Name
Specifies the Vserver to which the volume belongs.}
-volume <volume name> - Volume Name

Selects the performance data that match this parameter value. Enter a complete volume name or press the <Tab> key to complete the name. Wildcard query characters are not supported.

-iterations <integer> - Number of Iterations

Specifies the number of times the display is refreshed before terminating. If you do not specify this parameter, the command iterates until interrupted by Ctrl-C.

-refresh-display (true|false) - Toggle Screen Refresh Between Each Iteration

Specifies the display style. If true, the command clears the display after each data iteration. If false, the command displays each data iteration below the previous one. The default is false.

-show-flexgroup-as-constituents (true|false) - Display Flexgroups as Constituents

If the parameter is specified and if the value is true, it will display data for FlexVols and Flexgroup Constituents. Otherwise it will display data for FlexVols and Flexgroups.

Examples

```
Examples

cluster1::> qos statistics volume performance show -iterations 100 -rows 3

qos statistics volume resource commands

The resource directory

qos statistics volume resource cpu commands

The cpu directory
qos statistics volume resource cpu show

Display CPU resource utilization data per volume

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The qos statistics volume resource cpu show command displays the CPU utilization for volumes per node.

The command displays the following data:

- The QoS volume name (Workload)
- The QoS workload ID (ID)
- CPU utilization observed in percentage (CPU)

The results displayed per iteration are sorted by total CPU utilization. Each iteration starts with a row that displays the total CPU utilization across all volumes.

Parameters
- node (<nodename>|local) - Node
  Selects the volumes that match this parameter value.

  { [ -rows <integer> ] } - Number of Rows in the Output
  Specifies the number of busiest QoS policy groups to display. The default setting is 10. The allowed range of values is 1 to 20.

  | -vserver <vserver name> - Vserver Name
  Specifies the Vserver to which the volume belongs.

  -volume <volume name> - Volume Name
  Selects the CPU utilization data that match this parameter value. Enter a complete volume name or press the <Tab> key to complete the name. Wildcard query characters are not supported.

  [ -iterations <integer> ] - Number of Iterations
  Specifies the number of times the display is refreshed before terminating. If you do not specify this parameter, the command iterates until interrupted by Ctrl-C.

  [ -refresh-display {true|false} ] - Toggle Screen Refresh Between Each Iteration
  Specifies the display style. If true, the command clears the display after each data iteration. If false, the command displays each data iteration below the previous one. The default is false.

  [ -show-flexgroup-as-constituents {true|false} ] - Display Flexgroups as Constituents
  If the parameter is specified and if the value is true, it will display data for FlexVols and Flexgroup Constituents. Otherwise it will display data for FlexVols and Flexgroups.

Examples

```
cluster1::> qos statistics volume resource cpu show -node nodeA -iterations 100 -rows 3
Workload           ID   CPU
--------------- ----- ----- `--total- (100%) - 9%
vs0vol1-wid-102   102    5%
vs0vol2-wid-121   121    2%
vs2_vol0-wid-..   212    2%
--total- (100%) - 8%
```
The example above displays total CPU utilization for the 3 volumes with the highest CPU utilization and it refreshes the display 100 times before terminating.

```
cluster1::> qos statistics volume resource cpu show -node local -vserver vs0 -volume vs0_vol1 -iterations 100

Workload          ID   CPU
--------------- ----- ----- 
  -total- (100%)   -    2%
  vs0_vol1-wid7..  7916    2%
  -total- (100%)   -    1%
  vs0_vol1-wid7..  7916    1%
  -total- (100%)   -    2%
  vs0_vol1-wid7..  7916    2%
  -total- (100%)   -    1%
  vs0_vol1-wid7..  7916    1%
```

The following example shows the output when the session privilege level is "diagnostic".

```

```
qos statistics volume resource disk commands

The disk directory

qos statistics volume resource disk show

Display disk resource utilization data per volume

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The qos statistics volume resource disk show command displays the disk utilization for volumes per node. The disk utilization shows the percentage of time spent on the disk during read and write operations. The command only supports hard disks.

The command displays the following data:

- The QoS volume name (Workload)
- The QoS workload ID (ID)
- Disk utilization (Disk)
- The number of HDD data disks utilized (Number of HDD Disks)
The results displayed are sorted by total disk utilization. Each iteration starts with a row that displays the total disk utilization across all volumes.

Parameters

- **-node (<nodename>|local)** - Node
  
  Selects the volumes that match this parameter value.

  { [-rows <integer>] - Number of Rows in the Output
  
  Specifies the number of busiest QoS policy groups to display. The default setting is 10. The allowed range of values is 1 to 20.

  | -vserver <vserver name> | - Vserver Name
  
  Specifies the Vserver to which the volume belongs.

- **-volume <volume name>** - Volume Name
  
  Selects the disk utilization data that match this parameter value. Enter a complete volume name or press the <Tab> key to complete the name. Wildcard query characters are not supported.

  [ -iterations <integer>] - Number of Iterations
  
  Specifies the number of times the display is refreshed before terminating. If you do not specify this parameter, the command iterates until interrupted by Ctrl-C.

  [ -refresh-display (true|false)] - Toggle Screen Refresh Between Each Iteration
  
  Specifies the display style. If true, the command clears the display after each data iteration. If false, the command displays each data iteration below the previous one. The default is false.

  [ -show-flexgroup-as-constituents (true|false)] - Display Flexgroups as Constituents
  
  If the parameter is specified and if the value is true, it will display data for FlexVols and Flexgroup Constituents. Otherwise it will display data for FlexVols and Flexgroups.

Examples

```
cluster1::> qos statistics volume resource disk show -node nodeB -iterations 100 -rows 3

  Workload            ID  Disk Number of HDD Disks
  -------------- ------ ----- -------------------
  -total- (100%)       -   30%                   4
  vs0_vo11-wid101     101   12%                   2
  vs0_vo12-wid121     121   10%                   1
  vo10-wid1002        1002    8%                   1
  -total- (100%)       -   30%                   4
  vs0_vo11-wid101     101   12%                   2
  vs0_vo12-wid121     121   10%                   1
  vo10-wid1002        1002    8%                   1
```

The example above displays total disk utilization for the 3 volumes with the highest disk utilization and it refreshes the display 100 times before terminating.

```
cluster1::> qos statistics volume resource disk show -node local -vserver vs0 -volume vs0_vol0 -iterations 100

  Workload            ID  Disk Number of HDD Disks
  -------------- ------ ------ -------------------
  -total-              -     5%                  10
  vs0_vo10-wid1..  15658    1%                 6
  -total-              -     5%                  10

  -total-              -     6%                  10
  vs0_vo10-wid1..  15658    2%                 6
  -total-              -     6%                  10
```

cos statistics commands 447
qos statistics workload commands

Detail by workload

qos statistics workload characteristics commands

Workload characterization

qos statistics workload characteristics show

Display QoS workload characterization

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The qos statistics workload characteristics show command displays data that characterizes the behavior of QoS workloads.

The command displays the following data:

- The QoS workload name (Workload)
- The QoS workload ID (ID)
- Input/output operations performed per second (IOPS)
- Throughput achieved in kilobytes per second (KB/s) or megabytes per second (MB/s) as appropriate (Throughput)
- Request size in bytes (B) (Request size)
- Read percentage from total IOPS (Read)
- Concurrency, which indicates the number of concurrent users generating the I/O traffic (Concurrency)

The results displayed per iteration are sorted by IOPS. Each iteration starts with a row that displays the total IOPS used across all QoS workloads. Other columns in this row are either totals or averages.

Parameters

[-node {<nodename>|local}] - Node
   Selects the QOS workloads that match this parameter value. If you do not specify this parameter, the command displays data for the entire cluster.

[-iterations <integer>] - Number of Iterations
   Specifies the number of times the display is refreshed before terminating. If you do not specify this parameter, the command iterates until interrupted by Ctrl-C.

[-refresh-display {true|false}] - Toggle Screen Refresh Between Each Iteration
   Specifies the display style. If true, the command clears the display after each data iteration. If false, the command displays each data iteration below the previous one. The default is false.

{ [-rows <integer>] - Number of Rows in the Output
   Specifies the number of busiest QoS policy groups to display. Valid values are from 1 to 20. The default value is 10.}
[[-policy-group <text>]] - QoS Policy Group Name

Selects the QoS workloads that belong to the QoS policy group specified by this parameter value. If you do not specify this parameter, the command displays data for all QoS workloads.

[[-workload <text>]] - QoS Workload Name

Selects the QoS workload that match this parameter value. If you do not specify this parameter, the command displays data for all QoS workloads.

[[-workload-id <integer>]] - QoS Workload ID

Selects the QoS workload that match the QoS workload ID specified by this parameter value.

[[-show-flexgroup-as-constituents (true|false)]] - Display Flexgroups as Constituents

If the parameter is specified and if the value is true, it will display data for FlexVols and Flexgroup Constituents. Otherwise it will display data for FlexVols and Flexgroups.

qos statistics commands
qos statistics workload latency commands
Latency breakdown

qos statistics workload latency show
Display latency breakdown data per QoS workload

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The qos statistics workload latency show command displays the average latencies for QoS workloads on Data ONTAP subsystems.

The command displays the following data:

• The QoS workload name (Workload)
• The QoS workload ID (ID)
• Total latency observed per I/O operation (Latency)
• Latency observed per I/O operation in the Network subsystem (Network)
• Latency observed per I/O operation across the internally connected nodes in a Cluster (Cluster)
• Latency observed per I/O operation in the Data management subsystem (Data)
• Latency observed per I/O operation in the Storage subsystem (Disk)
• Latency observed per I/O operation in the QoS subsystem (QoS)
• Latency observed per I/O operation for NVRAM transfer (NVRAM)
• Latency observed per I/O operation for Object Store(Cloud) operations

The results displayed per iteration are sorted by the total latency field. Each iteration starts with a row that displays the average latency, in microseconds (us) or milliseconds (ms) observed across all QoS workloads.

Parameters

- `-node <nodename> | local] - Node
  Selects the QOS workloads that match this parameter value. If you do not specify this parameter, the command displays data for the entire cluster.

- `-iterations <integer> - Number of Iterations
  Specifies the number of times that the command refreshes the display with updated data before terminating. If you do not specify this parameter, the command continues to run until you interrupt it by pressing Ctrl-C.

- `-refresh-display [true | false] - Toggle Screen Refresh Between Each Iteration
  Specifies the display style. If true, the command clears the display after each data iteration. If false, the command displays each data iteration below the previous one. The default is false.

- `{ -rows <integer>] - Number of Rows in the Output
  Specifies the number of busiest QoS policy groups to display. Valid values are from 1 to 20. The default value is 10.
[-policy-group <text>] - QoS Policy Group Name

Selects the QoS workloads that belong to the QoS policy group specified by this parameter value. If you do not specify this parameter, the command displays data for all QoS workloads.

[-workload <text>] - QoS Workload Name

Selects the QoS workload that match this parameter value. If you do not specify this parameter, the command displays data for all QoS workloads.

[-workload-id <integer>] - QoS Workload ID

Selects the QoS workload that match the QoS workload ID specified by this parameter value.

[-show-flexgroup-as-constituents [true|false]] - Display Flexgroups as Constituents

If the parameter is specified and if the value is true, it will display data for FlexVols and Flexgroup Constituents. Otherwise it will display data for FlexVols and Flexgroups.

**qos statistics workload performance commands**

System performance

**qos statistics workload performance show**

Display system performance data per QoS workload

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**

The `qos statistics workload performance show` command shows the current system performance that each QoS workload is achieving.

The command displays the following data:

- The QoS workload name (Workload)
- The QoS workload ID (ID)
- Input/output operations performed per second (IOPS)
- Throughput in kilobytes per second (KB/s) or megabytes per second (MB/s) as appropriate (Throughput)
- Latency observed per request in microseconds (us) or milliseconds (ms) as appropriate (Latency)

The results displayed per iteration are sorted by IOPS. Each iteration starts with a row that displays the total IOPS used across all QoS workloads. Other columns in this row are either totals or averages.
Parameters

[-node {<nodename>|local}] - Node

Selects the QoS workloads that match this parameter value. If you do not specify this parameter, the command displays data for the entire cluster.

[-iterations <integer>] - Number of Iterations

Specifies the number of times the display is refreshed before terminating. If you do not specify this parameter, the command iterates until interrupted by Ctrl-C.

[-refresh-display {true|false}] - Toggle Screen Refresh Between Each Iteration

Specifies the display style. If true, the command clears the display after each data iteration. If false, the command displays each data iteration below the previous one. The default is false.

[-rows <integer>] - Number of Rows in the Output

Specifies the number of busiest QoS policy groups to display. Valid values are from 1 to 20. The default value is 10.

[-policy-group <text>] - QoS Policy Group Name

Selects the QoS workloads that belong to the QoS policy group specified by this parameter value. If you do not specify this parameter, the command displays data for all QoS workloads.

[-workload <text>] - QoS Workload Name

Selects the QoS workload that match this parameter value. If you do not specify this parameter, the command displays data for all QoS workloads.

[-workload-id <integer>] - QoS Workload ID

Selects the QoS workload that match the QoS workload ID specified by this parameter value.

[-show-flexgroup-as-constituents {true|false}] - Display Flexgroups as Constituents

If the parameter is specified and if the value is true, it will display data for FlexVols and Flexgroup Constituents. Otherwise it will display data for FlexVols and Flexgroups.

Examples

```
cluster1::> qos statistics workload performance show -iterations 100 -rows 4
Workload ID IOPS Throughput Latency
--------- ------ -------- --------
 -total-  -  97 1.90MB/s 216.87ms
 _Scan_Besteff..  101  31 0KB/s  0ms
 vol_2-wid104  104  28 1.75MB/s 412.78ms
 vol_1-wid103  103  25 100.00KB/s 169.16ms
 vs1vol0-wid102  102  13 52.00KB/s 403.78ms
 -total-  -  98 1276.00KB/s 89.98ms
 _Scan_Besteff..  101  34 0KB/s  0ms
 vs1vol0-wid102  102  28 112.00KB/s 112.80ms
 vol_1-wid103  103  19 76.00KB/s 114.72ms
 vol_2-wid104  104  17 1088.00KB/s 257.60ms
 -total-  -  78 1152.00KB/s 225.22ms
 _Scan_Besteff..  101  30 0KB/s  0ms
 vol_1-wid103  103  17 68.00KB/s 452.27ms
 vol_2-wid104  104  16 1024.00KB/s 419.93ms
 vs1vol0-wid102  102  15 60.00KB/s 210.63ms
```

The example above displays the system performance for the 4 QoS workloads with the highest IOPS and it refreshes the display 100 times before terminating.

```
cluster1::> qos statistics workload performance show -iterations 100 -rows 2 -policy-group pg1
Workload ID IOPS Throughput Latency
--------- ------ -------- --------
 -total-  - 2598 9.96MB/s 1223.00us
 file-testfile..  4228 650 2.54MB/s 1322.00us
 file-testfile..  11201 635 2.48MB/s 1128.00us
```

**qos statistics workload resource commands**

Resource utilization

**qos statistics workload resource cpu commands**

CPU utilization

**qos statistics workload resource cpu show**

Display CPU resource utilization data per QoS workload

**Availability:** This command is available to cluster administrators at the *admin* privilege level.

**Description**

The qos statistics workload resource cpu show command displays the CPU utilization for QoS workloads per node. The command displays the following data:

- The QoS workload name (Workload)
- The QoS workload ID (ID)
- CPU utilization observed in percentage (CPU)

The results displayed per iteration are sorted by total CPU utilization. Each iteration starts with a row that displays the total CPU utilization across all QoS workloads.

**Parameters**

- **-node {<nodename>|local}** - Node
  
  Selects the QoS workloads that match this parameter value.

- **[-iterations <integer>]** - Number of Iterations
  
  Specifies the number of times the display is refreshed before terminating. If you do not specify this parameter, the command iterates until interrupted by Ctrl-C.
[-refresh-display {true|false}] - Toggle Screen Refresh Between Each Iteration

Specifies the display style. If true, the command clears the display after each data iteration. If false, the command displays each data iteration below the previous one. The default is false.

{[-rows <integer>] - Number of Rows in the Output

Specifies the number of busiest QoS policy groups to display. Valid values are from 1 to 20. The default value is 10.

[-policy-group <text>] - QoS Policy Group Name

Selects the QoS workloads that belong to the QoS policy group specified by this parameter value. If you do not specify this parameter, the command displays data for all QoS workloads.

[-workload <text>] - QoS Workload Name

Selects the QoS workload that match this parameter value. If you do not specify this parameter, the command displays data for all QoS workloads.

[-workload-id <integer>] - QoS Workload ID

Selects the QoS workload that match the QoS workload ID specified by this parameter value.

[=show-flexgroup-as-constituents {true|false}] - Display Flexgroups as Constituents

If the parameter is specified and if the value is true, it will display data for FlexVols and Flexgroup Constituents. Otherwise it will display data for FlexVols and Flexgroups.

Examples

```
cluster1::> qos statistics workload resource cpu show -node nodeA -iterations 100 -rows 3
Workload   ID   CPU  
----------- ----- ----- 
--total- (100%)      -   9%
vs0-wid-102      102   5%
file-bigvmdk-...  121   2%
vs2_vol0-wid-...  212   2%
--total- (100%)      -   8%
vs0-wid-101      102   5%
file-bigvmdk-...  121   2%
vs2_vol0-wid-...  212   1%
```

The following example shows the output when the session privilege level is "diagnostic".

```
cluster1::*> qos statistics workload resource cpu show -node nodeB -iterations 100 -rows 3
Workload   ID   CPU  Wafl_exempt Kahuna Network Raid  Exempt Protocol
----------- ----- ----- ----------- ------ ------- ----- ------ --------
--total- (200%)      -   23%          0%     0%      0%    0%    18%       5%
vs0-wid-102      102   18%          0%     0%      0%    0%    15%       3%
file-bigvmdk-...  121   3%          0%     0%      0%    0%     2%       1%
vs2_vol0-wid-...  212   2%          0%     0%      0%    0%     1%       1%
--total- (200%)      -   24%          0%     0%      0%    0%    19%       5%
vs0-wid-102      102   19%          0%     0%      0%    0%    16%       3%
file-bigvmdk-...  121   2%          0%     0%      0%    0%     2%       1%
vs2_vol0-wid-...  212   1%          0%     0%      0%    0%     1%       1%
```

The example above displays total CPU utilization for the 3 QoS workloads with the highest CPU utilization and it refreshes the display 100 times before terminating.

```
cluster1::> qos statistics workload resource cpu show -node local -iterations 100 -rows 2 -policy-group pg1
Workload   ID   CPU
----------- ----- ----- 
--total- (100%)      -   41%
file-test1_b-..  9492   16%
file-test1_c-..  5078   16%
```

qos statistics commands
The example above displays total CPU utilization for the 2 QoS workloads belonging to QoS policy group pg1 with the highest IOPS and it refreshes the display 100 times before terminating.

```
cpu-test1_c..  5078   17%
cpu-test1_b..  9492   16%
total- (100%)  -   43%
cpu-test1_c..  5078   16%
cpu-test1_b..  9492   15%
total- (100%)  -   40%
```

```
cluster1::> qos statistics workload resource cpu show -node local -iterations 100 -workload-id 9492

<table>

```

**qos statistics workload resource disk commands**

Disk utilization

**qos statistics workload resource disk show**

Display disk resource utilization data per QoS workload

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

The `qos statistics workload resource disk show` command displays the disk utilization for QoS workloads per node. The disk utilization shows the percentage of time spent on the disk during read and write operations. The command displays disk utilization for system-defined workloads; however, their disk utilization is not included in the total utilization. The command only supports hard disks.

The command displays the following data:

- The QoS workload name (Workload)
- The QoS workload ID (ID)
- Disk utilization (Disk)
- The number of HDD data disks utilized (Number of HDD Disks)

The results displayed are sorted by total disk utilization. Each iteration starts with a row that displays the total disk utilization across all QoS workloads.

**Parameters**

- `-node {<nodename>|local}` - Node
  
  Selects the QOS workloads that match this parameter value.

- `[<iterations <integer>]]` - Number of Iterations
  
  Specifies the number of times the display is refreshed before terminating. If you do not specify this parameter, the command iterates until interrupted by Ctrl-C.
[-refresh-display {true|false}] - Toggle Screen Refresh Between Each Iteration

Specifies the display style. If true, the command clears the display after each data iteration. If false, the command displays each data iteration below the previous one. The default is false.

{ [-rows <integer>] - Number of Rows in the Output

Specifies the number of busiest QoS policy groups to display. Valid values are from 1 to 20. The default value is 10.

[-policy-group <text>] - QoS Policy Group Name

Selects the QoS workloads that belong to the QoS policy group specified by this parameter value. If you do not specify this parameter, the command displays data for all QoS workloads.

| [-workload <text>] - QoS Workload Name

Selects the QoS workload that match this parameter value. If you do not specify this parameter, the command displays data for all QoS workloads.

| [-workload-id <integer>] - QoS Workload ID

Selects the QoS workload that match the QoS workload ID specified by this parameter value.

[-show-flexgroup-as-constituents {true|false}] - Display Flexgroups as Constituents

If the parameter is specified and if the value is true, it will display data for FlexVols and Flexgroup Constituents. Otherwise it will display data for FlexVols and Flexgroups.

Examples

```
cluster1::> qos statistics workload resource disk show -node nodeB -iterations 100 -rows 3

<table>
<thead>
<tr>
<th>Workload</th>
<th>ID</th>
<th>Disk</th>
<th>Number of HDD Disks</th>

<tr>
<td>file-test1_wi</td>
<td>6%</td>
<td>6</td>
<td></td>
</tr>
</tbody>
</table>
```

The example above displays total disk utilization for the 2 QoS workloads belonging to QoS policy group pg1 with the highest IOPS and it refreshes the display 100 times before terminating.
qos workload commands

QoS workload settings

qos workload show

Display a list of workloads

Availability: This command is available to cluster administrators at the admin privilege level.

Description
Shows the current status of workloads on a cluster. Use this command to determine the types of workloads that are currently on a cluster. The types of workloads include: system-defined, preset, and user-defined. The system generates system-defined and preset workloads. You cannot create, modify, or delete these workloads. Also, you can only modify or delete a user-defined workload, but cannot create one.

Parameters

{ [-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use ‘-fields ?’ to display the fields to specify.

| [-instance ]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-workload <text>] - Workload Name

If you use this parameter, the command displays the workloads that contain the specified workload name.

[-uuid <UUID>] - Workload UUID (privilege: advanced)

If you use this parameter, the command displays the workloads that contain the specified UUID.

[-class {preset|user-defined|system-defined|autovolume}] - Workload Class

If you use this parameter, the command displays the workloads that contain the specified class. The Class options include system-defined, preset, and user-defined.

[-wid <integer>] - Workload ID

If you use this parameter, the command displays the workloads that contain the specified internal workload ID.

[-category <text>] - Workload Category

If you use this parameter, the command displays the workloads that contain the specified category. The category options include Scanner and Efficiency.

[-policy-group <text>] - Policy Group Name

If you use this parameter, the command displays the workloads that match the specified policy group name.
[-read-ahead <text>] - Read-ahead Tunables
   If you use this parameter, the command displays the workloads that contain the specified read-ahead cache
tunable.

[-vserver <vserver name>] - Vserver
   If you use this parameter, the command displays the workloads that match the specified Vserver.

[-volume <volume name>] - Volume
   If you use this parameter, the command displays the workloads that match the specified volume.

[-qtree <qtree name>] - Qtree Name
   If you use this parameter, the command displays the workloads that match the specified Qtree name.

[-lun <text>] - LUN Name
   If you use this parameter, the command displays the workloads that match the specified LUN name.

[-file <text>] - File Path
   If you use this parameter, the command displays the workloads that match the specified file path.

[-max-throughput <qos_tput>] - Maximum Throughput
   Selects the workloads that match this parameter value
   A maximum throughput limit specifies the throughput in IOPS that the workload must not exceed.

[-min-throughput <qos_tput>] - Minimum Throughput
   Selects the workloads that match this parameter value
   A minimum throughput specifies the desired performance level for a workload in IOPS.

[-is-adaptive {true|false}] - Adaptive
   If you use this parameter, the command displays only adaptive workloads.

[-is-constituent {true|false}] - Is Constituent Volume
   If this parameter is specified, the command displays information only about storage objects that either are or
are not constituents of a FlexGroup, depending on the value provided.

Examples

<table>
<thead>
<tr>
<th>Workload</th>
<th>Wid</th>
<th>Policy Group</th>
<th>Vserver</th>
<th>Volume</th>
<th>LUN</th>
<th>Qtree</th>
<th>File Path</th>
</tr>
</thead>
<tbody>

<td>-</td>
</tr>
</tbody>
</table>

Security Commands

The security directory
The security commands enable you to manage security for the management interface.

security snmpusers

Show SNMP users

Availability: This command is available to cluster administrators at the admin privilege level.
Description
The `security snmpusers` displays the following information about SNMP users:

- User name
- Authentication method
- Hexadecimal engine ID
- Authentication protocol
- Privacy protocol
- Security group

Parameters

`[-fields <fieldname>, ...]`
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

`[-instance]`
If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-vserver <Vserver Name>] - Vserver`
If this parameter is specified, the command displays information only about the SNMP user or users that belong to the specified Vserver.

`[-username <text>] - User Name`
If this parameter is specified, the command displays information only about the SNMP user with the specified user name.

`[-authmethod <text>] - Authentication Method`
If this parameter is specified, the command displays information only about the SNMP user or users that use the specified authentication method. Possible values include the following:

- community-SNMP community strings
- usm-SNMP user security model

`[-remote-switch-ipaddress <IP Address>] - Remote Switch IP Address`
If this parameter is specified, the command displays information only about the remote SNMP user or users that belong to the specified remote switch.

`[-engineid <Hex String>] - Engine Id`
If this parameter is specified, the command displays information only about the SNMP user or users that use the specified engine ID, specified in hexadecimal format.

`[-authprotocol <text>] - Authentication Protocol`
If this parameter is specified, the command displays information only about the SNMP user or users that use the specified authentication protocol.

`[-privprotocol <text>] - Privacy Protocol`
If this parameter is specified, the command displays information only about the SNMP user or users that use the specified privacy protocol.

`[-securitygroup <text>] - Security Group`
If this parameter is specified, the command displays information only about the SNMP user or users that belong to the specified security group.
Examples
The following example displays information about all SNMP users:

```
cluster1::> security snmpusers

Vserver  UserName   AuthMethod EngineId         Auth Priv Group     Switch IP
-------- ---------- ---------- ---------------- ---- ---- --------- -----------
cluster1 comm1      community  8000031504312d38302d313233343536     -    -    readwrite
cluster1 private    community  8000031504312d38302d313233343536        -    -    readwrite
cluster1 snmpuser1  usm        80000634b21000000533296869 -    -    readwrite 172.2.20.91
vs1      snmpuser2  community  8000031504312d38302d31323334353632        -    -    readwrite -
vs1      snmpuser3  usm        8000031504312d38302d31323334353632        -    -    readwrite -
```

security audit commands
Manage administrative audit logging settings

security audit modify
Set administrative audit logging settings

Availability: This command is available to `cluster` administrators at the `admin` privilege level.

Description
The `security audit modify` command modifies the following audit-logging settings for the management interface:

- Whether get requests for the CLI are audited
- Whether get requests for the Data ONTAP API (ONTAPI) are audited

Parameters

[-cliget (on|off)] - Enable auditing of CLI get operations

This specifies whether get requests for the CLI are audited. The default setting is `off`.

[-ontapiget (on|off)] - Enable auditing of Data ONTAP API get operations

This specifies whether get requests for the Data ONTAP API (ONTAPI) interface are audited. The default setting is `off`.

Examples
The following example turns off auditing of get requests for the CLI interface:

```
cluster1::> security audit modify -cliget off
```

security audit show
Show administrative audit logging settings

Availability: This command is available to `cluster` administrators at the `admin` privilege level.
Description
The `security audit show` command displays the following audit-logging settings for the management interface:

- Whether get requests for the CLI are audited
- Whether get requests for the Data ONTAP API (ONTAPI) are audited

Audit log entries are written to the 'audit' log, viewable via the 'security audit log show' command.

Examples
The following example displays the audit-logging settings for the management interface:

```
cluster1::> security audit show
Auditing State for Get Requests:
------------------
CLI:       off
ONTAPI:    on
```

security audit log commands
Display administrative audit logging entries

security audit log show
Display audit entries merged from multiple nodes in the cluster
Availability: This command is available to cluster administrators at the `admin` privilege level.

Description
The `security audit log show` command displays cluster-wide audit log messages. Messages from each node are interleaved in chronological order.

Parameters
`{ [-fields <fieldname>, ...]`
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.
`| [-instance ]}`
If you specify the `-instance` parameter, the command displays detailed information about all fields.
`[-timestamp <Date>] - Log Entry Timestamp`
Selects the entries that match the specified input for timestamp. This will be in the local timezone.
`[-node (<nodename> | local)] - Node`
Selects the entries that match the specified input for node.
`[-entry <text>] - Log Message Entry`
Selects the entries that match the specified input for entry.

security certificate commands
Manage Digital Certificates
security certificate create

Create and Install a Self-Signed Digital Certificate

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The security certificate create command creates and installs a self-signed digital certificate, which can be used for server authentication, for signing other certificates by acting as a certificate authority (CA), or for Data ONTAP as an SSL client. The certificate function is selected by the -type field. Self-signed digital certificates are not as secure as certificates signed by a CA. Therefore, they are not recommended in a production environment.

Parameters
-vserver <Vserver Name> - Name of Vserver
This specifies the name of the Vserver on which the certificate will exist.

-common-name <FQDN or Custom Common Name> - FQDN or Custom Common Name
This specifies the desired certificate name as a fully qualified domain name (FQDN) or custom common name or the name of a person. The supported characters, which are a subset of the ASCII character set, are as follows:
- Letters a through z, A through Z
- Numbers 0 through 9
- Asterisk (*), period (.), underscore (_) and hyphen (-)
The common name must not start or end with a "-" or a ".". The maximum length is 253 characters.

-type <type of certificate> - Type of Certificate
This specifies the certificate type. Valid values are the following:
- server - creates and installs a self-signed digital certificate and intermediate certificates to be used for server authentication
- root-ca - creates and installs a self-signed digital certificate to sign other certificates by acting as a certificate authority (CA)
- client - includes a self-signed digital certificate and private key to be used for Data ONTAP as an SSL client

[-subtype <kmip-cert>] - Certificate Subtype
This specifies a certificate subtype. This optional parameter can have an empty value (the default). The only valid value is as follows:
- kmip-cert - this is a Key Management Interoperability Protocol (KMIP) certificate

-size <size of requested certificate in bits> - Size of Requested Certificate in Bits
This specifies the number of bits in the private key. The larger the value, the more secure is the key. The default is 2048. Possible values include 512, 1024, 1536, 2048 and 3072 when the "FIPS Mode" in "security config" is false. When the "FIPS Mode" is true, the possible values are 2048 and 3072.

-country <text> - Country Name
This specifies the country where the Vserver resides. The country name is a two-letter code. The default is US. Here is the list of country codes: Country Codes

-state <text> - State or Province Name
This specifies the state or province where the Vserver resides.
-locality <text> - Locality Name
  This specifies the locality where the Vserver resides. For example, the name of a city.

-organization <text> - Organization Name
  This specifies the organization where the Vserver resides. For example, the name of a company.

-unit <text> - Organization Unit
  This specifies the unit where the Vserver resides. For example, the name of a section or a department within a company.

-email-addr <mail address> - Contact Administrator's Email Address
  This specifies the email address of the contact administrator for the Vserver.

-expire-days <integer> - Number of Days until Expiration
  This specifies the number of days until the certificate expires. The default value is 365 days. Possible values are between 1 and 3652.

-protocol <protocol> - Protocol
  This specifies the protocol type. This parameter currently supports only the SSL protocol type. The default is SSL.

-hash-function <hashing function> - Hashing Function
  This specifies the cryptographic hashing function for signing the certificate. The default is SHA256. Possible values include SHA1, SHA256, MD5, SHA224, SHA384 and SHA512 when the "FIPS Mode" in "security config" is false. When the "FIPS Mode" is true, the possible values are SHA224, SHA256, SHA384 and SHA512.

Examples
This example creates a server type, self-signed digital certificate for a Vserver named vs0 at a company whose custom common name is www.example.com and whose Vserver name is vs0.

```
cluster1::> security certificate create -vserver vs0 -common-name www.example.com -type server
```

This example creates a root-ca type, self-signed digital certificate with a 2048-bit private key generated by the SHA256 hashing function that will expire in 365 days for a Vserver named vs0 for use by the Software group in IT at a company whose custom common name is www.example.com, located in Sunnyvale, California, USA. The email address of the contact administrator who manages the Vserver is web@example.com.

```
cluster1::> security certificate create -vserver vs0 -common-name www.example.com -type root-ca -size 2048 -country US -state California -locality Sunnyvale -organization IT -unit Software -email-addr web@example.com -expire-days 365 -hash-function SHA256
```

This example creates a client type of self-signed digital certificate for a Vserver named vs0 at a company that uses Data ONTAP as an SSL client. The company's custom common name is www.example.com and its Vserver name is vs0.

```
cluster1::> security certificate create -vserver vs0 -common-name www.example.com -type client -size 2048 -country US -state California -locality Sunnyvale -organization IT -unit Software -email-addr web@example.com -expire-days 365 -hash-function SHA256
```

security certificate delete
Delete an Installed Digital Certificate

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command deletes an installed digital security certificate.
Parameters

-vserver <Vserver Name> - Name of Vserver
This specifies the Vserver that contains the certificate.

-common-name <FQDN or Custom Common Name> - FQDN or Custom Common Name
This specifies the desired certificate name as a fully qualified domain name (FQDN) or custom common name or the name of a person. The supported characters, which are a subset of the ASCII character set, are as follows:

- Letters a through z, A through Z
- Numbers 0 through 9
- Asterisk (*), period (.), underscore (_) and hyphen (-)

The common name must not start or end with a "-" or a ".". The maximum length is 253 characters.

-[serial <text>] - Serial Number of Certificate
This specifies the certificate serial number.

-ca <text> - Certificate Authority
This specifies the certificate authority (CA).

-type <type of certificate> - Type of Certificate
This specifies the certificate type. Valid values are the following:

- server - includes server certificates and intermediate certificates
- root-ca - includes a self-signed digital certificate to sign other certificates by acting as a certificate authority (CA)
- client-ca - includes the public key certificate for the root CA of the SSL client. If this client-ca certificate is created as part of a root-ca, it will be deleted along with the corresponding deletion of the root-ca.
- server-ca - includes the public key certificate for the root CA of the SSL server to which Data ONTAP is a client. If this server-ca certificate is created as part of a root-ca, it will be deleted along with the corresponding deletion of the root-ca.
- client - includes a public key certificate and private key to be used for Data ONTAP as an SSL client

-[subtype <kmip-cert>] - Certificate Subtype
This specifies a certificate subtype. This optional parameter can have an empty value (the default). The only valid value is as follows:

- kmip-cert - this is a Key Management Interoperability Protocol (KMIP) certificate

Examples
This example deletes a root-ca type digital certificate for a Vserver named vs0 in a company named www.example.com with serial number 4F57D3D1.

```
cluster1::> security certificate delete -vserver vs0 -common-name www.example.com -ca www.example.com -type root-ca -serial 4F57D3D1
```
security certificate generate-csr

Generate a Digital Certificate Signing Request

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command generates a digital certificate signing request and displays it on the console. A certificate signing request (CSR or certification request) is a message sent securely to a certificate authority (CA) via any electronic media, to apply for a digital identity certificate.

Parameters
- **common-name <FQDN or Custom Common Name>** - FQDN or Custom Common Name
  This specifies the desired certificate name as a fully qualified domain name (FQDN) or custom common name or the name of a person. The supported characters, which are a subset of the ASCII character set, are as follows:
  - Letters a through z, A through Z
  - Numbers 0 through 9
  - Asterisk (*), period (.), underscore (_) and hyphen (-)
  The common name must not start or end with a "-" or a ".". The maximum length is 253 characters.

- **size <size of requested certificate in bits>** - Size of Requested Certificate in Bits
  This specifies the number of bits in the private key. The higher the value, the more secure is the key. The default is 2048. Possible values include 512, 1024, 1536 and 2048.

- **country <text>** - Country Name
  This specifies the country where the Vserver resides. The country name is a two-letter code. The default is US. Here is the list of country codes: Country Codes

- **state <text>** - State or Province Name
  This specifies the state or province where the Vserver resides.

- **locality <text>** - Locality Name
  This specifies the locality where the Vserver resides. For example, the name of a city.

- **organization <text>** - Organization Name
  This specifies the organization where the Vserver resides. For example, the name of a company.

- **unit <text>** - Organization Unit
  This specifies the unit where the Vserver resides. For example, the name of a section or a department within a company.

- **email-addr <mail address>** - Contact Administrator's Email Address
  This specifies the email address of the contact administrator for the Vserver.

- **hash-function <hashing function>** - Hashing Function
  This specifies the cryptographic hashing function for signing the certificate. The default is SHA256. Possible values include SHA1, SHA256 and MD5.

Examples
This example creates a certificate-signing request with a 2048-bit private key generated by the SHA256 hashing function for use by the Software group in IT at a company whose custom common name is www.example.com, located in
Sunnyvale, California, USA. The email address of the contact administrator who manages the Vserver is web@example.com.

```
cluster1:/> security certificate generate-csr -common-name www.example.com -size 2048 -country US -state California -locality Sunnyvale -organization IT -unit Software -email-addr web@example.com -hash-function SHA256
```

security certificate install

Install a Digital Certificate

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The security certificate install command installs digital security certificates signed by a certificate authority (CA) and the public key certificate of the root CA. Digital security certificates also include the intermediate certificates to construct the chain for server certificates (the server type), client-side root CA certificates (the client-ca type), or server-side root CA certificates (the server-ca type). With FIPS enabled, the following restrictions apply to the certificate getting installed. server/client/server-ca/client-ca: Key size >= 2048, server/client: Hash function (No MD-5, No SHA-1), server-ca/client-ca: (Intermediate CA), Hash Function (No MD-5, No SHA-1), server-ca/client-ca: (Root CA), Hash Function (No MD-5)

Parameters
- `vserver <Vserver Name>` - Name of Vserver
  This specifies the Vserver that contains the certificate.

- `type <type of certificate>` - Type of Certificate
  This specifies the certificate type. Valid values are the following:
  - server - includes server certificates and intermediate certificates.
  - client-ca - includes the public key certificate for the root CA of the SSL client
  - server-ca - includes the public key certificate for the root CA of the SSL server to which Data ONTAP is a client
  - client - includes a self-signed or CA-signed digital certificate and private key to be used for Data ONTAP as an SSL client
Certificate Subtype

This specifies a certificate subtype. This optional parameter can have an empty value (the default). The only valid value is as follows:

- `kmip-cert` - this is a Key Management Interoperability Protocol (KMIP) certificate

**Note:** This parameter is deprecated and might be removed in the future releases of Data ONTAP.
This parameter is applicable only to the `kmip-cert` subtype. It specifies the IP address of the KMIP server.

---

**Examples**

This example installs a CA-signed certificate (along with intermediate certificates) for a Vserver named vs0.

```
cluster1::> security certificate install -vserver vs0 -type server
Please enter Certificate: Press <Enter> when done

**security certificate show**

Display Installed Digital Certificates

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

This command displays information about the installed digital certificates. Some details are displayed only when you use the command with the `-instance` parameter.

**Parameters**

- **[-fields <fieldname>, ...]**
  
  If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

- **[-instance]**
  
  If you specify the `-instance` parameter, the command displays detailed information about all fields.

- **[-vserver <Vserver Name>]** - Name of Vserver
  
  Selects the Vserver whose digital certificates you want to display.

- **[-common-name <FQDN or Custom Common Name>]** - FQDN or Custom Common Name
  
  Selects the certificates that match this parameter value.
[-serial <text>] - Serial Number of Certificate
     Selects the certificates that match this parameter value.

[-ca <text>] - Certificate Authority
     Selects the certificates that match this parameter value.

[-type <type of certificate>] - Type of Certificate
     Selects the certificates that match this parameter value.

[-subtype <kmip-cert>] - Certificate Subtype
     Selects the certificate subtype that matches the specified value. The valid values are as follows:
     • kmip-cert - this is a Key Management Interoperability Protocol (KMIP) certificate

[-size <size of requested certificate in bits>] - Size of Requested Certificate in Bits
     Selects the certificates that match this parameter value.

[-start <Date>] - Certificate Start Date
     Selects the certificates that match this parameter value.

[-expiration <Date>] - Certificate Expiration Date
     Selects the certificates that match this parameter value.

[-public-cert <certificate>] - Public Key Certificate
     Selects the certificates that match this parameter value.

[-country <text>] - Country Name
     Selects the certificates that match this parameter value.

[-state <text>] - State or Province Name
     Selects the certificates that match this parameter value.

[-locality <text>] - Locality Name
     Selects the certificates that match this parameter value.

[-organization <text>] - Organization Name
     Selects the certificates that match this parameter value.

[-unit <text>] - Organization Unit
     Selects the certificates that match this parameter value.

[-email-add <mail address>] - Contact Administrator's Email Address
     Selects the certificates that match this parameter value.

[-protocol <protocol>] - Protocol
     Selects the certificates that match this parameter value.

[-hash-function <hashing function>] - Hashing Function
     Selects the certificates that match this parameter value.

[-self-signed {true|false}] - Self-Signed Certificate
     Selects the certificates that match this parameter value.

### Examples

The examples below display information about digital certificates.

```
cluster1::> security certificate show
Vserver   Serial Number   Common Name                                                                                           Type
--------- --------------- -----------------------------------------   -------------------------------

security certificate sign

Sign a Digital Certificate using Self-Signed Root CA

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command signs a digital certificate signing request and generates a certificate using a Self-Signed Root CA certificate in either PEM or PKCS12 format. You can use the security certificate generate-csr command to generate a digital certificate signing request.

Parameters
-vserver <Vserver Name> - Name of Vserver
This specifies the name of the Vserver on which the signed certificate will exist.
-ca <text> - Certificate Authority to Sign
This specifies the name of the Certificate Authority that will sign the certificate.
-ca-serial <text> - Serial Number of CA Certificate
This specifies the serial number of the Certificate Authority that will sign the certificate.
-ct-expire-days <integer> - Number of Days until Expiration
This specifies the number of days until the signed certificate expires. The default value is 365 days. Possible values are between 1 and 3652.
[-format <certificate format>] - Certificate Format

This specifies the format of signed certificate. The default value is PEM. Possible values include PEM and PKCS12.

[-destination (ftp|http)://(hostname|IPv4 Address|'['IPv6 Address'])...] - Where to Send File

This specifies the destination to upload the signed certificate. This option can only be used when the format is PKCS12.

[-hash-function <hashing function>] - Hashing Function

This specifies the cryptographic hashing function for the self-signed certificate. The default value is SHA256. Possible values include SHA1, SHA256, and MD5.

Examples

This example signs a digital certificate for a Vserver named vs0 using a Certificate Authority certificate that has a ca of www.ca.com and a ca-serial of 4F4EB629 in PEM format using the SHA256 hashing function.

```
cluster1::> security certificate sign -vserver vs0 -ca www.ca.com -ca-serial 4F4EB629 -expire-days 36 -format PEM -hash-function SHA256
Please enter Certificate Signing Request(CSR): Press <Enter> when done

security certificate ca-issued commands

Show Digital Certificates Issued by Self-Signed CA

security certificate ca-issued revoke

Revoke a Digital Certificate

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command revokes a digital certificate signed by a Self-Signed Root CA.

Parameters

-vserver <Vserver Name> - Vserver
This specifies the name of the Vserver on which the certificate is stored.

-serial <text> - Serial Number of Certificate
This specifies the serial number of the certificate.

-ca <text> - Certificate Authority
This specifies the name of the Certificate Authority whose certificate will be revoked.

-ca-serial <text> - Serial Number of CA Certificate
This specifies the serial number of Certificate Authority.

[<common-name <FQDN or Custom Common Name>]] - FQDN or Custom Common Name
This specifies a fully qualified domain name (FQDN) or custom common name or the name of a person. This field is optional if ca-serial is specified.

Examples
This example revokes a signed digital certificate for a Vserver named vs0 with serial as 4F5A2DF2 for a Certificate Authority certificate that has a ca of www.ca.com and a ca-serial of 4F4EB629.
security certificate ca-issued show

Display CA-Issued Digital Certificates

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command displays the following information about the digital certificates issued by the self-signed root-ca:

- Vserver
- Serial number of certificate
- FQDN or custom common name or the name of a person
- Serial number of CA certificate
- Status (active, revoked)
- Certificate Authority
- Expiration date
- Revocation date

To display more details, run the command with the -instance parameter. This will add the following information:

- Country name
- State or province name
- Locality name
- Organization name
- Organization unit
- Contact administrator's email address

Parameters

[[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

[[-instance]]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver
Selects the certificates that match this parameter value.

[-serial <text>] - Serial Number of Certificate
Selects the certificates that match this parameter value.

[-ca <text>] - Certificate Authority
Selects the certificates that match this parameter value.

[-ca-serial <text>] - Serial Number of CA Certificate
Selects the certificates that match this parameter value.
[-common-name <FQDN or Custom Common Name>] - FQDN or Custom Common Name
Selects the certificates that match this parameter value.

[-status <status of certificate>] - Status of Certificate
Selects the certificates that match this parameter value. Possible values include active and revoked.

[-expiration <Date>] - Certificate Expiration Date
Selects the certificates that match this parameter value.

[-revocation <Date>] - Certificate Revocation Date
Selects the certificates that match this parameter value.

[-country <text>] - Country Name (2 letter code)
Selects the certificates that match this parameter value.

[-state <text>] - State or Province Name (full name)
Selects the certificates that match this parameter value.

[-locality <text>] - Locality Name (e.g. city)
Selects the certificates that match this parameter value.

[-organization <text>] - Organization Name (e.g. company)
Selects the certificates that match this parameter value.

[-unit <text>] - Organization Unit (e.g. section)
Selects the certificates that match this parameter value.

[-email-addr <mail address>] - Email Address (Contact Name)
Selects the certificates that match this parameter value.

Examples
The examples below display information about CA issued digital certificates.

security certificate commands
security config commands

Manage Cluster Security Configuration

security config modify

Modify Security Configuration Options

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The `security config modify` command modifies the existing cluster-wide security configuration. If you enable FIPS-compliant mode, the cluster will automatically select only compliant TLS protocols (currently TLSv1.2 and TLSv1.1). Non-compliant protocols are not enabled when FIPS-compliant mode is disabled. Use the `--supported-protocols` parameter to include or exclude TLS protocols independently from the FIPS mode. All protocols at or above the lowest version specified will be enabled, even those not explicitly specified. By default, FIPS mode is disabled, and Data ONTAP supports the TLSv1.2, TLSv1.1 and TLSv1 protocols. For backward compatibility, Data ONTAP supports adding SSLv3 to the supported-protocols list when FIPS mode is disabled. Use the `--supported-ciphers` parameter to configure only AES, or AES and 3DES, or disable weak ciphers such as RC4 by specifying !RC4. By default the supported-cipher setting is ALL:!LOW:!aNULL:!EXP:!eNULL. This setting means that all supported cipher suites for the protocols are enabled, except the ones with no authentication, no encryption, no exports, and low encryption cipher suites (currently those using 64-bit or 36-bit encryption algorithms). Select a cipher suite which is available with the corresponding selected protocol. An invalid configuration may cause some functionality to fail to operate properly. Refer to "https://www.openssl.org/docs/apps/ciphers.html" published by the OpenSSL software foundation for the correct cipher string syntax. After modifying the security configuration, reboot all the nodes manually.

Parameters

- `--interface <SSL>` - FIPS-Compliant Interface
  Selects the FIPS-compliant interface. Default is SSL.

- `--is-fips-enabled {true|false}` - FIPS Mode
  Enables or disables FIPS-compliant mode for the entire cluster. Default is false.

- `--supported-protocols {TLSv1.2|TLSv1.1|TLSv1|SSLv3},...` - Supported Protocols
  Selects the supported protocols for the selected interface. Default is TLSv1.2, TLSv1.1, TLSv1

- `--supported-ciphers <Cipher String>` - Supported Ciphers
  Selects the supported cipher suites for the selected interface. Default is ALL:!LOW:!aNULL:!EXP:!eNULL.

Examples

The following command enables FIPS mode in the cluster. (Default setting for FIPS mode is false)

```
cluster1:~> security config modify --interface SSL --is-fips-enabled true
```

The following command modifies supported protocols to TLSv1.2 and TLSv1.1 in the cluster. (Default setting for supported protocols is TLSv1.2, TLSv1.1, TLSv1)

```
cluster1:~> security config modify --interface SSL --supported-protocols TLSv1.2, TLSv1.1
```
The following command modifies supported ciphers to ALL:!LOW:!aNULL:!EXP!:eNULL:!RC4 in the cluster. (Default setting for supported ciphers is ALL:!LOW:!aNULL:!EXP!:eNULL)

```bash
cluster1::*> security config modify -interface SSL -supported-ciphers ALL:!LOW:!aNULL:!EXP!:eNULL!:RC4
```

**security config show**

Display Security Configuration Options

**Availability:** This command is available to cluster administrators at the *advanced* privilege level.

**Description**
The `security config show` command displays the security configurations of the cluster in advanced privilege mode.

Default values are as follows:

- SSL FIPS mode: disabled
- Supported protocols: TLSv1.2,TLSv1.1,TLSv1
- Supported ciphers: ALL:!LOW:!aNULL:!EXP!:eNULL

The default cipher suites represent all suites for the listed protocols except those that have no authentication, no encryption, no exports, and low encryption (below 64 or 56 bit).

Enabling FIPS mode will cause the entire cluster to use FIPS-compliant crypto operations only.

Use the `security config modify` command to change the protocols and ciphers that the cluster will support. When all the nodes in the cluster are updated with the modified settings, the cluster security config ready value will be shown as *yes*.

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

```
[-instance]
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[-interface <SSL>] - FIPS-Compliant Interface
```

Displays configurations that match the specified value for the interface.

```
[-is-fips-enabled {true|false}] - FIPS Mode
```

Displays configurations that match the specified value for FIPS mode.

```
[-supported-protocols {TLSv1.2|TLSv1.1|TLSv1|SSLv3}, ...] - Supported Protocols
```

Displays configurations that match the specified protocols.

```
[-supported-ciphers <Cipher String>] - Supported Ciphers
```

Displays the configurations that match the specified supported ciphers.

**Examples**
The following example shows the default security configurations for a cluster.
The following example shows the security configuration after FIPS mode has been enabled.

```
cluster1::> security config show
Cluster                                          Cluster Security
Interface FIPS Mode  Supported Protocols     Supported Ciphers Config Ready
--------- ---------- ----------------------- ----------------- ----------------
SSL       true      TLSv1.2, TLSv1.1        ALL:!LOW:         yes
            !aNULL:!EXP:
            !eNULL:!RC4
```

### security config ocsp commands

Manage OCSP Support for SSL Applications

#### security config ocsp disable

Disable OCSP for one or more selected applications

**Availability:** This command is available to `cluster` administrators at the `advanced` privilege level.

**Description**

The `security config ocsp disable` command disables the OCSP-based certificate status check for applications supporting SSL/TLS communications. For more information about the OCSP-based certificate status check for applications supporting SSL/TLS communications, see the `security config ocsp show` command.

**Parameters**

- `-application <Application supporting SSL/TLS protocol>, ... - Application Name`

  Use this parameter to specify the application to disable the OCSP support. To disable all applications, the value 'all' can be used. Note: You cannot specify the value 'all' with other applications.

**Examples**

The following example disables the OCSP support for AutoSupport and EMS applications:

```bash
cluster1::*> security config ocsp disable -application autosupport,ems
```

The following example disables the OCSP support for all applications:

```bash
cluster1::*> security config ocsp show
Application OCSP Enabled?
--------------- ------------
autosupport    false
audit_log      true
fabricpool     true
ems            false
kmip           true
ldap           true
6 entries were displayed.
```
cluster1::*> security config ocsp disable -application all
Warning: OCSP will be disabled for all applications. Any previous modifications will be ignored.
Do you want to continue? {y|n}: y

cluster1::*> security config ocsp show
Application  OCSP Enabled?
----------------- ---------------
autosupport    false
audit_log      false
fabricpool     false
ems             false
kmip            false
ldap            false
6 entries were displayed.

security config ocsp show on page 480

security config ocsp enable
Enable OCSP for one or more selected applications

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The security config ocsp enable command enables the OCSP-based certificate status check for applications supporting SSL/TLS communications. For more information about the OCSP-based certificate status check for applications supporting SSL/TLS communications, see the security config ocsp show command.

Parameters
-application <Application supporting SSL/TLS protocol>, ... - List of Applications

Use this parameter to specify the application to enable the OCSP support. To enable all applications, the value 'all' can be used. Note: You cannot specify the value 'all' with other applications.

Examples
The following example enables the OCSP support for AutoSupport and EMS applications:

```
cluster1::*> security config ocsp enable -application autosupport,ems
```

```
cluster1::> security config ocsp show
Application  OCSP Enabled?
----------------- ---------------
autosupport    true
audit_log      false
fabricpool     false
ems             true
kmip            false
ldap            false
6 entries were displayed.
```

The following example enables the OCSP support for all applications:

```
cluster1::*> security config ocsp enable -application all
Warning: OCSP will be enabled for all applications. Any previous modifications will be ignored.
Do you want to continue? {y|n}: y
```

```
cluster1::*> security config ocsp show
Application  OCSP Enabled?
----------------- ---------------
```

security config ocsp show on page 480

security config ocsp show

Show Online Certificate Status Protocol (OCSP) settings

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The security config ocsp show command displays the support status of the OCSP-based certificate status check for applications supporting SSL/TLS communications. If the OCSP support is enabled for an application, this check is done in addition to the certificate chain validation as part of the SSL handshake process. The OCSP-based certificate status check is done for all the certificates in the chain, provided that each certificate has the OCSP URI access points mentioned in them. If no access points are specified, the OCSP-based certificate revocation status check is ignored for that certificate and checking continues for the rest of the certificates in the chain.

Parameters

{-fields <fieldname>, ...}

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use ‘-fields ?’ to display the fields to specify.

[-instance ]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-application <Application supporting SSL/TLS protocol>] - Application Name

Selects the application that matches this parameter value. Applications include:

• autosupport - AutoSupport
• audit_log - Audit Logging
• fabricpool - External capacity tiers
• ems - Event Management System
• kmip - Key Management Interoperability Protocol
• ldap_ad - Lightweight Directory Access Protocol - Active Directory (query and modify items in Active Directory)
• ldap_nis_namemap - Lightweight Directory Access Protocol - NIS and Name Mapping (query Unix user, group, netgroup and name mapping information)

[-is-ocsp-enabled {true|false}] - Is OCSP-based Certificate Status Check Enabled?

Selects the application that matches this parameter value.

Examples

The following example displays the OCSP support for the applications supporting SSL/TLS communications:
The following example displays the OCSP support for AutoSupport:

```
cluster1::*> security config ocsp show -application autosupport
Application Name: autosupport
Is OCSP-based Certificate Status Check Enabled?: true
```

---

**security config status commands**

The status directory

**security config status show**

Display Security Configuration Status

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**

The `security config status show` command displays the required reboot status of the nodes in the cluster after security configuration settings have been modified using the `security config modify` command. Use this command to monitor the status of the required reboot process. When all nodes have rebooted, the cluster is ready to use the new security configuration settings.

**Parameters**

`[-fields <fieldname>, ...]`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

`[-instance]`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-node <nodename>|local] - Node Name`

Select the node whose reboot-status you want to display.

`[-reboot-needed {true|false}] - Reboot Needed`

reboot-needed status of the node that tells if the node requires a reboot for security configuration to take effect.

**Examples**

The following example displays the status of a configuration change in a four-node cluster.

```
cluster1::> security config status show
Nodes in Cluster Reboot Needed
--------------------- ---------------
nod1 true
```

---
The following example shows the output of the command after the cluster reboot process is complete.

```
cluster1::> security config status show
Nodes in Cluster          Reboot Needed
--------------------- -------------------
node1                 false
node2                 false
node3                 false
node4                 false
4 entries were displayed.
```

security config modify on page 476

**security key-manager commands**

Manage Key Management Servers

**security key-manager add**

Add a key management server

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

This command adds a key management server at the indicated IP address to its list of four possible active key management servers. The command fails if there are already four key management servers configured. This command is not supported when onboard key management is enabled.

**Parameters**

- `--address <IP Address>` - IP Address
  
  This parameter specifies the IP address of the key management server you want to use to store keys.

- `[-server-port <integer>]` - Server TCP Port
  
  This parameter specifies the TCP port on which the key management server will listen for incoming connections.

**Examples**

The following example adds the key management server with address 10.233.1.98, listening for incoming connections on the default TCP port 5696, to the list of key management servers used by the external key manager:

```
cluster-1::> security key-manager add --address 10.233.1.198
```

The following example adds the key management server with address 10.233.1.98, listening for incoming connections on TCP port 15696, to the list of key management servers used by the external key manager:
security key-manager create-key

Create a new authentication key

Availability: This command is available to cluster administrators at the admin privilege level.

Description
This command creates a new authentication key (AK) and stores it on the configured key management servers. The command fails if the configured key management servers are already storing more than 128 AKs. If command fails due to more than 128 keys in cluster, delete unused keys on your key management servers and try the command again. This command is not supported when onboard key management is enabled.

Parameters
[-key-tag <text>] - Key Tag
This parameter specifies the key tag that you want to associate with the new authentication key (AK). The default value is the node name. This parameter can be used to help identify created authentication keys (AKs). For example, the key-manager query command key-tag parameter can be used to query for a specific key-tag value.

[-prompt-for-key {true|false}] - Prompt for Authentication Passphrase
If you specify this parameter as true, the command prompts you to enter an authentication passphrase manually instead of generating it automatically. For security reasons, the authentication passphrase you entered is not displayed at the command prompt. You must enter the authentication passphrase a second time for verification. To avoid errors, copy and paste authentication passphrases electronically instead of entering them manually. Data ONTAP saves the resulting authentication key/key ID pair automatically on the configured key management servers.

Examples
The following example creates an authentication key with the node name as the default key-tag value:

```bash
cluster-1::> security key-manager create-key
Verifying requirements...
Node: node1
Creating authentication key...
Authentication key creation successful.
Key ID: 00000000000000000200000000000100D0F7C2462D626B739FE81B89F29A092F.

Node: node2
Key manager restore operation initialized.
Successfully restored key information.
```

The following example creates an authentication key with key-tag "disk1-key":

```bash
cluster-1::> security key-manager create-key -key-tag disk1-key
Verifying requirements...
Node: node1
Creating authentication key...
Authentication key creation successful.
Key ID: 00000000000000000200000000000100B8297A6189BC24B9B84C1916ED576857.
```
The following example creates an authentication key with a user-specified authentication passphrase:

```
cluster-1::> security key-manager create-key -prompt-for-key true
Enter a new passphrase::
Reenter the passphrase::
Verifying requirements...
```

Node: node1
Creating authentication key...
Authentication key creation successful.
Key ID: 0000000000000000200000000106268333F870860128FBE17D393E5083B.

Node: node2
Key manager restore operation initialized.
Successfully restored key information.

security key-manager delete

Delete a key management server

Availability: This command is available to cluster administrators at the admin privilege level.

Description
This command removes the key management server at the indicated IP address from the list of active key management servers. If the indicated key management server is the sole storage location for any key that is in use by Data ONTAP, you will be unable to remove the key server. This command is not supported when onboard key management is enabled.

Parameters
- `address <IP Address>` - IP Address
  
  This parameter specifies the IP address of the key management server you want to remove from use.

Examples
The following example removes the key server at IP address 10.233.1.198 from the set of configured key management servers:

```
cluster-1::> security key-manager delete -address 10.233.1.198
```

security key-manager delete-key-database

Deletes the key hierarchy for onboard key manager

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The `security key-manager delete-key-database` command permanently deletes the onboard key-management configuration from all nodes of the cluster.
Examples

The following example deletes the onboard key-management configuration from all nodes of the cluster:

```
cluster-1::*> security key-manager delete-key-database
Warning: This command will permanently delete all keys from onboard key management.
Do you want to continue? {y|n}: y
```

security key-manager delete-kmip-config

Deletes the KMIP configuration

**Availability:** This command is available to cluster administrators at the advanced privilege level.

**Description**
The `security key-manager delete-kmip-config` command permanently deletes the Key Management Interoperability Protocol (KMIP) server configuration from all nodes of the cluster.

**Note:** The keys stored by the external KMIP servers cannot be deleted by Data ONTAP, and must be deleted by using external tools.

Examples

The following example deletes the KMIP-server configuration from all nodes of the cluster:

```
cluster-1::*> security key-manager delete-kmip-config
Warning: This command will permanently delete the KMIP-server configuration from all nodes of the cluster.
Do you want to continue? {y|n}: y
The KMIP-server configuration has been successfully deleted from all nodes of the cluster. The keys stored by the external KMIP servers cannot be deleted by Data ONTAP, and must be deleted by using external tools.
```

security key-manager prepare-to-downgrade

Disables onboard keymanagement features for unsupported versions

**Availability:** This command is available to cluster administrators at the advanced privilege level.

**Description**
The `security key-manager prepare-to-downgrade` command disables the onboard key management features that are not supported in releases prior to ONTAP 9.1.0. The features that are disabled are onboard key management support for Metrocluster configurations, and Volume Encryption (VE).

Examples

The following example disables the onboard key management support for Metrocluster configurations and Volume Encryption (VE):

```
cluster1::*> security key-manager prepare-to-downgrade
```
**security key-manager query**

Displays the key IDs stored in a key management server.

**Availability:** This command is available to cluster administrators at the `admin` privilege level.

**Description**
This command displays the IDs of the keys that are stored on the key management servers. This command does not update the key tables on the node. To refresh the key tables on the nodes with the key management server key tables, run the `security key-manager restore` command. This command is not supported when onboard key management is enabled.

**Parameters**

- **[-fields <fieldname>, ...]**
  - If you specify the `[-fields <fieldname>, ...]` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

- **[-instance]**
  - If you specify the `[-instance]` parameter, the command displays detailed information about all fields.

- **[-node {<nodename> | local}]** - Node
  - This parameter specifies the name of the node that queries the specified key management servers. If this parameter is not specified, then all nodes will query the specified key management servers.

- **[-address <IP Address>]** - IP Address
  - This parameter specifies the IP address of the key management server that you want to query.

- **[-key-id <text>]** - Key ID
  - If you specify this parameter, then the command displays only the key IDs that match the specified value.

- **[-key-tag <text>]** - Key Tag
  - If you specify this parameter, then the command displays only the key IDs that match the specified value. The key-tag for Volume Encryption Keys (VEKs) is set to the UUID of the encrypted volume.

- **[-key-type <Key Usage Type>]** - Key Type
  - If you specify this parameter, then the command displays only the key IDs that match the specified value.

- **[-count <integer>]** - (DEPRECATED)-Key Server's Total Key Count
  - The value `count` is deprecated and may be removed in a future release of Data ONTAP. This parameter specifies the total number of keys stored in the key management servers. If you specify this parameter, then the command displays only the key IDs retrieved from the key management servers whose total key count matches the specified count number.

- **[-restored {yes|no}]** - Key/Key ID Pair Present in Node's Key Table?
  - This parameter specifies whether the key corresponding to the displayed key ID is present in the specified node's internal key table. If you specify 'yes' for this parameter, then the command displays the key IDs of only those keys that are present in the system's internal key table. If you specify 'no' for this parameter, then the command displays the key IDs of only those keys that are not present in the system's internal key table.

- **[-key-manager-server-status {available|not-responding|unknown}]** - Command Error Code
  - This parameter specifies the connectivity status of the key management server. If you specify this parameter, then the command displays only the key IDs retrieved from the key management servers with specified status.

**Examples**
The following example shows all the keys on all configured key servers, and whether those keys have been restored for all nodes in the cluster:
cluster-1::> security key-manager query

<td></td>
</tr>
<tr>
<td>Key ID: 000000000000000000000000005004d03aca5b72cd20b2f83eae1531c605e00000000000000</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

If any listed keys have "no" in the "Restored" column, run "security key-manager restore" to restore those keys.

The following example shows all keys stored on the key server with address "10.0.0.10" from node "node1" with key-tag "node1":

cluster-1::> security key-manager query -address 10.0.0.10 -node node1 -key-tag node1

Node: node1
Key Manager: 10.0.0.10
Server Status: available

<table>
<thead>
<tr>
<th>Key Tag</th>
<th>Key Type</th>
<th>Restored</th>
</tr>
</thead>
<tbody>
<tr>
<td>node1</td>

<td></td>
<td></td>
</tr>
</tbody>
</table>

If any listed keys have "no" in the "Restored" column, run "security key-manager restore" to restore those keys.
Related references

`security key-manager restore` on page 488

**security key-manager restore**

Restore the authentication key and key ID pairs from the key management servers.

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**

This command retrieves and restores any current unrestored keys associated with the storage controller from the specified key management servers. This command is not supported when onboard key management is enabled.

**Parameters**

```bash
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```bash
[-instance]
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```bash
[-node <nodename>|local] - Node
```

This parameter specifies the name of the node that is to load the key IDs into its internal key table. If not specified, all nodes retrieve keys into their internal key table.

```bash
[-address <IP Address>] - IP Address
```

If this parameter is specified, the command restores only from key management server at the specified IP address. If not specified the command restores from all available key management servers.

```bash
[-key-tag <text>] - Key Tag
```

This parameter specifies the value associated with the key ID pair at the time of their creation. If specified, restore only key ID pairs associated with the specified key tag. If not specified, all key ID pairs for the cluster are retrieved.

```bash
[-key-ids <text>, ...] - Authentication Key ID
```

If this parameter is specified, the command restores only the specified key IDs.

```bash
[-count <integer>] - AK/Key ID Pair Count
```

The value `count` is deprecated and may be removed in a future release of Data ONTAP. This parameter specifies the total number of keys stored in the key management servers. If this parameter is specified, then the command displays only the key IDs retrieved from the key management servers whose total key count matches the specified count number.

```bash
[-key-manager-server-status {available|not-responding|unknown}] - Command Error Code
```

This parameter specifies the connectivity status of the key management server. If you specify this parameter the command displays only the key IDs retrieved from key management servers with specified status.

**Examples**

The following command restores keys that are currently on a key server but are not stored within the key tables on the cluster:

```bash
cluster-1::> security key-manager restore
```

Node: node1
Key Manager: 10.0.0.10
Server Status: available

Key IDs
The following loads any keys that exist on the key servers with IP address 10.0.0.10 with key-tag "node1" that are not currently stored in key tables of the nodes in the cluster. In this example, a key with that key-tag was missing from two nodes in the cluster:

```
cluster-1::> security key-manager restore -address 10.0.0.10 -key-tag node1
```

security key-manager setup

Configure key manager connectivity

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The `security key-manager setup` command enables you to configure key management. Data ONTAP supports two mutually exclusive key management methods: external via one or more key management interoperability protocol (KMIP) servers, or internal via an onboard key manager. This command is used to configure an external or internal key manager. When configuring an external key management server, this command records networking information on all node that is used during the boot process to retrieve keys needed for booting from the KMIP servers. For onboard key management, this command prompts you to configure a passphrase to protect internal keys in encrypted form.

This command can also be used to refresh missing onboard keys. For example, if you add a node to a cluster that has onboard key management configured, you will run this command to refresh the missing keys.

For onboard key management in a MetroCluster configuration, if the `security key-manager update-passphrase` command is used to update the passphrase on one site, then run the `security key-manager setup` command with the new passphrase on the partner site before proceeding with any key-manager operations.
Parameters

[-node <nodename>] - Node Name

This parameter is used only with onboard key management when a refresh operation is required (see command description). This parameter is ignored when configuring external key management and during the initial setup of onboard key management.

Examples

The following example creates a configuration for external key management:

```
cluster-1::> security key-manager setup
Welcome to the key manager setup wizard, which will lead you through the steps to add boot information.

Enter the following commands at any time
"help" or "?" if you want to have a question clarified,
"back" if you want to change your answers to previous questions, and
"exit" if you want to quit the key manager setup wizard. Any changes you made before typing "exit" will be applied.

Restart the key manager setup wizard with "security key-manager setup". To accept a default or omit a question, do not enter a value.

Would you like to configure onboard key management? {yes, no} [yes]: no
Would you like to configure the KMIP server environment? {yes, no} [yes]: yes
```

The following example creates a configuration for onboard key management:

```
cluster-1::> security key-manager setup
Welcome to the key manager setup wizard, which will lead you through the steps to add boot information.

Enter the following commands at any time
"help" or "?" if you want to have a question clarified,
"back" if you want to change your answers to previous questions, and
"exit" if you want to quit the key manager setup wizard. Any changes you made before typing "exit" will be applied.

Restart the key manager setup wizard with "security key-manager setup". To accept a default or omit a question, do not enter a value.

Would you like to configure onboard key management? {yes, no} [yes]: yes
Enter the cluster-wide passphrase for onboard key management. To continue the configuration, enter the passphrase, otherwise type "exit":
Re-enter the cluster-wide passphrase:
After configuring onboard key management, save the encrypted configuration data in a safe location so that you can use it if you need to perform a manual recovery operation. To view the data, use the "security key-manager backup show" command.
```

- `security key-manager update-passphrase` on page 491

security key-manager show

Display key management servers

Availability: This command is available to `cluster` administrators at the `admin` privilege level.

Description

This command displays the key management servers configured on the cluster. This command is not supported when onboard key management is enabled.
Parameters

\{-fields \langle\text{fieldname}\rangle, ...\}

If you specify the \(-fields \langle\text{fieldname}\rangle, ...\) parameter, the command output also includes the specified field or fields. You can use \(-fields ?\) to display the fields to specify.

\{-status\}

If you specify this parameter, the command displays the status of each key management server.

\{-instance\}

If you specify the \(-instance\) parameter, the command displays detailed information about all fields.

\{-node \{\langle\text{nodename}\rangle|local\}\} - Node

This parameter specifies the name of the node that you want to retrieve key management server status for. If parameter is not specified, all nodes will retrieve the key management servers status.

\{-address \langle\text{IP Address}\rangle\} - IP Address

Shows only a key management server registered with the input address. It is also possible to show multiple key management servers.

\{-server-port \langle\text{integer}\rangle\} - Server TCP Port

If you specify this parameter, the command displays only key servers listening on this port.

Examples

The following example lists all configured key management servers:

```
cluster-l::> security key-manager show
Node                Registered Key Manager
------------------  ---------------------------
nodel               10.225.89.33
node2               10.225.89.33
```

The following example lists all configured key management servers, the TCP port on which those servers are expected to listen for incoming KMIP connections, and their server status:

```
cluster-l::> security key-manager show -status
Node    Port    Registered Key Manager       Status
----------------------  ---------------------------  ---------------
nodel1  5696    10.225.89.33                 available
node2   5696    10.225.89.33                 available
```

security key-manager update-passphrase

Update cluster-wide passphrase

Availability: This command is available to \textit{cluster} administrators at the \textit{advanced} privilege level.

Description

The \texttt{security key-manager update-passphrase} command provides a way to update the cluster-wide passphrase, created initially by running the \texttt{security key-manager setup} command, that is used for onboard key management. This command prompts for the existing passphrase, and if that passphrase is correct then the command prompts for a new passphrase.

When the \texttt{security key-manager update-passphrase} command is executed in a MetroCluster configuration, then run the \texttt{security key-manager setup} command with the new passphrase on the partner site before proceeding with any key-manager operations. This allows the updated passphrase to be replicated to the partner site.
Examples
The following example updates the cluster-wide passphrase used for onboard key management:

```
cluster-1:~*> security key-manager update-passphrase

Warning: This command will reconfigure the cluster passphrase for onboard key-management.
Do you want to continue? {y|n}: y

Enter current passphrase:
Enter new passphrase:
Reenter the new passphrase:
```

Update passphrase has completed. Save the new encrypted configuration data in a safe location so that you can use it if you need to perform a manual recovery operation. To view the data, use the "security key-manager backup show" command.

- security key-manager backup commands

security key-manager backup commands

The backup directory

security key-manager backup show

Show salt and wrapped keys as a hex dump

Availability: This command is available to cluster administrators at the admin privilege level.

Description
This command displays the backup information for onboard key management, which would be used to recover the cluster in case of catastrophic situations. The information displayed is for the cluster as a whole (not individual nodes). This command is not supported for an external key management configuration.

Examples
The following example displays the onboard key management backup data for the cluster:

```
cluster-1:~*> security key-manager backup show

```

---BEGIN BACKUP---

---END BACKUP---

Commands: Manual Page Reference
security key-manager certificate commands

The certificate directory

security key-manager certificate update

(DEPRECATED)-Update key manager SSL certificates

Availability: This command is available to cluster administrators at the admin privilege level.

Description

Note: This command is deprecated and might be removed in a future release of Data ONTAP.

This command updates the SSL/TLS certificate in-place without requiring the original SSL/TLS certificate to be deleted. This command is not supported when onboard key management is enabled.

Parameters

-type {client|server} - (DEPRECATED)-SSL Certificate Type

This parameter is either "client" or "server". If "client", the internal client certificate is replaced. If "server", the internal server certificate is replaced.

-[address <IP Address>] - (DEPRECATED)-Key Manager IP Address

This parameter updates the key manager server certificate for a particular key management server at the given IP address.

Examples

The following example is for updating a server certificate:

```
cluster-l::> security key-manager certificate update -type server -address 10.232.186.8
Node: node1
Key manager 10.232.186.8 certificate-authority certificate will be updated.
Update successful.
```

```
Node: node2
Key manager 10.232.186.8 certificate-authority certificate will be updated.
Update successful.
```

The following example is for updating a client certificate:

```
cluster-l::> security key-manager certificate update -type client
Node: node1
The system client certificate registered with key manager will be updated.
Update successful.
```
security key-manager key commands

The key directory

security key-manager key show

Display Encryption Key IDs

Availability: This command is available to cluster administrators at the admin privilege level.

Description
This command displays the key IDs of the authentication keys (NSE-AK) and vserv keys (SVM-KEK) that are available in onboard key management. This command is not supported for an external key management configuration.

Parameters

{-fields <fieldname>, ...}
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

[-detail]
If this parameter is specified, the command displays additional details about the key IDs.

[-instance]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-node <nodename>|local] - Node
If this parameter is specified, the command displays information only about key IDs that are located on the specified storage system.

[-key-store <Key Store>] - Key Store
If this parameter is specified, the command displays information only about key IDs that are managed by the specified key management. For example, use onboard for onboard key management.

[-key-id <text>] - Key Identifier
If this parameter is specified, the command displays information only about the specified key IDs.

[-key-tag <text>] - Key Tag
If this parameter is specified, the command displays information only about key IDs that have the specified key tags.

[-key-location <text>] - Key Location
If this parameter is specified, the command displays information only about key IDs that are located on the specified key location. For example, use local-cluster for onboard key management.

[-used-by <Key Usage Type>] - Used By
If this parameter is specified, the command displays information only about key IDs that are associated with the specified application usage of the keys. For example, "NSE-AK" would display key IDs only for NSE drives.
-restored (yes|no) - Restored

If this parameter is specified, the command displays information only about key IDs that have the specified value of restored keys. If restored is yes, then the corresponding key is available (normal). If restored is no, use the security key-manager setup command to restore the key. See the man page for security key-manager setup for details.

Examples

The following example shows all keys stored in the onboard key manager:

```
cluster-1::> security key-manager key show
```

Node: node1
Key Store: onboard
Key ID
----------------------------------------

security key-manager setup on page 489

security key-manager commands 495
security login commands

Manage login methods, roles, and passwords

security login create

Add a login method

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The security login create command creates a login method for the management utility. A login method consists of a user name, an application (access method), and an authentication method. A user name can be associated with multiple applications. It can optionally include an access-control role name. If an Active Directory, LDAP, or NIS group name is used, then the login method gives access to users belonging to the specified group. If the user is a member of multiple groups provisioned in the security login table, then the user will get access to a combined list of the commands authorized for the individual groups.

Parameters

-vserver <Vserver Name> - Vserver

This specifies the Vserver name of the login method.

-user-or-group-name <text> - User Name or Group Name

This specifies the user name or Active Directory, LDAP, or NIS group name of the login method. The Active Directory, LDAP, or NIS group name can be specified only with the domain or nsswitch authentication method and ontapi and ssh application. If the user is a member of multiple groups provisioned in the security login table, then the user will get access to a combined list of the commands authorized for the individual groups.

-application <text> - Application

This specifies the application of the login method. Possible values include console, http, ontapi, rsh, snmp, service-processor, ssh, and telnet.

Setting this parameter to service-processor grants the user access to the Service Processor (SP). Because the SP supports only password authentication, when you set this parameter to service-processor, you must also set the -authentication-method parameter to password. Vserver user accounts cannot access the SP. Therefore, you cannot use the -vserver parameter when you set this parameter to service-processor.

-authentication-method <text> - Authentication Method

This specifies the authentication method for login. Possible values include the following:

- cert - SSL certificate authentication
- community - SNMP community strings
- domain - Active Directory authentication
- nsswitch - LDAP or NIS authentication
- password - Password
- publickey - Public-key authentication
- usm - SNMP user security model
- saml - SAML authentication
[-remote-switch-ipaddress <IP Address>] - Remote Switch IP Address
This specifies the IP address of the remote switch. The remote switch could be a cluster switch monitored by cluster switch health monitor (CSHM) or a Fibre Channel (FC) switch monitored by MetroCluster health monitor (MCC-HM). This parameter is applicable only when the application is snmp and authentication method is usm (SNMP user security model).

-role <text> - Role Name
This specifies an access-control role name for the login method.

[-comment <text>] - Comment Text
This specifies comment text for the user account, for example, "Guest account". The maximum length is 128 characters.

[-is-ns-switch-group {yes|no}] - Whether Ns-switch Group
This specifies whether user-or-group-name is an LDAP or NIS group. Possible values are yes or no. Default value is no.

[-second-authentication-method {none|publickey|password}] - Second Authentication Method
This specifies the authentication method for the login. It will be used as the second factor for authentication. Possible values include the following:
- password - Password
- publickey - Public-key authentication
- none - default value

Examples
The following example illustrates how to create a login that has the user name monitor, the application ssh, the authentication method password, and the access-control role guest for Vserver vs:

```
cluster1::> security login create -vserver vs -user-or-group-name monitor -application ssh -authentication-method password -role guest
```

The following example illustrates how to create a login that has the user name monitor, the application ontapi, the authentication method password, and the access-control role vsadmin for Vserver vs:

```
cluster1::> security login create -vserver vs -user-or-group-name monitor -application ontapi -authentication-method password -role vsadmin
```

The following example illustrates how to create a login that has the user name monitor, the application ssh, the authentication method pubkey, and the access-control role guest for Vserver vs:

```
cluster1::> security login create -vserver vs -user-or-group-name monitor -application ssh -authentication-method pubkey -role guest
```

The following example illustrates how to create a login that has the user name monitor, the application http, the authentication method cert, and the access-control role admin for Vserver vs:

```
cluster1::> security login create -vserver vs -user-or-group-name monitor -application http -authentication-method cert -role admin
```

The following example illustrates how to create a login that has the Active Directory group name adgroup in DOMAIN1, the application ssh, the authentication method domain, and the access-control role vsadmin for Vserver vs:

```
cluster1::> security login create -vserver vs -user-or-group-name DOMAIN1\adgroup -application ssh -authentication-method domain -role vsadmin
```
The following example illustrates how to create a login that has a group name `nssgroup` in the LDAP or NIS server, the application `ontapi`, the authentication method `nsswitch`, and the access-control role `vsadmin` for Vserver `vs`. Here `is-ns-switch-group` must be set to `yes`:

```
cluster1::> security login create -vserver vs -user-or-group-name nssgroup -application ontapi -
authentication-method nsswitch -role vsadmin -is-ns-switch-group yes
```

The following example illustrates how to create a login that has the user name `monitor`, the application `ssh`, the authentication method `password`, the second authentication method `publickey` and the access-control role `vsadmin` for Vserver `vs`:

```
cluster1::> security login create -vserver vs -user-or-group-name monitor -application ssh -
authentication-method password -second-authentication-method publickey -role vsadmin
```

The following example illustrates how to create a login that has the user name `monitor`, the application `ssh`, the authentication method `password`, the second authentication method `none` and the access-control role `vsadmin` for Vserver `vs`:

```
cluster1::> security login create -vserver vs -user-or-group-name monitor -application ssh -
authentication-method password -second-authentication-method none -role vsadmin
```

---

**security login delete**

Delete a login method

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**
The `security login delete` command deletes a login method.

**Parameters**

- `-vserver <Vserver Name>` - Vserver
  
  This optionally specifies the Vserver name of the login method.

- `-user-or-group-name <text>` - User Name or Group Name
  
  This specifies the user name or Active Directory, LDAP, or NIS group name of the login method that is to be deleted. A user name can be associated with multiple applications.

- `-application <text>` - Application
  
  This specifies the application of the login method. Possible values include console, http, ontapi, rsh, snmp, service-processor, ssh, and telnet.

- `-authentication-method <text>` - Authentication Method
  
  This specifies the authentication method of the login method. Possible values include the following:

  - cert - SSL certificate authentication
  - community - SNMP community strings
  - domain - Active Directory authentication
  - nsswitch - LDAP or NIS authentication
  - password - Password
  - publickey - Public-key authentication
  - usm - SNMP user security model
• saml - SAML authentication

[-remote-switch-ipaddress <IP Address>] - Remote Switch IP Address

This specifies the IP address of the remote switch. The remote switch could be a cluster switch monitored by cluster switch health monitor (CSHM) or a Fibre Channel (FC) switch monitored by MetroCluster health monitor (MCC-HM). This parameter is applicable only when the application is snmp and authentication method is usm (SNMP user security model).

Examples

The following example illustrates how to delete a login that has the username guest, the application ssh, and the authentication method password for Vserver vs:

```
cluster1::> security login delete -user-or-group-name guest -application ssh -authentication-method password -vserver vs
```

The following example illustrates how to delete a login that has the username guest, the application ontapi, and the authentication method cert for Vserver vs:

```
cluster1::> security login delete -user-or-group-name guest -application ontapi -authentication-method cert -vserver vs
```

The following example illustrates how to delete a login that has the Active Directory group name adgroup in DOMAIN1, the application ssh, and the authentication method domain for Vserver vs:

```
cluster1::> security login delete -user-or-group-name DOMAIN1\adgroup -application ssh -authentication-method domain -vserver vs
```

The following example illustrates how to delete a login that has a group name nssgroup in the LDAP or NIS server, the application ontapi, and the authentication method nsswitch for Vserver vs:

```
cluster1::> security login delete -user-or-group-name nssgroup -application ontapi -authentication-method nsswitch -vserver vs
```

security login expire-password

Expire user's password

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The security login expire-password command expires a specified user account password, forcing the user to change the password upon next login.

Parameters

-vserver <Vserver Name> - Vserver

This optionally specifies the Vserver to which the user account belongs.

-username <text> - Username

This specifies the user name of the account whose password you want to expire.

[-hash-function {sha512|sha256}] - Password Hash Function

This optionally specifies the password-hashing algorithm used for encrypting the passwords that you want to expire. The supported values include are as follows:

• sha512 - Secure hash algorithm (512 bits)
- sha256 - Secure hash algorithm (256 bits)
- md5 - Message digest algorithm (128 bits)

[[-lock-after <integer>]] - Lock User Account After N days (privilege: advanced)
This optionally specifies the number of days after which the new password hash policy will be enforced. The enforcement will lock all user accounts that are still compliant with the provided hash algorithm using the `-hash-function` parameter.

**Examples**
The following command expires the password of the 'jdoe' user account which belongs to the 'vs1' Vserver.

```
cluster1::> security login expire-password -vserver vs1 -username jdoe
```

The following command expires all user account passwords that are encrypted with the MD5 hash function.

```
cluster1::> security login expire-password -vserver * -username * -hash-function md5
```

The following command expires the password of any Vserver's user account named 'jdoe' that is encrypted with the MD5 hash function.

```
cluster1::> security login expire-password -vserver * -username jdoe -hash-function md5
```

The following command expires the password of the 'vs1' Vserver user account named 'jdoe' that is encrypted with the MD5 hash function.

```
cluster1::> security login expire-password -vserver vs1 -username jdoe -hash-function md5
```

The following command expires all user account passwords that are encrypted with the MD5 hash function and enforce the new password hash policy after 180 days.

```
cluster1::> security login expire-password -vserver * -username * -hash-function md5 -lock-after 180
```

**security login lock**
Lock a user account with password authentication method

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**
The security login lock command locks a specified account, preventing it from accessing the management interface.

