This parameter specifies whether SMB encryption is required when accessing shares in the Vserver. When enabled and depending on negotiation during session setup, it is possible that data transfers between the client and the server are made secure by encrypting the SMB traffic. If you do not specify this parameter, the default is false.

[-session-security-for-ad-ldap {none|sign|seal}] - Client Session Security

This parameter specifies the level of security to be used for LDAP communications. If you do not specify this parameter, the default is none.

LDAP Client Session Security can be one of the following:

- none - No Signing or Sealing.
- sign - Sign LDAP traffic.
- seal - Seal and Sign LDAP traffic.

[-smb1-enabled-for-dc-connections {false|true|system-default}] - SMB1 Enabled for DC Connections

This parameter specifies whether SMB1 is enabled for use with connections to domain controllers. If you do not specify this parameter, the default is system-default.

SMB1 Enabled For DC Connections can be one of the following:

- false - SMB1 is not enabled.
- true - SMB1 is enabled.
- system-default - This sets the option to whatever is the default for the release of Data ONTAP that is running. For this release it is: SMB1 is enabled.

[-smb2-enabled-for-dc-connections {false|true|system-default}] - SMB2 Enabled for DC Connections

This parameter specifies whether SMB2 is enabled for use with connections to domain controllers. If you do not specify this parameter, the default is system-default.

SMB2 Enabled For DC Connections can be one of the following:
false - SMB2 is not enabled.

true - SMB2 is enabled.

system-default - This sets the option to whatever is the default for the release of Data ONTAP that is running. For this release it is: SMB2 is enabled.

Examples

The following example makes the following changes: the Kerberos clock skew is set to 3 minutes, the Kerberos ticket lifetime to 8 hours and it makes signing required for Vserver "vs1".

```
cluster1::> vserver cifs security modify -vserver vs1 -kerberos-clock-skew 3 -kerberos-ticket-age 8 -is-signing-required true
```

```
cluster1::> vserver cifs security show
Vserver: vs1
     Kerberos Clock Skew:               3 minutes
     Kerberos Ticket Age:               8 hours
     Kerberos Renewal Age:               7 days
     Kerberos KDC Timeout:               3 seconds
     Is Signing Required:            true
     Is Password Complexity Required:            true
     Use start_tls For AD LDAP connection:           false
     Is AES Encryption Enabled:           false
     LM Compatibility Level:             krb
     Is SMB Encryption Required:           false
     Client Session Security:            none
     SMB1 Enabled For DC Connections:  system-default
     SMB2 Enabled For DC Connections:  system-default
```

vserver cifs security show

Display CIFS security settings

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver cifs security show command displays information about CIFS server security settings.

Parameters

[-fields <fieldname>,...]

If you specify the -fields parameter, the command only displays the fields that you specify.

[-instance]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>+] - Vserver

This parameter specifies the name of the Vserver whose CIFS security settings you want to display.
-kerberos-clock-skew <integer> - Maximum Allowed Kerberos Clock Skew
If this parameter is specified, the command displays information only about the security settings that match the specified Kerberos ticket clock skew.

-kerberos-ticket-age <integer> - Kerberos Ticket Lifetime
If this parameter is specified, the command displays information only about the security settings that match the specified Kerberos ticket age.

-kerberos-renew-age <integer> - Maximum Kerberos Ticket Renewal Days
If this parameter is specified, the command displays information only about the security settings that match the specified Kerberos renewal age.

-kerberos-kdc-timeout <integer> - Timeout for Kerberos KDC Connections (Secs)
If this parameter is specified, the command displays information only about the security settings that match the specified Kerberos KDC timeout.

-realm <text> - Kerberos Realm
If this parameter is specified, the command displays information only about the security settings that match the specified Kerberos realm.

-kdc-ip <text>, ... - KDC IP Address
If this parameter is specified, the command displays information only about the security settings that match the specified KDC IP address.

-kdc-name <text>, ... - KDC Name
If this parameter is specified, the command displays information only about the security settings that match the specified KDC name.

-site <text>, ... - KDC Site
If this parameter is specified, the command displays information only about the security settings that match the specified Windows site.

-is-signing-required {true|false} - Require Signing for Incoming CIFS Traffic
This parameter specifies whether signing is required for incoming CIFS traffic. If this parameter is specified, the command displays information only about the security settings that match the specified value for is-signing-required.

-is-password-complexity-required {true|false} - Require Password Complexity for Local User Accounts
If this parameter is set to true, the command displays CIFS security configuration information only for CIFS servers where password complexity for local user accounts is required. If set to false, the command displays security configuration information for CIFS servers where password complexity for local user accounts is not required.

-use-start-tls-for-ad-ldap {true|false} - Use start_tls for AD LDAP Connections
If this parameter is set to true, the command displays CIFS security configuration information only for CIFS servers where Start TLS is used for communication with the AD LDAP Server. If set to false, the command displays CIFS security configuration information only for CIFS servers where Start TLS is not used for communication with the AD LDAP Server.

-is-aes-encryption-enabled {true|false} - Is AES-128 and AES-256 Encryption for Kerberos Enabled
If this parameter is set to true, the command displays CIFS security configuration information only for CIFS servers where AES-128 and AES-256 encryption types for Kerberos are enabled. If set to false, the command displays security configuration information for CIFS servers where AES-128 and AES-256 encryption types for Kerberos are disabled.

-lm-compatibility-level {lm-ntlm-ntlmv2-krb|ntlm-ntlmv2-krb|ntlmv2-krb|krb} - LM Compatibility Level
If this parameter is specified, the command displays information only about the security settings that match the specified LM compatibility level.
[-is-smb-encryption-required {true|false}] - Require SMB Encryption for Incoming CIFS Traffic

If this parameter is set to true, the command displays CIFS security configuration information only for CIFS servers where SMB encryption is required. If set to false, the command displays security configuration information for CIFS servers where SMB encryption is not required.

[-session-security-for-ad-ldap (none|sign|seal)] - Client Session Security

If this parameter is set to seal, the command displays CIFS security configuration information only for CIFS servers where both signing and sealing are required for LDAP communications. If set to sign, the command displays security configuration information for CIFS servers where only signing is required for LDAP communications. If set to none, the command displays security configuration information for CIFS servers where no security is required for LDAP communications.

[-smb1-enabled-for-dc-connections {false|true|system-default}] - SMB1 Enabled for DC Connections

If this parameter is set to true, the command displays CIFS security configuration information only for CIFS servers where SMB1 is enabled for use with connections to domain controllers. If set to false, the command displays security configuration information for CIFS servers where SMB1 is not enabled for use with connections to domain controllers. If set to system-default, the command displays security configuration information for CIFS servers where the system-default setting (SMB1 enabled) is used for connections to domain controllers.

[-smb2-enabled-for-dc-connections {false|true|system-default}] - SMB2 Enabled for DC Connections

If this parameter is set to true, the command displays CIFS security configuration information only for CIFS servers where SMB2 is enabled for use with connections to domain controllers. If set to false, the command displays security configuration information for CIFS servers where SMB2 is not enabled for use with connections to domain controllers. If set to system-default, the command displays security configuration information for CIFS servers where the system-default setting (SMB2 enabled) is used for connections to domain controllers.

Examples

The following example displays CIFS server security settings.

```
cluster1::> vserver cifs security show
Vserver: vs1

Kerberos Clock Skew: 3 minutes
Kerberos Ticket Age: 8 hours
Kerberos Renewal Age: 7 days
Kerberos KDC Timeout: 3 seconds
Is Signing Required: true
Is Password Complexity Required: true
Use start_tls For AD LDAP connection: false
Is AES Encryption Enabled: false
LM Compatibility Level: krb
Is SMB Encryption Required: false
Client Session Security: none
SMB1 Enabled For DC Connections: system-default
SMB2 Enabled For DC Connections: system-default
```

The following example displays the Kerberos clock skew for all Vservers.

```
cluster1::> vserver cifs security show -fields kerberos-clock-skew
vserver kerberos-clock-skew
-------- -------------------
vs1 5
```

CIFS session Commands

Manage CIFS sessions

The vserver cifs session commands are used to manage established CIFS sessions and their attributes.

vserver cifs session close

Close an open CIFS session

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver cifs session close command closes the specified CIFS sessions.

Parameters

- node {<nodename>|local} - Node
  If you specify this parameter, the command will close all the opened CIFS sessions on the specified node.

- vserver <vserver name> - Vserver
  If you specify this parameter, the command will close all the opened CIFS sessions on the specified CIFS-enabled Vserver.

- session-id <integer> - Session ID
  If you specify this parameter, the command will close the open CIFS session that matches the specified session ID.

[ -connection-id <integer>] - Connection ID
  If you specify this parameter, the command will close all the opened CIFS sessions that match the specified connection ID.

[ -lif-address <IP Address>] - Incoming Data LIF IP Address
  If you specify this parameter, the command will close all the opened CIFS sessions that are established through the specified data LIF IP address.

[ -address <IP Address>] - Workstation IP address
  If you specify this parameter, the command will close all the opened CIFS sessions that are opened from the specified IP address.

[ -auth-mechanism <Authentication Mechanism>] - Authentication Mechanism
  If you specify this parameter, the command will close all the opened CIFS sessions that used the specified authentication mechanism. The authentication mechanism can include one of the following:
  - NTLMv1 - NTLMv1 authentication mechanism
  - NTLMv2 - NTLMv2 authentication mechanism
  - Kerberos - Kerberos authentication mechanism
  - Anonymous - Anonymous authentication mechanism

[ -windows-user <TextNoCase>] - Windows User
  If you specify this parameter, the command will close all the opened CIFS sessions that are established for the specified CIFS user. The acceptable format for CIFS user is [domain]user.
[-unix-user <text>] - UNIX User

If you specify this parameter, the command will close all the opened CIFS sessions that are established for the specified UNIX user.

[-protocol-version <CIFS Dialects>] - Protocol Version

If you specify this parameter, the command will close all the opened CIFS sessions that are established over the specified version of CIFS protocol. The protocol version can include one of the following:

- SMB1 - SMB 1.0
- SMB2 - SMB 2.0
- SMB2_1 - SMB 2.1
- SMB3 - SMB 3.0
- SMB3_1 - SMB 3.1

[-continuously-available <CIFS Open File Protection>] - Continuously Available

If you specify this parameter, the command will close all the opened CIFS sessions with open files that have the specified level of continuously available protection. The open files are "continuously available" if they are opened from an SMB 3 client through a share with the "continuously_available" property set. These open files are capable of non-disruptively recovering from takeover and giveback as well as general aggregate relocation between partners in a high-availability relationship. This is in addition to the traditional SMB 2 capability allowing clients to recover from LIF migration and other brief network interruptions.

Note: The CA protection levels depict the continuous availability at the connection level so it might not be accurate for a session if the connection has multiple sessions. Streams opened through a continuously available share are permitted, but are not currently made continuously available. Directories may be opened through a continuously available share, but, by design, will not appear continuously available as clients do not open them that way. These protection levels are applicable to the sessions on read/write volumes residing on storage failover aggregates.

The continuously available status can be one of the following:

- No - The session contains one or more open file but none of them are continuously available.
- Yes - The session contains one or more open files and all of them are continuously available.
- Partial - The session contains at least one continuously available open file but other open files that are not.

[-is-session-signed {true|false}] - Is Session Signed

If you specify this parameter, the command will close all the opened CIFS sessions that are established with the specified SMB signing option.

[-smb-encryption-status {unencrypted|encrypted|partially-encrypted}] - SMB Encryption Status

If you specify this parameter, the command will close all the opened CIFS sessions that are established over the specified SMB encryption status.

The SMB encryption status can be one of the following:

- unencrypted - The CIFS session is not encrypted.
- encrypted - The CIFS session is fully encrypted. Vserver level encryption is enabled and encryption happens for the entire session.
- partially-encrypted - The CIFS session is partially encrypted. Share level encryption is enabled and encryption is initiated when the tree-connect occurs.
Examples
The following example closes all open CIFS sessions on all the nodes with protocol-version SMB2:

```
cluster1::> cifs session close -node * -protocol-version SMB2
2 entries were acted on.
```

The following example closes all open CIFS sessions for all Vservers on node node1:

```
cluster1::> cifs session close -node node1 -vserver *
3 entries were acted on.
```

**vserver cifs session show**
Display established CIFS sessions

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver cifs session show` command displays information about established CIFS sessions. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all CIFS sessions:

- Node name
- Vserver name
- CIFS connection ID
- CIFS session ID
- Workstation IP address
- CIFS user name
- CIFS open files
- Session idle time

You can specify additional parameters to display only information that matches those parameters. For example, to display information only about CIFS sessions established on connection ID 2012, run the command with the `-connection-id` parameter set to 2012.

**Parameters**

```
[-fields <fieldname>,...]
```
If you specify this parameter, the command only displays the fields that you specify.

```
[-show-win-unix-creds]
```
If you specify this parameter along with a valid session-id, the command displays Windows and UNIX credentials along with the detailed information about matching CIFS sessions.

```
[-instance]
```
If you specify this parameter, the command displays detailed information about matching CIFS sessions.

```
[-node (<nodename>|local)] - Node
```
If you specify this parameter, the command displays information about the CIFS sessions on the specified node.
vserver cifs commands

[\-vserver <vserver name>] - Vserver
  If you specify this parameter, the command displays information about CIFS sessions on the specified CIFS-enabled Vserver.

[\-session-id <integer>] - Session ID
  If you specify this parameter, the command displays information about the CIFS session that match the specified session ID.

[\-connection-id <integer>] - Connection ID
  If you specify this parameter, the command displays information about CIFS sessions that match the specified connection ID.

[\-lif-address <IP Address>] - Incoming Data LIF IP Address
  If you specify this parameter, the command displays information about CIFS sessions that are established through the specified data LIF IP address.

[\-address <IP Address>] - Workstation IP address
  If you specify this parameter, the command displays information about CIFS sessions that are opened from the specified IP address.

[\-auth-mechanism <Authentication Mechanism>] - Authentication Mechanism
  If you specify this parameter, the command displays information about CIFS sessions that used the specified authentication mechanism. The authentication mechanism can include one of the following:
  • None - Could not authenticate
  • NTLMv1 - NTLMv1 authentication mechanism
  • NTLMv2 - NTLMv2 authentication mechanism
  • Kerberos - Kerberos authentication mechanism
  • Anonymous - Anonymous authentication mechanism

[\-windows-user <TextNoCase>] - Windows User
  If you specify this parameter, the command displays information about CIFS sessions that are established for the specified CIFS user. The acceptable format for CIFS user is [domain]\user.

[\-unix-user <text>] - UNIX User
  If you specify this parameter, the command displays information about CIFS sessions that are established for the specified UNIX user.

[\-shares <integer>] - Open Shares
  If you specify this parameter, the command displays information about CIFS sessions that have the specified number of CIFS shares opened.

[\-files <integer>] - Open Files
  If you specify this parameter, the command displays information about CIFS sessions that have the specified number of regular CIFS files opened.

[\-other <integer>] - Open Other
  If you specify this parameter, the command displays information about CIFS sessions that have the specified number of special CIFS files opened such as streams or directories.

[\-connected-time <elapsed>] - Connected Time
  If you specify this parameter, the command displays information about CIFS sessions that are established for the specified time duration.
## [-idle-time <elapsed>] - Idle Time

If you specify this parameter, the command displays information about CIFS sessions on which there is no activity for the specified time duration.

## [-protocol-version <CIFS Dialects>] - Protocol Version

If you specify this parameter, the command displays information about CIFS sessions that are established over the specified version of CIFS protocol. The protocol version can include one of the following:

- SMB1 - SMB 1.0
- SMB2 - SMB 2.0
- SMB2_1 - SMB 2.1
- SMB3 - SMB 3.0
- SMB3_1 - SMB 3.1

## [-continuously-available <CIFS Open File Protection>] - Continuously Available

If you specify this parameter, the command displays information about CIFS sessions with open files that have the specified level of continuously available protection. The open files are "continuously available" if they are opened from an SMB 3 client through a share with the "continuously_available" property set. These open files are capable of non-disruptively recovering from takeover and giveback as well as general aggregate relocation between partners in a high-availability relationship. This is in addition to the traditional SMB 2 capability allowing clients to recover from LIF migration and other brief network interruptions.

**Note:** The CA protection levels depict the continuous availability at the connection level so it might not be accurate for a session if the connection has multiple sessions. Streams opened through a continuously available share are permitted, but are not currently made continuously available. Directories may be opened through a continuously available share, but, by design, will not appear continuously available as clients do not open them that way. These protection levels are applicable to the sessions on read/write volumes residing on storage failover aggregates.

The continuously available status can be one of the following:

- No - The session contains one or more open file but none of them are continuously available.
- Yes - The session contains one or more open files and all of them are continuously available.
- Partial - The session contains at least one continuously available open file but other open files that are not.

## [-is-session-signed {true|false}] - Is Session Signed

If you specify this parameter, the command displays information about CIFS sessions that are established with the specified SMB signing option.

## [-user-type {local-user|domain-user|guest-user|anonymous-user}] - User Authenticated as

If you specify this parameter, the command displays information about CIFS sessions that are established for the specified user type. The user type can include one of the following:

- local-user - Authenticated as a local CIFS user
- domain-user - Authenticated as a domain user
- guest-user - Authenticated as a guest user
- anonymous-user - Authenticated as an anonymous or null user

## [-netbios-name <text>] - NetBIOS Name

If you specify this parameter, the command displays information about CIFS sessions that are established with the specified NetBIOS Name.
If you specify this parameter, the command displays information about CIFS sessions that are established with the specified SMB encryption status.

The SMB encryption status can be one of the following:

- **unencrypted** - The CIFS session is not encrypted.
- **encrypted** - The CIFS session is fully encrypted. Vserver level encryption is enabled and encryption happens for the entire session.
- **partially-encrypted** - The CIFS session is partially encrypted. Share level encryption is enabled and encryption is initiated when the tree-connect occurs.

If you specify this parameter, the command displays information about CIFS sessions that have the specified number of CIFS connections.

**Examples**

The following example displays information about all CIFS sessions:

```
cluster1::> vserver cifs session show
Node:    node1
Vserver: vs1
Connection Session ID Workstation Windows User Open Files Idle Time Connection Count
---------- ------- ---------------- --------------- --------------- --------- --------------- -----------------
127834     1       172.17.193.172 CIFSQA\Administrator 2             22s                 4
```

The following example displays information about a CIFS session with session-id 1.

```
cluster1::> vserver cifs session show -session-id 1 -instance
Node: node1
Vserver: vs1
Session ID: 1
Connection ID: 127834
Incoming Data LIF IP Address: 10.53.13.224
Workstation: 172.17.193.172
Authentication Mechanism: NTLMv2
Windows User: CIFSQA\Administrator
UNIX User: root
Open Shares: 2
Open Files: 2
Open Other: 0
Connected Time: 2d 17h 58m 5s
Idle Time: 22s
Protocol Version: SMB3
Continuously Available: No
Is Session Signed: true
User Authenticated as: domain-user
NetBIOS Name: ALIAS1
SMB Encryption Status: encrypted
Connection Count: 4
Windows Unix Credentials: -
```

**CIFS session file Commands**

Manage opened files over CIFS

The `vserver cifs session file` commands are used to manage open CIFS files and their attributes.
**vserver cifs session file close**

Close an open CIFS file

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `vserver cifs session file close` command closes the specified open CIFS file.

**Parameters**
- `-node {<nodename> | local}` - Node
  If you specify this parameter, the command will close all the opened CIFS files on the specified node.
- `-vserver <vserver name>` - Vserver
  If you specify this parameter, the command will close all the opened CIFS files on the specified CIFS-enabled Vserver.
- `-file-id <integer>` - File ID
  If you specify this parameter, the command will close the opened CIFS file that matches the specified file ID.
- `[-connection-id <integer>]` - Connection ID
  If you specify this parameter, the command will close all the opened CIFS files connected on the specified connection ID.
- `[-session-id <integer>]` - Session ID
  If you specify this parameter, the command will close all the opened CIFS files connected on the specified session ID.

**Examples**
The following example closes all the opened CIFS files that are connected to the data LIFs of Vserver vs1 on the node node1:

```
cluster1::> vserver cifs session file close -node node1 -vserver vs1
5 entries were acted on.
```

The following example closes all the opened CIFS files on all the nodes with the file-id 1:

```
cluster1::> vserver cifs session file close -node * -file-id 1
2 entries were acted on.
```

**vserver cifs session file show**

Display opened CIFS files

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `vserver cifs session file show` command displays information about all open CIFS files. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all open CIFS files:

- Node name
- Vserver name
• CIFS connection ID
• CIFS session ID
• CIFS file ID
• CIFS file type
• CIFS file open mode
• CIFS file hosting volume
• CIFS share name
• CIFS file path
• Continuously available protection level

You can specify additional parameters to display only information that matches those parameters. For example, to display information only about CIFS files opened on connection ID 1201, run the command with the `--connection-id` parameter set to 1201.

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify this parameter, the command only displays the fields that you specify.

```
[-instance]
```

If you specify this parameter, the command displays detailed information about matching open CIFS files.

```
[-node <nodename> | local]
```

- **Node**
  If you specify this parameter, the command displays information about the open CIFS files on the specified node.

```
[-vserver <vserver name>]
```

- **Vserver**
  If you specify this parameter, the command displays information about open CIFS files on the specified CIFS-enabled Vserver.

```
[-file-id <integer>]
```

- **File ID**
  If you specify this parameter, the command displays information about the open CIFS file that match the specified file ID.

```
[-connection-id <integer>]
```

- **Connection ID**
  If you specify this parameter, the command displays information about open CIFS files that are opened on the specified connection ID.

```
[-session-id <integer>]
```

- **Session ID**
  If you specify this parameter, the command displays information about the CIFS file that are opened on the specified session ID.

```
[-connection-count <integer>]
```

- **Connection Count**
  If you specify this parameter, the command displays information about CIFS files opened through a session that have the specified number of CIFS connections.

```
[-file-type <CIFS File Type>]
```

- **File Type**
  If you specify this parameter, the command displays information about opened CIFS files that are of the specified file type. The file type can be any of these: Regular, Symlink, Stream, or Directory.

```
[-open-mode <CIFS Open Mode>]
```

- **Open Mode**
  If you specify this parameter, the command displays information about CIFS files that are opened with the specified mode. The open mode can include one or more of the following:
• R - This property specifies that the file is opened for read.

• W - This property specifies that the file is opened for write.

• D - This property specifies that the file is opened for delete.

The open mode can have multiple values specified as a list with no commas.

[-hosting-aggregate <aggregate name>] - Aggregate Hosting File
If you specify this parameter, the command displays information about open CIFS files that reside on the specified aggregate.

[-hosting-volume <volume name>] - Volume Hosting File
If you specify this parameter, the command displays information about open CIFS files that reside on the specified volume.

[-share <Share>] - CIFS Share
If you specify this parameter, the command displays information about CIFS files that are opened over the specified CIFS share.

[-path <text>] - Path from CIFS Share
If you specify this parameter, the command displays information about open CIFS files that match the specified CIFS file path.

[-share-mode <CIFS Open Mode>] - Share Mode
If you specify this parameter, the command displays information about open CIFS files that are opened with the specified share mode. The share mode can include one or more of the following:

• R - This property specifies that the file is shared for read.

• W - This property specifies that the file is shared for write.

• D - This property specifies that the file is shared for delete.

The share mode can have multiple values specified as a list with no commas.

[-range-locks <integer>] - Range Locks
If you specify this parameter, the command displays information about open CIFS files that have the specified number of range locks.

[-continuously-available <CIFS Open File Protection>] - Continuously Available
If you specify this parameter, the command displays information about open CIFS files with or without continuously available protection. The open files are "continuously available" if they are opened from an SMB 3 client through a share with the "continuously_available" property set. These open files are capable of non-disruptively recovering from takeover and giveback as well as general aggregate relocation between partners in a high-availability relationship. Streams opened through a continuously available share are permitted, but are not currently made continuously available. Directories may be opened through a continuously available share, but, by design, will not appear continuously available as clients do not open them that way. These protection levels are applicable to the files on read/write volumes residing on storage failover aggregates.

The continuously available status can be one of the following:

• No - The open file is not continuously available.

• Yes - The open file is continuously available.

[-reconnected <text>] - Reconnected
If you specify this parameter, the command displays information about open CIFS files that have the specified reconnected state. The reconnected state can be one of the following:

• No - The open file is not reconnected.
Examples

The following example displays information about all open CIFS files:

```
cluster1::> vserver cifs session file show

Node: node1
Vserver: vs1
Connection: 2192
Session: 1
Connection Count: 4

File | File Type | Mode | Volume Hosting File | Share | Continuous
--- | --------- | ---- | ------------------- | ------ | ----------
7    | Regular   | rw   | rootvs1            | rootca| Yes
Path: \win8b8.txt
```

The following example displays information about a CIFS file with file-id 7.

```
cluster1::> vserver cifs session file show -file-id 7 -instance

Node: node1
Vserver: vs1
File ID: 7
Connection ID: 2192
Session ID: 1
Connection count: 4
File Type: Regular
Open Mode: rw
Aggregate Hosting File: aggr1
Volume Hosting File: rootvs1
CIFS Share: rootca
Path from CIFS Share: \win8b8.txt
Share Mode: rd
Range Locks: 0
Continuously Available: Yes
Reconnected: No
```

Share Commands

Manage CIFS shares

The `vserver cifs share` commands are used to manage CIFS shares and their attributes.

**vserver cifs share create**

Create a CIFS share

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**
The `vserver cifs share create` command creates a CIFS share.

**Parameters**

- **-vserver <vserver name>** - Vserver
  
  This parameter specifies the CIFS-enabled Vserver on which you want to create a CIFS share.

- **-share-name <Share>** - Share
  
  This parameter specifies the name of the CIFS share that you want to create. A share name can be up to 256 characters long. If this is a home directory share (designated as such by specifying the `homedirectory` on the `-share-properties` parameter), you can include `%w` (Windows user name), `%u` (UNIX user name) and
%d (Windows domain name) variables in any combination with this parameter to generate shares dynamically, with the resultant share names based on the authenticating user’s Windows user name, UNIX user name, and/or Windows domain name. If the share is used by administrators to connect to other users’ home directory (the option is-home-dirs-access-for-admin-enabled is set to true) or by a user to connect to other users’ home directory (the option is-home-dirs-access-for-public-enabled is set to true), the dynamic share pattern must be preceded by a tilde (~).

**-path <text>** - Path

This parameter specifies the path to the CIFS share. This path must exist in a volume. A directory path name can be up to 256 characters long. If there is a space in the path name, you must enclose the entire string in quotation marks (for example, ”/new volume/mount here“). If this is a home directory share as specified by value of home directory on the **-share-properties** parameter, you can make the path name dynamic by specifying the %w (Windows user name), %u (UNIX user name), or %d (domain name) variables or any of their combination as a part of the value of this parameter.

**[-share-properties <share properties>, ...]** - Share Properties

This optional parameter specifies a list of properties for the share. The list can include one or more of the following:

- **homedirectory** - This property specifies that the share and path names are dynamic. Specify this value for a home directory share. In a home directory share, Data ONTAP can dynamically generate the share's name and path by substituting %w, %u, and %d variables with the corresponding Windows user name, UNIX user name, and domain, respectively, specified as the value of the **-share-name** and **-path** parameters. For instance, if a dynamic share is defined with a name of %d_%w, a user logged on as barbara from a domain named FIN sees the share as FIN_barbara. Using the homedirectory value specifies that the share and path names are dynamically expanded. This property cannot be added or removed after share creation.

- **oplocks** - This property specifies that the share uses opportunistic locks, also known as client-side caching. Oplocks are enabled on shares by default; however, some applications do not work well when oplocks are enabled. In particular, database applications such as Microsoft Access are vulnerable to corruption when oplocks are enabled. An advantage of shares is that a single path can be shared multiple times, with each share having different properties. For instance, if a path named /dept/finance contains both a database and other types of files, you can create two shares to it, one with oplocks disabled for safe database access and one with oplocks enabled for client-side caching.

- **browsable** - This property allows Windows clients to browse the share. This is the default initial property for all shares.

- **showsnapshot** - This property specifies that Snapshot copies can be viewed and traversed by clients.

- **changenotify** - This property specifies that the share supports ChangeNotify requests. For shares on a Vserver with FlexVol volumes, this is a default initial property. For shares on a Vserver with Infinite Volume, the ChangeNotify property is not set by default, and setting it requires the advanced privilege level. When the ChangeNotify property is set for a share on a Vserver with Infinite Volume, change notifications are not sent for changes to file attributes and timestamps. If the path of the share is within a FlexGroup, change notifications are not sent because FlexGroups do not support ChangeNotify.

- **attributecache** - This property enables the file attribute caching on the CIFS share in order to provide faster access of attributes over SMB 1.0.

  **Note:** For certain workloads, stale file attribute data could be delivered to a client.

- **continuously-available** - This property permits SMB clients that support it to open files in a persistent manner. Files opened this way are protected from disruptive events, such as failover and giveback. This option is not supported for FlexGroups, Vservers with Infinite Volume and workgroup CIFS servers.

- **branchcache** - This property specifies that the share allows clients to request BranchCache hashes on the files within this share. This option is useful only if you specify **-share** as the operating mode in the
CIFS BranchCache configuration, and also specify the "oplocks" share property. This option is not supported for Vservers with Infinite Volume.

- access-based-enumeration - This property specifies that Access Based Enumeration is enabled on this share. ABE-filtered shared folders are visible to a user based on that individual user's access rights, preventing the display of folders or other shared resources that the user does not have rights to access.

- namespace-caching - This property specifies that the SMB clients connecting to this share can cache the directory enumeration results returned by the CIFS servers.

- encrypt-data - This property specifies that SMB encryption must be used when accessing this share. Clients that do not support encryption will not be able to access this share.

- show-previous-versions - This property specifies that the previous version can be viewed and restored from the client. This property is enabled by default.

```
[-symlink-properties {enable|hide|read-only|symlinks|symlinks-and-widelinks|disable},...]
```

**Symlink Properties**

This optional parameter specifies how the storage system presents UNIX symbolic links (symlinks) to CIFS clients. The default value for this parameter is "symlinks". The list can include one or more of the following:

- enable (DEPRECATED*) - This property enables both local symlinks and wide links for read-write access. DFS advertisements are generated for both local symlinks and wide links even if the CIFS option -is-advertise-dfs-enabled is set to false.

- hide (DEPRECATED*) - This property hides symlinks. DFS advertisements are generated if the CIFS option -is-advertise-dfs-enabled is set to true.

- read-only (DEPRECATED*) - This property enables symlinks for read-only access.

- symlinks - This property enables local symlinks for read-write access. DFS advertisements are not generated even if the CIFS option -is-advertise-dfs-enabled is set to true.

- symlinks-and-widelinks – This property enables both local symlinks and wide links for read-write access. DFS advertisements are generated for both local symlinks and wide links even if the CIFS option -is-advertise-dfs-enabled is set to false.

- disable - This property disables symlinks and wide links. DFS advertisements are not generated even if the CIFS option -is-advertise-dfs-enabled is set to true.

- no-strict-security (OBSOLETE)- This property enables clients to follow symlinks outside share boundaries.

**Note:** * The enable, hide, and read-only parameters are deprecated and may be removed in a future release of Data ONTAP.

**Note:** The no_strict_security setting does not apply to wide links.

```
[-file-umask <Octal Integer>] - File Mode Creation Mask
```

This optional parameter specifies the default UNIX umask for new files created on the share.

```
[-dir-umask <Octal Integer>] - Directory Mode Creation Mask
```

This optional parameter specifies the default UNIX umask for new directories created on the share.

```
[-comment <text>] - Share Comment
```

This optional parameter specifies a text comment for the share that is made available to Windows clients. The comment can be up to 256 characters long. If there is a space in the descriptive remark or the path, you must enclose the entire string in quotation marks (for example, "This is engineering's share.").
[-attribute-cache-ttl <\(<\text{integer}>\ h\)<\(<\text{integer}>m\)<\(<\text{integer}>s\)>]<\(\) - File Attribute Cache Lifetime

This optional parameter specifies the lifetime for the attribute cache share property, which you specify as the value of the -share-properties parameter.

**Note:** This value is useful only if you specify attributecache as a share property.

[-offline-files {none|manual|documents|programs}] - Offline Files

This optional parameter allows Windows clients to cache data on this share. The actual caching behavior depends upon the Windows client. The value can be one of the following:

- none - Disallows Windows clients from caching any files on this share.
- manual - Allows users on Windows clients to manually select files to be cached.
- documents - Allows Windows clients to cache user documents that are used by the user for offline access.
- programs - Allows Windows clients to cache programs that are used by the user for offline access and may use those files in an offline mode even if the share is available.

[-vscan-fileop-profile {no-scan|standard|strict|writes-only}] - Vscan File-Operations Profile

This optional parameter controls which operations trigger virus scans. The value can be one of the following:

- no-scan: Virus scans are never triggered for this share.
- standard: Virus scans can be triggered by open, close, and rename operations. This is the default profile.
- strict: Virus scans can be triggered by open, read, close, and rename operations.
- writes-only: Virus scans can be triggered only when a file that has been modified is closed.

[-max-connections-per-share <integer>] - Maximum Tree Connections on Share

This optional parameter specifies the maximum number of simultaneous connections on the new share. This limit is at the node level, not the Vserver or cluster level. The default for this parameter is 4294967295. The value 4294967295 indicates no limit. The allowed range for this parameter is (1 through 4294967295).

[-force-group-for-create <text>] - UNIX Group for File Create

This optional parameter specifies that all files that CIFS users create in a specific share belong to the same group (also called the "force-group"). The "force-group" must be a predefined group in the UNIX group database. This setting has no effect unless the security style of the volume is UNIX or mixed security style. If "force-group" has been specified for a share, the following becomes true for the share:

- Primary GID of the CIFS users who access this share is temporarily changed to the GID of the "force-group".
- All files in this share that CIFS users create belong to the same "force-group", regardless of the primary GID of the file owner.

**Examples**

The following example creates a CIFS share named SALES_SHARE on a Vserver named vs1. The path to the share is /sales.

```
cluster1::> vserver cifs share create -vserver vs1 -share-name SALES_SHARE -path /sales -symlink-properties enable
```

The following example creates a CIFS share named SALES_SHARE on a Vserver named vs1. The path to the share is /sales and the share uses opportunistic locks (client-side caching), the share can be browsed by Windows clients, and a notification is generated when a change occurs.
The following example creates a CIFS share named DOCUMENTS on a Vserver named vs1. The path to the share is /documents and the share uses opportunistic locks (client-side caching), a notification is generated when a change occurs, and the share allows clients to ask for BranchCache hashes for files in the share.

```
cluster1::> vserver cifs share create -vserver vs1 -share-name DOCUMENTS path /documents -share-properties branchcache,changenotify,oplocks
```

The following example creates a CIFS share named DOCUMENTS on a Vserver named vs1. The path to the share is /documents and the share uses opportunistic locks (client-side caching), a notification is generated when a change occurs, and the share allows clients to cache (client-side caching) user documents on this share.

```
cluster1::> vserver cifs share create -vserver vs1 -share-name DOCUMENTS -path /documents -share-properties changenotify,oplocks -offline-files documents
```

The following example creates a home directory share on a Vserver named vs1. The path to the share has a %d and %w combination.

```
cluster1::> vserver cifs share create -share-name %d%w -path %d/%w -share-properties homedirectory -vserver vs1
```

The following example creates a home directory share on a Vserver vs1 to be used with the home directory options is-home-dirs-access-for-admin-enabled and/or is-home-dirs-access-for-public-enabled. The path to the share has a %d and %w combination.

```
cluster1::> vserver cifs share create -share-name ~%d~%w -path %d/%w -share-properties homedirectory -vserver vs1
```

---

### vserver cifs share delete

Delete a CIFS share

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**
The `vserver cifs share delete` command deletes a CIFS share.

**Parameters**

- **-vserver <vserver name>** - Vserver
  
  This parameter specifies the Vserver from which you want to delete a CIFS share.

- **-share-name <Share>** - Share
  
  This parameter specifies the name of the CIFS share you want to delete.

**Examples**

The following example deletes a CIFS share named share1 from a Vserver named vs1.

```
cluster1::> vserver cifs share delete -vserver vs1 -share-name share1
```
vserver cifs share modify
Modify a CIFS share

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs share modify command modifies a CIFS share.

Parameters
-vserver <vserver name> - Vserver
This parameter specifies the CIFS-enabled Vserver containing the CIFS share you want to modify.

-share-name <Share> - Share
This parameter specifies the name of the CIFS share that you want to create. A share name can be up to 256 characters long. If this is a home directory share (designated as such by specifying the homedirectory on the -share-properties parameter), you can include %w (Windows user name), %u (UNIX user name) and %d (Windows domain name) variables in any combination with this parameter to generate shares dynamically, with the resultant share names based on the authenticating user.s Windows user name, UNIX user name, and/or Windows domain name.

-path <text> - Path
This parameter specifies the path to the CIFS share. This path must exist in a volume. A directory path name can be up to 256 characters long. If there is a space in the path name, you must enclose the entire string in quotation marks (for example, "/new volume/mount here"). If this is a homedirectory share as specified by value of home directory on the -share-properties parameter, a dynamic path name must be specified using %w (Windows user name), %u (UNIX user name), or %d (domain name) variables or any of their combination as a part of the value of this parameter. If this is a continuously-available share as specified by value of continuously-available on the -share-properties parameter, the path must not be within a FlexGroup because this property is not supported for FlexGroups.

-symlink-properties {enable|hide|read-only|symlinks|symlinks-and-widelinks|disable}, ... - Symlink Properties
This optional parameter enables how the storage system presents UNIX symbolic links (symlinks) to CIFS clients. The list can include one or more of the following:
- enable (DEPRECATED*) - This property enables both local symlinks and wide links for read-write access. DFS advertisements are generated for both local symlinks and wide links even if the CIFS option -is-advertise-dfs-enabled is set to false.
- hide (DEPRECATED*) - This property hides symlinks. DFS advertisements are generated if the CIFS option -is-advertise-dfs-enabled is set to true.
- read-only (DEPRECATED*) - This property enables symlinks for read-only access.
- symlinks - This property enables local symlinks for read-write access. DFS advertisements are not generated even if the CIFS option -is-advertise-dfs-enabled is set to true.
- symlinks-and-widelinks – This property enables both local symlinks and wide links for read-write access. DFS advertisements are generated for both local symlinks and wide links even if the CIFS option -is-advertise-dfs-enabled is set to false.
- disable - This property disables symlinks and wide links. DFS advertisements are not generated even if the CIFS option -is-advertise-dfs-enabled is set to true.
- no-strict-security (OBSOLETE)- This property enables clients to follow symlinks outside share boundaries.
**Note:** The read_only setting does not apply to wide links.

**Note:** * The enable, hide, and read_only parameters are deprecated and may be removed in a future release of Data ONTAP.

**Note:** The no_strict_security setting does not apply to wide links.

```
[-file-umask <Octal Integer>] - File Mode Creation Mask
This optional parameter specifies the default UNIX umask for new files created on the share.
```

```
[-dir-umask <Octal Integer>] - Directory Mode Creation Mask
This optional parameter specifies the default UNIX umask for new directories created on the share.
```

```
[-comment <text>] - Share Comment
This optional parameter specifies a text comment for the share that is made available to Windows clients. The comment can be up to 256 characters long. If there is a space in the descriptive remark or the path, you must enclose the entire string in quotation marks (for example, "This is engineering's share.").
```

```
[-attribute-cache-ttl {<integer>h}|<integer>m|<integer>s}] - File Attribute Cache Lifetime
This optional parameter specifies the lifetime for the attribute cache share property, which you specify as the value of the -share-properties parameter.

**Note:** This value is useful only if you specify attributecache as a share property.
```

```
[-offline-files {none|manual|documents|programs}] - Offline Files
This optional parameter allows Windows clients to cache data on this share. The actual caching behavior depends upon the Windows client. The value can be one of the following:

- none - Disallows Windows clients from caching any files on this share.
- manual - Allows users on Windows clients to manually select files to be cached.
- documents - Allows Windows clients to cache user documents that are used by the user for offline access.
- programs - Allows Windows clients to cache programs that are used by the user for offline access and may use those files in an offline mode even if the share is available.
```

```
[-vscan-fileop-profile {no-scan|standard|strict|writes-only}] - Vscan File-Operations Profile
This optional parameter controls which operations trigger virus scans. The value can be one of the following:

- no-scan: Virus scans are never triggered for this share.
- standard: Virus scans can be triggered by open, close, and rename operations. This is the default profile.
- strict: Virus scans can be triggered by open, read, close, and rename operations.
- writes-only: Virus scans can be triggered only when a file that has been modified is closed.
```

```
[-max-connections-per-share <integer>] - Maximum Tree Connections on Share
This optional parameter specifies a maximum number of simultaneous connections to the share. This limit is at the node level, not the Vserver or cluster level. The default for this parameter is 4294967295. The value 4294967295 indicates no limit. The allowed range for this parameter is (1 through 4294967295).
```

```
[-force-group-for-create <text>] - UNIX Group for File Create
This optional parameter specifies that all files that CIFS users create in a specific share belong to the same group (also called the "force-group"). The "force-group" must be a predefined group in the UNIX group database. This setting has no effect unless the security style of the volume is UNIX or mixed security style. You can disable this option by passing a null string "".
```
Examples

The following example modifies a CIFS share named SALES_SHARE on a Vserver named vs1. The share uses opportunistic locks. The file mask is set to 644 and the directory mask to 777.

```
cluster1::> vserver cifs share modify -vserver vs1 -share-name SALES_SHARE -symlink-properties hide -file-umask 644 -dir-umask 777
```

The following example modifies a CIFS share named SALES_SHARE on a Vserver named vs1. The path to the share is /sales and the share uses opportunistic locks (client-side caching), the share can be browsed by Windows clients, and a notification is not generated when a change occurs.

```
cluster1::> vserver cifs share modify -vserver vs1 -share-name SALES_SHARE -path /sales -share-properties oplocks,browsable
```

The following example modifies a CIFS share named DOCUMENTS on a Vserver named vs1. The share uses opportunistic locks (client-side caching), a notification is generated when a change occurs, and the share allows clients to ask for BranchCache hashes for files in the share.

```
cluster1::> vserver cifs share modify -vserver vs1 -share-name DOCUMENTS -share-properties branchcache,changenotify,oplocks
```

The following example modifies a CIFS share named DOCUMENTS on a Vserver named vs1. The share uses opportunistic locks (client-side caching), a notification is generated when a change occurs, and the share allows clients to cache (client-side caching) user documents on this share.

```
cluster1::> vserver cifs share modify -vserver vs1 -share-name DOCUMENTS -share-properties changenotify,oplocks,offline-files documents
```

The following example modifies a CIFS share named DOCUMENTS on a Vserver named vs1. The optional parameter "force-group-for-create" can be disabled by passing the null string as parameter to "force-group-for-create" option.

```
cluster1::> cifs share modify -vserver vs1 -share-name DOCUMENTS -force-group-for-create ""
```

The following example modifies the symlink property of all the shares on all the Vserver to "enable".

```
cluster1::> vserver cifs share modify -vserver * -share-name * -symlink-properties enable
```

vserver cifs share show

Display CIFS shares

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver cifs share show command displays information about CIFS shares. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all CIFS shares:

- Vserver name
- CIFS share name
- Path
- Share properties
- Comment
You can specify additional parameters to display only information that matches those parameters. For example, to display information only about CIFS shares that use dynamic shares, run the command with the `-share-properties dynamicshare` parameter.

**Parameters**

`{-fields <fieldname>, ...}`

If you specify this parameter, the command only displays the fields that you specify.

`{-shadowcopy}`

If you specify this parameter, the command displays information only about CIFS shadow copy shares.

`{-umask}`

If you specify this parameter, the command displays file and directory masks for CIFS shares.

`{-instance}`

If you specify this parameter, the command displays detailed information about all CIFS shares.

`{-vserver <vserver name>}` - Vserver

If you specify this parameter, the command displays information only about CIFS shares on the specified CIFS-enabled Vserver.

`{-share-name <Share>}` - Share

If you specify this parameter, the command displays information only about the CIFS share or shares that match the specified name.

`{-cifs-server <NetBIOS>}` - CIFS Server NetBIOS Name

If you specify this parameter, the command displays information only about the CIFS share or shares that use the CIFS-enabled Vserver with the specified CIFS server name.

`{-path <text>}` - Path

If you specify this parameter, the command displays information only about the CIFS share or shares that have the specified path.

`{-share-properties <share properties>, ...}` - Share Properties

If you specify this parameter, the command displays information only about the CIFS share or shares that have the specified share properties.

`{-symlink-properties {enable|hide|read-only|symlinks|symlinks-and-widelinks|disable}, ...}` - Symlink Properties

If you specify this parameter, the command displays information only about the CIFS share or shares that have the specified symbolic link properties.

`{-file-umask <Octal Integer>}` - File Mode Creation Mask

If you specify this parameter, the command displays information only about the CIFS share or shares that use the specified file mask.

`{-dir-umask <Octal Integer>}` - Directory Mode Creation Mask

If you specify this parameter, the command displays information only about the CIFS share or shares that use the specified directory mask.

`{-comment <text>}` - Share Comment

If you specify this parameter, the command displays information only about the CIFS share or shares that have the specified comment.

`{-acl <text>, ...}` - Share ACL

If you specify this parameter, the command displays information only about the CIFS share or shares that have the specified ACL.
-attribute-cache-ttl <[<integer>h][<integer>m][<integer>s]>] - File Attribute Cache Lifetime
  If you specify this parameter, the command displays information only about the CIFS share or shares that have the specified attribute-cache-ttl for attribute cache.

-volume <volume name> - Volume Name
  If you specify this parameter, the command displays information only about the CIFS shares that are present in this volume.

-offline-files {none|manual|documents|programs} - Offline Files
  If you specify this parameter, the command displays information only about the CIFS shares that have the specified Offline Files properties.

-vscan-fileop-profile {no-scan|standard|strict|writes-only} - Vscan File-Operations Profile
  If you specify this parameter, the command displays information only about the CIFS shares that have the specified Vscan fileop profile.

-max-connections-per-share <integer> - Maximum Tree Connections on Share
  If you specify this parameter, the command displays information only about the CIFS shares that have the specified maximum connections per share configured.

-force-group-for-create <text> - UNIX Group for File Create
  This optional parameter displays information about the CIFS shares that have the specified "force-group" parameter configured.

### Examples

The following example displays information about all CIFS shares:

```
cluster1::> vserver cifs share show
Vserver Share Path Properties Comment  ACL
-------------- ------------- ----------------- ---------- -------- -----------
vs1 ROOTSHARE / oplocks Share..... CNC 
       browsable mapped  Everyone / Full
       changenotifo... Vserver
       global namespace
       Control

vs1 admin$ / browsable - -
vs1 c$ / oplocks - BUILTIN\Administrators / Full
          browsable niators /
          changenotifo... Full
          Control

vs1 ipc$ / browsable - -
4 entries were displayed.
```

The following example displays information about a CIFS share named SALES_SHARE on a Vserver named vs1.

```
cluster1::> vserver cifs share show -vserver vs1 -share-name SALES_SHARE
Vserver: vs1
Share: SALES_SHARE
CIFS Server NetBIOS Name: WINDATA
Path: /sales
Share Properties: oplocks browsable
Symlink Properties: enable
File Mode Creation Mask: -
Directory Mode Creation Mask: -
Share Comment: -
Share ACL: Everyone / Full Control
File Attribute Cache Lifetime: -
Offline Files: manual
Vscan File-Operations Profile: standard
```
vserver cifs share access-control commands

The access-control directory

vserver cifs share access-control create

Create an access control list

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs share access-control create command adds a user or group to a CIFS share's ACL.

Parameters
-vserver <vserver name> - Vserver
This parameter specifies the name of the Vserver containing the CIFS share.

-share <Share> - Share Name
This parameter specifies the name of the CIFS share.

-user-or-group <TextNoCase> - User/Group Name
This parameter specifies the user or group to add to the CIFS share's access control list. If you specify the user name, you must include the user's domain using the format "domain\username". The user-or-group parameter is case-insensitive text.

[-user-group-type {windows|unix-user|unix-group}] - User or Group Type
This parameter specifies the type of the user or group to add to the CIFS share's access control list. The default type is windows. The user-group-type can be one of the following:

- windows
- unix-user
- unix-group

-permission <access rights> - Access Type
This parameter specifies the permissions for the user or group. The permissions can be one of the following:

- No_access
- Read
- Change
- Full_Control

Examples
The following example adds the windows group "Everyone" with "Full_Control" permission to the access control list of the share "vol3".

    vs1::> vserver cifs share access-control create -share vol3 -user-or-group Everyone -user-group-type windows -permission Full_Control

The following example adds the unix-user "pcuser" and unix-group "daemon" with "read" permission to the access control list of the share "vol3".
vserver cifs share access-control delete

Delete an access control list

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs share access-control delete command deletes a user or group from a CIFS share's ACL.

Parameters
-vserver <vserver name> - Vserver
This parameter specifies the name of the Vserver containing the CIFS share.

-share <Share> - Share Name
This parameter specifies the name of the CIFS share.

-user-or-group <TextNoCase> - User/Group Name
This parameter specifies the user or group to delete from the CIFS share's access control list. If you specify a user name, you must include the user's domain using the format "domain\username". The user-or-group parameter is case-insensitive text.

[-user-group-type {windows|unix-user|unix-group}] - User or Group Type
This parameter specifies the type of the user or group to delete from the CIFS share's access control list. The default type is windows. The user-group-type can be one of the following:

- windows
- unix-user
- unix-group

Examples
The following example deletes the group "Everyone" for the access control list of share "vol3".

vsl::> vserver cifs share access-control delete -share vol3 -user-or-group Everyone

vserver cifs share access-control modify

Modify an access control list

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs share access-control modify command modifies the permissions of a user or group in a CIFS share's ACL.
Parameters
- **vserver <vserver name>** - Vserver
  
  This parameter specifies the name of the Vserver containing the CIFS share whose ACL you want to modify.

- **share <Share>** - Share Name
  
  This parameter specifies the name of the CIFS share whose ACL you want to modify.

- **user-or-group <TextNoCase>** - User/Group Name
  
  This parameter specifies the user or group to modify. If you specify the user name, you must include the user's domain using the format "domain\username". The user-or-group parameter is case-insensitive text.

- **[-user-group-type {windows|unix-user|unix-group}]** - User or Group Type
  
  This parameter specifies the type of the user or group to modify. The default type is windows. The user-group-type can be one of the following:
  
  - windows
  - unix-user
  - unix-group

- **[-permission <access rights>]** - Access Type
  
  This parameter specifies the permissions for the user or group. The permissions can be one of the following:
  
  - No_access
  - Read
  - Change
  - Full_Control

Examples
The following example modifies the access control list for a share named "vol3". It changes the permission for the windows group "Everyone" to "Full_Control".

```bash
vs1::*> vserver cifs share access-control modify -share vol3 -user-or-group Everyone -user-group-type windows -permission Full_Control
```

The following example modifies the access control list for a share named "vol3". It changes the permission for the unix-user "pcuser" and unix-group "daemon" to "change".

```bash
vs1::> vserver cifs share access-control modify -share vol3 -user-or-group pcuser -user-group-type unix-user -permission change
vs1::> vserver cifs share access-control modify -share vol3 -user-or-group daemon -user-group-type unix-group -permission change
```

**vserver cifs share access-control show**

Display access control lists on CIFS shares

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The **vserver cifs share access-control show** command displays the ACLs of CIFS shares.
Parameters

\{[-fields <fieldname>, ...]\}

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

\{[-instance ]\}

If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver

This optional parameter specifies the name of the Vserver containing the share for which you want to display the access control list.

[-share <Share>] - Share Name

This optional parameter specifies the name of the CIFS share for which you want to display the access control list.

[-user-or-group <TextNoCase>] - User/Group Name

If you specify this optional parameter, the command displays only access control lists for the CIFS shares that have ACLs matching the specified user or group.

[-user-group-type {windows|unix-user|unix-group}] - User or Group Type

If you specify this optional parameter, the command displays only access control lists for the CIFS shares that have ACLs matching the specified user-group-type. The user-group-type can be one of the following:

- windows
- unix-user
- unix-group

[-permission <access rights>] - Access Type

If you specify this optional parameter, the command displays only access control lists for the CIFS shares that have ACLs matching the specified permission. The permissions can be one of the following:

- No_access
- Read
- Change
- Full_Control

[-winsid <windows sid>] - Windows SID

If you specify this optional parameter, the command displays only access control lists for the CIFS shares that have ACLs matching the specified Windows SID.

[-access-mask <Hex Integer>] - Access mask

If you specify this optional parameter, the command displays only access control lists for the CIFS shares that have ACLs matching the specified access rights.

**Examples**

The following example displays all the ACLs for shares in Vserver vs1.

```bash
vs1::> vserver cifs share access-control show

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Share</th>
<th>User/Group</th>
<th>User/Group Type</th>
<th>Access Permission</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>
<td>vol3</td>
<td>CIFSQA\administrator</td>
<td>windows</td>
<td>Read</td>
</tr>
<tr>
<td>vs1</td>
<td>vol3</td>
<td>Everyone</td>
<td>windows</td>
<td>Full_Control</td>
</tr>
</tbody>
</table>
```

1704  Commands: Manual Page Reference
vserver cifs share properties commands

Manage share properties

vserver cifs share properties add

Add to the list of share properties

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The `vserver cifs share properties add` command adds share properties to the list of share properties of an existing CIFS share. You can add one or more share properties. You can add additional share properties at any time by rerunning this command. Any share properties that you have previously specified will remain in effect and newly added properties are appended to the existing list of share properties.

Parameters

-vserver <vserver name> - Vserver
This parameter specifies the name of the Vserver containing the CIFS share whose share properties you want to add.

-share-name <Share> - Share
This parameter specifies the name of the CIFS share.

-share-properties <share properties>, ... - Share Properties
This parameter specifies the list of share properties you want to add to the CIFS share. The share properties can be one or more of the following:

- oplocks - This property specifies that the share uses opportunistic locks, also known as client-side caching. This is a default initial property for all shares; however, some applications do not work well when oplocks are enabled. In particular, database applications such as Microsoft Access are vulnerable to corruption when oplocks are enabled. An advantage of shares is that a single path can be shared multiple times, with each share having different properties. For instance, if a path named /dept/finance contains both a database and other types of files, you can create two shares to it, one with oplocks disabled for safe database access and one with oplocks enabled for client-side caching.

- browsable - This property allows Windows clients to browse the share. This is a default initial property for all shares.

- showsnapshot - This property specifies that Snapshot copies can be viewed and traversed by clients.

- changenotify - This property specifies that the share supports ChangeNotify requests. For shares on a Vserver with FlexVol volumes, this is a default initial property. For shares on a Vserver with Infinite Volume, the ChangeNotify property is not set by default, and setting it requires the advanced privilege level. When the ChangeNotify property is set for a share on a Vserver with Infinite Volume, change notifications are not sent for changes to file attributes and timestamps. If the path of the share is within a FlexGroup, change notifications are not sent because FlexGroups do not support ChangeNotify.

- attributecache - This property enables the file attribute caching on the CIFS share in order to provide faster access of attributes over SMB 1.0.

Note: For certain workloads, stale file attribute data could be delivered to a client.
• continuously-available - This property permits SMB clients that support it to open files in a persistent manner. Files opened this way are protected from disruptive events, such as failover and giveback. This option is not supported for FlexGroups, Vservers with Infinite Volume and workgroup CIFS servers.

• branchcache - This property specifies that the share allows clients to request BranchCache hashes on the files within this share. This option is useful only if you specify "per-share" as the operating mode in the CIFS BranchCache configuration, and also specify the "oplocks" share property. This option is not supported for Vservers with Infinite Volume.

• access-based-enumeration - This property specifies that Access Based Enumeration(ABE) is enabled on this share. ABE-filtered shared folders are visible to a user based on that individual user's access rights, preventing the display of folders or other shared resources that the user does not have rights to access.

• namespace-caching - This property specifies that the SMB clients connecting to this share can cache the directory enumeration results returned by the CIFS servers.

• encrypt-data - This property specifies that SMB encryption must be used when accessing this share. Clients that do not support encryption will not be able to access this share.

• show-previous-versions - This property specifies that the previous version can be viewed and restored from the client. This property is enabled by default.

Note: The oplock, browsable, changenotify and show-previous-versions share properties are assigned to a share by default. If you have removed them from a share, you can use the vserver cifs share properties add command to add these properties to the share.

Examples
The following example adds the "showsnapshot" and "changenotify" properties to a share named "sh1".

```
cluster1::> vserver cifs share properties add -vserver vs1 -share-name sh1 -share-properties showsnapshot,changenotify
```

vserver cifs share properties remove
Remove from the list of share properties

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs share properties remove command removes share properties from the list of share properties of an existing CIFS share. You can remove one or more share properties. You can remove additional share properties at any time by rerunning this command. Any existing share properties that you do not remove remain in effect.

Parameters
-vserver <vserver name> - Vserver
This parameter specifies the name of the Vserver containing the CIFS share whose share properties you want to remove.

-share-name <Share> - Share
This parameter specifies the name of the CIFS share.

-share-properties <share properties>, ... - Share Properties
This parameter specifies the list of share properties you want to remove from the CIFS share. The share properties can be one or more of the following:
- **oplocks** - This property specifies that the share uses opportunistic locks, also known as client-side caching. Oplocks are enabled on shares by default; however, some applications do not work well when oplocks are enabled. In particular, database applications such as Microsoft Access are vulnerable to corruption when oplocks are enabled. An advantage of shares is that a single path can be shared multiple times, with each share having different properties. For instance, if a path named `/dept/finance` contains both a database and other types of files, you can create two shares to it, one with oplocks disabled for safe database access and one with oplocks enabled for client-side caching.

- **browsable** - This property allows Windows clients to browse the share.

- **showsnapshot** - This property specifies that Snapshot copies can be viewed and traversed by clients.

- **changenotify** - This property specifies that the share supports ChangeNotify requests. For shares on a Vserver with FlexVol volumes, this is a default initial property. For shares on a Vserver with Infinite Volume, the ChangeNotify property is not set by default, and setting it requires the advanced privilege level. When the ChangeNotify property is set for a share on a Vserver with Infinite Volume, change notifications are not sent for changes to file attributes and timestamps. If the path of the share is within a FlexGroup, change notifications are not sent because FlexGroups do not support ChangeNotify.

- **attributecache** - This property enables the file attribute caching on the CIFS share in order to provide faster access of attributes over SMB 1.0.

  **Note:** For certain workloads, stale file attribute data could be delivered to a client.

- **continuously-available** - This property permits SMB clients that support it to open files in a persistent manner. Files opened this way are protected from disruptive events, such as failover and giveback. This option is not supported for FlexGroups, Vservers with Infinite Volume and workgroup CIFS servers.

- **branchcache** - This property specifies that the share allows clients to request BranchCache hashes on the files within this share. This option is useful only if you specify "per-share" as the operating mode in the CIFS BranchCache configuration, and also specify the "oplocks" share property. This option is not supported for Vservers with Infinite Volume.

- **access-based-enumeration** - This property specifies that Access Based Enumeration(ABE) is enabled on this share. ABE-filtered shared folders are visible to a user based on that individual user's access rights, preventing the display of folders or other shared resources that the user does not have rights to access.

- **namespace-caching** - This property specifies that the SMB clients connecting to this share can cache the directory enumeration results returned by the CIFS servers.

- **encrypt-data** - This property specifies that SMB encryption must be used when accessing this share. Clients that do not support encryption will not be able to access this share.

- **show-previous-versions** - This property specifies that the previous version can be viewed and restored from the client. This property is enabled by default.

### Examples

The following example removes "showsnapshot" and "changenotify" properties to a share named "sh1".

```bash
cluster1::> vserver cifs share properties remove -vserver vs1 -share-name sh1 -share-properties showsnapshot,changenotify
```

**vserver cifs share properties show**

Display share properties

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.
Description
The `vserver cifs share properties show` command displays the CIFS share properties.

Parameters

`[-fields <fieldname>, ...]`
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

`[-instance]`
If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-vserver <vserver name>]` - Vserver
This optional parameter specifies the name of the Vserver containing the CIFS share for which you want to display share properties.

`[-share-name <Share>]` - Share
If you specify this parameter, the command displays share properties only for the CIFS share that you specify.

`[-share-properties <share properties>, ...]` - Share Properties
If you specify this parameter, the command displays share properties only for CIFS shares using the properties you specify. The share properties can be one or more of the following:

- homedirectory - This property specifies that the share and path names are dynamic. Specify this value for a home directory share. In a home directory share, the share's name and path can be generated by substituting `%w` and `%d` variables with the corresponding user's name and domain, respectively, specified as the value of the `-share-name` and `-path` parameters. For instance, if a dynamic share is defined with a name of `%d_%w`, a user logged on as `barbara` from a domain named `FIN` sees the share as `FIN_barbara`. Using the homedirectory value specifies that the share and path names are dynamically expanded.

- oplocks - This property specifies that the share uses opportunistic locks, also known as client-side caching.

- browsable - This property allows Windows clients to browse the share.

- showsnapshot - This property specifies that Snapshot copies can be viewed and traversed by clients.

- changenotify - This property specifies that the share supports Change Notify requests.

- attributecache - This property enables the file attribute caching on the CIFS share in order to provide faster access of attributes over SMB 1.0.

  **Note:** For certain workloads, stale file attribute data could be delivered to a client.

- continuously-available - This property permits SMB clients that support it to open files in a persistent manner. Files opened this way are protected from disruptive events, such as failover and giveback. This attribute is not supported for FlexGroups and workgroup CIFS servers.

- branchcache - This property specifies that the share allows clients to request BranchCache hashes on the files within this share. This option is useful only if you specify "per-share" as the operating mode in the CIFS BranchCache configuration, and also specify the "oplocks" share property.

- shadowcopy - This property specifies that the share is pointing to a shadow copy. This attribute cannot be added or removed from a share.

- access-based-enumeration - This property specifies that Access Based Enumeration is enabled on this share. ABE-filtered shared folders are visible to a user based on that individual user's access rights, preventing the display of folders or other shared resources that the user does not have rights to access.

- namespace-caching - This property specifies that the SMB clients connecting to this share can cache the directory enumeration results returned by the CIFS servers.
• **encrypt-data** - This property specifies that SMB encryption must be used when accessing this share. Clients that do not support encryption will not be able to access this share.

• **show-previous-versions** - This property specifies that the previous version can be viewed and restored from the client. This property is enabled by default.

### Examples
The following example displays share properties for shares in Vserver vs1.

```
cluster1::> vserver cifs share properties show
Vserver  Share            Properties
---------------- ---------------- ------------------
vs1      abc              oplocks
         browsable
         changenotify
         show-previous-versions
vs1      admin$           browsable
vs1      ipc$             browsable
         oplocks
vs1      sh1              browsable
         changenotify
         show-previous-versions
4 entries were displayed.
```

### vserver cifs superuser commands

(DEPRECATED) Manage superuser permissions on CIFS accounts

**vserver cifs superuser create**

Adds superuser permissions to a CIFS account

**Availability:** This command is available to **cluster** and **Vserver** administrators at the **advanced** privilege level.

**Description**
The `vserver cifs superuser create` command elevates the privileges of the specified domain account in this Vserver to superuser. With superuser privileges, Data ONTAP bypasses some of the security checks. This command is not supported for workgroup CIFS servers.

**Parameters**

- `-vserver <vserver name>` - **Vserver**
  
  Vserver name.

- `-domain <CIFS domain>` - **Domain**
  
  The domain name of accountname.

- `-accountname <CIFS account>` - **User**
  
  The domain account to which you want to give superuser privileges.

### Examples
The following example shows how to elevate ExampleUser in EXAMPLE domain to superuser for a Vserver vs1.

```
vs1::> vserver cifs superuser create -domain EXAMPLE -accountname ExampleUser -vserver vs1
```
vserver cifs superuser delete

Deletes superuser permissions from a CIFS account

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The vserver cifs superuser delete command removes the superuser privileges for the specified domain account in this Vserver. With superuser privileges, Data ONTAP bypasses some of the security checks.

Parameters
- \texttt{--vserver \textit{vserver name}} - Vserver
  Vserver name.
- \texttt{--domain \textit{CIFS domain}} - Domain
  The domain name of accountname.
- \texttt{--accountname \textit{CIFS account}} - User
  The domain account name you want to remove superuser privileges.

Examples
The following example shows how to remove superuser privileges for ExampleUser in EXAMPLE domain for a Vserver vs1.

\begin{verbatim}
  vs1::> vserver cifs superuser delete --domain EXAMPLE --accountname ExampleUser --vserver vs1
\end{verbatim}

vserver cifs superuser show

Display superuser permissions for CIFS accounts

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The vserver cifs superuser show command displays all account names with superuser privileges. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following superuser information for all CIFS servers:

- Vserver name
- CIFS server NetBIOS name
- Domain
- Account Name

Parameters
\begin{verbatim}
  \{ \[\texttt{--fields \textit{fieldname}}, ...\]
  \[\texttt{--instance}\]
  \[\texttt{--vserver \textit{vserver name}}\] \}
\end{verbatim}

If you specify the \texttt{--fields \textit{fieldname}}, ... parameter, the command output also includes the specified field or fields. You can use \texttt{--fields ?} to display the fields to specify.

If you specify the \texttt{--instance} parameter, the command displays detailed information about all fields.

If you specify this parameter, the command displays superuser information of only the specified Vservers.
[-domain <CIFS domain>] - Domain
If you specify this parameter, the command displays superuser information of only for accounts that are in the specified domain.

[-accountname <CIFS account>] - User
If you specify this parameter, the command displays superuser information of only the CIFS servers with the specified superuser account.

[-cifs-server <NetBIOS>] - CIFS Server NetBIOS Name
If you specify this parameter, the command displays superuser information of only the Vservers with specified CIFS server name.

Examples
The following example displays superuser information of all Vservers.

```
vserver cifs superuser show
```

<table>
<thead>
<tr>
<th>Vserver</th>
<th>CIFS Server</th>
<th>Domain</th>
<th>Account Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>
<td>SMB_SERVER1</td>
<td>CIFSDOMAIN</td>
<td>ADMINISTRATOR</td>
</tr>
<tr>
<td>vs2</td>
<td>SMB_SERVER2</td>
<td>CIFSDOMAIN</td>
<td>ADMINISTRATOR</td>
</tr>
</tbody>
</table>

vserver cifs symlink commands
Manage symbolic and wide links

vserver cifs symlink create
Create a symlink path mapping

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs symlink create command creates a symbolic link mapping for CIFS. A mapping consists of a Vserver name, a UNIX (NFS) path, a CIFS share name, and a CIFS path. You can also specify a CIFS server name and whether the CIFS symbolic link is a local link, a free link (obsolete), or wide link. A local symbolic link maps to the local CIFS share. A free symbolic link can map anywhere on the local server. A wide symbolic link maps to any CIFS share on the network. If the target share is a Home Directory, then the -home-directory field must be set to true for correct processing.

Parameters
-vserver <vserver name> - Vserver
This parameter specifies the Vserver on which you want to create the mapping.

-unix-path <text> - UNIX Path
This parameter specifies the UNIX (NFS) path for the mapping.

Note: It must begin and end with a forward slash (/).

-share-name <Share> - CIFS Share
This parameter specifies the CIFS share for the mapping.

-cifs-path <TextNoCase> - CIFS Path
This parameter specifies the CIFS path for the mapping. Note that this value is specified by using a UNIX-style path.

Note: It must begin and end with a forward slash (/).
[-cifs-server <TextNoCase>] - Remote NetBIOS Server Name
This parameter specifies a new CIFS server DNS name, IP address, or NetBIOS name for the mapping.

[-locality {local|widelink}] - Local or Wide Symlink
This parameter specifies whether the CIFS symbolic link is a local link, a free link (obsolete), or wide link. A local symbolic link maps to the local CIFS share. A free symbolic link can map anywhere on the local server. A wide symbolic link maps to any CIFS share on the network. The default setting is local. The free link option is obsolete.

[-home-directory {true|false}] - Home Directory
This parameter specifies whether the target share is a home directory. The default value is false.

   **Note:** This field must be set to true when the target share is a Home Directory for correct processing.

### Examples

The following example creates a symbolic link mapping on a Vserver named vs1. It has the UNIX path /sales/, the CIFS share name SALES_SHARE, and the CIFS path /mycompany/sales/.

```sh
cluster1::> vserver cifs symlink create -vserver vs1
   -unix-path /sales/ -share-name SALES_SHARE -cifs-path /*/mycompany/sales/*
```

The following example creates a symbolic link mapping on a Vserver named vs1. It has the UNIX path /example/, the CIFS share name EXAMPLE_SHARE, the CIFS path /mycompany/example/, the CIFS server IP address, and is a wide link.

```sh
cluster1::> vserver cifs symlink create -vserver vs1
   -unix-path /example/ -share-name EXAMPLE_SHARE
   -cifs-path /*/mycompany/example/* -cifs-server CIFSSERVER1 -locality widelink
```

### vserver cifs symlink delete
Delete a symlink path mapping

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver cifs symlink delete` command deletes a symbolic link mapping for CIFS.

**Parameters**

- **-vserver <vserver name>** - Vserver
  This specifies the Vserver on which the symbolic link mapping is located.

- **-unix-path <text>** - UNIX Path
  This specifies the UNIX (NFS) path of the mapping that you want to delete.

### Examples

The following example deletes a symbolic link mapping to a UNIX path /example/ from a Vserver named vs1:

```sh
cluster1::> vserver cifs symlink delete -vserver vs1 -unix-path /example/
```

### vserver cifs symlink modify
Modify a symlink path mapping

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.
**Description**

The `vserver cifs symlink modify` command modifies the CIFS share name, CIFS path, CIFS server name, or locality of a symbolic link mapping. It can also be used to modify the value of `-home-directory` field.

**Parameters**

- `vserver <vserver name>` - Vserver
  This parameter specifies the Vserver on which the symbolic link mapping is located.

- `unix-path <text>` - UNIX Path
  This parameter specifies the UNIX (NFS) path of the mapping that you want to modify.
  
  **Note:** It must begin and end with a forward slash (/).

- `share-name <Share>` - CIFS Share
  This parameter specifies a new CIFS share name for the mapping.

- `cifs-path <TextNoCase>` - CIFS Path
  This parameter specifies a new CIFS path for the mapping. Note that this value is specified by using a UNIX-style path.
  
  **Note:** It must begin and end with a forward slash (/).

- `cifs-server <TextNoCase>` - Remote NetBIOS Server Name
  This parameter specifies a new CIFS server DNS name, IP address, or NetBIOS name for the mapping.

- `locality {local|widelink}` - Local or Wide Symlink
  This parameter specifies a new locality for the mapping. A local symbolic link maps to the local CIFS share. A free symbolic link can map anywhere on the local server. A wide symbolic link maps to any CIFS share on the network. The default setting is `local`. The free link option is obsolete.

- `home-directory {true|false}` - Home Directory
  This parameter specifies whether the new target share is a home directory.
  
  **Note:** This field must be set to true when the target share is a Home Directory for correct processing.

**Examples**

The following example modifies the symbolic link mapping to a UNIX path `/example/` on a Vserver named vs1. The mapping is modified to use the CIFS path `/mycompany/example/`.

```
cluster1::> vserver cifs symlink modify -vserver vs1 -unix-path /example/ -cifs-path "/mycompany/example/
```

The following example modifies the symbolic link mapping to a UNIX path `/example/` on a Vserver named vs1. The mapping is modified to use the CIFS share name `EXAMPLE_SHARE`, the CIFS path `/mycompany/example/`, on the CIFS server `cifs.example.com`, and to be a wide link.

```
cluster1::> vserver cifs symlink modify -vserver vs1 -unix-path /example/ -share-name EXAMPLE_SHARE -cifs-path "/mycompany/example/" -cifs-server cifs.example.com -locality widelink
```

**vserver cifs symlink show**

Show symlink path mappings

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.
Description
The vserver cifs symlink show command displays the following information about symbolic link mappings for CIFS:

- Vserver
- UNIX (NFS) path
- The DNS name, IP address, or NetBIOS name of the CIFS server
- CIFS share name
- CIFS path
- Whether the locality of the CIFS server is a local, free, or wide link. (A local symbolic link maps to the local CIFS share. A free symbolic link can map anywhere on the local server. A wide symbolic link maps to any CIFS share on the network. The free link option is deprecated and may be removed in a future release of Data ONTAP.)

Parameters
{ [-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command only displays the fields that you specify.

| [-instance ]
  If you specify the -instance parameter, the command displays detailed information about all entries.

[-vserver <vserver name>] - Vserver
  If you specify this parameter, the command displays information about symbolic link mappings on the specified Vserver.

[-unix-path <text>] - UNIX Path
  If you specify this parameter, the command displays information only about the symbolic link mapping that uses the specified UNIX (NFS) path.

[-share-name <Share>] - CIFS Share
  If you specify this parameter, the command displays information only about the symbolic link mapping or mappings that use the specified CIFS share.

[-cifs-path <TextNoCase>] - CIFS Path
  If you specify this parameter, the command displays information only about the symbolic link mapping that uses the specified CIFS path.

[-cifs-server <TextNoCase>] - Remote NetBIOS Server Name
  If you specify this parameter, the command displays information only about the symbolic link mapping that uses the specified CIFS server.

[-locality {local|widelink}] - Local or Wide Symlink
  If you specify this parameter, the command displays information only about the symbolic link mappings that have the specified locality.

[-home-directory {true|false}] - Home Directory
  If you specify this parameter, the command displays information only about the symbolic link mappings that have the target share as a home directory (if true) or as a static CIFS share (if false).

Examples
The following example displays information about all symbolic link mappings for CIFS:
vserver cifs symlink commands

Manage local users, groups, and privileges

vserver cifs symlink show

The following example displays information about all symbolic link mappings that are wide links:

```
cluster1::> vserver cifs symlink show -locality widelink
Vserver    Unix Path  CIFS Server         CIFS Share  CIFS Path       Locality
---------- ---------- ------------------- ----------- --------------- --------
vs1        /hr/       192.0.2.160         HR_SHARE    /mycompany/hr/  widelink
vs1        /web/      cifs.example.com    WEB_SHARE   /mycompany/web/ widelink
2 entries were displayed.
```

vserver cifs users-and-groups commands

Manage local users, groups, and privileges

vserver cifs users-and-groups update-names

Update the names of Active Directory users and groups

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

**Description**
The `vserver cifs users-and-groups update-names` command updates the names of Active Directory users and groups that are registered in local databases on the cluster and reports the status of the update operations. This is done so that objects that were renamed in the Active Directory can be properly displayed and configured in the local databases.

**Parameters**

- `-vserver <vserver name>` - *Vserver*
  
  If you specify this parameter, the command will only be performed within the scope of the Vserver that matches the specified Vserver name.

  `{[-display-failed-only (true|false)] - Display Only Failures

  If you set this parameter to true, the command displays only the Active Directory users and groups that failed to update. If set to false, the command displays only the Active Directory users and groups that successfully updated.

  [{[-suppress-all-output (true|false)]} - Suppress All Output

  If you set this parameter to true, the command does not display information about the status of the updates of Active Directory users and groups. To display information about the status of the updates, set this parameter to false or do not specify this parameter in the command.

**Examples**
The following example updates the names of Active Directory users and groups associated with Vserver "vs1". In the last case, there is a dependent chain of names that needs to be updated.

```
cluster1::*> vserver cifs users-and-groups update-names -vserver vs1
Vserver:           vs1
SID:               S-1-5-21-123456789-234565432-987654321-12345
Domain:            EXAMPLE1
Out-of-date Name:  dom_user1

vserver cifs commands
vserver cifs users-and-groups local-group commands

Manage local groups

vserver cifs users-and-groups local-group add-members

Add members to a local group

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs users-and-groups local-group add-members command adds members to a local group.

Parameters

-vserver <vserver name> - Vserver
This specifies the name of the Vserver.

-group-name <CIFS name> - Group Name
This specifies the name of the local group.

-member-names <CIFS name>, ... - Names of Users or Active Directory Groups to be Added
This specifies the list of local users, Active Directory users, or Active Directory groups to be added to a particular local group.

Examples
The following example adds a local user "CIFS_SERVER\loc_usr1" and an Active Directory group "CIFS_SERVER \dom_grp2" to the local group "CIFS_SERVER\g1".

cluster1::> vserver cifs users-and-groups local-group add-members -vserver vs1 -group-name CIFS_SERVER\g1 -member-names CIFS_SERVER\loc_usr1,AD_DOMAIN\dom_grp2

vserver cifs users-and-groups local-group create

Create a local group

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.
Description
The vserver cifs users-and-groups local-group create command creates a local group and optionally sets the description of that local group. The group name must meet the following criteria:

• The group name length must not exceed 256 characters.
• The group name cannot be terminated by a period.
• The group name cannot include commas.
• The group name cannot include any of the following printable characters: ", /, [ ], :, |, <, >, +=, ?, @
• The group name cannot include characters in the ASCII range 1-31, which are non-printable.

Parameters
-vserver <vserver name> - Vserver
  This specifies the name of the Vserver.
-group-name <CIFS name> - Group Name
  This specifies the name of the local group.
[-description <TextNoCase>] - Description
  This specifies a description for this local group. If the description contains a space, enclose the parameter in quotation marks.

Examples
The following example creates a local group "CIFS_SERVER\g1" associated with Vserver "vs1".

cluster1::> vserver cifs users-and-groups local-group create -vserver vs1 -group-name CIFS_SERVER \g1

vserver cifs users-and-groups local-group delete
Delete a local group

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs users-and-groups local-group delete command deletes a local group. Removing a local group removes its membership records.

Parameters
-vserver <vserver name> - Vserver
  This specifies the name of the Vserver.
-group-name <CIFS name> - Group Name
  This specifies the name of the local group to delete.

Examples
The following example deletes the local group "CIFS_SERVER\g1" associated with Vserver "vs1".

cluster1::> vserver cifs users-and-groups local-group delete -vserver vs1 -group-name CIFS_SERVER \g1
vserver cifs users-and-groups local-group modify

Modify a local group

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs users-and-groups local-group modify command modifies the description of a local group.

Parameters
-vserver <vserver name> - Vserver
This specifies the name of the Vserver.

-group-name <CIFS name> - Group Name
This specifies the name of the local group.

[-description <TextNoCase>] - Description
This specifies a description for this local group. If the description contains a space, enclose the parameter in quotation marks.

Examples
The following example modifies the description of the local group "CIFS_SERVER\g1" associated with Vserver "vs1".

    cluster1::> vserver cifs users-and-groups local-group modify -vserver vs1 -group-name CIFS_SERVER\g1 -description "Example Description"

vserver cifs users-and-groups local-group remove-members

Remove members from a local group

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs users-and-groups local-group remove-members command removes members from a local group.

Parameters
-vserver <vserver name> - Vserver
This specifies the name of the Vserver.

-group-name <CIFS name> - Group Name
This specifies the name of the local group.

-member-names <CIFS name>, ... - Names of Users or Active Directory Groups to be Removed
This specifies the list of local users, Active Directory users, or Active Directory groups to be removed from a particular local group.

Examples
The following example removes the local users "CIFS_SERVER\u1" and "CIFS_SERVER\u2" from the local group "CIFS_SERVER\g1".
vserver cifs users-and-groups local-group rename

Rename a local group

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs users-and-groups local-group rename command renames a local group. The new group name must remain in the same domain as the old group name. The new group name must meet the following criteria:

- The group name length must not exceed 256 characters.
- The group name cannot be terminated by a period.
- The group name cannot include commas.
- The group name cannot include any of the following printable characters: ", /, \, [, ], :, |, <, >, +, =, ;, ?, *, @
- The group name cannot include characters in the ASCII range 1-31, which are non-printable.

Parameters
-vserver <vserver name> - Vserver
This specifies the name of the Vserver.

-group-name <CIFS name> - Group Name
This specifies the local group's name.

-new-group-name <CIFS name> - New Group Name
This specifies the local group's new name.

Examples
The following example renames the local group "CIFS_SERVER\g_old" to "CIFS_SERVER\g_new" on Vserver "vs1".

```
cluster1:/> vserver cifs users-and-groups local-group rename -group-name CIFS_SERVER\g_old -new-group-name CIFS_SERVER\g_new -vserver vs1
```

vserver cifs users-and-groups local-group show

Display local groups

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs users-and-groups local-group show command displays local groups.

Parameters

\[-fields <fieldname>, ...\]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.
If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-vserver <vserver name>] - Vserver`

If this parameter is specified, the command displays information only about local groups that match the specified Vserver name.

`[-group-name <CIFS name>] - Group Name`

If this parameter is specified, the command displays information only about local groups that match the specified group name.

`[-description <TextNoCase>] - Description`

If this parameter is specified, the command displays information only about local groups that match the specified description.

**Examples**

The following example displays all local groups associated with Vserver "vs1".

```
cluster1::> vserver cifs users-and-groups local-group show -vserver vs1
Vserver Group Name Description
---------- ----------- -----------------------------------------------
vs1 BUILTIN\Administrators Built-in Administrators group
vs1 BUILTIN\Backup Operators Backup Operators group
vs1 BUILTIN\Power Users Restricted administrative privileges
vs1 BUILTIN\Users All users
vs1 CIFS_SERVER\g1
vs1 CIFS_SERVER\g2
6 entries were displayed.
```

**vserver cifs users-and-groups local-group show-members**

Display local groups' members

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The `vserver cifs users-and-groups local-group show-members` command displays members of a local group. The members can be local or Active Directory users or groups.

**Parameters**

`{ [-fields <fieldname>, ...]`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

`[-instance]`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-vserver <vserver name>] - Vserver`

If this parameter is specified, the command displays group members of local groups that match the specified Vserver name.

`[-group-name <CIFS name>] - Group Name`

If this parameter is specified, the command displays group members of local groups that match the specified group name.

`[-member <CIFS name>, ...] - Member Name`

If this parameter is specified, the command displays group members that match the specified member name. The name can be that of a local user, Active Directory user, or Active Directory group.
vserver cifs users-and-groups local-user commands

Manage local users

vserver cifs users-and-groups local-user create

Create a local user

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver cifs users-and-groups local-user create` command creates a local user and optionally sets the attributes for that local user. The command prompts for the local user's password.
The user name must meet the following criteria:

- The user name length must not exceed 20 characters.
- The user name cannot be terminated by a period.
- The user name cannot include commas.
- The user name cannot include any of the following printable characters: ", /, , ), :, |, <, >, +, =, ?, @
- The user name cannot include characters in the ASCII range 1-31, which are non-printable.

The password must meet the following criteria:

- The password must be at least six characters in length.
- The password must not contain user account name.
- The password must contain characters from three of the following four categories:
  - English uppercase characters (A through Z)
  - English lowercase characters (a through z)
  - Base 10 digits (0 through 9)
  - Special characters: ~, !, @, #, $, %, ^, &, *, _, - , +, =, \, |, (, ), [ , ] , ;, :, ', " , <, >, .. ?, /

**Parameters**

`-vserver <vserver name>` - Vserver

This specifies the name of the Vserver.

---

**Examples**
The following example displays members of local groups associated with Vserver "vs1".

```console
cluster1::> vserver cifs users-and-groups local-group show-members -vserver vs1
Vserver        Group Name                   Members
-------------- ---------------------------- ------------------------
vs1            BUILTIN\Administrators       CIFS_SERVER\Administrator
              AD_DOMAIN\Domain Admins
              BUILTIN\Users                AD_DOMAIN\Domain Users
              AD_DOMAIN\dom_usr1
              CIFS_SERVER\g1               CIFS_SERVER\u1
6 entries were displayed.
```
-user-name <CIFS name> - User Name
This specifies the user name.

[-full-name <TextNoCase>] - Full Name
This specifies the user's full name. If the full name contains a space, enclose the full name within double quotation marks.

[-description <TextNoCase>] - Description
This specifies a description for this local user. If the description contains a space, enclose the parameter in quotation marks.

[-is-account-disabled {true|false}] - Is Account Disabled
This specifies whether the user account is enabled or disabled. Set this parameter to true to disable the account. Set this parameter to false to enable the account. If this parameter is not specified, the default is to enable the user account.

Examples
The following example creates a local user "CIFS_SERVER\u1" associated with Vserver "vs1".

```
cluster1::> vserver cifs users-and-groups local-user create -vserver vs1 -user-name CIFS_SERVER\u1
Enter the password:
Confirm the password:
```

vserver cifs users-and-groups local-user delete
Delete a local user

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs users-and-groups local-user delete command deletes a local user. Upon deletion, all membership entries for this local user are deleted.

Parameters
- -vserver <vserver name> - Vserver
This specifies the name of the Vserver.

- -user-name <CIFS name> - User Name
This specifies the user name.

Examples
The following example deletes the local user "CIFS_SERVER\u1" associated with Vserver "vs1".

```
cluster1::> vserver cifs users-and-groups local-user show-membership
(vserver cifs users-and-groups local-user show-membership)
<table>
<thead>
<tr>
<th>Vserver</th>
<th>User Name</th>
<th>Membership</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>
<td>CIFS_SERVER\Administrator</td>
<td>BUILTIN\Administrators</td>
</tr>
<tr>
<td></td>
<td>CIFS_SERVER\u1</td>
<td></td>
</tr>
<tr>
<td></td>
<td>CIFS_SERVER\g1</td>
<td></td>
</tr>
</tbody>
</table>
2 entries were displayed.
cluster1::> vserver cifs users-and-groups local-user delete -vserver vs1 -user-name CIFS_SERVER\u1
```

1722

Commands: Manual Page Reference
vserver cifs users-and-groups local-user modify

Modify a local user

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The *vserver cifs users-and-groups local-user modify* command modifies attributes of a local user.

**Parameters**
- `-vserver <vserver name>` - *Vserver*
  - This specifies the name of the Vserver.
- `-user-name <CIFS name>` - *User Name*
  - This specifies the user name.
- `[-full-name <TextNoCase>]` - *Full Name*
  - This specifies the user’s full name. If the full name contains a space in the name, enclose it within double quotation marks.
- `[-description <TextNoCase>]` - *Description*
  - This specifies a description for this local user. If the description contains a space, enclose the parameter in quotation marks.
- `[-is-account-disabled {true|false}]` - *Is Account Disabled*
  - This specifies if the user account is enabled or disabled. Set this parameter to true to disable the account. Set this parameter to false to enable the account.

**Examples**
The following example modifies the full name of the local user "CIFS_SERVER\u1".

```
cluster1:/> vserver cifs users-and-groups local-user modify -user-name CIFS_SERVER\u1 -full-name "John Smith" -vserver vs1
```

vserver cifs users-and-groups local-user rename

Rename a local user

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The *vserver cifs users-and-groups local-user rename* command renames a local user. The new user name must remain in the same domain as the old user name.

The new user name must meet the following criteria:

- The user name length must not exceed 20 characters.
- The user name cannot be terminated by a period.
- The user name cannot include commas.
• The user name cannot include any of the following printable characters: ", /, [, ], :, <, >, +, =, ?, *, @
• The user name cannot include characters in the ASCII range 1-31, which are non-printable.

Parameters

- `vserver <vserver name>` - Vserver
  This specifies the name of the Vserver.

- `user-name <CIFS name>` - User Name
  This specifies the user name.

- `new-user-name <CIFS name>` - New User Name
  This specifies the new user name.

Examples

The following example renames the local user "CIFS_SERVER\u_old" to "CIFS_SERVER\u_new" on Vserver "vs1".

```bash
cluster1::> vserver cifs users-and-groups local-user rename -user-name CIFS_SERVER\u_old -new-user-name CIFS_SERVER\u_new -vserver vs1
```

vserver cifs users-and-groups local-user set-password

Set a password for a local user

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The `vserver cifs users-and-groups local-user set-password` command sets the password for the specified local user. The password must meet the following criteria:

• The password must be at least six characters in length.
• The password must not contain user account name.
• The password must contain characters from three of the following four categories:
  ◦ English uppercase characters (A through Z)
  ◦ English lowercase characters (a through z)
  ◦ Base 10 digits (0 through 9)
  ◦ Special characters: ~, !, @, #, $, %, ^, &, *, _, -, +, =, `, ', |, (, ), [ , ], :, ;, "", \, |, <, >, .. , ?, /

Parameters

- `vserver <vserver name>` - Vserver
  This specifies the name of the Vserver.

- `user-name <CIFS name>` - User Name
  This specifies the user name.

Examples

The following example sets the password for the local user "CIFS_SERVER\u1" associated with Vserver "vs1".
The following example attempts to set the password but fails because the password did not meet password complexity requirements.

```
cluster1::> vserver cifs users-and-groups local-user set-password -user-name CIFS_SERVER\ul -vserver vs1
Enter the new password:
Confirm the new password:
Error: command failed: The password does not meet the password complexity requirements. Refer to the man page for details.
```

vserver cifs users-and-groups local-user show

Display local users

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver cifs users-and-groups local-user show` command displays local users and their attributes.

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

```
[-instance ]
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[-vserver <vserver name>] - Vserver
```

If this parameter is specified, the command displays information only about local users that match the specified Vserver name.

```
[-user-name <CIFS name>] - User Name
```

If this parameter is specified, the command displays information only about local users that match the specified user name.

```
[-full-name <TextNoCase>] - Full Name
```

If this parameter is specified, the command displays information only about local users that match the specified full name.

```
[-description <TextNoCase>] - Description
```

If this parameter is specified, the command displays information only about local users that match the specified description.

```
[-is-account-disabled {true|false}] - Is Account Disabled
```

If this parameter is specified, the command displays information only about local users that match the status specified.

**Examples**
The following example displays information about all local users.
vserver cifs users-and-groups local-user show-membership

Display local users' membership information

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The `vserver cifs users-and-groups local-user show-membership` command displays the membership of local users.

**Parameters**

[-fields `<fieldname>`, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

[-instance]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver `<vserver name>`] - Vserver

If this parameter is specified, the command displays local user membership information for local users that are associated with the specified Vserver.

[-user-name `<CIFS name>`] - User Name

If this parameter is specified, the command displays local user membership information for a local user that matches the specified user name.

[-membership `<CIFS name>`, ...] - Local Group That This User is a Member of

If this parameter is specified, the command displays local user membership information for the local group of which this local user is a member.

**Examples**

The following example displays the membership information of all local users; user "CIFS_SERVER\Administrator" is a member of "BUILTIN\Administrators" group, and "CIFS_SERVER\u1" is a member of "CIFS_SERVER\g1" group.

```
cluster1::> vserver cifs users-and-groups local-user show-membership
Vserver User Name Membership
----------------- --------------------- ------------------------
vs1 CIFS_SERVER\Administrator BUILTIN\Administrators
vs1 CIFS_SERVER\u1 CIFS_SERVER\g1
2 entries were displayed.
```

vserver cifs users-and-groups privilege commands

Manage privileges
vserver cifs users-and-groups privilege add-privilege

Add local privileges to a user or group

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs users-and-groups privilege add-privilege command adds privileges to a local or Active Directory user or group.

Parameters
-vserver <vserver name> - Vserver
This specifies the name of the Vserver.

-user-or-group-name <CIFS name> - User or Group Name
This specifies the name of the local or Active Directory user or group.

-privileges <Privilege>, ... - Privileges
This specifies the list of privileges to be associated with this user or group.

Examples
The following example adds the privileges "SeTcbPrivilege" and "SeTakeOwnershipPrivilege" to the user "CIFS_SERVER\u1".

```
cluster1::> vserver cifs users-and-groups privilege add-privilege -vserver vs1 -user-or-group-name CIFS_SERVER\u1 -privileges SeTcbPrivilege,SeTakeOwnershipPrivilege
```

vserver cifs users-and-groups privilege remove-privilege

Remove privileges from a user or group

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs users-and-groups privilege remove-privilege command removes privileges from a local or Active Directory user or group. This command creates a new or modifies an existing privilege entry.

Parameters
-vserver <vserver name> - Vserver
This specifies the name of the Vserver.

-user-or-group-name <CIFS name> - User or Group Name
This specifies the name of the local or Active Directory user or group.

-privileges <Privilege>, ... - Privileges
This specifies the list of privileges to be removed from this user or group.

Examples
The following example removes the previously added "SeTcbPrivilege" and "SeTakeOwnershipPrivilege" privileges from the user "CIFS_SERVER\u1".

```
cluster1::> vserver cifs users-and-groups privilege show
Vserver User or Group Name Privileges
------------- ------------------------------
```

vserver cifs commands
vserver cifs users-and-groups privilege remove-privilege
-vserver vs1 -user-or-group-name CIFS_SERVER\u1
-privileges SeTcbPrivilege,SeTakeOwnershipPrivilege

cluster1::> vserver cifs users-and-groups privilege show
Vservlet User or Group Name Privileges
-------------- ---------------------------- -------------------
vs1 CIFS_SERVER\u1 -

The following example removes "SeBackupPrivilege" from the group "BUILTIN\Administrators".

cluster1::> vserver cifs users-and-groups privilege show
This table is currently empty.
cluster1::> vserver cifs users-and-groups privilege remove-privilege
-vserver vs1 -user-or-group-name BUILTIN\Administrators
-privileges SeBackupPrivilege

cluster1::> vserver cifs users-and-groups privilege show
Vservlet User or Group Name Privileges
-------------- ---------------------------- -------------------
vs1 BUILTIN\Administrators SeRestorePrivilege
SeSecurityPrivilege
SeTakeOwnershipPrivilege

vserver cifs users-and-groups privilege reset-privilege
Reset local privileges for a user or group

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs users-and-groups privilege reset-privilege command resets privileges of a local or Active Directory user or group.

Parameters
-vserver <vserver name> - Vserver
This specifies the name of the Vserver.

-user-or-group-name <CIFS name> - User or Group Name
This specifies the name of the local or Active Directory user or group.

Examples
The following example resets the privileges for the local user "CIFS_SERVER\u1". This operation removes the privilege entry, if any, associated with the local user "CIFS_SERVER\u1".

cluster1::> vserver cifs users-and-groups privilege show
Vservlet User or Group Name Privileges
-------------- ---------------------------- -------------------
vs1 CIFS_SERVER\u1 SeTakeOwnershipPrivilege
SeRestorePrivilege

cluster1::> vserver cifs users-and-groups privilege reset-privilege
-vserver vs1 -user-or-group-name CIFS_SERVER\u1

cluster1::> vserver cifs users-and-groups privilege show
This table is currently empty.

The following example resets the privileges for the group "BUILTIN\Administrators", effectively removing the privilege entry.
vserver cifs users-and-groups privilege show

Display privileges

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs users-and-groups privilege show command displays privilege overrides assigned to local or Active Directory users or groups.

Parameters

[-fields <fieldname>, ...]  
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance ]  
If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver  
If this parameter is specified, the command displays information only about privilege overrides assigned to local or Active Directory users or groups that match the specified Vserver name.

[-user-or-group-name <CIFS name>] - User or Group Name  
If this parameter is specified, the command displays information only about privilege overrides assigned to local or Active Directory users or groups that match the specified user name or group name.

[-privileges <Privilege>, ...] - Privileges  
If this parameter is specified, the command displays information only about privilege overrides assigned to local or Active Directory users or groups that match the specified privileges.

Examples
The following example displays all privileges explicitly associated with local or Active Directory users or groups for Vserver "vs1".

cluster1::> vserver cifs users-and-groups privilege show -vserver vs1
Vserver User or Group Name Privileges
------------ ----------------------------- -------------------
vs1 BUILTIN\Administrators SeTakeOwnershipPrivilege
SeRestorePrivilege

vserver cifs commands
vserver config-replication commands

The Vserver configuration replication directory

vserver config-replication pause

Temporarily pause Vserver configuration replication

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
Vserver domain locking functionality locks the Vserver while Vserver DM is recording configuration baseline. This command aborts the ongoing baseline generation activity, unlocks the Vserver and temporarily pauses configuration replication for the Vserver. Command confirmations has to be enabled to execute this command. The time at which replication resumes is displayed after successful completion of the command. Configuration changes made after executing this command is not replicated to the partner cluster. If a disaster occurs during this time, the configuration changes made are lost. Replication can be manually resumed by executing the vserver config replication resume command.

Parameters
-vserver <vserver name> - Vserver name

Examples

<table>
<thead>
<tr>
<th>cluster::&gt; vserver config replication pause -vserver vs1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vserver configuration replication will be paused, then automatically resumed after five minutes.</td>
</tr>
<tr>
<td>Manually resume configuration replication by running the &quot;vserver config replication resume -vserver vs1&quot; command.</td>
</tr>
<tr>
<td>Do you want to continue ? {y</td>
</tr>
<tr>
<td>Vserver configuration replication is paused and will be resumed at: 5/24/2014 06:11:23</td>
</tr>
</tbody>
</table>

vserver config-replication resume

Resume Vserver configuration replication

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
This command resumes configuration replication of the Vserver which was temporarily paused by using vserver config replication pause command. Successful completion of the command ensures that configuration replication has been resumed for the Vserver.

Parameters
-vserver <vserver name> - Vserver name
vserver config-replication show

Display Vserver configuration replication resume time

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The `vserver config-replication show` command displays the time at which the configuration replication resumes for the Vserver.

Parameters

{-fields <fieldname>,...}
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

{-instance}
If you specify the `-instance` parameter, the command displays detailed information about all fields.

{-vserver <vserver>} - Vserver
If you specify this parameter, the command displays resume time for the specified Vserver.

{-resume-time <MM/DD/YYYY HH:MM:SS>} - Replication resume time
If you specify this parameter, the command displays Vservers whose configuration replications are resumed at the specified resume time.

Examples

```
cluster::> vserver config-replication show
Replication
Vserver       Resume Time
-----------   ------------------
vs1           12/9/2014 03:18:48
```

vserver data-policy commands

Manage data policy
vserver data-policy export

Display a data policy

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver-data policy export command displays the current data policy for a Vserver with Infinite Volume.

Parameters
-vserver <vserver name> - Vserver Name
This specifies the Vserver with Infinite Volume for which the data policy will be displayed.

Examples
The following example shows the current data policy.

```
cluster1::> vserver data-policy export -vserver vs1

{ "ruleset_format_version" : "1.0",
  "rules" : [

```

vserver data-policy import

Import a data policy

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver data-policy import command sets a new data policy for a Vserver with Infinite Volume. After entering the command, you are prompted to type or paste the content of the new data policy. When you are done, press ENTER on a blank line.

Parameters
-vserver <vserver name> - Vserver Name
This specifies the Vserver with Infinite Volume for which the data policy will be changed.

Examples
The following examples attempt to change the Vserver data policy, first with bad content, and then with an acceptable data policy.
vserver data-policy import -vserver vs1

Enter the contents of the file data policy for Vserver "vs1":
Press <Enter> when done

{ "foo" : "bar" }

Error: command failed: Data Policy validation failed: 'ruleset_format_version'
is a required field.

vserver data-policy import -vserver vs1

Enter the contents of the file data policy for Vserver "vs1":
Press <Enter> when done

{ "ruleset_format_version" : "1.0",
  "rules" : [
    { "rule_label" : "default",
      "rule_id" : "ec17a05f-7785-11e1-baf4-123478563412",
      "rule_scope" : [],
      "rule_epoch" : { "epoch_reference" : "ctime" },
      "rule_epochs" : {
        "0" : {
          "local" : {
            "metadata" : {
              "storageservice" : "-"
            }
          }
        }
      }
    }
  ]
}

vserver data-policy validate

Validate a data policy without import

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver data-policy validate command checks a data policy for errors, without modifying the data policy for the Vserver with Infinite Volume.

Parameters
-vserver <vserver name> - Vserver Name

This specifies the Vserver with Infinite Volume for which the data policy will be validated.

Examples
The following examples show first a problem with a given data policy, and then an example of a valid data policy.

cluster1::> vserver data-policy validate -vserver vs1

Enter the contents of the file data policy for Vserver "vs1":
Press <Enter> when done

{ "foo" : "bar" }

Error: command failed: Data Policy validation failed: 'ruleset_format_version'
is a required field.

cluster1::> vserver data-policy validate -vserver vs1
### vserver export-policy commands

Manage export policies and rules

#### vserver export-policy check-access

Given a Volume And/or a Qtree, Check to See If the Client Is Allowed Access

**Availability:** This command is available to **cluster** and **Vserver** administrators at the **admin** privilege level.

**Description**
The `vserver export-policy check-access` command checks whether a specific client is allowed access to a specific export path. This enables you to test export policies to ensure they work as intended and to troubleshoot client access issues.

The command takes the volume name (and optionally the qtree name) as input and computes the export path for the volume/qtree. It evaluates the export policy rules that apply for each path component and displays the policy name, policy owner, policy rule index and access rights for that path component. If no export policy rule matches the specified client IP address access is denied and the policy rule index will be set to 0. The output gives a clear view on how the export policy rules are evaluated and helps narrow down the policy and (where applicable) the specific rule in the policy that grants or denies access. This command is not supported on Infinite Volumes.

**Parameters**

```bash
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`[-instance]`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

- **-vserver <vserver name>** - Vserver Name
  
  This parameter specifies the name of the Vserver in which the export policy resides.

- **-volume <volume name>** - Volume Name
  
  This parameter specifies the name of the volume that you want to check export access for. To check export access for a qtree use the `-qtree` parameter. The `-qtree` parameter is optional. If you specify the `-qtree`
parameter, you must provide the name of the volume containing the qtree. If you do not specify the -qtree parameter, export access will be checked only for the volume.

\textbf{-client-ip <IP Address> - Client IP Address}  
This parameter specifies the IP address of the client that you want to check export access for.

\textbf{-authentication-method <authentication method> - Authentication Method}  
This parameter specifies the authentication method of the client that is attempting access. Possible values include the following:

- \textit{sys} - The authentication method used by the client is AUTH_SYS.
- \textit{krb5} - The authentication method used by the client is Kerberos v5.
- \textit{krb5i} - The authentication method used by the client is Kerberos v5 with integrity service.
- \textit{krb5p} - The authentication method used by the client is Kerberos v5 with privacy service.
- \textit{ntlm} - The authentication method used by the client is CIFS NTLM.
- \textit{none} - The authentication method used by the client is not explicitly listed in the list of values in the rorule.

\textbf{-protocol <Client Access Protocol> - Protocol}  
This parameter specifies the protocol that the client is using when attempting to access the exported path. Possible values include the following:

- \textit{nfs3} - The NFSv3 protocol
- \textit{nfs4} - The NFSv4 protocol
- \textit{cifs} - The CIFS protocol
- \textit{flexcache} - The FlexCache protocol

\textbf{-access-type \{read|read-write\} - Access Rights to Check for}  
This parameter specifies the type of access you want to check for. Possible values are read for read-only access and read-write for read-write access.

\textbf{[<qtree name>] - Name of the Qtree}  
This optional parameter specifies the qtree in the volume that is part of the exported path. If you specify this parameter, you must also provide the name of the volume the qtree belongs to.

\textbf{[<path <text>]> - Path}  
Selects the entries in the output that match the specified path value. This field describes the junction-path path component encountered when evaluating the export policies starting from the root ('/') of the Vserver.

\textbf{[<policy <text>]> - Export Policy}  
Selects the entries in the output that match the specified policy value. This field describes the export policy that is in effect for the path encountered so far when evaluating the export policies starting from the root ('/') of the Vserver.

\textbf{[<policy-owner <text>]> - Export Policy Owner}  
Selects the entries in the output that match the specified policy owner value. This field describes the owner of the export policy that is in effect for the path encountered so far when evaluating the export policies starting from the root ('/') of the vserver. The owner of the export policy could be a volume or a qtree.

\textbf{[<policy-owner-type \{volume|qtree\}> - Type of Export Policy Owner}  
Selects the entries in the output that match the specified type of the owner of an export policy. Possible values include the following:
• `volume` - The owner of the export policy is a volume
• `qtree` - The owner of the export policy is a qtree

`[-rule-index <integer>]` - Export Policy Rule Index

Selects the entries in the output that match the specified export policy rule index. This field describes the rule index of the rule in the export policy that grants or denies access. If the value of the rule index is 0 it implies none of the client match strings provided in the rules of the export policy matched the specified IP address of the client.

`[-access {read|read-write}]` - Access Rights

Selects the entries in the output that match the specified access value. This field describes the access rights to the path. Possible values include the following:
• `read` - Read access is granted
• `read-write` - Read-write access is granted
• `denied` - Requested access is denied

`[-partial-rule-match {true|false}]` - Did a Subset of the Rules Match?

Selects the entries in the output that match if a partially matched subset of rules in the export policy were used to grant access to the client.

`[-clientmatch <text>]` - Client Match Spec

Selects the entries in the output that match the specified clientmatch string. The clientmatch string denotes the string that resulted in a rule match for the specified client IP address.

**Examples**

The following examples of the `vserver export-policy check-access` command display various possible results for client export access checks.

```
cluster1::> vserver export-policy check-access -vserver vs1 -client-ip 10.22.32.42 -volume flex_vol -authentication-method sys -protocol nfs3 -access-type read

```
vserver export-policy copy

Copy an export policy

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver export-policy copy` command creates a copy of an export policy on the same or a different Vserver. The command fails if an export policy with the specified new name already exists on the target Vserver.

**Parameters**
- `-vserver <vserver name>` - Vserver
  
  This parameter specifies the Vserver on which the export policy that you want to copy is located.

- `-policyname <export policy name>` - Policy Name
  
  This parameter specifies the export policy that you want to copy.

- `-newvserver <vserver name>` - New Vserver
  
  This parameter specifies the Vserver to which you want to copy the export policy.

- `-newpolicyname <export policy name>` - New Export Policy Name
  
  This parameter specifies the name of the new policy.

**Examples**
The following example copies an existing policy named read_only_expolicy located on a Vserver named vs0 to a new policy named default_expolicy located on a Vserver named vs1.

```bash
vs1::> vserver export-policy copy -vserver vs0 -policyname read_only_expolicy -newvserver vs1 -newpolicyname default_expolicy
```

vserver export-policy create

Create a rule set

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver export-policy create` command creates an export policy. You can use the `vserver export-policy rule create` command to add rules to a policy. Each cluster has an empty default export policy with the ID 0. This default export policy does not contain any rules. You cannot delete the default export policy, but you can rename or modify it.
Parameters

-vserver <vserver name> - Vserver
This parameter specifies the Vserver on which you want to create the export policy.

-policyname <export policy name> - Policy Name
This parameter specifies the export policy that you want to create.

Examples
The following example creates an export policy named read_only_expolicy on a Vserver named vs0:

vs1::> vserver export-policy create -vserver vs0 -policyname read_only_expolicy

Related references
vserver export-policy rule create on page 1754

vserver export-policy delete
Delete a rule set

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver export-policy delete command deletes an export policy. You cannot delete the default policy (named default) for a Vserver unless you delete the Vserver.

Parameters

-vserver <vserver name> - Vserver
This parameter specifies the Vserver on which the export policy that you want to delete is located.

-policyname <export policy name> - Policy Name
This parameter specifies the export policy that you want to delete.

Examples
The following example deletes an export policy named test_expolicy from a Vserver named vs0:

vs1::> vserver export-policy delete -vserver vs0 -policyname test_expolicy

vserver export-policy rename
Rename an export policy

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver export-policy rename command renames an export policy.

Parameters

-vserver <vserver name> - Vserver
This parameter specifies the Vserver on which the export policy is located.

-policyname <export policy name> - Policy Name
This parameter specifies the export policy that you want to rename.
-newpolicyname <export policy name> - New Export Policy Name

This parameter specifies the new name of the export policy.

**Examples**
The following example renames an export policy named user_expolicy with the name read_only_expolicy on a Vserver named vs0:

```bash
vs1::> vserver export-policy rename -vserver vs0 -policyname user_expolicy -newpolicyname read_only_expolicy
```

**vserver export-policy show**

Display a list of rule sets

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver export-policy show` command displays the following information:

- Vserver name
- Export policy name
- Policy ID (diagnostic privilege level only)

**Parameters**

`[[-fields <fieldname>, ...]]`

If you specify the `-fields` parameter, the command only displays the fields that you specify.

`[[-instance]]`

If you specify the `-instance` parameter, the command displays detailed information about all entries.

`[-vserver <vserver name>] - Vserver`

If you specify this parameter, the command displays a list of export policies that are located on the Vserver that you specify.

`[-policyname <export policy name>] - Policy Name`

If you specify this parameter, the command displays only the export policy or sets that match the specified name.

**Examples**
The following example displays a list of all export policies:

```bash
vs1::> vserver export-policy show
     Vserver          Policy Name
               ---------------
               default_expolicy
               read_only_expolicy
               default_expolicy
               test_expolicy
    4 entries were displayed.
```

**vserver export-policy access-cache commands**

The access-cache directory
vserver export-policy access-cache config commands

The config directory

vserver export-policy access-cache config modify

Modify exports access cache configuration

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description

The vserver export-policy access-cache config modify command modifies access cache timeout values per Vserver. Modifying these values from any node updates the values on all the nodes in the cluster. The modified values persist across reboots.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the Vserver name for which the timeout values need to be modified.

-<ttl-positive <integer>> - TTL For Positive Entries (Secs)

This parameter specifies the duration after which positive access cache entries will be refreshed upon client access.

-<ttl-negative <integer>> - TTL For Negative Entries (Secs)

This parameter specifies the duration after which negative access cache entries will be refreshed upon client access.

-<harvest-timeout <integer>> - Harvest Timeout (Secs)

This parameter specifies the time period after which Data ONTAP deletes unused entries in the access cache.

Examples

The following command sets the positive TTL value to 36000 seconds, the negative TTL value to 3600 seconds, and the harvest timeout value to 43200 seconds for Vserver 'vs0':

```
cluster1::*> vserver export-policy access-cache config modify -ttl-positive 36000 -ttl-negative 3600 -harvest-timeout 43200
cluster1::*> vserver export-policy access-cache config show -vserver vs0

Vserver: vs0
TTL For Positive Entries (secs): 36000
TTL For Negative Entries (secs): 3600
TTL For Entries with Failure (secs): 1
Harvest Timeout (secs): 43200
```

vserver export-policy access-cache config modify-all-vservers

Modify exports access cache configuration for all Vservers

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

The vserver export-policy access-cache config modify-all-vservers command modifies access cache timeout values for all Vservers. Modifying these values from any node updates the values on all the nodes in the cluster. The modified values persist across reboots.
Note: This command is not supported in a cluster with effective cluster version of Data ONTAP 9.0.0 or later. The access cache settings are modified on a per-Vserver basis starting Data ONTAP 9.0.0. See the `vserver export-policy access-cache config modify` command.

**Parameters**

- **[-ttl-positive <integer>] - TTL For Positive Entries (Secs)**
  
  This parameter specifies the duration after which positive access cache entries will be refreshed when the client accesses.

- **[-ttl-negative <integer>] - TTL For Negative Entries (Secs)**
  
  This parameter specifies the duration after which negative access cache entries will be refreshed when the client accesses.

- **[-harvest-timeout <integer>] - Harvest Timeout (Secs)**
  
  This parameter specifies the time period after which Data ONTAP deletes unused entries in the access cache.

**Examples**

The following command sets the positive TTL value to 36000 seconds, the negative TTL value to 3600 seconds, and the harvest timeout value to 43200 seconds for all Vservers in a cluster where the effective cluster version is earlier than Data ONTAP 9.0.0.

```
cluster1::*> vserver export-policy access-cache config modify-all-vservers -ttl-positive 36000 -
  ttl-negative 3600 -harvest-timeout 43200
```

```
cluster1::*> vserver export-policy access-cache config show-all-vservers
  TTL For Positive Entries (secs): 36000
  TTL For Negative Entries (secs): 3600
  Harvest Timeout (secs): 43200
```

**Related references**

`vserver export-policy access-cache config modify` on page 1740

**vserver export-policy access-cache config show**

Display exports access cache configuration

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `advanced` privilege level.

**Description**

The `vserver export-policy access-cache config show` command displays the timeout attributes related to the exports access cache. The access cache maintains export rules applicable to a client that is accessing the volume or qtree. The command output displays the following timeout parameters and their values for each Vserver:

- **TTL for Positive Entries:** This is the TTL for positive entries in the access cache. During client access, if the TTL for the access cache entry that is allowing access has expired, that access cache entry will be refreshed. While the refresh is in progress, client access will be evaluated with the existing information in the access cache entry.

- **TTL for Negative Entries:** This is the TTL for negative entries in the access cache. During client access, if the TTL for the access cache entry that is denying access has expired, that access cache entry will be refreshed. While the refresh is in progress, client access will be evaluated with the existing information in the access cache entry.

- **TTL for Entries with Failure:** This is the TTL for access cache entries for which a failure was encountered while trying to get matching rules.
• Harvest Timeout: If Data ONTAP does not use an entry that is stored in the access cache for this period of time, it deletes the entry.

Parameters
{ [-fields <fieldname>, ...]  
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use ‘-fields ?’ to display the fields to specify.

[ [-instance ]]  
  If you specify the -instance parameter, the command displays detailed information about all fields.

[ -vserver <vserver name> ] - Vserver  
  If this parameter is specified, the command displays the timeout values for the specified Vserver.

[ -ttl-positive <integer> ] - TTL For Positive Entries (Secs)  
  If this parameter is specified, the command displays the timeout values for Vservers whose ttl-positive matches the provided value.

[ -ttl-negative <integer> ] - TTL For Negative Entries (Secs)  
  If this parameter is specified, the command displays the timeout values for Vservers whose ttl-negative matches the provided value.

[ -harvest-timeout <integer> ] - Harvest Timeout (Secs)  
  If this parameter is specified, the command displays the timeout values for Vservers whose harvest-timeout matches the provided value.

Examples
The following command displays the exports access cache timeout values for all Vservers in the cluster:

```
cluster1: ~> vserver export-policy access-cache config show
Vserver TTL Positive TTL Negative TTL Failure TTL Harvest Timeout
---------- ------------- ------------ ----------- ---------------
            (secs)        (secs)      (secs)          (secs)
vs0          300            60           1            3600
vs1          36000          3600           5            3600
2 entries were displayed.
```

vserver export-policy access-cache config show-all-vservers

Display exports access cache configuration for all Vservers

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The vserver export-policy access-cache config show-all-vservers command displays the timeout attributes related to the exports access cache. The access cache maintains export rules applicable to a client that is accessing the volume or qtree. Data ONTAP obtains the access cache timeout values from the node where you run the command. The command output displays the following timeout parameters and their values:

• TTL for Positive Entries: This is the TTL for positive entries in the access cache. During client access, if the TTL for the access cache entry that is allowing access has expired, that access cache entry will be refreshed. While the refresh is in progress, client access will be evaluated with the existing information in the access cache entry.

• TTL for Negative Entries: This is the TTL for negative entries in the access cache. During client access, if the TTL for the access cache entry that is denying access has expired, that access cache entry will be refreshed. While the refresh is in progress, client access will be evaluated with the existing information in the access cache entry.
- Harvest Timeout: If Data ONTAP does not use an entry that is stored in the access cache for this period of time, it deletes the entry.

**Note:** This command is not supported in a cluster with effective cluster version of Data ONTAP 9.0.0 or later. The access cache settings are stored on a per-Vserver basis starting Data ONTAP 9.0.0. See the `vserver export-policy access-cache config show` command.

**Examples**

The following command displays the exports access cache timeout values for all Vservers in a cluster where the effective cluster version is earlier than Data ONTAP 9.0.0:

```
cluster1:/> vserver export-policy access-cache config show-all-vservers
  TTL For Positive Entries (secs): 36000
  TTL For Negative Entries (secs): 3600
  Harvest Timeout (secs): 43200
```

**Related references**

`vserver export-policy access-cache config show` on page 1741

**vserver export-policy cache commands**

Manage the export-policy cache

**vserver export-policy cache flush**

Flush the Export Caches

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

The `vserver export-policy cache flush` command clears out the contents of the export policy caches for a Vserver. You might need to flush the caches to allow the changes to immediately take effect for your NFS clients because of:

- A change to your export policy rules.
- Modifying a host name record in a name server (i.e., local hosts or DNS).
- Modifying a PTR record in a DNS server (i.e., reverse DNS lookup).
- Modifying the entries in a netgroup in a name server (i.e., local netgroup, LDAP, or NIS).
- Recovering from a network outage that resulted in a netgroup being partially expanded.

To flush the caches, you must specify the following items:

- Vserver: either a specific Vserver or use "*" to flush all of them.

You can optionally specify the following items:

- Node: if flushing the `access` cache, you can also specify which node to flush it on.
- Cache to flush: by default all but `showmount` will be flushed.

Note that the `showmount` cache is not used to determine NFS client access and as such is only flushable explicitly.
Parameters

\texttt{\textbf{-vserver <vserver name>}} - Vserver

This parameter specifies the name of the Vserver on which you want to flush the caches.

\texttt{\textbf{-node <nodename>}} - Node

This parameter specifies the node on which you want to flush the \textit{access} cache.

\texttt{\textbf{-cache \{all|access|host|id|name|netgroup|showmount|ip\}}} - Cache Name

This parameter specifies the name of the cache which you want to flush. Possible values include the following:

- \texttt{all} - All caches but \textit{showmount}. This is the default.
- \texttt{access} - The export-policy rules access cache.
- \texttt{host} - The host name to IP cache.
- \texttt{id} - The ID to credential cache.
- \texttt{ip} - The IP to host name cache.
- \texttt{name} - The name to ID cache.
- \texttt{netgroup} - The netgroup cache.
- \texttt{showmount} - The showmount caches.

**Examples**

The following example flushes the access cache on a Vserver named vs0:

```
cluster1::> vserver export-policy cache flush -vserver vs0 -cache access
```

**vserver export-policy config-checker commands**

The config-checker directory

**vserver export-policy config-checker show**

Show the status of export policy configuration checker jobs

**Availability:** This command is available to cluster administrators at the \textit{admin} privilege level.

**Description**

The \texttt{vserver export-policy config-checker show} command displays status information about export policy configuration checker job. This command displays the following information:

- Vserver name
- Export policy name
- Export policy configuration checker job state
- Export policy rule checked count
- Export policy rule being checked rule index
- Export policy rule with issue count

**Note:** This command output will only be available after running the export policy configuration checker job.
Parameters

{[-fields <fieldname>,...]
   If you specify the -fields parameter, the command only displays the fields that you specify.

   [-instance ]
   If you specify the -instance parameter, the command displays detailed information about all entries.

-vserver <vserver name> - Vserver
   If you specify this parameter, the command displays export policy configuration checker job state information for Vservers that match the specified value.

-policy <export policy name> - Policy Name
   If you specify this parameter, the command displays export policy configuration checker job state information for policy that match the specified value.

-rules-checked <integer> - Number of Rules Checked
   If you specify this parameter, the command displays export policy configuration checker job state information that have the specified rules-checked count matching.

-rule-being-checked <integer> - Rule Being Checked
   If you specify this parameter, the command displays export policy configuration checker job state information that have the specified rule-being-checked index matching.

-rules-with-issues <integer> - Number of Rules with Issues
   If you specify this parameter, the command displays export policy configuration checker job state information that have the specified rules-with-issues count matching.

-state {Initial|Queued|Running|Waiting|Pausing|Paused|Quitting|Success|Failure|Reschedule|Error|Quit|Dead|Unknown|Restart|Dormant} - Job State
   If you specify this parameter, the command displays export policy configuration checker job state information that have the specified state matching.

Examples

The following example displays an export policy configuration checker job state information for vserver vs2 and policy default:

```
cluster1::> vserver export-policy config-checker show -vserver vs2 -policy default
```

<table>
<thead>
<tr>
<th>Job</th>
<th>Rules</th>
<th>Rule Index</th>
<th>Rules With</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs2</td>
<td>default</td>
<td>Running</td>
<td>1</td>
</tr>
</tbody>
</table>

vserver export-policy config-checker start

Start export policy configuration checker job

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver export-policy config-checker start command invokes background job, which will check export policy configuration and if issue found in rules then error entry is created for each affected rule in export policy configuration checker error rule list.

Note: Export policy configuration checker only validates hostname, netgroup and anonymous user related configuration.
Parameters
-vserver <vserver name> - Vserver
  If you specify this parameter, the export policy configuration checker job will be triggered for specified Vserver.

[{-policy <export policy name>]} - Export Policy Name
  If you specify this parameter, the export policy configuration checker job will be triggered for specified policy.

Examples
The following example start a export policy configuration checker job for vserver vs2 and policy default:

cluster1::> vserver export-policy config-checker start -vserver vs2 -policy default
[Job 644] Job is queued: Export Policy configuration checker.

vserver export-policy config-checker stop
Stop export policy configuration checker job

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver export-policy config-checker stop command stops running export policy configuration checker job.

Note: Export policy configuration checker stop command only works if the keys provided are same as the keys provided at the time of starting export policy configuration checker job.

Parameters
-vserver <vserver name> - Vserver
  If you specify this parameter, the command stops export policy configuration checker job, if any export policy configuration checker job is running for the specified Vserver.

[{-policy <export policy name>]} - Export Policy Name
  If you specify this parameter, the command stops export policy configuration checker job, if any export policy configuration checker job is running for the specified policy.

Examples
The following example stop an export policy configuration checker job for Vserver vs2 and policy default:

cluster1::> vserver export-policy config-checker stop -vserver vs2 -policy default

vserver export-policy config-checker rule commands
  The rule directory

vserver export-policy config-checker rule delete
Delete error entries for rules from export policy configuration checker error rule list

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The vserver export-policy config-checker rule delete command deletes error rule entries from export policy configuration checker error rule list. You can delete a specific error entry rule by specifying its rule index number.
Parameters

- **node** `<nodename>|local` - Node
  This parameter specifies the node on which the export policy configuration error rule entries are stored.

- **vserver** `<vserver name>` - Vserver
  This parameter specifies the Vserver which contains the export policy.

- **policy** `<export policy name>` - Policy Name
  This parameter specifies the export policy from which you want to delete an error rule entry.

- **rule-index** `<integer>` - Rule Index
  This parameter specifies the index number of the error rule entry that you want to delete. You can use the `vserver export-policy config-checker rule show` command to view a list of rules with their index numbers.

Examples

The following example deletes an error rule entry from config-checker error rule list, with the index number 1 from an export policy named default on a Vserver named vs34:

```
cluster1::>vserver export-policy config-checker rule delete -node node-vsim3 -vserver vs34 -policy test -rule-index 1
(vserver export-policy config-checker rule delete)
1 entry was deleted.
```

**vserver export-policy config-checker rule show**

Show error entries for rules in export policy configuration checker job

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**

The `vserver export-policy config-checker rule show` command displays information about error related to configuration in export policy rules. If a rule has any issues the configuration checker job will log information about such errors on the node where the job runs. The command displays the following information:

- Node name
- Vserver name
- Export policy name
- Export policy rule index number
- Export policy rule error

**Parameters**

```
[[-fields <fieldname>,...]]
```

If you specify the `-fields` parameter, the command only displays the fields that you specify.

```
[[-instance]]
```

If you specify the `-instance` parameter, the command displays detailed information about all entries.
If you specify this parameter, the command displays detailed error information for node that matches the specified value.

If you specify this parameter, the command displays detailed error information for Vservers that match the specified value.

If you specify this parameter, the command displays detailed error information for policy that match the specified value.

If you specify this parameter, the command displays detailed error information for rule-index that match the specified value.

If you specify this parameter, the command displays rule index information for error that match the specified value. The complete error string needs to be specified within "{}".

Examples
The following example displays information about error related to export rules:

```
cluster1::> vserver export-policy config-checker rule show -node node-vsim3 -vserver vs34 -policy test
(vserver export-policy config-checker rule show)

<table>
<thead>
<tr>
<th>Node</th>
<th>Vserver</th>
<th>Policy</th>
<th>Index</th>
<th>Error</th>
</tr>
</thead>
<tbody>
<tr>
<td>node-vsim3</td>
<td>vs34</td>
<td>test</td>
<td>1</td>
<td>DNS lookup for host &quot;h1&quot; failed</td>
</tr>
<tr>
<td></td>
<td>vs34</td>
<td>test</td>
<td>2</td>
<td>Entry not found for &quot;UserName: testuser&quot;, DNS lookup for host &quot;h2&quot; failed</td>
</tr>
</tbody>
</table>

2 entries were displayed.
```

```
cluster1::> vserver export-policy config-checker rule show -node node-vsim3 -vserver vs34 -policy test -rule-index 1
(vserver export-policy config-checker rule show)

Node: node-vsim3
Vserver: vs34
Policy Name: test
Rule Index: 1
Error Details: DNS lookup for host "h1" failed
```

```
cluster1::> vserver export-policy config-checker rule show -node node-vsim3 -vserver vs34 -policy test -error {DNS lookup for host "h1" failed}
(vserver export-policy config-checker rule show)

<table>
<thead>
<tr>
<th>Rule</th>
<th>Node</th>
<th>Vserver</th>
<th>Policy</th>
<th>Index</th>
<th>Error</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>node-vsim3</td>
<td>vs34</td>
<td>test</td>
<td>1</td>
<td>DNS lookup for host &quot;h1&quot; failed</td>
</tr>
</tbody>
</table>
```

vserver export-policy netgroup commands

The netgroup directory
vserver export-policy netgroup check-membership

Check to see if the client is a member of the netgroup.

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver export-policy netgroup check-membership command determines if the client IP address is a member of the netgroup. Data ONTAP can determine the membership information only after it has fully loaded the netgroup into the cache. Until then, while the reverse lookup scan algorithm might find a match, both DNS round robin and DNS aliases prevent ruling out non-matches. You can use the vserver export-policy netgroup queue show command to monitor the loading of the netgroup.

Parameters
-vserver <vserver name> - Vserver
This parameter specifies the name of the Vserver whose netgroup you want to check for client membership.

-netgroup <text> - Name of the Netgroup
This parameter specifies the name of the netgroup that you want to check for client membership.

-client-ip <IP Address> - Client Address
This parameter specifies the IP address of the client whose netgroup membership you want to check.

Examples
The following examples of the vserver export-policy netgroup check-membership command display various possible results for client membership checks.

```
cluster1::*> vserver export-policy netgroup check-membership -vserver vs1 -netgroup mercury -client-ip 172.17.16.72
Client 172.17.16.72 is a member of netgroup "mercury" for Vserver "vs1" with state "reverse lookup scan".

cluster1::*> vserver export-policy netgroup check-membership -vserver vs1 -netgroup mercury -client-ip 172.17.16.72
Client 172.17.16.72 is a member of netgroup "mercury" for Vserver "vs1" with state "cache".

cluster1::*> vserver export-policy netgroup check-membership -vserver vs1 -netgroup mercury -client-ip 172.17.16.14
Client 172.17.16.14 is not a member of netgroup "mercury" for Vserver "vs1".

cluster1::*> vserver export-policy netgroup check-membership -vserver vs1 -netgroup big -client-ip 172.17.16.69
Cannot yet determine the membership of client 172.17.16.69 in netgroup "big" for Vserver "vs1". Try again when the netgroup is loaded in the cache.

cluster1::*> vserver export-policy netgroup check-membership -vserver vs1 -netgroup big -client-ip 172.17.16.72
Client 172.17.16.72 is a member of netgroup "big" for Vserver "vs1" with state "cache".

cluster1::*> vserver export-policy netgroup check-membership -vserver vs1 -netgroup big -client-ip 2002:c65f:e228:0:0:0:0:0
Cannot yet determine the membership of client 2002:c65f:e228:: in netgroup "big" for Vserver "vs1". Try again when the netgroup is loaded in the cache.
```

vserver export-policy netgroup queue show on page 1751
vserver export-policy netgroup cache commands

The cache directory

vserver export-policy netgroup cache show

Show the Netgroup Cache

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver export-policy netgroup cache show command displays the contents of the export policy netgroup cache for a Vserver. Entries shown here correspond to the caches used to evaluate client membership in a netgroup. To show the netgroup cache, you must specify the following item:

- Vserver: The name of the Vserver whose netgroup cache you want to display.

The following information is displayed per cache entry:

- Vserver name: The name of the Vserver.
- Netgroup name: The name of the netgroup.
- State of the cache entry: The state of the cache entry. There are four possible values:
  - initializing: The cache entry is being populated for the first time.
  - ready: Processing of the cache entry is complete and it is ready to be used.
  - not-found: The netgroup could not be found.
  - abandoned: The cache entry has been abandoned.
- Total number of hosts in the netgroup cache: The number of host names retrieved from the name service in mapping the netgroup to a list of hosts.
- How long it took to expand the netgroup: How long it took to expand the netgroup the last time in the queue.
- Entry is refreshing: If the entry is a complete miss or refresh.
- Next refresh time: When the next refresh is scheduled to take place.
- Netgroup by host state: Boolean state indicating if netgroup-by-host feature is used for resolving netgroup membership check.
- Number of IP addresses cached: Number of client IP addresses that are matched for the netgroup. The count includes both positive and negative results.

Parameters
[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance]
If you specify the -instance parameter, the command displays detailed information about all fields.

-vserver <vserver name> - Vserver
If you specify this parameter, the command displays the netgroup cache information only if the Vserver name matches the specified value.
[-netgroup <text>] - Name of the Netgroup
   If you specify this parameter, the command displays the netgroup cache information only if the netgroup name matches the specified value.

[-cache-state {initializing|ready|not-found|abandoned}] - State of the Cache Entry
   If you specify this parameter, the command displays the netgroup cache information only if the netgroup cache state matches the specified value.

[-total-hosts <integer>] - Total Number of Hosts in the Netgroup
   If you specify this parameter, the command displays the netgroup cache information only if the netgroup record's count of host names matches the specified value.

[-expansion-duration <[<hours>:]<minutes>:[<seconds>]>] - Expansion Duration
   If you specify this parameter, the command displays the netgroup cache information only if the netgroup record expansion time matches the specified value.

[-is-refreshing {true|false}] - Is Entry Refreshing?
   If you specify this parameter, the command displays the netgroup cache information only if the netgroup record refreshing state matches the specified value.

[-time-next-refresh <Date>] - Next Refresh Time
   If you specify this parameter, the command displays the netgroup cache information only if the time of the next scheduled refresh matches the specified value.

[-num-ip-addrs-cache <integer>] - Number of Cached IP Addresses
   If you specify this parameter, the command displays the netgroup cache information only if the number of cached IP addresses matches the specified value.

Examples
The following example displays the netgroup cache for the Vserver vs1 and the netgroup netgroup1:

```bash
cluster1::> vserver export-policy netgroup cache show -vserver vs1 -netgroup netgroup1
Vserver  Netgroup   State
-------- ---------- ------------
vs1      netgroup1  Ready
```

vserver export-policy netgroup queue commands
The queue directory

vserver export-policy netgroup queue show
Show the Netgroup Processing Queue

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The `vserver export-policy netgroup queue show` command displays the ongoing processing of the netgroup cache for a node. Entries shown here are not used to evaluate client membership in a netgroup. The following information is displayed per queue entry:

- Vserver name: The name of the Vserver.
- Netgroup name: The name of the netgroup.
- Age of entry in the queue: How long the entry has been in the queue.
• Queue state: The state of the entry in the queue. There are three possible values:
  ◦ running: The entry is currently being processed.
  ◦ waiting: The entry is waiting to be processed.
  ◦ retrying: The entry is waiting to be reprocessed.

Note that as the vserver export-policy netgroup queue show command is not atomic. Several queue entries might show up in the 'running' state.

• Number of times retried in the queue: The number of times was the entry was taken off of the netgroup processing queue and added back on it.

• Total number of hosts in the netgroup: The number of host names retrieved from the name service in mapping the netgroup to a list of hosts.

Parameters

{ [-fields <fieldname>, ...] }  
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[ [-instance ] ]  
If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver  
If you specify this parameter, the command displays the netgroup cache information only if the Vserver name matches the specified value.

[-netgroup <text>] - Name of the Netgroup  
If you specify this parameter, the command displays the netgroup cache information only if the netgroup name matches the specified value.

[-queue-state {waiting|running|retrying}] - State of Entry in the Queue  
If you specify this parameter, the command displays the netgroup cache information only if the netgroup queue state matches the specified value.

[-age <[<hours>]:]<minutes>:<seconds>] - Age of Entry in the Queue  
If you specify this parameter, the command displays the netgroup cache information only if the age of when the netgroup record was put on the netgroup processing queue matches the specified value.

[-retries-on-queue <integer>] - Number of Retries on the Queue  
If you specify this parameter, the command displays the netgroup cache information only if, during a refresh, the number of times the netgroup record has been put back on the netgroup processing queue matches the specified value.

[-total-hosts <integer>] - Total Number of Hosts in the Netgroup  
If you specify this parameter, the command displays the netgroup cache information only if the netgroup record's count of hosts matches the specified value.

Examples

The following example displays the netgroup queue:

```
cluster1::> vserver export-policy netgroup queue show
 Vserver  Netgroup  State     Age on Queue  Total Hosts
---------- ---------- --------- --------- ---------
testvs1    test-netgr retrying 0:0:47     12441
           test      waiting  0:0:35      -
```
vserver export-policy rule commands

Manage export rules

vserver export-policy rule add-clientmatches

Add list of clientmatch strings to an existing rule

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver export-policy rule add-clientmatches command adds a list of strings to the clientmatch field of a specified export rule in a policy. This command only operates on the clientmatch field; to modify other fields in a rule use the vserver export-policy modify command.

Parameters
-vserver <vserver name> - Vserver
This parameter specifies the Vserver on which the export policy is located.

-policyname <export policy name> - Policy Name
This parameter specifies the name of the export policy containing the export rule to which you want to add additional clientmatch strings.

-ruleindex <integer> - Rule Index
This parameter specifies the index number of the export rule to which you want to add additional clientmatch strings. To view a list of rules with their index numbers, use the vserver export-policy rule show command.

-clientmatches <text> - List of Clientmatch Strings to Add
This parameter specifies list of the match strings specifying the client or clients to add to the export rule. Duplicate match strings will not be created and the list may not contain duplicates entries. Match strings from the clientmatches list are added to the clientmatch field if the match string is not identical to one of the strings already in the clientmatch field. You can specify the match string in any of the following formats:

- As a hostname; for instance, host1
- As an IPv4 address; for instance, 10.1.12.24
- As an IPv6 address; for instance, fd20:8b1e:b255:4071::100:1
- As an IPv4 address with a subnet mask expressed as a number of bits; for instance, 10.1.12.0/24
- As an IPv6 address with a subnet mask expressed as a number of bits; for instance, fd20:8b1e:b255:4071::/64
- As an IPv4 address with a network mask; for instance, 10.1.16.0/255.255.255.0
- As a netgroup, with the netgroup name preceded by the @ character; for instance, @eng
- As a domain name preceded by the . character; for instance, .example.com

Note: Entering an IP address range, such as 10.1.12.10-10.1.12.70, is not allowed. Entries in this format are interpreted as a text string and treated as a hostname.

Examples
The following example adds match strings "2.2.2.2" and "3.3.3.3" to the clientmatch field of the export rule with index number 3 in an export policy named default_expolicy on a Vserver named vs0.
Related references

vserver export-policy rule show on page 1765

vserver export-policy rule create

Create a rule

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver export-policy rule create command creates an export rule and adds it to a policy. To create an export rule, you must specify the following items:

- Vserver
- Export policy
- Clients that match the rule
- Read-only access rule
- Read-write access rule

You can optionally specify the following items:

- Index number; that is, the location of the export rule in the policy
- Access protocol
- Anonymous ID
- Superuser security type
- Whether suid access is enabled
- Whether creation of devices is enabled
- Whether UNIX-type permissions changes on NTFS (Windows) volumes are prohibited or allowed when the request originates from an NFS client (advanced privilege and higher only)
- Whether ownership changes are restricted or not (advanced privilege and higher only)

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the Vserver on which the export policy is located.

-policyname <export policy name> - Policy Name

This parameter specifies the name of the export policy to which you want to add the new export rule. The export policy must already exist. To create an export policy, see the vserver export-policy create command.

[-ruleindex <integer>] - Rule Index

This optional parameter specifies the index number of the export rule that you want to create. If you specify an index number that already matches a rule, the index number of the existing rule is incremented, as are the index numbers of all subsequent rules, either to the end of the list or to an open space in the list. If you do not specify an index number, the new rule is placed at the end of the policy’s list.
-protocol <Client Access Protocol>, ... - Access Protocol

This optional parameter specifies the list of access protocols for which you want to apply the export rule. Possible values include the following:

- *any* - Any current or future access protocol
- *nfs* - Any current or future version of NFS
- *nfs3* - The NFSv3 protocol
- *nfs4* - The NFSv4 protocol
- *cifs* - The CIFS protocol
- *flexcache* - The FlexCache protocol

You can specify a comma-separated list of multiple access protocols for an export rule. If you specify the protocol as *any*, you cannot specify any other protocols in the list. If you do not specify this parameter, the value defaults to *any*. If you enable NFSv4, you will not be able to apply the policy to which this rule belongs to a FlexGroup, as FlexGroups do not support NFSv4 protocol access.

-clientmatch <text> - List of Client Match Hostnames, IP Addresses, Netgroups, or Domains

This parameter specifies list of the match strings specifying the client or clients to which the export rule applies. Duplicate match strings in the same rule are not allowed. You can specify the match string in any of the following formats:

- As a hostname; for instance, host1
- As an IPv4 address; for instance, 10.1.12.24
- As an IPv6 address; for instance, fd20:8b1e:b255:4071::100:1
- As an IPv4 address with a subnet mask expressed as a number of bits; for instance, 10.1.12.0/24
- As an IPv6 address with a subnet mask expressed as a number of bits; for instance, fd20:8b1e:b255:4071::/64
- As an IPv4 address with a network mask; for instance, 10.1.16.0/255.255.255.0
- As a netgroup, with the netgroup name preceded by the @ character; for instance, @eng
- As a domain name preceded by the . character; for instance, .example.com

Note: Entering an IP address range, such as 10.1.12.10-10.1.12.70, is not allowed. Entries in this format are interpreted as a text string and treated as a hostname.

-rorule <authentication method>, ... - RO Access Rule

This parameter specifies the security type for read-only access to volumes that use the export rule. Possible values include the following:

- *sys* - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is AUTH_SYS. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes sys.
- *krb5* - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is Kerberos v5. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes krb5.
- *krb5i* - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is Kerberos v5 with integrity service. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes krb5i.
- **krb5p**: For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is Kerberos v5 with privacy service. The effective security type of the incoming request (to be used subsequently in evaluation of rrule/superuser) becomes krb5p.

- **ntlm**: For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is CIFS NTLM. The effective security type of the incoming request (to be used subsequently in evaluation of rrule/superuser) becomes ntlm.

- **any**: For an incoming request from a client matching the clientmatch criteria, allow read access to the volume regardless of the security type of that incoming request. The effective security type of the incoming request (to be used subsequently in evaluation of rrule/superuser) remains the same as the security type of the incoming request.

  **Note**: If the security type of the incoming request is AUTH_NONE, read access will be granted to that incoming request as an anonymous user.

- **none**: For an incoming request from a client matching the clientmatch criteria, allow read access to the volume as an anonymous user if the security type of that incoming request is not explicitly listed in the list of values in the rorule. The effective security type of the incoming request (to be used subsequently in evaluation of rrule/superuser) becomes none.

- **never**: For an incoming request from a client matching the clientmatch criteria, do not allow any access to the volume regardless of the security type of that incoming request.

You can specify a comma-separated list of multiple security types for an export rule. If you specify the security type as *any* or *never*, you cannot specify any other security types.

  **Note**: For an incoming request from a client matching the clientmatch criteria, if the security type doesn't match any of the values listed in rorule (as explained above), access will be denied to that incoming request.

- **rrule <authentication method>, ...**: RW Access Rule

  This parameter specifies the security type for read-write access to volumes that use the export rule. Possible values include the following:

  - **sys**: For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the effective security type (determined from rorule) of that incoming request is AUTH_SYS.

  - **krb5**: For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the effective security type (determined from rorule) of that incoming request is Kerberos v5.

  - **krb5i**: For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the effective security type (determined from rorule) of that incoming request is Kerberos v5 with integrity service.

  - **krb5p**: For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the effective security type (determined from rorule) of that incoming request is Kerberos v5 with privacy service.

  - **ntlm**: For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the effective security type (determined from rorule) of that incoming request is CIFS NTLM.

  - **any**: For an incoming request from a client matching the clientmatch criteria, allow write access to the volume regardless of the effective security type (determined from rorule) of that incoming request.

  **Note**: If the effective security type (determined from rorule) of the incoming request is none, write access will be granted to that incoming request as an anonymous user.
• **none** - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume as an anonymous user if the effective security type (determined from rorule) of that incoming request is none.

• **never** - For an incoming request from a client matching the clientmatch criteria, do not allow write access to the volume regardless of the effective security type (determined from rorule) of that incoming request.

You can specify a comma-separated list of multiple security types for an export rule. If you specify the security type as *any* or *never*, you cannot specify any other security types.

**Note:** For an incoming request from a client matching the clientmatch criteria, if the effective security type (determined by rorule) doesn't match any of the values listed in rwrule (as explained above), write access will be denied to that incoming request.

[|-anon <text>|-] - User ID To Which Anonymous Users Are Mapped

This parameter specifies a UNIX user ID or user name that the user credentials are mapped to when evaluation of rorule or superuser parameters result in user being mapped to the anonymous user. The default setting of this parameter is 65534. NFS clients typically associate user ID 65534 with the user name nobody. In clustered Data ONTAP, this user ID is associated with the user pcuser. To disable access by any client with a user ID of 0, specify a value of 65535 which is associated with the user nobody.

[|-superuser <authentication method>, ...|-] - Superuser Security Types

This parameter specifies a security type for superuser access to files. The default setting of this parameter is *none*. Possible values include the following:

• **sys** - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume if the effective security type (determined from rorule) of that incoming request is AUTH_SYS.

• **krb5** - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume if the effective security type (determined from rorule) of that incoming request is Kerberos v5.

• **krb5i** - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume if the effective security type (determined from rorule) of that incoming request is Kerberos v5 with integrity service.

• **krb5p** - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume if the effective security type (determined from rorule) of that incoming request is Kerberos v5 with privacy service.

• **ntlm** - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume if the effective security type (determined from rorule) of that incoming request is CIFS NTLM.

• **any** - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume regardless of the effective security type (determined by rorule) of that incoming request.

  **Note:** If the effective security type (determined from rorule) of the incoming request is none, access will be granted to that incoming request as an anonymous user.

• **none** - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow access to the volume as an anonymous user if the effective security type (determined from rorule) of that incoming request is none.

You can specify a comma-separated list of multiple security types for superuser access. If you specify the security type as *any*, you cannot specify any other security types.
Note: For an incoming request from a client matching the clientmatch criteria and with the user ID 0, if the effective security type doesn't match any of the values listed in superuser (as explained above), the user ID is mapped to anonymous user.

[-allow-suid {true|false}] - Honor SetUID Bits in SETATTR
This parameter specifies whether set user ID (suid) and set group ID (sgid) access is enabled by the export rule. The default setting is true.

[-allow-dev {true|false}] - Allow Creation of Devices
This parameter specifies whether the creation of devices is enabled by the export rule. The default setting is true.

[-ntfs-unix-security-ops {ignore|fail}] - NTFS Unix Security Options (privilege: advanced)
This parameter specifies whether UNIX-type permissions changes on NTFS (Windows) volumes are prohibited (fail) or allowed (ignore) when the request originates from an NFS client. The default setting is fail.

[-chown-mode {restricted|unrestricted}] - Change Ownership Mode (privilege: advanced)
This parameter specifies who is allowed to change the ownership mode of a file. The default setting is restricted. The allowed values are:

- restricted - Only root may change the ownership of the file.
- unrestricted - Non-root users may change ownership of files that they own.

Examples
The following example creates an export rule with index number 1 in an export policy named read_only_expolicy on a Vserver named vs0. The rule matches all clients in the domains named example.com or example.net. The rule enables all access protocols. It enables read-only access by any matching client and requires authentication by AUTH_SYS, NTLM, or Kerberos 5 for read-write access. Clients with the UNIX user ID zero are mapped to user ID 65534 (which normally maps to the user name nobody). It does not enable suid and sgid access or the creation of devices.

```
cluster1::> vserver export-policy rule create -vserver vs0 -policyname read_only_expolicy -ruleindex 1 -protocol any -clientmatch ".example.com,.example.net" -rorule any -rwrule "ntlm,krb5,sys" -anon 65534 -allow-suid false -allow-dev false
```

vserver export-policy rule delete
Delete a rule

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver export-policy rule delete command deletes an export rule from a policy. You can specify the export rule by specifying its index number in the policy. When you delete a rule, the other rules in the policy are not automatically renumbered or reordered. You can use the vserver export-policy rule setindex command to reorder the rules in a rule set.

Parameters
-vserver <vserver name> - Vserver
This parameter specifies the Vserver which contains the export policy.
-policyname <export policy name> - Policy Name

This parameter specifies the export policy from which you want to delete a rule.

-ruleindex <integer> - Rule Index

This parameter specifies the index number of the rule that you want to delete. You can use the \texttt{vserver export-policy rule show} command to view a list of rules with their index numbers.

\textbf{Examples}

The following example deletes an export rule with the index number 5 from an export policy named rs1 on a Vserver named vs0:

```
cluster1::> vserver export-policy rule delete -vserver vs0 -policyname read_only Expolicy -ruleindex 5
```

\texttt{vserver export-policy rule show} on page 1765
\texttt{vserver export-policy rule setindex} on page 1764

\textbf{vserver export-policy rule modify}

Modify a rule

\textbf{Availability:} This command is available to \textit{cluster} and \textit{Vserver} administrators at the \textit{admin} privilege level.

\textbf{Description}

The \texttt{vserver export-policy rule modify} command modifies a specified export rule in a policy. This command cannot change the position of a rule in a policy; to reorder rules in a policy, use the \texttt{vserver export-policy rule setindex} command. Duplicate match strings in the same rule are not allowed. You can use this command to change the following attributes of an export rule:

- Access protocol
- Client match specification
- Read-only access rule
- Read-write access rule
- Anonymous ID
- Superuser security type
- Whether suid access is enabled
- Whether creation of devices is enabled
- Whether UNIX-type permissions changes on NTFS (Windows) volumes are prohibited or allowed when the request originates from an NFS client (advanced privilege and higher only)
- Whether ownership changes are restricted or not (advanced privilege and higher only)

\textbf{Parameters}

-\texttt{--vserver <vserver name> - Vserver}  
  This parameter specifies the Vserver on which the export policy is located.

-\texttt{--policyname <export policy name> - Policy Name}  
  This parameter specifies the name of the export policy containing the export rule that you want to modify.
-ruleindex <integer> - Rule Index
  This parameter specifies the index number of the export rule that you want to modify. To view a list of rules with their index numbers, use the vserver export-policy rule show command.

[-protocol <Client Access Protocol>, ...] - Access Protocol
  This optional parameter specifies the list of access protocols for which you want to apply the export rule. Possible values include the following:
  - any - Any current or future access protocol
  - nfs - Any current or future version of NFS
  - nfs3 - The NFSv3 protocol
  - nfs4 - The NFSv4 protocol
  - cifs - The CIFS protocol
  - flexcache - The FlexCache protocol
  You can specify a comma-separated list of multiple access protocols for an export rule. If you specify the protocol as any, you cannot specify any other protocols in the list. If you do not specify this parameter, the value defaults to any. If you enable NFSv4, you will not be able to apply the policy to which this rule belongs to a FlexGroup, as FlexGroups do not support NFSv4 protocol access.

[-clientmatch <text>] - List of Client Match Hostnames, IP Addresses, Netgroups, or Domains
  This parameter specifies list of the match strings specifying the client or clients to which the export rule applies. You can specify the match string in any of the following formats:
  - As a hostname; for instance, host1
  - As an IPv4 address; for instance, 10.1.12.24
  - As an IPv6 address; for instance, fd20:8b1e:b255:4071::100:1
  - As an IPv4 address with a subnet mask expressed as a number of bits; for instance, 10.1.12.0/24
  - As an IPv6 address with a subnet mask expressed as a number of bits; for instance, fd20:8b1e:b255:4071::/64
  - As an IPv4 address with a network mask; for instance, 10.1.16.0/255.255.255.0
  - As a netgroup, with the netgroup name preceded by the @ character; for instance, @eng
  - As a domain name preceded by the . character; for instance, .example.com
  Note: Entering an IP address range, such as 10.1.12.10-10.1.12.70, is not allowed. Entries in this format are interpreted as a text string and treated as a hostname.

[-rorule <authentication method>, ...] - RO Access Rule
  This parameter modifies the security type for read-only access to volumes that use the export rule. Possible values include the following:
  - sys - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is AUTH_SYS. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes sys.
  - krb5 - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is Kerberos v5. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes krb5.
• **krb5i** - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is Kerberos v5 with integrity service. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes krb5i.

• **krb5p** - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is Kerberos v5 with privacy service. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes krb5p.

• **ntlm** - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is CIFS NTLM. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes ntlm.

• **any** - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume regardless of the security type of that incoming request. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) remains the same as the security type of the incoming request.

  **Note:** If the security type of the incoming request is AUTH_NONE, read access will be granted to that incoming request as an anonymous user.

• **none** - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume as an anonymous user if the security type of that incoming request is not explicitly listed in the list of values in the rorule. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes none.

• **never** - For an incoming request from a client matching the clientmatch criteria, do not allow any access to the volume regardless of the security type of that incoming request.

You can specify a comma-separated list of multiple security types for an export rule. If you specify the security type as *any* or *never*, you cannot specify any other security types.

  **Note:** For an incoming request from a client matching the clientmatch criteria, if the security type doesn't match any of the values listed in rorule (as explained above), access will be denied to that incoming request.

[[-rwrule <authentication method> , ...]] - RW Access Rule

This parameter modifies the security type for read-write access to volumes that use the export rule. Possible values include the following:

• **sys** - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the effective security type (determined from rorule) of that incoming request is AUTH_SYS.

• **krb5** - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the effective security type (determined from rorule) of that incoming request is Kerberos v5.

• **krb5i** - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the effective security type (determined from rorule) of that incoming request is Kerberos v5 with integrity service.

• **krb5p** - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the effective security type (determined from rorule) of that incoming request is Kerberos v5 with privacy service.

• **ntlm** - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the effective security type (determined from rorule) of that incoming request is CIFS NTLM.

• **any** - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume regardless of the effective security type (determined from rorule) of that incoming request.
Note: If the effective security type (determined from rorule) of the incoming request is none, write access will be granted to that incoming request as an anonymous user.

- none - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume as an anonymous user if the effective security type (determined from rorule) of that incoming request is none.

- never - For an incoming request from a client matching the clientmatch criteria, do not allow write access to the volume regardless of the effective security type (determined from rorule) of that incoming request.

You can specify a comma-separated list of multiple security types for an export rule. If you specify the security type as any or never, you cannot specify any other security types.

Note: For an incoming request from a client matching the clientmatch criteria, if the effective security type (determined by rorule) doesn't match any of the values listed in rwrule (as explained above), write access will be denied to that incoming request.

[-anon <text>] - User ID To Which Anonymous Users Are Mapped

This parameter specifies a UNIX user ID or user name that the user credentials are mapped to when evaluation of rorule or superuser parameters result in user being mapped to the anonymous user. The default setting of this parameter is 65534, which is normally associated with the user name nobody. The following notes apply to the use of this parameter:

- To disable access by any client with a user ID of 0, specify a value of 65535.

[-superuser <authentication method>,...] - Superuser Security Types

This parameter specifies a security type for superuser access to files. The default setting of this parameter is none. Possible values include the following:

- sys - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume if the effective security type (determined from rorule) of that incoming request is AUTH_SYS.

- krb5 - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume if the effective security type (determined from rorule) of that incoming request is Kerberos v5.

- krb5i - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume if the effective security type (determined from rorule) of that incoming request is Kerberos v5 with integrity service.

- krb5p - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume if the effective security type (determined from rorule) of that incoming request is Kerberos v5 with privacy service.

- ntlm - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume if the effective security type (determined from rorule) of that incoming request is CIFS NTLM.

- any - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume regardless of the effective security type (determined by rorule) of that incoming request.

Note: If the effective security type (determined from rorule) of the incoming request is none, access will be granted to that incoming request as an anonymous user.

- none - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow access to the volume as an anonymous user if the effective security type (determined from rorule) of that incoming request is none.
You can specify a comma-separated list of multiple security types for superuser access. If you specify the
security type as *any*, you cannot specify any other security types.

**Note:** For an incoming request from a client matching the clientmatch criteria and with the user ID 0, if the
effective security type doesn't match any of the values listed in superuser (as explained above), the user ID
is mapped to anonymous user.

`[-allow-suid {true|false}]` - Honor SetUID Bits in SETATTR

This parameter specifies whether set user ID (suid) and set group ID (sgid) access is enabled by the export
rule. The default setting is *true*.

`[-allow-dev {true|false}]` - Allow Creation of Devices

This parameter specifies whether the creation of devices is enabled by the export rule. The default setting is
*true*.

`[-ntfs-unix-security-ops {ignore|fail}]` - NTFS Unix Security Options (privilege: advanced)

This parameter specifies whether UNIX-type permissions changes on NTFS (Windows) volumes are
prohibited (with value *fail*) or allowed (with value *ignore*) when the request originates from an NFS client.
The default setting is *fail*. This parameter is only used if you set the NTFS UNIX security option for the
Vserver to `use-export-policy`; otherwise, it has no effect.

`[-chown-mode {restricted|unrestricted}]` - Change Ownership Mode (privilege: advanced)

This parameter specifies who is authorized to change the ownership mode of a file. The default setting is
*restricted*. This parameter is only used if you set the change ownership mode option for the Vserver to
`use-export-policy`; otherwise, it has no effect. The allowed values are:

- restricted - Only root user can change the ownership of the file.
- unrestricted - Non-root users can change ownership of files that they own.

**Examples**

The following example modifies the export rule with index number 3 in an export policy named `default_expolicy` on a
Vserver named `vs0`. The rule is modified to match any clients in the netgroups named `group1` or `group2` to enable NFSv2
and CIFS support, to enable read-only access by any matching client, to require authentication by NTLM or Kerberos 5
for read-write access, and to enable suid and sgid access.

```
cluster1::> vserver export-policy rule modify -vserver vs0 -policyname default_expolicy -ruleindex
3 -protocol "nfs2,cifs" -clientmatch "@group1, @group2" -rorule any -rwrule "ntlm,krb5" -allow-suid true
```

- `vserver export-policy rule setindex` on page 1764

vserver export-policy rule remove-clientmatches

Remove list of clientmatch strings from an existing rule

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**

The `vserver export-policy rule remove-clientmatches` command removes a list of strings from the clientmatch
field of a specified export rule in a policy. This command only operates on the clientmatch field; to modify other fields in a rule
use the `vserver export-policy modify` command.
Parameters

-vserver <vserver name> - Vserver
This parameter specifies the Vserver on which the export policy is located.

-policyname <export policy name> - Policy Name
This parameter specifies the name of the export policy containing the export rule from which you want to remove clientmatch strings.

-ruleindex <integer> - Rule Index
This parameter specifies the index number of the export rule from which you want to remove clientmatch strings. To view a list of rules with their index numbers, use the vserver export-policy rule show command.

-clientmatches <text> - List of Clientmatch Strings to Remove
This parameter specifies list of the match strings specifying the client or clients to remove from the export rule. Match strings are removed from the clientmatch field if the match string is identical to one of the elements in the clientmatches list. If all match strings are removed from the clientmatch field the entire export rule is deleted. You can specify the match string in any of the following formats:

- As a hostname; for instance, host1
- As an IPv4 address; for instance, 10.1.12.24
- As an IPv6 address; for instance, fd20:8b1e:b255:4071::100:1
- As an IPv4 address with a subnet mask expressed as a number of bits; for instance, 10.1.12.0/24
- As an IPv6 address with a subnet mask expressed as a number of bits; for instance, fd20:8b1e:b255:4071::/64
- As an IPv4 address with a network mask; for instance, 10.1.16.0/255.255.255.0
- As a netgroup, with the netgroup name preceded by the @ character; for instance, @eng
- As a domain name preceded by the . character; for instance, .example.com

Note: Entering an IP address range, such as 10.1.12.10-10.1.12.70, is not allowed. Entries in this format are interpreted as a text string and treated as a hostname.

Examples

The following example removes match strings "2.2.2.2" and "3.3.3.3" from the clientmatch field of the export rule with index number 3 in an export policy named default_expolicy on a Vserver named vs0.

```
cluster1:/> vserver export-policy rule remove-clientmatches -vserver vs0 -policyname default_expolicy -ruleindex 3 -clientmatches "2.2.2.2,3.3.3.3"
```

Related references

vserver export-policy rule show on page 1765

vserver export-policy rule setindex

Move a rule to a specified index

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.
**Description**

The `vserver export-policy rule setindex` command modifies the index number of the specified export rule. If the new index number is already in use, the command reorders the list to accommodate it. If the existing index is given a higher index number (that is, later in the list), the command decrements the index numbers of rules between the moved rule and moved-to rule; otherwise, the command increments the index numbers between the moved-to rule and the existing rule.

You can use the `vserver export-policy rule show` command to view a list of rules with their index numbers.

**Parameters**

- `-vserver <vserver name>` - Vserver
  
  This parameter specifies the Vserver on which the export policy is located.

- `-policyname <export policy name>` - Policy Name
  
  This parameter specifies the export policy that contains the rule whose index number you want to modify.

- `-ruleindex <integer>` - Rule Index
  
  This parameter specifies the index number of the rule that you want to move.

- `-newruleindex <integer>` - Index
  
  This parameter specifies the new index number for the rule.

**Examples**

The following example changes the index number of a rule at index number 5 to index number 3 in an export policy named rs1 on a Vserver named vs0:

```
cluster1::> vserver export-policy rule setindex -vserver vs0
   -policyname read_only_policy -ruleindex 5 -newruleindex 3
```

**Related references**

`vserver export-policy rule show` on page 1765

**vserver export-policy rule show**

Display a list of rules

**Availability:** This command is available to cluster and Vserver administrators at the `admin` privilege level.

**Description**

The `vserver export-policy rule show` command displays information about export rules. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information:

- Vserver name
- Export policy name
- Export rule index number
- Access protocol
- Client match
- Read-only access rule
- Read-write access rule
To display detailed information about a specific export rule, run the command with the `-vserver`, `-policyname`, and `-ruleindex` parameters. The detailed view provides all of the information in the previous list and the following additional information:

- Anonymous ID
- Superuser security type
- Whether set user ID (suid) and set group ID (sgid) access is enabled
- Whether creation of devices is enabled
- NTFS security settings
- Change ownership mode

You can specify additional parameters to display only the information that matches those parameters. For example, to display information only about export rules that have a read-write rule value of never, run the command with the `-rwrule never` parameter.

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify the `-fields` parameter, the command only displays the fields that you specify.

```
[-instance]]
```

If you specify the `-instance` parameter, the command displays detailed information about all entries.

```
[-vserver <vserver name>] - Vserver
```

If you specify this parameter, the `-policyname` parameter, and the `-ruleindex` parameter, the command displays detailed information about the specified export rule. If you specify this parameter by itself, the command displays information only about the export rules on the specified Vserver.

```
[-policyname <export policy name>] - Policy Name
```

If you specify this parameter, the `-vserver` parameter, and the `-ruleindex` parameter, the command displays detailed information about the specified export rule. If you specify this parameter by itself, the command displays information only about the export rules on the specified policy.

```
[-ruleindex <integer>] - Rule Index
```

If you specify this parameter, the `-vserver` parameter, and the `-policyname` parameter, the command displays detailed information about the specified export rule. If you specify this parameter by itself, the command displays information only about the export rules that have the specified index number.

```
[-protocol <Client Access Protocol>, ...] - Access Protocol
```

If you specify this parameter, the command displays information only about the export rules that have the specified access protocol or protocols. Possible values include the following:

- `any` - Any current or future access protocol
- `nfs` - Any current or future version of NFS
- `nfs3` - The NFSv3 protocol
- `nfs4` - The NFSv4 protocol
- `cifs` - The CIFS protocol
- `flexcache` - The FlexCache protocol

You can specify a comma-separated list of multiple access protocols for an export rule. If you specify the protocol as any, you cannot specify any other protocols in the list.
[-clientmatch <text>] - List of Client Match Hostnames, IP Addresses, Netgroups, or Domains

If you specify this parameter, the command displays information only about the export rules that have a
clientmatch list containing all of the strings in the specified client match. You can specify the match as a list of
strings in any of the following formats:

- As a hostname; for instance, host1
- As an IPv4 address; for instance, 10.1.12.24
- As an IPv6 address; for instance, fd20:8b1e:b255:4071::100:1
- As an IPv4 address with a subnet mask expressed as a number of bits; for instance, 10.1.12.0/24
- As an IPv6 address with a subnet mask expressed as a number of bits; for instance,
  fd20:8b1e:b255:4071::/64
- As an IPv4 address with a network mask; for instance, 10.1.16.0/255.255.255.0
- As a netgroup, with the netgroup name preceded by the @ character; for instance, @eng
- As a domain name preceded by the . character; for instance, .example.com

[-rorule <authentication method>, ...] - RO Access Rule

If you specify this parameter, the command displays information only about the export rule or rules that have
the specified read-only rule. Possible values include the following:

- **sys** - For an incoming request from a client matching the clientmatch criteria, allow read access to the
  volume if the security type of that incoming request is AUTH_SYS. The effective security type of the
  incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes sys.
- **krb5** - For an incoming request from a client matching the clientmatch criteria, allow read access to the
  volume if the security type of that incoming request is Kerberos v5. The effective security type of the
  incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes krb5.
- **krb5i** - For an incoming request from a client matching the clientmatch criteria, allow read access to the
  volume if the security type of that incoming request is Kerberos v5 with integrity service. The effective
  security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes
  krb5i.
- **krb5p** - For an incoming request from a client matching the clientmatch criteria, allow read access to the
  volume if the security type of that incoming request is Kerberos v5 with privacy service. The effective
  security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes
  krb5p.
- **ntlm** - For an incoming request from a client matching the clientmatch criteria, allow read access to the
  volume if the security type of that incoming request is CIFS NTLM. The effective security type of the
  incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes ntlm.
- **any** - For an incoming request from a client matching the clientmatch criteria, allow read access to the
  volume regardless of the security type of that incoming request. The effective security type of the incoming
  request (to be used subsequently in evaluation of rwrule/superuser) remains the same as the security type
  of the incoming request.

  **Note:** If the security type of the incoming request is AUTH_NONE, read access will be granted to that
  incoming request as an anonymous user.

- **none** - For an incoming request from a client matching the clientmatch criteria, allow read access to the
  volume as an anonymous user if the security type of that incoming request is not explicitly listed in the list
  of values in the rorule. The effective security type of the incoming request (to be used subsequently in
  evaluation of rwrule/superuser) becomes none.
- For an incoming request from a client matching the clientmatch criteria, do not allow any access to the volume regardless of the security type of that incoming request.

You can specify a comma-separated list of multiple security types for an export rule. If you specify the security type as *any* or *never*, you cannot specify any other security types.

**Note:** For an incoming request from a client matching the clientmatch criteria, if the security type doesn't match any of the values listed in rorule (as explained above), access will be denied to that incoming request.

**rwrule <authentication method>, ...** - RW Access Rule

If you specify this parameter, the command displays information only about the export rule or rules that have the specified read-write rule. Possible values include the following:

- *sys* - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the effective security type (determined from rorule) of that incoming request is AUTH_SYS.

- *krb5* - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the effective security type (determined from rorule) of that incoming request is Kerberos 5.

- *krb5i* - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the security type of that incoming request is Kerberos v5 with integrity service. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes krb5i.

- *krb5p* - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the security type of that incoming request is Kerberos v5 with privacy service. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes krb5p.

- *ntlm* - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the effective security type (determined from rorule) of that incoming request is CIFS NTLM.

- *any* - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume regardless of the effective security type (determined from rorule) of that incoming request.

  **Note:** If the effective security type (determined from rorule) of the incoming request is none, write access will be granted to that incoming request as an anonymous user.

- *none* - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume as an anonymous user if the effective security type (determined from rorule) of that incoming request is none.

- *never* - For an incoming request from a client matching the clientmatch criteria, do not allow write access to the volume regardless of the effective security type (determined from rorule) of that incoming request.

You can specify a comma-separated list of multiple security types for an export rule. If you specify the security type as *any* or *never*, you cannot specify any other security types.

**Note:** For an incoming request from a client matching the clientmatch criteria, if the effective security type (determined by rorule) doesn't match any of the values listed in rwrule (as explained above), write access will be denied to that incoming request.

**-anon <text>** - User ID To Which Anonymous Users Are Mapped

If you specify this parameter, the command displays information only about the export rule or rules that have the specified anonymous ID.

**-superuser <authentication method>, ...** - Superuser Security Types

If you specify this parameter, the command displays information only about the export rule or rules that have the specified superuser security type. Possible values include the following:
• **sys** - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume if the effective security type (determined from rorule) of that incoming request is AUTH_SYS.

• **krb5** - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume if the effective security type (determined from rorule) of that incoming request is Kerberos v5.

• **krb5i** - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is Kerberos v5 with integrity service. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes krb5i.

• **krb5p** - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is Kerberos v5 with privacy service. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes krb5p.

• **ntlm** - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume if the effective security type (determined from rorule) of that incoming request is CIFS NTLM.

• **any** - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume regardless of the effective security type (determined by rorule) of that incoming request.

  **Note:** If the effective security type (determined from rorule) of the incoming request is none, access will be granted to that incoming request as an anonymous user.

• **none** - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow access to the volume as an anonymous user if the effective security type (determined from rorule) of that incoming request is none.

• **never** - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow access to the volume as an anonymous user regardless of the effective security type (determined from rorule) of that incoming request.

  **Note:** Only export rules that were created in an earlier release can have the superuser parameter set to the security type never.

You can specify a comma-separated list of multiple security types for superuser access. If you specify the security type as any, you cannot specify any other security types.

  **Note:** For an incoming request from a client matching the clientmatch criteria and with the user ID 0, if the effective security type doesn't match any of the values listed in superuser (as explained above), the user ID is mapped to anonymous user.

[-allow-suid {true|false}] - Honor SetUID Bits in SETATTR

If you specify this parameter, the command displays information only about the export rule or rules that have the specified setting for set user ID (suid) and set group ID (sgid) access.

[-allow-dev {true|false}] - Allow Creation of Devices

If you specify this parameter, the command displays information only about the export rule or rules that have the specified setting for the creation of devices.

[-ntfs-unix-security-ops {ignore|fail}] - NTFS Unix Security Options (privilege: advanced)

If you have specified this parameter for a particular export policy rule, then the command displays information about the UNIX security options that apply to that export policy rule. The setting can either prohibit (with value fail) or allow (with value ignore) UNIX-type permissions changes on NTFS (Windows) volumes.
when the request originates from an NFS client. If the Vserver NTFS UNIX security option is set to fail or allow for the Vserver, then this parameter is overridden.

\[\text{-ntfs-unix-security-ops-vs \{fail|ignore|use-export-policy\}}\] - Vserver NTFS Unix Security Options (privilege: advanced)

If you specify this parameter, the command displays information about the UNIX security options that apply to all volumes in this Vserver. The setting can prohibit (with value fail) or allow (with value ignore) UNIX-type permissions changes on NTFS (Windows) volumes when the request originates from an NFS client, or you can set it to use-export-policy. If you set this parameter to fail or allow, this parameter overrides the individual UNIX security options set for the export policy rules. If you set this parameter to use-export-policy, the UNIX security options associated with the respective export policy rule is used.

\[\text{-chown-mode \{restricted|unrestricted\}}\] - Change Ownership Mode (privilege: advanced)

If you have specified this parameter for a particular export policy rule, then the command displays information about the change ownership mode that applies to that export-policy rule. The setting can either allow only the root (with value restricted) or all users (with value unrestricted) to change ownership of the files that they own. If the Vserver NTFS change ownership mode is set to restricted or unrestricted for the Vserver, then this parameter is overridden.

\[\text{-chown-mode-vs \{restricted|unrestricted|use-export-policy\}}\] - Vserver Change Ownership Mode (privilege: advanced)

If you specify this parameter, the command displays information about the change ownership mode that applies to all volumes in this Vserver. The setting can allow only the root (with value restricted) or all users (with value unrestricted) to change ownership of the files that they own, or you can set it to use-export-policy. If you set this parameter to restricted or unrestricted, this parameter overrides the individual change ownership mode set for the export policy rules. If you set this parameter to use-export-policy, the change ownership mode associated with the respective export policy rule is used.

Examples

The following example displays information about all export rules:

```
cluster1::> vserver export-policy rule show

<table>
<thead>
<tr>
<th>Vserver</th>

</tr>
</tbody>
</table>

4 entries were displayed.
```

vserver fcp commands

Manage the FCP service on a Vserver

Commands used for managing the FCP service configuration of a Vserver.

vserver fcp create

Create FCP service configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

This command creates an FCP service for a Vserver. An FCP service must be licensed before you can manage FCP services. If the FCP service is not licensed, the FCP command returns an error.
When you create an FCP service on a Vserver, the Vserver has the following configuration defaults:

- The administrative status of the FCP service is up.
- The FCP command automatically generates a unique World Wide Node Name (WWNN) unless you specify one.

The format for a WWNN is XX:XX:XX:XX:XX:XX:XX:XX where X is a hexadecimal digit. When selecting a new WWNN, use the following format to fit with the registered names: 2X:XX:00:a0:98:XX:XX where XX is some integral value. If your unique WWNN does not match this format, use the -f parameter. To modify a target-name, use the vserver fcp modify command. The default value is up.

**Parameters**

-vserver <Vserver Name> - Vserver Name
   Specifies the Vserver for the FCP service.

[-target-name <text>] - Target Name (privilege: advanced)
   Specifies the World Wide Node Name (WWNN). The format for a WWNN is XX:XX:XX:XX:XX:XX:XX:XX where X is a hexadecimal digit.

[-status-admin {down|up}] - Administrative Status
   Specifies the administrative status of the FCP service of a Vserver. If you set this parameter to up, the FCP service will accept login requests from FCP initiators. If you set this parameter to down, FCP initiators will not be allowed to log in.

[-force | -f [true]] - Force (privilege: advanced)
   Allows you to use a World Wide Node Name outside the Vendor's registered namespace. If you use this parameter without a value, it is set to true, and the command does not prompt you when the WWNN is outside the Vendor's registered namespace.

**Examples**

   cluster1:~:> vserver fcp create -vserver vs_1

**Related references**

vserver fcp modify on page 1772

**vserver fcp delete**

Delete FCP service configuration

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

Deletes an FCP service of a Vserver. Before you can delete an FCP service, the administration status must be down. Use the vserver fcp modify command to change the administration status.

**Parameters**

-vserver <Vserver Name> - Vserver Name
   Specifies the Vserver for the FCP service.
Examples

cluster1::> vserver fcp delete -vserver vs_1

Related references

vserver fcp modify on page 1772

vserver fcp modify

Modify FCP service configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

This command modifies an FCP service configuration on a Vserver.

If the target name provided is outside the vendor's namespace, the user must verify that the target name is unique outside the cluster. The vendor cannot verify that the target name is unique outside the cluster if the vendor did not generate the target name.

Parameters

-vserver <Vserver Name> - Vserver Name
Specifies the Vserver for the FCP service.

-[target-name <text>] - Target Name (privilege: advanced)
Specifies the World Wide Node Name (WWNN). The format for a WWNN is XX:XX:XX:XX:XX:XX:XX:XX where X is a hexadecimal digit.

-status-admin {down|up} - Administrative Status
Specifies the administrative status of the FCP service of a Vserver. If you set this parameter to up, the FCP service begins to accept login requests from FCP initiators. If you set this parameter to down, FCP initiators cannot log in.

-force | -f [true] - Force (privilege: advanced)
Allows you to use a World Wide Node Name outside the Vendor's registered namespace. If you use this parameter without a value, it is set to true, and the command does not prompt you when the WWNN is outside the Vendor's registered namespace.

Examples

cluster1::> vserver fcp modify -vserver vs_1 -status-admin down

vserver fcp show

Display FCP service configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

Displays the current status of the FCP service in a cluster.
Parameters

{[-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

[-instance ]

If you specify the -instance parameter, the command displays detailed information about all fields.

[ -vserver <Vserver Name>] - Vserver Name

Use this parameter to display the FCP services that match the Vserver that you specify.

[ -target-name <text>] - Target Name

Use this parameter to display the FCP service that matches the target name that you specify.

[ -status-admin {down|up}] - Administrative Status

Use this parameter to display the FCP services that match the administrative status that you specify.

Examples

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Target Name</th>
<th>Status Admin</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs0</td>
<td>20:00:00:a0:98:0c:b0:eb</td>
<td>up</td>
</tr>
<tr>
<td>vs2</td>
<td>20:01:00:a0:98:0c:b0:eb</td>
<td>up</td>
</tr>
</tbody>
</table>

vserver fcp start

Starts the FCP service

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

This command starts the FCP service of a Vserver. When you start the FCP service, the logical interfaces are brought online. You must have a license before you can start the FCP service. Use system license add to enable the FCP license.

Parameters

-vserver <Vserver Name> - Vserver Name

Specifies the Vserver for the FCP service.

Examples

cluster1::> vserver fcp start -vserver vs_1
(vserver fcp start)

Related references

system license add on page 1175

vserver fcp stop

Stops the FCP service

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.
**Description**
This command stops the FCP service of a Vserver. When you stop the FCP service, the operation status of all FCP logical interfaces in the Vserver will be **down**.

**Parameters**
- `vserver <Vserver Name>` - Vserver Name
  
  Specifies the Vserver for the FCP service.

**Examples**
```
cluster1::> vserver fcp stop -vserver vs_1
(vserver fcp stop)
```

**vserver fcp initiator commands**

The initiator directory

Commands for managing the active initiators for an FCP service.

**vserver fcp initiator show**

Display FCP initiators currently connected

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
This command displays information about FCP initiators that are currently logged in.

If you do not specify a Vserver, the command displays all initiators logged into all FCP Vservers within a cluster. If you specify a Vserver but not a logical interface, the command displays information about all initiators connected to all logical interfaces within the specified Vserver.

If an initiator belongs to an initiator group or has a World Wide Port Name (WWPN) alias, the command displays this information.

**Parameters**

```
[[-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.
][[-instance]]
  If you specify the -instance parameter, the command displays detailed information about all fields.
[-vserver <Vserver Name>] - Vserver
  Use this parameter to display the FCP initiators logged into the Vserver that you specify.
[-lif <lif-name>] - Logical Interface
  Use this parameter to display the FCP initiators that match the logical interfaces that you specify.
[-wwpn <text>] - Initiator WWPN
  Use this parameter to display the FCP initiators that matches the World Wide Port Name (WWPN) that you specify.
[-port-address <Hex Integer>] - Port Address
  Use this parameter to display FCP initiators that match the port address that you specify.
```
-Initiator WWNN
Use this parameter to display the FCP initiator that matches the World Wide Node Name (WWNN) that you specify.

-alias <text>,... - Initiator WWPN Alias
Use this parameter to display the FCP initiator that matches the alias name that you specify.

-igroup <text>,... - Igroup Name
Use this parameter to display the FCP initiator that matches the initiator group that you specify.

Examples

```bash
cluster1::> vserver fcp initiator show
Logical    Initiator      Initiator
Vserver   Interface  WWNN           WWPN          Igroup
--------- ---------- -------------- ------------- -------------------------
vs1       vs1.fcp    2f:a2:00:a0:98:0b:56:13 2f:a2:00:a0:98:0b:56:15 igroup1
```

vserver fcp interface commands
The interface directory
Commands used for managing FCP data logical interfaces for a Vserver.

vserver fcp interface show
Display configuration information for an FCP interface

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command displays FCP logical interface information. If you do not specify a Vserver, the command displays all of the FCP data interfaces of a cluster.

Parameters

{-fields <fieldname>,...}
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?' to display the fields to specify.

{-instance}
If you specify the -instance parameter, the command displays detailed information about all fields.

{-vserver <Vserver Name>}-Vserver
Use this parameter with other options to display information about FCP logical interfaces scoped to the specified Vserver.

{-lif <lif-name>}-Logical Interface
Use this parameter to display FCP logical interfaces that match the names of logical interfaces that you specify. You can provide a partial logical interface name, and press tab to complete the name or the closest match.

{-wwpn <text>}- WWPN
Use this parameter to display FCP logical interfaces that match the World Wide Port Name (WWPN) that you specify.

vserver fcp commands
[\-\text{wwnn} \text{\textless} \text{text}\textgreater\-\text{WWNN}]

Use this parameter to display FCP logical interfaces that match the World Wide Node Name (WWNN) that you specify.

[\-\text{status\-admin} \{\text{up} | \text{down}\}]-\text{Administrative Status}

Specifies the configured status of the FCP logical interface. If you set this parameter to \text{up} the command displays all FCP logical interfaces with the administrative status of \text{up}. If you set this parameter to \text{down} the command displays all the FCP logical interfaces with the administrative status of \text{down}.

[\-\text{status\-oper} \{\text{up} | \text{down}\}]-\text{Operational Status}

Specifies the current status of the FCP logical interface. If you set this parameter to \text{up} the command displays all the FCP logical interfaces with the operational status of \text{up}. If you set this parameter to \text{down} the command displays all the FCP logical interfaces with the operational status of \text{down}.

[\-\text{status\-extended} \text{\textless} \text{text}\textgreater\-\text{Extended Status}]

Use this parameter to display more detailed information on the status of the FCP logical interface that you specify.

[\-\text{port\-address} \{\text{Hex Integer}\}]-\text{Host Port Address}

Use this parameter to display FCP logical interfaces that match the host port address that you specify.

[\-\text{curr\-node} \text{\textless} \text{nodename}\textgreater\-\text{Current Node}]

Use this parameter to display FCP logical interfaces that are on the node that you specify.

[\-\text{curr\-port} \{\text{netport} | \text{ifrgrp}\}]-\text{Current Port}

Use this parameter to display FCP logical interfaces that are on the port that you specify.

[\-\text{is\-home} \{\text{true} | \text{false}\}]-\text{Is Home}

Specifies whether the node hosting the FCP interface is the initially configured node. If you use this command without using this parameter, it is set to \text{true}, and the command displays all FCP interfaces that are on the initially configured node.

[\-\text{relative\-port\-id} \text{\textless} \text{integer}\textgreater\-\text{Relative Port ID}]

Use this parameter to display FCP logical interfaces that match the relative target port ID that you specify. The system assigns each LIF and target portal group a relative target port ID that is Vserver unique. You cannot change this ID.

**Examples**

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Logical Interface</th>
<th>Status</th>
<th>Current WWPN</th>
<th>Current Node</th>
<th>Current Port ID</th>
<th>Home</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>
<td>vs1.fcp</td>
<td>up/down</td>
<td>2f:a2:00:a0:9b:0b:56:13</td>
<td>node1</td>
<td>0c</td>
<td>true</td>
</tr>
</tbody>
</table>

**vserver fcp nameserver commands**

FCP fabric name server directory

**vserver fcp nameserver show**

Display FCP fabric name server entries

*Availability:* This command is available to \text{cluster} and \text{Vserver} administrators at the \text{admin} privilege level.
Description
This command shows entries in the fabric name server database.

Parameters
[-fields <fieldname>,...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance]]
If you specify the -instance parameter, the command displays detailed information about all fields.

-[vserver <Vserver Name>] - Vserver
Use this parameter to select the Vservers that contain FCP LIFs.

-[lif <text>] - LIF Name
Use this parameter to select the FCP LIFs.

-[port-id <integer>] - Port Identifier
Use this parameter to select the assigned port identifier of the LIF.

-[unzoned [true]] - Show unzoned name server entries
Use this parameter to show unzoned name server information.

-[port-type <text>] - Port Type
Use this parameter to select the port type of the LIF.

-[port-wwn <text>] - Port WWN
Use this parameter to select World Wide Port Name (WWPN) of the LIF.

-[fabric-port-wwn <text>] - Fabric Port WWN
Use this parameter to select the fabric World Wide Port Name (WWPN) of the LIF.

-[node-wwn <text>] - Node WWN
Use this parameter to select the World Wide Node Name (WWNN) of the LIF.

-[service-class <text>] - Service Class
Use this parameter to select the registered class of services as defined in the FC-FS standard.

-[fc4-type <text>] - FC4 Type
Use this parameter to select the registered FC4 type.

-[switch-port <text>] - Switch Port
Use this parameter to select the name of switch port connected to target array.

Examples

cluster1::> vserver fcp nameserver show

<table>
<thead>
<tr>
<th>Vserver:Lif</th>
<th>Node WWN, Port WWN</th>
<th>Port Id</th>
<th>Port Type</th>
<th>FC4 Type</th>

vserver fcp ping-igroup commands

The FCP ping igroup directory

Command for performing a connectivity check (ping) between the FCP initiators of an initiator group (igroup) and the FCP LIFs for which they are configured.

vserver fcp ping-igroup show

Ping FCP by Igroup

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command performs a connectivity check (ping) between the FCP initiators of an igroup and the FCP LIFs for which they are configured.

Parameters

[-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver

Use this parameter to select the Vservers that contain initiators and FCP LIFs.

[-igroup <text>] - Igroup Name

Use this parameter to select the FCP initiators that belong to the specified igroup and FCP LIFs that belong to the portset that is bound to the igroup. If the igroup is not bound to a portset, then the default portset (all FCP LIFs in the Vserver), is used.

[-wwpn <text>] - FCP initiator WWPN

Use this parameter to select the FCP initiator WWPN.

[-lif <text>] - LIF Name

Use this parameter to limit the test to a subset of the FCP LIFs available for the igroup.

[-portset <text>] - Portset

Use this parameter to select igroups bound to the specified portset.

[-node <nodename>] - Node

Use this parameter to select the nodes that contain the specified FCP LIFs.

[-status {unknown|reachable|not-reachable|not-zoned|cannot-ping-same-wwpn|fcp-service-busy|lif-is-down|zone-info-not-available}] - Ping Status

Use this parameter to select the status of FCP ping command.

Use this parameter to select the extended status of FCP ping command.

[-check-fabric [true]] - Query Fabric Records (privilege: advanced)

Use this parameter to query the unzoned name server for the FCP initiator WWPN.
vserver fcp ping-initiator commands

The ping directory
Command for performing a connectivity check (ping) between FCP initiators and FCP LIFs.

vserver fcp ping-initiator show

Ping FCP initiator

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command performs a connectivity check (ping) between FCP initiators and FCP LIFs.

Parameters

[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver
Use this parameter to select the Vservers that contain FCP initiators and FCP LIFs.

-wwpn <text> - Remote WWPN
Use this parameter to select the remote WWPN (most likely, FCP initiator).

[-lif <text>] - LIF Name
Use this parameter to limit the test to a subset of the FCP LIFs available for the igroup.

[-check-fabric [true]] - Query Fabric Records (privilege: advanced)
Use this parameter to query the unzoned name server for the FCP initiator WWPN.

[-node <nodename>] - Node
Use this parameter to select the nodes that contain the specified FCP LIFs.

[-status {unknown|reachable|not-reachable|not-zoned|cannot-ping-same-wwpn|fcp-service-busy|lif-is-down|zone-info-not-available}] - Ping Status
Use this parameter to select the result of FCP ping command.

Use this parameter to select the extended result of FCP ping command.
vserver fcp portname commands

The portname directory

Commands used for managing the World Wide Port Names (WWPN) of FCP data logical interfaces in a Vserver.

vserver fcp portname set

Assigns a new WWPN to a FCP adapter

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description

This command assigns a new World Wide Port Name (WWPN) to a logical interface. The administration status of logical interface must be down before you can change the WWPN.

Use the network interface modify to change the administration status of the logical interface.

Parameters

-vserver <Vserver Name> - Vserver

Specifies the Vserver.

-lif <lif-name> - Logical Interface

Specifies the logical interface to which you want to assign a new WWPN.

-wwpn <text> - FCP Adapter WWPN

Specifies the WWPN that you want to change.

[-force | -f [true]] - Force

Allows you to use a WWPN that is not in the format 2X:XX:0a:09:80:XX:XX:XX when set to true. If you use this parameter without a value, it is set to true, and the command does not prompt you when the WWNN does not follow this format.

Examples

```
cluster1::*> vserver fcp portname set -vserver vs_1 -lif vs_1.fcp -wwpn 2f:a2:00:a0:98:0b:56:13
```

Related references

network interface modify on page 342
**vserver fcp portname show**

Display WWPN for FCP logical interfaces

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
This command displays a list of World Wide Port Names (WWPN) that are used by the FCP logical interfaces.

**Parameters**

{ [-fields <fieldname>, ...]  
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.}

{ [-instance ]  
  If you specify the -instance parameter, the command displays detailed information about all fields.}

{ [-vserver <Vserver Name>] - Vserver  
  Use this parameter to display a list of FCP logical interfaces and their WWPNs that match the Vserver name you specify.}

{ [-lif <lif-name> ] - Logical Interface  
  Use this parameter to display a list of FCP logical interfaces and their WWPNs that match the logical interface that you specify. You can use wildcards in the logical interface to display a specific group of logical interfaces.}

{ [-wwpn <text>] - WWPN  
  Use this parameter to display a list of FCP logical interfaces and their WWPNs that match the WWPN that you specify. You can use wildcards in the WWPN to display a specific group of WWPNs.}

**Examples**

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Interface</th>
<th>WWPN</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs_a</td>
<td>vs_a.fcp</td>
<td>2f:a2:00:a0:98:0b:56:13</td>

**vserver fcp topology commands**

The vserver fcp topology directory

**vserver fcp topology show**

Show FCP topology interconnect elements

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
Show FCP topology interconnect elements
Parameters

```
{[-fields <fieldname>, ...]
   If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance ]
   If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver
   Use this parameter to select the interconnect elements for the specified Vservers.

[-lif <text>] - LIF Name
   Use this parameter to select the interconnect elements for the specified FCP LIFs.

[-domain-id <integer>] - Domain Identifier
   Use this parameter to select the interconnect elements with the specified domain identifier

[-logical-name <text>] - Logical Name
   Use this parameter to select the interconnect elements with the specified logical name

[-vendor <text>] - Vendor
   Use this parameter to select the interconnect elements with the specified vendor

[-release <text>] - Release
   Use this parameter to select the interconnect elements with the specified release

[-wwn <text>] - World Wide Name
   Use this parameter to select the interconnect elements with the specified World Wide Name

[-port-count <integer>] - Port Count
   Use this parameter to select the interconnect elements with the specified port count
```

Examples

```
cluster1::> vserver fcp topology show

<table>

vserver fcp wwn commands

The wwn directory

vserver fcp wwn blacklist commands

Manage blacklisted WWNs

The vserver fcp wwn blacklist commands manage blacklisted WWNs.
A blacklisted WWN is a WWN that is prohibited for use as either a fiber channel protocol service WWNN or a fiber channel data LIF WWPN.

vserver fcp wwn blacklist show
Displays the blacklisted WWNs

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
This command displays WWNs that have been blacklisted from re-use.
A blacklisted WWN is a WWN that is prohibited for use as either a fiber channel protocol service WWNN or a fiber channel data LIF WWPN.

Parameters

\[-fields <fieldname>, ... \]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[[-instance]]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-wwn <text>] - World Wide Name
Selects the blacklisted WWNs that match the parameter value.

[-vserver <Vserver Name>] - Vserver Name
Selects the blacklisted WWNs that were previously assigned to the Vserver(s) that match the parameter value.

Examples

```
ccluster1::> vserver fcp wwn blacklist show
WWN                     Vserver
----------------------- ----------
01:02:03:04:05:06:07:08 vs1
01:02:03:04:05:06:07:09 vs1
2 entries were displayed.
```

vserver fcp wwpn-alias commands

The wwpn-alias directory
Commands used for managing the WWPN Aliases of active initiators for an FCP service.

vserver fcp wwpn-alias remove
Removes an alias for a World Wide Port Name of an initiator.

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command removes an alias from a World Wide Port Name (WWPN).

Parameters

- vserver <Vserver Name> - Vserver Name
  Specifies the Vserver.
{ -alias | -a <text>, ... - Initiator WWPN Alias
    Specifies the alias of the WWPN that you want to remove.
| -wwpn | -w <FC WWN> } - Initiator WWPN
    Specifies the WWPN.

Examples

```
cluster1::> vserver fcp wwpn-alias remove -vserver vs_1 -wwpn 2f:a0:00:a0:98:0b:56:13
```

On Vserver vs_1, removes all the aliases on WWPN 2f:a0:00:a0:98:0b:56:13.
```
cluster1::> vserver fcp wwpn-alias remove -vserver vs_1 -alias my_alias
```

vserver fcp wwpn-alias set

Set an alias for a World Wide Port Name of an initiator that might login to the target.
Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command creates a new alias for a World Wide Port Name (WWPN). You can create multiple aliases for a WWPN, but you cannot use the same alias for multiple WWPNs.

An alias name is a case-sensitive name that must contain one to 32 characters. Spaces are not allowed.

Parameters
- -vserver <Vserver Name> - Vserver Name
    Specifies the Vserver.
- -alias | -a <text> - Initiator WWPN Alias
    Specifies the alias of the WWPN.
- -wwpn | -w <FC WWN> - Initiator WWPN
    Specifies the WWPN.
- [-force | -f [true]] - Force
    Allows you to override a WWPN associated with an existing alias with a newly specified WWPN. If you use this parameter without a value, it is set to true, and the command does not prompt you when you override an existing alias.

Examples

```
cluster1::> vserver fcp wwpn-alias set -vserver vs_1 -alias my_alias -wwpn 2f:a0:00:a0:98:0b:56:13
```

vserver fcp wwpn-alias show

Displays a list of the WWPN aliases configured for initiators
Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command displays aliases associated with World Wide Port Names (WWPN).
Note: You can also use these commands to display WWPN aliases:

- `lun igroup show`
- `lun igroup create`
- `lun igroup add`
- `lun igroup remove`
- `vserver fcp show`

Parameters

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance]
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[-vserver <Vserver Name>] - Vserver Name
```

Use this parameter to display a list of WWPNs and the associated aliases that match the Vserver name that you specify.

```
[-alias | -a <text>] - Initiator WWPN Alias
```

Use this parameter to display the WWPN that matches the alias that you specify.

```
[-wwpn | -w <FC WWN>] - Initiator WWPN
```

Use this parameter to display a list of aliases that match the WWPN that you specify.

### Examples

```
cluster1::> vserver fcp wwpn-alias show
Initiator               Initiator
Vserver   WWPN                    Alias
--------- ----------------------- ------------------
vs1       2f:a0:00:a0:98:0b:56:13 my_alias
```

### vserver fpolicy commands

Manage FPolicy

### vserver fpolicy disable

Disable a policy

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.
Description
The `vserver fpolicy disable` command disables an FPolicy policy for the specified Vserver.

**Note:** This command is not supported for a Vserver with Infinite Volume.

Parameters

- `-vserver <Vserver Name>` - Vserver
  This parameter specifies the name of the Vserver on which you want to disable an FPolicy policy.

- `-policy-name <Policy name>` - Policy
  This parameter specifies the name of the FPolicy policy you want to disable.

Examples

The following command disables an FPolicy policy.

```
cluster1::> vserver fpolicy show
Vserver                  Policy Name                    Sequence  Status   Engine
----------------------- ------------------------------ --------  -------  -------
vs1.example.com          vs1_pol                               -  off      native
vs2.example.com          vs2_pol                               5  on       external
2 entries were displayed.
cluster1::> vserver fpolicy disable -vserver vs2.example.com -policy-name vs2_pol
```

```
cluster1::> vserver fpolicy show
Vserver                  Policy Name                    Sequence  Status   Engine
----------------------- ------------------------------ --------  -------  -------
vs1.example.com          vs1_pol                               -  off      native
vs2.example.com          vs2_pol                               -  off      external
2 entries were displayed.
```

`vserver fpolicy enable`

Enable a policy

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

Description
The `vserver fpolicy enable` command enables FPolicy policies for the specified Vserver and sets their sequence (priority). The sequence is used when multiple policies have subscribed to the same file access event. To modify the sequence number of a policy, the administrator must disable the policy (if it is enabled) and then use this command to enable it with the new sequence number. Policies that use the `native` engine configuration have a higher priority than policies for any other engine, regardless of the sequence number assigned to them.

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Note:** Events on FlexGroup volumes do not notify the FPolicy server.

Parameters

- `-vserver <Vserver Name>` - Vserver
  This parameter specifies the name of the Vserver on which you want to enable an FPolicy policy. The Vserver administrator can enable FPolicy policies created within the scope of the Vserver and can also enable an FPolicy policy created by the cluster administrator. The cluster administrator can enable FPolicy policies for any Vserver but cannot enable them with a scope of cluster. The scope is determined at a Vserver level.
-policy-name <Policy name> - Policy

This parameter specifies the name of the FPolicy policy you want to enable.

-sequence-number <integer> - Policy Sequence Number

This parameter specifies the sequence number that is assigned to the policy.