**Parameters**
- `-vserver <Vserver Name>` - Vserver
  This optionally specifies the Vserver to which the user account belongs.
- `-username <text>` - Username
  This specifies the user name of the account that is to be locked.

**Examples**
The following example locks a user account named 'jdoe' which belongs to the Vserver 'vs1'.
security login modify

Modify a login method

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The security login modify command modifies the access-control role name of a login method. If the user is a member of multiple groups provisioned in the security login table, then the user will get access to a combined list of the commands authorized for the individual groups.

Parameters
-vserver <Vserver Name> - Vserver
This specifies the Vserver name of the login method.

-user-or-group-name <text> - User Name or Group Name
This specifies the user name, Active Directory, LDAP, or NIS group name of the login method that is to be modified. A user name can be associated with multiple applications. If the user is a member of multiple groups provisioned in the security login table, then the user will get access to a combined list of the commands authorized for the individual groups.

-application <text> - Application
This specifies the application of the login method. Possible values include console, http, ontapi, rsh, snmp, service-processor, ssh, and telnet.

-authentication-method <text> - Authentication Method
This specifies the authentication method of the login method. Possible values include the following:

- cert - SSL certificate authentication
- community - SNMP community strings
- domain - Active Directory authentication
- nsswitch - LDAP or NIS authentication
- password - Password
- publickey - Public-key authentication
- usm - SNMP user security model
- saml - SAML authentication

[-remote-switch-ipaddress <IP Address>] - Remote Switch IP Address
This specifies the IP address of the remote switch. The remote switch could be a cluster switch monitored by cluster switch health monitor (CSHM) or a Fibre Channel (FC) switch monitored by MetroCluster health monitor (MCC-HM). This parameter is applicable only when the application is snmp and authentication method is usm (SNMP user security model).

[-role <text>] - Role Name
This modifies the access-control role name for the login method.

[-comment <text>] - Comment Text
This specifies comment text for the user account, for example, "Guest account". The maximum length is 128 characters.
[-is-ns-switch-group {yes|no}] - Whether Ns-switch Group

This specifies if user-or-group-name is an LDAP or NIS group. Possible values are yes or no. Default value is no.

[-second-authentication-method {none|publickey|password}] - Second Authentication Method

This specifies the authentication method for the login method. It will be used as the second factor for authentication. Possible values include the following:

- password - Password
- publickey - Public-key authentication
- none - default value

Examples

The following example illustrates how to modify a login method that has the user name guest, the application ontapi, and the authentication method password to use the access-control role guest for Vserver vs:

```bash
cluster1::> security login modify -user-or-group-name guest -application ontapi -authentication-method password -role guest -vserver vs
```

The following example illustrates how to modify a login method that has the user name guest, the application ssh, and the authentication method publickey to use the access-control role vsadmin for Vserver vs:

```bash
cluster1::> security login modify -user-or-group-name guest -application ssh -authentication-method publickey -role vsadmin -vserver vs
```

The following example illustrates how to modify a login method that has the group name nssgroup, the application ontapi, and the authentication method nsswitch to use the access-control role readonly for Vserver vs. Here is-ns-switch-group must be set to yes:

```bash
cluster1::> security login modify -user-or-group-name nssgroup -application ontapi -authentication-method nsswitch -role readonly -vserver vs -is-ns-switch-group yes
```

The following example illustrates how to modify a login method that has the user name guest, the application ssh, and the authentication method publickey to use the second-authentication-method password for Vserver vs:

```bash
cluster1::> security login modify -user-or-group-name guest -application ssh -authentication-method publickey -second-authentication-method password -vserver vs
```

The following example illustrates how to modify a login method to have individual authentication methods that have the user name guest, the application ssh, and the authentication method publickey to use the second-authentication-method none for Vserver vs:

```bash
cluster1::> security login modify -user-or-group-name guest -application ssh -authentication-method publickey -second-authentication-method none -vserver vs
```

security login password

Modify a password for a user

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The security login password command resets the password for a specified user. The command prompts you for the user's old and new password.
Parameters
-vserver <Vserver Name> - Vserver
   This optionally specifies the Vserver name of the login method.

-username <text> - Username
   This optionally specifies the user name whose password is to be changed. If you do not specify a user, the command defaults to the user name you are currently using.

Examples
The following command initiates a password change for the 'admin' user account of the 'vs' Vserver.

   cluster1:/> security login password -username admin -vserver vs

The following command initiates a password change for the 'vs' Vserver user account named 'admin'. The new password will be encrypted by using the SHA512 password-hashing algorithm.

   cluster1:/> security login password -username admin -vserver vs -hash-function sha512

The following command initiates a password change for the 'vs' Vserver user account named 'admin'. The new password will be encrypted by using the SHA256 password-hashing encryption algorithm.

   cluster1:/> security login password -username admin -vserver vs -hash-function sha256

security login password-prepare-to-downgrade

Reset password features introduced in the Data ONTAP version

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
If the password of the system administrator is not encrypted with an encryption type supported by releases earlier than ONTAP 9.0, this command prompts the administrator for a new password and encrypt it using a supported encryption type on each cluster or at each site in a MetroCluster configuration. In a MetroCluster configuration, this command must be run on both sites. The password for all other users are marked as 'expired'. This causes them to be re-encrypted using a compatible encryption type. The expired passwords are changed with an internally generated password. The administrator must change the passwords for all users before the users can login. The users are prompted to change their password upon login. This command disables the logging of unsuccessful login attempts. The command must be run by a user with the cluster admin role from a clustershell session on the console device. This user must be unlocked. If you fail to run this command, the revert process fails.

Parameters
-disable-feature-set <downgrade version> - Data ONTAP Version
   This parameter specifies the Data ONTAP version that introduced the password feature set.

Examples
The following command disables the logging of unsuccessful login attempts.

   cluster1:/> security login password prepare-to-downgrade -disable-feature-set 8.3.1

   Warning: This command will disable the MOTD feature that prints unsuccessful login attempts.
   Do you want to continue? {y|n}: y
   cluster1:/>
The following command prompts system administrator to enter password and encrypt it with the hashing algorithm supported by releases earlier than Data ONTAP 9.0.

```
cluster1::*> security login password prepare-to-downgrade -disable-feature-set 9.0.0
```

Warning: If your password is not encrypted with an encryption type supported by releases earlier than Data ONTAP 9.0.0, this command will prompt you for a new password and encrypt it using a supported encryption type on each cluster or at each site in a MetroCluster configuration. In a MetroCluster configuration, this command must be run on both sites.

The password for all other users are marked as "expired" and changed to an internally generated password. The administrator must change the passwords for all users before the users can login. The users are prompted to change their password upon login.

Do you want to continue? {y|n}:

Enter a new password:
Enter it again:

```
cluster1::*> security login show
```

**security login show**

Show user login methods

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

The security login show command displays the following information about user login methods:

- User name
- Application (console, http, ontapi, rsh, snmp, service-processor, ssh, or telnet)
- Authentication method (community, password, publickey, or usm)
- Role name
- Whether the account is locked
- Whether the user name refers to nsswitch group
- Password hash function

**Parameters**

```
[-fields <fieldname>, ...]  
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance ]  
If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver  
Displays the login methods that match the specified Vserver name.

[-user-or-group-name <text>] - User Name or Group Name  
Displays the login methods that match this parameter value. Value can be a user name or Active Directory, LDAP, or NIS group name.

[-application <text>] - Application  
Displays the login methods that match the specified application type. Possible values include console, http, ontapi, rsh, snmp, service-processor, ssh, and telnet.
```
[-authentication-method <text>] - Authentication Method
    Displays the login methods that match the specified authentication method. Possible values include the
    following:
    • cert - SSL certificate authentication
    • community - SNMP community strings
    • domain - Active Directory authentication
    • nsswitch - LDAP or NIS authentication
    • password - Password
    • publickey - Public-key authentication
    • usm - SNMP user security model
    • saml - SAML authentication

[-remote-switch-ipaddress <IP Address>] - Remote Switch IP Address
    Displays the login methods that match the specified IP address of the remote switch. The remote switch could
    be a cluster switch monitored by cluster switch health monitor (CSHM) or a Fibre Channel (FC) switch
    monitored by MetroCluster health monitor (MCC-HM). This parameter is applicable only when the
    application is snmp and authentication method is usm (SNMP user security model).

[-role <text>] - Role Name
    Displays the login methods that match the specified role.

[-is-account-locked {yes|no}] - Account Locked
    Displays the login methods that match the specified account lock status.

[-comment <text>] - Comment Text
    Displays the login methods that match the specified comment text.

[-is-ns-switch-group {yes|no}] - Whether Ns-switch Group
    This specifies whether user-or-group-name is an LDAP or NIS group. Possible values are yes or no.

[-hash-function {sha512|sha256}] - Password Hash Function (privilege: advanced)
    Displays the login methods that match the specified password-hashing algorithm. Possible values are:
    • sha512 - Secure hash algorithm (512 bits)
    • sha256 - Secure hash algorithm (256 bits)
    • md5 - Message digest algorithm (128 bits)

[-second-authentication-method {none|publickey|password}] - Second Authentication Method2
    Displays the login methods that match the specified authentication method to be used as the second factor.
    Possible values include the following:
    • password - Password
    • publickey - Public-key authentication
    • none - default value

**Examples**
The example below illustrates how to display information about all user login methods:
security login unlock

Unlock a user account with password authentication method

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The security login unlock command unlocks a specified account, enabling it to access the management interface.

Parameters
-vserver <Vserver Name> - Vserver
This optionally specifies the Vserver to which the user account belongs.

-username <text> - Username
This specifies the user name of the account that is to be unlocked.

Examples
The following command unlocks a user account named jdoe which belongs to the Vserver vs1.

cluster1::> security login unlock -vserver vs1 -username jdoe

security login whoami

Show the current user and role of this session

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The security login whoami command displays the name and role of the user logged in at the current console session. It takes no options or other parameters.
Examples

The following example shows that the current session is logged in by using the 'admin' user account:

```
cluster1::> whoami
(security login whoami)
User: admin
Role: admin
```

SSH login banner

Manage the login banner

The SSH login banner management commands.

security login banner modify

Modify the login banner message

Availability: This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

Description
The `security login banner modify` command modifies the login banner. The login banner is printed just before the authentication step during the SSH and console device login process.

Parameters

- `-vserver <Vserver Name>` - Vserver Name
  Use this parameter to specify the Vserver whose banner will be modified. Use the name of the cluster admin Vserver to modify the cluster-level message. The cluster-level message is used as the default for data Vservers that do not have a message defined.

{ [-message <text>] - Login Banner Message
  This optional parameter can be used to specify a login banner message. If the cluster has a login banner message set, the cluster login banner will be used by all data Vservers as well. Setting a data Vserver's login banner will override the display of the cluster login banner. To reset a data Vserver's login banner to use the cluster login banner, use this parameter with the value "-".

  If you use this parameter, the login banner cannot contain newlines (also known as end of lines (EOLs) or line breaks). To enter a login banner message with newlines, do not specify any parameter. You will be prompted to enter the message interactively. Messages entered interactively can contain newlines.

  Non-ASCII characters must be provided as Unicode UTF-8.

| [-uri {(ftp|http)://(hostname|IPv4 Address|'['IPv6 Address']')}...]} - Download URI for the Banner Message
  Use this parameter to specify the URI from where the login banner will be downloaded. Note that the message must not exceed 2048 bytes in length. Non-ASCII characters must be provided as Unicode UTF-8.

Examples

This example shows how to enter a login banner interactively:
security login banner modify

Enter the login banner for Vserver "cluster1".
Max size: 2048. Enter a blank line to terminate input. Press Ctrl-C to abort.

cluster1::>

security login banner show

Display the login banner message

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The security login banner show command displays the login banner.

Parameters
{{ -fields <fieldname>, ... }}
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

| -instance ]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver Name
Selects login banners that match the specified value. Use the name of the admin Vserver to specify the cluster-level login banner.

[-message <text>] - Login Banner Message
Selects login banners that match the specified value. By default, this command will not display unconfigured, or empty, login banners. To display all banners, specify -message *.

Examples
The following shows sample output from this command:

cluster1::> security login banner show
Message
-----------------------------------------------
Authorized users only!

security login domain-tunnel commands

The domain-tunnel directory

security login domain-tunnel create

Add authentication tunnel Vserver for administrative Vserver

Availability: This command is available to cluster administrators at the admin privilege level.
Description
This command establishes a gateway (tunnel) for authenticating Windows Active Directory (AD) domain users' access to the cluster.

Before using this command to establish the tunnel, the following must take place:

- You must use the `security login create` command to create one or more AD domain user accounts that will be granted access to the cluster.
  - The `-authmethod` parameter of the `security login create` command must be set to 'domain'.
  - The `-username` parameter of the `security login create` command must be set to a valid AD domain user account that is defined in a Windows Domain Controller's Active Directory. The user account must be specified in the format of `<domainname>\<username>`, where "domainname" is the name of the CIFS domain server.
- You must identify or create a CIFS-enabled data Vserver that will be used for Windows authentication with the Active Directory server. This Vserver is the tunnel Vserver, and it must be running for this command to succeed.

Only one Vserver can be used as the tunnel. If you attempt to specify more than one Vserver for the tunnel, Data ONTAP returns an error. If the tunnel Vserver is stopped or deleted, AD domain users' authentication requests to the cluster will fail.

Parameters
-v<server> - Authentication Tunnel Vserver
This parameter specifies a data Vserver that has been configured with CIFS. This Vserver will be used as the tunnel for authenticating AD domain users' access to the cluster.

Examples
The following commands create an Active Directory domain user account ('DOMAIN1\Administrator') for the 'cluster1' cluster, create a data Vserver ('vs'), create a CIFS server ('vscifs') for the Vserver, and specify 'vs' as the tunnel for authenticating the domain user access to the cluster.

```
cluster1::> security login create -vserver cluster1 -username DOMAIN1\Administrator -application ssh -authmethod domain -role admin
cluster1::> vserver create -vserver vs -rootvolume vol -aggregate aggr -rootvolume-security-style mixed
cluster1::> vserver cifs create -vserver vs -cifs-server vscifs -domain companyname.example.com -ou CN=Computers
cluster1::> security login domain-tunnel create -vserver vs
```

- `vserver cifs create` on page 1607

security login domain-tunnel delete
Delete authentication tunnel Vserver for administrative Vserver

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The `security login domain-tunnel delete` command deletes the tunnel established by the `security login domain-tunnel create` command. An error message will be generated if no tunnel exists.
Examples
The following command deletes the tunnel established by `security login domain-tunnel create`.

```
cluster1::> security login domain-tunnel delete
```

Related references
`security login domain-tunnel create` on page 508

`security login domain-tunnel modify`
Modify authentication tunnel Vserver for administrative Vserver

Availability: This command is available to `cluster` administrators at the `admin` privilege level.

Description
The `security login domain-tunnel modify` command modifies or replaces the tunnel Vserver. If a tunnel Vserver is not already specified, it sets the current tunnel Vserver with this Vserver, otherwise, it replaces the current tunnel Vserver with the Vserver that you specify. If the tunnel Vserver is changed, authentication requests via previous Vserver will fail. See `security login domain-tunnel create` for more information.

Parameters
`[-vserver <vserver>]` - Authentication Tunnel Vserver
This parameter specifies a Vserver that has been configured with CIFS and is associated with a Windows Domain Controller's Active Directory authentication. This Vserver will be used as an authentication tunnel for login accounts so that they can be used with administrative Vservers.

Examples
The following command modifies the tunnel Vserver for administrative Vserver.

```
cluster1::> security login domain-tunnel modify -vserver vs
```

Related references
`security login domain-tunnel create` on page 508

`security login domain-tunnel show`
Show authentication tunnel Vserver for administrative Vserver

Availability: This command is available to `cluster` administrators at the `admin` privilege level.

Description
The `security login domain-tunnel show` command shows the tunnel Vserver that was specified by the `security login domain-tunnel create` or `security login domain-tunnel modify` command.

Examples
The example below shows the tunnel Vserver, `vs`, that is currently used as an authentication tunnel. The output informs you that the table is currently empty if tunnel Vserver has not been specified.

security login domain-tunnel modify on page 510

security login motd commands

Manage the message of the day (MOTD)
Manage the clustershell message of the day (MOTD).

security login motd modify

Modify the message of the day

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The security login motd modify command updates the message of the day (MOTD).

There are two categories of MOTDs: the cluster-level MOTD and the data Vserver-level MOTD. A user logging in to a data Vserver's clustershell will potentially see two messages: the cluster-level MOTD followed by the Vserver-level MOTD for that Vserver. The cluster administrator can enable or disable the cluster-level MOTD on a per-Vserver basis. If the cluster administrator disables the cluster-level MOTD for a Vserver, a user logging into the Vserver will not see the cluster-level message. Only a cluster administrator can enable or disable the cluster-level message.

Parameters

-vserver <Vserver Name> - Vserver Name
Use this parameter to specify the Vserver whose MOTD will be modified. Use the name of the cluster admin Vserver to modify the cluster-level message.

{-message <text>} - Message of the Day (MOTD)
This optional parameter can be used to specify a message. If you use this parameter, the MOTD cannot contain newlines (also known as end of lines (EOLs) or line breaks). If you do not specify any parameter other than the -vserver parameter, you will be prompted to enter the message interactively. Messages entered interactively can contain newlines. Non-ASCII characters must be provided as Unicode UTF-8.

The message may contain dynamically generated content using the following escape sequences:

• \ - A single backlash character.
• \b - No output: supported for compatibility with Linux only.
• \c - Cluster name.
• \d - Current date as set on the login node.
• \t - Current time as set on the login node.
• \I - Incoming LIF IP address (prints 'console' for a console login).
• \l - Login device name (prints 'console' for a console login).
• \L - Last login for the user on any node in the cluster.
• \m - Machine architecture.
• \n - Node or data Vserver name.
• \N - Name of user logging in.
• \o - Same as \O. Provided for Linux compatibility.
• \O - DNS domain name of the node. Note that the output is dependent on the network configuration and may be empty.
• \r - Software release number.
• \s - Operating system name.
• \u - Number of active clustershell sessions on the local node. For the cluster admin: all clustershell users. For the data Vserver admin: only active sessions for that data Vserver.
• \u - Same as \u, but has 'user' or 'users' appended.
• \v - Effective cluster version string.
• \w - Active sessions across the cluster for the user logging in ('who').

A backslash followed by any other character is emitted as entered.

```
[-uri {http://(hostname|IPv4 Address|'['IPv6 Address']')...}] - Download URI for the MOTD
```

Use this parameter to specify the URI from where the message of the day will be downloaded. Note that the message must not exceed 2048 bytes in length. Non-ASCII characters must be provided as Unicode UTF-8.

```
[-is-cluster-message-enabled {true|false}] - Is Cluster-level Message Enabled?
```

Use this parameter to enable or disable the display of the cluster-level MOTD for the specified Vserver.

### Examples

This example shows how to enter a MOTD interactively:

```
cluster1::> security login motd modify -vserver vs0

Enter the message of the day for Vserver "vs0".
Max size: 2048. Enter a blank line to terminate input. Press Ctrl-C to abort.
0 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23
12345678901234567890123456789012345678901234567890123456789012345678901234567890
Welcome to the Vserver!

cluster1::>
```

### security login motd show

Display the message of the day

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**

The `security login motd show` command displays information about the cluster-level and data Vserver clustershell message of the day (MOTD).
Parameters

\{ [-\textit{fields} <\textit{fieldname}>], ... \}

If you specify the \textit{-fields} \textit{<fieldname>}, ... parameter, the command output also includes the specified field or fields. You can use \textit{-fields ?} to display the fields to specify.

\{ [-\textit{instance}] \}

If you specify the \textit{-instance} parameter, the command displays detailed information about all fields.

\textit{-vserver <Vserver Name>} - Vserver Name

Selects the message of the day entries that match this parameter value. Use the name of the cluster admin Vserver to see the cluster-level MOTD.

\textit{-message <text>} - Message of the Day (MOTD)

Selects the message of the day entries that match this parameter value.

\textit{-is-cluster-message-enabled \{true|false\}} - Is Cluster-level Message Enabled?

Selects the message of the day entries that match this parameter value.

Examples

The following example displays all message of the day entries:

```
class1::> security login motd show
Vserver: class1
Is the Cluster MOTD Displayed?: true
Message _____________________________________________________________
The cluster is running normally.
Vserver: vs0
Is the Cluster MOTD Displayed?: true
Message _____________________________________________________________
Welcome to the Vserver!
2 entries were displayed.
```

security login publickey commands

Manage public keys

security login publickey create

Add a new public key

\textbf{Availability:} This command is available to cluster and Vserver administrators at the admin privilege level.

\textbf{Description}

The \texttt{security login publickey create} associates an existing public key with a user account. This command requires that you enter a valid OpenSSH-formatted public key, a user name, index number, and optionally, a comment.

\textbf{Parameters}

\textit{-vserver <Vserver Name>} - Vserver

This parameter optionally specifies the Vserver of the user for whom you are adding the public key.

\textit{-username <text>} - Username

This parameter specifies the name of the user for whom you are adding the public key. If you do not specify a user, the user named admin is specified by default.
[--index <integer>] - Index
   This parameter specifies an index number for the public key. The default value is the next available index value, starting with zero if it is the first public key created for the user.

--publickey <certificate> - Public Key
   This specifies the OpenSSH public key, which must be enclosed in double quotation marks.

[--comment <text>] - Comment
   This optionally specifies comment text for the public key. Note that comment text should be enclosed in quotation marks.

Examples

The following command associates a public key with a user named tsmith for Vserver vs1. The public key is assigned index number 5 and the comment text is “This is a new key”.

```
cluster1::> security login publickey create -vserver vs1 -username tsmith -index 5 -publickey
"ssh-rsa AAAAB3NzaC1yc2EAAAABIAwAAAIEAspH64CYbUsDQCdW2zJnK6J
/vU9upKnZAx3k9C1f7YaNRUFm2QeGLu3Q3di8AD0Vfzeb576HPC1xNAIza
FciDy7hnmmjQm5N4EdGur/JNnftQbdhiYybX+72DpPQB0tYW8he6eDJoPlob
ZBGfxZPN8/VjeU44i7W4+s0hG0E=tsmith@publickey.example.com"
-comment "This is a new key"
```

security login publickey delete

Delete a public key

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `security login publickey delete` command deletes a public key for a specific user. To delete a public key, you must specify a user name and index number.

**Parameters**

--vserver <Vserver Name> - Vserver
   This parameter optionally specifies the Vserver of the user for whom you are adding the public key.

--username <text> - Username
   This parameter specifies the name of the user for whom you are deleting a public key. If you do not specify a user, the user named admin is specified by default.

--index <integer> - Index
   This parameter specifies an index number for the public key.

Examples

The following command deletes the public key for the user named tsmith with the index number 5.

```
cluster1::> security login publickey delete -username tsmith -index 5
```

security login publickey load-from-uri

Load one or more public keys from a URI

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.
Description
The `security login publickey load-from-uri` command loads one or more public keys from a Universal Resource Identifier (URI). To load public keys from a URI, you must specify a user name, the URI from which to load them, and optionally, whether you want to overwrite the existing public keys.

Parameters

- `-vserver <vserver name>` - Vserver
  This parameter optionally specifies the Vserver for the user associated with the public keys.

- `-username <text>` - Username
  This parameter specifies the username for the public keys. If you do not specify a username, the username "admin" is used by default.

- `-uri {(ftp|http)://(hostname|IPv4 Address|'['IPv6 Address'])...} - URI to load from`
  This parameter specifies the URI from which the public keys will be loaded.

- `-overwrite {true|false} - Overwrite Entries`
  This parameter optionally specifies whether you want to overwrite existing public keys. The default value for this parameter is `false`. If the value is `true` and you confirm to overwrite, then the existing public keys are overwritten with the new public keys. If you use the value `false` or do not confirm the overwrite, then newly loaded public keys are appended to the list of existing public keys using the next available index.

Examples
The following command shows how to load public keys for the user named tsmith from the URI ftp://ftp.example.com/identity.pub. This user's existing public keys are not overwritten.

```
cluster1::> security login publickey load-from-uri -username tsmith -uri ftp://ftp.example.com/identity.pub -overwrite false
```

The following command shows how to load public keys for the user named tsmith from the URI ftp://ftp.example.com/identity.pub. This user's existing public keys are overwritten if user entered the option 'y' or 'Y'. The user's existing public keys are not overwritten if user entered the option 'n' or 'N' and the newly loaded public keys are appended to the list of existing public keys using the next available index. The user and password credentials that you provide when you use this command are the credentials to access the server specified by the URI.

```
cluster1::> security login publickey load-from-uri -username tsmith -uri ftp://ftp.example.com/identity.pub -overwrite true -vserver vs0
Enter User:
Enter Password:
```

Warning: You are about to overwrite the existing publickeys for the user "tsmith" in Vserver "vs0". Do you want to proceed? [y|n]:

security login publickey modify
Modify a public key

Availability: This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

Description
The `security login publickey modify` command modifies a public key and optionally its comment text.

Parameters

- `-vserver <Vserver Name>` - Vserver
  Specifies the Vserver for the user associated with the public key.
- **username <text>** - Username

  Specifies the username for the public key. If you do not specify a username, the username 'admin' is used by default.

- **index <integer>** - Index

  Specifies the index number of the public key. The index number of the public key can be found by using the `security login publickey show` command.

- **[[-publickey <certificate>]]** - Public Key

  Specifies the new public key. You must enclose the new public key in double quotation marks.

- **[-comment <text>]** - Comment

  Specifies the new comment text for the public key.

### Examples

The following command modifies the public key at index number 10 for the user named tsmith of Vserver vs1:

```
cluster1::> security login publickey modify -vserver vs1 -username tsmith -index 10 -publickey "ssh-rsa AAAAB3NzaC1yc2EAAAADAQABAAABAQDDD+pFzFgV/2dlowKRFgym9K91OH/u+BVTGitCtHteHy08thmaXT 1OLczaOC/12+XXlYMRhBj0D95vo4QQKUXHdCP5lSgR5PnAe39set39ECCLZmduPlJnkWxX66pQH/bq2g3upPcd6z9 c37ugFTVpV8As1sI/9WDOjmeIEM2mJ.JudJeU552W2w5ybgTaN1jxDWus9SO2C43F/vmCCKVTS29UHt/4/ePcaaHOGTiQ O8+Qmm59uTgcfnpq53yYkpeAQV8DrTlMrR44nehI1WZrmW7x5N4XNvtEzr9cvb9qytX1cKQGFDoDb+7T7y3X7M if/qKQY6FsoyjvF2D"
```

### security login publickey show

Display public keys

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**

The `security login publickey show` command displays information about public keys.

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance]
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[-vserver <Vserver Name>] - Vserver
```

Selects the public keys that match this parameter value.

```
[-username <text>] - Username
```

Selects the public keys that match this parameter value.

```
[-index <integer>] - Index
```

Selects the public keys that match this parameter value.

```
[-publickey <certificate>] - Public Key
```

Selects the public keys that match this parameter value.
[-fingerprint <text>] - Hex Fingerprint
Selects the public keys that match this parameter value.

[-bubblebabble <text>] - Bubblebabble Fingerprint
Selects the public keys that match this parameter value.

[-comment <text>] - Comment
Selects the public keys that match this parameter value.

Examples
The example below displays public key information for the user named tsmith.

```
cluster1::> security login publickey show -username tsmith
UserName: tsmith Index: 5
Public Key: ssh-rsa AAAAB3NzaC1yc2EAAAABIwAAAIEAspH64CYbUsDQCdw22JnK6J
/VU9upnKxdz2Azk9C1f7YaWRRUAFNs2QeS1UmQ3ldi8AD0VFbr574R2PC1zNAIza
FciDy7gmnjd9eNgedGr/JNrcfQbLDhZybx+72DpQB0tYNMhe6eDJ1oFlO
2BGKlExh8VjeU44i784+s0H2RE-tsmith8publickey.example.com
Comment: This is a new key
```

security login role commands

Manage access control roles

security login role create

Add an access control role

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The `security login role create` command creates an access-control role. An access-control role consists of a role name and a command or directory to which the role has access. It optionally includes an access level (none, readonly, or all) and a query that applies to the specified command or command directory. After you create an access-control role, you can apply it to a management-utility login account by using the `security login modify` or `security login create` commands.

**Parameters**

- **-vserver <Vserver Name>** - Vserver
  This optionally specifies the Vserver name associated with the role.

- **-role <text>** - Role Name
  This specifies the role that is to be created.

- **-cmddirname <text>** - Command / Directory
  This specifies the command or command directory to which the role has access. To specify the default setting, use the special value "DEFAULT".

- **[-access <Access>]** - Access Level
  This optionally specifies an access level for the role. Possible access level settings are none, readonly, and all. The default setting is all.
[-query <query>] - Query

This optionally specifies the object that the role is allowed to access. The query object must be applicable to the command or directory name specified by -cmddirname. The query object must be enclosed in double quotation marks (""), and it must be a valid field name.

Examples

The following command creates an access-control role named "admin" for the vs1.example.com Vserver. The role has all access to the "volume" command but only within the "aggr0" aggregate.

```
cluster1::> security login role create -role admin -cmddirname volume -query "-aggr aggr0" -access all -vserver vs1.example.com
```

Related references

security login modify on page 501
security login create on page 496

security login role delete

Delete an access control role

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The security login role delete command deletes an access-control role.

Parameters

- **-vserver <Vserver Name>** - Vserver
  
This optionally specifies the Vserver name associated with the role.

- **-role <text>** - Role Name
  
This specifies the role that is to be deleted.

- **-cmddirname <text>** - Command / Directory
  
This specifies the command or command directory to which the role has access. To specify the default setting, use the special value "DEFAULT".

Examples

The following command deletes an access-control role with the role name readonly and the command access "volume" for Vserver vs.example.com.

```
cluster1::> security login role delete -role readonly -cmddirname volume -vserver vs.example.com
```

security login role modify

Modify an access control role

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The security login role modify command modifies an access-control role.
Parameters
-vserver <Vserver Name> - Vserver
This optionally specifies the Vserver name associated with the role.

-role <text> - Role Name
This specifies the role that is to be modified.

-cmddirname <text> - Command / Directory
This specifies the command or command directory to which the role has access. To specify the default setting for a role, use the special value "DEFAULT". This value can be modified only for the roles created for the admin Vserver.

[-access <Access>] - Access Level
This optionally specifies a new access level for the role. Possible access level settings are none, readonly, and all. The default setting is all.

[-query <query>] - Query
This optionally specifies the object that the role is allowed to access. The query object must be applicable to the command or directory name specified by -cmddirname. The query object must be enclosed in double quotation marks (""), and it must be a valid field name.

Examples
The following command modifies an access-control role with the role name readonly and the command access "volume" to have the access level readonly for Vserver vs.example.com:

```
cluster1::> security login role modify -role readonly -cmddirname volume -access readonly -vserver vs.example.com
```

security login role prepare-to-downgrade
Update role configurations so that they are compatible with earlier releases of Data ONTAP

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The security login role prepare-to-downgrade command restores predefined roles of all Vservers earlier than Data ONTAP 8.3.2. You must run this command in advanced privilege mode when prompted to do so during the release downgrade.

Examples
The following command restores predefined roles of all Vservers earlier than Data ONTAP 8.3.2.

```
cluster1::*> security login role prepare-to-downgrade
```

security login role show
Show access control roles

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The security login role show command displays the following information about access-control roles:

- Role name
- Command or command directory to which the role has access
- Access level (none, read-only, or all)
- Query (detailed view only)

**Parameters**

```
[ [-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.
]

[ [-instance ]]  
  If you specify the -instance parameter, the command displays detailed information about all fields.

[ -vserver <Vserver Name> ] - Vserver
  Selects the roles that match this parameter value.

[ -role <text> ] - Role Name
  Selects the roles that match this parameter value. If this parameter and the -cmddirname parameter are both used, the command displays detailed information about the specified access-control role.

[ -cmddirname <text> ] - Command / Directory
  Selects the roles that match this parameter value. If this parameter and the -role parameter are both used, the command displays detailed information about the specified access-control role.

[ -access <Access> ] - Access Level
  Selects the roles that match this parameter value.

[ -query <query> ] - Query
  Selects the roles that match this parameter value.
```

**Examples**

The example below displays information about all access-control roles:

```
cluster1::> security login role show
Vserver     RoleName      Command/Directory                          Query AccessLevel
---------- ------------- -------------------------------- ----- -----------
vs          vsadmin       DEFAULT                                none
vs          vsadmin       dashboard health vserver               readonly
vs          vsadmin       job                                    readonly
vs          vsadmin       job schedule                           none
vs          vsadmin       lun                                    all
vs          vsadmin       network connections                    readonly
cluster1    admin         DEFAULT                                all
cluster1    readonly      DEFUALT                               readonly
cluster1    readonly      volume                                none
```

**security login role show-ontapi**

Display the mapping between Data ONTAP APIs and CLI commands

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The *security login role show-ontapi* command displays Data ONTAP APIs (ONTAPIs) and the CLI commands that they are mapped to.
Parameters
{[-fields <fieldname>, ...]}
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use ‘-fields ?’ to display the fields to specify.

[[-instance]]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-ontapi <text>] - ONTAPI Name
Use this parameter to view the corresponding CLI command for the specified API.

[-command <text>] - CLI Command
Use this parameter to view the corresponding API or APIs for the specified CLI command.

Examples
The following command displays all Data ONTAP APIs and their mapped CLI commands:

```
cluster1::> security login role show-ontapi
ONTAPI                  Command
-------------------------------
aggr-add                storage aggregate add-disks
aggr-check-spare-low    storage aggregate check_spare_low
aggr-create             storage aggregate create
aggr-destroy            storage aggregate delete
aggr-get-filer-info     aggr
aggr-get-iter           storage aggregate show-view
aggr-offline            storage aggregate offline
aggr-online             storage aggregate online
aggr-options-list-info  storage aggregate show
aggr-rename             storage aggregate rename
aggr-restrict           storage aggregate restrict
aggr-set-option         storage aggregate modify
autosupport-budget-get  system node autosupport budget show
autosupport-budget-get-iter system node autosupport budget show
autosupport-budget-get-total-records
autosupport-budget-modify system node autosupport budget modify
autosupport-config-get  system node autosupport show
autosupport-config-get-iter system node autosupport show
autosupport-config-get-total-records
autosupport-config-modify system node autosupport modify
Press <space> to page down, <return> for next line, or 'q' to quit...
```

The following example displays all Data ONTAP APIs which are mapped to the specified CLI command:

```
cluster1::> security login role show-ontapi -command version
ONTAPI                  Command
-------------------------------
autosupport-budget-get  version
autosupport-budget-get-total-records
autosupport-budget-modify version
autosupport-config-get  version
autosupport-config-get-iter version
autosupport-config-get-total-records
autosupport-config-modify version
Press <space> to page down, <return> for next line, or 'q' to quit...
```

The following example displays the CLI command that is mapped to the specified Data ONTAPI API:

```
cluster1::> security login role show-ontapi -ontapi aggr-create
ONTAPI Name: aggr-create
Command: storage aggregate create
```

**security login role config commands**
Manage the configuration of login roles
security login role config modify

Modify local user account restrictions

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The security login role config modify command modifies user account and password restrictions.

For the password character restrictions documented below (uppercase, lowercase, digits, etc.), the term "characters" refers to ASCII-range characters only - not extended characters.

Parameters
-vserver <vserver name> - Vserver
   This specifies the Vserver name associated with the profile configuration.

-role <text> - Role Name
   This specifies the role whose account restrictions are to be modified.

[-username-minlength <integer>] - Minimum Username Length Required
   This specifies the required minimum length of the user name. Supported values are 3 to 16 characters. The default setting is 3 characters.

[-username-alphanum {enabled|disabled}] - Username Alpha-Numeric
   This specifies whether a mix of alphabetic and numeric characters are required in the user name. If this parameter is enabled, a user name must contain at least one letter and one number. The default setting is disabled.

[-passwd-minlength <integer>] - Minimum Password Length Required
   This specifies the required minimum length of a password. Supported values are 3 to 64 characters. The default setting is 8 characters.

[-passwd-alphanum {enabled|disabled}] - Password Alpha-Numeric
   This specifies whether a mix of alphabetic and numeric characters is required in the password. If this parameter is enabled, a password must contain at least one letter and one number. The default setting is enabled.

[-passwd-min-special-chars <integer>] - Minimum Number of Special Characters Required in the Password
   This specifies the minimum number of special characters required in a password. Supported values are from 0 to 64 special characters. The default setting is 0, which requires no special characters.

[-passwd-expiry-time <unsigned32_or_unlimited>] - Password Expires In (Days)
   This specifies password expiration in days. A value of 0 means all passwords associated with the accounts in the role expire now. The default setting is unlimited, which means the passwords never expire.

[-require-initial-passwd-update {enabled|disabled}] - Require Initial Password Update on First Login
   This specifies whether users must change their passwords when logging in for the first time. Initial password changes can be done only through SSH or serial-console connections. The default setting is disabled.

[-max-failed-login-attempts <integer>] - Maximum Number of Failed Attempts
   This specifies the allowed maximum number of consecutive invalid login attempts. When the failed login attempts reach the specified maximum, the account is automatically locked. The default is 0, which means failed login attempts do not cause an account to be locked.

[-lockout-duration <integer>] - Maximum Lockout Period (Days)
   This specifies the number of days for which an account is locked if the failed login attempts reach the allowed maximum. The default is 0, which means the accounts will be locked for 1 day.
[<integer>] - Disallow Last 'N' Passwords
This specifies the number of previous passwords that are disallowed for reuse. The default setting is six, meaning that the user cannot reuse any of their last six passwords. The minimum allowed value is 6.

[<integer>] - Delay Between Password Changes (Days)
This specifies the number of days that must pass between password changes. The default setting is 0.

[<integer>] - Delay after Each Failed Login Attempt (Secs)
This specifies the amount of delay observed by the system in seconds upon invalid login attempts. The default setting is 4 seconds.

[<integer>] - Minimum Number of Lowercase Alphabetic Characters Required in the Password
This specifies the minimum number of lowercase characters required in a password. Supported values are from 0 to 64 lowercase characters. The default setting is 0, which requires no lowercase characters.

[<integer>] - Minimum Number of Uppercase Alphabetic Characters Required in the Password
This specifies the minimum number of uppercase characters required in a password. Supported values are from 0 to 64 uppercase characters. The default setting is 0, which requires no uppercase characters.

[<integer>] - Minimum Number of Digits Required in the Password
This specifies the minimum number of digits required in a password. Supported values are from 0 to 64 digits characters. The default setting is 0, which requires no digits.

[<unsigned32_or_unlimited>] - Display Warning Message Days Prior to Password Expiry (Days)
This specifies the warning period for password expiry in days. A value of 0 means warn user about password expiry upon every successful login. The default setting is unlimited, which means never warn about password expiry.

[<unsigned32_or_unlimited>] - Account Expires in (Days)
This specifies account expiration in days. The default setting is unlimited, which means the accounts never expire. The account expiry time must be greater than account inactive limit.

[<unsigned32_or_unlimited>] - Maximum Duration of Inactivity before Account Expiration (Days)
This specifies inactive account expiry limit in days. The default setting is unlimited, which means the inactive accounts never expire. The account inactive limit must be less than account expiry time.

Examples
The following command modifies the user-account restrictions for an account with the role name admin for a Vserver named vs. The minimum size of the password is set to 12 characters.

```bash
cluster1::> security login role config modify -role admin -vserver vs -passwd-minlength 12
```

**security login role config reset**
Reset RBAC characteristics supported on releases later than Data ONTAP 8.1.2

**Availability:** This command is available to cluster administrators at the advanced privilege level.
The `security login role config reset` command resets the following role based access control (RBAC) characteristics to their default values. The system prompts you to run this command if you revert to Data ONTAP 8.1.2 or earlier. If you do not reset these characteristics, the revert process will fail.

- Minimum number of special characters required in password ("0")
- Password-expiration time, in days ("unlimited")
- Whether the password must be changed at the initial login ("disabled")
- Maximum number of failed login attempts permitted before the account is locked out ("0")
- Number of days that the user account is locked out after the maximum number of failed login attempts is reached ("0")

**Examples**
The following command resets the above mentioned RBAC characteristics of all cluster and Vserver roles to their default values.

```
cluster1::> security login role config reset
```

The `security login role config show` command displays the following information about account restrictions for management-utility user accounts:

- Role name `-role`
- Minimum size of the password, in characters `-passwd-minlength`
- Whether the password requires alphanumeric characters `-passwd-alphanum`
- Number of previous passwords that cannot be reused `-disallowed-reuse`
- Minimum number of days that must elapse before users can change their passwords `-change-delay`

You can display detailed information about the restrictions on a specific account by specifying the `-role` parameter. This adds the following information:

- Minimum length of the user name, in characters `-username-minlength`
- Whether the user name requires alphanumeric characters `-username-alphanum`
- Minimum length of the password, in characters `-passwd-minlength`
- Whether the password requires alphanumeric characters `-passwd-alphanum`
- Minimum number of special characters required in password `-passwd-min-special-chars`
- Minimum number of lowercase characters required in password `-passwd-min-lowercase-chars`
- Minimum number of uppercase characters required in password `-passwd-min-uppercase-chars`
- Minimum number of digits required in password `-passwd-min-digits`
- Minimum number of days that must elapse before users can change their passwords `-change-delay`
• Whether the password must be changed at the initial login -require-initial-passwd-update
• Password-expiration time, in days -passwd-expiry-time
• Display warning message days prior to password expiry -passwd-expiry-warn-time
• Number of previous passwords that cannot be reused -disallowed-reuse
• Maximum number of failed login attempts permitted before the account is locked out -max-failed-login-attempts
• Number of days for which the user account is locked after the maximum number of failed login attempts is reached -lockout-duration
• Account-expiration time, in days -account-expiry-time
• Maximum duration of inactivity before account expiration, in days -account-inactive-limit
• Delay after each failed login attempt, in secs -delay-after-failed-login

Parameters
{-fields <fieldname>,...}
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

{-instance }
If you specify the -instance parameter, the command displays detailed information about all fields.

{-vserver <vserver name>} - Vserver
Selects the profile configurations that match this parameter value.

{-role <text>} - Role Name
If this parameter is specified, the command displays detailed information about restrictions for the specified user account.

{-username-minlength <integer>} - Minimum Username Length Required
Selects the profile configurations that match this parameter value.

{-username-alphanum {enabled|disabled}} - Username Alpha-Numeric
Selects the profile configurations that match this parameter value. Enabled means a user name must contain both letters and numbers.

{-passwd-minlength <integer>} - Minimum Password Length Required
Selects the profile configurations that match this parameter value.

{-passwd-alphanum {enabled|disabled}} - Password Alpha-Numeric
Selects the profile configurations that match this parameter value. Enabled means a password must contain both letters and numbers.

{-passwd-min-special-chars <integer>} - Minimum Number of Special Characters Required in the Password
Selects the profile configurations that match this parameter value.

{-passwd-expiry-time <unsigned32_or_unlimited>} - Password Expires In (Days)
Selects the profile configurations that match this parameter value.

{-require-initial-passwd-update {enabled|disabled}} - Require Initial Password Update on First Login
Selects the profile configurations that match this parameter value.

{-max-failed-login-attempts <integer>} - Maximum Number of Failed Attempts
Selects the profile configurations that match this parameter value.
[-lockout-duration <integer>] - Maximum Lockout Period (Days)
Selects the profile configurations that match this parameter value.

[-disallowed-reuse <integer>] - Disallow Last 'N' Passwords
Selects the profile configurations that match this parameter value.

[-change-delay <integer>] - Delay Between Password Changes (Days)
Selects the profile configurations that match this parameter value.

[-delay-after-failed-login <integer>] - Delay after Each Failed Login Attempt (Secs)
Selects the profile configurations that match this parameter value.

[-passwd-min-lowercase-chars <integer>] - Minimum Number of Lowercase Alphabetic Characters Required in the Password
Selects the profile configurations that match this parameter value.

[-passwd-min-uppercase-chars <integer>] - Minimum Number of Uppercase Alphabetic Characters Required in the Password
Selects the profile configurations that match this parameter value.

[-passwd-min-digits <integer>] - Minimum Number of Digits Required in the Password
Selects the profile configurations that match this parameter value.

[-passwd-expiry-warn-time <unsigned32_or_unlimited>] - Display Warning Message Days Prior to Password Expiry (Days)
Selects the profile configurations that match this parameter value.

[-account-expiry-time <unsigned32_or_unlimited>] - Account Expires in (Days)
Selects the profile configurations that match this parameter value.

[-account-inactive-limit <unsigned32_or_unlimited>] - Maximum Duration of Inactivity before Account Expiration (Days)
Selects the profile configurations that match this parameter value.

### Examples
The example below displays restriction information about all user accounts:

```bash
cluster1::> security login role config show
----- Password Restrictions -----

<table>
<thead>
<tr>
<th>Vserver</th>

```

### security protocol commands
Manage application configuration

### security protocol modify
Modify application configuration options

**Availability:** This command is available to `cluster` administrators at the `advanced` privilege level.
Description
The **security protocol modify** command modifies the existing cluster-wide configuration of RSH and Telnet. Enable RSH and Telnet in the cluster by setting the enabled field as `true`.

Parameters
- **-application <text>** - application
  Selects the application. Supported values are `rsh` and `telnet`.
- **[-enabled {true|false}]** - enabled
  Enables or disables the corresponding application. The default value is `false`.

Examples
The following command enables RSH in the cluster. The default setting for RSH is `false`:

```
cluster1::> security protocol modify -application rsh -enabled true
```

The following command enables Telnet in the cluster. The default setting for Telnet is `false`:

```
cluster1::> security protocol modify -application telnet -enabled true
```

---

**security protocol show**
Show application configuration options

**Availability:** This command is available to cluster administrators at the `advanced` privilege level.

Description
The **security protocol show** command displays the cluster-wide configuration of RSH and Telnet in the cluster in advanced privilege mode. RSH and Telnet are disabled by default. Use the **security protocol modify** command to change the RSH and Telnet configuration that the cluster supports.

Parameters
- **[-fields <fieldname>, ...]**
  If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.
- **[-instance]**
  If you specify the `-instance` parameter, the command displays detailed information about all fields.
- **[-application <text>]** - application
  Displays the insecure applications in the cluster.
- **[-enabled {true|false}]** - enabled
  Displays whether the application is enabled or disabled in the cluster.

Examples
The following example shows the default security protocol configurations for a cluster:
cluster1::> security protocol show

<table>
<thead>
<tr>
<th>Application</th>
<th>Enabled</th>
</tr>
</thead>
<tbody>
<tr>
<td>rsh</td>
<td>false</td>
</tr>
<tr>
<td>telnet</td>
<td>false</td>
</tr>
</tbody>
</table>

The following example shows the security protocol configuration after RSH and Telnet have been enabled:

cluster1::> security protocol show

<table>
<thead>
<tr>
<th>Application</th>
<th>Enabled</th>
</tr>
</thead>
<tbody>
<tr>
<td>rsh</td>
<td>true</td>
</tr>
<tr>
<td>telnet</td>
<td>true</td>
</tr>
</tbody>
</table>

security protocol ssh commands

Manage SSH global configuration

security protocol ssh modify

Modify the SSH configuration

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

The security protocol ssh modify command modifies the existing cluster-wide configuration of SSH

Parameters

[-per-source-limit <integer>] - Per-Source Limit

Modifies the maximum number of SSH instances per source IP address on a per-node basis.

[-max-instances <integer>] - Maximum Number of Instances

Modifies the maximum number of SSH instances that can be handled on a per-node basis.

[-connections-per-second <integer>] - Connections Per Second

Modifies the maximum number of SSH connections per second on a per-node basis.

Examples

The following example modifies cluster-wide SSH configuration:

cluster1::*> security protocol ssh modify -per-source-limit 30 -max-instances 60 -connections-per-second 5

security protocol ssh show

Show the SSH configuration

Availability: This command is available to cluster administrators at the advanced privilege level.
Description
The `security protocol ssh show` command displays the cluster-wide SSH configuration in advanced privilege mode. Use the `security protocol ssh modify` command to change the SSH configuration that the cluster supports.

Examples
The following example displays cluster-wide SSH configuration:

```
cluster1:*> security protocol ssh show
     Per-Source Limit: 32
     Maximum Number of Instances: 64
     Connections Per Second: 10
```

security protocol ssh modify on page 528

Manage SAML authentication single sign-on configuration

Manage SAML authentication single sign-on configuration

These commands configure the Security Assertion Markup Language (SAML) Service Provider (SP) single sign-on configuration. SAML SP functionality provides the ability for Data ONTAP to use an Identity Provider (IdP) for authentication.

**security saml-sp create**

Configure SAML service provider for authentication

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**
The `security saml-sp create` command configures ONTAP with Security Assertion Markup Language (SAML) Service Provider (SP) for single sign-on authentication. This command does not enable SAML SP, it just configures it. Configuring and enabling SAML SP is a two-step process:

- Create a SAML SP configuration using `security saml-sp create` command.
- Enable SAML SP by using `security saml-sp modify -is-enabled true`

After the SAML SP configuration is created, it cannot be modified. It must be deleted and created again to change any settings.

**Note:** This restarts the web server. Any HTTP/S connections that are active will be disrupted.

**Parameters**
- `-idp-uri {(ftp|http)://(hostname|IPv4 Address|IPv6 Address)...) - Identity Provider (IdP)`
- `Metadata Location`
  This is the URI of the desired identity provider's (IdP) metadata.
- `[-sp-host <Remote InetAddress>] - SAML Service Provider Host`
  This specifies the SAML service provider host IP address.
- `{ -cert-ca <text> - Server Certificate Issuing CA`
  This specifies the service provider's certificate issuing CA.
- `-cert-serial <text> - Server Certificate Serial Number`
  This specifies the service provider's certificate's serial number.
- `[-cert-common-name <FQDN or Custom Common Name>]` - Server Certificate Common Name
  This specifies the service provider certificate's common name.

- `[-verify-metadata-server {true|false}]` - Verify IdP Metadata Server Identity
  When the IdP metadata is downloaded, the identity of the server hosting the metadata is verified using transport layer security (TLS), validating the server's X.509 certificate against the list of certificate authorities (CAs) in Data ONTAP, and verifying that the host in the server certificate matches the host in the URI (the `idp-uri` field). This verification can be bypassed by setting this field to `false`. Bypassing the server verification is not recommended as the server can not be trusted that way, but will be necessary to use non-TLS URIs, e.g. with the "http" scheme, or when the server certificates are self-signed. If the server's certificate was signed by a CA that is not installed in Data ONTAP, the `security certificate install -type server-ca` command can be used to install it.

- `[-foreground {true|false}]` - Foreground Process
  When this parameter is set to `false` the command runs in the background as a job. The default is `true`, which causes the command to return after the operation completes.

## Examples

The following example configures ONTAP with SAML SP IdP information:

```
cluster1::> security saml-sp create -idp-uri http://public-idp-uri -sp-host 1.1.1.1
cluster1::>
```

## security saml-sp delete

Delete SAML service provider for authentication

**Availability:** This command is available to cluster administrators at the `admin` privilege level.

**Description**

The `security saml-sp delete` command is used to remove the Security Access Markup Language (SAML) Service Provider (SP). Running this command frees resources used by the SP. SAML SP services will no longer be available after the SP is removed.

If the SAML SP is currently enabled, it is necessary to first use `security saml-sp modify -is-enabled false` prior to `security saml-sp delete`. The `security saml-sp modify -is-enabled false` command must be issued by a password authenticated console application user or from a SAML authenticated command interface.

**Note:** This restarts the web server. Any HTTP/S connections that are active will be disrupted.

## Examples

The following example unconfigures SAML SP:

```
cluster1::> security saml-sp delete
cluster1::>
```
security saml-sp modify

Modify SAML service provider authentication

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The `security saml-sp modify` command modifies the Security Assertion Markup Language (SAML) Service Provider (SP) configuration for single sign-on authentication. This command is used to enable or disable an existing SAML SP, `security saml-sp modify -is-enabled true` or `false` respectively.

This command will check the validity of the current SAML SP configuration before enabling the SP. Also, it is necessary to use this command with the `-is-enabled false` parameter prior to deleting an existing SAML SP configuration. SAML SP can only be disabled in this way by a password authenticated console application user or from a SAML authenticated command interface. The delete command must be used if the SAML configuration settings are to be changed, as only the `is-enabled` parameter can be modified.

Note: This may restart the web server. Any HTTP/S connections that are active may be disrupted.

Parameters

`[-is-enabled {true|false}]` - SAML Service Provider Enabled

Use this parameter to enable or disable the SAML SP.

Examples

The following example enables SAML SP:

```
cluster1::> security saml-sp modify -is-enabled true
cluster1::>
```

security saml-sp repair

Repair a failed SAML SP configuration

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

The `security saml-sp repair` command attempts to repair a failed SAML SP configuration on a given node. The status of the individual nodes can be viewed using the `security saml-sp status show` command.

Note: This restarts the web server. Any active HTTP/S requests to the web server will be disrupted.

Parameters

`-node {<nodename>|local}` - Node

This identifies a single node that matches the input. The repair job will run on this node.

`[-foreground {true|false}]` - Foreground Process

When this parameter is set to `false` the command runs in the background as a job. The default is `true`, which causes the command to return after the operation completes.
Examples
The following example repairs a failed SAML SP configuration:

```
cluster1:> security saml-sp repair -node node-2
Warning: This restarts the web server. Any active HTTP/S requests to the web
server will be disrupted
Do you want to continue? [y|n]: y
```

Related references
security saml-sp status show on page 532

security saml-sp show
Display SAML service provider for authentication

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The security saml-sp show command displays the Security Assertion Markup Language (SAML) Service Provider (SP) configuration.

The Identity Provider (IdP) URI indicates the URI of the desired IdP's metadata.

The Service Provider (SP) host indicates the IP address containing SAML SP metadata.

The Certificate Common Name indicates the SAML SP certificate's common name.

The Certificate Serial indicates the SAML SP certificate's serial number.

Examples
The following example displays the SAML SP configuration:

```
cluster1::> security saml-sp show
Identity Provider URI: https://www.my.idp.com
Service Provider Host: 1.1.1.1
Certificate Name: mycert
Certificate Serial: 1234abcd
Is SAML Enabled: false
```

security saml-sp status commands
The status directory

security saml-sp status show
Display SAML service provider configuration status

Availability: This command is available to cluster administrators at the advanced privilege level.
Description
The `security saml-sp status show` command displays the SAML Service Provider (SP) status for all nodes in the cluster.

Parameters

\{[-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

\{[-instance] \}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-node <nodename>|local]` - Node
This identifies the node in the cluster.

`[-status {not-configured|config-in-progress|config-failed|config-success}]` - Update Status
This identifies the SAML SP status on the specified node.

`[-error-text <text>]` - Error Text
This identifies the error text associated with the latest saml SP update for this node.

`[-is-enabled {true|false}]` - SAML Service Provider Enabled
When this parameter is set to `true` it indicates that the SAML SP is enabled on this node. Similarly, when this parameter is set to `false`, it indicates that the SAML SP is not enabled on this node.

Examples
The following example displays the SAML SP status information for all nodes in the cluster.

```
cluster::security saml-sp status> show
Node                      SAML SP Status      Enabled
------------------------- ------------------ --------
c1                        not-configured     false
2 entries were displayed.
cluster::*>
```

Security Session Commands

Manage CLI and ONTAPI sessions and view request statistics

The `security session` commands provide statistics to monitor management session activity and limit configurations to control management session activity for specific categories.

security session kill-cli

Kill an active CLI session

Availability: This command is available to `cluster` administrators at the `admin` privilege level.

Description
The `security session kill-cli` command is used to terminate active CLI sessions. If the session being killed is actively processing a non-read command, the kill will wait until the command is complete before terminating the session. If the session being killed is actively processing a read (show) command, the kill will wait until the current row is returned before terminating the session.
Parameters

- `-node {<nodename>|local}` - Node
  Selects the sessions that match this parameter value. This identifies the node that is processing the session.

- `-interface {cli|ontapi}` - Interface
  Selects the sessions that match this parameter value. This identifies the interface (CLI or ONTAPI) that is processing the session.

- `-start-time <MM/DD HH:MM:SS>` - Start Time
  Selects the sessions that match this parameter value. This identifies the start time of the current active session.

- `-session-id <integer>` - Session ID
  Selects the sessions that match this parameter value. This number uniquely identifies a management session within a given node.

- `-vserver <vserver>` - Vserver
  Selects the sessions that match this parameter value. This identifies the Vserver associated with this management session.

- `-username <text>` - Username
  Selects the sessions that match this parameter value. This identifies the authenticated user associated with this management session.

- `-application <text>` - Client Application
  Selects the sessions that match this parameter value. This identifies the calling application by name.

- `-location <text>` - Client Location
  Selects the sessions that match this parameter value. This identifies the location of the calling client application. This is typically the IP address of the calling client, or "console" or "localhost" for console or localhost connections.

- `-idle-seconds <integer>` - Idle Seconds
  Selects the sessions that match this parameter value. When a session is not actively executing a command request (the session is idle), this indicates the time (in seconds) since the last request completed.

- `-state {pending|active|idle}` - Session State
  Selects the sessions that match this parameter value. This identifies the state (pending, active, or idle) of the session. The state is "pending" if it hit a session limit and the session is waiting for another session to end. The state is "idle" for CLI sessions that are waiting at the command prompt. The state is "active" if the session is actively working on a request.

- `-request <text>` - Active Command
  Selects the sessions that match this parameter value. This identifies the request (command) that is currently being handled by the session.

Examples

The following example illustrates killing a CLI session by specifying the node and the session id.

cluster1::> security session show -node node1

<table>
<thead>
<tr>
<th>Node: node1</th>
<th>Interface: cli</th>
<th>Start Time</th>
<th>Sess ID</th>
<th>Application</th>
<th>Location</th>
<th>Vserver</th>
<th>Username</th>
<th>Seconds</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>03/27 16:58:13</td>
<td>1358</td>
<td>console</td>
<td>console</td>
<td>cluster1</td>
<td>admin</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>03/27 16:58:17</td>
<td>1359</td>
<td>ssh</td>
<td>10.98.16.164</td>
<td>cluster1</td>
<td>admin</td>
<td>650</td>
</tr>
</tbody>
</table>

2 entries were displayed.

cluster1::>

cluster1::> security session kill-cli -node node1 -session-id 1359
The following example illustrates killing a CLI session by specifying the node and specifying a query on idle-seconds.

```
cluster1::> security session show -node node1
Node: node1               Interface: cli                                   Idle
Start Time     Sess ID Application Location           Vserver Username  Seconds
-------------- ------- ----------- ------------ ------------- -------- --------
03/27 16:58:13 1358    console     console           cluster1 admin           -
Active Seconds: 0  Request: security session show

cluster1::> security session kill-cli -node node1 -session-id * -idle-seconds > 80
1 entry was acted on.

cluster1::> security session show
Node: node1               Interface: cli                                   Idle
Start Time     Sess ID Application Location           Vserver Username  Seconds
-------------- ------- ----------- ------------ ------------- -------- --------
03/27 16:58:13 1358    console     console           cluster1 admin           -
Active Seconds: 0  Request: security session show
```

**security session show**

Show active CLI & ONTAPI sessions

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
The `security session show` command displays all active management sessions across the cluster.

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance]
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[-node <nodename>|local] - Node
```

Selects the sessions that match this parameter value. This identifies the node that is processing the session.

```
[-interface (cli|ontapi)] - Interface
```

Selects the sessions that match this parameter value. This identifies the interface (CLI or ONTAPI) that is processing the session.
[-start-time <MM/DD HH:MM:SS>] - Start Time
Selects the sessions that match this parameter value. This identifies the start time of the current active session.

[-session-id <integer>] - Session ID
Selects the sessions that match this parameter value. This number uniquely identifies a management session within a given node.

[-vserver <vserver>] - Vserver
Selects the sessions that match this parameter value. This identifies the Vserver associated with this management session.

[-username <text>] - Username
Selects the sessions that match this parameter value. This identifies the authenticated user associated with this management session.

[-application <text>] - Client Application
Selects the sessions that match this parameter value. This identifies the calling application by name.

[-location <text>] - Client Location
Selects the sessions that match this parameter value. This identifies the location of the calling client application. This is typically the IP address of the calling client, or "console" or "localhost" for console or localhost connections.

[-ipspace <IPspace>] - IPspace of Location
Selects the sessions that match this parameter value. This identifies the IPspace of the client location.

[-total <integer>] - Total Requests
Selects the sessions that match this parameter value. This identifies the total number of requests that have been made thus far in the active session. The following commands are not counted: top, up, cd, rows, history, exit.

[-failed <integer>] - Failed Requests
Selects the sessions that match this parameter value. This identifies the number of requests that have failed for any reason (including if they were blocked by configured limits).

[-max-time <integer>] - Maximum Time (ms)
Selects the sessions that match this parameter value. This identifies the maximum amount of time (in milliseconds) that any request took for this session.

[-last-time <integer>] - Last Time (ms)
Selects the sessions that match this parameter value. This identifies the amount of time (in milliseconds) that the last request took for this session.

[-total-seconds <integer>] - Total Seconds
Selects the sessions that match this parameter value. This identifies the total time (in seconds) that has been taken by all completed requests for the current session; it does not include session idle time.

[-state {pending|active|idle}] - Session State
Selects the sessions that match this parameter value. This identifies the state (pending, active, or idle) of the session. The state is "pending" if it hit a session limit and the session is waiting for another session to end. The state is "idle" for CLI sessions that are waiting at the command prompt. The state is "active" if the session is actively working on a request.

[-request <text>] - Request Input
Selects the sessions that match this parameter value. This identifies the request (command) that is currently being handled by the session.

[-idle-seconds <integer>] - Idle Seconds
Selects the sessions that match this parameter value. When a session is not actively executing a command request (the session is idle), this indicates the time (in seconds) since the last request completed.
[-active-seconds <integer>] - Active Seconds

Selects the sessions that match this parameter value. When a session is actively executing a command request, this indicates the time (in seconds) since the current request started.

Examples

The following example illustrates displaying all active sessions across the cluster. In this example, we see one active session on node node2 from the console application. We also see three active sessions on node node1. One is from the console application and two are from the ssh application. Also one of the ssh sessions is from user diag and the other ssh session is from user admin.

```bash
cluster1::> security session show

Node: node1               Interface: cli                                   Idle
Start Time     Sess ID Application Location           Vserver Username  Seconds
-------------- ------- ----------- ------------ ------------- -------- --------
03/27 16:58:13 1358    console     console           cluster1 admin           -
Active Seconds: 0  Request: security session show
03/27 17:17:04 1514    ssh         10.98.16.164      cluster1 admin         139
03/27 17:17:29 1515    ssh         10.98.16.164      cluster1 diag          115

Node: node2               Interface: cli                                   Idle
Start Time     Sess ID Application Location           Vserver Username  Seconds
-------------- ------- ----------- ------------ ------------- -------- --------
03/27 17:18:54 1509    console     console           cluster1 admin          23
4 entries were displayed.

cluster1::>
```

The following example illustrates displaying all active sessions that have been idle for longer than 500 seconds.

```bash
cluster1::> security session show -idle-seconds > 500

Node: node1               Interface: cli                                   Idle
Start Time     Sess ID Application Location           Vserver Username  Seconds
-------------- ------- ----------- ------------ ------------- -------- --------
03/27 17:17:04 1514    ssh         10.98.16.164      cluster1 admin         607
03/27 17:17:29 1515    ssh         10.98.16.164      cluster1 diag          583
2 entries were displayed.

cluster1::>
```

Security Session Limit Commands

Manage management session limits

These commands allow management session limits to be configured for specific categories, including application, location, request, user, and Vserver. The default limits can be overridden for specific values within each category by using advanced privilege level commands.

security session limit create

Create default session limit

Availability: This command is available to cluster administrators at the admin privilege level.

Description

This command allows creation of a default management session limit that does not yet exist. The default limits can be overridden for specific values within each category by using advanced privilege level commands.
Parameters

- `interface {cli|ontapi} - Interface`
  The interface (CLI or ONTAPI) to which the limit applies.

- `category {application|location|request|user|vserver} - Category`
  The session type for this default limit. The following categories are supported: application, location, request, user, Vserver.

- `max-active-limit <integer> - Max-Active Limit`
  The maximum number of concurrent sessions allowed for this interface and category.

Examples

The following example illustrates creating a default limit for management sessions using the same application.

```
cluster1::> security session limit create -interface ontapi -category application -max-active-limit 8
```

security session limit delete

Delete default session limit

Availability: This command is available to cluster administrators at the admin privilege level.

Description

This command allows deletion of a default management session limit.

Parameters

- `interface {cli|ontapi} - Interface`
  The interface (CLI or ONTAPI) to which the limit applies.

- `category {application|location|request|user|vserver} - Category`
  The session type for this default limit. The following categories are supported: application, location, request, user, Vserver.

Examples

The following example illustrates deleting all default limits for CLI management sessions.

```
cluster1::> security session limit delete -interface cli -category *
3 entries were deleted.
```

security session limit modify

Modify default session limit

Availability: This command is available to cluster administrators at the admin privilege level.

Description

This command allows modification of a default management session limit.
Parameters

- **interface {cli|ontapi}** - Interface
  
The interface (CLI or ONTAPI) to which the limit applies.

- **category {application|location|request|user|vserver}** - Category
  
The session type for this default limit. The following categories are supported: application, location, request, user, Vserver.

- **[-max-active-limit <integer>]** - Max-Active Limit
  
The maximum number of concurrent sessions allowed for this interface and category.

Examples

The following example illustrates modifying the default limit for CLI management sessions from the same location.

```
cluster1::> security session limit modify -interface cli -category location -max-active-limit 4
```

**security session limit show**

Show default session limits

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

This command shows the default management session limits that have been configured for each interface and category.

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance]
```

If you specify the -instance parameter, the command displays detailed information about all fields.

```
[-interface {cli|ontapi}] - Interface
```

Selects the sessions that match this parameter value. This identifies the interface (CLI or ONTAPI) to which the limit applies.

```
[-category {application|location|request|user|vserver}] - Category
```

Selects the sessions that match this parameter value. This identifies the category for the limit. The following categories are supported: application, location, request, user, and Vserver.

```
[-max-active-limit <integer>] - Max-Active Limit
```

Selects the sessions that match this parameter value. This identifies the configured limit that is used to throttle or reject requests.

**Examples**

The following example illustrates displaying the default limits for management sessions.

```
cluster1::> security session limit show
Interface Category    Max-Active
--------- ----------- ----------
cli       user                 2
```
Security Session Application Limit Commands

Manage per-application session limits

These commands allow management session limits to be configured for specific applications.

security session limit application create

Create per-application session limit

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
This command allows creation of a per-application management session limit that does not yet exist.

Parameters
- `interface {cli|ontapi} - Interface`
  The interface (CLI or ONTAPI) to which the limit applies.
- `application <text> - Application`
  The specified application to which this limit applies. The limit with the application name `-default-` is the limit used for any application without a specific configured limit.
- `max-active-limit <integer> - Max-Active Limit`
  The maximum number of concurrent sessions allowed for this interface and application.

Examples
The following example illustrates creating a limit for management sessions from a custom application.

```
cluster1:*> security session limit application create -interface ontapi -application "custom_app" -max-active-limit 8
```

security session limit application delete

Delete per-application session limit

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
This command allows deletion of a per-application management session limit.

Parameters
- `interface {cli|ontapi} - Interface`
  The interface (CLI or ONTAPI) to which the limit applies.
- `application <text> - Application`
  The specified application to which this limit applies. The limit with the application name `-default-` is the limit used for any application without a specific configured limit.
Examples
The following example illustrates deleting a limit for management sessions from a custom application.

```
cluster1:~> security session limit application delete -interface ontapi -application "custom_app"
```

security session limit application modify
Modify per-application session limit

Availability: This command is available to cluster administrators at the `advanced` privilege level.

Description
This command allows modification of a per-application management session limit.

Parameters
- **-interface** `{cli|ontapi}` - Interface
  The interface (CLI or ONTAPI) to which the limit applies.
- **-application** `<text>` - Application
  The specified application to which this limit applies. The limit with the application name `-default` is the limit used for any application without a specific configured limit.
- **[-max-active-limit <integer>]** - Max-Active Limit
  The maximum number of concurrent sessions allowed for this interface and application.

Examples
The following example illustrates modifying management session limits for some custom applications.

```
cluster1:~> security session limit application modify -interface ontapi -application custom* -max-active-limit 4
2 entries were modified.
```

security session limit application show
Show per-application session limits

Availability: This command is available to cluster administrators at the `advanced` privilege level.

Description
This command shows the per-application management session limits that have been configured for each interface and application.

Parameters
```
{[-fields <fieldname>,...],

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `?` to display the fields to specify.

| [-instance ]

If you specify the -instance parameter, the command displays detailed information about all fields.
```
[-interface {cli|ontapi}] - Interface
Selects the sessions that match this parameter value. This identifies the interface (CLI or ONTAPI) to which
the limit applies.

[-application <text>] - Application
Selects the sessions that match this parameter value. This identifies the application for the limit. The limit with
the application name -default- is the limit used for any application without a specific configured limit.

[-max-active-limit <integer>] - Max-Active Limit
Selects the sessions that match this parameter value. This identifies the configured limit that is used to throttle
or reject requests.

### Examples
The following example illustrates displaying the per-application limits for ONTAPI management sessions.

```plaintext
cluster1:*> security session limit application show -interface ontapi
Interface Application          Max-Active
--------- -------------------- ----------
onapi    -default-                     5
ontapi    custom_app                   10
2 entries were displayed.
```

### Security Session Location Limit Commands
Manage per-location session limits

These commands allow management session limits to be configured for specific locations.

**security session limit location create**
Create per-location session limit

**Availability:** This command is available to cluster administrators at the advanced privilege level.

**Description**
This command allows creation of a per-location management session limit that does not yet exist.

**Parameters**
- **-interface {cli|ontapi}** - Interface
  The interface (CLI or ONTAPI) to which the limit applies.
- **-location <text>** - Location
  The specified location to which this limit applies. The limit with the location name -default- (in the Default
  IPspace) is the limit used for any location (in any IPspace) without a specific configured limit.
- **-ipspace <IPspace>** - IPspace of Location
  This identifies the IPspace of the client location. If not specified, changes are made in the Default IPspace.
- **-max-active-limit <integer>** - Max-Active Limit
  The maximum number of concurrent sessions allowed for this interface and location.

### Examples
The following example illustrates creating a CLI limit for specific location.

```plaintext
```
security session limit location delete

Delete per-location session limit

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
This command allows deletion of a per-location management session limit.

Parameters

- **-interface {cli|ontapi}** - Interface
  The interface (CLI or ONTAPI) to which the limit applies.

- **-location <text>** - Location
  The specified location to which this limit applies. The limit with the location name -default- (in the Default IPspace) is the limit used for any location (in any IPspace) without a specific configured limit.

[**-ipspace <IPspace>**] - IPspace of Location
  This identifies the IPspace of the client location. If not specified, changes are made in the Default IPspace.

Examples
The following example illustrates deleting limits for management sessions from a specific set of locations.

```
cluster1:*> security session limit location delete -interface * -location 10.98.*
3 entries were deleted.
```

security session limit location modify

Modify per-location session limit

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
This command allows modification of a per-location management session limit.

Parameters

- **-interface {cli|ontapi}** - Interface
  The interface (CLI or ONTAPI) to which the limit applies.

- **-location <text>** - Location
  The specified location to which this limit applies. The limit with the location name -default- (in the Default IPspace) is the limit used for any location (in any IPspace) without a specific configured limit.

[**-ipspace <IPspace>**] - IPspace of Location
  This identifies the IPspace of the client location. If not specified, changes are made in the Default IPspace.

[**-max-active-limit <integer>**] - Max-Active Limit
  The maximum number of concurrent sessions allowed for this interface and location.
Examples
The following example illustrates modifying management sessions limits for specific locations.

```
cluster1::*> security session limit location modify -interface * -location 10.98.* -max-active-limit 2
3 entries were modified.
```

security session limit location show

Show per-location session limits

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
This command shows the per-location management session limits that have been configured for each interface and location.

Parameters

```
[-fields <fieldname>, ...]
```

If you specify the `fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance]
```

If you specify the `instance` parameter, the command displays detailed information about all fields.

```
[-interface {cli|ontapi}]
```

- **Interface** selects the sessions that match this parameter value. This identifies the interface (CLI or ONTAPI) to which the limit applies.

```
[-location <text>]
```

- **Location** selects the sessions that match this parameter value. This identifies the location for the limit. The limit with the location name `-default-` (only in the `Default` IPspace) is the limit used for any location (in any IPspace) without a specific configured limit.

```
[-ipspace <IPspace>]
```

- **IPspace of Location** selects the sessions that match this parameter value. This identifies the IPspace of the client location. The default IPspace is `Default`.

```
[-max-active-limit <integer>]
```

- **Max-Active Limit** selects the sessions that match this parameter value. This identifies the configured limit that is used to throttle or reject requests.

Examples
The following example illustrates displaying the per-location limits for management sessions.

```
cluster1::*> security session limit location show
Interface Location       IPspace      Max-Active
--------- ----------------- ----------- ----------
cli       -default-      Default      16
cli       10.98.16.164   Default      0
ontapi    -default-      Default      6
ontapi    10.98.16.164   Default      0
4 entries were displayed.
```
Security Session Request Limit Commands

Manage per-request session limits

These commands allow management session limits to be configured for specific requests.

security session limit request create

Create per-request session limit

**Availability:** This command is available to cluster administrators at the **advanced** privilege level.

**Description**
This command allows creation of a per-request management session limit that does not yet exist.

**Parameters**
- **-interface <cli|ontapi>** - Interface
  The interface (CLI or ONTAPI) to which the limit applies.
- **-request <text>** - Request Name
  The specified request to which this limit applies. The limit with the request name `-default-` is the limit used for any request without a specific configured limit.
- **-max-active-limit <integer>** - Max-Active Limit
  The maximum number of concurrent sessions allowed for this interface and request.

**Examples**
The following example illustrates creating a limit for number of clients executing a specific API.

```
cluster1::*> security session limit request create -interface ontapi -request storage-disk-get-iter -max-active-limit 2
```

security session limit request delete

Delete per-request session limit

**Availability:** This command is available to cluster administrators at the **advanced** privilege level.

**Description**
This command allows deletion of a per-request management session limit.

**Parameters**
- **-interface <cli|ontapi>** - Interface
  The interface (CLI or ONTAPI) to which the limit applies.
- **-request <text>** - Request Name
  The specified request to which this limit applies. The limit with the request name `-default-` is the limit used for any request without a specific configured limit.

**Examples**
The following example illustrates deleting custom limits for that were configured for the volume commands and APIs.
security session limit request modify

Modify per-request session limit

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
This command allows modification of a per-request management session limit.

Parameters
- `interface {cli|ontapi}` - Interface
  The interface (CLI or ONTAPI) to which the limit applies.
- `request <text>` - Request Name
  The specified request to which this limit applies. The limit with the request name `-default-` is the limit used for any request without a specific configured limit.
- `[-max-active-limit <integer>]` - Max-Active Limit
  The maximum number of concurrent sessions allowed for this interface and request.

Examples
The following example illustrates modifying the limit of the number of clients simultaneously executing a specific API.

```
cluster1:*> security session limit request modify -interface ontapi -request storage-disk-get-iter -max-active-limit 4
```

security session limit request show

Show per-request session limits

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
This command shows the per-request management session limits that have been configured for each interface and request.

Parameters
- `[-fields <fieldname>, ...]`  
  If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.
- `[-instance]`
  If you specify the `-instance` parameter, the command displays detailed information about all fields.
- `[-interface {cli|ontapi}]` - Interface
  Selects the sessions that match this parameter value. This identifies the interface (CLI or ONTAPI) to which the limit applies.
-request <text> - Request Name

Selects the sessions that match this parameter value. This identifies the request (command or API) for the limit. The limit with the request name -default- is the limit used for any request without a specific configured limit.

-max-active-limit <integer> - Max-Active Limit

Selects the sessions that match this parameter value. This identifies the configured limit that is used to throttle or reject requests.

**Examples**

The following example illustrates displaying the per-request limits for management sessions.

```bash
cluster1:*> security session limit request show
Interface Request                     Max-Active
-------------------------------------- ----------
cli                                   -default- 10
ontapi                               -default- 5
ontapi storage-disk-get-iter          2
3 entries were displayed.
```

**Security Session User Limit Commands**

Manage per-user session limits

These commands allow management session limits to be configured for specific Vserver users.

**security session limit user create**

Create per-user session limit

**Availability:** This command is available to cluster administrators at the advanced privilege level.

**Description**

This command allows creation of a per-user management session limit that does not yet exist.

**Parameters**

- **-interface (cli|ontapi) - Interface**
  
  The interface (CLI or ONTAPI) to which the limit applies.

- **-vserver <vserver> - Vserver**
  
  The specified Vserver to which this limit applies. The "Cluster" Vserver is used to limit Vservers that do not have a configured limit.

- **-user <text> - User**
  
  The specified user to which this limit applies. The limit with the user name -default- is the limit used for any user without a specific configured limit.

- **-max-active-limit <integer> - Max-Active Limit**
  
  The maximum number of concurrent sessions allowed for this interface, Vserver, and user.

**Examples**

The following example illustrates creating a per-user limit override for ONTAPI requests for the admin user in the admin Vserver.
security session limit user create

Create per-user session limit

Availability: This command is available to cluster administrators.

Description
This command allows the creation of a per-user management session limit.

Parameters

- `interface {cli|ontapi}` - Interface
  The interface (CLI or ONTAPI) to which the limit applies.

- `vserver <vserver>` - Vserver
  The specified Vserver to which this limit applies. The "Cluster" Vserver is used to limit Vservers that do not have a configured limit.

- `user <text>` - User
  The specified user to which this limit applies. The limit with the user name `-default-` is the limit used for any user without a specific configured limit.

Examples
The following example illustrates creating a per-user management session limit.

```
cluster1::*> security session limit user create -interface ontapi -vserver cluster1 -username admin -max-active-limit 16
```

security session limit user delete

Delete per-user session limit

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
This command allows deletion of a per-user management session limit.

Parameters

- `interface {cli|ontapi}` - Interface
  The interface (CLI or ONTAPI) to which the limit applies.

- `vserver <vserver>` - Vserver
  The specified Vserver to which this limit applies. The "Cluster" Vserver is used to limit Vservers that do not have a configured limit.

- `user <text>` - User
  The specified user to which this limit applies. The limit with the user name `-default-` is the limit used for any user without a specific configured limit.

Examples
The following example illustrates deleting all user-specific limits for CLI management sessions.

```
cluster1::*> security session limit user delete -interface cli -user !"-default-"
2 entries were deleted.
```

security session limit user modify

Modify per-user session limit

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
This command allows modification of a per-user management session limit.

Parameters

- `interface {cli|ontapi}` - Interface
  The interface (CLI or ONTAPI) to which the limit applies.

- `vserver <vserver>` - Vserver
  The specified Vserver to which this limit applies. The "Cluster" Vserver is used to limit Vservers that do not have a configured limit.

- `user <text>` - User
  The specified user to which this limit applies. The limit with the user name `-default-` is the limit used for any user without a specific configured limit.
[-max-active-limit <integer>] - Max-Active Limit

The maximum number of concurrent sessions allowed for this interface, Vserver, and user.

Examples
The following example illustrates modifying the admin user's limit for CLI management sessions.

```
cluster1:*> security session limit user modify -interface cli -vserver cluster1 -username admin -
max-active-limit 30
```

security session limit user show

Show per-user session limits

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
This command shows the per-user management session limits that have been configured for each interface, Vserver, and user.

Parameters
[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance ] |
If you specify the -instance parameter, the command displays detailed information about all fields.

[-interface (cli|ontapi)] - Interface
Selects the sessions that match this parameter value. This identifies the interface (CLI or ONTAPI) to which the limit applies.

[-vserver <vserver>] - Vserver
Selects the sessions that match this parameter value. This identifies the Vserver for the limit. The "Cluster" Vserver is used to limit Vservers that do not have a configured limit.

[-user <text>] - User
Selects the sessions that match this parameter value. This identifies the user for the limit. The limit with the user name -default- is the limit used for any user without a specific configured limit.

[-max-active-limit <integer>] - Max-Active Limit
Selects the sessions that match this parameter value. This identifies the configured limit that is used to throttle or reject requests.

Examples
The following example illustrates displaying the per-user limits for CLI management sessions. In this example, there is a default limit of 4 sessions for each user. That limit is expanded to 8 for the admin Vserver. That limit is further expanded to 20 for the admin user in the admin Vserver.

```
cluster1:*> security session limit user show -interface cli
Interface Vserver User Max-Active
----------------- ----------------------- ------
cli Cluster -default- 4
```

Security Session Commands
Security Session Vserver Limit Commands

Manage per-vserver session limits

These commands allow management session limits to be configured for specific Vservers.

**security session limit vserver create**

Create per-vserver session limit

_Availability:_ This command is available to _cluster_ administrators at the _advanced_ privilege level.

_Description:_ This command allows creation of a per-Vserver management session limit that does not yet exist.

_Parameters_

- **-interface {cli|ontapi}** - _Interface_  
The interface (CLI or ONTAPI) to which the limit applies.

- **-vserver <vserver>** - _Vserver_  
The specified Vserver to which this limit applies. The "Cluster" Vserver is used to limit Vservers that do not have a configured limit.

- **-max-active-limit <integer>** - _Max-Active Limit_  
The maximum number of concurrent sessions allowed for this interface and Vserver.

**Examples**

The following example illustrates creating a per-Vserver limit override for ONTAPI requests on the admin Vserver.

```
cluster1::*> security session limit vserver create -interface ontapi -vserver cluster1 -max-active-limit 4
```

**security session limit vserver delete**

Delete per-vserver session limit

_Availability:_ This command is available to _cluster_ administrators at the _advanced_ privilege level.

_Description:_ This command allows deletion of a per-Vserver management session limit. The "Cluster" vserver is used when the specific Vserver doesn't have a configured limit.

_Parameters_

- **-interface {cli|ontapi}** - _Interface_  
The interface (CLI or ONTAPI) to which the limit applies.

- **-vserver <vserver>** - _Vserver_  
The specified Vserver to which this limit applies. The "Cluster" Vserver is used to limit Vservers that do not have a configured limit.
Examples

The following example illustrates deleting all per-Vserver limits for management sessions except the default limit.

```
cluster1:*> security session limit vserver delete -interface * -vserver !Cluster
1 entries was deleted.
```

security session limit vserver modify

Modify per-vserver session limit

Availability: This command is available to `cluster` administrators at the `advanced` privilege level.

Description

This command allows modification of a per-Vserver management session limit.

Parameters

- `-interface {cli|ontapi} - Interface`
  
The interface (CLI or ONTAPI) to which the limit applies.

- `-vserver <vserver> - Vserver`
  
The specified Vserver to which this limit applies. The "Cluster" Vserver is used to limit Vservers that do not have a configured limit.

- `[-max-active-limit <integer>] - Max-Active Limit`
  
The maximum number of concurrent sessions allowed for this interface and Vserver.

Examples

The following example illustrates modifying the admin Vserver's limit for CLI management sessions.

```
cluster1:*> security session limit vserver modify -interface cli -vserver cluster1 -max-active-limit 40
```

security session limit vserver show

Show per-vserver session limits

Availability: This command is available to `cluster` administrators at the `advanced` privilege level.

Description

This command shows the per-Vserver management session limits that have been configured for each interface and Vserver.

Parameters

```
([-fields <fieldname>, ...]

| [-instance ]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

If you specify the `-instance` parameter, the command displays detailed information about all fields.
[-interface {cli|ontapi}] - Interface
Selects the sessions that match this parameter value. This identifies the interface (CLI or ONTAPI) to which the limit applies.

[-vserver <vserver>] - Vserver
Selects the sessions that match this parameter value. This identifies the Vserver for the limit. The "Cluster" Vserver is used to limit Vservers that do not have a configured limit.

[-max-active-limit <integer>] - Max-Active Limit
Selects the sessions that match this parameter value. This identifies the configured limit that is used to throttle or reject requests.

Examples
The following example illustrates displaying the per-Vserver limits for management sessions.

```
cluster1:*> security session limit vserver show
Interface Vserver Max-Active
--------- -------------------- ----------
cli Cluster 4
ontapi Cluster 2
ontapi cluster1 16
3 entries were displayed.
```

Security Session Request-Statistics Commands

View session request statistics
These commands provide historical statistics surrounding management session activity for specific categories, including application, location, request, user, and Vserver.

security session request-statistics show-by-application
Show session request statistics by application

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The `security session request-statistics show-by-application` command shows historical statistics for management session activity, categorized by application name. CLI sessions connections will have an application name based on the connection method, i.e.: `ssh`, `telnet`, `rsh`, `console`, or `ngsh`. ONTAPI sessions will extract the application name from the ZAPI request. ONTAP looks for the application name in the following three locations, in the following order of precedence:

1. The "X-Dot-Client-App" HTTP header;
2. The "app-name" attribute of the "netapp" element, within the ZAPI XML request;
3. The "User-Agent" HTTP header.

Parameters

```
[-fields <fieldname>,...]
```
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance ]
```
If you specify the `-instance` parameter, the command displays detailed information about all fields.
[[-node {<nodename>|local}] - Node
Selects the sessions that match this parameter value. This identifies the node that processed the session.