**Examples**

The following command enables an FPolicy policy:

```
cluster1::> vserver fpolicy show
Vserver               Policy Name      Sequence  Status Engine
---------------------------------------------------------------
vs1.example.com       vs1_pol          -   off    native
vs2.example.com       vs2_pol          -   off    external
2 entries were displayed.

cluster1::> vserver fpolicy enable -vserver vs2.example.com -policy-name vs2_pol -sequence-number 5

cluster1::> vserver fpolicy show
Vserver               Policy Name      Sequence  Status Engine
---------------------------------------------------------------
vs1.example.com       vs1_pol          -   off    native
vs2.example.com       vs2_pol          5   on      external
2 entries were displayed.
```

**vserver fpolicy engine-connect**

Establish a connection to FPolicy server

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The `vserver fpolicy engine-connect` command connects an FPolicy server to a specified node. Connecting the FPolicy server to a node enables FPolicy processing, providing the FPolicy configuration is complete. Before connecting an FPolicy server to a node, you must configure FPolicy by completing the following tasks:

- Create an FPolicy event
- Create an FPolicy external engine
- Create an FPolicy policy
- Create a scope for the FPolicy policy

**Note:** The FPolicy event and external engine must be attached to the FPolicy policy.

**Note:** The FPolicy policy should be enabled.

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**

- **-node {<nodename>|local} - Node**

  This parameter specifies the node that you want to connect to the FPolicy server. The value local specifies the current node.
**vserver <Vserver Name> - Vserver**

This parameter specifies the Vserver that you want to connect to the specified FPolicy server using the specified FPolicy policy.

**-policy-name <Policy name> - Policy**

This parameter specifies the name of the FPolicy policy that is attached to an external engine.

**-server <IP Address> - Server**

This parameter specifies the FPolicy server to which you want to connect the node. The specified server must be present in the external engine configuration of the above specified policy.

### Examples

The following example connects an FPolicy server.

```
cluster1::> vserver fpolicy engine-connect -node FPolicy-01 -vserver vs1.example.com -policy-name p -server 1.1.1.1
```

```
cluster1::> vserver fpolicy show

FPolicy            Server-       Server-
Vserver         Policy        Node          Server            status        type
--------------- ------------- ------------ ----------------- -------------- -----------
vs1.example.com p             FPolicy-01   1.1.1.1           connected      primary
```

**vserver fpolicy engine-disconnect**

Terminate connection to FPolicy server

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The `vserver fpolicy engine-disconnect` command disconnects an FPolicy server from a specified node.

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**

- `-node <nodename>|local` - Node
  
  This parameter specifies the node that you want to disconnect from the FPolicy server. The value local specifies the current node.

- `-vserver <Vserver Name>` - Vserver
  
  This parameter specifies the Vserver that you want to disconnect from the specified FPolicy server with the specified attached FPolicy policy.

- `-policy-name <Policy name>` - Policy
  
  This parameter specifies the name of the FPolicy policy that is attached with an external engine.

- `-server <IP Address>` - Server
  
  This parameter specifies the FPolicy server you want to disconnect. The specified server must be present in the external engine configuration of the above specified FPolicy policy.

### Examples

The following example disconnects an FPolicy server.
vserver fpolicy prepare-to-downgrade

Restore the FPolicy configuration to Earlier Release of Data ONTAP

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The vserver fpolicy prepare-to-downgrade command restores the FPolicy configurations for Data ONTAP based on the input parameter disable-feature-set.

Parameters
-disable-feature-set <downgrade version> - Data ONTAP Version
This parameter specifies the Data ONTAP version that introduced the new FPolicy features and needs to be restored. The value can be one of the following:

- 9.0.0 - Disables the FPolicy features introduced in Data ONTAP release 9.0.0. These features include:
  - FPolicy filters for setattr operation.
  - FPolicy filter exclude-directory for directory operations.
  - FPolicy Async Resiliency feature.
  - FPolicy "Monitor Objects With No Extension" feature.

Examples

cluster1::*> vserver fpolicy prepare-to-downgrade -disable-feature-set 9.0.0

vserver fpolicy show

Display all policies with status

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver fpolicy show command displays status information about all FPolicy policies in the Vserver. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all FPolicy policies:

- Vserver name
- Policy name
• Sequence number
• Status

You can specify the `-fields` parameter to specify which fields of information to display about FPolicy policies.
You can specify the `-instance` parameter to display information for all FPolicy policies in a list format.

**Note:** This command is not supported for a Vserver with Infinite Volume.

### Parameters

`{ [-fields <fieldname>, ...]`  
If you specify the -fields <fieldname>, ... parameter, the command only displays the fields that you specify.

`[-instance]`  
If you specify the -instance parameter, the command displays detailed information about all entries.

`[-vserver <Vserver Name>]`  
If you specify this parameter, the command displays information only about the FPolicy policies for the specified Vserver.

`[-policy-name <Policy name>]`  
If you specify this parameter, the command displays information only about the FPolicy policy that you specify.

`[-sequence-number <integer>]`  
If you specify this parameter, the command displays information only about the FPolicy policy or policies that use the specified sequence-number.

`[-status {on|off}]`  
If you specify this parameter, the command displays information only about the FPolicy policy or policies that use the specified status.

`[-engine <Engine name>]`  
If you specify this parameter, the command displays information only about the FPolicy policy or policies that use the specified engine.

### Examples

The following example displays the information about FPolicy policies on the cluster using the `vserver fpolicy show` command.

```
cluster1::> vserver fpolicy show

+--------------------------+--------------------------+---------+-------+-----------+
|            Vserver       |            Policy Name   | Sequence| Status | FPolicy   |
|--------------------------+--------------------------+---------+-------+-----------|
| FPolicy                  | cserver_policy          | -       | off   | eng1      |
| vs1.example.com          | v1p1                    | -       | off   | native    |
| vs1.example.com          | v1p2                    | -       | off   | native    |
| vs1.example.com          | v1p3                    | -       | off   | native    |
| vs1.example.com          | cserver_policy          | -       | off   | eng1      |
| vs2.example.com          | v1p1                    | 3       | on    | native    |
| vs2.example.com          | v1p2                    | 1       | on    | eng3      |
| vs2.example.com          | cserver_policy          | 2       | on    | eng1      |
+--------------------------+--------------------------+---------+-------+-----------+
8 entries were displayed.
```
vserver fpolicy show-enabled

Display all enabled policies

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The vserver fpolicy show-enabled command displays information about all enabled policies in the Vserver. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all FPolicy policies:

- Vserver name
- Policy name
- Priority

You can specify the -fields parameter to specify which fields of information to display about FPolicy policies.

You can specify the -instance parameter to display information for all FPolicy policies in a list format.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters

[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command only displays the fields that you specify.

[-instance]
If you specify the -instance parameter, the command displays detailed information about all entries.

[-vserver <vserver>] - Vserver
If you specify this parameter, the command displays information only about the FPolicy policies for the specified Vserver.

[-policy-name <Policy name>] - Policy Name
If you specify this parameter, the command displays information only about the FPolicy policy that you specify.

[-priority <text>] - Policy Priority
If you specify this parameter, the command displays information only about the FPolicy policies with the policy priority that you specify.

Examples

The following example displays the information about enabled FPolicy policies on the cluster.

```
cluster1::> vserver fpolicy show-enabled
Vserver          Policy Name    Priority
----------------- -------------- ---------
vs1.example.com   pol_native     native
vs1.example.com   pol_native2    native
vs1.example.com   poll           2
vs1.example.com   pol2           4
```

vserver fpolicy commands
vserver fpolicy show-engine

Display FPolicy server status

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver fpolicy show-engine command displays status information for all FPolicy external engines or displays status information only for FPolicy servers for a specified Vserver. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information for all FPolicy servers:

- Vserver name
- Node name
- FPolicy policy name
- FPolicy server IP Address
- FPolicy server status
- FPolicy server type

You can specify the -fields parameter to specify which fields of information to display about FPolicy servers. You can specify specific parameters to display only information that matches those parameters. For instance, to display information only about all FPolicy servers (external engines) that are connected, run the command with the -fields parameter set to server and -server-status parameter set to connected.

You can specify the -instance parameter to display all information for all policies in the list form.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters

[-fields <fieldname>,...]
If you specify the -fields <fieldname>,... parameter, the command only displays the fields that you specify.

[-instance ]
If you specify the -instance parameter, the command displays detailed information about all entries.

[-node <nodename>|local] - Node
If you specify this parameter, the command displays information only about the FPolicy external engine attached to the specified node.

[-vserver <Vserver Name>] - Vserver
If you specify this parameter, the command displays information only about the FPolicy server for the specified Vserver.

[-policy-name <Policy name>] - Policy
If you specify this parameter, the command displays information only about the FPolicy servers that are attached with the specified policy.

[-server <IP Address>] - Server
If you specify this parameter, the command displays information only about the FPolicy servers that you specify.

[-server-status <Status>] - Server Status
If you specify this parameter, the command displays information only about the FPolicy servers that have the specified status.
[-server-type <Server Type>] - Server Type

If you specify this parameter, the command displays information only about the FPolicy servers that have the specified server type.

[-connected-since <MM/DD/YYYY HH:MM:SS>] - Time FPolicy Server was Connected

If you specify this parameter, the command displays information only about the FPolicy servers that have been connected since the specified time.

[-disconnected-since <MM/DD/YYYY HH:MM:SS>] - Time FPolicy Server was Disconnected

If you specify this parameter, the command displays information only about the FPolicy servers that have been disconnected since the specified time.

[-disconnect-reason <text>] - Reason for FPolicy Server Disconnection

If you specify this parameter, the command displays information only about the FPolicy servers that are disconnected because of the specified reason.

[-disconnect-reason-id <integer>] - ID for FPolicy Server Disconnection

If you specify this parameter, the command displays information about the FPolicy servers that are disconnected because of the specified disconnect reason ID. There is a unique ID associated with each disconnect reason, which can be used to identify the reason for FPolicy server disconnection.

[-session-id <text>] - Session ID

If you specify this parameter, the command displays information about the FPolicy server that is connected with the specified session ID. There is a unique session ID associated with each connection to FPolicy server, which can be used to identify the established connection.

Examples

This example displays information about all FPolicy servers (external engines).

vserver fpolicy show-passthrough-read-connection

Display connection status for FPolicy passthrough-read

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The `vserver fpolicy show-passthrough-read-connection` command displays the status of the passthrough-read connection from all FPolicy servers. Passthrough-read is a way to read data for offline files without restoring the files to primary storage. If you do not specify any parameters, the command displays following information about the passthrough-read connection from FPolicy servers:

- Vserver name
- FPolicy policy name
- Node name
- FPolicy server IP address
- Passthrough-read connection status

You can specify the `-fields` parameter to specify which fields of information to display. In addition to the fields above, you can display the following fields.

- Session ID of the control channel
- Time passthrough-read channel was connected
- Time passthrough-read channel was disconnected
- Reason for passthrough-read channel disconnection

You can specify the `-instance` parameter to display information for all passthrough-read connections in the list form.

**Parameters**

<table>
<thead>
<tr>
<th><code>-fields &lt;fieldname&gt;,...</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>If you specify the -fields &lt;fieldname&gt;, ... parameter, the command only displays the fields that you specify.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><code>-instance</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>If you specify the -instance parameter, the command displays detailed information about all entries.</td>
</tr>
</tbody>
</table>

| `-node <nodename>|local` - Node |
|-----------------|
| If you specify this parameter, the command displays information only about the passthrough-read connections on the specified node. |

<table>
<thead>
<tr>
<th><code>-vserver &lt;Vserver Name&gt;</code> - Vserver</th>
</tr>
</thead>
<tbody>
<tr>
<td>If you specify this parameter, the command displays information only about the passthrough-read connections for the specified Vserver.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><code>-policy-name &lt;Policy name&gt;</code> - Policy</th>
</tr>
</thead>
<tbody>
<tr>
<td>If you specify this parameter, the command displays information only about the passthrough-read connections that are attached with the specified FPolicy policy.</td>
</tr>
</tbody>
</table>
[server <IP Address>] - Server

If you specify this parameter, the command displays information only about the passthrough-read connections from the specified FPolicy server.

[control-session-id <text>] - Session ID of the Control Channel

If you specify this parameter, the command displays information only about the passthrough-read connections that are connected with the specified control session ID. The passthrough-read connection is attached to a control connection that has a unique control session ID.

[server-status <Status of fpolicy passthrough-read connection>] - Server Status

If you specify this parameter, the command displays information only about the passthrough-read connections that have the specified status.

[connected-since <MM/DD/YYYY HH:MM:SS>] - Time Channel Was Connected

If you specify this parameter, the command displays information only about the passthrough-read connections that have the specified connection time.

[disconnected-since <MM/DD/YYYY HH:MM:SS>] - Time Channel Was Disconnected

If you specify this parameter, the command displays information only about the passthrough-read connections that have the specified disconnection time.

[disconnect-reason <Reason for fpolicy passthrough-read disconnection>] - Reason for Disconnection

If you specify this parameter, the command displays information only about the passthrough-read connections that are disconnected because of the specified disconnect reason.

### Examples

This example displays information about passthrough-read connections from all FPolicy servers.

```
cluster1::> vserver fpolicy show-passthrough-read-connection
FPolicy   Server
Vserver          Policy Name   Node         Server            Status
---------------  ------------- ------------ ----------------- --------------
vs2.example.com  pol_cifs_2    FPolicy-01   2.2.2.2           disconnected
vs1.example.com  pol_cifs_1    FPolicy-01   1.1.1.1           connected
2 entries were displayed.
```

This example displays information about passthrough-read connections from all connected FPolicy servers.

```
cluster1::> vserver fpolicy show-passthrough-read-connection -server-status connected
FPolicy   Server
Vserver          Policy Name   Node         Server            Status
---------------  ------------- ------------ ----------------- --------------
vs1.example.com  pol_cifs_1    FPolicy-01   1.1.1.1           connected
```

This example displays information about passthrough-read connections from FPolicy servers configured in an FPolicy policy.

```
cluster1::> vserver fpolicy show-passthrough-read-connection -policy-name pol_cifs_1 -instance
Node: FPolicy-01
Vserver: vs1.example.com
Policy: pol_cifs_1
Server: 2.2.2.2
Session ID of the Control Channel: 8cef052e-2502-11e3-88d4-123478563412
Server Status: connected
Time Passthrough Read Channel was Connected: 9/24/2013 10:17:45
```
vserver fpolicy policy commands

Manage FPolicy policies

vserver fpolicy policy create

Create a policy

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The `vserver fpolicy policy create` command creates an FPolicy policy. You must create an FPolicy event name before creating an FPolicy policy. If you are using an external FPolicy server, you must also create an FPolicy engine before creating a policy.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters

- `vserver <Vserver Name>` - Vserver
  This parameter specifies the name of the Vserver on which you want to create an FPolicy policy.

- `policy-name <Policy name>` - Policy
  This parameter specifies the name of the FPolicy policy that you want to create. An FPolicy policy name can be up to 256 characters long and is a string that can only contain any combination of ASCII-range alphanumeric characters (a-z, A-Z, 0-9), "_" and ".".

- `events <Event name>, ...` - Events to Monitor
  This parameter specifies a list of events to monitor for the FPolicy policy. All the events in the event list should be created by the administrator of the specified Vserver or the cluster administrator. The events must already exist. Create events using the `fpolicy policy event create` command.

- `engine <Engine name>` - FPolicy Engine
  This parameter specifies an external engine for this FPolicy policy. An external engine contains information required by the node to send notifications to an FPolicy server. The Vserver administrator of the specified Vserver or the cluster administrator creates the external engine prior to creating the FPolicy policy. If this parameter is not specified, the default native external engine is used. The native external engine is internal to Data ONTAP and is used if you want to configure native file blocking and you do not want to use an external FPolicy server.

- `is-mandatory {true|false}` - Is Mandatory Screening Required
  This parameter specifies what action to take on a file access event in a case when all primary and secondary servers are down or no response is received from the FPolicy servers within a given timeout period. When this parameter is set to `true`, file access events will be denied under these circumstances. To allow file access events under these circumstances, set this parameter to `false`. By default, it is `true`.

- `allow-privileged-access {yes|no}` - Allow Privileged Access
  This parameter specifies privileged access for FPolicy servers. It is used to specify whether privileged access is required for FPolicy servers. Privileged access is used when the FPolicy server requires direct access to the cluster nodes. With this option set to `yes`, FPolicy servers can access files on the cluster using a separate data channel with privileged access. By default, it is `no`. 
[-privileged-user-name <text>] - User Name for Privileged Access

This parameter specifies the privileged user name. It is used to specify the privileged user name for accessing files on the cluster using a separate data channel with privileged access. The input for this field should be in "domain\user name" format. If -allow-privileged-access is set to no, any value set for this field is ignored.

[-is-passthrough-read-enabled {true|false}] - Is Passthrough Read Enabled

This parameter specifies whether passthrough-read should be allowed for FPolicy servers registered for the policy. Passthrough-read is a way to read data for offline files without restoring the files to primary storage. Offline files are the files which have been moved to secondary storage. If passthrough-read is enabled, the FPolicy server provides the data for the file over a separate channel instead of restoring the file to primary storage. By default, this parameter is false.

Examples

The following example creates an FPolicy policy.

```bash
cluster1::> vserver fpolicy policy create -vserver vs1.example.com -policy-name vs1_pol -events cserver_evt,v1e1 -engine native -is-mandatory true -allow-privileged-access no -is-passthrough-read-enabled false
```

```bash
cluster1::> vserver fpolicy policy show -vserver vs1.example.com -policy-name vs1_pol

Vserver: vs1.example.com
Policy Name: vs1_pol
Events to Monitor: cserver_evt, v1e1
FPolicy Engine: native
Is Mandatory Screening Required: true
Allow Privileged Access: no
User Name for Privileged Access: -
Is Passthrough Read Enabled: false
```

vserver fpolicy policy delete

Delete a policy

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver fpolicy policy delete command deletes an FPolicy policy.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters

-vserver <Vserver Name> - Vserver

This parameter specifies the name of the Vserver from which you want to delete the FPolicy policy.

-policy-name <Policy name> - Policy

This parameter specifies the name of the FPolicy policy that you want to delete.

Examples

The following example deletes an FPolicy policy.
vserver fpolicy policy modify

Modify a policy

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver fpolicy policy modify command modifies an FPolicy policy.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters

-vserver <Vserver Name> - Vserver

This parameter specifies the name of the Vserver on which you want to modify an FPolicy policy.

-policy-name <Policy name> - Policy

This parameter specifies the name of the FPolicy policy that you want to modify. An FPolicy policy name can be up to 256 characters long and is a string that can only contain any combination of ASCII-range alphanumeric characters (a-z, A-Z, 0-9), ",", and ".".

[-events <Event name>, ...] - Events to Monitor

This parameter specifies a list of events to monitor for the FPolicy policy. All the events in the event list should be created by the administrator of the specified Vserver or the cluster administrator. The events must already exist. Create events using the fpolicy policy event create command.

[-engine <Engine name>] - FPolicy Engine

This parameter specifies an external engine for this FPolicy policy. An external engine contains information required by the node to send notifications to an FPolicy server. The Vserver administrator of the specified Vserver or the cluster administrator creates the external engine prior to modifying the FPolicy policy. If this parameter is not specified, the default native external engine is used. The native external engine is internal to Data ONTAP and is used if you want to configure native file blocking and you do not want to use an external FPolicy server.

[-is-mandatory {true | false}] - Is Mandatory Screening Required

This parameter specifies what action to take on a file access event in a case when all primary and secondary servers are down or no response is received from the FPolicy servers within a given timeout period. When this parameter is set to true, file access events will be denied under these circumstances. To allow file access events under these circumstances, set this parameter to false. By default, it is true.

[-allow-privileged-access {yes | no}] - Allow Privileged Access

This parameter specifies privileged access for FPolicy servers. It is used to specify whether privileged access is required for FPolicy servers. Privileged access is used when the FPolicy server requires direct access to the cluster nodes. With this option set to yes, FPolicy servers can access files on the cluster using a separate data channel with privileged access. By default, it is no.

[-privileged-user-name <text>] - User Name for Privileged Access

This parameter specifies the privileged user name. It is used to specify the privileged user name for accessing files on the cluster using a separate data channel with privileged access. The input for this field should be in "domain\username" format. If -allow-privileged-access is set to no, any value set for this field is ignored.
[-is-passthrough-read-enabled {true|false}] - Is Passthrough Read Enabled

This parameter specifies whether passthrough-read should be allowed for FPolicy servers registered for the policy. Passthrough-read is a way to read data for offline files without restoring the files to primary storage. Offline files are the files which have been moved to secondary storage. If passthrough-read is enabled, the FPolicy server provides the data for the file over a separate channel instead of restoring the file to primary storage. By default, this parameter is false.

Examples

The following example modifies an FPolicy policy.

```
cluster1::> vserver fpolicy policy modify -vserver vs1.example.com -policy-name vs1_pol -events cserver_evt,vle1 -engine native -is-mandatory true -allow-privileged-access no -is-passthrough-read-enabled false
```

```
cluster1::> vserver fpolicy policy show -vserver vs1.example.com -policy-name vs1_pol

Vserver: vs1.example.com
Policy Name: vs1_pol
Events to Monitor: cserver_evt, vle1
FPolicy Engine: native
Is Mandatory Screening Required: true
Allow Privileged Access: no
User Name for Privileged Access: -
Is Passthrough Read Enabled: false
```

vserver fpolicy policy show

Display policy configuration

**Availability:** This command is available to cluster and Vserver administrators at the **admin** privilege level.

**Description**

The `vserver fpolicy policy show` command displays information about all FPolicy policies belonging to the Vserver. Any Vserver administrator can see FPolicy policies associated with their Vserver as well as policies created by the cluster administrator. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all FPolicy policies:

- Vserver name
- Policy name
- Events to monitor
- FPolicy engine
- Is mandatory screening required
- Allow privileged access
- User name for privileged access

You can specify the `-fields` parameter to specify which fields of information to display about FPolicy policies. You can specify additional parameters to display only information that matches those parameters. For example, to display information only about FPolicy policies where the FPolicy server requires privileged access, run the command with the `-fields` parameter set to policy-name (no ".") and `-allow-privileged-access` parameter set to yes.
You can specify the `-instance` parameter to display all information for all policies in the list form.

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**

[-fields `<fieldname>`, ...]

- If you specify the `-fields` parameter, the command only displays the fields that you specify.

[-instance ]

- If you specify the `-instance` parameter, the command displays detailed information about all entries.

[-vserver `<Vserver Name>`] - Vserver

- If you specify this parameter, the command displays information only about the FPolicy policies for the specified Vserver. FPolicy policies created by the cluster administrator are visible for all Vservers.

[-policy-name `<Policy name>`] - Policy

- If you specify this parameter, the command displays information only about the FPolicy policy that you specify.

[-events `<Event name>`, ...] - Events to Monitor

- If you specify this parameter, the command displays information only about the FPolicy policy or policies that use the specified event or events.

[-engine `<Engine name>`] - FPolicy Engine

- If you specify this parameter, the command displays information only about the FPolicy policy or policies that use the specified engine.

[-is-mandatory {true|false}] - Is Mandatory Screening Required

- If you specify this parameter, the command displays information only about the FPolicy policy or policies that use the specified mandatory attribute.

[-allow-privileged-access {yes|no}] - Allow Privileged Access

- If you specify this parameter, the command displays information only about the FPolicy policy or policies that use the specified privileged access.

[-privileged-user-name `<text>`] - User Name for Privileged Access

- If you specify this parameter, the command displays information only about the FPolicy policy or policies that use the specified privileged user name.

[-is-passthrough-read-enabled {true|false}] - Is Passthrough Read Enabled

- If you specify this parameter, the command displays information only about the FPolicy policies that use the specified passthrough-read setting.

**Examples**

The following example displays the information about FPolicy policies on the cluster using the `vserver fpolicy policy show` command.

```plaintext
cluster1::> vserver fpolicy policy show
Vserver          Policy       Events     Engine         Is Mandatory  PrivAccess
---------------- -----------  ---------- -------------  ------------  ----------
Cluster          cserver_pol  cserver_     cserver_eng    true          yes
                evt         r
vs1.example.com  p            r          n              true          no
vs1.example.com  cserver_pol  cserver_     cserver.eng    true          yes
                evt         r
vs2.example.com  cserver_pol  cserver_     cserver.eng    true          yes
                evt         r
```

1800  Commands: Manual Page Reference
4 entries were displayed.

The following example displays FPolicy policy name information about all Vserver FPolicy policies with the \texttt{-allow-privileged-access} parameter set to "yes".

\begin{verbatim}
cluster1::> vserver fpolicy policy show -fields policy-name -allow-privileged-access yes

vserver         policy-name
--------------- -----------
Cluster         cserver_pol
vs1.example.com cserver_pol
vs2.example.com cserver_pol

3 entries were displayed.
\end{verbatim}

\textbf{vserver fpolicy policy event commands}

Manage policy event for FPolicy

\textbf{vserver fpolicy policy event create}

Create an event

\textbf{Availability}: This command is available to \textit{cluster} and \textit{Vserver} administrators at the \textit{admin} privilege level.

\textbf{Description}

The \texttt{vserver fpolicy policy event create} command creates an FPolicy event. An event describes what to monitor. An event can contain protocol, file operations, filters, and volume operation event types. In the FPolicy configuration, an event is attached to an FPolicy policy. You can attach the same event to one or more policies.

\textbf{Note}: This command is not supported for a Vserver with Infinite Volume.

\textbf{Note}: Three parameters have dependency rules: \texttt{-protocol, -files-operations} and \texttt{-filters}. The following combinations are supported:

- Both \texttt{-protocol} and \texttt{-file-operations}
- All of \texttt{-protocol, -file-operations} and \texttt{-filters}
- Specify none of three

\textbf{Parameters}

\texttt{-vserver \textit{<Vserver Name>}} - Vserver

This parameter specifies the name of the Vserver on which you want to create an FPolicy event.

\texttt{-event-name \textit{<Event name>}} - Event

This parameter specifies the name of the FPolicy event that you want to create. An event name can be up to 256 characters long. An event name value is a string that can only contain any combination of ASCII-range alphanumeric characters (a-z, A-Z, 0-9), "_", and ".".

\texttt{[-protocol \textit{<Protocol>}]} - Protocol

This parameter specifies the protocol name for which the event will be created. By default, no protocol is selected. The value of this parameter must be one of the following:
• **cifs** - This specifies that the event is for the CIFS protocol.
• **nfsv3** - This specifies that the event is for the NFSv3 protocol.
• **nfsv4** - This specifies that the event is for the NFSv4 protocol.

**Note:** If you specify `-protocol`, then you must also specify a valid value for the `-file-operations` parameter.

```bash
[-file-operations <File Operation>, ...] - File Operations
```

This parameter specifies a list of file operations for the FPolicy event. The event will check the operations specified in this list from all client requests using the protocol specified in the `-protocol` parameter. The list can include one or more of the following operations:

• **close** - File close operations.
• **create** - File create operations.
• **create_dir** - Directory create operations.
• **delete** - File delete operations.
• **delete_dir** - Directory delete operations.
• **getattr** - Get attribute operations.
• **link** - Link operations.
• **lookup** - Lookup operations.
• **open** - File open operations.
• **read** - File read operations.
• **write** - File write operations.
• **rename** - File rename operations.
• **rename_dir** - Directory rename operations.
• **setattr** - Set attribute operations.
• **symlink** - Symbolic link operations.

**Note:** If you specify `-file-operations` then you must specify a valid protocol in the `-protocol` parameter.

```bash
[-filters <Filter>, ...] - Filters
```

This parameter specifies a list of filters of given file operation or operations for the protocol specified in the `-protocol` parameter. The values in the `-filters` parameter are used to filter client requests. The list can include one or more of the following:

• **monitor-ads** - Filter the client request for alternate data stream.
• **close-with-modification** - Filter the client request for close with modification.
• **close-without-modification** - Filter the client request for close without modification.
• **close-with-read** - Filter the client request for close with read.
• **first-read** - Filter the client requests for the first-read. When this filter is used for CIFS events, the first-read request within a CIFS session results in FPolicy processing. When this filter is used for NFS
events, the `-file-session-io-grouping-count` and `-file-session-io-grouping-duration` configurations determine the first read-request for which FPolicy processing is done.

- **first-write** - Filter the client requests for the first-write. When this filter is used for CIFS events, the first-write request within a CIFS session results in FPolicy processing. When this filter is used for NFS events, the `-file-session-io-grouping-count` and `-file-session-io-grouping-duration` configurations determine the first-write request for which FPolicy processing is done.

- **offline-bit** - Filter the client request for offline bit set. Setting this filter, FPolicy server receives notification only when offline files are accessed.

- **open-with-delete-intent** - Filter the client request for open with delete intent. Setting this filter, FPolicy server receives notification only when an attempt is made to open a file with the intent to delete it. This is used by file systems when the FILE_DELETE_ON_CLOSE flag is specified.

- **open-with-write-intent** - Filter the client request for open with write intent. Setting this filter, FPolicy server receives notification only when an attempt is made to open a file with the intent to write something in it.

- **write-with-size-change** - Filter the client request for write with size change.

- **setattr-with-owner-change** - Filter the client setattr requests for changing owner of a file or directory.

- **setattr-with-group-change** - Filter the client setattr requests for changing group of a file or directory.

- **setattr-with-sacl-change** - Filter the client setattr requests for changing sacl on a file or directory.

- **setattr-with-dacl-change** - Filter the client setattr requests for changing dacl on a file or directory.

- **setattr-with-modify-time-change** - Filter the client setattr requests for changing the modification time of a file or directory.

- **setattr-with-access-time-change** - Filter the client setattr requests for changing the access time of a file or directory.

- **setattr-with-creation-time-change** - Filter the client setattr requests for changing the creation time of a file or directory.

- **setattr-with-mode-change** - Filter the client setattr requests for changing the mode bits on a file or directory.

- **setattr-with-size-change** - Filter the client setattr requests for changing the size of a file.

- **setattr-with-allocation-size-change** - Filter the client setattr requests for changing the allocation size of a file.

- **exclude-directory** - Filter the client requests for directory operations. When this filter is specified directory operations are not monitored.

**Note:** If you specify a value for the `-filters` parameter, then you must also specify valid values for the `-file-operations` and `-protocol` parameters.

**Note:** If the client sends multiple read/write requests simultaneously for the same file, then the first-read and first-write filters can result in more than one FPolicy notification.

`[-volume-operation (true|false)]` - Send Volume Operation Notifications

This parameter specifies whether volume operations generate notifications for the FPolicy event. If this field is set to `true` then FPolicy sends notifications when volumes are mounted or unmounted. By default, it is `false`.
Examples

The following example creates an FPolicy event.

```
cluster1::> vserver fpolicy policy event create -vserver vs1.example.com -event-name cifs_event -protocol cifs -file-operations open,close,read,write -filters first-read,offline-bit -volume-operation true
```

```
cluster1::> vserver fpolicy policy event show -vserver vs1.example.com -event-name cifs_event
Vserver: vs1.example.com
Event Name: cifs_event
Protocol: cifs
File Operations: open, close, read, write
Filters: first-read, offline-bit
Volume Operation: true
```

vserver fpolicy policy event delete

Delete an event

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver fpolicy policy event delete command deletes an FPolicy event.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters

- `vserver <Vserver Name>` - Vserver
  This parameter specifies the Vserver from which you want to delete an FPolicy event.

- `event-name <Event name>` - Event
  This parameter specifies the name of the FPolicy event you want to delete.

Examples

The following example deletes an FPolicy event.

```
cluster1::> vserver fpolicy policy event delete -vserver vs1.example.com -event-name cifs_event
```

vserver fpolicy policy event modify

Modify an event

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver fpolicy policy event modify command modifies an FPolicy event. An event describes what to monitor. An event can contain protocol, file operations, filters, and volume operation event types. In the FPolicy configuration, an event is
attached to an FPolicy policy. You can attach the same event to one or more policies. You can modify an event while it is attached to an FPolicy policy. Any changes to the event take effect immediately.

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Note:** Three parameters have dependency rules: `-protocol`, `-files-operations` and `-filters`. The following combinations are supported:

- Both `-protocol` and `-file-operations`
- All of `-protocol`, `-file-operations` and `-filters`
- Specify none of three

**Parameters**

- `vserver <Vserver Name>` - Vserver
  
  This parameter specifies the name of the Vserver on which you want to modify an FPolicy event.

- `event-name <Event name>` - Event
  
  This parameter specifies the name of the FPolicy event that you want to modify. An event name can be up to 256 characters long. An event name value is a string that can only contain any combination of ASCII-range alphanumeric characters (a-z, A-Z, 0-9), ”_” and “.”.

- `[-protocol <Protocol>]` - Protocol
  
  This parameter specifies the protocol name for which the event will be modified. By default, no protocol is selected. The value of this parameter must be one of the following:

  - `cifs` - This specifies that the event is for the CIFS protocol.
  - `nfsv3` - This specifies that the event is for the NFSv3 protocol.
  - `nfsv4` - This specifies that the event is for the NFSv4 protocol.

  **Note:** If you specify `-protocol`, then you must also specify a valid value for the `-file-operations` parameter.

- `[-file-operations <File Operation>, ...]` - File Operations
  
  This parameter specifies a list of file operations for the FPolicy event. The event will check the operations specified in this list from all client requests using the protocol specified in the `-protocol` parameter. The list can include one or more of the following operations:

  - `close` - File close operations.
  - `create` - File create operations.
  - `create_dir` - Directory create operations.
  - `delete` - File delete operations.
  - `delete_dir` - Directory delete operations.
  - `getattr` - Get attribute operations.
  - `link` - Link operations.
  - `lookup` - Lookup operations.
  - `open` - File open operations.
  - `read` - File read operations.
- File write operations.

- File rename operations.

- Directory rename operations.

- Set attribute operations.

- Symbolic link operations.

**Note:** If you specify `-file-operations` then you must specify a valid protocol in the `-protocol` parameter.

`[-filters <Filter>, ...] - Filters`  
This parameter specifies a list of filters of given file operation or operations for the protocol specified in the `-protocol` parameter. The values in the `-filters` parameter are used to filter client requests. The list can include one or more of the following:

- `monitor-ads` - Filter the client request for alternate data stream.

- `close-with-modification` - Filter the client request for close with modification.

- `close-without-modification` - Filter the client request for close without modification.

- `close-with-read` - Filter the client request for close with read.

- `first-read` - Filter the client requests for the first-read. When this filter is used for CIFS events, the first-read request within a CIFS session results in FPolicy processing. When this filter is used for NFS events, the `-file-session-io-grouping-count` and `-file-session-io-grouping-duration` configurations determine the first read request for which FPolicy processing is done.

- `first-write` - Filter the client requests for the first-write. When this filter is used for CIFS events, the first-write request within a CIFS session results in FPolicy processing. When this filter is used for NFS events, the `-file-session-io-grouping-count` and `-file-session-io-grouping-duration` configurations determine the first write request for which FPolicy processing is done.

- `offline-bit` - Filter the client request for offline bit set. Setting this filter, FPolicy server receives notification only when offline files are accessed.

- `open-with-delete-intent` - Filter the client request for open with delete intent. Setting this filter, FPolicy server receives notification only when an attempt is made to open a file with the intent to delete it. This is used by file systems when the FILE_DELETE_ON_CLOSE flag is specified.

- `open-with-write-intent` - Filter the client request for open with write intent. Setting this filter, FPolicy server receives notification only when an attempt is made to open a file with the intent to write something in it.

- `write-with-size-change` - Filter the client request for write with size change.

- `setattr-with-owner-change` - Filter the client setattr requests for changing owner of a file or directory.

- `setattr-with-group-change` - Filter the client setattr requests for changing group of a file or directory.

- `setattr-with-sacl-change` - Filter the client setattr requests for changing sacl on a file or directory.

- `setattr-with-dacl-change` - Filter the client setattr requests for changing dacl on a file or directory.

- `setattr-with-modify-time-change` - Filter the client setattr requests for changing the modification time of a file or directory.
- **setattr-with-access-time-change** - Filter the client setattr requests for changing the access time of a file or directory.

- **setattr-with-creation-time-change** - Filter the client setattr requests for changing the creation time of a file or directory.

- **setattr-with-mode-change** - Filter the client setattr requests for changing the mode bits on a file or directory.

- **setattr-with-size-change** - Filter the client setattr requests for changing the size of a file.

- **setattr-with-allocation-size-change** - Filter the client setattr requests for changing the allocation size of a file.

- **exclude-directory** - Filter the client requests for directory operations. When this filter is specified directory operations are not monitored.

**Note:** If you specify a value for the `-filters` parameter, then you must also specify valid values for the `-file-operations` and `-protocol` parameters.

**Note:** If the client sends multiple read/write requests simultaneously for the same file, then the first-read and first-write filters can result in more than one FPolicy notification.

**[-volume-operation {true|false}] - Send Volume Operation Notifications**

This parameter specifies whether volume operations generate notifications for the FPolicy event. If this field is set to `true` then FPolicy sends notifications when volumes are mounted or unmounted. By default, it is `false`.

### Examples

The following example modifies an FPolicy event.

```
cluster1::> vserver fpolicy policy event modify -vserver vs1.example.com -event-name cifs_event -protocol cifs
-force operations open,close,read,write
-first-read,offline-bit
-volume-operation true
```

```
cluster1::> vserver fpolicy policy event show -vserver vs1.example.com -event-name cifs_event
Vserver: vs1.example.com
Event Name: cifs_event
Protocol: cifs
File Operations: open, close, read, write
Filters: first-read, offline-bit
Volume Operation: true
```

vserver fpolicy policy event show

Display events

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**

The `vserver fpolicy policy event show` command displays information about all FPolicy events belonging to the Vserver. Any Vserver administrator can see FPolicy events associated with their Vserver as well as FPolicy events created by
the cluster administrator. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all FPolicy events:

- Vserver name
- FPolicy event name
- Protocol name
- List of file operations
- List of filters
- Volume operation

You can specify the `-fields` parameter to specify which fields of information to display about FPolicy events. You can specify additional parameters to display only information that matches those parameters. For example, to display information only about all CIFS events configured with the `-volume-operation` field set, run the command with the `-fields` parameter set to `-event-name event-name -protocol cifs -volume-operation yes.`

You can specify the `-instance` parameter to display all information for all policies in a list format.

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**

```
[-fields <fieldname>,...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command only displays the fields that you specify.

```
[-instance]
```

If you specify the `-instance` parameter, the command displays detailed information about all entries.

```
[-vserver <Vserver Name>] - Vserver
```

If you specify this parameter, the command displays information only about the FPolicy events for the specified Vserver. Events created on the admin Vserver by the cluster administrator are visible in all Vservers.

```
[-event-name <Event name>] - Event
```

If you specify this parameter, the command displays information only about the FPolicy event that matches the specified event name.

```
[-protocol <Protocol>] - Protocol
```

If you specify this parameter, the command displays information only about the FPolicy event or events that use the specified protocol.

```
[-file-operations <File Operation>,... ] - File Operations
```

If you specify this parameter, the command displays information only about the FPolicy event or events that use the specified file operation or operations.

```
[-filters <Filter>,... ] - Filters
```

If you specify this parameter, the command displays information only about the FPolicy event or events that use the specified filter or filters.

```
[-volume-operation {true|false}] - Send Volume Operation Notifications
```

If this field is set to `true`, then FPolicy displays information about those events for which it sends notifications when volumes are mounted or unmounted. If you set this parameter to `true`, the command displays information about events where the `-volume-operation` parameter is set `true` and volume operations such as mount and unmount are monitored. If you set this parameter to `false`, the command displays information about events where volume operations are not monitored.
Examples

The following example displays the information about all Vserver FPolicy policy events.

```
cluster1::> vserver fpolicy policy event show
       Event                      File                        Volume
       --------                      ----------                        ----
       Vserver         Name               Protocols Operations    Filters      Operation
       --------------- ------------------ --------- ------------- ------------
cluster         cserver_evt        cifs      open, close,  first-write, true
                    read, write   first-read
vs1.example.com cserver_evt        cifs      open, close,  first-write, true
                    read, write   first-read
vs1.example.com v1e1               cifs      open, read    first-read   -
vs1.example.com v1e2               cifs      open          -            false
vs1.example.com v1e3               nfsv4     open          -            true
vs2.example.com cserver_evt        cifs      open, close,  first-write, true
                    read, write   first-read

6 entries were displayed.
```

The following example displays event name information about all Vserver FPolicy policy events with CIFS as a protocol and with false as volume operation.

```
cluster1::> vserver fpolicy policy event show -fields event-name -protocol cifs - volume-operation false

vserver         event-name
--------------- ----------
vs1.example.com v1e2
```

vserver fpolicy policy external-engine commands

Manage FPolicy external engine

vserver fpolicy policy external-engine create

Create an external engine

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver fpolicy policy external-engine create command creates an FPolicy external engine. The cluster uses the external engine to hold configuration information that it needs in order to send notification information to the FPolicy servers. It specifies the primary servers and secondary servers to which the cluster will send notifications. It also specifies FPolicy server related configuration information.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters

-vserver <Vserver Name> - Vserver

This parameter specifies the name of the Vserver on which you want to create an FPolicy external engine.

-engine-name <Engine name> - Engine

This parameter specifies the name of the FPolicy external engine that you want to create. An external engine name can be up to 256 characters long. An external engine name is a string that can only contain any combination of ASCII-range alphabetic characters (a-z, A-Z, 0-9), ",", and ".".
-primary-servers <IP Address>, ... - Primary FPolicy Servers

This parameter specifies a list of IP addresses for the primary FPolicy servers to which you want the external engine you create to apply. The -primary-servers parameter is used to specify a list of servers to which to send file access events for a given FPolicy policy. When an administrator configures multiple servers as primary servers, notifications are sent to the FPolicy servers in a round-robin fashion.

-port <integer> - Port Number of FPolicy Service

This parameter specifies the port number for the FPolicy service.

[-secondary-servers <IP Address>, ...] - Secondary FPolicy Servers

This parameter specifies a list of IP addresses for the secondary FPolicy servers to which you want the external engine you create to apply. Secondary servers will be used only when all the primary servers are not reachable. When an administrator configures multiple servers as secondary servers, notifications are sent to FPolicy server in a round-robin fashion. By default, no secondary server is selected.

-[extern-engine-type <External Engine Type>] - External Engine Type

This parameter specifies the type of the external engine. This specifies how the FPolicy server should behave, synchronously or asynchronously. By default, it is synchronous in nature. When set to synchronous, after sending a notification to the external FPolicy server, request processing does not continue until after receiving a response from the FPolicy server. At that point request flow either continues or processing results in denial, depending on whether the response from the FPolicy server permits the requested action. When set to asynchronous, after sending a notification to the external FPolicy server, file request processing continues.

-ssl-option {no-auth|server-auth|mutual-auth} - SSL Option for External Communication

This parameter specifies the SSL option for external communication with the FPolicy server. Possible values include the following:

- no-auth : When set to no-auth, no authentication takes place. The communication link is established over the TCP protocol.
- server-auth : When set to server-auth, only the FPolicy server is authenticated by the Vserver. With this option, before creating the FPolicy external engine, the administrator must install the public certificate of the certificate authority (CA) that signed the FPolicy server certificate.
- mutual-auth : When set to mutual-auth, mutual authentication takes place between the Vserver and the FPolicy server, i.e. authentication of the FPolicy server by the Vserver along with authentication of the Vserver by the FPolicy server. With this option, before creating the FPolicy external engine, the administrator must install the public certificate of the certificate authority (CA) that signed the FPolicy server certificate along with the public certificate and key file for authentication of the Vserver.

The public certificate of certificate authority (CA) that is used to sign the FPolicy server certificate is installed using the security certificate install command with -type set to client_ca. The private key and public certificate required for authentication of the Vserver is installed using the security certificate install command with -type set to server.

-reqs-cancel-timeout <[<integer>h][<integer>m][<integer>s]>] - Timeout for Canceling a Request (privilege: advanced)

This parameter specifies the timeout for canceling a request. It is used to specify the time interval in which the node waits for a response from the FPolicy server. Beyond this timeout, a cancel request is sent to the FPolicy server to cancel the pending request. The request is then sent to an alternate FPolicy server that is registered for the policy. This timeout helps in handling a FPolicy server that is not responding, which can improve CIFS/NFS client response. Also, this feature can help in releasing of system resources since the request is moved from a down/bad FPolicy server to an alternate FPolicy server. The value for this field must be between 0s and 100s. By default, it is 20s.
[-reqs-abort-timeout <[<integer>h][<integer>m][<integer>s]>] - Timeout for Aborting a Request
(privilege: advanced)

This parameter specifies the timeout for aborting a request. The value for this field must be between 0s and
200s. By default, it is 40s.

[-status-req-interval <[<integer>h][<integer>m][<integer>s]>] - Interval for Sending Status Requests
(privilege: advanced)

This parameter specifies the interval for sending status requests. It is used to specify the interval after which a
status request will be send to the FPolicy server. The value for this field must be between 0s and 50s. By
default, it is 10s.

[-max-connection-retries <integer>] - Max Reconnect Attempt (privilege: advanced)

This parameter specifies the maximum number of attempts to reconnect to the FPolicy server from a Vserver.
It is used to specify the number of times a broken connection will be retried. The value for this field must be
between 0 and 20. By default, it is 5.

[-max-server-reqs <integer>] - Maximum Outstanding Requests for FPolicy Server (privilege: advanced)

This parameter specifies the maximum number of outstanding requests for the FPolicy server. It is used to
specify maximum outstanding requests that will be queued up for the FPolicy server. The value for this field
must be between 1 and 10000. By default, it is 50.

[-server-progress-timeout <[<integer>h][<integer>m][<integer>s]>] - Timeout for Disconnecting Non-
responsive Server (privilege: advanced)

This parameter specifies the timeout for disconnecting non-responsive FPolicy servers. It is used to specify the
time interval after which the connection to the FPolicy server is terminated. This happens only when the
FPolicy server's queue contains the maximum allowed number of requests that it can hold in its queue and no
response is received within this timeout. The maximum allowed number of requests is either 50 (the default)
or the number specified by the -max-server-reqs parameter. The value for this field must be between 1s
and 100s. By default, it is 60s.

[-keep-alive-interval <[<integer>h][<integer>m][<integer>s]>] - Interval for Sending Keep-Alive
Messages (privilege: advanced)

This parameter specifies the interval in hours (h), minutes (m), or seconds (s) at which keep-alive messages are
sent to the FPolicy server. Keep-alive messages are used to detect half-open connections. The range of
supported values for this field is 10 through 600 (h, m, or s). Alternatively, the value can be set to 0, which
disables keep-alive messages and prevents them from being sent to the FPolicy servers. The default value for
this field is 120s.

[-certificate-common-name <FQDN or Custom Common Name>] - FQDN or Custom Common Name

This parameter specifies the certificate name as a fully qualified domain name (FQDN) or custom common
name. The certificate is used if SSL authentication between the Vserver and the FPolicy server is configured.

[-certificate-serial <text>] - Serial Number of Certificate

This parameter specifies the serial number of the certificate used for authentication if SSL authentication
between the Vserver and the FPolicy server is configured.

[-certificate-ca <text>] - Certificate Authority

This parameter specifies the certificate authority (CA) name of the certificate used for authentication if SSL
authentication between the Vserver and the FPolicy server is configured.

[-recv-buffer-size <integer>] - Receive Buffer Size (privilege: advanced)

This parameter specifies the receive buffer size of the connected socket for the FPolicy server. The default
value is set to 256 kilobytes (Kb). When the value is set to 0, the size of the receive buffer is set to a value
defined by the system. For example, if the default receive buffer size of the socket is 65536 bytes, by setting
the tunable value to 0, the socket buffer size is set to 65536 bytes. You can use any non-default value to set the
size (in bytes) of the receive buffer.
[-send-buffer-size <integer>] - Send Buffer Size (privilege: advanced)

This parameter specifies the send buffer size of the connected socket for the FPolicy server. The default value is set to 256 kilobytes (Kb). When the value is set to 0, the size of the send buffer is set to a value defined by the system. For example, if the default send buffer size of the socket is set to 65536 bytes, by setting the tunable value to 0, the socket buffer size is set to 65536 bytes. You can use any non-default value to set the size (in bytes) of the send buffer.

[-session-timeout [<integer>h] [<integer>m] [<integer>s>] - Session ID Purge Timeout During Reconnection (privilege: advanced)

This parameter specifies the interval after which a new session ID is sent to the FPolicy server during reconnection attempts. The value for this field must be between 0s and 200s. The default value is set to 10 seconds. If the connection between the storage controller and the FPolicy server is terminated and reconnection is made within the -session-timeout interval, the old session ID is sent to FPolicy server so that it can send responses for old notifications.

[-is-resiliency-enabled {true|false}] - Is Resiliency Feature Enabled

This parameter specifies whether the resiliency feature is enabled. When this parameter is set to true and all the primary and secondary servers are down, or no response is received from the FPolicy servers, file access events are stored inside the storage controller under the specified -resiliency-directory-path. To deny the file access events from being stored under these circumstances, set this parameter to false. By default, it is false.

[-resiliency-max-retention-duration [<integer>h] [<integer>m] [<integer>s>] - Maximum Notification Retention Duration

This parameter specifies the duration for which the notifications are written to files inside the storage controller during network outage. The value for this field must be between 0s and 600s. By default, it is set to 180s.

[-resiliency-directory-path <text>] - Directory for Notification Storage

This parameter specifies the directory path under the -vserver namespace, where notifications are stored in the files whenever network outage happens.

Examples

The following example creates an FPolicy external engine.

```
cluster1::> vserver fpolicy policy external-engine create -vserver vs1.example.com -engine-name new_engine -primary-servers 1.1.1.1 -port 10 -secondary-servers 2.2.2.2 -ssl-option mutual-auth -extern-engine-type synchronous -certificate-serial 8DDE112A114D1FBC -certificate-common-name Sample1-FPolicy-Client -certificate-ca TASample1
```

```
cluster1::> vserver fpolicy policy external-engine show -vserver vs1.example.com -engine-name new_engine

Vserver: vs1.example.com
Engine: new_engine
Primary FPolicy Servers: 1.1.1.1
Port Number of FPolicy Service: 10
Secondary FPolicy Servers: 2.2.2.2
External Engine Type: synchronous
SSL Option for External Communication: mutual-auth
FQDN or Custom Common Name: Sample1-FPolicy-Client
Serial Number: 8DDE112A114D1FBC
Certificate Authority: TASample1
```

- security certificate install on page 467
vserver fpolicy policy external-engine delete

Delete an external engine

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver fpolicy policy external-engine delete command deletes an FPolicy external engine.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters
-vserver <Vserver Name> - Vserver
This parameter specifies the Vserver from which you want to delete an FPolicy external engine.

-engine-name <Engine name> - Engine
This parameter specifies the name of the FPolicy external engine you want to delete.

Examples
The following example deletes an FPolicy external engine.

```
cluster1::> vserver fpolicy policy external-engine show -vserver vs1.example.com -engine-name new_engine
Vserver: vs1.example.com
Engine: new_engine
Primary FPolicy Servers: 1.1.1.1
Port Number of FPolicy Service: 10
Secondary FPolicy Servers: 2.2.2.2
External Engine Type: synchronous
SSL Option for External Communication: mutual-auth
FQDN or Custom Common Name: Sample1-FPolicy-Client
Certificate Authority: TASample1

cluster1::> vserver fpolicy policy external-engine delete -vserver vs1.example.com -engine-name new_engine
```

vserver fpolicy policy external-engine modify

Modify an external engine

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver fpolicy policy external-engine modify command modifies an FPolicy external engine. The cluster uses the external engine to hold configuration information that it needs in order to send notification information to the FPolicy servers. It specifies the primary servers and secondary servers to which the cluster will send notifications. It also specifies FPolicy server related configuration information.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters
-vserver <Vserver Name> - Vserver
This parameter specifies the name of the Vserver on which you want to modify an FPolicy external engine.
-engine-name <Engine name> - Engine

This parameter specifies the name of the FPolicy external engine that you want to modify. An external engine name can be up to 256 characters long. An external engine name is a string that can only contain any combination of ASCII-range alphanumeric characters (a-z, A-Z, 0-9), "_", and ".".

[-primary-servers <IP Address>, ...] - Primary FPolicy Servers

This parameter specifies a list of IP addresses for the primary FPolicy servers to which you want the external engine you modify to apply. The -primary-servers parameter is used to specify a list of servers to which to send file access events for a given FPolicy policy. When an administrator configures multiple servers as primary servers, notifications are sent to the FPolicy servers in a round-robin fashion.

[-port <integer>] - Port Number of FPolicy Service

This parameter specifies the port number for the FPolicy service.

[-secondary-servers <IP Address>, ...] - Secondary FPolicy Servers

This parameter specifies a list of IP addresses for the secondary FPolicy servers to which you want the external engine you modify to apply. Secondary servers will be used only when all the primary servers are not reachable. When an administrator configures multiple servers as secondary servers, notifications are sent to FPolicy server in a round-robin fashion. By default, no secondary server is selected.

[-extern-engine-type <External Engine Type>] - External Engine Type

This parameter specifies the type of the external engine. This specifies how the FPolicy server should behave, synchronously or asynchronously. By default, it is synchronous in nature. When set to synchronous, after sending a notification to the external FPolicy server, request processing does not continue until after receiving a response from the FPolicy server. At that point request flow either continues or processing results in denial, depending on whether the response from the FPolicy server permits the requested action. When set to asynchronous, after sending a notification to the external FPolicy server, file request processing continues.

[-ssl-option {no-auth|server-auth|mutual-auth}] - SSL Option for External Communication

This parameter specifies the SSL option for external communication with the FPolicy server. Possible values include the following:

- no-auth: When set to no-auth, no authentication takes place. The communication link is established over the TCP protocol.
- server-auth: When set to server-auth, only the FPolicy server is authenticated by the Vserver. With this option, before creating the FPolicy external engine, the administrator must install the public certificate of the certificate authority (CA) that signed the FPolicy server certificate.
- mutual-auth: When set to mutual-auth, mutual authentication takes place between the Vserver and the FPolicy server, i.e. authentication of the FPolicy server by the Vserver along with authentication of the Vserver by the FPolicy server. With this option, before creating the FPolicy external engine, the administrator must install the public certificate of the certificate authority (CA) that signed the FPolicy server certificate along with the public certificate and key file for authentication of the Vserver.

The public certificate of certificate authority (CA) that is used to sign the FPolicy server certificate is installed using the security certificate install command with -type set to client_ca. The private key and public certificate required for authentication of the Vserver is installed using the security certificate install command with -type set to server.

[-reqs-cancel-timeout <[<integer>h][<integer>m][<integer>s]>] - Timeout for Canceling a Request (privilege: advanced)

This parameter specifies the timeout for canceling a request. It is used to specify the time interval in which the node waits for a response from the FPolicy server. Beyond this timeout, a cancel request is sent to the FPolicy server to cancel the pending request. The request is then sent to an alternate FPolicy server that is registered for the policy. This timeout helps in handling a FPolicy server that is not responding, which can improve CIFS/NFS client response. Also, this feature can help in releasing of system resources since the request is
moved from a down/bad FPolicy server to an alternate FPolicy server. The value for this field must be between 0s and 100s. By default, it is 20s.

`-reqs-abort-timeout [<integer>h] [<integer>m] [<integer>s>]` - Timeout for Aborting a Request (privilege: advanced)
This parameter specifies the timeout for aborting a request. The value for this field must be between 0s and 200s. By default, it is 40s.

`-status-req-interval [<integer>h] [<integer>m] [<integer>s>]` - Interval for Sending Status Requests (privilege: advanced)
This parameter specifies the interval for sending status requests. It is used to specify the interval after which a status request will be sent to the FPolicy server. The value for this field must be between 0s and 50s. By default, it is 10s.

`-max-connection-retries <integer>` - Max Reconnect Attempt (privilege: advanced)
This parameter specifies the maximum number of attempts to reconnect to the FPolicy server from a Vserver. It is used to specify the number of times a broken connection will be retried. The value for this field must be between 0 and 20. By default, it is 5.

`-max-server-reqs <integer>` - Maximum Outstanding Requests for FPolicy Server (privilege: advanced)
This parameter specifies the maximum number of outstanding requests for the FPolicy server. It is used to specify the maximum outstanding requests that will be queued up for the FPolicy server. The value for this field must be between 1 and 10000. By default, it is 50.

`-server-progress-timeout [<integer>h] [<integer>m] [<integer>s>]` - Timeout for Disconnecting Non-responsive Server (privilege: advanced)
This parameter specifies the timeout for disconnecting non-responsive FPolicy servers. It is used to specify the time interval after which the connection to the FPolicy server is terminated. This happens only when the FPolicy server's queue contains the maximum allowed number of requests that it can hold in its queue and no response is received within this timeout. The maximum allowed number of requests is either 50 (the default) or the number specified by the `-max-server-reqs` parameter. The value for this field must be between 1s and 100s. By default, it is 60s.

`-keep-alive-interval [<integer>h] [<integer>m] [<integer>s>]` - Interval for Sending Keep-Alive Messages (privilege: advanced)
This parameter specifies the interval in hours (h), minutes (m), or seconds (s) at which keep-alive messages are sent to the FPolicy server. Keep-alive messages are used to detect half-open connections. The range of supported values for this field is 10 through 600 (h, m, or s). Alternatively, the value can be set to 0, which disables keep-alive messages and prevents them from being sent to the FPolicy servers. The default value for this field is 120s.

`-certificate-common-name <FQDN or Custom Common Name>` - FQDN or Custom Common Name
This parameter specifies the certificate name as a fully qualified domain name (FQDN) or custom common name. The certificate is used if SSL authentication between the Vserver and the FPolicy server is configured.

`-certificate-serial <text>` - Serial Number of Certificate
This parameter specifies the serial number of the certificate used for authentication if SSL authentication between the Vserver and the FPolicy server is configured.

`-certificate-ca <text>` - Certificate Authority
This parameter specifies the certificate authority (CA) name of the certificate used for authentication if SSL authentication between the Vserver and the FPolicy server is configured.

`-recv-buffer-size <integer>` - Receive Buffer Size (privilege: advanced)
This parameter specifies the receive buffer size of the connected socket for the FPolicy server. The default value is set to 256 kilobytes (Kb). When the value is set to 0, the size of the receive buffer is set to a value defined by the system. For example, if the default receive buffer size of the socket is 65536 bytes, by setting the tunable value to 0, the socket buffer size is set to 65536 bytes. You can use any non-default value to set the size (in bytes) of the receive buffer.
[-send-buffer-size <integer>] - Send Buffer Size (privilege: advanced)

This parameter specifies the send buffer size of the connected socket for the FPolicy server. The default value is set to 256 kilobytes (Kb). When the value is set to 0, the size of the send buffer is set to a value defined by the system. For example, if the default send buffer size of the socket is set to 65536 bytes, by setting the tunable value to 0, the socket buffer size is set to 65536 bytes. You can use any non-default value to set the size (in bytes) of the send buffer.

[-session-timeout <[integer]h][<integer>m][<integer>s>] - Session ID Purge Timeout During Reconnection (privilege: advanced)

This parameter specifies the interval after which a new session ID is sent to the FPolicy server during reconnection attempts. The value for this field must be between 0s and 200s. The default value is set to 10 seconds. If the connection between the storage controller and the FPolicy server is terminated and reconnection is made within the -session-timeout interval, the old session ID is sent to FPolicy server so that it can send responses for old notifications.

[-is-resiliency-enabled {true|false}] - Is Resiliency Feature Enabled

This parameter specifies whether the resiliency feature is enabled. When this parameter is set to true and all the primary and secondary servers are down, or no response is received from the FPolicy servers, file access events are stored inside the storage controller under the specified -resiliency-directory-path. To deny the file access events from being stored under these circumstances, set this parameter to false. By default, it is false.

[-resiliency-max-retention-duration <[integer]h][<integer>m][<integer>s>] - Maximum Notification Retention Duration

This parameter specifies the duration for which the notifications are written to files inside the storage controller during network outage. The value for this field must be between 0s and 600s. By default, it is set to 180s.

[-resiliency-directory-path <text>] - Directory for Notification Storage

This parameter specifies the directory path under the -vserver namespace, where notifications are stored in the files whenever network outage happens.

Examples

The following example modifies an FPolicy external engine.

```
cluster1::> vserver fpolicy policy external-engine modify -vserver vs1.example.com -engine-name new_engine
primary-servers 1.1.1.1 -port 10 -secondary-servers 2.2.2.2
```

```
cluster1::> vserver fpolicy policy external-engine show -vserver vs1.example.com

Vserver: vs1.example.com
  Engine: new_engine
  Primary FPolicy Servers: 1.1.1.1
  Port Number of FPolicy Service: 10
  Secondary FPolicy Servers: 2.2.2.2
  External Engine Type: synchronous
  SSL Option for External Communication: mutual-auth
  FQDN or Custom Common Name: Sample1-FPolicy-Client
  Serial Number: 8DE112A114D1FBC
  Certificate Authority: TASample1
```

The following example shows how to modify -recv-buffer-size and -send-buffer-size to a non-default value of 0.

```
cluster1::*> vserver fpolicy policy external-engine modify -vserver vs1.example.com
new_engine -recv-buffer-size 0 -send-buffer-size 0
```
vserver fpolicy policy external-engine show

Display external engines

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The `vserver fpolicy policy external-engine show` command displays information about all FPolicy external engines belonging to the Vserver. Any Vserver administrator can see FPolicy external engines associated to their Vserver as well as external engines created by cluster administrator. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all FPolicy external engines:

- Vserver name
- FPolicy external engine name
- List of primary FPolicy servers
- List of secondary FPolicy servers
- Port number for FPolicy service
- FPolicy external engine type

You can specify the `-fields <fieldname>, ...` parameter to specify which fields of information to display about FPolicy external engines. You can specify additional parameters to display only information that matches those parameters. For instance, to display information only about all external engines where the `-port` parameter is set to 9, run the command with the `-field` parameter set to engine-name and `-port` parameter set to 9.

You can specify the `-instance` parameter to display all information for all policies in a list format.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters

{ [-fields <fieldname>, ...]  
  If you specify the `-fields <fieldname>, ...` parameter, the command only displays the fields that you specify.

  | [-instance ]  
  If you specify the `-instance` parameter, the command displays detailed information about all entries.

[-vserver <Vserver Name>] - Vserver

If you specify this parameter, the command displays information only about the FPolicy external engines for the specified Vserver. FPolicy external engines that the cluster administrator creates are visible in all Vservers.

[-engine-name <Engine name>] - Engine

If you specify this parameter, the command displays information only about the FPolicy external engine that you specify.

[-primary-servers <IP Address>, ...] - Primary FPolicy Servers

If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified IP addresses as primary FPolicy servers.

[-port <integer>] - Port Number of FPolicy Service

If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified port for the FPolicy service.
[-secondary-servers <IP Address>, ...] - Secondary FPolicy Servers
   If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified IP addresses as secondary FPolicy servers.

[-extern-engine-type <External Engine Type>] - External Engine Type
   If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified external engine type.

[-ssl-option {no-auth|server-auth|mutual-auth}] - SSL Option for External Communication
   If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified SSL option.

[-reqs-cancel-timeout <[<integer>h][<integer>m][<integer>s]>] - Timeout for Canceling a Request
   (privilege: advanced)
   If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified timeout for canceling a request.

[-reqs-abort-timeout <[<integer>h][<integer>m][<integer>s]>] - Timeout for Aborting a Request
   (privilege: advanced)
   If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified timeout for aborting a request.

[-status-req-interval <[<integer>h][<integer>m][<integer>s]>] - Interval for Sending Status Requests
   (privilege: advanced)
   If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified interval for sending status requests.

[-max-connection-retries <integer>] - Max Reconnect Attempt (privilege: advanced)
   If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified maximum reconnect attempts.

[-max-server-reqs <integer>] - Maximum Outstanding Requests for FPolicy Server (privilege: advanced)
   If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified FPolicy server maximum outstanding requests.

[-server-progress-timeout <[<integer>h][<integer>m][<integer>s]>] - Timeout for Disconnecting Non-responsive Server
   (privilege: advanced)
   If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified timeout for disconnecting non-responsive server.

[-keep-alive-interval <[<integer>h][<integer>m][<integer>s]>] - Interval for Sending Keep-Alive Messages
   (privilege: advanced)
   If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified keep-alive interval.

[-certificate-common-name <FQDN or Custom Common Name>] - FQDN or Custom Common Name
   If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified certificate common name.

[-certificate-serial <text>] - Serial Number of Certificate
   If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified certificate serial number.

[-certificate-ca <text>] - Certificate Authority
   If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified certificate authority name.
[-recv-buffer-size <integer>] - Receive Buffer Size (privilege: advanced)
If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified receive buffer size.

[-send-buffer-size <integer>] - Send Buffer Size (privilege: advanced)
If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified send buffer size.

[-session-timeout <[<integer>h][<integer>m][<integer>s]>] - Session ID Purge Timeout During Reconnection (privilege: advanced)
If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified session timeout.

[-is-resiliency-enabled {true|false}] - Is Resiliency Feature Enabled
If you specify this parameter set to true, the command displays information only about the FPolicy external engine or engines that has the resiliency feature enabled.

[-resiliency-max-retention-duration <[<integer>h][<integer>m][<integer>s]>] - Maximum Notification Retention Duration
If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified network outage duration.

[-resiliency-directory-path <text>] - Directory for Notification Storage
If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified directory path.

Examples
The following example displays the information about the configured external engines using the vserver fpolicy policy external-engine show command.

```
cluster1::> vserver fpolicy policy external-engine show

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Engine</th>
<th>Primary Servers</th>
<th>Secondary Servers</th>
<th>Port</th>
<th>Engine Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cluster</td>
<td>cserver_eng</td>
<td>9.9.9.9</td>
<td>-</td>
<td>9</td>
<td>synchronous</td>
</tr>
<tr>
<td>vs1.example.com</td>
<td>cserver_eng</td>
<td>9.9.9.9</td>
<td>1.1.1.1</td>
<td>9</td>
<td>synchronous</td>
</tr>
<tr>
<td>vs2.example.com</td>
<td>cserver_eng</td>
<td>9.9.9.9</td>
<td>2.2.2.2</td>
<td>1</td>
<td>synchronous</td>
</tr>
<tr>
<td>vs2.example.com</td>
<td>v2n1</td>
<td>3.3.3.3</td>
<td>5.5.5.5</td>
<td>2</td>
<td>synchronous</td>
</tr>
</tbody>
</table>

5 entries were displayed.
```

The following example displays the information about all Vserver FPolicy external engines with the -port parameter set to 9.

```
cluster1::> vserver fpolicy policy external-engine show -fields engine-name -port 9

vserver  engine-name
---------  ------------
Cluster    cserver_eng
vs1.example.com cserver_eng
vs2.example.com cserver_eng
3 entries were displayed.
```

The following example displays the values of all the advanced-level parameters for the external engine v1n1 in Vserver vs1.example.com.
vserver fpolicy policy scope commands

Manage policy scope for FPolicy

vserver fpolicy policy scope create

Create scope

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver fpolicy policy scope create command creates an FPolicy scope for an FPolicy policy. A scope defines the boundaries on which the FPolicy policy will apply. The Vserver is the basic scope boundary. When you create a scope for an FPolicy policy, you must define the FPolicy policy to which it will apply and you must designate to which Vserver you want to apply the scope. There are a number of parameters that further restrict the scope within the specified Vserver. You can restrict the scope by specifying what to include in the scope. Or you can restrict the scope by specifying what to exclude from the scope. For example, you can restrict the scope by specifying which volumes to include using the \texttt{-volumes-to-include} parameter or which volumes to exclude using the \texttt{-volumes-to-exclude} parameter. Once you apply a scope to an enabled policy, policy event checks get applied to the scope defined by this command.

Note: There are special considerations for the scope for a cluster FPolicy policy. The cluster FPolicy policy is a policy that the cluster administrator creates for the admin Vserver. If the cluster administrator also creates the scope for that cluster FPolicy policy, a Vserver administrator cannot create a scope for that same policy. However, if the cluster administrator does not create a scope for the cluster FPolicy policy, then any Vserver administrator can create the scope for that cluster policy. In the event that the Vserver administrator creates a scope for that cluster FPolicy policy, the cluster administrator cannot subsequently create a cluster scope for that same cluster policy. This is because the cluster administrator cannot override the scope for the same cluster policy.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters

\texttt{-vserver \textit{<Vserver Name>}} - Vserver

This parameter specifies the name of the Vserver on which you want to create an FPolicy policy scope.

.cluster1::*	exttt{vserver fpolicy policy external-engine show -vserver vs1.example.com -engine-name v1n1 -instance}

\texttt{(vserver fpolicy policy external-engine show)}

Vserver: vs1.example.com
Engine: v1n1
Primary FPolicy Servers: 1.1.1.1
Port Number of FPolicy Service: 1
Secondary FPolicy Servers: 2.2.2.2
External Engine Type: synchronous
SSL Option for External Communication: no-auth
Timeout for Canceling a Request: 20s
Timeout for Aborting a Request: 40s
Interval for Sending Status Requests: 10s
Max Reconnect Attempt: 5
Maximum Outstanding Requests for FPolicy Server: 50
Timeout for Disconnecting Non-responsive Server: 1m
Interval for Sending Keep-Alive Messages: 2m
FQDN or Custom Common Name: -
Serial Number of Certificate: -
Certificate Authority: -
Receive Buffer Size: 0
Send Buffer Size: 0
Session ID Purge Timeout During Reconnection: 10s
Is Resiliency Feature Enabled: true
Maximum Notification Retention Duration: 3m
Directory for Notification Storage: /fpolicy
-policy-name <Policy name> - Policy
This parameter specifies the name of the FPolicy policy for which you want to create the scope.

[-shares-to-include <Share name>, ...] - Shares to Include
This parameter specifies a list of shares for file access monitoring. With this option, the administrator provides a list of shares, separated by commas. For file access events relative to the specified shares and file operations monitored by the FPolicy policy, a notification is generated. The `-shares-to-include` parameter can contain regular expressions and can include metacharacters such as "?" and ":".

**Note:** When a share is included in the `-shares-to-include` parameter and the parent volume of the share is included in the `-volumes-to-exclude` parameter, `-volumes-to-exclude` has precedence over `-shares-to-include`.

[-shares-to-exclude <Share name>, ...] - Shares to Exclude
This parameter specifies a list of shares to exclude from file access monitoring. With this option, the administrator provides a list of shares, separated by commas. When a share is specified in the `-shares-to-exclude` parameter, no notification is sent for files accessed relative to that share. The `-shares-to-exclude` parameter can contain regular expressions and can include metacharacters such as "?" and ":".

[-volumes-to-include <volume name>, ...] - Volumes to Include
This parameter specifies a list of volumes for file access monitoring. With this option, the administrator provides a list of volumes, separated by commas. For file access events within the volume and file operations monitored by the FPolicy policy, a notification is generated. The `-volumes-to-include` parameter can contain regular expressions and can include metacharacters such as "?" and ":".

[-volumes-to-exclude <volume name>, ...] - Volumes to Exclude
This parameter specifies a list of volumes to exclude from file access monitoring. With this option, the administrator provides a list of volumes, separated by commas, for which no file access notifications are generated. The `-volumes-to-exclude` parameter can contain regular expressions and can include metacharacters such as "?" and ":".

**Note:** When a share is included in the `-shares-to-include` parameter and the parent volume of the share is included in the `-volumes-to-exclude` parameter, `-volumes-to-exclude` has precedence over `-shares-to-include`. Similarly, when an export policy is included in the `-export-policies-to-include` parameter and the parent volume of the export-policy is included in the `-volumes-to-exclude` parameter, `-volumes-to-exclude` has precedence over `-export-policies-to-include`.

[-export-policies-to-include <FPolicy export policy>, ...] - Export Policies to Include
This parameter specifies a list of export policies for file access monitoring. With this option, the administrator provides a list of export policies, separated by commas. For file access events within an export policy and file operations monitored by the FPolicy policy, a notification is generated. The `-export-policies-to-include` parameter can contain regular expressions and can include metacharacters such as "?" and ":".

**Note:** When an export policy is included in the `-export-policies-to-include` parameter and the parent volume of the export policy is included in the `-volumes-to-exclude` parameter, `-volumes-to-exclude` has precedence over `-export-policies-to-include`.

[-export-policies-to-exclude <FPolicy export policy>, ...] - Export Policies to Exclude
This parameter specifies a list of export policies to exclude from file access monitoring. With this option, the administrator provides a list of export policies, separated by commas, for which no file access notification is sent. The `-export-policies-exclude` parameter can contain regular expressions and can include metacharacters such as "?" and ":".

[-file-extensions-to-include <File extension>, ...] - File Extensions to Include
This parameter specifies a list of file extensions, separated by commas, for a given FPolicy policy for which FPolicy processing is required. Any file access to files with the same extensions included in the `-file-
extensions-to-include parameter generates a notification. The -file-extensions-to-include parameter can contain regular expressions and can include metacharacters such as "\?".

[-file-extensions-to-exclude <File extension>, ...] - File Extensions to Exclude

This parameter specifies a list of file extensions, separated by commas, for a given FPolicy policy for which FPolicy processing will be excluded. Using the exclude list, the administrator can request notification for all extensions except those in the excluded list. Any file access to files with the same extensions included in the -file-extensions-to-exclude parameter does not generate a notification. The -file-extensions-to-exclude parameter can contain regular expressions and can include metacharacters such as "\?".

Note: An administrator can specify both -file-extensions-to-include and -file-extensions-to-exclude lists. The -file-extensions-to-exclude parameter is checked first before the -file-extensions-to-include parameter is checked.

[-is-file-extension-check-on-directories-enabled {true|false}] - Is File Extension Check on Directories Enabled (privilege: advanced)

This parameter specifies whether the file name extension checks apply to directory objects as well. If this parameter is set to true, the directory objects are subjected to same extension checks as regular files. If this parameter is set to false, the directory names are not matched for extensions and notifications would be sent for directories even if their name extensions do not match. By default, it is false.

[-is-monitoring-of-objects-with-no-extension-enabled {true|false}] - Is Monitoring of Objects with No Extension Enabled (privilege: advanced)

This parameter specifies whether the extension checks apply to objects with no extension as well. If this parameter is set to true, the objects with no extension are also monitored along with the objects with extension. By default, it is false.

Note: This parameter is ignored when file-extensions-to-include and file-extensions-to-exclude lists are empty.

Examples

The following example creates an FPolicy policy scope.

```
cluster1::> vserver fpolicy policy scope create -vserver vs1.example.com
            -policy-name vs1_pol
            -file-extensions-to-include flv, wmv, mp3, mp4

cluster1::> vserver fpolicy policy scope show
           -file-extensions-to-exclude cpp, c, h, txt
```

```
Vserver       Policy          Extensions           Extensions
Name          Name            Included             Excluded
Cluster       cserver_pol    txt                   mp3, wmv
vs1.example.com vs1_pol       flv, wmv, mp3, mp4   cpp, c, h, txt
2 entries were displayed.
```

vserver fpolicy policy scope delete

Delete scope

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver fpolicy policy scope delete command deletes an FPolicy policy scope.
Note: This command is not supported for a Vserver with Infinite Volume.

Parameters

-vserver <Vserver Name> - Vserver
This parameter specifies the name of the Vserver from which you want to delete the FPolicy policy scope.

-policy-name <Policy name> - Policy
This parameter specifies the name of the FPolicy policy for which you want to delete the scope.

Examples

The following example deletes a scope of an FPolicy policy.

```
cluster1::> vserver fpolicy policy scope delete -vserver vs1.example.com -policy-name vs1_pol
```

vserver fpolicy policy scope modify

Modify scope

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver fpolicy policy scope modify command modifies an FPolicy scope for an FPolicy policy. A scope defines the boundaries on which the FPolicy policy will apply. The Vserver is the basic scope boundary. When you modify a scope for an FPolicy policy, you must define the FPolicy policy to which it will apply and you must designate to which Vserver you want to apply the scope. There are a number of parameters that further restrict the scope within the specified Vserver. You can restrict the scope by specifying what to include in the scope. Or you can restrict the scope by specifying what to exclude from the scope. For example, you can restrict the scope by specifying which volumes to include using the -volumes-to-include parameter or which volumes to exclude using the -volumes-to-exclude parameter. Once you apply a scope to an enabled policy, policy event checks get applied to the scope defined by this command.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters

-vserver <Vserver Name> - Vserver
This parameter specifies the name of the Vserver on which you want to modify an FPolicy policy scope.

-policy-name <Policy name> - Policy
This parameter specifies the name of the FPolicy policy for which you want to modify the scope.

[-shares-to-include <Share name>, ...] - Shares to Include
This parameter specifies a list of shares for file access monitoring. With this option, the administrator provides a list of shares, separated by commas. For file access events relative to the specified shares and file operations monitored by the FPolicy policy, a notification is generated. The -shares-to-include parameter can contain regular expressions and can include metacharacters such as "?" and "."

Note: When a share is included in the -shares-to-include parameter and the parent volume of the share is included in the -volumes-to-exclude parameter, -volumes-to-exclude has precedence over -shares-to-include.

[-shares-to-exclude <Share name>, ...] - Shares to Exclude
This parameter specifies a list of shares to exclude from file access monitoring. With this option, the administrator provides a list of shares, separated by commas. When a share is specified in the -shares-to-
exclude parameter, no notification is sent for files accessed relative to that share. The -shares-to-
exclude parameter can contain regular expressions and can include metacharacters such as "?" and "*".

[-volumes-to-include <volume name>, ...] - Volumes to Include
This parameter specifies a list of volumes for file access monitoring. With this option, the administrator
provides a list of volumes, separated by commas. For file access events within the volume and file operations
monitored by the FPolicy policy, a notification is generated. The -volumes-to-include parameter can
contain regular expressions and can include metacharacters such as "?" and "*".

Note: When a share is included in the -shares-to-include parameter and the parent volume of the share
is included in the -volumes-to-exclude parameter, -volumes-to-exclude has precedence over -
shares-to-include. Similarly, when an export policy is included in the -export-policies-to-
include parameter and the parent volume of the export-policy is included in the -volumes-to-exclude
parameter, -volumes-to-exclude has precedence over -export-policies-to-include.

[-volumes-to-exclude <volume name>, ...] - Volumes to Exclude
This parameter specifies a list of volumes to exclude from file access monitoring. With this option, the
administrator provides a list of volumes, separated by commas, for which no file access notifications are
generated. The -volumes-to-exclude parameter can contain regular expressions and can include
metacharacters such as "?" and "*".

Note: When a share is included in the -shares-to-include parameter and the parent volume of the share
is included in the -volumes-to-exclude parameter, -volumes-to-exclude has precedence over -
shares-to-include. Similarly, when an export policy is included in the -export-policies-to-
include parameter and the parent volume of the export-policy is included in the -volumes-to-exclude
parameter, -volumes-to-exclude has precedence over -export-policies-to-include.

[-export-policies-to-include <FPolicy export policy>, ...] - Export Policies to Include
This parameter specifies a list of export policies for file access monitoring. With this option, the administrator
provides a list of export policies, separated by commas. For file access events within an export policy and file
operations monitored by the FPolicy policy, a notification is generated. The -export-policies-to-
include parameter can contain regular expressions and can include metacharacters such as "?" and "*".

Note: When an export policy is included in the -export-policies-to-include parameter and the
parent volume of the export policy is included in the -volumes-to-exclude parameter, -volumes-to-
exclude has precedence over -export-policies-to-include.

[-export-policies-to-exclude <FPolicy export policy>, ...] - Export Policies to Exclude
This parameter specifies a list of export policies to exclude from file access monitoring. With this option, the
administrator provides a list of export policies, separated by commas, for which no file access notification is
sent. The -export-policies-exclude parameter can contain regular expressions and can include
metacharacters such as "?" and "*".

[-file-extensions-to-include <File extension>, ...] - File Extensions to Include
This parameter specifies a list of file extensions, separated by commas, for a given FPolicy policy for which
FPolicy processing is required. Any file access to files with the same extensions included in the -file-
extensions-to-include parameter generates a notification. The -file-extensions-to-include parameter can contain regular expressions and can include metacharacters such as "?".

[-file-extensions-to-exclude <File extension>, ...] - File Extensions to Exclude
This parameter specifies a list of file extensions, separated by commas, for a given FPolicy policy for which
FPolicy processing will be excluded. Using the exclude list, the administrator can request notification for all
extensions except those in the excluded list. Any file access to files with the same extensions included in the -
file-extensions-to-exclude parameter does not generate a notification. The -file-extensions-to-
exclude parameter can contain regular expressions and can include metacharacters such as "?".

Note: An administrator can specify both -file-extensions-to-include and -file-extensions-
to-exclude lists. The -file-extensions-to-exclude parameter is checked first before the -file-
extensions-to-exclude parameter is checked.

[-is-file-extension-check-on-directories-enabled {true|false}] - Is File Extension Check on
Directories Enabled (privilege: advanced)
This parameter specifies whether the file name extension checks apply to directory objects as well. If this
parameter is set to true, the directory objects are subjected to same extension checks as regular files. If this
parameter is set to false, the directory names are not matched for extensions and notifications would be sent for directories even if their name extensions do not match. By default, it is \textit{false}.

\textbf{[-is-monitoring-of-objects-with-no-extension-enabled \{true|false\}]} - Is Monitoring of Objects with No Extension Enabled (privilege: advanced)

This parameter specifies whether the extension checks apply to objects with no extension as well. If this parameter is set to true, the objects with no extension are also monitored along with the objects with extension. By default, it is \textit{false}.

\textbf{Note:} This parameter is ignored when file-extensions-to-include and file-extensions-to-exclude lists are empty.

\textbf{vserver fpolicy policy scope show}

Display scope

\textbf{Availability:} This command is available to \textit{cluster} and \textit{Vserver} administrators at the \textit{admin} privilege level.

\textbf{Description}

The \texttt{vserver fpolicy policy scope show} command displays scope information about all FPolicy policies belonging to the Vserver. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all FPolicy scopes:

- Vserver name
- Policy name
- The file extensions to include
- The file extensions to exclude

You can use the \texttt{-fields} parameter to specify which fields of information to display about FPolicy scopes. In addition to the fields above, you can display the following fields:

- The shares to include
- The shares to exclude
- The volumes to include
- The volumes to exclude
- The export policies to include
- The export policies to exclude
- Whether file extension check on directories is enabled
- Whether monitoring of objects with no extension is enabled

You can specify specific parameters to display only information that matches those parameters. For example, to display scope information only about all FPolicy policies where the `-file-extensions-to-include` parameter is set to txt, run the command with the `-fields` parameter set to policy-name and `-file-extensions-to-include` parameter set to txt.

You can specify the `-instance` parameter to display scope information for all FPolicy policies in a list format.

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**

`[-fields <fieldname>, ...]`
If you specify the `-fields <fieldname>, ...` parameter, the command only displays the fields that you specify.

`[-instance]`
If you specify the `-instance` parameter, the command displays detailed information about all entries.

`[-vserver <Vserver Name>] - Vserver`
If you specify this parameter, the command displays scope information only about the FPolicy policies for the specified Vserver.

`[-policy-name <Policy name>] - Policy`
If you specify this parameter, the command displays information only about the specified FPolicy policy.

`[-shares-to-include <Share name>, ...] - Shares to Include`
If you specify this parameter, the command displays scope information only about the FPolicy policy or policies that use the specified share or shares in the include list.

`[-shares-to-exclude <Share name>, ...] - Shares to Exclude`
If you specify this parameter, the command displays scope information only about the FPolicy policy or policies that use the specified share or shares in the exclude list.

`[-volumes-to-include <volume name>, ...] - Volumes to Include`
If you specify this parameter, the command displays scope information only about the FPolicy policy or policies that use the specified volume or volumes in the include list.

`[-volumes-to-exclude <volume name>, ...] - Volumes to Exclude`
If you specify this parameter, the command displays scope information only about the FPolicy policy or policies that use the specified volume or volumes in the exclude list.

`[-export-policies-to-include <FPolicy export policy>, ...] - Export Policies to Include`
If you specify this parameter, the command displays scope information only about the FPolicy policy or policies that use the specified export policy or policies in the include list.

`[-export-policies-to-exclude <FPolicy export policy>, ...] - Export Policies to Exclude`
If you specify this parameter, the command displays scope information only about the FPolicy policy or policies that use the specified export policy or policies in the exclude list.

`[-file-extensions-to-include <File extension>, ...] - File Extensions to Include`
If you specify this parameter, the command displays scope information only about the FPolicy policy or policies that use the specified file extension or extensions in the include list.
[-file-extensions-to-exclude <File extension>, ...] - File Extensions to Exclude

If you specify this parameter, the command displays scope information only about the FPolicy policy or policies that use the specified file extension or extensions in exclude list.

[-is-file-extension-check-on-directories-enabled {true|false}] - Is File Extension Check on Directories Enabled (privilege: advanced)

If you specify this parameter, the command displays scope information only about the FPolicy policy or policies that use the specified file extension check on directories. If set to true, the command displays information about scopes where file extension checks on directories is enabled. If set to false, the command displays information about scopes where file extension checks on directories is disabled.

[-is-monitoring-of-objects-with-no-extension-enabled {true|false}] - Is Monitoring of Objects with No Extension Enabled (privilege: advanced)

If you specify this parameter, the command displays scope information only about the FPolicy policy or policies that use the specified monitoring of objects with no extension setting. If set to true, the command displays information about scope of policy or policies for which monitoring of objects with no extension is enabled.

Examples

The following example displays scope information about FPolicy policies.

```
cluster1::> vserver fpolicy policy scope show
Vserver   Policy     Extensions     Extensions
Name      Name          Included       Excluded
----------------- ------------------- -------------------- -------------------
Cluster   cserver_pol  -               -                    -
vs1.example.com   p     -               -                    -
vs1.example.com   vs1_pol  mp3           -                    -
3 entries were displayed.
```

vserver group-mapping commands

The group-mapping directory

vserver group-mapping create

Create a group mapping

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver group-mapping create command creates a group mapping. Group mappings are applied in the order in which they occur in the priority list; for example, a group mapping that occurs at position 2 in the priority list is applied before a group mapping that occurs at position 3. Each mapping direction (Kerberos-to-UNIX, Windows-to-UNIX, and UNIX-to- Windows) has its own priority list. Data ONTAP prevents you from creating two group mappings with the same pattern. Patterns can be expressed as POSIX regular expressions. For information about regular expressions, see the UNIX reference page for regex(7).

Each Vserver can have up to 1024 group mappings in each direction.

The vserver group-mapping create command is not supported on Vservers with FlexVol volumes.
**Note:** If you are using the CLI, you must delimit all regular expressions with double quotation marks ("). For instance, to enter the regular expression (.+) in the CLI, type "(.+) " at the command prompt. To add a "?" to the expression, press ESC followed by the "?".

### Parameters

- **-vserver <vserver name> - Vserver**
  
  This parameter specifies the Vserver on which you want to create the group mapping.

- **-direction {krb-unix|win-unix|unix-win} - Name Mapping Direction**
  
  This parameter specifies the direction of the group mapping. Possible values are krb-unix for a Kerberos-to-UNIX group mapping, win-unix for a Windows-to-UNIX group mapping, and unix-win for a UNIX-to-Windows group mapping.

- **-position <integer> - Position**
  
  This parameter specifies the group mapping's position in the priority list. Specify the position as a positive integer.

  **Note:** If you want to create a new group mapping at a position that is already occupied in the priority list, use the **vserver group-mapping insert** command instead of the **vserver group-mapping create** command.

- **-pattern <text> - Pattern**
  
  This parameter specifies the pattern you want to match. Refer to the command description section for details. The pattern can be up to 256 characters in length.

- **-replacement <text> - Replacement**
  
  This parameter specifies the replacement pattern. The replacement pattern can be up to 256 characters in length.

### Examples

The following example creates a group mapping on a Vserver named vs1. The mapping is from UNIX to Windows at position 5 in the priority list. The mapping maps the pattern cifs to the replacement EXAMPLE\Domain Groups.

```
cluster1::> vserver group-mapping create -vserver vs1 -direction unix-win -position 5 -pattern cifs -replacement "EXAMPLE\Domain Groups"
```

### Related references

**vserver group-mapping insert** on page 1829

### vserver group-mapping delete

Delete a group mapping

**Availability:** This command is available to **cluster** and **Vserver** administrators at the **admin** privilege level.

**Description**

The **vserver group-mapping delete** command deletes a group mapping.

The **vserver group-mapping delete** command is not supported on Vservers with FlexVol volumes.

**Parameters**

- **-vserver <vserver name> - Vserver**
  
  This parameter specifies the Vserver from which you want to delete the group mapping.
-direction {krb-unix|win-unix|unix-win} - Name Mapping Direction
   This parameter specifies the direction of the group mapping that you want to delete.

-position <integer> - Position
   This parameter specifies the position of the group mapping that you want to delete. Specify the position as a positive integer.

Examples
The following example deletes a group mapping on a Vserver named vs1. The group mapping is from UNIX to Windows and is at position 5.

```bash
cluster1::> vserver group-mapping delete -vserver vs1 -direction unix-win -position 5
```

vserver group-mapping insert
Create a group mapping at a specified position

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver group-mapping insert command creates a group mapping at a specified position in the priority list. The command rearranges the list as needed to accommodate the new entry. For instance, if you have a priority list of five mappings and insert a new mapping at position 3, the mapping previously at position 3 is moved to position 4, the mapping previously at position 4 is moved to position 5, and the mapping previously at position 5 is moved to position 6. Each mapping direction (Kerberos-to-UNIX, Windows-to-UNIX, and UNIX-to-Windows) has its own priority list.

You can specify patterns as POSIX regular expressions. For information about regular expressions, see the UNIX reference page for regex(7).

Each Vserver can have up to 1024 group mappings in each direction.

The vserver group-mapping insert command is not supported on Vservers with FlexVol volumes.

Note: If you are using the CLI, you must delimit all regular expressions with double quotation marks ("). For instance, to enter the regular expression (.+) in the CLI, type "(.+)" at the command prompt. To add a "?" to the expression, press ESC followed by the "?".

Parameters
-vserver <vserver name> - Vserver
   This parameter specifies the Vserver on which you want to create the group mapping.

-direction {krb-unix|win-unix|unix-win} - Name Mapping Direction
   This parameter specifies the direction of the group mapping. Possible values are krb-unix for a Kerberos-to-UNIX group mapping, win-unix for a Windows-to-UNIX group mapping, and unix-win for a UNIX-to-Windows group mapping.

-position <integer> - Position
   This parameter specifies the position in the priority list at which you want to insert the new group mapping. Specify a position as a positive integer.

-pattern <text> - Pattern
   This parameter specifies the pattern you want to match. Refer to the command description section for details. The pattern can be up to 256 characters in length.
-replacement <text> - Replacement

This parameter specifies the replacement pattern. The replacement pattern can be up to 256 characters in length.

Examples

The following example creates a group mapping on a Vserver named vs1. It is a group mapping from Kerberos to UNIX. It is inserted into the priority list at position 2. The group mapping maps any principal in the Kerberos realm SEC.EXAMPLE.COM to the UNIX group name corresponding to the principal's base name with any instance names removed; for example, artists/admin@SEC.EXAMPLE.COM is mapped to artists.

```
cluster1::> vserver group-mapping insert -vserver vs1 -direction krb-unix -position 2 -pattern "([^@/]++)/([^@]+)?@SEC.EXAMPLE.COM" -replacement "\""
```

vserver group-mapping modify

Modify a group mapping's pattern, replacement pattern, or both

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver group-mapping modify command modifies the pattern, the replacement pattern, or both of a specified group mapping.

You can specify patterns as POSIX regular expressions. For information about regular expressions, see the UNIX reference page for regex(7).

Each Vserver can have up to 1024 group mappings in each direction.

The vserver group-mapping modify command is not supported on Vservers with FlexVol volumes.

Note: If you are using the CLI, you must delimit all regular expressions with double quotation marks ("'). For instance, to enter the regular expression (\+) in the CLI, type "(\+)" at the command prompt. To add a "\?" to the expression, press ESC followed by the "\"".

Parameters

- vserver <vserver name> - Vserver
  This parameter specifies the Vserver on which you want to modify the group mapping.

- direction {krb-unix|win-unix|unix-win} - Name Mapping Direction
  This parameter specifies the direction of the group mapping. Possible values are krb-unix for a Kerberos-to-UNIX group mapping, win-unix for a Windows-to-UNIX group mapping, and unix-win for a UNIX-to-Windows group mapping.

- position <integer> - Position
  This parameter specifies the group mapping's position in the priority list. A position is specified as a positive integer. Each mapping direction (Kerberos-to-UNIX, Windows-to-UNIX, and UNIX-to-Windows) has its own priority list.

- [pattern <text>] - Pattern
  This parameter specifies the pattern you want to match. Refer to the command description section for details. The pattern can be up to 256 characters in length.

- [replacement <text>] - Replacement
  This parameter specifies the replacement pattern. The replacement pattern can be up to 256 characters in length.
Examples
The following example modifies the group mapping on the Vserver named vs1 and direction win-unix, at position 3. The pattern to be matched is changed to "EXAMPLE\(.+\)".

```
cluster1::> vserver group-mapping modify -vserver vs1 -direction win-unix -position 3 -pattern "EXAMPLE\(.+\)"
```

vserver group-mapping show
Display group mappings

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver group-mapping show command displays information about group mappings. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all group mappings:

- Vserver name
- Direction of the mapping (krb-unix for Kerberos-to-UNIX, win-unix for Windows-to-UNIX, or unix-win for UNIX-to-Windows)
- Position of the mapping in the priority list
- Pattern to be matched
- Replacement pattern

You can specify additional parameters to display only information that matches those parameters. For instance, to display information only about Kerberos-to-UNIX group mappings, run the command with the -direction krb-unix parameter.

The vserver group-mapping show command is not supported on Vservers with FlexVol volumes.

Parameters
```
[-fields <fieldname>, ...]  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance ]]  If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver  If you specify this parameter, the command displays information only about the group mapping or mappings that match the specified Vserver.

[-direction {krb-unix|win-unix|unix-win}] - Name Mapping Direction  If you specify this parameter, the command displays information only about the group mapping or mappings that have the specified mapping direction.