[[-interface {cli|ontapi}] - Interface
Selects the sessions that match this parameter value. This identifies the interface (CLI or ONTAPI) that processed the session.

[[-application <text>] - Application
Selects the sessions that match this parameter value. This identifies the calling application by name.

[[-total <integer>] - Total Requests
Selects the sessions that match this parameter value. This identifies the total number of requests that have been made on a session. The following commands are not counted: top, up, cd, rows, history, exit.

[[-blocked <integer>] - Blocked Requests
Selects the sessions that match this parameter value. This identifies the number of requests that were blocked due to configured limits.

[[-failed <integer>] - Failed Requests
Selects the sessions that match this parameter value. This identifies the number of requests that failed for any reason (including if they were blocked by configured limits).

[[-max-time <integer>] - Maximum Time (ms)
Selects the sessions that match this parameter value. This identifies the maximum amount of time (in milliseconds) that any request took.

[[-last-time <integer>] - Last Time (ms)
Selects the sessions that match this parameter value. This identifies the amount of time (in milliseconds) that the last request took.

[[-active <integer>] - Number Active Now
Selects the sessions that match this parameter value. This identifies the number of currently active sessions.

[[-max-active <integer>] - Max Number Active
Selects the sessions that match this parameter value. This identifies the maximum number of concurrently active sessions.

[[-last-active-seconds <integer>] - Seconds Since Last Session Start
Selects the sessions that match this parameter value. When a session is active, this indicates the time (in seconds) since the last session started.

[[-idle-seconds <integer>] - Idle Seconds
Selects the sessions that match this parameter value. When no sessions are active, this indicates the time (in seconds) since the last session ended.

[[-total-seconds <integer>] - Total Seconds
Selects the sessions that match this parameter value. This identifies the total time (in seconds) that have been taken by all completed requests; it does not include session idle time.

[[-average-time <integer>] - Average Time (ms)
Selects the sessions that match this parameter value. This identifies the mean time spent processing requests.

[[-success-percent <percent>] - Success Percent
Selects the sessions that match this parameter value. This identifies the percentage of successful requests.

[[-blocked-percent <percent>] - Blocked Percent
Selects the sessions that match this parameter value. This identifies the percentage of requests that were blocked due to configured limits.
[-failed-percent <percent>] - Failed Percent

Selects the sessions that match this parameter value. This identifies the percentage of requests that failed for any reason (including if they were blocked by configured limits).

[-max-active-limit <integer>] - Max-Active Limit (privilege: advanced)

Selects the sessions that match this parameter value. This identifies the configured limit that is used to throttle or reject requests.

**Examples**

The following example illustrates displaying historical statistics for all management session activity across the cluster, categorized by application name.

```
cluster1::> security session request-statistics show-by-application
```

<table>

**security session request-statistics show-by-location**

Show session request statistics by location

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**

The `security session request-statistics show-by-location` command shows historical statistics for management session activity, categorized by client location.
Parameters

{ [-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

[-instance ]
  If you specify the -instance parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node
  Selects the sessions that match this parameter value. This identifies the node that processed the session.

[-interface {cli|ontapi}] - Interface
  Selects the sessions that match this parameter value. This identifies the interface (CLI or ONTAPI) that processed the session.

[-location <text>] - Client Location
  Selects the sessions that match this parameter value. This identifies the location of the calling client application. This is typically the IP address of the calling client, or "console" or "localhost" for console or localhost connections.

[-ipspace <IPspace>] - IPspace of Location
  Selects the sessions that match this parameter value. This identifies the IPspace of the client location.

[-total <integer>] - Total Requests
  Selects the sessions that match this parameter value. This identifies the total number of requests that have been made on a session. The following commands are not counted: top, up, cd, rows, history, exit.

[-blocked <integer>] - Blocked Requests
  Selects the sessions that match this parameter value. This identifies the number of requests that were blocked due to configured limits.

[-failed <integer>] - Failed Requests
  Selects the sessions that match this parameter value. This identifies the number of requests that failed for any reason (including if they were blocked by configured limits).

[-max-time <integer>] - Maximum Time (ms)
  Selects the sessions that match this parameter value. This identifies the maximum amount of time (in milliseconds) that any request took.

[-last-time <integer>] - Last Time (ms)
  Selects the sessions that match this parameter value. This identifies the amount of time (in milliseconds) that the last request took.

[-active <integer>] - Number Active Now
  Selects the sessions that match this parameter value. This identifies the number of currently active sessions.

[-max-active <integer>] - Max Number Active
  Selects the sessions that match this parameter value. This identifies the maximum number of concurrently active sessions.

[-last-active-seconds <integer>] - Seconds Since Last Session Start
  Selects the sessions that match this parameter value. When a session is active, this indicates the time (in seconds) since the last session started.

[-idle-seconds <integer>] - Idle Seconds
  Selects the sessions that match this parameter value. When no sessions are active, this indicates the time (in seconds) since the last session ended.

Security Session Commands
[-total-seconds <integer>] - Total Seconds
Selects the sessions that match this parameter value. This identifies the total time (in seconds) that have been taken by all completed requests; it does not include session idle time.

[-average-time <integer>] - Average Time (ms)
Selects the sessions that match this parameter value. This identifies the mean time spent processing requests.

[-success-percent <percent>] - Success Percent
Selects the sessions that match this parameter value. This identifies the percentage of successful requests.

[-blocked-percent <percent>] - Blocked Percent
Selects the sessions that match this parameter value. This identifies the percentage of requests that were blocked due to configured limits.

[-failed-percent <percent>] - Failed Percent
Selects the sessions that match this parameter value. This identifies the percentage of requests that failed for any reason (including if they were blocked by configured limits).

[-max-active-limit <integer>] - Max-Active Limit (privilege: advanced)
Selects the sessions that match this parameter value. This identifies the configured limit that is used to throttle or reject requests.

Examples
The following example illustrates displaying historical statistics for all management session activity across the cluster, categorized by location.

```
cluster1::> security session request-statistics show-by-location
Node: node1               Interface: cli                 Idle    Total
Location          IPspace    Total Now Max Pass Fail  Seconds  Seconds Avg (ms)
----------------- ------- -------- --- --- ---- ---- -------- -------- --------
console           Default        1  1  1 100%    0     333        9      739      111
localhost         Default        2  1  1 100%    0     991       30      333      111
----------------- ------- -------- --- --- ---- ---- -------- -------- --------
```

The following example illustrates displaying historical statistics for management session activity on a specific node and for a specific location.

```
cluster1::> security session request-statistics show-by-location -node node2 -location localhost
Node: node2               Interface: cli                 Idle    Total
Location          IPspace    Total Now Max Pass Fail  Seconds  Seconds Avg (ms)
----------------- ------- -------- --- --- ---- ---- -------- -------- --------
localhost         Default        2  1  1 100%    0     991       30      333      111
----------------- ------- -------- --- --- ---- ---- -------- -------- --------
```

556  Commands: Manual Page Reference
security session request-statistics show-by-request

Show session request statistics by request name

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The security session request-statistics show-by-request command shows historical statistics for management session activity, categorized by request (command or API name).

Parameters

{ [-fields <fieldname>, ...] 
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.
  
  [-instance] 
  If you specify the -instance parameter, the command displays detailed information about all fields.
  
  [-node {<nodename>|local}] - Node 
  Selects the sessions that match this parameter value. This identifies the node that processed the session.
  
  [-interface {cli|ontapi}] - Interface 
  Selects the sessions that match this parameter value. This identifies the interface (CLI or ONTAPI) that processed the session.
  
  [-request <text>] - Request Name 
  Selects the sessions that match this parameter value. This identifies the command associated with these requests.
  
  [-total <integer>] - Total Requests 
  Selects the sessions that match this parameter value. This identifies the total number of requests that have been made on a session. The following commands are not counted: top, up, cd, rows, history, exit.
  
  [-blocked <integer>] - Blocked Requests 
  Selects the sessions that match this parameter value. This identifies the number of requests that were blocked due to configured limits.
  
  [-failed <integer>] - Failed Requests 
  Selects the sessions that match this parameter value. This identifies the number of requests that failed for any reason (including if they were blocked by configured limits).
  
  [-max-time <integer>] - Maximum Time (ms) 
  Selects the sessions that match this parameter value. This identifies the maximum amount of time (in milliseconds) that any request took.
  
  [-last-time <integer>] - Last Time (ms) 
  Selects the sessions that match this parameter value. This identifies the amount of time (in milliseconds) that the last request took.
  
  [-active <integer>] - Number Active Now 
  Selects the sessions that match this parameter value. This identifies the number of currently active requests.
  
  [-max-active <integer>] - Max Number Active 
  Selects the sessions that match this parameter value. This identifies the maximum number of concurrently active requests.

Security Session Commands
- Last-Active-Seconds <integer> - Seconds Since Last Request Start

Selects the sessions that match this parameter value. When requests are active, this indicates the time (in seconds) since the last request started.

- Idle-Seconds <integer> - Idle Seconds

Selects the sessions that match this parameter value. When no requests are active, this indicates the time (in seconds) since the last request ended.

- Total-Seconds <integer> - Total Seconds

Selects the sessions that match this parameter value. This identifies the total time (in seconds) that have been taken by all completed requests; it does not include session idle time.

- Average-Time <integer> - Average Time (ms)

Selects the sessions that match this parameter value. This identifies the mean time spent processing requests.

- Success-Percent <percent> - Success Percent

Selects the sessions that match this parameter value. This identifies the percentage of successful requests.

- Blocked-Percent <percent> - Blocked Percent

Selects the sessions that match this parameter value. This identifies the percentage of requests that were blocked due to configured limits.

- Failed-Percent <percent> - Failed Percent

Selects the sessions that match this parameter value. This identifies the percentage of requests that failed for any reason (including if they were blocked by configured limits).

- Max-Active-Limit <integer> - Max-Active Limit (privilege: advanced)

Selects the sessions that match this parameter value. This identifies the configured limit that is used to throttle or reject requests.

Examples

The following example illustrates displaying historical statistics for all management session activity on a specific node, with a specific request query.

```cluster1::> security session request-statistics show-by-request -node node1 -request network*
Node: node1               Interface: cli                 Idle    Total
Request Name                 Total Now Max Pass Fail  Seconds  Seconds Avg (ms)
------------------------- -------- --- --- ---- ---- -------- -------- --------
network interface create         2   0   1 100%    0     2556        0      485
network interface modify         1   0   1 100%    0     2518        0       34
network interface show           8   0   1 100%    0     2152       12     1614
network route create             1   0   1 100%    0     2135        0       45
network route show               2   0   1 100%    0     2145        0       17
5 entries were displayed.
cluster1::>
```

security session request-statistics show-by-user

Show session request statistics by username

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The security session request-statistics show-by-user command shows historical statistics for management session activity, categorized by username. Entries for username 'autosupport' reflect commands that are executed by the AutoSupport OnDemand feature.
Parameters

\([\text{-fields}<\text{fieldname}>,\ldots]\)

If you specify the \(\text{-fields}<\text{fieldname}>,\ldots\) parameter, the command output also includes the specified field or fields. You can use `\(-fields\ ?\)` to display the fields to specify.

\([\text{-instance}]\)

If you specify the \(\text{-instance}\) parameter, the command displays detailed information about all fields.

\([-\text{node}\ (<\text{nodename}|\text{local})]\) - Node

Selects the sessions that match this parameter value. This identifies the node that processed the session.

\([-\text{interface}\ (\text{cli}|\text{ontapi})]\) - Interface

Selects the sessions that match this parameter value. This identifies the interface (CLI or ONTAPI) that processed the session.

\([-\text{vserver}\ <\text{vserver}>]\) - Vserver

Selects the sessions that match this parameter value. This identifies the Vserver associated with this management session.

\([-\text{username}\ <\text{text}>]\) - Username

Selects the sessions that match this parameter value. This identifies the authenticated user associated with this management session.

\([-\text{total}\ <\text{integer}>]\) - Total Requests

Selects the sessions that match this parameter value. This identifies the total number of requests that have been made on a session. The following commands are not counted: top, up, cd, rows, history, exit.

\([-\text{blocked}\ <\text{integer}>]\) - Blocked Requests

Selects the sessions that match this parameter value. This identifies the number of requests that were blocked due to configured limits.

\([-\text{failed}\ <\text{integer}>]\) - Failed Requests

Selects the sessions that match this parameter value. This identifies the number of requests that failed for any reason (including if they were blocked by configured limits).

\([-\text{max-time}\ <\text{integer}>]\) - Maximum Time (ms)

Selects the sessions that match this parameter value. This identifies the maximum amount of time (in milliseconds) that any request took.

\([-\text{last-time}\ <\text{integer}>]\) - Last Time (ms)

Selects the sessions that match this parameter value. This identifies the amount of time (in milliseconds) that the last request took.

\([-\text{active}\ <\text{integer}>]\) - Number Active Now

Selects the sessions that match this parameter value. This identifies the number of currently active sessions.

\([-\text{max-active}\ <\text{integer}>]\) - Max Number Active

Selects the sessions that match this parameter value. This identifies the maximum number of concurrently active sessions.

\([-\text{last-active-seconds}\ <\text{integer}>]\) - Seconds Since Last Session Start

Selects the sessions that match this parameter value. When a session is active, this indicates the time (in seconds) since the last session started.

\([-\text{idles-seconds}\ <\text{integer}>]\) - Idle Seconds

Selects the sessions that match this parameter value. When no sessions are active, this indicates the time (in seconds) since the last session ended.
[-total-seconds <integer>] - Total Seconds
Selects the sessions that match this parameter value. This identifies the total time (in seconds) that have been taken by all completed requests; it does not include session idle time.

[-average-time <integer>] - Average Time (ms)
Selects the sessions that match this parameter value. This identifies the mean time spent processing requests.

[-success-percent <percent>] - Success Percent
Selects the sessions that match this parameter value. This identifies the percentage of successful requests.

[-blocked-percent <percent>] - Blocked Percent
Selects the sessions that match this parameter value. This identifies the percentage of requests that were blocked due to configured limits.

[-failed-percent <percent>] - Failed Percent
Selects the sessions that match this parameter value. This identifies the percentage of requests that failed for any reason (including if they were blocked by configured limits).

[-max-active-limit <integer>] - Max-Active Limit (privilege: advanced)
Selects the sessions that match this parameter value. This identifies the configured limit that is used to throttle or reject requests.

### Examples
The following example illustrates displaying historical statistics for all management session activity across the cluster, categorized by username.

```
cluster1::> security session request-statistics show-by-user

Node: node1               Interface: cli                 Idle    Total
Vserver          Username    Total Now Max Pass Fail  Seconds  Seconds Avg (ms)
-------------- ---------- -------- --- --- ---- ---- -------- -------- --------
cluster1            admin       81   1   3  80%    16        -     1228    15171
    diag        1   0   1 100%    0     1982     1511  1511958
    autosupport 4   0   1 100%    0        -        0       17 

Node: node1               Interface: ontapi          Idle    Total
Vserver          Username    Total Now Max Pass Fail  Seconds  Seconds Avg (ms)
-------------- ---------- -------- --- --- ---- ---- -------- -------- --------
cluster1            admin        2   0   1 100%    0     2585        0       18 

Node: node2               Interface: cli                 Idle    Total
Vserver          Username    Total Now Max Pass Fail  Seconds  Seconds Avg (ms)
-------------- ---------- -------- --- --- ---- ---- -------- -------- --------
cluster1            admin       6   1   1  83%    1     3106      423    70557 

4 entries were displayed.
```

The following example illustrates displaying historical statistics for management session activity on a specific node and for a specific username.

```
cluster1::> security session request-statistics show-by-user -node node1 -username diag

Node: node1               Interface: cli                 Idle    Total
Vserver          Username    Total Now Max Pass Fail  Seconds  Seconds Avg (ms)
-------------- ---------- -------- --- --- ---- ---- -------- -------- 
cluster1            diag        1   0   1 100%    0        -     1511  1511958

cluster1::>
```
security session request-statistics show-by-vserver

Show session request statistics by Vserver

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The security session request-statistics show-by-vserver command shows historical statistics for management session activity, categorized by vserver.

Parameters

[-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

[-instance]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-node {<nodename> | local}] - Node
Selects the sessions that match this parameter value. This identifies the node that processed the session.

[-interface {cli | ontapi}] - Interface
Selects the sessions that match this parameter value. This identifies the interface (CLI or ONTAPI) that processed the session.

[-vserver <vserver>] - Vserver
Selects the sessions that match this parameter value. This identifies the Vserver associated with this management session.

[-total <integer>] - Total Requests
Selects the sessions that match this parameter value. This identifies the total number of requests that have been made on a session. The following commands are not counted: top, up, cd, rows, history, exit.

[-blocked <integer>] - Blocked Requests
Selects the sessions that match this parameter value. This identifies the number of requests that were blocked due to configured limits.

[-failed <integer>] - Failed Requests
Selects the sessions that match this parameter value. This identifies the number of requests that failed for any reason (including if they were blocked by configured limits).

[-max-time <integer>] - Maximum Time (ms)
Selects the sessions that match this parameter value. This identifies the maximum amount of time (in milliseconds) that any request took.

[-last-time <integer>] - Last Time (ms)
Selects the sessions that match this parameter value. This identifies the amount of time (in milliseconds) that the last request took.

[-active <integer>] - Number Active Now
Selects the sessions that match this parameter value. This identifies the number of currently active sessions.

[-max-active <integer>] - Max Number Active
Selects the sessions that match this parameter value. This identifies the maximum number of concurrently active sessions.
[-last-active-seconds <integer>] - Seconds Since Last Session Start
Selects the sessions that match this parameter value. When a session is active, this indicates the time (in seconds) since the last session started.

[-idle-seconds <integer>] - Idle Seconds
Selects the sessions that match this parameter value. When no sessions are active, this indicates the time (in seconds) since the last session ended.

[-total-seconds <integer>] - Total Seconds
Selects the sessions that match this parameter value. This identifies the total time (in seconds) that have been taken by all completed requests; it does not include session idle time.

[-average-time <integer>] - Average Time (ms)
Selects the sessions that match this parameter value. This identifies the mean time spent processing requests.

[-success-percent <percent>] - Success Percent
Selects the sessions that match this parameter value. This identifies the percentage of successful requests.

[-blocked-percent <percent>] - Blocked Percent
Selects the sessions that match this parameter value. This identifies the percentage of requests that were blocked due to configured limits.

[-failed-percent <percent>] - Failed Percent
Selects the sessions that match this parameter value. This identifies the percentage of requests that failed for any reason (including if they were blocked by configured limits).

[-max-active-limit <integer>] - Max-Active Limit (privilege: advanced)
Selects the sessions that match this parameter value. This identifies the configured limit that is used to throttle or reject requests.

### Examples

The following example illustrates displaying historical statistics for all management session activity across the cluster, categorized by Vserver.

```bash
cluster1::> security session request-statistics show-by-vserver
Node: node1               Interface: cli                 Idle    Total
Vserver                      Total Now Max Pass Fail  Seconds  Seconds Avg (ms)
------------------------- -------- --- --- ---- ---- -------- -------- --------
cluster1                      2725   1   8  94%  146        -     3052     1120
Node: node1               Interface: ontapi              Idle    Total
Vserver                      Total Now Max Pass Fail  Seconds  Seconds Avg (ms)
------------------------- -------- --- --- ---- ---- -------- -------- --------
cluster1                         2   0   1 100%    0     2742        0       18
Node: node2               Interface: cli                 Idle    Total
Vserver                      Total Now Max Pass Fail  Seconds  Seconds Avg (ms)
------------------------- -------- --- --- ---- ---- -------- -------- --------
cluster1                      2552   1   6  95%  117        -      705      276
3 entries were displayed.
cluster1::>
```

The following example illustrates displaying historical statistics for management session activity on a specific node, for a specific Vserver.

```bash
cluster1::> security session request-statistics show-by-vserver -node node1 -vserver cluster1
Node: node1               Interface: cli                 Idle    Total
Vserver                      Total Now Max Pass Fail  Seconds  Seconds Avg (ms)
------------------------- -------- --- --- ---- ---- -------- -------- --------
cluster1                      2725   1   8  94%  146        -     3052     1120
```

562 Commands: Manual Page Reference
security ssh commands

Manage SSH Configuration

security ssh add

Add SSH configuration options

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `security ssh add` command adds additional SSH key exchange algorithms or ciphers or MAC algorithms to the existing configurations of the cluster or a Vserver. The added algorithms or ciphers or MAC algorithms are enabled on the cluster or Vserver. If you change the cluster configuration settings, it is used as the default for all newly created Vservers. The existing SSH key exchange algorithms, ciphers, and MAC algorithms remain unchanged in the configuration. If the SSH key exchange algorithms or ciphers or MAC algorithms are already enabled in the current configuration, the command will not fail. Data ONTAP supports the `diffie-hellman-group-exchange-sha256` key exchange algorithm for SHA-2. Data ONTAP also supports the `diffie-hellman-group-exchange-sha1`, `diffie-hellman-group14-sha1`, and `diffie-hellman-group1-sha1` SSH key exchange algorithms for SHA-1. The SHA-2 key exchange algorithm is more secure than the SHA-1 key exchange algorithms. Data ONTAP also supports the `ecdh-sha2-nistp256`, `ecdh-sha2-nistp384`, `ecdh-sha2-nistp521`, and `curve25519-sha256` key exchange algorithms. Data ONTAP also supports the AES and 3DES symmetric encryptions (also known as ciphers) of the following types: `aes256-ctr`, `aes192-ctr`, `aes128-ctr`, `aes256-cbc`, `aes192-cbc`, `aes128-cbc`, `aes128-gcm`, `aes256-gcm`, and `3des-cbc`. Data ONTAP also supports MAC algorithms of the following types: `hmac-shal`, `hmac-sha1`, `hmac-md5`, `hmac-md5-96`, `hmac-ripemd160`, `umac-64`, `umac-64`, `umac-128`, `hmac-sha2-256`, `hmac-sha2-512`, `hmac-sha2-512`, `hmac-sha2-512`, `hmac-sha2-512`, `hmac-sha2-512`, `hmac-md5-96`, `hmac-ripemd160`, `umac-64`, `umac-64`, and `umac-128`. Data ONTAP also supports MAC algorithms of the following types: `hmac-shal`, `hmac-sha1`, `hmac-md5`, `hmac-md5-96`, `hmac-ripemd160`, `umac-64`, `umac-64`, `umac-128`, `hmac-sha2-256`, `hmac-sha2-512`, `hmac-sha2-512`, `hmac-sha2-512`, `hmac-sha2-512`, `hmac-md5-96`, `hmac-ripemd160`, `umac-64`, `umac-64`, and `umac-128`.

**Parameters**

`-vserver <Vserver Name>` - *Vserver*

Identifies the Vserver to which you want to add additional SSH key exchange algorithms or ciphers.

`[-key-exchange-algorithms <algorithm name>, ...]` - *List of SSH Key Exchange Algorithms to Add*

Adds the specified SSH key exchange algorithm or algorithms to the Vserver.

`[-ciphers <cipher name>, ...]` - *List of SSH Ciphers to Add*

Adds the specified cipher or ciphers to the Vserver.

`[-mac-algorithms <MAC name>, ...]` - *List of SSH MAC Algorithms to Add*

Adds the specified MAC algorithm or algorithms to the Vserver.

**Examples**
The following command adds the `diffie-hellman-group-exchange-sha256` and `diffie-hellman-group-exchange-sha1` key exchange algorithms for the cluster1 Vserver. It also adds the `aes256-cbc` and `aes192-cbc` ciphers and the `hmac-shal` and `hmac-sha2-256` MAC algorithms to the cluster1 Vserver.
security ssh modify

Modify SSH configuration options

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `security ssh modify` command replaces the existing configurations of the SSH key exchange algorithms or ciphers or MAC algorithms for the cluster or a Vserver with the configuration settings you specify. If you modify the cluster configuration settings, it will be used as the default for all newly created Vservers. Data ONTAP supports the `diffie-hellman-group-exchange-sha256` key exchange algorithm for SHA-2. Data ONTAP also supports the `diffie-hellman-group-exchange-sha1`, `diffie-hellman-group14-sha1`, and `diffie-hellman-group1-sha1` SSH key exchange algorithms for SHA-1. The SHA-2 key exchange algorithm is more secure than the SHA-1 key exchange algorithms. Data ONTAP also supports the AES and 3DES symmetric encryptions (also known as ciphers) of the following types: `aes256-ctr`, `aes192-ctr`, `aes128-ctr`, `aes256-cbc`, `aes192-cbc`, `aes128-cbc`, `aes256-gcm`, `aes128-gcm`, and `3des-cbc`. Data ONTAP supports MAC algorithms of the following types: `hmac-shal`, `hmac-shal-96`, `hmac-md5`, `hmac-md5-96`, `hmac-ripemd160`, `umac-64`, `umac-64`, `umac-128`, `hmac-sha2-256`, `hmac-sha2-512`, `hmac-shal-etr`, `hmac-shal-96-etr`, `hmac-sha2-256-etr`, `hmac-sha2-512-etr`, `hmac-md5-etr`, `hmac-md5-96-etr`, `hmac-ripemd160-etr`, `umac-64-etr`, and `umac-128-etr`.

**Parameters**

- `-vserver <Vserver Name>` - Vserver
  Identifies the Vserver for which you want to replace the existing SSH key exchange algorithm and cipher configurations.

- `[\-key-exchange-algorithms <algorithm name>, ...]` - Key Exchange Algorithms
  Enables the specified SSH key exchange algorithm or algorithms for the Vserver. This parameter also replaces all existing SSH key exchange algorithms with the specified settings.

- `[\-ciphers <cipher name>, ...]` - Ciphers
  Enables the specified cipher or ciphers for the Vserver. This parameter also replaces all existing ciphers with the specified settings.

- `[\-mac-algorithms <MAC name>, ...]` - MAC Algorithms
  Enables the specified MAC algorithm or algorithms for the Vserver. This parameter also replaces all existing MAC algorithms with the specified settings.

- `[\-max-authentication-retry-count <integer>]` - Max Authentication Retry Count
  Modifies the maximum number of authentication retry count for the Vserver.

**Examples**
The following command enables the `diffie-hellman-group-exchange-sha256` and `diffie-hellman-group14-sha1` key exchange algorithms for the cluster1 Vserver. It also enables the `aes256-ctr`, `aes192-ctr` and `aes128-ctr` ciphers, `hmac-shal` and `hmac-sha2-256` MAC algorithms for the cluster1 Vserver. It also modifies the maximum authentication retry count to 3 for the cluster1 Vserver:

```
cluster1::> security ssh modify -vserver cluster1 -key-exchange-algorithms diffie-hellman-group-exchange-sha256,diffie-hellman-group14-sha1 -ciphers aes256-ctr,aes192-ctr,aes128-ctr -mac-algorithms hmac-shal,hmac-sha2-256 -max-authentication-retry-count 3
```
security ssh prepare-to-downgrade

Downgrade the SSH configuration to be compatible with releases earlier than Data ONTAP 9.2.0.

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**
This command downgrades the SSH configurations of all Vservers and the cluster to settings compatible with releases earlier than Data ONTAP 9.2.0. This command also disables the max-authentication-retry feature. You must run this command in advanced privilege mode when prompted to do so during the release downgrade. Otherwise, the release downgrade process will fail.

**Examples**
The following command downgrades the SSH security configurations of all Vservers and the cluster to settings compatible with releases earlier than Data ONTAP 9.2.0.

```
cluster1:*> security ssh prepare-to-downgrade
```

security ssh remove

Remove SSH configuration options

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `security ssh remove` command removes the specified SSH key exchange algorithms or ciphers from the existing configurations of the cluster or a Vserver. The removed algorithms or ciphers are disabled on the cluster or Vserver. If you changed the cluster configuration settings, it will be used as the default for all newly created Vservers. If the SSH key exchange algorithms or ciphers that you specify with this command are not currently enabled, the command will not fail. Data ONTAP supports the `diffie-hellman-group-exchange-sha256` key exchange algorithm for SHA-2. Data ONTAP also supports the `diffie-hellman-group-exchange-sha1`, `diffie-hellman-group14-sha1`, and `diffie-hellman-group1-sha1` key exchange algorithms for SHA-1. The SHA-2 key exchange algorithm is more secure than the SHA-1 key exchange algorithms. Data ONTAP also supports `ecdh-sha2-nistp256`, `ecdh-sha2-nistp384`, `ecdh-sha2-nistp521`, and `curve25519-sha256`. Data ONTAP also supports the AES and 3DES symmetric encryption (also known as ciphers) of the following types: `aes256-ctr`, `aes192-ctr`, `aes128-ctr`, `aes256-cbc`, `aes192-cbc`, `aes128-cbc`, `aes128-gcm`, `aes256-gcm` and `3des-cbc`. Data ONTAP supports MAC algorithms of the following types: `hmac-sha1`, `hmac-sha1-96`, `hmac-md5`, `hmac-md5-96`, `hmac-ripemd160`, `umac-64`, `umac-128`, `hmac-sha2-256`, `hmac-sha2-512`, `hmac-sha1-96-etm`, `hmac-sha2-256-etm`, `hmac-sha2-512-etm`, `hmac-md5-etm`, `hmac-md5-96-etm`, `hmac-ripemd160-etm`, `umac-64-etm`, and `umac-128-etm`.

**Parameters**

- `vserver <Vserver Name>` - Vserver
  - Identifies the Vserver from which you want to remove the SSH key exchange algorithms or ciphers.

- `[key-exchange-algorithms <algorithm name>, ...]` - List of SSH Key Exchange Algorithms to Remove
  - Removes the specified key exchange algorithm or algorithms from the Vserver.

- `[ciphers <cipher name>, ...]` - List of SSH Ciphers to Remove
  - Removes the specified ciphers or ciphers from the Vserver.

- `[mac-algorithms <MAC name>, ...]` - List of SSH MAC algorithms to Remove
  - Removes the specified MAC algorithm or algorithms from the Vserver.
Examples
The following command removes the `diffie-hellman-group1-shal` and `diffie-hellman-group-exchange-shal` key exchange algorithms from the cluster1 Vserver. It also removes the `aes128-cbc` and `3des-cbc` ciphers and the `hmac-shal-96` and `hmac-sha2-256` MAC algorithms from the cluster1 Vserver.

```
cluster1::> security ssh remove -vserver cluster1 -key-exchange-algorithms diffie-hellman-group1-shal,diffie-hellman-group-exchange-shal -ciphers aes128-cbc,3des-cbc -mac-algorithms hmac-shal-96,hmac-sha2-256
```

security ssh show
Display SSH configuration options

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `security ssh show` command displays the configurations of the SSH key exchange algorithms, ciphers, MAC algorithms and maximum authentication retry count for the cluster and Vservers. The SSH protocol uses a Diffie-Hellman based key exchange method to establish a shared secret key during the SSH negotiation phase. The key exchange method specifies how one-time session keys are generated for encryption and authentication and how the server authentication takes place. Data ONTAP supports the `diffie-hellman-group-exchange-sha256` key exchange algorithm for SHA-2. Data ONTAP also supports the `diffie-hellman-group-exchange-shal`, `diffie-hellman-group14-shal`, and `diffie-hellman-group1-shal` key exchange algorithms for SHA-1. Data ONTAP also supports `ecdh-sha2-nistp256`, `ecdh-sha2-nistp384`, `ecdh-sha2-nistp521`, `curve25519-sha256`. Data ONTAP also supports the AES and 3DES symmetric encryptions (also known as ciphers) of the following types: `aes256-ctr`, `aes192-ctr`, `aes128-ctr`, `aes256-cbc`, `aes192-cbc`, `aes128-cbc`, `aes128-gcm`, `aes256-gcm` and `3des-cbc`. Data ONTAP supports MAC algorithms of the following types: `hmac-shal`, `hmac-shal-96`, `hmac-md5`, `hmac-md5-96`, `hmac-ripemd160`, `umac-64`, `umac-64`, `umac-128`, `umac-256`, `hmac-sha2-256`, `hmac-sha2-512`, `hmac-shal-96-eth`, `hmac-sha2-256-eth`, `hmac-sha2-512-eth`, `hmac-md5-eth`, `hmac-md5-96-eth`, `hmac-ripemd160-eth`, `umac-64-eth`, `umac-128-eth`

**Parameters**

```
[-fields <fieldname>, ...]
```
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance]
```
If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[-vserver <Vserver Name>]
```
Identifies the Vserver for which you want to display the SSH key exchange algorithm, cipher, and MAC algorithm configurations.

```
[-key-exchange-algorithms <algorithm name>, ...]
```
Key Exchange Algorithms
Displays the Vserver or Vservers that have the specified key exchange algorithms enabled.

```
[-ciphers <cipher name>, ...]
```
Ciphers
Displays the Vserver or Vservers that have the specified ciphers enabled.

```
[-mac-algorithms <MAC name>, ...]
```
MAC Algorithms
Displays the Vserver or Vservers that have the specified MAC algorithm or algorithms.

```
[-max-authentication-retry-count <integer>]
```
Max Authentication Retry Count
Displays Vservers with a matching maximum authentication retry count value.
Examples

The following command displays the enabled SSH key exchange algorithms, ciphers, MAC algorithms and maximum number of authentication retry count for the cluster and all Vservers. The cluster settings are used as the default for all newly created Vservers:

```
cluster-1::> security ssh show
```

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Ciphers</th>
<th>Key Exchange Algorithms</th>
<th>MAC Algorithms</th>
<th>Max Authentication Retry Count</th>
</tr>
</thead>
<tbody>
<tr>
<td>cluster-1</td>
<td>3des-cbc</td>
<td>diffie-hellman-group-exchange-sha256</td>
<td>hmac-sha1</td>
<td>4</td>
</tr>
</tbody>
</table>

2 entries were displayed.

Virtual Server SSL Management

Manage the SSL configurations for a Vserver

These commands control the use of encrypted HTTP on Vservers, including whether SSL is available, which certificate is used for communication, and whether OCSP checks are enabled.

security ssl modify

Modify the SSL configuration for HTTP servers

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

This command modifies the configuration of encrypted HTTP (SSL) for Vservers in the cluster. Depending on the requirements of the individual node's or cluster's web services (displayed by the vserver services web show command), this encryption might or might not be used. If the Vserver does not have a certificate associated with it, SSL will not be available.

**Parameters**

```
-vserver <Vserver Name> - Vserver
```

Identifies a Vserver for hosting SSL-encrypted web services.
- **Server Certificate Issuing CA**
  Identifies a Certificate Authority (CA) of a certificate to be associated with the instance of a given Vserver. If this parameter, along with serial, is omitted during modification, a self-signed SSL certificate can be optionally generated for that Vserver.

- **Server Certificate Serial Number**
  Identifies a serial number of a certificate to be associated with the instance of a given Vserver. If this parameter, along with ca, is omitted during modification, a self-signed SSL certificate can be optionally generated for that Vserver.

- **Server Certificate Common Name**
  Identifies the common name (CN) of a certificate to be associated with the instance of a given Vserver. This parameter becomes optional if serial and ca are specified. You can use the `security certificate create` and `security certificate install` commands to add new certificates to Vservers.

  **Note:** The use of self-signed SSL certificates exposes users to man-in-the-middle security attacks. Where possible, obtain a certificate that is signed by a reputable certificate authority (CA) and use the `security certificate install` command to configure it before enabling SSL on a Vserver.

- **SSL Server Authentication Enabled**
  Defines the working condition of SSL server authentication in an instance of the Vserver. Any Vserver with a valid certificate of type server is server-enabled.

- **SSL Client Authentication Enabled**
  Defines the working condition of SSL client authentication in an instance of the Vserver. Any Vserver with a valid certificate of type client-ca is client-enabled. It can only be enabled if server-enabled is true.

- **Online Certificate Status Protocol Validation Enabled**
  This parameter enables OCSP validation of the client certificate chain. When this parameter is enabled, certificates in the certificate chain of the client will be validated against an OCSP responder after normal verification (including CRL checks) has occurred. The OCSP responder used for validation process is either extracted from the certificate itself, or it is derived by configuration.

- **URI of the Default Responder for OCSP Validation**
  This parameter sets the default OCSP responder to use. If this parameter is not enabled, the URI given will be used only if no responder URI is specified in the certificate that are being verified.

- **Force the Use of the Default Responder URI for OCSP Validation**
  This parameter forces the configured default OCSP responder to be used during OCSP certificate validation, even if the certificate that is being validated references an OCSP responder.

- **Timeout for OCSP Queries**
  Use this parameter to specify the timeout in seconds for OSCP responders. Specify zero for the minimum possible timeout. The default value is 10 seconds.

- **Maximum Allowable Age for OCSP Responses**
  This parameter sets the maximum allowable age (freshness) in seconds for the OCSP responses. The default value for this parameter is unlimited, which does not enforce a maximum age and the OCSP responses are considered valid as long as their expiration date field is in the future.

- **Maximum Allowable Time Skew for OCSP Response Validation**
  This parameter sets the maximum allowable time difference for OCSP responses (when validating their ThisUpdate and NextUpdate fields).
Use a NONCE within OCSP Queries

This parameter determines whether the queries to the OCSP responders should contain a NONCE or not. By default, a query NONCE is always used and checked against the OCSP response. When the responder does not use NONCEs, this parameter should be disabled.

Note: A NONCE is a unique identifier included in each OCSP request or OCSP response to prevent a replay attack.

Examples

The following example enables SSL server authentication for a Vserver named vs0 with a certificate that has ca as www.example.com and serial as 4F4EB629.

```bash
cluster1::> security ssl modify -vserver vs0 -ca www.example.com -serial 4F4EB629 -server-enabled true
```

The following example disables SSL server authentication for a Vserver name vs0.

```bash
cluster1::> security ssl modify -vserver vs0 -server-enabled false
```

The following example enables SSL client authentication for a Vserver named vs0.

```bash
cluster1::> security ssl modify -vserver vs0 -client-enabled true
```

The following example disables SSL client authentication for a Vserver named vs0.

```bash
cluster1::> security ssl modify -vserver vs0 -client-enabled false
```

security ssl show

Display the SSL configuration for HTTP servers

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

This command displays the configuration of encrypted HTTP (SSL) for Vservers in the cluster. Depending on the requirements of the individual node's or cluster's web services (displayed by the vserver services web show command), this encryption might or might not be used. If the Vserver does not have a certificate associated with it, SSL will not be available.

Parameters

```
[-fields <fieldname>, ...]
```

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use ‘-fields ?’ to display the fields to specify.

```
[-ocsp]
```

If you specify the -ocsp parameter, the command displays the Online Certificate Status Protocol configuration.
If you specify the `instance` parameter, the command displays detailed information about all fields.

```
[-instance ]
```

Identifies a Vserver for hosting SSL-encrypted web services.

```
[-vserver <Vserver Name>] - Vserver
```

Filters the display of SSL configuration by specifying the Certificate Authority (CA) that issued the server certificate.

```
[-ca <text>] - Server Certificate Issuing CA
```

Filters the display of SSL configuration by specifying the serial number of a server certificate.

```
[-serial <text>] - Server Certificate Serial Number
```

Filters the display of SSL configuration by specifying the common name for the server certificate.

```
[-common-name <FQDN or Custom Common Name>] - Server Certificate Common Name
```

Filters the display of SSL configuration according to whether the SSL server authentication is enabled or disabled. Vservers have self-signed certificates automatically generated during their creation. These Vserver self-signed certificates are server-enabled by default.

```
[-server-enabled {true|false}] - SSL Server Authentication Enabled
```

Filters the display of SSL configuration according to whether the SSL client authentication is enabled or disabled. You can enable client authentication only when server authentication is enabled.

```
[-client-enabled {true|false}] - SSL Client Authentication Enabled
```

Filters the display of SSL configuration when the Online Certificate Status Protocol validation is enabled.

```
[-ocsp-enabled {true|false}] - Online Certificate Status Protocol Validation Enabled
```

Filters the display of SSL configuration according to the URI of the default responder for OCSP validation.

```
[-ocsp-default-responder <text>] - URI of the Default Responder for OCSP Validation
```

Filters the display of SSL configuration according to the URI of the default responder URI for OCSP validation.

```
[-ocsp-override-responder {true|false}] - Force the Use of the Default Responder URI for OCSP Validation
```

Filters the display of SSL configuration according to the timeout for queries to OCSP responders.

```
[-ocsp-responder-timeout <[<integer>h][<integer>m][<integer>s]>] - Timeout for OCSP Queries
```

Filters the display of SSL configuration according to the maximum allowable age (freshness) in seconds for the OCSP responses.

```
[-ocsp-max-response-age <unsigned32_or_unlimited>] - Maximum Allowable Age for OCSP Responses (secs)
```

Filters the display of SSL configuration according to the maximum allowable time difference for OCSP responses (when validating their ThisUpdate and NextUpdate fields).

```
[-ocsp-use-request-nonce {true|false}] - Use a NONCE within OCSP Queries
```

Filters the display of SSL configuration by specifying whether the queries to the OCSP responders should contain a NONCE or not.

**Note:** A NONCE is a unique identifier included in each OCSP request or OCSP response to prevent a replay attack.

### Examples

The following example displays the configured certificates for Vservers.

```
570
```

SnapLock Commands

Manages SnapLock attributes in the system

The snaplock commands manage compliance-related functionality in the system. A volume created using the volume create command becomes a SnapLock volume when it is created on a SnapLock aggregate. A SnapLock aggregate is created using the storage aggr create command when the snaplock-type is specified as either compliance or enterprise.

The snaplock compliance-clock command can be used to manage the ComplianceClock in the system.

The snaplock log command can be used to manage SnapLock log infrastructure.

SnapLock Clock commands

Manages ComplianceClock of nodes

The snaplock compliance-clock manages the ComplianceClock of the system. ComplianceClock determines the expiry time of the SnapLock objects in the system. ComplianceClock can be initialized only once by the user and once it is set, it cannot be changed or altered by the user. There are two types of ComplianceClocks in the system:

- System ComplianceClock
- Volume ComplianceClock

System ComplianceClock (SCC) is maintained per node. SCC is used to update the Volume ComplianceClock and to provide a base value for Volume ComplianceClock for new SnapLock volumes. The SCC is initialized once by the user and takes the initial base value from the system clock. snaplock compliance-clock show can be used to check the value of the System ComplianceClock.

Volume ComplianceClock (VCC) is maintained per volume and is used as the time reference to calculate the expiry time of SnapLock objects in the SnapLock volume, such as files and the expiry date of the volume. volume snaplock show can be used to check the value of the Volume ComplianceClock.

snaplock compliance-clock show on page 572
volume snaplock show on page 1543
**snaplock compliance-clock initialize**

Initializes the node ComplianceClock

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The `snaplock compliance-clock initialize` command is used to initialize System ComplianceClock from the system clock. System ComplianceClock can be initialized only once by the user. Once initialized, user cannot make any changes to the System ComplianceClock. Hence, user should ensure that system clock is correct before initializing the System ComplianceClock.

**Parameters**

- **-node** `<nodename>|local` - Node
  
  Specifies the name of the node on which System ComplianceClock needs to be initialized.

  **[--force [true]]** - Forces Initialization
  
  If you use this parameter, it will suppress the warning message during `snaplock compliance-clock initialize` operation.

**Examples**

```
cluster-1::> snaplock compliance-clock initialize -node node1
Warning: You are about to initialize the secure ComplianceClock of the node
node1 to the current value of the node's system clock. This
procedure can be performed only once on a given node, so you should
ensure that the system time is set correctly before proceeding.
The current node's system clock is: Wed Nov 26 16:18:30 IST 2014
Do you want to continue? {y|n}: y
cluster-1::>
```

`snaplock compliance-clock show` on page 572

---

**snaplock compliance-clock show**

Displays the node ComplianceClock

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The `snaplock compliance-clock show` command will display System ComplianceClock of the nodes in the cluster. It will display the following information:

- Node name
- ComplianceClock Time

**Parameters**

  ```
  [[-fields <fieldname>, ...]
  If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.
  ```
If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[-node <nodename> | local] - Node
```

If this parameter is specified, the command will display ComplianceClock for that particular node only.

```
[-time <text>] - ComplianceClock Time of the Node
```

If this parameter is specified, the command will display nodes having the same `time` value.

### Examples

```
cluster1::> snaplock compliance-clock show
Node    ComplianceClock Time
------------------- -----------------------------------
nod1 Mon Jan 12 11:34:15 IST 2015 +05:30
nod2 Mon Jan 12 11:34:10 IST 2015 +05:30
2 entries were displayed.
```

```
cluster1::> snaplock compliance-clock show -node nod1
Node    ComplianceClock Time
------------------- -----------------------------------
nod1 Mon Jan 12 11:34:45 IST 2015 +05:30
```

The following example shows the output when the session privilege level is "diagnostic".

```
cluster1::*> snaplock compliance-clock show
Node    ComplianceClock Time                Node ID    ID
----------- ----------------------------------- ---------- -------------
nod1 Mon Jan 12 11:37:13 IST 2015 +05:30 4040216954 1418640203778
nod2 ComplianceClock is not configured.   -          -
2 entries were displayed.
```

The following example shows the output when the session privilege level is "diagnostic".

```
cluster1::*> snaplock compliance-clock show -node nod1
Node: nod1
ComplianceClock Time: Mon Jan 12 11:37:55 IST 2015 +05:30
Node ID: 4040216954
ID: 1418640203778
ComplianceClock Time (secs): 1419002188
ComplianceClock Skew (secs): 1014
```

### snaplock event-retention commands

SnapLock Event Based Retention commands
snaplock event-retention abort

Abort an Event Based Retention policy operation.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `snaplock event-retention abort` is used to abort an ongoing Event Based Retention (EBR) operation. This command only aborts the operations that have not yet completed. Only a user with security login role `vsadmin-snaplock` is allowed to perform this operation.

**Parameters**
- `vserver <vserver name>` - Vserver Name
  Specifies the vserver on which the EBR operation is running.
- `operation-id <integer>` - Operation ID
  Specifies the operation ID of the EBR operation that needs to be aborted.

**Examples**
The following example aborts an ongoing EBR operation with operation-id 16842754:

```
vs1::> snaplock event-retention abort -operation-id 16842754
vs1::>
```

snaplock event-retention apply

Apply an Event Based Retention policy on all files within a user specified path.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `snaplock event-retention apply` command starts a new operation to apply the specified Event Based Retention (EBR) policy to all files in the specified path. If a file is a regular file, it will be made a WORM file and retained for a retention-period as defined by the specified policy name. If a file is already WORM, its retention time will be extended to a retention-period as defined by the specified policy name, starting from the current time. The retention time of a file will be extended only if the file's current retention time is less than the new retention time value to be set. Only a user with security login role `vsadmin-snaplock` is allowed to perform this operation.

**Parameters**
- `vserver <vserver name>` - Vserver Name
  Specifies the name of the Vserver which has the EBR policy defined to be applied on one or more files.
- `policy-name <text>` - Policy Name
  Specifies the name of the EBR policy to be applied on one or more files.
- `volume <volume name>` - Volume
  Specifies the name of the SnapLock volume containing a file path or a directory path as specified by the path parameter. The specified EBR policy is applied to one or more files depending on the value of path.
- `path <text>` - Path
  Specifies the path relative to the output volume root, of the form "/path". The path can be path to a file or a directory. The EBR policy is applied to all files under the specified path. To apply the EBR policy to all files in a volume, specify the path as "/".
Examples
The following example starts an EBR operation to apply a policy on files for specified volume:

```bash
vs1:> snaplock event-retention apply -policy-name p1 -volume slc -path /
SnapLock event based retention operation is queued. Run "snaplock event-retention show -operation-id 16842754 -instance" to view the operation status.
```

**snaplock event-retention show**

Show status of Event Based Retention operation

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `snaplock event-retention show` command displays the status of an Event Based Retention (EBR) operation. Information about completed operations will be cleaned up after an hour after completion. Only a user with security login role `vsadmin-snaplock` is allowed to perform this operation.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>-fields &lt;fieldname&gt;,...</code></td>
<td>If you specify the <code>-fields &lt;fieldname&gt;,...</code> parameter, the command output also includes the specified field or fields. You can use <code>-fields ?</code> to display the fields to specify.</td>
</tr>
<tr>
<td><code>[-instance]</code></td>
<td>If you specify the <code>-instance</code> parameter, the command displays detailed information about all fields.</td>
</tr>
<tr>
<td><code>[-vserver &lt;vserver name&gt;]</code></td>
<td>Vserver Name If this parameter is specified, the command displays all EBR operations that match the specified Vserver.</td>
</tr>
<tr>
<td><code>[-operation-id &lt;integer&gt;]</code></td>
<td>Operation ID If this parameter is specified, the command displays all EBR operations that match the specified operation ID.</td>
</tr>
<tr>
<td><code>[-volume &lt;volume name&gt;]</code></td>
<td>Volume Name If this parameter is specified, the command displays all EBR operations that match the specified volume. The parameter specifies the volume on which EBR operation is running or has completed.</td>
</tr>
<tr>
<td><code>[-path &lt;text&gt;]</code></td>
<td>Path If this parameter is specified, the command displays all EBR operations that match the specified path. The parameter specifies the path on which EBR operation is running or has completed.</td>
</tr>
<tr>
<td><code>[-policy-name &lt;text&gt;]</code></td>
<td>Policy Name If this parameter is specified, the command displays all EBR operations that match the specified policy name. The parameter specifies the EBR policy name.</td>
</tr>
<tr>
<td>`[-retention-period {&lt;integer&gt; seconds</td>
<td>minutes</td>
</tr>
<tr>
<td><code>[-num-files-processed &lt;integer&gt;]</code></td>
<td>Number of Files Processed If this parameter is specified, the command displays all EBR operations that match the specified number of processed files. The parameter specifies the number of files on which EBR policy was applied successfully.</td>
</tr>
</tbody>
</table>
[-num-files-failed <integer>] - Number of Files Failed
   If this parameter is specified, the command displays all EBR operations that match the specified number of failed files. The parameter specifies the number of files on which the application of EBR policy failed.

[-num-files-skipped <integer>] - Number of Files Skipped
   If this parameter is specified, the command displays all EBR operations that match the specified number of skipped files. The parameter specifies the number of files on which the application of EBR policy was skipped. A file that is under legal-hold will be skipped. If the retention time of a file is being shortened as a result of applying the EBR policy, that file will also be skipped.

[-num-inodes-ignored <integer>] - Number of Inodes Ignored
   If this parameter is specified, the command displays all EBR operations that match the specified number of ignored inodes. The parameter specifies the number of inodes on which the application of EBR policy was not attempted because they were not regular files.

[-operation-status {Unknown|In-Progress|Failed|Aborting|Completed}] - Operation Status
   If this parameter is specified, the command displays all EBR operations that match the specified operation status. The parameter specifies the operation status of an EBR operation.

[-status-details <text>] - Status Details
   If this parameter is specified, the command displays all EBR operations that match the specified status details. The parameter specifies the status details of an EBR operation.

Examples
   The following examples show the status of EBR operations for Vserver "vs1" and volume "slc" and the status of event-retention operation for operation ID 16842753 respectively.

```
vs1::*> snaplock event-retention operation show -volume slc
Operation ID   Vserver         Volume          Operation Status
-------------- --------------- --------------- ----------------
16842753       vs1             slc             Completed
16842754       vs1             slc             In-progress

vs1::*> snaplock event-retention operation show -operation-id 16842753
Operation ID: 16842753
Vserver: vs1
Volume: slc
Path: /vol/slc/d1
Policy Name: p1
Retention Period: 10 years
Number of Files Processed: 50
Number of Files Failed: 0
Number of Inodes Ignored: 2
Operation Status: Completed
Status Details: No error
```

snaplock event-retention show-vservers
   Show Vservers with SnapLock Event Based Retention policies

   Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

   Description
   The snaplock event-retention show-vservers command is used to display the Vservers that have SnapLock Event Based Retention (EBR) policies created.
Parameters

[-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

Examples

The following example displays all Vservers that have SnapLock EBR policies:

```
   cluster-1::*> snaplock event-retention show-vservers
   Vserver
   -----------------
   vs1
```

snaplock event-retention policy commands

SnapLock Event Based Retention policy commands

snaplock event-retention policy create

Create SnapLock Event Based Retention policies for a Vserver

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The snaplock event-retention policy create command is used to create Event Based Retention (EBR) policies for a Vserver. A policy consists of a policy-name and a retention-period. Only a user with security login role vsadmin-snaplock is allowed to perform this operation.

Parameters

-vserver <vserver name> - Vserver Name

   Specifies the name of the Vserver for which a policy needs to be created.

-name <text> - Policy Name

   Specifies the name of the EBR policy to be created.

-retention-period {(<integer> seconds|minutes|hours|days|months|years) | infinite) - Event Retention Period

   Specifies the retention period for an EBR policy.

Examples

The following example creates a new EBR policy "p1" for Vserver "vs1" with a retention period of "10 years":

```
   vs1::> snaplock event-retention policy create -name p1 -retention-period "10 years"
```

snaplock event-retention policy delete

Delete SnapLock Event Based Retention policies for a Vserver

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.
Description
The `snaplock event-retention policy delete` command is used to delete Event Based Retention (EBR) policies for a Vserver. Only a user with security login role `vsadmin-snaplock` is allowed to perform this operation.

Parameters
- `-vserver <vserver name>` - Vserver Name
  If this parameter is specified, the command deletes all EBR policies that match the specified Vserver.
- `-name <text>` - Policy Name
  If this parameter is specified, the command deletes all EBR policies that match the specified `name`.

Examples
The following example deletes retention policy "p1" for Vserver "vs1":
```
vs1::> snaplock event-retention policy delete -name p1
```

snaplock event-retention policy modify
Modify SnapLock Event Based Retention policies for a Vserver
Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The `snaplock event-retention policy modify` command is used to modify the retention period of an Event Based Retention (EBR) policy for a Vserver. Only a user with security login role `vsadmin-snaplock` is allowed to perform this operation.

Parameters
- `-vserver <vserver name>` - Vserver Name
  Specifies the name of the Vserver for which retention period of a policy needs to be modified.
- `-name <text>` - Policy Name
  Specifies the name of the EBR policy for which the retention period needs to be modified.
- `-retention-period ({{<integer> seconds|minutes|hours|days|months|years} | infinite})` - Event Retention Period
  Specifies the new value of retention period.

Examples
The following example modifies the retention period of policy "p1" for Vserver "vs1" to "5 years":
```
vs1::> snaplock event-retention policy modify -name p1 -retention-period "5 years"
```

snaplock event-retention policy show
Show SnapLock Event Based Retention policies for a Vserver
Availability: This command is available to cluster and Vserver administrators at the admin privilege level.
**Description**
The `snaplock event-retention policy show` command is used to show Event Based Retention (EBR) policies for a Vserver. A policy consists of a `policy-name` and a `retention-period`. The command output depends on the parameter or parameters specified. If no parameters are specified, all policies for all vservers will be displayed. If one or more parameters are specified, only those entries matching the specified values will be displayed. Only a user with security login role `vsadmin-snaplock` is allowed to perform this operation.

**Parameters**

`{ [-fields <fieldname>, ...]`

  If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

`| [-instance ]]`

  If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-vserver <vserver name>] - Vserver Name`

  If this parameter is specified, the command displays all EBR policies that match the specified Vserver.

`[-name <text>] - Policy Name`

  If this parameter is specified, the command displays all EBR policies that match the specified `name`.

`[-retention-period {(<integer> seconds|minutes|hours|days|months|years) | infinite]} - Event Retention Period`

  If this parameter is specified, the command displays all EBR policies that match the specified `retention-period`.

**Examples**
The following example displays all event-retention policies for vserver "vs1":

```
vs1::> snaplock event-retention policy show
Vserver   Name    Retention Period
---------- ----------------------
vs1        p1               10 years
vs1        p2                5 years
```

**snaplock legal-hold commands**
Snaplock legal-hold related commands

**snaplock legal-hold abort**
Abort Snaplock legal-hold operation.

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**
The `snaplock legal-hold abort` is used to abort an ongoing legal-hold operation. The type of legal-hold operations that can be aborted using this command are begin, end and dump-files. This command only aborts operations that have not yet completed. Only a user with security login role `vsadmin-snaplock` is allowed to perform this operation.
Parameters

-vserver <vserver name> - Vserver Name
   Specifies the vserver on which the legal-hold operation is running.

-operation-id <integer> - Operation ID
   Specifies the operation ID of the legal-hold operation to be aborted.

Examples

The following example aborts an ongoing legal-hold operation with operation-id 16842754:

```
vs1::> snaplock legal-hold abort -operation-id 16842754
vs1::>
```

snaplock legal-hold begin

Starts an operation to place files under legal-hold in the user specified path on a SnapLock compliance volume.

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The snaplock legal-hold begin command is used to place specified file or files under legal-hold for a given litigation. Only a user with security login role vsadmin-snaplock is allowed to perform this operation.

Parameters

-vserver <vserver name> - Vserver Name
   Specifies the name of the Vserver which owns the volume. The specified file or files to be placed under legal-hold reside on this volume.

-litigation-name <text> - Litigation Name
   Specifies the name of the litigation for which the file or files have to be placed under legal-hold.

-volume <volume name> - Volume
   Specifies the name of the SnapLock compliance volume on which the file or files to be placed under legal-hold reside.

-path <text> - Path
   Specifies a path relative to the volume root. The path can be either a file path of the single file to be placed under legal-hold or a directory path where all regular files under it must be placed under legal-hold.

Examples

The following example starts a legal-hold begin operation on file file1 in volume slc_vol1:

```
vs1::> snaplock legal-hold begin -litigation-name litigation1 -volume slc_vol1 -path /file1
SnapLock legal-hold begin operation is queued. Run "snaplock legal-hold show -operation-id 16842773 -instance" to view the operation status.
```

The following example starts a legal-hold begin operation on all files in the volume slc_vol1:

```
```
snaplock legal-hold dump-files

Dump list of files under legal-hold to specified output path.

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `snaplock legal-hold dump-files` is used to dump the list of files under legal-hold for a given vserver, volume and litigation to an auto-generated file in the user specified path. Only a user with security login role `vsadmin-snaplock` is allowed to perform this operation.

**Parameters**
- `-vserver <vserver name>` - Vserver Name
  Specifies the name of the Vserver for which the list of files under legal-hold is to be dumped.
- `-litigation-name <text>` - Litigation Name
  Specifies the name of the litigation for which the list of files under legal-hold is to be dumped.
- `-volume <volume name>` - Volume Name
  Specifies the name of the SnapLock compliance volume for which the list of files under legal-hold is to be dumped.
- `-output-volume <volume name>` - Output Volume Name
  Specifies the name of the output volume containing the output directory path where the list of files under legal-hold is to be dumped. The output volume must be a regular read-write volume.
- `-output-directory-path <text>` - Path Relative to Output Volume Root
  Specifies the output directory path relative to the output volume root, where the list of files under legal-hold is to be dumped. The output directory path should be of the form `/directory-path`. If output needs to be dumped on the volume root, specify the path as `"/"`.

**Examples**
The following example starts a legal-hold dump-files operation:

```bash
vs1::> snaplock legal-hold dump-files -volume vol1_slc -litigation-name lit1 -output-volume vol1 -output-directory-path /d1
SnapLock legal-hold dump-files operation is queued. Run "snaplock legal-hold show -operation-id 16842754 -instance" to view the operation status.

vs1::>
```

snaplock legal-hold dump-litigations

Dump list of litigations for a given Vserver to specified output path.

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.
**Description**

The `snaplock legal-hold dump-litigations` command is used to dump the list of litigations for a given vserver to a user specified path. Under the user specified path, we create a directory with a unique name. Under the user specified path, a directory with an auto-generated name is created. Under this directory, multiple files are created. Each file represents a unique litigation name that was found in the given vserver. Each file contains a list of volume names that have files under legal-hold for that given litigation. For example, if the file name is "lit1" and the contents of the file are "volume1" and "volume2", then it indicates that both these volumes have files under legal-hold for litigation "lit1". Only a user with security login role `vsadmin-snaplock` is allowed to perform this operation.

**Parameters**

- `-vserver <vserver name>` - Vserver Name
  
  Specifies the name of the Vserver for which the list of litigations is to be dumped.

- `[-volume <volume name>]` - Volume Name
  
  If this parameter is specified, the command displays the list of litigations for volume that matches the specified value. The volume must be of type SnapLock compliance.

- `-output-volume <volume name>` - Output Volume Name
  
  Specifies the name of the output volume containing the output directory path where the list of litigations is to be dumped. The output volume must be a regular read-write volume.

- `-output-directory-path <text>` - Path Relative to Output Volume Root
  
  Specifies the output directory path relative to the volume root, where the list of litigations is to be dumped. The output directory path should be of the form "/directory-path". If output needs to be dumped to the volume root, specify the path as "/".

**Examples**

The following example starts a legal-hold dump-litigations job:

```
vs1::> snaplock legal-hold dump-litigations -output-volume vol1 -output-directory-path /d1
Dump Litigations job for Vserver "vs1" has been queued. Run "job show -id 22 -instance" to view the status.
vs1::>
```

**snaplock legal-hold end**

Starts an operation to release legal-hold on files in the user specified path on a SnapLock compliance volume.

**Availability:** This command is available to cluster and Vserver administrators at the `admin` privilege level.

**Description**

The `snaplock legal-hold end` command is used to release legal-hold on specified file or files for a given litigation. Only a user with security login role `vsadmin-snaplock` is allowed to perform this operation.

**Parameters**

- `-vserver <vserver name>` - Vserver Name
  
  Specifies the name of the Vserver which owns the volume. The specified file or files to be released from legal-hold reside on this volume.

- `-litigation-name <text>` - Litigation Name
  
  Specifies the name of the litigation for which the file or files have to release from legal-hold.
-volume <volume name> - Volume
   Specifies the name of the SnapLock compliance volume on which the file or files to be released from legal-
   hold reside.

-path <text> - Path
   Specifies a path relative to the volume root. The path can be either a file path of the single file to be released
   from legal-hold or a directory path where all regular files under it must be released from legal-hold.

Examples
The following example starts a legal-hold end operation on file file1 in volume slc_vol1:

 The following example starts a legal-hold begin operation on all files in the volume slc_vol1:

 snaplock legal-hold show
Show status of a legal-hold operation.

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The snaplock legal-hold show command displays the status of a legal-hold operation. Information about completed
operations will be cleaned up after an hour of completion. Only a user with security login role vsadmin-snaplock is allowed
to perform this operation.

Parameters
{ [-fields <fieldname>, ...]
   If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified
   field or fields. You can use -fields ?' to display the fields to specify.

   [ -instance ]
   If you specify the -instance parameter, the command displays detailed information about all fields.

   [-vserver <vserver name>] - Vserver Name
   If this parameter is specified, the command displays all legal-hold operations that match the specified Vserver.

   [-operation-id <integer>] - Operation ID
   If this parameter is specified, the command displays all legal-hold operations that match the specified
   operation ID.

   [-volume <volume name>] - Volume Name
   If this parameter is specified, the command displays all legal-hold operations that match the specified volume.
   The parameter specifies the volume on which legal-hold operation is running or has completed.
[<path <text>]] - Path
If this parameter is specified, the command displays all legal-hold operations that match the specified path. The parameter specifies the path on which legal-hold operation is running or has completed.

[<litigation-name <text>]] - Litigation Name
If this parameter is specified, the command displays all legal-hold operations that match the specified litigation name. The parameter specifies the legal-hold litigation name.

[<operation-type {unknown|begin|end|dump-files}>]] - Operation Type
If this parameter is specified, the command displays all legal-hold operations that match the specified operation type. The parameter specifies the type of legal-hold operation.

[<operation-status {Unknown|In-Progress|Failed|Aborting|Completed}>]] - Operation Status
If this parameter is specified, the command displays all legal-hold operations that match the specified operation status. The parameter specifies the status of legal-hold operation.

[<num-files-processed <integer>]] - Number of Files Processed
If this parameter is specified, the command displays all legal-hold operations that match the specified number of files processed. The parameter specifies the number of files on which legal-hold operation was successful.

[<num-files-failed <integer>]] - Number of Files Failed
If this parameter is specified, the command displays all legal-hold operations that match the specified number of files failed. The parameter specifies the number of files on which legal-hold operation failed.

[<num-files-skipped <integer>]] - Number of Files Skipped
If this parameter is specified, the command displays all legal-hold operations that match the specified number of files skipped.

The parameter specifies the number of files on which legal-hold begin operation was skipped. The legal-hold begin operation is skipped on a file if it is already under hold for a given litigation or if it is a hard link to a file that is already under hold for a given litigation.

[<num-inodes-ignored <integer>]] - Number of Inodes Ignored
If this parameter is specified, the command displays all legal-hold operations that match the specified number of inodes ignored. The parameter specifies the number of inodes on which the legal-hold operation was not attempted because they were not regular files.

[<status-details <text>]] - Status Details
If this parameter is specified, the command displays all legal-hold operations that match the specified status details. The parameter specifies the status details of an legal-hold operation.

Examples
The following examples show the status of legal-hold operations for Vserver vs1 and volume slc_voll and the status of legal-hold operation for operation ID 16842786 respectively:

```
vsl::> snaplock legal-hold show -volume slc_voll
Operation     Operation ID   Vserver  Volume   Status
------------- --------------- --------- ------- ---------
begin         16842784       vs1       slc_voll Completed
begin         16842786       vs1       slc_voll Completed
begin         16842788       vs1       slc_voll In-Progress
dump-files    16842790       vs1       slc_voll Completed
end           16842794       vs1       slc_voll Completed
5 entries were displayed.
vsl::> snaplock legal-hold show -operation-id 16842786
```

584 Commands: Manual Page Reference
SnapLock Log commands

Create and manage audit log configuration for a Vserver.

The snaplock log commands manage SnapLock log infrastructure for the SnapLock feature. This infrastructure provides the capability to record events that are required to provide an audit trail. These commands enable you to create and initialize the SnapLock log configuration for the Vserver, modify attributes associated with the SnapLock log configuration, and delete the auditlog configuration. Attributes of a SnapLock log configuration include the following:

- SnapLock log volume
- Maximum log size
- Default retention period

The SnapLock log volume is a SnapLock Compliance volume. The SnapLock log infrastructure creates directories and files in this volume to store the SnapLock log records.

The maximum log size specifies the maximum size of a log file that stores SnapLock log records. Once the file reaches this size, it is archived and a new log file is created.

The default retention period is the time period for which the log file is retained, if the SnapLock log records that are stored in the file do not carry any retention period.

snaplock log create

Create audit log configuration for a Vserver.

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The snaplock log create command is used to create a SnapLock log configuration for the Vserver. A SnapLock log configuration consists of volume to store the log, the maximum size of the log file, and the default period of time for which the log file should be retained.

Parameters
-vserver <vserver name> - Vserver Name
   Specifies the name of the Vserver for which the configuration needs to be created.

-volume <volume name> - Log Volume Name
   Specifies the name of the volume that is used for logging. This must be a SnapLock Compliance volume.

[-max-log-size {<integer>[KB|MB|GB|TB|PB]}] - Maximum Size of Log File
   Specifies the maximum size of the log file. Once a log file reaches this limit, it is archived and a new log file is created. This parameter is optional. The default value is 10MB.
- Default Log Record Retention Period

Specifies the default period of time a record (which is logged) is retained. This parameter is optional. The default value is "6 months".

Example

```
class1::> snaplock log create -volume vol1 -max-log-size 50MB -default-retention-period "1 year" -vserver vs1
[Job 47] Job succeeded: SnapLock log created for Vserver "vs1".
```

**snaplock log delete**

Delete audit log configuration for a Vserver.

*Availability:* This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The `snaplock log delete` command deletes the SnapLock log configuration associated with the Vserver. This command closes all the active log files in the log volume and mark the volume as disabled for SnapLock logging.

**Parameters**

- `-vserver <vserver name>` - Vserver Name

  Specifies the name of the Vserver whose SnapLock log configuration is deleted.

Example

```
class1::> snaplock log delete -vserver vs1
[Job 47] Job succeeded: SnapLock log deleted for Vserver "vs1".
```

**snaplock log modify**

Modify audit log configuration for a Vserver.

*Availability:* This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The `snaplock log modify` command modifies the SnapLock log configuration of the Vserver. Log volume, maximum size of log file, and default retention period can be modified. If the log volume is modified, then the active log files in the existing log volume is closed and the log volume is marked as disabled for logging. The new log volume is enabled for logging.

**Parameters**

- `-vserver <vserver name>` - Vserver Name

  Specifies the name of the Vserver for which the SnapLock log configuration needs to be modified.

- `[–volume <volume name>]` - Log Volume Name

  Specifies the new log volume that is configured for this Vserver for logging.

- `[–max-log-size {<integer>{KB|MB|GB|TB|PB}}]` - Maximum Size of Log File

  Specifies the new value for maximum log file size.
- Default Log Record Retention Period

Specifies the new value for default retention period.

**Examples**

```bash
cluster1::> snaplock log modify -volume vol1 -vserver vs1 -max-log-size 15MB [Job 48] Job succeeded: SnapLock log modified for Vserver "vs1".
```

**snaplock log show**

Display audit log configuration.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `snaplock log show` command displays the following information about the SnapLock log infrastructure:

- Vserver name
- Volume name
- Maximum log size
- Default retention period

**Parameters**

```bash
{-fields <fieldname>, ...} If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

{-instance} If you specify the `-instance` parameter, the command displays detailed information about all fields.

{-vserver <vserver name>} - Vserver Name

If this parameter is specified, the command displays the log information for Vservers that match the specified value.

{-volume <volume name>} - Log Volume Name

If this parameter is specified, the command displays the log configuration for volumes that match the specified value.

{-max-log-size <integer>[KB|MB|GB|TB|PB]} - Maximum Size of Log File

If this parameter is specified, the command displays the log configuration with a matching `-max-log-size` value.

{-default-retention-period [{<integer> seconds|minutes|hours|days|months|years} | infinite]} - Default Log Record Retention Period

If this parameter is specified, the command displays the log configuration with a matching `-default-retention-period` value.
**Examples**

```bash
cluster1::> snaplock log show -vserver vs1
Vserver Name                        : vs1
Log Volume Name                     : 15MB
Maximum Size of Log File            : 15MB
Default Log Record Retention Period : 6 months
```

```bash
cluster1::> snaplock log show
Vserver   Volume     Maximum Size  Retention Period
----------- ----------- --------------- ------------
vs1        voll        15MB            6 months
```

**SnapLock Log File commands**

Manage Audit Log files of a Vserver.

The **snaplock log file** commands manage the log files used for recording events that need to be logged. Commands in this directory enable you to archive and close log files and display active log files.

**snaplock log file archive**

Archive Active Log Files in Log Volume

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The **snaplock log file archive** command archives the currently active log file by closing it and creating a new active log file. If base-name is not provided, the command archives all active log files associated with the Vserver. Otherwise, the command archives the active log file associated with the base-name provided.

**Parameters**

- `-vserver <vserver name>` - Vserver Name
  
  Specifies the name of the Vserver for which active log files need to be archived.

- `[-base-name {privileged-delete | system | legal-hold}]` - Base Name of Log File
  
  Specifies the log base-name, whose active log file needs to be archived. The base-name is the name of the source of log records. Valid base-names are `system`, `privileged-delete` and `legal-hold`. Each base-name has its own directory in which log files containing log records generated by base-name are stored.

**Examples**

```bash
cluster1::> snaplock log archive -vserver vs1
[Job 48] Job succeeded: SnapLock log archived for Vserver "vs1",
```

**snaplock log file show**

Display audit log file information.

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.
Description

The `snaplock log file show` command displays the following information about the log files:

- Vserver name
- Volume name
- File path
- Expiry time of the file
- File size

Parameters

```
[-fields <fieldname>,...]
```

If you specify the `-fields <fieldname>,...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance ]
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[vserver <vserver name>] - Vserver Name
```

If this parameter is specified, then log files in the Vserver that match the specified value is displayed.

```
[base-name {privileged-delete | system | legal-hold}] - Base Name of Log File
```

If this parameter is specified, then the log files having a matching `-base-name` is displayed.

```
[volume <volume name>] - Log Volume Name
```

If this parameter is specified, then the log files in volumes that match the specified value are shown.

```
[file-path <text>] - Log File Path
```

If this parameter is specified, then the log files that match the specified value are displayed.

```
[expiry-time <text>] - Log File Expiry Time
```

If this parameter is specified, then the log files having a matching `-expiry-time` value are displayed.

```
[file-size (<integer> [KB|MB|GB|TB|PB])] - File Size
```

If this parameter is specified, then the log files having a matching `-file-size` value are displayed.

Examples

```
cluster1::> snaplock log file show
Vserver     Volume  Base Name       File Path
----------------- ------------------- ------------------- ----------------------
vs1          voll    system           /vol/voll/snaplock_log/
system_logs/20160120_183756_GMT-present
```

```
cluster1::> snaplock log file show -vserver vs1 -base-name system

Vserver : vs1
Volume : voll
Base Name : system
File Path : /vol/voll/snaplock_log/system_logs/20160120_183756_GMT-present
File Size : 560B
```

SnapLock Log commands
SnapMirror Commands

Manage SnapMirror

The `snapmirror` commands enable you to create and manage data protection mirrors, extended data protection relationships, and load-sharing mirrors.

These commands are available to the cluster and Vserver administrators.

Note that there are "Pre 8.2" relationships: (1) load-sharing relationships; (2) data protection relationships with the source volume on a storage system running clustered Data ONTAP 8.1; (3) data protection relationships that existed before the source and destination storage systems were upgraded from clustered Data ONTAP 8.1 to clustered Data ONTAP 8.2 and later and have not yet been converted to ones with Data ONTAP 8.2 capabilities. These relationships have the same limitations as on Data ONTAP 8.1. In particular, only `snapmirror` commands present on Data ONTAP 8.1 can be used for these relationships. The "Relationship Capability" field, as shown in the output of the `snapmirror show` command, is set to "Pre 8.2" for these relationships. "Pre 8.2" data protection relationships can only be created and managed by the cluster administrator; load-sharing relationships which are all "Pre 8.2" can be created and managed by either a cluster or Vserver administrator.

Data protection relationships that existed before the source and destination storage systems were upgraded from Data ONTAP 8.1 will be auto-converted to "8.2 and above" with full capabilities when a Vserver peering relationship is set up between the source and destination Vservers. Relationships which have both the source and destination in the same Vserver and therefore require no Vserver peering relationship will be converted on the first boot when all nodes in the storage system are running Data ONTAP 8.2 or later. Note that since there is no "8.2 and above" implementation of load-sharing relationships, there is no conversion of load-sharing relationships to "8.2 and above".

When a SnapMirror relationship is created with the type of the relationship specified as data protection (DP), an extended data protection (XDP) relationship will be created. This relationship will provide the same functional behavior as the DP type in terms of Snapshot copy selection and retention. This is achieved by using a policy which has the rule to replicate all Snapshot copies. There is an exception to this relationship creation behavior of overriding of the type DP. If a relationship of type DP in the opposite direction already exists, the new relationship will also be of type DP. The type DP will eventually be deprecated and applications should not use this type when creating new relationships. When the type is specified as DP or when no type is specified, if a policy of type `async-mirror` is specified that does not have the rule to replicate all Snapshot copies, the `snapmirror create` command will fail.

snapmirror abort

Abort an active transfer

Availability: This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

Description

The `snapmirror abort` command stops SnapMirror transfers that might have started and not completed. A SnapMirror transfer is an operation on a given SnapMirror relationship and the relationship is identified by its destination endpoint, which can be a volume, a Vserver, or a non-Data ONTAP endpoint. You identify the SnapMirror relationship with this command and the command aborts the transfer for the relationship. For load-sharing mirrors, the command also aborts transfers for other relationships that are part of the same load-sharing set. For SolidFire destination endpoints, the `snapmirror abort` command is only supported if the endpoint is in a SnapMirror relationship.
Load-sharing mirrors are either up to date and serving data to clients, or they are lagging and not serving data to clients. If the \texttt{snapmirror abort} command identifies an up-to-date load-sharing mirror, then SnapMirror transfers to the up-to-date load-sharing mirror and associated up-to-date load-sharing mirrors in the set of load-sharing mirrors are aborted. If the \texttt{snapmirror abort} command identifies a lagging load-sharing mirror, then only the SnapMirror transfer associated with the lagging load-sharing mirror is aborted.

After the \texttt{snapmirror abort} command successfully completes its operation, the volume on the receiving side of the transfer might contain a restart checkpoint. The restart checkpoint can be used by a subsequent transfer to restart and continue the aborted SnapMirror transfer.

This command is supported for SnapMirror relationships with the field "Relationship Capability" showing as either "8.2 and above" or "Pre 8.2" in the output of the \texttt{snapmirror show} command.

The use of wildcards in parameter values is not supported from the source Vserver or cluster for relationships with "Relationship Capability" of "8.2 and above".

You can use this command from the source or the destination Vserver or cluster for FlexVol volume relationships or Infinite Volume relationships.

For Vserver SnapMirror relationships, this command must be run only from the cluster containing the destination Vserver.

\textbf{Parameters}

\begin{itemize}
\item \texttt{[-source-path | -S \{\texttt{[vserver:]\[volume]\}|\texttt{[[cluster:]//vserver/]volume}|\texttt{hostip:/lun/name}|\texttt{hostip:/share/share-name}\}]} - Source Path

This parameter specifies the source endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or the volume (volume). To support relationships with "Relationship Capability" of "Pre 8.2", a format which also includes the name of the cluster (cluster) is provided. The "Pre 8.2" format cannot be used when operating in a Vserver context on relationships with "Relationship Capability" of "8.2 and above". For SnapMirror relationships with an AltaVault source, the source endpoint is specified in the form \texttt{hostip:/share/share-name}. For SnapMirror relationships with a SolidFire source, the source endpoint is specified in the form \texttt{hostip:/lun/name}.

\item \texttt{[-source-cluster <Cluster name>]} - Source Cluster

Specifies the source cluster of the SnapMirror relationship. If this parameter is specified, the \texttt{-source-vserver} and \texttt{-source-volume} parameters must also be specified. This parameter is only applicable for relationships with "Relationship Capability" of "Pre 8.2". This parameter cannot be specified when operating in a Vserver context on relationships with "Relationship Capability" of "8.2 and above".

\item \texttt{[-source-vserver <vserver name>]} - Source Vserver

Specifies the source Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters \texttt{-source-volume} and \texttt{-source-cluster} must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

\item \texttt{[-source-volume <volume name>]} - Source Volume

Specifies the source volume of the SnapMirror relationship. If this parameter is specified, parameters \texttt{-source-vserver} and for relationships with "Relationship Capability" of "Pre 8.2", \texttt{-source-cluster} must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

\item \texttt{[-destination-path \{\texttt{[vserver:]\[volume]\}|\texttt{[[cluster:]//vserver/]volume}|\texttt{hostip:/lun/name}|\texttt{hostip:/share/share-name}\}]} - Destination Path

This parameter specifies the destination endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or volume (volume). To support relationships with "Relationship Capability" of "Pre 8.2", a format which also includes the name of the cluster (cluster) is provided. The "Pre 8.2" format cannot be used when operating in a Vserver context on relationships with "Relationship Capability" of "8.2 and above". For SnapMirror relationships
with AltaVault destinations, the destination endpoint is specified in the form `hostip:/share/share-name`. For relationships with SolidFire destinations, the destination endpoint is specified in the form `hostip:/lun/name`.

`[-destination-cluster <Cluster name>]` - Destination Cluster

Specifies the destination cluster of the SnapMirror relationship. If this parameter is specified, parameters `-destination-vserver` and `-destination-volume` must also be specified. This parameter is only applicable for relationships with "Relationship Capability" of "Pre 8.2". This parameter cannot be specified when operating in a Vserver context on relationships with "Relationship Capability" of "8.2 and above".

`-destination-vserver <vserver name>` - Destination Vserver

Specifies the destination Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters `-destination-volume` and for relationships with "Relationship Capability" of "Pre 8.2", -destination-cluster must also be specified. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

`-destination-volume <volume name>` - Destination Volume

Specifies the destination volume of the SnapMirror relationship. If this parameter is specified, parameters -destination-vserver and for relationships with "Relationship Capability" of "Pre 8.2", -destination-cluster must also be specified. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

`[-hard | -h [true]]` - Discard Restart Checkpoint

If this option is specified true, the restart checkpoint is discarded and the destination volume is restored to the last Snapshot copy that was successfully transferred. You can use the -hard option to discard the restart checkpoint of a previous transfer attempt which forces the subsequent transfer to start with a fresh Snapshot copy on the destination volume. This option can only be used from the destination Vserver or cluster. This parameter is not supported for relationships with non-Data ONTAP endpoints.

`[-foreground | -w [true]]` - Foreground Process

This specifies whether the operation runs as a foreground process. If this parameter is specified, the default setting is true (the operation runs in the foreground). When set to true, the command will not return until the process completes. This parameter is only applicable to relationships with "Relationship Capability" of "Pre 8.2".

**Examples**

To stop the active SnapMirror replication to the destination volume `vs2.example.com:dept_eng_dp_mirror1`, type the following command:

```
vs2.example.com::> snapmirror abort -destination-path vs2.example.com:dept_eng_dp_mirror1
```

For relationships with "Relationship Capability" of "Pre 8.2", to stop the active SnapMirror replication to the destination volume `cluster2://vs2.example.com/dept_eng_dp_mirror1`, type the following command:

```
cluster2::> snapmirror abort -destination-path cluster2://vs2.example.com/dept_eng_dp_mirror1
```

To stop the active SnapMirror replication to the destination Vserver `dvs1.example.com`, type the following command:

```
cluster2::> snapmirror abort -destination-path dvs1.example.com:
```

Under PVR control to stop user-initiated active SnapMirror replication to the destination Consistency Group `cg_dst` in Vserver `vs2.example.com`, type the following command:

snapmirror break

Make SnapMirror destination writable

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The `snapmirror break` command breaks a SnapMirror relationship between a source and destination endpoint of a data protection mirror. The destination endpoint can be a Vserver, volume or SolidFire endpoint. When Data ONTAP breaks the relationship, if the endpoint is a volume or SolidFire endpoint, the destination is made read/write and can diverge from the source volume, client redirection is turned off on the destination, the restart checkpoint is cleared, and the clients can see the latest Snapshot copy. If the endpoint is a Vserver, the subtype of the destination Vserver is changed to default, volumes in the destination Vserver are made read/write and the clients can now access the Vserver namespace for modifications. For SolidFire destination endpoints, the `snapmirror break` command is only supported if the endpoint is in a SnapMirror relationship.

Subsequent manual or scheduled SnapMirror updates to the broken relationship will fail until the SnapMirror relationship is reestablished using the `snapmirror resync` command.

This command applies to data protection mirrors. For vault relationships, this command is only intended for use when preparing for a Data ONTAP revert operation (see the `-delete-snapshots` parameter in advanced privilege level). This command is not intended for use with load-sharing mirrors.

This command is supported for SnapMirror relationships with the field "Relationship Capability" showing as either "8.2 and above" or "Pre 8.2" in the output of the `snapmirror show` command.

The `snapmirror break` command must be used from the destination Vserver or cluster.

Parameters

```
{ [-source-path | -S {<vserver:volume> |<cluster://vserver:volume>|<hostip:/lun/name> |<hostip:/share/share-name>} ] - Source Path
```

This parameter specifies the source endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or the volume (volume). To support relationships with "Relationship Capability" of "Pre 8.2", a format which also includes the name of the cluster (cluster) is provided. The "Pre 8.2" format cannot be used when operating in a Vserver context on relationships with "Relationship Capability" of "8.2 and above". For SnapMirror relationships with an AltaVault source, the source endpoint is specified in the form hostip:/share/share-name. For SnapMirror relationships with a SolidFire source, the source endpoint is specified in the form hostip:/lun/name.