[-position <integer>] - Position  If you specify this parameter, the command displays information only about the group mapping that has the specified position in the priority list.
```
[-pattern <text>] - Pattern

If you specify this parameter, the command displays information only about the group mapping or mappings
that use the specified matching pattern. The pattern can be up to 256 characters in length. Refer to the
command description section for details.

[-replacement <text>] - Replacement

If you specify this parameter, the command displays information only about the group mapping or mappings
that use the specified replacement pattern.

Examples

The following example displays information about all group mappings:

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Direction</th>
<th>Position</th>
<th>Pattern:</th>
<th>Replacement:</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>
<td>win-unix</td>
<td>1</td>
<td>EXAMPLE\artists</td>
<td>nobody</td>
</tr>
<tr>
<td>vs1</td>
<td>unix-win</td>
<td>1</td>
<td>EXAMPLE(.+)</td>
<td>_1</td>
</tr>
<tr>
<td>vs2</td>
<td>win-unix</td>
<td>1</td>
<td>(.+)</td>
<td>EXAMPLE\artists</td>
</tr>
</tbody>
</table>

vserver group-mapping swap

Exchange the positions of two group mappings

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver group-mapping swap command exchanges the positions of two group mappings in the priority list.

The vserver group-mapping swap command is not supported on Vservers with FlexVol volumes.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the Vserver on which the group mappings are located.

-direction {krb-unix|win-unix|unix-win} - Name Mapping Direction

This parameter specifies the direction of the group mappings that you want to exchange. Each mapping
direction (Kerberos-to-UNIX, Windows-to-UNIX, and UNIX-to-Windows) has its own priority list.

-position <integer> - Position

This parameter specifies the position in the priority list of the first group mapping that you want to exchange.
Specify a position as a positive integer.

-with-position <integer> - Position of an existing group mapping entry in the list of group mappings for this
Vserver. This entry will be swapped with the entry at 'position'.

This parameter specifies the position in the priority list of the second group mapping that you want to exchange.
Specify a position as a positive integer.

Examples

The following example exchanges the positions of two group mappings on a Vserver named vs1. The group mappings
have the direction Windows-to-UNIX. The group mappings are exchanged between positions 2 and 4.

cluster1::> vserver group-mapping swap -vserver vs1 -direction win-unix -position 2 -with-position 4
vserver iscsi commands

Manage the iSCSI services on a Vserver

Commands used to manage the iSCSI service of a Vserver.

vserver iscsi create

Create a Vserver's iSCSI service

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command creates an iSCSI target for a specified Vserver. By default the system creates a default iSCSI target name with the status-admin set to enabled. Until you create an iSCSI service, iSCSI initiators cannot log into the Vserver.

Parameters
-vserver <Vserver Name> - Vserver
  Specifies the Vserver for the iSCSI service.

[-target-name <text>] - Target Name (privilege: advanced)
  Specifies an iSCSI target name of a Vserver. This name is unique and is not case sensitive. The target name must conform to this format iqn.1995-08.com.example:string and the following rules:
  - Contains up to 128 bytes.
  - Contains alphanumeric characters. The period ".", hyphen "-", and colon ":" are acceptable.
  - Does not contain the underscore character "_".

[-target-alias <text>] - Target Alias
  Specifies an iSCSI target alias name of a Vserver. The maximum number of characters for an alias name is 128. The alias default name is the Vserver name.

[-status-admin {down|up}] - Administrative Status
  Specifies the administrative status of the iSCSI service of a Vserver. If you set this parameter to up, the command creates an iSCSI service with the administrative status of up. If you set this parameter to down, the command creates an iSCSI service with the administrative status of down.

[-max-error-recovery-level <integer>] - Max Error Recovery Level (privilege: advanced)
  Specifies the maximum error recovery level allowed by the iSCSI service. You can specify 0, 1, or 2, or you can accept the default. The default is zero. The actual error recovery level depends on the negotiated error recovery level between the initiator and the iSCSI target when the session is created.
  - 0 - Session failure recovery
  - 1 - Digest failure recovery
  - 2 - Connection failure recovery

[-retain-timeout <integer>] - RFC3720 DefaultTime2Retain Value (in sec) (privilege: advanced)
  Specifies the wait time before an active task reassignment is possible after an unexpected connection termination. For example, a value of 0 means that the connection or task state is immediately discarded by the target. The default is 20 seconds.

[-login-timeout <integer>] - Login Phase Duration (in sec) (privilege: advanced)
  Specifies the login phase duration. The default is 15 seconds.
[-max-conn-per-session <integer>] - Max Connections per Session (privilege: advanced)
    Specifies the maximum number of connections per session that a target can accept. The default is 4 connections.

[-max-ios-per-session <integer>] - Max Commands per Session (privilege: advanced)
    Specifies the maximum number of commands per session that a target can accept. The default is 128 commands per session.

[-tcp-window-size <integer>] - TCP Receive Window Size (in bytes) (privilege: advanced)
    Specifies the TCP receive window size (in bytes). The default is 131,400 bytes.

[-force | -f [true]] - Allow Non-Vendor Target Name (privilege: advanced)
    Force the command to accept a target name that would normally be rejected as invalid.

Examples

    cluster1::> vserver iscsi create -vserver vs_1

vserver iscsi delete

Delete a Vserver's iSCSI service

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command deletes the iSCSI service from a Vserver.

    Note: You must first disable the service with the command vserver iscsi modify with "-status-admin down" before you can delete the service.

Parameters
-vserver <Vserver Name> - Vserver
    Specifies the Vserver for the iSCSI service.

Examples

    cluster1::> vserver iscsi delete -vserver vs_1

Related references
vserver iscsi modify on page 1834

vserver iscsi modify

Modify a Vserver's iSCSI service

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command modifies the configuration for an iSCSI service.

    Modifications take effect immediately after you execute the command. Making modifications to your service can result in traffic loss on a live system. Call technical support if you are unsure of the possible consequences.
Parameters

\(-vserver <Vserver Name>\) - Vserver

Specifies the Vserver for the iSCSI service.

\([-target-name <text>]\) - Target Name (privilege: advanced)

Specifies an iSCSI target name of a Vserver. This name is unique and is not case sensitive. The target name must conform to this format iqn.1995-08.com.example:string and the following rules:

- Contains up to 128 bytes.
- Contains alphanumeric characters. The period ".", hyphen "-", and colon ":" are acceptable.
- Does not contain the underscore character "_".

**Note:** The iSCSI service must be down in order to change the target name.

\([-target-alias <text>]\) - Target Alias

Specifies the new target alias of the iSCSI service.

\([-clear \ -c [true]]\) - Clear the Target Alias

Clears the current target alias from the iSCSI service configuration.

\([-status-admin \{down|up\}]\) - Administrative Status

Specifies the configured administrative status of a service. If you set this parameter to up, the iSCSI service begins to accept login requests from iSCSI initiators. If you set this parameter to down, iSCSI initiators cannot log in.

\([-max-error-recovery-level <integer>]\) - Max Error Recovery Level (privilege: advanced)

Specifies the maximum error recovery level the iSCSI service negotiates with iSCSI initiators during login phase.

- 0 - Session failure recovery
- 1 - Digest failure recovery
- 2 - Connection failure recovery

\([-retain-timeout <integer>]\) - RFC3720 DefaultTime2Retain Value (in sec) (privilege: advanced)

Specifies the wait time before active task reassignment is possible after an unexpected connection termination. For example, a value of 0 means that the connection or task state is immediately discarded by the target.

\([-login-timeout <integer>]\) - Login Phase Duration (in sec) (privilege: advanced)

Specifies maximum time the login phase remains active until the iSCSI target terminates the connection.

\([-max-conn-per-session <integer>]\) - Max Connections per Session (privilege: advanced)

Specifies the maximum number of connections per session that the iSCSI target can accept.

\([-max-ios-per-session <integer>]\) - Max Commands per Session (privilege: advanced)

Specifies the maximum number of commands per session that the iSCSI target can accept.

\([-tcp-window-size <integer>]\) - TCP Receive Window Size (in bytes) (privilege: advanced)

Specifies the TCP receive window size (in bytes).

A change to the TCP receive window size value takes effect for all network interfaces when you restart the iSCSI service for the Vserver as follows:

```
 vserver iscsi stop -vserver <vserver name>
 vserver iscsi start -vserver <vserver name>
```

If you change an individual network interface from up to down back to up, as follows, the new value for TCP receive window size takes effect for that network interface:
network interface modify -vserver <vserver name> -lif <LIF name> -status-admin down
network interface modify -vserver <vserver name> -lif <LIF name> -status-admin up

[-force | -f [true]] - Allow Non-Vendor Target Name (privilege: advanced)
Force the command to accept a target name that would normally be rejected as invalid.

Examples
Specifies the TCP receive window size (in bytes).
A change to the TCP receive window size value takes effect for all network interfaces when you restart the iSCSI service for the Vserver as follows:

vserver iscsi stop -vserver <vserver name>
vserver iscsi start -vserver <vserver name>

If you change an individual network interface from up to down back to up, as follows, the new value for TCP receive window size takes effect for that network interface:

network interface modify -vserver <vserver name> -lif <LIF name> -status-admin down
network interface modify -vserver <vserver name> -lif <LIF name> -status-admin up

cluster1::> vserver iscsi modify -vserver vs_1 -status-admin down

Related references
vserver iscsi stop on page 1838
vserver iscsi start on page 1838
network interface modify on page 342

vserver iscsi show
Display a Vserver's iSCSI configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command displays the current configuration of the iSCSI service.

Parameters

[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance ]
If you specify the -instance parameter, the command displays detailed information about all fields.

-[vserver <Vserver Name>] - Vserver
Selects the iSCSI services for the Vserver that matches the parameter value.

-[target-name <text>] - Target Name
Selects the iSCSI services with a target name that matches the parameter value.
[-target-alias <text>] - Target Alias
Selects the iSCSI services with a target alias that matches the parameter value.

[-status-admin (down|up)] - Administrative Status
Selects the iSCSI services with a configured status that matches the parameter value.

[-max-error-recovery-level <integer>] - Max Error Recovery Level (privilege: advanced)
Selects the iSCSI services with a maximum error recovery level that matches the parameter value.

[-retain-timeout <integer>] - RFC3720 DefaultTime2Retain Value (in sec) (privilege: advanced)
Selects the iSCSI services with a wait time that matches the parameter value. The wait time is the amount of time before active task reassignment is possible after an unexpected connection termination.

[-login-timeout <integer>] - Login Phase Duration (in sec) (privilege: advanced)
Selects the iSCSI services with a login phase duration that matches the parameter value.

[-max-conn-per-session <integer>] - Max Connections per Session (privilege: advanced)
Selects the iSCSI services with a maximum connection per session that matches the parameter value.

[-max-ios-per-session <integer>] - Max Commands per Session (privilege: advanced)
Selects the iSCSI services with a maximum number of commands per session that matches the parameter value.

[-tcp-window-size <integer>] - TCP Receive Window Size (in bytes) (privilege: advanced)
Selects the iSCSI services with a TCP receive window size (in bytes) that matches the parameter value.

### Examples

```bash
cluster1::> vserver iscsi show
Target                           Target                       Status
Vserver    Name                             Alias                        Admin
---------- -------------------------------- ---------------------------- ------
vs_1       iqn.1992-08.com.example:sn.c7c82a22bf9f11df83e5123478563412:vs.2
vs_1_alias                   up
1 entries were displayed.

cluster1::> vserver iscsi show -instance

Vserver: vs_1
Target Name: iqn.1992-08.com.example:sn.c7c82a22bf9f11df83e5123478563412:vs.2
Target Alias: vs_1_alias
Administrative Status: up
1 entries were displayed.
```

Displays the output of the show command at the admin privilege level.

```bash
cluster1::*> vserver iscsi show
Target                           Target                       Status
Vserver    Name                             Alias                        Admin
---------- -------------------------------- ---------------------------- ------
vs_1       iqn.1992-08.com.example:sn.c7c82a22bf9f11df83e5123478563412:vs.2
vs_1_alias                   up
1 entries were displayed.

cluster1::*> vserver iscsi show -instance

Vserver: vs_1
Target Name: iqn.
```

Displays the output of the show command at the advanced privilege level.
vserver iscsi start

Starts the iSCSI service

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command starts the iSCSI service of a Vserver. You can also use vserver iscsi modify with "-status-admin up".

Parameters
-vserver <Vserver Name> - Vserver
Specifies the Vserver for the iSCSI service.

Examples

cluster1::> vserver iscsi start -vserver vs_1

Related references
vserver iscsi modify on page 1834

vserver iscsi stop

Stops the iSCSI service

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
Stops the iSCSI service of a Vserver. This command shuts down all active iSCSI sessions and stops any new iSCSI sessions. You can also use vserver iscsi modify with "-status-admin down".

Parameters
-vserver <Vserver Name> - Vserver
Specifies the Vserver for the iSCSI service.

Examples

cluster1::> vserver iscsi stop -vserver vs_1

Related references
vserver iscsi modify on page 1834
vserver iscsi connection commands

The connection directory

Commands used for managing iSCSI connections.

vserver iscsi connection show

Display active iSCSI connections

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command displays iSCSI connection information within a session. If you do not specify a connection, the command displays all information for all connections.

An active iSCSI session can contain one or multiple iSCSI connections. If an iSCSI connection has not completed the iSCSI login sequence, the iSCSI session might not contain iSCSI connections.

This command gives real-time status of connection activity. You can use the parameters header-digest-enabled and data-digest-enabled to troubleshoot performance problems.

Parameters

{ [-fields <fieldname>, ...] 
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]] 
If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver
Use this parameter to display iSCSI connections that match the Vserver that you specify.

[-tpgroup <text>] - Target Portal Group
Use this parameter to display iSCSI connections that match the target portal group that you specify.

[-tsih <integer>] - Target Session ID
Use this parameter to display iSCSI connections that match the target session ID that you specify.

[-connection-id <integer>] - Connection ID
Use this parameter to display iSCSI connections that match the connection ID that you specify.

[-connection-state <iSCSI Connection State>] - Connection State
Use this parameter to display iSCSI connections that match the connection state you specify.

[-has-session {true|false}] - Connection Has session
Specifies if a session is established for a connection. If you enter this command using the parameter without a value, it is set to true, and the command displays all connections that have an established session. If you set this parameter to false, the command displays all connections that do not have established sessions.

[-lif <text>] - Logical interface
Use this parameter to display iSCSI connections that match the logical interface that you specify.

[-tpgroup-tag <integer>] - Target Portal Group Tag
Use this parameter to display iSCSI connections that use the target portal group tag that you specify.

[-local-address <text>] - Local IP Address
Use this parameter to display iSCSI connections that use the local IP address that you specify.
## Examples

```bash
cluster1::> vserver iscsi connection show -vserver vs1

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Name</th>
<th>Tpgroup</th>
<th>Conn</th>
<th>Local Address</th>
<th>Remote Address</th>
<th>TCP Recv Size</th>
</tr>

</tr>
</tbody>
</table>

2 entries were displayed.
```

### vserver iscsi connection shutdown

Shut down a connection on a node

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `advanced` privilege level.

**Description**

This command shuts down a specified iSCSI connection within a session. If you want to shut down all iSCSI connections in a session, use the `vserver iscsi session shutdown` command.

**Parameters**

- `vserver <Vserver Name>` - *Vserver*

  Specifies the Vserver.
-tpgroup <text> - Target Portal Group
  Specifies the target portal group that contains the connection you want to shut down.

-tsih <integer> - Target Session ID
  Specifies the target session ID that you want to shut down.

-connection-id <integer> - Connection ID
  Specifies the connection ID that you want to shut down.

Examples

cluster1::*> vserver iscsi connection shutdown -vserver vs_1 -tpgroup tpgroup_1 -tsih 4 -
  connection-id 0

vserver iscsi command commands

The command directory
Commands used to manage active iSCSI commands.

vserver iscsi command show

Display active iSCSI commands

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command displays the status of active iSCSI commands in an iSCSI session. If you specify an iSCSI command ID, the
command shows what commands are active in a session and is useful for initiator debugging.

Parameters

{ -fields <fieldname>, ...
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified
  field or fields. You can use '-fields ?' to display the fields to specify.

  | -instance }
  If you specify the -instance parameter, the command displays detailed information about all fields.

-<vserver > <Vserver Name> - Vserver
  Use this parameter to display a list of active iSCSI commands that match the Vserver name that you specify.

-<tpgroup > <text> - Target Portal Group
  Use this parameter to display a list of active iSCSI commands that are within the target portal group.

-<tsih > <integer> - Target Session ID
  Use this parameter to display a list of active iSCSI commands that match the target session ID handle that you
  specify.

-<command-id > <integer> - Command ID
  Use this parameter to display a list of active iSCSI commands that match the command ID that you specify.

-<initiator-name > <text> - Initiator Name
  Use this parameter to display a list of active iSCSI commands that match the initiator name that you specify.
[-initiator-alias <text>] - Initiator Alias
Use this parameter to display a list of active iSCSI commands that match the initiator alias that you specify.

[-sid <text>] - Initiator Session ID
Use this parameter to display a list of active iSCSI commands that match the initiator session ID that you specify.

[-command-sub-id <integer>] - Command Sub ID
Use this parameter to display a list of active iSCSI commands that match the command sub ID that you specify.

[-command-state <iSCSI Command States>] - Command State
Use this parameter to display a list of active iSCSI commands that match the command state that you specify.

[-command-type {Sequenced|Imm_Taskmgmt|Imm_Other}] - Command Type
If you use this parameter, the command displays a list of active iSCSI commands that contains the specified command type. The command types indicate:

- "Sequenced" -- the system processes the commands in sequence
- "Imm_Taskmgmt" -- the system processes the commands immediately
- "Imm_Other" -- the system processes the commands as queued

Examples

```
cluster1::> vserver iscsi command show -instance -vserver vs_1
Vserver: vs_1
Target Portal Group Name: tpgroup_1
Target Session ID: 2
Command ID: 20797
Initiator Name: iqn.1993-08.org.debian:01:fa752b8a5a3a
Initiator Alias: alias_1
Initiator Session ID: 00:02:3d:01:00:00
Command Sub ID: 20797
Command State: Scsicdb_Waiting_STLayer
Command Type: Sequenced
```

vserver iscsi initiator commands
The initiator directory
Commands used for managing the initiators connected to SAN targets.

vserver iscsi initiator show
Display iSCSI initiators currently connected

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command displays a list of active initiators currently connected to a specified Vserver.

Parameters

{ [-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.}
If you specify the \texttt{-instance} parameter, the command displays detailed information about all fields.

\textbf{\texttt{-vserver <Vserver Name>}} - Vserver
Use this parameter to display the active initiators that match the Vserver that you specify.

\textbf{\texttt{-tpgroup <text>}} - Target Portal Group
Use this parameter to display the active initiators that match the name of the target portal group that you specify.

\textbf{\texttt{-tsih <integer>}} - Target Session ID
Use this parameter to display the active initiators that match the target session ID you specify.

\textbf{\texttt{-initiator-name <text>}} - Initiator Name
Use this parameter to display the active initiators that match the initiator name that you specify.

\textbf{\texttt{-initiator-alias <text>}} - Initiator Alias
Use this parameter to display the active initiators that match the alias name that you specify.

\textbf{\texttt{-tpgroup-tag <integer>}} - TPGroup Tag
Use this parameter to display the active initiators that match the target portal group tag that you specify.

\textbf{\texttt{-isid <text>}} - Initiator Session ID
Use this parameter to display the active initiators that match the initiator session ID that you specify.

\textbf{\texttt{-igroup <text>,...}} - Igroup Name
Use this parameter to display the active initiators that match the initiator group that you specify.

\textbf{Examples}

```
cluster1::> vserver iscsi initiator show -vserver vs_1
  Tpgroup Initiator
  Vserver Name       TSIH Name                  ISID              IGroup
  ------- -------- ---- --------------------- ----------------- ------------------
   vs_1    vs_1.iscsi  6 iqn.1994-05.com.redhat:6ed6dfb0489e00:02:3d:03:00:00 -
   vs_1    vs_1.iscsi  7 iqn.1993-08.org.debian:01:fa752b8a5a3a00:02:3d:01:00:00 igroup_1
```

\textbf{vserver iscsi interface commands}

The interface directory

Commands used to manage iSCSI data logical interfaces.

\textbf{vserver iscsi interface disable}

Disable the specified interfaces for iSCSI service

\textbf{Availability:} This command is available to \textit{cluster} and \textit{Vserver} administrators at the \textit{admin} privilege level.

\textbf{Description}

This command disables the specified logical interfaces for an iSCSI service. Once disabled, all subsequent attempts to establish new iSCSI connections over the logical interface will fail.

\textbf{Parameters}

\textbf{\texttt{-vserver <Vserver Name>}} - Vserver

Specifies the Vserver.
vserver iscsi interface disable

Enable the specified interfaces for iSCSI service

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command enables specified logical interfaces for iSCSI Vserver service. Once enabled, your system accepts new iSCSI connections and services iSCSI requests over the newly enabled logical interfaces.

Parameters
-vserver <Vserver Name> - Vserver
  Specifies the Vserver.

{lif <lif-name>, ...} - Logical Interface
  Specifies the logical interfaces on a Vserver that you want to disable.

-all | -a {true} - All
  Specifies that all logical interfaces on the Vserver are disabled.

-force | -f {true} - Force
  When set to true, forces the termination of any active iSCSI sessions without prompting you for a confirmation.

Examples

cluster1::> vserver iscsi interface disable -vserver vs_1 -lif vs_1.iscsi

vserver iscsi interface enable

Modify network interfaces used for iSCSI connectivity

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The vserver iscsi interface modify command modifies the iSCSI specific configuration for an iSCSI LIF.

Parameters
-vserver <Vserver Name> - Vserver
  Specifies the Vserver.

{lif <lif-name>, ...} - Logical Interface
  Use this parameter to specify the logical interface on a Vserver that you want to modify.

Examples

cluster1::> vserver iscsi interface enable -vserver vs_1 -lif vs_1.iscsi
[-sendtargets-fqdn <text>] - iSCSI Discovery SendTargets FQDN

Use this parameter to specify the Fully Qualified Domain Name (FQDN) to return during an iSCSI Discovery SendTargets operation. To clear the FQDN, set this parameter to "". If unset, the IP address of the LIF is used in iSCSI SendTargets discovery.

This is not part of iSNS and will not affect the iSNS configuration.

Related references

    network interface modify on page 342

vserver iscsi interface show

Show network interfaces used for iSCSI connectivity

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

This command shows the iSCSI logical interfaces for a specified Vserver. If you do not specify any of the parameters, the command displays all of the interfaces on a Vserver.

Parameters

    { [-fields <fieldname>, ...]
      If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.
    |
      [-instance ]
      If you specify the -instance parameter, the command displays detailed information about all fields.

    [-vserver <Vserver Name>] - Vserver
      Use this parameter to display iSCSI logical interfaces that match the Vserver that you specify.

    [-lif <lif-name>] - Logical Interface
      Use this parameter to display iSCSI logical interfaces that that you specify.

    [-status-admin {up|down}] - Administrative Status
      Specifies the configured status of the logical interface. If you set this parameter to up, the command displays all iSCSI logical interfaces with the administrative status of up. If you set this parameter to down, the command displays all the iSCSI logical interfaces with the administrative status of down.

    [-status-oper {up|down}] - Operational Status
      Specifies the current status of the logical interface. If you set this parameter to up, the command displays all the iSCSI logical interfaces with the operational status of up. If you set this parameter to down, the command displays all the iSCSI logical interfaces with the operational status of down.

    [-enabled {true|false}] - Enabled
      Specifies if this logical unit is enabled for iSCSI service. If you enter this command without a parameter, its effective value is true, and the command displays all the enabled iSCSI logical interfaces.
[-address <IP Address>] - IP Address
Use this parameter to display iSCSI logical interfaces that match the IP address that you specify.

[-ip-port <integer>] - IP Port Number
Use this parameter to display iSCSI logical interfaces that match IP port number for the logical interface that you specify.

[-curr-node <nodename>] - Current Node
Use this parameter to display iSCSI logical interfaces that match current node that you specify.

[-curr-port <netport>|<ifgrp>] - Current Port
Use this parameter to display iSCSI logical interfaces that match specified current physical port that you specify.

[-is-home [true|false]] - Is Home
Specifies if the node hosting the logical interface is the initially configured node. If you use this command without using this parameter, it is set to true, and the command displays all iSCSI interfaces that are on the initially configured node.

[-tpgroup <text>] - TPGroup Name
Use this parameter to display iSCSI logical interfaces that match the target portal group name that you specify.

[-tpgroup-tag | -t <integer>] - TPGroup Tag
Use this parameter to display iSCSI logical interfaces that match the target portal group tag that you specify.

[-relative-port-id <integer>] - Relative Port ID
Use this parameter to display the iSCSI logical interface that matches the relative target port ID that you specify. The system assigns each logical interfaces and target portal group a relative target port ID that is Vserver unique. You cannot change this ID.

[-sendtargets-fqdn <text>] - iSCSI Discovery SendTargets FQDN (privilege: advanced)
Use this parameter to display the iSCSI logical interfaces that match the iSCSI Discovery SendTargets Fully Qualified Domain Name (FQDN) that you specify.

Examples
The following example displays information for logical interfaces on Vserver vs_1.

```
cluster1::> vserver iscsi interface show -vserver vs_1
 Vserver Logical Interface Status TPGT Admin/Oper Address Curr Node Port Enabled
---------- ---------- ---------- --------------- ----------- ---- -------
 vs_1 vs_1.iscsi 1027   up/up 10.63.8.165 node1       e0c  true
 vs_1 vs_1.iscsi2 1028   up/up 10.63.8.166 node1       e0c  true
 2 entries were displayed.
```

The following example displays the logical interface vs_1.iscsi with the relative target port ID of 1.

```
cluster1::> vserver iscsi interface show -vserver vs_1 -relative-port-id 1
 Vserver Logical Interface Status TPGT Admin/Oper Address Curr Node Port Enabled
---------- ---------- ---------- --------------- ----------- ---- -------
 vs_1 vs_1.iscsi 1027   up/up 10.63.8.165 node1       e0c  true
```

vserver iscsi interface accesslist commands
The accesslist directory
Commands used to manage iSCSI accesslists.
vserver iscsi interface accesslist add

Add the iSCSI LIFs to the accesslist of the specified initiator

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
This command adds network interfaces to an access list for a specified initiator. An access list ensures that an initiator only logs in with IP addresses associated with the interfaces defined in the access list.

You can restrict an initiator to certain network interfaces to improve performance and security. Access lists are useful where a particular initiator cannot access all of the network interfaces on a node.

Access list policies are based on the interface name. The accesslist rules are:

- If you disable the network interface for iSCSI through the `vserver iscsi interface disable` command, for example, the network interface is not accessible to any initiator regardless of any access lists in effect.
- If an initiator does not have an access list, that initiator can access any iSCSI-enabled network interface.
- If an initiator has an access list, that initiator can only login to network interfaces in its access list. Additionally, the initiator cannot discover any IP addresses that are not on this access list. If an initiator sends an iSCSI sendtargets request, the node responds with a list of IP addresses for iSCSI data logical interfaces that are in its access list.
- If an initiator does not have an access list, you automatically create an access list when you issue the `vserver iscsi interface accesslist add` command.
- If you remove all the interfaces from the access list of an initiator with the `vserver iscsi interface accesslist remove` command, the accesslist is also deleted.
- Creating or modifying access list requires that initiator log out and log back in before changes take effect.

When you use the add or remove commands, the system warns you if an iSCSI session could be affected.

**Note:** You will not affect any iSCSI sessions if you use the -a parameter when adding or removing all interfaces.

**Parameters**
- **vserver <Vserver Name>** - Vserver
  Specifies the Vserver name.
- **-initiator-name <text>** - Initiator Name
  Specifies the initiator you want to add to the access list.
- **{-lif <lif-name>, ...}** - Logical Interface
  Specifies the lif you want to add to an access list.
- **| -all | -a [true] |** - All
  If you use this parameter without a value, it is set to true, and the command adds all iSCSI data logical interfaces for a vserver to an initiator’s accesslist. If the initiator does not have an accesslist, the system creates a new accesslist.
- **[-force | -f [true]]** - Force
  If you use this parameter without a value, it is set to true, and the command does not prompt you when an active iSCSI service or any active iSCSI data logical interfaces could be affected. If you do not use this parameter, the command prompts for confirmation if the iSCSI service is active or if any active data logical interfaces would be affected.
vserver iscsi interface accesslist remove

Remove the iSCSI LIFs from the accesslist of the specified initiator

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
This command removes network interfaces from an access list for a specified initiator. The system removes the access list when the list is empty. When you remove a network interface from an initiator, this action could result in the shutdown of active sessions.

**Parameters**

- `-vserver <Vserver Name>` - Vserver
  Specifies the Vserver name.

- `-initiator-name <text>` - Initiator Name
  Specifies the initiator that you want to remove logical interfaces from.

{ `-lif <lif-name>`, ... - Logical Interface
  Specifies the logical interface you want to remove.

| `-all | -a [true]` - All
  If you use this parameter without a value, it is set to true, and the command removes all of the iSCSI data logical interfaces from an initiator's accesslist. If you remove all the network interfaces from an access list, the system removes the access list.

[ `-force | -f [true]` - Force
  If you use this parameter without a value, it is set to true, and the command does not prompt you when an active iSCSI service or any active iSCSI data logical interfaces could be affected. If you do not use this parameter, the command prompts for confirmation if the iSCSI service is active or if any active data logical interfaces would be affected.

---

vserver iscsi interface accesslist show

Show accesslist of the initiators for iSCSI connectivity

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.
Description
This command displays an access list for an initiator. An access list is a list of logical interfaces that an initiator can use for iSCSI logins. The system records the access lists as part of the node configuration and preserves the access lists during reboots.

Parameters

\{ [-fields <fieldname>, ...] \\
\} If you specify the \{-fields <fieldname>, ...\} parameter, the command output also includes the specified field or fields. You can use \`-fields ?` to display the fields to specify.

\{-instance \} If you specify the \{-instance\} parameter, the command displays detailed information about all fields.

\{-vserver <Vserver Name>\} - Vserver
Use this parameter to display the access lists that match the Vserver name that you specify.

\{-initiator-name <text>\} - Initiator Name
Use this parameter to display the access lists that match the initiator that you specify.

\{-lif <lif-name>\} - Logical Interface
Use this parameter to display the access lists that match the logical interface that you specify.

Examples

```
cluster1::> vserver iscsi interface accesslist show -vserver vs1
  Vserver            Initiator Name                Logical Interface
                ------------------ ----------------------------- -----------------------------
               vs1        iqn.2010-01.com.example:aaaaa isw1
                              isw2
                               iqn.2010-01.com.example:aaabb isw1
                                           isw2

4 entries were displayed.
```

vserver iscsi isns commands

The isns directory

vserver iscsi isns create

Configure the iSNS service for the Vserver

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command creates and starts an iSNS service with the IP address of the iSNS server.

Note: A Vserver management LIF must exist before you can create an iSNS service. This LIF is used to communicate with the iSNS server. To create a Vserver management LIF, use the \`network interface create\` command, with \`-role data\` and \`-data-protocol none\`.

Parameters

\{-vserver <Vserver Name>\} - Vserver Name
  Specifies the Vserver for the iSNS service that you want to create.

\{-address <IP Address>\} - iSNS Server IP Address
  Specifies the IP address of the iSNS server. Both IPv4 and IPv6 address families are supported. The address family must be the same as that of the vserver management LIF.
**Note:** A default route must exist for the specified vserver. To create a route, use the `network routing-groups route create` command. To view existing routes, use the `network routing-groups route show` command.

`[-status-admin {down up}]` - Administrative Status

Specifies the administrative status of the iSNS service of a Vserver. If you set this parameter to up, the iSNS service starts for the Vserver and registers with the configured iSNS server. If you set this parameter to down, the Vserver loses its ability to register with the iSNS server and to be discovered by iSNS clients.

`[-force {true}]` - Force

`vserver iscsi isns create` fails if vserver management LIF is not configured. When you set this option to "true," you create an iSNS service on a Vserver even if the vserver does not have a vserver management LIF.

### Examples

```
cluster1::> vserver iscsi isns create -vserver vs_1 -address 10.60.1.1 -status-admin up
```

Creates the iSNS service for Vserver vs_1 using the IPv4 address.

```
cluster1::> vserver iscsi isns create -vserver vs_1 -address fd20:8b1e:b255:840b:a0df:565b:19b5:4d06 -status-admin up
```

### Related references

- `network routing-groups route create` on page 402
- `network routing-groups route show` on page 403
- `network interface create` on page 337

### vserver iscsi isns delete

Remove the iSNS service for the Vserver

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

This command deletes the iSNS service for the Vserver.

**Parameters**

- `vserver <Vserver Name>` - Vserver Name

  Specifies the Vserver for the iSNS service that you want to delete.

**Examples**

```
cluster1::> vserver iscsi isns delete -vserver vs_1
```

### vserver iscsi isns modify

Modify the iSNS service for the Vserver

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

This command modifies the configuration of an iSNS service.
Modifications take effect immediately after you execute the command.

**Parameters**

- **-vserver <Vserver Name> - Vserver Name**
  
  Specifies the Vserver for the iSNS service that you want to modify.

- **[ -address <IP Address> - iSNS Server IP Address**
  
  Specifies the IP address of the iSNS server. Both IPv4 and IPv6 address families are supported. The address family must be the same as that of the vserver management LIF.

  **Note:** A default route must exist for the specified vserver. To create a route, use the `network routing-groups route create` command. To view existing routes, use the `network routing-groups route show` command.

- **[ -status-admin {down|up} - Administrative Status**
  
  Specifies the administrative status of the iSNS service of a Vserver. If you set this parameter to up, the iSNS service starts for the Vserver, and registers with the configured iSNS server. If you set this parameter to down, the Vserver loses its ability to register with the iSNS server and to be discovered by iSNS clients.

- **[ -force [true] - Force**
  
  `vserver iscsi isns modify` fails to modify the iSNS server address if vserver management LIF is not configured. When you set this option to "true," you can modify the iSNS service on a Vserver even if the vserver does not have a vserver management LIF.

**Examples**

```
cluster1::> iscsi isns modify -vserver vs_1 -status-admin up
```

**Related references**

- `network routing-groups route create` on page 402
- `network routing-groups route show` on page 403

**vserver iscsi isns show**

Show iSNS service configuration

**Availability:** This command is available to cluster and Vserver administrators at the `admin` privilege level.

**Description**

Shows the iSNS service configuration.

**Parameters**

- **{ [-fields <fieldname>, ...]**
  
  If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

- **[ [-instance ]**
  
  If you specify the `-instance` parameter, the command displays detailed information about all fields.

- **[ -vserver <Vserver Name> - Vserver Name**
  
  Use this parameter to display the iSNS services that match the Vserver name that you specify.

- **[ -address <IP Address> - iSNS Server IP Address**
  
  Use this parameter to display the iSNS services that match the IP address of the iSNS server that you specify.
[-status-admin {down|up}] - Administrative Status
   Use this parameter to display the iSNS services that match the configured status of the service that you
   specify.
[-entity-id <text>] - iSNS Server Entity Id
   Use this parameter to display the iSNS services that match the configured iSNS server entity-id that you
   specify.
[-last-successful-update <MM/DD/YYYY HH:MM:SS>] - Last Successful Update
   Use this parameter to display the iSNS services that match the time of the last successful attempt.
[-last-update-attempt <MM/DD/YYYY HH:MM:SS>] - Last Update Attempt
   Use this parameter to display the iSNS services that match the time of the last update attempt.
[-last-update-result <isnsErrors>] - Last Update Result
   Use this parameter to display the iSNS services that match the result of the last update attempt.

Examples

<table>
<thead>
<tr>
<th>Vserver</th>
<th>iSNS Server Entity Identifier</th>
<th>iSNS Server IP Address</th>
<th>iSNS Status</th>

</thead>
<tbody>
<tr>
<td>iscsi_vs</td>
<td>isns:00000044</td>
<td>10.229.136.188</td>
<td>up</td>
</tr>
</tbody>
</table>

Displays the output of the show command for all Vservers in a cluster.

cluster1::> vserver iscsi isns show -instance
Vserver Name: vs1
iSNS Server IP Address: 10.72.19.11
Administrative Status: up
iSNS Server Entity Id: isns.0000001c
Last Successful Update: 11/12/2011 10:18:45
   Last Update Attempt: 11/12/2011 10:18:45
   Last Update Result: iSNS_Ok

Vserver Name: vs2
iSNS Server IP Address: 10.72.16.13
Administrative Status: up
iSNS Server Entity Id: isns.0000001b
Last Successful Update: 11/12/2011 13:38:05
   Last Update Attempt: 11/12/2011 13:38:05
   Last Update Result: iSNS_Ok

2 entries were displayed.

vserver iscsi isns start
Starts the iSNS service

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
Starts the iSNS service. Once you start the iSNS service, the Vserver automatically register with the iSNS server.

Parameters
- -vserver <Vserver Name> - Vserver Name
   Specifies the Vserver for the iSNS service that you want to start.
vserver iscsi isns stop

Stops the iSNS service

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
Stops the iSNS service. Once you stop the iSNS service, the Vserver loses the ability to register with the iSNS server and to be discovered by iSNS clients.

Parameters
-vserver <Vserver Name>

Specifies the Vserver for the iSNS service that you want to stop.

Examples

cluster1::> vserver iscsi isns stop -vserver vs_1

vserver iscsi isns update

Force update of registered iSNS information

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
Forces an update of the registration information with the iSNS server. Normally, the system checks for iSNS configuration changes on the Vserver every few minutes and automatically sends updates to the iSNS server.

Parameters
-vserver <Vserver Name>

Specifies the Vserver for the iSNS service that you want to update.

Examples

cluster1::> vserver iscsi isns update -vserver vs_1

vserver iscsi security commands

The security directory
Commands used to manage iSCSI security configuration.

vserver iscsi security add-initiator-address-ranges

Add IP Address Ranges

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.
Description
Add IP address ranges to an existing iSCSI security entry

Parameters
-vserver <Vserver Name> - Vserver
   Specifies the Vserver.

-initiator-name | -i <text> - Initiator Name
   Specifies the initiator.

-initiator-address-ranges {<ipaddr>|<ipaddr>-<ipaddr>}, ... - Initiator IP Address Ranges
   Specifies one or more initiator source IP address range. The IPv4 or IPv6 address range contains a start address and an end address. The start and end addresses themselves are included in the range.
   An example of a valid IPv4 address range is: '192.168.1.100-192.168.1.150'.
   An example of a valid IPv6 address range is: '2001:db8::1000:1-2001:db8::1000:50'.

Examples
   cluster1::> vserver iscsi security add-initiator-address-range
   -vserver vs1 -initiator-name iqn.1993-08.com.example:01:e3f87c7cf2e4
   -initiator-address-range 192.168.2.1-192.168.2.255

vserver iscsi security create
Create an iSCSI authentication configuration for an initiator

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command configures the security method for an iSCSI initiator on a Vserver. The outbound CHAP password and user name are optional. If you want mutual authentication, you need to configure both inbound and outbound CHAP passwords and user names.

You cannot use the same password for inbound and outbound settings.

Parameters
-vserver <Vserver Name> - Vserver
   Specifies the Vserver.

-initiator-name | -i <text> - Initiator Name
   Specifies the initiator that you want to create a security method for. You can use either an iqn such as iqn.1995-08.com.example:string or eui such as eui.0123456789abcdef for the initiator.

-auth-type | -s {CHAP|deny|none} - Authentication Type
   Specifies the authentication type:
   • CHAP - Authenticates using a CHAP user name and password.
   • none - The initiator can access the Vserver without authentication.
   • deny - The initiator cannot access the Vserver.

[-user-name | -n <text>] - Inbound CHAP User Name
   Specifies the inbound CHAP user name. CHAP user names can be one to 128 bytes. A null user name is not allowed. If provided, you will be prompted to provide the corresponding inbound CHAP password.
[-outbound-user-name | -m <text>] - Outbound CHAP User Name

Specifies the outbound CHAP user name. CHAP user names can be one to 128 bytes. If provided, you will be prompted to enter the corresponding outbound CHAP password.

[-initiator-address-ranges {<ipaddr>|<ipaddr>-<ipaddr>},...] - Initiator IP Address Ranges

Specifies one or more initiator source IP address ranges. If this list is empty, the initiator is allowed to log in from any IP address. The IPv4 or IPv6 address range contains a start address and an end address. The start and end addresses themselves are included in the range.

An example of a valid IPv4 address range is: '192.168.1.100-192.168.1.150'.

An example of a valid IPv6 address range is: '2001:db8::1000:1-2001:db8::1000:50'.

Examples

```
cluster1::> vserver iscsi security create -initiator eui.0123456789abcdef -auth-type CHAP -user-name bob -outbound-user-name bob2
Password: {enter password}
Outbound Password: {enter password}
```

Creates authentication method chap for initiator eui.0123456789abcdef with inbound and outbound usernames and passwords.

```
cluster1::> vserver iscsi security create -vserver vs_1
-initiator-name iqn.1995-08.com.example:e3f87c7cf2e4 -auth-type none
-initiator-address-ranges 192.168.1.1-192.168.1.255
```

vserver iscsi security default

Configure the default authentication settings

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

This command defines a default iSCSI authentication method for your Vserver. If you do not configure the initiator to use a user-defined authentication method, the system assigns the default authentication method automatically to the initiator. Use the vserver iscsi security create command if you want to configure a user-defined authentication method.

The outbound CHAP user name and password are optional. If you want a bi-directional handshake, provide the outbound user name and you will be prompted for the corresponding password.

You cannot use the same password for inbound and outbound settings.

Parameters

- -vserver <Vserver Name> - Vserver
  Specifies the Vserver.

- -auth-type | -s {CHAP|deny|none} - Authentication Method
  Specifies the authentication type:
  • CHAP - Authenticates using a CHAP user name and password.
  • none - The initiator can access the Vserver without authentication.
  • deny - The initiator cannot access the Vserver.
[[-user-name | -n <text>] - Inbound CHAP User Name
  Specifies the inbound CHAP user name. CHAP user names can be one to 128 bytes. A null user name is not
  allowed. If provided, you will be prompted to provide the corresponding inbound CHAP password.

{ [[-outbound-user-name | -m <text>] - Outbound CHAP User Name
  Specifies the outbound CHAP user name. CHAP user names can be one to 128 bytes. If provided, you will be
  prompted to enter the corresponding outbound CHAP password.

| [[-clear-outbound [true]]] - Clear Outbound CHAP Parameters
  Removes the outbound user name and the outbound password information from the default authentication
  method. After you clear the outbound information, you no longer have a bi-directional handshake.

Examples

cluster1::> vserver iscsi security default -vserver vs1 -security chap -user-name bob -outbound-
  user-name bob_out
  Password:
  Outbound Password:

  vserver iscsi security create on page 1854

vserver iscsi security delete
  Delete the iSCSI authentication configuration for an initiator

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
  This command removes the security settings for this initiator. The default authentication setting now applies to this initiator.

Parameters
  -vserver <Vserver Name> - Vserver
    Specifies the Vserver.

  -initiator-name | -i <text> - Initiator Name
    Specifies the initiator that you want to remove the authentication setting from.

Examples

cluster1::> vserver iscsi security delete -vserver vs1 -initiator iqn.1992-08.com.example:abcdefg

vserver iscsi security modify
  Modify the iSCSI authentication configuration for an initiator

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
  The command modifies an existing authentication method for an initiator. To delete the authentication setting for an initiator,
  use the vserver iscsi security delete command.

  The outbound CHAP password and user name are optional. If you want a bi-directional handshake, you need to configure both
  inbound and outbound CHAP passwords and user names.
You do not need to know the inbound or outbound passwords to change them.

**Parameters**

```
-vserver <Vserver Name> - Vserver
  Specifies the Vserver.

-initiator-name | -i <text> - Initiator Name
  Specifies the initiator name that you want to modify the existing authentication method.

-[auth-type | -s {CHAP|deny|none}] - Authentication Type
  Specifies the authentication type:
  • CHAP - Authenticates using a CHAP user name and password.
  • none - The initiator can access the Vserver without authentication.
  • deny - The initiator cannot access the Vserver.

-[user-name | -n <text>] - Inbound CHAP User Name
  Specifies the inbound CHAP user name. CHAP user names can be one to 128 bytes. A null user name is not allowed. If provided, you will be prompted to provide the corresponding inbound CHAP password.

{ [-outbound-user-name | -m <text>] - Outbound CHAP User Name
  Specifies the outbound CHAP user name. CHAP user names can be one to 128 bytes. If provided, you will be prompted to enter the corresponding outbound CHAP password.

| [-clear-outbound [true]] - Clear Outbound CHAP Parameters
  Removes the outbound user name and the outbound password information from the authentication method. After you clear the outbound information, you no longer have a bi-directional handshake.
```

**Examples**

```
cluster1::> vserver iscsi security modify -vserver vs_1 -initiator iqn.1992-08.com.example:abcdefg -auth-type chap -user-name bob -outbound-user-name bob_out
Password:
Outbound Password:
```

**vserver iscsi security prepare-to-downgrade**

Prepares the system for downgrade

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

This command prepares the cluster for a downgrade to an earlier version of Data ONTAP. Before using this command verify that all security entries do not have any initiator address ranges defined. This may be done by running the command *vserver iscsi security show address-ranges*

**Examples**

```
cluster1::> vserver iscsi security prepare-to-downgrade
```
**vserver iscsi security remove-initiator-address-ranges**

Remove an IP Address Range

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
Remove IP address ranges to an existing iSCSI security entry

**Parameters**
- `-vserver <Vserver Name>` - *Vserver*
  Specifies the Vserver.
- `-initiator-name` | `-i <text>` - *Initiator Name*
  Specifies the initiator.
- `-initiator-address-ranges {<ipaddr>|<ipaddr>-<ipaddr>}, ...` - *Initiator IP Address Ranges*
  Specifies one or more initiator source IP address range. The IPv4 or IPv6 address range contains a start address and an end address. The start and end addresses themselves are included in the range.
  An example of a valid IPv4 address range is: '192.168.1.100-192.168.1.150'.
  An example of a valid IPv6 address range is: '2001:db8::1000:1-2001:db8::1000:50'.

**Examples**

```
netapp-clus-1::> vserver iscsi security remove-initiator-address-range
-vserver vs1 -initiator-name iqn.1993-08.com.example:01:e3f87c7cf2e4
-initiator-address-range 192.168.2.1-192.168.2.255
```

**vserver iscsi security show**

Show the current iSCSI authentication configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
This command displays the default authentication and all initiator-specific authentication information. Data ONTAP authentication overrides all other service authentication methods.

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-address-masks]
```

Display the list of IP Address ranges in CIDR notation that each initiator is allowed to originate from. If this list is empty, the initiator is allowed to log in from any IP address. The IPv4 or IPv6 address range contains a start address and an end address. The start and end addresses themselves are included in the range.
Display the list of IP Address ranges that each initiator is allowed to originate from. If this list is empty, the initiator is allowed to log in from any IP address. The IPv4 or IPv6 address range contains a start address and an end address. The start and end addresses themselves are included in the range.

If you specify the \-instance parameter, the command displays detailed information about all fields.

\[-vserver <Vserver Name>] - Vserver
Use this parameter to display authentication information that matches the Vserver name that you specify.

\[-initiator-name | -i <text>] - Initiator Name
Use this parameter to display authentication information that matches the initiator that you specify.

\[-auth-type | -s {CHAP|deny|none}] - Authentication Type
Use this parameter to display authentication information that matches the authentication type that you specify.

\[-user-name | -n <text>] - Inbound CHAP User Name
Use this parameter to display authentication information that matches the inbound CHAP user name that you specify.

\[-outbound-user-name | -m <text>] - Outbound CHAP User Name
Use this parameter to display authentication information that matches the outbound CHAP user name that you specify.

\[-auth-chap-policy <local>] - Authentication CHAP Policy
Use this parameter to display authentication information that matches the authentication CHAP policy that you specify.

\[-initiator-address-ranges {<ipaddr>|<ipaddr>-<ipaddr>}, ...] - Initiator IP Address Ranges
Use this parameter to display authentication information that matches the initiator address range that you specify. If this list is empty, the initiator is allowed to log in from any IP address. The IPv4 or IPv6 address range contains a start address and an end address. The start and end addresses themselves are included in the range.

An example of a valid IPv4 address range is: '192.168.1.100-192.168.1.150'.

An example of a valid IPv6 address range is: '2001:db8::1000:1-2001:db8::1000:50'.

\[-initiator-address-masks <IP Address/Mask>, ...] - Initiator IP Address Masks
Use this parameter to display authentication information that matches the initiator address masks that you specify. If this list is empty, the initiator is allowed to log in from any IP address. The IPv4 or IPv6 address range contains a start address and an end address. The start and end addresses themselves are included in the range.

An example of a valid IPv4 address range in CIDR notation is: 192.168.1.3/32.

An example of a valid IPv6 address range in CIDR notation is: 2001:db8::1000:1/128.

### Examples

```
cluster1::> vserver iscsi security show -vserver vs1

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Initiator Name</th>
<th>Auth Type</th>
<th>Auth CHAP Policy</th>
<th>Inbound CHAP User Name</th>
<th>Outbound CHAP User Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>
<td>default</td>
<td>none</td>
<td>CHAP</td>
<td>bob</td>
<td>bob2</td>
</tr>
<tr>
<td></td>
<td>iqn.2010-12.com.example:abcdefg</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

2 entries were displayed.
```

Displays the authentication information for Vserver vs1.
Displays the initiator and their valid address ranges for Vserver vs1.

vserver iscsi session commands

The session directory

vserver iscsi session show

Display iSCSI sessions

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command displays iSCSI session information. If you do not specify the target session ID (TSIH), the command displays all session information for the specified Vserver. If a Vserver is not specified, the command displays all session information in the cluster. Use the vserver iscsi connection show command to display connection information. Use the vserver iscsi session parameter show command to show the parameters used when creating the session.

You can use session information for troubleshooting performance problems.

An iSCSI session can have one or multiple connections. Typically a session has at least one connection.

Most of the parameters are read-only. However, some parameters can be modified with the vserver iscsi modify command.

Parameters

[-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?' to display the fields to specify.
If you specify the \texttt{-instance} parameter, the command displays detailed information about all fields.

\texttt{-vserver <Vserver Name> - Vserver}

Use this parameter to display iSCSI session information that matches the Vserver name that you specify.

\texttt{-tpgroup <text> - Target Portal Group}

Use this parameter to display iSCSI session information that matches the target portal group name that you specify.

\texttt{-tsih <integer> - Target Session ID}

Use this parameter to display iSCSI session information that matches the target session ID that you specify.

\texttt{-max-ios-per-session <integer> - Max Commands per Session}

Use this parameter to display iSCSI session information that matches the maximum commands per session count you specify.

\texttt{-data-pdu-in-order \{true|false\} - Data PDU in Order}

Specifies if the data PDUs are in sequence order. If you enter this command without using this parameter, it is set to true, and the command displays all session information that supports PDUs in order. If you provide a false value, the command displays all session information that does not support PDUs in order.

\texttt{-data-sequence-in-order \{true|false\} - Data Sequence in Order}

Specifies if the data is in sequence order. If you enter this command without using this parameter, it is set to true, and the command displays all session information where data sequence is supported. If you provide a false value, the command displays all session information that does not support data sequence.

\texttt{-default-time-to-retain <integer> - Default Time to Retain}

Use this parameter to display session information that matches the retain time that you specify. This value specifies the amount of time before active reassignment is possible after an unexpected connection termination or a connection reset. A value of 0 means the connection task state is immediately discarded by the target.

\texttt{-default-time-to-wait <integer> - Default Time to Wait}

Use this parameter to display session information that matches the logout or active task assignment wait time that you specify. Wait time refers to the amount of time before attempting an explicit or implicit logout or active task assignment after an unexpected connection termination or connection reset.

\texttt{-error-recovery-level <integer> - Error Recovery Level}

Use this command to display session information that matches the error recovery level that you specify.

\texttt{-first-burst-length <integer> - First Burst Length}

Use this parameter to display session information that matches the first burst length that you specify. First burst length is the maximum amount of unsolicited data in bytes that can be sent during the execution of a single iSCSI packet. First burst length covers the total amount of immediate data and the unsolicited data-out PDU. The first burst length must not exceed the maximum burst length.

\texttt{-immediate-data-enabled \{true|false\} - Immediate Data}

Specifies if immediate data is supported. When immediate data is supported, the initiator can send immediate data. If you enter this command using the parameter without a value, it is set to true, and the command displays all session information that supports immediate data. If you provide a false value, the command displays all session information that does not support immediate data.

\texttt{-initiator-alias <text> - Initiator Alias}

Use this parameter to display iSCSI session information that matches the alias name of the initiator that you specify.

\texttt{-initial-r2t-enabled \{true|false\} - Initial R2T Enabled}

Specifies if the initiator supports Initial Ready to Transfer (R2T). R2T is the mechanism that allows the target to request the initiator for output data. If you enter this command using the parameter without a value, it is set...
to true, and the command displays all session information that supports initial R2T data. If you provide a false value, the command displays all session information that does not support initial R2T data.

[-initiator-name <text>] - Initiator Name
Use this parameter to display the iSCSI session information that matches the initiator name that you specify.

[-isid <text>] - Initiator Session ID
Use this parameter to display iSCSI session information that matches the initiator session ID that you specify.

[-max-burst-length <integer>] - Max Burst Length for Session
Use this parameter to display iSCSI session information that matches the maximum burst length that you specify. Maximum burst length is the maximum iSCSI data payload in bytes for a data-in or solicited data-out sequence.

[-max-connections <integer>] - Max Connections for Session
Use this parameter to display iSCSI session information that matches the maximum number of connections that you specify.

[-max-outstanding-r2t <integer>] - Max Outstanding R2T for Session
Use this parameter to display iSCSI session information that matches the maximum number of outstanding R2T per task that you specify.

[-session-type <iSCSI Session Type>] - Session Type
Use this parameter to display iSCSI session information that matches the session type that you specify.

[-tpgroup-tag <integer>] - Target Portal Group Tag
Use this parameter to display iSCSI session information that matches the target portal group tag that you specify.

[-connection-ids <integer>, ...] - Active Connection IDs
Use this parameter to display iSCSI session information that matches the active connection IDs that you specify.

Examples

cluster1::> vserver iscsi session show -vserver vs_1
Vserver     Tpgroup    Initiator                      Initiator
----------- ------- ---------------------- -----------------------
vs_1        tpgroup_1 2      iqn.1993-08.org.debian:01:fa752b8a5a3a
            00:02:3d:01:00:00
            initiator-alias

Displays session information for all sessions on Vserver vs_1.

vserver iscsi session shutdown
Shut down a session on a node

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.
**Description**
This command forces a shutdown of all connections in a session. If you want to shut down a single connection in a session, use the `vserver iscsi connection shutdown` command.

**Parameters**
- `vserver <Vserver Name>` - Vserver
  Specifies the Vserver.
- `tpgroup <text>` - Target Portal Group
  Specifies the target portal group that contains the session you want to shutdown.
- `tsih <integer>` - Target Session ID
  Specifies the target session ID that you want to shut down.

**Examples**
```
cluster1::*> vserver iscsi session shutdown -vserver vs_1 -tpgroup tpgroup_1 -tsih 2
```

**Related references**
- `vserver iscsi connection shutdown` on page 1840

**vserver iscsi session parameter commands**
The parameter directory
Commands used for displaying parameters used for iSCSI sessions

**vserver iscsi session parameter show**
Display the parameters used to establish an iSCSI session

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
This command displays session parameter information. This command is intended for troubleshooting performance problems.

Most of the parameters are read-only. However, some parameters can be modified with the `vserver iscsi modify` command.

**Parameters**
```
[-fields <fieldname>, ...]
```
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance ]
```
If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[-vserver <Vserver Name>] - Vserver
```
Use this parameter to display session information that matches the Vserver name that you specify.

```
[tpgroup <text>] - Target Portal Group
```
Use this parameter to display session information that matches the target portal group name that you specify.

```
[tsih <integer>] - Target Session ID
```
Use this parameter to display session information that matches the target session ID that you specify.
[-cmd-window-size <integer>] - Max Commands per Session

Use this parameter to display session information that matches the command window size that you specify.

[-data-pdu-in-order {true|false}] - Data PDU in Order

Use this parameter to display session information with the value of the Protocol Data Units (PDU) in order flag you specify. This parameter indicates if the data within a sequence can be in any order or must be in sequence. If you enter this command without using this parameter, it is set to true, and the command displays all session information that supports PDUs in order. If you provide a false value, the command displays all session information that does not support PDUs in order.

[-data-sequence-in-order {true|false}] - Data Sequence in Order

Use this parameter to display session information with the value of the data sequence in order flag that you specify. If you enter this command without using this parameter, it is set to true, and the command displays all session information that supports data sequence. If you set the values to false, the command displays all session information that does not support data sequence.

[-default-time-to-retain <integer>] - Default Time to Retain

Use this parameter to display session information that matches the retain time that you specify. This value specifies the amount of time before active reassignment is possible after an unexpected connection termination or a connection reset. A value of 0 means the connection task state is immediately discarded by the target.

[-default-time-to-wait <integer>] - Default Time to Wait

Use this parameter to display session information that matches the logout or active task assignment wait time that you specify. Wait time refers to the amount of time before attempting an explicit or implicit logout or active task assignment after an unexpected connection termination or connection reset.

[-error-recovery-level <integer>] - Error Recovery Level

Use this command to display session information that matches the error recovery level that you specify.

[-first-burst-length <integer>] - First Burst Length

Use this parameter to display session information that matches the first burst length that you specify. First burst length is the maximum amount of unsolicited data in bytes that can be sent during the execution of a single iSCSI packet. First burst length covers the total amount of immediate data and the unsolicited data-out PDU. The first burst length must not exceed the maximum burst length.

[-immediate-data-enabled {true|false}] - Immediate Data

Use this parameter to display session information with the value of the immediate data-enabled flag that you specify. If you enter this command without using this parameter, it is set to true, and the command displays all session information that supports immediate data. If you set the value to false, the command displays all session information that does not support immediate data.

[-initial-r2t-enabled {true|false}] - Initial R2T Enabled

Use this parameter to display session information with the value of the R2T data-enabled flag that you specify. If you enter this command without using this parameter, it is set to true, and the command displays all session information that supports R2T data. If you set the value to false, the command displays all session information that does not support R2T data.

[-initiator-alias <text>] - Initiator Alias

Use this parameter to display iSCSI session information that matches the initiator alias name you specify.

[-initiator-name <text>] - Initiator Name

Use this parameter to display iSCSI session information that matches the initiator name you specify.

[-isid <text>] - Initiator Session ID

Use this parameter to display iSCSI session information that matches the initiator session identifier you specify.
[-max-burst-length <integer>] - Max Burst Length for Session
    Use this parameter to display iSCSI session information that matches the maximum burst length that you
    specify. Maximum burst length is the maximum iSCSI data payload in bytes for a data-in or solicited data-out
    sequence.

[-max-connections <integer>] - Max Connections for Session
    Use this parameter to display iSCSI session information that matches the maximum number of connections
    that you specify.

[-max-outstanding-r2t <integer>] - Max Outstanding R2T for Session
    Use this parameter to display iSCSI session information that matches the maximum number of outstanding
    R2T per task that you specify.

[-session-type <iSCSI Session Type>] - Session Type
    Use this parameter to display iSCSI session information that matches the session type you specify.

[-tpgroup-tag <integer>] - Target Portal Group Tag
    Use this parameter to display iSCSI session information that matches the target portal group tag you specify.

[-initiator-mrdsl <integer>, ...] - Initiator Max Recv Data Len
    Use this parameter to display iSCSI session information that matches the initiator maximum receivable data
    segment length you specify. An iSCSI initiator declares the maximum data segment length in bytes it can
    receive in an iSCSI PDU during the iSCSI login phase.

[-target-mrdsl <integer>, ...] - Target Max Recv Data Len
    Use this parameter to display iSCSI session information that matches the target maximum receivable data
    segment length you specify. An iSCSI target declares the maximum data segment length in bytes it can receive
    in an iSCSI PDU during the iSCSI login phase.

### Examples

```
cluster1::> iscsi session parameter show -vserver vs_1

<table>
<thead>
<tr>
<th>Tpgroup</th>

## vserver locks commands

Manage Client Locks

### vserver locks break

Break file locks based on a set of criteria

**Availability:** This command is available to cluster and Vserver administrators at the advanced privilege level.

**Description**

The `vserver locks break` command breaks one or more locks.
Parameters

{ -vserver <vserver name> - Vserver

This parameter specifies the Vserver containing the lock.}

-volume <volume name> - Volume

This parameter specifies the name of the volume containing the lock.

-lif <lif-name> - Logical Interface

This parameter specifies the logical interface through which the lock was established.

-path <text> - Object Path

This parameter specifies a path to the lock.

| -lockid <UUID> } - Lock UUID

This parameter specifies the universally unique identifier (UUID) for the lock. Queries and wildcard characters are not supported.

-owner-id <text> - Owner ID

This parameter specifies an owner ID for a lock. This parameter must be used with the query notation { } exhibited in the second example.

-protocol <lock protocol> - Lock Protocol

This parameter specifies the protocol that was used to establish a lock. This parameter must be used with the query notation { } exhibited in the second example.

-client-address <IP Address> - Client Address

This parameter specifies a client address associated with a lock. This parameter must be used with the query notation { } exhibited in the second example.

-client-address-type {ipv4|ipv6|ipv6z} - Client Address Type

This parameter specifies the type of ip address a client used to create its lock (ipv4, ipv6). This parameter must be used with the query notation { } exhibited in the second example.

Examples

The following example breaks the locks on all objects on the Vserver named vs0 in the volume named vol0, regardless of the paths to the locked objects and the logical interface through which the locks were established.

```
cluster1::*> vserver locks break -vserver vs0 -volume vol0 -path * -lif *
WARNING: Breaking file locks can cause applications to become unsynchronized and may lead to data corruption.
Do you want to continue? {y|n}: y
1 entry was acted on.
```

The vserver locks break command can also be issued using a query on the parameters available to the vserver locks show command. The following example breaks all NLM protocol lock objects locked by the client at address 12.34.56.78.

```
cluster1::*> vserver locks break { -protocol nlm -client-address 12.34.56.78 }
Warning: Breaking file locks can cause applications to become unsynchronized and may lead to data corruption.
Do you want to continue? {y|n}: y
1 entry was acted on.
```
vserver locks show

Display current list of locks

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver locks show command displays information about locks. A lock is a synchronization mechanism for enforcing limits on concurrent access to files where many clients can be accessing the same file at the same time. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about locks:

- Vserver name
- Volume name
- Object path
- Logical interface name
- Lock protocol
- Lock type
- Client

Parameters

[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-smb-attrs]
If you specify the -smb-attrs parameter, the command displays information related to SMB2 and higher.

[-instance]]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver
If you specify this parameter, the command displays information about locks on the specified Vserver.

[-volume <volume name>] - Volume
If you specify this parameter, the command displays information about locks on the specified volume.

[-lif <lif-name>] - Logical Interface
If you specify this parameter, the command displays information about locks established through the specified logical interface.

[-path <text>] - Object Path
If you specify this parameter, the command displays information about locks at the specified path name.

[-lockid <UUID>]] - Lock UUID
If you specify this parameter, the command displays information about the lock with the specified universally unique identifier (UUID).

[-is-constituent {true|false}] - Is Constituent Volume
If you specify this parameter, the command displays information only about volumes that either are or are not constituents of a FlexGroup, depending on the value provided. This field is false for constituents of an Infinite Volume.
[-protocol <lock protocol>] - Lock Protocol

If you specify this parameter, the command displays information about locks established through the specified protocol. Some of the valid protocols are:

- **cifs**: SMB locks
- **nlm**: NFS3 locks
- **nfsv4**: NFS4.0 locks
- **nfsv4.1**: NFS4.1 locks
- **crposix**: CrPosix locks for CREATE and LINK
- **fcache**: Delegations for 7-mode destination FlexCache volumes

[-type {byte-range|share-level|op-lock|delegation}] - Lock Type

If you specify this parameter, the command displays information about locks of the specified lock type. The four types of locks are:

- Byte-range locks: Lock only a portion of a file.
- Share locks: Represent opened files.
- Opportunistic locks: Control client-side caching over SMB.
- Delegations: Control client-side caching over NFSv4.

[-node <nodename>] - Node Holding Lock State

If you specify this parameter, the command displays information about all locks on the specified node.

[-lock-state <lock_state>] - Lock State

If you specify this parameter, the command displays information about the state of the lock. Some of the valid states are:

- **granted**: The lock is established.
- **revoking**: The server is currently coordinating with the client to change the state of this lock.
- **revoked**: The lock is undergoing revocation to be downgraded or released.
- **adjusted**: The lock is undergoing revocation to be replaced by a lock equal to or weaker than the current lock.
- **subsumed**: The lock is one of a set of locks that will replace a lock that is being revoked.
- **waiting**: The lock is waiting to be granted, because it conflicts with another lock.
- **denied**: The lock has been denied.
- **timeout**: The lock was waiting and has now timed out.
- **gone**: The lock is about to be released.
- **unused**: The lock is allocated but has not been processed into any state.

[-bytelock-offset <integer>] - Bytelock Starting Offset

If you specify this parameter, the command displays information about bytelocks with the specified offset value. This is the index in the file (in bytes) where the lock begins.
[-bytelock-length <integer>] - Number of Bytes Locked
   If you specify this parameter, the command displays information about bytelocks with the specified length. This is the number of bytes that are locked by this particular lock.

[-bytelock-mandatory {true|false}] - Bytelock is Mandatory
   If you specify this parameter, the command displays information only about mandatory bytelocks. A mandatory bytelock enforces the requirement of byte range locking on clients before accessing the associated range.

[-bytelock-exclusive {true|false}] - Bytelock is Exclusive
   If you specify this parameter, the command displays information only about exclusive bytelocks. When an exclusive bytelock is granted, no other bytelock may be granted whose range overlaps it.

[-bytelock-super {true|false}] - Bytelock is Superlock
   If you specify this parameter, the command displays information only about super-bytelocks. When a super-bytelock is granted, all other locks on that file are released, and no other operations will be allowed on that file.

[-bytelock-soft {true|false}] - Bytelock is Soft
   If you specify this parameter, the command displays information only about softened bytelocks. An NFSv4 bytelock might become softened if the connection to the client is interrupted. Soft locks might be reclaimed if the client reconnects. However if another client requests a lock that conflicts with a soft lock, then the soft lock will be released.

[-oplock-level {exclusive|level2|batch|null|read-batch}] - Oplock Level
   If you specify this parameter, the command displays information about locks with the specified oplock level. The oplock level determines which operations the client may cache locally. Those operations include opening, reading, writing, closing, and creating and destroying bytelocks on a file. The five valid oplock levels are:
   - batch: The client may cache all operations on the file.
   - exclusive: The client may cache reads and writes on the file.
   - read-batch: The client may cache reads and opens on the file.
   - level2: The client may cache reads on the file.
   - null: The client may not cache any operations on the file.

[-sharelock-mode <share lock mode>] - Shared Lock Access Mode
   If you specify this parameter, the command displays information about locks with the specified sharelock mode. The parameter has two components separated by a hyphen: the access mode followed by the share mode. The access mode specifies which operations the client is allowed to perform on the file. The share mode specifies which operations other clients are disallowed to perform. The two modes are a combination of one or more of these permissions:
   - read
   - write
   - delete
   - all
   - none

   For example, the sharelock mode read write-deny delete allows the client to read and write the file, and disallows other clients to delete the file. A special mode is delete-on-close, which specifies that the server will delete the file as soon as it is closed.
[sharelock-soft (true|false)] - Shared Lock is Soft

If you specify this parameter, the command displays information only about softened sharelocks. A NFSv4 sharelock can become softened when the connection to the client is interrupted. If the client reconnects, it might reclaim the sharelock. However, if another client creates a sharelock that conflicts with the softened sharelock, the softened sharelock will be released.

[delegation-type (read|write)] - Delegation Type

If you specify this parameter, the command displays information only about locks with the specified delegation-type setting. The delegation type determines which operations the client may cache locally. The two valid delegation types are:

- **read**: The client may cache reads on the file.
- **write**: The client may cache reads and writes on the file.

[owner-id <text>] - Owner ID

If you specify this parameter, the command displays information only about locks with the specified owner ID. The owner ID is an opaque byte string generated by the server for each file lock request.

[client-address <IP Address>] - Client Address

If you specify this parameter, the command displays information only about locks from the specified client IP address.

[client-address-type (ipv4|ipv6|ipv6z)] - Client Address Type

If you specify this parameter, the command displays information only about locks corresponding to a certain IP address type. Please note that locks created over the NFSv4 or NFSv4.1 protocol cannot have their address types resolved. Valid options are:

- **ipv4**: Clients operating over an IPv4 interface.
- **ipv6**: Clients operating over an IPv6 interface.

[smb-open-type (none|durable|persistent)] - SMB Open Type

If you specify this parameter, the command displays information only about locks with the specified SMB open type. Valid open types are

- **durable**: Durability is a feature of SMB2. A durable lock might become "disconnected" if the connection between the client and server is disrupted. A disconnected durable lock might be reconnect if the connection is reestablished.
- **persistent**: Persistence is a feature of SMB3. Persistent locks can become disconnected and later reconnected, like durable locks. Persistent locks are used to facilitate continuously available shares.
- **none**: The lock is neither durable nor persistent.

[smb-connect-state <Lock Connect State>] - SMB Connect State

If you specify this parameter, the command displays information only about locks with the specified SMB connection state. Some of the valid states are:

- **connected**: This is the normal state of a SMB lock when the server and client are connected.
- **disconnected**: If a lock is durable or persistent, it might become disconnected if the connection between the server and its client is interrupted. Disconnected locks may later be reconnected if the connection is reestablished.

[smb-expiration-time <integer>] - SMB Expiration Time (Secs)

If you specify this parameter, the command displays information only about locks with the specified SMB lock expiration time. When a lock is disconnected, **smb-expiration-time** shows the time remaining until the lock expires. The server releases the lock after it expires.
If you specify this parameter, the command displays information only about locks with the specified SMB open group identifier. This is an opaque byte string provided by the client as the SMB lease key when the lock is first established.

**Examples**

The following example displays default information about all locks:

```
cluster1::> vserver locks show
Vserver: vs0
Volume  Object Path               LIF         Protocol  Lock Type   Client
-------- ------------------------- ----------- --------- ----------- ----------
vol1     /vol1/notes.txt           node1_data1
          cifs share-level 192.168.1.5
          Sharelock Mode: read_write-deny_delete
          Oplock Level: read-batch
/vol1/notes1.txt          node1_data1
          cifs share-level 192.168.1.5
          Sharelock Mode: read_write-deny_delete
          Oplock Level: batch
/vol1               node1_data2
          cifs share-level 192.168.1.5
          Sharelock Mode: read-deny_delete
          Oplock Level: read-batch
/Vol1/notes.txt           node1_data2
          cifs share-level 192.168.1.5
          Sharelock Mode: read_write-deny_delete
          Oplock Level: read-batch
7 entries were displayed.
```

The following example displays the SMB related information about all locks:

```
cluster1::> vserver locks show -smb-attrs
Vserver: vs0
Volume  Object Path               LIF         Protocol  Lock Type   Client
-------- ------------------------- ----------- --------- ----------- ----------
vol1     /vol1/notes.txt           node1_data1
          cifs share-level 192.168.1.5
          Sharelock Mode: read_write-deny_delete
          Oplock Level: read-batch
/vol1/notes1.txt          node1_data1
          cifs share-level 192.168.1.5
          Sharelock Mode: read_write-deny_delete
          Oplock Level: batch
/vol1               node1_data2
          cifs share-level 192.168.1.5
          Sharelock Mode: read-deny_delete
          Oplock Level: read-batch
/Vol1/notes.txt           node1_data2
          cifs share-level 192.168.1.5
          Sharelock Mode: read_write-deny_delete
          Oplock Level: read-batch
```

```
vserver migrate commands

Migrate command set

vserver migrate cleanup

Remove migrating entity

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
This command cleans up the migrate destination Vserver. If the Vserver migrate operation has failed or is paused, use this command to delete the destination Vserver.

Parameters
-vserver <vserver name> - Vserver Name
Name of the Vserver which is being migrated.

Examples

vserver migrate cutover

Perform Cutover of the migrate operation

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
This command performs a cutover of the Vserver from the source cluster to the destination cluster. It must be run on the destination cluster of the Vserver migrate.

Parameters
-vserver <vserver name> - Vserver Name
Name of the Vserver which is being migrated.
**vserver migrate pause**

Pause a Vserver migrate operation

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**
This command pauses a Vserver migrate operation. Both data transfer and configuration replication are stopped. It must be run on the destination cluster of the Vserver migrate operation.

**Parameters**
- `-vserver <vserver name>` - Vserver Name
  Name of the Vserver whose migrate will be paused.

**vserver migrate repeer**

Repeer Existing Vserver Peer Relationships after Vserver Migration

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**
This command re-establishes the existing Vserver peer relationships after Vserver migration has finished.

**Parameters**
- `-source-cluster <text>` - Source Cluster Name
  Name of the source cluster.
- `-vserver-name <text>` - migrated vserver name
  Name of the Vserver that has finished migrating.

**vserver migrate resume**

Resume a migrate operation

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**
This command resumes a Vserver migrate operation. It must be run on the destination cluster of the Vserver migrate operation. The migrate operation, which either previously failed or was paused in order to prioritize other cluster operations, can be resumed.

**Parameters**
- `-vserver <vserver name>` - Vserver Name
  Name of the Vserver being migrated.
[-force {true|false}] - Force flag for continuing with disruptive migrate

If set to true, the Vserver migrate will be disruptive, and will continue to completion even if cutover lasts longer than its normal 30 second window.

[-auto-cutover {true|false}] - Automatically cutover when ready

This parameter is to specify if the Vserver migrate operation should cutover automatically when ready.

[-skip-performance-check {true|false}] - Skip checking iops requirement of volume on destination aggregates

If set to true, the destination aggregates will not be checked to see if they meet the IOPS requirements.

### Examples

#### vserver migrate show

Display status of migrating Vservers

**Availability:** This command is available to cluster administrators at the advanced privilege level.

**Description**

This command displays information about the migrating vserver.

**Parameters**

{[-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-migrate-status-details]

If this parameter is specified, the command displays the following information about Vserver migrate operation.

- Vserver
- Migrate status
- Status details

[-instance ]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver Name

Name of the Vserver which is migrating.

[-vserver-uuid <UUID>] - Vserver UUID

If this parameter is specified, the command displays Vserver migrate information that matches the specified Vserver UUID.

[-transaction-id <integer>] - Transaction Id

If this parameter is specified, the command displays Vserver migrate information that matches the specified transaction-id. A transaction-id is a 64 bit integer which identifies each Vserver migrate operation uniquely.

[-destination-cluster <Cluster name>] - Destination Cluster Name

If this parameter is specified, the command displays Vserver migrate information that matches the specified destination cluster.

[-source-cluster <Cluster name>] - Source Cluster Name

If this parameter is specified, the command displays Vserver migrate information that matches the specified source cluster.

vserver migrate commands
If this parameter is specified, the command displays Vserver migrate information that matches the specified
Vserver migrate status.

[-start-time <MM/DD/YYYY HH:MM:SS>] - Migrate start time

If this parameter is specified, the command displays Vserver migrate information that matches the specified
Vserver migrate start time.

[-completion-time <MM/DD/YYYY HH:MM:SS>] - Migrate operation finish time

If this parameter is specified, the command displays Vserver migrate information that matches the specified
Vserver migrate completion time.

[-last-pause-time <MM/DD/YYYY HH:MM:SS>] - Last migrate pause time

If this parameter is specified, the command displays Vserver migrate information that matches the specified
Vserver migrate last paused time.

[-last-resume-time <MM/DD/YYYY HH:MM:SS>] - Last migrate resume time

If this parameter is specified, the command displays Vserver migrate information that matches the specified
Vserver migrate last resume time.

[-last-rollback-time <MM/DD/YYYY HH:MM:SS>] - Last migrate rollback time

If this parameter is specified, the command displays Vserver migrate information that matches the specified
Vserver migrate last rollback time.

[-cutover-trigger-time <MM/DD/YYYY HH:MM:SS>] - Cutover trigger time

If this parameter is specified, the command displays Vserver migrate information that matches the specified
Vserver migrate cutover trigger time.

[-cutover-start-time <MM/DD/YYYY HH:MM:SS>] - Cutover start time

If this parameter is specified, the command displays Vserver migrate information that matches the specified
Vserver migrate cutover start time.

[-cutover-complete-time <MM/DD/YYYY HH:MM:SS>] - Cutover complete time

If this parameter is specified, the command displays Vserver migrate information that matches the specified
Vserver migrate cutover completion time.

[-rollback-count <integer>] - Rollback Count

If this parameter is specified, the command displays Vserver migrate information that matches the specified
rollback count.

[-status-details <text>, ...] - Errors and Warnings During Migrate

If this parameter is specified, the command displays Vserver migrate information that matches the specified
Vserver migrate status details.

[-cutover-window <integer>] - Cutover duration(seconds)

If this parameter is specified, the command displays Vserver migrate information that matches the specified
Vserver migrate cutover window.

[-ipspace <IPspace>] - Destination cluster IPspace Name for vserver

If this parameter is specified, the command displays Vserver migrate information that matches the specified
ipspace.

[-force {true | false}] - Force cutover until completion

If force is set to "true", the command will only display Vserver migrate operation information about Vservers
where the value of force is set to "true". If set to "false", the command will only display Vserver migrate
operation information where force is set to "false".
[-aggr-list <aggregate name>, ...] - Aggregate list for creating the volumes
If this parameter is specified, the command displays Vserver migrate information that matches the specified aggregate list that are assigned for Vserver to use.

[-migrate-vserver-type {migrate-source|migrate-destination}] - Identify if the Vserver is migrate source or destination
If this parameter is specified, the command displays Vserver migrate information that matches the specified Vserver migrate type.

[-is-past-point-of-no-return {true|false}] - Indicate point of no return for migrate
If this parameter is specified, the command displays Vserver migrate information that matches the specified past point of no return flag.

[-current-migrate-operation {none|start|resume|pause|cleanup|cutover}] - Current Migrate operation
If this parameter is specified, the command displays Vserver migrate information that matches the specified current Vserver migrate operation.

[-last-migrate-operation {none|start|resume|pause|cleanup|cutover}] - Last Migrate operation
If this parameter is specified, the command displays Vserver migrate information that matches the specified last Vserver migrate operation.

[-local-vserver-id <integer>] - Vserver ID
If this parameter is specified, the command displays Vserver migrate information that matches the specified local vserver id.

[-group-id <integer>] - Group ID
If this parameter is specified, the command displays Vserver migrate information that matches the specified group id.

[-partner-vserver-id <integer>] - Partner Vserver ID
If this parameter is specified, the command displays Vserver migrate information that matches the specified partner vserver id.

[-partner-group-id <integer>] - Partner group ID
If this parameter is specified, the command displays Vserver migrate information that matches the specified partner group id.

[-auto-cutover {true|false}] - Automatic cutover
If this parameter is specified, the command displays Vserver migrate information that matches the specified auto cutover flag.

[-skip-performance-check {true|false}] - Skip checking iops requirement of volume on destination aggregates
If this parameter is specified, the command displays Vserver migrate information that matches the specified skip performance flag.

[-cutover-ready-max-transfer-time-limit <integer>] - Transfer duration for marking ready for cutover (seconds)
If this parameter is specified, the command displays Vserver migrate information that matches the specified time required to mark cutover ready.

**Examples**

**vserver migrate show-progress**
Display status of volumes in a migrating Vservers

**Availability:** This command is available to cluster and Vserver administrators at the advanced privilege level.
Description
This command displays data transfer progress of all the volumes in migrating Vservers.

Parameters
[<fields <fieldname>, ...]
This specifies the fields that need to be displayed.

[<instance >]
If this parameter is specified, the command displays detailed volume progress information.

[vserver <vserver name>] - Vserver
Name of the Vserver which is migrating.

[volume <volume name>] - Volume Name
If this parameter is specified, the command displays the details of volume progress that matches specified volume.

[vserver-uuid <UUID>] - Vserver UUID
If this parameter is specified, the command displays the details of volume progress that matches specified Vserver UUID.

[source-cluster-uuid <UUID>] - Source Cluster Uuid
If this parameter is specified, the command displays the details of volume progress that matches specified source cluster UUID.

[bytes-transferred <integer> [KB|MB|GB|TB|PB]] - Bytes transferred per volume
If this parameter is specified, the command displays the details of volume progress that matches specified bytes transferred.

[bytes-to-be-transferred <integer> [KB|MB|GB|TB|PB]] - Bytes to be transferred per volume
If this parameter is specified, the command displays the details of volume progress that matches specified bytes to be transferred.

[transfer-rate <text>] - Rate of data transfers
If this parameter is specified, the command displays the details of volume progress that matches specified transfer rate.

[transfer-start-time <integer>] - Transfer start time
If this parameter is specified, the command displays the details of volume progress that matches specified transfer start time.

[total-bytes-to-be-transferred <integer> [KB|MB|GB|TB|PB]] - Total bytes to be transferred per vserver
If this parameter is specified, the command displays the details of volume progress that matches specified total bytes to be transferred.

[progress-time-last-updated <integer>] - Real time progress time given by SnapMirror
If this parameter is specified, the command displays the details of volume progress that matches specified real time progress time given by snapmirror.

[last-transfer-time <integer>] - Last transfer time
If this parameter is specified, the command displays the details of volume progress that matches specified last transfer time.

[progress-bytes-last-updated <integer> [KB|MB|GB|TB|PB]] - Real time progress bytes given by SnapMirror
If this parameter is specified, the command displays the details of volume progress that matches specified real time progress bytes given by snapmirror.
If this parameter is specified, the command displays the details of volume progress that matches specified time remaining for bytes transfer.

[-percent-complete <percent>] - Percentage of transfer completed

If this parameter is specified, the command displays the details of volume progress that matches specified percentage of transfer completed.

[-total-bytes-transferred {<integer> [KB|MB|GB|TB|PB]}] - Total bytes transferred per vserver

If this parameter is specified, the command displays the details of volume progress that matches specified total bytes transferred per vserver.

[-average-transfer-rate <text>] - Average transfer rate per vserver

If this parameter is specified, the command displays the details of volume progress that matches specified average transfer rate per vserver.

[-total-time-remaining <text>] - Total Time Remaining per vserver

If this parameter is specified, the command displays the details of volume progress that matches specified total time remaining per vserver.

[-total-percent-complete <percent>] - Total Percent complete per vserver

If this parameter is specified, the command displays the details of volume progress that matches specified total percent of transfer complete per vserver.

[-total-used {<integer> [KB|MB|GB|TB|PB]}] - Total Used

If this parameter is specified, the command displays the details of volume progress that matches specified total used size.

Examples

vserver migrate show-volume

Display status of volumes in a migrating Vservers

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
This command displays status of all the volumes in a migrating Vservers.

Parameters
{ [-fields <filename>, ...] }  
This specifies the fields that need to be displayed.

[[-instance ]]  
If this parameter is specified, the command displays detailed volume status information.

[-vserver <vserver name>] - Vserver Name

Name of the Vserver which is migrating.

[-volume <volume name>] - Volume Name

If this parameter is specified, the command displays detailed volume status information that matches specified volume.

[-volume-dsid <integer>] - Volume DSID

If this parameter is specified, the command displays the details of volume status that matches specified DSID.

[-volume-msid <integer>] - Volume MSID

If this parameter is specified, the command displays the details of volume status that matches specified MSID.
[\texttt{\textbf{-vserver-uuid <UUID>]]} - Vserver UUID

If this parameter is specified, the command displays the details of volume status that matches specified Vserver UUID.

\texttt{\textbf{-node <nodename>]} - Node

If this parameter is specified, the command displays the details of volume status that matches specified node.

\texttt{\textbf{-state \{Transfer | ReadyForCutover | PreCutover | Penultimate | CutoverStarted | CutoverComplete | Cleanup | MigrateFailed\]}} - Status of the transfer

If this parameter is specified, the command displays the details of volume status that matches specified vserver migrate status.

\texttt{\textbf{-last-transfer-duration <integer>]} - Duration of last transfer in seconds

If this parameter is specified, the command displays the details of volume status that matches specified last transfer duration.

\texttt{\textbf{-last-transfer-done \{true|false\}}} - Is the last transfer done

If this parameter is specified, the command displays the details of volume status that matches specified last transfer done flag status.

\texttt{\textbf{-break-done \{true|false\}}} - Is the break done

If this parameter is specified, the command displays the details of volume status that matches specified break-done flag status.

\texttt{\textbf{-errors <text>]]} - Errors in volume operation if any

If this parameter is specified, the command displays the details of volume status that matches specified errors.

\texttt{\textbf{-last-transfer-queue-time <MM/DD/YYYY HH:MM:SS>]]} - Time of the last transfer

If this parameter is specified, the command displays the details of volume status that matches specified last transfer queue time.

\texttt{\textbf{-transfer-completed \{true|false\}}} - Is the transfer completed

If this parameter is specified, the command displays the details of volume status that matches specified transfer completed flag status.

\texttt{\textbf{-cutover-transfer-count <integer>]]} - Number of transfers within cutover threshold

If this parameter is specified, the command displays the details of volume status that matches specified cutover transfer count.

\texttt{\textbf{-force \{true|false\}}} - Volume force cutover flag

If this parameter is specified, the command displays the details of volume status that matches specified volume force cutover flag.

\begin{tabular}{|l|}
\hline
\textbf{Examples} \\

\end{tabular}

\begin{verbatim}
\textbf{vserver migrate start}
\end{verbatim}

Start the Vserver migrate operation

\textbf{Availability:} This command is available to \textit{cluster} administrators at the \textit{advanced} privilege level.

\textbf{Description}

This command starts the migration of a Vserver from one cluster to another. This has to be run on the destination cluster, i.e. the cluster where the Vserver is intended to migrate. The source cluster from where the Vserver is to be migrated is specified in the command.
Parameters
-vserver <vserver name> - Vserver Name
   Name of the Vserver which needs to be migrated.
-source-cluster <Cluster name> - Source Cluster Name
   Name of the source cluster.
[-check-only {true|false}] - Check if migrate can be done
   Runs the prechecks and tells if the Vserver migrate operation can be started or not.
[-ipspace <IPspace>] - Destination cluster IPspace Name for vserver
   Name of the IPspace in the destination cluster.
[-aggr-list <aggregate name>,...] - Aggregate list
   Provide the list of aggregates where the volumes will be created in the destination cluster.
[-force {true|false}] - Force flag for continuing with disruptive migrate
   The force parameter is set to true when the user wants Vserver migrate operation to continue to completion
   even though the 30 sec cutover duration is not met. When this parameter is used, it indicates that the admin
   wants to perform a disruptive migrate operation.
[-auto-cutover {true|false}] - Automatically cutover when ready
   This parameter is to specify if the Vserver migrate operation should cutover automatically when ready.
[-skip-performance-check {true|false}] - Skip checking iops requirement of volume on destination
aggregates
   This parameter is set to true when the user wants the Vserver migrate operation to skip checking IOPS
   requirement of volume on destination aggregates.

Examples

vserver name-mapping commands

The name-mapping directory

vserver name-mapping create

Create a name mapping

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver name-mapping create command creates a name mapping. Name mappings are applied in the order in which
they occur in the priority list; for example, a name mapping that occurs at position 2 in the priority list is applied before a name
mapping that occurs at position 3. Each mapping direction (Kerberos-to-UNIX, Windows-to-UNIX, and UNIX-to-Windows)
has its own priority list. Data ONTAP prevents you from creating two name mappings with the same pattern.

Patterns can be expressed as POSIX regular expressions. For information about regular expressions, see the UNIX reference
page for regex(7).

Each Vserver can have up to 1024 name mappings in each direction.

Note: If you are using the CLI, you must delimit all regular expressions with double quotation marks ("). For instance, to
enter the regular expression "(+)" in the CLI, type "(\+)" at the command prompt. To add a "?" to the expression, press ESC
followed by the "?".
Parameters

-vserver <vserver name> - Vserver
This parameter specifies the Vserver on which you want to create the name mapping.

direction (krb-unix|win-unix|unix-win) - Direction
This parameter specifies the direction of the name mapping. Possible values are krb-unix for a Kerberos-to-UNIX name mapping, win-unix for a Windows-to-UNIX name mapping, and unix-win for a UNIX-to-Windows name mapping.

-position <integer> - Position
This parameter specifies the name mapping's position in the priority list. Specify the position as a positive integer.

Note: If you want to create a new name mapping at a position that is already occupied in the priority list, use the vserver name-mapping insert command instead of the vserver name-mapping create command.

-pattern <text> - Pattern
This parameter specifies the pattern you want to match. Refer to the command description section for details. The pattern can be up to 256 characters in length.

-replacement <text> - Replacement
This parameter specifies the replacement pattern. The replacement pattern can be up to 256 characters in length.

{-address <IP Address/Mask>} - IP Address with Subnet Mask
This optional parameter specifies the IP address that can be used to match the client's workstation IP address with the pattern.

{|-hostname <text>} | Hostname
This optional parameter specifies the hostname that can be used to match the corresponding client's workstation IP address with the list of IP addresses with the pattern.

Examples

The following example creates a name mapping on a Vserver named vs1. The mapping is from UNIX to Windows at position 5 in the priority list. The mapping maps the pattern cifs to the replacement EXAMPLE\Domain Users.

```
cluster1::> vserver name-mapping create -vserver vs1 -direction unix-win -position 5 -pattern cifs -replacement "EXAMPLE\Domain Users -address 10.238.33.245/24"
cluster1::> vserver name-mapping create -vserver vs1 -direction unix-win -position 5 -pattern cifs -replacement "EXAMPLE\Domain Users -hostname google.com"
```

Related references

vserver name-mapping insert on page 1883

vserver name-mapping delete

Delete a name mapping

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver name-mapping delete command deletes a name mapping.
Parameters

-vserver <vserver name> - Vserver
This parameter specifies the Vserver from which you want to delete the name mapping.

-direction (krb-unix|win-unix|unix-win) - Direction
This parameter specifies the direction of the name mapping that you want to delete.

-position <integer> - Position
This parameter specifies the position of the name mapping that you want to delete. Specify the position as a positive integer.

Examples
The following example deletes a name mapping on a Vserver named vs1. The name mapping is from UNIX to Windows and is at position 5.

```
cluster1:/> vserver name-mapping delete -vserver vs1 -direction unix-win -position 5
```

vserver name-mapping insert

Create a name mapping at a specified position

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver name-mapping insert command creates a name mapping at a specified position in the priority list. The command rearranges the list as needed to accommodate the new entry. For instance, if you have a priority list of five mappings and insert a new mapping at position 3, the mapping previously at position 3 is moved to position 4, the mapping previously at position 4 is moved to position 5, and the mapping previously at position 5 is moved to position 6. Each mapping direction (Kerberos-to-UNIX, Windows-to-UNIX, and UNIX-to-Windows) has its own priority list.

You can specify patterns as POSIX regular expressions. For information about regular expressions, see the UNIX reference page for regex(7).

Each Vserver can have up to 1024 name mappings in each direction.

Note: If you are using the CLI, you must delimit all regular expressions with double quotation marks ("), For instance, to enter the regular expression "(\+\+\+)" in the CLI, type "(\+\+\+)" at the command prompt. To add a "?" to the expression, press ESC followed by the "?". 

Parameters

-vserver <vserver name> - Vserver
This parameter specifies the Vserver on which you want to create the name mapping.

-direction {krb-unix|win-unix|unix-win} - Direction
This parameter specifies the direction of the name mapping. Possible values are krb-unix for a Kerberos-to-UNIX name mapping, win-unix for a Windows-to-UNIX name mapping, and unix-win for a UNIX-to-Windows name mapping.

-position <integer> - Position
This parameter specifies the position in the priority list at which you want to insert the new name mapping. Specify a position as a positive integer.

-pattern <text> - Pattern
This parameter specifies the pattern you want to match. Refer to the command description section for details. The pattern can be up to 256 characters in length.
-replacement <text> - Replacement

This parameter specifies the replacement pattern. The replacement pattern can be up to 256 characters in length.

{[-address <IP Address/Mask>]} - IP Address with Subnet Mask

This optional parameter specifies the IP address that can be used to match the client's workstation IP address with the pattern.

| [-hostname <text>] | - Hostname

This optional parameter specifies the hostname that can be used to match the corresponding client's workstation IP address with the list of IP addresses with the pattern.

Examples

The following example creates a name mapping on a Vserver named vs1. It is a user mapping from Kerberos to UNIX. It is inserted into the priority list at position 2. The name mapping maps any principal in the Kerberos realm SEC.EXAMPLE.COM to the UNIX user name corresponding to the principal's base name with any instance names removed; for example, tom/admin@SEC.EXAMPLE.COM is mapped to tom.

```bash
cluster1::> vserver name-mapping insert -vserver vs1 -direction krb-unix -position 2 -pattern "([^@/]+)(/[^@]+)?@SEC.EXAMPLE.COM" -replacement \1
cluster1::> vserver name-mapping insert -vserver vs1 -direction krb-unix -position 3 -pattern "([^@/]+)(/[^@]+)?@SEC.EXAMPLE.COM" -replacement \1 -address 10.238.33.245/24
```

Vserver name-mapping modify

Modify a name mapping's pattern, replacement pattern, or both

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver name-mapping modify command modifies the pattern, the replacement pattern, or both of a specified name mapping.

You can specify patterns as POSIX regular expressions. For information about regular expressions, see the UNIX reference page for regex(7).

Each Vserver can have up to 1024 name mappings in each direction.

Note: If you are using the CLI, you must delimit all regular expressions with double quotation marks ("). For instance, to enter the regular expression (.+) in the CLI, type "(.+)" at the command prompt. To add a "?" to the expression, press ESC followed by the "?".

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the Vserver on which you want to modify the name mapping.

-direction {krb-unix|win-unix|unix-win} - Direction

This parameter specifies the direction of the name mapping. Possible values are krb-unix for a Kerberos-to-UNIX name mapping, win-unix for a Windows-to-UNIX name mapping, and unix-win for a UNIX-to-Windows name mapping.

-position <integer> - Position

This parameter specifies the name mapping's position in the priority list. A position is specified as a positive integer. Each mapping direction (Kerberos-to-UNIX, Windows-to-UNIX, and UNIX-to-Windows) has its own priority list.
The `vserver name-mapping modify` command allows you to change the pattern used to match client IP addresses or hostnames.

**Parameters**

- `-pattern <text>` - Pattern
  This parameter specifies the pattern you want to match. Refer to the command description section for details. The pattern can be up to 256 characters in length.

- `-replacement <text>` - Replacement
  This parameter specifies the replacement pattern. The replacement pattern can be up to 256 characters in length.

- `[{-address <IP Address/Mask>}]` - IP Address with Subnet Mask
  This optional parameter specifies the IP address that can be used to match the client's workstation IP address with the pattern.

- `[{-hostname <text>}]` - Hostname
  This optional parameter specifies the hostname that can be used to match the corresponding client's workstation IP address with the list of IP addresses with the pattern.

**Examples**

The following example modifies the name mapping on the Vserver named `vs1` and direction `win-unix`, at position 3. The pattern to be matched is changed to "EXAMPLE(.+)".

```bash
cluster1::> vserver name-mapping modify -vserver vs1 -direction win-unix -position 3 -pattern "EXAMPLE\(.+)" -address 10.238.2.54/32
```

```bash
cluster1::> vserver name-mapping modify -vserver vs1 -direction win-unix -position 3 -pattern "EXAMPLE\(.+)" -hostname google.com
```

**vserver name-mapping refresh-hostname-ip**

Refresh the IP addresses for configured hostnames

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `advanced` privilege level.

**Description**

The `vserver name-mapping refresh-hostname-ip` command will refresh the IP Address entries in the name-mapping configuration by resolving the hostname. If you run this command with no parameters, this will refresh the IP address entries for every hostname in the name-mapping configuration.

**Parameters**

- `-vserver <vserver>` - Vserver
  This parameter specifies the Vserver for which the hostname lookup needs to be done.

- `[{-direction {krb-unix|win-unix|unix-win}}]` - Name Mapping Direction
  This optional parameter specifies the direction of the name-mapping entry for the hostname lookup.

- `[{-hostname <text>}]` - Hostname
  This optional parameter specifies the hostname for which the lookup needs to be done.

**Examples**

```bash
cluster1::*> vserver name-mapping refresh-hostname-ip -vserver vs1 -direction win-unix -hostname
```
vserver name-mapping show

Display name mappings

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver name-mapping show command displays information about name mappings. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all name mappings:

- Vserver name
- Direction of the mapping (krb-unix for Kerberos-to-UNIX, win-unix for Windows-to-UNIX, or unix-win for UNIX-to-Windows)
- Position of the mapping in the priority list
- Pattern to be matched
- Replacement pattern

You can specify additional parameters to display only information that matches those parameters. For instance, to display information only about Kerberos-to-UNIX name mappings, run the command with the -direction krb-unix parameter.

Parameters

{ [-fields <fieldname>, ...] } If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

| [-instance ] } If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver

If you specify this parameter, the command displays information only about the name mapping or mappings that match the specified Vserver.

[-direction {krb-unix|win-unix|unix-win}] - Direction

If you specify this parameter, the command displays information only about the name mapping or mappings that have the specified mapping direction.

[-position <integer>] - Position

If you specify this parameter, the command displays information only about the name mapping that has the specified position in the priority list.

[-pattern <text>] - Pattern

If you specify this parameter, the command displays information only about the name mapping or mappings that use the specified matching pattern. The pattern can be up to 256 characters in length. Refer to the command description section for details.

[-replacement <text>] - Replacement

If you specify this parameter, the command displays information only about the name mapping or mappings that use the specified replacement pattern.

[-address <IP Address/Mask>] - IP Address with Subnet Mask

If you specify this parameter, the command displays information only about the name mapping or mappings that use the specified IP address.
[-hostname <text>] - Hostname

If you specify this parameter, the command displays information only about the name mapping or mappings that use the specified hostname.

**Examples**
The following example displays information about all name mappings:

```bash
cluster1::> vserver name-mapping show
Vserver: vs1
Direction: win-unix
Position Hostname         IP Address/Mask
-------- ---------------- ----------------
1        google.com       -                  Pattern: EXAMPLE\administrator
Replacement: nobody
2        -                10.238.2.34/32     Pattern: EXAMPLE\(.+)
Replacement: _1
```

### vserver name-mapping swap

Exchange the positions of two name mappings

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `vserver name-mapping swap` command exchanges the positions of two name mappings in the priority list.

**Parameters**
- `-vserver <vserver name>` - Vserver
  
  This parameter specifies the Vserver on which the name mappings are located.

- `-direction {krb-unix|win-unix|unix-win}` - Direction
  
  This parameter specifies the direction of the name mappings that you want to exchange. Each mapping direction (Kerberos-to-UNIX, Windows-to-UNIX, and UNIX-to-Windows) has its own priority list.

- `-position <integer>` - Position
  
  This parameter specifies the position in the priority list of the first name mapping that you want to exchange. Specify a position as a positive integer.

- `-with-position <integer>` - Position of an existing name mapping entry in the list of name mappings for this Vserver. This entry will be swapped with the entry at 'position'.
  
  This parameter specifies the position in the priority list of the second name mapping that you want to exchange. Specify a position as a positive integer.

**Examples**
The following example exchanges the positions of two name mappings on a Vserver named vs1. The name mappings have the direction Windows-to-UNIX. The name mappings are exchanged between positions 2 and 4.

```bash
cluster1::> vserver name-mapping swap -vserver vs1 -direction win-unix -position 2 -with-position 4
```

### vserver nfs commands

Manage the NFS configuration of a Vserver
vserver nfs create

Create an NFS configuration for a Vserver

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver nfs create command enables and configures a Vserver to serve NFS clients. The Vserver must already exist. An NFS-enabled Vserver is associated with an NIS domain.

Parameters
-vserver <vserver name> - Vserver
This parameter specifies the Vserver on which you want to create the NFS configuration.

[-access {true|false}] - General NFS Access
This optional parameter specifies whether to enable NFS access on the Vserver. The default setting is true.

[-rpcsec-ctx-high <integer>] - RPC GSS Context Cache High Water Mark (privilege: advanced)
This optional parameter specifies the maximum number of RPCSEC_GSS authentication contexts, which are used by Kerberos. The default setting is zero. See RFC 2203 for information about RPCSEC_GSS contexts.

[-rpcsec-ctx-idle <integer>] - RPC GSS Context Idle (privilege: advanced)
This optional parameter specifies, in seconds, the amount of time a RPCSEC_GSS context is permitted to remain unused before it is deleted. The default setting is zero seconds. See RFC 2203 for information about RPCSEC_GSS contexts.

[-v3 {enabled|disabled}] - NFS v3
This optional parameter specifies whether to enable access for NFSv3 clients. The default setting is enabled.

[-v4.0 {enabled|disabled}] - NFS v4.0
This optional parameter specifies whether to enable access for NFSv4.0 clients. The default setting is disabled. This parameter is not supported for Vservers with Infinite Volume.

[-udp {enabled|disabled}] - UDP Protocol
This optional parameter specifies whether to enable NFS access over UDP. The default setting is enabled. This parameter is not supported for Vservers with Infinite Volume.

Note: Even if UDP is disabled, if TCP is enabled, the Vserver does not block NFSv3 traffic over UDP. By allowing this traffic, the storage system can process NFS_NULL ops that the Solaris automounter sends to determine if the storage system is alive. (Solaris sends these ops over UDP even if configured to use TCP.) To disallow access for certain clients, including over UDP, you can use export-policy rules. For more information, see the vserver export-policy rule create command.

[-tcp {enabled|disabled}] - TCP Protocol
This optional parameter specifies whether to enable NFS access over TCP. The default setting is enabled.

[-default-win-user <text>] - Default Windows User
This optional parameter specifies a list of default Windows users for the NFS server.

[-enable-ejukebox {true|false}] - Enable NFSv3 EJUKEBOX error (privilege: advanced)
This optional parameter specifies whether EJUKEBOX errors are enabled for NFSv3. The default setting is true.

[-v3-require-read-attributes {true|false}] - Require All NFSv3 Reads to Return Read Attributes (privilege: advanced)
This optional parameter specifies whether NFSv3 read operations are required to return read attributes. The default setting is false.
[\texttt{-v3-fsid-change \{enabled|disabled\}}] - Show Change in FSID as NFSv3 Clients Traverse Filesystems
\small{(privilege: advanced)}

This optional parameter specifies whether Data ONTAP shows changes in file system identifiers (FSIDs) as
NFSv3 clients traverse file systems. The default setting is \texttt{enabled}.

[\texttt{-v3-connection-drop \{enabled|disabled\}}] - Enable the Dropping of a Connection When an NFSv3 Request is Dropped
\small{(privilege: advanced)}

This optional parameter specifies whether Data ONTAP allows to drop the connection when a NFSv3 request
is dropped. The default setting is \texttt{enabled}.

[\texttt{-ntfs-unix-security-ops \{fail|ignore|use-export-policy\}}] - Vserver NTFS Unix Security Options
\small{(privilege: advanced)}

This optional parameter specifies how NFSv3 security changes affect NTFS volumes. If you set this parameter
to \texttt{ignore}, Data ONTAP ignores NFSv3 security changes. If you set this parameter to \texttt{fail}, this overrides the
unix security options set in the relevant export rules. If you set this parameter to \texttt{use-export-policy}, Data
ONTAP processes NFSv3 security changes in accordance with the relevant export rules. The default setting is
\texttt{use-export-policy} at the time of creation.

[\texttt{-chown-mode \{restricted|unrestricted|use-export-policy\}}] - Vserver Change Ownership Mode
\small{(privilege: advanced)}

This optional parameter specifies whether ownership of a file can be changed by superusers or by non-root
users who currently own the file. If you set this parameter to \texttt{restricted}, the ownership of a file can be
changed by superusers only. If you set this parameter to \texttt{unrestricted}, the ownership of a file can be
changed by superusers and the current owner of the file. If you set this parameter to \texttt{use-export-policy},
the ownership of a file can be changed in accordance with the relevant export rules. The default setting is
\texttt{use-export-policy}.

[\texttt{-trace-enabled \{true|false\}}] - NFS Response Trace Enabled
\small{(privilege: advanced)}

This optional parameter specifies whether Data ONTAP logs NFS requests when they exceed the NFS
response trigger time (see the \texttt{trigger} parameter). The default setting is \texttt{false}.

[\texttt{-trigger \text{\{integer\}}} ] - NFS Response Trigger (in secs) \small{(privilege: advanced)}

This optional parameter specifies the amount of time, in seconds, after which Data ONTAP must log an NFS
request if it has not completed (assuming the \texttt{-trace-enabled option is true}). The default setting is 60.

[\texttt{-udp-max-xfer-size \text{\{integer\}}} ] - UDP Maximum Transfer Size (bytes) \small{(privilege: advanced)}

This optional parameter specifies the maximum transfer size (in bytes) that the NFS mount protocol will
negotiate with the client for UDP transport. The range is 8192 to 57344. The default setting is 32768.

[\texttt{-tcp-max-xfer-size \text{\{integer\}}} ] - TCP Maximum Transfer Size (bytes) \small{(privilege: advanced)}

This optional parameter specifies the maximum transfer size (in bytes) that the storage system negotiates with
the client for TCP transport of data for NFSv3, and NFSv4.x protocols. The range is 8192 to 1048576. The default
setting is 65536.

\textbf{Note:} Setting the parameter value greater than 65536 may cause performance degradation for existing
connections using smaller values. Contact technical support for guidance.

[\texttt{-v3-tcp-max-read-size \text{\{integer\}}} ] - NFSv3 TCP Maximum Read Size (bytes) \small{(privilege: advanced)}

This optional parameter specifies the maximum transfer size (in bytes) that the storage system negotiates with
the client for TCP transport of data for NFSv3 read requests. The range is 8192 to 1048576. The default
setting is 65536 when created.

\textbf{Note:} This parameter is deprecated and may be removed in a future release of Data ONTAP. Use the \texttt{-tcp-max-xfer-size} parameter instead.
[-v3-tcp-max-write-size <integer>] - NFSv3 TCP Maximum Write Size (bytes) (privilege: advanced)

This optional parameter specifies the maximum transfer size (in bytes) that the storage system negotiates with the client for TCP transport of data for NFSv3 write requests. The range is 8192 to 65536. The default setting is 65536 when created.

Note: This parameter is deprecated and may be removed in a future release of Data ONTAP. Use the -tcp-max-xfer-size parameter instead.

[-v4.0-acl {enabled|disabled}] - NFSv4.0 ACL Support

This optional parameter specifies whether Data ONTAP supports NFSv4.0 access control lists (ACLs). The default setting is disabled. This parameter is not supported for Vservers with Infinite Volume.

[-v4.0-read-delegation {enabled|disabled}] - NFSv4.0 Read Delegation Support

This optional parameter specifies whether Data ONTAP supports NFSv4.0 read delegations. The default setting is disabled. This parameter is not supported for Vservers with Infinite Volume.

[-v4.0-write-delegation {enabled|disabled}] - NFSv4.0 Write Delegation Support

This optional parameter specifies whether Data ONTAP supports NFSv4.0 write delegations. The default setting is disabled. This parameter is not supported for Vservers with Infinite Volume.

[-v4-fsid-change {enabled|disabled}] - Show Change in FSID as NFSv4 Clients Traverse Filesystems (privilege: advanced)

This optional parameter specifies whether Data ONTAP shows changes in file system identifiers (FSIDs) as NFSv4 clients traverse file systems. The default setting is enabled.

Note: If users access the storage system using NFSv4 from Solaris 10 clients, you must set this option to disabled.

[-v4-referrals {enabled|disabled}] - NFSv4.0 Referral Support (privilege: advanced)

This optional parameter specifies whether Data ONTAP supports NFSv4.0 referrals. The default setting is disabled. You can set this parameter to enabled only if you also set the -v4-fsid-change to enabled. If clients accessing the node do not support NFSv4.0 referrals, set this option to disabled; otherwise, those clients will not be able to access the file system. This parameter is not supported for Vservers with Infinite Volume.

[-v4-id-domain <nfs domain>] - NFSv4 ID Mapping Domain

This optional parameter specifies the domain portion of the string form of user and group names as defined by the NFSv4 protocol. By default, the domain name is normally taken from the NIS domain or the DNS domain in use. However, the value of this parameter overrides the default. The domain name must be agreed upon by both the NFS client and the storage controller before NFSv4 operations can be executed. It is recommended that the domain be specified in the fully qualified domain name format.

[-v4-validate-symlinkdata {enabled|disabled}] - NFSv4 Validate UTF-8 Encoding of Symbolic Link Data (privilege: advanced)

This optional parameter specifies whether Data ONTAP validates the UTF-8 encoding of symbolic link data. The default setting is disabled.

[-v4-lease-seconds <integer>] - NFSv4 Lease Timeout Value (in secs) (privilege: advanced)

This optional parameter specifies the time period in which Data ONTAP irrevocably grants a lock to a client. By default, the lease period is 30 seconds. The minimum value is 10. The maximum value is one less than the value of the -v4-grace-seconds parameter.

[-v4-grace-seconds <integer>] - NFSv4 Grace Timeout Value (in secs)

This optional parameter specifies the time period in which clients attempt to reclaim their locking state from Data ONTAP during server recovery. By default, the grace period is 45 seconds. The minimum value is 1 more than the value of the -v4-lease-seconds parameter. The maximum value is 90.
[-v4-acl-preserve {enabled|disabled}] - Preserves and Modifies NFSv4 ACL (and NTFS File Permissions in Unified Security Style)

This optional parameter specifies if the NFSv4 ACL is preserved or dropped when chmod is performed. In unified security style, this parameter also specifies if NTFS file permissions are preserved or dropped when chmod, chgrp, or chown are performed. The default is enabled.

[-v4.1 {enabled|disabled}] - NFSv4.1 Minor Version Support

This optional parameter specifies whether to enable access for NFSv4.1 clients. The default setting is disabled.

[-rquota {enabled|disabled}] - Rquota Enable

This optional parameter specifies whether to enable rquota over NFS. The default setting is disabled. This parameter is not supported for Vservers with Infinite Volume.

[-v4.1-implementation-domain <nfs domain>] - NFSv4.1 Implementation ID Domain (privilege: advanced)

This optional parameter specifies the NFSv4.1 implementation domain.

[-v4.1-implementation-name <text>] - NFSv4.1 Implementation ID Name (privilege: advanced)

This optional parameter specifies the NFSv4.1 implementation name.

[-v4.1-implementation-date <Date>] - NFSv4.1 Implementation ID Date (privilege: advanced)

This optional parameter specifies the NFSv4.1 implementation date.

[-v4.1-pnfs {enabled|disabled}] - NFSv4.1 Parallel NFS Support

This optional parameter specifies whether Data ONTAP supports parallel NFS over NFSv4.1. The default setting is enabled.

[-v4.1-referrals {enabled|disabled}] - NFSv4.1 Referral Support (privilege: advanced)

This optional parameter specifies whether Data ONTAP supports NFSv4.1 referrals. The default setting is disabled. You can set this parameter to enabled only if you also set the -v4-fsid-change to enabled. If clients accessing the node do not support NFSv4.1 referrals, set this option to disabled; otherwise, those clients will not be able to access the file system. This parameter is not supported for Vservers with Infinite Volume.

[-v4.1-acl {enabled|disabled}] - NFSv4.1 ACL Support

This optional parameter specifies whether Data ONTAP supports NFSv4.1 access control lists (ACLs). The default setting is disabled.

[-vstorage {enabled|disabled}] - NFS vStorage Support

This optional parameter specifies whether to enable vstorage over NFS. The default setting is disabled. This parameter is not supported for Vservers with Infinite Volume.

[-v4-numeric-ids {enabled|disabled}] - NFSv4 Support for Numeric Owner IDs

This optional parameter specifies whether the support for numeric string identifiers in NFSv4 owner attributes is enabled. The default setting is enabled.

[-default-win-group <text>] - Default Windows Group

This optional parameter specifies a list of default Windows groups for the NFS server.

[-v4.1-read-delegation {enabled|disabled}] - NFSv4.1 Read Delegation Support

This optional parameter specifies whether Data ONTAP supports NFSv4.1 read delegations. The default setting is disabled. This parameter is not supported for Vservers with Infinite Volume.

[-v4.1-write-delegation {enabled|disabled}] - NFSv4.1 Write Delegation Support

This optional parameter specifies whether Data ONTAP supports NFSv4.1 write delegations. The default setting is disabled. This parameter is not supported for Vservers with Infinite Volume.
[\texttt{-v4.x-session-num-slots <integer}>] - Number of Slots in the NFSv4.x Session slot tables (privilege: advanced)

This optional parameter specifies the number of entries in the NFSv4.x session slot table. By default, the number of slots is 180. The maximum value is 2000.

[\texttt{-v4.x-session-slot-reply-cache-size <integer}>] - Size of the Reply that will be Cached in Each NFSv4.x Session Slot (in bytes) (privilege: advanced)

This optional parameter specifies the number of bytes of the reply that will be cached in each NFSv4.x session slot. By default, the size of the cached reply is 640 bytes. The maximum value is 4096.

[\texttt{-v4-acl-max-aces <integer}>] - Maximum Number of ACEs per ACL (privilege: advanced)

This optional parameter specifies the maximum number of ACEs in an NFSv4 ACL. The range is 192 to 1024. The default value is 400. Setting it to a value more than the default could cause performance problems for clients accessing files with NFSv4 ACLs.

[\texttt{-mount-rootonly \{enabled|disabled\}}] - NFS Mount Root Only

This optional parameter specifies whether the Vserver allows MOUNT protocol calls only from privileged ports (port numbers less than 1024). The default setting is \texttt{enabled}.

[\texttt{-nfs-rootonly \{enabled|disabled\}}] - NFS Root Only

This optional parameter specifies whether the Vserver allows NFS protocol calls only from privileged ports (port numbers less than 1024). The default setting is \texttt{disabled}.

[\texttt{-auth-sys-extended-groups \{enabled|disabled\}}] - AUTH_SYS Extended Groups Enabled (privilege: advanced)

This optional parameter specifies whether Data ONTAP supports fetching auxillary groups from a name service rather than from the RPC header. The default setting is \texttt{disabled}.

[\texttt{-extended-groups-limit <integer}>] - AUTH_SYS and RPCSEC_GSS Auxillary Groups Limit (privilege: advanced)

This optional parameter specifies the maximum number of auxiliary groups supported over RPC security flavors AUTH_SYS and RPCSEC_GSS in Data ONTAP. The range is 32 to 1024. The default value is 32.

[\texttt{-validate-qtree-export \{enabled|disabled\}}] - Validation of Qtree IDs for Qtree File Operations (privilege: advanced)

This optional parameter specifies whether clustered Data ONTAP performs an additional validation on qtree IDs. The default setting is \texttt{enabled}. This parameter is ignored unless a non-inherited policy has been or is assigned to a qtree.

[\texttt{-mountd-port <integer}>] - NFS Mount Daemon Port (privilege: advanced)

This optional parameter specifies which port the NFS mount daemon (mountd) uses. The port numbers allowed are 635 (the default) and 1024 through 9999.

[\texttt{-nlm-port <integer}>] - Network Lock Manager Port (privilege: advanced)

This optional parameter specifies which port the network lock manager (NLM) uses. The port numbers allowed are 1024 through 9999. The default setting is 4045.

[\texttt{-nsm-port <integer}>] - Network Status Monitor Port (privilege: advanced)

This optional parameter specifies which port the network status monitor (NSM) uses. The port numbers allowed are 1024 through 9999. The default setting is 4046.

[\texttt{-rquotad-port <integer}>] - NFS Quota Daemon Port (privilege: advanced)

This optional parameter specifies which port the NFS quota daemon (rquotad) uses. The port numbers allowed are 1024 through 9999. The default setting is 4049.

[\texttt{-permitted-enc-types <NFS Kerberos Encryption Type>, ...}] - Permitted Kerberos Encryption Types

This optional parameter specifies the permitted encryption types for Kerberos over NFS. The default setting is \texttt{des.des3.aes-128.aes-256}.
[--showmount {enabled|disabled}] - Showmount Enabled

This optional parameter specifies whether to allow or disallow clients to see the Vserver's NFS exports list. The default setting is enabled.

**Note:** Showmount leverages the MOUNT protocol in NFSv3 to issue an EXPORT query to the NFS server. If the mount port is not listening or blocked by a firewall, or if NFSv3 is disabled on the NFS server, showmount queries fail.

[--name-service-lookup-protocol {TCP|UDP}] - Set the Protocol Used for Name Services Lookups for Exports

This optional parameter specifies the protocol to use for doing name service lookups. The allowed values are TCP and UDP. The default setting is UDP.

[--map-unknown-uid-to-default-windows-user {enable|disable}] - Map Unknown UID to Default Windows User (privilege: advanced)

If you enable this optional parameter, unknown UNIX users that do not have a name mapping to a Windows user are mapped to the configured default Windows user. This allows all unknown UNIX users access with the credentials of the default Windows user. If you disable it, all unknown UNIX users without name mapping are always denied access. By default, this parameter is enabled.

[--netgroup-dns-domain-search {enabled|disabled}] - DNS Domain Search Enabled During Netgroup Lookup (privilege: advanced)

If you enable this optional parameter, during client access check evaluation in a netgroup, Data ONTAP performs an additional verification to ensure that the domain returned from DNS for that client is listed in the DNS configuration of the Vserver. This enables you to validate the domain when clients have the same short name in multiple domains. The default setting is enabled.

[--netgroup-trust-any-ns-switch-no-match {enabled|disabled}] - Trust No-Match Result from Any Name Service Switch Source During Netgroup Lookup (privilege: advanced)

This optional parameter specifies if you can consider a no-match result from any netgroup ns-switch source to be authoritative. If this option is enabled, then a no-match response from any one of the netgroup ns-switch sources is deemed conclusive even if other sources could not be searched. The default setting is 'disabled', which causes all netgroup ns-switch sources to be consulted before a no-match result is deemed conclusive.

[--ntacl-display-permissive-perms {enabled|disabled}] - Display maximum NT ACL Permissions to NFS Client (privilege: advanced)

This optional parameter controls the permissions that are displayed to NFSv3 and NFSv4 clients on a file or directory that has an NT ACL set. When true, the displayed permissions are based on the maximum access granted by the NT ACL to any user. When false, the displayed permissions are based on the minimum access granted by the NT ACL to any user. The default setting is false.

[--v3-ms-dos-client {enabled|disabled}] - NFSv3 MS-DOS Client Support

This optional parameter specifies whether to enable access for NFSv3 MS-DOS clients. The default setting is disabled. This parameter is not supported for Vservers with Infinite Volume.

[--ignore-nt-acl-for-root {enabled|disabled}] - Ignore the NT ACL Check for NFS User 'root' (privilege: advanced)

This optional parameter specifies whether Windows ACLs affect root access from NFS. If this option is enabled, root access from NFS ignores the NT ACL set on the file or directory. If auditing is enabled for the Vserver and there is no name-mapping present, then a default SMB credential (Builtin\administrator) is used for auditing, and an EMS warning is generated. The default setting is 'disabled', which causes NFS 'root' to be mapped to a Windows account, like any other NFS user.

[--cached-cred-positive-ttl <integer>] - Time To Live Value (in msecs) of a Positive Cached Credential (privilege: advanced)

This optional parameter specifies the age of the positive cached credentials after which they will be cleared from the cache. The value specified must be from 60000 through 604800000. The default setting is 86400000.
[-cached-cred-negative-ttl <integer>] - Time To Live Value (in msecs) of a Negative Cached Credential (privilege: advanced)

This optional parameter specifies the age of the negative cached credentials after which they will be cleared from the cache. The value specified must be from 60000 through 604800000. The default setting is 7200000.

[-skip-root-owner-write-perm-check {enabled|disabled}] - Skip Permission Check for NFS Write Calls from Root/Owner (privilege: advanced)

This optional parameter specifies if permission checks are to be skipped for NFS WRITE calls from root/owner. For copying read-only files to a destination folder which has inheritable ACLs, this option must be enabled. Warning: When enabled, if an NFS client does not make use of an NFS ACCESS call to check for user-level permissions and then tries to write onto read-only files, the operation will succeed. The default setting is disabled.

[-v3-64bit-identifiers {enabled|disabled}] - Use 64 Bits for NFSv3 FSIDs and File IDs (privilege: advanced)

This optional parameter specifies whether Data ONTAP uses 64 bits (instead of 32 bits) for file system identifiers (FSIDs) and file identifiers (file IDs) that are returned to NFSv3 clients. The default setting is disabled. When -v3-fsid-change is disabled, enable this parameter to avoid file ID collisions.

[-v4-inherited-acl-preserve {enabled|disabled}] - Ignore Client Specified Mode Bits and Preserve Inherited NFSv4 ACL When Creating New Files or Directories (privilege: advanced)

This optional parameter specifies whether the client-specified mode bits should be ignored and the inherited NFSv4 ACL should be preserved when creating new files or directories. The default setting is disabled.

[-v3-search-unconverted-filename {enabled|disabled}] - Fallback to Unconverted Filename Search (privilege: advanced)

This optional parameter specifies whether to continue search without converting the filename to the Unicode character set while doing lookup in a directory.

[-file-session-io-grouping-count <integer>] - I/O Count to Be Grouped as a Session (privilege: advanced)

This optional parameter specifies the number of read or write operations on a file from a single client that are grouped and considered as one session for event generation applications, such as FPolicy. The event is generated on the first read or write of a file, and subsequently the event is generated only after the specified -file-session-io-grouping-count. The default value is 5000.

[-file-session-io-grouping-duration <integer>] - Duration for I/O to Be Grouped as a Session (Secs) (privilege: advanced)

This optional parameter specifies the duration for which the read or write operationss on a file from a single client are grouped and considered as one session for event generation applications, such as FPolicy. The default value is 120 seconds.

[-checksum-for-replay-cache {enabled|disabled}] - Enable or disable Checksum for Replay-Cache (privilege: advanced)

This optional parameter specifies whether to enable replay cache checksum for NFS requests . The default value is enabled.

Examples

The following example enables and configures NFS access on a Vserver named vs0. NFS access is enabled. The maximum number of RPCSEC_GSS authentication contexts is set to 5. The RPCSEC_GSS idle time is set to 360 seconds. Access is enabled for NFS v3 clients over both UDP and TCP.

```
cluster1::> vserver nfs create -vserver vs0 -access true -rpcsec-ctx-high 5 -rpcsec-ctx-idle 360 -v3 enabled -udp enabled -tcp enabled
```
vserver nfs delete

Delete the NFS configuration of a Vserver

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The `vserver nfs delete` command deletes the NFS configuration of a specified Vserver. This command does not delete the Vserver itself, just its ability to serve NFS clients.

Note: If you delete a Vserver, the Vserver's NFS configuration is automatically deleted. Any Windows-to-UNIX or UNIX-to-Windows name mappings defined for the Vserver are also deleted because they require both the CIFS and NFS servers.

Parameters
- `vserver <vserver name>` - Vserver
  This specifies the Vserver whose NFS configuration you want to delete.

Examples
The following example deletes the NFS configuration of a Vserver named vs2:

```
cluster1::> vserver nfs delete -vserver vs2
```

vserver nfs modify

Modify the NFS configuration of a Vserver

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The `vserver nfs modify` command modifies the configuration of an NFS-enabled Vserver.

Parameters
- `vserver <vserver name>` - Vserver
  This specifies the Vserver whose NFS configuration you want to modify.

  [-access {true|false}] - General NFS Access
  This optional parameter specifies whether NFS access is enabled on the Vserver.

  [-rpcsec-ctx-high <integer>] - RPC GSS Context Cache High Water Mark (privilege: advanced)
  This optional parameter specifies the maximum number of RPCSEC_GSS authentication contexts, which are used by Kerberos. The default setting is zero at the time of creation. See RFC 2203 for information about RPCSEC_GSS contexts.

  [-rpcsec-ctx-idle <integer>] - RPC GSS Context Idle (privilege: advanced)
  This optional parameter specifies, in seconds, the amount of time a RPCSEC_GSS context is permitted to remain unused before it is deleted. The default setting is zero seconds at the time of creation. See RFC 2203 for information about RPCSEC_GSS contexts.

  [-v3 {enabled|disabled}] - NFS v3
  This optional parameter specifies whether to enable access for NFS v3 clients.
[-v4.0 {enabled|disabled}] - NFS v4.0

This optional parameter specifies whether to enable access for NFSv4.0 clients. The default setting is enabled at the time of creation. This parameter is not supported for Vservers with Infinite Volume.

[-udp {enabled|disabled}] - UDP Protocol

This optional parameter specifies whether to enable NFS access over UDP. This value is not modifiable on a Vserver with Infinite Volume.

Note: Even if UDP is disabled, if TCP is enabled, the Vserver does not block NFSv3 traffic over UDP. By allowing this traffic, the storage system can process NFS_NULL ops that the Solaris automounter sends to determine if the storage system is alive. (Solaris sends these ops over UDP even if configured to use TCP.) To disallow access for certain clients, including over UDP, you can use export-policy rules. For more information, see the vserver export-policy rule create command.

[-tcp {enabled|disabled}] - TCP Protocol

This optional parameter specifies whether to enable NFS access over TCP.

[-default-win-user <text>] - Default Windows User

This optional parameter specifies a list of default Windows users for the NFS server.

[-enable-ejukebox {true|false}] - Enable NFSv3 EJUKEBOX error (privilege: advanced)

This optional parameter specifies whether EJUKEBOX errors are enabled for NFSv3. The default setting is true at the time of creation.

[-v3-require-read-attributes {true|false}] - Require All NFSv3 Reads to Return Read Attributes (privilege: advanced)

This optional parameter specifies whether NFSv3 read operations are required to return read attributes. The default setting is false at the time of creation.

[-v3-fsid-change {enabled|disabled}] - Show Change in FSID as NFSv3 Clients Traverse Filesystems (privilege: advanced)

This optional parameter specifies whether Data ONTAP shows changes in file system identifiers (FSIDs) as NFSv3 clients traverse file systems. If you change the value of this parameter, clients must remount any paths over which they are using NFSv3.

[-v3-connection-drop {enabled|disabled}] - Enable the Dropping of a Connection When an NFSv3 Request is Dropped (privilege: advanced)

This optional parameter specifies whether NFS v3 connection drop is enabled. The default setting is enabled at the time of creation.

[-ntfs-unix-security-ops {fail|ignore|use-export-policy}] - Vserver NTFS Unix Security Options (privilege: advanced)

This optional parameter specifies how NFSv3 security changes affect NTFS volumes. If you set this parameter to ignore, Data ONTAP ignores NFSv3 security changes. If you set this parameter to fail, this overrides the unix security options set in the relevant export rules. If you set this parameter to use_export_policy, Data ONTAP processes NFSv3 security changes in accordance with the relevant export rules. The default setting is use_export_policy at the time of creation.

[-chown-mode {restricted|unrestricted|use-export-policy}] - Vserver Change Ownership Mode (privilege: advanced)

This optional parameter specifies whether ownership of a file can be changed by superusers or by non-root users who currently own the file. If you set this parameter to restricted, the ownership of a file can be changed by superusers only. If you set this parameter to unrestricted, the ownership of a file can be changed by superusers and the current owner of the file. If you set this parameter to use-export-policy, the ownership of a file can be changed in accordance with the relevant export rules.
[-trace-enabled {true|false}] - NFS Response Trace Enabled (privilege: advanced)

This optional parameter specifies whether Data ONTAP logs NFS requests when they exceed the NFS response trigger time (see the -trigger parameter). The default setting is false at the time of creation.

[-trigger <integer>] - NFS Response Trigger (in secs) (privilege: advanced)

This optional parameter specifies the amount of time, in seconds, after which Data ONTAP must log an NFS request if it has not completed (assuming the -trace-enabled option is set to true). The default setting is 60 at the time of creation.

[-udp-max-xfer-size <integer>] - UDP Maximum Transfer Size (bytes) (privilege: advanced)

This optional parameter specifies the maximum transfer size (in bytes) that the NFS mount protocol negotiates with the client for UDP transport. The range is 8192 to 57344. The default setting is 32768 at the time of creation.

[-tcp-max-xfer-size <integer>] - TCP Maximum Transfer Size (bytes) (privilege: advanced)

This optional parameter specifies the maximum transfer size (in bytes) that the storage system negotiates with the client for TCP transport of data for NFSv3 and NFSv4.x protocols. The range is 8192 to 1048576. The default setting is 65536 when created.

[-v3-tcp-max-read-size <integer>] - NFSv3 TCP Maximum Read Size (bytes) (privilege: advanced)

This optional parameter specifies the maximum transfer size (in bytes) that the storage system negotiates with the client for TCP transport of data for NFSv3 read requests. The range is 8192 to 1048576. The default setting is 65536 when created.

Note: This parameter is deprecated and may be removed in a future release of Data ONTAP. Use the -tcp-max-xfer-size parameter instead.

[-v3-tcp-max-write-size <integer>] - NFSv3 TCP Maximum Write Size (bytes) (privilege: advanced)

This optional parameter specifies the maximum transfer size (in bytes) that the storage system negotiates with the client for TCP transport of data for NFSv3 write requests. The range is 8192 to 65536. The default setting is 65536 when created.

Note: This parameter is deprecated and may be removed in a future release of Data ONTAP. Use the -tcp-max-xfer-size parameter instead.

[-v4.0-acl {enabled|disabled}] - NFSv4.0 ACL Support

This optional parameter specifies whether Data ONTAP supports NFSv4.0 access control lists (ACLs). The default setting is disabled when created. This parameter is not supported for Vservers with Infinite Volume.

[-v4.0-read-delegation {enabled|disabled}] - NFSv4.0 Read Delegation Support

This optional parameter specifies whether Data ONTAP supports NFSv4 read delegations. The default setting is disabled when created. This parameter is not supported for Vservers with Infinite Volume.

[-v4.0-write-delegation {enabled|disabled}] - NFSv4.0 Write Delegation Support

This optional parameter specifies whether Data ONTAP supports NFSv4 write delegations. The default setting is disabled when created. This parameter is not supported for Vservers with Infinite Volume.

[-v4-fsid-change {enabled|disabled}] - Show Change in FSID as NFSv4 Clients Traverse Filesystems (privilege: advanced)

This optional parameter specifies whether Data ONTAP shows changes in file system identifiers (FSIDs) as NFSv4 clients traverse file systems. The default setting is enabled when created. If you change the value of this parameter, clients must remount any paths over which they are using NFSv4.

Note: If users access the storage system using NFSv4 from Solaris 10 clients, you must set this option to disabled.

[-v4.0-referrals {enabled|disabled}] - NFSv4.0 Referral Support (privilege: advanced)

This optional parameter specifies whether Data ONTAP supports NFSv4.0 referrals. The default setting is disabled when created. You can set this parameter to enabled only if the -v4-fsid-change option is also
set to **enabled**. If clients accessing the node do not support NFSv4.0 referrals, set this option to **disabled**; otherwise, those clients will not be able to access the file system. This parameter is not supported for Vservers with Infinite Volume.

```bash
[-v4-id-domain <nfs domain>] - NFSv4 ID Mapping Domain
```

This optional parameter specifies the domain portion of the string form of user and group names as defined by the NFSv4 protocol. By default, the domain name is normally taken from the NIS domain or the DNS domain in use. However, the value of this parameter overrides the default. The domain name must be agreed upon by both the NFS client and the storage controller before NFSv4 operations can be executed. It is recommended that the domain be specified in the fully qualified domain name format.

```bash
[-v4-validate-symlinkdata {enabled|disabled}] - NFSv4 Validate UTF-8 Encoding of Symbolic Link Data (privilege: advanced)
```

This optional parameter specifies whether Data ONTAP validates the UTF-8 encoding of symbolic link data. The default setting is **disabled** when created.

```bash
[-v4-lease-seconds <integer>] - NFSv4 Lease Timeout Value (in secs) (privilege: advanced)
```

This optional parameters specifies the time period in which Data ONTAP irrevocably grants a lock to a client. By default, the lease period is 30 seconds. The minimum value is 10. The maximum value is one less than the value of the `-v4-grace-seconds` parameter.

```bash
[-v4-grace-seconds <integer>] - NFSv4 Grace Timeout Value (in secs)
```

This optional parameter specifies the time period in which clients attempt to reclaim their locking state from Data ONTAP during server recovery. By default, the grace period is 45 seconds. The minimum value is 1 more than the value of the `-v4-lease-seconds` parameter. The maximum value is 90.

```bash
[-v4-acl-preserve {enabled|disabled}] - Preserves and Modifies NFSv4 ACL (and NTFS File Permissions in Unified Security Style)
```

This optional parameter specifies if the NFSv4 ACL is preserved or dropped when chmod is performed. In unified security style, this parameter also specifies if NTFS file permissions are preserved or dropped when chmod, chgrp, or chown are performed. The default is **enabled**.

```bash
[-v4.1 {enabled|disabled}] - NFSv4.1 Minor Version Support
```

This optional parameter specifies whether to enable access for NFSv4.1 clients. The default setting is **enabled** at the time of creation.

```bash
[-rquota {enabled|disabled}] - Rquota Enable
```

This optional parameter specifies whether to enable rquota over NFS. The default setting is **disabled** at the time of creation. This parameter is not supported for Vservers with Infinite Volume.

```bash
[-v4.1-implementation-domain <nfs domain>] - NFSv4.1 Implementation ID Domain (privilege: advanced)
```

This optional parameter specifies the NFSv4.1 implementation domain.

```bash
[-v4.1-implementation-name <text>] - NFSv4.1 Implementation ID Name (privilege: advanced)
```

This optional parameter specifies the NFSv4.1 implementation name.

```bash
[-v4.1-implementation-date <Date>] - NFSv4.1 Implementation ID Date (privilege: advanced)
```

This optional parameter specifies the NFSv4.1 implementation date.

```bash
[-v4.1-pnfs {enabled|disabled}] - NFSv4.1 Parallel NFS Support
```

This optional parameter specifies whether to enable access for pNFS for NFSv4.1. The default setting is **enabled** at the time of creation.

```bash
[-v4.1-referrals {enabled|disabled}] - NFSv4.1 Referral Support (privilege: advanced)
```

This optional parameter specifies whether Data ONTAP supports NFSv4.1 referrals. The default setting is **disabled** when created. You can set this parameter to enabled only if the `-v4-fsid-change` option is also set to **enabled**. If clients accessing the node do not support NFSv4.1 referrals, set this option to **disabled**; otherwise, those clients will not be able to access the file system. This parameter is not supported for Vservers with Infinite Volume.
[-v4.1-acl {enabled|disabled}] - NFSv4.1 ACL Support

This optional parameter specifies whether Data ONTAP supports NFSv4.1 access control lists (ACLs). The default setting is disabled when created.

[-vstorage {enabled|disabled}] - NFS vStorage Support

This optional parameter specifies whether to enable vstorage over NFS. The default setting is disabled at the time of creation. This parameter is not supported for Vservers with Infinite Volume.

[-v4-numeric-ids {enabled|disabled}] - NFSv4 Support for Numeric Owner IDs

This optional parameter specifies whether to enable the support for numeric string identifiers in NFSv4 owner attributes. The default setting is enabled at the time of creation.

[-default-win-group <text>] - Default Windows Group

This optional parameter specifies a list of default Windows groups for the NFS server.

[-v4.1-read-delegation {enabled|disabled}] - NFSv4.1 Read Delegation Support

This optional parameter specifies whether Data ONTAP supports NFSv4.1 read delegations. The default setting is disabled when created. This parameter is not supported for Vservers with Infinite Volume.

[-v4.1-write-delegation {enabled|disabled}] - NFSv4.1 Write Delegation Support

This optional parameter specifies whether Data ONTAP supports NFSv4.1 write delegations. The default setting is disabled when created. This parameter is not supported for Vservers with Infinite Volume.

[-v4.x-session-num-slots <integer>] - Number of Slots in the NFSv4.x Session slot tables (privilege: advanced)

This optional parameter specifies the number of entries in the NFSv4.x session slot table. By default, the number of slots is 180. The maximum value is 2000.

[-v4.x-session-slot-reply-cache-size <integer>] - Size of the Reply that will be Cached in Each NFSv4.x Session Slot (in bytes) (privilege: advanced)

This optional parameter specifies the number of bytes of the reply that will be cached in each NFSv4.x session slot. By default, the size of the cached reply is 640 bytes. The maximum value is 4096.

[-v4-acl-max-aces <integer>] - Maximum Number of ACEs per ACL (privilege: advanced)

This optional parameter specifies the maximum number of ACEs in a NFSv4 ACL. The range is 192 to 1024. The default value is 400. Setting it to a value more than the default could cause performance problems for clients accessing files with NFSv4 ACLs.

[-mount-rootonly {enabled|disabled}] - NFS Mount Root Only

This optional parameter specifies whether the Vserver allows MOUNT protocol calls only from privileged ports (port numbers less than 1024). The default setting is enabled.

[-nfs-rootonly {enabled|disabled}] - NFS Root Only

This optional parameter specifies whether the Vserver allows NFS protocol calls only from privileged ports (port numbers less than 1024). The default setting is disabled.

[-auth-sys-extended-groups {enabled|disabled}] - AUTH_SYS Extended Groups Enabled (privilege: advanced)

This optional parameter specifies whether Data ONTAP supports fetching auxillary groups from a name service rather than from the RPC header. The default setting is disabled.

[-extended-groups-limit <integer>] - AUTH_SYS and RPCSEC_GSS Auxiliary Groups Limit (privilege: advanced)

This optional parameter specifies the maximum number of auxillary groups supported over RPC security flavors AUTH_SYS and RPCSEC_GSS in Data ONTAP. The range is 32 to 1024. The default value is 32.
[-validate-qtree-export {enabled|disabled}] - Validation of Qtree IDs for Qtree File Operations (privilege: advanced)

This optional parameter specifies whether clustered Data ONTAP performs an additional validation on qtree IDs. The default setting is enabled. This parameter is ignored unless a non-inherited policy has been or is assigned to a qtree.

[-mountd-port <integer>] - NFS Mount Daemon Port (privilege: advanced)

This optional parameter specifies which port the NFS mount daemon (mountd) uses. The port numbers allowed are 635 (the default) and 1024 through 9999.

[-nlm-port <integer>] - Network Lock Manager Port (privilege: advanced)

This optional parameter specifies which port the network lock manager (NLM) uses. The port numbers allowed are 1024 through 9999. The default setting is 4045.

[-nsm-port <integer>] - Network Status Monitor Port (privilege: advanced)

This optional parameter specifies which port the network status monitor (NSM) uses. The port numbers allowed are 1024 through 9999. The default setting is 4046.

[-rquotad-port <integer>] - NFS Quota Daemon Port (privilege: advanced)

This optional parameter specifies which port the NFS quota daemon (rquotad) uses. The port numbers allowed are 1024 through 9999. The default setting is 4049.

[-permitted-enc-types <NFS Kerberos Encryption Type>, ...] - Permitted Kerberos Encryption Types

This optional parameter specifies the permitted encryption types for Kerberos over NFS. The default setting is des.des3.aes-128.aes-256.

[-showmount {enabled|disabled}] - Showmount Enabled

This optional parameter specifies whether to allow or disallow clients to see the Vserver’s NFS exports list. The default setting is enabled.

Note: Showmount leverages the MOUNT protocol in NFSv3 to issue an EXPORT query to the NFS server. If the mount port is not listening or blocked by a firewall, or if NFSv3 is disabled on the NFS server, showmount queries fail.

[-name-service-lookup-protocol {TCP|UDP}] - Set the Protocol Used for Name Services Lookups for Exports

This optional parameter specifies the protocol to use for doing name service lookups. The allowed values are TCP and UDP. The default setting is UDP.

[-map-unknown-uid-to-default-windows-user {enable|disable}] - Map Unknown UID to Default Windows User (privilege: advanced)

If you enable this optional parameter, unknown UNIX users that do not have a name mapping to a Windows user are mapped to the configured default Windows user. This allows all unknown UNIX users access with the credentials of the default Windows user. If you disable it, all unknown UNIX users without name mapping are always denied access. By default, this parameter is enabled.

[-netgroup-dns-domain-search {enabled|disabled}] - DNS Domain Search Enabled During Netgroup Lookup (privilege: advanced)

If you enable this optional parameter, during client access check evaluation in a netgroup, Data ONTAP performs an additional verification to ensure that the domain returned from DNS for that client is listed in the DNS configuration of the Vserver. This enables you to validate the domain when clients have the same short name in multiple domains. The default setting is enabled.

[-netgroup-trust-any-ns-switch-no-match {enabled|disabled}] - Trust No-Match Result from Any Name Service Switch Source During Netgroup Lookup (privilege: advanced)

This optional parameter specifies if you can consider a no-match result from any of the netgroup ns-switch sources to be authoritative. If this option is enabled, then a no-match response from any of the netgroup ns-switch sources is deemed conclusive even if other sources could not be searched. The default setting is
'disabled', which causes all netgroup ns-switch sources to be consulted before a no-match result is deemed conclusive.

\[-ntacl-display-permissive-perms {enabled|disabled}\] - Display maximum NT ACL Permissions to NFS Client (privilege: advanced)

This optional parameter controls the permissions that are displayed to NFSv3 and NFSv4 clients on a file or directory that has an NT ACL set. When true, the displayed permissions are based on the maximum access granted by the NT ACL to any user. When false, the displayed permissions are based on the minimum access granted by the NT ACL to any user. The default setting is false.

\[-v3-ms-dos-client {enabled|disabled}\] - NFSv3 MS-DOS Client Support

This optional parameter specifies whether to enable access for NFSv3 MS-DOS clients. The default setting is disabled at the time of creation. This parameter is not supported for Vservers with Infinite Volume

\[-ignore-nt-acl-for-root {enabled|disabled}\] - Ignore the NT ACL Check for NFS User 'root' (privilege: advanced)

This optional parameter specifies whether Windows ACLs affect root access from NFS. If this option is enabled, root access from NFS ignores the NT ACL set on the file or directory. If auditing is enabled for the Vserver and there is no name-mapping present, then a default SMB credential (BuiltIn\administrator) is used for auditing, and an EMS warning is generated. The default setting is 'disabled', which causes NFS 'root' to be mapped to a Windows account, like any other NFS user.

\[-cached-cred-positive-ttl <integer>\] - Time To Live Value (in msecs) of a Positive Cached Credential (privilege: advanced)

This optional parameter specifies the age of the positive cached credentials after which they will be cleared from the cache. The value specified must be from 60000 through 604800000. The default setting is 86400000.

\[-cached-cred-negative-ttl <integer>\] - Time To Live Value (in msecs) of a Negative Cached Credential (privilege: advanced)

This optional parameter specifies the age of the negative cached credentials after which they will be cleared from the cache. The value specified must be from 60000 through 604800000. The default setting is 7200000.

\[-skip-root-owner-write-perm-check {enabled|disabled}\] - Skip Permission Check for NFS Write Calls from Root/Owner (privilege: advanced)

This optional parameter specifies if permission checks are to be skipped for NFS WRITE calls from root/owner. For copying read-only files to a destination folder which has inheritable ACLs, this option must be enabled. Warning: When enabled, if an NFS client does not make use of an NFS ACCESS call to check for user-level permissions and then tries to write onto read-only files, the operation will succeed. The default setting is disabled.

\[-v3-64bit-identifiers {enabled|disabled}\] - Use 64 Bits for NFSv3 FSIDs and File IDs (privilege: advanced)

This optional parameter specifies whether Data ONTAP uses 64 bits (instead of 32 bits) for file system identifiers (FSIDs) and file identifiers (file IDs) that are returned to NFSv3 clients. If you change the value of this parameter, clients must remount any paths over which they are using NFSv3. When \[-v3-fsid-change\] is disabled, enable this parameter to avoid file ID collisions.

\[-v4-inherited-acl-preserve {enabled|disabled}\] - Ignore Client Specified Mode Bits and Preserve Inherited NFSv4 ACL When Creating New Files or Directories (privilege: advanced)

This optional parameter specifies whether the client-specified mode bits should be ignored and the inherited NFSv4 ACL should be preserved when creating new files or directories. The default setting is disabled.

\[-v3-search-unconverted-filename {enabled|disabled}\] - Fallback to Unconverted Filename Search (privilege: advanced)

This optional parameter specifies whether to continue search without converting the filename to the Unicode character set while doing lookup in a directory.
[-file-session-io-grouping-count <integer>] - I/O Count to Be Grouped as a Session (privilege: advanced)

This optional parameter specifies the number of read or write operations on a file from a single client that are grouped and considered as one session for event generation applications, such as FPolicy. The event is generated on the first read or write of a file, and subsequently the event is generated only after the specified -file-session-io-grouping-count. The default value is 5000.

[-file-session-io-grouping-duration <integer>] - Duration for I/O to Be Grouped as a Session (Secs)
(privilege: advanced)

This optional parameter specifies the duration for which the read or write operations on a file from a single client are grouped and considered as one session for event generation applications, such as FPolicy. The default value is 120 seconds.

[-checksum-for-replay-cache {enabled|disabled}] - Enable or disable Checksum for Replay-Cache
(privilege: advanced)

This optional parameter specifies whether to enable replay cache checksum for NFS requests. The default value is enabled.

Examples

The following example enables NFS access on a Vserver named vs0 for NFS clients that use NFS v3 over TCP:

```
cluster1::> vserver nfs modify -vserver vs0 -access true -v3 enabled -udp disabled -tcp enabled
```

Related references

vserver export-policy rule create on page 1754

vserver nfs off

Disable the NFS service of a Vserver

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver nfs off command disables NFS access on a Vserver. The Vserver must already exist.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the Vserver on which you want to disable NFS access.

Examples

The following example disables NFS access on a Vserver named vs0.

```
cluster1::> vserver nfs off -vserver vs0
```

vserver nfs on

Enable the NFS service of a Vserver

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver nfs on command enables NFS access on a Vserver. The Vserver must already exist.
**Parameters**

- `vserver <vserver name>` - Vserver

  This parameter specifies the Vserver on which you want to enable NFS access.

**Examples**

The following example enables NFS access on a Vserver named vs0.

```
cluster1::> vserver nfs on -vserver vs0
```

---

**vserver nfs prepare-for-v3-ms-dos-client-downgrade**

Disable NFSv3 MS-DOS Client Support

**Availability:** This command is available to `cluster` administrators at the `advanced` privilege level.

**Description**

The `vserver nfs prepare-for-v3-ms-dos-client-downgrade` command verifies that the NFSv3 MS-DOS client setting is disabled on all Vservers and disables the NFSv3 MS-DOS client support capability on the cluster when downgrading Data ONTAP to a version that does not support NFSv3 MS-DOS clients.

**Examples**

The following example disables NFSv3 MS-DOS client support on the Vservers.

```
cluster::1> vserver nfs prepare-for-v3-ms-dos-client-downgrade
```

---

**vserver nfs prepare-to-downgrade**

Remove NFS configurations that are not compatible with earlier versions of Data ONTAP

**Availability:** This command is available to `cluster` administrators at the `advanced` privilege level.

**Description**

The `vserver nfs prepare-to-downgrade` command removes NFS configurations incompatible with the earlier release of Data ONTAP.

**Parameters**

- `disable-feature-set <downgrade version>` - Data ONTAP Version

  This parameter specifies the Data ONTAP version that introduced the new NFS configurations and needs to be removed before downgrade. The value can be one of the following:

  - `9.2.0` - Remove the NFS configurations introduced in Data ONTAP release 9.2.0. The configurations include the following:
    - `-file-session-io-grouping-count`
    - `-file-session-io-grouping-duration`
vserver nfs show

Display the NFS configurations of Vservers

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver nfs show command displays information about NFS-enabled Vservers. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays the following information about all NFS-enabled Vservers:

- Vserver name
- Whether general NFS access is enabled
- Whether access to NFSv3 clients is enabled
- Whether access to NFSv4 clients is enabled
- Whether NFS access over UDP is enabled
- Whether NFS access over TCP is enabled
- List of default Windows users (detailed view only)

You can specify additional parameters to display only information that matches those parameters. For instance, to display information only about Vservers that enable access over TCP, enter the command with the -tcp-enable true parameter.

Parameters

[ [-fields <fieldname>, ...]
  If you specify the -fields parameter, the command only displays the fields that you specify.

| [-krb-opts ] (privilege: advanced)
  If you specify the parameter for -instance, the command shows detailed information about all NFS-enabled Vservers. Otherwise, if the -krb-opts parameter is specified, the command shows the following Kerberos-related information:

  - Vserver name
  - Maximum number of RPCSEC_GSS authentication contexts
  - Time, in seconds, an RPCSEC_GSS context can remain idle before being deleted

  Otherwise, if the -fields parameter is specified, the command shows information about all of the NFS-enabled Vservers that you specify as a comma-delimited list.

| [-instance ]
  If you specify the -instance parameter, the command displays detailed information about all entries.

[-vserver <vserver name>] - Vserver
  If you specify this parameter, the command displays information only about the specified NFS-enabled Vserver.
[-access {true|false}] - General NFS Access
If you specify this parameter, the command displays information only about the NFS-enabled Vservers that
have the specified general-access setting.

[-rpcsec-ctx-high <integer>] - RPC GSS Context Cache High Water Mark (privilege: advanced)
If you specify this parameter, the command displays information only about NFS-enabled Vservers that have
the specified maximum number of RPCSEC_GSS authentication contexts.

[-rpcsec-ctx-idle <integer>] - RPC GSS Context Idle (privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers that
have the specified timeout value for idle RPCSEC_GSS contexts.

[-v3 {enabled|disabled}] - NFS v3
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for
which the v3 option matches the specified input.

[-v4.0 {enabled|disabled}] - NFS v4.0
If you specify this parameter, the command displays information only about NFS-enabled Vservers for which
the v4.0 option matches the specified input.

[-udp {enabled|disabled}] - UDP Protocol
If you specify this parameter, the command displays information only about the NFS-enabled Vservers that
have the specified NFS-over-UDP access setting.

[-tcp {enabled|disabled}] - TCP Protocol
If you specify this parameter, the command displays information only about the NFS-enabled Vservers that
have the specified NFS-over-TCP setting.

[-default-win-user <text>] - Default Windows User
If you specify this parameter, the command displays information only about the NFS-enabled Vservers that
have the specified list of default Windows users.

[-enable-ejukebox {true|false}] - Enable NFSv3 EJUKEBOX error (privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for
which the enable-ejukebox option matches the specified input.

[-v3-require-read-attributes {true|false}] - Require All NFSv3 Reads to Return Read Attributes
(privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for
which NFSv3 read operations are required or not required to return read attributes.

[-v3-fsid-change {enabled|disabled}] - Show Change in FSID as NFSv3 Clients Traverse Filesystems
(privilege: advanced)
If you specify this parameter, the command displays information about changes in file system identifiers
(FSIDs) as NFSv3 clients traverse file systems.

[-v3-connection-drop {enabled|disabled}] - Enable the Dropping of a Connection When an NFSv3 Request
is Dropped (privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for
which the v3-connection-drop option matches the specified input.

[-ntfs-unix-security-ops {fail|ignore|use-export-policy}] - Vserver NTFS Unix Security Options
(privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for
which the NTFS-UNIX security setting matches the specified input.
[-chown-mode {restricted|unrestricted|use-export-policy}] - Vserver Change Ownership Mode (privilege: advanced)

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the chown-mode setting matches the specified input.

[-trace-enabled {true|false}] - NFS Response Trace Enabled (privilege: advanced)

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the trace-enabled option matches the specified input.

[-trigger <integer>] - NFS Response Trigger (in secs) (privilege: advanced)

If you specify this parameter, the command displays information only about the NFS-enabled Vservers with the specified NFS response trigger time.

[-udp-max-xfer-size <integer>] - UDP Maximum Transfer Size (bytes) (privilege: advanced)

If you specify this parameter, the command displays information only about the NFS-enabled Vservers with the specified UDP maximum transfer size. The range is 8192 to 57344.

[-tcp-max-xfer-size <integer>] - TCP Maximum Transfer Size (bytes) (privilege: advanced)

If you specify this parameter, the command displays information only about the NFS-enabled Vservers with the specified TCP maximum transfer size. The range is 8192 to 1048576.

[-v3-tcp-max-read-size <integer>] - NFSv3 TCP Maximum Read Size (bytes) (privilege: advanced)

If you specify this parameter, the command displays information only about the NFS-enabled Vservers with the specified TCP maximum transfer size for NFSv3 read requests. The range is 8192 to 1048576.

Note: This parameter is deprecated and may be removed in a future release of Data ONTAP. Use the -tcp-max-xfer-size parameter instead.

[-v3-tcp-max-write-size <integer>] - NFSv3 TCP Maximum Write Size (bytes) (privilege: advanced)

If you specify this parameter, the command displays information only about the NFS-enabled Vservers with the specified TCP maximum transfer size for NFSv3 write requests. The range is 8192 to 65536.

Note: This parameter is deprecated and may be removed in a future release of Data ONTAP. Use the -tcp-max-xfer-size parameter instead.

[-v4.0-acl {enabled|disabled}] - NFSv4.0 ACL Support

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the v4.0-acl option matches the specified input.

[-v4.0-read-delegation {enabled|disabled}] - NFSv4.0 Read Delegation Support

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the v4.0-read-delegation option matches the specified input.

[-v4.0-write-delegation {enabled|disabled}] - NFSv4.0 Write Delegation Support

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the v4.0-write-delegation option matches the specified input.

[-v4-fsid-change {enabled|disabled}] - Show Change in FSID as NFSv4 Clients Traverse Filesystems (privilege: advanced)

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the showing of NFSv4 file system identifier (FSID) changes has been enabled or disabled.

[-v4.0-referrals {enabled|disabled}] - NFSv4.0 Referral Support (privilege: advanced)

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the v4.0-referrals option matches the specified input.

[-v4-id-domain <nfs domain>] - NFSv4 ID Mapping Domain

If you specify this parameter, the command displays information only about the NFS-enabled Vservers having the specified domain name.
[-v4-validate-symlinkdata {enabled|disabled}] - NFSv4 Validate UTF-8 Encoding of Symbolic Link Data
(prивilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for
which validation of UTF-8 encoding of symbolic link data has been enabled or disabled.

[-v4-lease-seconds <integer>] - NFSv4 Lease Timeout Value (in secs) (privilege: advanced)
If you specify this parameter, it displays the locking lease period. It is expressed in seconds. Clients that have
been inactive for a period equal or longer to the lease period may lose all their locking state on a node.

[-v4-grace-seconds <integer>] - NFSv4 Grace Timeout Value (in secs)
If you specify this parameter, it displays the grace period for clients to reclaim file locks after a server failure.
The grace period is expressed in seconds.

[-v4-acl-preserve {enabled|disabled}] - Preserves and Modifies NFSv4 ACL (and NTFS File Permissions in
Unified Security Style)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for
which the v4-acl-preserve option matches the specified input.

[-v4.1 {enabled|disabled}] - NFSv4.1 Minor Version Support
If you specify this parameter, the command displays information only about NFS-enabled Vservers for which
the v4.1 option matches the specified input.

[-rquota {enabled|disabled}] - Rquota Enable
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for
which the rquota option matches the specified input.

[-v4.1-implementation-domain <nfs domain>] - NFSv4.1 Implementation ID Domain (privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for
which the v4.1-implementation-domain option matches the specified input.

[-v4.1-implementation-name <text>] - NFSv4.1 Implementation ID Name (privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for
which the v4.1-implementation-name option matches the specified input.

[-v4.1-implementation-date <Date>] - NFSv4.1 Implementation ID Date (privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for
which the v4.1-implementation-date option matches the specified input.

[-v4.1-pnfs {enabled|disabled}] - NFSv4.1 Parallel NFS Support
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for
which the v4.1-pnfs option matches the specified input.

[-v4.1-referrals {enabled|disabled}] - NFSv4.1 Referral Support (privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for
which the v4.1-referrals option matches the specified input.

[-v4.1-acl {enabled|disabled}] - NFSv4.1 ACL Support
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for
which the v4.1-acl option matches the specified input.

[-vstorage {enabled|disabled}] - NFS vStorage Support
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for
which the vstorage option matches the specified input.

[-v4-numeric-ids {enabled|disabled}] - NFSv4 Support for Numeric Owner IDs
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for
which the v4-numeric-ids option matches the specified input.
[[-default-win-group <text>]] - Default Windows Group
  If you specify this parameter, the command displays information only about the NFS-enabled Vservers that have the specified list of default Windows groups.

[[-v4.1-read-delegation {enabled|disabled}]] - NFSv4.1 Read Delegation Support
  If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the v4.1-read-delegation option matches the specified input.

[[-v4.1-write-delegation {enabled|disabled}]] - NFSv4.1 Write Delegation Support
  If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the v4.1-write-delegation option matches the specified input.

[[-v4.x-session-num-slots <integer>]] - Number of Slots in the NFSv4.x Session slot tables (privilege: advanced)
  If you specify this parameter, this command displays information only about the NFS-enabled Vservers for which the v4.x-session-num-slots option matches the specified input. The range is 1 to 2000.

[[-v4.x-session-slot-reply-cache-size <integer>]] - Size of the Reply that will be Cached in Each NFSv4.x Session Slot (in bytes) (privilege: advanced)
  If you specify this parameter, this command displays information only about the NFS-enabled Vservers for which the v4.x-session-slot-reply-cache-size option matches the specified input. The cache size is expressed in bytes. The range is 512 to 4096.

[[-v4-acl-max-aces <integer>]] - Maximum Number of ACEs per ACL (privilege: advanced)
  If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the v4-acl-max-aces option matches the specified input.

[[-mount-rootonly {enabled|disabled}]] - NFS Mount Root Only
  If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the mount-rootonly option matches the specified input.

[[-nfs-rootonly {enabled|disabled}]] - NFS Root Only
  If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the nfs-rootonly option matches the specified input.

[[-auth-sys-extended-groups {enabled|disabled}]] - AUTH_SYS Extended Groups Enabled (privilege: advanced)
  If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the auth-sys-extended-groups option matches the specified input.

[[-extended-groups-limit <integer>]] - AUTH_SYS and RPCSEC_GSS Auxiliary Groups Limit (privilege: advanced)
  If you specify this parameter, the command displays information about the NFS-enabled Vservers for which the extended-groups-limit option matches the specified input. The range is 32 to 1024.

[[-validate-qtree-export {enabled|disabled}]] - Validation of Qtree IDs for Qtree File Operations (privilege: advanced)
  If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the validate-qtree-export option matches the specified input.

[[-mountd-port <integer>]] - NFS Mount Daemon Port (privilege: advanced)
  If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the mountd-port option matches the specified input.

[[-nlm-port <integer>]] - Network Lock Manager Port (privilege: advanced)
  If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the nlm-port option matches the specified input.
[-nsm-port <integer>] - Network Status Monitor Port (privilege: advanced)
   If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the nsm-port option matches the specified input.

[-rquotad-port <integer>] - NFS Quota Daemon Port (privilege: advanced)
   If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the rquotad-port option matches the specified input.

[-permitted-enc-types <NFS Kerberos Encryption Type>, ...] - Permitted Kerberos Encryption Types
   If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which permitted-enc-types option matches any of the following: des, des3, aes-128, aes-256.

[-showmount {enabled|disabled}] - Showmount Enabled
   If you specify this parameter, the command displays information only about the NFS-enabled Vserver's for which the showmount option matches the specified input.

[-name-service-lookup-protocol {TCP|UDP}] - Set the Protocol Used for Name Services Lookups for Exports
   If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which -name-service-lookup-protocol matches the parameter.

[-map-unknown-uid-to-default-windows-user {enable|disable}] - Map Unknown UID to Default Windows User (privilege: advanced)
   If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which -map-unknown-uid-to-default-windows-user is enabled or disabled.

[-netgroup-dns-domain-search {enabled|disabled}] - DNS Domain Search Enabled During Netgroup Lookup (privilege: advanced)
   If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which -netgroup-dns-domain-search is enabled or disabled.

[-netgroup-trust-any-ns-switch-no-match {enabled|disabled}] - Trust No-Match Result from Any Name Service Switch Source During Netgroup Lookup (privilege: advanced)
   If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which -netgroup-trust-any-ns-switch-no-match is enabled or disabled.

[-ntacl-display-permissive-perms {enabled|disabled}] - Display maximum NT ACL Permissions to NFS Client (privilege: advanced)
   If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which -ntacl-display-permissive-perms matches the parameter.

[-v3-ms-dos-client {enabled|disabled}] - NFSv3 MS-DOS Client Support
   If you specify this parameter, the command displays information only about NFS-enabled Vservers for which NFSv3 MS-DOS client support is enabled or disabled.

[-ignore-nt-acl-for-root {enabled|disabled}] - Ignore the NT ACL Check for NFS User 'root' (privilege: advanced)
   If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which -ignore-nt-acl-for-root is enabled or disabled.

[-cached-cred-positive-ttl <integer>] - Time To Live Value (in msecs) of a Positive Cached Credential (privilege: advanced)
   If you specify this parameter, the command displays information about the NFS-enabled Vservers time to live value of the positive cached credentials.

[-cached-cred-negative-ttl <integer>] - Time To Live Value (in msecs) of a Negative Cached Credential (privilege: advanced)
   If you specify this parameter, the command displays information about the NFS-enabled Vservers time to live value of the negative cached credentials.
[--skip-root-owner-write-perm-check {enabled|disabled}] - Skip Permission Check for NFS Write Calls from Root/Owner (privilege: advanced)

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which --skip-root-owner-write-perm-check is enabled or disabled.

[--v3-64bit-identifiers {enabled|disabled}] - Use 64 Bits for NFSv3 FSIDs and File IDs (privilege: advanced)

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which --v3-64bit-identifiers is enabled or disabled.

[--v4-inherited-acl-preserve {enabled|disabled}] - Ignore Client Specified Mode Bits and Preserve Inherited NFSv4 ACL When Creating New Files or Directories (privilege: advanced)

If you specify this parameter, the command displays information about the NFS-enabled Vservers for which --v4-inherited-acl-preserve matches the specified input.

[--v3-search-unconverted-filename {enabled|disabled}] - Fallback to Unconverted Filename Search (privilege: advanced)

If you specify this parameter, the command displays information about the NFS-enabled Vservers for which --v3-search-unconverted-filename matches the specified input.

[--file-session-io-grouping-count <integer>] - I/O Count to Be Grouped as a Session (privilege: advanced)

If you specify this parameter, the command displays information about the NFS-enabled SVMs for which the --file-session-io-grouping-count matches the specified input.

[--file-session-io-grouping-duration <integer>] - Duration for I/O to Be Grouped as a Session (Secs) (privilege: advanced)

If you specify this parameter, the command displays information about the NFS-enabled SVMs for which the --file-session-io-grouping-duration matches the specified input.

[--checksum-for-replay-cache {enabled|disabled}] - Enable or disable Checksum for Replay-Cache (privilege: advanced)

If you specify this parameter, the command displays information about the NFS-enabled SVMs for which the --checksum-for-replay-cache matches the specified input.

**Examples**

The following example displays information about all NFS-enabled Vservers:

```
cluster1::> vserver nfs show
General                                      Default
Vserver      Access  v3       v4       v4.1     UDP     TCP     Windows User
------------ ------- -------- -------- -------- -------- -------- ------------
vs0          true    enabled  disabled disabled enabled  enabled  -
vs1          true    enabled  disabled disabled enabled  enabled  -
2 entries were displayed.
```

The following example displays Kerberos-related information about all NFS-enabled Vservers:

```
cluster1::*> vserver nfs show -krb-opts
Vserver Context High Context Idle
-------------- ------------ ------------
vs0            30           30
vs1            30           30
2 entries were displayed.
```

**vserver nfs start**

Start the NFS service of a Vserver

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.
The `vserver nfs start` command starts the NFS service on a Vserver to serve NFS clients. The Vserver must already exist.

**Parameters**

- `-vserver <vserver name>` - Vserver

  This parameter specifies the Vserver on which you want to start the NFS service.

**Examples**

The following example starts the NFS service on a Vserver named vs0.

```
cluster1::> vserver nfs start -vserver vs0
```

### vserver nfs status

Display the status of the NFS service of a Vserver

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**

The `vserver nfs status` command shows the status of NFS on a Vserver. The Vserver must already exist.

**Parameters**

- `-vserver <vserver name>` - Vserver

  This parameter specifies the Vserver for which you want to see the NFS status.

  `[--is-enabled {true|false}]` - NFS Service Enabled

  If you specify this optional parameter, the command displays whether NFS is enabled or not. This parameter is true if the NFS server is running.

**Examples**

The following example shows the status of NFS on a Vserver named vs0 for which NFS is enabled.

```
cluster1::> vserver nfs status -vserver vs0.
The NFS server is running.
```

### vserver nfs stop

Stop the NFS service of a Vserver

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**

The `vserver nfs stop` command stops the NFS service on a Vserver to serve NFS clients. The Vserver must already exist.

**Parameters**

- `-vserver <vserver name>` - Vserver

  This parameter specifies the Vserver on which you want to stop the NFS service.

**Examples**

The following example stops the NFS service on a Vserver named vs0.
vserver nfs kerberos commands

The kerberos directory

vserver nfs kerberos interface commands

Manage the Kerberos interface configuration for an NFS server

vserver nfs kerberos interface disable

Disable NFS Kerberos on a LIF

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver nfs kerberos interface disable command disables NFS Kerberos on a logical interface.

Parameters
- `-vserver <vserver name>` - Vserver
  This parameter specifies the Vserver in which the logical interface exists.
- `-lif <lif-name>` - Logical Interface
  This parameter specifies the name of the logical interface on which you want to disable NFS Kerberos.
- `[ -admin-username <text> ]` - Account Creation Username
  This optional parameter specifies the administrator user name.
- `[ -admin-password <text> ]` - Account Creation Password
  This optional parameter specifies the administrator password.

Examples
The following example disables NFS Kerberos on a Vserver named vs0 and a logical interface named datalif1.

```
vs1::> vserver nfs kerberos interface disable -vserver vs0 -lif datalif1
```

vserver nfs kerberos interface enable

Enable NFS Kerberos on a LIF

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver nfs kerberos interface enable command enables NFS Kerberos on a logical interface.

Parameters
- `-vserver <vserver name>` - Vserver
  This parameter specifies the Vserver in which the logical interface exists.
- `-lif <lif-name>` - Logical Interface
  This parameter specifies the name of the logical interface on which you want to enable NFS Kerberos.
[+-spn <text>] - Service Principal Name
This optional parameter specifies the service principal name (SPN) for the logical interface you want to enable. This value must be in the form nfs/host_name@REALM, where host_name is the fully qualified host name of the Kerberos server, nfs is the service, and REALM is the name of the Kerberos realm (for instance, EXAMPLE.COM). Specify Kerberos realm name in uppercase.

[+-admin-username <text>] - Account Creation Username
This optional parameter specifies the administrator user name.

[+-admin-password <text>] - Account Creation Password
This optional parameter specifies the administrator password.

[+-keytab-uri {(ftp|http):/(hostname|IPv4 Address|'['IPv6 Address']')...}] - Load Keytab from URI
This optional parameter specifies loading a keytab file from the specified URI.

[+-ou <text>] - Organizational Unit
This optional parameter specifies the organizational unit (OU) under which the Microsoft Active Directory server account will be created when you enable Kerberos using a realm for Microsoft KDC. If this parameter is not specified, the default OU is "CN=Computers".

**Examples**
The following example enables NFS Kerberos on a Vserver named vs0 and a logical interface named datalif1. The SPN is nfs/sec.example.com@AUTH.SEC.EXAMPLE.COM and the keytab file is loaded from ftp://ftp.example.com/keytab.

```
vserver nfs kerberos interface enable -vserver vs0 -lif datalif1 -spn nfs/sec.example.com@AUTH.SEC.EXAMPLE.COM -keytab-uri ftp://ftp.example.com/keytab
```

**vserver nfs kerberos interface modify**
Modify the Kerberos configuration of an NFS server

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The vserver nfs kerberos interface modify command modifies a Kerberos configuration for NFS. An NFS Kerberos configuration is associated with both a Vserver and a logical interface.

**Parameters**

- **vserver <vserver name>** - Vserver
  This parameter specifies the Vserver associated with the NFS Kerberos configuration you want to modify.

- **lif <lif-name>** - Logical Interface
  This parameter specifies the name of the logical interface associated with the NFS Kerberos configuration you want to modify.

- **kerberos {enabled|disabled}** - Kerberos Enabled
  This optional parameter specifies whether to enable or disable Kerberos for NFS on the specified Vserver and logical interface. If you specify a value of enable, you must also specify the -spn parameter. The command prompts you for a user name and password for a Kerberos principal in the same realm as the principal specified by the -spn parameter; this principal must have permission to create or modify the principal specified by the -spn parameter.
[spn <text>] - Service Principal Name
This optional parameter specifies the service principal name (SPN) of the Kerberos configuration you want to modify. If you specify a value of enable for the -kerberos parameter, you must also specify this parameter. This value must be in the form nfs/host_name@REALM, where host_name is the fully qualified host name of the Kerberos server, nfs is the service, and REALM is the name of the Kerberos realm (for instance, EXAMPLE.COM). Specify Kerberos realm names in uppercase.

[admin-username <text>] - Account Creation Username
This optional parameter specifies the administrator user name.

[keytab-uri {(ftp|http):/(hostname|IPv4 Address|'['IPv6 Address']')...}] - Load Keytab from URI
This optional parameter specifies loading a keytab file from the specified URI.

[ou <text>] - Organizational Unit
This optional parameter specifies the organizational unit (OU) under which the Microsoft Active Directory server account will be created when you enable Kerberos using a realm for Microsoft KDC. If this parameter is not specified, the default OU is "CN=Computers".

Examples
The following example enables an NFS Kerberos configuration on a Vserver named vs0 and a logical interface named datalif1. The SPN is nfs/sec.example.com@AUTH.SEC.EXAMPLE.COM and the keytab file is loaded from ftp://ftp.example.com/keytab.

vserver nfs kerberos interface modify -vserver vs0 -lif datalif1 -kerberos enabled -spn nfs/sec.example.com@AUTH.SEC.EXAMPLE.COM -keytab-uri ftp://ftp.example.com/keytab

vserver nfs kerberos interface show
Display the Kerberos configurations of NFS servers
Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver nfs kerberos interface show command displays information about Kerberos configurations for NFS. The command output depends on the parameters specified with the command. If you do not specify any parameters, the command displays the following information about all Kerberos configurations for NFS:

• Vserver name
• Logical interface name
• Logical interface IP address
• Whether Kerberos is enabled or disabled
• The Kerberos service principal name (SPN)
• The permitted encryption types

You can specify additional parameters to display only information that matches those parameters. For instance, to display information only about Kerberos configurations for NFS that are enabled, run the command with the -kerberos enabled parameter.
Parameters

{ [-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?' to display the fields to specify.

| [-instance ]
  If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver
  If you specify this parameter and the -lif parameter, the command displays information only about the Kerberos configuration or configurations for NFS that are associated with the specified Vserver and logical interface.

[-lif <lif-name>] - Logical Interface
  If you specify this parameter and the -vserver parameter, the command displays information only about the Kerberos configuration or configurations for NFS that are associated with the specified logical interface and Vserver.

[-address <IP Address>] - IP Address
  If you specify this parameter, the command displays information only about the Kerberos configurations for NFS that are associated with the specified logical-interface IP address.

[-kerberos {enabled|disabled}] - Kerberos Enabled
  If you specify this parameter, the command displays information only about the Kerberos configurations for NFS that match the specified value.

[-spn <text>] - Service Principal Name
  If you specify this parameter, the command displays information only about the Kerberos configuration or configurations for NFS that match the specified SPN.

[-permitted-enc-types <NFS Kerberos Encryption Type>, ...] - Permitted Encryption Types
  If you specify this parameter, the command displays information only about the Kerberos configuration for NFS that matches the specified encryption types.

Examples

The following example displays information about the Kerberos configuration for NFS associated with the Vserver vs0 and the logical interface datalif1:

```
vserver nfs kerberos interface show -vserver vs0 -lif datalif1
Vserver: vs0
  Logical Interface: datalif1
  IP Address: 192.0.2.130
  Kerberos Enabled: enabled
  Service Principal Name: nfs/sec.example.com@AUTH.SEC.EXAMPLE.COM
  Permitted Encryption Types: des,des3,aes-128,aes-256
```

vserver nfs kerberos realm commands

Manage NFS Kerberos realm configurations

vserver nfs kerberos realm create

Create a Kerberos realm configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver nfs kerberos realm create command creates a Kerberos realm configuration.
Parameters

- `-vserver <vserver name>` - Vserver
  This parameter specifies the Vserver associated with the Kerberos realm configuration that you want to create.

- `-realm <text>` - Kerberos Realm
  This parameter specifies the name of the Kerberos realm for the configuration.

- `-kdc-vendor <Kerberos Key Distribution Center (KDC) Vendor>` - KDC Vendor
  This optional parameter specifies the KDC vendor. Specify Microsoft if you are using a Microsoft Active Directory server; specify Other if you are using a UNIX server.

- `-kdc-ip <IP Address>` - KDC IP Address
  This optional parameter specifies the IP address of the Kerberos Distribution Center (KDC) server.

- `-kdc-port <integer>` - KDC Port
  This optional parameter specifies the port number of the KDC server. The default setting is 88.

- `-clock-skew <integer>` - Clock Skew
  This optional parameter specifies how many seconds of clock skew between the clients and the server are permitted. The default setting is 300 seconds.

- `-adserver-name <text>` - Active Directory Server Name
  This optional parameter specifies the name of an Active Directory server for the configuration. Use this parameter only if you specified the value of `-kdc-vendor` parameter as Microsoft.

- `-adserver-ip <IP Address>` - Active Directory Server IP Address
  This optional parameter specifies the IP address of an Active Directory server for the configuration. Use this parameter only if you specified the value of the `-kdc-vendor` parameter as Microsoft.

- `-comment <text>` - Comment
  This optional parameter specifies a comment for the Kerberos realm configuration.

- `-adminserver-ip <IP Address>` - Admin Server IP Address
  This optional parameter specifies the IP address of the administrative server. Use this parameter only if you specified the value of `-kdc-vendor` parameter as Other. The default setting for this parameter is the KDC server's IP address as specified by the `-kdc-ip` parameter.

- `-adminserver-port <integer>` - Admin Server Port
  This optional parameter specifies the port number of the administrative server. The default setting is 749. Use this parameter only if you specified the value of `-kdc-vendor` parameter as Other.

- `-passwordserver-ip <IP Address>` - Password Server IP Address
  This optional parameter specifies the IP address of the password server. Use this parameter only if you specified the value of `-kdc-vendor` parameter as Other. The default setting for this parameter is the KDC server's IP address as specified by the `-kdc-ip` parameter.

- `-passwordserver-port <integer>` - Password Server Port
  This optional parameter specifies the port number of the password server. The default setting is 464. Use this parameter only if you specified the value of `-kdc-vendor` parameter as Other.

Examples

The following example creates a Kerberos realm named SEC.EXAMPLE.COM for the Vserver named AUTH. The permitted clock skew is 15 seconds. The KDC's IP address is 192.0.2.170 and its port is 88. The KDC vendor is Other (for a UNIX KDC). The administrative server's IP address is 192.0.2.170 and its port is 749. The password server's IP address is 192.0.2.170 and its port is 464.
vserver nfs kerberos realm delete
Delete a Kerberos realm configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver nfs kerberos realm delete command deletes a Kerberos realm configuration from the system.

Parameters
-vserver <vserver name> - Vserver
This parameter specifies the name of the Vserver for the Kerberos realm configuration that you want to delete.

-realm <text> - Kerberos Realm
This parameter specifies the name of the Kerberos realm for the configuration.

Examples
The following example deletes the Kerberos realm SEC.EXAMPLE.COM from the Vserver named AUTH:

cluster1::> vserver nfs kerberos realm delete -vserver AUTH -realm SEC.EXAMPLE.COM

vserver nfs kerberos realm modify
Modify a Kerberos realm configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver nfs kerberos realm modify command modifies one or more attributes of a Kerberos realm configuration.

Parameters
-vserver <vserver name> - Vserver
This parameter specifies the name of the Vserver for the Kerberos realm configuration that you want to modify.

-realm <text> - Kerberos Realm
This optional parameter specifies the name of a Kerberos realm for the configuration.

-[-kdc-vendor <Kerberos Key Distribution Center (KDC) Vendor>] - KDC Vendor
This optional parameter specifies the KDC vendor. Specify Microsoft if you are using a Microsoft Active Directory server; specify Other if you are using a UNIX server.

-[-kdc-ip <IP Address>] - KDC IP Address
This optional parameter specifies the IP address of the Kerberos Distribution Center (KDC) server.

-[-kdc-port <integer>] - KDC Port
This optional parameter specifies the port number of the KDC server. The default setting at the time of creation is 88.
[-clock-skew <integer>] - Clock Skew
This optional parameter specifies how many seconds of clock-skew between server and the clients are permitted. The default setting at the time of creation is 300 seconds.

[-adserver-name <text>] - Active Directory Server Name
This optional parameter specifies the name of an Active Directory server for the configuration. Use this parameter if you specified the value of -kdc-vendor parameter as Microsoft.

[-adserver-ip <IP Address>] - Active Directory Server IP Address
This optional parameter specifies the IP address of an Active Directory server for the configuration. Use this parameter if you specified the value of the -kdc-vendor parameter as Microsoft.

[-comment <text>] - Comment
This optional parameter specifies a comment for the Kerberos realm configuration.

[-adminserver-ip <IP Address>] - Admin Server IP Address
This optional parameter specifies the IP address of the administrative server. Use this parameter if you specified the value of -kdc-vendor parameter as Other.

[-adminserver-port <integer>] - Admin Server Port
This optional parameter specifies the port number of the administrative server. The default setting at the time of creation is 749. Use this parameter if you specified the value of the -kdc-vendor parameter as Other.

[-passwordserver-ip <IP Address>] - Password Server IP Address
This optional parameter specifies the IP address of the password server. Use this parameter if you specified the value of -kdc-vendor parameter as Other.

[-passwordserver-port <integer>] - Password Server Port
This optional parameter specifies the port number of the password server. The default setting at the time of creation is 464. Use this parameter only if you specified the value of -kdc-vendor parameter as Other.

Examples
The following example modifies the Kerberos realm SEC.EXAMPLE.COM for the Vserver named AUTH to use a Microsoft KDC server with the IP address 192.0.2.170 and an Active Directory server named AUTH.SEC.EXAMPLE.COM with the IP address 192.0.2.170:

```
cluster1::> vserver nfs kerberos realm modify -vserver AUTH -realm SEC.EXAMPLE.COM -adserver-name AUTH.SEC.EXAMPLE.COM -adserver-ip 192.0.2.170 -kdc-ip 192.0.2.170 -kdc-vendor Microsoft
```

vserver nfs kerberos realm show
Display Kerberos realm configurations

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver nfs kerberos realm show command displays information about Kerberos realm configurations. The command output depends on the parameters specified with the command. If you do not specify any parameters, the command displays the following information about all Kerberos realm configurations:

- Vserver
- Kerberos realm name
- Active Directory server name
• Kerberos Distribution Center (KDC) vendor
• KDC IP address
• The permitted encryption types

Parameters
{
-fields <fieldname>, ...

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

-instance

If you specify the -instance parameter, the command displays detailed information about all fields.

-vserver <vserver name> - Vserver

If you specify this parameter, the command displays information only about the Kerberos realm configurations for the specified Vserver.

-realm <text> - Kerberos Realm

If you specify this parameter, the command displays information only about the Kerberos realm configurations that use the specified Kerberos realm.

-kdc-vendor <Kerberos Key Distribution Center (KDC) Vendor> - KDC Vendor

If you specify this parameter, the command displays information only about the Kerberos realm configurations that use the specified KDC vendor.

-kdc-ip <IP Address> - KDC IP Address

If you specify this parameter, the command displays information only about the Kerberos realm configurations that use the specified KDC IP address.

-kdc-port <integer> - KDC Port

If you specify this parameter, the command displays information only about the Kerberos realm configurations that use the specified KDC port number.

-clock-skew <integer> - Clock Skew

If you specify this parameter, the command displays information only about the Kerberos realm configurations that use the specified clock skew.

-adserver-name <text> - Active Directory Server Name

If you specify this parameter, the command displays information only about the Kerberos realm configurations that use the Active Directory server that has the specified name.

-adserver-ip <IP Address> - Active Directory Server IP Address

If you specify this parameter, the command displays information only about the Kerberos realm configurations that use the Active Directory server that has the specified IP address.

-comment <text> - Comment

If you specify this parameter, the command displays information only about the Kerberos realm configurations that match the specified comment text.

-adminserver-ip <IP Address> - Admin Server IP Address

If you specify this parameter, the command displays information only about the Kerberos realm configurations that use the specified administrative-server IP address.

-adminserver-port <integer> - Admin Server Port

If you specify this parameter, the command displays information only about the Kerberos realm configurations that use the specified administrative-server port number.
[-passwordserver-ip <IP Address>] - Password Server IP Address
If you specify this parameter, the command displays information only about the Kerberos realm configurations that use the specified password-server IP address.

[-passwordserver-port <integer>] - Password Server Port
If you specify this parameter, the command displays information only about the Kerberos realm configurations that use the specified password-server port number.

[-permitted-enc-types <NFS Kerberos Encryption Type>, ...] - Permitted Encryption Types
If you specify this parameter, the command displays information only about the Kerberos realm configuration that match the specified encryption types.

Examples
The following example displays information about all Kerberos realm configurations:

```
cluster1::> vserver nfs kerberos realm show

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Kerberos Realm</th>
<th>Active Directory KDC Server</th>
<th>KDC Vendor</th>
<th>KDC IP Address</th>
</tr>
</thead>
<tbody>
<tr>
<td>AUTH</td>
<td>SEC.EXAMPLE.COM</td>
<td>AUTH.SEC.EXAMPLE.COM</td>
<td>Microsoft</td>
<td>192.0.2.170</td>
</tr>
</tbody>
</table>
```

vserver nfs pnfs commands
Manage pNFS Devices and its Mappings

pNFS Device Commands
The devices directory
The `vserver nfs pnfs devices` command enables users to manage pNFS devices and their properties, including their configuration and state of the cache in the Data ONTAP kernel. A pNFS Device is a logical representation of a volume and determines how a volume is exported to the pNFS clients. pNFS clients acquire layouts on pNFS devices, which enable them to access storage via optimal network paths. A pNFS device consists of information about the device itself and mappings that enable direct network access to the storage constituents for the device. The information related to pNFS devices is visible via commands `vserver nfs pnfs devices show` and `vserver nfs pnfs devices mappings show`. All the commands implemented under this directory are for troubleshooting purposes only and users are NOT expected to execute them without the supervision of the NetApp Support personnel.

Related references
`vserver nfs pnfs devices show` on page 1922
`vserver nfs pnfs devices mappings show` on page 1924

vserver nfs pnfs devices create
Create a new pNFS device and its mapping

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The `vserver nfs pnfs devices create` command creates a pNFS device for a given instance of a volume. The actual creation of pNFS devices is automatically done by the pNFS implementation in Data ONTAP kernel. The usage of this command might interfere with the functionality of the pNFS server. Thus, it is advised that this command not be used without supervision by technical support.
vserver nfs pnfs devices delete
Delete a pNFS device

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description
The `vserver nfs pnfs devices delete` command deletes a unique pNFS device. The pNFS device to be deleted is identified by the unique device mapping identifier (mid) parameter passed to this operation. When this operation is successful, the device mappings corresponding to the device and the information corresponding to the device itself are removed. You can obtain the global mapping identifier from the list of devices using the command `vserver nfs pnfs devices show`.

Parameters
- `-global-device-table-id <integer>` - Global Device Mapping Table ID
  This parameter specifies the pNFS global device mapping identifier that uniquely identifies a pNFS device
Examples
The following example deletes the device information of a device with global mapping identifier value 2.

```
cluster1::> vserver nfs pnfs delete -mid 2
```

`vserver nfs pnfs devices show`
Display pNFS device information

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `advanced` privilege level.

**Description**
The `vserver nfs pnfs devices show` command displays a pNFS device for a given instance of a volume. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all pNFS devices:

- Vserver name
- The global device mapping identifier of the device
- The master data set ID (MSID) of the volume that leads to this device
- The mapping status of the device
- The generation number of the device

You can specify additional parameters to display only information that matches those parameters. For instance, to display information only about devices that are exported as write-only devices, enter the command with the `-access-flags 1` parameter.

**Parameters**

```
{ [-fields <fieldname>, ... ]

| [-instance ]

| [-global-device-table-id <integer>] - Global Device Mapping Table ID

| [-vserver <vserver name>] - Vserver Name

| [-msid <integer>] - Volume MSID

| [-striping-epoch <integer>] - Striping Epoch
```

If you specify the `-fields` parameter, the command only displays the fields that you specify.

If you specify the `-instance` parameter, the command displays detailed information about all entries.

If you specify this parameter, the command displays information only about the unique identifier that the pNFS devices subsystem assigns to the device that is being output.

If you specify this parameter, the command displays information only about the Vserver that owns the volume represented by MSID.

If you specify this parameter, the command displays information only about the volume or volumes that match the specified MSID.

If you specify this parameter, the command displays information only about the striping epoch identifier for a volume that serves as the basis for the pNFS device.
[-device-access <integer>] - Device Access Flags
If you specify this parameter, the command displays information only about access flags which specify the type of access that is given to the pNFS device. If the value is 1, it means write access. If the value is 0, it means read access.

[-version <integer>] - Device Version
If you specify this parameter, the command displays information only about pNFS devices that match the specified version number.

[-generation-count <integer>] - Device Generation
If you specify this parameter, the command displays information only about generation count associated with the pNFS device identifier.

[-create-time <MM/DD/YYYY HH:MM:SS>] - Device Creation Time
If you specify this parameter, the command displays information only about pNFS devices that were created at the specified time.

[-mapping-status {available|notavailable}] - Device Mapping Status
If you specify this parameter, the command displays information only about if the mapping exists for a device. If the value is set to "available", the mappings can be seen in the device mappings table. If the value is set to "notavailable", the mappings will not be seen in the device mappings table.

Examples
The following example displays the information of a device with global mapping identifier 6. The device corresponds to a volume with MSID 2147484673 on Vserver vs1. The device mappings corresponding to this device follow in the mappings table.

```
cluster1::*> vserver nfs pnfs devices show
Vserver Name     Mapping ID      Msid            Mapping Status  Generation
---------------  --------------- --------------- --------------- -------------
vs1              1               2147484673      available       6
```

```
cluster1::*> vserver nfs pnfs devices mappings show
Vserver Name    Mapping ID      Dsid            LIF IP
--------------  --------------- --------------- --------------------
vs1             1               1025            10.53.4.14
```

vserver nfs pnfs devices mappings show on page 1924

pNFS Device Cache Command
Manage pNFS Device Cache in N-blade
The vserver nfs pnfs devices cache command enables users to manage the pNFS device mappings cache present in the protocol stack of Data ONTAP kernel. The only supported action implemented is to flush the cache. This is to be mainly used for testing purposes only and users are NOT expected to use this without the supervision of NetApp support personnel.

```
vserver nfs pnfs devices cache show
```

Display the device cache
Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The vserver nfs pnfs devices cache show command displays the device cache.
Parameters

{[-fields <fieldname>, ...]}

If you specify the -fields parameter, the command only displays the fields that you specify.

[-instance ]

If you specify the -instance parameter, the command displays detailed information about all entries.

[-node <nodename> | local] - Node

If you specify this parameter, the command displays information only about the pNFS devices cache present on the node.

[-vserver <vserver name>] - Vserver Name

If you specify this parameter, the command displays information only about the Vserver that has the pNFS devices cache.

Examples

pNFS Device Mappings Command

Manage Device Mappings

The vserver nfs pnfs devices mappings command enables you to manage the pNFS device mappings corresponding to every pNFS device. The only supported action implemented for this command is to display the device mappings.

vserver nfs pnfs devices mappings show

Display the list of pNFS device mappings

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description

The vserver nfs pnfs devices show command displays a pNFS device for a given instance of a volume. The command output depends on the parameter or parameters specified with the command. If you do not specify parameters, the command displays the following information about all pNFS devices:

• Vserver name
• The global device mapping identifier of the device
• The Data Set ID (DSID) of the constituent volume
• The LIF IP address that serves the constituent on the same controller.

You can specify additional parameters to display only information that matches those parameters. For instance, to display information only about devices that are exported as write-only devices, enter the command with the -access-flags 1 parameter.

Parameters

{[-fields <fieldname>, ...]}

If you specify the -fields parameter, the command only displays the fields that you specify.

[-instance ]

If you specify the -instance parameter, the command displays detailed information about all entries.
[-vserver <vserver name>] - Vserver Name

If your specify this parameter, the command displays information only about the Vserver that the mapping identifier and DSID belong to.

[-global-device-table-id <integer>] - Global Device Mapping Table ID

This specifies the unique identifier that the pNFS devices subsystem assigns to the device whose mappings are being output.

[-dsid <integer>] - Constituent Volume DSID

If you specify this parameter, the command displays information only about the volume or volumes that match the specified DSID.

[-lifip <IP Address>] - LIF IP Address

If you specify this parameter, the command displays information only about the pNFS devices that match the specified LIF IP address.

**Examples**

The following example displays the device information of a device with global mapping identifier 6. The device corresponds to a volume with MSID 2147484673 on Vserver vs1. The device has one constituent with DSID 1025 and is served by the LIF with the IP address 10.53.4.14.

```
cluster1::*> vserver nfs pnfs devices* show
Vserver Name   Mapping ID   Msid            Mapping Status  Generation
---------------  --------------- --------------- --------------- ---------------
vs1             1              2147484673      available       6
cluster1::*> vserver nfs pnfs devices mappings show
Vserver Name   Mapping ID   Dsid            Lif IP
---------------  --------------- --------------- -------------
vs1             1              1025            10.53.4.14
```

**vserver peer commands**

Create and manage Vserver peer relationships

The vserver peer commands enable you to create and manage Vserver peering relationships.

**vserver peer accept**

Accept a pending Vserver peer relationship

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

The vserver peer accept command is used to accept the Vserver peer relationship between two Vservers. This command is used only for intercluster Vserver peer relationships.

**Parameters**

[-vserver <vserver>] - Vserver Name

Specifies name of the local Vserver for which you want to accept the Vserver peer relationship.
-peer-vserver <vserver> - Peer Vserver Name
  Specifies name of the peer Vserver with which the Vserver peer relationship was initiated.

[-local-name <vserver>] - Peer Vserver Local Name
  Specifies the unique local name to identify the peer Vserver with which the Vserver peer relationship was initiated. The default value is the remote peer Vserver name.

Examples
The following example illustrates how to accept the Vserver peer relationship between Vservers pvs1.example.com residing on cluster2, and lvs1.example.com residing on cluster1.

```
cluster2::> vserver peer accept -vserver pvs1.example.com -peer-vserver lvs1.example.com
```

The following example illustrates how to accept the Vserver peer relationship between Vservers pvs1.example.com residing on cluster2, and pvs1.example.com residing on cluster1. During execution of `vserver peer create` command on peer cluster, peer Vserver name is locally refered by unique system generated name pvs1.example.com.1. Using `vserver peer accept` command specify the unique `-local-name` for peer Vserver.

```
cluster2::> vserver peer accept -vserver pvs1.example.com -peer-vserver pvs1.example.com.1 -local-name locallyUniqueName
```

vserver peer create
Create a new Vserver peer relationship

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The `vserver peer create` command creates a Vserver peer relationship between two Vservers residing on the same cluster or across two clusters. For intercluster Vserver peer relationships, the cluster administrator must accept or reject the relationship on the peer cluster.

Parameters
- `-vserver <vserver>` - Vserver Name
  Specifies the name of the local Vserver.
- `-peer-vserver <vserver>` - Peer Vserver Name
  Specifies the name of the peer Vserver with which you want to create the Vserver peer relationship.
- `[peer-cluster <text>]` - Peer Cluster Name
  Specifies the name of the peer cluster. If this is not specified, it is assumed that the peer Vserver resides on the same cluster.
- `-applications {snapmirror|file-copy|lun-copy},...` - Peering Applications
  Specifies the applications for which the Vserver peer relationship is created.
- `[local-name <vserver>]` - Peer Vserver Local Name
  Specifies the unique local name to identify the peer Vserver with which you want to create the Vserver peer relationship. The default value is the remote peer Vserver name.
Examples

The following example illustrates how to create an intercluster Vserver peer relationship between Vserver 
\textit{lvs1.example.com}, residing on \textit{cluster1}, and \textit{pvs1.example.com}, residing on \textit{cluster2}. The relationship is 
created for SnapMirror.

\begin{verbatim}
cluster1::> vserver peer create -vserver lvs1.example.com -peer-vserver pvs1.example.com -peer-
cluster cluster2 -applications snapmirror
\end{verbatim}

The following example illustrates how to create an intercluster Vserver peer relationship between Vserver 
\textit{lvs1.example.com}, residing on \textit{cluster1}, and \textit{lvs1.example.com}, residing on \textit{cluster2}. The relationship is 
created for SnapMirror. The \texttt{-local-name} parameter is specified to create a local name used to identify the peer Vserver 
in cases where the name of the peer Vserver name is not uniquely referenced from local cluster.

\begin{verbatim}
cluster1::> vserver peer create -vserver lvs1.example.com -peer-vserver lvs1.example.com -peer-
cluster cluster2 -applications snapmirror -local-name cluster2lvs1locallyUniqueName
\end{verbatim}

\begin{verbatim}
cluster1::> vserver peer show
Peer        Peer                           Peering        Remote
Vserver     Vserver     State        Peer Cluster      Applications   Vserver
----------- ----------- ------------ ----------------- -------------- ---------
lvs1.example.com  cluster2lvs1locallyUniqueName initiated    cluster2          snapmirror     lvs1.example.com
\end{verbatim}

\begin{verbatim}
cluster1::> vserver peer show -instance
Local Vserver Name: lvs1.example.com
Peer Vserver Name: cluster2lvs1locallyUniqueName
Peering State: initiated
Peering Applications: snapmirror
Remote Vserver Name: lvs1.example.com
\end{verbatim}

The following example illustrates how to create an intercluster Vserver peer relationship between Vserver \textit{lvs1}, residing 
on \textit{cluster1}, and Vserver \textit{pvs1}, residing on \textit{cluster2}. The relationship is created for SnapMirror. The following 
Vserver peer permission exists on remote cluster \textit{cluster2} for local Vserver \textit{pvs1}.

\begin{verbatim}
cluster2::> vserver peer permission show
Peer Cluster     Vserver         Applications
---------------- --------------- -----------------
cluster1         pvs1            snapmirror
1 entries were displayed.
\end{verbatim}

\begin{verbatim}
cluster1::> vserver peer create -vserver lvs1 -peer-vserver pvs1 -peer-cluster cluster2 -
applications snapmirror
\end{verbatim}

\begin{verbatim}
cluster1::> vserver peer show
Peer        Peer                           Peering        Remote
Vserver     Vserver     State        Peer Cluster      Applications   Vserver
----------- ----------- ------------ ----------------- -------------- ---------
lvs1         pvs1          peered       cluster2          snapmirror     pvs1
\end{verbatim}

\begin{verbatim}
cluster2::> vserver peer show
Peer        Peer                           Peering        Remote
Vserver     Vserver     State        Peer Cluster      Applications   Vserver
----------- ----------- ------------ ----------------- -------------- ---------
pvs1         lvs1          peered       cluster1          snapmirror     lvs1
\end{verbatim}

Here is another example which creates an intracluster Vserver peer relationship.
vserver peer create

-vserver <vserver> - Vserver Name
-Specifies the local Vserver name for which you want to establish a Vserver peer relationship.

-peer-vserver <vserver> - Peer Vserver Name
-Specifies the peer Vserver name with which the Vserver peer relationship was established.

-applications snapmirror

vserver peer delete

Delete a Vserver peer relationship

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The vserver peer delete command deletes the Vserver peer relationship between two Vservers.

Parameters
-vserver <vserver> - Vserver Name
-Specifies the local Vserver name for which you want to delete the Vserver peer relationship.

-peer-vserver <vserver> - Peer Vserver Name
-Specifies the peer Vserver name with which the Vserver peer relationship was established.

-force [true] - Force Delete
-Deletes the Vserver peer relationship even if the remote cluster is not accessible due to, for example, network connectivity issues.