```
| [-source-cluster <Cluster name>] - Source Cluster
```

Specifies the source cluster of the SnapMirror relationship. If this parameter is specified, the `-source-vserver` and `-source-volume` parameters must also be specified. This parameter is only applicable for relationships with "Relationship Capability" of "Pre 8.2". This parameter cannot be specified when operating in a Vserver context on relationships with "Relationship Capability" of "8.2 and above".
[-source-vserver <vserver name>] - Source Vserver

Specifies the source Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters -source-volume and for relationships with "Relationship Capability" of "Pre 8.2", -source-cluster must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

[-source-volume <volume name>]] - Source Volume

Specifies the source volume of the SnapMirror relationship. If this parameter is specified, parameters -source-vserver and for relationships with "Relationship Capability" of "Pre 8.2", -source-cluster must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

{-destination-path <[vserver:][volume]|<<[cluster://vserver/]volume|<hostip:/lun/name>
<hostip:/share/share-name}> - Destination Path

This parameter specifies the destination endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or volume (volume). To support relationships with "Relationship Capability" of "Pre 8.2", a format which also includes the name of the cluster (cluster) is provided. The "Pre 8.2" format cannot be used when operating in a Vserver context on relationships with "Relationship Capability" of "8.2 and above". For SnapMirror relationships with AltaVault destinations, the destination endpoint is specified in the form hostip:/share/share-name. For relationships with SolidFire destinations, the destination endpoint is specified in the form hostip:/lun/name.

[-destination-cluster <Cluster name>] - Destination Cluster

Specifies the destination cluster of the SnapMirror relationship. If this parameter is specified, parameters -destination-vserver and -destination-volume must also be specified. This parameter is only applicable for relationships with "Relationship Capability" of "Pre 8.2". This parameter cannot be specified when operating in a Vserver context on relationships with "Relationship Capability" of "8.2 and above".

-destination-vserver <vserver name> - Destination Vserver

Specifies the destination Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters -destination-volume and for relationships with "Relationship Capability" of "Pre 8.2", -destination-cluster must also be specified. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

-destination-volume <volume name> - Destination Volume

Specifies the destination volume of the SnapMirror relationship. If this parameter is specified, parameters -destination-vserver and for relationships with "Relationship Capability" of "Pre 8.2", -destination-cluster must also be specified. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

[-force | -f [true]] - Force

If this parameter is specified, the command proceeds without prompting for confirmation.

[-foreground | -w [true]] - Foreground Process

This specifies whether the operation runs as a foreground process. If this parameter is specified, the default setting is true (the operation runs in the foreground). When set to true, the command will not return until the process completes. This parameter is only applicable to relationships with "Relationship Capability" of "Pre 8.2".

[-delete-snapshots [true]] - Delete Snapshots for Revert (privilege: advanced)

Using this parameter causes break to delete Snapshot copies on a vault destination so that the system can be reverted. Note that the only Snapshot copies that will be deleted are those that were created with the current version of Data ONTAP. Any Snapshot copies that might be present created with a different version will not be deleted.
-restore-destination-to-snapshot | -s <text> - Restore Destination to Snapshot Copy

This optional parameter specifies the Snapshot copy to which the destination volume is restored after a successful break operation. If the parameter is not specified, the destination is restored to the latest Snapshot copy. This parameter is not supported for Vserver or FlexGroup relationships.

-recover [true] - Recover (privilege: advanced)

When a SnapMirror break operation fails on a FlexGroup relationship, a subset of the destination FlexGroup constituents could have been made writable and subsequently user data could have been written to these constituents. To recover from this failure, you can execute the snapmirror break command again specifying the -recover parameter. All constituents will be restored to the latest Snapshot copy, and any writes to the read-write constituents will be lost. This parameter is applicable only for SnapMirror relationships with FlexGroup endpoints.

Examples

To stop the SnapMirror replication to the destination volume vs2.example.com:dept_eng_dp_mirror1, type the following command:

```bash
vs2.example.com::> snapmirror break -destination-path vs2.example.com:dept_eng_dp_mirror1
```

For relationships with "Relationship Capability" of "Pre 8.2", to stop the SnapMirror replication to the destination volume cluster2://vs2.example.com/dept_eng_dp_mirror1, type the following command:

```bash
cluster2::> snapmirror break -destination-path cluster2://vs2.example.com/dept_eng_dp_mirror1
```

To stop replication to the destination Vserver dvs1.example.com of a Vserver SnapMirror relationship, type the following command:

```bash
cluster2::> snapmirror break -destination-path dvs1.example.com:
```

Under PVR control to stop synchronous SnapMirror replication to the destination Consistency Group cg_dst in Vserver vs2.example.com, type the following command:

```bash
vs2.example.com::> snapmirror break -destination-path vs2.example.com:/cg/cg_dst
```

snapmirror create

Create a new SnapMirror relationship

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The snapmirror create command creates a SnapMirror relationship between a source and destination endpoint. You can use this command to create a data protection relationship, an extended data protection relationship, or a load-sharing relationship between FlexVol volumes. You can also use it to create a data protection relationship between Infinite Volumes and between Vservers. Infinite Volumes and Vservers support only data protection relationships. A SnapMirror relationship between

snapmirror create
Vservers can only be created if the system containing the source Vserver is also running Data ONTAP 8.3 or later. Creating Vserver SnapMirror relationships is not supported for Vservers with Infinite Volumes. You can also use the `snapmirror create` command to create an extended data protection relationship between FlexGroups. FlexGroups only support extended data protection relationships. A SnapMirror relationship between FlexGroups is only supported if the system containing the source FlexGroup volume is also running Data ONTAP 9.1.0 or later. The source or destination of a FlexGroup SnapMirror relationship cannot be the source or destination of any other SnapMirror relationship.

The `snapmirror create` command can be used to create an extended data protection (XDP) relationship between a Data ONTAP volume and a non-Data ONTAP endpoint that supports SnapMirror (AltaVault, Solidfire). AltaVault endpoints can only be used as destinations. SolidFire endpoints can be used as sources or destinations.

Before using this command to create a SnapMirror relationship between Vservers, you typically create a source and destination Vserver using the `vserver create` command. The source Vserver should be of subtype default and the destination Vserver of subtype dp-destination. Also, before creating the relationship between Vservers, you must setup Vserver peer by using the `vserver peer create` command between the source and destination Vservers. A Vserver relationship cannot be created between two Vservers within the same cluster. The root volume of the destination Vserver will be read-write and data from the source Vserver's root volume will not be replicated. Therefore there will be no volume level relationship created between the root volumes of the two Vservers.

After creating the relationship, the destination Vserver must be initialized by using the `snapmirror initialize` command.

Before using this command to create a volume SnapMirror relationship, you typically create a source and destination volume using the `volume create` command. The source volume should be in the online state and a read-write (RW) type. The destination volume should be in the online state and a data protection (DP) type. For FlexGroup SnapMirror relationships, the source and destination FlexGroups must be spread over the same number of aggregates as specified in the `-aggr-list` parameter with the same number of constituents per aggregate as specified in the `-aggr-list-multiplier` parameter of the `volume create` command.

When a FlexGroup SnapMirror relationship is created, normally hidden relationships are also created for the constituent volumes. These relationships can be seen by using the `expand` parameter of the `snapmirror show` command. Source information for these relationships can be seen using the `expand` parameter of the `snapmirror list-destinations` command. Other SnapMirror commands are disabled for FlexGroup constituent relationships and FlexGroup constituent volumes.

For an Infinite Volume SnapMirror relationship, the destination Infinite Volume size must be greater than or equal to the source Infinite Volume size in bytes. You can verify the size in bytes by running `set -units KB` followed by a `volume show` command.

If all systems involved are running Data ONTAP version 8.2 and later, a Vserver peering relationship must be set up using the `vserver peer create` command between the source and the destination Vservers to create a relationship between the source and destination volumes. To enable interoperability with Data ONTAP 8.1, if the source volume is on a storage system running clustered Data ONTAP 8.1, the cluster administrator can create a data protection relationship between the source and destination volumes without a Vserver peering relationship between the source and destination Vservers. These relationships are managed the same way as on Data ONTAP 8.1 and the "Relationship Capability" field, as shown in the output of the `snapmirror show` command, is set to "Pre 8.2".

**Note:** SnapMirror relationships, except load-sharing relationships, which are created between two volumes which are both on a storage system running Data ONTAP version 8.2 and later have the "Relationship Capability" field set to "8.2 and above".

Load-sharing mirrors must be confined to a single Vserver; they are not allowed to span Vservers. Load-sharing relationships are created with the "Relationship Capability" field set to "Pre 8.2" even if both the source and destination volumes are on a storage system running Data ONTAP version 8.2 and later. There is no "8.2 and above" implementation for load-sharing relationships.

A set of load-sharing mirrors can have one or more destination volumes. You create separate SnapMirror relationships between the common source volume and each destination volume to create the set of load-sharing mirrors.

The source or destination of a load-sharing relationship cannot be the source or destination of any other SnapMirror relationship.
After creating the relationship, the destination volume can be initialized using the `snapmirror initialize` command. The destination volumes in a set of load-sharing mirrors are initialized using the `snapmirror initialize-ls-set` command. Load sharing mirrors are not supported for Infinite Volumes.

The `snapmirror create` command must be used from the destination Vserver or cluster.

Parameters

{ `-source-path|--S (\[[vserver:]\[[volume]\])*|\[[cluster:]//vserver/\[volume]\]|<hostip:/lun/name>|<hostip:/share/share-name>\) - Source Path

This parameter specifies the source endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or the volume (volume). To support relationships with "Relationship Capability" of "Pre 8.2", a format which also includes the name of the cluster (cluster) is provided. The "Pre 8.2" format cannot be used when operating in a Vserver context on relationships with "Relationship Capability" of "8.2 and above". For SnapMirror relationships with an AltaVault source, the source endpoint is specified in the form `hostip:/share/share-name`. For SnapMirror relationships with a SolidFire source, the source endpoint is specified in the form `hostip:/lun/name`.

`[-source-cluster <Cluster name>] - Source Cluster

Specifies the source cluster of the SnapMirror relationship. If this parameter is specified, the `-source-vserver` and `-source-volume` parameters must also be specified. This parameter is only applicable for relationships with "Relationship Capability" of "Pre 8.2". This parameter cannot be specified when operating in a Vserver context on relationships with "Relationship Capability" of "8.2 and above".

`-source-vserver <vserver name>` - Source Vserver

Specifies the source Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters `-source-volume` and for relationships with "Relationship Capability" of "Pre 8.2", `-source-cluster` must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

`[-source-volume <volume name>] - Source Volume

Specifies the source volume of the SnapMirror relationship. If this parameter is specified, parameters `-source-vserver` and for relationships with "Relationship Capability" of "Pre 8.2", `-source-cluster` must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

{ `-destination-path {\[[vserver:]\[[volume]\])*|\[[cluster:]//vserver/\[volume]\]|<hostip:/lun/name>|<hostip:/share/share-name>\) - Destination Path

This parameter specifies the destination endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or volume (volume). To support relationships with "Relationship Capability" of "Pre 8.2", a format which also includes the name of the cluster (cluster) is provided. The "Pre 8.2" format cannot be used when operating in a Vserver context on relationships with "Relationship Capability" of "8.2 and above". For SnapMirror relationships with AltaVault destinations, the destination endpoint is specified in the form `hostip:/share/share-name`. For relationships with SolidFire destinations, the destination endpoint is specified in the form `hostip:/lun/name`.

`[-destination-cluster <Cluster name>] - Destination Cluster

Specifies the destination cluster of the SnapMirror relationship. If this parameter is specified, parameters `-destination-vserver` and `-destination-volume` must also be specified. This parameter is only applicable for relationships with "Relationship Capability" of "Pre 8.2". This parameter cannot be specified when operating in a Vserver context on relationships with "Relationship Capability" of "8.2 and above".
-destination-vserver <vserver name> - Destination Vserver

Specifies the destination Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters -destination-volume and for relationships with "Relationship Capability" of "Pre 8.2", -destination-cluster must also be specified. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

-destination-volume <volume name> - Destination Volume

Specifies the destination volume of the SnapMirror relationship. If this parameter is specified, parameters -destination-vserver and for relationships with "Relationship Capability" of "Pre 8.2", -destination-cluster must also be specified. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

[-type <snapmirrorType>] - Relationship Type

This parameter specifies the type of SnapMirror relationship that will be created. You can create a data protection (DP) relationship, an extended data protection (XDP) relationship, a transition data protection relationship between a Data ONTAP operating in 7-Mode system and a clustered Data ONTAP system (TDP), or a load-sharing (LS) relationship. The default value is XDP for all relationships except for Infinite Volume and Vserver DR relationships. Infinite Volumes support only DP relationships. FlexGroup volumes and non-Data ONTAP endpoints support only XDP relationships. For FlexVol volume relationships, when DP is specified as the type, an XDP relationship will be created unless a relationship of type DP in the opposite direction already exists. In that case the new relationship will be of type DP.

[-vserver <vserver name>] - Managing Vserver

If this optional parameter is specified, designates the managing Vserver. The managing Vserver is authorized to use snapmirror commands to manage the SnapMirror relationship. The -vserver parameter is currently a reserved parameter.

[-schedule <text>] - SnapMirror Schedule

This optional parameter designates the name of the schedule which is used to update the SnapMirror relationship. If you do not designate a schedule, updates are not scheduled, so you must update the SnapMirror relationship manually using the snapmirror update command or, in the case of a set of load-sharing mirrors, using the snapmirror update-ls-set command.

  **Note:** You define and name a schedule using the job schedule cron create command.

  The schedules associated with an Infinite Volume SnapMirror relationship should not have an interval shorter than hourly.

[-policy <sm_policy>] - SnapMirror Policy

This optional parameter designates the name of the SnapMirror policy which is associated with the SnapMirror relationship. For FlexVol volume relationships, the default policy when no type is specified or when the data protection (DP) type is specified is MirrorAllSnapshots and the default policy when the extended data protection (XDP) type is specified is XDPDefault. For FlexGroup volume relationships, the MirrorAllSnapshots policy is applied. For relationships with a SolidFire endpoint, there is no default policy. For these relationships a policy as described below must be specified. This parameter is not applicable to relationships with "Relationship Capability" of "Pre 8.2".

In clustered Data ONTAP 8.2 data protection (DP) relationships were used for mirroring, while extended data protection (XDP) relationships were used for vaulting. In clustered Data ONTAP 8.3 extended data protection (XDP) relationships support two more use cases, mirroring and unified mirror-vault. The exact behavior of an extended data protection (XDP) relationship is governed by the snapmirror policy associated with that relationship. In clustered Data ONTAP 8.3 the snapmirror policy has a new field type to indicate how the relationships with that policy will behave. The supported types are async-mirror (mirroring), vault (vaulting) and mirror-vault (unified mirroring and vault). For XDP relationships between a Data ONTAP source volume and an AltaVault destination endpoint, only policies of type vault are supported. For XDP relationships between a Data ONTAP source volume and a SolidFire destination endpoint, only policies of type async-mirror without an all_source_snapshots rule are supported. For XDP relationships...
between a SolidFire source endpoint and a Data ONTAP destination volume, only policies of type `async-mirror` without an `all_source_snapshots` rule, and policies of type `mirror-vault` are supported. SnapMirror policies of type `async-mirror` associated with FlexVol volume relationships when relationship type DP is specified or when no relationship type is specified, must include the label `all_source_snapshots`. Refer to the man page for the `snapmirror policy create` command for more information.

**Note:** You define and name a policy using the `snapmirror policy create` command.

[-tries <unsigned32_or_unlimited>] - Tries Limit

This optional parameter specifies the maximum number of times to attempt each manual or scheduled transfer for a SnapMirror relationship. The default is eight times. The `-tries` parameter can be set to 0 to disable manual and scheduled updates for the SnapMirror relationship. This parameter is only applicable to relationships with "Relationship Capability" of "Pre 8.2". For relationships with "8.2 and above" capability, the tries limit is controlled by the value of tries in the SnapMirror policy which is associated with the relationship.

[-throttle | -k <throttleType>] - Throttle (KB/sec)

This optional parameter limits the network bandwidth used for transfers. It configures for the relationship the maximum rate (in Kbytes/sec) at which data can be transferred. If no throttle is configured, by default the SnapMirror relationship fully utilizes the network bandwidth available. You can also configure the relationship to fully use the network bandwidth available by explicitly setting the throttle to `unlimited` or 0. The minimum effective throttle value is four Kbytes/sec, so if you specify a throttle value between 1 and 4, it will be treated as 4. For FlexGroup volume relationships, the throttle value is applied individually to each constituent relationship. The `-throttle` parameter does not affect load-sharing mirrors and other SnapMirror relationships with "Relationship Capability" of "Pre 8.2" confined to a single cluster.

[-identity-preserve {true|false}] - Identity Preserve Vserver DR

Specifies whether or not the identity of the source Vserver is replicated to the destination Vserver of the Vserver SnapMirror relationship that will be created. If this parameter is set to true, the source Vserver's configuration will additionally be replicated to the destination. If the parameter is set to false, then only the source Vserver's volumes and RBAC configuration are replicated to the destination. This parameter is applicable only for SnapMirror relationships with Vserver endpoints. The default value is false.

[-is-auto-expand-enabled {true|false}] - Is Auto Expand Enabled

This optional parameter specifies whether or not a FlexGroup SnapMirror relationship and its destination FlexGroup volume should be auto-expanded if the source FlexGroup volume is expanded. This parameter is supported only for FlexGroup SnapMirror relationships. The default value is true.

**Examples**

To create an extended data protection relationship between the source endpoint `vs1.example.com:dept_eng`, and the destination endpoint `vs2.example.com:dept_eng_dp_mirror2`, with the default policy of `MirrorAllSnapshots`, type the following command:

```bash
vs2.example.com::> snapmirror create -destination-path vs2.example.com:dept_eng_dp_mirror2 -source-path vs1.example.com:dept_eng -type DP
```

To create an extended data protection relationship between the source FlexGroup volume `vs1.example.com:fg_src` and the destination FlexGroup volume `vs2.example.com:fg_dst`, with the default policy of `MirrorAllSnapshots`, type the following command:

```bash
snapmirror create
```
<table>
<thead>
<tr>
<th>Command 1</th>
<th>Command 2</th>
<th>Command 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs2.example.com::&gt; snapmirror create -destination-path vs2.example.com:fg_dst -source-path vs1.example.com:fg_src</td>
<td>cluster2::&gt; snapmirror create -destination-path cluster2://vs2.example.com/dept_eng_dp_mirror2 -source-path cluster1://vs1.example.com/dept_eng -type DP</td>
<td>To create a data protection mirror between the source endpoint \texttt{cluster1://vs1.example.com/dept_eng}, and the destination endpoint \texttt{cluster2://vs2.example.com/dept_eng_dp_mirror2} when the source cluster is running Data ONTAP 8.1 software, type the following command:</td>
</tr>
<tr>
<td>To create a load-sharing mirror between the source endpoint \texttt{cluster1://vs1.example.com/mkt1}, and the destination endpoint \texttt{cluster1://vs1.example.com/mkt1_ls1} with the schedule named \texttt{5min} used to update the relationship, type the following command:</td>
<td>cluster1::&gt; snapmirror create -destination-path cluster1://vs1.example.com/mkt1_ls1 -source-path cluster1://vs1.example.com/mkt1 -type LS -schedule 5min</td>

**snapmirror delete**

Delete a SnapMirror relationship

**Availability:** This command is available to cluster and Vserver administrators at the `admin` privilege level.

**Description**

The `snapmirror delete` command removes the SnapMirror relationship between a source endpoint and a destination endpoint. The destination endpoint can be a Vserver, a volume, or a non-Data ONTAP endpoint. The Vservers, volumes and non-Data ONTAP destinations are not destroyed and Snapshot copies on the volumes are not removed.

For relationships with SolidFire endpoints, the SnapMirror source commands `snapmirror release` and `snapmirror list-destinations` are not supported. Therefore, Snapshot copies that are locked by SnapMirror on the source container cannot be cleaned up using the `snapmirror release` command. If the source container is a Data ONTAP volume, in order to reclaim space captured in the base Snapshot copy on the volume, issue a `snapshot delete` command specifying the –
**ignore-owners** parameter in diag privilege level. To reclaim space captured in a Snapshot copy locked by SnapMirror on a SolidFire system, refer to SolidFire documentation.

The `snapmirror delete` command fails if a SnapMirror transfer for the SnapMirror relationship is in progress for relationships with "Relationship Capability" of "Pre 8.2". For relationships with "8.2 and above" capability the delete will succeed even if a transfer is in progress and the transfer will ultimately stop.

A set of load-sharing mirrors can contain multiple destination volumes, each destination volume having a separate SnapMirror relationship with the common source volume. When used on one of the SnapMirror relationships from the set of load-sharing mirrors, the `snapmirror delete` command deletes the specified SnapMirror relationship from the set of load-sharing mirrors.

The `snapmirror delete` command preserves the read-write or read-only attributes of the volumes of a SnapMirror relationship after the relationship is deleted. Therefore, a read-write volume that was the source of a SnapMirror relationship retains its read-write attributes, and a data protection volume or a load-sharing volume that was a destination of a SnapMirror relationship retains its read-only attributes. Similarly, the subtype attribute of source and destination Vservers is not modified when a Vserver SnapMirror relationship is deleted.

**Note:** When a SnapMirror relationship from a set of load-sharing mirrors is deleted, the destination volume becomes a data protection volume and retains the read-only attributes of a data protection volume.

This command is supported for SnapMirror relationships with the field "Relationship Capability" showing as either "8.2 and above" or "Pre 8.2" in the output of the `snapmirror show` command.

For relationships with "Relationship Capability" of "8.2 and above", the `snapmirror delete` command must be used from the destination Vserver or cluster. The SnapMirror relationship information is deleted from the destination Vserver, but no cleanup or deletion is performed on the source Vserver. The `snapmirror release` command must be issued on the source Vserver to delete the source relationship information.

For relationships with "Relationship Capability" of "Pre 8.2", you can use this command from the source or from the destination cluster. When used from the destination cluster, the SnapMirror relationship information on the source and destination clusters is deleted. When used from the source cluster, only the SnapMirror relationship information on the source cluster is deleted. The use of `snapmirror delete` on a source cluster is not supported for an Infinite Volume relationships in this release.

**Parameters**

```
[-source-path -S {<[vserver:]>[volume]>|[<[cluster://vserver/]volume>|<hostip:/lun/name>|
<hostip://share/share-name>] } - Source Path

This parameter specifies the source endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or the volume (volume). To support relationships with "Relationship Capability" of "Pre 8.2", a format which also includes the name of the cluster (cluster) is provided. The "Pre 8.2" format cannot be used when operating in a Vserver context on relationships with "Relationship Capability" of "8.2 and above". For SnapMirror relationships with an AltaVault source, the source endpoint is specified in the form hostip://share/share-name. For SnapMirror relationships with a SolidFire source, the source endpoint is specified in the form hostip://lun/name.
```

```
[-source-cluster <Cluster name>] - Source Cluster

Specifies the source cluster of the SnapMirror relationship. If this parameter is specified, the `-source-vserver` and `-source-volume` parameters must also be specified. This parameter is only applicable for relationships with "Relationship Capability" of "Pre 8.2". This parameter cannot be specified when operating in a Vserver context on relationships with "Relationship Capability" of "8.2 and above".
```

```
[-source-vserver <vserver name>] - Source Vserver

Specifies the source Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters `-source-volume` and for relationships with "Relationship Capability" of "Pre 8.2", `-source-cluster` must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.
```
[-source-volume <volume name>] - Source Volume

Specifies the source volume of the SnapMirror relationship. If this parameter is specified, parameters -
source-vserver and for relationships with "Relationship Capability" of "Pre 8.2", -source-
cluster must also be specified. This parameter is not supported for relationships with non-Data ONTAP
source endpoints.

{-destination-path {<[vserver:]volume>||<[cluster:]//vserver/|volume>|<hostip:/lun/name>|
<hostip:/share/share-name>}} - Destination Path

This parameter specifies the destination endpoint of the SnapMirror relationship in one of four path formats.
The normal format includes the names of the Vserver (vserver) and/or volume (volume). To support
relationships with "Relationship Capability" of "Pre 8.2", a format which also includes the name of
the cluster (cluster) is provided. The "Pre 8.2" format cannot be used when operating in a Vserver context
on relationships with "Relationship Capability" of "8.2 and above". For SnapMirror relationships
with AltaVault destinations, the destination endpoint is specified in the form hostip:/share/share-name.
For relationships with SolidFire destinations, the destination endpoint is specified in the form hostip:/lun/
name.

[-destination-cluster <Cluster name>] - Destination Cluster

Specifies the destination cluster of the SnapMirror relationship. If this parameter is specified, parameters -
destination-vserver and -destination-volume must also be specified. This parameter is only
applicable for relationships with "Relationship Capability" of "Pre 8.2". This parameter cannot be
specified when operating in a Vserver context on relationships with "Relationship Capability" of "8.2
and above".

-destination-vserver <vserver name> - Destination Vserver

Specifies the destination Vserver of the SnapMirror relationship. For relationships with volumes as endpoints,
if this parameter is specified, parameters -destination-volume and for relationships with
"Relationship Capability" of "Pre 8.2", -destination-cluster must also be specified. This
parameter is not supported for relationships with non-Data ONTAP destination endpoints.

-destination-volume <volume name> - Destination Volume

Specifies the destination volume of the SnapMirror relationship. If this parameter is specified, parameters -
destination-vserver and for relationships with "Relationship Capability" of "Pre 8.2", -
destination-cluster must also be specified. This parameter is not supported for relationships with non-
Data ONTAP destination endpoints.

[-force | -f [true]] - Force

If specified, the delete proceeds even if it cannot clean up all artifacts of the relationship.

[-foreground | -w [true]] - Foreground Process

This specifies whether the operation runs as a foreground process. If this parameter is specified, the default
setting is true (the operation runs in the foreground). When set to true, the command will not return until
the process completes. This parameter is only applicable to relationships with "Relationship
Capability" of "Pre 8.2".

Examples

To delete the SnapMirror relationship with the destination endpoint vs2.example.com:dept_eng_dp_mirror4, type
the following command:

vs2.example.com:/> snapmirror delete -destination-path
    vs2.example.com:dept_eng_dp_mirror4

For relationships with "Relationship Capability" of "Pre 8.2", to delete the SnapMirror relationship with the
destination endpoint cluster2://vs2.example.com/dept_eng_dp_mirror4, type the following command:
To delete the SnapMirror relationship with destination endpoint `dvs1.example.com`, type the following command:

```
cluster2::> snapmirror delete -destination-path dvs1.example.com:
```

Under PVR control to delete the synchronous SnapMirror Consistency Group relationship with the destination Consistency Group `cg_dst` in Vserver `vs2.example.com` and all item mappings, type the following command:

```
vs2.example.com::> snapmirror delete -destination-path vs2.example.com:/cg/cg_dst
```

Under PVR control to delete the item mapping between `lun3` on volume `srcvol` and `lun3` on volume `dstvol` in the SnapMirror synchronous Consistency Group relationship with the destination Consistency Group `cg_dst` in Vserver `vs2.example.com`, type the following command:

```
vs2.example.com::> snapmirror delete -destination-path vs2.example.com:/cg/cg_dst -cg-item-mappings /vol/srcvol/lun3:@/vol/dstvol/lun3
```

### `snapmirror initialize`

Start a baseline transfer

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**

The `snapmirror initialize` command initializes the destination Vserver, volume or a non-Data ONTAP endpoint of a SnapMirror relationship. The command behaves differently between data protection (DP), extended data protection (XDP) and load-sharing (LS) relationships.

For data protection (DP) and extended data protection (XDP) relationships, the `snapmirror initialize` command initializes the destination volume.

For load-sharing (LS) relationships, the `snapmirror initialize` command initializes a new load-sharing mirror in an existing set of load-sharing mirrors. If the command finishes before the start of a scheduled or manual transfer of the set of load-sharing mirrors, the load-sharing mirror is up to date with the set of load-sharing mirrors; otherwise, the load-sharing mirror will be brought up to date at the next scheduled or manual transfer of the set of load-sharing mirrors.

The initial transfer to an empty destination volume is called a baseline transfer. During a baseline transfer for a data protection (DP) or extended data protection (XDP) relationship, the `snapmirror initialize` command takes a Snapshot copy on the source volume to capture the current image of the source volume. For data protection relationships, the `snapmirror initialize` command transfers all of the Snapshot copies up to and including the Snapshot copy created by it from the source volume.
volume to the destination volume. For extended data protection (XDP) relationships, the `snapmirror initialize` command behavior depends on the `snapmirror policy` associated with the relationship. If the policy type is `async-mirror` then depending on the rules in the policy it can transfer either all the Snapshot copies up to and including the Snapshot copy created by it or only the Snapshot copy created by it from the source volume to the destination volume. For extended data protection (XDP) relationships with policy type `vault` or `mirror-vault` the `snapmirror initialize` transfers only the Snapshot copy created by it.

After the `snapmirror initialize` command successfully completes, the last Snapshot copy transferred is made the exported Snapshot copy on the destination volume.

When an Infinite Volume SnapMirror relationship is initialized, the command will create any needed constituent volumes for the destination Infinite Volume. The Infinite Volume relationship will appear in the `snapmirror show` command output on the source cluster after it is initialized.

You can use the `snapmirror initialize` command to initialize a specific load-sharing mirror that is new to the set of load-sharing mirrors. An initialize of the new load-sharing mirror should bring it up to date with the other up-to-date destination volumes in the set of load-sharing mirrors.

**Note:** Using the `snapmirror initialize` command to initialize a set of load-sharing mirrors will not work. Use the `snapmirror initialize-ls-set` command to initialize a set of load-sharing mirrors.

If a SnapMirror relationship does not already exist, that is, the relationship was not created using the `snapmirror create` command, the `snapmirror initialize` command will implicitly create the SnapMirror relationship, with the same behaviors as described for the `snapmirror create` command before initializing the relationship. This implicit create feature is not supported for Infinite Volumes and Vservers.

This command is supported for SnapMirror relationships with the field "Relationship Capability" showing as either "8.2 and above" or "Pre 8.2" in the output of the `snapmirror show` command.

For relationships with "Relationship Capability" of "8.2 and above", you can track the progress of the operation using the `snapmirror show` command.

For relationships with "Relationship Capability" of "Pre 8.2", a job will be spawned to operate on the SnapMirror relationship, and the job id will be shown in the command output. The progress of the job can be tracked using the `job show` and `job history show` commands.

The `snapmirror initialize` command must be used from the destination Vserver or cluster.

**Parameters**

```bash
{-source-path | -S {<vserver:/>volume> | <cluster://vserver/volume> | hostip:/lun/name> | hostip:/share/share-name}} - Source Path
```

This parameter specifies the source endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or the volume (volume). To support relationships with "Relationship Capability" of "Pre 8.2", a format which also includes the name of the cluster (cluster) is provided. The "Pre 8.2" format cannot be used when operating in a Vserver context on relationships with "Relationship Capability" of "8.2 and above". For SnapMirror relationships with an AltaVault source, the source endpoint is specified in the form `hostip:/share/share-name`. For SnapMirror relationships with a SolidFire source, the source endpoint is specified in the form `hostip:/lun/name`.

```bash
[-source-cluster <Cluster name>] - Source Cluster
```

Specifies the source cluster of the SnapMirror relationship. If this parameter is specified, the `source-vserver` and `source-volume` parameters must also be specified. This parameter is only applicable for relationships with "Relationship Capability" of "Pre 8.2". This parameter cannot be specified when operating in a Vserver context on relationships with "Relationship Capability" of "8.2 and above".

```bash
[-source-vserver <vserver name>] - Source Vserver
```

Specifies the source Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters `source-volume` and for relationships with "Relationship Capability" of "Pre 8.2" and above, the `source-cluster` parameter must also be specified.
Capability" of "Pre 8.2", -source-cluster must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

[-source-volume <volume name>] - Source Volume

Specifies the source volume of the SnapMirror relationship. If this parameter is specified, parameters -source-vserver and for relationships with "Relationship Capability" of "Pre 8.2", -source-cluster must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

{-destination-path <[vserver:]volume>|<[[cluster:]//vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>} - Destination Path

This parameter specifies the destination endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or volume (volume). To support relationships with "Relationship Capability" of "Pre 8.2", a format which also includes the name of the cluster (cluster) is provided. The "Pre 8.2" format cannot be used when operating in a Vserver context on relationships with "Relationship Capability" of "8.2 and above". For SnapMirror relationships with AltaVault destinations, the destination endpoint is specified in the form hostip:/share/share-name. For relationships with SolidFire destinations, the destination endpoint is specified in the form hostip:/lun/name.

[-destination-cluster <Cluster name>] - Destination Cluster

Specifies the destination cluster of the SnapMirror relationship. If this parameter is specified, parameters -destination-vserver and -destination-volume must also be specified. This parameter is only applicable for relationships with "Relationship Capability" of "Pre 8.2". This parameter cannot be specified when operating in a Vserver context on relationships with "Relationship Capability" of "8.2 and above".

-destination-vserver <vserver name> - Destination Vserver

Specifies the destination Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters -destination-volume and for relationships with "Relationship Capability" of "Pre 8.2", -destination-cluster must also be specified. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

-destination-volume <volume name> - Destination Volume

Specifies the destination volume of the SnapMirror relationship. If this parameter is specified, parameters -destination-vserver and for relationships with "Relationship Capability" of "Pre 8.2", -destination-cluster must also be specified. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

[-source-snapshot |-s <text>] - Source Snapshot

This optional parameter specifies the Snapshot copy that snapmirror initialize will use for the baseline transfer. For data protection (DP) relationships, the baseline transfer will include all of the Snapshot copies up to and including the specified Snapshot copy. For extended data protection (XDP) relationships, the snapmirror initialize command behavior depends on the snapmirror policy associated with the relationship. If the policy type is async-mirror then depending on the rules in the policy it can transfer either all the Snapshot copies up to and including the specified Snapshot copy or only the specified Snapshot copy from the source volume to the destination volume. For extended data protection (XDP) relationships with policy type vault or mirror-vault the snapmirror initialize transfers only the specified Snapshot copy. This parameter is not supported for relationships with "Relationship Capability" of "Pre 8.2". This parameter is not supported for Infinite Volume SnapMirror relationships.

[-type <snapmirrorType>] - Snapmirror Relationship Type

Specifies the type of SnapMirror relationship if a relationship is implicitly created. This parameter is the same as the one used in the snapmirror create command.
-policy <sm_policy> - SnapMirror Policy
This optional parameter designates the name of the SnapMirror policy which is associated with the
SnapMirror relationship. If you do not designate a policy, the current policy will be retained. This parameter is
not applicable to relationships with "Relationship Capability" of "Pre 8.2". This parameter is not
supported by this operation for Infinite Volumes.

Note: You define and name a policy using the snapmirror policy create command.

-throttle | -k <throttleType> - Throttle (KB/sec)
This optional parameter limits the network bandwidth used for the initialize transfer. It sets the maximum rate
(in Kbytes/sec) at which data can be transferred during the operation. If this parameter is not specified, the
throttle value configured for the relationship with the snapmirror create or snapmirror modify
command will be used. To fully use the network bandwidth available, set the throttle value to unlimited or
0. The minimum throttle value is four Kbytes/sec, so if you specify a throttle value between 1 and 4, it will be
treated as if you specified 4. For FlexGroup relationships, the throttle value is applied individually to each
constituent relationship. The -throttle parameter does not affect load-sharing transfers and transfers for
other relationships with "Relationship Capability" of "Pre 8.2" confined to a single cluster.

-transfer-priority {low|normal} - Transfer Priority
This optional parameter specifies the priority at which the transfer runs. The default value for this parameter is
the value in the SnapMirror policy associated with this relationship. This parameter is not applicable to
relationships with a "Relationship Capability" of "Pre 8.2".

-is-auto-expand-enabled {true|false} - Is Auto Expand Enabled
This optional parameter specifies whether or not a FlexGroup SnapMirror relationship and its destination
FlexGroup should be auto-expanded if the source FlexGroup is expanded. This parameter is supported only for
FlexGroup SnapMirror relationships. If this initialize is creating a new SnapMirror relationship, the default
value is true. If it is not creating a new relationship, if a value is specified, it must match the current value for
the existing relationship. If the parameter is not specified the existing value will be retained.

-foreground | -w [true] - Foreground Process
This specifies whether the operation runs as a foreground process. If this parameter is specified, the default
setting is true (the operation runs in the foreground). When set to true, the command will not return until
the process completes. This parameter is only applicable to relationships with "Relationship
Capability" of "Pre 8.2".

Examples
To start the initial transfer for the SnapMirror relationship with the destination endpoint
vs2.example.com:dept_eng_dp_mirror2 after the relationship has been created with the snapmirror create
command, type the following command:

```
vs2.example.com::> snapmirror initialize -destination-path
           vs2.example.com:dept_eng_dp_mirror2
```

For relationships with "Relationship Capability" of "Pre 8.2", to start the initial transfer for the SnapMirror
relationship with the destination endpoint cluster2://vs2.example.com/dept_eng_dp_mirror2 after the
relationship has been created with the snapmirror create command, type the following command:

```
calculator2::> snapmirror initialize -destination-path
           cluster2://vs2.example.com/dept_eng_dp_mirror2
```

To create a data protection mirror relationship between the source endpoint vs1.example.com:dept_mkt, and the
destination endpoint vs2.example.com:dep_mkt_dp_mirror, and start the initial transfer, type the following command:
To create a data protection mirror relationship between the source endpoint `cluster1://vs1.example.com/dept_mkt`, and the destination endpoint `cluster2://vs2.example.com/dep_mkt_dp_mirror`, and start the initial transfer when the source cluster is running Data ONTAP 8.1 software, type the following command:

```
cluster2::> snapmirror initialize -destination-path
    cluster2://vs2.example.com/dep_mkt_dp_mirror
    -source-path cluster1://vs1.example.com/dept_mkt
```

To create an extended data protection (XDP) relationship between the Data ONTAP source endpoint `vs1.example.com:data_ontap_vol`, and the AltaVault destination endpoint `10.0.0.11:/share/share1`, and start the initial transfer, type the following command:

```
vs1.example.com::> snapmirror initialize -destination-path
    10.0.0.11:/share/share1
    -source-path vs1.example.com:data_ontap_vol -type XDP
```

To start the initial transfer for the Vserver SnapMirror relationship with destination endpoint `dvs1.example.com` after the relationship was created with the `snapmirror create` command, type the following command:

```
dvs1.example.com::> snapmirror initialize -destination-path
    dvs1.example.com:
```

Under PVR control to create a SnapMirror synchronous Consistency Group relationship with the following attributes:

- It is between the source Consistency Group `cg_src` in Vserver `vs1.example.com`, and the destination Consistency Group `cg_dst` in Vserver `vs2.example.com`.
- It has item mappings between `lun1` and `lun2` on volume `srcvol` and `lun1` and `lun2` on volume `dstvol`.
- It uses a policy named Sync that has a policy type of `sync-mirror` that the user has previously created.

and initialize it and bring it InSync, type the following command:

```
vs2.example.com::> snapmirror initialize -destination-path
    vs2.example.com:/cg/cg_dst -source-path
    vs1.example.com:/cg/cg_src -type XDP -policy Sync
    -cg-item-mappings /vol/srcvol/lun1:@/vol/dstvol/lun1,
    /vol/srcvol/lun2:@/vol/dstvol/lun2
```

Under PVR control to initialize the relationship with destination Consistency Group `cg_dst` in Vserver `vs2.example.com` that has been created with the `snapmirror create` command and bring it InSync, type the following command:

```
vs2.example.com::> snapmirror initialize -destination-path
    vs2.example.com:/cg/cg_dst
```

**snapmirror initialize-ls-set**

Start a baseline load-sharing set transfer

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The `snapmirror initialize-ls-set` command initializes and updates a set of load-sharing mirrors. This command is usually used after the `snapmirror create` command is used to create a SnapMirror relationship for each of the destination volumes in the set of load-sharing mirrors. The initial transfers to empty load-sharing mirrors are baseline transfers done in parallel. During a baseline transfer Data ONTAP takes a Snapshot copy on the source volume to capture the current image of the source volume and transfers all of the Snapshot copies on the source volume to each of the destination volumes.

After the `snapmirror initialize-ls-set` command successfully completes, the last Snapshot copy transferred is made the exported Snapshot copy on the destination volumes.

The parameter that identifies the set of load-sharing mirrors is the source volume. Data and Snapshot copies are transferred from the source volume to all up-to-date destination volumes in the set of load-sharing mirrors.

Use the `snapmirror initialize` command to add and initialize a new destination volume to an existing set of load-sharing mirrors.

**Note:** Even if the load-sharing set only has one mirror, you still need to use the `snapmirror initialize-ls-set` command to initialize the set. The `snapmirror initialize` command can only be used to initialize a new destination volume, if the load-sharing set has already been initialized.

This command is not supported on Infinite Volume snapmirror relationships.

This command is only supported for SnapMirror relationships with the field "Relationship Capability" showing as "Pre 8.2" in the output of the `snapmirror show` command.

**Parameters**

```
{-source-path | -S ({{vserver:}}[volume]|{{[cluster:}//vserver/]volume}|<hostip:/lun/name>|<hostip:/share/share-name>)} - Source Path
```

This parameter specifies the source endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or the volume (volume). To support relationships with "Relationship Capability" of "Pre 8.2", a format which also includes the name of the cluster (cluster) is provided. The "Pre 8.2" format cannot be used when operating in a Vserver context on relationships with "Relationship Capability" of "8.2 and above". For SnapMirror relationships with an AltaVault source, the source endpoint is specified in the form `hostip:/share/share-name`. For SnapMirror relationships with a SolidFire source, the source endpoint is specified in the form `hostip:/lun/name`.

```
| [-source-cluster <Cluster name>] - Source Cluster
```

Specifies the source cluster of the SnapMirror relationship. If this parameter is specified, the `-source-vserver` and `-source-volume` parameters must also be specified. This parameter is only applicable for relationships with "Relationship Capability" of "Pre 8.2". This parameter cannot be specified when operating in a Vserver context on relationships with "Relationship Capability" of "8.2 and above".
-source-vserver <vserver name> - Source Vserver

Specifies the source Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters -source-volume and for relationships with "Relationship Capability" of "Pre 8.2", -source-cluster must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

-source-volume <volume name> - Source Volume

Specifies the source volume of the SnapMirror relationship. If this parameter is specified, parameters -source-vserver and for relationships with "Relationship Capability" of "Pre 8.2", -source-cluster must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

[-foreground | -w [true]] - Foreground Process

This specifies whether the operation runs as a foreground process. If this parameter is specified, the default setting is true (the operation runs in the foreground). When set to true, the command will not return until the process completes. This parameter is only applicable to relationships with "Relationship Capability" of "Pre 8.2".

Examples

To initialize the group of load-sharing mirrors for the source endpoint //vs1.example.com/dept_eng, type the following command:

```
cluster1::> snapmirror initialize-ls-set -source-path //vs1.example.com/dept_eng
```

snapmirror list-destinations

Display a list of destinations for SnapMirror sources

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The snapmirror list-destinations command displays information including the destination endpoints, the relationship status, and transfer progress, for SnapMirror relationships whose source endpoints are in the current Vserver if you are in a Vserver context, or the current cluster if you are in a cluster context.

The command might display several relationships that have the same source and destination endpoints, but have different relationship IDs. If this is the case, some of the information is stale. It corresponds to relationships that have been deleted on the destination Vserver or cluster, and have not been released yet on the source Vserver or source cluster.

The relationships and the information displayed are controlled by the parameters that you specify. If no parameters are specified, the command displays the following information associated with each SnapMirror relationship whose source endpoint is in the current Vserver if you are in a Vserver context, or the current cluster if you are in a cluster context:

- Source path
- Relationship Type
• Destination Path
• Relationship Status
• Transfer Progress
• Progress Last Updated
• Relationship ID

Note the following limitations on the information displayed by the `snapmirror list-destinations` command:

• The "Relationship Status" field is not valid after the node hosting the source volume joins the cluster quorum, until at least one transfer is performed on the SnapMirror relationship.

• "Transfer Progress" and "Progress Last Updated" fields are only valid if a Snapshot copy transfer is in progress.

• The "Relationship ID" field is not valid for Vserver SnapMirror relationships.

• The "Relationship Status", "Transfer Progress", and "Progress Last Updated" fields are not valid for FlexGroup relationships, but they are valid for FlexGroup constituent relationships.

The `-instance` and `-fields` parameters are mutually exclusive and select the fields that are displayed. The `-instance` parameter if specified, displays detailed information about the relationships. The `-fields` parameter specifies what fields should be displayed. The other parameters of the `snapmirror list-destinations` command, select the SnapMirror relationships for which the information is displayed.

This command is not supported for SnapMirror relationships with non-Data ONTAP endpoints.

**Parameters**

```
[-fields <fieldname>,...]
```

If you specify the `-fields <fieldname>,...` parameter, the command only displays the fields that you have specified.

```
[-instance]
```

If you specify the `-instance` parameter, the command displays detailed information about all relationships selected.

```
[-source-path -S {<vserver:><volume>|<[[cluster://]vserver/]<volume>|<hostip://lun/name>|<hostip://share/share-name>}] - Source Path
```

Selects SnapMirror relationships that have a matching source path name.

```
[-source-vserver <vserver name>] - Source Vserver
```

Selects SnapMirror relationships that have a matching source Vserver name.

```
[-source-volume <volume name>] - Source Volume
```

Selects SnapMirror relationships that have a matching source volume name.

```
[-destination-path {<vserver:><volume>|<[[cluster://]vserver/]<volume>|<hostip://lun/name>|<hostip://share/share-name>}] - Destination Path
```

Selects SnapMirror relationships that have a matching destination path name.

```
[-destination-vserver <vserver name>] - Destination Vserver
```

Selects SnapMirror relationships that have a matching destination Vserver name.

```
[-destination-volume <volume name>] - Destination Volume
```

Selects SnapMirror relationships that have a matching destination volume name.

```
[-relationship-id <UUID>] - Relationship ID
```

Selects SnapMirror relationships that have a matching relationship identifier. This parameter is not supported for Vserver SnapMirror relationships.
[\-type <snapmirrorType>] - Relationship Type
Selects SnapMirror relationships that have a matching relationship type. Possible values are:
  • DP
  • XDP
  • RST

[\-relationship-group-type (none|vserver|infinitevol|consistencygroup|flexgroup)] - Relationship Group Type
Selects SnapMirror relationships that have a matching relationship group type. Possible values are:
  • none
  • vserver
  • infinitevol
  • flexgroup

[\-policy-type (vault|async-mirror|mirror-vault)] - SnapMirror Policy Type
Selects SnapMirror relationships that have a matching SnapMirror policy type. Possible values are:
  • async-mirror
  • vault
  • mirror-vault

[\-status <mirror status>] - Relationship Status
Selects SnapMirror relationships that have a matching relationship status. Possible values are:
  • Idle
  • Transferring
This parameter is not supported for FlexGroup SnapMirror relationships, but it is supported for FlexGroup constituent relationships.

[\-transfer-progress {<integer>[KB|MB|GB|TB|PB]}] - Transfer Progress
Selects SnapMirror relationships that have a matching transfer progress. This parameter is not supported for Infinite Volume or FlexGroup SnapMirror relationships, but it is supported for FlexGroup constituent relationships.

[\-progress-last-updated <MM/DD HH:MM:SS>] - Timestamp of Last Progress Update
Selects SnapMirror relationships that have a matching transfer progress last updated timestamp. This parameter is not supported for Infinite Volume or FlexGroup SnapMirror relationships, but it is supported for FlexGroup constituent relationships.

[\-is-constituent {true|false}] - Constituent Relationship
Selects SnapMirror relationships that have a matching constituent condition. This parameter is not supported for Vserver, FlexGroup, or FlexGroup constituent SnapMirror relationships.

[\-source-volume-node <nodename>] - Source Volume Node Name
Selects SnapMirror relationships that have a matching source volume node name. For FlexGroup relationships, it is the node which owns the root constituent source volume. This parameter is not supported for Vserver SnapMirror relationships.
[-expand [true]] - Show Constituents of the Group

Specifies whether to display constituent relationships of Vserver and FlexGroup SnapMirror relationships. By default, the constituents are not displayed.

Examples
To display summary information about all relationships whose source endpoints are in the current cluster, type the following command:

```
cluster1::> snapmirror list-destinations
```

<table>
<thead>
<tr>
<th>Source Path</th>
<th>Type</th>
<th>Destination Path</th>
<th>Status</th>
<th>Transfer Progress</th>
<th>Last Updated</th>

**snapmirror modify**

Modify a SnapMirror relationship

**Availability:** This command is available to cluster and Vserver administrators at the *admin* privilege level.

**Description**

The `snapmirror modify` command allows you to change one or more properties of SnapMirror relationships. The key parameter that identifies any SnapMirror relationship is the destination endpoint. The destination endpoint can be a Vserver, a volume, or a non-Data ONTAP endpoint.

For load-sharing mirrors, a change to a property affects all of the SnapMirror relationships in the set of load-sharing mirrors. Destination volumes in a set of load-sharing mirrors do not have individual property settings.

Changes made by the `snapmirror modify` command do not take effect until the next manual or scheduled update of the SnapMirror relationship. Changes do not affect updates that have started and have not finished yet.

This command is supported for SnapMirror relationships with the field "Relationship Capability" showing as either "8.2 and above" or "Pre 8.2" in the output of the `snapmirror show` command.

The `snapmirror modify` command must be used from the destination Vserver or cluster.

**Parameters**

```
{-source-path} {-S <[vserver:]volume>|<cluster://vserver/volume>|<hostip:/lun/name>|<hostip:/share/share-name>} - Source Path
```

This parameter specifies the source endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or the volume (volume). To support relationships with "Relationship Capability" of "Pre 8.2", a format which also includes the name of
the cluster (cluster) is provided. The "Pre 8.2" format cannot be used when operating in a Vserver context on relationships with "Relationship Capability" of "8.2 and above". For SnapMirror relationships with an AltaVault source, the source endpoint is specified in the form hostip:/share/share-name. For SnapMirror relationships with a SolidFire source, the source endpoint is specified in the form hostip:/lun/name.

| -source-cluster <Cluster name> | - Source Cluster

Specifies the source cluster of the SnapMirror relationship. If this parameter is specified, the -source-vserver and -source-volume parameters must also be specified. This parameter is only applicable for relationships with "Relationship Capability" of "Pre 8.2". This parameter cannot be specified when operating in a Vserver context on relationships with "Relationship Capability" of "8.2 and above".

| -source-vserver <vserver name> | - Source Vserver

Specifies the source Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters -source-volume and for relationships with "Relationship Capability" of "Pre 8.2", -source-cluster must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

| -source-volume <volume name> | - Source Volume

Specifies the source volume of the SnapMirror relationship. If this parameter is specified, parameters -source-vserver and for relationships with "Relationship Capability" of "Pre 8.2", -source-cluster must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

| -destination-path {<[vserver:]volume>|<[[cluster://vserver]/]volume>|<hostip:/lun/name> <hostip:/share/share-name>} | - Destination Path

This parameter specifies the destination endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or volume (volume). To support relationships with "Relationship Capability" of "Pre 8.2", a format which also includes the name of the cluster (cluster) is provided. The "Pre 8.2" format cannot be used when operating in a Vserver context on relationships with "Relationship Capability" of "8.2 and above". For SnapMirror relationships with AltaVault destinations, the destination endpoint is specified in the form hostip:/share/share-name. For relationships with SolidFire destinations, the destination endpoint is specified in the form hostip:/lun/name.

| -destination-cluster <Cluster name> | - Destination Cluster

Specifies the destination cluster of the SnapMirror relationship. If this parameter is specified, parameters -destination-vserver and -destination-volume must also be specified. This parameter is only applicable for relationships with "Relationship Capability" of "Pre 8.2". This parameter cannot be specified when operating in a Vserver context on relationships with "Relationship Capability" of "8.2 and above".

| -destination-vserver <vserver name> | - Destination Vserver

Specifies the destination Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters -destination-volume and for relationships with "Relationship Capability" of "Pre 8.2", -destination-cluster must also be specified. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

| -destination-volume <volume name> | - Destination Volume

Specifies the destination volume of the SnapMirror relationship. If this parameter is specified, parameters -destination-vserver and for relationships with "Relationship Capability" of "Pre 8.2", -destination-cluster must also be specified. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.
[-vserver <vserver name>] - Managing Vserver

If this optional parameter is specified, designates the managing Vserver. The managing Vserver is authorized to use some snapmirror commands to manage the SnapMirror relationship. The -vserver option is currently a reserved option.

[-schedule <text>] - SnapMirror Schedule

This optional parameter designates the name of the schedule which is used to update the SnapMirror relationship. If you do not designate a schedule, updates are not scheduled, so you must update the SnapMirror relationship manually using the snapmirror update command or, in the case of a set of load-sharing mirrors, using the snapmirror update-1s-set command.

Note: You define and name a schedule using the job schedule cron create command.

The schedules associated with an Infinite Volume SnapMirror relationship should not have an interval shorter than hourly.

[-policy <sm_policy>] - SnapMirror Policy

This optional parameter designates the name of the snapmirror policy which is associated with the SnapMirror relationship. If you do not designate a policy, the current policy will be retained. This parameter is not applicable to relationships with "Relationship Capability" of "Pre 8.2".

Note: You define and name a policy using the snapmirror policy create command.

[-tries <unsigned32_or_unlimited>] - Tries Limit

This optional parameter specifies the maximum number of times to attempt each manual or scheduled transfer for a SnapMirror relationship. The default is eight times. The -tries parameter can be set to 0 to disable manual and scheduled updates for the SnapMirror relationship. This parameter is only applicable to relationships with "Relationship Capability" of "Pre 8.2". For relationships with "8.2 and above" capability, the tries limit is controlled by the value of tries in the SnapMirror policy which is associated with the relationship.

[-throttle | -k <throttleType>] - Throttle (KB/sec)

This optional parameter limits the network bandwidth used for transfers. It configures for the relationship the maximum rate (in Kbytes/sec) at which data can be transferred. If no throttle is configured, by default the SnapMirror relationship fully utilizes the network bandwidth available. You can also configure the relationship to fully use the network bandwidth available by explicitly setting the throttle to unlimited or 0. The minimum effective throttle value is four Kbytes/sec, so if you specify a throttle value between 1 and 4, it will be treated as 4. For FlexGroup volume relationships, the throttle value is applied individually to each constituent relationship. The -throttle parameter does not affect load-sharing mirrors and other SnapMirror relationships with "Relationship Capability" of "Pre 8.2" confined to a single cluster.

[-is-auto-expand-enabled {true|false}] - Is Auto Expand Enabled

This optional parameter specifies whether or not a FlexGroup SnapMirror relationship and its destination FlexGroup should be auto-expanded if the source FlexGroup is expanded. This parameter is supported only for FlexGroup SnapMirror relationships. If you do not specify the parameter, the current value of auto expand will be retained.

[-foreground | -w [true]] - Foreground Process

This specifies whether the operation runs as a foreground process. If this parameter is specified, the default setting is true (the operation runs in the foreground). When set to true, the command will not return until the process completes. This parameter is only applicable to relationships with "Relationship Capability" of "Pre 8.2".

Examples

To change the schedule to halfhour for the SnapMirror relationship with the destination endpoint vs2.example.com:dept_eng_dp_mirror2, type the following command:
For relationships with "Relationship Capability" of "Pre 8.2", to change the schedule to halfhour for the SnapMirror relationship with the destination endpoint `cluster2://vs2.example.com/dept_eng_dp_mirror2`, type the following command:

```
cluster2::> snapmirror modify -destination-path
            cluster2://vs2.example.com/dept_eng_dp_mirror2
            -schedule halfhour
```

To change the schedule to halfhour for the Vserver SnapMirror relationship with destination endpoint `dvs1.example.com`, type the following command:

```
cluster2::> snapmirror modify -destination-path
            dvs1.example.com: -schedule halfhour
```

To change the policy associated with the synchronous SnapMirror Consistency Group relationship with the destination Consistency Group `cg_dst` in Vserver `vs2.example.com` to the policy `Sync2`, type the following command:

```
vs2.example.com::> snapmirror modify -destination-path
            vs2.example.com:/cg/cg_dst -policy Sync2
```

### snapmirror promote

Promote the destination to read-write

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The `snapmirror promote` command performs a failover to the destination volume of a SnapMirror relationship. This command changes the destination volume from a read-only volume to a read-write volume and makes the destination volume assume the identity of the source volume. The command then destroys the original source volume. The destination volume must be a load-sharing volume. Note that you can promote a load-sharing volume that has been left in read-write state by a previously failed promote operation.

Client accesses are redirected from the original source volume to the promoted destination volume. The view clients see on the promoted destination volume is the latest transferred Snapshot copy, which might lag behind the view clients had of the original source volume before the promote.

The SnapMirror relationship is always deleted as part of the promotion process.

It is possible that the original source volume is the source of multiple SnapMirror relationships. For such a configuration, the promoted destination volume becomes the new source volume of the other SnapMirror relationships.

This command is only supported for SnapMirror relationships with the field "Relationship Capability" showing as "Pre 8.2" in the output of the `snapmirror show` command.
The `snapmirror promote` command fails if a SnapMirror transfer is in progress for any SnapMirror relationship with "Relationship Capability" of "Pre 8.2" involving the original source volume. It does not fail if a SnapMirror transfer is in progress for a relationship with "Relationship Capability" of "8.2 and above".

This command is not supported on Infinite Volume snapmirror relationships.

**Parameters**

```
{ [-source-path | -S {<[vserver:]volume>|<[[cluster:]//vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>]] - Source Path

This parameter specifies the source endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or the volume (volume). To support relationships with "Relationship Capability" of "Pre 8.2", a format which also includes the name of the cluster (cluster) is provided. The "Pre 8.2" format cannot be used when operating in a Vserver context on relationships with "Relationship Capability" of "8.2 and above". For SnapMirror relationships with an AltaVault source, the source endpoint is specified in the form hostip:/share/share-name. For SnapMirror relationships with a SolidFire source, the source endpoint is specified in the form hostip:/lun/name.

| [-source-cluster <Cluster name>] - Source Cluster

Specifies the source cluster of the SnapMirror relationship. If this parameter is specified, the `-source-vserver` and `-source-volume` parameters must also be specified. This parameter is only applicable for relationships with "Relationship Capability" of "Pre 8.2". This parameter cannot be specified when operating in a Vserver context on relationships with "Relationship Capability" of "8.2 and above".

| [-source-vserver <vserver name>] - Source Vserver

Specifies the source Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters `-source-volume` and for relationships with "Relationship Capability" of "Pre 8.2", `-source-cluster` must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

| [-source-volume <volume name>] - Source Volume

Specifies the source volume of the SnapMirror relationship. If this parameter is specified, parameters `-source-vserver` and for relationships with "Relationship Capability" of "Pre 8.2", `-source-cluster` must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

| [-destination-path {<[vserver:]volume>|<[[cluster:]//vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>]} - Destination Path

This parameter specifies the destination endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or volume (volume). To support relationships with "Relationship Capability" of "Pre 8.2", a format which also includes the name of the cluster (cluster) is provided. The "Pre 8.2" format cannot be used when operating in a Vserver context on relationships with "Relationship Capability" of "8.2 and above". For SnapMirror relationships with AltaVault destinations, the destination endpoint is specified in the form hostip:/share/share-name. For relationships with SolidFire destinations, the destination endpoint is specified in the form hostip:/lun/name.

| [-destination-cluster <Cluster name>] - Destination Cluster

Specifies the destination cluster of the SnapMirror relationship. If this parameter is specified, parameters `-destination-vserver` and `-destination-volume` must also be specified. This parameter is only applicable for relationships with "Relationship Capability" of "Pre 8.2". This parameter cannot be specified when operating in a Vserver context on relationships with "Relationship Capability" of "8.2 and above". 
-destination-vserver <vserver name> - Destination Vserver

Specifies the destination Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters -destination-volume and for relationships with "Relationship Capability" of "Pre 8.2", -destination-cluster must also be specified. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

-destination-volume <volume name> - Destination Volume

Specifies the destination volume of the SnapMirror relationship. If this parameter is specified, parameters -destination-vserver and for relationships with "Relationship Capability" of "Pre 8.2", -destination-cluster must also be specified. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

- [force] -f [true] - Force

If this parameter is specified, the command proceeds without prompting for confirmation.

Examples

To promote a mirror named dept_eng_ls_mirror1 to be the source read-write volume for mirroring and client access, type the following command:

```
cluster1::> snapmirror promote -destination-path //vs1.example.com/dept_eng_ls_mirror1 -source-path //vs1.example.com/dept_eng -f true
```

snapmirror protect

Start protection for volumes

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The snapmirror protect command establishes SnapMirror protection for a list of volumes. For each volume, the command creates a data protection destination volume in the Vserver specified by the -destination-vserver parameter, creates an extended data protection (XDP) SnapMirror relationship, and starts the initialization of the SnapMirror relationship. This command must be used from the destination Vserver or cluster. This command is not supported for Infinite Volumes or Infinite Volume constituents, FlexGroup volumes or FlexGroup volume constituents, Vserver endpoints or non ONTAP endpoints.

Parameters

- [path-list] {<[vserver:]volume>|<[[cluster:]//vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>}, ... - Path List
  This parameter specifies the list of volumes to be protected. The list is a comma separated list of paths of the form vserver:volume, for example vs1.example.com:dept_eng1, vs1.example.com:dept_eng2

-destination-vserver <vserver name> - Destination Vserver
  This parameter specifies the Vserver in which to create the destination volumes of the SnapMirror relationships.

- [schedule <text>] - SnapMirror Schedule
  This optional parameter designates the name of the schedule which is used to update the SnapMirror relationships.
-policy <sm_policy> - SnapMirror Policy

This parameter designates the name of the SnapMirror policy which is associated with the SnapMirror relationships.

[-auto-initialize {true|false}] - Auto Initialize

This optional parameter specifies whether or not initializes of the SnapMirror relationships should be started after the relationships are created. The default value for this parameter is true.

[-destination-volume-prefix <text>] - Destination Volume Name Prefix

This optional parameter designates the prefix for the destination volume name. For example if the source path is of the form vserver:volume and the destination-volume-prefix specified is prefix_ and no destination-volume-suffix is specified, then the destination volume name will be prefix_volume_dst or possibly prefix_volume_1_dst if a name conflict is encountered. If both prefix and suffix are specified as prefix_ and _suffix, then the destination volume name will be prefix_volume_suffix or prefix_volume_1_suffix, if a name conflict is encountered.

[-destination-volume-suffix <text>] - Destination Volume Name Suffix

This optional parameter designates the suffix for the destination volume name. If you do not designate a suffix, a destination volume name with suffix _dst will be used. For example if the source path is of the form vserver:volume, and the suffix specified is _DP, the destination volume will be created with the name volume_DP or volume_1_DP if a name conflict is encountered. If both prefix and suffix are specified as prefix_ and _suffix, then the destination volume name will be prefix_volume_suffix or prefix_volume_1_suffix, if a name conflict is encountered.

Examples

To establish SnapMirror protection for the source volumes vs1.example.com:dept_eng1 and vs1.example.com:dept_eng2 using destination-vserver vs2.example.com and policy MirrorAllSnapshots type the following command:

```bash
vs2.example.com::> snapmirror protect -path-list vs1.example.com:dept_eng1,vs1.example.com:dept_eng2 -destination-vserver vs2.example.com -policy MirrorAllSnapshots
```

snapmirror quiesce

Disable future transfers

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The snapmirror quiesce command disables future transfers for a SnapMirror relationship. If there is no transfer in progress, the relationship becomes "Quiesced".

If there is a transfer in progress, it is not affected, and the relationship becomes "Quiescing" until the transfer completes. If the current transfer aborts, it will be treated like a future transfer and will not restart.

If applied to a load-sharing (LS) SnapMirror relationship, all the relationships in the load-sharing set will be quiesced.

When a SnapMirror relationship is quiesced, it remains quiesced across reboots and fail-overs.

This command is supported for SnapMirror relationships with the field "Relationship Capability" showing as either "8.2 and above" or "Pre 8.2" in the output of the snapmirror show command.

The snapmirror quiesce command must be used from the destination Vserver or cluster.
The relationship must exist on the destination Vserver or cluster. When issuing `snapmirror quiesce`, you must specify the destination endpoint. The specification of the source endpoint of the relationship is optional.

**Parameters**

\[ \{-source-path \} \{-S \} \{-source-cluster \} \{-source-vserver \} \{-source-volume \} \{-destination-path \} \{-destination-cluster \} \{-destination-vserver \} \{-destination-volume \} \]

This parameter specifies the source endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or the volume (volume). To support relationships with "Relationship Capability" of "Pre 8.2", a format which also includes the name of the cluster (cluster) is provided. The "Pre 8.2" format cannot be used when operating in a Vserver context on relationships with "Relationship Capability" of "8.2 and above". For SnapMirror relationships with an AltaVault source, the source endpoint is specified in the form hostip:/share/share-name. For SnapMirror relationships with a SolidFire source, the source endpoint is specified in the form hostip:/lun/name.

\[ \{-source-cluster \} \{-source-vserver \} \{-source-volume \} \]

This parameter specifies the source vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters `-source-volume` and for relationships with "Relationship Capability" of "Pre 8.2", `-source-cluster` must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

\[ \{-destination-path \} \{-destination-cluster \} \{-destination-vserver \} \{-destination-volume \} \]

This parameter specifies the destination endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or volume (volume). To support relationships with "Relationship Capability" of "Pre 8.2", a format which also includes the name of the cluster (cluster) is provided. The "Pre 8.2" format cannot be used when operating in a Vserver context on relationships with "Relationship Capability" of "8.2 and above". For SnapMirror relationships with AltaVault destinations, the destination endpoint is specified in the form hostip:/share/share-name. For relationships with SolidFire destinations, the destination endpoint is specified in the form hostip:/lun/name.

\[ \{-destination-cluster \} \{-destination-vserver \} \{-destination-volume \} \]

This parameter specifies the destination vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters `-destination-volume` and for relationships with "Relationship Capability" of "Pre 8.2", `-destination-cluster` must also be specified. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.
-destination-volume <volume name> - Destination Volume

Specifies the destination volume of the SnapMirror relationship. If this parameter is specified, parameters -
destination-vserver and for relationships with "Relationship Capability" of "Pre 8.2", -
destination-cluster must also be specified. This parameter is not supported for relationships with non-
Data ONTAP destination endpoints.

Examples

To quiesce the SnapMirror relationship with the destination endpoint vs2.example.com:dept_eng_mirror2, type the
following command:

    vs2.example.com::> snapmirror quiesce -destination-path
                       vs2.example.com:dept_eng_mirror2

For relationships with "Relationship Capability" of "Pre 8.2", to quiesce the SnapMirror relationship with the
destination endpoint cluster2://vs2.example.com/dept_eng_mirror2, type the following command:

    cluster2::> snapmirror quiesce -destination-path
                cluster2://vs2.example.com/dept_eng_mirror2

To quiesce the Vserver SnapMirror relationship with the destination endpoint dvs1.example.com:, type the following
command:

    cluster2::> snapmirror quiesce -destination-path
                dvs1.example.com:

Under PVR control to quiesce the synchronous SnapMirror Consistency Group relationship with the destination
Consistency Group cg_dst in Vserver vs2.example.com, type the following command:

    vs2.example.com::> snapmirror quiesce -destination-path
                        vs2.example.com:/cg/cg_dst

snapmirror release

Remove source information for a SnapMirror relationship

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The snapmirror release command removes the relationship information from the source Vserver. The command also
removes any Snapshot copy owner tags and any Snapshot copies which were created for the specified relationship from
the source volumes. It does not destroy any volumes or Vservers. This command must be used from the source Vserver or cluster.

You can use the snapmirror list-destinations command to display source Vservers' relationship information. This
information is populated during the first SnapMirror transfer, not when the snapmirror create command is issued.

This command is not supported for SnapMirror relationships with the field "Relationship Capability" showing as "Pre
8.2" in the output of the snapmirror show command.

This command is not supported for SnapMirror relationships with non-Data ONTAP endpoints.
The `snapmirror release` operation fails if a SnapMirror transfer for the SnapMirror relationship is in a data phase of the transfer.

**Parameters**

```
[-source-path | -S {<[vserver:]volume>|<[[cluster://vserver/]volume]|<host:/lun/name>|<host:/share/share-name>]} - Source Path
```

Specifies the source endpoint of the SnapMirror relationship in one of two formats. The normal format includes the names of the Vserver (vserver), and/or volume (volume). A format which also includes the name of the cluster (cluster) is also provided for consistency with other snapmirror commands. The form of the pathname which includes the cluster name cannot be used when operating in a Vserver context.

```
[-source-vserver <vserver name>] - Source Vserver
```

Specifies the source Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameter `-source-volume` must also be specified.

```
[-source-volume <volume name>] - Source Volume
```

Specifies the source volume of the SnapMirror relationship. If this parameter is specified, parameter `-source-vserver` must also be specified.

```
[-destination-path {<[vserver:]volume>|<[[cluster://vserver/]volume]|<host:/lun/name>|<host:/share/share-name>]} - Destination Path
```

Specifies the destination endpoint of the SnapMirror relationship in one of two formats. The normal format includes the names of the Vserver (vserver), and/or volume (volume). A format which also includes the name of the cluster (cluster) is also provided for consistency with other snapmirror commands. The form of the pathname which includes the cluster name cannot be used when operating in a Vserver context.

```
[-destination-vserver <vserver name>] - Destination Vserver
```

Specifies the destination Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameter `-destination-volume` must also be specified.

```
[-destination-volume <volume name>] - Destination Volume
```

Specifies the destination volume of the SnapMirror relationship. If this parameter is specified, parameter `-destination-vserver` must also be specified.

```
[-relationship-info-only [true]] - Remove relationship info only (skip cleanup of snapshots)
```

If this parameter is specified, the cleanup of Snapshot copies is bypassed and only the source relationship information is removed. It is recommended to specify this parameter only when the source volume is not accessible.

```
[-relationship-id <UUID>] - Relationship ID
```

This optional parameter specifies the relationship identifier of the relationship. It must be specified when information for more than one relationship with the same source and destination paths is present. This parameter is not supported for Vserver SnapMirror relationships.

```
[-force | -f [true]] - Force
```

If this parameter is specified, the command proceeds without prompting for confirmation.

**Examples**

To release the source information for the SnapMirror relationship with the destination endpoint `vs2.example.com:dept_eng_dp_mirror4`, type the following command:

```
vs1.example.com::> snapmirror release
    -destination-path vs2.example.com:dept_eng_dp_mirror4
```
To release the source information for the SnapMirror relationship with the destination endpoint `vs2.example.com:dept_eng_dp_mirror4`, and relationship-id `5f91a075-6a72-11e1-b562-123478563412`, type the following command:

```
vs1.example.com::> snapmirror release
    -destination-path vs2.example.com:dept_eng_dp_mirror4
    -relationship-id 5f91a075-6a72-11e1-b562-123478563412
```

To release the source information for the SnapMirror relationship with the destination endpoint `dvs1.example.com`, type the following command:

```
cluster1::> snapmirror release
    -destination-path dvs1.example.com:
```

Under PVR control to release the source information for the synchronous SnapMirror Consistency Group relationship with the destination Consistency Group `cg_dst` in Vserver `vs2.example.com`, type the following command:

```
vs2.example.com::> snapmirror release
    -destination-path vs2.example.com:/cg/cg_dst
```

Under PVR control to release just the source information but not remove the Snapshot copies that might be needed for a subsequent resync for the synchronous SnapMirror Consistency Group relationship with the destination Consistency Group `cg_dst` in Vserver `vs2.example.com`, type the following command:

```
vs2.example.com::> snapmirror release
    -destination-path vs2.example.com:/cg/cg_dst
    -relationship-info-only true
```

### snapmirror restore

Restore a Snapshot copy from a source volume to a destination volume

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**

The `snapmirror restore` command restores the entire contents of a Snapshot copy or one or more files or LUNs of a Snapshot copy from one volume to another volume.

The source of the restore can be a volume that is:

- the destination volume of a extended data protection (XDP) relationship
- the destination volume of a data protection (DP) relationship with "Relationship Capability" of "8.2 and above"
- a data-protection volume which is not the destination endpoint of any SnapMirror relationship
- a read-write volume.
• an AltaVault endpoint. In this case the destination must be an empty Data ONTAP volume.

The following cannot be used as either the source or destination volume of a restore:

• a volume that is the source or destination endpoint of a SnapMirror load-sharing relationship.
• a volume that is the destination endpoint of a SnapMirror relationship with the "Relationship Capability" of "Pre 8.2".
• a SolidFire endpoint.
• an Infinite Volume.

A SnapMirror relationship of type RST is created from the source volume to the destination volume by the snapmirror restore command. This relationship lasts for the duration of the restore operation and is deleted when the command completes successfully.

The following paragraphs describe the behavior when restoring the entire contents of a Snapshot copy to a destination volume.

By default the snapmirror restore will copy the latest Snapshot copy from the source volume to the destination volume. A specific Snapshot copy can be selected with the -source-snapshot parameter.

Any quota rules defined for the destination volume are deactivated prior to restoring the entire contents of a Snapshot copy. Run the command volume quota modify -vserver destination-volume-vserver -volume destination-volume-name -state on to reactivate quota rules after the entire contents of the Snapshot copy have been restored.

If the destination volume is an empty data protection volume, the snapmirror restore command performs a baseline restore. For a baseline restore the following steps are performed:

• Create the RST SnapMirror relationship.
• The entire contents of the Snapshot copy selected to be restored are copied to the active file system of the destination volume.
• The destination volume is made read-write.
• The RST SnapMirror relationship is deleted.

If the destination volume is a read-write volume, an incremental restore is performed. The incremental restore fails if it cannot find a common Snapshot copy between the source and destination volumes. Restoring a Snapshot copy to an empty read-write volume is not supported. Incremental restore from a non-Data ONTAP endpoint to a Data ONTAP volume is not supported.

An incremental restore preserves all Snapshot copies on the destination volume but does not preserve changes to the active file system since the latest Snapshot copy. To preserve changes to the destination volume since the latest Snapshot copy use the volume snapshot create command. Restore is a disruptive operation so client access of the destination volume is not advised for the duration of the operation.

For an incremental restore the following steps are performed:

• Create the RST SnapMirror relationship.
• The active file system of the destination volume is reverted to the latest Snapshot copy on the destination volume and the destination volume is made read-only.
• This Snapshot copy is the exported Snapshot copy and it is the view to which clients are redirected when accessing the destination volume.
• The contents of the Snapshot copy selected to be restored are copied to the active file system of the destination volume.
• The destination volume is made read-write.
• The RST SnapMirror relationship is deleted.
If `snapmirror restore` fails or is aborted, the `RST` relationship remains. Use the `snapmirror show` command with the destination volume name to display the reason for the error. An EMS is also generated when a failure occurs. There are two options to recover when restore fails or is aborted:

- Take corrective action suggested by the EMS and reissue the original command.
- Use the original command with `-clean-up-failure` to cancel the request.

When specifying `-clean-up-failure` to cancel an incremental restore request, the following steps are performed:

- If the Snapshot copy has not been restored to the destination volume, all data copied to the active file system by `snapmirror restore` to the destination volume is reverted.
- The destination volume is made read-write.
- The `RST` SnapMirror relationship is deleted.

When specifying `-clean-up-failure` to cancel a baseline restore request, the following steps are performed:

- If the Snapshot copy has been restored to the destination volume, the volume is made read-write.
- The `RST` SnapMirror relationship is deleted.

The following paragraphs describe the behavior and requirements when restoring one or more files or LUNs to the destination volume.

The destination volume must be a read-write volume. Restoring files or LUNs to a data protection volume is not supported. When restoring files or LUNs the source and destination volumes are not required to have a common Snapshot copy. If a common Snapshot copy exists, an incremental restore is performed for those files or LUNs being restored which exist in the common Snapshot copy.

The contents of the files or LUNs to which data is being restored on the destination volume are not preserved by this command. To preserve the contents of the destination files or LUNs, create a Snapshot copy on the destination volume prior to running this command. Client I/O is not allowed to a file or LUN to which data is being restored on the destination volume.

The `-source-snapshot` parameter is required when restoring files or LUNs. It identifies the Snapshot copy on the source volume from which the files or LUNs to be restored are copied. If all files or LUNs to be restored do not exist in this Snapshot copy the command fails.

The source path for each file or LUN being restored is required. The source path of a file or LUN is from the root of the source Snapshot copy of the source volume. The file is restored to the same path on the destination volume unless an optional destination path is specified. The destination path is from the root of the destination volume. If a file or LUN to which data is being restored on the destination volume does not exist, the file or LUN is created. If any directory in the path of the file or LUN being restored does not exist on the destination volume, the command fails. Overwriting the contents of an existing file with the contents of a different file or overwriting the contents of an existing LUN with the contents of a different LUN is supported. Overwriting a file with a LUN or a LUN with a file is not supported. Client I/O is not allowed to all files and LUNs to which data is being restored on the destination volume.

If quota rules have been defined for the destination volume, resource usage is updated during file restore, but limits of quota rules are not enforced. Therefore, resource limits might be exceeded during a file restore.

Multiple concurrent `snapmirror restore` commands, restoring one or more files or LUNs to the same destination volume, are not supported. The destination volume of a `snapmirror restore` to which one or more file or LUNs are being restored, can simultaneously be the source volume of a `snapmirror update`.

For a file or LUN restore the following steps are performed:

- Create the `RST` SnapMirror relationship.
- If any file or LUN being restored does not exist on the destination volume, create all such files or LUNs.
- Prevent client I/O to files or LUNs to which data is being restored on the destination volume.
- Revoke locks and space reservations held by NAS clients for files being restored.
• Copy the contents of all source files or LUNs to the corresponding file or LUN on the destination volume.
• Allow client I/O to files or LUNs to which data has been restored on the destination volume.
• Delete the \textit{RST} SnapMirror relationship.

\textbf{Note:} Some file restore operations require a Snapshot copy to be created. This Snapshot copy is temporary, it is deleted before the operation completes.

Since client I/O is not allowed to files or LUNs being restored, client I/O to files or LUNs being restored should be quiesced. Mapped LUNs remain mapped throughout the operation. SAN clients do not need to rediscover a mapped LUN that has been restored.

If \texttt{snapmirror restore} fails or is aborted, the \textit{RST} relationship remains. Use the \texttt{snapmirror show} command with the destination volume to display the reason for the error. An EMS is also generated when a failure occurs. There are two options to recover when restore fails or is aborted:

• Take corrective action suggested by the EMS and reissue the original command.
• Use \texttt{snapmirror restore \textasciitilde clean-up-failure} along with specifying the destination volume to cancel the request.

When specifying \texttt{\textasciitilde clean-up-failure} to cancel a file restore request, the following steps are performed:

• Any files to which Client I/O is not allowed are removed.
• Any Snapshot copy created for use during a file restore operation is deleted.
• The \textit{RST} SnapMirror relationship is deleted.

\textbf{Note:} LUNs to which Client I/O is not allowed remain. For LUNs to which client I/O is not allowed, do one of the following:

• Use the \texttt{snapmirror restore} command to restore data to the LUN. Once the command completes successfully, client I/O to the LUN is allowed.
• Delete the LUN using the \texttt{lun delete} command with the \texttt{-force-fenced} parameter.

The \texttt{snapmirror restore} command must be used from the destination Vserver or cluster.

\textbf{Parameters}

\begin{verbatim}
\{ [-source-path | -S {<vserver:}[volume]> | <[cluster://vserver/]volume> | <hostip:/lun/name> | <hostip:/share/share-name>] \} - Source Path
  Specifies the source endpoint in one of three formats. The basic format includes the names of the Vserver (vserver) and volume (volume). A format which also includes the name of the cluster (cluster) is supported for consistency with other \texttt{snapmirror} commands. The form of the pathname which includes the cluster name is not valid when operating in a Vserver context. A non-Data ONTAP source endpoint (for example, AltaVault) can be specified in the form \texttt{hostip:/share/share-name}.
\end{verbatim}

\begin{verbatim}
| [-source-cluster <Cluster name>] - Source Cluster
  Specifies the cluster in which the source volume resides. This parameter is not needed; it is provided for consistency with other \texttt{snapmirror} commands. If this parameter is specified, the \texttt{-source-vserver} and \texttt{-source-volume} parameters must also be specified. This parameter is not valid when operating in a Vserver context. This parameter is not supported if the source is a non-Data ONTAP endpoint.
\end{verbatim}

\begin{verbatim}
| [-source-vserver <vserver name>] - Source Vserver
  Specifies the source Vserver of the SnapMirror relationship. If this parameter is specified, the \texttt{-source-volume} parameter must also be specified. This parameter is not supported if the source is a non-Data ONTAP endpoint.
\end{verbatim}
[-source-volume <volume name>] - Source Volume

Specifies the source volume of the SnapMirror relationship. If this parameter is specified, the -source-vserver parameter must also be specified. This parameter is not supported if the source is a non-Data ONTAP endpoint.

{[-destination-path {<[vserver:]volume>|<[cluster:]//vserver/volume>|<hostip:lun/name>|<hostip:share/share-name}>] - Destination Path

Specifies the destination endpoint in one of two formats. The basic format includes the names of the Vserver (vserver) and volume (volume). A format that also includes the name of the cluster (cluster) is supported for consistency with other snapmirror commands. The form of the path which includes the cluster name is not valid when operating in a Vserver context.

[[[-destination-cluster <Cluster name>] - Destination Cluster

Specifies the cluster in which the destination volume resides. This parameter is not needed; it is provided for consistency with other snapmirror commands. If this parameter is specified, the -destination-vserver and -destination-volume parameters must also be specified. This parameter is not valid when operating in a Vserver context. This parameter is only applicable for relationships with "Relationship Capability" of "Pre 8.2".

-destination-vserver <vserver name> - Destination Vserver

Specifies the destination Vserver. If this parameter is specified, the -destination-volume parameter must also be specified.

-destination-volume <volume name> - Destination Volume

Specifies the destination volume. If this parameter is specified, the -destination-vserver parameter must also be specified.

[-source-snapshot | -s <text>] - Source Snapshot

When restoring the entire contents of a Snapshot copy, this optional parameter identifies the Snapshot copy to be restored from the source volume to the destination volume. The default value is the latest snapshot on the source volume. When restoring one or more files or LUNs from a Snapshot copy, this parameter is required.

[-throttle | -k <throttleType>] - Throttle (KB/sec)

This optional parameter limits the network bandwidth used for the restore transfer when the source and destination volumes belong to different clusters. It sets the maximum rate (in Kbytes/sec) at which data can be transferred between the clusters during the operation. To fully use the network bandwidth available between the clusters, set the throttle value to unlimited or 0. The minimum throttle value is four Kbytes/sec, so if you specify a throttle value between 1 and 4, it will be treated as if you specified 4.

[-transfer-priority (low|normal)] - Transfer Priority

This optional parameter specifies the priority at which the transfer runs. The default value for this parameter is normal.

[-disable-storage-efficiency [true]] - Disable Storage Efficient Transfer

The default behavior of restore is to preserve storage efficiency when possible. Use this optional parameter to turn off storage efficiency for data transferred over the wire and written to the destination volume.

[-clean-up-failure [true]] - Clean up after Failure

Use this optional parameter to recover from an aborted or failed restore operation. Any temporary RST relationship is removed from the destination Vserver. An attempt is made to remove any temporary RST relationship from the source Vserver. If cleaning up an incomplete restore of the entire contents of a Snapshot copy and the destination volume was read-write prior to the failed or aborted restore operation, it is converted back to read-write if necessary, while removing all data transferred or copied during the restore operation. If cleaning up an incomplete restore of one or more files or LUNs of a Snapshot copy, any file to which client I/O is not allowed is deleted.
Tries Limit

Specifies the total number of attempts to transfer data in cases where a transfer is interrupted by an error that SnapMirror can recover from. The value of this parameter must be a positive integer or unlimited.

Force

If this parameter is specified, the command proceeds without prompting for confirmation.

File List

Specifies the files or LUNs to be restored. The list can contain specifications for up to 8 files or LUNs. Specification for each file or LUN consists of a source_path and an optional destination_path, and is of the form 'source_path[,destination_path]'. source_path is required and is the path of the file from the source Snapshot copy, e.g. /dira/file1 or /lun1. The source path does not include the Snapshot name nor the source volume name. The path to each file to be restored in the active file system of the destination volume is the same as the path specified by source_path, unless an optional destination_path is specified. destination_path begins with the @ symbol followed by the path of the file from the root of the active file system of the destination volume, e.g. @/file1 or @/dira/lun1. Each source_path and destination_path is a separate entity in the list of paths. A destination_path is associated with the source_path that immediately precedes it. If this parameter is specified, -source-snapshot must also be specified. Examples:

```
/dira/file1
/dira/file1,@/dirb/file2
/dira/file1,@/dirb/file2,/dirc/file3
```

Use Network Compression

Use this optional parameter to use network compression for data transfer over the wire. This parameter is not supported for relationships with non-Data ONTAP endpoints.

Examples

The following example does an incremental restore between the restore source volume vs2.example.com:dept_eng_dp_mirror2 and the restore destination volume vs1.example.com:dept_eng:

```
vsl.example.com::> snapmirror restore
   -destination-path vs1.example.com:dept_eng
   -source-path vs2.example.com:dept_eng_dp_mirror2
   -source-snapshot snap3
Warning: All data newer than Snapshot copy snap6 on volume vsl.example.com:dept_eng will be deleted.
Do you want to continue? [y|n]: y
[Job 34] Job is queued: snapmirror restore from source vs2.example.com:dept_eng_dp_mirror2 for the snapshot snap3.
vsl.example.com::>
```

The following example restores /file3 from the source Snapshot copy snap3 on the source volume vs2.example.com:dept_eng_dp_mirror2 to the active file system of the restore destination volume vs1.example.com:dept_eng:

```
vsl.example.com::> snapmirror restore
   -destination-path vs1.example.com:dept_eng
   -source-path vs2.example.com:dept_eng_dp_mirror2
   -source-snapshot snap3
   -file-list /file3
Warning: This command will overwrite any file on destination "vsl.example.com:dept_eng" that has the same path as any of the files to be restored.
```
The following example restores /file3 from the source Snapshot copy snap3 on the source volume
vs2.example.com:dept_eng_dp_mirror2 to /file3.new in the active file system of the restore destination volume
vs1.example.com:dept_eng:

vs1.example.com::> snapmirror restore
   -destination-path vs1.example.com:dept_eng
   -source-path vs2.example.com:dept_eng_dp_mirror2
   -source-snapshot snap3
   -file-list /file3,@/file3.new
Warning: This command will overwrite any file on destination
"vs1.example.com:dept_eng" that has the same path as any of
the files to be restored.
Do you want to continue? {y|n}: y

The following example restores /file1, /file2, and /file3 from the source Snapshot copy snap3 on the source volume
vs2.example.com:dept_eng_dp_mirror2 respectively to /file1.new, /file2, and /file3.new in the active file system of
the restore destination volume vs1.example.com:dept_eng:

vs1.example.com::> snapmirror restore
   -destination-path vs1.example.com:dept_eng
   -source-path vs2.example.com:dept_eng_dp_mirror2
   -source-snapshot snap3
   -file-list /file1,@/file1.new,/file2,/file3,@/file3.new
Warning: This command will overwrite any file on destination
"vs1.example.com:dept_eng" that has the same path as any of
the files to be restored.
Do you want to continue? {y|n}: y

The following example deletes data from an incomplete file restore, captured in a Snapshot copy which was later
promoted to the active file system of a volume.

vs1.example.com::> snapmirror restore
   -destination-path vs1.example.com:dept_eng
   -file-restore-clean-up
Operation is queued: snapmirror restore with "-file-restore-clean-up"
on volume "vs1.example.com:dept_eng".
vs1.example.com::>

**snapmirror resume**

Enable future transfers

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `snapmirror resume` command enables future transfers for a SnapMirror relationship that has been quiesced.

If there is a scheduled transfer for the relationship, it will be triggered on the next schedule. If there is a restart checkpoint, it will be re-used if possible.

If applied on a load-sharing (LS) SnapMirror relationship, it enables future transfers for all the relationships in the load-sharing set.

When a quiesced SnapMirror relationship is resumed, future transfers remain enabled across reboots and fail-overs.

This command is supported for SnapMirror relationships with the field "Relationship Capability" showing as either "8.2 and above" or "Pre 8.2" in the output of the `snapmirror show` command.

The `snapmirror resume` command must be used from the destination Vserver or cluster.

The relationship must exist on the destination Vserver or cluster. When issuing `snapmirror resume`, you must specify the destination endpoint. The specification of the source endpoint of the relationship is optional.

**Parameters**

```bash
[-source-path | -S <[vserver:][volume]> | <[cluster:][vserver:][volume]> | <hostip:/lun/name> | <hostip:/share/share-name>] - Source Path
```

This parameter specifies the source endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or the volume (volume). To support relationships with "Relationship Capability" of "Pre 8.2", a format which also includes the name of the cluster (cluster) is provided. The "Pre 8.2" format cannot be used when operating in a Vserver context on relationships with "Relationship Capability" of "8.2 and above". For SnapMirror relationships with an AltaVault source, the source endpoint is specified in the form `hostip:/share/share-name`. For SnapMirror relationships with a SolidFire source, the source endpoint is specified in the form `hostip:/lun/name`.

```bash
[-source-cluster <Cluster name>] - Source Cluster
```

Specifies the source cluster of the SnapMirror relationship. If this parameter is specified, the `source-vserver` and `source-volume` parameters must also be specified. This parameter is only applicable for relationships with "Relationship Capability" of "Pre 8.2". This parameter cannot be specified when operating in a Vserver context on relationships with "Relationship Capability" of "8.2 and above".

```bash
[-source-vserver <vserver name>] - Source Vserver
```

Specifies the source Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters `source-volume` and for relationships with "Relationship Capability" of "Pre 8.2", `source-cluster` must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

```bash
[-source-volume <volume name>] - Source Volume
```

Specifies the source volume of the SnapMirror relationship. If this parameter is specified, parameters `source-vserver` and for relationships with "Relationship Capability" of "Pre 8.2", `source-cluster` must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.
This parameter specifies the destination endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or volume (volume). To support relationships with "Relationship Capability" of "Pre 8.2", a format which also includes the name of the cluster (cluster) is provided. The "Pre 8.2" format cannot be used when operating in a Vserver context on relationships with "Relationship Capability" of "8.2 and above". For SnapMirror relationships with AltaVault destinations, the destination endpoint is specified in the form `hostip:/share/share-name`. For relationships with SolidFire destinations, the destination endpoint is specified in the form `hostip:/lun/name`.

Specifies the destination cluster of the SnapMirror relationship. If this parameter is specified, parameters `-destination-vserver` and `-destination-volume` must also be specified. This parameter is only applicable for relationships with "Relationship Capability" of "Pre 8.2". This parameter cannot be specified when operating in a Vserver context on relationships with "Relationship Capability" of "8.2 and above".

Specifies the destination Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters `-destination-volume` and for relationships with "Relationship Capability" of "Pre 8.2", `-destination-cluster` must also be specified. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

Specifies the destination volume of the SnapMirror relationship. If this parameter is specified, parameters `-destination-vserver` and for relationships with "Relationship Capability" of "Pre 8.2", `-destination-cluster` must also be specified. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

**Examples**

To re-enable future transfers for the SnapMirror relationship with the destination endpoint `vs2.example.com:dept_eng_dp_mirror2` that has been previously quiesced, type the following command:

```
vs2.example.com::> snapmirror resume -destination-path
    vs2.example.com:dept_eng_dp_mirror2
```

To re-enable future transfers for the SnapMirror relationship with the destination endpoint `cluster2://vs2.example.comdept_eng_dp_mirror2` that has been previously quiesced, type the following command:

```
cluster2::> snapmirror resume -destination-path
    cluster2://vs2.example.com:dept_eng_dp_mirror2
```

To re-enable future transfers for the Vserver SnapMirror relationship with the destination endpoint `dvs1.example.com` that has been previously quiesced, type the following command:

```
cluster2::> snapmirror resume -destination-path
    dvs1.example.com
```

Under PVR control to re-enable future transfers and initiate an Auto Resync of the synchronous SnapMirror Consistency Group relationship with the destination Consistency Group `cg_dst` in Vserver `vs2.example.com`, type the following command:

snapmirror quiesce on page 620

snapmirror resync

Start a resynchronize operation

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The snapmirror resync command establishes or reestablishes a mirroring relationship between a source and a destination endpoint. The endpoints can be Vservers, volumes or non-Data ONTAP endpoints that support SnapMirror. snapmirror resync for a SnapMirror relationship with volumes as endpoints is typically executed in the following cases:

• The destination mirror is broken (that is, the destination volume is a read-write volume and no longer a data protection mirror). After the snapmirror resync command completes, the destination volume is made a data protection mirror and the mirror can be manually updated or scheduled for updates.

• snapmirror update command failed because the required common Snapshot copy was deleted on the source volume.

• The volumes are the first and third endpoints in a cascade chain of relationships and they have a common Snapshot copy. In this case, snapmirror resync might implicitly create the SnapMirror relationship between them.

Attention: The snapmirror resync command can cause data loss on the destination volume because the command can remove the exported Snapshot copy on the destination volume.

The default behavior of the snapmirror resync command for volume relationships is defined as follows:

• Finds the most recent common Snapshot copy between the source and destination volumes, removes Snapshot copies on the destination volume that are newer than the common Snapshot copy and mounts the destination volume as a DP volume with the common Snapshot copy as the exported Snapshot copy.

• For data protection (DP) relationships, takes a Snapshot copy of the source volume to capture the current image and transfers Snapshot copies that are newer than the common Snapshot copy from the source volume to the destination volume. For extended data protection (XDP) relationships, transfers Snapshot copies newer than the common Snapshot copy according to the relationship policy, i.e., Snapshot copies will match rules associated with the policy as defined by the snapmirror policy commands. For relationships associated with snapmirror policy of type async-mirror and mirror-vault the snapmirror resync first takes a Snapshot copy of the source volume and includes it in the Snapshot copies selected for transfer.

For Vserver SnapMirror relationships, a resync operation is typically executed when the relationship is broken-off, the subtype of the destination Vserver is default and the destination volumes are of type read-write. Once the command is queued, the subtype of the destination Vserver changes from default to dp-destination. A successful resync operation also makes the destination Vserver's volumes data protection volumes.

If the resync command is executed on a Vserver SnapMirror relationship, and the corresponding source and destination Vservers have volumes with volume level SnapMirror relationships, then the volume level SnapMirror relationships will be converted to volumes under the Vserver SnapMirror relationship. This conversion is supported only for source and destination Vservers which have been transitioned from a 7-Mode vFiler into a C-Mode Vserver. Some basic pre-requisites for the conversion are that the destination Vserver should be in a stopped state and all the destination Vserver volumes except the root volume should be...
in a volume level SnapMirror relationship with volumes of the source Vserver. The state of these volume level SnapMirror relationships should be **Snapmirrored** and status should be **Idle**.

The `snapmirror resync` command supports an optional parameter "`preserve`". The parameter "`preserve`" is only supported for extended data protection (XDP) relationships. It is not supported for relationships with a non-Data ONTAP endpoint. When used, the parameter "`preserve`" changes the behavior of `snapmirror resync` command. Changed behavior of the command can be described as follows:

- Finds the most recent common Snapshot copy between the source and destination volumes, preserves all Snapshot copies on the destination volume that are newer than the common Snapshot copy, and mounts the destination volume as a DP volume with the common Snapshot copy as the exported Snapshot copy.

- Performs a local rollback transfer to make a copy of the common Snapshot copy on the destination volume and establish it as the latest Snapshot copy on the destination volume. The command then transfers all Snapshot copies that are newer than the common Snapshot copy, from the source volume to the destination volume. The command only transfers Snapshot copies that match the relationship's policy, i.e., Snapshot copies will match rules associated with the policy as defined by the `snapmirror policy` commands.

If a SnapMirror relationship does not already exist, that is, the relationship was not created using the `snapmirror create` command, the `snapmirror resync` command will implicitly create the SnapMirror relationship, with the same behaviors as described for the `snapmirror create` command before resyncing it.

For Infinite Volumes and Vservers, you must create SnapMirror relationships between Infinite Volumes or Vservers by using the `snapmirror create` command before you run the `snapmirror resync` command. The `snapmirror resync` command does not implicitly create the relationship.

This command is supported for SnapMirror relationships with the field "`Relationship Capability`" showing as either "8.2 and above" or "Pre 8.2" in the output of the `snapmirror show` command.

For relationships with "`Relationship Capability`" of "8.2 and above", you can track the progress of the operation using the `snapmirror show` command.

For relationships with "`Relationship Capability`" of "Pre 8.2", a job will be spawned to operate on the SnapMirror relationship, and the job id will be shown in the command output. The progress of the job can be tracked using the `job show` and `job history show` commands.

The `snapmirror resync` command fails if the destination volume does not have a Snapshot copy in common with the source volume.

The `snapmirror resync` command does not work on load-sharing mirrors.

The `snapmirror resync` command must be used from the destination Vserver or cluster.

**Parameters**

```
[-source-path | -S {<vserver:volume>|<cluster://vserver/volume>|<hostip:/lun/name>|<hostip:/share/share-name>}] - Source Path
```

This parameter specifies the source endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or the volume (volume). To support relationships with "`Relationship Capability`" of "Pre 8.2", a format which also includes the name of the cluster (cluster) is provided. The "Pre 8.2" format cannot be used when operating in a Vserver context on relationships with "`Relationship Capability`" of "8.2 and above". For SnapMirror relationships with an AltaVault source, the source endpoint is specified in the form `hostip:/share/share-name`. For SnapMirror relationships with a SolidFire source, the source endpoint is specified in the form `hostip:/lun/name`.

```
[-source-cluster <Cluster name>] - Source Cluster
```

Specifies the source cluster of the SnapMirror relationship. If this parameter is specified, the `-source-vserver` and `-source-volume` parameters must also be specified. This parameter is only applicable for...
relationships with "Relationship Capability" of "Pre 8.2". This parameter cannot be specified when operating in a Vserver context on relationships with "Relationship Capability" of "8.2 and above".

- **source-vserver <vserver name>** - Source Vserver
  
  Specifies the source Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters -source-volume and for relationships with "Relationship Capability" of "Pre 8.2", -source-cluster must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

- **source-volume <volume name>** - Source Volume
  
  Specifies the source volume of the SnapMirror relationship. If this parameter is specified, parameters -source-vserver and for relationships with "Relationship Capability" of "Pre 8.2", -source-cluster must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

- **destination-path {<[vserver:]\[volume]\>|<[[cluster:]//vserver/\]volume>|<hostip:/lun/name>|<hostip:/share/share-name>** - Destination Path
  
  This parameter specifies the destination endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or volume (volume). To support relationships with "Relationship Capability" of "Pre 8.2", a format which also includes the name of the cluster (cluster) is provided. The "Pre 8.2" format cannot be used when operating in a Vserver context on relationships with "Relationship Capability" of "8.2 and above". For SnapMirror relationships with AltaVault destinations, the destination endpoint is specified in the form hostip:/share/share-name. For relationships with SolidFire destinations, the destination endpoint is specified in the form hostip:/lun/name.

- **destination-cluster <Cluster name>** - Destination Cluster
  
  Specifies the destination cluster of the SnapMirror relationship. If this parameter is specified, parameters -destination-vserver and -destination-volume must also be specified. This parameter is only applicable for relationships with "Relationship Capability" of "Pre 8.2". This parameter cannot be specified when operating in a Vserver context on relationships with "Relationship Capability" of "8.2 and above".

- **destination-vserver <vserver name>** - Destination Vserver
  
  Specifies the destination Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters -destination-volume and for relationships with "Relationship Capability" of "Pre 8.2", -destination-cluster must also be specified. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

- **destination-volume <volume name>** - Destination Volume
  
  Specifies the destination volume of the SnapMirror relationship. If this parameter is specified, parameters -destination-vserver and for relationships with "Relationship Capability" of "Pre 8.2", -destination-cluster must also be specified. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

- **source-snapshot \( -s \) <text>** - Source Snapshot
  
  This optional parameter specifies a Snapshot copy to transfer. The default behavior for a data protection relationship with a read-write source is that Data ONTAP creates a new Snapshot copy and uses it as the basis for determining what data are replicated; with this option, the specified Snapshot copy will be used instead. The default behavior for an extended data protection relationship depends on the relationship's policy type. For a data protection relationship, the specified Snapshot copy must be newer than the latest common Snapshot copy. For an extended data protection relationship, the specified Snapshot copy can be newer or older than the common Snapshot copy. This parameter is not supported for relationships with "Relationship Capability" of "Pre 8.2".
[\-type <snapmirrorType>] - Snapmirror Relationship Type
   Specifies the type of SnapMirror relationship if a relationship is implicitly created. This parameter is the same as the one used in the snapmirror create command.

[\-policy <sm_policy>] - SnapMirror Policy
   This optional parameter designates the name of the SnapMirror policy which is associated with the SnapMirror relationship. If you do not designate a policy, the current policy will be retained. This parameter is not applicable to relationships with "Relationship Capability" of "Pre 8.2". This parameter is not supported by this operation for Infinite Volumes.
   Note: You define and name a policy using the snapmirror policy create command.

[\-force | \-f [true]] - Force
   If this parameter is specified, the command proceeds without prompting for confirmation.

[\-throttle | \-k <throttleType>] - Throttle (KB/sec)
   This optional parameter limits the network bandwidth used for the resync transfer. It sets the maximum rate (in Kbytes/sec) at which data can be transferred during the operation. If this parameter is not specified, the throttle value configured for the relationship with the snapmirror create or snapmirror modify command will be used. To fully use the network bandwidth available, set the throttle value to unlimited or 0. The minimum throttle value is four Kbytes/sec, so if you specify a throttle value between 1 and 4, it will be treated as if you specified 4. For FlexGroup relationships, the throttle value is applied individually to each constituent relationship. The \-throttle parameter does not affect load-sharing transfers and transfers for other relationships with "Relationship Capability" of "Pre 8.2" confined to a single cluster.

[\-transfer-priority (low|normal)] - Transfer Priority
   This optional parameter specifies the priority at which the transfer runs. The default value for this parameter is the value in the SnapMirror policy associated with this relationship. This parameter is not applicable to relationships with a "Relationship Capability" of "Pre 8.2".

[\-preserve [true]] - Preserve
   This parameter is only supported for extended data protection (XDP) relationships with policies of type vault, and mirror-vault. It is not supported for relationships with a policy of type async-mirror and data protection and load-sharing relationships. This parameter is not supported for relationships with non-Data ONTAP endpoints. When specified, it changes the behavior of the snapmirror resync command to preserve Snapshot copies on the destination volume that are newer than the latest common Snapshot copy. This parameter is not supported for relationships with "Relationship Capability" of "Pre 8.2". This parameter is not supported for Infinite Volume SnapMirror relationships.

[\-quick-resync [true]] - Quick Resync
   This parameter is only supported for extended data protection (XDP) relationships. This parameter is not supported for relationships with non-Data ONTAP endpoints. Specifying this optional parameter reduces the resync time because the resync does not incur storage efficiency overhead before the transfer of new data. Specifying this parameter is recommended if the source of the resync does not have volume efficiency enabled or if reducing resync time is more important than preserving all possible storage efficiency. When this parameter is specified, resync does not preserve the storage efficiency of the new data with existing data over the wire and on the destination.

[\-is-auto-expand-enabled (true|false)] - Is Auto Expand Enabled
   This optional parameter specifies whether or not a FlexGroup SnapMirror relationship and its destination FlexGroup should be auto-expanded if the source FlexGroup is expanded. This parameter is supported only for FlexGroup SnapMirror relationships. If this resync is creating a new Snapmirror relationship, the default value is true. If it is not creating a new relationship, if a value is specified, it must match the current value for the existing relationship. If the parameter is not specified, the existing value will be retained.
[-foreground | -w [true]] - Foreground Process

This specifies whether the operation runs as a foreground process. If this parameter is specified, the default setting is true (the operation runs in the foreground). When set to true, the command will not return until the process completes. This parameter is only applicable to relationships with "Relationship Capability" of "Pre 8.2".

Examples

To reestablish mirroring for the destination endpoint vs2.example.com:dept_mkt_mirror that has been previously broken off with the snapmirror break command, type the following command:

```
vs2.example.com::> snapmirror resync -destination-path
vs2.example.com:dept_mkt_dp_mirror
```

For relationships with "Relationship Capability" of "Pre 8.2", to reestablish mirroring for the destination endpoint cluster2://vs2.example.com/dept_mkt_mirror that has been previously broken off with the snapmirror break command, type the following command:

```
cluster2::> snapmirror resync -destination-path
cluster2//vs2.example.com/dept_mkt_dp_mirror
```

To create a SnapMirror relationship and reestablish mirroring between the destination endpoint named vs2.example.com:dept_eng_dp_mirror2 and the source endpoint named vs1.example.com:dept_eng, type the following command:

```
vs2.example.com::> snapmirror resync -destination-path
vs2.example.com:dept_eng_dp_mirror2
 -source-path vs1.example.com:dept_eng
```

To create a SnapMirror relationship and reestablish mirroring between the destination endpoint named cluster2://vs2.example.com/dept_mkt_mirror and the source endpoint named cluster1://vs1.example.com/ dept_eng when the source cluster is running Data ONTAP 8.1 software, type the following command:

```
cluster2::> snapmirror resync -destination-path
cluster2//vs2.example.com/dept_mkt_dp_mirror2
 -source-path cluster1://vs1.example.com/dept_eng
```

To create and reestablish an extended data protection (XDP) relationship between the Data ONTAP source endpoint vs1.example.com:data_ontap_vol, and the non-Data ONTAP (for example, AltaVault) destination endpoint 10.0.0.11:/share/share1, and start the initial transfer, type the following command:

```
vs1.example.com::> snapmirror resync -destination-path
10.0.0.11:/share/share1
 -source-path vs1.example.com:data_ontap_vol -type XDP
```

To reestablish mirroring for the destination endpoint dvs1.example.com: of a Vserver relationship that has been previously broken off with the snapmirror break command, type the following command:

```
cluster2::> snapmirror resync -destination-path
dvs1.example.com:
```

Under PVR control to create a SnapMirror synchronous Consistency Group relationship with the following attributes:

- It is between the source Consistency Group cg_src in Vserver vs1.example.com, and the destination Consistency Group cg_dst in Vserver vs2.example.com.
- It has item mappings between lun1 and lun2 on volume srcvol and lun1 and lun2 on volume dstvol.
- It uses a policy named Sync that has a policy type of `sync-mirror` that the user has previously created.

and reestablish mirroring, type the following command:

```
vs2.example.com::> snapmirror resync -destination-path
  vs2.example.com:/cg/cg_dst -source-path
  vs1.example.com:/cg/cg_src -type XDP -policy Sync
  -cg-item-mappings /vol/srcvol/lun1:@/vol/dstvol/lun1,
  /vol/srcvol/lun2:@/vol/dstvol/lun2
```

Under PVR control to reestablish mirroring to the destination Consistency Group `cg_dst` in Vserver `vs2.example.com` that has been previously broken off with the `snapmirror break` command, type the following command:

```
vs2.example.com::> snapmirror resync -destination-path
  vs2.example.com:/cg/cg_dst
```

### `snapmirror set-options`

**Display/Set SnapMirror options**

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**

The `snapmirror set-options` command can be used to display or set snapmirror options. This command is not supported for Infinite Volume SnapMirror relationships.

**Parameters**

- `[-dp-source-xfer-reserve-pct {0|25%|50%|75%|100%}]` - Percentage Reserved for DP Source Transfers
  - Specifies the percentage of maximum allowed concurrent transfers reserved for source DP transfers
- `[-xdp-source-xfer-reserve-pct {0|25%|50%|75%|100%}]` - Percentage Reserved for XDP Source Transfers
  - Specifies the percentage of maximum allowed concurrent transfers reserved for source XDP transfers
- `[-dp-destination-xfer-reserve-pct {0|25%|50%|75%|100%}]` - Percentage Reserved for DP Destination Transfers
  - Specifies the percentage of maximum allowed concurrent transfers reserved for destination DP transfers
[-xdp-destination-xfer-reserve-pct {0%|25%|50%|75%|100%}] - Percentage Reserved for XDP Destination Transfers

Specifies the percentage of maximum allowed concurrent transfers reserved for destination XDP transfers.

**Examples**
The following example displays SnapMirror options:

```
cluster1::> snapmirror set-options
  Percentage Reserved for DP Source Transfers: 0
  Percentage Reserved for XDP Source Transfers: 0
  Percentage Reserved for DP Destination Transfers: 0
  Percentage Reserved for XDP Destination Transfers: 0
cluster1::> snapmirror set-options -dp-source-xfer-reserve-pct 25
       -xdp-source-xfer-reserve-pct 50
       -dp-destination-xfer-reserve-pct 0
       -xdp-destination-xfer-reserve-pct 50
cluster1::> snapmirror set-options
  Percentage Reserved for DP Source Transfers: 25
  Percentage Reserved for XDP Source Transfers: 50
  Percentage Reserved for DP Destination Transfers: 0
  Percentage Reserved for XDP Destination Transfers: 50
```

**snapmirror show**

Display a list of SnapMirror relationships.

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `snapmirror show` command displays information associated with SnapMirror relationships. By default, the command displays the following information:

- Source path
- Relationship Type
- Destination Path
- Mirror State
- Relationship Status
- Total Progress
- Healthy
- Progress Last Updated

For backward compatibility with clustered Data ONTAP 8.1, and to accommodate load-sharing relationships which are only supported in a Data ONTAP 8.1 compatible way, SnapMirror relationships, which match one of the following conditions are managed as on clustered Data ONTAP 8.1: (1) The relationship is of type load-sharing; (2) The source endpoint of the relationship is on a remote Data ONTAP 8.1 cluster; (3) The local cluster was upgraded from clustered Data ONTAP 8.1, the relationship was created before the upgrade, and the relationship has not yet been converted to one with Data ONTAP 8.2 capabilities. These relationships have the same limitations as on clustered Data ONTAP 8.1. Especially, they support the same set of information fields. The "Relationship Capability" field is set to "Pre 8.2" for these relationships.

The `snapmirror show` command displays information for SnapMirror relationships whose destination endpoints are in the current Vserver if you are in a Vserver context, or in the current cluster if you are in a cluster context, or on a non-Data ONTAP endpoint that supports SnapMirror (for example, AltaVault). For backward compatibility with clustered Data ONTAP 8.1, the
command also displays information for SnapMirror relationships with the "Relationship Capability" of "Pre 8.2", and whose source endpoints are in the current Vserver or cluster, and destination endpoints are in different Vservers or clusters. You must use the `snapmirror list-destinations` command to display information for SnapMirror relationships whose source endpoints are in the current Vserver or current cluster.

Some of the SnapMirror relationship information is cached. The `snapmirror show` command only returns the cached information, therefore there is a delay after the information is changed before it is reflected in the `snapmirror show` output. Other information, such as progress metrics during a transfer, is only updated periodically and can be very delayed in the `snapmirror show` output.

The `-instance` and `-fields` parameters are mutually exclusive and select the information fields that are displayed. The other parameters to the `snapmirror show` command select the SnapMirror relationships for which information is displayed. The `-instance` displays detailed information fields including:

| Source Path: Path of the source endpoint. |
| Destination Path: Path of the destination endpoint. |
| Relationship Type: Type of the SnapMirror relationship. Can be one of the following: |
| - DP: Data protection relationship. |
| - LS: Load-sharing relationship. |
| - XDP: Extended data protection relationship. |
| - RST: Temporary relationship created during a restore operation, and deleted if the operation completes successfully. |
| - TDP: 7-mode to clustered Data ONTAP transition data protection relationship. |
| Relationship Group Type: For FlexVol relationships, specifies the type of the group relationship that includes this FlexVol. For group relationships, specifies the type of the group relationship. Can be one of the following: |
| - none: No group relationship. |
| - vserver: Vserver relationship. |
| - infinitevol: Infinite Volume relationship. |
| - flexgroup: FlexGroup relationship. |
| Only for relationships with "Relationship Capability" of "8.2 and above". |
| Relationship Status: Status of the SnapMirror relationship. Can be one of the following: |
| - Idle: No transfer operation is in progress and future transfers are not disabled. |
| - Queued: A transfer operation has been accepted and queued in the system, and future transfers are not disabled. |
| - Transferring: A transfer operation is in progress and future transfers are not disabled. |
| - Preparing: Pre-transfer phase for Vault incremental transfers. For Vault relationships only. |
| - Finalizing: Post-transfer phase for Vault incremental transfers. Network traffic will be low as processing is primarily on the destination volume. For Vault relationships only. |
| - Aborting: A transfer abort operation |
that might include the removal of the checkpoint is underway. Future transfers are not disabled. Only for relationships with "Relationship Capability" of "8.2 and above".
- Quiesced: No transfer operation is in progress and future transfers are disabled.
- Quiescing: A transfer operation is in progress and future transfers are disabled.
- Checking: Destination volume is undergoing a diagnostic check, no transfer is in progress, and future transfers are not disabled. Only for relationships with "Relationship Capability" of "Pre 8.2".
- Breaking: The SnapMirror relationship is being broken off and no transfer is in progress.

Mirror State: State of the destination volume. Can be one of the following:
- Uninitialized: Destination volume has not been initialized.
- Snapmirrored: Destination volume has been initialized and is ready to receive SnapMirror updates.
- Broken-off: Destination volume is RW and snapshots are present.

Healthy: Condition of the relationship. Can be one of the following:
- true: The SnapMirror relationship is healthy. It has not missed a scheduled transfer, or experienced a manual update failure.
- false: The SnapMirror relationship is not healthy. It has missed a scheduled transfer, or has experienced a manual update failure.

Unhealthy Reason: Reason the SnapMirror relationship is not healthy. Only for relationships with "Relationship Capability" of "8.2 and above"

Newest Snapshot: Name of the newest Snapshot copy on the destination volume.
Newest Snapshot Timestamp: Timestamp of the newest Snapshot copy.
Exported Snapshot: Name of the exported Snapshot copy on the destination volume.
Exported Snapshot Timestamp: Timestamp of the exported Snapshot copy.
Lag Time: Time since the exported Snapshot copy was created. It is displayed in the format: hours:minutes:seconds. Only for relationships with "Relationship Capability" of "8.2 and above".
Transfer Type: Type of the current transfer operation. Can be one of the following:
- initialize
- update
- resync
- restore
Only for relationships with "Relationship Capability" of "8.2 and above".
Transfer Snapshot: Name of the Snapshot copy being transferred.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Snapshot Progress</td>
<td>Amount of data transferred for the transfer snapshot. This parameter is not supported for SnapMirror FlexGroup relationships, but it is supported for FlexGroup constituent relationships.</td>
</tr>
<tr>
<td>Total Progress</td>
<td>Total amount of data transferred for the current transfer operation. This parameter is not supported for SnapMirror FlexGroup relationships, but it is supported for FlexGroup constituent relationships.</td>
</tr>
<tr>
<td>Network Compression Ratio</td>
<td>The compression ratio achieved for the data sent over the wire as a part of the current transfer operation. The ratio is not maintained across checkpoint restarts. If network compression is disabled for the transfer, the ratio will be set to 1:1. Only for relationships with &quot;Relationship Capability&quot; of &quot;8.2 and above&quot;. This parameter is not supported for Vserver or FlexGroup SnapMirror relationships, but it is supported for FlexGroup constituent relationships.</td>
</tr>
<tr>

</tbody>
</table>
the previous transfer operation. If network compression was disabled for the transfer, the ratio will be set to 1:1.
Only for relationships with "Relationship Capability" of "8.2 and above".
This parameter is not supported for Vserver or FlexGroup SnapMirror relationships, but it is supported for FlexGroup constituent relationships.

Last Transfer Duration: Duration of the previous transfer operation if it was successful.
Only for relationships with "Relationship Capability" of "8.2 and above".

Last Transfer From: Source endpoint of the previous transfer operation.
Only for relationships with "Relationship Capability" of "8.2 and above".

Last Transfer End Timestamp: Timestamp of the end of the previous transfer operation.
Only for relationships with "Relationship Capability" of "8.2 and above".

Last Transfer Error: Cause of the failure of the previous transfer operation.
Only for relationships with "Relationship Capability" of "8.2 and above".

Relationship Capability: Management and control compatibility:
- "Pre 8.2": Management and control of the relationship is compatible with clustered Data ONTAP 8.1.
- "8.2 and above": Full support of clustered Data ONTAP 8.2 or later SnapMirror relationship management and control.
This parameter is not supported for Vserver SnapMirror relationships.

Relationship ID: The unique identifier of the relationship.
Only for relationships with "Relationship Capability" of "8.2 and above".
This parameter is not supported for Vserver SnapMirror relationships.

Current Operation ID: Operation unique identifier of the currently executing SnapMirror operation.
Only for relationships with "Relationship Capability" of "8.2 and above".

Throttle (KB/sec): Configured maximum transfer rate for cross-cluster transfers.

SnapMirror Policy Type: Type of the SnapMirror policy associated with the relationship. Can be one of the following:
- async-mirror
- vault
- mirror-vault

Refer to the man page for the `snapmirror policy create` command for a description of what these types mean.
Only for relationships with "Relationship Capability" of "8.2 and above".

SnapMirror Policy: Name of the SnapMirror policy associated with the relationship.
Only for relationships with...
"Relationship Capability" of "8.2 and above".

SnapMirror Schedule: Name of the schedule (empty if there is no schedule) associated with the relationship.

Tries Limit: Maximum number of times a transfer will be tried.

Constituent Relationship: Whether or not the SnapMirror relationship is between Infinite Volume constituent volumes. Can be:
- true: The relationship is between constituent volumes.
- false: The relationship is not between constituent volumes.

Destination Volume Node: Node which owns the destination volume of the relationship. For FlexGroup relationships it is the node which owns the root constituent destination volume.

Identity Preserve Vserver DR: Whether or not the identity of the source Vserver is replicated to the destination Vserver. Can be:
- true: Source Vserver's configuration will additionally be replicated to the destination, along with the Vserver's volumes and RBAC configuration.
- false: Only volumes and RBAC configuration of the source Vserver is replicated to the destination.

Volume MSIDs Preserved: Whether or not the MSIDs of the source volumes are retained while creating destination volumes. Can be:
- true: MSIDs of source Vserver volumes and destination Vserver volumes match.
- false: MSIDs of source Vserver volumes and destination Vserver volumes do not match.

Is Auto Expand Enabled: Whether or not the auto expand is enabled. Can be:
- true: Auto Expand is enabled.
- false: Auto Expand is disabled.

Number of Successful Updates: The number of successful SnapMirror update operations for the relationship.

Number of Failed Updates: The number of failed SnapMirror update operations for the relationship.
Only for relationships with "Relationship Capability" of "8.2 and above".
This parameter is not supported for Vserver SnapMirror relationships.

Number of Successful Resyncs: The number of successful SnapMirror resync operations for the relationship.
Only for relationships with "Relationship Capability" of "8.2 and above".
This parameter is not supported for Vserver SnapMirror relationships.

Number of Failed Resyncs: The number of failed SnapMirror resync operations for the relationship.
Only for relationships with "Relationship Capability" of "8.2 and above".
This parameter is not supported for Vserver SnapMirror relationships.

Number of Successful Breaks: The number of successful SnapMirror break operations for the relationship.
Only for relationships with "Relationship Capability" of "8.2 and above".
This parameter is not supported for Vserver SnapMirror relationships.

Number of Failed Breaks: The number of failed SnapMirror break operations for the relationship.
Only for relationships with "Relationship Capability" of "8.2 and above".
This parameter is not supported for Vserver SnapMirror relationships.

Total Transfer Bytes: Cumulative bytes transferred for the relationship.
Only for relationships with "Relationship Capability" of "8.2 and above".
This parameter is not supported for Vserver or FlexGroup SnapMirror relationships, but it is supported for FlexGroup constituent relationships.

Total Transfer Time: Cumulative total transfer time in seconds for the relationship.
Only for relationships with "Relationship Capability" of "8.2 and above".
This parameter is not supported for Vserver SnapMirror relationships.

Parameters

{ [-fields <fieldname>, ...] } 
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

{ [-instance ] } 
If you specify the -instance parameter, the command displays detailed information about all fields.

{ [-source-path |-S <[vserver:]<volume>]|<[cluster://vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>] } - Source Path
Select SnapMirror relationships that have a matching source path name.

{ [-source-cluster <Cluster name>] } - Source Cluster
Select SnapMirror relationships that have a matching source cluster name. This parameter is not supported for relationships with non-Data ONTAP source endpoints.
[-source-vserver <vserver name>] - Source Vserver
Select SnapMirror relationships that have a matching source Vserver name. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

[-source-volume <volume name>] - Source Volume
Select SnapMirror relationships that have a matching source volume name. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

{ [-destination-path (<[vserver:][volume]> |<([cluster://]vserver)/volume> |<hostip:/lun/ name> |<hostip:/share/share-name>>} - Destination Path
Select SnapMirror relationships that have a matching destination path name.

  Note: Using wildcards with this parameter:
  • To match all Vserver Snapmirror relationships, use: -destination-path *:
  • To match all the Snapmirror relationships except Vserver Snapmirror relationships in the cluster, use: -destination-path *

|--destination-cluster <Cluster name>] - Destination Cluster
Select SnapMirror relationships that have a matching destination cluster name. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

[-destination-vserver <vserver name>] - Destination Vserver
Select SnapMirror relationships that have a matching destination Vserver name. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

[-destination-volume <volume name>] - Destination Volume
Select SnapMirror relationships that have a matching destination volume name. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

[-type <snapmirrorType>] - Relationship Type
Select SnapMirror relationships that have a matching relationship type. Infinite Volumes and Vservers support only DP SnapMirror relationships. Possible values are:

  • DP
  • LS
  • XDP
  • TDP
  • RST

[-relationship-group-type {none|vserver|infinitevol|consistencygroup|flexgroup}] - Relationship Group Type
Select SnapMirror relationships that have a matching relationship group type. Possible values are:

  • none
  • vserver
  • infinitevol
  • flexgroup

[-vserver <vserver name>] - Managing Vserver
Select SnapMirror relationships that have a matching managing Vserver name. The -vserver option is currently a reserved option.
[\-schedule <text>] - SnapMirror Schedule
  Select SnapMirror relationships that have a matching schedule.

[\-policy-type (vault|async-mirror|mirror-vault)] - SnapMirror Policy Type
  Selects SnapMirror relationships that have a matching SnapMirror policy type. Possible values are:
  - async-mirror
  - vault
  - mirror-vault

[\-policy <sm_policy>] - SnapMirror Policy
  Select SnapMirror relationships that have a matching SnapMirror policy.

[\-tries <unsigned32_or_unlimited>] - Tries Limit
  Select SnapMirror relationships that have a matching tries limit.

[\-throttle | \-k <throttleType>] - Throttle (KB/sec)
  Select SnapMirror relationships that have a matching throttle.

[\-current-throttle <throttleType>] - Current Transfer Throttle (KB/sec)
  Select SnapMirror relationships that have a matching current throttle.

[\-state <mirror state>] - Mirror State
  Select SnapMirror relationships that have a matching mirror state. Possible values are:
  - Uninitialized
  - Snapmirrored
  - Broken-off

[\-status <mirror status>] - Relationship Status
  Select SnapMirror relationships that have a matching relationship status. Possible values are:
  - Idle
  - Queued
  - Transferring
  - Preparing
  - Finalizing
  - Aborting
  - Quiesced
  - Quiescing
  - Checking
  Status values Finalizing, Checking and Waiting are not supported for Infinite Volume SnapMirror relationships. Status values Finalizing, Checking, Waiting and Preparing are not supported for Vserver SnapMirror relationships.

[\-file-restore-file-count <integer>] - File Restore File Count
  The number of files being restored by file restore.

[\-file-restore-file-list <text>, ...] - File Restore File List
  List of the destination file names of the files being restored by file restore.
[-transfer-snapshot <text>] - Transfer Snapshot
Select SnapMirror relationships that have a matching transfer Snapshot copy.

[-snapshot-progress {<integer>[KB|MB|GB|TB|PB]}] - Snapshot Progress
Select SnapMirror relationships that have a matching Snapshot progress.

[-total-progress {<integer>[KB|MB|GB|TB|PB]}] - Total Progress
Select SnapMirror relationships that have a matching total progress.

[-network-compression-ratio <text>] - Network Compression Ratio
Select SnapMirror relationships that have a matching network compression ratio. This parameter is not supported for Vserver SnapMirror relationships.

[-snapshot-checkpoint {<integer>[KB|MB|GB|TB|PB]}] - Snapshot Checkpoint
Select SnapMirror relationships that have a matching Snapshot copy checkpoint. This parameter is not supported for Vserver SnapMirror relationships.

[-newest-snapshot <text>] - Newest Snapshot
Select SnapMirror relationships that have a matching newest Snapshot copy.

Select SnapMirror relationships that have a matching newest Snapshot copy timestamp.

[-exported-snapshot <text>] - Exported Snapshot
Select SnapMirror relationships that have a matching exported Snapshot copy name. For load-sharing mirror relationships, if the exported-snapshot field for a relationship has a dash (-), the load-sharing mirror is lagging behind the up-to-date mirrors in the set.

[-exported-snapshot-timestamp <MM/DD HH:MM:SS>] - Exported Snapshot Timestamp
Select SnapMirror relationships that have a matching exported Snapshot copy timestamp.

[-healthy {true|false}] - Healthy
Select SnapMirror relationships that have a matching healthy condition.

[-relationship-id <UUID>] - Relationship ID
Select SnapMirror relationships that have a matching relationship ID. This parameter is not supported for Vserver SnapMirror relationships.

[-current-operation-id <UUID>] - Current Operation ID
Select SnapMirror relationships that have a matching operation unique identifier of the currently executing SnapMirror operation.

[-current-transfer-type {initialize|update|resync|restore|check|file_restore|cggrs_initialize|cggrs_resync|cg_update|cg_initialize|cg_restore}] - Transfer Type
Select SnapMirror relationships that have a matching current transfer type. Transfer type Check is not supported for Infinite Volume SnapMirror relationships.

[-current-transfer-error <text>] - Transfer Error
Select SnapMirror relationships that have a matching current transfer error.

[-last-transfer-type {initialize|update|resync|restore|check|file_restore|cggrs_initialize|cggrs_resync|cg_update|cg_initialize|cg_restore}] - Last Transfer Type
Select SnapMirror relationships that have a matching last transfer type.

[-last-transfer-error <text>] - Last Transfer Error
Select SnapMirror relationships that have a matching last transfer error.

[-last-transfer-size {<integer>[KB|MB|GB|TB|PB]}] - Last Transfer Size
Select SnapMirror relationships that have a matching last transfer size.
SnapMirror relationships that have a matching last transfer network compression ratio. This parameter is not supported for Vserver SnapMirror relationships.

- **-last-transfer-duration** `[[<hours>]:<minutes>]:<seconds>]` - Last Transfer Duration
  Select SnapMirror relationships that have a matching last transfer duration.

- **-last-transfer-from** `<text>` - Last Transfer From
  Select SnapMirror relationships that have a matching last transfer source.

- **-last-transfer-end-timestamp** `<MM/DD HH:MM:SS>` - Last Transfer End Timestamp
  Select SnapMirror relationships that have a matching last transfer end timestamp.

- **-unhealthy-reason** `<text>` - Unhealthy Reason
  Select SnapMirror relationships that have a matching unhealthy reason. This option is not supported for Infinite Volume SnapMirror relationships.

- **-progress-last-updated** `<MM/DD HH:MM:SS>` - Progress Last Updated
  Select SnapMirror relationships that have a matching progress last updated.

- **-relationship-capability** `<text>` - Relationship Capability
  Select SnapMirror relationships that have a matching relationship capability. This parameter is not supported for Vserver SnapMirror relationships.

- **-lag-time** `[[<hours>]:<minutes>]:<seconds>]` - Lag Time
  Select SnapMirror relationships that have a matching lag time.

- **-current-transfer-priority** `{low|normal}` - Current Transfer Priority
  Select SnapMirror relationships that have a matching current transfer priority.

- **-is-smtape-op** `{true|false}` - SMTape Operation
  Select SnapMirror relationships that have a matching smtape operation. This option is not supported for Infinite Volume SnapMirror relationships.

- **-is-constituent** `{true|false}` - Constituent Relationship
  Select SnapMirror relationships that have a matching constituent condition.

- **-destination-volume-node** `<nodename>` - Destination Volume Node Name
  Select SnapMirror relationships that have a matching destination volume node name. This parameter is not supported for Vserver SnapMirror relationships.

- **-identity-preserve** `{true|false}` - Identity Preserve Vserver DR
  Select SnapMirror relationships that have a matching value for identity-preserve. This parameter is valid only for Vserver SnapMirror relationships.

- **-expand** `{true}` - Show Constituents of the Group
  Specifies whether to display constituent relationships of Vserver and FlexGroup SnapMirror relationships. By default, the constituents are not displayed.

- **-update-successful-count** `<integer>` - Number of Successful Updates
  Select SnapMirror relationships that have a matching number of successful updates. This parameter is not supported for Vserver SnapMirror relationships.

- **-update-failed-count** `<integer>` - Number of Failed Updates
  Select SnapMirror relationships that have a matching number of failed updates. This parameter is not supported for Vserver SnapMirror relationships.

- **-resync-successful-count** `<integer>` - Number of Successful Resyncs
  Select SnapMirror relationships that have a matching number of successful resyncs. This parameter is not supported for Vserver SnapMirror relationships.
[-resync-failed-count <integer>] - Number of Failed Resyncs
Select SnapMirror relationships that have a matching number of failed resyncs. This parameter is not supported for Vserver SnapMirror relationships.

[-break-successful-count <integer>] - Number of Successful Breaks
Select SnapMirror relationships that have a matching number of successful breaks. This parameter is not supported for Vserver SnapMirror relationships.

[-break-failed-count <integer>] - Number of Failed Breaks
Select SnapMirror relationships that have a matching number of failed breaks. This parameter is not supported for Vserver SnapMirror relationships.

[-total-transfer-bytes <integer>] - Total Transfer Bytes
Select SnapMirror relationships that have a matching total transfer bytes. This parameter is not supported for Vserver SnapMirror relationships.

[-total-transfer-time-secs <integer>] - Total Transfer Time in Seconds
Select SnapMirror relationships that have a matching total transfer time in seconds. This parameter is not supported for Vserver SnapMirror relationships.

[-msid-preserve {true|false}] - Source Volume MSIDs Preserved
This parameter specifies whether the volume MSIDs are preserved at the destination. This parameter is applicable only for Vserver SnapMirror relationships.

[-is-auto-expand-enabled {true|false}] - Is Auto Expand Enabled
Select SnapMirror relationships that have a matching value for auto expand. This parameter is supported only for FlexGroup SnapMirror relationships. Possible values are:

• true
• false

Examples
The snapmirror show command displays information associated with SnapMirror relationships. By default, the command displays the following information:
• Source path
• Relationship Type
• Destination Path
• Mirror State
• Relationship Status
• Total Progress
• Healthy
• Progress Last Updated

For backward compatibility with clustered Data ONTAP 8.1, and to accommodate load-sharing relationships which are only supported in a Data ONTAP 8.1 compatible way, SnapMirror relationships, which match one of the following conditions are managed as on clustered Data ONTAP 8.1: (1) The relationship is of type load-sharing; (2) The source endpoint of the relationship is on a remote Data ONTAP 8.1 cluster; (3) The local cluster was upgraded from clustered Data ONTAP 8.1, the relationship was created before the upgrade, and the relationship has not yet been converted to one with Data ONTAP 8.2 capabilities. These relationships have the same limitations as on clustered Data ONTAP 8.1. Especially, they support the same set of information fields. The "Relationship Capability” field is set to "Pre 8.2” for these relationships.
The `snapmirror show` command displays information for SnapMirror relationships whose destination endpoints are in the current Vserver if you are in a Vserver context, or in the current cluster if you are in a cluster context, or on a non-Data ONTAP endpoint that supports SnapMirror (for example, AltaVault). For backward compatibility with clustered Data ONTAP 8.1, the command also displays information for SnapMirror relationships with the "Relationship Capability" of "Pre 8.2", and whose source endpoints are in the current Vserver or cluster, and destination endpoints are in different Vservers or clusters. You must use the `snapmirror list-destinations` command to display information for SnapMirror relationships whose source endpoints are in the current Vserver or current cluster.

Some of the SnapMirror relationship information is cached. The `snapmirror show` command only returns the cached information, therefore there is a delay after the information is changed before it is reflected in the `snapmirror show` output. Other information, such as progress metrics during a transfer, is only updated periodically and can be very delayed in the `snapmirror show` output.

The `-instance` and `-fields` parameters are mutually exclusive and select the information fields that are displayed. The other parameters to the `snapmirror show` command select the SnapMirror relationships for which information is displayed. The `-instance` displays detailed information fields including:

```
Source Path: Path of the source endpoint.
Destination Path: Path of the destination endpoint.
Relationship Type: Type of the SnapMirror relationship. Can be one of the following:
  - DP: Data protection relationship.
  - LS: Load-sharing relationship.
  - XDP: Extended data protection relationship.
  - RST: Temporary relationship created during a restore operation, and deleted if the operation completes successfully.
  - TDP: 7-mode to clustered Data ONTAP transition data protection relationship.
Relationship Group Type: For FlexVol relationships, specifies the type of the group relationship that includes this FlexVol. For group relationships, specifies the type of the group relationship. Can be one of the following:
  - none: No group relationship.
  - vserver: Vserver relationship.
  - infinitevol: Infinite Volume relationship.
  - flexgroup: FlexGroup relationship.

Under PVR control the following group type is available:
  - consistencygroup: Consistency Group relationship.
There are no Flexvol relationships with group type of consistencygroup, only Consistency Group relationships and item-level relationships.
```

Only for relationships with "Relationship Capability" of "9.2 and above".

```
Relationship Status: Status of the SnapMirror relationship. Can be one of the following:
  - Idle: No transfer operation is in progress and future transfers are not disabled.
  - Queued: A transfer operation has been accepted and queued in the system, and future transfers are not disabled.
  - Transferring: A transfer operation is in progress and future transfers are not disabled.
  - Preparing: Pre-transfer phase for
```

The `snapmirror show` command displays detailed information fields including:
Vault incremental transfers.
For Vault relationships only.

- Finalizing: Post-transfer phase for Vault incremental transfers.
  Network traffic will be low as processing is primarily on the destination volume.
  For Vault relationships only.
- Aborting: A transfer abort operation that might include the removal of the checkpoint is underway. Future transfers are not disabled. Only for relationships with "Relationship Capability" of "8.2 and above".
- Quiesced: No transfer operation is in progress and future transfers are disabled.
- Quiescing: A transfer operation is in progress and future transfers are disabled.
- Checking: Destination volume is undergoing a diagnostic check, no transfer is in progress, and future transfers are not disabled. Only for relationships with "Relationship Capability" of "Pre 8.2".
- Breaking: The SnapMirror relationship is being broken off and no transfer is in progress.

The following values are only applicable to relationships with policy type sync-mirror under PVR control:
- OutOfSync: The SnapMirror relationship is not InSync and no async transfer operation is in progress.
- PreCutover: The SnapMirror relationship is setting up for the last transfer prior Cutover to InSync.
- Cutover: The SnapMirror relationship is transitioning to InSync.
- InSync: The SnapMirror relationship is InSync.

Mirror State: State of the destination volume. Can be one of the following:
- Uninitialized: Destination volume has not been initialized.
- Snapmirrored: Destination volume has been initialized and is ready to receive SnapMirror updates.
- Broken-off: Destination volume is RW and snapshots are present.

Healthy: Condition of the relationship. Can be one of the following:
- true: The SnapMirror relationship is healthy. It has not missed a scheduled transfer, or experienced a manual update failure.
- false: The SnapMirror relationship is not healthy. It has missed a scheduled transfer, or has experienced a manual update failure.

Unhealthy Reason: Reason the SnapMirror relationship is not healthy. Only for relationships with "Relationship Capability" of "8.2 and above"

Newest Snapshot: Name of the newest Snapshot copy on the destination volume.
Newest Snapshot Timestamp: Timestamp of the newest Snapshot copy.
Exported Snapshot: Name of the exported Snapshot copy on the destination volume.
Exported Snapshot Timestamp: Timestamp of the exported Snapshot copy.

Lag Time: Time since the exported Snapshot copy was created. It is displayed in the format: hours:minutes:seconds.

Transfer Type: Type of the current transfer operation. Can be one of the following:
- initialize
- update
- resync
- restore

Transfer Snapshot: Name of the Snapshot copy being transferred.

Snapshot Progress: Amount of data transferred for the transfer snapshot. This parameter is not supported for SnapMirror FlexGroup relationships, but it is supported for FlexGroup constituent relationships.

Total Progress: Total amount of data transferred for the current transfer operation. This parameter is not supported for SnapMirror FlexGroup relationships, but it is supported for FlexGroup constituent relationships.

Network Compression Ratio: The compression ratio achieved for the data sent over the wire as a part of the current transfer operation. The ratio is not maintained across checkpoint restarts. If network compression is disabled for the transfer, the ratio will be set to 1:1.

Snapshot Checkpoint: The amount of data transferred as recorded in the restart checkpoint of the current or most recent transfer snapshot. If a restart checkpoint is present the next transfer will continue from the checkpoint. This parameter is not supported for SnapMirror FlexGroup relationships, but it is supported for FlexGroup constituent relationships.

Transfer Error: Possible transient error condition if any, encountered by the current transfer operation.

Current Throttle: The maximum transfer rate in Kilobytes per second, used for the current transfer between clusters.

Current Transfer Priority: Priority assigned to the current transfer. Possible values are:
- low
- normal

Last Transfer Type: Type of the previous transfer operation:
- initialize
- update
- resync
- restore

Last Transfer Size: Total amount of data transferred during the previous transfer operation if it was
successful. Only for relationships with "Relationship Capability" of "8.2 and above".
This parameter is not supported for SnapMirror FlexGroup relationships, but it is supported for FlexGroup constituent relationships.

**Last Transfer Network Compression Ratio:** The compression ratio achieved for the data sent over the wire as a part of the previous transfer operation. If network compression was disabled for the transfer, the ratio will be set to 1:1.
Only for relationships with "Relationship Capability" of "8.2 and above".
This parameter is not supported for Vserver or FlexGroup SnapMirror relationships, but it is supported for FlexGroup constituent relationships.

**Last Transfer Duration:** Duration of the previous transfer operation if it was successful.
Only for relationships with "Relationship Capability" of "8.2 and above".

**Last Transfer From:** Source endpoint of the previous transfer operation.
Only for relationships with "Relationship Capability" of "8.2 and above".

**Last Transfer End Timestamp:** Timestamp of the end of the previous transfer operation.
Only for relationships with "Relationship Capability" of "8.2 and above".

**Last Transfer Error:** Cause of the failure of the previous transfer operation.
Only for relationships with "Relationship Capability" of "8.2 and above".

**Relationship Capability:** Management and control compatibility:
- "Pre 8.2": Management and control of the relationship is compatible with clustered Data ONTAP 8.1.
- "8.2 and above": Full support of clustered Data ONTAP 8.2 or later SnapMirror relationship management and control.
This parameter is not supported for Vserver SnapMirror relationships.

**Relationship ID:** The unique identifier of the relationship.
Only for relationships with "Relationship Capability" of "8.2 and above".
This parameter is not supported for Vserver SnapMirror relationships.

**Current Operation ID:** Operation unique identifier of the currently executing SnapMirror operation.
Only for relationships with "Relationship Capability" of "8.2 and above".

**Throttle (KB/sec):** Configured maximum transfer rate for cross-cluster transfers.

**SnapMirror Policy Type:** Type of the SnapMirror policy associated with the relationship. Can be one of the following:
- async-mirror
- vault
- mirror-vault

Under PVR control the following type is available:
- sync-mirror
Refer to the man page for the `snapmirror policy create` command for a description of what these types mean.

Only for relationships with "Relationship Capability" of "8.2 and above".

**SnapMirror Policy:** Name of the SnapMirror policy associated with the relationship. Only for relationships with "Relationship Capability" of "8.2 and above".

**SnapMirror Schedule:** Name of the schedule (empty if there is no schedule) associated with the relationship.

**Tries Limit:** Maximum number of times a transfer will be tried.

Only for relationships with "Relationship Capability" of "Pre 8.2". This parameter is not supported for Vserver SnapMirror relationships.

**Constituent Relationship:** Whether or not the SnapMirror relationship is between Infinite Volume constituent volumes. Can be:
- true: The relationship is between constituent volumes.
- false: The relationship is not between constituent volumes.

This parameter is not supported for FlexGroup or FlexGroup constituent SnapMirror relationships.

**Destination Volume Node:** Node which owns the destination volume of the relationship. For FlexGroup relationships it is the node which owns the root constituent destination volume. Only for relationships with "Relationship Capability" of "8.2 and above". This parameter is not supported for Vserver SnapMirror relationships.

**Identity Preserve Vserver DR:** Whether or not the identity of the source Vserver is replicated to the destination Vserver. Can be:
- true: Source Vserver's configuration will additionally be replicated to the destination, along with the Vserver's volumes and RBAC configuration.
- false: Only volumes and RBAC configuration of the source Vserver is replicated to the destination.

This parameter is supported only for Vserver SnapMirror relationships.

**Volume MSIDs Preserved:** Whether or not the MSIDs of the source volumes are retained while creating destination volumes. Can be:
- true: MSIDs of source Vserver volumes and destination Vserver volumes match.
- false: MSIDs of source Vserver volumes and destination Vserver volumes do not match.

This parameter is supported only for Vserver SnapMirror relationships.

**Is Auto Expand Enabled:** Whether or not the auto expand is enabled. Can be:
- true: Auto Expand is enabled.
- false: Auto Expand is disabled.

This parameter is supported only for FlexGroup SnapMirror relationships.

**Number of Successful Updates:** The number of successful SnapMirror update operations for the relationship. Only for relationships with "Relationship Capability" of "8.2 and above". This parameter is not supported for Vserver SnapMirror relationships.
SnapMirror relationships.

**Number of Failed Updates**: The number of failed SnapMirror update operations for the relationship.
Only for relationships with "Relationship Capability" of "8.2 and above". This parameter is not supported for Vserver SnapMirror relationships.

**Number of Successful Resyncs**: The number of successful SnapMirror resync operations for the relationship.
Only for relationships with "Relationship Capability" of "8.2 and above". This parameter is not supported for Vserver SnapMirror relationships.

**Number of Failed Resyncs**: The number of failed SnapMirror resync operations for the relationship.
Only for relationships with "Relationship Capability" of "8.2 and above". This parameter is not supported for Vserver SnapMirror relationships.

**Number of Successful Breaks**: The number of successful SnapMirror break operations for the relationship.
Only for relationships with "Relationship Capability" of "8.2 and above". This parameter is not supported for Vserver SnapMirror relationships.

**Number of Failed Breaks**: The number of failed SnapMirror break operations for the relationship.
Only for relationships with "Relationship Capability" of "8.2 and above". This parameter is not supported for Vserver SnapMirror relationships.

**Total Transfer Bytes**: Cumulative bytes transferred for the relationship.
Only for relationships with "Relationship Capability" of "8.2 and above". This parameter is not supported for Vserver or FlexGroup SnapMirror relationships, but it is supported for FlexGroup constituent relationships.

**Total Transfer Time**: Cumulative total transfer time in seconds for the relationship.
Only for relationships with "Relationship Capability" of "8.2 and above". This parameter is not supported for Vserver SnapMirror relationships.

The following fields are available only under PVR control for relationships with policy type *sync-mirror*.

**Number of Successful PCS**: The number of successful Pseudo Common Snapshot copy creation operations for the relationship. Pseudo Common Snapshot copies are created periodically for use by SnapMirror so that there is always a comparatively recent common Snapshot copy that can be used to get a relationship with policy type *sync-mirror* back InSync quickly.

**Number of Failed PCS**: The number of failed Pseudo Common Snapshot copy creation operations for the relationship.

**Average Time of Resync Operations**: Average duration in seconds of resync operations on relationships with policy type *sync-mirror*.
The following fields are available only at the diagnostic privilege level:

- **Last Transfer Error Codes**: Set of Data ONTAP internal error codes providing information on the context of the previous transfer failure. Only for relationships with "Relationship Capability" of "8.2 and above". This parameter is not supported for Vserver SnapMirror relationships.
- **Source Vserver UUID**: The unique identifier of the source Vserver. Only for relationships with "Relationship Capability" of "8.2 and above".
- **Destination Vserver UUID**: The unique identifier of the destination Vserver. Only for relationships with "Relationship Capability" of "8.2 and above".

The example below displays summary information for all SnapMirror relationships with destination endpoints in the current cluster:

```
cluster2::> snapmirror show

snapmirror show-history

Displays history of SnapMirror operations.

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The `snapmirror show-history` command displays history of the SnapMirror operations. It is not supported for FlexGroup SnapMirror relationships. This command is also not supported for relationships with non-Data ONTAP endpoints.

By default, the command displays the following information:

- Destination Path
- Source Path
- Operation
- Start Time
- End Time
- Result

The `snapmirror show-history` command displays - in reverse chronological order - the history of completed SnapMirror operations whose destination endpoints are in the current Vserver for Vserver administrators, or the current cluster for cluster administrators. This command does not return information about operations which happened prior to installing Data ONTAP 8.3. Also, it does not return information for relationships with the "Relationship Capability" field, as shown in the output of the snapmirror show command, set to "Pre 8.2".

The `-instance` parameter displays the following detailed information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Destination Path</td>
<td>Path of the destination endpoint.</td>
</tr>
<tr>
<td>Source Path</td>
<td>Path of the source endpoint.</td>
</tr>
<tr>
<td>Relationship ID</td>
<td>The unique identifier of the relationship. This parameter is not supported for Vserver SnapMirror relationships.</td>
</tr>
<tr>
<td>Relationship Group Type</td>
<td>For FlexVol relationships, specifies the type of the group relationship that includes this FlexVol. For group relationships, specifies the type of the group relationship. Can be one of the following: none: No group relationship. vserver: Vserver relationship. infinitevol: Infinite Volume relationship.</td>
</tr>
<tr>
<td>Operation</td>
<td>Type of the operation. Can be one of the following: create modify quiesce resume delete initialize manual update scheduled update</td>
</tr>
</tbody>
</table>
- break
- resync
- abort
- restore

Operation ID: The unique identifier of the operation.
Start Time: Timestamp of the start of the operation.
End Time: Timestamp of the end of the operation.
Result: Result of the SnapMirror operation.
Can be one of the following:
- success
- failure
Transfer Size: Total amount of data transferred during the SnapMirror operation.
Additional Information: A message describing the cause of the failure or additional information about a successful operation such as if a checkpoint was cleared as part of an abort operation.

Parameters

{-fields <fieldname>,...}
If you specify the -fields <fieldname>,... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

{-instance}
If you specify the -instance parameter, the command displays detailed information about all fields.

{-destination-path <[vserver:][volume]>|<[[cluster://vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name}> - Destination Path
Select SnapMirror operations that have a matching destination path name.

{-destination-vserver <vserver name> - Destination Vserver
Select SnapMirror operations that have a matching destination Vserver name.

{-destination-volume <volume name>} - Destination Volume
Select SnapMirror operations that have a matching destination volume name.

{-operation-id <UUID>} - Operation ID
Select SnapMirror operations that have a matching operation ID.

{-source-path <[vserver:][volume]>|<[[cluster://vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>} - Source Path
Select SnapMirror operations that have a matching source path name.

{-source-vserver <vserver name> - Source Vserver
Select SnapMirror operations that have a matching source Vserver name.

{-source-volume <volume name>} - Source Volume
Select SnapMirror operations that have a matching source volume name.

{-operation-type {create|modify|quiesce|resume|delete|initialize|manual-update|scheduled-update|break|resync|abort|restore}} - Operation Type
Select SnapMirror operations that have a matching operation type. Possible values are:
- create
- modify
- quiesce
- resume

[-start-time <MM/DD/YYYY HH:MM:SS>] - Start Time
Select SnapMirror operations that have a matching start time.

[-end-time <MM/DD/YYYY HH:MM:SS>] - End Time
Select SnapMirror operations that have a matching end time.

[-relationship-id <UUID>] - Relationship ID
Select SnapMirror operations that have a matching relationship ID.

[-relationship-group-type {none|vserver|infinitevol|consistencygroup|flexgroup}] - Relationship Group Type
Select SnapMirror relationships that have a matching relationship group type. Possible values are:
• none
• vserver
• infinitevol

[-result {success|failure}] - Result of the Operation
Select SnapMirror operations that have a matching result. Possible values are:
• success
• failure

[-transfer-size <integer>[KB|MB|GB|TB|PB]] - Transfer Size
Select SnapMirror operations that have a matching transfer size.

[-additional-info <text>] - Additional Information
Select SnapMirror operations that have a matching additional information.

[-max-rows-per-relationship <integer>] - Maximum Number of Rows per Relationship
Select matching number of SnapMirror operations per relationship.

[-expand [true]] - Show Constituents of the Group.
Select SnapMirror operations on relationships that are constituents and non-constituents of a group.

**Examples**
The example below displays summary information for all SnapMirror operations on relationships with destination endpoints in the current cluster:

```
cluster2::> snapmirror show-history
Destination Source                Start       End          Operation Time        Time        Result
Path        Path        Path
```

**snapmirror update**

Start an incremental transfer

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**

The `snapmirror update` command updates the destination volume or non-Data ONTAP endpoint of a SnapMirror relationship. The `snapmirror update` command behaves differently for data protection (DP), extended data protection (XDP) and load-sharing (LS) relationships. Refer to the `-type` parameter of the `snapmirror create` command to understand different types of relationships supported by SnapMirror.

The `snapmirror update` command performs an incremental transfer.

Before using this command, the relationship must be initialized using the `snapmirror initialize` or `snapmirror initialize-ls-set` commands.

For data protection SnapMirror relationships with volumes as endpoints, the `snapmirror update` command makes the destination volume an up-to-date mirror of the source volume with the following steps:

- If the source volume is read-write, takes a Snapshot copy on the source volume to capture the current image of the source volume
- Finds the most recent Snapshot copy on the destination volume and validates that the corresponding Snapshot copy is still present on the source
- Incrementally transfers Snapshot copies that are newer than the corresponding Snapshot copy to the destination volume
You can use the `snapmirror update` command to update a specific load-sharing mirror that lags behind up-to-date destination volumes in the set of load-sharing mirrors. An update to the lagging load-sharing mirror should bring it up to date with the other up-to-date destination volumes in the set of load-sharing mirrors.

**Note:** Using the `snapmirror update` command to update a set of load-sharing mirrors will not work. Use the `snapmirror update-1s-set` command to update a set of load-sharing mirrors.

For extended data protection (XDP) relationships with a `snapmirror policy` of type `async-mirror`, a `snapmirror update` always creates a new Snapshot copy on the source volume. Depending on the rules in the policy, the command might transfer just the newly created Snapshot copy or all Snapshot copies that are newer than the common Snapshot copy including the newly created Snapshot copy to the destination volume.

For extended data protection (XDP) relationships with a `snapmirror policy` of type `vault`, a `snapmirror update` does not create a new Snapshot copy on the source volume but transfers only selected Snapshot copies that are newer than the common Snapshot copy to the destination volume. (Those older than the common copy can be transferred by using the `-source-snapshot` parameter.) Snapshot copies are selected by matching the value of `-snapmirror-label` of a Snapshot copy with the value of `-snapmirror-label` of one of the rules from the corresponding SnapMirror policy associated with the SnapMirror relationship. All matching Snapshot copies are incrementally transferred to the destination volume.

For extended data protection (XDP) relationships with a `snapmirror policy` of type `mirror-vault`, a `snapmirror update` always creates a new Snapshot copy on the source volume and transfers only selected Snapshot copies that are newer than the common snapshot copy. The newly created Snapshot copy is always selected.

For extended data protection (XDP) relationships with a `snapmirror policy` of type `vault` or `mirror-vault`, the `snapmirror update` command also manages expiration of Snapshot copies on the destination volume. It does so by deleting Snapshot copies that have exceeded the value of `-keep` for the matching rule from the corresponding SnapMirror policy associated with the SnapMirror relationship. Snapshot copies that match the same `-snapmirror-label` will be deleted in oldest-first order.

For data protection relationships, the parameter `-source-snapshot` is optional and only allows for the transfer of Snapshot copies newer than the common Snapshot copy up to the specified `-source-snapshot`.

For extended data protection (XDP) relationships the parameter `-source-snapshot` is optional.

For extended data protection (XDP) relationships with a `snapmirror policy` of type `vault` or `mirror-vault`, the parameter `-source-snapshot` allows transfer of a Snapshot copy that is older than the common Snapshot copy and/or might not be selected for transfer based on policy-based selection of a scheduled update transfer.

For extended data protection (XDP) relationships with a `snapmirror policy` of type `async-mirror`, the `snapmirror update` command with parameter `-source-snapshot` does not create a new Snapshot copy on the source volume. Depending on the rules in the policy, the command might transfer just the specified Snapshot copy or Snapshot copies that are newer than the common Snapshot copy until including the specified Snapshot copy to the destination volume.

After the `snapmirror update` command successfully completes, the last Snapshot copy transferred is designated as the new exported Snapshot copy on the destination volume. If an update to an extended data protection (XDP) relationship specifies a Snapshot copy using the `-source-snapshot` parameter that is older than the common snapshot, after the `snapmirror update` successfully completes, the exported Snapshot copy on the destination volume will remain unchanged.

If the `snapmirror update` does not finish successfully--for example, due to a network failure or because a `snapmirror abort` command was issued--a restart checkpoint might be recorded on the destination volume. If a restart checkpoint is recorded, the next update restarts and continues the transfer from the restart checkpoint. For extended data protection (XDP) relationships, the next update will restart and continue the old transfer regardless of whether the Snapshot copy being transferred is a matching Snapshot copy or not.

If you add an aggregate to the source Infinite Volume, you must also add an aggregate of the same or greater size to the destination Infinite Volume before any `snapmirror update` occurs.

This command is supported for SnapMirror relationships with the field "Relationship Capability" showing as either "8.2 and above" or "Pre 8.2" in the output of the `snapmirror show` command.
For relationships with "Relationship Capability" of "8.2 and above", you can track the progress of the operation using the `snapmirror show` command.

For relationships with "Relationship Capability" of "Pre 8.2", a job will be spawned to operate on the SnapMirror relationship, and the job id will be shown in the command output. The progress of the job can be tracked using the `job show` and `job history show` commands.

For Vserver SnapMirror relationships, the `snapmirror update` command makes the destination Vserver an up-to-date mirror of the source Vserver.

The `snapmirror update` command must be used from the destination Vserver or cluster.

### Parameters

| [-source-path | -S {<vserver:/>[volume]>|<[cluster://vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>} ] - Source Path

This parameter specifies the source endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or the volume (volume). To support relationships with "Relationship Capability" of "Pre 8.2", a format which also includes the name of the cluster (cluster) is provided. The "Pre 8.2" format cannot be used when operating in a Vserver context on relationships with "Relationship Capability" of "8.2 and above". For SnapMirror relationships with an AltaVault source, the source endpoint is specified in the form `hostip:/share/share-name`. For SnapMirror relationships with a SolidFire source, the source endpoint is specified in the form `hostip:/lun/name`.

| [-source-cluster <Cluster name>] - Source Cluster

Specifies the source cluster of the SnapMirror relationship. If this parameter is specified, the `-source-vserver` and `-source-volume` parameters must also be specified. This parameter is only applicable for relationships with "Relationship Capability" of "Pre 8.2". This parameter cannot be specified when operating in a Vserver context on relationships with "Relationship Capability" of "8.2 and above".

| [-source-vserver <vserver name>] - Source Vserver

Specifies the source Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters `-source-volume` and for relationships with "Relationship Capability" of "Pre 8.2", `-source-cluster` must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

| [-source-volume <volume name>] - Source Volume

Specifies the source volume of the SnapMirror relationship. If this parameter is specified, parameters `-source-vserver` and for relationships with "Relationship Capability" of "Pre 8.2", `-source-cluster` must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

| [-destination-path {<vserver:/>[volume]>|<[cluster://vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>} ] - Destination Path

This parameter specifies the destination endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or volume (volume). To support relationships with "Relationship Capability" of "Pre 8.2", a format which also includes the name of the cluster (cluster) is provided. The "Pre 8.2" format cannot be used when operating in a Vserver context on relationships with "Relationship Capability" of "8.2 and above". For SnapMirror relationships with AltaVault destinations, the destination endpoint is specified in the form `hostip:/share/share-name`. For relationships with SolidFire destinations, the destination endpoint is specified in the form `hostip:/lun/name`.

| [-destination-cluster <Cluster name>] - Destination Cluster

Specifies the destination cluster of the SnapMirror relationship. If this parameter is specified, parameters `-destination-vserver` and `-destination-volume` must also be specified. This parameter is only applicable for relationships with "Relationship Capability" of "Pre 8.2". This parameter cannot be
specified when operating in a Vserver context on relationships with "Relationship Capability" of "8.2 and above".

**-destination-vserver <vserver name> - Destination Vserver**

Specifies the destination Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters **-destination-volume** and for relationships with "Relationship Capability" of "Pre 8.2", **-destination-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

**-destination-volume <volume name> - Destination Volume**

Specifies the destination volume of the SnapMirror relationship. If this parameter is specified, parameters **-destination-vserver** and for relationships with "Relationship Capability" of "Pre 8.2", **-destination-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

**[-source-snapshot | -s <text>] - Source Snapshot**

This optional parameter specifies a Snapshot copy to transfer. The default behavior for a data protection relationship with a read-write source is that Data ONTAP creates a new Snapshot copy and uses it as the basis for determining what data are replicated; with this option, the specified Snapshot copy will be used instead. The default behavior for an extended data protection relationship depends on the relationship’s policy type. For a data protection relationship, the specified Snapshot copy must be newer than the latest common Snapshot copy. For an extended data protection relationship, the specified Snapshot copy can be newer or older than the common Snapshot copy. This parameter is not supported for relationships with "Relationship Capability" of "Pre 8.2".

**[-throttle | -k <throttleType>] - Throttle (KB/sec)**

This optional parameter limits the network bandwidth used for the update transfer. It sets the maximum rate (in Kbytes/sec) at which data can be transferred during the operation. If this parameter is not specified, the throttle value configured for the relationship with the **snapmirror create** or **snapmirror modify** command will be used. To fully use the network bandwidth available, set the throttle value to 0. The minimum throttle value is four Kbytes/sec, so if you specify a throttle value between 1 and 4, it will be treated as if you specified 4. For FlexGroup relationships, the throttle value is applied individually to each constituent relationship. The **-throttle** parameter does not affect load-sharing transfers and transfers for other relationships with "Relationship Capability" of "Pre 8.2" confined to a single cluster.

**[-transfer-priority {low|normal}] - Transfer Priority**

This optional parameter specifies the priority at which the transfer runs. The default value for this parameter is the value in the SnapMirror policy associated with this relationship. This parameter is not applicable to relationships with a "Relationship Capability" of "Pre 8.2".

**[-enable-storage-efficiency [true]] - Enable Storage Efficient Transfers**

This is an optional parameter. For an extended data protection (XDP) relationship that is currently not storage efficient, set this parameter to true to enable storage efficient transfers. Storage efficient in this context refers to both over the wire efficiency and how the data is written to the destination volume. The transfer fails if storage efficiency cannot be achieved. If the transfer succeeds, future transfers will continue being storage efficient as long as it is still feasible, but will not fail if the transfer is not storage efficient. The default value is false. This parameter is not supported for relationships with non-Data ONTAP endpoints.

**[-foreground | -w [true]] - Foreground Process**

This specifies whether the operation runs as a foreground process. If this parameter is specified, the default setting is true (the operation runs in the foreground). When set to true, the command will not return until the process completes. This parameter is only applicable to relationships with "Relationship Capability" of "Pre 8.2".
Examples

To update the mirror relationship between the destination endpoint `vs2.example.com:dept_eng_dp_mirror3` and its source endpoint, type the following command:

```bash
vs2.example.com::> snapmirror update -destination-path vs2.example.com:dept_eng_dp_mirror3
```

For relationships with "Relationship Capability" of "Pre 8.2", to update the mirror relationship between the destination endpoint `cluster2://vs2.example.com/dept_eng_dp_mirror3` and its source endpoint, type the following command:

```bash
cluster2::> snapmirror update -destination-path cluster2://vs2.example.com/dept_eng_dp_mirror3
```

To update the Vserver SnapMirror relationship between destination endpoint `dvs1.example.com:` and its source endpoint, type the following command:

```bash
cluster2::> snapmirror update -destination-path dvs1.example.com:
```

**snapmirror update-ls-set**

Start an incremental load-sharing set transfer

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**

The `snapmirror update-ls-set` command updates a set of load-sharing mirrors. The command makes destination volumes, in the group of load-sharing mirrors, up-to-date mirrors of the source volume.

The key parameter that identifies the set of load-sharing mirrors is the source volume. SnapMirror transfers are performed from the source volume to each of the up-to-date destination volumes in the set of load-sharing mirrors.

The `snapmirror update-ls-set` command performs an incremental transfer to each of the destination volumes. During an incremental transfer, Data ONTAP takes a Snapshot copy on the source volume to capture the current image of the source volume, finds the most recent common Snapshot copy between the source and destination volumes, and incrementally transfers Snapshot copies that are newer than the common Snapshot copy to the destination volume.
**Note:** You still need to use the `snapmirror update-ls-set` command to manually update the set of load-sharing mirrors even if the set only has one destination mirror. The `snapmirror update` command can only be used to bring up to date a specific destination mirror that is lagging to the set.

After an update using the `snapmirror update-ls-set` command successfully completes, the last Snapshot copy transferred is made the new exported Snapshot copy on the destination volumes.

This command is not supported on Infinite Volume `snapmirror` relationships.

This command is only supported for SnapMirror relationships with the field "Relationship Capability" showing as "Pre 8.2" in the output of the `snapmirror show` command.

**Parameters**

```plaintext
{-source-path | -S {{vserver:}volume}|{{cluster://vserver/volume}|hostip:/lun/name}|<hostip://share/share-name> - Source Path

This parameter specifies the source endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or the volume (volume). To support relationships with "Relationship Capability" of "Pre 8.2", a format which also includes the name of the cluster (cluster) is provided. The "Pre 8.2" format cannot be used when operating in a Vserver context on relationships with "Relationship Capability" of "8.2 and above". For SnapMirror relationships with an AltaVault source, the source endpoint is specified in the form `hostip://share/share-name`. For SnapMirror relationships with a SolidFire source, the source endpoint is specified in the form `hostip://lun/name`.

| [-source-cluster <Cluster name>] - Source Cluster

Specifies the source cluster of the SnapMirror relationship. If this parameter is specified, the `-source-vserver` and `-source-volume` parameters must also be specified. This parameter is only applicable for relationships with "Relationship Capability" of "Pre 8.2". This parameter cannot be specified when operating in a Vserver context on relationships with "Relationship Capability" of "8.2 and above".

-`source-vserver <vserver name>` - Source Vserver

Specifies the source Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters `-source-volume` and for relationships with "Relationship Capability" of "Pre 8.2", `-source-cluster` must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

-`source-volume <volume name>` - Source Volume

Specifies the source volume of the SnapMirror relationship. If this parameter is specified, parameters `-source-vserver` and for relationships with "Relationship Capability" of "Pre 8.2", `-source-cluster` must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

[-foreground | -w [true]] - Foreground Process

This specifies whether the operation runs as a foreground process. If this parameter is specified, the default setting is true (the operation runs in the foreground). When set to true, the command will not return until the process completes. This parameter is only applicable to relationships with "Relationship Capability" of "Pre 8.2".
```

**Examples**

To update the group of load-sharing mirrors for the source endpoint named `//vs1.example.com/dept_eng`, type the following command:

```
cluster1::> snapmirror update-ls-set -source-path //vs1.example.com/dept_eng
```
snapmirror config-replication commands

The config-replication directory

snapmirror config-replication cluster-storage-configuration commands

The cluster-storage-configuration directory

snapmirror config-replication cluster-storage-configuration modify

Modify SnapMirror storage configuration information

**Availability:** This command is available to cluster administrators at the advanced privilege level.

**Description**
The `snapmirror config-replication cluster-storage-configuration modify` command modifies the configuration of storage used for configuration replication.

**Parameters**
- `-disallowed-aggregates <aggregate name>, ...` - Disallowed Aggregates
  
  Use this parameter to set the list of storage aggregates that are not available to host storage for configuration replication.

**Examples**
The following example disallows two aggregates named `aggr1` and `aggr2`:

```
cluster1::*> snapmirror config-replication cluster-storage-configuration modify -disallowed-aggregates aggr1,aggr2
```

- `snapmirror config-replication cluster-storage-configuration show` on page 672

snapmirror config-replication cluster-storage-configuration show

Display SnapMirror storage configuration information

**Availability:** This command is available to cluster administrators at the advanced privilege level.

**Description**
The `snapmirror config-replication cluster-storage-configuration show` command shows details of the configuration of the storage used for configuration replication.

The information displayed is the following:

- Disallowed Aggregates - The list of storage aggregates that are configured as not allowed to host storage areas.
- Auto-Repair - Displays `true` if the automatic repair of storage areas used by configuration replication is enabled.
- Auto-Recreate - Displays `true` if the automatic recreation of storage volumes used by configuration replication is enabled.
• Use Mirrored Aggregate - Displays true if storage areas for configuration replication are to be hosted on a mirrored aggregate.

**Examples**
The following is an example of the snapmirror config-replication cluster-storage-configuration show command:

```
cluster1:*> snapmirror config-replication cluster-storage-configuration show
  Disallowed Aggregates: -
  Auto-Repair: true
  Auto-Recreate: true
  Use Mirrored Aggregate: true
```

### snapmirror config-replication status commands
SnapMirror configuration replication status information

#### snapmirror config-replication status show
Display SnapMirror configuration replication status information

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**
The `snapmirror config-replication status show` command displays the current SnapMirror configuration replication status.

The command displays the following aspects of SnapMirror configuration replication:

- **Enabled:** Verifies that SnapMirror configuration replication is enabled on the cluster.
- **Running:** Verifies that SnapMirror configuration replication is running on the cluster.
- **Storage Status:** Verifies that SnapMirror configuration replication storage is healthy.
- **Storage In Use:** Prints the location of SnapMirror configuration replication storage.
- **Storage Remarks:** Prints the underlying root cause for non-healthy SnapMirror configuration storage.
- **Vserver Streams:** Verifies that SnapMirror configuration replication Vserver streams are healthy.

Additional information about the warnings (if any) and recovery steps can be viewed by running the command with the `-instance` option.

**Parameters**

`[-instance ]`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**Examples**
The following example shows the execution of the command:
snapmirror config-replication status show-aggregate-eligibility

Display the SnapMirror configuration replication aggregate eligibility

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The `snapmirror config-replication status show-aggregate-eligibility` command displays the SnapMirror configuration replication aggregate eligibility.

Parameters

<table>
<thead>
<tr>
<th>[-fields &lt;fieldname&gt;, ...]</th>
</tr>
</thead>
</table>
| If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

<table>
<thead>
<tr>
<th>[-instance ]</th>
</tr>
</thead>
</table>
| If you specify the `-instance` parameter, the command displays detailed information about all fields.

<table>
<thead>
<tr>
<th>[-aggregate &lt;aggregate name&gt;] - Aggregate</th>
</tr>
</thead>
</table>
| Display only rows that have a matching aggregate name.

<table>
<thead>
<tr>
<th>[-hosted-configuration-replication-volumes &lt;volume name&gt;, ...] - Currently Hosted Configuration Replication Volumes</th>
</tr>
</thead>
</table>
| Display only rows that have matching configuration replication volumes hosted on this aggregate.

| [-is-eligible-to-host-additional-volumes {true|false}] - Eligibility to Host Another Configuration Replication Volume |
|------------------------------------------------------------------------------------------------------------------|
| Display only rows that have a matching eligibility of the aggregate to host additional configuration replication volumes.

<table>
<thead>
<tr>
<th>[-comment &lt;text&gt;] - Comment for Eligibility Status</th>
</tr>
</thead>
</table>
| Display only rows that have a matching comment regarding the eligibility of the aggregate to host configuration replication volumes.

Examples
The following example shows the execution of the command in a SnapMirror configuration with thirteen aggregates in the cluster:

```
c1us1::*> snapmirror config-replication status show
    Enabled: true
    Running: true
    Storage Status: ok
    Storage In Use: Cluster-wide Volume: MDV_CRS_3d47e9106b7d11e4a77b000c29f810a2_A
    Storage Remarks: -
    Vserver Streams: ok
```

```
clusA::snapmirror config-replication status show-aggregate-eligibility

<table>

snapmirror config-replication status show on page 673

snapmirror config-replication status show-communication

Display SnapMirror configuration replication communication status information

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The `snapmirror config-replication status show-communication` command displays the current SnapMirror configuration replication communication status.

The command displays the following aspects of SnapMirror configuration replication for each peer cluster:

- Remote Heartbeat: Verifies that the SnapMirror configuration replication heartbeat with the remote cluster is healthy.
- Last Heartbeat Sent: Prints the timestamp of the last SnapMirror configuration replication heartbeat sent to the remote cluster.
- Last Heartbeat Received: Prints the timestamp of the last SnapMirror configuration replication heartbeat received from the remote cluster.

Additional information about the warnings (if any) and recovery steps can be viewed by running the command with the -instance option.

Parameters

`[-fields <fieldname>, ...]`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

`[-instance]`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-cluster-uuid <UUID>] - Remote Cluster`

Display only rows that have a matching peer cluster UUID.

`[-cluster <text>] - Peer Cluster Name`

Display only rows that have matching peer cluster name.

`[-remote-heartbeat {ok|warning|not-run|not-applicable}] - Remote Heartbeat`

Display only rows that have a matching remote heartbeat status.