Examples
The following example illustrates how to delete the Vserver peer relationship between two Vservers lvs1.example.com residing on cluster1, and pvs1.example.com residing on cluster2.

cluster1::> vserver peer delete -vserver lvs1.example.com -peer-vserver pvs1.example.com

Related references
-vserver peer accept on page 1925
-vserver peer reject on page 1929

vserver peer modify

Modify a Vserver peer relationship

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The vserver peer modify command modifies applications of the Vserver peer relationship.

Parameters
-vserver <vserver> - Vserver Name
-Specifies name of the local Vserver for which you want to modify applications of the Vserver peer relationship.
-peer-vserver <vserver> - Peer Vserver Name
  Specifies name of the peer Vserver for which you want to modify applications of the Vserver peer relationship.

-applications {snapmirror|file-copy|lun-copy}, ... - Peering Applications
  Specifies the Vserver peer applications.

Examples
The following example illustrates how to modify applications that are part of the peer relationship between the Vservers lvs1.example.com residing on cluster1, and pvs1.example.com residing on cluster2.

    cluster1::> vserver peer modify -vserver lvs1.example.com -peer-vserver pvs1.example.com -applications snapmirror

vserver peer modify-local-name
Modify the local name for a peer Vserver

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The vserver peer modify-local-name command modifies the local name for a remote peer Vserver. The new local name must be unique.

Parameters
  -peer-cluster <text> - Peer Cluster
    Use this parameter to specify the peer cluster.
  -peer-vserver <text> - Remote Peer Vserver
    Use this parameter to specify the existing remote peer Vserver name.
  -new-name <vserver> - Remote Peer Vserver Local Name
    Use this parameter to specify the new local name of the peer Vserver. The new local name must conform to the same rules as a Vserver name.

Examples
  cluster2::> vserver peer modify-local-name -peer-cluster cluster1 -peer-vserver vs51.example.com -new-name vs51_cluster1.example.com

vserver peer reject
Reject a Vserver peer relationship

Availability: This command is available to cluster administrators at the admin privilege level.
Description
The `vserver peer reject` command is used to reject the Vserver peer relationship between the two Vservers. This command is used only for an intercluster Vserver peer relationship.

Parameters
- `-vserver <vserver>` - Vserver Name
  Specifies the name of the local Vserver for which you want to reject the Vserver peer relationship.
- `-peer-vserver <vserver>` - Peer Vserver Name
  Specifies the name of the peer Vserver with which the Vserver peer relationship was initiated.

Examples
The following example illustrates how to reject the Vserver peer relationship between two Vservers `lvs1.example.com` residing on `cluster1`, and `pvs1.example.com` residing on `cluster2`.

```
cluster1::> vserver peer reject -vserver lvs1.example.com -peer-vserver pvs1.example.com
```

`vserver peer repair-peer-name`
Repair the peer vserver name that was not updated during the last rename operation

Availability: This command is available to cluster administrators at the `advanced` privilege level.

Description
Updates the peer Vserver name in remote peer clusters for the specified Vserver in the local cluster.

Parameters
- `-vserver <vserver>` - vserver
  Name of the Vserver in the local cluster. This name will be repaired on remote peer clusters.

Examples
The following example updates the peer-Vserver name across the peered clusters:

```
cluster1::*> vserver peer repair-peer-name -vserver vs1.example.com
Info: Command completed successfully
```

`vserver peer resume`
Resume a Vserver peer relationship

Availability: This command is available to cluster administrators at the `admin` privilege level.

Description
The `vserver peer resume` command resumes the Vserver peer relationship between two Vservers.
Parameters

-vserver <vserver> - Vserver Name
   Specifies name of the local Vserver for which you want to resume the Vserver peer relationship.

-peer-vserver <vserver> - Peer Vserver Name
   Specifies name of the peer Vserver with which you want to resume the Vserver peer relationship.

[-force [true]] - Force Resume
   Resumes the Vserver peer relationship even if the remote cluster is not accessible due to, for example, network connectivity issues.

Examples

The following example illustrates resuming a Vserver peer relationship between two Vservers lvs1.example.com residing on cluster1, and pvs1.example.com residing on cluster2.

```
cluster1::> vserver peer resume -vserver lvs1.example.com -peer-vserver pvs1.example.com
```

vserver peer show

Display Vserver peer relationships

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver peer show command displays the following information about Vserver peer relationships:

- Local Vserver name
- Peer Vserver name
- Local Vserver UUID
- Peer Vserver UUID
- Peer cluster name
- State of the peering relationship
- Applications
- Remote Vserver name

Parameters

{ [-fields <fieldname>, ...]
   If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use ‘-fields ?’ to display the fields to specify.

| [-instance ]
   If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver>] - Local Vserver Name
   If this parameter is specified, the command displays relationships that match the specified local Vserver.
[-peer-vserver <text>] - Peer Vserver Name
   If this parameter is specified, the command displays relationships that match the specified peer Vserver.

[-peer-state {peered|pending|initializing|initiated|rejected|suspended|deleted}] - Peering State
   If this parameter is specified, the command displays relationships that match the specified peer state.

[-applications {snapmirror|file-copy|lun-copy}, ...] - Peering Applications
   If this parameter is specified, the command displays relationships that have the specified applications.

[-peer-cluster <text>] - Peer Cluster Name
   If this parameter is specified, the command displays relationships that have the specified peer cluster name.

[-peer-vserver-uuid <UUID>] - Peer Vserver UUID (privilege: advanced)
   If this parameter is specified, the command displays relationships that match the specified peer Vserver UUID.

[-vserver-uuid <UUID>] - Local Vserver UUID (privilege: advanced)
   If this parameter is specified, the command displays relationships that match the specified local Vserver UUID.

[-remote-vserver-name <text>] - Remote Vserver Name
   If this parameter is specified, the command displays relationships that match the specified remote Vserver.

Examples
The following examples illustrate how to display Vserver peer relationships.
Cluster administrator:

```
cluster1::> vserver peer show
Peer        Peer                           Peering        Remote
Vserver     Vserver     State        Peer Cluster      Applications   Vserver
----------- ----------- ------------ ----------------- -------------- ---------
lvs1.example.com
lvs2.example.com peered       cluster1          snapmirror     lvs2.example.com
lvs1.example.com
pvs1.example.com
lvs2.example.com peered       cluster2          snapmirror     pvs1.example.com
lvs2.example.com
lvs1.example.com
lvs3.example.com peered       cluster1          snapmirror     lvs1.example.com
lvs3.example.com
pvs1_cluster3.example.com peered       cluster3          snapmirror     pvs1.example.com
lvs1.example.com
lvs1_cluster4.example.com peered       cluster4          snapmirror
lvs1.example.com
5 entries were displayed.
```

Vserver administrator:

```
vs11.example.com::> vserver peer show
Peer        Peer         Peering               Remote
Vserver     Vserver     State        Applications          Vserver
----------- ----------- ------------ --------------------- ----------
vs11.example.com
pvs21.example.com peered       snapmirror            pvs21.example.com
vs11.example.com
```

vserver peer show-all on page 1933

vserver peer show-all

(DEPRECATED)-Display Vserver peer relationships in detail

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The vserver peer show-all command displays the following information about Vserver peer relationships:

- Local Vserver name
- Peer Vserver name
- Local Vserver UUID
- Peer Vserver UUID
- Peer cluster name
- Applications
- State of the peering relationship
- Remote Vserver name

Parameters

{ [-fields <fieldname>, ...] }  

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

[ -instance ]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver>] - Local Vserver Name

If this parameter is specified, the command displays relationships that match the specified local Vserver.

[-peer-vserver <text>] - Peer Vserver Name

If this parameter is specified, the command displays relationships that match the specified peer Vserver.

[-vserver-uuid <UUID>] - Local Vserver UUID (privilege: advanced)

If this parameter is specified, the command displays relationships that match the specified local Vserver UUID.

[-peer-vserver-uuid <UUID>] - Peer Vserver UUID (privilege: advanced)

If this parameter is specified, the command displays relationships that match the specified peer Vserver UUID.

[-peer-state {peered|pending|initializing|initiated|rejected|suspended|deleted}] - Peering State

If this parameter is specified, the command displays relationships that match the specified peer state.

[-applications {snapmirror|file-copy|lun-copy}, ...] - Peering Applications

If this parameter is specified, the command displays relationships that have the specified applications.
[\texttt{-peer-cluster <text>}] - Peer Cluster Name

If this parameter is specified, the command displays relationships that have the specified peer cluster name.

[\texttt{-remote-vserver-name <text>}] - Remote Vserver Name

If this parameter is specified, the command displays relationships that match the specified remote Vserver.

**Examples**

The following example illustrates how to display Vserver peer relationships.

```
cluster1::> vserver peer show-all
Peer        Peer                           Peering        Remote
Vserver     Vserver     State        Peer Cluster      Applications   Vserver
----------- ----------- ------------ ----------------- -------------- ---------
lvs1.example.com lvs2.example.com    peered       cluster1          snapmirror     lvs2.example.com
lvs1.example.com pvs1.example.com    peered       cluster2          snapmirror     pvs1.example.com
lvs2.example.com lvs1.example.com    peered       cluster1          snapmirror     lvs1.example.com
lvs3.example.com pvs1_cluster3.example.com peered       cluster1          snapmirror     lvs1.example.com
lvs1.example.com lvs1_cluster4.example.com peered       cluster4          snapmirror
lvs1.example.com
5 entries were displayed.
```

### vserver peer suspend

Suspend a Vserver peer relationship

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

The `vserver peer suspend` command suspends the Vserver peer relationship between two Vservers.

**Parameters**

- [\texttt{-vserver <vserver>}] - Vserver Name

  Specifies name of the local Vserver for which you want to suspend the Vserver peer relationship.

- [\texttt{-peer-vserver <vserver>}] - Peer Vserver Name

  Specifies name of the peer Vserver for which you want to suspend the Vserver peer relationship.

- [\texttt{-force [true]}] - Force Suspend

 Suspends the Vserver peer relationship even if the remote cluster is not accessible due to, for example, network connectivity issues.

**Examples**

The following example illustrates how to suspend the Vserver peer relationship between two Vservers `lvs1.example.com` residing on `cluster1`, and `pvs1.example.com` residing on `cluster2`.

vserver peer permission commands

Create or Manage Vserver peer permissions

vserver peer permission create

Create a new Vserver peer permission

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The `vserver peer permission create` command creates a new Vserver peer permission that can be used during intercluster Vserver peer relationship creation. Once this permission exists for a local Vserver and peer cluster combination on local cluster, no explicit `vserver peer accept` command is required for any incoming Vserver peer relationship creation request from a remote cluster for that local Vserver. Peer relationship directly changes state to peered on both clusters.

Parameters

- `peer-cluster <text>` - Peer Cluster Name
  - Specifies the name of the peer Cluster.
- `vserver <text>` - Vserver Name
  - Specifies the name of the local Vserver. Use "*" to create permission that applies for all local Vservers.
- `applications <snapmirror>, ...` - Peering Applications
  - Specifies the applications that can make use of the intercluster Vserver peer relationship.

Examples

The following example illustrates how to create Vserver peer permissions:

```
cluster1::> vserver peer permission create -peer-cluster cluster2 -vserver vs1 -applications snapmirror
```

The following example illustrates how to create a Vserver peer permission that applies for all the local Vservers

```
cluster1::> vserver peer permission create -peer-cluster cluster2 -vserver "*" -applications snapmirror
```

Warning: This Vserver peer permission applies to all local Vservers. After that no explicit "vserver peer accept" command required for Vserver peer relationship creation request from peer cluster "cluster2" with any of the local Vservers. Do you want to continue? (y|n): y

```
cluster1::> vserver peer permission show
Peer Cluster     Vserver         Applications
---------------- --------------- -----------------
cluster2         "*"             snapmirror
cluster2         vs1             snapmirror
```

vserver peer commands
2 entries were displayed.

Note that both all Vservers and any local Vserver name permission can exists at same time.

vserver peer permission delete
Delete a Vserver peer permission

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The vserver peer permission delete command deletes Vserver peer permissions.

Parameters
- peer-cluster <text> - Peer Cluster Name
  Specifies the name of the peer Cluster.
- vserver <text> - Vserver Name
  Specifies the name of the local Vserver.

Examples
The following example illustrates how to delete Vserver peer permissions:

    cluster1::> vserver peer permission delete -peer-cluster cluster2 -vserver vs1

vserver peer permission show
Display Vserver peer permissions

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The vserver peer permission show command displays the following information about Vserver peer permissions:

- Peer cluster name
- Local Vserver name
- Applications

Parameters

{ [-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?' to display the fields to specify.
}

[-instance ]
  If you specify the -instance parameter, the command displays detailed information about all fields.
[-peer-cluster <text>] - Peer Cluster Name
If this parameter is specified, the command displays permissions that have the specified peer cluster name.

[-vserver <text>] - Vserver Name
If this parameter is specified, the command displays permissions that match the specified local Vserver.

[-applications <snapmirror>,...] - Peering Applications
If this parameter is specified, the command displays permissions that have the specified applications.

Examples
The following examples illustrate how to display Vserver peer permissions:

<table>
<thead>
<tr>
<th>Peer Cluster</th>
<th>Vserver</th>
<th>Applications</th>
</tr>
</thead>
<tbody>
<tr>
<td>cluster2</td>
<td>'*'</td>
<td>snapmirror</td>
</tr>
<tr>
<td>cluster3</td>
<td>vs1</td>
<td>snapmirror</td>
</tr>
</tbody>
</table>

2 entries were displayed.

vserver peer transition commands
Create and manage transition peer relationships.

The vserver peer transition commands enables you to create and manage transition peer relationships.

vserver peer transition create
Create a new transition peer relationship between a 7-Mode system and a Vserver.

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The vserver peer transition create command creates a transition peer relationship between a 7-Mode system and a Vserver.

Parameters
- -local-vserver <vserver name> - Local Vserver name
  Specifies the name of the local Vserver.
- -src-filer-name <text> - Source 7-Mode system
  Specifies the name of the source 7-Mode system (hostname or IP address).
- [multi-path-address <text>] - Additional address for source 7-Mode system
  Additional address (hostname or IP address) for the source 7-Mode system.
- [-local-lifs <lif-name>,...] - List of Local LIFs
  List of LIFs to be used for this peering relationship. The LIF role can be data or node-mgmt or intercluster or cluster-mgmt.

Examples
The following example illustrates how to create a transition peer relationship between Vserver vs1.example.com, residing on Cluster1, and a 7-Mode system src1.example.com. We can also specify an additional multipath address src1-e0d.example.com, for load balancing and list of local LIFs lif1, lif2 to be used.

vserver peer transition delete

Delete a transition peer relationship.

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The `vserver peer transition delete` command deletes the transition peer relationship.

Parameters
- `local-vserver <vserver name>` - Local Vserver name
  Specifies the name of the local Vserver.
- `src-filer-name <text>` - Source 7-Mode system
  Specifies the name of the source 7-Mode system (hostname or IP address).

Examples
The following example illustrates how to delete the transition peer relationship between a Vserver `lvs1.example.com` residing on `cluster1`, and source 7-Mode system `src1.example.com`.

```
cluster1::> vserver peer transition delete -vserver lvs1.example.com -src-filer-name src1.example.com
```

vserver peer transition modify

Modify a transition peer relationship.

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The `vserver peer transition modify` command is used to modify the multipath address or local LIFs of the transition peer relationship.

Parameters
- `local-vserver <vserver name>` - Local Vserver name
  Specifies the name of the local Vserver.
- **src-filer-name <text>** - **Source 7-Mode system**
  Specifies the name of the source 7-Mode system (hostname or IP address).

- **-multi-path-address <text>** - **Additional address for source 7-Mode system**
  Additional address (hostname or IP address) for the source 7-Mode system.

- **-local-lifs <lif-name>, ...** - **List of Local LIFs**
  List of LIFs to be used for this peering relationship. The LIF role can be data or node-mgmt or intercluster or cluster-mgmt.

### Examples

The following example illustrates how to modify a transition peer relationship’s multipath address.

```bash
cluster1::> vserver peer transition modify -vserver vs1.example.com -src-filer-name src1.example.com -multi-path-address src1-e0b.example.com
```

The following example illustrates how to modify the local LIFs of a transition peer relationship.

```bash
Cluster1::> vserver peer transition modify -vserver vs1.example.com -src-filer-name src1.example.com -local-lifs lif1,lif2
```

### vserver peer transition show

Display transition peer relationships.

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The `vserver peer transition show` command displays the following information about transition peer transition relationships:

- Local Vserver name
- Source 7-Mode system
- Multi-path address
- Local LIFs

**Parameters**

```bash
{[[-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.
}

| [-instance ]
  If you specify the -instance parameter, the command displays detailed information about all fields.

[[-local-vserver <vserver name>],] - **Local Vserver name**
  If this parameter is specified, the command displays transition peer information about the specified local Vserver.
```
[-src-filer-name <text>] - Source 7-Mode system
    If this parameter is specified, the command displays transition peer information about the specified source 7-Mode system.

[-multi-path-address <text>] - Additional address for source 7-Mode system
    If this parameter is specified, the command displays information about the specified multipath-address.

[-local-lifs <lif-name>,...] - List of Local LIFs
    If this parameter is specified, the command displays information about the specified local LIFs.

Examples

```
cluster1::> vserver peer transition show
Vserver  Source Filer  Multi Path Address    Local LIFs
-------  ------------  -----------------     ----------------
vs1.example.com                              lif1, lif2
src1.example.com
src1-e0b.example.com
```

vserver san commands

Manage SAN Vservers

Commands used for managing the SAN in-memory cache configuration of a Vserver.

vserver san prepare-to-downgrade

Restore the SAN Configurations to Earlier Release of Data ONTAP Version.

Availability: This command is available to `cluster` administrators at the `admin` privilege level.

Description

This command initiates the procedure to restore the configuration to Earlier Release of Data ONTAP Version.

As part of this command, capability for making SAN LIF offline if placed on the DR auxiliary partner as part of LIF placement in Metrocluster environment will be disabled.

Parameters

-`-feature-set <ClusterVersion>` - Disable the capability introduced in the Data ONTAP Version
    Specifies the DATA ONTAP Cluster Version from revert to.

Examples

```
cluster1::> vserver san prepare-to-downgrade -feature-set 8.3.1
```
vserver security commands

Manage ontap security

vserver security file-directory commands

Manage file security

vserver security file-directory apply

Apply security descriptors on files and directories defined in a policy to a Vserver

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver security file-directory apply command applies security settings to files and directories defined in a security policy of a Vserver.

Applying a security policy to a Vserver is the last step to creating and applying NTFS ACLs to files or folders. A security policy contains definitions for the security configuration of a file (or folder) or set of files (or, folders). The policy is a container for tasks. A task associates a file/folder path name to the security descriptor that needs to be set on the file/folder. Every task in a policy is uniquely identified by the file/folder path. A policy cannot have duplicate task entries. There can be only one task per path.

The steps to creating and applying NTFS ACLs are the following:

• Create an NTFS security descriptor.
  
• Add DACLs and SACLs to the NTFS security descriptor.
  
  Note: If you want to audit file and directory events, you must configure auditing on the Vserver in addition to adding the SACL to the security descriptor.
  
• Create a file/directory security policy.
  This step associates the policy with a Vserver.

• Create policy tasks.
  A policy task refers to a single operation to apply to a file (or folder) or to a set of files (or folders). Amongst other things, the task defines which security descriptor to apply to a path.

• Apply a policy to the associated Vserver.

The vserver security file-directory apply command is not supported for Vservers with Infinite Volume.

Parameters

-vserver <vserver name> - Vserver
  
  Specifies the Vserver that contains the path to which the security policy is applied.

-policy-name <Security policy name> - Policy Name
  
  Specifies the security policy to apply.

-[-ignore-broken-symlinks {true|false}] - Skip Broken Symlinks (privilege: advanced)
  
  If you specify this parameter as true, the file-directory apply job will skip all the symlinks that are broken instead of failing the job.
Examples

The following example applies a security policy named “p1” to Vserver vs0.

```
cluster1::> vserver security file-directory apply -vserver vs0 -policy-name p1
```

vserver security file-directory remove-slag

Removes Storage-Level Access Guard

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The `vserver security file-directory remove-slag` command removes Storage-Level Access Guard (SLAG) security from the specified volume or qtree path.

The `vserver security file-directory remove-slag` command is not supported for Vservers with Infinite Volume.

**Parameters**

- `-vserver <vserver>` - Vserver
  
  Specifies the name of the Vserver that is associated with the volume or qtree path from where you want to remove SLAG.

- `-path <text>` - Path
  
  Specifies the volume or qtree mounted junction path from which you want to remove SLAG security.

Examples

The following example removes SLAG security from the volume path “/vol1” on Vserver vs1.

```
cluster1::>vserver security file-directory show -vserver vs1 -path /vol1
Vserver: vs1
File Path: /vol1
Security Style: mixed
Effective Style: unix
DOS Attributes: 10
DOS Attributes in Text: ----D---
Expanded Dos Attributes: -
Unix User Id: 0
Unix Group Id: 0
Unix Mode Bits: 755
Unix Mode Bits in Text: rwxr-xr-x
ACLs: Storage-Level Access Guard
security
(Applies to Directories):
  ALLOW-CIFS1\Administrator-0x1200a9
DACL (Applies to Files):
  ALLOW-CIFS1\Administrator-0x1200a9

cluster1::>vserver security file-directory remove-slag -path /vol1 -vserver vs1
```

```
cluster1::>vserver security file-directory show -vserver vs1 -path /vol1
Vserver: vs1
File Path: /vol1
Security Style: mixed
Effective Style: unix
DOS Attributes: 10
DOS Attributes in Text: ----D---
Expanded Dos Attributes: -
Unix User Id: 0
Unix Group Id: 0
Unix Mode Bits: 755
```
The following example removes SLAG security from the qtree path "/vol1/q1" on Vserver vs1.

```
cluster1::>vserver security file-directory show -vserver vsl -path /vol1/q1

Vserver: vs1
File Path: /vol1/q1
Security Style: mixed
Effective Style: unix
DOS Attributes: 10
DOS Attributes in Text: ----D---
Expanded Dos Attributes: -
Unix User Id: 0
Unix Group Id: 0
Unix Mode Bits: 755
Unix Mode Bits in Text: rwxr-xr-x
ACLs: Storage-Level Access Guard
```

```
cluster1::>vserver security file-directory remove-slag -path /vol1/q1 -vserver vs1
```

```
cluster1::>vserver security file-directory show -vserver vsl -path /vol1/q1

Vserver: vs1
File Path: /vol1/q1
Security Style: mixed
Effective Style: unix
DOS Attributes: 10
DOS Attributes in Text: ----D---
Expanded Dos Attributes: -
Unix User Id: 0
Unix Group Id: 0
Unix Mode Bits: 755
Unix Mode Bits in Text: rwxr-xr-x
ACLs: -
```

### vserver security file-directory show

Display file/folder security information

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The `vserver file-directory show` command displays file/folder security information. The command output depends on the parameter or parameters specified with the command.

The `-vserver` and `-path` parameters are required for this command. If you do not specify any of the optional parameters, the command displays all security information in list format for the specified path.

You can specify the `-fields` parameter to specify which fields of information to display about files and folders security.

You can specify the `-instance` parameter to display all the security information in list format.

**Parameters**

`{[-fields <fieldname>, ...]}

If you specify the -fields <fieldname>, ... parameter, the command only displays the fields that you specify.
If you specify the -instance parameter, the command displays detailed information about all entries.

-vserver <vserver> - Vserver

Use this required parameter to specify the Vserver that contains the path to the file or folder specified with the required -path parameter.

{-path <text>} - File Path

Use this field to specify the path of the file or folder for which you want to display security information. If the volume name is not specified in the path, the path is relative to the Vserver root volume. If the path's last subcomponent has a wildcard ("*"), the output will display information for all files and directories below the parent path.

Note: If you want to display information of a file or directory which contains wildcard ("*"), as its last subcomponent, then provide the complete path inside "<path>".

For instance, vserver security file-directory show -vserver vs1 -path "/vol1/*" will show ACL information for the directory named ", only.

{-inode <integer>} - File Inode Number

Use this field to specify the inode number of the file or folder for which you want to display security information. If the volume name is not specified, inode is searched in the Vserver root volume.

{-volume-name <volume name>} - Volume Name

If you specify this parameter, the command displays information about file and directory security only for files and directories where the specified path is relative to the specified volume. If this parameter is not specified, the Vserver root volume is taken as default.

{-share-name <Share>} - Share Name

If you specify this parameter, the command displays information about file and directory security only for files and directories contained where the specified path is relative to the root of the specified share. If this parameter is not specified, the Vserver root volume is taken as default.

{-lookup-names {true|false}} - SID to Name Lookups

If you specify this parameter, the command displays information about file and directory security for files and directories where the information about owner and group are stored as names. If set to false, the command displays information about file and directory security for files and directories where the information for owner and group are stored as SIDs.

{-expand-mask {true|false}} - Expand Bit Masks

If you specify this parameter, the command displays information about file and directory security for files and directories where the hexadecimal bit mask entries are in expanded bit form. If set to false, the command displays information about file and directory security for files and directories where the hexadecimal bit mask entries are in collapsed form.

{-sddl {true|false}} - Display ACLs in SDDL Format

If you specify this parameter, the command displays the ACL information for files and directories in Security Descriptor Definition Language (SDDL) format. If the file has effective-style as "unix" then this flag has no effect.

{-security-style <security style>} - Security Style

If you specify this parameter, the command displays information about file and directory security only for files and directories with paths in volumes of the specified security style.

{-effective-style <security style>} - Effective Style

If you specify this parameter, the command displays information about file and directory security only for files and directories with the specified effective security style on the path.
[-dos-attributes <Hex Integer>] - DOS Attributes
If you specify this parameter, the command displays information about file and directory security only for files and directories with the specified DOS attributes.

[-text-dos-attr <TextNoCase>] - DOS Attributes in Text
If you specify this parameter, the command displays information about file and directory security only for files and directories with the specified text DOS attributes.

[-expanded-dos-attr <TextNoCase>] - Expanded Dos Attributes
If you specify this parameter, the command displays information about file and directory security only for files and directories with the specified extended DOS attributes. This parameter is useful only for files or directories where the -expand-mask is set to true.

[-user-id <user name>] - UNIX User Id
If you specify this parameter, the command displays information about file and directory security only for files and directories with the specified UNIX user ID.

[-group-id <group name>] - UNIX Group Id
If you specify this parameter, the command displays information about file and directory security only for files and directories with the specified UNIX group ID.

[-mode-bits <Octal Permission>] - UNIX Mode Bits
If you specify this parameter, the command displays information about file and directory security only for files and directories with the specified UNIX mode bits in Octal form.

[-text-mode-bits <text>] - UNIX Mode Bits in Text
If you specify this parameter, the command displays information about file and directory security only for files and directories with the specified UNIX mode bits in text form.

[-acls <Security acl>, ...] - ACLs
If you specify this parameter, the command displays information about file and directory security only for files and directories with the specified ACLs. If the specified path is a volume or qtree path and Storage-Level Access Guard (SLAG) is configured on the volume or qtree, this parameter displays the SLAG information. It also displays the Dynamic Access Control (DAC) policies if DAC is configured for the given file or directory path. The following ACL information can be entered:

• Type of ACL - NTFS or NFSV4
• Control bits in the security descriptors
• Owner - only in case of NTFS security descriptors
• Group - only in case of NTFS security descriptors
• Access Control Entries - discretionary access control list (DACL) and system access control list (SACL) access control entries (ACEs) in the ACL

Examples
The following example displays the security information about the path "/vol4" in Vserver vs1.

```bash
cluster1::> vserver security file-directory show -vserver vs1 -path /vol4
(vserver security file-directory show)
Vserver: vs1
File Path: /vol4
File Inode Number: 64
Security Style: ntfs
Effective Style: ntfs
DOS Attributes: 10
DOS Attributes in Text: ----D---
Expanded Dos Attributes: -
```

---

vserver security file-directory show-effective-permissions

Display effective file or folder permissions

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**

The `vserver security file-directory show-effective-permissions` command displays the effective permission granted to a Windows or UNIX user on the specified file or folder path. The command output depends on the parameter or parameters specified with the command.

The `-vserver`, `-win-user-name` or `-unix-user-name` and `-path` parameters are required for this command. If the optional parameter `-share-name` is specified, it will display the effective share permission.
Parameters

{{-fields <fieldname>, ...}}

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use the -fields ? to display the fields to specify.

| [-instance ]

If you specify the -instance parameter, the command displays detailed information about all fields.

-vserver <vserver> - Vserver

Use this required parameter to specify the Vserver that contains the path to the file or folder specified with the required -path parameter. Query characters, such as "*", are not supported.

{ -win-user-name <text> - Windows User Name

Use this parameter to specify the Windows user for which effective permission needs to be displayed on the given file or folder.

| -unix-user-name <text> - Unix User Name

Use this parameter to specify the UNIX user for which effective permission needs to be displayed on the given file or folder.

-path <text> - File Path

Use this mandatory parameter to specify the path of the file or the folder for which you want to display effective permissions. The path is relative to the Vserver root volume. If -share-name is specified then the path will be relative to the share path. Query characters, such as "*", are not supported.

[-share-name <Share>] - CIFS Share Name

If you specify this optional parameter, the command displays the file or directory effective permission for the mentioned user, only for files and directories contained where the specified path is relative to the root of the specified share. If this parameter is not specified, the Vserver root volume is taken as the default. If this optional parameter is specified, then it will also display the effective share permission of the user. Wildcard query characters are not supported.

[-client-ip-address <IP Address>] - Client IP Address

If you specify this optional parameter, the command displays the effective permission for the user with the specified client ip address.

[-expand-mask {true|false}] - Expand Bit Masks

If you specify this optional parameter, the command displays effective permission for files and directories where the hexadecimal bit mask entries are in expanded bit form. If set to default (false), the command displays effective permission for file or directory in collapsed (textual) form.

[-share-path <text>] - CIFS Share Path

If you specify this parameter, the command displays information only about the CIFS share that match the specified path. Query characters, such as "*", are not supported.

[-permission <Security acl>, ...] - Effective Permissions

If you specify this parameter, the command displays effective permission only if specified permission matches. Wildcard query characters are not supported.

vserver security file-directory job commands

Manage file security jobs

vserver security file-directory job show

Display a list of file security jobs

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.
Description
The `vserver security file-directory job show` command displays information about security file-directory jobs. To display detailed information about a specific job, run the command with the `-id` parameter.

You can specify additional parameters to select information that matches the values you specify for those parameters. For example, to display information only about security file-directory jobs running on a specific node, run the command with the `-node` parameter.

Parameters

```{-fields <fieldname>, ...}
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```{-inprogress}
```

Displays the job ID, the job name, the owning Vserver, and the progress of the security file-directory job.

```{-jobstate}
```

Displays information about each job's state, including the queue state, whether the job was restarted and when the job has completely timed out.

```{-sched}
```

Displays the job ID, the job name, the owning Vserver, and the schedule on which the security file-directory job runs.

```{-times}
```

Displays the job ID, the job name, the owning Vserver, the time when the job was last queued, the time when the job was last started, and the time when the job most recently ended.

```{-type}
```

Displays the job ID, the job name, the job type, and the job category.

```{-jobuuid} (privilege: advanced)
```

Displays the job ID, the job name, the owning Vserver, and the job UUID.

```{-instance }}
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```{-id <integer>} - Job ID
```

Selects the jobs that match the ID or range of IDs that you specify.

```{-vserver <vserver name>} - Owning Vserver
```

Selects jobs that are owned by the specified Vserver.

```{-name <text>} - Name
```

Selects the jobs that match this parameter value.

```{-description <text>} - Description
```

Selects the jobs that match this parameter value.

```{-priority {Low|Medium|High|Exclusive}} - Priority
```

Selects the jobs that match this parameter value.

```{-node <nodename>} - Node
```

Selects the jobs that match this parameter value.

```{-affinity {Cluster|Node}} - Affinity
```

Selects the jobs that match this parameter value.
[-schedule <job_schedule>] - Schedule
Selects the jobs that match this parameter value.

[-queuetime <MM/DD HH:MM:SS>] - Queue Time
Selects the jobs that match this parameter value.

[-starttime <MM/DD HH:MM:SS>] - Start Time
Selects the jobs that match this parameter value.

[-endtime <MM/DD HH:MM:SS>] - End Time
Selects the jobs that match this parameter value.

[-dropdeatime <MM/DD HH:MM:SS>] - Drop-dead Time
Selects the jobs that match this parameter value.

[-restarted {true|false}] - Restarted?
Selects the jobs that match this parameter value.

[-state {Initial|Queued|Running|Waiting|Pausing|Paused|Quitting|Success|Failure|Reschedule|Error|Quit|Dead|Unknown|Restart|Dormant}] - State
Selects the jobs that match this parameter value.

[-code <integer>] - Status Code
Selects the jobs that match this parameter value.

[-completion <text>] - Completion String
Selects the jobs that match this parameter value.

[-jobtype <text>] - Job Type
Selects the jobs that match this parameter value.

[-category <text>] - Job Category
Selects the jobs that match this parameter value.

[-uuid <UUID>] - UUID
Selects the jobs that match this parameter value.

[-progress <text>] - Execution Progress
Selects the jobs that match this parameter value.

[-username <text>] - User Name
Selects the jobs that match this parameter value.

[-process <text>] - Process
Selects jobs with the specified process number.

Examples
The following example displays information about the file-directory security job.

```bash
cluster1::> vserver security file-directory apply -policy-name pol -vserver vs1
cluster1::> vserver security file-directory job show

Job ID Name                 Vserver    Node           State
------ -------------------- ---------- -------------- ----------
25     Fsecurity Apply      vsim2.3    vsim2.3-01     Success

Description: File Directory Security Apply Job
```

1950

Commands: Manual Page Reference
vserver security file-directory ntfs commands

Manage NTFS security descriptors

vserver security file-directory ntfs create

Create an NTFS security descriptor

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver security file-directory ntfs create command creates an NTFS security descriptor to which you can add access control entries (ACEs) to the discretionary access control list (DACL) and the system access control list (SACL).

Creating an NTFS security descriptor is the first step in configuring and applying NTFS access control lists (ACLs) to files and folders residing within a namespace. Later, you will associate the security descriptor to a policy task.

You can create NTFS security descriptors for files and folders residing within FlexVol volumes with NTFS security-style or on NTFS security descriptors on mixed security-style volumes.

The steps to creating and applying NTFS ACLs are the following:

• Create an NTFS security descriptor.
• Add DACLs and SACLs to the NTFS security descriptor.
  
  Note: If you want to audit file and directory events, you must configure auditing on the Vserver in addition to adding a SACL to the security descriptor.
• Create a file/directory security policy.
  This step associates the policy with a Vserver.
• Create a policy task.
  A policy task refers to a single operation to apply to a file (or folder) or to a set of files (or folders). Amongst other things, the task defines which security descriptor to apply to a path.
• Apply a policy to the associated Vserver.

The vserver security file-directory ntfs create command is not supported for Vservers with Infinite Volume.

Parameters

-vserver <vserver name> - Vserver

Specifies the name of the Vserver on which to create the security descriptor.

-ntfs-sd <ntfs sd name> - NTFS Security Descriptor Name

Specifies the name of the security descriptor you want to create. After you create a security descriptor, you can add SACL and DACL access control entries (ACEs) to it.

Note: Every newly created security descriptor contains the 4 default DACL ACEs as mentioned below:

<table>
<thead>
<tr>
<th>To</th>
<th>Account Name</th>
<th>Access</th>
<th>Access</th>
<th>Apply</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vserver: vserver1</td>
<td>NTFS Security Descriptor Name: sd1</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>BUILTIN\Administrators</td>
<td>allow</td>
<td>full-control</td>
<td>this-</td>
<td></td>
</tr>
<tr>
<td>folder, sub-folders, files</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
BUILTIN\Users    allow    full-control      this-folder, sub-folders, files
CREATOR OWNER    allow    full-control      this-folder, sub-folders, files
NT AUTHORITY\SYSTEM allow    full-control      this-folder, sub-folders, files

[-owner <name or sid>] - Owner

Specifies the owner of the security descriptor. You can specify the owner using either a user name or SID. The owner of the security descriptor can modify the permissions on the file (or folder) or files (or folders) to which the security descriptor is applied and can give other users the right to take ownership of the object or objects to which the security descriptor is applied. You can use any of the following formats when specifying the value for this parameter:

- SID
- Domain\user-name
- user-name@Domain
- user-name@FQDN

Note: If you specify any of the three user name formats for the value of -owner, keep in mind that the value for the user name is case insensitive. The value for the user name is ignored for Storage-Level Access Guard (SLAG).

[-group <name or sid>] - Primary Group (privilege: advanced)

Specifies the owner group of the security descriptor. You can specify the owner group using either a group name or SID. You can use any of the following formats when specifying the value for this parameter:

- SID
- Domain\user-name
- user-name@Domain
- user-name@FQDN

Note: If you specify any of the three user name formats for the value of -group, keep in mind that the value for the user name is case insensitive. The value for the user name is ignored for SLAG.

[-control-flags-raw <Hex Integer>] - Raw Control Flags (privilege: advanced)

Specifies the control flags in the security descriptor.

Note: The value for the control flag is ignored for SLAG.

Examples

Every newly created security descriptor contains the 4 default DACL ACEs as mentioned below:

<table>
<thead>
<tr>
<th>Vserver: vserver1</th>

The following example creates an NTFS security descriptor named “sd1” on Vserver "vs1" and assigns “DOMAIN\Administrator” as the security descriptor owner.

```
cluster1::> vserver security file-directory ntfs create -ntfs-sd sd1 -vserver vs1 -owner DOMAIN\Administrator

cluster1::> vserver security file-directory ntfs show -vserver vs1 -ntfs-sd sd1
Vserver: vs1
Security Descriptor Name: sd1
Owner of the Security Descriptor: DOMAIN\Administrator
```

### vserver security file-directory ntfs delete

Delete an NTFS security descriptor

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**
The `vserver security file-directory ntfs delete` command deletes an NTFS security descriptor. Deleting a security descriptor also deletes all the contained DACL and SACL access control entries (ACEs).

The `vserver security file-directory ntfs delete` command is not supported for Vservers with Infinite Volume.

**Parameters**
- `-vserver <vserver name>` - Vserver
  Specifies the name of the Vserver that is associated with the security descriptor that you want to delete.
- `-ntfs-sd <ntfs sd name>` - NTFS Security Descriptor Name
  Specifies the name of the security descriptor to delete.

**Examples**
The following example deletes an NTFS security descriptor named "sd1" on Vserver vs1.

```
cluster1::> vserver security file-directory ntfs delete -ntfs-sd sd1 -vserver vs1
```

### vserver security file-directory ntfs modify

Modify an NTFS security descriptor

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**
The `vserver security file-directory ntfs modify` command modifies an NTFS security descriptor. You can change the `-owner`, `-group` and `-control-flags-raw` of the security descriptor with this command.

The `vserver security file-directory ntfs modify` command is not supported for Vservers with Infinite Volume.
Parameters

-vserver <vserver name> - Vserver
  Specifies the name of the Vserver associated with the security descriptor that you want to modify.

-ntfs-sd <ntfs sd name> - NTFS Security Descriptor Name
  Specifies the name of the security descriptor that you want to modify.

[-owner <name or sid>] - Owner
  Specifies the owner of the security descriptor. You can specify the owner using either the user name or SID.
  The owner of the security descriptor can modify the permissions on the file (or folder) or files (or folders) to
  which the security descriptor is applied and can give other users the right to take ownership of the object or
  objects to which the security descriptor is applied. You can use any of the following formats when specifying
  the value for this parameter:
  • SID
  • Domain\user-name
  • user-name@Domain
  • user-name@FQDN

  Note: If you specify any of the three user name formats for the value of -owner, keep in mind that the
  value for the user name is case insensitive. The value for the user name is ignored for Storage-Level Access
  Guard (SLAG).

[-group <name or sid>] - Primary Group (privilege: advanced)
  Specifies the owner group of the security descriptor. You can specify the owner group using either a group
  name or SID. You can use any of the following formats when specifying the value for this parameter:
  • SID
  • Domain\user-name
  • user-name@Domain
  • user-name@FQDN

  Note: If you specify any of the three user name formats for the value of -group, keep in mind that the
  value for the user name is case insensitive. The value for the user name is ignored for SLAG.

[-control-flags-raw <Hex Integer>] - Raw Control Flags (privilege: advanced)
  Specifies the control flags in the security descriptor to be modified.

  Note: The value for the control flag is ignored for SLAG.

Examples

The following example modifies the owner of an NTFS security descriptor named "sd2" on Vserver vs1.

```bash
cluster1::> vserver security file-directory ntfs modify -ntfs-sd sd2 -vserver vs1
-owner domain\administrator

cluster1::> vserver security file-directory ntfs show -vserver vs1 -ntfs-sd sd2

Vserver: vs1
Security Descriptor Name: sd2
Owner of the Security Descriptor: DOMAIN\Administrator
```
vserver security file-directory ntfs show

Display an NTFS security descriptors

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver file-directory ntfs show command displays information about the security descriptor. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays all information about all security descriptors defined on the cluster.

You can specify the -fields parameter to specify which fields of information to display about security descriptors.

You can specify the -instance parameter to display all the information about security descriptors in list format.

The vserver security file-directory ntfs show command is not supported for Vservers with Infinite Volume.

Parameters

[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command only displays the fields that you specify.

[[-instance]]
If you specify the -instance parameter, the command displays detailed information about all entries.

[-vserver <vserver name>] - Vserver
If you specify this parameter, the command displays information only about the security descriptors associated with the Vserver that you specify.

[-ntfs-sd <ntfs sd name>] - NTFS Security Descriptor Name
If you specify this parameter, the command displays information only about the security descriptors that you specify.

[-owner <name or sid>] - Owner
If you specify this parameter, the command displays information only about the security descriptors owned by the specified user name or SID.

[-group <name or sid>] - Primary Group (privilege: advanced)
If you specify this parameter, the command displays information only about the security descriptors associated with the owner group.

[-control-flags-raw <Hex Integer>] - Raw Control Flags (privilege: advanced)
If you specify this parameter, the command displays information only about the security descriptors associated with the control flags.

Examples

The following example displays information about an NTFS security descriptor named “sd2” on Vserver vs1.

```
cluster1::> vserver security file-directory ntfs show -vserver vs1 -ntfs-sd sd2
Vserver: vs1
Security Descriptor Name: sd2
Owner of the Security Descriptor: DOMAIN\Administrator
```
vserver security file-directory ntfs dacl commands

Manage NTFS file security DACLs

vserver security file-directory ntfs dacl add

Add a DACL entry to NTFS security descriptor

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver security file-directory ntfs dacl add command adds access control entries (ACEs) into a security descriptor’s discretionary access control list (DACL).

If the security descriptor contains a DACL that has existing ACEs, the command adds the new ACE to the DACL. If the security descriptor does not contain a DACL, the command creates the DACL and adds the new ACE to it.

Adding a DACL entry to the security descriptor is the second step in configuring and applying ACLs to a file or folder. Before you can add a DACL entry to a security descriptor, you must first create the security descriptor.

The steps to creating and applying NTFS ACLs are the following:

• Create an NTFS security descriptor.
• Add DACLs and SACLs to the NTFS security descriptor.
  
  Note: If you want to audit file and directory events, you must configure auditing on the Vserver in addition to adding the SACL to the security descriptor.
• Create a file/directory security policy.
  This step associates the policy with a Vserver.
• Create policy tasks.
  A policy task refers to a single operation to apply to a file (or folder) or to a set of files (or folders). Amongst other things, the task defines which security descriptor to apply to a path.
• Apply a policy to the associated Vserver.

The vserver security file-directory ntfs dacl add command is not supported for Vservers with Infinite Volume.

Parameters
-vserver <vserver name> - Vserver
  Specifies the name of the Vserver associated with the security descriptor to which you want to add a discretionary access control entry (discretionary ACE).

-ntfs-sd <ntfs sd name> - NTFS Security Descriptor Name
  Specifies the name of the security descriptor to which you want to add a discretionary access control entry.

-access-type {deny|allow} - Allow or Deny
  Specifies whether the discretionary access control entry is an allow or deny type of access control.

-account <name or sid> - Account Name or SID
  Specifies the account on which to apply the discretionary access control entry. You can specify the account by using a user name or SID. You can use any of the following formats when specifying the value for this parameter:
  • SID
  • Domain\user-name

1956

Commands: Manual Page Reference
• user-name@Domain

• user-name@FQDN

**Note:** If you specify any of the three user name formats for the value of -account, keep in mind that the value for the user name is case insensitive.

\[
\{ [-rights \{no-access|full-control|modify|read-and-execute|read|write\}] \} \text{- DACL ACE's Access}
\]

**Rights**

Specifies the right that you want to add for the account specified in the -account parameter. The -rights parameter is mutually exclusive with the -advanced-rights and -rights-raw parameter. If you specify the -rights parameter, you can only specify one value.

You can specify one of the following rights values:

- no-access
- full-control
- modify
- read-and-execute
- read
- write

\[
[[-advanced-rights <Advanced access right>,...]] \text{- DACL ACE's Advanced Access Rights}
\]

Specifies the advanced rights that you want to add for the account specified in the -account parameter. The -advanced-rights parameter is mutually exclusive with the -rights and -rights-raw parameter. You can specify more than one advanced-rights value by using a comma-delimited list.

You can specify one or more of the following advanced rights:

- read-data
- write-data
- append-data
- read-ea
- write-ea
- execute-file
- delete-child
- read-attr
- write-attr
- delete
- read-perm
- write-perm
- write-owner
- full-control
<table>
<thead>
<tr>
<th>[-rights-raw &lt;Hex Integer&gt;] - DACL ACE’s Raw Access Rights (privilege: advanced)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the raw rights that you want to add for the account specified in the -account parameter. The rights-raw parameter is mutually exclusive with the -advanced-rights and -rights parameter. Specify the value as a hexadecimal integer, for example: 0xA10F or 0xb3ff etc.</td>
</tr>
</tbody>
</table>

| [-apply-to (this-folder|sub-folders|files), ...] - Apply DACL Entry |
|--------------------------------------------------------------------------------|
| Specifies where to apply the discretionary access control entry. You can specify more than one value by using a comma-delimited list. You can specify one or more of the following values: |
| • this-folder |
| • sub-folder |
| • files |
| **Note:** Select one of the following combinations of values for the -apply-to parameter for Storage-Level Access Guard (SLAG): |
| • this-folder, sub-folder, files |
| • this-folder, sub-folder |
| • files |
| If you specify an invalid -apply-to value, this security descriptor is removed from the associated Storage-Level Access Guard (SLAG) security file-directory policy task. |

**Examples**
The following example adds a DACL entry to the security descriptor named “sd1” on Vserver "vs1" for the "DOMAIN \Administrator" account.

```
cluster1::> vserver security file-directory ntfs dacl add -ntfs-sd sd1 -access-type deny -account DOMAIN\Administrator -rights full-control -apply-to this-folder -vserver vs1
cluster1::> vserver security file-directory ntfs dacl show -vserver vs1 -ntfs-sd sd1 -access-type deny -account domain\administrator
```

---

**vserver security file-directory ntfs dacl modify**
Modify an NTFS security descriptor DACL entry

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver security file-directory ntfs dacl modify` command modifies parameters in an existing discretionary access control (DACL) entry.
You can unambiguously define which DACL entry to modify by specifying the following four parameters in the modify command:

- Vserver associated with the security descriptor that contains the DACL entry
- Name of the security descriptor that contains the DACL entry
- Whether the DACL is an allow or deny type of DACL entry
- The account name or SID to which the DACL is applied

You can modify the following parameters:

- -right,-advanced-rights,-rights-raw
- -apply-to

The `vserver security file-directory ntfs dacl modify` command is not supported for Vservers with Infinite Volume.

**Parameters**

- `-vserver <vserver name>` - Vserver
  
  Specifies the name of the Vserver associated with the security descriptor containing the discretionary access control entry whose parameters you want to modify.

- `-ntfs-sd <ntfs sd name>` - NTFS Security Descriptor Name
  
  Specifies the name of the security descriptor that contains the discretionary access control entry that you want to modify.

- `-access-type {deny|allow}` - Allow or Deny
  
  Specifies whether the discretionary access control entry that you want to modify is an `allow` or `deny` type of access control.

- `-account <name or sid>` - Account Name or SID
  
  Specifies the account associated with the discretionary access control entry you want to modify. You can specify the account by using a user name or SID. You can use any of the following formats when specifying the value for this parameter:
  
  - SID
  - Domain\user-name
  - user-name@Domain
  - user-name@FQDN

  **Note:** If you specify any of the three user name formats for the value of `-account`, keep in mind that the value for the user name is case insensitive.

- `[-rights {no-access|full-control|modify|read-and-execute|read|write}]` - Access Rights
  
  Specifies the right that you want to add for the account specified in the `-account` parameter. The `-rights` parameter is mutually exclusive with the `-advanced-rights` and `-rights-raw` parameter. If you specify the `-rights` parameter, you can only specify one value.

  You can specify one of the following rights values:
  
  - no-access
  - full-control
  - modify
• read-and-execute
• read
• write

\[[\text{-rights-raw}<\text{Hex Integer}>]\] - Raw Access Rights (privilege: advanced)

Specifies the raw rights that you want to add for the account specified in the \text{-account} parameter. The \text{-rights-raw} parameter is mutually exclusive with the \text{-advanced-rights} and \text{-rights} parameter. Specify the value as a hexadecimal integer, for example: 0xA10F or 0xb3ff etc.

\[[\text{-advanced-rights}<\text{Advanced access right}>, ...]\] - Advanced Access Rights

Specifies the advanced rights that you want to add for the account specified in the \text{-account} parameter. The \text{-advanced-rights} parameter is mutually exclusive with the \text{-rights} and \text{-rights-raw} parameter. You can specify more than one advanced-rights value by using a comma-delimited list.

You can specify one or more of the following advanced rights:

• read-data
• write-data
• append-data
• read-ea
• write-ea
• execute-file
• delete-child
• read-attr
• write-attr
• delete
• read-perm
• write-perm
• write-owner
• full-control

\[-\text{apply-to }\{\text{this-folder|sub-folders|files}, ...\}\] - Apply DACL Entry

Specifies where to apply the discretionary access control entry. You can specify more than one value by using a comma-delimited list.

You can specify one or more of the following values:

• this-folder
• sub-folder
• files

\textbf{Note:} Select one of the following combinations of values for the \text{-apply-to} parameter for Storage-Level Access Guard (SLAG):

• this-folder, sub-folder, files
• this-folder, sub-folder
• files

If you specify an invalid `-apply-to` value, this security descriptor is removed from the associated Storage-Level Access Guard (SLAG) security file-directory policy task.

**Examples**

The following example modifies the `-right` and `-apply-to` parameters in the DACL entry associated to the security descriptor named “sd2” on Vserver vs1 for the “BUILTIN\Administrators” account.

```
cluster1::> vserver security file-directory ntfs dacl modify -ntfs-sd sd2 -access-type allow -account BUILTIN\Administrators -vserver vs1 -rights modify -apply-to this-folder,sub-folders
```

```
cluster1::> vserver security file-directory ntfs dacl show -vserver vs1 -ntfs-sd sd2 -account BUILTIN\Administrators -instance

Vserver: vs1
Security Descriptor Name: sd2
  Allow or Deny: allow
  Account Name or SID: BUILTIN\Administrators
  Access Rights: modify
  Advanced Access Rights: -
    Apply To: this-folder, sub-folders
    Access Rights: modify
```

**vserver security file-directory ntfs dacl remove**

Remove a DACL entry from NTFS security descriptor.

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The `vserver security file-directory ntfs dacl remove` command removes a discretionary access control entry from a security descriptor.

You can unambiguously define which DACL entry to remove by specifying the following four parameters in the command:

- Vserver associated with the security descriptor that contains the DACL entry
- Name of the security descriptor that contains the DACL entry
- Whether the DACL is an allow or deny type of DACL entry
- The account name or SID to which the DACL is applied

The `vserver security file-directory ntfs dacl remove` command is not supported for Vservers with Infinite Volume.

**Parameters**

- `-vserver <vserver name>` - Vserver
  
  Specifies the name of the Vserver associated with the security descriptor from which you want to remove a discretionary access control entry.

- `-ntfs-sd <ntfs sd name>` - NTFS Security Descriptor Name
  
  Specifies the name of the security descriptor that contains the discretionary access control entry that you want to remove.
-access-type {deny|allow} - Allow or Deny

Specifies whether the discretionary access control entry you want to remove is an allow or deny of access control.

-account <name or sid> - Account Name or SID

Specifies the account name or SID associated with the discretionary access control entry that you want to remove.

---

**Examples**

The following example removes a DACL entry from the security descriptor named “sd2” with “allow” access type for the “BUILTIN\Administrators” account on Vserver vs1.

```
cluster1::> vserver security file-directory ntfs dacl remove -ntfs-sd sd2 -access-type allow -account BUILTIN\Administrators -vserver vs1
```

---

vserver security file-directory ntfs dacl show

Display NTFS security descriptor DACL entries

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The `vserver security file-directory ntfs dacl show` command displays information about all the discretionary access control entries in the Vserver. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all DACL entries:

- Vserver name
- Security descriptor
- List of DACL entries

You can specify the `-fields <fieldname>`, ... parameter to specify which fields of information to display about DACL entries.

You can specify the `-instance` parameter to display all information about DACL entries in a list format.

The `vserver security file-directory ntfs dacl show` command is not supported for Vservers with Infinite Volume.

**Parameters**

```
[-fields <fieldname>, ...]  
If you specify the -fields <fieldname>, ... parameter, the command only displays the fields that you specify.
```

```
[-instance]  
If you specify the -instance parameter, the command displays detailed information about all entries.
```

```
[-vserver <vserver name>] - Vserver
If you specify this parameter, the command displays information only about discretionary access control entries associated with the specified Vserver.
```

```
[-ntfs-sd <ntfs sd name>] - NTFS Security Descriptor Name
If you specify this parameter, the command displays information only about the discretionary access control entries for the security descriptor that you specify.
```

```
[-access-type {deny|allow}] - Allow or Deny
If you specify this parameter, the command displays information only about the discretionary access control entries with the access type that you specify.
```
[\-account <name or sid>] - Account Name or SID

If you specify this parameter, the command displays information only about the discretionary access control entries associated with the account name or SID that you specify. You can use any of the following formats when specifying the value for this parameter:

- SID
- Domain\user-name
- user-name@Domain
- user-name@FQDN

**Note:** If you specify any of the three user name formats for the value of \-account, keep in mind that the value for the user name is case insensitive.

[\-rights \{\no-access|\full-control|\modify|\read-and-execute|\read|\write\}] - Access Rights

If you specify this parameter, the command displays information only about the discretionary access control entries with the user right that you specify. Only one value can be specified.

You can specify one of the following rights values:

- no-access
- full-control
- modify
- read-and-execute
- read
- write

[\-rights-raw <Hex Integer>] - Raw Access Rights (privilege: advanced)

If you specify this parameter, the command displays information only about the discretionary access control entries with the advanced user rights that you specify. This value for this parameter is mutually exclusive with any other rights values. Specify the value as a hexadecimal integer, for example: 0xA10F or 0xb3ff etc.

[\-advanced-rights <Advanced access right>, ...] - Advanced Access Rights

If you specify this parameter, the command displays information only about the discretionary access control entries with the advanced user rights that you specify. You can specify more than one value by using a comma-delimited list.

You can specify one or more of the following advanced rights:

- read-data
- write-data
- append-data
- read-ea
- write-ea
- execute-file
- delete-child
- read-attr
- write-attr
- **delete**
- **read-perm**
- **write-perm**
- **write-owner**
- **full-control**

**[-apply-to (this-folder|sub-folders|files),...] - Apply DACL Entry**

If you specify this parameter, the command displays information only about the discretionary access control entries with the -applied-to value or values that you specify. You can specify more than one value by using a comma-delimited list.

You can specify one or more of the following values:

- **this-folder**
- **sub-folder**
- **files**

**[-readable-access-rights <TextNoCase>] - Access Rights**

If you specify this parameter, the command displays information only the discretionary access control entries with the readable access rights that you specify.

**Examples**

The following example shows information about a DACL entry.

```
cluster1::> vserver security file-directory ntfs dacl show
Vserver: vs1
NTFS Security Descriptor Name: sd2

<table>
<thead>
<tr>
<th>Account Name</th>
<th>Access</th>
<th>Access</th>
<th>Apply To</th>
</tr>
</thead>
<tbody>
<tr>
<td>BUILTIN\Users</td>
<td>allow</td>
<td>full-control</td>
<td>this-folder, sub-folders, files</td>
</tr>
<tr>
<td>CREATOR OWNER</td>
<td>allow</td>
<td>full-control</td>
<td>this-folder, sub-folders, files</td>
</tr>
<tr>
<td>NT AUTHORITY\SYSTEM</td>
<td>allow</td>
<td>full-control</td>
<td>this-folder, sub-folders, files</td>
</tr>
</tbody>
</table>
3 entries were displayed.
```

**vserver security file-directory ntfs sacl commands**

Manage NTFS file security SACLs

**vserver security file-directory ntfs sacl add**

Add a SACL entry to NTFS security descriptor

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The `vserver security file-directory ntfs sacl add` command adds system access control list entries (ACEs) into a security descriptor’s system access control list (SACL).

If the security descriptor contains a SACL that has existing security ACEs, the command adds the new security ACE to the SACL. If the security descriptor does not contain a SACL, the command creates the SACL and adds the new security ACE to it.
Adding a SACL entry to the security descriptor is the second step in configuring and applying security ACLs to a file or folder. Before you can add a SACL entry to a security descriptor, you must first create the security descriptor.

The steps to creating and applying NTFS ACLs are the following:

• Create an NTFS security descriptor.
• Add DACL and SACL entries to the NTFS security descriptor.
  
  Note: If you want to audit file and directory events, you must configure auditing on the Vserver in addition to adding the SACL to the security descriptor.
• Create a file/directory security policy.
  This step associates the policy with a Vserver.
• Create policy tasks.
  A policy task refers to a single operation to apply to a file (or folder) or to a set of files (or folders). Amongst other things, the task defines which security descriptor to apply to a path.
• Apply a policy to the associated Vserver.

The vserver security file-directory ntfs sacl add command is not supported for Vservers with Infinite Volume.

Parameters
-vserver <vserver name> - Vserver
  Specifies the name of the Vserver associated with the security descriptor to which you want to add a system access control list entry.

-ntfs-sd <ntfs sd name> - NTFS Security Descriptor Name
  Specifies the name of the security descriptor to which you want to add a system access control list entry.

-access-type {failure|success} - Success or Failure
  Specifies whether the system access control list entry that you want to add is a failure or success access audit type.

-account <name or sid> - Account Name or SID
  Specifies the account on which to apply the system access control list entry. You can specify the account by using a user name or SID. You can use any of the following formats when specifying the value for this parameter:
  • SID
  • Domain\user-name
  • user-name@Domain
  • user-name@FQDN
  
  Note: If you specify any of the three user name formats for the value of -account, keep in mind that the value for the user name is case insensitive.

{ [ -rights (no-access|full-control|modify|read-and-execute|read|write) ] } - Access Rights
  Specifies the right that you want to add for the account specified in the -account parameter. The -rights parameter is mutually exclusive with the -advanced-rights and -rights-raw parameter. If you specify the -rights parameter, you can only specify one value.

You can specify one of the following rights values:
  • no-access
  • full-control
• modify
• read-and-execute
• read
• write

[[-advanced-rights <Advanced access right>, ...] - Advanced Access Rights

Specifies the advanced rights that you want to add for the account specified in the -account parameter. The -advanced-rights parameter is mutually exclusive with the -rights and -rights-raw parameter. You can specify more than one advanced-rights value by using a comma-delimited list.

You can specify one or more of the following advanced rights:

• read-data
• write-data
• append-data
• read-ea
• write-ea
• execute-file
• delete-child
• read-attr
• write-attr
• delete
• read-perm
• write-perm
• write-owner
• full-control

[[-rights-raw <Hex Integer>] - Raw Access Rights (privilege: advanced)

Specifies the raw rights that you want to add for the account specified in the -account parameter. The -rights-raw parameter is mutually exclusive with the -advanced-rights and -rights parameter. Specify the value as a hexadecimal integer, for example: 0xA10F or 0xb3ff etc.

[-apply-to (this-folder|sub-folders|files), ...] - Apply SACL To

Specifies where to apply the system access control list entry. You can specify more than one value by using a comma-delimited list.

You can specify one or more of the following values:

• this-folder
• sub-folder
• files

Note: Select one of the following combinations of values for the -apply-to parameter for Storage-Level Access Guard (SLAG):

• this-folder, sub-folder, files
• this-folder, sub-folder
• files

If you specify an invalid -apply-to value, this security descriptor is removed from the associated Storage-Level Access Guard (SLAG) security file-directory policy task.

**Examples**
The following example adds a SACL entry to the security descriptor named “sd1” on Vserver vs1.

```
cluster1::> vserver security file-directory ntfs sacl add -ntfs-sd sd1 -access-type failure -account DOMAIN\Administrator -rights full-control -apply-to this-folder -vserver vs1

cluster1::> vserver security file-directory ntfs sacl show -vserver vs1 -ntfs-sd sd1 -access-type deny -account DOMAIN\Administrator

Vserver: vs1
Security Descriptor Name: sd1
Access type for Specified Access Rights: failure
Account Name or SID: DOMAIN\Administrator
Access Rights: full-control
Advance Access Rights: -
Apply To: this-folder
Access Rights: full-control
```

### vserver security file-directory ntfs sacl modify

Modify an NTFS security descriptor SACL entry

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver security file-directory ntfs sacl modify` command modifies parameters in an existing system access control list entry.

You can unambiguously define which SACL entry to modify by specifying the following four parameters in the modify command:

• Vserver associated with the security descriptor that contains the SACL entry
• Name of the security descriptor that contains the SACL entry
• Whether the SACL is a success or failure type of SACL entry
• The account name or SID to which the SACL is applied

You can modify the following parameters:

• -rights,-advanced-rights,-rights-raw
• -apply-to

The `vserver security file-directory ntfs sacl modify` command is not supported for Vservers with Infinite Volume.

**Parameters**

- **-vserver <vserver name> - Vserver**
  
  Specifies the name of the Vserver associated with the security descriptor containing the system access control list entry whose fields you want to modify.
-ntfs-sd <ntfs sd name> - NTFS Security Descriptor Name
   Specifies the name of the security descriptor that contains the system access control list entry that you want to modify.

-access-type {failure|success} - Success or Failure
   Specifies whether the system access control list entry that you want to modify is a failure or success access audit type.

-account <name or sid> - Account Name or SID
   Specifies the account on which to apply the system access control list entry. You can specify the account by using a user name or SID. You can use any of the following formats when specifying the value for this parameter:
   • SID
   • Domain\user-name
   • user-name@Domain
   • user-name@FQDN

   **Note:** If you specify any of the three user name formats for the value of -account, keep in mind that the value for the user name is case insensitive.

{| [ -rights {no-access|full-control|modify|read-and-execute|read|write}] - Access Rights
   Specifies the right that you want to add for the account specified in the -account parameter. The -rights parameter is mutually exclusive with the -advanced-rights and -rights-raw parameter. If you specify the -rights parameter, you can only specify one value.

   You can specify one of the following rights values:
   • no-access
   • full-control
   • modify
   • read-and-execute
   • read
   • write

   Specifies the raw rights that you want to add for the account specified in the -account parameter. The -rights-raw parameter is mutually exclusive with the -advanced-rights and -rights parameter. Specify the value as a hexadecimal integer, for example: 0xA10F or 0xb3ff.

| [ -advanced-rights <Advanced access right>, ... ] - Advanced Access Rights
   Specifies the advanced rights that you want to add for the account specified in the -account parameter. The -advanced-rights parameter is mutually exclusive with the -rights and -rights-raw parameter. You can specify more than one advanced-rights value by using a comma-delimited list.
   You can specify one or more of the following advanced rights:
   • read-data
   • write-data
   • append-data
   • read-ea
• write-ea
• execute-file
• delete-child
• read-attr
• write-attr
• delete
• read-perm
• write-perm
• write-owner
• full-control

[-apply-to {this-folder|sub-folders|files}, ...] - Apply SACL To

Specifies where to apply the system access control list entry. You can specify more than one value by using a
coma-delimited list.

You can specify one or more of the following values:

• this-folder
• sub-folder
• files

**Note:** Select one of the following combinations of values for the **-apply-to** parameter for Storage-Level
Access Guard (SLAG):

• this-folder, sub-folder, files
• this-folder, sub-folder
• files

If you specify an invalid **-apply-to** value, this security descriptor is removed from the associated Storage-
Level Access Guard (SLAG) security file-directory policy task.

**Examples**

The following example modifies the rights and -apply-to fields in the SACL entry.

```
cluster1::> vserver security file-directory ntfs sacl modify -ntfs-sd sd2 -access-type success -account BUILTIN\Administrators -vserver vs1 -rights modify -apply-to this-folder,sub-folders

cluster1::> vserver security file-directory ntfs sacl show -vserver vs1 -ntfs-sd sd2 -account BUILTIN\Administrators -instance
```

<table>
<thead>
<tr>
<th>Vserver: vs1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Security Descriptor Name: sd2</td>
</tr>
<tr>
<td>Access type for Specified Access Rights: success</td>
</tr>
<tr>
<td>Account Name or SID: BUILTIN\Administrators</td>
</tr>
<tr>

<tr>
<td>Advanced Access Rights: -</td>
</tr>
</tbody>
</table>
vserver security file-directory ntfs sacl remove

Remove a SACL entry from NTFS security descriptor

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The `vserver security file-directory ntfs sacl remove` command removes a system access control list entry from a security descriptor.

You can unambiguously define which SACL entry to remove by specifying the following four parameters in the command:

- Vserver associated with the security descriptor that contains the SACL entry
- Name of the security descriptor that contains the SACL entry
- Whether the SACL is a success or failure type of SACL entry
- The account name or SID to which the SACL is applied

The `vserver security file-directory ntfs sacl remove` command is not supported for Vservers with Infinite Volume.

**Parameters**

- `-vserver <vserver name>` - Vserver
  
  Specifies the name of the Vserver associated with the security descriptor from which you want to remove the system access control list entry.

- `-ntfs-sd <ntfs sd name>` - NTFS Security Descriptor Name
  
  Specifies the name of the security descriptor that contains the system access control list entry that you want to remove.

- `-access-type {failure|success}` - Success or Failure
  
  Specifies whether the system access control list entry that you want to remove is a *failure* or *success* access audit type.

- `-account <name or sid>` - Account Name or SID
  
  Specifies the account name or SID associated with the system access control list entry that you want to remove.

**Examples**

The following example removes a SACL entry named “sd2” on Vserver vs1 with an access type of “success” associated with the “BUILTIN\Administrators” account.

```
cluster1::> vserver security file-directory ntfs sacl remove -ntfs-sd sd2 -access-type success -account BUILTIN\Administrators -vserver vs1
```

**vserver security file-directory ntfs sacl show**

Display NTFS security descriptor SACL entries

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.
Description

The `vserver security file-directory ntfs sacl show` command displays information about all the system access control list entries in the Vserver. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all SACL entries:

- Vserver name
- Security descriptor
- List of SACL entries

You can specify the `-fields` parameter to specify which fields of information to display about SACL entries.

You can specify the `-instance` parameter to display all information about SACL entries in a list format.

The `vserver security file-directory ntfs sacl show` command is not supported for Vservers with Infinite Volume.

Parameters

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command only displays the fields that you specify.

```
[-instance]
```

If you specify the `-instance` parameter, the command displays detailed information about all entries.

```
[-vserver <vserver name>] - Vserver
```

If you specify this parameter, the command displays information only about system access control list entries associated with the specified Vserver.

```
[-ntfs-sd <ntfs sd name>] - NTFS Security Descriptor Name
```

If you specify this parameter, the command displays information only about the system access control list entries for the security descriptor that you specify.

```
[-access-type {failure|success}] - Success or Failure
```

If you specify this parameter, the command displays information only about the system access control list entries with the access type that you specify.

```
[-account <name or sid>] - Account Name or SID
```

If you specify this parameter, the command displays information only about the system access control list entries associated with the account name or SID that you specify. You can use any of the following formats when specifying the value for this parameter:

- SID
- Domain\user-name
- user-name@Domain
- user-name@FQDN

**Note:** If you specify any of the three user name formats for the value of `-account`, keep in mind that the value for the user name is case insensitive.

```
[-rights {no-access|full-control|modify|read-and-execute|read|write}] - Access Rights
```

If you specify this parameter, the command displays information only about the system access control list entries with the user right that you specify. The value for this parameter is mutually exclusive with any other rights values. Only one value can be specified.

You can specify one of the following rights values:

- no-access
- full-control
- modify
- read-and-execute
- read
- write

[-rights-raw <Hex Integer>] - Raw Access Rights (privilege: advanced)

If you specify this parameter, the command displays information only about the system access control list entries with the advanced user rights that you specify. This value for this parameter is mutually exclusive with any other rights values. Specify the value as a hexadecimal integer, for example: 0xA10F or 0xb3ff etc.

[-advanced-rights <Advanced access right>,... ] - Advanced Access Rights

If you specify this parameter, the command displays information only about the system access control list entries with the advanced user rights that you specify. You can specify more than one value by using a comma-delimited list.

You can specify one or more of the following advanced rights values:
- read-data
- write-data
- append-data
- read-ea
- write-ea
- execute-file
- delete-child
- read-attr
- write-attr
- delete
- read-perm
- write-perm
- write-owner
- full-control

[-apply-to {this-folder|sub-folders|files},...] - Apply SACL To

If you specify this parameter, the command displays information only about the system access control list entries with the -applied-to value or values that you specify. You can specify more than one value by using a comma-delimited list.

You can specify one or more of the following values:
- this-folder
- sub-folder
- files
**[-readable-access-rights <TextNoCase>] - Access Rights**

If you specify this parameter, the command displays information only about the system access control list entries with the readable access rights that you specify.

---

**Examples**

The following example shows a SACL entry.

```bash
cluster1::> vserver security file-directory sacl show
(vserver security file-directory ntfs sacl show)
Vserver: vs1
NTFS Security Descriptor Name: sd1

<table>
<thead>
<tr>
<th>Account Name</th>
<th>Access</th>
<th>Access Rights</th>
<th>Apply To</th>
</tr>
</thead>
<tbody>
<tr>
<td>domain\user</td>
<td>success</td>
<td>full-control</td>
<td>this-folder, sub-folders, files</td>
</tr>
</tbody>
</table>
```

---

**vserver security file-directory policy commands**

Manage file security policies

**vserver security file-directory policy create**

Create a file security policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The `vserver security file-directory policy create` command creates a security policy for a Vserver. A policy acts as a container for various tasks where each task is a single entry that can be applied to a file/folder.

Creating a security policy is the third step in configuring and applying security ACLs to a file or folder. You will later add tasks to the security policy.

**Note:** You cannot modify a security policy. If you want to apply a policy with the same settings to a different Vserver, you must create a new policy with the same configuration and apply it to the desired Vserver.

The steps to creating and applying NTFS ACLs are the following:

- Create an NTFS security descriptor.
- Add DACLS and SACLS to the NTFS security descriptor.
  
  **Note:** If you want to audit file and directory events, you must configure auditing on the Vserver in addition to adding SACLS to the security descriptor.
- Create a file/directory security policy.
  This step associates the policy with a Vserver.
- Create policy tasks.
  A policy task refers to a single operation to apply to a file (or folder) or to a set of files (or folders). Amongst other things, the task defines which security descriptor to apply to a path.
- Apply a policy to the associated Vserver.

The `vserver security file-directory policy create` command is not supported for Vservers with Infinite Volume.
Parameters
-vserver <vserver name> - Vserver
  Specifies the name of the Vserver on which to create the security policy.

-policy-name <Security policy name> - Policy Name
  Specifies the name of the security policy.

Examples
The following example creates a security policy named “policy1” on Vserver vs1.

```
cluster1::> vserver security file-directory policy create -policy-name policy1 -
vserver vs1
cluster1::> vserver security file-directory policy show

Vserver          Policy Name
------------     --------------
vs1              policy1
```

vserver security file-directory policy delete
Delete a file security policy

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**
The `vserver security file-directory policy delete` command deletes a security policy from a Vserver.

The `vserver security file-directory policy delete` command is not supported for Vservers with Infinite Volume.

**Note:** Deleting a policy fails if a job is currently running for the specified policy.

Parameters
-vserver <vserver name> - Vserver
  Specifies the name of the Vserver associated with the security policy that you want to delete.

-policy-name <Security policy name> - Policy Name
  Specifies the name of the security policy you want to delete.

Examples
The following example deletes a security policy named “policy1” from Vserver vs1.

```
cluster1::> vserver security file-directory policy delete -policy-name policy1 -
vserver vs1
```

vserver security file-directory policy show
Display file security policies

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.
Description

The `vserver security file-directory policy show` command displays information about all security policies in the Vserver. The command output depends on the parameter or parameters specified with the command.

You can specify the `-fields` parameter to specify which fields of information to display about security policies.

You can specify the `-instance` parameter to display information for all security policies in a list format.

The `vserver security file-directory policy show` command is not supported for Vservers with Infinite Volume.

Parameters

`{ [-fields <fieldname>, ...]`

If you specify the `-fields <fieldname>, ...` parameter, the command only displays the fields that you specify.

`| [-instance ]}`

If you specify the `-instance` parameter, the command displays detailed information about all entries.

`[-vserver <vserver name>] - Vserver`

If you specify this parameter, the command displays information only about security policies associated with the specified Vserver.

`[-policy-name <Security policy name>] - Policy Name`

If you specify this parameter, the command displays information only about the security policy you specify.

Examples

The following example displays information about the security policies on the cluster.

```
cluster1::> vserver security file-directory policy show
Vserver          Policy Name
------------     --------------
vs1              policy1
vs1              policy2
2 entries were displayed.
```

vserver security file-directory policy task commands

Manage file security policy tasks

**vserver security file-directory policy task add**

Add a policy task

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

Description

The `vserver security file-directory policy task add` command adds a single task entry to a security policy. A task refers to a single operation that can be done by a security policy to a file/folder.

Before you create a security policy task, you must first create a security policy and a security descriptor. You should also add DACL entries and SACL entries (if desired) to the security descriptor before you create the security policy task.

**Note:** You can add DACL and SACL entries to the security descriptor after you have associated it to a security policy task.

Creating a policy task is the fourth step in configuring and applying ACLs to a file or folder. When you create the policy task, you associate a security descriptor to it. You also associate the task to a security policy.

The steps to creating and applying NTFS ACLs are the following:
• Create an NTFS security descriptor.

• Add DACLS and SACLS to the NTFS security descriptor.

  **Note:** If you want to audit file and directory events, you must configure auditing on the Vserver in addition to adding SACLS to the Security Descriptor.

• Create a file/directory security policy.
  This step associates the policy with a Vserver.

• Create policy tasks.
  A policy task refers to a single operation to apply to a file (or folder) or to a set of files (or folders). Amongst other things, the task defines which security descriptor to apply to a path.

  **Note:** Adding a policy task fails if a job is currently running for the specified policy to which a task is being added.

• Apply a policy to the associated Vserver.

The `vserver security file-directory policy task add` command is not supported for Vservers with Infinite Volume.

**Parameters**

- `vserver <vserver name>` - Vserver
  Specifies the Vserver associated with the security policy to which you want to add a task.

- `policy-name <Security policy name>` - Policy Name
  Specifies the name of the security policy into which you want to add the task.

- `path <text>` - Path
  Specifies the path of the file/folder on which to apply the security descriptor associated with this task.

- `index-num <integer>` - Position
  Specifies the index number of a task. Tasks are applied in order. A task with a larger index value is applied after a task with a lower index number. If you do not specify this optional parameter, new tasks are applied to the end of the index list.

  The range of supported values is 1 through 9999. If there is a gap between the highest existing index number and the value entered for this parameter, the task with this number is considered to be the last task in the policy and is treated as having an index number of the previous highest index plus one.

  **Note:** If you specify an index number that is already assigned to an existing task, index number will be automatically arranged to the highest index number in the table.

- `security-type {ntfs|nfsv4}` - Security Type of the File
  Specifies whether the security descriptor associated with this task is an NTFS or a NFSv4 security descriptor type. If you do not specify a value for this optional parameter, the default is “ntfs”.

  **Note:** The nfsv4 security descriptor type is not supported in this release. If you specify this optional parameter, you must enter ntfs for the `-security-type` value.

- `ntfs-mode {propagate|ignore|replace}` - Propagation Mode
  Specifies how to propagate security settings to child subfolders and files. This setting determines how child files and/or folders contained within a parent folder inherit access control and audit information from the parent folder.

  You can specify one of the three parameter values that correspond to three types of propagation modes:
  
  • propagate - propagate inheritable permissions to all subfolders and files
  • replace - replace existing permissions on all subfolders and files with inheritable permissions
• ignore - do not allow permissions on this file or folder to be replaced

**Note:** The ntfs-mode value is ignored for Storage-Level Access Guard (SLAG).

`[-ntfs-sd <ntfs sd name>, ...]` - NTFS Security Descriptor Name

Specifies the list of security descriptor names to apply to the path specified in the `-path` parameter.

`[-access-control {file-directory|slag}]` - Access Control Level

Specifies the access control of the task to be applied. Valid values are `file-directory` or `slag`. Use the value `slag` to apply the specified security descriptors with the task for the volume or qtree. Otherwise, the security descriptors are applied on files and directories at the specified path. The value `slag` is not supported on FlexGroups. The default value is `file-directory`.

**Examples**

The following example adds a security policy task entry to the policy named “policy1” on Vserver vs1.

```
cluster1::> vserver security file-directory policy task add -vserver vs1 -policy-name policy1 -path / -access-control slag -security-type ntfs -ntfs-mode propagate -ntfs-sd sd -index-num 1
cluster1::> vserver security file-directory policy task add -vserver vs1 -policy-name policy2 -path /1 -security-type ntfs -ntfs-mode propagate -ntfs-sd sd1,sd2
cluster1::> vserver security file-directory policy task show
Vserver: vs1
Policy: policy1
Index  File/Folder  Access           Security  NTFS       NTFS Security
Path         Control          Type      Mode       Descriptor Name
-----  -----------  ---------------  --------  ---------- ---------------
1      /            slag             ntfs      propagate  sd
```

```
Vserver: vs1
Policy: policy2
Index  File/Folder  Access           Security  NTFS       NTFS Security
Path         Control          Type      Mode       Descriptor Name
-----  -----------  ---------------  --------  ---------- ---------------
1      /1           file-directory   ntfs      propagate  sd1, sd2
```

**vserver security file-directory policy task modify**

Modify policy tasks

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The `vserver security file-directory policy task modify` command modifies a task entry in a security policy.

**Note:** Modifying a policy task fails if a job is currently running for the specified policy in which a task is being modified.

You can unambiguously define which task to modify by specifying the following three parameters in the modify command:

• Vserver associated with the task
• Name of the security policy that contains the task
• Name of the path to which the task is applied

You can modify the following parameters:

• -ntfs-mode
-ntfs-sd

-index-num

**Note:** The only security type supported in this Data ONTAP release is "ntfs"; therefore, you cannot modify the -security-type parameter.

The vserver security file-directory policy task modify command is not supported for Vservers with Infinite Volume.

**Parameters**

- **-vserver <vserver name>** - Vserver
  Specifies the Vserver associated with the security policy that contains the task you want to modify.

- **-policy-name <Security policy name>** - Policy Name
  Specifies the name of the security policy that contains the task you want to modify.

- **-path <text>** - Path
  Specifies the path of the file/folder associated with the task that you want to modify.

- **[-index-num <integer>]** - Position
  Specifies the index number of a task. Tasks are applied in order. A task with a larger index value is applied after a task with a lower index number. If you do not specify this optional parameter, new tasks are applied to the end of the index list.

  The range of supported values is 1 through 9999. If there is a gap between the highest existing index number and the value entered for this parameter, the task with this number is considered to be the last task in the policy and is treated as having an index number of the previous highest index plus one.

  **Note:** If you specify an index number that is already assigned to an existing task, the command fails when you attempt to create a duplicate entry.

- **[-security-type {ntfs|nfsv4}]** - Security Type
  Specifies whether the security descriptor in the task that you want to modify should be an NTFS security descriptor type or an NFSv4 security descriptor type. Default value is ntfs.

  **Note:** The nfsv4 security descriptor type is not supported in this release. If you specify this optional parameter, you must enter ntfs for the -security-type value.

- **[-ntfs-mode {propagate|ignore|replace}]** - NTFS Propagation Mode
  Specifies how to propagate security settings to child subfolders and files. This setting determines how child files and/or folders contained within a parent folder inherit access control and audit information from the parent folder.

  You can specify one of the three parameter values that correspond to three types of propagation modes:

  • propagate - propagate inheritable permissions to all subfolders and files
  • replace - replace existing permissions on all subfolders and files with inheritable permissions
  • ignore - do not allow permissions on this file or folder to be replaced

- **[-ntfs-sd <ntfs sd name>, ...]** - NTFS Security Descriptor Name
  Specifies the list of security descriptor names to apply to the path specified in the -path parameter.

**Examples**

The following example modifies the ntfs mode, index, and ntfs-sd parameters in the security policy task entry.
vserver security file-directory policy task modify

Modify a policy task

Description
The `vserver security file-directory policy task modify` command modifies a task entry from a security policy.

Parameters
- `-vserver <vserver name>` - Vserver
  Specifies the Vserver associated with the security policy that contains the task you want to modify.
- `-policy-name <Security policy name>` - Policy Name
  Specifies the name of the security policy that contains the task you want to modify.
- `-path <text>` - Path
  Specifies the path of the file/folder associated with the task that you want to modify.

Examples
The following example modifies a security policy task entry.

```
cluster1::> vserver security file-directory policy task modify -vserver vs1 -policy-name policy1 -path / -security-type ntfs -ntfs-mode propagate -ntfs-sd sd -index-num 1
```

vserver security file-directory policy task remove

Remove a policy task

Availability: This command is available to cluster and Vserver administrators at the `admin` privilege level.

Description
The `vserver security file-directory policy task remove` command removes a task entry from a security policy.

The `vserver security file-directory policy task remove` command is not supported for Vservers with Infinite Volume.

Note: Removing a policy task fails if a job is currently running for the specified policy from which a task is being removed.

Parameters
- `-vserver <vserver name>` - Vserver
  Specifies the Vserver associated with the security policy that contains the task you want to remove.
- `-policy-name <Security policy name>` - Policy Name
  Specifies the name of the security policy that contains the task you want to remove.
- `-path <text>` - Path
  Specifies the path of the file/folder associated with the task that you want to remove.

Examples
The following example removes a security policy task entry.

```
cluster1::> vserver security file-directory policy task remove -vserver vs1 -policy-name policy1 -path /
```

vserver security file-directory policy task show

Display policy tasks

Availability: This command is available to cluster and Vserver administrators at the `admin` privilege level.
Description

The `vserver security file-directory policy task show` command displays information about all the task entries in the Vserver. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all task entries:

- Vserver name
- Policy name
- Task entries

The `vserver security file-directory policy task show` command is not supported for Vservers with Infinite Volume.

Parameters

```
[-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command only displays the fields that you specify.

[-instance]
  If you specify the -instance parameter, the command displays detailed information about all entries.

[-vserver <vserver name>]
  - Vserver
    If you specify this parameter, the command displays information only tasks associated with the specified Vserver.

[-policy-name <Security policy name>]
  - Policy Name
    If you specify this parameter, the command displays information only about tasks associated with the specified security policy.

[-index-num <integer>]
  - Position
    If you specify this parameter, the command displays information only about tasks assigned the index number that you specify.

[-path <text>]
  - Path
    If you specify this parameter, the command displays information only about tasks applied to the specified path.

[-security-type {ntfs|nfsv4}]
  - Security Type
    If you specify this parameter, the command displays information only about tasks associated with the specified security type.

  Note: The nfsv4 security descriptor type is not supported in this release.

[-ntfs-mode {propagate|ignore|replace}]
  - NTFS Propagation Mode
    If you specify this parameter, the command displays information only about tasks configured with the NTFS propagation mode that you specify.

[-ntfs-sd <ntfs sd name>, ...]
  - NTFS Security Descriptor Name
    If you specify this parameter, the command displays information only about the policy tasks associated with the NTFS security descriptor that you specify.

[-access-control {file-directory|slag}]
  - Access Control Level
    If you specify this parameter, the command displays information only about tasks associated to the access control.
```

Examples

The following example displays policy task entries for a policy named “policy1” on Vserver vs1.

```
cluster1:> vserver security file-directory policy task show -vserver vs1 -policy-name policy1

Vserver: vs1
Policy: policy1

<table>
<thead>
<tr>

vserver security trace commands

Manage security tracing

vserver security trace filter commands

Here we create a filter for tracing files and directories.

vserver security trace filter create

Create a security trace entry

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver security trace filter create command creates a security trace filter entry. Prior to Data ONTAP 9.3, this feature was only supported for CIFS. In Data ONTAP 9.3 and later, this feature is supported for both NFS and CIFS.

The vserver security trace filter create command is not supported for Vservers with Infinite Volume.

NFS security trace filters are not supported for FlexGroup volumes, and will only be applied to the FlexVol volumes within the specified Vserver.

Parameters

-vserver <vserver name> - Vserver
This parameter specifies the name of the Vserver on which the permission trace is applied.

-index <integer> - Filter Index
This parameter specifies the index number you want to assign to the trace filter. A maximum of 10 entries can be created. The allowed values for this parameter are 1 through 10.

-protocols {cifs|nfs}, ... - Protocols
This parameter specifies the protocols for which the permission trace is created. If the -protocols parameter is not specified, the filter will only apply to the CIFS protocol.

-client-ip <IP Address> - Client IP Address to Match
This parameter specifies the IP Address from which the user is accessing the Vserver.

-path <TextNoCase> - Path
This parameter specifies the path to which permission tracing is applied. The value can be the complete path, starting from the root of the share (for a CIFS filter) or the root of the junction path (for an NFS filter) that the client is accessing, or the value can be a part of the path that the client is accessing. Use NFS style directory separators in the path value.
Windows User Name

This parameter specifies the Windows user name to trace. You can use any of the following formats when specifying the value for this parameter:

- user_name
- domain\user_name

UNIX User Name or User ID

This parameter specifies the UNIX user name to trace. It accepts UNIX user ID only for NFS filters.

Trace Allow Events

Security tracing can trace deny events and allow events. Deny event tracing is always ON by default. Allow events can optionally be traced. If set to yes, this option allows tracing of allow events. If set to no, allow events are not traced.

Filter Enabled

This parameter specifies whether to enable or disable the filter. Filters are enabled by default.

Minutes Filter is Enabled

This parameter specifies a timeout for this filter, after which it is disabled.

Examples

The following example creates a security trace filter.

```
cluster1::> vserver security trace filter create -vserver vs0 -index 1 -time-enabled 120 -client-ip 10.72.205.207
```

The following examples create filters that include the -path option. If the client is accessing a file with the path `\server\sharename\dir1\dir2\dir3\file.txt`, for a filter applicable to CIFS, a complete path starting from the root of the share or a partial path can be given as shown:

```
cluster1::> vserver security trace filter create -vserver vs0 -index 1 -path /dir1/dir2/dir3/file.txt
```

```
cluster1::> vserver security trace filter create -vserver vs0 -index 1 -path dir3/file.txt
```

Similarly, while creating a filter for NFS, if -path option is specified and the client is accessing a file with path `/junction_path1/junction_path2/dir1/file.txt`, a complete path starting from the last junction path or a partial path can be given as shown:

```
cluster1::> vserver security trace filter create -vserver vs0 -index 1 -protocols nfs -path dir1/file.txt
```

```
cluster1::> vserver security trace filter create -vserver vs0 -index 1 -protocols nfs -path file.txt
```

The following example creates a filter that is applicable to both CIFS and NFS.

```
cluster1::> vserver security trace filter create -vserver vs0 -index 1 -protocols cifs,nfs -unix-user root
```

Delete a security trace entry

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.
Description
The `vserver security trace filter delete` command deletes a security trace filter entry. Prior to Data ONTAP 9.3, this feature was only supported for CIFS. In Data ONTAP 9.3 and later, this feature is supported for both NFS and CIFS.

The `vserver security trace filter delete` command is not supported for Vservers with Infinite Volume.

NFS security trace filters are not supported for FlexGroup volumes, and will only be applied to the FlexVol volumes within the specified Vserver.

Parameters

- `-vserver <vserver name>` - Vserver
  This parameter specifies the name of the Vserver on which the tracing filter entry that you want to delete is applied.

- `-index <integer>` - Filter Index
  This parameter specifies the index number for the filter that you want to delete. You can display a list of the filter index numbers by using the `vserver security trace filter show` command.

Examples
The following example deletes a security trace filter.
```bash
cluster1::> vserver security trace filter delete -vserver vs0 -index 1
```

Related references

- `vserver security trace filter show` on page 1985

`vserver security trace filter modify`
Modify a security trace entry

Availability: This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

Description
The `vserver security trace filter modify` command modifies a security trace filter entry. Prior to Data ONTAP 9.3, this feature was only supported for CIFS. In Data ONTAP 9.3 and later, this feature is supported for both NFS and CIFS.

The `vserver security trace filter modify` command is not supported for Vservers with Infinite Volume.

NFS security trace filters are not supported for FlexGroup volumes, and will only be applied to the FlexVol volumes within the specified Vserver.

Parameters

- `-vserver <vserver name>` - Vserver
  This parameter specifies the name of the Vserver on which the permission trace is applied.

- `-index <integer>` - Filter Index
  This parameter specifies the index number for the filter. A maximum of 10 entries can be created. The allowed values for this parameter are 1 through 10.

- `[-protocols {cifs|nfs}, ...]` - Protocols
  This parameter specifies the protocols for which the permission trace is created.

- `[-client-ip <IP Address>]` - Client IP Address to Match
  This parameter specifies the IP Address from which the user is accessing the Vserver.
[-path <TextNoCase>] - Path
This parameter specifies the path to which permission tracing is applied. The value can be the complete path, starting from the root of the share (for a CIFS filter) or the root of the junction path (for an NFS filter) that the client is accessing, or the value can be a part of the path that the client is accessing. Use NFS style directory separators in the path value.

{ [-windows-name <TextNoCase>] - Windows User Name
This parameter specifies the Windows user name to trace. You can use any of the following formats when specifying the value for this parameter:
  • user_name
  • domain\user_name

| [-unix-name <TextNoCase>] | UNIX User Name or User ID
This parameter specifies the UNIX user name to trace. It accepts UNIX user ID only for NFS filters.

[-trace-allow {yes|no}] - Trace Allow Events
Security tracing can trace deny events and allow events. Deny event tracing is always ON by default. Allow events can optionally be traced. If set to yes, this option allows tracing of allow events. If set to no, allow events are not traced.

[-enabled {enabled|disabled}] - Filter Enabled
This parameter specifies whether to enable or disable the filter. Filters are enabled by default.

[-time-enabled <integer>] - Minutes Filter is Enabled
This parameter specifies a timeout for this filter, after which it is disabled.

Examples
The following example modifies a security trace filter.

```
cluster1::> vserver security trace filter modify -vserver vs0 -index 1 -time-enabled 120 -client-ip 10.72.205.207
```

The following examples modify filters that include the -path option. If the client is accessing a file with the path \server \sharename\dir1\dir2\dir3\file.txt, for a filter applicable to CIFS, a complete path starting from the root of the share or a partial path can be given as shown:

```
cluster1::> vserver security trace filter modify -vserver vs0 -index 1 -path /dir1/dir2/dir3/file.txt
cluster1::> vserver security trace filter modify -vserver vs0 -index 1 -path dir3/file.txt
```

Similarly, for filters applicable to NFS, if -path option is specified and the client is accessing a file with path / junction_path1/junction_path2/dir1/file.txt, a complete path starting from the last junction path or a partial path can be given as shown:

```
cluster1::> vserver security trace filter modify -vserver vs0 -index 1 -protocols nfs -path dir1/file.txt
cluster1::> vserver security trace filter modify -vserver vs0 -index 1 -protocols nfs -path file.txt
```

The following example modifies a filter that is applicable to both CIFS and NFS.

vserver security trace filter show

Display a security trace entry

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver security trace filter show command displays information about security trace filter entries. Prior to Data ONTAP 9.3, this feature was only supported for CIFS. In Data ONTAP 9.3 and later, this feature is supported for both NFS and CIFS.

The vserver security trace filter show command is not supported for Vservers with Infinite Volume.

NFS security trace filters are not supported for FlexGroup volumes, and will only be applied to the FlexVol volumes within the specified Vserver.

Parameters

{ [-fields <fieldname>, ...]  
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?' to display the fields to specify.
  
  | [-instance ]}  
  If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver
  If you specify this parameter, the command displays permission tracing information only for filters applied to the specified Vserver.

[-index <integer>] - Filter Index
  If you specify this parameter, the command displays permission tracing information only for filters with the specified filter index number.

[-protocols {cifs|nfs}, ...] - Protocols
  If you specify this parameter, the command displays permission tracing information only for filters applied to the specified protocols.

[-client-ip <IP Address>] - Client IP Address to Match
  If you specify this parameter, the command displays permission tracing information only for filters applied to the specified client IP address.

[-path <TextNoCase>] - Path
  If you specify this parameter, the command displays permission tracing information only for filters applied to the specified path.

[-windows-name <TextNoCase>] - Windows User Name
  If you specify this parameter, the command displays permission tracing information only for filters applied to the specified Windows user name.

[-unix-name <TextNoCase>] - UNIX User Name or User ID
  If you specify this parameter, the command displays permission tracing information only for filters applied to the specified UNIX user name or user ID(for NFS specific filters).

[-trace-allow {yes|no}] - Trace Allow Events
  If you specify this parameter, the command displays information only about events that either trace or do not trace allow events, depending on the value provided.
Parameters

- **-node \(<nodename>|local\)** - Node
  This parameter specifies the cluster node on which the permission tracing event that you want to delete occurred.

- **-vserver \(<vserver name>\)** - Vserver
  This parameter specifies the Vserver on which the permission tracing event that you want to delete occurred.

- **-seqnum \(<integer>\)** - Sequence Number
  This parameter specifies the sequence number of the log entry to be deleted.

Examples

The following example deletes the security trace result record for the Vserver vserver_1 on node Node_1 whose sequence number is 999.

```
cluster1::> vserver security trace trace-result delete -vserver vserver_1 -node Node_1 -seqnum 999
```

vserver security trace trace-result commands

Trace results can be seen here.
vserver security trace trace-result show

Display security trace results

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The `vserver security trace trace-result show` command displays the list of security trace event records stored on the cluster. These records are generated in response to security trace filters that are created using the `vserver security trace filter create` command. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all the security trace events generated since the filter was enabled:

- Vserver name
- Cluster node name
- Security trace filter index number
- User name
- Security style
- Path
- Reason

You can specify additional parameters to display only information that match those parameters. For example, to display information about events that occurred for the user "guest", run the command with `-user-name` parameter set to `guest`.

The `vserver security trace trace-result show` command is not supported for Vservers with Infinite Volume.

Parameters

`[-fields <fieldname>,...]
If you specify this parameter, the command only displays the fields that you specify.
`n
`[-instance]
If you specify this parameter, the command displays detailed information about all security trace events.
`n
`[-node <nodename> | local] - Node
If you specify this parameter, the command displays information only about security trace events on the specified node.
`n
`[-vserver <vserver name>] - Vserver
If you specify this parameter, the command displays information only about security trace events on the specified Vserver.
`n
`[-seqnum <integer>] - Sequence Number
If you specify this parameter, the command displays information only about the security trace events with this sequence number.
`n
`[-keytime <Date>] - Time
If you specify this parameter, the command displays information only about security trace events that occurred at the specified time.
`n
`[-index <integer>] - Index of the Filter
If you specify this parameter, the command displays information only about security trace events that occurred as a result of the filter corresponding to the specified filter index number.
[=client-ip <IP Address>=] - Client IP Address

If you specify this parameter, the command displays information only about security trace events that occurred as a result of file access from the specified client IP address.

[=path <TextNoCase>=] - Path of the File Being Accessed

If you specify this parameter, the command displays information only about the security trace events that occurred as a result of file accesses to the specified path.

[=win-user <TextNoCase>=] - Windows User Name

If you specify this parameter, the command displays information only about the security trace events that occurred as a result of file access by the specified Windows user.

[=security-style <security style>=] - Effective Security Style On File

If you specify this parameter, the command displays information only about the security trace events that occurred on file systems with the specified security style. The allowed values for security style are the following:

- SECURITY_NONE - Security not Set
- SECURITY_UNIX_MODEBITS - UNIX and UNIX permissions
- SECURITY_UNIX_ACL - UNIX and NFSv4 ACL
- SECURITY_UNIX_SD - UNIX and NT ACL
- SECURITY_MIXED_MODEBITS - MIXED and UNIX permissions
- SECURITY_MIXED_ACL - MIXED and NFSv4 ACL
- SECURITY_MIXED_SD - MIXED and NT ACL
- SECURITY_NTFS_MODEBITS - NTFS and UNIX permissions
- SECURITY_NTFS_ACL - NTFS and NT ACL
- SECURITY_NTFS_SD - NTFS and NT ACL
- SECURITY_UNIX - UNIX
- SECURITY_MIXED - MIXED
- SECURITY_NTFS - NTFS
- SECURITY_MODEBITS - UNIX permissions
- SECURITY_ACL - ACL
- SECURITY_SD - SD

[=result <TextNoCase>=] - Result of Security Checks

If you specify this parameter, the command displays information about the security trace events that have the specified result. Access to a file or a directory can be 'allowed' or 'denied'. Output from this command displays the result as a combination of the reason for allowing or denying access, the location where access is either allowed or denied, and the access right for which the file operation is allowed or denied.

The following are the reasons why an access can be allowed:

- Access is allowed because the operation is trusted and no security is configured
- Access is allowed because the user has UNIX root privileges
- Access is allowed because the user has UNIX owner privileges
• Access is allowed because UNIX implicit permission grants requested access

• Access is allowed because the CIFS user is owner

• Access is allowed because the user has take ownership privilege

• Access is allowed because there is no CIFS ACL

• Access is allowed because CIFS implicit permission grants requested access

• Access is allowed because the security descriptor is corrupted and the user is a member of the Administrators group

• Access is allowed because the ACL is corrupted and the user is a member of the Administrators group

• Access is allowed because the user has UNIX permissions

• Access is allowed because explicit ACE grants requested access

• Access is allowed because the user has audit privileges

• Access is allowed because the user has superuser credentials

• Access is allowed because inherited ACE grants requested access

• Access is allowed because storage-level access guard (SLAG) grants requested access

• Access is allowed because no central access policies applied

• Access is allowed because no central access policies could be applied from the corrupt SACL

• Access is allowed because matching central access policy could not be located

• Access is allowed because no central access rules apply to the object

• Access is allowed because skipped one or more corrupt central access rules

• Access is allowed because all evaluated central access rules grant access

The following are the reasons why an access can be denied:

• Access is denied by UNIX permissions

• Access is denied by an explicit ACE

• Access is denied. The requested permissions are not granted by the ACE

• Access is denied. The security descriptor is corrupted

• Access is denied. The ACL is corrupted

• Access is denied. The sticky bit is set on the parent directory and the user is not the owner of file or parent directory

• Access is denied. The owner can be changed only by root

• Access is denied. The UNIX permissions/uid/gid/NFSv4 ACL can be changed only by owner or root

• Access is denied. The GID can be set by owner to a member of its legal group list only if 'Owner can chown' is not set

• Access is denied. The file or the directory has readonly bit set

• Access is denied. There is no audit privilege

• Access is denied. Enforce DOS bits blocks the access
• Access is denied. Hidden attribute is set
• Access is denied by an inherited ACE
• Access is denied as the volume is readonly or directory is a snapshot
• Access is denied. System attribute is not set in the request
• Access is denied by the storage-level access guard (SLAG)
• Access is denied, file is infected
• Access is denied. Central access policy DB not ready
• Access is denied. Central access rule is corrupt
• Access is denied. Central access rule explicitly denied access
• Access is denied. Matching central access policy not found
• Access is denied because the user does not have UNIX root privileges
• Access is denied because the UNIX user could not be mapped to a valid NT user
• Access is denied because the UNIX permissions/uid/gid/NFSv4 ACL cannot be set in an NTFS qtree

The command or the location at which access was denied or allowed are as follows:

• while traversing the directory.
• while truncating the file.
• while creating the directory.
• while creating the file.
• while checking parent's mode bits during delete.
• while deleting the child.
• while checking for child-delete access on the parent.
• while reading security descriptor.
• while accessing the link.
• while creating the directory.
• while creating or writing the file.
• while opening existing file or directory.
• while setting the attributes.
• while traversing the directory.
• while reading the file.
• while reading the directory.
• while deleting the target during rename.
• while deleting the child during rename.
• while writing data in the parent during rename.
• while adding a directory during rename.
• while adding a file during rename.
• while updating the target directory during rename.
• while setting attributes.
• while writing to the file.
• while extending the coral file.
• while creating the vdisk file.
• while checking for stale locks before open.
• while deleting a file or a directory.
• while truncating a hidden file.
• while truncating a file.
• while truncating a system file.
• while appending to a file or setting a file attribute.
• while opening a file or directory for delete.
• while checking for permission on parent directory during create.
• while appending to the file.
• while creating the device file.
• while reading the user's access rights on an object.

The access rights for which the file operation is allowed or denied are as follows:
• Append.
• Delete.
• Delete Child.
• Execute.
• Generic All.
• Generic Execute.
• Generic Read.
• Generic Write.
• Maximum Allowed.
• Read.
• Read Attributes.
• Read Control.
• Read EA.
• System Security.
• Synchronize.
• Write.
• Write Attributes.
• Write DAC.
• Write EA.
• Write Owner.
• None.

`[-unix-user <TextNoCase>] - UNIX User Name`
If you specify this parameter, the command displays information only about the security trace events that occurred as a result of file access by the specified UNIX user.

`[-session-id <integer>] - CIFS Session ID`
If you specify this parameter, the command displays information only about the security trace events that occurred as a result of file access by the specified CIFS session ID.

`[-share-name <TextNoCase>] - Accessed CIFS Share Name`
If you specify this parameter, the command displays information only about the security trace events that occurred as a result of file access by the specified CIFS share name.

`[-protocol {cifs|nfs}] - Protocol`
If you specify this parameter, the command displays information only about the security trace events that occurred for the specified protocol.

`[-volume-name <TextNoCase>] - Accessed Volume Name`
If you specify this parameter, the command displays information only about the security trace events that occurred as a result of file access by the specified volume name.

### Examples

The following example displays information about security trace records:

```
cluster1::> vserver security trace trace-result show
Vserver: vserver_1

Node                     Index     Filter Details      Reason
----------------------- -------- --------------------- -------------------------
cluster1-01             1        Security Style: MIXED Access is allowed because
and NT ACL             CIFS implicit permission
grants requested access
while opening existing
file or directory.
Access is granted for:
"Read Attributes"
Protocol: cifs
Share: sh1
Path: /stk/bit
Win-User: cifs1\administrator
Unix-User: root
Session-ID: 58455810
```

1 entries were displayed.

The following example displays information about security trace records for path /stk/bit/set:

```
cluster1::> vserver security trace trace-result show -path /stk/bit/set
Vserver: vserver_1

Node                     Index     Filter Details      Reason
----------------------- -------- --------------------- -------------------------
cluster1-01             1        Security Style: MIXED Access is allowed because
and UNIX permissions    the user has UNIX root
grants requested access privileges while opening
```

The following example displays information about security trace records for the protocol nfs:

```
cluster1::> vserver security trace trace-result show -protocol nfs
Vserver: vserver_1

**vserver services commands**

The vserver services directory

**vserver services access-check commands**

Access Check

**vserver services access-check authentication commands**

Check Authentication Information

**vserver services access-check authentication get-claim-name**

Get the Name of a Claim

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**
The *vserver services access-check authentication get-claim-name* command obtains the display name for a given claim.

**Parameters**

- `[-node {<nodename>|local}]` - Node Name
  The name of the node on which the command is executed.

- `vserver <vserver>` - Vserver Name
  The name of the Vserver.

- `claim-cn <text>` - Claim CN
  The claim ID of the claim display name.

**Examples**

This example gets the display name of a claim for the CIFS server created on Vserver vs2

```
cluster1::vserver services access-check*> authentication get-dc-info -node vsim1 -vserver vs2 -claim-cn ad://ext/accountExpires:88d065c21536d9fe
Name of claim ad://ext/accountExpires:88d065c21536d9fe: accountExpires
```
vserver services access-check authentication get-dc-info

Get Domain Controller Information

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The vserver services access-check authentication get-dc-info command obtains information about one of the Domain Controllers (DC) for the domain of which the CIFS server is a member. The information fetched is the Forest and Domain of which the DC is a member, the NetBIOS name of the Domain, the NetBIOS Hostname of the DC, the CIFS Server site, the CIFS Client site, GUID of the domain and flags. Flags describe the features and roles of the DC.

Parameters

[-node {<nodename> | local}] - Node Name
The name of the node on which the command is executed.

-vserver <vserver> - Vserver Name
The name of the Vserver.

Examples
This example gets the information about a Domain Controller for CIFS server created on Vserver vs2.

```
cluster1: vserver services access-check*> authentication get-dc-info -node vsim2-d1-01 -vserver vs2

DC Information:
----------------
Forest: cifs.lab.netapp.com
Domain: cifs.lab.netapp.com
NetBIOS Name: CIFSLLAB
NetBIOS Hostname: A7-6
Server Site: cifs-dev-j4
Client Site:
GUID: 0366BE1F-FA08-4747-B5AC56097189C90E
Flags: 0x00000178
   DS_LDAP_FLAG
   DS_DS_FLAG
   DS_KDC_FLAG
   DS_TIMESERV_FLAG
   DS_WRITABLE_FLAG
   DS_PING_FLAGS
```

vserver services access-check authentication sid-to-uid

Translate a Windows SID to a UNIX User ID

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The vserver services access-check authentication sid-to-uid translates a Windows SID to a UNIX UID.

Parameters

[-node {<nodename> | local}] - Node Name
The name of the node on which the command is executed.

-vserver <vserver> - Vserver Name
The name of the Vserver.
-sid <text> - Windows SID
The SID of a Windows user.

[-clientIp <IP Address>] - Client IP Address
The IP address of the client as specified by the user

Examples
This example translates a Windows SID on node "node2" and returns the corresponding UNIX user's UID.

```
cluster1::vserver services access-check*> sid-to-uid -vserver vs1 -sid S-1-5-21-1407423728-2963865486-1834115207-500 -node node2
UID: 0
```

vserver services access-check authentication sid-to-unix-name
Translate a Windows SID to a UNIX User Name

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The vserver services access-check authentication sid-to-unix-name translates a Windows SID to a UNIX Name.

Parameters
[-node {<nodename> | local}] - Node Name
The name of the node on which the command is executed.

-vserver <vserver> - Vserver Name
The name of the Vserver.

-sid <text> - Windows SID
The Windows SID which is to be translated to the corresponding UNIX name.

Examples
This example translates a Windows SID on node "node2" and returns the corresponding UNIX name.

```
cluster1::vserver services access-check*> sid-to-unix-name -node node2 -vserver vs1 -sid S-1-5-21-1407423728-2963865486-1834115207-500
SID Type: User
UNIX Name: test
Domain Name: TESTDOMAIN
Windows Name: test
```

vserver services access-check authentication translate
Translate between Various Names and Their Identifiers

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The vserver services access-check authentication translate command translates SIDs, UIDs, and GIDs to names. If you enter a SID, the command returns a Windows name; if you enter a Windows name, the command returns a SID; if you enter a UNIX username, the command returns a UID; if you enter a UID, the command returns a UNIX username; if you enter a GID, the command returns a UNIX group name; if you enter a UNIX group-name, the command returns a GID.
Parameters

- `-node <nodename>|local` - Node Name
  The name of the node on which the command is executed.

- `-vserver <vserver>` - Vserver Name
  The name of the Vserver.

- `-uid <integer>` - UNIX User ID
  The UNIX user's UID.

- `-gid <integer>` - UNIX Group ID
  The UNIX user's GID.

- `-sid <text>` - Windows SID
  The Windows user's SID.

- `-unix-user-name <text>` - UNIX User Name
  The UNIX username.

- `-unix-group-name <text>` - UNIX Group Name
  The UNIX group name.

- `-win-name <text>` - Windows Name
  The Windows name.

Examples

This example translates the UNIX UID 0 to username "root" on node "node2" for Vserver "vs1."

```
cluster1::vserver services access-check*> authentication translate -vserver vs1 -uid 0 -node node2
root
```

This example translates the Windows username "administrator" to the corresponding SID on node "node2" for Vserver "vs1."

```
cluster1::vserver services access-check*> authentication translate -vserver vs1 -win-name administrator -node node2
S-1-5-21-1407423728-2963865486-1834115207-500
```

vserver services access-check authentication uid-to-sid

Translate a UNIX User ID to a Windows SID

**Availability:** This command is available to cluster administrators at the advanced privilege level.

**Description**
The `vserver services access-check authentication uid-to-sid` translates a UNIX UID to a Windows SID.

Parameters

- `-node <nodename>|local` - Node Name
  The name of the node on which the command is executed.

- `-vserver <vserver>` - Vserver Name
  The name of the Vserver.

- `-uid <integer>` - UNIX User ID
  The User ID of a UNIX user.
[-clientIp <IP Address>] - Client IP Address
   The IP address of the client as specified by the user

Examples
This example translates a UNIX user's UID on node "node2" and returns the corresponding SID.

```
cluster1::vserver services access-check*> uid-to-sid -vserver vs1 -uid 0 -node node2
SID: S-1-5-21-1407423728-2963865486-1834115207-500
```

vserver services name-service cache group-membership commands
The group-membership directory

vserver services name-service cache group-membership delete
Delete an entry

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

**Description**
The `vserver services name-service cache group-membership delete` command removes the cached group membership entries of the users.

**Parameters**

- **-vserver <vserver name>** - Vserver
  Use this parameter to specify the Vserver for which the group membership entries need to be deleted.

- **-user <text>** - User Name
  Use this parameter to specify the user name for which the cached group membership entries need to be deleted.

- **-group <integer>** - Gid
  Use this parameter to specify the primary group identifier or GID for which the cached group membership entries need to be deleted.

**Examples**
The following example deletes all the cached group membership entries for Vserver vs0, user 'a' and group '1':

```
cluster1::> vserver services name-service cache group-membership delete -vserver vs0 -user a -group 1
```
vserver services name-service cache group-membership delete-all

Delete all the entries for the vserver

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The `vserver services name-service cache group-membership delete` command removes the cached group membership entries of the users for the specified Vserver.

Parameters
- `-vserver <vserver name>` - Vserver
  Use this parameter to specify the Vserver for which the group membership entries need to be deleted.

Examples
The following example deletes all the cached group membership entries for Vserver vs0:

```
cluster1::> vserver services name-service cache group-membership delete-all -vserver vs0
```

vserver services name-service cache group-membership show

Display group list

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The `vserver services name-service cache group-membership show` command displays the cached group membership information of the users.

Parameters

\{ [-fields `<fieldname>`, ...]

If you specify the `-fields `<fieldname>`, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| `-instance`

Use this parameter to display detailed information about the cached group membership details of the user.

| `-vserver `<vserver name>` | Vserver

Use this parameter to specify the Vserver for which the group membership entries need to be displayed.

| `-user `<text>` | User Name

Use this parameter to display information only about the cached group membership entries that have the specified user name.

| `-group `<integer>` | Gid

Use this parameter to display information only about the cached group membership entries of the users that have the specified primary group identifier or GID.

| `-ngroups `<integer>` | Number of Groups

Use this parameter to display information only about the cached group membership entries of the users who belong to the specified number of groups.
[<-groups <integer>, ...] - Group List
Use this parameter to display information only about the cached group membership entries of the users who belong to the specified group identifiers or GIDs.

[<-create-time <MM/DD/YYYY HH:MM:SS>] - Create Time
Use this parameter to display information only about the group membership entries that were cached at the specified time.

[<-is-partial {true|false}] - Is Partial Result
Use this parameter to display information only about the group membership entries that have the specified value for partial result. The Value true displays only the cached entries that have partial result and the value false displays only the cached entries that do not have partial result.

**Examples**
The following example displays the group membership details of the users for all the vservers:
```
cluster1::> vserver services name-service cache group-membership show
```
The following example displays all the group membership details of the users for Vserver vs0:
```
cluster1::> vserver services name-service cache group-membership show -vserver vs0
```

**vserver services name-service cache group-membership settings commands**
The settings directory
vserver services name-service cache group-membership settings modify
Modify Group Membership Cache Configuration

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The vserver services name-service cache group-membership settings modify command modifies the group membership cache configuration of the specified Vserver.

Parameters

- **-vserver <vserver name>** - Vserver
  Use this parameter to specify the Vserver for which the group membership cache settings need to be modified.

- **-[<is-enabled {true|false}]** - Is Cache Enabled?
  Use this parameter to specify if the cache needs to be enabled for the group membership database. The value true means the cache is enabled and the value false means the cache is disabled. The default value for this parameter is true.

- **-[<grplist-ttl <([<integer>h][<integer>m][<integer>s])]** - Time to Live for Grplist
  Use this parameter to specify the time(in hours, minutes and seconds) for which the group membership entries need to be cached. The default value is 24 hours.

**Examples**
The following example modifies the group membership cache configuration settings for Vserver vs0:
```
cluster1::> vserver services name-service cache group-membership settings modify -vserver vs0 -ttl 600
```
The following example disables the group membership cache for Vserver vs0:

```
cluster1::> vserver services name-service cache group-membership settings modify -vserver vs0 -is-enabled false
```

Display Group Membership Cache Configuration

**Availability:** This command is available to cluster and Vserver administrators at the advanced privilege level.

**Description**
The `vserver services name-service cache group-membership settings show` command displays information about the group membership cache configuration for the users.

**Parameters**

- `-fields <fieldname>, ...`
  
  If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

- `[-instance]`
  
  Use this parameter to display detailed information about the group membership cache configuration settings.

- `[-vserver <vserver name>] - Vserver`
  
  Use this parameter to display information about the group membership cache configuration settings for the Vserver you specify.

- `[-is-enabled {true|false}] - Is Cache Enabled?`
  
  Use this parameter to display information only about the group membership cache configuration settings that have the specified cache enabled setting. The value `true` displays only the entries that have cache enabled and the value `false` displays only the entries that have cache disabled.

- `[-grplist-ttl <[<integer>h][<integer>m][<integer>s]>] - Time to Live for Grplist`
  
  Use this parameter to display information only about the group membership cache configuration settings that have the specified Time to Live.

**Examples**
The following example shows the group membership cache configuration settings for all the Vservers:

```
cluster1::> vserver services name-service cache group-membership settings show
```

The following example shows the group membership cache configuration settings for Vserver vs0:

```
cluster1::> vserver services name-service cache group-membership settings show -vserver vs0
```

**vserver services name-service cache hosts commands**

- The hosts directory

**vserver services name-service cache hosts forward-lookup commands**

- The forward-lookup directory

vserver services name-service cache hosts forward-lookup delete
Delete an entry

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

**Description**
The `vserver services name-service cache hosts forward-lookup delete` command removes a cached host to IP lookup entry.

**Parameters**
- `-vserver <vserver name>` - *Vserver*
  Use this parameter to specify the Vserver for which the cached forward lookup table entries need to be deleted.
- `-host <text>` - *Hostname*
  Use this parameter to specify the hostname of the cached forward lookup table entries that need to be deleted.
- `-protocol {Any|ICMP|TCP|UDP}` - *Protocol*
  Use this parameter to specify the protocol of the cached forward lookup table entries that need to be deleted.
- `-sock-type {SOCK_ANY|SOCK_STREAM|SOCK_DGRAM|SOCK_RAW}` - *Sock Type*
  Use this parameter to specify the socket type of the cached forward lookup table entries that need to be deleted.
- `-flags {FLAG_NONE|AI_PASSIVE|AI_CANONNAME|AI_NUMERICHOST|AI_NUMERICSERV}` - *Flags*
  Use this parameter to specify the flag of the cached forward lookup table entries that need to be deleted.
- `-family {Any|Ipv4|Ipv6}` - *Family*
  Use this parameter to specify the family of the cached forward lookup table entries that need to be deleted.

**Examples**
The following example deletes the cached forward lookup entry for Vserver vs0 and host "abc":

```
cluster1::> vserver services name-service cache hosts forward-lookup delete -vserver vs0 -host abc
```

vserver services name-service cache hosts forward-lookup delete-all

Delete all the entries for the vserver

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

**Description**
The `vserver services name-service cache hosts forward-lookup delete-all` command removes all the cached host to IP lookup entries for a Vserver.

**Parameters**
- `-vserver <vserver name>` - *Vserver*
  Use this parameter to specify the Vserver for which the cached forward lookup entries need to be deleted.

**Examples**
The following example deletes all the cached forward lookup entries for Vserver vs0:

```
cluster1::> vserver services name-service cache hosts forward-lookup delete-all -vserver vs0
```

vserver services name-service cache hosts forward-lookup show
Display host-byname struct

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The vserver services name-service cache hosts forward-lookup show command displays the cached host to IP lookup entries.

Parameters

[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

[-instance]]
Use this parameter to display detailed information about the cached forward lookup table entries.

[-vserver <vserver name>] - Vserver
Use this parameter to specify the Vserver for which the cached forward lookup table entries need to be displayed.

[-host <text>] - Hostname
Use this parameter to display information only about the cached forward lookup table entries that have the specified hostname.

[-protocol {Any|ICMP|TCP|UDP}] - Protocol
Use this parameter to display information only about the cached forward lookup table entries that have the specified protocol.

[-sock-type {SOCK_ANY|SOCK_STREAM|SOCK_DGRAM|SOCK_RAW}] - Sock Type
Use this parameter to display information only about the cached forward lookup table entries that have the specified socket type.

[-flags {FLAG_NONE|AI_PASSIVE|AI_CANONNAME|AI_NUMERICHOST|AI_NUMERICSERV}] - Flags
Use this parameter to display information only about the cached forward lookup table entries that have the specified flags.

[-family {Any|Ipv4|Ipv6}] - Family
Use this parameter to display information only about the cached forward lookup table entries that have the specified family.

[-canonname <text>] - Canonical Name
Use this parameter to display information only about the cached forward lookup table entries that have the specified canonical name.

[-ips <IP Address>, ...] - IP Addresses
Use this parameter to display information only about the cached forward lookup table entries that have the specified IPs.

[-ip-protocol {Any|ICMP|TCP|UDP}, ...] - Protocol
Use this parameter to display information only about the cached forward lookup table entries that have the specified protocol of the resolved IP address from forward lookup.

[-ip-sock-type {SOCK_ANY|SOCK_STREAM|SOCK_DGRAM|SOCK_RAW}, ...] - Sock Type
Use this parameter to display information only about the cached forward lookup table entries that have the specified socket type of the resolved IP address from forward lookup.

[-ip-family {Any|Ipv4|Ipv6}, ...] - Family
Use this parameter to display information only about the cached forward lookup table entries that have the specified IP address family of the resolved IP address from forward lookup.
Use this parameter to display information only about the cached forward lookup table entries that have the specified IP address length of the resolved IP address from forward lookup.

- **-source** {none|files|dns|nis|ldap|netgrp_byname} - Source of the Entry
  Use this parameter to display information only about the cached forward lookup table entries that have the specified IP source of the resolved IP address from forward lookup.

- **-create-time** <MM/DD/YYYY HH:MM:SS> - Create Time
  Use this parameter to display information only about the cached forward lookup table entries that have the specified time when the entry was cached.

- **-ttl** <integer> - DNS TTL
  Use this parameter to display information only about the cached forward lookup table entries that have the specified Time To Live.

**Examples**

The following example displays all the cached forward lookup entries:

```
cluster1::> vserver services name-service cache hosts forward-lookup show
```

The following example displays all the cached forward lookup entries for Vserver vs0:

```
cluster1::> vserver services name-service cache hosts forward-lookup show -vserver vs0
```

**vserver services name-service cache hosts reverse-lookup commands**

The reverse-lookup directory

vserver services name-service cache hosts reverse-lookup delete

Delete an entry

**Availability:** This command is available to cluster and Vserver administrators at the advanced privilege level.

**Description**

The `vserver services name-service cache hosts reverse-lookup delete` command removes a cached IP to host lookup entry.

**Parameters**

- **-vserver** *vserver name* - Vserver
  Use this parameter to specify the Vserver for which the cached reverse lookup table entries need to be deleted.

- **-ip** *IP Address* - IP Address
  Use this parameter to specify the IP address of the cached reverse lookup table entries that need to be deleted.

- **-serv-flag** *integer* - Service flags
  Use this parameter to specify the service flag of the cached reverse lookup table entries that need to be deleted.

**Examples**

The following example deletes the cached reverse lookup entry for Vserver vs0 and IP address 1.1.1.1:

```
cluster1::> vserver services name-service cache hosts reverse-lookup delete -vserver vs0 -ip 1.1.1.1
```

vserver services name-service cache hosts reverse-lookup delete-all
Delete all the entries for the vserver

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The `vserver services name-service cache hosts reverse-lookup delete-all` command removes all the cached IP to host lookup entries for a Vserver.

Parameters
-vserver <vserver name> - Vserver
Use this parameter to specify the Vserver whose cached reverse lookup entries need to be deleted.

Examples
The following example deletes all the cached reverse lookup entries for Vserver vs0:

```
cluster1::> vserver services name-service cache hosts reverse-lookup delete-all -vserver vs0
```

vserver services name-service cache hosts reverse-lookup show
Display ip-to-host struct

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The `vserver services name-service cache hosts reverse-lookup show` command displays the cached IP to host lookup(reverse lookup) entries.

Parameters

[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance]
Use this parameter to display detailed information about the cached reverse lookup table entries.

[-vserver <vserver name>] - Vserver
Use this parameter to specify the Vserver for which the cached reverse lookup table entries need to be displayed.

[-ip <IP Address>] - IP Address
Use this parameter to display information only about the cached reverse lookup table entries that have the specified IP address.

[-serv-flag <integer>] - Service flags
Use this parameter to display information only about the cached reverse lookup table entries that have the specified service flag.

[-host <text>] - Hostname
Use this parameter to display information only about the cached reverse lookup table entries that have the specified hostname.

[-service <text>] - Service Name
Use this parameter to display information only about the cached reverse lookup table entries that have the specified service name.
[-aliases <text>, ...] - Host Aliases
Use this parameter to display information only about the cached reverse lookup table entries that have the specified aliases.

[-addrtype <integer>] - Address Type
Use this parameter to display information only about the cached reverse lookup table entries that have the specified address type.

[-addrlength <integer>] - Address Length
Use this parameter to display information only about the cached reverse lookup table entries that have the specified address length.

[-create-time <MM/DD/YYYY HH:MM:SS>] - Create Time
Use this parameter to display information only about the cached reverse lookup table entries that have the specified create time.

[-source {none|files|dns|nis|ldap|netgrp_byname}] - Source of the Entry
Use this parameter to display information only about the cached reverse lookup table entries that have the specified source.

[-ttl <integer>] - DNS TTL
Use this parameter to display information only about the cached reverse lookup table entries that have the specified Time To Live.

Examples
The following example displays all the cached reverse lookup entries:

cluster1::> vserver services name-service cache hosts reverse-lookup show

The following example displays the cached reverse lookup entries for Vserver vs0:

cluster1::> vserver services name-service cache hosts reverse-lookup show -vserver vs0

vserver services name-service cache hosts settings commands
The settings directory
vserver services name-service cache hosts settings modify
Modify Hosts Cache Configuration

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The vserver services name-service cache hosts settings modify command modifies the hosts cache configuration of the specified Vserver.

Parameters
-vserver <vserver name> - Vserver
Use this parameter to specify the Vserver for which the hosts cache settings need to be modified.

[-is-enabled {true|false}] - Is Cache Enabled?
Use this parameter to specify if the cache needs to be enabled for the hosts database. The value true means the cache is enabled and the value false means the cache is disabled. The default value for this parameter is true.
- **-is-negative-cache-enabled {true|false}** - Is Negative Cache Enabled?
  
  Use this parameter to specify if the cache needs to be enabled for the negative entries. Negative entries mean the entries which are not present in the hosts database and the lookup fails. The default value for this parameter is true. Negative cache is disabled by default if the parameter is-enabled is set to false.

- **-ttl <[<integer>h][<integer>m][<integer>s]>** - Time to Live
  
  Use this parameter to specify the time (in hours, minutes and seconds) for which the positive entries need to be cached. The positive entries mean the entries which are present in the hosts database and the lookup succeeds. The default value is 24 hours.

- **-negative-ttl <[<integer>h][<integer>m][<integer>s]>** - Negative Time to Live
  
  Use this parameter to specify the time for which the negative entries need to be cached. The default value is 1 minute.

### Examples

The following example modifies the hosts cache configuration settings for Vserver vs0:

```
cluster1::> vserver services name-service cache hosts settings modify -vserver vs0 -ttl 600 -negative-ttl 300
```

The following example disables the cache for Vserver vs0:

```
cluster1::> vserver services name-service cache hosts settings modify -vserver vs0 -is-enabled false
```

### Display Hosts Cache Configuration

#### Availability:
This command is available to cluster and Vserver administrators at the advanced privilege level.

#### Description
The `vserver services name-service cache hosts settings show` command displays information about the hosts cache configuration of the specified Vserver.

#### Parameters

- **{ [-fields <fieldname>, ...]**
  
  If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

- **[-instance]**
  
  Use this parameter to display detailed information about the hosts cache configuration settings.

- **[-vserver <vserver name>] - Vserver**
  
  Use this parameter to display information about the hosts cache configuration settings for the Vserver you specify.

- **[-is-enabled {true|false}] - Is Cache Enabled?**
  
  Use this parameter to display information only about the hosts cache configuration settings that have the specified cache enabled setting. Value true displays only the entries that have cache enabled and value false displays only the entries that have cache disabled.

- **[-is-negative-cache-enabled {true|false}] - Is Negative Cache Enabled?**
  
  Use this parameter to display information only about the hosts cache configuration settings that have the specified negative cache enabled setting. Value true displays only the entries that have negative cache enabled and value false displays only the entries that have negative cache disabled.
[-ttl \([\text{integer}\text{h}] [\text{integer}\text{m}] [\text{integer}\text{s}]\)] - Time to Live
Use this parameter to display information only about the hosts cache configuration settings that have the specified Time to Live.

[-negative-ttl \([\text{integer}\text{h}] [\text{integer}\text{m}] [\text{integer}\text{s}]\)] - Negative Time to Live
Use this parameter to display information only about the hosts cache configuration settings that have the specified negative Time to Live.

**Examples**

The following example shows the hosts cache configuration settings for Vserver vs0:

```bash
cluster1::> vserver services name-service cache hosts settings show -vserver vs0
```

The following example shows the hosts cache configuration settings that have cache disabled:

```bash
cluster1::> vserver services name-service cache hosts settings show -is-enabled false
```

---

**vserver services name-service cache netgroups ip-to-netgroup commands**

The ip-to-netgroup directory

vserver services name-service cache netgroups ip-to-netgroup delete
Delete netgroup.byhost cache entry

**Availability:** This command is available to cluster and Vserver administrators at the *advanced* privilege level.

**Description**

The `vserver services name-service cache netgroups ip-to-netgroup delete` command removes the cached client IP to netgroup entries.

**Parameters**

- `--vserver <vserver name>` - Vserver
  Use this parameter to specify the Vserver for which the cached client IP to netgroup entries need to be deleted.

- `--host <text>` - Host field
  Use this parameter to specify the IP address for which the cached IP to netgroup entries need to be deleted.

- `--netgrp <text>` - Netgroup field
  Use this parameter to specify the netgroup for which the cached IP to netgroup entries need to be deleted.

**Examples**

The following example deletes all the cached IP to netgroup entries for Vserver vs0, host 1.1.1.1 and netgrp 'abc':

```bash
cluster1::> vserver services name-service cache netgroups ip-to-netgroup delete --vserver vs0 --host 1.1.1.1 --netgrp abc
```

vserver services name-service cache netgroups ip-to-netgroup delete-all
Delete all the entries for the vserver

**Availability:** This command is available to cluster and Vserver administrators at the *advanced* privilege level.
Description
The vserver services name-service cache netgroups ip-to-netgroup delete-all command removes all the cached client IP to netgroup entries of the specified Vserver.

Parameters
-vserver <vserver name> - Vserver
Use this parameter to specify the Vserver for which the cached client IP to netgroup entries need to be deleted.

Examples
The following example deletes all the cached IP to netgroup entries for Vserver vs0:

```
cluster1::> vserver services name-service cache netgroups ip-to-netgroup delete-all -vserver vs0
```

vserver services name-service cache netgroups ip-to-netgroup show
Display netgroup.byhost cache entries

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The vserver services name-service cache netgroups ip-to-netgroup show command displays the cached client IP to netgroup entries.

Parameters
{ [-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.
 |
[-instance]]
Use this parameter to display detailed information about the cached client IP to netgroup entries.

[-vserver <vserver name>] - Vserver
Use this parameter to specify the Vserver for which the cached client IP to netgroup entries need to be displayed.

[-host <text>] - Host field
Use this parameter to display information only about the cached IP to netgroup entries that have the specified IP address.

[-netgrp <text>] - Netgroup field
Use this parameter to display information only about the cached IP to netgroup entries that have the specified netgroup.

[-create-time <MM/DD/YYYY HH:MM:SS>] - Create Time
Use this parameter to display information only about the IP to netgroup entries that were cached at the specified time.

[-source {none|files|dns|nis|ldap|netgrp_byname}] - Source of the Entry
Use this parameter to display information only about the cached IP to netgroup entries that have the specified look-up source.

Examples
The following example displays all the cached IP to netgroup entries:

```
cluster1::> vserver services name-service cache netgroups ip-to-netgroup show
```

vserver services commands 2009
The following example deletes all the cached IP to netgroup entries for Vserver vs0:

cluster1::> vserver services name-service cache netgroups ip-to-netgroup show -vserver vs0
```

**vserver services name-service cache netgroups members commands**

The members directory

vserver services name-service cache netgroups members delete

Delete netgroup cache entry

**Availability:** This command is available to cluster and Vserver administrators at the advanced privilege level.

**Description**
The `vserver services name-service cache netgroups members delete` command deletes the cached members of the netgroups.

**Parameters**

- `-vserver <vserver name>` - Vserver
  Use this parameter to specify the Vserver for which the cached netgroup members entries need to be deleted.

- `-netgroup <text>` - Netgroup
  Use this parameter to specify the netgroup for which the cached netgroup members entries need to be deleted.

**Examples**
The following example deletes all the cached netgroup members entries for Vserver vs0 and netgroup 'abc':

```bash
cluster1::> vserver services name-service cache netgroups members delete -vserver vs0 -netgroup abc
```

vserver services name-service cache netgroups members delete-all

Delete all the entries for the vserver

**Availability:** This command is available to cluster and Vserver administrators at the advanced privilege level.

**Description**
The `vserver services name-service cache netgroups members delete-all` command deletes all the cached netgroup member entries of the specified Vserver.

**Parameters**

- `-vserver <vserver name>` - Vserver
  Use this parameter to specify the Vserver for which the cached netgroup members entries need to be deleted.

**Examples**
The following example deletes all the cached netgroup members of Vserver vs0:

```bash
cluster1::> vserver services name-service cache netgroups members delete-all -vserver vs0
```

vserver services name-service cache netgroups members show

Display netgroup cache entries

**Availability:** This command is available to cluster and Vserver administrators at the advanced privilege level.
Description
The `vserver services name-service cache netgroups members show` command displays the cached members of the netgroups.

Parameters

`{-fields <fieldname>, ...}`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use ‘-fields ?’ to display the fields to specify.

`{-instance}`

Use this parameter to display detailed information about the cached members of a netgroup.

`{-vserver <vserver name>}` - Vserver
Use this parameter to specify the Vserver for which the cached netgroup members entries need to be displayed.

`{-netgroup <text>}` - Netgroup
Use this parameter to display information only about the cached members that belong to the specified netgroup.

`{-hosts <text>}` - Hosts
Use this parameter to display information only about the cached netgroups that have the specified host as a member.

`{-create-time <MM/DD/YYYY HH:MM:SS>}` - Create Time
Use this parameter to display information only about the netgroup member entries that were cached at the specified time.

`{-source {none|files|dns|nis|ldap|netgrp_byname}}` - Source of the Entry
Use this parameter to display information only about the cached netgroup member entries that have the specified look-up source.

Examples
The following example displays all the cached netgroup members entries:

```
.cluster1::> vserver services name-service cache netgroups members show
```

The following example displays all the cached netgroup members entries for Vserver vs0:

```
.cluster1::> vserver services name-service cache netgroups members show -vserver vs0
```

**vserver services name-service cache netgroups settings commands**

The settings directory

vserver services name-service cache netgroups settings modify

Modify Netgroup Cache Configuration

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `advanced` privilege level.

**Description**

The `vserver services name-service cache netgroups settings modify` command modifies the netgroups cache configuration of the specified Vserver.
Parameters
-vserver <vserver name> - Vserver
Use this parameter to specify the Vserver for which the netgroups cache settings need to be modified.

[-is-enabled {true|false}] - Is Cache Enabled?
Use this parameter to specify if the cache needs to be enabled for the netgroups database. The value true means the cache is enabled and the value false means the cache is disabled. The default value for this parameter is true.

[-is-negative-cache-enabled {true|false}] - Is Negative Cache Enabled?
Use this parameter to specify if the cache needs to be enabled for the negative entries. Negative entries means the entries which are not present in the netgroups database and the look-up fails. The default value for this parameter is true. Negative cache is disabled by default if the parameter is-enabled is set to false.

[-ttl <[<integer>h][<integer>m][<integer>s]>] - Time to Live
Use this parameter to specify the time (in hours, minutes and seconds) for which the positive entries need to be cached. The positive entries means the entries which are present in the netgroups database and the look-up succeeds. The default value is 24 hours.

[-negative-ttl <[<integer>h][<integer>m][<integer>s]>] - Negative Time to Live
Use this parameter to specify the time (in hours, minutes and seconds) for which the negative entries need to be cached. The default value is 1 minute.

[-ttl-members <[<integer>h][<integer>m][<integer>s]>] - TTL for netgroup members
Use this parameter to specify the time (in hours, minutes and seconds) for which the netgroup members need to be cached. The default value is 24 hours.

Examples
The following example modifies the netgroups cache configuration settings for Vserver vs0:

```
cluster1::> vserver services name-service cache netgroups settings modify -vserver vs0 -ttl 600 -negative-ttl 300
```

The following example disables the cache for Vserver vs0:

```
cluster1::> vserver services name-service cache netgroups settings modify -vserver vs0 -is-enabled false
```

vserver services name-service cache netgroups settings show
Display Netgroup Cache Configuration

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The vserver services name-service cache netgroups settings show command displays information about the netgroups cache configuration of the specified Vserver.

Parameters

{-fields <fieldname>,...}
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

{-instance}
Use this parameter to display detailed information about the netgroups cache configuration settings.
[\text{-vserver} <\text{vserver name}>] - Vserver

Use this parameter to display information about the netgroups cache configuration settings for the Vserver you specify.

[\text{-is-enabled} \{true|false\}] - Is Cache Enabled?

Use this parameter to display information only about the netgroups cache configuration settings that have the specified cache enabled setting. Value \text{true} displays only the entries that have cache enabled and value \text{false} displays only the entries that have cache disabled.

[\text{-is-negative-cache-enabled} \{true|false\}] - Is Negative Cache Enabled?

Use this parameter to display information only about the netgroups cache configuration settings that have the specified negative cache enabled setting. Value \text{true} displays only the entries that have negative cache enabled and value \text{false} displays only the entries that have negative cache disabled.

[\text{-ttl} <[<\text{integer}>h][<\text{integer}>m][<\text{integer}>s]>] - Time to Live

Use this parameter to display information only about the netgroups cache configuration settings that have the specified Time to Live.

[\text{-negative-ttl} <[<\text{integer}>h][<\text{integer}>m][<\text{integer}>s]>] - Negative Time to Live

Use this parameter to display information only about the netgroups cache configuration settings that have the specified negative Time to Live.

[\text{-ttl-members} <[<\text{integer}>h][<\text{integer}>m][<\text{integer}>s]>] - TTL for netgroup members

Use this parameter to display information only about the netgroups cache configuration settings that have the specified Time to Live for netgroup members.

\textbf{Examples}

The following example shows the netgroups cache configuration settings for Vserver vs0:

\begin{verbatim}
cluster1::> vserver services name-service cache netgroups settings show -vserver vs0
\end{verbatim}

The following example shows the netgroups cache configuration settings that have cache disabled:

\begin{verbatim}
cluster1::> vserver services name-service cache netgroups settings show -is-enabled false
\end{verbatim}

\textbf{vserver services name-service cache unix-group commands}

The unix-group directory

\textbf{vserver services name-service cache unix-group group-by-gid commands}

The group-by-gid directory

vserver services name-service cache unix-group group-by-gid delete

Delete an entry

\textbf{Availability:} This command is available to cluster and Vserver administrators at the advanced privilege level.

\textbf{Description}

The vserver services name-service cache unix-group group-by-gid delete command removes the group entries that are cached by the group identifier or GID. If group cache propagation is enabled, the corresponding group-by-name cache entry will also be removed.
Parameters
-vserver <vserver name> - Vserver

Use this parameter to specify the Vserver for which the group entries that are cached by the group identifier or GID need to be deleted.

-gr-gid <integer> - gr_gid field

Use this parameter to specify the group identifier or GID for which the cached entries need to be deleted.

Examples
The following example deletes all the cached group entries for Vserver vs0 and the group identifier or GID 123:

```
cluster1::> vserver services name-service cache unix-group group-by-gid delete -vserver vs0 -gr-gid 123
```

vserver services name-service cache unix-group group-by-gid delete-all
Delete all the entries for the vserver

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The vserver services name-service cache unix-group group-by-gid delete-all command removes all the group entries that are cached by the group identifier or GID.

Parameters
-vserver <vserver name> - Vserver

Use this parameter to specify the Vserver for which the group entries that are cached by the group identifier or GID need to be deleted.

Examples
The following example deletes all the cached group entries for Vserver vs0:

```
cluster1::> vserver services name-service cache unix-group group-by-gid delete-all -vserver vs0
```

vserver services name-service cache unix-group group-by-gid show
Display group struct

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The vserver services name-service cache unix-group group-by-gid show command displays the group information cached by the group identifier or GID.

Parameters

```
[-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance ]

Use this parameter to display detailed information about the group entries cached by the group identifier or GID.
```
[-vserver <vserver name>] - Vserver
    Use this parameter to specify the Vserver for which the group entries that are cached by the group identifier or GID need to be displayed.

[-gr-gid <integer>] - gr_gid field
    Use this parameter to display information only about the cached group entries that have the specified group identifier or GID.

[-gr-name <text>] - gw_name field
    Use this parameter to display information only about the cached group entries that have the specified group name.

[-create-time <MM/DD/YYYY HH:MM:SS>] - Create Time
    Use this parameter to display information only about the group entries that were cached at the specified time.

[-source {none|files|dns|nis|ldap|netgrp_byname}] - Source of the Entry
    Use this parameter to display information only about the group entries cached by the group identifier or GID that have the specified lookup source.

Examples
The following example displays all the groups which are cached by the group identifier or GID:

    cluster1::> vserver services name-service cache unix-group group-by-id show

The following example displays all the group entries cached by the group identifier or GID for Vserver vs0:

    cluster1::> vserver services name-service cache unix-group group-by-id show -vserver vs0

**vserver services name-service cache unix-group group-by-name commands**

The group-by-name directory

vserver services name-service cache unix-group group-by-name delete

Delete an entry

**Availability:** This command is available to cluster and Vserver administrators at the advanced privilege level.

**Description**
The vserver services name-service cache unix-group group-by-name delete command removes the group entries that are cached by group name. If group cache propagation is enabled, the corresponding group-by-gid cache entry will also be removed.

**Parameters**

-vserver <vserver name> - Vserver
    Use this parameter to specify the Vserver for which the group entries that are cached by group name need to be deleted.

-gr-name <text> - gw_name field
    Use this parameter to specify the group name for which the cached entries need to be deleted.

Examples
The following example deletes all the cached group entries for Vserver vs0 and group name abc:
vserver services name-service cache unix-group group-by-name delete-all

Delete all the entries for the vserv.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

**Description**
The `vserver services name-service cache unix-group group-by-name delete-all` command removes all the group entries that are cached by the group name for the specified Vserver.

**Parameters**

- `-vserver <vserver name>` - Vserver
  
  Use this parameter to specify the Vserver for which the group entries that are cached by group name need to be deleted.

**Examples**
The following example deletes all the cached group entries for Vserver vs0:

```
cluster1::> vserver services name-service cache unix-group group-by-name delete-all -vserver vs0
```

vserver services name-service cache unix-group group-by-name show

Display group struct

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

**Description**
The `vserver services name-service cache unix-group group-by-name show` command displays the group information cached by group name.

**Parameters**

- `[-fields <fieldname>, ...]`
  
  If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

- `[-instance ]`
  
  Use this parameter to display detailed information about the group entries cached by group name.

- `-vserver <vserver name>` - Vserver
  
  Use this parameter to specify the Vserver for which the group entries that are cached by group name need to be displayed.

- `-gr-name <text>` - gw_name field
  
  Use this parameter to display information only about the cached group entries that have the specified group name.

- `-gr-gid <integer>` - gr_gid field
  
  Use this parameter to display information only about the cached group entries that have the specified group identifier or GID.

- `-create-time <MM/DD/YYYY HH:MM:SS>` - Create Time
  
  Use this parameter to display information only about the group entries that were cached at the specified time.
[-source {none|files|dns|nis|ldap|netgrp_byname}] - Source of the Entry

Use this parameter to display information only about the group entries cached by group name that have the specified lookup source.

**Examples**

The following example displays all the groups which are cached by group name:

```bash
cluster1::> vserver services name-service cache unix-group group-by-name show
```

The following example displays all the group entries cached by group name for Vserver vs0:

```bash
cluster1::> vserver services name-service cache unix-group group-by-name show -vserver vs0
```

---

**vserver services name-service cache unix-group settings commands**

The settings directory

vserver services name-service cache unix-group settings modify

Modify UNIX Group Cache Configuration

**Availability:** This command is available to cluster and Vserver administrators at the advanced privilege level.

**Description**

The `vserver services name-service cache unix-group settings modify` command modifies the groups cache configuration of the specified Vserver.

**Parameters**

- `-vserver <vserver name>` - Vserver
  
  Use this parameter to specify the Vserver for which the groups cache settings need to be modified.

- `[-is-enabled {true|false}]` - Is Cache Enabled?
  
  Use this parameter to specify if the cache needs to be enabled for the groups database. The value `true` means the cache is enabled and the value `false` means the cache is disabled. The default value for this parameter is `true`.

- `[-is-negative-cache-enabled {true|false}]` - Is Negative Cache Enabled?
  
  Use this parameter to specify if the cache needs to be enabled for the negative entries. Negative entries mean the entries which are not present in the groups database and the lookup fails. The default value for this parameter is `true`. Negative cache is disabled by default if the parameter `is-enabled` is set to `false`.

- `[-ttl <[<integer>h][<integer>m][<integer>s]>]` - Time to Live
  
  Use this parameter to specify the time(in hours, minutes and seconds) for which the positive entries need to be cached. The positive entries mean the entries which are present in the groups database and the lookup succeeds. The default value is 24 hours.

- `[-negative-ttl <[<integer>h][<integer>m][<integer>s]>]` - Negative Time to Live
  
  Use this parameter to specify the time(in hours, minutes and seconds) for which the negative entries need to be cached. The default value is 5 minutes.

- `[-is-propagation-enabled {true|false}]` - Is Propagation Enabled?
  
  Use this parameter to specify whether the cached groups entries need to be propagated to the group by the group identifier or GID cache. The default value is `true`. Specify `false` to disable propagation.

**Examples**

The following example modifies the groups cache configuration settings for Vserver vs0:

```bash
vserver services commands
```
vserver services name-service cache unix-group settings show

Display UNIX Group Cache Configuration

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The vserver services name-service cache unix-group settings show command displays information about the groups cache configuration of the specified Vserver.

Parameters

[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

| [-instance ] |
Use this parameter to display detailed information about the groups cache configuration settings.

[-vserver <vserver name>] - Vserver
Use this parameter to display information about the groups cache configuration settings for the Vserver you specify.

[-is-enabled {true|false}] - Is Cache Enabled?
Use this parameter to display information only about the groups cache configuration settings that have the specified cache enabled setting. The value true displays only the entries that have cache enabled and the value false displays only the entries that have cache disabled.

[-is-negative-cache-enabled {true|false}] - Is Negative Cache Enabled?
Use this parameter to display information only about the groups cache configuration settings that have the specified negative cache enabled setting. The value true displays only the entries that have negative cache enabled and the value false displays only the entries that have negative cache disabled.

[-ttl <[<integer>h] [<integer>m] [<integer>s]>] - Time to Live
Use this parameter to display information only about the groups cache configuration settings that have the specified Time to Live.

[-negative-ttl <[<integer>h] [<integer>m] [<integer>s]>] - Negative Time to Live
Use this parameter to display information only about the groups cache configuration settings that have the specified Negative Time to Live.

[-is-propagation-enabled {true|false}] - Is Propagation Enabled?
Use this parameter to display information only about the groups cache configuration settings that have the specified propagation enabled setting. The value true displays only the entries that have the propagation of cached entries to groups by the group identifier or GID cache enabled and the value false displays only the entries that have the propagation of cached entries to groups by the group identifier or GID cache disabled.

Examples
The following example shows the groups cache configuration settings for all the Vservers:
vserver services name-service cache unix-user commands

The unix-user directory

vserver services name-service cache unix-user settings commands

The settings directory

vserver services name-service cache unix-user settings modify

Modify UNIX users Cache Configuration

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description

The vserver services name-service cache unix-user settings modify command modifies the users cache configuration of the specified Vserver.

Parameters

-vserver <vserver name> - Vserver

Use this parameter to specify the Vserver for which the users cache settings need to be modified.

[ -is-enabled {true|false} ] - Is Cache Enabled?

Use this parameter to specify if the cache needs to be enabled for the users database. The value true means the cache is enabled and the value false means the cache is disabled. The default value for this parameter is true.

[ -is-negative-cache-enabled {true|false} ] - Is Negative Cache Enabled?

Use this parameter to specify if the cache needs to be enabled for the negative entries. Negative entries means the entries which are not present in the users database and the look-up fails. The default value for this parameter is true. Negative cache is disabled by default if the parameter is-enabled is set to false.

[ -ttl <[<integer>h][<integer>m][<integer>s]> ] - Time to Live

Use this parameter to specify the time (in hours, minutes and seconds) for which the positive entries need to be cached. The positive entries means the entries which are present in the users database and the look-up succeeds. The default value is 24 hours.

[ -negative-ttl <[<integer>h][<integer>m][<integer>s]> ] - Negative Time to Live

Use this parameter to specify the time (in hours, minutes and seconds) for which the negative entries need to be cached. The default value is 5 minutes.

[ -is-propagation-enabled {true|false} ] - Is Propagation Enabled?

Use this parameter to specify whether the cached users entries need to be propagated to the users by id cache. The default value is true. Specify false to disable propagation.

cluster1::> vserver services name-service cache unix-group settings show

The following example shows the groups cache configuration settings for Vserver vs0:

cluster1::> vserver services name-service cache unix-group settings show -vserver vs0

The following example shows the groups cache configuration settings that have cache disabled:

cluster1::> vserver services name-service cache unix-group settings show -is-enabled false
Examples
The following example modifies the users cache configuration settings for Vserver vs0:

```
cluster1::> vserver services name-service cache unix-user settings modify -vserver vs0 -ttl 600 -
           negative-ttl 300
```

The following example disables the cache for Vserver vs0:

```
cluster1::> vserver services name-service cache unix-user settings modify -vserver vs0 -is-enabled
           false
```

display UNIX users Cache Configuration

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The vserver services name-service cache unix-user settings show command displays information about the
users cache configuration of the specified Vserver.

Parameters

```
{-fields <fieldname>,...}
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified
field or fields. You can use `-fields ?` to display the fields to specify.

```
{-instance}
```

Use this parameter to display detailed information about the users cache configuration settings.

```
{-vserver <vserver name>}
```

Use this parameter to display information about the users cache configuration settings for the Vserver you
specify.

```
{-is-enabled {true|false}}
```

Use this parameter to display information only about the users cache configuration settings that have the
specified cache enabled setting. Value `true` displays only the entries that have cache enabled and value `false`
displays only the entries that have cache disabled.

```
{-is-negative-cache-enabled {true|false}}
```

Use this parameter to display information only about the users cache configuration settings that have the
specified negative cache enabled setting. Value `true` displays only the entries that have negative cache
enabled and value `false` displays only the entries that have negative cache disabled.

```
{-ttl <[<integer>h][<integer>m][<integer>s]>}
```

Use this parameter to display information only about the users cache configuration settings that have the
specified Time to Live.

```
{-negative-ttl <[<integer>h][<integer>m][<integer>s]>}
```

Use this parameter to display information only about the users cache configuration settings that have the
specified Negative Time to Live.

```
{-is-propagation-enabled {true|false}}
```

Use this parameter to display information only about the users cache configuration settings that have the
specified propagation enabled setting. Value `true` displays only the entries that have the propagation of
cached entries to users by id cache enabled and value `false` displays only the entries that have the
propagation of cached entries to users by id cache disabled.
### Examples
The following example shows the users cache configuration settings for all the Vservers:

```
cluster1::> vserver services name-service cache unix-user settings show
```

The following example shows the users cache configuration settings for Vserver vs0:

```
cluster1::> vserver services name-service cache unix-user settings show -vserver vs0
```

The following example shows the users cache configuration settings that have cache disabled:

```
cluster1::> vserver services name-service cache unix-user settings show -is-enabled false
```

---

**vserver services name-service cache unix-user user-by-id commands**

The user-by-id directory

vserver services name-service cache unix-user user-by-id delete

Delete an entry

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

**Description**
The `vserver services name-service cache unix-user user-by-id delete` command removes the user entries that are cached by the user identifier or UID. If user cache propagation is enabled, the corresponding user-by-name cache entry will also be removed.

**Parameters**

- **-vserver `<vserver name>` - Vserver**
  
  Use this parameter to specify the Vserver for which the user entries that are cached by the user identifier or UID need to be deleted.

- **-pw-uid `<integer>` - pw_uid field**
  
  Use this parameter to specify the user identifier or UID for which the cached entries need to be deleted.

---

**Examples**
The following example deletes all the user entries cached by the user identifier or UID for Vserver vs0 and user identifier or UID 123:

```
cluster1::> vserver services name-service cache unix-user user-by-id delete -vserver vs0 -pw-uid 123
```

---

vserver services name-service cache unix-user user-by-id delete-all

Delete all the entries for the vserver

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

**Description**
The `vserver services name-service cache unix-user user-by-id delete-all` command removes all the user entries that are cached by the user identifier or UID for the specified Vserver.
Parameters
-vserver <vserver name> - Vserver

Use this parameter to specify the Vserver for which the user entries that are cached by the user identifier or UID need to be deleted.

Examples
The following example deletes all the cached user entries for Vserver vs0:

```
cluster1::> vserver services name-service cache unix-user user-by-id delete-all -vserver vs0
```

Display password struct

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The vserver services name-service cache unix-user user-by-id show command displays the user information cached by the user identifier or UID.

Parameters

[-fields <fieldname>, ... ]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance ]

Use this parameter to display detailed information about the user entries cached by the user identifier or UID.

[-vserver <vserver name>] - Vserver

Use this parameter to specify the Vserver for which the user entries that are cached by the user identifier or UID need to be displayed.

[-pw-uid <integer>] - pw_uid field

Use this parameter to specify the user identifier or UID for which the cached entries need to be displayed.

[-pw-name <text>] - pw_name field

Use this parameter to display information only about the cached user entries that have the specified user identifier or UID.

[-pw-gid <integer>] - pw_gid field

Use this parameter to display information only about the cached user entries that have the specified group identifier or GID.

[-create-time <MM/DD/YYYY HH:MM:SS>] - Create Time

Use this parameter to display information only about the user entries that were cached at the specified time.

[-source {none|files|dns|nis|ldap|netgrp_byname}] - Source of the Entry

Use this parameter to display information only about the user entries cached by the user identifier or UID that have the specified lookup source.

Examples
The following example displays all the users which are cached by the user identifier or UID:

```
cluster1::> vserver services name-service cache unix-user user-by-id show
```

The following example displays all the users entries cached by the user identifier or UID for Vserver vs0:

```
cluster1::> vserver services name-service cache unix-user user-by-id show
```
vserver services name-service cache unix-user user-by-name delete

Delete an entry

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

**Description**
The `vserver services name-service cache unix-user user-by-name delete` command removes the user entries that are cached by the user name. If user cache propagation is enabled, the corresponding user-by-id cache will also be removed.

**Parameters**
- `-vserver <vserver name>` - Vserver
  
  Use this parameter to specify the Vserver for which the user entries that are cached by user name need to be deleted.

- `-pw-name <text>` - pw_name field
  
  Use this parameter to specify the user name for which the cached entries need to be deleted.

**Examples**
The following example deletes all the cached user entries for Vserver vs0 and user name abc:

```
cluster1::> vserver services name-service cache unix-user user-by-name delete -vserver vs0 -pw-name abc
```

vserver services name-service cache unix-user user-by-name delete-all

Delete all the entries for the vserver

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

**Description**
The `vserver services name-service cache unix-user user-by-name delete-all` command removes all the user entries that are cached by the user name for the specified Vserver.

**Parameters**
- `-vserver <vserver name>` - Vserver
  
  Use this parameter to specify the Vserver for which the user entries that are cached by user name need to be deleted.

**Examples**
The following example deletes all the cached user entries for Vserver vs0:

```
cluster1::> vserver services name-service cache unix-user user-by-name delete-all -vserver vs0
```

vserver services name-service cache unix-user user-by-name show

Display password struct

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.
Description
The vserver services name-service cache unix-user user-by-name show command displays the user information cached by the user name.

Parameters

{-fields <fieldname>, ...}
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

{-instance}
Use this parameter to display detailed information about the user entries cached by the user name.

{-vserver <vserver name> - Vserver}
Use this parameter to specify the Vserver for which the user entries that are cached by the user name need to be displayed.

{-pw-name <text> - pw_name field}
Use this parameter to display information only about the cached user entries that have the specified user name.

{-pw-uid <integer> - pw_uid field}
Use this parameter to display information only about the cached user entries that have the specified user identifier or UID.

{-pw-gid <integer> - pw_gid field}
Use this parameter to display information only about the cached user entries that have the specified group identifier or GID.

{-create-time <MM/DD/YYYY HH:MM:SS> - Create Time}
Use this parameter to display information only about the user entries that were cached at the specified time.

{-source {none|files|dns|nis|ldap|netgrp_byname} - Source of the Entry}
Use this parameter to display information only about the user entries cached by user name that have the specified look-up source.

Examples
The following example displays all the users which are cached by user name:

```
cluster1::> vserver services name-service cache unix-user user-by-name show
```

The following example displays all the users entries cached by user name for Vserver vs0:

```
cluster1::> vserver services name-service cache unix-user user-by-name show -vserver vs0
```

vserver services name-service dns commands
Manage DNS service

vserver services name-service dns check
Display validation status of a DNS configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
Use the vserver services name-service dns check command to check the status of configured DNS servers.
Parameters
[-fields <fieldname>, 
If you specify the -fields <fieldname>, parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

[-instance]
If you specify the -instance parameter, the command displays detailed information about all fields.

-vserver <vserver name> - Vserver
Use this parameter to specify the Vserver whose DNS mapping needs to be validated.

[-name-server <IP Address>] - Name Server
Use this parameter to display information only about name-servers that match the value you specify.

[-status {up|down}] - Name Server Status
Use this parameter to display information only about name-servers with a status that matches the value you specify.

[-status-details <text>] - Status Details
Use this parameter to display information only about name-servers with status details that match the value you specify.

Examples
The following example checks the DNS server mapping on the Vserver vs0:

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Name Server</th>
<th>Status</th>
<th>Status Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs0</td>
<td>10.11.12.13</td>
<td>up</td>
<td>Response time (msec): 55</td>
</tr>
<tr>
<td>vs0</td>
<td>10.11.12.14</td>
<td>up</td>
<td>Response time (msec): 70</td>
</tr>
<tr>
<td>vs0</td>
<td>10.11.12.15</td>
<td>down</td>
<td>Connection refused.</td>
</tr>
</tbody>
</table>

vserver services name-service dns create
Create a new DNS table entry

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver services name-service dns create command creates new DNS server mappings. DNS servers provide remote connection information, such as IP addresses, based on domain and system names.

Parameters
-vserver <vserver name> - Vserver
Use this parameter to specify the Vserver on which to create the new DNS server mapping.

-domains <text>, ... - Domains
Use this parameter to specify the domains of the Vserver. Separate multiple domains with commas.

-name-servers <IP Address>, ... - Name Servers
Use this parameter to specify the IP addresses of the DNS servers that provide name service for the domains in this DNS server mapping. Separate multiple addresses with commas.

[-timeout <integer>] - Timeout (secs)
Use this parameter to specify a timeout value (in seconds) for queries to the name servers. The default value is 2 seconds.
[-attempts <integer>] - Maximum Attempts
Use this parameter to specify the number of attempts the Vserver should make when querying the DNS name servers. The default value is 1 attempt.

[-is-tld-query-enabled {true|false}] - Is TLD Query Enabled? (privilege: advanced)
Use this parameter to enable or disable top-level domain (TLD) queries. If the parameter is set to false, the resolver will not attempt to resolve a name that has no "." characters in it. The default value for this parameter is true.

[-require-source-address-match {true|false}] - Require Source and Reply IPs to Match (privilege: advanced)
Use this parameter to allow dns responses sourced from an IP that does not match where the vserver sent the request. If the parameter is set to false, the resolver will allow response from an IP other than the one to which the request was sent. The default value for this parameter is true.

[-require-packet-query-match {true|false}] - Require Packet Queries to Match (privilege: advanced)
Use this parameter to check if the query section of the reply packet is equal to that of the query packet. If the parameter is set to false, the resolver will not check if the query section of the reply packet is equal to that of the query packet. The default value for this parameter is true.

[-skip-config-validation {true}] - Skip Configuration Validation
Use this parameter to skip the DNS configuration validation.
The domain name specified with the -domains is validated with the following rules:
• The name must contain only the following characters: A through Z, a through z, 0 through 9, ".", "+" or ".-".
• The first character of each label, delimited by ".", must be one of the following characters: A through Z or a through z or 0 through 9.
• The last character of each label, delimited by ".", must be one of the following characters: A through Z, a through z, or 0 through 9.
• The top level domain must contain only the following characters: A through Z, a through z.
• The maximum supported length is 254 characters.
• The system reserves the following names: "all", "local", and "localhost".
The hosts specified with the -name-servers parameter are validated to verify that each of the name servers is reachable, and is providing DNS services.
The validation fails, if the domain name is invalid, or there is no valid name server.

Examples
This example creates a new DNS server mapping for the Vserver vs0 in the domain example.com, specifying that 192.168.0.16 and 192.168.0.24 are the name servers for this domain.

    cluster1:/> vserver services name-service dns create -vserver vs0 -domains example.com -name-servers 192.168.0.16,192.168.0.24

vserver services name-service dns delete
Remove a DNS table entry
Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver services name-service dns delete command removes the DNS server mapping from a Vserver.
Deleting a DNS server mapping removes it permanently. If you delete a DNS server mapping, commands or jobs that do not use IP addresses do not succeed.

**Parameters**

- **vserver <vserver name>** - Vserver

  Use this parameter to specify the Vserver whose DNS server mapping is deleted.

**Examples**

This example removes the DNS server mapping from the Vserver node1.

```
cluster1::> vserver services name-service dns delete -vserver vs0
```

**vserver services name-service dns modify**

Change a DNS table entry

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

Use the `vserver services name-service dns modify` command to modify an existing DNS server mapping.

To permanently remove a mapping, use the `vserver services name-service dns delete` command.

**Parameters**

- **vserver <vserver name>** - Vserver

  Use this parameter to specify the Vserver whose DNS mapping is modified.

- **-domains <text>, ...** - Domains

  Use this parameter to specify a domain for the Vserver.

- **-name-servers <IP Address>, ...** - Name Servers

  Use this parameter to specify the IP addresses of the DNS name servers for this Vserver.

- **-timeout <integer>** - Timeout (secs)

  Use this parameter to specify a timeout value (in seconds) for queries to the DNS servers.

- **-attempts <integer>** - Maximum Attempts

  Use this parameter to specify the number of times to attempt queries to the DNS servers.

- **-is-tld-query-enabled {true|false}** - Is TLD Query Enabled? (privilege: advanced)

  Use this parameter to enable or disable top-level domain (TLD) queries. If the parameter is set to `false`, the resolver will not attempt to resolve a name that has no "." characters in it. The default value for this parameter is `true`.

- **-require-source-address-match {true|false}** - Require Source and Reply IPs to Match (privilege: advanced)

  Use this parameter to allow dns responses sourced from an IP that does not match where the vserver sent the request. If the parameter is set to `false`, the resolver will allow response from an IP other than the one to which the request was sent.

- **-require-packet-query-match {true|false}** - Require Packet Queries to Match (privilege: advanced)

  Use this parameter to check if the query section of the reply packet is equal to that of the query packet. If the parameter is set to `false`, the resolver will not check if the query section of the reply packet is equal to that of the query packet.
Use this parameter to skip the DNS configuration validation.

The domain name specified with the -domains is validated with the following rules:

- The name must contain only the following characters: A through Z, a through z, 0 through 9, ".", "," or ".".
- The first character of each label, delimited by ",", must be one of the following characters: A through Z or a through z or 0 through 9.
- The last character of each label, delimited by ",", must be one of the following characters: A through Z, a through z, or 0 through 9.
- The top level domain must contain only the following characters: A through Z, a through z.
- The maximum supported length is 254 characters.
- The system reserves the following names: "all", "local", and "localhost".

The hosts specified with the -name-servers parameter are validated to verify that each of the name servers is reachable, and is providing DNS services.

The validation fails, if the domain name is invalid, or there is no valid name server.

Examples

This example modifies the DNS server mapping for the domain example.com on the Vserver vs0, specifying that 10.0.0.1 and 10.0.0.2 are the name servers for this domain.

```
cluster1::> vserver services name-service dns modify -vserver vs0 -domains example.com -name-servers 10.0.0.1,10.0.0.2
```

vserver services name-service dns delete on page 2026

vserver services name-service dns show

Display DNS configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver services name-service dns show command displays information about DNS server mappings. DNS servers provide remote connection information, such as IP addresses, based on domain and system names.

Parameters

[-fields <fieldname>, ...]  
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

[[-instance]]  
If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vservename>] - Vserver  
Use this parameter to display information only about the DNS server mapping of the Vservers you specify.
[-domains <text>, ...] - Domains
  Use this parameter to display information only about the DNS server mappings for Vservers in the domains
  you specify.

[-name-servers <IP Address>, ...] - Name Servers
  Use this parameter to display information only about DNS server mappings that use the DNS name servers
  you specify.

[-timeout <integer>] - Timeout (secs)
  Use this parameter to display information only about DNS server mappings that have the timeout value you
  specify.

[-attempts <integer>] - Maximum Attempts
  Use this parameter to display information only about DNS server mappings that make the maximum number
  of attempts you specify.

[-is-tld-query-enabled {true|false}] - Is TLD Query Enabled? (privilege: advanced)
  Use this parameter to display information only about DNS server mappings that have the specified TLD query
  setting.

[-require-source-address-match {true|false}] - Require Source and Reply IPs to Match (privilege: advanced)
  Use this parameter to display information only about DNS server mappings that have the specified setting to
  require the source address of the response packet to match the address where the vserver sent the request.

[-require-packet-query-match {true|false}] - Require Packet Queries to Match (privilege: advanced)
  Use this parameter to display information only about DNS server mappings that have the specified setting to
  require the query section of the reply packet to match that of the query packet.

Examples
The following example shows typical output from the command. Note that cluster1 uses different name servers for
example.com.

```
cluster1::> vserver services name-service dns show
  Vserver     Domains                  Name Servers
  ---------   -----------------------   ------------------
  vs1        example.com              10.0.0.1,
             10.0.0.2
  vs2        example.com, example2.com 10.0.0.1,
             10.0.0.2
  vs3        example.com, example2.com 192.168.0.1,
             192.168.0.2
```

vserver services name-service dns dynamic-update commands
Manage Dynamic DNS Updates

vserver services name-service dns dynamic-update modify
Modify a Dynamic DNS Update Configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver services name-service dns dynamic-update modify command modifies the configuration for
dynamic DNS updates for a Data Vserver.
Parameters

-vserver <vserver name> - Vserver
Use this parameter to specify the Vserver for which you want to modify the dynamic DNS update configuration.

-[is-enabled {true|false}] - Is Dynamic DNS Update Enabled?
Use this parameter with value true to enable the dynamic DNS update feature. This field is set to false by default.

-[use-secure {true|false}] - Use Secure Dynamic Update?
Use this parameter with value true to enable secure dynamic DNS updates. This field is set to false by default.

-[vserver-fqdn <text>] - Vserver FQDN to Be Used for DNS Updates
Use this parameter to modify the Vserver FQDN to be used for dynamic DNS updates.

-[ttl <[<integer>h][<integer>m][<integer>s]>] - Time to Live for DNS Updates (privilege: advanced)
Use this parameter to modify the Time to Live value for the dynamic DNS updates. The default value is set to 24 hours. The maximum supported value for TTL is 720 hours.

-[skip-fqdn-validation {true}] - Skip Vserver FQDN Validation
If the parameter is specified, the FQDN name validation is skipped.

Examples

The following example enables the dynamic DNS update feature and modifies the FQDN to be used for dynamic DNS updates for the Vserver vs1, specifying vs1.abcd.com as the new FQDN.

```
class1::*> vserver services name-service dns dynamic-update modify -vserver vs1 -is-enabled true -vserver-fqdn vs1.abcd.com
```

The following example modifies the dynamic DNS updates configuration to only send secure updates to the DNS server configured for the Vserver vs1.

```
class1::*> vserver services name-service dns dynamic-update modify -vserver vs1 -is-enabled true -use-secure true
```

vserver services name-service dns dynamic-update prepare-to-downgrade

Disable the Dynamic DNS update feature to be compatible with releases earlier than Data ONTAP 8.3.1

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

The vserver services name-service dns dynamic-update prepare-to-downgrade command disables the Dynamic DNS updates on all Vservers and removes all related configurations. This command is used to prepare for downgrading the system to a release earlier than Data ONTAP 8.3.1 only.

Examples

The following example disables the dynamic DNS updates feature.

```
class1::*> vserver services name-service dns dynamic-update prepare-to-downgrade
Warning: This command will disable dynamic DNS updates on all Vservers, remove all related configurations, and disable the dynamic DNS update
```
vserver services name-service dns dynamic-update show

Display Dynamic DNS Update Configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver services name-service dns dynamic-update show command shows the dynamic DNS update configuration related to the DNS server for a Vserver.

Parameters

{-fields <fieldname>, ...}
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

{-instance}
If you specify the -instance parameter, the command displays detailed information about all fields.

{-vserver <vserver name>}
Vserver
Use this parameter to display dynamic DNS update configuration for the Vservers you specify.

{-is-enabled {true|false}}
Is Dynamic DNS Update Enabled?
Use this parameter with value true to display information about dynamic DNS update configurations that are active.

{-use-secure {true|false}}
Use Secure Dynamic Update?
Use this parameter with value true to display information about dynamic DNS update configurations that are set to send secure dynamic updates only.

{-vserver-fqdn <text>}
Vserver FQDN to Be Used for DNS Updates
Use this parameter to display information about dynamic DNS update configurations that are set to send the dynamic updates with the FQDN you have specified.

{-ttl <[<integer>h][<integer>m][<integer>s]>}
Time to Live for DNS Updates (privilege: advanced)
If you specify this parameter, the command displays dynamic DNS update configurations having the specified Time to Live value.

Examples
The following example shows all information about dynamic DNS update configurations.

```
cluster1::*> vserver services name-service dns dynamic-update show
gupgclust-3::> dns dynamic-update show
Vserver Is-Enabled Use-Secure Vserver FQDN TTL
------------- ---------- ---------- ------------------ ------
vs1     true     false     vs1.abcd.com      24h
vs2     false     false     vs2.abcd.com      24h
2 entries were displayed.
```

vserver services name-service dns dynamic-update record commands

The Record Directory
vserver services name-service dns dynamic-update record add

Adds a New DNS Resource Record

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The vserver services name-service dns dynamic-update record add command sends an update to add a new DNS resource record of an existing logical interface (LIF) of the Vserver to the configured DNS server.

Parameters

-vserver <vserver name> - Vserver
Use this parameter to specify the Vserver for which you want to add a resource record on the configured DNS server.

-lif <lif-name> - Logical Interface
Use this parameter to specify the Logical Interface(LIF) name for which you want to add a resource record on the configured DNS server.

Examples
The following example adds a resource record entry for the Logical Interface lif1 belonging to the Vserver vs1 to the configured DNS server.

```
cluster1::*> vserver services name-service dns dynamic-update record add -vserver vs1 -lif lif1
```

vserver services name-service dns dynamic-update record delete

Deletes a DNS Resource Record

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The vserver services name-service dns dynamic-update record delete command sends an update to remove an existing DNS resource record of the Logical Interface (LIF) of the Vserver from the configured DNS server.

Parameters

-vserver <vserver name> - Vserver
Use this parameter to specify the Vserver of which you want to delete a resource record from the configured DNS server.

{-lif <lif-name> - Logical Interface
Use this parameter to specify the Logical Interface(LIF) name whose corresponding resource record you want to remove from the configured DNS server.

{-address <IP Address}> - IP Address
Use this parameter to specify the IP address of the Logical Interface whose corresponding resource record you want to remove from the configured DNS server.

Examples
The following example removes a resource record entry of the Logical Interface lif1 belonging to the Vserver vs1 from the configured DNS server.
The following example removes a resource record entry of the Logical Interface whose address is 1.1.1.1 belonging to the Vserver vs1 from the configured DNS server.

```
cluster1::*> vserver services name-service dns dynamic-update record delete -vserver vs1 -lif lif1
```

**vserver services name-service dns hosts commands**

Manage local mapping for host names

**vserver services name-service dns hosts create**

Create a new host table entry

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

Use the `vserver services name-service dns hosts create` command to create new DNS host table entries. These entries map hostnames to IP addresses.

**Parameters**

- `-vserver <vserver name>` - Vserver
  
  Use this parameter to specify the Vserver on which the host table entry will be created.

- `-address <IP Address>` - IP Address
  
  Use this parameter to specify the IP address of the new host table entry.

- `-hostname <text>` - Canonical Hostname
  
  Use this parameter to specify the full hostname for the new host table entry.

- `[-aliases <text>, ...]` - Aliases
  
  Use this parameter to specify any aliases to include in the new host table entry. Separate multiple aliases with commas.

**Examples**

This example creates a new DNS host table entry for 10.0.0.17 on the vserver vs1, with the hostname test.example.com and the alias test.

```
cluster1::> vserver services name-service dns hosts create -vserver vs1 -address 10.0.0.17 -hostname test.example.com -aliases test
```

**vserver services name-service dns hosts delete**

Remove a host table entry

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

Use the `vserver services name-service dns hosts delete` command to delete DNS host table entries.
**Parameters**

-vserver `<vserver name>` - Vserver

Use this parameter to specify the Vserver whose host table entry will be deleted.

-address `<IP Address>` - IP Address

Use this parameter to specify the IP address of the host table entry to delete.

**Examples**

This example removes the DNS host table entry of 10.0.0.15 from the host table of the vserver vs1.

```
cluster1::> vserver services name-service dns hosts delete -vserver vs1 -address 10.0.0.16
1 entry was deleted.
```

**vserver services name-service dns hosts modify**

Modify hostname or aliases

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

Use the `vserver services name-service dns hosts modify` command to modify existing DNS host table entries.

**Parameters**

-vserver `<vserver name>` - Vserver

Use this parameter to specify the Vserver whose host table will be modified.

-address `<IP Address>` - IP Address

Use this parameter to specify the IP address of the host table entry to modify.

[-hostname `<text>`] - Canonical Hostname

Use this parameter to specify a full hostname for the host table entry.

[-aliases `<text>`, ...] - Aliases

Use this parameter to specify alternate hostnames for the host table entry.

**Examples**

This example changes the host table of vserver vs1 so that the hostname stored in the host table entry for 10.0.0.57 is pgh.example.com.

```
cluster1::> vserver services name-service dns hosts modify -vserver vs1 -address 10.0.0.57 -hostname pgh.example.com
1 entry was modified.
```

This example changes the host table of vserver vs1 to store the name loghost as an alternate hostname for IP address 10.0.0.5.

```
cluster1::> vserver services name-service dns hosts modify -vserver vs1 -address 10.0.0.5 -aliases loghost
1 entry was modified.
```

**vserver services name-service dns hosts show**

Display IP address to hostname mappings

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.
Description
Use the `vserver services name-service dns hosts show` command to display Domain Name System (DNS) host table entries. These entries map hostnames to IP addresses. Entries may also include alternate hostnames, known as aliases. Host table entries enable you to refer to other Internet hosts by a memorable name instead of by a numeric IP address. This host table is similar to the `/etc/hosts` file found on most UNIX style systems.

Parameters

```
([-fields <fieldname>, ...]
  If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

| [-instance ]
  If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver
  Use this parameter to display information only about host table entries on the Vservers you specify.

[-address <IP Address>] - IP Address
  Use this parameter to display information only about host table entries that match the IP addresses you specify.

[-hostname <text>] - Canonical Hostname
  Use this parameter to display information only about host table entries that match the hostnames you specify.

[-aliases <text>, ...] - Aliases
  Use this parameter to display information only about host table entries that include the alternate hostnames you specify.
```

Examples

The following example shows a typical host table.

```
cluster1::> vserver services name-service dns hosts show
Vserver  Address        Hostname        Aliases
        -------------- --------------- ----------------------
vs1      10.0.0.10      mail.example.com  mail, mailhost, snmp
vs1      10.0.0.15      ftp.example.com  ftp
vs1      10.0.0.16      www.example.com  www
vs2      10.0.0.10      mail.example.com  mail, mailhost, snmp
vs2      10.0.0.15      ftp.example.com  ftp
vs2      10.0.0.16      www.example.com  www
vs2      10.0.0.17      test.example.com
7 entries were displayed.
```

**vserver services name-service getxxbyyyy commands**

Execute `getXXbyYY` for the given command.

The `vserver services name-service getxxbyyyy` command performs name lookups for a given Vserver. The underlying service for doing the lookup is selected based on the configured name service switch order.

**vserver services name-service getxxbyyyy getaddrinfo**

Gets the IP address information by using the host name.

**Availability:** This command is available to `cluster` administrators at the `advanced` privilege level.
Description
The vserver services name-service getxxbyyy getaddrinfo gets the IP address information by using the host name for a given Vserver. The underlying service for doing the lookup is selected based on the configured name service switch order.

Parameters
- **node \(<\text{nodename}|\text{local}\)\) - Node Name
  Use this parameter to specify the node where the lookup will be performed
- **vserver \(<\text{vserver name}\)\) - Vserver Name
  Use this parameter to specify the Vserver where the lookup will be performed
- **hostname \(<\text{text}\)\) - Host Name
  Use this parameter to specify the Host Name for which the IP address information is needed
- \([-\text{address-family} \{ipv4|ipv6|all\}\)\) - Return Addresses for Family
  Use this parameter to specify the Address Family for which the IP address information is needed
- \([-\text{show-source} \{true|false\}\)\) - Show Source used for Lookup
  Use this parameter to specify if source used for lookup needs to be displayed
- \([-\text{use-cache} \{true\}\)\) - Enable/Disable cache
  If set to true, locally-cached values will be used. The default value is false.

Examples
The following example requests address information for localhost:

```
cluster1::*> vserver services name-service getxxbyyy getaddrinfo -node cluster1-01 -vserver vs1 -hostname localhost -address-family all -show-source true -use-cache false
Source used for Lookup: Files
Host name: localhost
Canonical name: localhost
IPv4 : 127.0.0.1
IPv6 : ::1
```

**vserver services name-service getxxbyyy getgrbygid**

Gets the group members by using the group identifier or GID.

**Availability:** This command is available to cluster administrators at the advanced privilege level.

Description
The vserver services name-service getxxbyyy getgrbygid gets the group members by using the group identifier or GID for a given Vserver. The underlying service for doing the lookup is selected based on the configured name service switch order.

Parameters
- **node \(<\text{nodename}|\text{local}\)\) - Node Name
  Use this parameter to specify the node where the lookup will be performed
- **vserver \(<\text{vserver name}\)\) - Vserver Name
  Use this parameter to specify the Vserver where the lookup will be performed
- **groupID \(<\text{integer}\)\) - Group ID
  Use this parameter to specify the GroupID for which the members are requested
[-show-source {true|false}] - Source used for Lookup
Use this parameter to specify if source used for lookup needs to be displayed

[-use-cache {true}] - Use Locally-Cached Values
If set to true, locally-cached values will be used. The default value is false.

Examples
The following example requests group information for the given groupid

```
cluster1::>* vserver services name-service getxxbyyy getgrbygid -node cluster1-01 -vserver vs1 -groupID 1
name: daemon
gid: 1
```

vserver services name-service getxxbyyy getgrbyname

Gets the group members by using the group name.

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The vserver services name-service getxxbyyy getgrbyname gets the group members by using the group name.

Parameters
-node {<nodename>|local} - Node Name
Use this parameter to specify the node where the lookup will be performed

-vserver <vserver name> - Vserver Name
Use this parameter to specify the Vserver where the lookup will be performed

-groupname <text> - Group Name
Use this parameter to specify the Group Name for which the members are requested

[-show-source {true|false}] - Source used for Lookup
Use this parameter to specify if source used for lookup needs to be displayed

[-use-cache {true}] - Use Locally-Cached Values
If set to true, locally-cached values will be used. The default value is false.

Examples
The following example requests group information for the given group name

```
cluster1::>* vserver services name-service getxxbyyy getgrbyname -node cluster1-01 -vserver vs1 -groupname daemon -show-source false
name: daemon
gid: 1
```

vserver services name-service getxxbyyy getgrlist

Gets the group list by using the user name.

Availability: This command is available to cluster administrators at the advanced privilege level.
Description
The `vserver services name-service getxxbyyy getgrlist` gets the list of groups to which user belongs. This command will go through all the sources configured for the group database in the name servers ns-switch configuration.

Parameters
- `-node <nodename>|local` - Node Name
  Use this parameter to specify the node where the lookup will be performed
- `-vserver <vserver name>` - Vserver Name
  Use this parameter to specify the Vserver where the lookup will be performed
- `-username <text>` - User Name
  Use this parameter to retrieve the list of groups where the given user is a member
- `[-use-cache [true]]` - Use Locally-Cached Values
  If set to `true`, locally-cached values will be used. The default value is `false`.

Examples
The following example requests the grouplist for the given username

```
$ cluster1::*> vserver services name-service getxxbyyy getgrlist -node cluster1-01 -vserver vs1 -username root
pw_name: root
Groups: 5
```

`vserver services name-service getxxbyyy gethostbyaddr`

Gets the host information from the IP address.

Availability: This command is available to cluster administrators at the `advanced` privilege level.

Description
The `vserver services name-service getxxbyyy gethostbyaddr` gets the host name by using the IP address. The underlying service for doing the lookup is selected based on the configured name service switch order.

Parameters
- `-node <nodename>|local` - Node Name
  Use this parameter to specify the node where the lookup will be performed
- `-vserver <vserver name>` - Vserver Name
  Use this parameter to specify the Vserver where the lookup will be performed
- `-ipaddress <IP Address>` - IP Address
  Use this parameter to specify the IPv4/IPv6 address for which the host information is needed
- `[-show-source {true|false}]` - Source used for Lookup
  Use this parameter to specify if source used for lookup needs to be displayed
- `[-use-cache [true]]` - Enable/Disable cache
  If set to `true`, locally-cached values will be used. The default value is `false`.

Examples
The following example requests host information for the given IP address:
**vserver services name-service getxxbyyy gethostbyname**

Gets the IP address information from host name.

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**
The `vserver services name-service getxxbyyy gethostbyname` gets the IP address by using the host name. The underlying service for doing the lookup is selected based on the configured name service switch order. When the look up happens from the hosts file, only the first IP address is returned for a host configured with multiple IP addresses.

**Parameters**
- `node {<nodename>|local}` - Node Name
  
  Node Use this parameter to specify the node where the lookup will be performed.
- `vserver <vserver name>` - Vserver Name
  
  Vserver Name Use this parameter to specify the Vserver where the lookup will be performed.
- `hostname <text>` - Host Name
  
  Use this parameter to specify the Hostname for which the IP address information is requested.
- `[-show-source {true|false}]` - Source used for Lookup
  
  Use this parameter to specify if source used for lookup needs to be displayed.

**Examples**
The following example requests IP Address information from the given hostname

```text
cluster1::*> vserver services name-service getxxbyyy gethostbyname -node cluster1-01 -vserver
val -hostname localhost -show-source false -use-cache false
IP address: 127.0.0.1
Host name: localhost
```

**vserver services name-service getxxbyyy getnameinfo**

Gets the name information by using the IP address.

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**
The `vserver services name-service getxxbyyy getnameinfo` gets the host and service by using the socket address. The underlying service for doing the lookup is selected based on the configured name service switch order.

**Parameters**
- `node {<nodename>|local}` - Node Name
  
  Use this parameter to specify the node where the lookup will be performed.

```text
cluster1::*> vserver services name-service getxxbyyy getnameinfo -node cluster1-01 -vserver
val -hostname localhost -show-source false
Host name: localhost
 Canonical name: localhost
 IPv4: 127.0.0.1
```
-vserver <vserver name> - Vserver Name
   Use this parameter to specify the Vserver where the lookup will be performed

-<ipaddress IP Address> - IP Address
   Use this parameter to specify IPv4/IPv6 address for which the name information is requested

[-show-source {true|false}] - Source used for Lookup
   Use this parameter to specify if source used for lookup needs to be displayed

[-use-cache {true}] - Enable/Disable cache
   If set to true, locally-cached values will be used. The default value is false.

Examples
The following example gets the name information for the given IP Address:

```
cluster1::*> vserver services name-service getxxbyyy getnameinfo -node cluster1-01 -
vserver vs1 -ipaddress 127.0.0.1 -show-source false -use-cache false
IP address: 127.0.0.1
Host name: localhost
```

vserver services name-service getxxbyyy getpwbyname

Gets the password entry by using the user name.

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The vserver services name-service getxxbyyy getpwbyname gets the password entry by using the user name. The underlying service for doing the lookup is selected based on the configured name service switch order.

Parameters
-<node {<nodename>|local}] - Node Name
   Use this parameter to specify the node where the lookup will be performed

-<vserver name> - Vserver Name
   Use this parameter to specify the Vserver where the lookup will be performed

-<username text> - User Name
   Use this parameter to specify the Username for which the password entry is requested

[-show-source {true|false}] - Source used for Lookup
   Use this parameter to specify if source used for lookup needs to be displayed

[-use-cache {true}] - Enable/Disable cache
   If set to true, locally-cached values will be used. The default value is false.

Examples
The following example requests password entry from the given username:

```
cluster1::*> vserver services name-service getxxbyyy getpwbyname -node cluster1-01 -vserver
vs1 -username vsadmin -show-source true -use-rbac false -use-cache false
   Source used for lookup: Files
        pw_name: daemon
        pw_passwd: *  
        pw_uid: 1, pw_gid: 1
```
vserver services name-service getxxbyyy getpwbyuid

Gets the password entry by using the user identifier or UID.

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**
The `vserver services name-service getxxbyyy getpwbyuid` gets the password entry by using the user identifier or UID. The underlying service for doing the lookup is selected based on the configured name service switch order.

**Parameters**
- `-node {<nodename>|local}` - Node Name
  
  Use this parameter to specify the node where the lookup will be performed.
- `-vserver <vserver name>` - Vserver Name
  
  Use this parameter to specify the Vserver where the lookup will be performed.
- `-userID <integer>` - User ID
  
  Use this parameter to specify the UserID for whom the password entry is requested.
- `[--show-source {true|false}]` - Source used for Lookup
  
  Use this parameter to specify if source used for lookup needs to be displayed.
- `[--use-cache {true}]` - Enable/Disable cache
  
  If set to `true`, locally-cached values will be used. The default value is `false`.

**Examples**
The following example requests password entry by using the user ID:

```bash
cluster1::*> vserver services name-service getxxbyyy getpwbyuid -node cluster1-01 -vserver vs1 -userID 1001 -show-source true -use-rbac true -use-cache false
Source used for Lookup: Files
pw_name: vsadmin
pw_passwd: $1$f7b22f685KihTlptYqpEjcM4jfE60f0
pw_uid: 1001
pw_gid: 65533
pw_gecos: User
pw_dir: /var/home/vsadmin
pw_shell: /sbin/ngsh
```

vserver services name-service getxxbyyy netgrp

Checks if a client is part of a netgroup.

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**
The `vserver services name-service getxxbyyy netgrp` checks if a client is part of a netgroup. The underlying service for doing the lookup is selected based on the configured name service switch order.
Parameters
- **node** `{<nodename>|local}` - Node Name
  Use this parameter to specify the node where the lookup will be performed

- **vserver** `{vserver name}` - Vserver Name
  Use this parameter to specify the Vserver where the lookup will be performed

- **netgroup** `<text>` - Netgroup Name
  Use this parameter to specify the Netgroup name

- **client-name** `<text>` - Client Name
  Use this parameter to specify the Client name for which the membership in a given netgroup needs to be checked

- [-**show-source** `{true|false}`] - Source used for Lookup
  Use this parameter to specify if source used for lookup needs to be displayed

Examples
The following example checks if the given client is part of the given netgroup:

```
  cluster1::*> vserver services name-service getxxbyyy netgrp -node cluster1-01 -vserver vs1
  -netgroup net1 -client-name h1 -show-source false
  h1 is a member of net1
```

**vserver services name-service getxxbyyy netgrpbyhost**

Check if a client is part of a netgroup using netgroup-by-host query

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**
The `vserver services name-service getxxbyyy netgrpbyhost` command checks whether a client is part of a netgroup using the netgroup.byhost map. The underlying service for doing the lookup is selected based on the configured name service switch order.

**Parameters**
- **node** `{<nodename>|local}` - Node Name
  Use this parameter to specify the node where the lookup will be performed.

- **vserver** `{vserver name}` - Vserver Name
  Use this parameter to specify the Vserver where the lookup will be performed.

- **netgroup** `<text>` - Netgroup Name
  Use this parameter to specify the netgroup name.

- **clientIP** `{IP Address}` - Client IP Address
  Use this parameter to specify the client IPv4/IPv6 address for which you want to check the membership in a given netgroup.

- [-**enable-domain-search-flag** `{true|false}`] - Use DNS domain
  Use this parameter to specify whether you want to perform shortname host lookups in case the configured DNS search domains match the domain returned by the reverse lookup.

- [-**show-source** `{true|false}`] - Source Used for Lookup
  Use this parameter to specify whether you want to display the source used for the lookup.
vserver services name-service getxxbyyy netgrpcheck

Check if a client is part of a netgroup using combined API

**Availability:** This command is available to cluster administrators at the *advanced* privilege level.

**Description**
The `vserver services name-service getxxbyyy netgrpcheck` checks if a client is part of a netgroup. The underlying service for doing the lookup is selected based on the configured name service switch order.

**Parameters**
- `--node {<nodename>|local}` - Node Name
  
  Use this parameter to specify the node where the lookup will be performed

- `--vserver <vserver name>` - Vserver Name
  
  Use this parameter to specify the Vserver where the lookup will be performed

- `--netgroup <text>` - Netgroup Name
  
  Use this parameter to specify the Netgroup name

- `--clientIP <IP Address>` - Client IP Address
  
  Use this parameter to specify the Client IP for which the membership in a given netgroup needs to be checked

  [--enable-domain-search-flag {true|false}] - Use DNS domain
  
  Use this parameter to use DNS domain. Default value for this field is true

  [--trust-any-source {true|false}] - Trust any source
  
  Use this parameter to set trust any source parameter. Default value for this field is false

  [--show-source {true|false}] - Source Used for Lookup
  
  Use this parameter to specify if source used for lookup needs to be displayed

**Examples**
The following example checks if the given client is part of the given netgroup:

```
cluster1::* vserver services name-service getxxbyyy netgrpcheck --node cluster1-01 --vserver vs1 --netgroup net1 --clientIP 10.232.98.198 --show-source false
10.232.98.198 is a member of net1
```

vserver services name-service ldap commands

Manage LDAP configuration
vserver services name-service ldap check

Display validation status of a LDAP configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
Use the vserver services name-service ldap check command to check the status of the LDAP configuration.

Parameters
{-fields <fieldname>, ...}
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

|-instance |
If you specify the -instance parameter, the command displays detailed information about all fields.

-vserver <Vserver Name> - Vserver
Use this parameter to specify the Vserver whose LDAP configuration needs to be validated.

[-client-config <text>] - Client Configuration Name
Use this parameter to specify the LDAP client configuration which is assigned to LDAP configuration for the specified Vserver.

[-ldap-status {up|down}] - LDAP Status
Use this parameter to display information only about LDAP configurations with a status that matches the value you specify.

[-ldap-status-details <text>] - LDAP Status Details
Use this parameter to display information only about LDAP configurations with a status detail that matches the value you specify.

Examples
The following example checks the LDAP configuration on the Vserver vs0:

```
cluster1::> vserver services name-service ldap check -vserver vs0
Vserver: vs0
Client Configuration Name: cl
LDAP Status: up
LDAP Status Details: Successfully connected to LDAP server "10.11.12.13".
```

vserver services name-service ldap create

Create an LDAP configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver services name-service ldap create command associates an LDAP client configuration with a Vserver.

Parameters
-vserver <Vserver Name> - Vserver
This parameter specifies the Vserver with which you want to associate the LDAP client configuration. A data Vserver or admin Vserver can be specified.
-client-config <text> - LDAP Client Configuration

This parameter specifies the name of the LDAP client configuration, defined under the `vserver services name-service ldap client` command, that you want to associate with the Vserver. The value of the bind-as-cifs-server parameter on this LDAP client should be false, if the CIFS server of the associated data Vserver does not exist or exists in workgroup mode.

[-skip-config-validation [true]] - Skip Configuration Validation

Use this parameter to skip the LDAP configuration validation.

The LDAP client configuration, specified by the `-client-config` parameter, that you want to associate with the Vserver is validated to verify that at least one of the LDAP servers is reachable, and is providing LDAP services.

The validation fails if ONTAP was unable to connect to any LDAP server with the specified `-client-config`.

Examples

The following example associates the LDAP client configuration "corp" with the Vserver "vs1":

```
cluster1::> vserver services name-service ldap create -vserver vs1 -client-config corp
```

vserver services name-service ldap delete

Delete an LDAP configuration

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**
The `vserver services name-service ldap delete` command removes the LDAP configuration, which is an LDAP client configuration's association with a Vserver.

**Note:** Make sure that you remove 'ldap' from the Vserver's `-ns-switch` and `-nm-switch` parameters and test connectivity before deleting a working LDAP configuration.

**Parameters**

- `<Vserver Name>` - Vserver

  This parameter specifies the Vserver from which you want to disassociate the LDAP client configuration. A data Vserver or admin Vserver can be specified.

Examples

The following example disassociates the current LDAP client configuration from Vserver "vs1".

```
cluster1::> vserver services name-service ldap delete -vserver vs1
```

vserver services name-service ldap modify

Modify an LDAP configuration

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.
Description

The `vserver services name-service ldap modify` command modifies an LDAP client configuration’s association with a Vserver.

**Note:** Make sure that you remove 'ldap' from the Vserver's `-ns-switch` and `-nm-switch` configurations and test connectivity before disabling a working LDAP configuration.

Parameters

* `-vserver <Vserver Name>` - Vserver
  This parameter specifies the Vserver with which you want to associate the LDAP client configuration. A data Vserver or admin Vserver can be specified.

* `-client-config <text>` - LDAP Client Configuration
  This parameter specifies the name of the LDAP client configuration, defined under `vserver services name-service ldap client` command, that you want to associate with the Vserver. The value of the `bind-as-cifs-server` parameter on this LDAP client should be false if the CIFS server of the associated data Vserver does not exist or exists in workgroup mode.

* `-skip-config-validation [true]` - Skip Configuration Validation
  Use this parameter to skip the LDAP configuration validation.
  The LDAP client configuration, specified by the `-client-config` parameter, that you want to associate with the Vserver is validated to verify that at least one of the LDAP servers is reachable, and is providing LDAP services.
  If ONTAP was unable to connect to any LDAP server with the specified `-client-config`.