`[-last-heartbeat-sent <MM/DD/YYYY HH:MM:SS>] - Last Heartbeat Sent Time`

Display only rows that have a matching timestamp of the last heartbeat sent.
Examples

The following example shows the execution of the command in a SnapMirror configuration with two peer clusters:

```
clus1::*> snapmirror config-replication status show-communication
  Peer Cluster: clus2
  Remote Heartbeat: ok
  Last Heartbeat Sent: 11/11/2014 11:11:45
  Last Heartbeat Received: 11/11/2014 11:11:46

  Peer Cluster: clus3
  Remote Heartbeat: ok
  Last Heartbeat Sent: 11/11/2014 11:11:26
  Last Heartbeat Received: 11/11/2014 11:11:27
```

2 entries were displayed.

snapmirror config-replication status show on page 673

snapmirror policy commands

Manage SnapMirror policies

The `snapmirror policy` command enables you to manage SnapMirror policies.

**snapmirror policy add-rule**

Add a new rule to SnapMirror policy

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**

The `snapmirror policy add-rule` command adds a rule to a SnapMirror policy. Rules define which Snapshot copies are protected by vault relationships or define the schedule at which Snapshot copies are created on the SnapMirror destination. Rules which do not include a schedule are rules for protecting Snapshot copies. Rules which include a schedule are rules for creating Snapshot copies on the SnapMirror destination. A rule with a schedule can only be added to SnapMirror policies of type `vault` or `mirror-vault`. A rule must not be added to a policy that will be associated with a SnapMirror data protection relationship. A policy that will be associated with a SnapMirror vault relationship must have at least one rule and at most ten rules. A SnapMirror policy with rules must have at least one rule without a schedule.

**Parameters**

- `--vserver <vserver name>` - Vserver Name
  
  Specifies the Vserver for the SnapMirror policy.

- `--policy <sm_policy>` - SnapMirror Policy Name
  
  Specifies the SnapMirror policy name.

- `--snapmirror-label <text>` - Snapshot Copy Label
  
  This parameter is primarily used for the purpose of Snapshot copy selection for extended data protection (XDP) relationships. Only Snapshot copies that have a SnapMirror label that matches this parameter will be
transferred to the SnapMirror destination. However, when this parameter is associated with a rule containing a schedule, Snapshot copies will be created on the SnapMirror destination using this snapmirror-label parameter. The label can be 31 or fewer characters in length. SnapMirror policies of type async-mirror and mirror-vault have a rule added for label sm_created at the time of policy creation. This rule cannot be removed or modified by the user. This rule when coupled with create-snapshot field set to true indicates that the SnapMirror relationship using this policy shall create a new Snapshot copy and transfer it as part of a snapmirror update operation. SnapMirror policies of type async-mirror support one additional rule with SnapMirror label all_source_snapshots. This rule along with the rule for SnapMirror label sm_created indicates that all new Snapshot copies on the primary volume along with the newly created Snapshot copy are transferred as part of a snapmirror update or snapmirror initialize operation. Rules with any other SnapMirror labels cannot be added to SnapMirror policies of type async-mirror. The rule for label sm_created when added to a snapmirror policy of type vault indicates that all SnapMirror created Snapshot copies of the primary volume are selected for transfer.

-keep <text> - Snapshot Copy Retention Count

Specifies the maximum number of Snapshot copies that are retained on the SnapMirror destination volume for a rule. The total number of Snapshot copies retained for all the rules in a policy cannot exceed 251. For all the rules in SnapMirror policies of type async-mirror, this parameter must be set to value 1.

[-preserve {true|false}] - Snapshot Copy Preserve Enabled

Specifies the behavior when the Snapshot copy retention count is reached on the SnapMirror vault destination for the rule. The default value is false, which means that the oldest Snapshot copy will be deleted to make room for new ones only if the number of Snapshot copies has exceeded the retention count specified in the "keep" parameter. When set to true, and when the Snapshot copies have reached the retention count, then an incremental SnapMirror vault update transfer will fail or if the rule has a schedule, Snapshot copies will no longer be created on the SnapMirror destination. For all the rules in SnapMirror policies of type async-mirror this parameter must be set to value false.

[-warn <integer>] - Warning Threshold Count

Specifies the warning threshold count for the rule. The default value is 0. When set to a value greater than zero, an event is generated after the number of Snapshot copies (for the particular rule) retained on a SnapMirror vault destination reaches the specified warn limit. The preserve parameter for the rule must be true to set the warn parameter to a value greater than zero.

[-schedule <text>] - Snapshot Copy Creation Schedule

This optional parameter specifies the name of the schedule associated with a rule. This parameter is allowed only for rules associated with SnapMirror policies of type vault or mirror-vault. When this parameter is specified, Snapshot copies are directly created on the SnapMirror destination. The Snapshot copies created will have the same content as the latest Snapshot copy already present on the SnapMirror destination. Snapshot copies on the source that have a SnapMirror label matching this rule will not be selected for transfer. The default value is -.

Note: You define and name a schedule using the job schedule cron create command.

[-prefix <text>] - Snapshot Copy Creation Prefix

This optional parameter specifies the prefix for the Snapshot copy name to be created as per the schedule. If no value is specified, then the snapmirror-label will be used as the prefix. The prefix parameter can only be specified for rules which have a schedule.

Examples

The following example adds a rule named nightly to the SnapMirror policy named TieredBackup on Vserver vs0.example.com. The rule will retain a maximum of 5 nightly Snapshot copies.

```
vs0.example.com::> snapmirror policy add-rule -vserver vs0.example.com -policy TieredBackup -snapmirror-label nightly -keep 5
```
The following example adds a rule named *SyncProtectMe* to the SnapMirror policy named *Sync* on Vserver *vs0.example.com*. The rule will retain the same *SyncProtectMe* snapshots on the destination as are present on the source when the relationship is InSync.

```bash
vs0.example.com::> snapmirror policy add-rule -vserver vs0.example.com -policy Sync -snapmirror-label SyncProtectMe -keep 1
```

- `job schedule cron create` on page 177

### snapmirror policy create

Create a new SnapMirror policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The `snapmirror policy create` command creates a SnapMirror policy. When applied to a SnapMirror relationship, the SnapMirror policy controls the behavior of the relationship and specifies the configuration attributes for that relationship. The policies *DPDefault*, *MirrorAllSnapshots*, *MirrorAndVault*, *MirrorLatest*, *Unified7year* and *XDPDefault* are created by the system.

**Note:** All SnapMirror policies have a field `create-snapshot`. This field specifies whether SnapMirror creates a new Snapshot copy on the primary volume at the beginning of a `snapmirror update` or `snapmirror resync` operation. Currently this field cannot be set or modified by the user. It is set to `true` for SnapMirror policies of type *async-mirror* and *mirror-vault* at the time of creation. SnapMirror policies of type *vault* have `create-snapshot` set to `false` at the time of creation.

**Note:** Use the `snapmirror policy add-rule` command to add a rule to a policy.

**Parameters**

- `-vserver <vserver name>` - Vserver Name
  
  Specifies the Vserver for the SnapMirror policy.

- `-policy <sm_policy>` - SnapMirror Policy Name
  
  This parameter specifies the SnapMirror policy name. A policy name can be made up of the characters A to Z, a to z, 0 to 9, ".", "-", and "_". The name can be up to 256 characters in length.

- `[ -type {vault|async-mirror|mirror-vault}]` - Snapmirror Policy Type
  
  This parameter specifies the SnapMirror policy type. The supported values are `async-mirror`, `vault` and `mirror-vault`. Data protection (DP) relationships support only `async-mirror` policy type, while extended data protection (XDP) relationships support all three policy types.

If the type is set to *async-mirror* then the policy is for Disaster Recovery. When the policy type is associated with extended data protection (XDP) relationships, `snapmirror update` and `snapmirror resync` operations transfer selected Snapshot copies from the primary volume to the secondary volume. The selection of Snapshot copies is governed by the rules in the policy. However `snapmirror initialize` and `snapmirror update` operations on data protection (DP) relationships ignore the rules in the policy and transfer all Snapshot copies of the primary volume which are newer than the common Snapshot copy on the destination. For both data protection (DP) and extended data protection (XDP) relationships, the Snapshot
copies are kept on the secondary volume as long as they exist on the primary volume. Once a protected Snapshot copy is deleted from the primary volume, it is deleted from the secondary volume as part of the next transfer. The policy type supports rules with certain pre-defined label names only. Refer to the man page for the snapmirror policy add-rule command for the details.

If the type is set to vault then the policy is used for Backup and Archive. The rules in this policy type determine which Snapshot copies are protected and how long they are retained on the secondary volume. This policy type is supported by extended data protection (XDP) relationships only.

If the type is set to mirror-vault then the policy is used for unified data protection which provides both Disaster Recovery and Backup using the same secondary volume. This policy type is supported by extended data protection (XDP) relationships only.

[-comment <text>] - Comment
Specifies a text comment for the SnapMirror policy. If the comment contains spaces, it must be enclosed within quotes.

[-tries <unsigned32_or_unlimited>] - Tries Limit
Determines the maximum number of times to attempt each manual or scheduled transfer for a SnapMirror relationship. The value of this parameter must be a positive integer or unlimited. The default value is 8.

[-transfer-priority {low|normal}] - Transfer Scheduling Priority
Specifies the priority at which a transfer runs. The supported values are normal or low. The normal transfers are scheduled before the low priority transfers. The default is normal.

[-ignore-atime {true|false}] - Ignore File Access Time
This parameter applies only to extended data protection (XDP) relationships. It specifies whether incremental transfers will ignore files which have only their access time changed. The supported values are true or false. The default is false.

[-restart {always|never|default}] - Restart Behavior
This parameter applies only to data protection relationships. It defines the behavior of SnapMirror if an interrupted transfer exists. The supported values are always, never, or default. If the value is set to always, an interrupted SnapMirror transfer always restarts provided it has a restart checkpoint and the conditions are the same as they were before the transfer was interrupted. In addition, a new SnapMirror Snapshot copy is created which will then be transferred. If the value is set to never, an interrupted SnapMirror transfer will never restart, even if a restart checkpoint exists. A new SnapMirror Snapshot copy will still be created and transferred. Data ONTAP version 8.2 will interpret a value of default as being the same as always. Vault transfers will always resume based on a restart checkpoint, provided the Snapshot copy still exists on the source volume.

[-is-network-compression-enabled {true|false}] - Is Network Compression Enabled
Specifies whether network compression is enabled for transfers. The supported values are true or false. The default is false.

[-discard-configs <network>, ...] - Configurations Not Replicated During Identity Preserve Vserver DR
Specifies the configuration to be dropped during replication. The supported values are:

* network - Drops network interfaces, routes, and kerberos configuration.

This parameter is supported only for policies of type async-mirror and applicable only for identity-preserve Vserver SnapMirror relationships.

Examples
The following example creates a SnapMirror policy named TieredBackup on a Vserver named vs0.example.com.

vs0.example.com:~> snapmirror policy create -vserver vs0.example.com -policy TieredBackup -type vault -tries 10 -restart never
The following example executed under PVR control creates a SnapMirror policy named `Sync` on a Vserver named `vs0.example.com` with `-always-replicate_snapshots` set to `true` to be used for a relationship between items in Consistency Groups.

```bash
vs0.example.com::> snapmirror policy create -vserver vs0.example.com -policy Sync -type sync-mirror -always-replicate-snapshots true
```

### snapmirror policy delete

Delete a SnapMirror policy

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `snapmirror policy delete` command deletes a SnapMirror policy. A policy that is to be deleted must not be associated with any SnapMirror relationship. The built-in policies cannot be deleted.

**Parameters**

- `-vserver <vserver name>` - Vserver Name
  Specifies the Vserver for the SnapMirror policy.

- `-policy <sm_policy>` - SnapMirror Policy Name
  Specifies the SnapMirror policy name.

**Examples**
The following example deletes a SnapMirror policy named `TieredBackup` on Vserver `vs0.example.com`:

```bash
vs0.example.com::> snapmirror policy delete -vserver vs0.example.com -policy TieredBackup
```

### snapmirror policy modify

Modify a SnapMirror policy

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `snapmirror policy modify` command can be used to modify the policy attributes.

**Note:** Use the `snapmirror policy modify-rule` command to modify a rule in a SnapMirror policy.
Parameters
-vserver <vserver name> - Vserver Name
   Specifies the Vserver for the SnapMirror policy.

-policy <sm_policy> - SnapMirror Policy Name
   Specifies the SnapMirror policy name.

-[comment <text>] - Comment
   Specifies a text comment for the SnapMirror policy. If the comment contains spaces, it must be enclosed
   within quotes.

-[tries <unsigned32_or_unlimited>] - Tries Limit
   Determines the maximum number of times to attempt each manual or scheduled transfer for a SnapMirror
   relationship. The value of this parameter must be a positive integer or unlimited. The default value is 8.

-[transfer-priority (low|normal)] - Transfer Scheduling Priority
   Specifies the priority at which a transfer runs. The supported values are normal or low. The normal transfers
   are scheduled before the low priority transfers. The default is normal.

-[ignore-atime {true|false}] - Ignore File Access Time
   This parameter applies only to extended data protection (XDP) relationships. It specifies whether incremental
   transfers will ignore files which have only their access time changed. The supported values are true or
   false. The default is false.

-[restart {always|never|default}] - Restart Behavior
   This parameter applies only to data protection relationships. It defines the behavior of SnapMirror if an
   interrupted transfer exists. The supported values are always, never, or default. If the value is set to
   always, an interrupted SnapMirror transfer always restarts provided it has a restart checkpoint and the
   conditions are the same as they were before the transfer was interrupted. In addition, a new SnapMirror
   Snapshot copy is created which will then be transferred. If the value is set to never, an interrupted
   SnapMirror transfer will never restart, even if a restart checkpoint exists. A new SnapMirror Snapshot copy
   will still be created and transferred. Data ONTAP version 8.2 will interpret a value of default as being the
   same as always. Vault transfers will always resume based on a restart checkpoint, provided the Snapshot copy
   still exists on the source volume.

-[is-network-compression-enabled {true|false}] - Is Network Compression Enabled
   Specifies whether network compression is enabled for transfers. The supported values are true or false. The
   default is false.

-[discard-configs <network>, ...] - Configurations Not Replicated During Identity Preserve Vserver DR
   Specifies the configuration to be dropped during replication. The supported values are:
   • network - Drops network interfaces, routes, and kerberos configuration.

   This parameter is supported only for policies of type async-mirror and applicable only for identity-preserve
   Vserver SnapMirror relationships.

Examples
The following example changes the "transfer-priority" and the "comment" text of a snapmirror policy named
TieredBackup on Vserver vs0.example.com:

vs0.example.com::> snapmirror policy modify -vserver vs0.example.com -policy TieredBackup -
transfer-priority low -comment "Use for tiered backups"

   snapmirror update on page 666
snapmirror policy modify-rule

Modify an existing rule in SnapMirror policy

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The snapmirror policy modify-rule command can be used to modify the retention count, preserve setting, warning threshold count, schedule, and prefix for a rule in a SnapMirror policy. Reducing the retention count or disabling the preserve setting for a rule in a SnapMirror policy might result in the deletion of Snapshot copies on the vault destination when the next transfer by the snapmirror update command occurs or when the next scheduled Snapshot copy creation on the destination for the rule occurs. Modifying a rule to add a schedule will enable creation of Snapshot copies on the SnapMirror destination. Snapshot copies on the source that have a SnapMirror label matching this rule will not be selected for transfer. Schedule and prefix can only be modified for rules associated with SnapMirror policies of type vault or mirror-vault. A SnapMirror policy with rules must have at least one rule without a schedule.

Note: The rules in SnapMirror policies of type async-mirror cannot be modified.

Parameters
-vserver <vserver name> - Vserver Name
Specifies the Vserver for the SnapMirror policy.

-policy <sm_policy> - SnapMirror Policy Name
Specifies the SnapMirror policy name.

-snapmirror-label <text> - Snapshot Copy Label
This parameter specifies the rule that is to be modified in a SnapMirror policy.

[keep <text>] - Snapshot Copy Retention Count
Specifies the maximum number of Snapshot copies that are retained on the SnapMirror destination volume for a rule. The total number of Snapshot copies retained for all the rules in a policy cannot exceed 251. For all the rules in SnapMirror policies of type async-mirror, this parameter must be set to value 1.

[preserve {true|false}] - Snapshot Copy Preserve Enabled
Specifies the behavior when the Snapshot copy retention count is reached on the SnapMirror vault destination for the rule. The default value is false, which means that the oldest Snapshot copy will be deleted to make room for new ones only if the number of Snapshot copies has exceeded the retention count specified in the “keep” parameter. When set to true, and when the Snapshot copies have reached the retention count, then an incremental SnapMirror vault update transfer will fail or if the rule has a schedule, Snapshot copies will no longer be created on the SnapMirror destination. For all the rules in SnapMirror policies of type async-mirror this parameter must be set to value false.

[warn <integer>] - Warning Threshold Count
Specifies the warning threshold count for the rule. The default value is 0. When set to a value greater than zero, an event is generated after the number of Snapshot copies (for the particular rule) retained on a SnapMirror vault destination reaches the specified warn limit. The preserve parameter for the rule must be true to set the warn parameter to a value greater than zero.

[schedule <text>] - Snapshot Copy Creation Schedule
This optional parameter specifies the name of the schedule associated with a rule. This parameter is allowed only for rules associated with SnapMirror policies of type vault or mirror-vault. When this parameter is
specified, Snapshot copies are directly created on the SnapMirror destination. The Snapshot copies created will have the same content as the latest Snapshot copy already present on the SnapMirror destination. Snapshot copies on the source that have a SnapMirror label matching this rule will not be selected for transfer. The default value is `-.

Note: You define and name a schedule using the job schedule cron create command.

```
[prefix <text>] - Snapshot Copy Creation Prefix
```

This optional parameter specifies the prefix for the Snapshot copy name to be created as per the schedule. If no value is specified, then the snapmirror-label will be used as the prefix. The prefix parameter can only be specified for rules which have a schedule.

**Examples**

The following example changes the retention count for nightly Snapshot copies to 6 for a rule named nightly on a SnapMirror policy named TieredBackup on Vserver vs0.example.com:

```
vs0.example.com::> snapmirror policy modify-rule -vserver vs0.example.com
   -policy TieredBackup -snapmirror-label nightly -keep 6
```

### snapmirror policy remove-rule

Remove a rule from SnapMirror policy

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The snapmirror policy remove-rule command removes a rule from a SnapMirror policy. On the destination of a SnapMirror relationship with snapmirror policy of type vault or mirror-vault, all Snapshot copies with a SnapMirror label matching the rule being removed are no longer processed by SnapMirror and might need to be deleted manually. A snapmirror policy of type vault must have at least one rule if that policy is associated with a SnapMirror relationship. A SnapMirror policy with rules must have at least one rule without a schedule.

**Parameters**

- `-vserver <vserver name>` - Vserver Name
  
  Specifies the Vserver for the SnapMirror policy.

- `-policy <sm_policy>` - SnapMirror Policy Name
  
  Specifies the SnapMirror policy name.

- `-snapmirror-label <text>` - Snapshot Copy Label
  
  This parameter specifies the rule that is removed from the SnapMirror policy.

  The rule for SnapMirror label sm_created cannot be removed from SnapMirror policies of type async-mirror or mirror-vault.

**Examples**

The following example removes a rule named nightly from a SnapMirror policy named TieredBackup on Vserver vs0.example.com:

```
```

snapmirror policy on page 676

snapmirror policy show

Show SnapMirror policies

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The snapmirror policy show command displays the following information about SnapMirror policies:

- Vserver Name
- SnapMirror Policy Name
- SnapMirror Policy Type
- Number of Rules in the policy
- Tries
- Transfer Priority
- Comment for the policy
- Individual Rule Names
- Keep value for the Rule
- Total of Keep values across all Rules in the policy

Parameters

[-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver Name

Selects the policies that match this parameter value.

[-policy <sm_policy>] - SnapMirror Policy Name

Selects the policies that match this parameter value.

[-type {vault|async-mirror|mirror-vault}] - Snapmirror Policy Type

Selects the policies that match this parameter value. A policy can be of type async-mirror, vault or mirror-vault.

[-owner {cluster-admin|vserver-admin}] - Owner of the Policy

Selects the policies that match this parameter value. A policy can be owned by either the "Cluster Admin" or a "Vserver Admin".
[--comment <text>] - Comment
Selects the policies that match this parameter value.

[--tries <unsigned32_or_unlimited>] - Tries Limit
Selects the policies that match this parameter value.

[--transfer-priority {low|normal}] - Transfer Scheduling Priority
Selects the policies that match this parameter value.

[--ignore-atime {true|false}] - Ignore File Access Time
Selects the policies that match this parameter value.

[--restart {always|never|default}] - Restart Behavior
Selects the policies that match this parameter value.

[--is-network-compression-enabled {true|false}] - Is Network Compression Enabled
Selects the policies that match this parameter value.

[--create-snapshot {true|false}] - Create a New Snapshot Copy
Selects the policies that match this parameter value.

[--snapmirror-label <text>, ...] - Snapshot Copy Label
Selects the policies that match this parameter value.

[--keep <text>, ...] - Snapshot Copy Retention Count
Selects the policies that match this parameter value.

[--preserve {true|false}, ...] - Snapshot Copy Preserve Enabled
Selects the policies that match this parameter value.

[--warn <integer>, ...] - Warning Threshold Count
Selects the policies that match this parameter value.

[--schedule <text>, ...] - Snapshot Copy Creation Schedule
Selects the policies that match this parameter value.

[--prefix <text>, ...] - Snapshot Copy Creation Prefix
Selects the policies that match this parameter value.

[--total-rules <integer>] - Total Rules in the Policy
Selects the policies that match this parameter value.

[--total-keep <integer>] - Total Retention Count for All Rules in the Policy
Selects the policies that match this parameter value.

[--discard-configs <network>, ...] - Configurations Not Replicated During Identity Preserve Vserver DR
Selects the policies that match this parameter value.

### Examples

The following example displays information about all SnapMirror policies:

```bash
cs::> snapmirror policy show
Vserver Policy Policy Number Transfer
Name Name Type Of Rules Tries Priority Comment
------- ------------------ ------ -------- ----- -------- ----------

cs   DPDefault async-mirror 2 8 normal Asynchronous SnapMirror policy for mirroring all Snapshot copies and the latest active file system.
      SnapMirror Label: sm_created
      Keep: 1
      all_source_snapshots
      Keep: 1
      Total Keep: 2

      MirrorAllSnapshots async-mirror 2 8 normal Asynchronous SnapMirror policy for mirroring all Snapshot copies and the latest active file system.
```
The following example shows all the policies with the following fields - vserver (default), policy (default) and transfer-priority:

cs::> snapmirror policy show -fields transfer-priority
<table>
<thead>
<tr>
<th>vserver</th>
<th>policy</th>
<th>transfer-priority</th>
</tr>
</thead>
<tbody>
<tr>
<td>cs</td>
<td>DPDefault</td>
<td>normal</td>
</tr>
<tr>

<td>MirrorAllSnapshots</td>
<td>normal</td>
</tr>
<tr>
<td>cs</td>
<td>MirrorAndVault</td>
<td>normal</td>
</tr>
<tr>
<td>cs</td>
<td>MirrorLatest</td>
<td>normal</td>
</tr>
<tr>
<td>vs0.example.com</td>
<td>TieredBackup</td>
<td>normal</td>
</tr>
<tr>
<td>cs</td>
<td>Unified7year</td>
<td>normal</td>
</tr>
<tr>
<td>cs</td>
<td>XDPDefault</td>
<td>normal</td>
</tr>
</tbody>
</table>

7 entries were displayed.

**snapmirror snapshot-owner commands**

Manage Snapshot Copy Preservation

The `snapmirror snapshot-owner` command enables management of user-created owners for a Snapshot copy.

**snapmirror snapshot-owner create**

Add an owner to preserve a Snapshot copy for a SnapMirror mirror-to-vault cascade configuration

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.
Description
The `snapmirror snapshot-owner create` command adds an owner on the specified Snapshot copy. A Snapshot copy can have at most one owner. An owner can only be added to a Snapshot copy on a read-write volume. The Snapshot copy must have a valid SnapMirror label.

**Note:** Refer to the *ONTAP Data Protection Guide* for valid use cases to add an owner on a Snapshot copy.

Parameters

- `vserver <vserver name>` - Vserver Name
  This parameter specifies the Vserver on which the volume is located.

- `volume <volume name>` - Volume Name
  This parameter specifies the name of the volume.

- `snapshot <snapshot name>` - Snapshot Copy Name
  This parameter specifies the name of the Snapshot copy.

- `[owner <owner name>]` - Snapshot Copy Owner Name
  This parameter specifies the name of the owner for the Snapshot copy. The owner name can be made up of the characters A to Z, a to z, 0 to 9, and "_". The name can be up to 32 characters in length. When not specified, an owner will be added with a system-generated default name.

Examples

The following example adds owner `app1` on Snapshot copy `snap1` on volume `vol1` in Vserver `vs0.example.com`.

```
cluster1:/> snapmirror snapshot-owner create -vserver vs0.example.com
       -volume vol1 -snapshot snap1 -owner app1
```

The following example adds a default owner on Snapshot copy `snap2` on volume `vol1` in Vserver `vs0.example.com`.

```
cluster1:/> snapmirror snapshot-owner create -vserver vs0.example.com
       -volume vol1 -snapshot snap2
```

snapmirror snapshot-owner delete

Delete an owner used to preserve a Snapshot copy for a SnapMirror mirror-to-vault cascade configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description
The `snapmirror snapshot-owner delete` command removes an owner on the specified Snapshot copy, which was added using the `snapmirror snapshot-owner create` command.

Parameters

- `vserver <vserver name>` - Vserver Name
  This parameter specifies the Vserver on which the volume is located.

- `volume <volume name>` - Volume Name
  This parameter specifies the name of the volume.

- `snapshot <snapshot name>` - Snapshot Copy Name
  This parameter specifies the name of the Snapshot copy.

- `[owner <owner name>]` - Snapshot Copy Owner Name
  This parameter specifies the name of the owner for the Snapshot copy. When not specified, the owner with the system-generated default name will be removed.
Examples
The following example removes owner `app1` on Snapshot copy `snap1` on volume `vol1` in Vserver `vs0.example.com`.

```
cluster1::> snapmirror snapshot-owner delete -vserver vs0.example.com -volume vol1 -snapshot snap1 -owner app1
```

The following example removes the default owner on Snapshot copy `snap2` on volume `vol1` in Vserver `vs0.example.com`.

```
cluster1::> snapmirror snapshot-owner delete -vserver vs0.example.com -volume vol1 -snapshot snap2
```

* `snapmirror snapshot-owner create` on page 686

**snapmirror snapshot-owner show**

Display Snapshot Copies with Owners

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**
The `snapmirror snapshot-owner show` command is used to list all Snapshot copies with owners that were added using the `snapmirror snapshot-owner create` command.

**Parameters**

{ ![–fields <fieldname>,...](image)
  
  If this parameter is specified, the command displays information about the specified fields.

  ![–instance ](image)
  
  If this parameter is specified, the command displays detailed information about all fields.

  `–vserver <vserver name>` - Vserver Name
  
  This parameter specifies the Vserver on which the volume is located.

  `–volume <volume name>` - Volume Name
  
  This parameter specifies the name of the volume.

  `–snapshot <snapshot name>` - Snapshot Copy Name
  
  If this parameter is specified, the command displays the owner name for the specified Snapshot copy.

**Examples**
The following example lists all Snapshot copies with owners on volume `vol1` in Vserver `vs0`. The system-generated default owner name is displayed as "-".

```
cluster1::> snapmirror snapshot-owner show
   -vserver vs0.example.com -volume vol1
   Vserver  Volume  Snapshot  Owner Names
   ------  --------  --------  --------------
   vs0.example.com
       vol1     snap2     -
       snap1     app1
```

The following example displays the owner name for Snapshot copy `snap1` on volume `vol1` in Vserver `vs0.example.com`.

```
class=class
```
cluster1::> snapmirror snapshot-owner show
    -vserver vs0.example.com -volume vol1 -snapshot snap1

    Vserver: vs0.example.com
    Volume: vol1
    Snapshot: snap1
    Owner Names: app1

statistics-v1 commands

The statistics-v1 directory

statistics-v1 nfs commands

Monitor NFS statistics

statistics-v1 nfs show-mount

Display mount statistics

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The statistics-v1 nfs show-mount command displays the following statistics about the NFS mounts on each node in the cluster:

• Result of the operations (success or failure)
• Total number of null operations
• Total number of mount operations
• Total number of dump operations
• Total number of unmount operations
• Total number of unmountall operations
• Total number of export operations
• Total number of exportall operations
• Total number of pathconf operations
• Total number of all the above operations

This command is designed to be used to analyze performance characteristics and to help diagnose issues.

Parameters

{-fields <fieldname>,...}

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.
If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[-node {<nodename>|local}] - Node
```
If you specify this parameter, the command displays statistics only for the specified node.

```
[-result {success|failure|all}] - Result
```
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified result (success/failure/all).

```
[-null <Counter with Delta>] - Null Operations
```
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of null operations.

```
[-mount <Counter with Delta>] - Mount Operations
```
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of mount operations.

```
[-dump <Counter with Delta>] - Dump Operations
```
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of dump operations.

```
[-unmnt <Counter with Delta>] - UnMount Operations
```
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of umount operations.

```
[-unmntall <Counter with Delta>] - UnMountAll Operations
```
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of umountall operations.

```
[-export <Counter with Delta>] - Export Operations
```
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of export operations.

```
[-exportall <Counter with Delta>] - ExportAll Operations
```
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of exportall operations.

```
[-pathconf <Counter with Delta>] - PathConf Operations
```
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of pathconf operations.

```
[-total <Counter64 with Delta>] - Total Operations
```
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of total operations.

### Examples

The following example displays statistics about the NFS mounts for a node named node1:

```bash
cluster1::*> statistics-v1 nfs show-mount -node node1
```

<table>
<thead>
<tr>
<th>Node</th>
<th>Value</th>
<th>Delta</th>
</tr>
</thead>
<tbody>
<tr>
<td>node1</td>
<td></td>
<td>success-------</td>
</tr>
<tr>
<td>Null Ops:</td>
<td>2</td>
<td>0/s:16s</td>
</tr>
<tr>
<td>Mount Ops:</td>
<td>1</td>
<td>0/s:16s</td>
</tr>
<tr>
<td>Dump Ops:</td>
<td>0</td>
<td>-</td>
</tr>
<tr>
<td>Unmount Ops:</td>

</tbody>
</table>
statistics-v1 nfs show-nlm

(DEPRECATED)-Display NLM statistics

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The statistics-v1 nfs show-nlm command displays the following statistics about the Network Lock Manager (NLM) on each node in the cluster:

- Result of the operations (success or failure)
- Total number of null operations
- Total number of test operations
- Total number of lock operations
- Total number of cancel operations
- Total number of unlock operations
- Total number of granted operations
- Total number of share operations
- Total number of unshare operations
- Total number of nmlock operations
- Total number of freeall operations
- Total number of all the above operations

This command is designed to be used to analyze performance characteristics and to help diagnose issues.

Note: This command requires an effective cluster version earlier than Data ONTAP 9.0. Data for nodes running Data ONTAP 9.0 or later is not collected, and will not be displayed. Use the statistics show-object nlm command instead.

Parameters

\{ [-fields <fieldname>, ...] \}

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

\{ [-instance] \}

If you specify the -instance parameter, the command displays detailed information about all fields.

[-node {<nodename> | local}] - Node

If you specify this parameter, the command displays statistics only for the specified node.
[-result {success|failure|all}] - Result
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified result (success/failure/all).

[-null <Counter with Delta>] - Null Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of null operations.

[-test <Counter with Delta>] - Test Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of test operations.

[-lock <Counter with Delta>] - Lock Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lock operations.

[-cancel <Counter with Delta>] - Cancel Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of cancel operations.

[-unlock <Counter with Delta>] - Unlock Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of unlock operations.

[-granted <Counter with Delta>] - Granted Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of granted operations.

[-share <Counter with Delta>] - Share Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of share operations.

[-unshare <Counter with Delta>] - Unshare Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of unshare operations.

[-nmlock <Counter with Delta>] - NmLock Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of nmlock operations.

[-freeall <Counter with Delta>] - FreeAll Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of freeall operations.

[-total <Counter64 with Delta>] - Total Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of total operations.

Examples
The following example displays statistics about the NLM for a node named node1:

```
cluster1::*> statistics-v1 nfs show-nlm -node node1

Node             Value         Delta
node1             --------success-------
Null:                   0             -
Test:                   0             -
Lock:                   2       0/s:23s
Cancel:                 0             -
Unlock:                 1       0/s:23s
```

Commands: Manual Page Reference
statistics-v1 nfs show-statusmon

Display status monitor statistics

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The statistics-v1 nfs show-statusmon command displays the following statistics about the Status Monitor on each node in the cluster:

- Result of the operations (success or failure)
- Total number of null operations
- Total number of stat operations
- Total number of monitor operations
- Total number of unmonitor operations
- Total number of unmonitor all operations
- Total number of simucrash operations
- Total number of notify operations
- Total number of all the above operations

This command is designed to be used to analyze performance characteristics and to help diagnose issues.

Parameters

\{ [-fields <fieldname>, ...] \}

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

\{ [-instance] \}

If you specify the -instance parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

If you specify this parameter, the command displays statistics only for the specified node.

[-result {success|failure|all}] - Result

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified result (success/failure/all).

[-null <Counter with Delta>] - Null Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of null operations.

[-stat <Counter with Delta>] - Stat Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of stat operations.

[-monitor <Counter with Delta>] - Monitor Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of monitor operations.

[-unmonitor <Counter with Delta>] - Unmonitor Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of unmonitor operations.

[-unmonall <Counter with Delta>] - Unmonitor All Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of unmonitor all operations.

[-simucrash <Counter with Delta>] - SimuCrash Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of simucrash operations.

[-notify <Counter with Delta>] - Notify Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of notify operations.

[-total <Counter64 with Delta>] - Total Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of total operations.

Examples

The following example displays statistics about the status monitor for a node named node1:

ccluster1::*> statistics-v1 nfs show-statusmon -node node1

statistics-v1 nfs show-v3

Display NFSv3 statistics

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The statistics-v1 nfs show-v3 command displays the following statistics about the NFSv3 operations on each node in the cluster:

- Result of the operations (success or failure)
- Total number of null operations
- Total number of getattr operations
- Total number of setattr operations
- Total number of lookup operations
- Total number of access operations
- Total number of read symlink operations
- Total number of read operations
- Total number of write operations
- Total number of create operations
- Total number of mkdir operations
- Total number of symlink operations
- Total number of mknod operations
- Total number of remove operations
- Total number of rmdir operations
- Total number of rename operations
- Total number of link operations
- Total number of readdir operations
- Total number of readdirplus operations
- Total number of fsstat operations
- Total number of fsinfo operations
- Total number of pathconf operations
- Total number of commit operations
- Total number of nfsv3 operations
- Percent of null operations
• Percent of getattr operations
• Percent of setattr operations
• Percent of lookup operations
• Percent of access operations
• Percent of readsymlink operations
• Percent of read operations
• Percent of write operations
• Percent of create operations
• Percent of mkdir operations
• Percent of symlink operations
• Percent of mknod operations
• Percent of remove operations
• Percent of rmdir operations
• Percent of rename operations
• Percent of link operations
• Percent of readdir operations
• Percent of readdirplus operations
• Percent of fsstat operations
• Percent of fsinfo operations
• Percent of pathconf operations
• Percent of commit operations

This command is designed to be used to analyze performance characteristics and to help diagnose issues.

Parameters

{ [-fields <fieldname>, ...]  
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance ]  
If you specify the -instance parameter, the command displays detailed information about all fields.

[-node <nodename> | local] - Node  
If you specify this parameter, the command displays NFSv3 statistics only for the specified node.

[-result (success | failure | all)] - Result  
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified result (success/failure/all).

[-null <Counter with Delta>] - Null Operations  
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of null operations.
[-gattr <Counter with Delta>] - GetAttr Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of getattr operations.

[-sattr <Counter with Delta>] - SetAttr Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of setattr operations.

[-lookup <Counter with Delta>] - LookUp Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lookup operations.

[-access <Counter with Delta>] - Access Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of access operations.

[-rsym <Counter with Delta>] - ReadSymlink Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of readsymlink operations.

[-read <Counter with Delta>] - Read Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of read operations.

[-write <Counter with Delta>] - Write Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of write operations.

[-create <Counter with Delta>] - Create Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of create operations.

[-mkdir <Counter with Delta>] - MkDir Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of mkdir operations.

[-symln <Counter with Delta>] - SymLink Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of symlink operations.

[-mknod <Counter with Delta>] - MkNod Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of mknod operations.

[-remove <Counter with Delta>] - Remove Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of remove operations.

[-rmdir <Counter with Delta>] - RmDir Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of rmdir operations.

[-rename <Counter with Delta>] - Rename Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of rename operations.

[-link <Counter with Delta>] - Link Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of link operations.
[-rdir <Counter with Delta>] - ReadDir Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the
specified number of readdir operations.

[-rdirp <Counter with Delta>] - ReadDirPlus Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the
specified number of readdirplus operations.

[-fsstat <Counter with Delta>] - FsStat Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the
specified number of fsstat operations.

[-fsinfo <Counter with Delta>] - FsInfo Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the
specified number of fsinfo operations.

[-pconf <Counter with Delta>] - PathConf Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the
specified number of pathconf operations.

[-commit <Counter with Delta>] - Commit Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the
specified number of commit operations.

[-total <Counter64 with Delta>] - Total Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the
specified number of total NFSv3 operations.

[-null-pct <Counter with Delta>] - Percent Null Ops
If you specify this parameter, the command displays statistics only about the node or nodes that have the
specified percentage of null operations.

[-gattr-pct <Counter with Delta>] - Percent GetAttr Ops
If you specify this parameter, the command displays statistics only about the node or nodes that have the
specified percentage of getattr operations.

[-sattr-pct <Counter with Delta>] - Percent SetAttr Ops
If you specify this parameter, the command displays statistics only about the node or nodes that have the
specified percentage of setattr operations.

[-lookup-pct <Counter with Delta>] - Percent LookUp Ops
If you specify this parameter, the command displays statistics only about the node or nodes that have the
specified percentage of lookup operations.

[-access-pct <Counter with Delta>] - Percent Access Ops
If you specify this parameter, the command displays statistics only about the node or nodes that have the
specified percentage of access operations.

[-rsym-pct <Counter with Delta>] - Percent ReadSymlink Ops
If you specify this parameter, the command displays statistics only about the node or nodes that have the
specified percentage of readsymlink operations.

[-read-pct <Counter with Delta>] - Percent Read Ops
If you specify this parameter, the command displays statistics only about the node or nodes that have the
specified percentage of read operations.

[-write-pct <Counter with Delta>] - Percent Write Ops
If you specify this parameter, the command displays statistics only about the node or nodes that have the
specified percentage of write operations.
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of create operations.

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of mkdir operations.

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of symlink operations.

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of mknod operations.

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of remove operations.

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of rmdir operations.

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of rename operations.

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of readdir operations.

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of readdirplus operations.

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of fsstat operations.

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of fsinfo operations.

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of pathconf operations.

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of commit operations.

Examples

statistics-v1 nfs show-v4

Display NFSv4 statistics

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The statistics-v1 nfs show-v4 command displays the following statistics about the NFSv4 operations on each node in the cluster:

- Result of the operations (success or failure)
- Total number of null operations
- Total number of compound operations
- Total number of access operations
- Total number of close operations
- Total number of commit operations
- Total number of create operations
- Total number of delegpurge operations
- Total number of delegret operations
- Total number of getattr operations
- Total number of getfh operations
- Total number of link operations
- Total number of lock operations
- Total number of lockt operations
- Total number of locku operations
- Total number of lookup operations
- Total number of lookupp operations
- Total number of nverify operations
- Total number of open operations
- Total number of openattr operations
- Total number of openconf operations
- Total number of opendowng operations
- Total number of putfh operations
- Total number of putpubfh operations
- Total number of putrootfh operations

| FsInfo Ops:  | 5 | - | 9% | - |
| PathConf Ops: | 0 | - | 0% | - |
| Commit Ops:  | 0 | - | 0% | - |
| Total Ops:   | 56 | - |   |   |
- Total number of read operations
- Total number of readdir operations
- Total number of readlink operations
- Total number of remove operations
- Total number of rename operations
- Total number of renew operations
- Total number of restorefh operations
- Total number of savefh operations
- Total number of secinfo operations
- Total number of setattr operations
- Total number of setcliid operations
- Total number of setcliidconf operations
- Total number of verify operations
- Total number of write operations
- Total number of rellockown operations
- Total number of total operations
- Percent of null operations
- Percent of compound operations
- Percent of access operations
- Percent of close operations
- Percent of commit operations
- Percent of create operations
- Percent of delegpurge operations
- Percent of delegret operations
- Percent of getattr operations
- Percent of getfh operations
- Percent of link operations
- Percent of lock operations
- Percent of lockt operations
- Percent of locku operations
- Percent of lookup operations
- Percent of lookupp operations
- Percent of nverify operations
- Percent of open operations
This command is designed to be used to analyze performance characteristics and to help diagnose issues.

Parameters

\{-fields <fieldname>, ...\}
If you specify the \{-fields <fieldname>, ...\} parameter, the command output also includes the specified field or fields. You can use '\-fields \?' to display the fields to specify.

\{-instance\}
If you specify the \{-instance\} parameter, the command displays detailed information about all fields.

\{-node <nodename> | local\} - Node
If you specify this parameter, the command displays NFSv4 statistics only for the specified node.

\{-result success|failure|all\} - Result
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified result (success/failure/all).

\{-null <Counter with Delta>\} - Null Procedure
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of null operations.
[-cmpnd <Counter with Delta>] - Compound Procedure
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of compound operations.

[-access <Counter with Delta>] - Access Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of access operations.

[-close <Counter with Delta>] - Close Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of close operations.

[-commit <Counter with Delta>] - Commit Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of commit operations.

[-create <Counter with Delta>] - Create Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of create operations.

[-delpur <Counter with Delta>] - Delegpurge Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of delegpurge operations.

[-delrtn <Counter with Delta>] - Delegret Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of deleget operations.

[-gattr <Counter with Delta>] - GetAttr Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of getattr operations.

[-getfh <Counter with Delta>] - GetFh Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of getfh operations.

[-link <Counter with Delta>] - Link Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of link operations.

[-lock <Counter with Delta>] - Lock Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lock operations.

[-lockt <Counter with Delta>] - LockT Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lockt operations.

[-locku <Counter with Delta>] - LockU Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of locku operations.

[-lookup <Counter with Delta>] - Lookup Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lookup operations.

[-lookpp <Counter with Delta>] - LookupP Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lookpp operations.
If you specify this parameter, the command displays statistics only about the node or nodes that have the
specified number of nverify operations.

If you specify this parameter, the command displays statistics only about the node or nodes that have the
specified number of open operations.

If you specify this parameter, the command displays statistics only about the node or nodes that have the
specified number of openattr operations.

If you specify this parameter, the command displays statistics only about the node or nodes that have the
specified number of openconf operations.

If you specify this parameter, the command displays statistics only about the node or nodes that have the
specified number of opendowng operations.

If you specify this parameter, the command displays statistics only about the node or nodes that have the
specified number of putfh operations.

If you specify this parameter, the command displays statistics only about the node or nodes that have the
specified number of putpubfh operations.

If you specify this parameter, the command displays statistics only about the node or nodes that have the
specified number of putrootfh operations.

If you specify this parameter, the command displays statistics only about the node or nodes that have the
specified number of read operations.

If you specify this parameter, the command displays statistics only about the node or nodes that have the
specified number of readdir operations.

If you specify this parameter, the command displays statistics only about the node or nodes that have the
specified number of readlink operations.

If you specify this parameter, the command displays statistics only about the node or nodes that have the
specified number of remove operations.

If you specify this parameter, the command displays statistics only about the node or nodes that have the
specified number of rename operations.

If you specify this parameter, the command displays statistics only about the node or nodes that have the
specified number of renew operations.

If you specify this parameter, the command displays statistics only about the node or nodes that have the
specified number of restorefh operations.
[-savefh <Counter with Delta>] - SaveFh Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of savefh operations.

[-secinf <Counter with Delta>] - SecInfo Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of secinfo operations.

[-sattr <Counter with Delta>] - SetAttr Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of setattr operations.

[-sclid <Counter with Delta>] - SetCliId Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of setcliid operations.

[-scidc <Counter with Delta>] - SetCliIdConf Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of setcliidconf operations.

[-verify <Counter with Delta>] - Verify Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of verify operations.

[-write <Counter with Delta>] - Write Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of write operations.

[-relown <Counter with Delta>] - RelLockOwn Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of rellockown operations.

[-total <Counter with Delta>] - Total Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of total nfsv4 operations.

[-null-pct <Counter with Delta>] - Percent Null Procedure
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of null operations.

[-cmpnd-pct <Counter with Delta>] - Percent Compound Procedure
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of compound operations.

[-access-pct <Counter with Delta>] - Percent Access Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of access operations.

[-close-pct <Counter with Delta>] - Percent Close Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of close operations.

[-commit-pct <Counter with Delta>] - Percent Commit Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of commit operations.

[-create-pct <Counter with Delta>] - Percent Create Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of create operations.
[-delpur-pct <Counter with Delta>] - Percent Delegpurge Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of delegpurge operations.

[-delrtn-pct <Counter with Delta>] - Percent Delegret Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of delegret operations.

[-gattr-pct <Counter with Delta>] - Percent GetAttr Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage ofgetattr operations.

[-getfh-pct <Counter with Delta>] - Percent GetFh Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of getfh operations.

[-link-pct <Counter with Delta>] - Percent Link Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of link operations.

[-lock-pct <Counter with Delta>] - Percent Lock Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lock operations.

[-lockt-pct <Counter with Delta>] - Percent LockT Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lockt operations.

[-locku-pct <Counter with Delta>] - Percent LockU Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of locku operations.

[-lookup-pct <Counter with Delta>] - Percent Lookup Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lookup operations.

[-lookpp-pct <Counter with Delta>] - Percent LookupP Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lookpp operations.

[-nverfy-pct <Counter with Delta>] - Percent Nverify Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of nverify operations.

[-open-pct <Counter with Delta>] - Percent Open Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of open operations.

[-opattr-pct <Counter with Delta>] - Percent OpenAttr Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of openattr operations.

[-opconf-pct <Counter with Delta>] - Percent OpenConf Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of openconf operations.

[-opndg-pct <Counter with Delta>] - Percent OpenDowng Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of opendowng operations.
[\text{-putfh\text{-pct \text{<Counter with Delta>}}} - \text{Percent PutFh Operations}]

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of putfh operations.

[\text{-putpfh\text{-pct \text{<Counter with Delta>}}} - \text{Percent PutPubFh Operations}]

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of putpubfh operations.

[\text{-putrfh\text{-pct \text{<Counter with Delta>}}} - \text{Percent PutRootFh Operations}]

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of putrootfh operations.

[\text{-read\text{-pct \text{<Counter with Delta>}}} - \text{Percent Read Operations}]

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of read operations.

[\text{-readdr\text{-pct \text{<Counter with Delta>}}} - \text{Percent ReadDir Operations}]

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of readdir operations.

[\text{-rlink\text{-pct \text{<Counter with Delta>}}} - \text{Percent ReadLink Operations}]

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of readlink operations.

[\text{-remove\text{-pct \text{<Counter with Delta>}}} - \text{Percent Remove Operations}]

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of remove operations.

[\text{-rename\text{-pct \text{<Counter with Delta>}}} - \text{Percent Rename Operations}]

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of rename operations.

[\text{-renew\text{-pct \text{<Counter with Delta>}}} - \text{Percent Renew Operations}]

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of renew operations.

[\text{-restfh\text{-pct \text{<Counter with Delta>}}} - \text{Percent RestoreFh Operations}]

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of restorefh operations.

[\text{-savefh\text{-pct \text{<Counter with Delta>}}} - \text{Percent SaveFh Operations}]

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of savefh operations.

[\text{-secinf\text{-pct \text{<Counter with Delta>}}} - \text{Percent SecInfo Operations}]

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of secinfo operations.

[\text{-sattr\text{-pct \text{<Counter with Delta>}}} - \text{Percent SetAttr Operations}]

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of setattr operations.

[\text{-sclid\text{-pct \text{<Counter with Delta>}}} - \text{Percent SetCliId Operations}]

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of setclid operations.

[\text{-scidc\text{-pct \text{<Counter with Delta>}}} - \text{Percent SetCliIdConf Operations}]

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of setclidconf operations.
[-verify-pct <Counter with Delta>] - Percent Verify Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of verify operations.

[-write-pct <Counter with Delta>] - Percent Write Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of write operations.

[-relown-pct <Counter with Delta>] - Percent RelLockOwn Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of rellockown operations.

Examples

The following example displays statistics about the NFSv4 operations for a node named node1:

```
cluster1::> statistics-v1 nfs show-v4 -node node1
```

statistics-v1 protocol-request-size commands

The protocol-request-size directory

statistics-v1 protocol-request-size show

Display size statistics for CIFS and NFS protocol read and write requests

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description
This command displays size statistics for CIFS and NFS protocol read and write requests. The output of the command includes the following information:

- Node name
- Statistic type
- Average size of request
- Total request count
- Current number of requests in each category of request size
- Number of requests after the command was last executed

Parameters

```
[-fields <fieldname>, ...]  
   If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?' to display the fields to specify.

[-instance ]  
   If you specify the -instance parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node  
   If this parameter is specified, the command displays statistics only for the specified node.

[-stat-type <Protocol Type>] - RW Request Stat Type  
   If this parameter is specified, the command displays only the statistics of the specified protocol type. Protocol types include the following: cifs_read, cifs_write, nfs2_read, nfs2_write, nfs3_read, and nfs3_write.

[-total-req-count <Counter64 with Delta>] - Total Request Count  
   If this parameter is specified, the command displays only statistics with the specified total number of requests.

[-average-size <Counter64 with Delta>] - Average Request Size  
   If this parameter is specified, the command displays only statistics with the specified average request size.

[-histo08 <Counter64 with Delta>] - 0 - 511  
   If this parameter is specified, the command displays only statistics with the specified number of requests in this size range.

[-histo09 <Counter64 with Delta>] - 512 - 1023  
   If this parameter is specified, the command displays only statistics with the specified number of requests in this size range.
```
[-histo10 <Counter64 with Delta>] - 1024 - 2047
If this parameter is specified, the command displays only statistics with the specified number of requests in this size range.

[-histo11 <Counter64 with Delta>] - 2048 - 4096
If this parameter is specified, the command displays only statistics with the specified number of requests in this size range.

[-histo12 <Counter64 with Delta>] - 4096 - 8191
If this parameter is specified, the command displays only statistics with the specified number of requests in this size range.

[-histo13 <Counter64 with Delta>] - 8192 - 16K
If this parameter is specified, the command displays only statistics with the specified number of requests in this size range.

[-histo14 <Counter64 with Delta>] - 16K - 32K
If this parameter is specified, the command displays only statistics with the specified number of requests in this size range.

[-histo15 <Counter64 with Delta>] - 32K - 64K
If this parameter is specified, the command displays only statistics with the specified number of requests in this size range.

[-histo16 <Counter64 with Delta>] - 64K - 128K
If this parameter is specified, the command displays only statistics with the specified number of requests in this size range.

[-histo17 <Counter64 with Delta>] - Greater than 128K
If this parameter is specified, the command displays only statistics with the specified number of requests in this size range.

Examples
The following example displays the number of NFS v3 requests in each size range for only one node in the cluster.

```
cluster1::> statistics protocol-request-size show -stat-type nfs3_* -node node0
```

Statistics Commands

The statistics directory

The statistics commands display performance statistics.

statistics show

Display performance data for a time interval

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description

This command displays performance data for a period of time.

To display data for a period of time, collect a sample using the statistics start and statistics stop commands. The data that displays is calculated data based on the samples the cluster collects. To view the sample, specify the -sample-id parameter.

Parameters

[-fields <fieldname>,...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-tab]

If this parameter is specified, the command displays performance data in tabular format.

[-object <text>] - Object

Selects the objects for which you want to display performance data. To view a list of valid object names, type statistics show -object ? or statistics catalog object show. To specify multiple objects, use "|" between each object.

Caution: You should limit the scope of this command to only a few objects at a time to avoid a potentially significant impact on the performance of the system.

[-instance <text>] - Instance

Selects the instances for which you want to display performance data. If you do not specify this parameter, the command displays statistics for all of the instances associated with the specified objects. To specify multiple instances, use "|" between each instance.

For example, if you want to display disk object statistics, you can use this parameter to specify the name of a specific disk whose statistics you want to view. If you do not specify this parameter, the command displays statistics for all disks in the system.

[-counter <text>] - Counter

Selects the counters for which you want to display performance data. To specify multiple counters, use "|" between each counter.
[-preset <text>] - Preset
If this parameter is specified, the command displays statistics for the specified preset.

[-node {<nodename> | local}] - Node
Selects the nodes for which you want to display performance data.

[-vserver <vserver name>] - Vserver
Selects the Vserver for which you want to display performance data.

[-value <text>] - Text Value
Selects the performance data that matches the specified counter value.

[-labels <text>, ...] - List of Labels
Selects the performance data that matches the specified label.

[-values <text>, ...] - List of Values
Displays only the statistics that have the specified values.

[-filter <text>] - Filter Data
Selects performance data for the instance that matches the specified filter criteria. For example, to display the instances that match a value of greater than 50 for the total_ops counter, specify -filter "total_ops>50".

[-sample-id <text>] - Sample Identifier
Displays performance data for the specified sample. You collect a sample by using the statistics start and statistics stop commands.

[-interval <integer>] - Interval
Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

[-iterations <integer>] - Iterations
Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

[-sort-key <text>] - Counter Used For Sorting
If this parameter is specified, the command displays statistics sorted by the specified counter. Only one counter can be specified.

[-sort-order {ascending|descending}] - Sort Order
This parameter may be used in conjunction with the -sort-key parameter. This parameter changes the order in which statistics are sorted. Possible values are ascending and descending. The default setting is descending.

[-max <integer>] - Tracker Size
Specifies the number of most active instances of an active object to display. The default setting is to display all of the instances.

Examples
The following example starts collecting statistics and displays statistics for the sample named smpl_1 for counters: avg_processor_busy and cpu_busy

```
cluster1::*> statistics start -object system -counter avg_processor_busy|cpu_busy -sample-id smpl_1
Statistics collection is being started for Sample-id: smpl_1

cluster1::*> statistics show -sample-id smpl_1
Object: system
Instance: cluster
Start-time: 8/2/2012 18:27:53
End-time: 8/2/2012 18:27:56
Cluster: cluster1
```

Commands: Manual Page Reference
The following example starts and stops data collection and displays statistics for the sample named smpl_1 for counters: `avg_processor_busy` and `cpu_busy`:

```bash
cluster1::*> statistics start -object system -counter avg_processor_busy|cpu_busy -sample-id smpl_1
Statistics collection is being started for Sample-id: smpl_1

cluster1::*> statistics stop -sample-id smpl_1
Statistics collection is being stopped for Sample-id: smpl_1

cluster1::*> statistics show -sample-id smpl_1
Object: system
Instance: cluster
Start-time: 8/2/2012 18:27:53
End-time: 8/2/2012 18:27:56
Cluster: cluster1
Counter Value
----------------- -------------------
avg_processor_busy 6%
cpu_busy 6%
```

The following example displays raw statistics:

```bash
cluster1::*> statistics show -raw -object system
Object: system
Instance: cluster
Start-time: 9/13/2012 18:18:18
End-time: 9/13/2012 18:18:18
Cluster: cluster1
Counter Value
----------------- -------------------
avg_processor_busy 249876451
cifs_ops 0
cpu_busy 303355441
disk_data_read 51453952
disk_data_written 486117376
cp_data_recv 0
cp_data_sent 0
fcp_ops 0
fcp_data_recv 0
fcp_data_sent 0
hdd_data_read 51453952
hdd_data_written 486117376
hostname node-name1
http_ops 0
instance_name cluster
iscsi_ops 0
net_data_recv 35034112
net_data_sent 3177472
nfs_ops 0
node_name node-name1
node_uuid
...
```

The following example displays raw statistics for counters "avg_processor_busy" and "cpu_busy":

```bash
cluster1::*> statistics show -raw -object system -counter avg_processor_busy|cpu_busy
Object: system
Instance: cluster
Start-time: 9/13/2012 18:18:18
End-time: 9/13/2012 18:18:18
Cluster: cluster1
Counter Value
----------------- -------------------
avg_processor_busy 249876451
cpu_busy 303355441
...
```
statistics show-periodic

Continuously display current performance data at regular interval

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
This command continuously displays specified performance data at a regular interval. The command output displays data in the following columns:

Note: This command has been deprecated and may be removed from a future version of Data ONTAP. Use the "statistics show" command with the tabular format instead.

- cpu avg: Average processor utilization across all processors in the system.
- cpu busy: Overall system utilization based on CPU utilization and subsystem utilization. Examples of subsystems include the storage subsystem and RAID subsystem.
- total ops: Number of total operations per second.
- nfs-ops: Number of NFS operations per second.
- cifs-ops: Number of CIFS operations per second.
- fcache ops: Number of flexcache operations per second.
- pkts recv: Number of packets received over physical ports per second.
- pkts sent: Number of packets sent over physical ports per second.
- total recv: Total network traffic received over physical ports per second (KBps).
- total sent: Total network traffic sent over physical ports per second (KBps).
- data busy: The percentage of time that data ports sent or received data.
- data recv: Network traffic received on data ports (KBps).
- data sent: Network traffic sent on data ports (KBps).
- cluster busy: The percentage of time that cluster ports sent or received data.
- cluster recv: Network traffic received on cluster ports (KBps).
- cluster sent: Network traffic sent on cluster ports (KBps).
- disk read: Data read from disk (KBps).
- disk write: Data written to disk (KBps).

Parameters
- [-object <text>] - Object
  Selects the object for which you want to display performance data. The default object is "cluster".
[-instance <text>] - Instance

Selects the instance for which you want to display performance data. This parameter is required if you specify the -object parameter and enter any object other than "cluster". Multiple values for this parameter are not supported.

For example, if you want to display disk object statistics, you can use this parameter to specify the name of a specific disk whose statistics you want to view.

[-counter <text>] - Counter

Selects the counters for which you want to display performance data. If you do not specify this parameter, the command displays statistics for all of the counters in the specified objects. To specify multiple counters, use "|" between each counter.

[-preset <text>] - Preset

If this parameter is specified, the command displays statistics for the specified preset.

[-node {<nodename>|local}] - Node

Selects the nodes for which you want to display performance data. The default node is "cluster:summary".

[-vserver <vserver name>] - Vserver

Selects the Vserver for which you want to display performance data. If you do not specify this parameter, the command displays statistics for all of the Vservers in the cluster.

[-interval <integer>] - Interval in Seconds

Specifies, in seconds, the interval between statistics updates. The default setting is 1 second.

[-iterations <integer>] - Number of Iterations

Specifies the number of iterations the command runs before terminating. The default setting is 0 (zero); this means that the command continues to run until you interrupt it by pressing Ctrl-C.

[-summary {true|false}] - Print Summary

Specifies whether the command prints a final summary of statistics after the command has gone through all of its iterations. The default setting is true.

[-filter <text>] - Filter Data

Selects instances that match the specified filter criteria. For example, to display instances from node1, specify "filter "node_name=node1"."

Examples

The following example displays the "cluster" statistics for a node named node1. Because no number of iterations is specified, this command will continue to run until you interrupt it by pressing Ctrl-C.

```
cluster1::*> statistics show-periodic -node node1
```

```
cpu  cpu  cpu  total  total  total
data  data  data  cluster  cluster  cluster
recv  busy  total  ops  nfs-ops  cifs-ops  disk  disk  rec
sent  busy  total  sent  read  write

```

statistics show-periodic
The following example displays the "processor" statistics for an instance named processor1. This command will display only five iterations.

```
cluster1:*> statistics show-periodic -object processor -instance processor1 -iteration 5
instance processor  sk
name      busy switches
-------- --------- --------
processor1  8%   1722
processor1  6%   1234
processor1  5%   1680
processor1  4%   1336
processor1  7%   1801
[...]
```

The following example displays the processor statistics for an instance named processor1 and counters "processor_busi" and "sk_switches". This command will display only five iterations.

```
cluster1:*> statistics show-periodic -object processor -instance processor1 -iteration 5 -counter processor_busy|sk_switches
processor  sk
busy switches
--------- --------
 5%   1267
 4%   1163
 7%   1512
 5%   1245
 4%   1128
[...]
```

**statistics start**

Start data collection for a sample

**Availability:** This command is available to cluster and Vserver administrators at the *advanced* privilege level.

**Description**

This command starts the collection of performance data. Use the **statistics stop** command to stop the collection. You view the sample of performance data by using the **statistics show** command. You can collect more than one sample at a time.

**Parameters**

[-object <text>] - Object

Selects the objects for which you want to collect performance data. This parameter is required. To view a list of valid object names, type **statistics catalog object show** at the command prompt. To specify multiple objects, use "|" between each object.

**Caution:** You should limit the scope of this command to only a few objects at a time to avoid a potentially significant impact on the performance of the system.

[-instance <text>] - Instance

Selects the instances for which you want to collect performance data. If you do not specify this parameter, the command collects statistics for all of the instances associated with the specified objects. To specify multiple instances, use "|" between each instance.
For example, if you want to collect disk object statistics, you can use this parameter to specify the name of a specific disk whose statistics you want to view. If you do not specify this parameter, the command will collect statistics for all disks in the system.

[-counter <text>] - Counter
Selects the counters for which you want to collect performance data. If you do not specify this parameter, the command collects statistics for all of the counters in the specified objects. To specify multiple counters, use "|" between each counter.

[-preset <text>] - Preset
If this parameter is specified, the command displays statistics for the specified preset.

[-sample-id <text>] - Sample Identifier
Specifies an identifier for the sample. Identifiers must be unique and are restricted to the characters 0-9, a-z, A-Z, and ".". If you do not specify this parameter, the command generates a sample identifier for you and defines this sample as the default sample for the CLI session. When you run the statistics show command without specifying the -sample-id parameter, data from the default sample displays. If you run this command during the same CLI session and do not specify the -sample-id parameter, the command overwrites the previous sample. The command does not delete the default sample when you close your session.

[-vserver <vserver name>] - Vserver
Selects the vserver for which you want to collect performance data. If you do not specify this parameter, the command collects statistics for all of the Vservers in the cluster.

[-node {<nodename> | local}] - Node
Selects the node for which you want to collect performance data. If you do not specify this parameter, the command collects statistics for all of the nodes in the cluster.

[-filter <text>] - Filter
Selects performance data for the instance that matches the specified filter criteria. For example, to display the instances from node1, specify "-filter "node_name=node1"."

[-duration <integer>] - Sample Duration in Minutes
If this parameter is specified, the command will collect the closing sample after the time specified. Duration can be specified in minutes.

[-max <integer>] - Tracker Size
Specifies the number of most active instances of an active object to display. The default setting is to display all of the instances.

[-sort-key <text>] - Counter Used For Sorting
If this parameter is specified, the command displays statistics sorted by the specified counter. Only one counter can be specified.

[-sort-order {ascending|descending}] - Sort Order
This parameter may be used in conjunction with the -sort-key parameter. This parameter changes the order in which statistics are sorted. Possible values are ascending and descending. The default setting is descending.

Examples
The following example starts statistics collection for sample "smpl_1":

```
cluster1:*> statistics start -object system -sample-id smpl_1
Statistics collection is being started for Sample-id: smpl_1
```

The following example starts collecting statistics for the sample named smpl_1 for counters: avg_processor_busy and cpu_busy

statistics stop

Stop data collection for a sample

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description

This command stops the collection of performance data. You view the sample of performance data by using the statistics show command.

Parameters

[-sample-id <text>] - Sample Identifier

Specifies the identifier of the sample for which you want to stop data collection. If you do not specify this parameter, the command stops data collection for the last sample that you started by running the statistics start command without the -sample-id parameter.

Examples

The following example stops data collection for sample "smpl_1":

```bash
cluster1::*> statistics stop -sample-id smpl_1
Statistics collection is being stopped for Sample-id: smpl_1
```

statistics aggregate commands

Aggregate throughput and latency metrics

statistics aggregate show

Aggregate throughput and latency metrics

Availability: This command is available to cluster administrators at the admin privilege level.

Description

This command continuously displays performance data for aggregates at a regular interval. The command output displays data in the following columns:
• Aggregate - aggregate name.
• Node - node name.
• Total Ops - total number of operations per second.
• Read Ops - read operations per second.
• Write Ops - write operations per second.

**Parameters**

\[-aggregate <text>] - Aggregate

Selects the aggregate for which you want to display performance data.

\[-node {<nodename>|local}] - Node

Selects the node for which you want to display performance data.

\[-sort-key <text>] - Column to Sort By

If this parameter is specified, the command displays statistics sorted by the specified column.

\[-interval <integer>] - Interval

Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

\[-iterations <integer>] - Iterations

Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

\[-max <integer>] - Maximum Number of Instances

Specifies maximum number of aggregates to display. The default setting is 25.

**Examples**

The following example displays aggregate statistics:

```
cluster1::> statistics aggregate show
cluster-1 : 12/31/1969 16:00:04

*Total Read Write
Aggregate    Node    Ops  Ops   Ops
--------------------- ------------- ------ ---- -----
aggr0_cluster_node2_0 cluster-node2 9    0     8
aggr0 cluster-node1 6    0     5
[...]
```

**statistics cache commands**

Displays performance data for caches

**statistics cache flash-pool commands**

Flash pool throughput metrics

**statistics cache flash-pool show**

Flash pool throughput metrics

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.
Description
This command continuously displays performance data for flash pool caches at a regular interval. The command output displays data in the following columns:

- Aggregate - aggregate name.
- Vserver - vserver name.
- Volume - volume name.
- Read Hit - percent of IOs serviced from a cache level.
- Write Hit - percent of IOs serviced from a cache level.
- Cache Used - percent of cache used.
- Read Blocks - read blocks.
- Write Blocks - write blocks.
- Rejects - cache rejects.

Parameters
[-aggregate <text>] - Aggregate
Selects the aggregate for which you want to display performance data.

[-vserver <vserver name>] - Vserver
Selects the vserver for which you want to display performance data.

[-volume <text>] - Volume
Selects the volume for which you want to display performance data.

[-sort-key <text>] - Column to Sort By
If this parameter is specified, the command displays statistics sorted by the specified column.

-iteration <integer> - Interval
Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

-iterations <integer> - Iterations
Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

-max <integer> - Maximum Number of Instances
Specifies the maximum number of flash pools to display. The default setting is 25.

Examples
The following example displays flash pool statistics:

```
cluster1::> statistics cache flash-pool show
cluster1 : 12/31/2013 16:00:04

Commands: Manual Page Reference
statistics catalog directory

The catalog directory

The statistics catalog commands provide access to performance catalog data.

statistics catalog counter commands

The counter directory

statistics catalog counter show

Display the list of counters in an object

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
This command displays the names and descriptions of counters. The displayed data is either node-specific or cluster-wide, depending on the objects specified.

Parameters

{-fields <fieldname>, ...} 
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

| -describe |
Displays detailed information about each counter, including privilege level, label, and whether the counter is a key counter.

-object <text> - Object
Selects the object for which you want to display the list of counters. This parameter is required. To view a list of valid object names, type statistics catalog counter show -object ? or statistics catalog object show.

-counter <text> - Counter
Selects the counters that match this parameter value. If you do not specify this parameter, the command displays details for all counters.

-filter <text> - Filter Data
Selects the counters that match this parameter value. For example, to display counters from node1, specify -filter "node_name=node1".

-label <text>, ... - Labels for Array Counters
Selects the counters that match this parameter value. A label is the name of the bucket to which an array counter belongs.

-description <text> - Description
Selects the counters that match this parameter value.

-privilege <text> - Privilege Level
Selects the counters that match this parameter value.

-is-key-counter {true|false} - Is Key Counter
Selects the counters that are key counters (true) or are not key counters (false). A key counter is a counter that uniquely identifies an instance across the cluster. The default setting is false. For example, "vserver_name" and
"node_name" are key counters because they identify the specific Vserver or node to which the instance belongs.

[-is-deprecated {true|false}] - Is Counter Deprecated
Selects the counters that are deprecated (true) or are not deprecated (false).

[-replaced-by <text>] - Replaced By Counter If Deprecated
Selects all deprecated counters that are replaced by the counter provided to this parameter.

### Examples

The following example displays the list of counters in the processor object.

```
cluster1::> statistics catalog counter show -object processor
Object: processor
<p>|</p>
<table>
<thead>
<tr>
<th>Counter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>instance_name</td>
<td>Instance Name</td>
</tr>
<tr>
<td>instance_uuid</td>
<td>Instance UUID</td>
</tr>
<tr>
<td>node_name</td>
<td>System node name</td>
</tr>
<tr>
<td>node_uuid</td>
<td>System node id</td>
</tr>
<tr>
<td>process_name</td>
<td>Ontap process that provided this instance</td>
</tr>
<tr>
<td>processor_busy</td>
<td>Percentage of elapsed time that the processor is executing non-idle processes</td>
</tr>
<tr>
<td>processor_elapsed_time</td>
<td>Wall-clock time since boot used for calculating processor utilization</td>
</tr>
<tr>
<td>sk_switches</td>
<td>Number of sk switches per second</td>
</tr>
</tbody>
</table>
```

8 entries were displayed.

The instance directory

#### statistics catalog instance show

Display the list of instances associated with an object

**Availability:** This command is available to cluster and Vserver administrators at the advanced privilege level.

**Description**

This command displays the names of instances associated with the specified object. The displayed data is either node-specific or cluster-wide, depending on the objects specified.

**Parameters**

[-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

-object <text> - Object

Selects the object for which you want to display the list of instances. This parameter is required. To view a list of valid object names, type statistics catalog instance show -object ? or statistics catalog object show.

[-instance <text>] - Instance Name

Selects the instances that match this parameter value. If you do not specify this parameter, the command displays all the instances.
[-filter <text>] - Filter Data
Selects the instances that match this parameter value. For example, to display instances from vserver1, specify
-Filter "vserver_name=vserver1".

[-vserver <vserver name>, ...] - Vserver Name
Selects the instances that match this parameter value. If you do not specify this parameter, the command
displays instances for all of the Vservers in the cluster.

[-node {<nodename>|local}, ...] - Node Name
Selects the instances that match this parameter value. If you do not specify this parameter, the command
displays instances for all of the nodes in the cluster.

Examples
The following example displays the list of instances associated with the processor object.

```
cluster1::> statistics catalog instance show -object processor
Object: processor
  processor0
  processor0
  processor1
  processor1
4 entries were displayed.
```

statistics catalog object commands

The object directory

statistics catalog object show

Display the list of objects

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
This command displays the names and descriptions of objects from which you can obtain performance data. The displayed data
is either node-specific or cluster-wide, depending on the objects specified.

Parameters

{ [-fields <fieldname>, ...]  
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified
field or fields. You can use '-fields ?' to display the fields to specify.

| [-describe ]]  
Displays detailed information about each object, including privilege level.

[-object <text>] - Object
Selects the objects for which you want to display information. If you do not specify this parameter, the
command displays details for all of the objects.

[-privilege <text>] - Privilege Level
Selects the objects that match this parameter value.
[-is-deprecated {true|false}] - Is Object Deprecated

Selects the objects that are deprecated (true) or are not deprecated (false).

[-replaced-by <text>] - Replaced By Object If Deprecated

Selects all deprecated objects that are replaced by the object provided to this parameter.

[-is-statistically-tracked {true|false}] - Is Object Statistically Tracked

Specifies if the object is statistically tracked

[-description <text>] - Description

Selects the objects that match this parameter value.

**Examples**

The following example displays descriptions of all objects in the cluster:

```
cluster1::> statistics catalog object show
agggregate                   CM object for exporting aggregate performance counters
audit_ng                    CM object for exporting audit_ng performance counters
cifs                        These counters report activity from both SMB and SMB2 revisions of the CIFS protocol. For information isolated to SMB, see the 'smb1' object. For SMB2, see the 'smb2' object.
cifs:node                   These counters report activity from both SMB and SMB2 revisions of the CIFS protocol. For information isolated to SMB, see the 'smb1' object. For SMB2, see the 'smb2' object.
cifs:vserver                These counters report activity from both SMB and SMB2 revisions of the CIFS protocol. For information isolated to SMB, see the 'smb1' object. For SMB2, see the 'smb2' object.
cluster_peer                The cluster peer object contains peer counters.
[...]
```

**statistics disk commands**

Disk throughput and latency metrics

**statistics disk show**

Disk throughput and latency metrics

**Availability:** This command is available to cluster administrators at the advanced privilege level.

**Description**

This command continuously displays performance data for disks at a regular interval. The command output displays data in the following columns:

- Disk - disk name.
- Node - node name.
- Busy (%) - percentage of time there was at least one outstanding request to the disk.
- Total Ops - total operations per second.
- Read Ops - read operations per second.
- Write Ops - write operations per second.
Parameters

[-disk <text>] - Disk
Selects the disk for which you want to display performance data.

[-node {<nodename>|local}] - Node
Selects the node for which you want to display performance data.

[-sort-key <text>] - Column to Sort By
If this parameter is specified, the command displays statistics sorted by the specified column.

-interval <integer> - Interval
Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

-iterations <integer> - Iterations
Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

-max <integer> - Maximum Number of Instances
Specifies the maximum number of disks to display. The default setting is 25.

Examples

The following example displays disk statistics:

```
cluster1::> statistics disk show
cluster1 : 12/31/1969 16:00:04

Busy *Total Read Write
Disk     Node  (%) Ops Ops Ops
-------- -------- ---- ------ ---- -----
VMw-1.31 node2    0     2    2     0
VMw-1.30 node2    0     3    0     3
VMw-1.3   node1    0     0    0     0
VMw-1.29 node2    0     1    0     1
[...]
```

statistics lif commands

Logical network interface throughput and latency metrics

statistics lif show

Logical network interface throughput and latency metrics

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command continuously displays performance data for LIFs at a regular interval. The command output displays data in the following columns:

- LIF - logical interface name.
- Vserver - vserver name.
- Recv Packet - packets received per second.
- Recv Data (Bps) - bytes received per second.
- Recv Errors - receive errors per second.
• Sent Packet - packets sent per second.
• Sent Data (Bps) - bytes sent per second.
• Sent Errors - transfer errors per second.
• Current Port - current use port.

Parameters
[-lif <text>] - LIF
Selects the LIF for which you want to display performance data.

[-vserver <vserver name>] - Vserver
Selects the vserver for which you want to display performance data.

[-sort-key <text>] - Column to Sort By
If this parameter is specified, the command displays statistics sorted by the specified column.

-interval <integer> - Interval
Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

-iterations <integer> - Iterations
Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

-max <integer> - Maximum Number of Instances
Specifies the maximum number of LIFs to display. The default setting is 25.

Examples
The following example displays LIFs statistics:

```
cluster1::> statistics lif show
cluster1 : 12/31/1969 16:00:04

<table>
<thead>
<tr>
<th>LIF</th>
<th>Vserver</th>
<th>Recv Data</th>
<th>Recv Errors</th>

statistics lun commands
LUN throughput and latency metrics

statistics lun show
LUN throughput and latency metrics

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command continuously displays performance data for LUNs at a regular interval. The command output displays data in the following columns:
• Lun - LUN name.
• Vserver - vserver name.
• Total Ops - total number of operations per second.
• Read Ops - read operations per second.
• Write Ops - write operations per second.
• Other Ops - other operations per second.
• Read (Bps) - read throughput in bytes per second.
• Write (Bps) - write throughput in bytes per second.
• Latency(ms) - average latency for an operation in milliseconds.

Parameters

[\-lun <text>] - Lun
    Selects the LUN for which you want to display performance data.

[\-vserver <vserver name>] - Vserver
    Selects the vserver for which you want to display performance data.

[\-sort-key <text>] - Column to Sort By
    If this parameter is specified, the command displays statistics sorted by the specified column.

\-interval <integer> - Interval
    Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

\-iterations <integer> - Iterations
    Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number
    is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

\-max <integer> - Maximum Number of Instances
    Specifies the maximum number of LUNs to display. The default setting is 25.

Examples

The following example displays LUN statistics:

cluster1::> statistics lun show
cluster1 : 12/31/2013 16:00:04

<table>

</tr>
</tbody>
</table>

[...]
statistics nfs show-mount

Display mount statistics

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The statistics nfs show-mount command displays the following statistics about the NFS mounts on each node in the cluster:

• Result of the operations (success or failure)
• Total number of null operations
• Total number of mount operations
• Total number of dump operations
• Total number of unmount operations
• Total number of unmountall operations
• Total number of export operations
• Total number of exportall operations
• Total number of pathconf operations
• Total number of all the above operations

This command is designed to be used to analyze performance characteristics and to help diagnose issues.

Parameters

\([-\text{fields }<\text{fieldname}>,\ldots]\]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use ‘-fields ?’ to display the fields to specify.

\([-\text{instance}]\]
If you specify the -instance parameter, the command displays detailed information about all fields.

\([-\text{node }<\text{nodename}>|\text{local}]\) - Node
If you specify this parameter, the command displays statistics only for the specified node.

\([-\text{result }<\text{success}|\text{failure}|\text{all}>\)] - Result
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified result (success/failure/all).

\([-\text{null }<\text{Counter with Delta}>]\) - Null Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of null operations.

\([-\text{mount }<\text{Counter with Delta}>]\) - Mount Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of mount operations.

\([-\text{dump }<\text{Counter with Delta}>]\) - Dump Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of dump operations.
[-unmnt <Counter with Delta>] - UnMount Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of umount operations.

[-unmntall <Counter with Delta>] - UnMountAll Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of umountall operations.

[-export <Counter with Delta>] - Export Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of export operations.

[-exportall <Counter with Delta>] - ExportAll Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of exportall operations.

[-pathconf <Counter with Delta>] - PathConf Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of pathconf operations.

[-total <Counter64 with Delta>] - Total Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of total operations.

Examples
The following example displays statistics about the NFS mounts for a node named node1:

```
cluster1::*> statistics nfs show-mount -node node1
Node                     Value         Delta
node1               ----------success-------
Null Ops:                    2       0/s:16s
Mount Ops:                   1       0/s:16s
Dump Ops:                    0             -
Unmount Ops:                 1       0/s:16s
Unmount All Ops:             0             -
Export Ops:                  0             -
ExportAll Ops                0             -
PathConf Ops:                0             -
Total Ops:                   4       0/s:16s
```

```
Node                     Value         Delta
node1               ----------failure------
Null Ops:                    0             -
Mount Ops:                   0             -
Dump Ops:                    0             -
Unmount Ops:                 0             -
Unmount All Ops:             0             -
Export Ops:                  0             -
ExportAll Ops                0             -
PathConf Ops:                0             -
Total Ops:                   0             -
```

```
statistics nfs show-nlm
(DEPRECATED)-Display NLM statistics
```

**Availability:** This command is available to _cluster_ administrators at the _advanced_ privilege level.

**Description**
The `statistics nfs show-nlm` command displays the following statistics about the Network Lock Manager (NLM) on each node in the cluster:
- Result of the operations (success or failure)
- Total number of null operations
- Total number of test operations
- Total number of lock operations
- Total number of cancel operations
- Total number of unlock operations
- Total number of granted operations
- Total number of share operations
- Total number of unshare operations
- Total number of nmlock operations
- Total number of freeall operations
- Total number of all the above operations

This command is designed to be used to analyze performance characteristics and to help diagnose issues.

Note: This command requires an effective cluster version earlier than Data ONTAP 9.0. Data for nodes running Data ONTAP 9.0 or later is not collected, and will not be displayed. Use the statistics show-object nlm command instead.

Parameters

- fields <fieldname>, ...
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

- instance
  If you specify the -instance parameter, the command displays detailed information about all fields.

- node <nodename>|local
  If you specify this parameter, the command displays statistics only for the specified node.

- result {success|failure|all}
  If you specify this parameter, the command displays statistics only about the node or nodes that have the specified result (success/failure/all).

- null <Counter with Delta>
  If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of null operations.

- test <Counter with Delta>
  If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of test operations.

- lock <Counter with Delta>
  If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lock operations.

- cancel <Counter with Delta>
  If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of cancel operations.
[unlock <Counter with Delta>] - Unlock Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of unlock operations.

[granted <Counter with Delta>] - Granted Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of granted operations.

[share <Counter with Delta>] - Share Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of share operations.

[unshare <Counter with Delta>] - Unshare Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of unshare operations.

[nmlock <Counter with Delta>] - NmLock Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of nmlock operations.

[freeall <Counter with Delta>] - FreeAll Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of freeall operations.

[total <Counter64 with Delta>] - Total Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of total operations.

Examples
The following example displays statistics about the NLM for a node named node1:

```
cluster1::*> statistics nfs show-nlm -node node1

Node                 Value         Delta
node1             --------success-------
Null:                    0             -
Test:                    0             -
Lock:                    2       0/s:23s
Cancel:                  0             -
Unlock:                  1       0/s:23s
Granted:                 0             -
Share:                   0             -
Unshare:                 0             -
NmLock:                  0             -
FreeAll:                 0             -
Total:                   3       0/s:23s

Node                 Value         Delta
node1             --------failure-------
Null:                    0             -
Test:                    0             -
Lock:                    0             -
Cancel:                  0             -
Unlock:                  0             -
Granted:                 0             -
Share:                   0             -
Unshare:                 0             -
NmLock:                  0             -
FreeAll:                 0             -
Total:                   0             -
```
statistics nfs show-statusmon

Display status monitor statistics

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

The statistics nfs show-statusmon command displays the following statistics about the Status Monitor on each node in the cluster:

- Result of the operations (success or failure)
- Total number of null operations
- Total number of stat operations
- Total number of monitor operations
- Total number of unmonitor operations
- Total number of unmonitor all operations
- Total number of simucrash operations
- Total number of notify operations
- Total number of all the above operations

This command is designed to be used to analyze performance characteristics and to help diagnose issues.

Parameters

[-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use ‘-fields?’ to display the fields to specify.

[-instance]]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-node <nodename>|local]] - Node

If you specify this parameter, the command displays statistics only for the specified node.

[-result (success|failure|all)] - Result

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified result (success/failure/all).

[-null <Counter with Delta>] - Null Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of null operations.

[-stat <Counter with Delta>] - Stat Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of stat operations.

[-monitor <Counter with Delta>] - Monitor Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of monitor operations.
[-unmonitor <Counter with Delta>] - Unmonitor Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of unmonitor operations.

[-unmonall <Counter with Delta>] - Unmonitor All Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of unmonitor all operations.

[-simucrash <Counter with Delta>] - SimuCrash Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of simucrash operations.

[-notify <Counter with Delta>] - Notify Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of notify operations.

[-total <Counter64 with Delta>] - Total Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of total operations.

**Examples**
The following example displays statistics about the status monitor for a node named node1:

```
cluster1::*> statistics nfs show-statusmon -node node1

Node                   Value         Delta
node1               --------success-------
Null Ops:                  0             -
Stat Ops:                  0             -
Monitor Ops:               0             -
Unmonitor Ops:             0             -
Unmon All Ops:             0             -
SimuCrash Ops:             0             -
Notify Ops:                0             -
Total Ops:                 0             -

Node                   Value         Delta
node1               --------failure-------
Null Ops:                  0             -
Stat Ops:                  0             -
Monitor Ops:               0             -
Unmonitor Ops:             0             -
Unmon All Ops:             0             -
SimuCrash Ops:             0             -
Notify Ops:                0             -
Total Ops:                 0             -
```

**statistics nfs show-v3**
Display NFSv3 statistics

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The `statistics nfs show-v3` command displays the following statistics about the NFSv3 operations on each node in the cluster:

- Result of the operations (success or failure)
- Total number of null operations
- Total number of getattr operations
• Total number of setattr operations
• Total number of lookup operations
• Total number of access operations
• Total number of readsym link operations
• Total number of read operations
• Total number of write operations
• Total number of create operations
• Total number of mkdir operations
• Total number of symlink operations
• Total number of mknod operations
• Total number of remove operations
• Total number of rmdir operations
• Total number of rename operations
• Total number of link operations
• Total number of readdir operations
• Total number of readdirplus operations
• Total number of fsstat operations
• Total number of fsinfo operations
• Total number of pathconf operations
• Total number of commit operations
• Total number of nfsv3 operations
• Percent of null operations
• Percent of getattr operations
• Percent of setattr operations
• Percent of lookup operations
• Percent of access operations
• Percent of readsym link operations
• Percent of read operations
• Percent of write operations
• Percent of create operations
• Percent of mkdir operations
• Percent of symlink operations
• Percent of mknod operations
• Percent of remove operations
• Percent of rmdir operations
• Percent of rename operations
• Percent of link operations
• Percent of readdir operations
• Percent of readdirplus operations
• Percent of fsstat operations
• Percent of fsinfo operations
• Percent of pathconf operations
• Percent of commit operations

This command is designed to be used to analyze performance characteristics and to help diagnose issues.

**Parameters**

```
[-fields <fieldname>, ...]  
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance ]  
  If you specify the -instance parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node  
  If you specify this parameter, the command displays NFSv3 statistics only for the specified node.

[-result {success|failure|all}] - Result  
  If you specify this parameter, the command displays statistics only about the node or nodes that have the specified result (success/failure/all).

[-null <Counter with Delta>] - Null Operations  
  If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of null operations.

[-getattr <Counter with Delta>] - GetAttr Operations  
  If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of getattr operations.

[-setattr <Counter with Delta>] - SetAttr Operations  
  If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of setattr operations.

[-lookup <Counter with Delta>] - LookUp Operations  
  If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lookup operations.

[-access <Counter with Delta>] - Access Operations  
  If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of access operations.

[-rsym <Counter with Delta>] - ReadSymlink Operations  
  If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of readsymlink operations.
```
[-read <Counter with Delta>] - Read Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of read operations.

[-write <Counter with Delta>] - Write Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of write operations.

[-create <Counter with Delta>] - Create Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of create operations.

[-mkdir <Counter with Delta>] - MkDir Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of mkdir operations.

[-symlink <Counter with Delta>] - SymLink Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of symlink operations.

[-mknod <Counter with Delta>] - MkNod Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of mknod operations.

[-remove <Counter with Delta>] - Remove Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of remove operations.

[-rmdir <Counter with Delta>] - RmDir Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of rmdir operations.

[-rename <Counter with Delta>] - Rename Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of rename operations.

[-link <Counter with Delta>] - Link Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of link operations.

[-rdir <Counter with Delta>] - ReadDir Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of readdir operations.

[-rdirp <Counter with Delta>] - ReadDirPlus Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of readdirplus operations.

[-fsstat <Counter with Delta>] - FsStat Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of fsstat operations.

[-fsinfo <Counter with Delta>] - FsInfo Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of fsinfo operations.

[-pconf <Counter with Delta>] - PathConf Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of pathconf operations.
[\-commit <Counter with Delta>] - Commit Operations
    If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of commit operations.

[\-total <Counter64 with Delta>] - Total Operations
    If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of total NFSv3 operations.

[\-null-pct <Counter with Delta>] - Percent Null Ops
    If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of null operations.

[\-getattr-pct <Counter with Delta>] - Percent GetAttr Ops
    If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of getattr operations.

[\-setattr-pct <Counter with Delta>] - Percent SetAttr Ops
    If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of setattr operations.

[\-lookup-pct <Counter with Delta>] - Percent LookUp Ops
    If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lookup operations.

[\-access-pct <Counter with Delta>] - Percent Access Ops
    If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of access operations.

[\-rsym-pct <Counter with Delta>] - Percent ReadSymlink Ops
    If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of readsymlink operations.

[\-read-pct <Counter with Delta>] - Percent Read Ops
    If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of read operations.

[\-write-pct <Counter with Delta>] - Percent Write Ops
    If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of write operations.

[\-create-pct <Counter with Delta>] - Percent Create Ops
    If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of create operations.

[\-mkdir-pct <Counter with Delta>] - Percent MkDir Ops
    If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of mkdir operations.

[\-symln-pct <Counter with Delta>] - Percent SymLink Ops
    If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of symlink operations.

[\-mknod-pct <Counter with Delta>] - Percent MkNod Ops
    If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of mknod operations.

[\-remove-pct <Counter with Delta>] - Percent Remove Ops
    If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of remove operations.
[-rmdir-pct <Counter with Delta>] - Percent RmDir Ops
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of rmdir operations.

[-rename-pct <Counter with Delta>] - Percent Rename Ops
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of rename operations.

[-link-pct <Counter with Delta>] - Percent Link Ops
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of link operations.

[-rdir-pct <Counter with Delta>] - Percent ReadDir Ops
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of readdir operations.

[-rdirp-pct <Counter with Delta>] - Percent ReadDirPlus Ops
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of readdirplus operations.

[-fsstat-pct <Counter with Delta>] - Percent FsStat Ops
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of fsstat operations.

[-fsinfo-pct <Counter with Delta>] - Percent FsInfo Ops
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of fsinfo operations.

[-pconf-pct <Counter with Delta>] - Percent PathConf Ops
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of pathconf operations.

[-commit-pct <Counter with Delta>] - Percent Commit Ops
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of commit operations.

Examples
The following example displays statistics about the NFSv3 operations for a node named node1:

```
cluster1::> statistics nfs show-v3 -node node1
```

<table>
<thead>
<tr>
<th>Node</th>
<th>Value</th>
<th>Delta</th>
<th>Percent Ops</th>
<th>Delta</th>

### statistics nfs show-v4

**Display NFSv4 statistics**

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The `statistics nfs show-v4` command displays the following statistics about the NFSv4 operations on each node in the cluster:

- Result of the operations (success or failure)
- Total number of null operations
- Total number of compound operations
- Total number of access operations

---

**Parameters**

```bash
[-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.
```

```bash
[-instance]

If you specify the `-instance` parameter, the command displays detailed information about all fields.
```

```bash
[-node {<nodename>|local}] - Node

If you specify this parameter, the command displays NFSv4 statistics only for the specified node.
```

```bash
[-result {success|failure|all}] - Result

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified result (success/failure/all).
```

```bash
[-null <Counter with Delta>] - Null Procedure

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of null operations.
```

```bash
[-cmpnd <Counter with Delta>] - Compound Procedure

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of compound operations.
```

```bash
[-access <Counter with Delta>] - Access Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of access operations.
```

```bash
[-close <Counter with Delta>] - Close Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of close operations.
```

```bash
[-commit <Counter with Delta>] - Commit Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of commit operations.
```

```bash
[-create <Counter with Delta>] - Create Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of create operations.
```

```bash
[-delpur <Counter with Delta>] - Delegpurge Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of delegpurge operations.
```
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of deleget operations.

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of getattr operations.

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of getfh operations.

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of link operations.

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lockt operations.

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of locku operations.

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lookup operations.

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lookupp operations.

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of nverify operations.

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of open operations.

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of openattr operations.

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of openconf operations.

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of opendowng operations.

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of putfh operations.
[-putpfh <Counter with Delta>] - PutPubFh Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of putpubfh operations.

[-putrfh <Counter with Delta>] - PutRootFh Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of putrootfh operations.

[-read <Counter with Delta>] - Read Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of read operations.

[-readdr <Counter with Delta>] - ReadDir Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of readdir operations.

[-rlink <Counter with Delta>] - ReadLink Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of readlink operations.

[-remove <Counter with Delta>] - Remove Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of remove operations.

[-rename <Counter with Delta>] - Rename Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of rename operations.

[-renew <Counter with Delta>] - Renew Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of renew operations.

[-restfh <Counter with Delta>] - RestoreFh Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of restorefh operations.

[-savefh <Counter with Delta>] - SaveFh Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of savefh operations.

[-secinf <Counter with Delta>] - SecInfo Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of secinfo operations.

[-sattr <Counter with Delta>] - SetAttr Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of setattr operations.

[-scid <Counter with Delta>] - SetCliId Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of setcliid operations.

[-scidc <Counter with Delta>] - SetCliIdConf Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of setcliidconf operations.

[-verify <Counter with Delta>] - Verify Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of verify operations.
[-write <Counter with Delta>] - Write Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of write operations.

[-relown <Counter with Delta>] - RelLockOwn Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of rellockown operations.

[-total <Counter64 with Delta>] - Total Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of total nfsv4 operations.

[-null-pct <Counter with Delta>] - Percent Null Procedure
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of null operations.

[-cmpnd-pct <Counter with Delta>] - Percent Compound Procedure
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of compound operations.

[-access-pct <Counter with Delta>] - Percent Access Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of access operations.

[-close-pct <Counter with Delta>] - Percent Close Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of close operations.

[-commit-pct <Counter with Delta>] - Percent Commit Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of commit operations.

[-create-pct <Counter with Delta>] - Percent Create Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of create operations.

[-delpur-pct <Counter with Delta>] - Percent Delegpurge Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of delegpurge operations.

[-delrtn-pct <Counter with Delta>] - Percent Delegret Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of delegret operations.

[-gattr-pct <Counter with Delta>] - Percent GetAttr Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of getattr operations.

[-getfh-pct <Counter with Delta>] - Percent GetFh Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of getfh operations.

[-link-pct <Counter with Delta>] - Percent Link Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of link operations.

[-lock-pct <Counter with Delta>] - Percent Lock Operations
If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lock operations.
[-lockt-pct <Counter with Delta>] - Percent LockT Operations
   If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lockt operations.

[-locku-pct <Counter with Delta>] - Percent LockU Operations
   If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of locku operations.

[-lookup-pct <Counter with Delta>] - Percent Lookup Operations
   If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lookup operations.

[-lookpp-pct <Counter with Delta>] - Percent LookupP Operations
   If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lookpp operations.

[-nverify-pct <Counter with Delta>] - Percent Nverify Operations
   If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of nverify operations.

[-open-pct <Counter with Delta>] - Percent Open Operations
   If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of open operations.

[-opattr-pct <Counter with Delta>] - Percent OpenAttr Operations
   If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of opattr operations.

[-opconf-pct <Counter with Delta>] - Percent OpenConf Operations
   If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of opconf operations.

[-openp-pct <Counter with Delta>] - Percent OpenDowng Operations
   If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of openp operations.

[-putfh-pct <Counter with Delta>] - Percent PutFh Operations
   If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of putfh operations.

[-putpfh-pct <Counter with Delta>] - Percent PutPubFh Operations
   If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of putpfh operations.

[-putrfh-pct <Counter with Delta>] - Percent PutRootFh Operations
   If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of putrootfh operations.

[-read-pct <Counter with Delta>] - Percent Read Operations
   If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of read operations.

[-readdir-pct <Counter with Delta>] - Percent ReadDir Operations
   If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of readdir operations.

[-rlink-pct <Counter with Delta>] - Percent ReadLink Operations
   If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of rlink operations.
[-remove-pct <Counter with Delta>] - Percent Remove Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of remove operations.

[-rename-pct <Counter with Delta>] - Percent Rename Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of rename operations.

[-renew-pct <Counter with Delta>] - Percent Renew Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of renew operations.

[-restfh-pct <Counter with Delta>] - Percent RestoreFh Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of restorefh operations.

[-savefh-pct <Counter with Delta>] - Percent SaveFh Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of savefh operations.

[-secinf-pct <Counter with Delta>] - Percent SecInfo Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of secinfo operations.

[-sattr-pct <Counter with Delta>] - Percent SetAttr Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of setattr operations.

[-sclid-pct <Counter with Delta>] - Percent SetCliId Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of setcliid operations.

[-scidc-pct <Counter with Delta>] - Percent SetCliIdConf Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of setcliidconf operations.

[-verify-pct <Counter with Delta>] - Percent Verify Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of verify operations.

[-write-pct <Counter with Delta>] - Percent Write Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of write operations.

[-relown-pct <Counter with Delta>] - Percent RelLockOwn Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of rellockown operations.

### Examples

The following example displays statistics about the NFSv4 operations for a node named node1:

```
cluster1::> statistics nfs show-v4 -node node1

<table>
<thead>
<tr>
<th>Node</th>
<th>Value</th>
<th>Delta</th>
<th>Percent Ops</th>
<th>Delta</th>

**statistics node commands**

System utilization metrics for each node in the cluster

**statistics node show**

System utilization metrics for each node in the cluster

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

This command continuously displays performance data for nodes at a regular interval. The command output displays data in the following columns:

- **Node** - node name.
- **CPU (%)** - CPU utilization.
- **Total Ops** - total number of operations per second.
- **Latency(ms)** - average latency for an operation in milliseconds.

**Parameters**

[-node `<nodename>` | local] - Node

Selects the node for which you want to display performance data.
- sort-key <text> - Column to Sort By
  If this parameter is specified, the command displays statistics sorted by the specified column.

- interval <integer> - Interval
  Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

- iterations <integer> - Iterations
  Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

- max <integer> - Maximum Number of Instances
  Specifies the maximum number of aggregates to display. The default setting is 25.

Examples
The following example displays node statistics:

```
cluster1::> statistics node show
cluster1 : 12/31/2013 16:00:04

CPU *Total Latency
Node (%)  Ops  (ms)
----- --- ------ -------
node2  76   113      -
node1  58    10      -

[...]
```

statistics oncrpc commands
Monitor ONC RPC statistics

statistics oncrpc show-rpc-calls
Display ONC RPC Call Statistics

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
Attention: This command is deprecated and will be removed in a future major release.

The statistics oncrpc show-rpc-calls command displays information about the Open Network Computing Remote Procedure Call (ONC RPC) calls performed by the nodes of a cluster.

Parameters
```
[[ -fields <fieldname>, ...]]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

[[-instance]]
  If you specify the -instance parameter, the command displays detailed information about all fields.

[-node {<nodename> | local}] - Node
  Use this parameter to display information only about the RPC calls performed by the node you specify.
```
[-protocol {TCP|UDP}] - Transport Protocol

Use this parameter to display information only about the RPC calls performed using the network protocol you specify.

[-badproc <Counter with Delta>] - Bad Procedure Calls

Use this parameter to display information only about the RPC calls that have the number of bad procedure calls you specify. Bad procedure calls are RPC requests that contain invalid procedure numbers and cannot be completed.

[-badlen <Counter with Delta>] - Bad Length Calls

Use this parameter to display information only about the RPC calls that have the number of bad length calls you specify.

[-badhdr <Counter with Delta>] - Bad Header Calls

Use this parameter to display information only about the RPC calls that have the number of bad header calls you specify.

[-badcalls <Counter with Delta>] - Bad Calls

Use this parameter to display information only about the RPC calls that have the number of bad calls you specify.

[-badprogcalls <Counter with Delta>] - Bad Program Calls

Use this parameter to display information only about the RPC calls that have the number of bad program calls you specify.

[-calls <Counter64 with Delta>] - Total Calls

Use this parameter to display information only about the RPC calls that have the total number of bad calls you specify.

Examples

```
cluster1::> statistics oncrpc show-rpc-calls

statistics oncrpc commands
statistics port commands

Displays performance data for ports

**statistics port fcp commands**

FCP port interface throughput and latency metrics

**statistics port fcp show**

FCP port interface throughput and latency metrics

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

This command continuously displays performance data for FCP ports at a regular interval. The command output displays data in the following columns:

- Port - port name.
- Read Ops - read operations per second.
- Write Ops - write operations per second.
- Other Ops - other operations per second.

**Parameters**

- `-port <text>` - Port
  
  Selects the port for which you want to display performance data.

- `-sort-key <text>` - Column to Sort By
  
  If this parameter is specified, the command displays statistics sorted by the specified column.

- `-interval <integer>` - Interval
  
  Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

- `-iterations <integer>` - Iterations
  
  Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

- `-max <integer>` - Maximum Number of Instances
  
  Specifies the maximum number of ports to display. The default setting is 25.

**Examples**

The following example displays port statistics:

```
cluster1::> statistics port fcp show
cluster1 : 12/31/2013 16:00:04

*Total Read Write
Port     Ops  Ops   Ops
------- ------ ---- ----
```
Performance Preset configuration directory

The preset directory

Directory contains commands to delete, modify, import, and display Performance Preset configurations and their details. A Performance Preset declares a list of one or more Performance Object names and a list of Performance Counter names (for each Object). Preset configurations expected to be used by the Performance Archive will specify sample periods for each Counter, declaring how often each Counter is to be archived. To create a new Performance Preset configuration, the perf-preset-create API or statistics preset import command must be used.

statistics preset delete

Delete an existing Performance Preset

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

Deletes a performance preset configuration and all of its associated details.

Parameters

- -preset <text> - Preset Name

Specifies the name of the performance presets that you want to delete.

Examples

```
cluster1:*> statistics preset show
Preset Name: asup-event
  Preset UUID: 55c03699-01db-11e2-8e3e-123478563412
  Comment: The event-based AutoSupport Data ONTAP Performance Archive preset configuration. This preset configuration is used whenever an event-based AutoSupport is triggered.
  Privilege: diagnostic
  Read-Only: true
  Archive Enabled: false
  Generation ID: 0

Preset Name: asup-hourly
  Preset UUID: 56178a2a-01db-11e2-8e3e-123478563412
  Comment: The hourly AutoSupport Data ONTAP Performance Archive preset configuration. This preset configuration is used by the hourly AutoSupport collection events.
  Privilege: diagnostic
  Read-Only: true
  Archive Enabled: true
  Generation ID: 0

Preset Name: default
  Preset UUID: 55ac6297-01db-11e2-8e3e-123478563412
  Comment: The default Data ONTAP Performance Archive preset configuration. This preset configuration includes essential counters to assist in general troubleshooting of system performance.
  Privilege: diagnostic
  Read-Only: true
  Archive Enabled: true
  Generation ID: 0

Preset Name: diagnostic
  Preset UUID: 561db291-01db-11e2-8e3e-123478563412
  Comment: The diagnostic Data ONTAP Performance Archive preset
```
configuration. This preset configuration includes more counters at faster sample periods than the default configuration to assist in troubleshooting abnormal system performance.

**statistics preset modify**

Modify an existing Performance Preset

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.
Description
Modifies an existing performance preset configuration. The command modifies the global properties of a preset, but does not modify the details of the preset, such as specific objects and counters sampled.

Parameters
- **-preset <text>** - Preset Name
  Name of the performance preset to be modified.

  **[-new-name <text>]** - New Preset Name
  Set preset name to the given new name.

  **[-comment <text>]** - Preset Description
  Set comment to the given value.

  **[-privilege <PrivilegeLevel>]** - Preset Privilege Level
  Set privilege level at which this preset can be viewed or modified to the given value. Possible values: admin, advanced, diagnostic.

Examples
```
cluster1::*> statistics preset show
Preset Name: delta
Preset UUID: 7a04f19d-02a7-11e2-8e40-123478563412
  Comment: custom preset description
  Privilege: diagnostic
  Read-Only: false
  Archive Enabled: false
  Generation ID: 0
1 entry was displayed.

cluster1::*> statistics preset modify -preset delta -comment "new comment"

cluster1::*> statistics preset show
Preset Name: delta
Preset UUID: 7a04f19d-02a7-11e2-8e40-123478563412
  Comment: new comment
  Privilege: diagnostic
  Read-Only: false
  Archive Enabled: false
  Generation ID: 0
1 entry was displayed.
```

**statistics preset show**
Display information about Performance Presets

**Availability:** This command is available to cluster administrators at the advanced privilege level.

**Description**
Displays information about performance preset configurations.

**Parameters**

- **{ [-fields <fieldname>, ...] **
  Selects which performance preset attributes to display.

- **[-instance ] **
  Shows details of all attributes of performance preset configuration.

- **[-preset <text>]** - Preset Name
  Selects the performance presets that match the specified preset name.
[[-comment <text>]] - Preset Description
  Selects the performance presets that match the specified comment.

[[-privilege <PrivilegeLevel>]] - Preset Privilege Level
  Selects the performance presets that are available with the specified privilege.

[[-is-read-only {true|false}]] - Is Preset Read-Only?
  Selects the performance presets that are read-only (true) or are not read-only (false). Read-only presets cannot be modified.

[[-store <text>]] - Name of Store Where Data is Saved
  Selects the store where data is saved.

---

Examples

```
cluster1::*> statistics preset show
Preset Name         Privilege  Read-Only Comment
------------------- ---------- --------- --------------------------------------
aggregate_overview  admin      true      This preset configuration is used by
                                 statistics aggregate show command.
                                 Provides overview of aggregate object.
                                 
disk_overview       advanced   true      This preset configuration is used by
                                 statistics disk show command.
                                 Provides overview of disk object.
                                 
fcp_port_overview   admin      true      This preset configuration is used by
                                 statistics port fcp show command.
                                 Provides overview of fcp port object.
                                 
flash_pool_overview admin      true      This preset configuration is used by
                                 statistics cache flash-pool show
                                 command. Provides overview of flash
                                 pool object.
                                 
[...]
```

Performance Preset Detail directory

The detail directory

Directory contains commands to display Performance Preset Details for Performance Preset configurations.

**statistics preset detail show**

Display information about Performance Preset Details

**Availability:** This command is available to cluster administrators at the advanced privilege level.

**Description**

Displays the specific details of each preset, including the objects sampled, the counter sample periods, and the counters sampled.

**Parameters**

{ [-fields <fieldname>, ...] 
  Selects which performance preset detail attributes to display. 
  
  [[-instance ]] 
  Displays all of the performance preset detail attributes. 

[[-preset <text>]] - Preset Name
  Selects the performance preset details that match the specified preset name.

[[-object <text>]] - Performance Object
  Selects the performance preset details that match the specified object name.
[\-sample-period <sample_period>] - Archive Sample period

Selects the performance preset details that are collected at the specified sample period.

[\-counter-set <text>, ...] - Performance Counter Name Set

Selects the performance preset details that match the specified counters in the counter set. Use ";" to separate multiple counters.

[\-instance-filters <text>, ...] - Performance Instance Filters

Selects the performance preset details that match the specified instance filters. Use ";" to separate multiple instance filters. This field is reserved for future use.

Examples

```
class1::*> statistics preset detail show
                     | Preset Name | Object | Sample Counter | Instance Set | Filters
-------------------+------------+--------+----------------+--------------+----------------
asup-event         + aggregate  + lw     + instance_name, -
                   |            |        | node_name,     |
                   |            |        | process_name,  |
                   |            |        | parent_host,   |
                   |            |        | total_transfers,|
                   |            |        | user_reads,    |
                   |            |        | user_writes,   |
                   |            |        | cp_reads,      |
                   |            |        | user_read_blocks,|
                   |            |        | user_write_blocks,|
                   |            |        | cp_read_blocks,|
                   |            |        | wv_fsid,       |
                   |            |        | wv_vol_type,   |
                   |            |        | wv_fsinfo_fs_version,|
                   |            |        | wv_volinfo_fs_options,|
                   |            |        | . . .           |
```

statistics samples directory

The samples directory

The statistics samples commands provide information about samples.

statistics samples delete

Delete statistics samples

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description

This command deletes samples that you created using the statistics start command.

Parameters

\-vserver <vserver name> - Vserver

Selects the Vserver for which you want to delete the sample. The default Vserver is admin Vserver.

\-sample-id <text> - Sample Identifier

Specifies the sample that you want to delete. This is a required parameter.
Examples
The following example deletes the sample "smpl_1":

```
cluster1:*> statistics samples delete -sample-id smpl_1
```

statistics start on page 718

**statistics samples show**
Display statistics samples

**Availability:** This command is available to cluster and Vserver administrators at the advanced privilege level.

**Description**
This command displays information about the samples that you created using the statistics start command.

**Parameters**
```
{ [-fields <fieldname>, ...]  
    If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?' to display the fields to specify.

 [-describe]  
    Displays detailed information about each sample.

 [-vserver <vserver name>] - Vserver  
    Selects the samples that match this parameter value. If you omit this parameter, the command displays details for all samples.

 [-sample-id <text>] - Sample Identifier  
    Selects the samples that match this parameter value. If you do not specify this parameter, the command will display information about all the samples in the cluster.
```

Examples
The following example displays information for sample "smpl_1":

```
cluster1:*> statistics samples show -sample-id smpl_1
```

<table>

Counter: -
Start Time: 09/13 18:06:46
statistics settings commands

Manage the displaying of statistics

statistics settings modify

Modify settings for the statistics commands

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
This command modifies the settings for all of the statistics commands.

Parameters
- \[-display-rates \{true|false\}\] - Display Rates
  Specifies whether the statistics commands display rate counters in rates/second. The default is true.

- \[-client-stats \{enabled|disabled\}\] - Collect Per-Client Statistics
  Specifies whether statistics commands display per-client information. The default is disabled.
  Note: If you enable this setting, you might significantly impact system performance.

- \[-counter-display-units \{B|KB|MB|GB\}\] - Counter Display Units
  Specifies display units for the counters. The default setting is MB.

- \[-display-count-exponent <integer>\] - Display Count Exponent
  Specifies display exponent value for the counters representing counts. The default setting is 3 (thousand).

Examples

The following example sets the value of the \[-display-rates\] parameter to false:

```
cluster1::* > statistics settings modify -display-rates false
```

Availability: This command is available to cluster administrators at the admin privilege level.

Description
This command continuously displays performance data for cluster at a regular interval. The command output displays data in the following columns:

- System - cluster name.
- CPU (%) - CPU utilization.
- Total Ops - total number of operations per second.
- Latency(ms) - average latency for an operation in milliseconds.

Parameters

- `-system <text>` - System
  Selects the cluster for which you want to display performance data.

- `-sort-key <text>` - Column to Sort By
  If this parameter is specified, the command displays statistics sorted by the specified column.

- `-interval <integer>` - Interval
  Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

- `-iterations <integer>` - Iterations
  Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

- `-max <integer>` - Maximum Number of Instances
  Specifies the maximum number of systems to display. The default setting is 25.

Examples
The following example displays system statistics:
statistics top commands
Displays performance data for statistically tracked objects

statistics top client commands
Most active clients

statistics top client show
Most active clients

Availability: This command is available to cluster administrators at the admin privilege level.

Description
This command continuously displays performance data for top clients at a regular interval. The command output displays data in the following columns:

• Client - client name.
• Vserver - vserver name.
• Node - node name.
• Protocol - protocol name.
• Total Ops - total number of operations per second.
• Total (Bps) - total throughput in bytes per second.

Parameters

[-node {<nodename>|local}] - Node
Selects the node for which you want to display performance data.

[-sort-key <text>] - Column to Sort By
If this parameter is specified, the command displays statistics sorted by the specified column.

-interval <integer> - Interval
Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

-iterations <integer> - Iterations
Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

-max <integer> - Maximum Number of Instances
Specifies maximum number of top clients to display. The default setting is 10.
Examples
The following example displays top client statistics:

```
cluster1::> statistics top client show
cluster-1 : 12/31/1969 16:00:04

<table>
<thead>
<tr>
<th>Client</th>
<th>Vserver</th>
<th>Node</th>
<th>Total Operations</th>
<th>Total Throughput</th>
</tr>
</thead>
<tbody>
<tr>
<td>172.17.236.53:938</td>
<td>vserver01</td>
<td>cluster-node2</td>
<td>9</td>
<td>80</td>
</tr>
<tr>
<td>172.17.236.160:898</td>
<td>vserver02</td>
<td>cluster-node1</td>
<td>6</td>
<td>50</td>
</tr>
</tbody>
</table>
```

statistics top file commands
Most actively accessed files

statistics top file show
Most actively accessed files

Availability: This command is available to cluster administrators at the admin privilege level.

Description
This command continuously displays performance data for top files at a regular interval. The command output displays data in the following columns:

- File - file name.
- Volume - volume name.
- Vserver - vserver name.
- Aggregate - aggregate name.
- Node - node name.
- Total Ops - total number of operations per second.
- Total (Bps) - total throughput in bytes per second.

Parameters

- `[-node <nodename> | local]` - Node
  Selects the node for which you want to display performance data.

- `[-sort-key <text>]` - Column to Sort By
  If this parameter is specified, the command displays statistics sorted by the specified column.

- `[-interval <integer>]` - Interval
  Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

- `[-iterations <integer>]` - Iterations
  Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

- `[-max <integer>]` - Maximum Number of Instances
  Specifies maximum number of top files to display. The default setting is 10.
Examples

The following example displays top files statistics:

```
cluster1::> statistics top file show
cluster-1 : 12/31/1969 16:00:04

<table>
<thead>
<tr>
<th>File</th>
<th>Volume</th>
<th>Vserver</th>
<th>Aggregate</th>
<th>Node</th>
<th>Total Ops (Bps)</th>
</tr>
</thead>
<tbody>
<tr>
<td>/vol/vol01/clus/cache</td>
<td>vol01</td>
<td>vserver01</td>
<td>aggr1</td>
<td>cluster-node2</td>
<td>9   80</td>
</tr>
<tr>
<td>/vol/vol02</td>
<td>vol02</td>
<td>vserver02</td>
<td>aggr2</td>
<td>cluster-node1</td>
<td>6   50</td>
</tr>
</tbody>
</table>

statistics volume commands

Volume throughput and latency metrics

statistics volume show

Volume throughput and latency metrics

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

This command continuously displays performance data for volumes at a regular interval. The command output displays data in the following columns:

- Volume - volume name.
- Vserver - vserver name.
- Aggregate - aggregate name.
- Total Ops - total number of operations per second.
- Read Ops - read operations per second.
- Write Ops - write operations per second.
- Other Ops - other operations per second.
- Read (Bps) - read throughput in bytes per second.
- Write (Bps) - write throughput in bytes per second.
- Latency(us) - average latency for an operation in microseconds.

Parameters

[-volume <text>] - Volume
Selects the volume for which you want to display performance data.

[-vserver <vserver name>] - Vserver
Selects the vserver for which you want to display performance data.

[-aggregate <text>] - Aggregate
Selects the aggregate for which you want to display performance data.
--- Column to Sort By

If this parameter is specified, the command displays statistics sorted by the specified column.

--- Interval <integer> - Interval

Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

--- Iterations <integer> - Iterations

Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

--- Maximum Number of Instances

Specifies the maximum number of volumes to display. The default setting is 25.

Examples

The following example displays volume statistics:

```
cluster1::> statistics volume show
cluster1 : 12/31/2013 16:00:04

*Total Read Write Other   Read Write Latency
Volume Vserver Aggregate Ops  Ops   Ops   Ops  (Bps) (Bps)    (us)
------ ------- --------- ------ ---- ----- ----- ------ ----- -------
vol0    -     aggr0     58   13    15    29 310585  3014      39
vol0    -   aggr0_n0     56    0    11    45   8192 28826      47
```

statistics vserver commands

Vserver throughput and latency metrics

statistics vserver show

Vserver throughput and latency metrics

Availability: This command is available to cluster administrators at the admin privilege level.

Description

This command continuously displays performance data for Vservers at a regular interval. The command output displays data in the following columns:

- Vserver - Vserver name.
- Total Ops - total number of operations per second.
- Read Ops - read operations per second.
- Write Ops - write operations per second.
- Other Ops - other operations per second.
- Read (Bps) - read throughput in bytes per second.
- Write (Bps) - write throughput in bytes per second.
- Latency(us) - average latency for an operation in microseconds.
Parameters

[-vserver <vserver name>] - Vserver

Selects the vserver for which you want to display performance data.

[-sort-key <text>] - Column to Sort By

If this parameter is specified, the command displays statistics sorted by the specified column.

[-interval <integer>] - Interval

Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

[-iterations <integer>] - Iterations

Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

[-max <integer>] - Maximum Number of Instances

Specifies the maximum number of Vservers to display. The default setting is 25.

Examples

The following example displays Vserver statistics:

```
cluster1::> statistics vserver show
cluster1 : 12/31/2013 16:00:04

*Total Read Write Other   Read Write Latency
Vserver    Ops  Ops   Ops   Ops  (Bps) (Bps)    (us)
------- ------ ---- ----- ----- ------ ----- -------
vs1     58   13    15    29 310585  3014      39
vs2     56    0    11    45   8192 28826      47

statistics workload commands

QoS workload throughput and latency metrics

statistics workload show

QoS workload throughput and latency metrics

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

This command continuously displays performance data for workloads at a regular interval. The command output displays data in the following columns:

- Workload - workload name.
- Total Ops - total number of operations per second.
- Read Ops - read operations per second.
- Write Ops - write operations per second.
- Other Ops - other operations per second.
- Read (Bps) - read throughput in bytes per second.
- Write (Bps) - write throughput in bytes per second.
• Latency(us) - average latency for an operation in microseconds.

Parameters

[-workload <text>] - Workload
Selects the workload for which you want to display performance data.

[-sort-key <text>] - Column to Sort By
If this parameter is specified, the command displays statistics sorted by the specified column.

-interval <integer> - Interval
Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

-iterations <integer> - Iterations
Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

-max <integer> - Maximum Number of Instances
Specifies the maximum number of workloads to display. The default setting is 25.

Examples

The following example displays workload statistics:

```
cluster1::> statistics workload show
cluster1 : 12/31/2013 16:00:04

*Total Read Write Other   Read Write Latency  
Workload    Ops  Ops   Ops  (Bps) (Bps)    (us) 
--------------- ------ ---- ----- ----- ------ -------
_USERSPACE_APPS     30    1     3     0  30765  8553       0

[...]```

storage-service commands

Manage Storage Services

storage-service show

Display the available storage services

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description

This command displays the available Storage Services.

Note: The available Storage Services are defined by the type of storage making up an aggregate.

Parameters

{ [-fields <fieldname>, ...] }  
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use ‘-fields?’ to display the fields to specify.
If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-vserver <vserver name>] - Vserver`
Selects the available Storage Services for Vservers that match the parameter value.

`[-storage-service <text>] - Storage Service`
Selects the available Storage Services whose name matches the parameter value.

`[-description <text>] - Description`
Selects the available Storage Services whose description matches the parameter value. This field is a text description of the Storage Service.

`[-expected-iops-per-tb <integer>] - Expected IOPS per TB`
Selects the available Storage Services whose expected IOPs per TB matches the parameter value. This field is the number of IOPs per provisioned TB nominally guaranteed by this Storage Service.

`[-peak-iops-per-tb <integer>] - Peak IOPS per TB`
Selects the available Storage Services whose peak IOPs per TB matches the parameter value. This field is the number of IOPs per provisioned TB used as the maximum Quality of Service (QoS) throttle.

`[-absolute-min-iops <integer>] - Absolute Minimum IOPS`
Selects the available Storage Services whose absolute minimum IOPs matches the parameter value. This field is the minimum number of IOPs used as the Quality of Service (QoS) throttle, if larger than the values calculated using the IOPs per TB parameters.

`[-target-latency <integer>] - Target Latency (ms)`
Selects the available Storage Service whose target latency matches the parameter value.

`[-aggr-list <aggregate name>, ...] - Aggregate List`
Selects the available Storage Services whose aggregate list matches the parameter value. The aggregates shown are the only ones used for provisioning when the corresponding Vserver and Storage Service are selected.

### Examples

```
cluster1::*> storage-service show
Vserver       Storage Service       Description
------------- ------------------------- ----------------------------------------------
vs1           extreme                Extreme Performance
              performance            Performance
              value                  Value
3 entries were displayed.
```

### Storage Commands

Manage physical storage, including disks, aggregates, and failover

The `storage` commands enable you to manage physical and logical storage, including disks and storage aggregates. They also enable you to manage storage failover.
Storage aggregate Commands

Manage storage aggregates

The_STORAGE_AGGREGATE_ command family manages aggregates. The storage aggregate commands can create new aggregates, add more disks to an aggregate, delete the existing ones, change aggregate status and apply options to an aggregate. Aggregate commands often affect the volumes contained within aggregates.

An aggregate name can contain letters, numbers, and the underscore character(_), but the first character must be a letter or underscore. A maximum of 100 aggregates can be created on each node.

An aggregate may be online, restricted, iron_restricted, or offline. When an aggregate is offline, no read or write access is allowed. When an aggregate is restricted, certain operations are allowed (parity recomputation or RAID reconstruction) but data access is not allowed.

Aggregates can be in combinations of the following raid status:

normal
The aggregate is in a normal state.
copying
The aggregate is currently the target aggregate of an active aggr copy operation.
ironing
A WAFL consistency check is being performed on this aggregate.
degraded
The aggregate contains at least one degraded RAID group that is not being reconstructed.
mirror degraded
The aggregate is a mirrored aggregate, and one of its plexes is offline or resyncing.
growing
Disks are in the process of being added to the aggregate.
initializing
The aggregate is in the process of being initialized.
invalid
The aggregate does not contain any volume and no volume can be added to it. Typically, this happens after an aborted aggregate copy operation.
needs check
A WAFL consistency check needs to be performed on the aggregate.
partial
The aggregate contains at least one disk, however, two or more disks are missing.
reconstruct
At least one RAID group in the aggregate is being reconstructed.
raid0
The aggregate consists of RAID-0 (no parity) RAID groups (V-Series and NetCache only).
raid4
The aggregate consists of RAID-4 RAID groups.
raid_dp
The aggregate consists of RAID-DP (Double Parity) RAID groups.

raid_tec
The aggregate consists of RAID-TEC (Triple Erasure Code) RAID groups.

redirect
A reallocation process optimized the layout of blocks in the aggregate. You cannot clear this status.

wafl inconsistent
The aggregate has been marked corrupted. Please contact technical support if you see an aggregate in this state.

**storage aggregate add-disks**
Add disks to an aggregate

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
The `storage aggregate add-disks` command adds disks to an existing aggregate. You must specify the number of disks or provide a list of disks to be added. If you specify the number of disks without providing a list of disks, the system selects the disks.

**Parameters**
- **-aggregate <aggregate name>** - Aggregate
  
  This parameter specifies the aggregate to which disks are to be added.

- **[-diskcount <integer>]** - Disk Count
  
  This parameter specifies the number of disks that are to be added to the aggregate.

- **{ [-disktype | -T {ATA | BSAS | FCAL | FSAS | LUN | MSATA | SAS | SSD | VMDISK | SSD-NVM}] }** - Disk Type
  
  This parameter specifies the type of disk that is to be added. It must be specified with the `-diskcount` parameter when adding disks to a Flash Pool.

  **Note:** Only the aggregates marked as hybrid-enabled can be converted to Flash Pools. Use `storage aggregate modify` command to mark the aggregate as hybrid-enabled.

  **Note:** When this parameter is used, disk selection is not influenced by RAID options `raid.mix.hdd.disktype.capacity` or `raid.mix.hdd.disktype.performance`. Only disks of the specified type are considered eligible for selection.

- **{ [-diskclass | -C {capacity | performance | archive | solid-state | array | virtual}] }** - Disk Class
  
  This parameter specifies the class of disk that is to be added. All disks that belong to the specified class are considered eligible for selection. The possible values are:
  
  - capacity = Capacity-oriented, near-line disk types. Includes disk types FSAS, BSAS and ATA.
  - performance = Performance-oriented, enterprise class disk types. Includes disk types FCAL and SAS.
  - archive = Archive class SATA disks in multi-disk carrier storage shelves. Includes disk type MSATA.
  - solid-state = Solid-state drives. Includes disk type SSD.
  - array = Logical storage devices backed by storage arrays and used by Data ONTAP as disks. Includes disk type LUN.
- virtual = Virtual disks that are formatted and managed by the hypervisor. Includes disk type VMDISK.

Note: When this parameter is used, disk selection is not influenced by RAID options
raid.mix.hdd.disktype.capacity or raid.mix.hdd.disktype.performance.

[--chksumstyle <aggrChecksumStyle>] - Checksum Style
This parameter specifies the checksum style for the disks to be added to an aggregate. It is not applicable if --disklist or --mirror-disklist is specified. The possible values are block for block checksum and advanced_zoned for advanced zoned checksum (AZCS). By default, disks with the same checksum style as the aggregate are selected. This behavior can be overridden by using this parameter to create a mixed checksum aggregate. A mixed checksum aggregate can support only the block and advanced_zoned checksum styles.

[--disksize <integer>] - Disk Size(GB)
This parameter specifies the size, in GB, of the disks that are to be added to the aggregate. Disks with a usable size between 90% and 105% of the specified size are selected.

|--disklist | -d <disk path name>, ...| - Disks
This parameter specifies a list of disks to be added. If you specify the --disklist parameter, you cannot further qualify the list of disks to be added by count, checksum style, size or type.

|--mirror-disklist <disk path name>, ...| - Disks for Mirrored Plex
This parameter specifies a list of mirror disks to be added. It must contain the same number of disks specified in --disklist parameter. If you specify the --mirror-disklist parameter, you cannot further qualify the list of disks to be added by count, checksum style or type.

|--ignore-pool-checks [true]| - Don't Enforce Plex Pool Best Practices
The disks in a plex are normally required to come from the same SyncMirror pool. This behavior can be overridden with this parameter when it is set to true.

|--allow-mixed-rpm | -f [true]| - Allow Disks With Different RPM Values
This parameter specifies whether disks that have different RPM values can be added. For example, SAS disks can rotate at 10,000 or 15,000 RPM. If this parameter is set to true and a list of disks are provided by using the --disklist parameter, the disks will be added even if the SAS disks you specify have different RPM values. This parameter works similarly for ATA disks, which can rotate at 5,400 or 7,200 RPM.

Note: This parameter is applicable only when the --disklist or --mirror-disklist parameter is used.

|--allow-same-carrier [true]| - Allow Same RAID Group Within Carrier
This parameter can be used to allow two disks housed in the same carrier to be in the same RAID group when you add disks to an aggregate.

Having disks in the same carrier in the same RAID group is not desirable because a carrier failure can cause a simultaneous outage for two disks in the same RAID group. You can add a disk to an aggregate that causes this situation, but when an alternate disk becomes available, Data ONTAP automatically initiates a series of disk copy operations to put the disks into different RAID groups. For this reason, you should use this parameter only when necessary. When possible, allow Data ONTAP to choose disks that need to be added to the aggregate.

This parameter affects only the add-disks operation. It is not a persistent attribute of the aggregate.

|--storage-pool <storage pool name>| - Storage Pool
This parameter specifies the name of the SSD storage pool from which available allocation units are added to a given aggregate. This parameter cannot be used with the --disk-list or --disk-count parameters.

|--allocation-units <integer>]] - Allocation Units
This parameter specifies the number of allocation units to be added to a given aggregate from an SSD storage pool. Number of allocation units available and size of each unit can be found using the storage pool
show-available-capacity command. This parameter works only when you also use the -storage-pool parameter.

[[-simulate | -n [true]] - Simulate Addition of Disks]
This parameter is used with the disktype and diskcount parameters to determine which disks would be added without actually performing the addition of disks operation.

[[-raidgroup | -g {new|all|<raidgroup>}]] - RAID Group
This parameter enables the administrator to specify which RAID group will receive the added disks. If this parameter is not used, the disks are added to the most recently created RAID group until it is full, then new raid groups are created and filled until all the disks are added. If a RAID group name rgX is specified, the disks are added to that RAID group. If new is specified, the disks are added to a new RAID group, even if the disks would fit into an existing RAID group. If all is specified, the disks are added to existing RAID groups until all existing RAID groups are full. Then Data ONTAP creates one or more new RAID groups and adds the remaining disks to the new groups. If the disk type or checksum style parameters are specified with this parameter, the command operates only on the RAID groups with the matching disk type or checksum style, even if all is specified.

[[-cache-raid-group-size <integer>]] - RAID Group Size for Cache Tier
This parameter specifies the maximum number of disks that can be included in an SSD RAID group for this aggregate.

**Note:** This parameter is applicable only when adding SSDs for the first time to a hybrid-enabled aggregate. If this parameter is not used when the first SSDs are added to the aggregate, the maximum RAID group size for the SSD cache is set to the default SSD RAID group size for the RAID type of the SSD cache.

[[-raidtype | -t {raid_tec|raid_dp|raid4}]] - RAID Type
This parameter specifies the type for the new RAID groups that would be created while adding disks to the aggregate. Use this parameter when you add the first RAID group comprised of SSDs to a hybrid-enabled aggregate. The values are raid4 for RAID4, raid_dp for RAID Double Parity, and raid_tec for RAID-TEC. The default value is the type of RAID groups of the aggregate, except for RAID-TEC hybrid-enabled aggregates where the SSD tier will default to raid_dp. An aggregate might include a mix of different RAID types.

**Examples**
The following example adds 10 disks to an aggregate named aggr0. The disks are added to a RAID group named rg1:

```
cluster1::> storage aggregate add-disks -aggregate aggr0 -diskcount 10 -raidgroup rg1
```

In this example, an aggregate is converted to a Flash Pool aggregate using SSD capacity from a storage pool. The aggregate was created using RAID-DP for the hard disks and the SSDs are added using RAID4.

```
cluster1::> storage aggregate add-disks -aggregate FlashPool -storage-pool SP1 -allocation-units 1 -raidtype raid4
```

storage aggregate auto-provision

Recommend and create new aggregates in the cluster

Availability: This command is available to cluster administrators at the admin privilege level.

Description

This command analyzes available spare disks in the cluster, and it provides a recommendation how spare disks should be used to create aggregates according to best practices. The command prints the summary of recommended aggregates including their names and usable size. It then prompts the user whether the aggregates should be created as recommended. On positive response, ONTAP creates aggregates as described in the recommendation.

The command parameters allow to restrict the command to some nodes in the cluster, print more details about recommended aggregates, and to skip the prompt.

Parameters

[-nodes {<nodename>|local}, ...] - List of Nodes

Comma separated list of node names to which the command applies. If this parameter is not used, the command applies to all nodes in the cluster.

[-verbose [true]] - Report More Details

Report additional details about recommended aggregates and spare disks. Per node summary shows number and total size of aggregates to create, discovered spares, and also remaining spare disks and partitions after aggregate creation. RAID group layout shows how spare disks and partitions will be used in new data aggregates to be created. The last table shows spare disks and partitions remaining unused after aggregate creation.

[-skip-confirmation [true]] - Skip the Confirmation and Create Recommended Aggregates

When this parameter is used, the command automatically creates the recommended aggregates. When this parameter is not used, the command checks to proceed with aggregate creation or not.

Note: The command is not affected by the CLI session setting: set -confirmations on/off.

Examples

```
cluster1::storage aggregate> auto-provision
Node               New Data Aggregate            Usable Size
------------------ ---------------------------- ------------
node1              node1_SSD_1                        3.66TB
node2              node2_SSD_1                        3.66TB
------------------ ---------------------------- ------------
Total:             2 new data aggregates              7.32TB

Do you want to create recommended aggregates? {y|n}: n

cluster1::storage aggregate> auto-provision -verbose
Per node summary of new aggregates to create, discovered spares, and also remaining spare disks and partitions after aggregate creation:

storage aggregate create

Create an aggregate

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The storage aggregate create command creates an aggregate. An aggregate consists of disks. You must specify the number of disks or provide a list of disks to be added to the new aggregate. If you specify the number of disks without providing a list of disks, the system selects the disks.

When creating an aggregate, you can optionally specify the aggregate’s home node, the RAID type for RAID groups on the aggregate, the maximum number of disks that can be included in a RAID group, and whether the aggregate's contents are encrypted.

Parameters

- **aggregate <aggregate name>** - Aggregate
  
  This parameter specifies the name of the aggregate that is to be created.

- **[-chksumstyle <aggrChecksumStyle>]** - Checksum Style
  
  This parameter specifies the checksum style for the aggregate. The values are block for Block Checksum and advanced_zoned for Advanced Zoned Checksum (AZCS).
-diskcount <integer> - Number Of Disks

This parameter specifies the number of disks that are to be included in the aggregate, including the parity disks. The disks in this newly created aggregate come from the pool of spare disks. The smallest disks in this pool are added to the aggregate first, unless you specify the -disksize parameter.

[-diskrpm | R <integer>] - Disk RPM

This parameter specifies the RPM of the disks on which the aggregate is to be created. The possible values include 5400, 7200, 10000, and 15000.

[-disksize <integer>] - Disk Size(GB)

This parameter specifies the size, in GB, of the disks on which the aggregate is to be created. Disks with a usable size between 90% and 105% of the specified size are selected.

[-disktype | -T {ATA | BSAS | FCAL | FSAS | LUN | MSATA | SAS | SSD | VMDISK | SSD-NVM}] - Disk Type

This parameter specifies the type of disk on which the aggregate is to be created.

Note: When this parameter is used, disk selection is not influenced by RAID options raid.mix.hdd.disktype.capacity or raid.mix.hdd.disktype.performance. Only disks of the specified type are considered eligible for selection.

[-diskclass | -C {capacity | performance | archive | solid-state | array | virtual}] - Disk Class

This parameter specifies the class of disks on which the aggregate is to be created. All disks that belong to the specified class are considered eligible for selection. The possible values are:

- capacity = Capacity-oriented, near-line disk types. Includes disk types FSAS, BSAS and ATA.
- performance = Performance-oriented, enterprise class disk types. Includes disk types FCAL and SAS.
- archive = Archive class SATA disks in multi-disk carrier storage shelves. Includes disk type MSATA.
- solid-state = Solid-state drives. Includes disk type SSD.
- array = Logical storage devices backed by storage arrays and used by Data ONTAP as disks. Includes disk type LUN.
- virtual = Virtual disks that are formatted and managed by the hypervisor. Includes disk type VMDISK.

Note: When this parameter is used, disk selection is not influenced by RAID options raid.mix.hdd.disktype.capacity or raid.mix.hdd.disktype.performance.

[-mirror | -m [true]] - Mirror

This parameter specifies that the new aggregate be mirrored (have two plexes). If this parameter is set to true, the specified disks are split between the two plexes. By default, the new aggregate will not be mirrored. You cannot use the -mirror parameter when supplying a specific list of disks with either the -disklist or -mirror-disklist parameters.

[-pool <aggrSparePool>] - Spare Pool

This parameter specifies the SyncMirror pool to be used to supply the disks for the aggregate. Valid values are Pool0 or Pool1.

[-disklist | -d <disk path name>, ...] - Disks for First Plex

This parameter specifies a list of disks to be added to the new aggregate. If you specify the -disklist parameter, you cannot further qualify the list of disks to be added by count, checksum style, type, size, or RPM. You cannot use the -disklist parameter when the -mirror parameter is set to true.

[-mirror-disklist <disk path name>, ...] - Disks for Mirrored Plex

This parameter specifies a list of mirror disks to be added to the new mirrored aggregate. It must contain the same number of disks specified in -disklist parameter. If you specify the -mirror-disklist parameter,
you cannot further qualify the list of disks to be added by count, checksum style, type, size, or RPM. You
cannot use the \texttt{-mirror-disklist} parameter when the \texttt{-mirror} parameter is set to \texttt{true}.

\textbf{[-ignore-pool-checks \{true\}]} - Don't Enforce Plex Pool Best Practices

The disks in a plex are normally required to come from the same SyncMirror pool. This behavior can be
overridden with this parameter when it is set to \texttt{true}. This option cannot be used when the \texttt{-mirror} option is set to \texttt{true}.

\textbf{[-allow-mixed-rpm] \{-f \{true\}\]} - Allow Disks With Different RPM Values

This parameter specifies whether the aggregate can contain disks that have different RPM values. For example,
SAS disks can rotate at 10,000 or 15,000 RPM. If this parameter is set to \texttt{true} and a list of disks are provided
by using the \texttt{-disklist} parameter, the aggregate will be created even if the SAS disks you specify have
different RPM values. This parameter works similarly for ATA disks, which can rotate at 5,400 or 7,200 RPM.

\textbf{[-allow-same-carrier \{true\}]} - Allow Same RAID Group Within Carrier

This parameter can be used to allow two disks housed in the same carrier to be in the same RAID group when
you add disks to an aggregate.

Having disks in the same carrier in the same RAID group is not desirable because a carrier failure can cause a
simultaneous outage for two disks in the same RAID group. You create an aggregate with this characteristic,
but when an alternate disk becomes available, Data ONTAP automatically initiates a series of disk copy
operations to put the disks into different RAID groups. For this reason, you should use this parameter only
when necessary. When possible, allow Data ONTAP to choose the disks from which to create the aggregate.

This parameter affects only the aggregate creation operation. It is not a persistent attribute of the aggregate.

\textbf{[-node \{<nodename>|local\}]} - Node

This parameter specifies the home node for the aggregate. If this parameter is not specified, Data ONTAP
selects the node where the aggregate is created.

\textbf{[-maxraisdsize] \{-s \<integer\}\]} - Max RAID Size

This parameter specifies the maximum number of disks that can be included in a RAID group.

\textbf{[-raidtype] \{-t \{raid_tec|raid_dp|raid4\}\]} - RAID Type

This parameter specifies the type for RAID groups on the aggregate. The values are \texttt{raid4} for RAID4,
\texttt{raid_dp} for RAID Double Parity, and \texttt{raid_tec} for RAID Triple-Erasure-Code. The default setting is
\texttt{raid_dp} unless the disks are HDDs with a capacity larger than 4 TB, in which case the default will be
\texttt{raid_tec}. This parameter is not needed for array LUNs because they are always created with the \texttt{raid0}
raidtype.

\textbf{[-simulate \{true\}] - Simulate Aggregate Provisioning Operation}

This option simulates the aggregate creation and prints the layout of the new aggregate.

\textbf{[-force-small-aggregate \{true\}]} - Force the Creation of a Small Aggregate (privilege: advanced)

This parameter can be used to force the creation of a 2-disk RAID4 aggregate, or a 3-disk or 4-disk RAID-DP
aggregate.

\textbf{[-is-autobalance-eligible \{true|false\}]} - Is Eligible for Auto Balance Aggregate (privilege: advanced)

This specifies whether the aggregate will be considered by the Auto Balance Aggregate feature. If the Auto
Balance Aggregate feature is not used, this field is not used. When this parameter is set to \texttt{true} the Auto
Balance Aggregate feature might recommend moving volumes to or from this aggregate in order to balance
system workload. When this parameter is set to \texttt{false} the aggregate will not be considered as a destination
for the Auto Balance Aggregate feature allowing for predictability in data placement. The default value is
\texttt{false}.

\textbf{[-encrypt \{true\}]} - Enable Encryption

This parameter specifies that the new aggregate be encrypted. If this parameter is set to \texttt{true}, the specified
aggregate's contents will be encrypted.
[-snaplock-type \-L {non-snaplock\|compliance\|enterprise}] - SnapLock Type

This parameter specifies the type of SnapLock aggregate to be created. In order to create a SnapLock Compliance aggregate, specify compliance. To create a SnapLock Enterprise aggregate, specify enterprise.

[-autobalance-unbalanced-threshold-percent <integer>] - Threshold When Aggregate Is Considered Unbalanced (%) (privilege: advanced)

This parameter specifies the space used threshold percentage that will cause the Auto Balance Aggregate feature to consider an aggregate as unbalanced.

[-autobalance-available-threshold-percent <integer>] - Threshold When Aggregate Is Considered Balanced (%) (privilege: advanced)

This parameter specifies the threshold percentage which will determine if an aggregate is a target destination for a move. The Auto Balance Aggregate feature will attempt to move volumes from an unbalanced aggregate until it is under this percentage.

Examples

The following example creates an aggregate named aggr0 on a home node named node0. The aggregate contains 20 disks and uses RAID-DP. The aggregate contains regular FlexVol volumes:

```
cluster1::> storage aggregate create -aggregate aggr0 -nodes node0 -diskcount 20 -raidtype raid_dp -volume-style flex
```

The following example creates an aggregate named aggr0 on a home node named node0. The aggregate contains the disks specified and uses RAID-DP

```
cluster1::> storage aggregate create -aggregate aggr0 -nodes node0 -disklist 1.0.15,1.0.16,1.0.17,1.0.18,1.0.19 -raidtype raid_dp
```

The following example creates an aggregate named aggr0 on a home node named node0. The aggregate contains 20 disks of size 6 TB and of type FSAS and uses RAID-TEC:

```
cluster1::> storage aggregate create -aggregate aggr0 -nodes node0 -diskcount 20 -raidtype raid_tec -disksize 6000 -disktype FSAS
```

The following example creates a mirrored aggregate named aggr0 on the local node. The aggregate contains 10 disks in each plex:

```
cluster1::> storage aggregate create -aggregate aggr0 -mirror -diskcount 20
```

The following example creates an aggregate named aggr1 on the local node. The aggregate contains 3 disks and is encrypted

```
cluster1::> storage aggregate create -aggregate aggr1 -diskcount 3 -encrypt true
```

storage raid-options on page 1000

storage aggregate delete

Delete an aggregate

Availability: This command is available to cluster administrators at the admin privilege level.
Description
The `storage aggregate delete` command deletes a storage aggregate. The command fails if there are volumes present on the aggregate. If the aggregate has an object store attached to it, then in addition to deleting the aggregate the command deletes the objects in the object store as well. No changes are made to the object store configuration as part of this command.

Parameters
- `aggregate <aggregate name>` - Aggregate
  This parameter specifies the aggregate that is to be deleted.
- `[-preserve-config-data [true]]` - Delete Physical Aggregate but Preserve Configuration Data (privilege: advanced)
  Deletes the physical aggregate, but preserves the aggregate configuration data. The aggregate must not have any disks associated with it. If the parameter `[-preserve-config-data]` is specified without a value, the default value is `true`; if this parameter is not specified, the default value is `false`.

Examples
The following example deletes an aggregate named aggr1:

```
cluster1::> storage aggregate delete -aggregate aggr1
```

storage aggregate mirror
Mirror an existing aggregate

Availability: This command is available to `cluster` administrators at the `admin` privilege level.

Description
The `storage aggregate mirror` command adds a plex to an existing unmirrored aggregate. You can specify a list of disks to be used for the mirrored plex. If you do not specify the disks, the system automatically selects the disks based on the aggregate's existing plex.

Parameters
- `aggregate <aggregate name>` - Aggregate
  This parameter specifies the aggregate to mirror.
- `[-allow-mixed-rpm] [-f [true]]` - Allow Disks With Different RPM Values
  This parameter specifies whether disks that have different RPM values can be used. For example, SAS disks can rotate at 10,000 or 15,000 RPM. If this parameter is set to `true` and a list of disks are provided by using the `-mirror-disklist` parameter, the disks will be added even if the SAS disks you specify have different RPM values. This parameter works similarly for ATA disks, which can rotate at 5,400 or 7,200 RPM.

  **Note:** This parameter is only applicable when the `-mirror-disklist` parameter is used.

- `[-mirror-disklist | -d <disk path name>, ...]` - Disks for Mirrored Plex
  This parameter specifies a list of disks to be used for the plex to be added. It must contain the same number of disks as the existing plex of the unmirrored aggregate specified using the `-aggregate` parameter.

- `[-ignore-pool-checks [true]]` - Don't Enforce Plex Pool Best Practices
  For maximum reliability, all disks from a plex should come from the same SyncMirror pool, and the disks for the second plex should all come from the other pool. If needed, this behavior can be overridden by setting this parameter to `true`. This parameter can be used only with the `-mirror-disklist` parameter.

- `[-allow-same-carrier] [-f [true]]` - Allow Same RAID Group Within Carrier
  This parameter can be used to allow two disks housed in the same carrier to be in the same RAID group for a mirrored aggregate. Having disks in the same carrier in the same RAID group is not desirable, because a
carrier failure can cause a simultaneous outage for two disks in the same RAID group. For this reason, this configuration is not allowed by default. This restriction can be overridden by setting this parameter to \textit{true}.

\textbf{Note:} This parameter is accepted only when the \texttt{-mirror-disklist} parameter is used.

\texttt{[-simulate | -n [true]}\texttt{]} - Simulate Mirroring of an Existing Aggregate

This option simulates the mirroring of an existing aggregate and prints the layout of the new plex.

\begin{verbatim}
Examples
The following example mirrors an unmirrored aggregate aggr1:

cluster1::> storage aggregate mirror -aggregate aggr1

The following example mirrors an unmirrored aggregate aggr1. The specified disks are used for the new plex.

cluster1::> storage aggregate mirror -aggregate aggr1 -mirror-disklist 1.2.12, 1.2.14, 1.2.16
\end{verbatim}

\textbf{storage aggregate modify}

Modify aggregate attributes

\textbf{Availability:} This command is available to \textit{cluster} administrators at the \textit{admin} privilege level.

\textbf{Description}

The \textit{storage aggregate modify} command can be used to modify attributes of an aggregate such as RAID type and maximum RAID group size.

Changing the RAID type immediately changes the RAID group type for all RAID groups in the aggregate.

Changing the maximum RAID size does not cause existing RAID groups to grow or to shrink; rather, it affects the size of RAID groups created in the future, and determines whether more disks can be added to the RAID group that was most recently created.

\textbf{Parameters}

\texttt{-aggregate <aggregate name>} - Aggregate

This parameter specifies the storage aggregate that is to be modified.

\texttt{[-disktype | -T \{ATA | BSAS | FCAL | FSAS | LUN | MSATA | SAS | SSD | VMDISK | SSD-NVM\}}} - Disk Type

This parameter specifies either the HDD tier or the SSD tier when changing the RAID type of a Flash Pool. If the HDD tier is composed of more than one type of disk, specifying any of the disk types in use causes that tier to be modified.

\texttt{[-free-space-realloc \{on\|off\}]} - Free Space Reallocation

This parameter specifies whether free space reallocation is enabled on the aggregate.

Free space reallocation optimizes the free space in an aggregate immediately before Data ONTAP writes data to the blocks in that aggregate.

The default setting is \textit{off}.

\texttt{[-ha-policy \{sfo|cfo\}]} - HA Policy

This parameter specifies the high-availability policy to be used in the context of a root recovery procedure. Do not modify this setting unless directed to do so by a customer support representative.
[-percent-snapshot-space <percent>] - Space Reserved for Snapshot Copies

This parameter is used to set the space reserved for Snapshot copies to the specified value. For example, to set the snapshot reserve to 5%, you should enter `-percent-snapshot-space 5`.

[-space-nearly-full-threshold-percent <percent>] - Aggregate Nearly Full Threshold Percent

This optionally specifies the percentage at which the aggregate is considered nearly full, and above which an EMS warning will be generated. The default value is 95%. The maximum value for this option is 99%. Setting this threshold to 0 disables the aggregate nearly full space alerts.

[-space-full-threshold-percent <percent>] - Aggregate Full Threshold Percent

This optionally specifies the percentage at which the aggregate is considered full, and above which a critical EMS error will be generated. The default value is 98%. The maximum value for this option is 100%. Setting this threshold to 0 disables the aggregate full space alerts.

[-hybrid-enabled {true|false}] - Hybrid Enabled

If the hybrid-enabled option is set to "true", the aggregate is marked as hybrid_enabled, that is, the aggregate can contain a mix of SSDs and HDDs (Hard Disk Drives, e.g., SAS, SATA, and/or FC). By default, aggregates cannot be marked "hybrid_enabled" if the aggregate contains FlexVols that cannot be write cached. A FlexVol cannot be write-cached if it is part of an aggregate created in Data ONTAP 7. Use `-force-hybrid-enabled` to over-ride this behavior.

[-force-hybrid-enabled | -f {true}] - Force Marking of Aggregate as Hybrid Enabled

By default, aggregates cannot be marked "hybrid_enabled" if the aggregate contains FlexVols that cannot be write cached. A FlexVol cannot be write-cached if it is part of an aggregate created in Data ONTAP 7. Use `-force-hybrid-enabled` to over-ride this behavior. Note that read caching will be enabled on these FlexVols, but write caching will be disabled. Setting this parameter to `true` would mark the aggregate as hybrid_enabled; this means that the aggregate can contain a mix of SSDs and HDDs (Hard Disk Drives, for example, SAS, SATA and/or FC). This parameter is used to force marking aggregates which have FlexVols that cannot be write cached as hybrid enabled. FlexVols in the aggregate marked as hybrid enabled using this parameter which cannot participate in write-caching will only have read-caching enabled. All other FlexVols in the aggregate can participate in both read and write caching.

[-maxraidsize |-s <integer>] - Max RAID Size

This parameter specifies the maximum number of disks that can be included in a RAID group for this aggregate.

Note: For Flash Pools, this option controls the maximum size of the HDD RAID groups.

[-cache-raid-group-size <integer>] - Flash Pool SSD Tier Maximum RAID Group Size

This parameter specifies the maximum number of disks that can be included in a SSD RAID group for this Flash Pool.

Note: This parameter is applicable only for Flash Pools.

[-raidtype |-t {raid_tec|raid_dp|raid4}] - RAID Type

This parameter specifies the RAID type for RAID groups on the aggregate. The possible values are `raid4` for RAID4, `raid_dp` for RAID-DP, and `raid_tec` for RAID-TEC. If you change the RAID type from RAID4 to RAID-DP, each RAID group allocates a spare disk for the group's second parity disk and begins a reconstruction process. If you change the RAID type from RAID-DP to RAID-TEC, each RAID group allocates a spare disk for the group's third parity disk and begins a reconstruction process. Changing the RAID type from RAID4 to RAID-TEC or vice-versa is not supported. To change the RAID type from RAID4 to RAID-TEC, first change from RAID4 to RAID-DP and then to RAID-TEC.

[-resyncsnaptime <integer>] - SyncMirror Resync Snapshot Frequency in Minutes

This parameter sets the mirror resynchronization snapshot frequency to be the given number of minutes. The default value is 60 (minutes).
[-state <aggregate state>] - State

This deprecated parameter specifies the state of the aggregate. The possible values are as follows:

- online - Immediately sets the aggregate online. All volumes on the aggregate are set to the state they were in when the aggregate was taken offline or restricted. The preferred command to bring an aggregate online is storage aggregate online.
- offline - Takes an aggregate offline. You cannot take an aggregate offline if any of its volumes are online. The preferred command to take an aggregate offline is storage aggregate offline.
- restricted - Restrictions the aggregate. You cannot restrict an aggregate if any of its volumes are online. The preferred command to restrict an aggregate is storage aggregate restrict.

[-is-autobalance-eligible {true|false}] - Is Eligible for Auto Balance Aggregate (privilege: advanced)

This specifies whether the aggregate is considered by the Auto Balance Aggregate feature. If the Auto Balance Aggregate feature is not used, this field is not used. When this parameter is set to true the Auto Balance Aggregate feature might recommend moving volumes to or from this aggregate in order to balance system workload. When this parameter is set to false the aggregate will not be considered as a destination for the Auto Balance Aggregate feature allowing for predictability in data placement. The default value is false.

[-autobalance-unbalanced-threshold-percent <integer>] - Threshold When Aggregate Is Considered Unbalanced (%) (privilege: advanced)

This parameter sets the space used threshold percentage that will cause the Auto Balance Aggregate feature to consider an aggregate as unbalanced.

[-autobalance-available-threshold-percent <integer>] - Threshold When Aggregate Is Considered Balanced (%) (privilege: advanced)

This parameter sets the threshold percentage which will determine if an aggregate is a target destination for a move. The Auto Balance Aggregate feature will attempt to move volumes from an unbalanced aggregate until it is under this percentage.

[-resync-priority {high(fixed)|high|medium|low}] - Resynchronization Priority

This parameter specifies the new resynchronization priority value for the specified aggregate. This field cannot be modified for unmirrored or Data ONTAP system aggregates.

Possible values for this parameter are:

- high: Mirrored data aggregates with this priority value start resynchronization first.
- medium: Mirrored data aggregates with this priority value start resynchronization after all the system aggregates and data aggregates with 'high' priority value have started resynchronization.
- low: Mirrored data aggregates with this priority value start resynchronization only after all the other aggregates have started resynchronization.

[-single-instance-data-logging {off|on}] - Enable SIDL

This parameter specifies whether Single Instance Data Logging feature is enabled on the aggregate and the constituent volumes on the aggregate. This feature improves user write performace by optimizing the amount of data nvlogged by user writes on platforms where NVRAM and secondary storage are of same media type.

Examples

The following example changes all RAID groups on an aggregate named aggr0 to use RAID-DP:

```bash
cluster1::> storage aggregate modify -aggregate aggr0 -raidtype raid_dp
```

The following example changes all RAID groups with FSAS disks in an aggregate named aggr0 to use RAID-TEC:

storage aggregate scrub on page 785

storage aggregate offline
Offline an aggregate

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The storage aggregate offline command takes an aggregate offline.

If you are taking a root aggregate offline, the node owning the aggregate must be in maintenance mode.

Parameters

-aggregate <aggregate name> - Aggregate
The name of the aggregate to be taken offline.

Examples
The following example takes an aggregate named aggr1 offline:

cluster1::> storage aggregate offline -aggregate aggr1

The following example takes an aggregate named aggr1 offline by unmounting its volumes:

cluster1::> storage aggregate offline -aggregate aggr1 -unmount-volumes true

Related references

storage aggregate online on page 783

storage aggregate online
Online an aggregate

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The storage aggregate online command brings an aggregate online if the aggregate is in offline or restricted state. If an aggregate is in an inconsistent state, it must be brought to a consistent state before it can be brought online. If you have an aggregate that is in an inconsistent state, contact technical support.

Parameters

-aggregate <aggregate name> - Aggregate
The name of the aggregate to be brought online.

Examples
The following example brings an aggregate named aggr1 online:
storage aggregate remove-stale-record

Remove a stale aggregate record

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

The `storage aggregate remove-stale-record` command removes a stale storage aggregate record on disk. A stale aggregate record refers to an aggregate that has been removed from the storage system, but whose information remains recorded on disk. Stale aggregate records are displayed in the nodeshell `aggr status -r` command, but the `storage aggregate show` command does not show the aggregate as hosted on that node.

Parameters

-`-aggregate <aggregate name>` - Aggregate
  This parameter specifies the aggregate that corresponds to the stale aggregate record that is to be deleted.

-`-nodename {<nodename>|local}` - Node Name
  This parameter specifies the node that contains the aggregate.

Examples

The following example removes a stale aggregate record that refers to aggregate "aggr1":

```
cluster1::> storage aggregate remove-stale-record -aggregate aggr1 -nodename node1
```

storage aggregate rename

Rename an aggregate

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The `storage aggregate rename` command renames an aggregate.

Parameters

-`-aggregate <aggregate name>` - Aggregate
  This parameter specifies the aggregate to be renamed.

-`-newname <aggregate name>` - New Name
  This parameter specifies the new name for the aggregate.

Examples

The following example renames an aggregate named aggr5 as sales-aggr:
storage aggregate restrict

Restrict an aggregate

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
The `storage aggregate restrict` command puts an aggregate in restricted state to make data in the aggregate's volumes unavailable to clients. When an aggregate is in restricted state data access is not allowed. However, few operations such as aggregate copy, parity recomputation, scrub and RAID reconstruction are allowed. You can also use this command if you want the aggregate to be the target of an aggregate copy or SnapMirror replication operation.

**Parameters**

- `-aggregate <aggregate name>` - Aggregate
  
The name of the aggregate to be restricted.

**Examples**
The following example restricts an aggregate named aggr1:

```
cluster1::> storage aggregate restrict -aggregate aggr1
```

The following example restricts an aggregate named aggr2 by unmounting all the volumes within the aggregate:

```
cluster1::*> storage aggregate restrict -aggregate aggr2 -unmount-volumes true
```

**Related references**

`storage aggregate show` on page 787

storage aggregate scrub

Aggregate parity scrubbing

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
The `storage aggregate scrub` command scrubs an aggregate for media and parity errors. Parity scrubbing compares the data disks to the parity disks in their RAID group and corrects the parity disks contents, as required. If no name is given, parity scrubbing is started on all online aggregates.

**Note:** By default, scrubs are scheduled to run for a specified time on a weekly basis. However, you can use this command to run scrubs manually to check for errors and data inconsistencies.

**Parameters**

- `-aggregate <aggregate name>` - Aggregate
  
  This parameter specifies the aggregate to be scrubbed for errors.

- `[-plex <text>]` - Plex
  
  This parameter specifies the name of the plex to scrub. If this parameter is not specified, the command scrubs the entire aggregate.
[-raidgroup <text>] - RAID Group

This parameter specifies the RAID group to be scrubbed. If this parameter is not specified, the command
scrubs the entire aggregate.

**Note:** This parameter is only applicable when the `-plex` parameter is used.

| -node {<nodename>|local}) - Node

This parameter specifies the name of the node associated with the aggregate to be scrubbed. The value `local`
specifies the current node.

- `-action {start|stop|resume|suspend|status}` - Action

This parameter specifies the action to be taken. The possible actions are:

- **start** - Starts a scrub.
- **stop** - Permanently stops a scrub. A stopped scrub cannot be resumed.
- **resume** - Resumes a suspended parity scrub.
- **suspend** - Suspends a parity scrub.
- **status** - Displays the current status of a scrub.

**Examples**

The following example starts a scrub on a RAID group named rg0 of plex named plex0 on an aggregate named aggr0:

```bash
cluster1::> storage aggregate scrub -aggregate aggr0 -raidgroup rg0 -plex plex0 -action start
```

The following example queries the status of a scrub:

```bash
cluster1::> storage aggregate scrub -aggregate aggr0 -raidgroup rg0 -plex plex0 -action status
Raid Group:/aggr0/plex0/rg0, Is Suspended:false, Last Scrub:Sun Nov 13 01:30:55 2011, Percentage Completed:7%
```

The following example starts a scrub on plex1 of an aggregate named aggr1:

```bash
cluster1::> storage aggregate scrub -aggregate aggr1 -plex plex1 -action start
```

The following example queries the status of plex1 of an aggregate named aggr1:

```bash
cluster1::> storage aggregate scrub -aggregate aggr1 -plex plex1 -action status
Raid Group:/aggr1/plex1/rg0, Is Suspended:false, Last Scrub:Sun Nov 13 02:07:29 2011, Percentage Completed:1%
```

The following example queries the status of all the plexes for an aggregate named aggr1:

```bash
cluster1::> storage aggregate scrub -aggregate aggr1 -action status
Raid Group:/aggr1/plex0/rg0, Is Suspended:false, Last Scrub:Sun Nov 13 01:58:06 2011
Raid Group:/aggr1/plex1/rg0, Is Suspended:false, Last Scrub:Sun Nov 13 02:07:29 2011, Percentage Completed:4%
```
storage aggregate show

Display a list of aggregates

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The storage aggregate show command displays information about aggregates. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays the following information about all aggregates:

- Aggregate name
- Size
- Available size
- Percentage used
- State
- Number of volumes
- Node on which the aggregate is located
- RAID status

To display detailed information about a single aggregate, use the -aggregate parameter.

Parameters

{ [-fields <fieldname>, ...]  
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

  [-checksum]  
  If this parameter is specified, the command displays information about the checksum for all aggregates in the cluster:
  - Aggregate name
  - Checksum status (active, off, reverting, none, unknown, initializing, reinitializing, reinitialized, upgrading_phase1, upgrading_phase2)
  - Checksum style (none, advanced_zoned, block, mixed, WAFL, or unknown)

  [-disk]  
  If this parameter is specified, the command displays disk names for all aggregates in the cluster:
  - Aggregate name
  - Number and names of disks in the aggregate

  [-raid-info]  
  If this parameter is specified, the command displays information about RAID groups, RAID type, maximum RAID size, checksum state, checksum style and whether the RAID status is inconsistent.

  [-instance ]]  
  If this parameter is specified, the command displays detailed information about all aggregates in the cluster.
[-aggregate <aggregate name>] - Aggregate
    If this parameter is specified, the command displays detailed information about the specified aggregate.

[-storage-type {hdd | hybrid | lun | ssd | vmdisk}] - Storage Type
    If this parameter is specified, the command displays information only about the aggregates with the specified
    storage type. The possible values are hdd, hybrid, lun, ssd and vmdisk.

[-checksumstyle <aggrChecksumStyle>] - Checksum Style
    If this parameter is specified, the command displays information only about the aggregates that use the
    specified checksum style.

[-diskcount <integer>] - Number Of Disks
    If this parameter is specified, the command displays information only about the aggregates that have the
    specified number of disks.

[-mirror | -m [true]] - Mirror
    If this parameter is specified, the command displays information only about the aggregates that have the
    specified mirrored value.

[-disklist | -d <disk path name>, ...] - Disks for First Plex
    If this parameter is specified, the command displays information only about the aggregates that have the
    specified disk or disks.

[-mirror-disklist <disk path name>, ...] - Disks for Mirrored Plex
    If this parameter is specified, the command displays information only about the aggregates that have the
    specified disk or disks present in the mirrored plex.

[-node {<nodename> | local}] - Node
    If this parameter is specified, the command displays information only about the aggregates that are located on
    the specified node.

[-free-space-realloc {on | off}] - Free Space Reallocation
    If this parameter is specified, the command displays whether free space reallocation is enabled on the specified
    aggregate.

[-ha-policy {sfo | cfo}] - HA Policy
    This optionally specifies the high-availability policy to be used in the context of a root recovery procedure. Do
    not modify this setting unless directed to do so by a customer support representative.

[-percent-snapshot-space <percent>] - Space Reserved for Snapshot Copies
    If this parameter is specified, the command displays information only about the aggregates that have the
    specified space reserved for Snapshot copies.

[-space-nearly-full-threshold-percent <percent>] - Aggregate Nearly Full Threshold Percent
    If this parameter is specified, the command displays information only about the aggregates that have the
    specified nearly full threshold percent.

[-space-full-threshold-percent <percent>] - Aggregate Full Threshold Percent
    If this parameter is specified, the command displays information only about the aggregates that have the
    specified full threshold percent.

[-hybrid-enabled {true | false}] - Hybrid Enabled
    If this parameter is specified, the command displays information only about the aggregates that are eligible to
    contain both SSD and non-SSD RAID groups.

[-availsize <integer> {KB | MB | GB | TB | PB}] - Available Size
    If this parameter is specified, the command displays information only about the aggregates that have the
    specified available size.
[-chksumenabled {true|false}] - Checksum Enabled
If this parameter is specified, the command displays information only about the aggregates that have the
specified checksum setting.

[-chksumstatus <text>] - Checksum Status
If this parameter is specified, the command displays information only about the aggregates that have the
specified checksum status. The possible values for checksum status include the following: active, off,
reverting, none, unknown, initializing, reinitializing, reinitialized, upgrading_phase1, and upgrading_phase2.

[-cluster <text>] - Cluster
If this parameter is specified, the command displays information only about the aggregates that are owned by
nodes in the specified cluster. By default, only local cluster aggregates are displayed.

[-cluster-id <UUID>] - Home Cluster ID
If this parameter is specified, the command displays information only about the aggregates that are owned by
nodes in the cluster specified by the cluster UUID. By default, only local cluster aggregates are displayed.

[-dr-home-id <integer>] - DR Home ID
If this parameter is specified, the command displays information only about the aggregates whose Disaster
Recovery home node has the specified system ID.

[-dr-home-name <text>] - DR Home Name
If this parameter is specified, the command displays information only about the aggregates whose Disaster
Recovery home is the specified node.

[-inofile-version <integer>] - Inofile Version (privilege: advanced)
If this parameter is specified, the command displays information only about the aggregates whose inode files
are at the specified version.

[-has-mroot {true|false}] - Has Mroot Volume
If this parameter is specified, the command displays information about only the aggregates that contain their
owning node’s management root directory.

[-has-partner-mroot {true|false}] - Has Partner Node Mroot Volume
If this parameter is specified, the command displays information about only the aggregates that contain the
management root directory of their owning node’s failover partner.

[-home-id <integer>] - Home ID
If this parameter is specified, the command displays information only about the aggregates whose home node
has the specified system ID.

[-home-name <text>] - Home Name
If this parameter is specified, the command displays information only about the aggregates whose home node
is the specified node.

[-hybrid-cache-size-total <integer> {KB|MB|GB|TB|PB}] - Total Hybrid Cache Size
If this parameter is specified, the command displays information only about the aggregates that have the
specified total cache size in a Flash Pool.

[-hybrid {true|false}] - Hybrid
If this parameter is specified, the command displays information only about the aggregates that currently
contain both SSD and non-SSD RAID groups.

[-inconsistent {true|false}] - Inconsistent
If this parameter is specified, the command displays information only about the aggregates that have the
specified consistency.
[-is-home {true|false}] - Is Aggregate Home
If this parameter is specified, the command displays information only about the aggregates whose home node
and owner node have the same system ID.

[-maxraidsize | <integer>] - Max RAID Size
If this parameter is specified, the command displays information only about the aggregates that have the
specified maximum number of disks for RAID groups.

  Note: For Flash Pools, this option controls the maximum size of the HDD RAID groups.

[-cache-raid-group-size <integer>] - Flash Pool SSD Tier Maximum RAID Group Size
If this parameter is specified, the command displays information about the maximum RAID group size for the
SSD tier for Flash Pools.

  Note: This parameter is applicable only for Flash Pools.

[-owner-id <integer>] - Owner ID
If this parameter is specified, the command displays information only about the aggregates that are owned by
the node with the specified system ID.

[-owner-name <text>] - Owner Name
If this parameter is specified, the command displays information only about the aggregates that are owned by
the specified node.

[-percent-used <percent>] - Used Percentage
If this parameter is specified, the command displays information only about the aggregates that have the
specified used size, as a percentage.

[-plexes <text>, ...] - Plexes
If this parameter is specified, the command displays information only about the aggregates that have the
specified plex or plexes.

[-raidgroups <text>, ...] - RAID Groups
If this parameter is specified, the command displays information only about the aggregates that have the
specified RAID group or groups.

[-raidstatus <text>] - RAID Status
If this parameter is specified, the command displays information only about the aggregates that have the
specified RAID status. The possible values for RAID status are normal, copying, ironing, degraded, mirror
degraded, growing, initializing, invalid, needs check, partial, reconstruct, raid4, raid0, raid_dp, raid_tec,
redirect, and wafl inconsistent. You can specify multiple values (for example, reconstruct and growing).

[-raidtype | -t {raid_tec|raid_dp|raid4}] - RAID Type
If this parameter is specified, the command displays information only about the aggregates that use the
specified RAID type. The possible values are raid0 for RAID 0, raid4 for RAID4, raid_dp for RAID-DP,
raid_tec for RAID-TEC, and mixed_raid_type for aggregates that include a mix of RAID types.

[-resyncsnaptime <integer>] - SyncMirror Resync Snapshot Frequency in Minutes
If this parameter is specified, the command displays information only about the aggregates whose SyncMirror
Resynchronization Snapshot Frequency is the specified value.

[-root {true|false}] - Is Root
If this parameter is specified, the command displays information about only the root aggregates in the cluster.

[-sis-metadata-space-used {<integer>[KB|MB|GB|TB|PB]}] - Space Used by Metadata for Volume
Efficiency
If this parameter is specified, the command displays information about only the aggregates with the specified
space used by A-SIS metafiles for volume efficiency. This parameter is deprecated in Data ONTAP 8.2 and
later. Use the volume-footprint-list-info API for details related to space usage by deduplication metadata.
If this parameter is specified, the command displays information only about the aggregates that have the specified size. The size of the aggregate is reported as the size available for use by WAFL, excluding WAFL reserve and aggregate Snapshot reserve capacity. Use the `storage aggregate show-space` command to see the details of space utilization within an aggregate.

If this parameter is specified, the command displays information only about the aggregates that have the specified state.

If this parameter is specified, the command displays information only about the aggregates that have the specified used size.

Selects the aggregates that match this parameter value. This parameter is used to list all the aggregates that use shared HDDs or shared SSDs.

If this parameter is specified, the command displays information only about the aggregate that has the specified UUID. This parameter is available only at the advanced privilege level and higher.

If this parameter is specified, the command displays information only about the aggregates that have the specified number of volumes.

If this parameter is specified, the command displays information only about the aggregates that are considered by the Auto Balance Aggregate feature.

If this parameter is specified, the command displays information only about the aggregates that have the specified state.

If this parameter is specified, the command displays information only about the aggregates that have the specified physical used size. This differs from `total-used` space by the space that is guaranteed for future writes. The value includes blocks in use by Snapshot copies.

If this parameter is specified, the command displays information only about the aggregates that have the specified physical used percent.

If this parameter is specified, the command displays information only about the aggregates that have the specified number of state change caused by the Auto Balance Aggregate feature.

Selects the aggregates that are encrypted.

Selects the aggregates that have the specified snaplock-type.

Selects the aggregates that are encrypted with the specified key ID.
[-is-cft-precommit {true|false}] - Is in the precommit phase of Copy-Free Transition (privilege: advanced)
Selects the aggregates that are set with this parameter value. This parameter lists all the aggregates that are in
the precommit phase of a Copy-Free Transition workflow.

[-is-transition-out-of-space {true|false}] - Is a 7-Mode transitioning aggregate that is not yet committed
in clustered Data ONTAP and is currently out of space (privilege: advanced)
Selects the aggregates that match this parameter value. This parameter is used to list all the 7-mode
transitioning aggregates that are not yet committed in clustered Data ONTAP, and are currently out of space.

[-autobalance-unbalanced-threshold-percent <integer>] - Threshold When Aggregate Is Considered
Unbalanced (%) (privilege: advanced)
If this parameter is specified, the command displays information only about the aggregates that have the
specified unbalanced threshold percentage.

[-autobalance-available-threshold-percent <integer>] - Threshold When Aggregate Is Considered
Balanced (%) (privilege: advanced)
If this parameter is specified, the command displays information only about the aggregates that have the
specified available threshold percentage.

[-resync-priority {high(fixed)|high|medium|low}] - Resynchronization Priority
This parameter indicates the relative priority that is used to decide whether a mirrored aggregate can start a
resynchronization operation or not. This field is not set for unmirrored aggregates.
Use the `storage aggregate resynchronization modify` command to modify this field for mirrored
aggregates.
The valid values for this field are:

- high(fixed): This value is reserved for Data ONTAP system aggregates, which cannot have any other value
  for this field. It cannot be explicitly set on a data aggregate. These aggregates always start their
  resynchronization operation at the first available opportunity.
- high: Mirrored data aggregates with this priority value start resynchronization first.
- medium: Mirrored data aggregates with this priority value start resynchronization after all the system
  aggregates and data aggregates with 'high' priority value have started resynchronization.
- low: Mirrored data aggregates with this priority value start resynchronization only after all the other
  aggregates have started resynchronization.

[-data-compaction-space-saved <integer> [KB|MB|GB|TB|PB]]] - Space Saved by Data Compaction
This parameter indicates the amount of the space saved by Data Compaction in bytes.

[-data-compaction-space-saved-percent <percent>] - Percentage Saved by Data Compaction
This parameter indicates the percentage of space saved in the aggregate by Data Compaction.

[-data-compacted-count <integer> [KB|MB|GB|TB|PB]] - Amount of compacted data
This parameter indicates the number of bytes occupied by compacted data inside this aggregate.

[-creation-timestamp <MM/DD/YYYY HH:MM:SS>] - Timestamp of Aggregate Creation
This parameter indicates the date and time the aggregate was created.

[-single-instance-data-logging {off|on}] - Enable SIDL
If this parameter is specified, the command displays whether Single Instance Data Logging feature is enabled
on the specified aggregate.

[-composite {true|false}] - Composite
If this parameter is specified, the command displays information only about aggregates whose classification as
FabricPool matches the specified value. A FabricPool has an external capacity tier attached to it.
Storage aggregate Commands

Example

The following example displays information about all aggregates that are owned by nodes in the local cluster:

```
cluster1::> storage aggregate show

Agg Aggr   Size Available Used% State    #Vols Nodes            RAID Status
--------- -------- --------- ----- ------- ------ ---------------  ------------
aggr0     6.21TB 1.78TB   71% online      49 cluster1-01      raid_dp, normal
aggr1     56.04MB 55.89MB   0% online       0 cluster1-02      raid_dp, mirrored, normal
aggr2     1.77TB  1.63TB   8% online       1 cluster1-01      raid_dp, normal
aggr3     1.77TB  1.73TB   2% online       2 cluster1-02      raid_dp, normal
4 entries were displayed.
```

The following example displays information about an aggregate name aggr1:

```
cluster1::> storage aggregate show -aggregate aggr1

Aggregate: aggr1
Checksum Style: block
Number Of Disks: 6
Mirror: true
Nodes: cluster1-02
Disks for First Plex: 1.1.2, 1.1.10, 1.1.11
Disks for Mirrored Plex: 1.1.6, 1.1.8, 1.1.9
Free Space Reallocation: off
HA Policy: sfo
Space Reserved for Snapshot Copies: 5%
Hybrid Enabled: false
Available Size: 53.10MB
Block Type: 64-bit
Checksum Enabled: true
Checksum Status: active
Cluster: cluster1
Home Cluster ID: 686964a0-2172-11e3-837d-123478563412
DR Home ID: -
DR Home Name: -
Has Mroot Volume: false
Has Partner Node Mroot Volume: false
Home ID: 4050409551
Home Name: cluster1-02
Total Hybrid Cache Size: 0B
Hybrid: false
Inconsistent: false
Is Aggregate Home: true
Max RAID Size: 16
Hybrid Aggregate SSD Tier Maximum RAID Group Size: -
Owner ID: 4050409551
Owner Name: cluster1-02
Used Percentage: 0%
```
The following example displays information about aggregates that are owned by nodes in cluster1:

```
cluster1::> storage aggregate show -cluster cluster1

cluster1:  
Aggregate     Size Available Used% State   #Vols  Nodes            RAID Status
--------- -------- --------- ----- ------- ------ ---------------- ------------
aggr0       6.04GB    3.13GB   48% online       2 cluster1-01      raid_dp, mirrored, normal
aggr1      53.24MB   12.59MB   76% online       2 cluster1-02      raid_dp, mirrored, normal

2 entries were displayed.
```

The following example displays information about aggregates that are owned by nodes in the remote cluster named cluster2:

```
cluster1::> storage aggregate show -cluster cluster2

cluster2:  
Aggregate     Size Available Used% State #Vols Nodes RAID Status
--------- -------- --------- ----- -------- ------ ---------------- ------------
aggr2            -         -     - remote_cluster  - -      raid_dp, mirrored, normal
aggr3            -         -     - remote_cluster  - -

2 entries were displayed.
```

The following example displays information about aggregates that are owned by nodes in all the clusters:
cluster1::> storage aggregate show -cluster *

<table>
<thead>

**storage aggregate show-cumulated-efficiency**
Display cumulated storage efficiency details

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
The `storage aggregate show-cumulated-efficiency` command displays information about the cumulated storage efficiency of all the aggregates. The storage efficiency is displayed at four different levels:

- Total
- Aggregate
- Volume
- Snapshot and FlexClone volume

**Parameters**

```
[-fields <fieldname>, ...]
```
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

```
[-details]
```
Use this parameter to show additional Storage Efficiency Ratios.

```
[-all-details] (privilege: advanced)
```
Use this parameter to show additional Storage Efficiency Ratios and size values.

```
[-instance]
```
If you specify the `-instance` parameter, the command displays detailed information about all fields.
[-aggregates <aggregate name>, ...] - List of Aggregates to cumulate Storage Efficiency ratio
   If this parameter is specified, the command calculates the cumulated storage efficiency of the specified list of aggregates.

[-nodes <nodename> | local], ...] - List of Aggregates to cumulate Storage Efficiency ratio
   If this parameter is specified, the command calculates the cumulated storage efficiency of aggregates that are located on the specified list of node.

[-total-logical-used <integer> [KB|MB|GB|TB|PB]] - Logical Size Used by volumes, clones, Snapshot copies in the Aggregate (privilege: advanced)
   Displays the total logical size used in all the specified aggregates. This includes Volumes, Clones and Snapshots in all the specified aggregates. The logical size is computed based on physical usage and savings obtained in all the specified aggregates.

[-total-physical-used <integer> [KB|MB|GB|TB|PB]] - Total Physical Used (privilege: advanced)
   Displays the physical size used by all the specified aggregates.

[-total-storage-efficiency-ratio <text>] - Total Storage Efficiency Ratio
   Displays the total storage efficiency ratio of the aggregate.

[-total-data-reduction-logical-used <integer> [KB|MB|GB|TB|PB]] - Total Data Reduction Logical Used (privilege: advanced)
   Displays the total logical size used in all the specified aggregates excluding Snapshots and FlexClones.

[-total-data-reduction-physical-used <integer> [KB|MB|GB|TB|PB]] - Total Data Reduction Physical Used (privilege: advanced)
   Displays the total physical size used by all the specified aggregates aggregates excluding Snapshots and FlexClones.

[-total-data-reduction-efficiency-ratio <text>] - Total Data Reduction Efficiency Ratio
   Displays the total storage efficiency ratio obtained by Deduplication, Compression, Data Compaction and Pattern Detection data reduction technologies on the specified aggregates.

[-volume-logical-used <integer> [KB|MB|GB|TB|PB]] - Logical Space Used for All volumes (privilege: advanced)
   Displays the total logical size used by all the volumes in all the specified aggregates.

[-volume-physical-used <integer> [KB|MB|GB|TB|PB]] - Physical Space Used for All volumes (privilege: advanced)
   Displays the total physical size used by all volumes in all the specified aggregates.

[-volume-dedupe-zero-pattern-saved <integer> [KB|MB|GB|TB|PB]] - Space Saved by volume Deduplication and pattern detection (privilege: advanced)
   Displays the total disk space that is saved by deduplication, Zero pattern detection and FlexClone for files or LUNs by all volumes in all the specified aggregates.

[-volume-efficiency-saved-ratio <text>] - Volume Deduplication Savings ratio
   Displays the storage efficiency ratio for savings by deduplication and FlexClone for files or LUNs by all volumes in all the specified aggregates.

[-volume-compression-saved <integer> [KB|MB|GB|TB|PB]] - Space Saved by volume Compression (privilege: advanced)
   Displays the total disk space that is saved by compressing blocks by all volumes in all the specified aggregates.

[-volume-compression-saved-ratio <text>] - Volume Compression Savings ratio
   Displays the storage efficiency ratio for savings by compressing blocks on all volumes in all the specified aggregates.
Displays the storage efficiency ratio of all the volumes in all the specified aggregates.

[-aggr-logical-used {<integer> [KB|MB|GB|TB|PB]}] - Logical Space Used by the Aggregate (privilege: advanced)
Displays the logical size used by all the specified aggregates.

[-aggr-physical-used {<integer> [KB|MB|GB|TB|PB]}] - Physical Space Used by the Aggregate (privilege: advanced)
Displays the physical size used by all the specified aggregates.

[-aggr-data-reduction-storage-efficiency-ratio <text>] - Aggregate Data Reduction SE Ratio
Displays the storage efficiency ratio of the aggregate.

[-snapshot-logical-used {<integer> [KB|MB|GB|TB|PB]}] - Logical Size Used by Snapshot copies (privilege: advanced)
Displays the logical size used by all Volume Snapshots residing in all the specified aggregates.

[-snapshot-physical-used {<integer> [KB|MB|GB|TB|PB]}] - Physical Size Used by Snapshot copies (privilege: advanced)
Displays the physical size used by all Volume Snapshots residing in all the specified aggregates.

[-flexclone-volume-logical-used {<integer> [KB|MB|GB|TB|PB]}] - Logical Size Used by FlexClone volumes (privilege: advanced)
Displays the logical size used by all FlexClone volumes residing in all the specified aggregates.

[-flexclone-volume-physical-used {<integer> [KB|MB|GB|TB|PB]}] - Physical Size Used by FlexClone volumes (privilege: advanced)
Displays the physical size used by all FlexClone volumes in all the specified aggregates.

[-snapshot-flexclone-volume-data-reduction-storage-efficiency-ratio <text>] - Snapshot And FlexClone volume Data Reduction SE Ratio
Displays the Snapshot and FlexClone volume storage efficiency ratio of the aggregate.

[-snapshot-volume-data-reduction-storage-efficiency-ratio <text>] - Snapshot volume Data Reduction Ratio
Displays the Snapshot volume storage efficiency ratio of the aggregate.

[-flexclone-volume-data-reduction-storage-efficiency-ratio <text>] - FlexClone volume Data Reduction Ratio
Displays the FlexClone volume storage efficiency ratio of the aggregate.

[-number-of-offline-volumes <integer>] - Number of volumes Offline
Displays the number of volumes that are offline in all the specified aggregates.

[-number-of-sis-disabled-volumes <integer>] - Number of SIS Disabled volumes
Displays the number of volumes on which volume efficiency is disabled in all the specified aggregates.

[-number-of-sis-change-log-disabled-volumes <integer>] - Number of SIS Change Log Disabled volumes (privilege: advanced)
Displays the number of volumes on which efficiency change log is disabled in all the specified aggregates. The scheduled background Deduplication will be disabled on these volumes.

[-number-of-skipped-aggregates <integer>] - Number of Skipped Aggregates
Displays the number of aggregates that were skipped for calculating the cumulated storage efficiency.

[-skipped-aggregates <aggregate name>, ...] - List of Aggregates skipped
Displays the list of aggregates that were skipped for calculating the cumulated storage efficiency.
Examples

The following example displays information about all aggregates that are owned by nodes in the local cluster:

```bash
cluster::> aggr show-cumulated-efficiency
Total Storage Efficiency Ratio: 6.97:1

cluster::> aggr show-cumulated-efficiency -details
Total Storage Efficiency Ratio: 6.97:1
Total Data Reduction Ratio: 8.44:1

Aggregate level Storage Efficiency
(Aggregate Deduplication and Data Compaction): 1.00:1
Volume Deduplication Efficiency: 1.12:1
Compression Efficiency: 5.73:1

Snapshot Volume Storage Efficiency: 1.00:1

storage aggregate show-efficiency

Display aggregate storage efficiency details

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The storage aggregate show-efficiency command displays information about the storage efficiency of all the aggregates. The storage efficiency is displayed at four different levels:

- Total
- Aggregate
- Volume
- Snapshot and FlexClone volume

Parameters

{ [-fields <fieldname>, ...]  
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.  
  [-details]  
  Use this parameter to show additional Storage Efficiency Ratios.  
  [-advanced] (privilege: advanced)  
  Use this parameter to show additional Storage Efficiency Ratios and size values.  
  [-instance]  
  If you specify the -instance parameter, the command displays detailed information about all fields.  
  [-aggregate <aggregate name>] - Name of the Aggregate  
  Displays the aggregate name. If this parameter is specified, the command displays detailed information about the storage efficiency of the specified aggregate.  
  [-node <nodename> | local] - Node where Aggregate Resides  
  Displays the node which owns the aggregate. If this parameter is specified, the command displays storage efficiency information only about the aggregates that are located on the specified node.  
  [-total-logical-used <integer> [KB|MB|GB|TB|PB]] - Logical Size Used by Volumes, Clones, Snapshot Copies in the Aggregate (privilege: advanced)  
  Displays the logical size used in the aggregate. This includes Volumes, Clones and Snapshots in the aggregate. The logical size is computed based on physical usage and savings obtained in the aggregate.  
  [-total-physical-used <integer> [KB|MB|GB|TB|PB]] - Total Physical Used (privilege: advanced)  
  Displays the physical size used by the aggregate.  
  [-total-storage-efficiency-ratio <text>] - Total Storage Efficiency Ratio  
  Displays the total storage efficiency ratio of the aggregate.  
  [-total-data-reduction-logical-used <integer> [KB|MB|GB|TB|PB]] - Total Data Reduction Logical Used (privilege: advanced)  
  Displays the logical size used in the aggregate excluding Snapshots and FlexClones.
[-total-data-reduction-physical-used {<integer> [KB|MB|GB|TB|PB]}] - Total Data Reduction Physical Used (privilege: advanced)
   Displays the physical size used by the aggregate excluding Snapshots and FlexClones.

[-total-data-reduction-efficiency-ratio <text>] - Total Data Reduction Efficiency Ratio
   Displays the total storage efficiency ratio obtained by Deduplication, Compression, Data Compaction and
   Pattern Detection data reduction technologies on the aggregate.

[-volume-logical-used {<integer> [KB|MB|GB|TB|PB]}] - Logical Space Used for All Volumes
   Displays the logical size used by all the volumes in the aggregate.

[-volume-physical-used {<integer> [KB|MB|GB|TB|PB]}] - Physical Space Used for All Volumes
   Displays the physical size used by all volumes in the aggregate.

[-volume-efficiency-saved {<integer> [KB|MB|GB|TB|PB]}] - Space Saved by Volume Deduplication
   (privilege: advanced)
   Displays the total disk space that is saved by deduplication and FlexClone for files or LUNs by all volumes in
   the aggregate.

[-volume-dedupe-zero-pattern-saved {<integer> [KB|MB|GB|TB|PB]}] - Space Saved by Volume
   Deduplication and pattern detection (privilege: advanced)
   Displays the total disk space that is saved by deduplication, Zero pattern detection and FlexClone for files or
   LUNs by all volumes in the aggregate.

[-volume-efficiency-saved-ratio <text>] - Volume Deduplication Savings ratio
   Displays the storage efficiency ratio for savings by deduplication and FlexClone for files or LUNs by all
   volumes in the aggregate.

[-volume-compression-saved {<integer> [KB|MB|GB|TB|PB]}] - Space Saved by Volume Compression
   (privilege: advanced)
   Displays the total disk space that is saved by compressing blocks by all volumes in the aggregate.

[-volume-compression-saved-ratio <text>] - Volume Compression Savings ratio
   Displays the storage efficiency ratio for savings by compressing blocks on all volumes in the aggregate.

[-volume-vbn-zero-saved {<integer> [KB|MB|GB|TB|PB]}] - Space Saved by Inline Zero Pattern Detection
   Displays the total disk space that is saved by inline zero pattern detection by all the volumes in the aggregate.

   Displays the storage efficiency ratio of all the volumes in the aggregate.

[-aggr-logical-used {<integer> [KB|MB|GB|TB|PB]}] - Logical Space Used by the Aggregate (privilege:
   advanced)
   Displays the logical size used by the aggregate.

[-aggr-physical-used {<integer> [KB|MB|GB|TB|PB]}] - Physical Space Used by the Aggregate (privilege:
   advanced)
   Displays the physical size used by the aggregate.

[-aggr-compaction-saved {<integer> [KB|MB|GB|TB|PB]}] - Space Saved by Aggregate Data Reduction
   (privilege: advanced)
   Displays the total disk space that is saved by data compaction at the aggregate level.

[-aggr-data-reduction-storage-efficiency-ratio <text>] - Aggregate Data Reduction SE Ratio
   (privilege: advanced)
   Displays the storage efficiency ratio of the aggregate.

[-snapshot-logical-used {<integer> [KB|MB|GB|TB|PB]}] - Logical Size Used by Snapshot Copies (privilege:
   advanced)
   Displays the logical size used by all Volume Snapshots residing in the aggregate.
[-snapshot-physical-used {<integer> [KB|MB|GB|TB|PB]}] - Physical Size Used by Snapshot Copies (privilege: advanced)

Displays the physical size used by all Volume Snapshots residing in the aggregate.

[-flexclone-volume-logical-used {<integer> [KB|MB|GB|TB|PB]}] - Logical Size Used by FlexClone Volumes (privilege: advanced)

Displays the logical size used by all FlexClone volumes residing in the aggregate.

[-flexclone-volume-physical-used {<integer> [KB|MB|GB|TB|PB]}] - Physical Size Used by FlexClone Volumes (privilege: advanced)

Displays the physical size used by all FlexClone volumes in the aggregate.

[-snapshot-flexclone-volume-data-reduction-storage-efficiency-ratio <text>] - Snapshot And FlexClone Volume Data Reduction SE Ratio

Displays the Snapshot and FlexClone volume storage efficiency ratio of the aggregate.

[-snapshot-volume-data-reduction-storage-efficiency-ratio <text>] - Snapshot Volume Data Reduction Ratio

Displays the Snapshot volume storage efficiency ratio of the aggregate.

[-flexclone-volume-data-reduction-storage-efficiency-ratio <text>] - FlexClone Volume Data Reduction Ratio

Displays the FlexClone volume storage efficiency ratio of the aggregate.

[-number-of-offline-volumes <integer>] - Number of Volumes Offline

Displays the number of volumes that are offline in the aggregate.

[-number-of-sis-disabled-volumes <integer>] - Number of SIS Disabled Volumes

Displays the number of volumes on which volume efficiency is disabled in the aggregate.

[-number-of-sis-change-log-disabled-volumes <integer>] - Number of SIS Change Log Disabled Volumes (privilege: advanced)

Displays the number of volumes on which efficiency change log is disabled in the aggregate. The scheduled background Deduplication will be disabled on these volumes.

Examples

The following example displays information about all aggregates that are owned by nodes in the local cluster:

```
cluster::*> aggr show-efficiency
Aggregate: aggr1
  Node: node1
  Total Storage Efficiency Ratio: 4.29:1
  Total Data Reduction Ratio: 2.39:1
Aggregate: aggr2
  Node: node1
  Total Storage Efficiency Ratio: 4.29:1
  Total Data Reduction Ratio: 2.39:1
cluster::*> aggr show-efficiency -details
Aggregate: aggr1
  Node: node1
  Total Storage Efficiency Ratio: 4.29:1
  Total Data Reduction Ratio: 2.39:1
  Aggregate level Storage Efficiency
    (Aggregate Deduplication and Data Compaction): 1.00:1
  Volume Deduplication Efficiency: 5.03:1
  Compression Efficiency: 1.00:1
  Snapshot Volume Storage Efficiency: 8.81:1
```
### FlexClone Volume Storage Efficiency

- Number of Efficiency Disabled Volumes: 1

#### Aggregate: aggr2
- Node: node1

- Total Storage Efficiency Ratio: 4.29:1
- Total Data Reduction Ratio: 2.39:1

- Aggregate level Storage Efficiency
  - (Aggregate Deduplication and Data Compaction): 1.00:1
- Volume Deduplication Efficiency: 5.03:1
- Compression Efficiency: 1.00:1

- Snapshot Volume Storage Efficiency: 8.81:1
- FlexClone Volume Storage Efficiency: -
- Number of Efficiency Disabled Volumes: 1

---

**storage aggregate show-resync-status**

Display aggregate resynchronization status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The `storage aggregate show-resync-status` command displays resync status information for each plex. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays the following information about all aggregates:

- Aggregate Name
- Resyncing Plex Name
- Resyncing Percentage

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance]
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[-aggregate <aggregate name>] - Aggregate
```

This parameter specifies the name of the aggregate.

```
[-plex <text>] - Plex Name
```

This parameter specifies the name of the plex.

```
[-status <text>] - Status
```

Displays plex status. Possible values are:

- `normal`
- `failed`
- `empty`
- `invalid`
- `uninitialized`
• failed assimilation
• limbo
• active
• inactive
• resyncing

These values may appear by themselves or in combination separated by commas; for example, "normal,active".

[is-online {true|false}] - Is Online
Indicates whether the plex is online.

[in-progress {true|false}] - Resync is in Progress
Indicates whether the plex is currently resyncing.

[resyncing-percent <percent>] - Resyncing Percentage
Displays the resynchronization completion percentage if the plex is currently being resynced, '.' otherwise.

[resync-level <integer>] - Resync Level
Displays the resync level if the plex is currently being resynced, '.' otherwise.

[pool <integer>] - Pool
The pool number to which the majority of disks in the plex belong.

Examples
The following example displays resynchronization status for all the aggregates:

```sh
cluster1::> storage aggregate show-resync-status
Complete
Aggregate  Resyncing Plex  Percentage
---------  ---------------  -----------
aggr0      plex0          -
aggr1      plex0          -
aggr1      plex1          10.00
aggr2      plex0          -
aggr2      plex2          -
5 entries were displayed.
```

storage aggregate show-scrub-status

Display aggregate scrubbing status

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The `storage aggregate show-scrub-status` command displays the following information about the scrub status of aggregates:

• Aggregate name
• RAID groups
• Whether the scrub is suspended
• Percentage of the scrub that is completed
• Last scrub time of the aggregate

Parameters

{ [-fields <fieldname>, ...]
  
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance ]
  
  If you specify the -instance parameter, the command displays detailed information about all fields.

[-aggregate <aggregate name>] - Aggregate
  
  If this parameter is specified, the command displays detailed scrub-status information about the specified aggregate.

[-raidgroup <text>] - RAID Group
  
  If this parameter is specified, the command displays information only about the aggregate that contains the specified RAID group.

[-node {<nodename>|local}] - Node
  
  If this parameter is specified, the command displays information only about the aggregates on the specified node. The value local specifies the current node.

[-suspended {true|false}] - Is Suspended
  
  If this parameter is specified, the command displays information only about the aggregates that have the specified scrub-suspension state (true or false).

[-complete-percentage <percent>] - Percentage Completed
  
  If this parameter is specified, the command displays information only about the aggregates whose scrubs have the specified completed percentage.

[-last-scrub-time <MM/DD/YYYY HH:MM:SS>] - Last Scrub Time
  
  If this parameter is specified, the command displays information only about the aggregates that have the specified last-scrub time, in the format MM/DD/YYYY HH:MM:SS.

Examples

The following example displays scrub-status information for all the aggregates:

```
cluster1::> storage aggregate show-scrub-status
Aggregate RAID Groups         Suspended  Percentage Last Scrub Time
--------- ------------------- ---------- ---------- -------------------
aggr0     /aggr0/plex0/rg0    true               0% 3/31/2011  21:23:02
aggr1     /aggr1/plex0/rg1    true              45% 3/30/2011  01:05:00
aggr2     /aggr2/plex0/rg0    true              33% 3/30/2011  23:43:34
aggr3     /aggr3/plex0/rg1    true              79% 3/29/2011  00:34:36
4 entries were displayed.
```

The following example displays detailed information about the aggregate named aggr1:

```
cluster1::> storage aggregate show-scrub-status -instance -aggregate aggr1
Aggregate: aggr1
  RAID Group: /aggr1/plex0/rg0
  Is Suspended: false
  Percentage Completed: 2%
  Last Scrub Time: 3/31/2011 22:02:50
```
storage aggregate show-space

Display details of space utilization within an aggregate.

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The storage aggregate show-space command displays information about space utilization within aggregates and any attached external capacity tier. The command output breaks down space usage in the specified aggregate by feature. If no parameters are specified, the command displays this information about all aggregates. Note that used percentage for an external capacity tier will be non-zero only if a size limit was set for that aggregate's attached tier.

Parameters

[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance]]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-aggregate-name <aggregate name>] - Aggregate
If this parameter is specified, the command displays information only about the specified aggregates.

[-bin-num <integer>] - Bin Number
If this parameter is specified, the command displays information only about the aggregates whose bin number for the storage tier matches the specified value. Typically, bin 0 refers to the performance tier or active file system and bin numbers greater than 0 refer to the external capacity tiers attached to the aggregate.

[-tier-name <text>] - Tier Name For Show Command
If this parameter is specified, the command displays information only about the aggregates whose attached storage tier name matches the specified value.

[-aggregate <aggregate name>] - Aggregate Display Name
If this parameter is specified, the command displays information only about space used in the specified aggregate or aggregates.

[-aggregate-uuid <UUID>] - Uuid of the Aggregate
If this parameter is specified, the command displays information only about the aggregates whose UUID matches the specified value.

[-volume-footprints (<integer> [KB|MB|GB|TB|PB])] - Volume Footprints
If this parameter is specified, the command displays information only about the aggregate or aggregates that have the specified amount of space in use by volume footprints. A volume’s footprint is the overall amount of space that a volume occupies in the aggregate, including the volume metadata and data.

[-volume-footprints-percent <percent_no_limit>] - Volume Footprints Percent
If this parameter is specified, the command displays information only about the aggregate or aggregates whose volume footprints occupy the specified percentage of space.

[-snap-size-total (<integer> [KB|MB|GB|TB|PB])] - Total Space for Snapshot Copies in Bytes
If this parameter is specified, the command displays information only about the aggregate or aggregates that have the specified amount of space in use by aggregate Snapshot copies. This field includes the space that is reserved for Snapshot copies and is not available to volumes or aggregate data and metadata. It is set to 0 by default.
[-percent-snapshot-space <percent>] - Space Reserved for Snapshot Copies
   If this parameter is specified, the command displays information only about the aggregate or aggregates that have the specified percentage of space in use by aggregate Snapshot copies.

[-aggregate-metadata (integer [KB|MB|GB|TB|PB])] - Aggregate Metadata
   If this parameter is specified, the command displays information only about the aggregate or aggregates that have the specified amount of space in use by aggregate metadata.

[-aggregate-metadata-percent <percent_no_limit>] - Aggregate Metadata Percent
   If this parameter is specified, the command displays information only about the aggregate or aggregates that have the specified percentage of space in use by aggregate metadata.

[-used-including-snapshot-reserve (integer [KB|MB|GB|TB|PB])] - Total Used
   If this parameter is specified, the command displays information only about the aggregate or aggregates that have the specified amount of space in use in the aggregate.

   It is important to note that this parameter treats the entire Snapshot reserve as used space since it is not available for volumes.

[-used-including-snapshot-reserve-percent <percent_no_limit>] - Total Used Percent
   If this parameter is specified, the command displays information only about the aggregate or aggregates that have the specified percentage of space in use in the aggregate and its Snapshot reserve.

[-aggregate-size (integer [KB|MB|GB|TB|PB])] - Size
   If this parameter is specified, the command displays information only about the aggregate or aggregates that have the specified size.

[-snapshot-reserve-unusable (integer [KB|MB|GB|TB|PB])] - Snapshot Reserve Unusable
   If this parameter is specified, the command displays information only about the aggregate or aggregates that have the specified amount of space reserved but unusable in the volume.

   Snapshot reserve can be diminished under certain conditions to accommodate volume metadata. Creating space in the aggregate will make this space available.

[-snapshot-reserve-unusable-percent <percent_no_limit>] - Snapshot Reserve Unusable Percent
   If this parameter is specified, the command displays information only about the aggregate or aggregates that have the specified percentage of space reserved but unusable.

[-physical-used (integer [KB|MB|GB|TB|PB])] - Total Physical Used Size
   If this parameter is specified, the command displays information only about the aggregate or aggregates that have the specified amount of physical space in use by the aggregate.

   This differs from total-used space by the space that is guaranteed for future writes. The value includes blocks in use by Snapshot copies.

[-physical-used-percent <percent_no_limit>] - Physical Used Percentage
   If this parameter is specified, the command displays information only about the aggregate or aggregates that have the specified percentage of physical space in use in the aggregates.

[-object-store-physical-used (integer [KB|MB|GB|TB|PB])] - Total Physical Used Size
   If this parameter is specified, the command displays information only about the aggregates whose physical space use in the attached object store matches the specified value.

[-object-store-physical-used-percent <percent_no_limit>] - Physical Used Percentage
   If this parameter is specified, the command displays information only about aggregates whose physical space in use in the attached object store as a percentage of the license limit matches the specified value.
[-object-store-referenced-capacity {<integer>[KB|MB|GB|TB|PB]}] - Total Object Store Referenced Capacity
If this parameter is specified, the command displays information only about the aggregates whose reference capacity space in use in the attached object store matches the specified value.

[-object-store-referenced-capacity-percent <percent_no_limit>] - Object Store Referenced Capacity Percentage
If this parameter is specified, the command displays information only about aggregates whose reference capacity space in use in the attached object store as a percentage of the license limit matches the specified value.

[-object-store-metadata {<integer>[KB|MB|GB|TB|PB]}] - Object Store Metadata
If this parameter is specified, the command displays information only about the aggregates whose metadata space in use in the attached object store matches the specified value.

[-object-store-metadata-percent <percent_no_limit>] - Object Store Metadata Percent
If this parameter is specified, the command displays information only about aggregates whose metadata space in use in the attached object store as a percentage of the license limit matches the specified value.

[-object-store-unreclaimed-space {<integer>[KB|MB|GB|TB|PB]}] - Total Unreclaimed Space
If this parameter is specified, the command displays information only about the aggregates whose unreclaimed space in use in the attached object store matches the specified value.

[-object-store-unreclaimed-space-percent <percent_no_limit>] - Object Store Unreclaimed Space Percentage
If this parameter is specified, the command displays information only about aggregates whose unreclaimed space in use in the attached object store as a percentage of the license limit matches the specified value.

[-object-store-size {<integer>[KB|MB|GB|TB|PB]}] - Object Store Size
If this parameter is specified, the command displays information only about the aggregates whose attached object store size limit matches the specified value.

Examples
The following example displays information about all aggregates:

```
cluster1::> storage aggregate show-space
Aggregate : aggr0
Feature                                      Used      Used%
-----------------------------------------------------------
Volume Footprints                           5.75GB     91%
Aggregate Metadata                          380KB      0%
Snapshot Reserve                           325.3MB    5%
Total Used                                  6.07GB    96%
Total Physical Used                        221.9MB     3%

Aggregate : aggr1
Feature                                      Used      Used%
-----------------------------------------------------------
Volume Footprints                           2.03GB     33%
Aggregate Metadata                          304KB      0%
Total Used                                  2.03GB     33%
```

Storage aggregate Commands
The following example displays information about all the aggregates in a system including the ones that have an object store attached to them.

```
cluster-1::> storage aggregate show-space

Aggregate : aggr0

Feature                                   Used      Used% 
--------------------------------    ----------     ------
Volume Footprints                       2.87GB        90% 
Aggregate Metadata                       328KB         0% 
Snapshot Reserve                       162.6MB         5%

```

**storage aggregate show-spare-disks**

Display spare disks

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

The command `storage aggregate show-spare-disks` displays information about spare disks. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays information about all spare disks in the cluster.

**Parameters**

```
{ [-fields <fieldname>, ...] } 
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
| [-partition-info ] (privilege: advanced) 
Displays the following information about root-data and root-data1-data2 partitioned spares.
```

- Disk
• Type
• Class
• RPM
• Checksum
• Local Data Usable
• Local Data1 Usable
• Local Data2 Usable
• Local Root Usable
• Physical Size
• Status

[-instance ]
If this parameter is specified, the command displays detailed information about each spare disk.

[-original-owner <text>] - Original Owner
Selects the spare disks that match this parameter value.

[-disk <disk path name>] - Disk Name
Selects the spare disks that match this parameter value.

[-checksum-style {advanced_zoned | block | none}] - Checksum Style
Selects the spare disks that match this parameter value. Possible values are:
• block -- Supports block checksum
• advanced_zoned -- Supports advanced zone checksum
• none -- No checksum support

[-disk-type {ATA | BSAS | FCAL | FSAS | LUN | MSATA | SAS | SSD | VMDISK | SSD-NVM}] - Disk Type
Selects the spare disks that match this parameter value.

[-effective-disk-type {ATA | BSAS | FCAL | FSAS | LUN | MSATA | SAS | SSD | VMDISK | SSD-NVM}] - Effective Disk Type
Selects the spare disks that match this parameter value.

Hard disk drives with the same effective-disk-type value may be mixed together in the same aggregate depending upon the system’s raid.mix.hdd.disktype.capacity and
raid.mix.hdd.disktype.performance option settings.

[-standard-disk-type {SATA | FC | NL-SAS | LUN | SAS | SCSI | SSD | VM-DISK | NVMe-SSD}] - Standard Disk Type
Selects the spare disks that match this parameter value.

[-disk-class {capacity | performance | archive | solid-state | array | virtual}] - Disk Class
Selects the spare disks that match this parameter value. Possible values are:
• capacity -- Capacity-oriented, near-line disk types. Includes disk types FSAS, BSAS and ATA.
• performance -- Performance-oriented, enterprise class disk types. Includes disk types FCAL and SAS.
• archive -- Archive class SATA disks in multi-disk carrier storage shelves. Includes disk type MSATA.
• solid-state -- Solid-state drives. Includes disk type SSD.
• array -- Logical storage devices backed by storage arrays and used by Data ONTAP as disks. Includes disk type LUN.
• virtual -- Virtual disks that are formatted and managed by the hypervisor. Includes disk type VMDISK.

Disks with the same *disk-class* value are compatible for use in the same aggregate.

```
[-disk-rpm <integer>] - Disk RPM
Selects the spare disks that match this parameter value.
```

```
[-effective-disk-rpm <integer>] - Effective Disk RPM
Selects the spare disks that match this parameter value.

Hard disk drives with the same *effective-disk-rpm* value may be mixed together in the same aggregate depending upon the system's *raid.mix.hdd.rpm.capacity* and *raid.mix.hdd.rpm.performance* option settings.
```

```
[-syncmirror-pool <text>] - Pool Number
Selects the spare disks that match this parameter value.
```

```
[-owner-name {<nodename>|local}] - Current Owner
Selects the spare disks that match this parameter value.
```

```
[-home-owner-name {<nodename>|local}] - Home Owner
Selects the spare disks that match this parameter value.
```

```
[-dr-owner-name {<nodename>|local}] - DR Home Owner
Selects the spare disks that match this parameter value.
```

```
[-usable-size-blks <integer>] - Disk Usable Size in 4K blocks
Selects the spare disks that match this parameter value.
```

```
[-local-usable-data-size-blks <integer>] - Local Node Data Usable Size in 4K blocks
Selects the spare disks that match this parameter value.

Disks that have two partitions can be used for one root aggregate and one data aggregate.

Disks that have three partitions can be used for one root aggregate and one or two data aggregates.

This value describes the data partition size (of root-data partitioned disk) or the combined data1 + data2 partition size (of root-data1-data2 partitioned disk) in 4KB blocks.
```

```
[-local-usable-root-size-blks <integer>] - Local Node Root Usable Size in 4K blocks
Selects the spare disks that match this parameter value.

Disks that have two partitions can be used for one root aggregate and one data aggregate.

Disks that have three partitions can be used for one root aggregate and one or two data aggregates.

This value describes the root partition size in 4KB blocks.
```

```
[-usable-size [<integer> [KB|MB|GB|TB|PB]]] - Disk Usable Size
Selects the spare disks that match this parameter value.
```

```
[-total-size [<integer> [KB|MB|GB|TB|PB]]] - Total Size
Selects the spare disks that match this parameter value.
```

```
[-local-usable-data-size [<integer> [KB|MB|GB|TB|PB]]] - Local Node Data Usable Size
Selects the spare disks that match this parameter value.

Disks that have two partitions can be used for one root aggregate and one data aggregate.
```

Disks that have three partitions can be used for one root aggregate and one or two data aggregates.

This value describes the root partition size in 4KB blocks.
Disks that have three partitions can be used for one root aggregate and one or two data aggregates.
This value describes the data partition size (of root-data partitioned disk) or the combined data1 + data2 partition size (of root-data1-data2 partitioned disk) in auto-scaled units.

`[-local-usable-root-size <integer> [KB|MB|GB|TB|PB]]` - Local Node Root Usable Size

Selects the spare disks that match this parameter value.

Disks that have two partitions can be used for one root aggregate and one data aggregate.
Disks that have three partitions can be used for one root aggregate and one or two data aggregates.
This value describes the root partition size in auto-scaled units.

`[-is-disk-zeroed {true|false}]` - Is Disk Zeroed?

Selects the spare disks that match this parameter value.

When disks are zeroed, they can be provisioned directly into aggregates which avoids a lengthy zeroing process.

`[-is-disk-zeroing {true|false}]` - Is Disk Zeroing?

Selects the spare disks that match this parameter value.

`[-zeroing-percent <percent>]` - Zeroing Percentage Completed

Selects the spare disks that match this parameter value.

`[-is-sparecore {true|false}]` - Sparecore Disk?

Selects the spare disks that match this parameter value.

`[-sparecore-status <Spare core status>]` - Sparecore Status

Selects the spare disks that match this parameter value.

`[-sparecore-percent <percent>]` - Sparecore Percentage Completed

Selects the spare disks that match this parameter value.

`[-is-disk-shared {true|false}]` - Is Disk Shared?

Selects the spare disks that match this parameter value.

Shared disks have partitions that allow them to be used in multiple aggregates and between nodes in an HA pair. When set to true, this parameter selects shared disks in which the root partition and/or the data partition is a spare. When set to false only spare disks without partitions are displayed. When this parameter is not used, all spare disks are displayed.

`[-is-disk-offline {true|false}]` - Is Disk Offline?

Selects the spare disks that match this parameter value.

Disk offline events are typically temporary events which allow Data ONTAP to perform background error recovery activity.

`[-is-disk-sick {true|false}]` - Is Disk Sick?

Selects the spare disks that match this parameter value.

A sick disk triggers Rapid RAID Recovery to copy data to a spare drive. At the end of the process the sick disk is marked as broken.

`[-is-disk-left-behind {true|false}]` - Is Disk Left Behind Spare?

Selects the spare disks that match this parameter value.

Disks are left behind if they are not responding during a giveback or switchback event.

`[-local-usable-data1-size-blks <integer>]` - Local Node Data1 Usable Size in 4K blocks (privilege: advanced)

Selects the spare disks that match this parameter value.
Disks that have two partitions can be used for one root aggregate and one data aggregate.
Disks that have three partitions can be used for one root aggregate and one or two data aggregates.
This value describes the data1 partition size of a root-data1-data2 partitioned disk in 4KB blocks.

`[-local-usable-data2-size-blks <integer>]` - Local Node Data2 Usable Size in 4K blocks (privilege: advanced)

Selects the spare disks that match this parameter value.
Disks that have two partitions can be used for one root aggregate and one data aggregate.
Disks that have three partitions can be used for one root aggregate and one or two data aggregates.
This value describes the data2 partition size of a root-data1-data2 partitioned disk in 4KB blocks.

`[-local-usable-data1-size]` - Local Node Data1 Usable Size (privilege: advanced)

Selects the spare disks that match this parameter value.
Disks that have two partitions can be used for one root aggregate and one data aggregate.
Disks that have three partitions can be used for one root aggregate and one or two data aggregates.
This value describes the data1 partition size of a root-data1-data2 partitioned disk in auto-scaled units.

`[-local-usable-data2-size]` - Local Node Data2 Usable Size (privilege: advanced)

Selects the spare disks that match this parameter value.
Disks that have two partitions can be used for one root aggregate and one data aggregate.
Disks that have three partitions can be used for one root aggregate and one or two data aggregates.
This value describes the data2 partition size of a root-data1-data2 partitioned disk in auto-scaled units.

### Examples

Display spare disks owned by node `node-b`.

```
cluster1::> storage aggregate show-spare-disks -owner-name node-b

Original Owner: node-b
Pool0
  Spare Pool
  Disk             Type  Class          RPM Checksum           Size     Size Status
  ---------------- ----- ----------- ------ -------------- -------- -------- --------
  1.1.13           BSAS  capacity     7200  block           827.7GB  828.0GB zeroed
  1.1.15           BSAS  capacity     7200  block           413.2GB  414.0GB zeroed

Original Owner: node-b
Pool10
  Partitioned Spares
  Disk             Type  Class          RPM Checksum  Usable Physical
  ---------------- ----- ----------- ------ --------------
  1.0.8            SAS   performance  10000 block      472.9GB  73.89GB  547.1GB zeroed

Check on the progress of a previous disk zeroing command.

```

```
cluster1::> storage aggregate show-spare-disks -owner-name node-b -zeroing-percent >0

Original Owner: node-b
Pool10
```

**storage aggregate show-status**

Display aggregate configuration

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**

The `storage aggregate show-status` command displays the RAID layout and disk configuration of aggregates. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays information about all aggregates in the cluster.

**Note:** This command does not use pagination. You can reduce the output by filtering with the parameters below.

**Parameters**

```
[[-fields <fieldname>, ...]  # If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.
][[-instance ]]  # This parameter currently has no effect.
[[-aggregate <text>] - Aggregate Name  # Selects the aggregates that match this parameter value.
[[-node <nodename>] - Node  # Selects the aggregates that match this parameter value.
[[-aggregate-uuid <UUID>] - Aggregate UUID  # Selects the aggregates that match this parameter value.
```

**Examples**

Display the RAID layout of a Flash Pool aggregate.

```
cluster1::> storage aggregate show-status -aggregate nodeB_flashpool_1
```

Owner Node: node-b
Aggregate: nodeB_flashpool_1 (online, raid_dp, hybrid) (block checksums)
  Plex: /nodeB_flashpool_1/plex0 (online, normal, active, pool0)
  RAID Group /nodeB_flashpool_1/plex0/rg0 (normal, block checksums)

storage aggregate verify

Verify an aggregate

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The storage aggregate verify command verifies the two plexes of an aggregate. It compares the data in the two plexes to ensure that the plexes are identical. It can be used whenever the administrator needs to ensure that the two plexes are completely synchronized with each other. To view any discrepancies, use the following command:

```
event log show -message-name raid.mirror.verify.mismatch
```

Parameters

- **-aggregate <aggregate name> - Aggregate**
  This parameter specifies the aggregate to be verified. If no aggregate is specified then the action specified by the parameter -action will be taken on all the aggregates.

- **-action {start|stop|resume|suspend|status} - Action**
  This parameter specifies the action to be taken. The possible actions are:
  - start - Starts a verify.
  - stop - Permanently stops a verify. A stopped verify cannot be resumed.
  - resume - Resumes a suspended verify.
  - suspend - Suspends a verify.
  - status - Displays the current status of a verify.

- **[-plex-to-fix <text>] - Plex to be Corrected in Case of Mismatches**
  This parameter specifies the name of a plex to fix in case the two plexes of the aggregate do not match. The default behavior is to log any discrepancies instead of fixing them.

  Note: This parameter is only applicable when the command is used to start a verify.

Examples

The storage aggregate verify command verifies the two plexes of an aggregate. It compares the data in the two plexes to ensure that the plexes are identical. It can be used whenever the administrator needs to ensure that the two plexes are completely synchronized with each other. To view any discrepancies, use the following command:

```
event log show -message-name raid.mirror.verify.mismatch
```

The following example starts a verify on an aggregate named aggr1.
The following example queries the status of a verify on an aggregate named aggr1.

```
cluster1::> storage aggregate verify -aggregate aggr1 -action status
Aggregate:aggr1, Is Suspended:false, Percentage Completed:19.03%
```

The following example starts a verify on all the aggregates.

```
cluster1::> storage aggregate verify -action start
```

### storage aggregate efficiency commands

Manage aggregate efficiency

### storage aggregate efficiency show

Display aggregate storage efficiency details

**Availability:** This command is available to cluster administrators at the *admin* privilege level.

**Description**

The `storage aggregate efficiency show` command displays information about the different storage efficiency of all the aggregates. If no parameters are specified, the command displays the following information for all aggregates:

- Aggregate
- Node
- Cross-vol-background-dedupe State (Enabled, Disabled)
- Cross-vol-inline-dedupe State (Enabled, Disabled)

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance]
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[-aggregate <aggregate name>] - Aggregate
```

Displays the aggregate name. If this parameter is specified, the command displays detailed information about the storage efficiency of the specified aggregate.

```
[-node <nodename> | local] - Node
```

Displays the node which owns the aggregate. If this parameter is specified, the command displays storage efficiency information only about the aggregates that are located on the specified node.

```
[-cross-volume-background-dedupe {true|false}] - Cross Volume Background Deduplication
```

Displays whether the cross volume background deduplication is enabled/disabled in the aggregate.

```
[-cross-volume-inline-dedupe {true|false}] - Cross Volume Inline Deduplication
```

Displays whether the cross volume inline deduplication is enabled/disabled in the aggregate.
Has Cross Volume Deduplication Savings
Displays whether the aggregate has savings from cross volume deduplication.

Examples
The following example displays information about all aggregates that are owned by nodes in the local cluster:

```
cluster:::> storage aggregate efficiency show
Aggregate: aggr0
  Node: vivek6-vsim2
  Has Cross Volume Deduplication Savings: false
  Cross Volume Background Deduplication: false
  Cross Volume Inline Deduplication: false
Aggregate: aggr1
  Node: vivek6-vsim2
  Has Cross Volume Deduplication Savings: true
  Cross Volume Background Deduplication: true
  Cross Volume Inline Deduplication: true
2 entries were displayed.
```

storage aggregate efficiency cross-volume-dedupe commands
Manage aggregate efficiency for cross volume deduplication

storage aggregate efficiency cross-volume-dedupe revert-to
Reverts the cross volume deduplication savings on an aggregate

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The `storage aggregate cross-volume-dedupe revert-to` command is used to revert cross volume deduplication savings on an aggregate.

Parameters
- `aggregate <aggregate name>` - Aggregate
  This specifies the aggregate on which cross volume deduplication savings should be reverted. If no aggregate is specified then it will revert the savings on all aggregates

[-`clean-up` | `-c` {true|false}] - Delete Previously Downgraded Metafiles
  This specifies whether downgrade metafile needs to be removed so that other efficiency operations can start on that aggregate.

Examples
The following example displays information for reverting cross volume background deduplication on aggregate "aggr1":

```
cluster:::> storage aggregate efficiency cross-volume-dedupe revert-to -aggregate aggr1
The revert operation started on aggregate "aggr1" successfully.

cluster:::> storage aggregate efficiency cross-volume-dedupe revert-to -aggregate aggr1 -clean-up true
The revert operation started on aggregate "aggr1" successfully.
```
**storage aggregate efficiency cross-volume-dedupe show**

Display aggregate cross volume deduplication efficiency details

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The `storage aggregate efficiency cross-volume-dedupe show` command displays information in detail about the different storage efficiency of all the aggregates. If no parameters are specified, the command displays the following information for all aggregates:

**Parameters**

`{[-fields <fieldname>, ...]`  
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

`[-instance]`  
If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-aggregate <aggregate name>] - Aggregate`  
Displays the aggregate name. If this parameter is specified, the command displays detailed information about the storage efficiency of the specified aggregate.

`[-node {<nodename> | local}] - Node`  
Displays the node which owns the aggregate. If this parameter is specified, the command displays storage efficiency information only about the aggregates that are located on the specified node.

`[-background-progress <text>] - Progress`  
Displays the information for the aggregates that match the specified progress.

`[-background-op-status <text>] - Operation Status`  
Displays the information for the aggregates that match the specified operation status.

`[-background-last-op-state <text>] - Last Operation State`  
Displays the information for the aggregates that match the specified last operation state.

`[-background-last-success-op-begin <Date>] - Last Success Operation Begin Time`  
Displays the information for the aggregates that match the specified last successful operation begin time.

`[-background-last-success-op-end <Date>] - Last Success Operation End Time`  
Displays the information for the aggregates that match the specified last successful operation end time.

`[-background-last-op-begin <Date>] - Last Operation Begin Time`  
Displays the information for the aggregates that match the specified last operation begin time.

`[-background-last-op-end <Date>] - Last Operation End Time`  
Displays the information for the aggregates that match the specified last operation end time.

`[-background-last-op-error <text>] - Last Operation Error`  
Displays the information for the aggregates that match the specified last operation error.

`[-background-stage <text>] - Stage`  
Displays the information for the aggregates that match the specified stage.

`[-background-checkpoint-time <Date>] - Checkpoint Time`  
Displays the information for the aggregates that match the specified checkpoint time.
[[-background-checkpoint-op-type <text>] - Checkpoint Operation Type
Displays the information for the aggregates that match the specified checkpoint operation type.

[[-background-checkpoint-stage <text>] - Checkpoint Stage
Displays the information for the aggregates that match the specified checkpoint stage.

[[-background-dedupe [true|false]] - Background State
Displays the information for the aggregates that match the specified cross volume background dedupe state.

[[-inline-dedupe [true|false]] - Inline State
Displays the information for the aggregates that match the specified cross volume inline dedupe state.

[[-dedupe-savings [true|false]] - Has Cross Volume Deduplication Savings
Displays the information for the aggregates that has some savings from cross volume deduplication.

Examples
The following example displays information about all aggregates that are owned by nodes in the local cluster:

```bash
cluster:::> storage aggregate efficiency cross-volume-dedupe show
Aggregate: aggr0
  Node: vivek6-vsim2
  Has Cross Volume Deduplication Savings: false
-------:Cross Volume Background Deduplication Status:-------
  State: false
  Progress:
  Operation Status: Idle
  Last Operation State: Success
  Last Success Operation Begin Time: -
  Last Success Operation End Time: -
  Last Operation Begin Time: -
  Last Operation End Time: -
  Last Operation Error: Operation succeeded
  Stage:
  Checkpoint Time:
  Checkpoint Operation Type:
  Checkpoint Stage:
-------:Cross Volume Inline Deduplication Status:-------
  State: false
Aggregate: aggr1
  Node: vivek6-vsim2
  Has Cross Volume Deduplication Savings: true
-------:Cross Volume Background Deduplication Status:-------
  State: true
  Progress:
  Operation Status: Idle
  Last Operation State: Success
  Last Success Operation End Time: Wed Aug 30 06:31:50 2017
  Last Operation End Time: Wed Aug 30 06:31:50 2017
  Last Operation Error: Operation succeeded
  Stage: Cross volume sharing Done
  Checkpoint Time:
  Checkpoint Operation Type:
  Checkpoint Stage:
-------:Cross Volume Inline Deduplication Status:-------
  State: true
2 entries were displayed.
```
storage aggregate efficiency cross-volume-dedupe stop

Stops the cross volume background deduplication on an aggregate

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

The `storage aggregate cross-volume-dedupe stop` command is used to stop cross volume background deduplication on an aggregate.

Parameters

- `aggregate <aggregate name>` - Aggregate
  
  This specifies the aggregate on which cross volume background deduplication should be stopped. If no aggregate is specified then it will stop on all aggregates

Examples

The following example displays information for stopping cross volume background deduplication on aggregate "aggr1":

```
cluster:::> storage aggregate efficiency cross-volume-dedupe stop -aggregate aggr1
The efficiency operation on aggregate "aggr1" is being stopped.
```

storage aggregate inode-upgrade commands

Manage aggregate inode upgrade

storage aggregate inode-upgrade resume

Resume suspended inode upgrade

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

The `storage aggregate inode-upgrade resume` command resumes a suspended inode upgrade process. The inode upgrade process might have been suspended earlier due to performance reasons.

Parameters

- `node {<nodename>|local}` - Node Name
  
  If this parameter is specified, the command resumes the upgrade process of an aggregate that is located on the specified node.

- `aggregate <aggregate name>` - Aggregate Name
  
  This specifies the aggregate for which the inode upgrade process is to be resumed.

Examples

The following example resumes an aggregate upgrade process:

```
cluster1::> storage aggregate inode-upgrade resume -aggregate aggr1
```
storage aggregate inode-upgrade show

Display inode upgrade progress

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The storage aggregate inode-upgrade show command displays information about aggregates undergoing the inode upgrade process. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays the default fields about all aggregates undergoing the inode upgrade process. The default fields are:

• aggregate
• status
• scan-percent
• remaining-time
• space-needed
• scanner-progress

Parameters

{[-fields <fieldname>, ...]}

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance]]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-aggregate <text>] - Aggregat Name

If this parameter is specified with the -node parameter, the command displays detailed information about the specified aggregate. If only this parameter is specified, the command displays information about all aggregates that match the specified name.

[-node <nodename>] - Node Name

If this parameter is specified, the command displays information only about the aggregate or aggregates that are located on the specified node.

[-status {pending|scanning|suspended-initializing|suspended|cleanup-pending|cleanup|cleanup-done|suspended-aborting|suspended-removing|suspended-while-removing|suspended-ironing}] - Upgrade Status

If this parameter is specified, the command displays information only about the aggregate or aggregates that match the specified inode upgrade status.

[-scan-percent <percent>] - Upgrade Scan Percent Complete

If this parameter is specified, the command displays information only about the aggregate or aggregates that match the specified inode upgrade progress percentage.

[-space-needed [<integer> [KB|MB|GB|TB|PB]]] - Space Needed to Complete Upgrade

If this parameter is specified, the command displays information only about the aggregate or aggregates where the space needed to complete the upgrade process matches the specified size.

[-remaining-time [<integer>h][<integer>m][<integer>s]] - Remaining Upgrade Time

If this parameter is specified, the command displays information only about the aggregate or aggregates where the remaining time to complete the inode upgrade process matches the specified time.
[-scanner-progress <text>] - Scanner Progress

If this parameter is specified, the command displays information only about the aggregate or aggregates where the progress of the inode upgrade process matches the input.

Examples
The following example displays information about all aggregates undergoing the inode upgrade process:

```
cluster1::> storage aggregate inode-upgrade show
Aggregate Status   %Complete Time Remaining Space Needed Inode Progress
--------- --------- -------------- -------------- --------------
aggr0     pending   0%        -              20.36MB      Public : Inode 0 out of 65562
aggr1     pending   0%        -              19.84MB      Public : Inode 0 out of 63714
```

storage aggregate object-store commands

Manage storage aggregate object-store

storage aggregate object-store attach

Attach an object store to an aggregate

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The `storage aggregate object-store attach` command attaches an object store to an aggregate to create a FabricPool. This command requires two parameters to create a FabricPool - an aggregate and a configuration to attach an object-store to the aggregate. This command verifies whether the object store is accessible through the intercluster LIF both from the node on which the aggregate is present as well as its High Availability (HA) partner node. The command fails if the object store is not accessible.

Parameters
- `-aggregate <text>` - Name of the Aggregate
  This parameter specifies the aggregate to which the object store must be attached to create a FabricPool.
- `-object-store-name <text>` - Object Store Configuration Name
  This parameter specifies the object store configuration that describes the object store to be attached. The object store configuration has information about object store server name, port, access credentials, and provider type.

Examples
The following example attaches an object store to aggregate aggr1:

```
cluster1::>storage aggregate object-store attach -aggregate aggr1 -object-store-name my-store
```

storage aggregate object-store show

Display the details of object stores attached to an aggregate

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The `storage aggregate object-store show` command displays information about all the object stores in the system.
Parameters

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance]
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[-aggregate <text>] - Aggregate Name
```

If this parameter is specified, the command displays information only about the object stores that are attached to the specified aggregates.

```
[-object-store-name <text>] - ONTAP Name for this Object Store Config
```

If this parameter is specified, the command displays information only about object stores whose configuration name matches the specified names.

```
[-object-store-availability <object Store Availability>] - Availability of the Object Store
```

If this parameter is specified, the command displays information only about object stores whose availability status matches the specified value. Supported values with this parameter are `available` and `unavailable`.

```
[-license-used-percent <percent_no_limit>] - License Space Used Percent
```

If this parameter is specified, the command displays information only about object stores whose space used by the aggregate as a percentage of the license limit matches the specified value.

Examples

The following example displays all information about all object stores:

```
cluster1::>storage aggregate object-store show
```

---

**storage aggregate object-store show-freeing-status**

Show status of background object freeing work after aggregate delete

**Availability:** This command is available to cluster administrators at the `advanced` privilege level.

**Description**

The `storage aggregate object-store show-freeing-status` command displays status information about the background work that frees an aggregate's objects from an object store after a `storage aggregate delete`.

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance]
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[-bin-uuid <UUID>] - UUID of the Bin
```

If this parameter is specified, the command displays information only about the aggregate attached to the specified bin UUID.

```
[-object-store-name <text>] - Object Store Configuration Name
```

If this parameter is specified, the command displays information only about object stores whose configuration name matches the specified names.
[\textbf{-aggregate-name} <\textit{aggregate name}>] - \textbf{Aggregate}

If this parameter is specified, the command displays information only about the specified aggregates that were deleted.

[\textbf{-request-state} \{\textit{queued} | \textit{running} | \textit{cleaning-up}\}] - \textbf{Request State}

If this parameter is specified, the command displays information only about the object stores that have the specified object freeing request state.

[\textbf{-num-objects-freed} \textit{integer}] - \textbf{Num Objects Freed}

If this parameter is specified, the command displays information only about the object stores that have the specified number of objects that have been freed.

[\textbf{-last-error} <\textit{text}>] - \textbf{The Last Error Encountered}

If this parameter is specified, the command displays information only about the object stores that have the specified last error encountered.

\textbf{Related references}

storage aggregate delete on page 778

\textbf{storage aggregate object-store show-space}

Display space utilization of object stores attached to an aggregate

\textbf{Availability}: This command is available to \textit{cluster} administrators at the \textit{admin} privilege level.

\textbf{Description}

The \texttt{storage aggregate object-store show-space} command displays information about the amount of space used in the object store for each of the aggregates in FabricPool. The used space is displayed in both absolute size as well as a percentage of the FabricPool license limit.

\textbf{Parameters}

\texttt{[[-fields} <\textit{fieldname}>\texttt{, ...]}

If you specify the \texttt{[-fields} <\textit{fieldname}>\texttt{, ...} parameter, the command output also includes the specified field or fields. You can use ‘-fields ?’ to display the fields to specify.

\texttt{| [-instance ]|}

If you specify the \texttt{[-instance]} parameter, the command displays detailed information about all fields.

[\textbf{-aggregate} <\textit{text}>] - \textbf{Aggregate Name}

If this parameter is specified, the command displays space information only about object stores that are attached to the specified aggregates.

[\textbf{-object-store-name} <\textit{text}>] - \textbf{ONTAP Name for this Object Store Config}

If this parameter is specified, the command displays space information only about object stores whose configuration name matches the specified names.

[\textbf{-object-store-availability} <\textit{object Store Availability}>] - \textbf{Availability of the Object Store}

If this parameter is specified, the command displays space information about the object stores whose availability status matches the specified value. Supported values with this parameter are - available and unavailable.

[\textbf{-license-used-percent} <\textit{percent_no_limit}>] - \textbf{License Space Used Percent}

If this parameter is specified, the command displays space information only about object stores whose space used by the associated aggregate as a percentage of the license limit matches the specified value. If the object store does not require a license, then this field is not set.
The following example displays space information about all object stores:

```bash
cluster1:/>storage aggregate object-store show-space
```

### storage aggregate object-store config commands

The `config` directory

#### storage aggregate object-store config create

Define the configuration for an object store

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The `storage aggregate object-store config create` command is used by a cluster administrator to tell Data ONTAP how to connect to an object store. Following prerequisites must be met before creating an object store configuration in Data ONTAP:

- A valid data bucket or container must be created with the object store provider. This assumes that the user has valid account credentials with the object store provider to access the data bucket.

- The Data ONTAP node must be able to connect to the object store. This includes:
  - Fast, reliable connectivity to the object store.
  - An inter-cluster LIF (Logical Interface) must be configured on the cluster. Data ONTAP will verify connectivity prior to saving this configuration information.
  - If SSL/TLS authentication is required, then valid certificates must be installed.
  - FabricPool license (required for Amazon S3 object store).

An object-store configuration once created must not be reassigned with a different object-store or container. See `storage aggregate object-store config modify` command for more information. If no secret password or access key is provided while setting up a configuration for AWS_S3 object store, Data ONTAP will try to obtain them through Data ONTAP Cloud in AWS using the AWS Identity and Access Management (IAM) role. If Data ONTAP is unable to create a object store configuration, then the command will fail explaining the reason for failure.

**Parameters**

- `-object-store-name <text>` - **Object Store Configuration Name**
  This parameter specifies the name that will be used to identify the object store configuration. The name can contain the following characters: "_", ".", A-Z, a-z, and 0-9. The first character must be one of the following: "_", A-Z, or a-z.

- `-provider-type <providerType>` - **Type of the Object Store Provider**
  This parameter specifies the type of object store provider that will be attached to the aggregate. Valid options are: AWS_S3 (Amazon S3 storage) and SGWS (StorageGrid WebScale).

- `-server <Remote InetAddress>` - **Fully Qualified Domain Name of the Object Store Server**
  This parameter specifies the Fully Qualified Domain Name (FQDN) of the remote object store server. For Amazon S3, server name must be an AWS regional endpoint in the format s3.amazonaws.com or s3-region.amazonaws.com, for example, s3-us-west-2.amazonaws.com. The region of the server and the bucket must match. For more information on AWS regions, refer to 'Amazon documentation on AWS regions and endpoints'.
[-ssl-enabled {true|false}] - SSL/HTTPS Enabled?
   This parameter indicates whether secured connection will be used during data access to the object store.
   Default: False. Use of SSL certificates is one such method to ensure secure communication.

[-port <integer>] - Port Number of the Object Store
   This parameter specifies the port number on the remote server that Data ONTAP will use while establishing
   connection to the object store.

[-container-name <text>] - Data Bucket/Container Name Used in S3 Requests
   This parameter specifies the data bucket or container that Data ONTAP should read and write to.

[-access-key <text>] - Access Key
   This parameter specifies the access key (access key ID) required to authorize requests to the object store.

[-secret-password <text>] - Secret Password
   This parameter specifies the password (secret access key) to authenticate requests to the object store.

[-ipspace <IPspace>] - IPspace to Use in Order to Reach the Object Store
   This optional parameter specifies the ipspace to use to connect to the object store. Default value: Default

[-use-iam-role {true|false}] - Use IAM Role for AWS ONTAP Cloud
   This parameter specifies whether IAM credentials must be used for data access from AWS_S3 object store.
   This parameter is required only when setting up a AWS_S3 object store configuration in Data ONTAP. The
   IAM credentials required for setting up this configuration will obtained through Data ONTAP Cloud in AWS.
   This option is available only through ONTAPI.

Examples
   The following example creates a object store configuration in Data ONTAP:

```
cluster1::>storage aggregate object-store config create -object-store-name my-aws_store
   -provider-type AWS_S3 -server objstr_srvr.amazon.com -port 1237 -s3-name AWS-bucket
   -ssl-enabled false -ipspace Default
```

Related references
   `storage aggregate object-store config modify` on page 826

storage aggregate object-store config delete
   Delete the configuration of an object store

   Availability: This command is available to `cluster` administrators at the `admin` privilege level.

   Description
   The `storage aggregate object-store config delete` command removes an existing object store configuration in
   Data ONTAP. The configuration cannot be deleted if it is used by any aggregates or if the system is still freeing objects from the
   object store from a previously executed `storage aggregate delete` command. The command `storage aggregate
   object-store show` can be used to view the aggregates attached to the object store before issuing the delete command.

   Note: The `storage aggregate object-store show` command will not display aggregates that have been previously
   deleted but still has objects in the object store.

   Parameters
   - `object-store-name <text>` - Object Store Configuration Name
     This parameter specifies the object store configuration to be deleted.
Examples
The following example deletes an object store configuration named my-store:

```
cluster1::>storage aggregate object-store config delete -object-store-name my-store
```

Related references
- `storage aggregate delete` on page 778
- `storage aggregate object-store show` on page 821

`storage aggregate object-store config modify`

Modify object store configuration attributes

**Availability:** This command is available to cluster administrators at the `admin` privilege level.

**Description**
The `storage aggregate object-store config modify` command is used to update one or more of object store configuration parameters. This command must not be used to reassociate an existing valid object-store configuration to a new object-store or container. The modifiable parameters include object store name, server name, port, access_key, secret-password, ipspace and ssl-enabled.

**Parameters**

- `--object-store-name <text>` - Object Store Configuration Name
  
  This parameter identifies the configuration to be modified.

- `[-new-object-store-name <text>]` - Object Store Configuration New Name
  
  This optional parameter specifies the new name for the object store configuration.

- `[-server <Remote InetAddress>]` - Fully Qualified Domain Name of the Object Store Server
  
  This optional parameter specifies the new Fully Qualified Domain Name (FQDN) of the same object store server. For Amazon S3, server name must be an AWS regional endpoint in the format s3.amazonaws.com or s3-<region>.amazonaws.com, for example, s3-us-west-2.amazonaws.com. The region of the server and the bucket must match. For more information on AWS regions, refer to ‘Amazon documentation on AWS regions and endpoints’.

- `[-ssl-enabled {true|false}]` - SSL/HTTPS Enabled?

  This optional parameter can be toggled to indicate whether secured connection should be used for communication with the object store server. Use of SSL certificates is one such method to ensure secure communication.

- `[-port <integer>]` - Port Number of the Object Store

  This optional parameter specifies a new port number to connect to the object store server indicated in the --server parameter.

- `[-access-key <text>]` - Access Key

  This optional parameter specifies a new access key for the object store.

- `[-secret-password <text>]` - Secret Password

  This optional parameter specifies a new password for the object store.

- `[-ipspace <IPspace>]` - IPspace to Use in Order to Reach the Object Store

  This optional parameter specifies new ipspace values for the configuration.
[-use-iam-role {true|false}] - Use IAM Role for AWS ONTAP Cloud

This optional parameter specifies whether to enable IAM role for this object store configuration. IAM role can be enabled only if connecting to AWS object store in Data ONTAP Cloud. When using this parameter, -secret-password and -access-key parameters must not be explicitly specified as they will be obtained from Data ONTAP Cloud in AWS using the IAM role.

Examples
The following example modifies two parameters (port number and ssl-enabled) of an object store configuration named my-store:

```
cluster1::>storage aggregate object-store config modify -object-store-name my-store -port 1235 -ssl-enabled true
```

storage aggregate object-store config rename

Rename an existing object store configuration

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The storage aggregate object-store config rename command is used to rename an existing object store configuration.

Parameters
-object-store-name <text> - Object Store Configuration Name
  This parameter identifies an existing object store configuration.

-new-object-store-name <text> - Object Store Configuration New Name
  This parameter specifies the new object store configuration name.

Examples
The following example renames an object store configuration from my-store to ms1:

```
cluster1::>storage aggregate object-store config rename -object-store-name my-store -new-object-store-name ms1
```

storage aggregate object-store config show

Display a list of object store configurations

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The storage aggregate object-store config show command displays information about all existing object store configurations in the cluster.

Parameters
{ [-fields <fieldname>, ...]  
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?' to display the fields to specify.
  | [-instance]  
  If you specify the -instance parameter, the command displays detailed information about all fields.}
[-object-store-name <text>] - Object Store Configuration Name
   If this parameter is specified, the command displays information only about object store configurations whose
   name matches the specified names.

[-object-store-uuid <UUID>] - UUID of the Object Store Configuration
   If this parameter is specified, the command displays information only about object store configurations whose
   UUID matches the specified UUID values.

[-provider-type <providerType>] - Type of the Object Store Provider
   If this parameter is specified, the command displays information only about object store configurations whose
   provider type matches the specified value.

[-server <Remote InetAddress>] - Fully Qualified Domain Name of the Object Store Server
   If this parameter is specified, the command displays information only about object store configurations whose
   server name matches the specified value. The server name is specified as a Fully Qualified Domain Name
   (FQDN).

[-ssl-enabled {true|false}] - SSL/HTTPS Enabled?
   If this parameter is specified, the command displays information only about object store configurations whose
   status about the use of secured communication over the network (for example, SSL certificates) matches the
   specified value.

[-port <integer>] - Port Number of the Object Store
   If this parameter is specified, the command displays information only about object store configurations whose
   port numbers matches the specified value.

[-container-name <text>] - Data Bucket/Container Name Used in S3 Requests
   If this parameter is specified, the command displays information only about object store configurations whose
   container name matches the specified value. Data ONTAP uses this container name or object store data bucket
   while accessing data from the object store.

[-access-key <text>] - Access Key
   If this parameter is specified, the command displays information only about object store configurations whose
   access key matches the specified value. Data ONTAP requires the access key for authorized access to the
   object store.

[-ipspace <IPspace>] - IPspace to Use in Order to Reach the Object Store
   If this parameter is specified, the command displays information only about object store configurations whose
   IPspace matches the specified value. Data ONTAP uses the IPspace value to connect to the object store.

[-use-iam-role {true|false}] - Use IAM Role for AWS ONTAP Cloud
   If this parameter is specified, the command displays information only about object store configurations whose
   IAM role status flag matches the specified value. The -iam-role and -use-iam-role parameters are
   relevant only in the context of AWS object store and indicates whether IAM role must be used for accessing it.
   The IAM credentials can be obtained only through AWS Data ONTAP Cloud.

[-iam-role <text>] - IAM Role for AWS ONTAP Cloud
   If this parameter is specified, the command displays information only about object store configurations whose
   IAM (Identity and Access Management) role matches the specified value.

Examples

The following example displays all available object store configuration in the cluster:

```bash
cluster1:~>storage aggregate object-store config show
```
storage aggregate plex commands

Manage storage aggregate plexes

The plex directory contains commands that operate on a plex of an aggregate.

storage aggregate plex delete

Delete a plex

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The storage aggregate plex delete command deletes the specified plex. The aggregate specified with the -aggregate parameter will be unmirrored and contain the remaining plex. The disks in the deleted plex become spare disks.

Parameters

- aggregate <aggregate name> - Aggregate
  Name of an existing aggregate which contains the plex specified with the -plex parameter.

- plex <text> - Plex
  Name of a plex which belongs to the aggregate specified with the -aggregate parameter.

Examples

The following example deletes plex0 of aggregate aggr1:

```bash
cluster1::> storage aggregate plex delete -aggregate aggr1 -plex plex0
```

storage aggregate plex offline

Offline a plex

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The storage aggregate plex offline command takes the specified plex offline. The aggregate specified with the -aggregate parameter must be a mirrored aggregate and both plexes must be online. Prior to taking a plex offline, the system will flush all internally-buffered data associated with the plex and create a snapshot that is written out to both plexes. The snapshot allows for efficient resynchronization when the plex is subsequently brought back online.

Parameters

- aggregate <aggregate name> - Aggregate
  Name of an existing aggregate which contains the plex specified with the -plex parameter.

- plex <text> - Plex
  Name of a plex which belongs to the aggregate specified with the -aggregate parameter.

Examples

The following example takes plex0 of aggregate aggr1 offline:

```bash
cluster1::> storage aggregate plex offline -aggregate aggr1 -plex plex0
```
storage aggregate plex online

Online a plex

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The storage aggregate plex online command brings the specified plex online. The aggregate specified with the -aggregate parameter must be an online mirrored aggregate. The system will initiate resynchronization of the plex as part of online processing.

Parameters
- aggregate <aggregate name> - Aggregate
  Name of an existing aggregate which contains the plex specified with the -plex parameter.
- plex <text> - Plex
  Name of a plex which belongs to the aggregate specified with the -aggregate parameter.

Examples
The following example brings plex0 of aggregate aggr1 online:

```
cluster1::> storage aggregate plex online -aggregate aggr1 -plex plex0
```

storage aggregate plex show

Show plex details

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The storage aggregate plex show command displays information for the specified plex. By default, the command displays the following information about all plexes:

- Aggregate Name
- Plex Name
- Is Online
- Is Resyncing
- Resyncing Percentage
- Plex Status

To display detailed information about a single plex, use the -aggregate and -plex parameter.

Parameters
  [{ -fields <fieldname>, ...]
    If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.
  | [-instance ]
    If you specify the -instance parameter, the command displays detailed information about all fields.
[-aggregate <aggregate name>] - Aggregate

Name of an existing aggregate which contains the plex specified with the -plex parameter.

[-plex <text>] - Plex Name

Name of a plex which belongs to the aggregate specified with the -aggregate parameter.

[-status <text>] - Status

Displays plex status. Possible values are:

- normal
- failed
- empty
- invalid
- uninitialized
- failed assimilation
- limbo
- active
- inactive
- resyncing

These values may appear by themselves or in combination separated by commas, for example, "normal,active".

[-is-online {true|false}] - Is Online

Selects the plexes that match this parameter value.

[-in-progress {true|false}] - Resync is in Progress

Selects the plexes that match this parameter value.

[-resyncing-percent <percent>] - Resyncing Percentage

Selects the plexes that match this parameter value.

[-resync-level <integer>] - Resync Level

Selects the plexes that match this parameter value.

[-pool <integer>] - Pool

Selects the plexes that match this parameter value.

Examples

The following example displays information about all the plexes for all the aggregates:

```
cluster1::> storage aggregate plex show

Is      Is         Resyncing
Aggregate Plex      Online  Resyncing    Percent Status
--------- --------- ------- ---------- --------- ---------------
aggr0     plex0     true    false              - normal,active
aggr1     plex0     true    false              - normal,active
aggr1     plex1     true    false              - normal,active
aggr2     plex0     true    false              - normal,active
aggr2     plex2     true    false              - normal,active
5 entries were displayed.
```

Storage aggregate Commands 831
The following example displays information about plex1 of aggregate aggr1:

```
cluster1::> storage aggregate plex show -aggregate aggr1 -plex plex1
```

<table>
<thead>
<tr>
<th>Aggregate: aggr1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plex Name: plex1</td>
</tr>
<tr>
<td>Status: normal,active</td>
</tr>
<tr>
<td>Is Online: true</td>
</tr>
<tr>
<td>Resync is in Progress: false</td>
</tr>
<tr>
<td>Resyncing Percentage: -</td>
</tr>
<tr>
<td>Resync Level: -</td>
</tr>
<tr>
<td>Pool: 1</td>
</tr>
</tbody>
</table>

---

### storage aggregate reallocation commands

Commands for optimizing freespace layout

#### storage aggregate reallocation quiesce

Quiets reallocate job on aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

Temporarily stops any reallocation jobs that are in progress. When you use this command, the persistent state is saved. You can use the `storage aggregate reallocation restart` command to restart a job that is quiesced.

There is no limit to how long a job can remain in the quiesced (paused) state.

**Parameters**

- `aggregate <aggregate name>` - Aggregate Name

  Specifies the aggregate on which you want to temporarily pause the job.

**Examples**

```
cluster1::> storage aggregate reallocation quiesce
- aggregate aggr0
```

**Related references**

*storage aggregate reallocation restart* on page 832

#### storage aggregate reallocation restart

Restart reallocate job on aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

Starts a reallocation job. Use this command to restart a quiesced (temporarily stopped) job or a scheduled scan that is idle for the aggregate.

**Parameters**

- `aggregate <aggregate name>` - Aggregate Name

  Specifies the aggregate on which you want to restart reallocation scans.
**[-ignore-checkpoint | -i [true]] - Ignore Checkpoint**

Restarts the job at the beginning when set to true. If you use this command without specifying this parameter, its effective value is false and the job starts the scan at the point where it was stopped. If you specify this parameter without a value, it is set to true and the scan restarts at the beginning.

**Examples**

```
cluster1::> storage aggregate reallocation restart
-aggregate aggr0 -ignore-checkpoint true
```

**storage aggregate reallocation schedule**

Modify schedule of reallocate job on aggregate

**Availability:** This command is available to cluster administrators at the *admin* privilege level.

**Description**

Schedules a reallocation scan for an existing reallocation job. If the reallocation job does not exist, use the `storage aggregate reallocation start` command to define a reallocation job.

You can delete an existing reallocation scan schedule. However, if you do this, the job's scan interval reverts to the schedule that was defined for it when the job was created with the `storage aggregate reallocation start` command.

**Parameters**

- **-aggregate <aggregate name> - Aggregate Name**
  
  Specifies the aggregate on which you want to schedule reallocation jobs.

- **[-del | -d [true]] - Delete**
  
  Deletes an existing reallocation schedule when set to true. If you use this command without specifying this parameter, its effective value is false and the reallocation schedule is not deleted. If you specify this parameter without a value, it is set to true and the reallocation schedule is deleted.

- **[-cron | -s <text>] - Cron Schedule**
  
  Specifies the schedule with the following four fields in sequence. Use a space between field values. Enclose the values in double quotes.

  • minute is a value from 0 to 59.
  
  • hour is a value from 0 (midnight) to 23 (11:00 p.m.).
  
  • day of week is a value from 0 (Sunday) to 6 (Saturday).
  
  • day of month is a value from 1 to 31.

  **Note:** If you specify 31 as the value for the day of month, reallocation scans will not run in any months with fewer than 31 days.

  Use an asterisk "*" as a wildcard to indicate every value for that field. For example, an * in the day of month field means every day of the month. You cannot use the wildcard in the minute field.

  You can enter a number, a range, or a comma-separated list of values for a field.

**Examples**

```
cluster1::> storage aggregate reallocation schedule -aggregate aggr0 -cron "0 23 6 *"
```
storage aggregate reallocation show

Show reallocate job status for improving free space layout

Availability: This command is available to cluster administrators at the admin privilege level.

Description
Displays the status of a reallocation scan, including the state, schedule, aggregate and scan id. If you do not specify the id for a particular reallocation scan, the command displays information about all the existing reallocation scans.

Parameters

[-fields <fieldname>,...]
Displays the value of relevant field that you specify for the reallocation scans that are present.

[-v]
Specify this parameter to display the output in a verbose format.

[-instance]
Displays information about reallocation scans on aggregates in a list format.

[-id <integer>] - Job ID
Specify this parameter to display the reallocation scan that matches the reallocation job ID that you specify.

[-aggregate <aggregate name>] - Aggregate Name
Specify this parameter to display the reallocation scan that matches the aggregate that you specify.

[-description <text>] - Job Description
Specify this parameter to display reallocation scans that match the text description that you specify.

[-state {Initial|Queued|Running|Pausing|Paused|Quitting|Success|Failure|Reschedule|Error|Quit|Dead|Unknown|Restart|Dormant}] - Job State
Specify this parameter to display reallocation jobs that match the state that you specify.

[-progress <text>] - Execution Progress
Specify this parameter to list the running reallocation jobs whose progress indicator matches the text that you provide. For example, if you specify "Starting ..." as the text string for the progress option, then the system lists all the jobs that are starting.

[-schedule <job_schedule>] - Schedule Name
Specify this parameter to display reallocation scans that match the schedule name that you specify. If you want a list of all job schedules, use the job schedule show command.

[-global-status <text>] - Global State of Scans
Specify this parameter to indicate if reallocation scans are on or off globally. You must type either of the following text strings:

• "Reallocation scans are on"
• "Reallocation scans are off"
Examples

```plaintext
cluster1:~> storage aggregate reallocation show
Job ID   Aggregate   Schedule               State
-------- ---------               --------                -----
23       aggr0      reallocate_0 23 * 6     Queued
```

Related references

`job schedule show` on page 175

**storage aggregate reallocation start**

Start reallocate job on aggregate

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**

Begins a reallocation scan on a specified aggregate.

Before performing a reallocation scan, the reallocation job normally performs a check of the current layout optimization. If the current layout optimization is less than the threshold, then the system does not perform a reallocation on the aggregate.

You can define the reallocation scan job so that it runs at a specific interval, or you can use the `storage aggregate reallocation schedule` command to schedule reallocation jobs.

**Parameters**

- **-aggregate <aggregate name>** - Aggregate Name
  
  Specify this parameter to specify the target aggregate on which to start a reallocation scan.

- **{-interval | -i <text>}** - Interval Schedule
  
  Specified the schedule in a single string with four fields:
  
  - minute is a value from 0 to 59.
  - hour is a value from 0 (midnight) to 23 (11:00 p.m.).
  - day of month is a value from 1 to 31.
  
  **Note:** If you specify 31 as the value for the day of the month, reallocation scans will not run in any of the months with fewer than 31 days.

  - day of the week is a value from 0 (Sunday) to 6 (Saturday).

  Use an asterisk "*" as a wildcard to indicate every value for that field. For example, an * in the day of month field means every day of the month. You cannot use the wildcard in the minute field.

  You can enter a number, a range, or a comma-separated list of values for a field.

- **{-once | -o [true]}** - Once
  
  Specifies that the job runs once and then is automatically removed from the system when set to true. If you use this command without specifying this parameter, its effective value is false and the reallocation scan runs as scheduled. If you enter this parameter without a value, it is set to true and a reallocation scan runs once.
Examples

```
cluster1::> storage aggregate reallocation start -aggregate aggr0 -interval "0 23 * 6"
```

Related references

storage aggregate reallocation schedule on page 833

**storage aggregate reallocation stop**

Stop reallocate job on aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

Stops and deletes any reallocation scan running on the specified aggregate. This command stops and deletes in-progress, scheduled, and quiesced scans.

**Parameters**

- `-aggregate <aggregate name>` - Aggregate Name
  Specify this parameter to specify the target aggregate on which to stop and delete a reallocation scan.

Examples

```
cluster1::> storage aggregate reallocation stop -aggregate aggr0
```

**Storage Aggregate Relocation Commands**

Manage aggregate relocation

The `storage aggregate relocation` commands enable you to relocate aggregates from one node to another node in the same cluster that share storage.

**storage aggregate relocation show**

Display relocation status of an aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The `storage aggregate relocation show` command displays status of aggregates which were relocated in the last instance of relocation operation.

**Parameters**

- `[-fields <fieldname>, ...]`
  If you specify the `-fields <fieldname>, ...` parameter, the command only displays the fields that you specify.

- `[-instance ]`
  If you specify the `-instance` parameter, the command displays detailed information about all entries.

- `[-node (<nodename> | local)]` - Node
  Selects aggregates from the specified source node.
[-aggregate <text>] - Aggregate Name
Selects the aggregates that match this parameter value.

[-relocation-status <text>] - Aggregates Relocation Status
Selects the aggregates whose relocation status matches this parameter value.

[-destination <text>] - Destination for Relocation
Selects the aggregates that are designated for relocation on the specified destination node.

Examples
The following example displays the relocation status of aggregates on all nodes in the cluster:

```
classroom1::> storage aggregate relocation show
<table>
<thead>
<tr>
<th>Source</th>
<th>Aggregate</th>
<th>Destination</th>
<th>Relocation Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>node0</td>
<td>-</td>
<td>-</td>
<td>Not attempted yet</td>
</tr>
<tr>
<td>node1</td>
<td>aggr1</td>
<td>node0</td>
<td>Done</td>
</tr>
<tr>
<td></td>
<td>aggr2</td>
<td>node0</td>
<td>In progress</td>
</tr>
<tr>
<td></td>
<td>aggr3</td>
<td>node0</td>
<td>Not attempted yet</td>
</tr>
</tbody>
</table>
4 entries were displayed.
```

storage aggregate relocation start
Relocate aggregates to the specified destination

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The storage aggregate relocation start command initiates the relocation of the aggregates from one node to the partner node in a high-availability (HA) pair.

Parameters

- `-node {<nodename>|local}` - Name of the Node that currently owns the aggregate
  This specifies the source node where the aggregates to be relocated reside.

- `-destination {<nodename>|local}` - Destination node
  This specifies the destination node where aggregates are to be relocated.

- `-aggregate-list <aggregate name>, ...` - List of Aggregates to be relocated
  This specifies the list of aggregate names to be relocated from source node to destination node.

[-`override-vetoes {true|false}`] - Override Vetoes
This specifies whether to override the veto checks for relocation operation. Initiating aggregate relocation with vetoes overridden will result in relocation proceeding even if the node detects outstanding issues that would make aggregate relocation dangerous or disruptive. The default value is false.

[-`relocate-to-higher-version {true|false}`] - Relocate To Higher Version
This specifies if the aggregates are to be relocated to a node which is running on a higher version of Data ONTAP than the source node. If an aggregate is relocated to this destination then that aggregate cannot be relocated back to the source node till the source is also upgraded to the same or higher Data ONTAP version. This option is not required if the destination node is running on higher minor version, but the same major version. The default value is false.
[-override-destination-checks {true|false}] - Override Destination Checks

This specifies if the relocation operation should override the check done on destination node. This option could be used to force a relocation of aggregates even if the destination has outstanding issues. Note that this could make the relocation dangerous or disruptive. The default value is false.

[-ndo-controller-upgrade {true|false}] - Relocate Aggregates for NDO Controller Upgrade (privilege: advanced)

This specifies if the relocation operation is being done as a part of non-disruptive controller upgrade process. Aggregate relocation will not change the home ownerships of the aggregates while relocating as part of controller upgrade. The default value is false.

Examples

The following example relocates aggregates name aggr1 and aggr2 from source node node0 to destination node node1:

```
cluster1::> storage aggregate relocation start -node node0 -destination node1 -aggregate-list aggr1, aggr2
```

Storage Aggregate Resynchronization Commands

Manage aggregate resynchronization priorities and options