Examples

The following example modifies the LDAP client configuration used by Vserver "vs1" to "corpnew":

```
cluster1::> vserver services name-service ldap modify -vserver vs1 -client-config corpnew
```

`vserver services name-service ldap client` on page 2047

`vserver services name-service ldap show`

Display LDAP configurations

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**

The `vserver services name-service ldap show` command displays information about LDAP configurations.

**Parameters**

* `{-fields <fieldname>, ...}`
  If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

* `{-instance}`
  If you specify the `-instance` parameter, the command displays detailed information about all fields.
[-vserver <Vserver Name>] - Vserver
If you specify this parameter, the command displays information about the LDAP configuration on the specified Vserver. A data Vserver or admin Vserver can be specified.

[-client-config <text>] - LDAP Client Configuration
If you specify this parameter, the command displays information about LDAP configurations using the specified client.

Examples
The following example shows the LDAP configuration for Vserver "vs1":

```
cluster1::> vserver services name-service ldap show -vserver vs1
Client          Vserver        Configuration
----------------- ------------- --------------
vs1              corp
```

vserver services name-service ldap client commands
Manage LDAP client configurations

**vserver services name-service ldap client create**
Create an LDAP client configuration

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver services name-service ldap client create` command creates an LDAP client configuration. A client configuration is associated with a Vserver using the `vserver services name-service ldap` commands.

**Parameters**

- **-vserver <Vserver Name>** - Vserver
  This parameter specifies the Vserver for which configuration is created. A data Vserver or admin Vserver can be specified.

- **-client-config <text>** - Client Configuration Name
  This parameter specifies the name that you would like to use to refer to the new LDAP client configuration.

- **{-ldap-servers <text>, ...}** - LDAPP Server List
  This parameter specifies the list of LDAP servers used when making LDAP connections using this client configuration. If you specify this parameter, you cannot specify the `-servers`, `-ad-domain`, `-preferred-ad-servers` or `-bind-as-cifs-server` parameters. This parameter takes both FQDNs and IP addresses.

- **{-servers <IP Address>, ...}** (DEPRECATED) - LDAPP Server List
  (DEPRECATED) This parameter specifies the list of LDAP servers used when making LDAP connections using this client configuration. If you specify this parameter, you cannot specify the `-ldap-servers`, `-ad-domain`, `-preferred-ad-servers` or `-bind-as-cifs-server` parameters. This parameter is deprecated 9.1.0 and onwards. Use `-ldap-servers` instead.

- **-ad-domain <TextNoCase>** - Active Directory Domain
  This parameter specifies the name of the Active Directory domain used to discover LDAP servers for use by this client. This assumes that the Active Directory schema has been extended to act as a NIS replacement. If you use this parameter, you cannot specify the `-ldap-servers` and `-servers` parameter. However, you can specify a list of preferred servers using the `-preferred-ad-servers` parameter.
-preferred-ad-servers <IP Address>, ... - Preferred Active Directory Servers

This parameter specifies a list of LDAP servers that are preferred over those that are discovered in the domain specified in the -ad-domain parameter.

/bind-as-cifs-server {true|false}] - Bind Using the Vserver's CIFS Credentials

This parameter specifies whether LDAP binds made using this client configuration use the Vserver's CIFS server credentials. If you do not specify this parameter, and the -ad-domain is configured, the default is true, otherwise the default is false.

/schema <text> - Schema Template

This parameter specifies the name of the schema template the Vserver uses when making LDAP queries. You can view and modify the templates using the vserver services name-service ldap client schema commands.

/port <integer>] - LDAP Server Port

This parameter specifies the port that the LDAP client uses to connect to LDAP servers. If you do not specify this parameter, the default is port 389.

/query-timeout <integer>] - Query Timeout (sec)

This parameter specifies the amount of time (in seconds) that the LDAP client waits for a query to complete. If you do not specify this parameter, the default is 3 seconds.

/min-bind-level {anonymous|simple|sasl}] - Minimum Bind Authentication Level

This parameter specifies the lowest acceptable level of security the LDAP client uses to bind to an LDAP server. If you do not specify this parameter, the default is an anonymous bind.

/bind-dn <ldap_dn>] - Bind DN (User)

This parameter specifies the user that binds to the LDAP servers. For Active Directory servers, specify the user in the account (DOMAIN\user) or principal (user@domain.com) form. Otherwise, specify the user in distinguished name (CN=user,DC=domain,DC=com) form. This parameter is ignored if -bind-as-cifs-server is set.

/base-dn <ldap_dn>] - Base DN

This parameter specifies the default base DN for all searches, including user, group, and netgroup searches. For example, “DC=example,DC=com”. If you do not specify this parameter, the default is the root, specified by an empty (“” ) set.

/base-scope {base|onelevel|subtree}] - Base Search Scope

This parameter specifies the default search scope for LDAP queries. Specify base to search just the named entry, onelevel to search entries immediately below the DN, or subtree to search the named DN entry and the entire subtree below the DN. If you do not specify this parameter, the scope is set to subtree by default.

/user-dn <ldap_dn>] - User DN (privilege: advanced)

This parameter specifies the user DN, which overrides the base DN for user lookups.

    Note: To specify multiple DNs, separate multiple DN entries with semicolons (;). If you configure multiple user or group DNs and a DN contains a semicolon, add an escape character (\) immediately before the semicolon or enclose the entire DN with quotation marks (" ).

/user-scope {base|onelevel|subtree}] - User Search Scope (privilege: advanced)

This parameter specifies the user search scope. If you do not specify this parameter, the scope is set to subtree by default.

/group-dn <ldap_dn>] - Group DN (privilege: advanced)

This parameter specifies the group DN, which overrides the base DN for group lookups.

    Note: To specify multiple DNs, separate multiple DN entries with semicolons (;). If you configure multiple user or group DNs and a DN contains a semicolon, add an escape character (\) immediately before the semicolon or enclose the entire DN with quotation marks (" ).
[-group-scope {base|onelevel|subtree}] - Group Search Scope (privilege: advanced)
This parameter specifies the group search scope. If you do not specify this parameter, the scope is set to subtree by default.

[-netgroup-dn <ldap_dn>] - Netgroup DN (privilege: advanced)
This parameter specifies the netgroup DN, which overrides the base DN netgroup lookups.

   Note: To specify multiple DNs, separate multiple DN entries with semicolons (;). If you configure multiple netgroup DNs and a DN contains a semicolon, add an escape character (\) immediately before the semicolon or enclose the entire DN with quotation marks (").

[-netgroup-scope {base|onelevel|subtree}] - Netgroup Search Scope (privilege: advanced)
This parameter specifies the netgroup search scope. If you do not specify this parameter, the scope is set to subtree by default.

[-use-start-tls {true|false}] - Use start-tls Over LDAP Connections
This parameter specifies whether or not to use Start TLS over LDAP connections. When enabled, the communication between the Data ONTAP LDAP Client and the LDAP Server will be encrypted using Start TLS. Start TLS is a mechanism to provide secure communication by using the TLS/SSL protocols. If you do not specify this parameter, the default is false.

[-is-netgroup-byhost-enabled {true|false}] - Enable Netgroup-By-Host Lookup (privilege: advanced)
Use this parameter to enable or disable netgroup-by-host lookup. If your LDAP directory contains map structures equivalent to the netgroup.byhost map in NIS, enabling this feature greatly speeds up netgroup resolution queries over LDAP. By default this parameter is set to false.

[-netgroup-byhost-dn <ldap_dn>] - Netgroup-By-Host DN (privilege: advanced)
This parameter specifies the netgroup-by-host DN, which overrides the base DN for netgroup-by-host lookups.

   Note: To specify multiple DNs, separate multiple DN entries with semicolons (;). If you configure multiple netgroup DNs and a DN contains a semicolon, add an escape character (\) immediately before the semicolon or enclose the entire DN with quotation marks (").

[-netgroup-byhost-scope {base|onelevel|subtree}] - Netgroup-By-Host Scope (privilege: advanced)
This parameter specifies the netgroup-by-host search scope for LDAP queries. If you do not specify this parameter, the scope is set to subtree by default.

[-session-security {none|sign|seal}] - Client Session Security
This parameter specifies the level of security to be used for LDAP communications. If you do not specify this parameter, the default is none.

   LDAP Client Session Security can be one of the following:
   • none - No Signing or Sealing.
   • sign - Sign LDAP traffic.
   • seal - Seal and Sign LDAP traffic.

Examples
The following example creates an LDAP client configuration named corp that makes anonymous binds to ldapserver.example.com for Vserver vs1:

   cluster1::> vserver services name-service ldap client create -vserver vs1 -client-config corp -ldap-servers ldapserver.example.com
The following example creates an LDAP client configuration named **corp** that makes binds to **ldapserver.example.com** for Vserver **vs1** for bind-dn **diag**:

```
cluster1::> vserver services name-service ldap client create -vserver vs1 -client-config corp -ldap-servers ldapserver.example.com -bind-dn diag
Please enter password:
Confirm password:
```

The following example creates an LDAP client configuration with multiple user DNs.

**Note:** The following commands are only available in advanced mode.

```
cluster1::*> vserver services ldap client create -vserver vs1 -client-config corp -ldap-servers ldapserver.example.com -user-dn "ou=People,dc=mypc,dc=example,dc=com; ou=People1,dc=mypc1,dc=example2,dc=com"
```

The following example creates an LDAP client configuration with multiple user DNs, one of them containing a semicolon

```
cluster1::*> vserver services ldap client create -vserver vs1 -client-config corp -ldap-servers ldapserver.example.com -user-dn "ou=People,dc=mypc,dc=example,dc=com; ou=People1,dc=mypc1,dc=example2,dc=com"
```

The following example creates an LDAP client configuration with multiple user DNs, one of them containing a semicolon and a backslash.

```
cluster1::*> vserver services ldap client create -vserver vs1 -client-config corp -ldap-servers ldapserver.example.com -user-dn "ou=People\;dc=mypc,dc=example,dc=com\; ou=People1,dc=mypc1,dc=example2,dc=com"
```

The following example creates an LDAP client configuration with netgroup by host DN.

```
cluster1::*> vserver services ldap client create -vserver vs1 -client-config corp -ldap-servers ldapserver.example.com -netgroup-byhost-dn nisMapName="netgroup.byhost",dc=rfcbis,dc=com
```

The following example creates an LDAP client configuration with ldap-servers as list of ip addresses.

```
cluster1::*> vserver services ldap client create -vserver vs1 -client-config corp -ldap-servers 172.16.0.100,172.16.0.101 -netgroup-byhost-dn nisMapName="netgroup.byhost",dc=rfcbis,dc=com
```

The following example creates an LDAP client configuration with ldap-servers as list of ip addresses and hostnames.

```
cluster1::*> vserver services ldap client create -vserver vs1 -client-config corp -ldap-servers ldapserver.example.com,172.16.0.100,172.16.0.101 -netgroup-byhost-dn nisMapName="netgroup.byhost",dc=rfcbis,dc=com
```

**vserver services name-service ldap client delete**
Delete an LDAP client configuration

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver services name-service ldap client delete` command deletes an LDAP client configuration. A Vserver administrator can only delete configurations owned by the Vserver.

**Parameters**

- `[-vserver <Vserver Name>] - Vserver`
  This parameter specifies the name of the Vserver which owns the LDAP client you want to delete. A data Vserver or admin Vserver can be specified.

- `[-client-config <text>] - Client Configuration Name`
  This parameter specifies the name of the LDAP client configuration you want to delete.

**Examples**
The following example deletes an LDAP client configuration named *corp* owned by Vserver *vs1*:

```
cluster1::> vserver services name-service ldap client delete -vserver vs1 -client-config corp
```

**vserver services name-service ldap client modify**
Modify an LDAP client configuration

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver services name-service ldap client modify` command modifies an LDAP client configuration. A Vserver administrator can modify only configurations owned by the Vserver.

**Parameters**

- `[-vserver <Vserver Name>] - Vserver`
  This parameter specifies the name of the Vserver which owns the LDAP client you want to modify. A data Vserver or admin Vserver can be specified.

- `[-client-config <text>] - Client Configuration Name`
  This parameter specifies the name of the LDAP client configuration.

- `[-ldap-servers <text>, ...] - LDAP Server List`
  This parameter specifies the list of LDAP servers used when making LDAP connections using this client configuration. If you specify this parameter, you cannot specify the `-servers`, `-ad-domain`, `-preferred-ad-servers` or `-bind-as-cifs-server` parameters.

- `[-servers <IP Address>, ...] - (DEPRECATED)-LDAP Server List`
  (DEPRECATED)This parameter specifies the list of LDAP servers used when making LDAP connections using this client configuration. If you specify this parameter, you cannot specify the `-ldap-servers`, `-ad-domain`, `-preferred-ad-servers` or `-bind-as-cifs-server` parameters. This parameter is deprecated 9.1.0 and onwards. Use `-ldap-servers` instead.
[-ad-domain <TextNoCase>] - Active Directory Domain
   This parameter specifies the name of the Active Directory domain used to discover LDAP servers for use by this client. This assumes that the Active Directory schema has been extended to act as a NIS replacement. If you use this parameter, you cannot specify the -servers, -ldap-servers parameter. However, you can specify a list of preferred servers using the -preferred-ad-servers parameter.

[-preferred-ad-servers <IP Address>, ...] - Preferred Active Directory Servers
   This parameter specifies a list of LDAP servers that are preferred over those that are discovered in the domain specified in the -ad-domain parameter.

[-bind-as-cifs-server {true|false}] - Bind Using the Vserver's CIFS Credentials
   This parameter specifies whether or not LDAP binds made using this client configuration use the Vserver's CIFS server credentials. If you do not specify this parameter, the default is false.

[-schema <text>] - Schema Template
   This parameter specifies the name of the schema template the Vserver uses when making LDAP queries. You can view and modify the templates using the vserver services name-service ldap client schema commands.

[-port <integer>] - LDAP Server Port
   This parameter specifies the port that the LDAP client uses to connect to LDAP servers. If you do not specify this parameter, the default is port 389.

[-query-timeout <integer>] - Query Timeout (sec)
   This parameter specifies the amount of time (in seconds) that the LDAP client waits for a query to complete. If you do not specify this parameter, the default is 3 seconds.

[-min-bind-level {anonymous|simple|sasl}] - Minimum Bind Authentication Level
   This parameter specifies the lowest acceptable level of security the LDAP client uses to bind to an LDAP server. If you do not specify this parameter, the default is an anonymous bind.

[-bind-dn <ldap_dn>] - Bind DN (User)
   This parameter specifies the user that binds to the LDAP servers. For Active Directory servers, specify the user in the account (DOMAIN\user) or principal (user@domain.com) form. Otherwise, specify the user in distinguished name (CN=user,DC=domain,DC=com) form. This parameter is ignored if -bind-as-cifs-server is set.

[-base-dn <ldap_dn>] - Base DN
   This parameter specifies the default base DN for all searches, including user, group, and netgroup searches. For example, "DC=example,DC=com". If you do not specify this parameter, the default is the root, specified by an empty ("") set.

[-base-scope {base|onelevel|subtree}] - Base Search Scope
   This parameter specifies the default search scope for LDAP queries. Specify base to search just the named entry, onelevel to search entries immediately below the DN, or subtree to search the named DN entry and the entire subtree below the DN. If you do not specify this parameter, the scope is set to subtree by default.

[-user-dn <ldap_dn>] - User DN (privilege: advanced)
   This parameter specifies the user DN, which overrides the base DN for user lookups.
   Note: To specify multiple DNs, separate multiple DN entries with semicolons (;). If you configure multiple user or group DNs and a DN contains a semicolon, add an escape character ('\') immediately before the semicolon or enclose the entire DN with quotation marks ("').

[-user-scope {base|onelevel|subtree}] - User Search Scope (privilege: advanced)
   This parameter specifies the user search scope. If you do not specify this parameter, the scope is set to subtree by default.
[-group-dn <ldap_dn>] - Group DN (privilege: advanced)

This parameter specifies the group DN, which overrides the base DN for group lookups.

Note: To specify multiple DNs, separate multiple DN entries with semicolons (;). If you configure multiple
user or group DNs and a DN contains a semicolon, add an escape character ('\') immediately before the
semicolon or enclose the entire DN with quotation marks ('"').

[-group-scope {base|onelevel|subtree}] - Group Search Scope (privilege: advanced)

This parameter specifies the group search scope. If you do not specify this parameter, the scope is set to
subtree by default.

[-netgroup-dn <ldap_dn>] - Netgroup DN (privilege: advanced)

This parameter specifies the netgroup DN, which overrides the base DN netgroup lookups.

Note: To specify multiple DNs, separate multiple DN entries with semicolons (;). If you configure multiple
netgroup DNs and a DN contains a semicolon, add an escape character ('\') immediately before the
semicolon or enclose the entire DN with quotation marks ('"').

[-netgroup-scope {base|onelevel|subtree}] - Netgroup Search Scope (privilege: advanced)

This parameter specifies the netgroup search scope. If you do not specify this parameter, the scope is set to
subtree by default.

[-use-start-tls {true|false}] - Use start-tls Over LDAP Connections

This parameter specifies whether or not to use Start TLS over LDAP connections. When enabled, the
communication between the Data ONTAP LDAP Client and the LDAP Server will be encrypted using Start
TLS. Start TLS is a mechanism to provide secure communication by using the TLS/SSL protocols. If you do
not specify this parameter, the default is false.

[-is-netgroup-byhost-enabled {true|false}] - Enable Netgroup-By-Host Lookup (privilege: advanced)

Use this parameter to enable or disable netgroup-by-host lookup. If your LDAP directory contains map
structures equivalent to the netgroup.byhost map in NIS, enabling this feature greatly speeds up netgroup
resolution over LDAP. By default this parameter is set to false.

[-netgroup-byhost-dn <ldap_dn>] - Netgroup-By-Host DN (privilege: advanced)

This parameter specifies the netgroup-by-host DN, which overrides the base DN for netgroup-by-host lookups.

Note: To specify multiple DNs, separate multiple DN entries with semicolons (;). If you configure multiple
netgroup DNs and a DN contains a semicolon, add an escape character ('\') immediately before the
semicolon or enclose the entire DN with quotation marks ('"').

[-netgroup-byhost-scope {base|onelevel|subtree}] - Netgroup-By-Host Scope (privilege: advanced)

This parameter specifies the netgroup-by-host search scope for LDAP queries. If you do not specify this
parameter, the scope is set to subtree by default.

[-session-security {none|sign|seal}] - Client Session Security

This parameter specifies the level of security to be used for LDAP communications. If you do not specify this
parameter, the default is none.

LDAP Client Session Security can be one of the following:

• none - No Signing or Sealing.
• sign - Sign LDAP traffic.
• seal - Seal and Sign LDAP traffic.

[-skip-config-validation {true}] - Skip Configuration Validation

Use this parameter to skip the LDAP client configuration validation.
The LDAP client configuration specified with the `-client-config` parameter is validated to verify that all the Vservers associated with this LDAP client configuration has at least one of the LDAP servers reachable, and is providing LDAP services.

The validation fails if ONTAP was unable to connect to any LDAP server with the specified `-client-config`.

**Examples**

The following example modifies an existing LDAP client configuration named `corp` owned by Vserver `vs1` to require simple binds using the administrator@example.com account:

```
cluster1::> vserver services name-service ldap client modify -client-config corp -vserver vs1 -bind-dn administrator@example.com -min-bind-level simple
```

The following example modifies the user DN of an existing LDAP client configuration to contain multiple DNs separated by a semicolon.

```
cluster1::> vserver services ldap client modify -client-config corp -vserver vs1 -bind-dn administrator@example.com -user-dn "ou=People,dc=mypc,dc=example,dc=in; ou=People1,dc=mypc,dc=example2,dc=com" -min-bind-level simple
```

The following example demonstrates how you can use a semicolon as a valid character in a DN instead of a separator.

```
cluster1::> vserver services ldap client modify -client-config corp -vserver vs1 -bind-dn administrator@example.com -user-dn "ou=People\;,dc=mypc,dc=example,dc=com; ou=People1,dc=mypc,dc=example2,dc=com"
```

The following example modifies an existing LDAP client configuration with multiple user DNs, one of them containing a semicolon and a backslash.

```
cluster1::> vserver services ldap client modify -client-config corp -vserver vs1 -bind-dn administrator@example.com -user-dn "ou=People\;,dc=mypc,dc=example,dc=com\; ou=People1,dc=mypc,dc=example2,dc=com"
```

The following example modifies an existing LDAP client configuration with netgroup by host DN.

```
cluster1::*>vserver services ldap client modify -vserver vs1 -client-config corp -netgroup-byhost-dn nisMapName="netgroup.byhost",dc=rfcbis,dc=com
```

- `vserver services name-service ldap client modify-bind-password`

Modify Bind Password of an LDAP client configuration

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.
Description
The `vserver services name-service ldap client modify-bind-password` command modifies bind-password of a given LDAP client configuration.

Parameters

`[-vserver <Vserver Name>] - Vserver`
This parameter specifies the name of the Vserver which owns the LDAP client you want to modify. A data Vserver or admin Vserver can be specified.

`-client-config <text> - Client Configuration Name`
This parameter specifies the name of the LDAP client configuration.

Examples
The following example modifies the password for a given LDAP client configuration

```bash
cluster1::> vserver services name-service ldap client modify-bind-password -client-config corp
Please enter password:
Confirm password:
```

`vserver services name-service ldap client show`
Display LDAP client configurations

Availability: This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

Description
The `vserver services name-service ldap client show` command displays information about LDAP client configurations which a Vserver can be associated with. An LDAP client configuration created by a Vserver's administrator or by the cluster administrator for the Vserver is owned by the Vserver. A cluster-wide LDAP client configuration is created by a cluster administrator by specifying the admin Vserver's name as a value to the `-vserver` parameter. In addition to its owned LDAP client configurations, a Vserver can be associated with such cluster-wide LDAP client configurations.

Parameters

`{ [-fields <fieldname>,...]`
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`| [-instance]`
If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-vserver <Vserver Name>] - Vserver`
If you specify this parameter, the command displays all LDAP client configurations that can be associated with the specified Vserver. A data Vserver or admin Vserver can be specified.

`[-client-config <text>] - Client Configuration Name`
If you specify this parameter, the command displays information about the LDAP client configuration you specify.

`[-ldap-servers <text>, ...] - LDAP Server List`
If you specify this parameter, the command displays LDAP client configurations using the specified list of LDAP servers.
[-servers <IP Address>, ...] - (DEPRECATED)-LDAP Server List
    (DEPRECATED)-If you specify this parameter, the command displays LDAP client configurations using the
specified list of LDAP servers.
[-ad-domain <TextNoCase>] - Active Directory Domain
    If you specify this parameter, the command displays LDAP client configurations using the specified domain to
discover their list of LDAP servers.
[-preferred-ad-servers <IP Address>, ...] - Preferred Active Directory Servers
    If you specify this parameter, the command displays LDAP client configurations using the specified list of
preferred servers.
[-bind-as-cifs-server {true|false}] - Bind Using the Vserver's CIFS Credentials
    If you specify this parameter, the command displays LDAP client configurations that bind using CIFS server
credentials. If the CIFS server is in workgroup mode, the value of this parameter should be false.
[-schema <text>] - Schema Template
    If you specify this parameter, the command displays LDAP client configurations using the specified schema.
[-port <integer>] - LDAP Server Port
    If you specify this parameter, the command displays LDAP client configurations using the specified server
port.
[-query-timeout <integer>] - Query Timeout (sec)
    If you specify this parameter, the command displays LDAP client configurations using the specified query
timeout (in seconds).
[-min-bind-level {anonymous|simple|sasl}] - Minimum Bind Authentication Level
    If you specify this parameter, the command displays LDAP client configurations using the specified minimum
bind level.
[-bind-dn <ldap_dn>] - Bind DN (User)
    If you specify this parameter, the command displays LDAP client configurations using the specified bind DN.
[-base-dn <ldap_dn>] - Base DN
    If you specify this parameter, the command displays LDAP client configurations using the specified base DN.
[-base-scope {base|onelevel|subtree}] - Base Search Scope
    If you specify this parameter, the command displays LDAP client configurations using the specified base
search scope.
[-user-dn <ldap_dn>] - User DN (privilege: advanced)
    If you specify this parameter, the command displays LDAP client configurations using the specified user DN.
[-user-scope {base|onelevel|subtree}] - User Search Scope (privilege: advanced)
    If you specify this parameter, the command displays LDAP client configurations using the specified user
search scope.
[-group-dn <ldap_dn>] - Group DN (privilege: advanced)
    If you specify this parameter, the command displays LDAP client configurations using the specified group
DN.
[-group-scope {base|onelevel|subtree}] - Group Search Scope (privilege: advanced)
    If you specify this parameter, the command displays LDAP client configurations using the specified group
search scope.
[-netgroup-dn <ldap_dn>] - Netgroup DN (privilege: advanced)
    If you specify this parameter, the command displays LDAP client configurations using the specified netgroup
DN.
[-netgroup-scope (base|onelevel|subtree)] - Netgroup Search Scope (privilege: advanced)
If you specify this parameter, the command displays LDAP client configurations using the specified netgroup search scope.

[-is-owner (true|false)] - Vserver Owns Configuration
If you set this parameter to true, the command displays LDAP client configurations with the Vservers which own them.

[-use-start-tls (true|false)] - Use start-tls Over LDAP Connections
This parameter specifies whether or not to use Start TLS over LDAP connections. When enabled, the communication between the Data ONTAP LDAP Client and the LDAP Server will be encrypted using Start TLS. Start TLS is a mechanism to provide secure communication by using the TLS/SSL protocols. If you do not specify this parameter, the default is false.

[-is-netgroup-byhost-enabled (true|false)] - Enable Netgroup-By-Host Lookup (privilege: advanced)
If you set this parameter to true, the command displays LDAP client configurations for which netgroup-by-host lookup is enabled.

[-netgroup-byhost-dn <ldap_dn>] - Netgroup-By-Host DN (privilege: advanced)
If you specify this parameter, the command displays LDAP client configurations using the specified netgroup-by-host DN.

[-netgroup-byhost-scope (base|onelevel|subtree)] - Netgroup-By-Host Scope (privilege: advanced)
If you specify this parameter, the command displays LDAP client configurations using the specified netgroup-by-host search scope.

[-session-security (none|sign|seal)] - Client Session Security
If this parameter is set to seal, the command displays LDAP client configurations where both signing and sealing are required for LDAP communications. If set to sign, the command displays LDAP client configurations where only signing is required for LDAP communications. If set to none, the command displays LDAP client configurations where no security is required for LDAP communications.

Examples
The following example shows a summary of all of the LDAP client configurations available for Vserver vs1:

```
cluster1::> vserver services name-service ldap show -vserver vs1
Vserver    Client        LDAP             Active Directory            Minimum
---------- ------------- ---------------- ---------------- ---------- ----------
vs1        corp          ldapserver.      -                RFC-2307   anonymous
test.com
vs1        corpnew       172.16.0.200     -                RFC-2307   simple
```

vserver services name-service ldap client schema commands
Manage LDAP client schema templates
vserver services name-service ldap client schema copy
Copy an existing LDAP schema template

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The vserver services name-service ldap client schema copy command creates a new LDAP schema template from an existing one. In addition to an owned LDAP schema template, a Vserver administrator can also copy a cluster-wide LDAP schema template that is owned by the admin Vserver.
Parameters

- `-vserver <Vserver Name>` - Vserver
  This parameter specifies the Vserver for which you want to copy an existing LDAP schema template.

- `-schema <text>` - Schema Template
  This parameter specifies the name of the existing schema template you want to copy.

- `-new-schema-name <text>` - New Schema Template Name
  This parameter specifies the name of the schema template copy.

Examples

The following example creates a copy of the RFC-2307 schema template and names it `corp-schema` for Vserver "vs1":

```bash
cluster1::> vserver services name-service ldap client schema copy -vserver vs1 -schema RFC-2307 -new-schema-name corp-schema
```

vserver services name-service ldap client schema delete

Delete an LDAP schema template

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description

The `vserver services name-service ldap client schema delete` command deletes an LDAP schema template. A Vserver administrator can only delete templates owned by the Vserver.

Note: You cannot delete the default schema templates.

Parameters

- `-vserver <Vserver Name>` - Vserver
  This parameter specifies the name of Vserver owning the LDAP schema template you want to delete.

- `-schema <text>` - Schema Template
  This parameter specifies the name of the schema template you want to delete.

Examples

The following example deletes a schema template named `corp-schema` owned by Vserver `vs1`:

```bash
cluster1::> vserver services name-service ldap client schema delete -vserver vs1 -schema corp-schema
```

vserver services name-service ldap client schema modify

Modify an LDAP schema template

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description

The `vserver services name-service ldap client schema modify` command modifies an existing LDAP schema template. You cannot modify the default schema templates. Create a copy of a default schema template using the `vserver services name-service ldap client schema copy` command, and then modify the copy. A Vserver administrator can only modify templates owned by the Vserver.

Parameters

- `-vserver <Vserver Name>` - Vserver
  This parameter specifies the name of the Vserver owning the LDAP schema template you want to modify.
-schema <text> - Schema Template
  This parameter specifies the name of the schema template you want to modify.

-<comment <text>> - Comment
  This parameter specifies a comment that describes the schema template.

-posix-account-object-class <text> - RFC 2307 posixAccount Object Class
  This parameter specifies the RFC 2307 posixAccount object class name defined by the schema.

-posix-group-object-class <text> - RFC 2307 posixGroup Object Class
  This parameter specifies the RFC 2307 posixGroup object class name defined by the schema.

-nis-netgroup-object-class <text> - RFC 2307 nisNetgroup Object Class
  This parameter specifies the RFC 2307 nisNetgroup object class name defined by the schema.

-uid-attribute <text> - RFC 2307 uid Attribute
  This parameter specifies the RFC 2307 uid attribute name defined by the schema.

-uid-number-attribute <text> - RFC 2307 uidNumber Attribute
  This parameter specifies the RFC 2307 uidNumber attribute name defined by the schema.

-gid-number-attribute <text> - RFC 2307 gidNumber Attribute
  This parameter specifies the RFC 2307 gidNumber attribute name defined by the schema.

-cn-group-attribute <text> - RFC 2307 cn (for Groups) Attribute
  This parameter specifies the RFC 2307 cn (for Groups) attribute name defined by the schema.

-cn-netgroup-attribute <text> - RFC 2307 cn (for Netgroups) Attribute
  This parameter specifies the RFC 2307 cn (for Netgroups) attribute name defined by the schema.

-user-password-attribute <text> - RFC 2307 userPassword Attribute
  This parameter specifies the RFC 2307 userPassword attribute name defined by the schema.

-gecos-attribute <text> - RFC 2307 gecos Attribute
  This parameter specifies the RFC 2307 gecos attribute name defined by the schema.

-home-directory-attribute <text> - RFC 2307 homeDirectory Attribute
  This parameter specifies the RFC 2307 homeDirectory attribute name defined by the schema.

-login-shell-attribute <text> - RFC 2307 loginShell Attribute
  This parameter specifies the RFC 2307 loginShell attribute name defined by the schema.

-member-uid-attribute <text> - RFC 2307 memberUid Attribute
  This parameter specifies the RFC 2307 memberUid attribute name defined by the schema.

-member-nis-netgroup-attribute <text> - RFC 2307 memberNisNetgroup Attribute
  This parameter specifies the RFC 2307 memberNisNetgroup attribute name defined by the schema.

-nis-netgroup-triple-attribute <text> - RFC 2307 nisNetgroupTriple Attribute
  This parameter specifies the RFC 2307 nisNetgroupTriple attribute name defined by the schema.

-enable/rfc2307bis (true|false) - Enable Support for Draft RFC 2307bis
  This parameter specifies whether RFC 2307bis is enabled for the schema.

-group-of-unique-names-object-class <text> - RFC 2307bis groupOfUniqueNames Object Class
  This parameter specifies the RFC 2307bis groupOfUniqueNames object class name defined by the schema.
  This parameter takes effect only when RFC 2307bis is enabled for the schema.

-unique-member-attribute <text> - RFC 2307bis uniqueMember Attribute
  This parameter specifies the RFC 2307bis uniqueMember attribute name defined by the schema. This parameter takes effect only when RFC 2307bis is enabled for the schema.
[-windows-to-unix-object-class <text>] - Data ONTAP Name Mapping windowsToUnix Object Class
This parameter specifies the name mapping windowsToUnix object class name defined by the schema.

[-windows-account-attribute <text>] - Data ONTAP Name Mapping windowsAccount Attribute
This parameter specifies the name mapping windowsAccount attribute name defined by the schema.

[-windows-to-unix-attribute <text>] - Data ONTAP Name Mapping windowsToUnix Attribute
This parameter specifies the name mapping windowsToUnix attribute name defined by the schema.

[-windows-to-unix-no-domain-prefix {true|false}] - No Domain Prefix for windowsToUnix Name Mapping
This parameter specifies the name mapping windowsToUnixNoDomainPrefix setting defined by the schema.

[-nis-object-class <text>] - RFC 2307 nisObject Object Class
This parameter specifies the nisObject class name defined by the schema. This parameter takes effect only when netgroup.byhost is enabled for the vserver.

[-nis-mapname-attribute <text>] - RFC 2307 nisMapName Attribute
This parameter specifies the nisMapName attribute name defined by the schema. This parameter takes effect only when netgroup.byhost is enabled for the vserver.

[-nis-mapentry-attribute <text>] - RFC 2307 nisMapEntry Attribute
This parameter specifies the nisMapEntry attribute name defined by the schema. This parameter takes effect only when netgroup.byhost is enabled for the vserver.

Examples
The following example modifies the schema template called corp-schema owned by Vserver vs1 to use User as the uid attribute name:

cluster1::> vserver services name-service ldap client schema modify -vserver vs1 -schema corp-schema -uid-attribute User

Related references

vserver services name-service ldap client schema copy on page 2057

vserver services name-service ldap client schema show
Display LDAP schema templates

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver services name-service ldap client schema show command shows information about LDAP schema templates which a Vserver can access. An LDAP schema template created by a Vserver's administrator or by the cluster administrator for the Vserver is owned by the Vserver. A cluster-wide LDAP schema template is created by a cluster administrator by specifying the admin Vserver's name as a value to the -vserver parameter. In addition to its owned LDAP schema templates, a Vserver can access such cluster-wide LDAP schema templates.

Parameters

{-fields <fieldname>, ...}
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

| [-instance ] |
If you specify the -instance parameter, the command displays detailed information about all fields.
[-vserver <Vserver Name>] - Vserver
   If you specify this parameter, the command displays all LDAP schema templates that can be accessed by the specified Vserver.

[-schema <text>] - Schema Template
   If you specify this parameter, the command displays the schema template with the specified name.

[-comment <text>] - Comment
   If you specify this parameter, the command displays schema templates with the specified comment.

[-posix-account-object-class <text>] - RFC 2307 posixAccount Object Class
   If you specify this parameter, the command displays schema templates with the specified posixAccount object class.

[-posix-group-object-class <text>] - RFC 2307 posixGroup Object Class
   If you specify this parameter, the command displays schema templates with the specified posixGroup object class.

[-nis-netgroup-object-class <text>] - RFC 2307 nisNetgroup Object Class
   If you specify this parameter, the command displays schema templates with the specified nisNetgroup object class.

[-uid-attribute <text>] - RFC 2307 uid Attribute
   If you specify this parameter, the command displays schema templates with the specified uid attribute.

[-uid-number-attribute <text>] - RFC 2307 uidNumber Attribute
   If you specify this parameter, the command displays schema templates with the specified uidNumber attribute.

[-gid-number-attribute <text>] - RFC 2307 gidNumber Attribute
   If you specify this parameter, the command displays schema templates with the specified gidNumber attribute.

[-cn-group-attribute <text>] - RFC 2307 cn (for Groups) Attribute
   If you specify this parameter, the command displays schema templates with the specified cn (for Groups) attribute.

[-cn-netgroup-attribute <text>] - RFC 2307 cn (for Netgroups) Attribute
   If you specify this parameter, the command displays schema templates with the specified cn (for Netgroups) attribute.

[-user-password-attribute <text>] - RFC 2307 userPassword Attribute
   If you specify this parameter, the command displays schema templates with the specified userPassword attribute.

[-gecos-attribute <text>] - RFC 2307 gecos Attribute
   If you specify this parameter, the command displays schema templates with the specified gecos attribute.

[-home-directory-attribute <text>] - RFC 2307 homeDirectory Attribute
   If you specify this parameter, the command displays schema templates with the specified homeDirectory attribute.

[-login-shell-attribute <text>] - RFC 2307 loginShell Attribute
   If you specify this parameter, the command displays schema templates with the specified loginShell attribute.

[-member-uid-attribute <text>] - RFC 2307 memberUid Attribute
   If you specify this parameter, the command displays schema templates with the specified memberUid attribute.

[-member-nis-netgroup-attribute <text>] - RFC 2307 memberNisNetgroup Attribute
   If you specify this parameter, the command displays schema templates with the specified memberNisNetgroup attribute.
[-nis-netgroup-triple-attribute <text>] - RFC 2307 nisNetgroupTriple Attribute
If you specify this parameter, the command displays schema templates with the specified nisNetgroupTriple
attribute.

[-enable-rfc2307bis {true|false}] - Enable Support for Draft RFC 2307bis
If you set this parameter to true, the command displays RFC 2307bis enabled LDAP schema templates.

[-group-of-unique-names-object-class <text>] - RFC 2307bis groupOfUniqueNames Object Class
If you specify this parameter, the command displays schema templates with the specified
groupOfUniqueNames object class.

[-unique-member-attribute <text>] - RFC 2307bis uniqueMember Attribute
If you specify this parameter, the command displays schema templates with the specified uniqueMember
attribute.

[-windows-to-unix-object-class <text>] - Data ONTAP Name Mapping windowsToUnix Object Class
If you specify this parameter, the command displays schema templates with the specified windowsToUnix
object class.

[-windows-account-attribute <text>] - Data ONTAP Name Mapping windowsAccount Attribute
If you specify this parameter, the command displays schema templates with the specified windowsAccount
attribute.

[-windows-to-unix-attribute <text>] - Data ONTAP Name Mapping windowsToUnix Attribute
If you specify this parameter, the command displays schema templates with the specified windowsToUnix
attribute.

[-windows-to-unix-no-domain-prefix {true|false}] - No Domain Prefix for windowsToUnix Name
Mapping
If you specify this parameter, the command displays schema templates with the specified
windowsToUnixNoDomainPrefix setting.

[-is-owner {true|false}] - Vserver Owns Schema
If you set this parameter to true, the command displays LDAP schema templates with the Vservers which own
them.

[-nis-object-class <text>] - RFC 2307 nisObject Object Class
If you specify this parameter, the command displays schema templates with the specified nisObject attribute.

[-nis-mapname-attribute <text>] - RFC 2307 nisMapName Attribute
If you specify this parameter, the command displays schema templates with the specified nisMapName
attribute.

[-nis-mapentry-attribute <text>] - RFC 2307 nisMapEntry Attribute
If you specify this parameter, the command displays schema templates with the specified nisMapEntry
attribute.

Examples
The following example shows a summary of all of the default LDAP schema templates defined in the cluster:

```
class11:/> vserver services name-service ldap client schema show
Vserver Schema Template Comment
------------------ -------------------------------------------------------
cluster-node3 MS-AD-BIS   Schema based on Active Directory Identity Management for UNIX (read-only)
cluster-node3 AD-IDMU    Schema based on Active Directory Identity Management for UNIX (read-only)
```
vserver services name-service netgroup commands

Manage local netgroups

vserver services name-service netgroup load

Load netgroup definitions from a URI

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver services name-service netgroup load command loads netgroup definitions from a uniform resource identifier (URI) to a specified Vserver. You can load from a netgroup file at an FTP or a HTTP location (source URI) using the respective protocol.

Before Data ONTAP saves the new netgroup definitions, it checks that the netgroup file does not have any file structure issues, does not contain any syntax errors, and all entries comply with the following rules:

- A domain name consists of one or more labels separated by periods (.).
- A hostname is a valid domain name, IPv4 address, or IPv6 address.
- Valid characters for a label are all alphanumeric characters, underscore (_), and dash (-). A label may not begin or end with a dash.
- Valid characters for a username are all ASCII printable characters with the exception of whitespace, parentheses, and comma (,).
- Valid characters for a netgroup name are all alphanumeric characters, underscore (_), and dash (-). A netgroup name may not begin with a dash.
- A single line in the netgroup file may not exceed 4096 characters.

If the file is found to contain errors, Data ONTAP will issue an error to that effect and netgroup definitions will not be loaded into the specified Vserver. After correcting the error, reload the netgroup file into the specified Vserver.

Parameters

-vserver <vserver name> - Vserver
  This parameter specifies the Vserver for which you want to load netgroup definitions.

-source {ftp|http}://(hostname|IPv4 Address|'[IPv6 Address']... - URI to Load from
  This parameter specifies the source URI from which you want to load netgroup definitions. You can load from a URI either using the FTP or the HTTP protocol.

-foreground {true|false} - Load Netgroup in the Foreground
  This parameter specifies whether the operation runs in the foreground. The default setting is true (the operation runs in foreground). When set to true, the command does not return until the operation completes.

-skip-hostname-validation [true] - Skip Hostname Validation (privilege: advanced)
  If this parameter is specified, the hostname validation is skipped.
[-skip-file-size-check {true}] - Skip File Size Check Before Download (privilege: advanced)

If this parameter is specified, the file is downloaded without checking the file size. Use this parameter if the server does not supply the file size or does not provide an accurate value. This parameter can also be used to download a file greater than the default 5 MB size limit.

Note: If this parameter is specified and the file is very large, the transfer may take a long time or fail due to disk space limitations.

[-skip-file-duplicate-check {true}] - Skip Netgroup File Duplicate Check (privilege: advanced)

If this parameter is specified, the netgroup file is downloaded even if the contents are same as the existing netgroup file. In this case, the existing file will be replaced.

Examples

The following example loads netgroup definitions into a Vserver named vs1 from the file netgroup1 at FTP location ftp://ftp.example.com:

```
cluster1::> vserver services name-service netgroup load -vserver vs1 -source ftp://ftp.example.com/netgroup1
```

vserver services name-service netgroup status

Display local netgroup definitions status

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description

The `vserver services name-service netgroup status` command displays the status of local netgroup definitions across a cluster. This enables you to verify that netgroup definitions are consistent across all nodes that back a Vserver into which netgroup definitions have been loaded.

The command displays the following information:
- Vserver name
- Node name
- Load time for netgroup definitions
- Hash value of the netgroup definitions
- Hash value of the netgroup-by-host database
- File size of the netgroup definitions file

Parameters

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance]
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[-vserver <vserver name>] - Vserver
```

If you specify this parameter, the command displays the netgroup status only for the specified Vserver.

```
[-node (<nodename>|local)] - Node
```

If you specify this parameter, the command displays the netgroup status only for the specified node.
If you specify this parameter, the command displays the status only for the netgroup definitions that were loaded at the specified time. Specify time in the format MM/DD/YYYY HH:MM:SS. Note that the load time stamps for identical definitions are different on different nodes, because each node downloads the definitions from the URI individually.

**[-hashvalue <text>] - Hash Value**

If you specify this parameter, command displays the status only for the netgroup definitions that have the specified hash value. Note that the primary purpose of the command is to verify that the definitions on all nodes have the same hash value, so querying on a specific hash value is not useful in most cases.

**[-hashvalue-byhost <text>] - Hash Value Byhost**

If you specify this parameter, the command displays the status only for the netgroup definitions that have the specified hash value for netgroup-by-host database. Note that the primary purpose of the command is to verify that the definitions on all nodes have the same hash value for netgroup-by-host database.

**[-filesize {<integer> [KB|MB|GB|TB|PB]}] - File Size**

If you specify this parameter, the command displays the status only for the netgroup definitions that have the specified file size. Note that the primary purpose of the command is to verify that the definitions on all nodes have the same file size, so querying on a specific file size is not useful in most cases.

### Examples

The following example displays the netgroup definition status for all Vservers:

```
cluster1::*> vserver services name-service netgroup file status
Vserver  Node     Load Time           Hash Value                       Hash Value By-Host               File Size
--------- -------  ------------------- -------------------------------- ---------- ----------
--------- -------  ------------------- -------------------------------- ---------- ----------
vs1       node1    9/20/2008 16:04:55  e6cb38ec1396a280c0d2b77e3a84eda2 913a182a72aa187249be3a84eda2 1.00KB
913a182a72aa187249be398e2bb2cd23 1.00KB node2    9/20/2008 16:04:53  e6cb38ec1396a280c0d2b77e3a84eda2 913a182a72aa187249be3a84eda2 1.00KB
913a182a72aa187249be398e2bb2cd23 1.00KB vs2       node1    9/20/2008 16:06:26  c0d2b77e3a84eda2e6cb38ec1396a280 009321eddb4561e959df7f7f7f7ec0621 2.3MB
009321eddb4561e959df7f7f7f7ec0621 2.3MB node2    9/20/2008 16:06:27  c0d2b77e3a84eda2e6cb38ec1396a280 009321eddb4561e959df7f7f7f7ec0621 2.3MB
4 entries were displayed.
```

### vserver services name-service netgroup file commands

- **Manage Local Netgroup Files**
  - Managing local netgroup files

- **vserver services name-service netgroup file delete**
  - Remove a local netgroup file

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**

The `vserver services name-service netgroup file delete` command deletes the local netgroup files for given Vservers.
Parameters
- **vserver <vserver name>** - Vserver
  
  Use this parameter to specify the Vservers whose local netgroup file you want to delete. Separate multiple Vserver names with commas.

**Examples**

The following example deletes the local netgroup file for a Vserver named vs1.

```
cluster1::> vserver services netgroup file delete -vserver vs1
```

**vserver services name-service netgroup file show**

Display a local netgroup file

**Availability:** This command is available to cluster and Vserver administrators at the *admin* privilege level.

**Description**

The `vserver services netgroup file show` command displays the contents of the local netgroup file for the specified Vservers. All the entries under a given netgroup, specified in the Netgroup column of the command output, list the members of that netgroup. Each netgroup file specifies netgroups, which are sets of tuples. Each member of a netgroup is either the name of another netgroup, specified in the Member Netgroup column, or a specification of a tuple as follows: (Host, User, Domain) where Host, User, and Domain are character string names for the corresponding component. Any of the components of a tuple can either be empty to specify a wildcard value or a dash (-) to specify no valid value.

**Parameters**

```
{ [ -fields <fieldname>, ... ]
  If you specify the -fields fieldname, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?' to display the fields to specify.

  [ -instance ]
  If you specify the -instance parameter, the command displays detailed information about all fields.

  -vserver <vserver name> - Vserver
  Use this parameter to display the local netgroup file contents for the Vservers you specify.

  -netgroup <text> - Netgroup Name
  If you specify this parameter, the command displays information about the netgroup you specify.

  -netgrpmemb <text> - Member Netgroup
  If you specify this parameter, the command displays information about the member netgroup you specify.

  -host <text> - Member Host
  If you specify this parameter, the command displays information about the host you specify.

  -user <text> - Member User
  If you specify this parameter, the command displays information about the user you specify.

  -domain <text> - Member Domain
  If you specify this parameter, the command displays information about the domain you specify.

  Examples
  The following example displays the netgroup file contents for the Vserver named vs1.
```

```
### vserver services name-service nis-domain commands

Manage Network Information Service domains

### vserver services name-service nis-domain create

Create a NIS domain configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `vserver services name-service nis-domain create` command creates a configuration for an NIS domain. You can configure only one NIS domain for a given Vserver. You can also configure more than one Vserver with the same NIS domain.

**Parameters**
- `-vserver <Vserver Name>` - Vserver
  - Use this parameter to specify the Vserver on which the NIS domain configuration is created. A data Vserver or admin Vserver can be specified.
- `-domain <nis domain>` - NIS Domain
  - Use this parameter to specify the NIS domain for which a configuration is created. Maximum Supported NIS Domain length: 64 characters.
- `{ -nis-servers <text>, ... - NIS Servers
  - Use this parameter to specify the hostnames/IP addresses of NIS servers used by the NIS domain configuration. Separate multiple hostnames/IP addresses with commas.
- | -servers <IP Address>, ...} - (DEPRECATED)-NIS Server
  - **Note:** This parameter has been deprecated and might be removed in a future version of ONTAP.
  - Use this parameter to specify the IP addresses of NIS servers used by the NIS domain configuration. Separate multiple IP addresses with commas.

**Examples**
The following example creates an NIS domain configuration on the Vserver named vs0. The NIS domain is named nisdomain and uses an NIS server with the IP address 192.0.2.180.

```
cluster1::> vserver services name-service nis-domain create -vserver vs0 -domain nisdomain -nis-servers 192.0.2.180
```

vserver services name-service nis-domain delete
Delete a NIS domain configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver services name-service nis-domain delete command deletes an NIS domain configuration.
Deleting a NIS domain configuration removes it permanently.

Parameters
-vserver <Vserver Name> - Vserver
Use this parameter to specify the Vserver from which the NIS domain configuration is deleted. A data Vserver or admin Vserver can be specified.

domain <nis domain> - NIS Domain
Use this parameter to specify the NIS domain whose configuration is deleted.

Examples
The following example deletes the configuration of an NIS domain named testnisdomain from a Vserver named vs2:

cluster1::> vserver services name-service nis-domain delete -vserver vs2 -domain testnisdomain

vserver services name-service nis-domain modify
Modify a NIS domain configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
Use the vserver services name-service nis-domain modify command to modify the NIS server of a NIS domain configuration.
To change the NIS domain, delete the NIS configuration using the vserver services name-service nis-domain delete command and then create the NIS configuration with new NIS domain using the vserver services name-service nis-domain create command. To permanently remove a configuration, use the vserver services name-service nis-domain delete command.

Parameters
-vserver <Vserver Name> - Vserver
Use this parameter to specify the Vserver whose NIS domain configuration is modified. A data Vserver or admin Vserver can be specified.

domain <nis domain> - NIS Domain
Use this parameter to specify the NIS domain whose configuration is modified.

-nis-servers <text>, ... - NIS Servers
Use this parameter to specify the hostnames/IP addresses of NIS servers used by the the NIS domain configuration. Separate multiple hostnames/IP addresses with commas.

Note: This parameter has been deprecated and might be removed in a future version of ONTAP.
Use this parameter to specify the IP addresses of NIS servers used by the the NIS domain configuration. Separate multiple IP addresses with commas.
Examples
The following example modifies the NIS servers of a NIS domain named nisdomain on a Vserver named vs0:

```
cluster1::> vserver services name-service nis-domain modify -vserver vs0 -domain nisdomain -nis-servers 192.0.2.180
```

- `vserver services name-service nis-domain create` on page 2067

### vserver services name-service nis-domain show

Display NIS domain configurations

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The `vserver services name-service nis-domain show` command displays information about NIS domain configurations.

**Parameters**

```
{[-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance ]
  If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver
  Use this parameter to display information only about the NIS domain configurations of the Vservers you specify. Use this parameter with the -domain parameter to display information only about a particular NIS domain configuration on the Vserver you specify. A data Vserver or admin Vserver can be specified.

[-domain <nis domain>] - NIS Domain
  Use this parameter to display information only about the NIS domain configurations that match the NIS domain name you specify. Use this parameter with the -vserver parameter to display information only about a particular NIS domain configuration on the Vserver you specify.

[-nis-servers <text>, ...] - NIS Servers
  Use this parameter to display information only about the NIS domain configurations that use the NIS servers at the hostnames/IP addresses you specify.

[-servers <IP Address>, ...] (DEPRECATED)-NIS Server
  **Note:** This parameter has been deprecated and might be removed in a future version of ONTAP. Use this parameter to display information only about the NIS domain configurations that use the NIS servers at the IP addresses you specify.
```

Examples
The following example displays information about all NIS domain configurations:
vserver services name-service nis-domain show-bound

Display binding status of a NIS domain configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver services name-service nis-domain show-bound command displays binding information about NIS domain configurations.

Parameters

{-fields <fieldname>,...}  
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance]  
If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver  
If you use this parameter, the command displays binding information only about the NIS domain configurations of the specified Vservers. Use this parameter with the -domain parameter to display binding information only about a particular NIS domain configuration on the specified Vserver. A data Vserver or admin Vserver can be specified.

[-domain <nis domain>] - NIS Domain  
If you use this parameter, the command displays binding information only about the NIS domain configurations that match the specified NIS domain name. Use this parameter with the -vserver parameter to display binding information only about a particular Vserver on the specified NIS domain name.

[-bound-servers <IP Address>,...] - Bound NIS Servers  
If you use this parameter, the command displays NIS binding information only about the specified NIS servers.

Examples

The following example displays binding information about all NIS domain configurations:

```
cluster1::> vserver services name-service nis-domain show-bound
Bound
Vserver   Domain          NIS Server
---------- ----------- ------------------
vs1        testnisdomain1  192.0.2.180,
vs2        testnisdomain2  10.0.2.17
2 entries were displayed.
```
vserver services name-service nis-domain group-database build

Build NIS group database

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The `vserver services name-service nis-domain group-database build` command rebuilds the NIS group.byuser DB for a given Vserver if NIS is added as source for group and an active nis-domain exists.

Parameters

-vserver <vserver name> - Vserver Name
Use this parameter to specify the Vserver for which NIS group.byuser DB will be rebuilt. A data Vserver can be specified.

Examples

The following example rebuilds NIS group.byuser DB for Vserver vs0.

```
cluster1::> vserver services name-service nis-domain group-database build -vserver vs0
```

vserver services name-service nis-domain group-database status

Display NIS group database status of the local node

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The `vserver services name-service nis-domain group-database status` command displays the status of local NIS group.byuser db across a cluster. This enables you to verify that NIS group.byuser db are consistent across all nodes.

The command displays the following information:

- Vserver name
- Node name
- Last build time of NIS group.byuser db
- Hash value of the NIS group.byuser db
- File size of the NIS group.byuser db

Parameters

[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver
If you specify this parameter, the command displays the NIS group.byuser db status only for the specified Vserver.
[-node {<nodename>|local}] - Node
   If you specify this parameter, the command displays the NIS group.byuser db status only for the specified node.

[-timestamp <MM/DD/YYYY HH:MM:SS>] - Load Time
   If you specify this parameter, the command displays the status only for the NIS group.byuser db that were built at the specified time. Specify time in the format MM/DD/YYYY HH:MM:SS. Note that the load time stamps for identical definitions are different on different nodes, because each node extracts the db individually.

[-filesize <integer> [KB|MB|GB|TB|PB]] - File Size
   If you specify this parameter, the command displays the status only for the NIS group.byuser db that have the specified file size. Note that the primary purpose of the command is to verify that the definitions on all nodes have the same file size, so querying on a specific file size is not useful in most cases.

[-hashvalue <text>] - Hash Value
   If you specify this parameter, command displays the status only for the NIS group.byuser db that have the specified hash value. Note that the primary purpose of the command is to verify that the definitions on all nodes have the same hash value, so querying on a specific hash value is not useful in most cases.

Examples
The following example displays the NIS group.byuser db status for vserver vs0 :

```
cluster1::*> vserver services name-service nis-domain group-database status -vserver vs0
Vserver   Node            Last Build Time     File Size
--------- --------------- ------------------- ----------
Hash Value
--------------------------------
vs0        node1           2/14/2017 11:39:56  136KB
          a30b7d6d03197a7af25de72dcc4bd64f
```

vserver services name-service ns-switch commands

Manage Name Services Switch ordering

Manages name service switch configurations. Each name service switch entry specifies the order in which to lookup the name service sources, for a given Vserver and name service database. Each name service database contains some information regarding hosts, group, password, netgroup or name_map. Such a database comes from one or more name service sources such as files, DNS, LDAP or NIS.

Note: If a name service switch entry is deleted, default entry of 'files' will be used for the requested name service database except for hosts database for which default source list of 'files, dns' will used.

Note: If "files" is not specified as the default source for "passwd" or "group" database, ensure that default user and group entries for 'passwd' and 'group' respectively are present in the source configured. Default entries for passwd database: nobody, pcuser, root, sshd, toor, daemon, operator, bin, tty, kmem, games, news, man, smmsp, mailnull, bind, proxy, uucp, pop, www, admin, diag, autosupport. Default entries for group database: wheel, daemon, kmem, sys, tty, operator, mail, bin, news, man, games, ftp, staff, sshd, smmsp, mailnull, guest, bind, proxy, authpf, _pflogd, _dhcp, uucp, dialer, network, audit, www, antivirus, nogroup, nobody.

vserver services name-service ns-switch create

Create a new Name Service Switch table entry

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.
Description
The `vserver services name-service ns-switch create` command specifies the order in which to lookup the name service sources, for a given Vserver and name service database. Each name service database contains some information regarding hosts, group, password, netgroup or namemap. Such a database comes from one or more name service sources such as files, DNS, LDAP or NIS.

Note: The `vserver services name-service ns-switch` command provides the functionality of the `/etc/nsswitch.conf` file on UNIX systems. For more information, see the UNIX man page for `nsswitch.conf(5)`.

Parameters

-vserver `<vserver name>` - Vserver
Use this parameter to specify the Vserver on which to create the new name service switch entry.

-database `<hosts|group|passwd|netgroup|namemap>` - Name Service Switch Database
Name Service Switch Database Use this parameter to specify the name service database for which the order of the source lookup is being specified. This parameter can have the following values:

- hosts
- group
- passwd
- netgroup
- namemap

-sources `<files|dns|ldap|nis>`, ... - Name Service Source Order
Name Service Source Order Use this parameter to specify the name service sources and the order in which to look them up for the specified Vserver and name service database. Each name service source in the list for this parameter must be one of the following:

- files
- dns
- ldap
- nis

Separate multiple name service sources with commas.

For each database specified with the -database parameter, one or more sources must be specified. The valid sources for each database type are shown in the following table:

<table>
<thead>
<tr>
<th>Database</th>
<th>Valid Sources</th>
</tr>
</thead>
<tbody>
<tr>
<td>hosts</td>
<td>files, dns</td>
</tr>
<tr>
<td>group</td>
<td>files, nis, ldap</td>
</tr>
<tr>
<td>passwd</td>
<td>files, nis, ldap</td>
</tr>
<tr>
<td>netgroup</td>
<td>files, nis, ldap</td>
</tr>
<tr>
<td>namemap</td>
<td>files, ldap</td>
</tr>
</tbody>
</table>

Note: If "files" is not specified as the default source for the "passwd" or "group" database, ensure that default user and group entries for the 'passwd' and 'group' respectively are present in the source configured. Default entries for "passwd" database: nobody, pcuser, root, sshd, toor, daemon, operator, bin, tty, kmem, games, news, man, smsgp, mailnull, bind, proxy, uucp, pop, www, admin, diag, autosupport. Default entries for "group" database: wheel, daemon, kmem, sys, tty, operator, mail, bin, news, man, games, ftp,
Examples

The following example creates name service source ordering for the hosts database on a Vserver named vs0. The order of looking up the sources is specified as files followed by DNS.

```
cluster1::> vserver services name-service ns-switch create -vserver vs0 -database hosts -sources files,dns
```

The following example creates the name service source ordering for the passwd database on a Vserver named vs1. The order of looking up the sources is specified as files, NIS and LDAP.

```
cluster1::> vserver services name-service ns-switch create -vserver vs1 -database passwd -sources files,nis,ldap
```

**vserver services name-service ns-switch delete**

Remove a Name Service Switch table entry

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

Use the `vserver services name-service ns-switch delete` command to permanently remove an existing name service switch entry.

Parameters

```
-vserver <vserver name> - Vserver
```

Vserver Use this parameter to specify the Vserver for which to delete the name service switch entry.

```
-database {hosts|group|passwd|netgroup|namemap} - Name Service Switch Database
```

Name Service Switch Database Use this parameter to specify the name service database, of the Vserver, for which the name service switch entry is to be deleted. Following are the possible values for this parameter:

- hosts
- group
- passwd
- netgroup
- name_map

Examples

The following example deletes the name service switch entry for the hosts database on a Vserver named vs0.

```
cluster1::> vserver services name-service ns-switch delete -vserver vs0 -database hosts.
```

The following example deletes the name service switch entry for the group database on a Vserver named vs1.
vserver services name-service ns-switch modify

Change a Name Service Switch table entry

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
Use the `vserver services name-service ns-switch modify` command to modify the order of looking up the name service sources, for an existing name service switch entry.

**Parameters**

- **-vserver `<vserver name>`** - Vserver
  
  Use this parameter to specify the Vserver on which to modify the name service switch entry. A data Vserver or admin Vserver can be specified.

- **-database {hosts|group|passwd|netgroup|namemap}** - Name Service Switch Database
  
  Name Service Switch Database Use this parameter to specify the name service database, of the given Vserver, for which to modify the name service switch entry. Following are the possible values for this parameter:
  
  - hosts
  - group
  - passwd
  - netgroup
  - namemap

- **[-sources {files|dns|ldap|nis}, ...]** - Name Service Source Order
  
  Name Service Source Order Use this parameter to specify the name service sources and the order in which look up for the specified Vserver and name service database. Each name service source in the list for this parameter must be one of the following:
  
  - files
  - dns
  - ldap
  - nis

  Separate multiple sources with commas.

  For each database specified with the `-database` parameter, one or more sources must be specified. The valid sources for each database type are shown in the following table:

<table>
<thead>
<tr>
<th>Database</th>
<th>Valid Sources</th>
</tr>
</thead>
<tbody>
<tr>
<td>hosts</td>
<td>files, dns</td>
</tr>
<tr>
<td>group</td>
<td>files, nis, ldap</td>
</tr>
<tr>
<td>passwd</td>
<td>files, nis, ldap</td>
</tr>
<tr>
<td>netgroup</td>
<td>files, nis, ldap</td>
</tr>
<tr>
<td>namemap</td>
<td>files, ldap</td>
</tr>
</tbody>
</table>
Note: If "files" is not specified as the default source for the "passwd" or "group" database, ensure that default user and group entries for the 'passwd' and 'group' respectively are present in the source configured. Default entries for "passwd" database: nobody, pcuser, root, sshd, toor, daemon, operator, bin, tty, kmem, games, news, man, smmsp, mailnull, bind, proxy, uucp, pop, www, admin, diag, autosupport. Default entries for "group" database: wheel, daemon, kmem, sys, tty, operator, mail, bin, news, man, games, ftp, staff, sshd, smmsp, mailnull, guest, bind, proxy, authpf, _pflogd, _dhcp, uucp, dialer, network, audit, www, antivirus, nogroup, nobody.

Examples

The following example modifies the name service source ordering for the hosts database on a Vserver named vs0. The order of looking up the sources is changed to only DNS.

```
cluster1::> vserver services name-service ns-switch modify -vserver vs0 -database hosts -sources dns
```

The following example modifies the name service source ordering for the passwd database on a Vserver named vs1. The order of looking up the sources is changed to LDAP followed by NIS.

```
cluster1::> vserver services name-service ns-switch modify -vserver vs1 -database passwd -sources ldap,nis
```

vserver services name-service ns-switch show

Display Name Service Switch configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

Use the vserver services name-service ns-switch show command to display information about one or more name service switch entries. A name service switch entry provides information about the order of looking up the name service sources, for a Vserver and name service database.

Parameters

{ [-fields <fieldname>,...]
  If you specify the -fields [fieldname], ... parameter, the command only displays the fields that you specify.

  [-instance ]
  If you specify the -instance parameter, the command displays detailed information about all entries.

  [-vserver <vserver name>] - Vserver
  Vserver Use this parameter to display only the name service switch entries for the Vserver you specify. A data Vserver or admin Vserver can be specified.

  [-database {hosts|group|passwd|netgroup|namemap}] - Name Service Switch Database
  Name Service Switch Database Use this parameter to display only the name service switch entries of the name service database type you specify. Following are the possible values for this parameter:

  - hosts
  - group
  - passwd
  - netgroup

2076

Commands: Manual Page Reference
• name_map

[-sources {files|dns|ldap|nis}, ...] - Name Service Source Order

Name Service Source Order Use this parameter to display only name service switch entries with the specified name service source order. Each name service source in the list for this parameter must be one of the following:

- files
- dns
- ldap
- nis

Separate multiple sources with commas.

Examples

The following example shows the output of the `vserver services name-service ns-switch show` command.

```
class1::> vserver services name-service ns-switch show

| Vserver | Database | Source
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>vs0</td>
<td>hosts</td>
<td>files, dns</td>
</tr>
<tr>
<td>vs1</td>
<td>passwd</td>
<td>files, ldap, nis</td>
</tr>
</tbody>
</table>

2 entries were displayed.
```

**vserver services name-service unix-group commands**

Manage local UNIX group accounts

**vserver services name-service unix-group adduser**

Add a user to a local UNIX group

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**

The `vserver services name-service unix-group adduser` command adds a user to a local UNIX group.

**Parameters**

- `-vserver <vserver name>` - Vserver

  Use this parameter to specify the Vserver location of the local UNIX group to which the user is added.

- `-name <text>` - Group Name

  Use this parameter to specify the local UNIX group to which to add the user.

- `-username <text>` - Name of User

  Use this parameter to specify the user name to add to the local UNIX group.

- `[-skip-name-validation {true|false}]` - Skip Name Validation

  By default, Data ONTAP validates the name to ensure it complies with the following rules:

  - The name contains only these valid characters: 0 through 9, A through Z, ".", ",", and ",".
The name does not start with the character ".".

• The name does not contain "$" except as the last character.

If the parameter is set to true, the name validation is skipped.

Examples
The following example adds a user named tsmith to a local UNIX group named sales on a Vserver named vs0:

```
cluster1::> vserver services name-service unix-group adduser -vserver vs0 -name sales -username
tsmith
```

vserver services name-service unix-group create
Create a local UNIX group

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver services name-service unix-group create command creates a local UNIX group on a Vserver. Use a local UNIX group for Windows-to-UNIX and UNIX-to-Windows group mappings.

Parameters
-vserver <vserver name> - Vserver
Use this parameter to specify the Vserver on which to create the local UNIX group.

-name <text> - Group Name
Use this parameter to specify the name of the group to create.

-id <integer> - Group ID
Use this parameter to specify an ID number for the group.

[-skip-name-validation {true|false}] - Skip Name Validation
By default, Data ONTAP validates the name to ensure it complies with the following rules:

• The name contains only valid characters: 0 through 9, A through Z, a through z, ",", ".", and "-"

• The name does not start with "-"

• The name does not contain "$" except as the last character

If the parameter is set to true, the name validation is skipped.

Examples
The following example creates a group named sales on a Vserver named vs0. The group has the ID 94.

```
cluster1::> vserver services name-service unix-group create -vserver vs0 -name sales -id 94
```

vserver services name-service unix-group delete
Delete a local UNIX group

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver services name-service unix-group delete command deletes a local UNIX group from a Vserver.

2078

Commands: Manual Page Reference
**vserver services name-service unix-group delete**

Delete a user from a local UNIX group

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The *vserver services name-service unix-group delete* command removes a user from a local UNIX group.

**Parameters**

- **-vserver <vserver name>** - *Vserver*
  
  Use this parameter to specify the *Vserver* location of the local UNIX group from which the user is removed.

- **-name <text>** - *Group Name*
  
  Use this parameter to specify the local UNIX group from which to remove the user.

- **-username <text>** - *Name of User*
  
  Use this parameter to specify the user name to remove from the local UNIX group.

**Examples**
The following example removes a user named testuser from a local UNIX group named sales on a *Vserver* named vs0:

```bash
cluster1::> vserver services name-service unix-group deluser -vserver vs0 -name eng -username testuser
```

**vserver services name-service unix-group load-from-uri**

Load one or more local UNIX groups from a URI

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The *vserver services name-service unix-group load-from-uri* command loads UNIX groups from a universal resource identifier (URI). The URI must contain group information in the UNIX /etc/group format:

```
group_name:password:group_ID:comma_separated_list_of_users
```

The command discards the value of the *password* field.

**Parameters**

- **-vserver <vserver>** - *Vserver*
  
  Use this parameter to specify the *Vserver* on which to locate the local UNIX groups.
-uri {ftp|http}://(hostname|IPv4 Address|IPv6 Address')... - URI to Load From

Use this parameter to specify the URI from which the command loads group information.

[-overwrite {true|false}] - Overwrite Entries

Use this parameter with the value true to specify that group information loaded from the URI should overwrite existing group information. The default value is false, specifying that group information loaded from the URI should not overwrite existing group information.

[-skip-name-validation {true|false}] - Skip Name Validation

By default, Data ONTAP validates the name to ensure it complies with the following rules:

- The name contains only valid characters: 0 through 9, A through Z, a through z, "," », ".", and "-
- The name does not start with "-"
- The name does not contain "$" except as the last character

If the parameter is set to true, the name validation is skipped.

[-foreground {true|false}] - Load Unix Groups file in the Foreground

If this parameter is set to false, the operation runs as a job in the background. Otherwise, the command does not return until the operation is complete. The default value is true.

Examples

The following example loads group information from the URI ftp://ftp.example.com/groups onto a Vserver named vs0:

```
cluster1::> vserver services name-service unix-group load-from-uri -vserver vs0 -uri ftp://ftp.example.com/groups
```

vserver services name-service unix-group modify

Modify a local UNIX group

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

Use the vserver services name-service unix-group modify command to modify a local UNIX group's group ID.

Parameters

- **-vserver <vserver name>** - Vserver
  
  Use this parameter to specify the Vserver location of the local UNIX group to modify.

- **-name <text>** - Group Name
  
  Use this parameter to specify the name of the group to modify.

- **[-id <integer>]** - Group ID
  
  Use this parameter to specify an ID number for the group.

Examples

The following example changes a local UNIX group named sales on a Vserver named vs0 to have the group ID 100:

```
cluster1::> vserver services name-service unix-group modify -vserver vs0 -group sales -id 100
```
**vserver services name-service unix-group show**

Display local UNIX groups

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `vserver services name-service unix-group show` command displays information about local UNIX groups.

**Parameters**

- `[[-fields <fieldname>, ...]]`
  
  If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

- `[-members ]`
  
  Use this parameter to display the list of users in each local UNIX group.

- `[-instance ]`
  
  If you specify the `-instance` parameter, the command displays detailed information about all fields.

- `[-vserver <vserver name>] - Vserver`
  
  Use this parameter with the `-name` parameter to display information only about the local UNIX group you specify. Use this parameter without `-vserver` to display information only about the local UNIX groups that are located on the specified Vserver.

- `[-name <text>] - Group Name`
  
  Use this parameter with the `-vserver` parameter to display information only about the local UNIX group you specify. Use this parameter without `-vserver` to display information only about the local UNIX groups that match the name you specify.

- `[-id <integer>] - Group ID`
  
  Use this parameter to display information only about the local UNIX group that has the ID you specify.

- `[-users <text>, ...] - Users`
  
  Use this parameter to display information only about the local UNIX groups that include the user names you specify.

**Examples**
The following example displays information about all local UNIX groups, including lists of their users:

```
cluster1::> vserver services name-service unix-group show -members
Vserver  Name    ID
vs0       dev    44
Users: admin, jdoe, tsmith
vs0       sales  12
Users: admin, guest, pjones
vs1       testgroup 13
Users: admin, root, testuser
vs1       users  100
Users: admin, jdoe, pjones, tsmith
```

**vserver services name-service unix-group file commands**

Manage local UNIX-group file
**vserver services name-service unix-group file show**
Display local UNIX groups file

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

**Description**
The `vserver services name-service unix-group file show` command displays information about local UNIX groups. It displays the content as it is from the actual UNIX group file which resides in the mroot volume.

**Parameters**
- `-vserver <vserver>` - Vserver
  If you specify this parameter, the command displays information about the local UNIX group or groups that are located on the specified Vserver.

- `[-search-string <text>]` - Pattern to be searched
  If you specify this parameter and the `-vserver` parameter, the command only displays information from the UNIX group file which matches the specified parameter.

**Examples**
The following example displays information about all local UNIX groups belonging to a specific Vserver:

```plaintext
  cluster1::> vserver services name-service unix-group file show -vserver vs0
  Line No  File content
    ----------  ----------------
            1  daemon:*:1:
            2  nobody:*:65535:
            3  pcuser:*:65534:
            4  root:*:0:
```

**vserver services name-service unix-group file status**
Display local Unix Groups file status

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

**Description**
The `vserver services name-service unix-group file status` command displays the status of local UNIX group file across a cluster. This enables you to verify that UNIX group files are consistent across all nodes that back a Vserver into which UNIX group files have been loaded.

The command displays the following information:

- Vserver name
- Node name
- Load time for the UNIX group file
- Hash value of the UNIX group file
- Hash value of the UNIX group database file
- Hash value of the UNIX group byuser database file
- File size of the UNIX group file
Parameters

[-fields <fieldname>, ...]
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

| [-instance ] |
If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver
If you specify this parameter, the command displays the UNIX group status only for the specified Vserver.

[-node {<nodename> | local}] - Node
If you specify this parameter, the command displays the UNIX group status only for the specified node.

[-timestamp <MM/DD/YYYY HH:MM:SS>] - Load Time
If you specify this parameter, the command displays the status only for the UNIX group file that were loaded at the specified time. Specify time in the format MM/DD/YYYY HH:MM:SS. Note that the load time stamps for identical files are different on different nodes, because each node downloads the definitions from the source URI individually.

[-hashvalue <text>] - Hash Value
If you specify this parameter, command displays the status only for the UNIX group files that have the specified hash value. Note that the primary purpose of the command is to verify that the files on all nodes have the same hash value, so querying on a specific hash value is not useful in most cases.

[-hashvalue-db-grp <text>] - Hash Value DB
If you specify this parameter, command displays the status only for the UNIX group files that have the specified hash value for the UNIX group database. Note that the primary purpose of the command is to verify that the files on all nodes have the same hash value, so querying on a specific hash value is not useful in most cases.

[-hashvalue-db <text>] - Hash Value byuser DB
If you specify this parameter, the command displays the status only for the UNIX group files that have the specified hash value for the UNIX group byuser database. Note that the primary purpose of the command is to verify that the files on all nodes have the same hash value for UNIX group database.

[-filesize {<integer> [KB|MB|GB|TB|PB]}] - File Size
If you specify this parameter, the command displays the status only for the UNIX group files that have the specified file size. Note that the primary purpose of the command is to verify that the files on all nodes have the same file size, so querying on a specific file size is not useful in most cases.

Examples

The following example displays the UNIX group file status for all Vservers:

```
cluster1:*> vserver services name-service unix-group file status -instance
Vserver: vs1
 Node: node1
 Load Time: 8/9/2016 19:56:25
 Hash Value: 835c7f530fb76f96c3bca00e380d36b7
 Hash Value DB: e6cb38ec1396a280c0d2b77e3a84eda2
 Hash Value byuser DB: 913a182a72aa1872495be398ebb2cd23
 File Size: 58B

 Vserver: vs2
 Node: node1
 Load Time: 8/9/2016 20:15:40
 Hash Value: c0d2b77e3a84eda2e6cb38ec1396a280
```
vserver services name-service unix-group max-limit commands

Manage Configuration Limits for UNIX-Group

vserver services name-service unix-group max-limit modify

Change Configuration Limits for UNIX-Group

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `vserver services name-service unix-group max-limit modify` command enables you to modify maximum UNIX groups and group-members that can be configured on the system. This allows you to set certain limits to prevent performance issues due to service configurations using excessive resources.

Parameters

`[-limit <integer>]` - System Limit

This parameter specifies the maximum limit that you want to set for unix-group. The default setting for the limit is 32768. The supported range of values for this parameter is 0 to 65536.

Examples

The following example modifies the system-wide limit of the total number of UNIX groups and members that can be configured on the cluster.

```
vserver services name-service unix-group max-limit modify -limit 33792
```

vserver services name-service unix-group max-limit show

Display Configuration Limits for UNIX-Group

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `vserver services name-service unix-group max-limit show` command displays information on UNIX group limits that are configurable with `vserver services name-service unix-group max-limit modify` command. The output will show the following:

- Limit: The configured limit on the total number of UNIX groups and group members configurable.
- Current Count: Total number of current entries for UNIX groups and group members.

Examples

The following example shows the limits and total number of current entries for UNIX group configuration:

```
cluster1::> vserver services name-service unix-group max-limit show
  (vserver services name-service unix-group max-limit show)
  Limit     Current Count
  --------  --------------
  400       3
```

vserver services name-service unix-group max-limit commands

Manage Configuration Limits for UNIX-Group

vserver services name-service unix-group max-limit modify

Change Configuration Limits for UNIX-Group

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `vserver services name-service unix-group max-limit modify` command enables you to modify maximum UNIX groups and group-members that can be configured on the system. This allows you to set certain limits to prevent performance issues due to service configurations using excessive resources.

Parameters

`[-limit <integer>]` - System Limit

This parameter specifies the maximum limit that you want to set for unix-group. The default setting for the limit is 32768. The supported range of values for this parameter is 0 to 65536.

Examples

The following example modifies the system-wide limit of the total number of UNIX groups and members that can be configured on the cluster.

```
vserver services name-service unix-group max-limit modify -limit 33792
```

vserver services name-service unix-group max-limit show

Display Configuration Limits for UNIX-Group

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `vserver services name-service unix-group max-limit show` command displays information on UNIX group limits that are configurable with `vserver services name-service unix-group max-limit modify` command. The output will show the following:

- Limit: The configured limit on the total number of UNIX groups and group members configurable.
- Current Count: Total number of current entries for UNIX groups and group members.

Examples

The following example shows the limits and total number of current entries for UNIX group configuration:

```
cluster1::> vserver services name-service unix-group max-limit show
  (vserver services name-service unix-group max-limit show)
  Limit     Current Count
  --------  --------------
  400       3
```

---

**vserver services name-service unix-user commands**

Manage local UNIX user accounts

---

**vserver services name-service unix-user create**

Create a local UNIX user

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The `vserver services name-service unix-user create` command creates a local UNIX user on a Vserver. You can use local UNIX users for Windows-to-UNIX and UNIX-to-Windows name mappings.

**Parameters**

- `-vserver <vserver name>` - Vserver
  
  This parameter specifies the Vserver on which you want to create the local unix user.

- `-user <text>` - User Name
  
  This parameter specifies the user account that you want to create.

- `-id <integer>` - User ID
  
  This parameter specifies an ID number for the user.

- `-primary-gid <integer>` - Primary Group ID
  
  This parameter specifies the ID number of the user's primary group.

- `[-full-name <text>]` - User's Full Name
  
  This parameter specifies the user’s full name.

- `[-skip-name-validation {true|false}]` - Skip Name Validation
  
  By default, Data ONTAP validates the name to ensure it complies with the following rules:
  
  - The name contains only valid characters: 0 through 9, A through Z, a through z, "_", ".", and "-"
  - The name does not start with "-"
  - The name does not contain "$" except as the last character

  If the parameter is set to true, the name validation is skipped.

**Examples**

The following example creates a local UNIX user named tsmith on a Vserver named vs0. The user has the ID 4219 and the primary group ID 100. The user's full name is Tom Smith.

```
vs1::> vserver services name-service unix-user create -vserver vs0 -user tsmith -id 4219 -primary-gid 100 -full-name "Tom Smith"
```

---

**vserver services name-service unix-user delete**

Delete a local UNIX user

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.
Description
The `vserver services name-service unix-user delete` command deletes a local UNIX user from a Vserver.

Parameters
- `vserver <vserver name>` - Vserver
  This parameter specifies the Vserver on which the local UNIX user is located.
- `user <text>` - User Name
  This parameter specifies the user that you want to delete.

Examples
The following example deletes a local UNIX user named testuser from a Vserver named vs0:
```
vs1::> vserver services name-service unix-user delete -vserver vs0 -user testuser
```

---

`vserver services name-service unix-user load-from-uri`
Load one or more local UNIX users from a URI

Availability: This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

Description
The `vserver services name-service unix-user load-from-uri` command loads one or more UNIX users from a universal resource identifier (URI). The URI must contain user information in the UNIX `/etc/passwd` format:
```
user_name:password:user_ID:group_ID:full_name:home_directory:shell
```
The command discards the value of the `password` field and of the fields after the `full_name` field (home_directory and shell).

Parameters
- `vserver <vserver>` - Vserver
  This specifies the Vserver on which the local UNIX user or users are to be located.
- `uri {(ftp|http):/(hostname|IPv4 Address|'[IPv6 Address'])...}` - URI to Load From
  This specifies the URI from which user information is to be loaded.
- `overwrite {true|false}` - Overwrite Entries
  This optionally specifies whether user information from the URI overwrites existing user information. The default setting is `false`.
- `skip-name-validation {true|false}` - Skip Name Validation
  By default, Data ONTAP validates the name to ensure it complies with the following rules:
  - The name contains only valid characters: 0 through 9, A through Z, a through z, "_", ".", and ":" 
  - The name does not start with "_"
  - The name does not contain "$" except as the last character
  If the parameter is set to `true`, the name validation is skipped.
- `foreground {true|false}` - Load Unix Users file in the Foreground
  If this parameter is set to `false`, the operation runs as a job in the background. Otherwise, the command does not return until the operation is complete. The default value is `true`.

Examples
The following example loads user information from the URI ftp://ftp.example.com/users onto a Vserver named vs0:
vserver services name-service unix-user modify

Modify a local UNIX user

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver services name-service unix-user modify command modifies a local UNIX user's ID, primary group ID, or full name.

Parameters
- `vserver <vserver name>` - Vserver
  This parameter specifies the Vserver on which the local UNIX user is located.
- `user <text>` - User Name
  This parameter specifies the user account that you want to modify.
- `[-id <integer>]` - User ID
  This optional parameter specifies an ID number for the user.
- `[-primary-gid <integer>]` - Primary Group ID
  This optional parameter specifies the ID number of the user's primary group.
- `[-full-name <text>]` - User's Full Name
  This optional parameter specifies the user's full name.

Examples
The following example modifies the local UNIX user named pjones on a Vserver named vs0. The user's primary group ID is changed to 100 and the user's full name is Peter Jones.

```
vs1::> vserver services name-service unix-user modify -vserver vs0 -user pjones -primary-gid 100 -full-name "Peter Jones"
```

vserver services name-service unix-user show

Display local UNIX users

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver services name-service unix-user show command displays information about local UNIX users. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all local UNIX users:

- Vserver name
- User name
- User ID
- Primary group ID
- Full name
Parameters
{[-fields <fieldname>,...]
If you specify the -fields parameter, the command only displays the fields that you specify.
}[[-instance]]
If you specify the -instance parameter, the command displays detailed information about all entries.
[-vserver <vserver name>] - Vserver
If you specify this parameter and the -user parameter, the command displays information only about the specified local UNIX user. If you specify this parameter by itself, the command displays information only about the local UNIX user or users that are located on the specified Vserver.
[-user <text>] - User Name
If you specify this parameter and the -vserver parameter, the command displays information only about the specified local UNIX user. If you specify this parameter by itself, the command displays information only about the local UNIX user or users that have the specified name.
[-id <integer>] - User ID
If you specify this parameter, the command displays information only about the local UNIX user that has the specified ID.
[-primary-gid <integer>] - Primary Group ID
If you specify this parameter, the command displays information only about the local UNIX user or users that have the specified primary group ID.
[-full-name <text>] - User's Full Name
If you specify this parameter, the command displays information only about the local UNIX user or users that match the specified name.

Examples
The following example displays information about all local UNIX users:

```
vs1::> vserver services name-service unix-user show
User       User   Group  Full
Vserver    Name       ID     ID     Name
---------- ---------- ------ ------ ----------------
vs0        admin      100    100    administrator
vs0        guest      1000   100    guest
vs0        jdoe       4673   100    Jane Doe
vs0        monitor    2000   100    monitor
vs0        pjones     4236   100    Peter Jones
vs0        root       10    100    root
vs0        tsmith     3289   100    Tom Smith
```

vserver services name-service unix-user file commands
Manage local UNIX-user file

```
vserver services name-service unix-user file show
```
Display local UNIX users file

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The vserver services name-service unix-user file show command displays information about local UNIX users. It displays the content as it is from the actual UNIX user file which resides in the mroot volume.
Parameters

-vserver <vserver> - Vserver

If you specify this parameter, the command displays information about the local UNIX user or users that are located on the specified Vserver.

[-search-string <text>] - Pattern to be searched

If you specify this parameter and the -vserver parameter, the command only displays information from the UNIX user file which matches the specified parameter.

Examples

The following example displays information about all local UNIX users belonging to a specific Vserver:

```
cluster1::> vserver services name-service unix-user file show -vserver vs0
  Line No  File content
  ----------  ----------------
           1  nobody:*:65535:65535:::::::
           2  pcuser:*:65534:65534:::::::
           3  root:*:0:1:::::::
```

vserver services name-service unix-user file status

Display local Unix Users file status

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description

The vserver services name-service unix-user file status command displays the status of local UNIX user file across a cluster. This enables you to verify that UNIX user files are consistent across all nodes that back a Vserver into which UNIX user files have been loaded.

The command displays the following information:

- Vserver name
- Node name
- Load time for the UNIX user file
- Hash value of the UNIX user file
- Hash value of the UNIX user database file
- File size of the UNIX user file

Parameters

[-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver

If you specify this parameter, the command displays the UNIX user status only for the specified Vserver.

[-node (<nodename> | local)] - Node

If you specify this parameter, the command displays the UNIX user status only for the specified node.
[-timestamp <MM/DD/YYYY HH:MM:SS>] - Load Time
If you specify this parameter, the command displays the status only for the UNIX user file that were loaded at the specified time. Specify time in the format MM/DD/YYYY HH:MM:SS. Note that the load time stamps for identical files are different on different nodes, because each node downloads the definitions from the source URI individually.

[-hashvalue <text>] - Hash Value
If you specify this parameter, command displays the status only for the UNIX user files that have the specified hash value. Note that the primary purpose of the command is to verify that the files on all nodes have the same hash value, so querying on a specific hash value is not useful in most cases.

[-hashvalue-db <text>] - Hash Value DB
If you specify this parameter, the command displays the status only for the UNIX user files that have the specified hash value for the UNIX user database. Note that the primary purpose of the command is to verify that the files on all nodes have the same hash value for UNIX user database.

[-filesize {<integer>[KB|MB|GB|TB|PB]}] - File Size
If you specify this parameter, the command displays the status only for the UNIX user files that have the specified file size. Note that the primary purpose of the command is to verify that the files on all nodes have the same file size, so querying on a specific file size is not useful in most cases.

Examples
The following example displays the UNIX user file status for all Vservers:

```
   cluster1::*> vserver services name-service unix-user file status
   Vserver   Node     Load Time           Hash Value                       Hash Value      File Size
   --------- -------  ------------------- ---------------------------------------- --------

vserver services name-service unix-user max-limit commands
Manage Configuration Limits for UNIX-User

   vserver services name-service unix-user max-limit modify
Change Configuration Limits for UNIX-User
Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The vserver services name-service unix-user max-limit modify command enables you to modify maximum UNIX users that can be configured on the system. This allows you to set certain limits to prevent performance issues due to service configurations using excessive resources.
Parameters

[-limit <integer>] - System Limit

This parameter specifies the maximum limit that you want to set for unix-user. The default setting for the limit is 32768. The supported range of values for this parameter is 0 to 65536.

Examples

The following example modifies the system-wide limit of the total number of UNIX users that can be configured on the cluster.

vserver services name-service unix-user max-limit modify -limit 33792

vserver services name-service unix-user max-limit show

Display Configuration Limits for UNIX-User

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

The vserver services name-service unix-user max-limit show command displays information on UNIX user limits that are configurable with vserver services name-service unix-user max-limit modify command. The output will show the following:

• Limit: The configured limit on the total number of UNIX users configurable.
• Current Count: Total number of current entries for UNIX users configuration.

Examples

The following example shows the limits and total number of current entries for UNIX user configuration:

cluster1:/> vserver services name-service unix-user max-limit show
(vserver services name-service unix-user max-limit show)
Limit Current Count
---------- ------------
400 3

vserver services name-service ypbind commands

The ypbind directory

vserver services name-service ypbind start

Start ypbind

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

The vserver services name-service ypbind start starts the ypbind. NIS creation will fail if ypbind is stopped. This command starts ypbind on all the nodes in a cluster and is persistent across node reboots.

Examples

The following example starts ypbind:
vserver services name-service ypbind start

vserver services name-service ypbind status

Current ypbind status

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The vserver services name-service ypbind status displays whether the ypbind is running or stopped.

Examples
The following example displays ypbind status:

vsl::> vserver services name-service ypbind status
Status: Running

vserver services name-service ypbind stop

Stop ypbind

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The vserver services name-service ypbind stop stops the ypbind. Command fails if NIS entries are present. This command stops ypbind on all the nodes in a cluster and is persistent across node reboots.

Examples
The following example stops ypbind:

vsl::> vserver services name-service ypbind stop

vserver services ndmp commands

Manage vserver scoped NDMP

vserver services ndmp generate-password

Generates NDMP password for a user

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command is used to generate NDMP password for a given user in the specified Vserver context. The generated NDMP password is based on the user's login password. For this reason regenerate it whenever the user's login password changes. This command fails if a user does not exist for the Vserver.

Parameters
{-fields <fieldname>, ...}
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.
If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-vserver <Vserver Name>] - Vserver`
Specify the Vserver context for which password is to be generated.

`[-user <text>] - User`
Specify the user name for which the NDMP password needs to be generated.

`[-password <text>] - Password`
The generated NDMP password string that is used for authentication.

**Examples**
The following example shows the usage this command to generate NDMP password for a user belonging to a specific Vserver:

```bash
cluster1::> vserver services ndmp generate-password -vserver vserver1 -user user1
Vserver: vserver1
User: user1
Password: a9cCCUp32yjGmBiD
```

**vserver services ndmp kill**
Kill the specified NDMP session

**Availability:** This command is available to cluster and Vserver administrators at the `admin` privilege level.

**Description**
This command terminates a specific NDMP session on a particular Vserver in the cluster.

**Parameters**

```text``` - Session Identifier
Session ID of the NDMP session. A session-id is a string used to identify a particular NDMP session.

**Examples**
The following example shows how a specific NDMP session on the Vserver named vserver1 can be terminated:

```bash
cluster1::> vserver services ndmp kill 1000:8002 -vserver vserver1
```

**vserver services ndmp kill-all**
Kill all NDMP sessions

**Availability:** This command is available to cluster and Vserver administrators at the `admin` privilege level.

**Description**
This command terminates all NDMP sessions on a particular Vserver in the cluster.
Parameters
-vserver <vserver name> - Vserver

Specifies the Vserver name in which all NDMP sessions that are to be terminated are running.

Examples
The following example shows how all NDMP sessions on the Vserver named vserver1 can be terminated:

```plaintext
cluster1::> vserver services ndmp kill-all -vserver vserver1
```

vserver services ndmp modify

Modify NDMP Properties

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command is used to change NDMP options on Vservers.

One or more of the options specified in the parameters section can be modified for a specific Vserver, by this command. A short description of each of the options is provided in the parameters section.

Parameters
-vserver <Vserver Name> - Vserver

This parameter specifies the name of the Vserver.

[-ignore-ctime-enabled {true|false}] - Ignore Ctime

This option, when true, allows user to exclude files with ctime changed from storage system' incremental dumps since other processes like virus scanning often alter the ctime of files. When this option is false, backup on the Vserver will include all files with a change or modified time later then the last dump in the previous level dump. The default value is false. This option is persistent across reboots.

Most WIN32 APIs are often unaware of the "last changed time", ctime, they often incorrectly set a later time for files, causing these files to be included in the Vserver's incremental dumps, making the incremental dump very large. This is partially defying the purpose of having incremental dumps, since one uses incremental dumps to speed up the backup by only dumping files that were truly changed since the last backup.

The -option-value for this parameter should be true/false.

[-offset-map-enable {true|false}] - Enable Offset Map

This option is used to enable or disable generation of the inode offset map during NDMP based dump backups. The offset map is required to perform Enhanced Direct Access Restore (DAR) on the backup data. Enhanced DAR provides support for directory DAR and DAR of files with NT streams. The default value for this option is true. This option is persistent across reboots.

The -option-value for this parameter should be true/false.

[-tcpnodelay {true|false}] - Enable TCP Nodelay

Enables/Disables the TCPNODELAY configuration parameter for the socket between the Vserver and the DMA. When set to true, the Nagle algorithm is disabled and small packets are sent immediately rather than held and bundled with other small packets. This optimizes the system for response time rather than throughput.

This option becomes active when the next NDMP session starts. Existing sessions are unaffected. The default value for this option is false. This option is persistent across reboots.
The `-option-value` for this parameter should be true/false.

```
[-tcpwinsize <integer>] - TCP Window Size
```

This option can be used to change the TCP buffer size of the NDMP data connection. The minimum and maximum values are 8192(8K) and 262,144(256K), respectively. The default value for this option is 32768(32K).

This option is persistent across reboots.

The `-option-value` for this parameter should be a number between 8192(8K) and 262,144(256K).

```
[-data-port-range <text>] - Data Port Range
```

This option allows administrators to specify a port range on which the NDMP server can listen for data connections.

The format of this option is `start_port - end_port`. `start_port` and `end_port` can have values between [1024-65535]; `start_port` must be lesser than or equal to `end_port`. If a valid range is specified, NDMP uses a port within that range to listen for data connections. A listen request fails if no ports in the specified range are free.

This option is modifiable only from the admin Vserver context and the said option is applicable for all the data Vservers and the admin Vserver. For example, if the value of the above option is set with 2000-3000, the same value will be applicable throughout the cluster. The value `all` implies that any available port can be used to listen for data connections. The default value for this option is `all`. This option is persistent across reboots.

The `-option-value` for this option should be in the format `{<start_port>-<end_port> | all}` - where `start_port`, `end_port` can have values between [1024-65535]; `start_port` must be lesser than or equal to `end_port`.

```
[-backup-log-enable {true|false}] - Enable Backup Log
```

Backup logging captures important events during dump/restore and records them in /mroot/etc/log/backup on the root volume. The option allows users to enable or disable this feature. The default value for this option is `true`. This option is persistent across reboots.

The `-option-value` for this parameter should be true/false.

```
[-per-qtree-exclude-enable {true|false}] - Enable per Qtree Exclusion
```

If this option is `true`, users can specify exclude list on a per qtree basis to be excluded from backup. This exclude list will override any values already present due to 'EXCLUDE' environment variable . The user can specify the exclusion list through a .exclude_list file which resides at the root of the qtree. The exclusion list can be a list of files or files that match a specified pattern. The default value for this option is `false`. This option is persistent across reboots.

The `-option-value` for this parameter should be true/false.

```
[-authtype <NDMP Authentication types>, ...] - Authentication Type
```

Allows the administrator to choose the authentication method. NDMP supports three authentication types: challenge, plaintext and plaintext_sso. The plaintext_sso authentication type is mutually exclusive with the other authentication types. By setting the authentication type as plaintext_sso, the actual password for the user can be used to authenticate instead of having to generate an NDMP specific password. The default of this option is `challenge`. This option is persistent across reboots.

The `-option-value` for this parameter can be `{challenge | plaintext | plaintext_sso | challenge, plaintext | plaintext, challenge}`.

```
[-debug-enable {true|false}] - Enable Debug (privilege: advanced)
```

This option enables debug logging for NDMP. Debug messages will be logged to the ndmpd log file /mroot/etc/log/mlog/ndmpd.log . The default value for this option is `false`. This option is persistent across reboots.
The `option-value` for this parameter should be true/false.

`[-debug-filter <text>]` - Debug Filter (privilege: advanced)

This option controls the NDMP modules for which debug logging is to be enabled. `option-value` can take five values for this option: all, none, normal, backend or "filter-expression".

`all` enables debug logging for all modules.

`none` disables debug logging for all modules. It is equivalent to `modify -vserver vserver_name -debug-enable false`.

`normal` is a shortcut option that enables debug logging for all modules except `verbose` and `io_loop`. The equivalent filter string is `all-verbose-io_loop`.

`backend` is a shortcut option that enables debug logging for all modules except `verbose`, `io_loop`, `ndmps` and `ndmpp`. The equivalent filter string is `all-verbose-io_loop-ndmps-ndmpp`.

`(filter-expression)` is a combination of one or more modules for which debug logs needs to be enabled. Multiple module names can be combined using following operators:

- `~` to remove the given module from the list of specified modules in the filter string. For example the filter `all-ndmpp` will enable debug logging for all modules but not `ndmpp`.
- `^` to add the given module or modules to the list of modules specified in the filter string. For example the filter `ndmpp^mover^data` will enable debug logging for `ndmpp`, `mover` and `data`.

The possible module names and a brief description is given below:-

<table>
<thead>
<tr>
<th>Modules</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>verbose</td>
<td>verbose message</td>
</tr>
<tr>
<td>io</td>
<td>I/O process loop</td>
</tr>
<tr>
<td>io_loop</td>
<td>I/O process loop verbose messages</td>
</tr>
<tr>
<td>ndmps</td>
<td>NDMP service</td>
</tr>
<tr>
<td>ndmpp</td>
<td>NDMP Protocol</td>
</tr>
<tr>
<td>rpc</td>
<td>General RPC service</td>
</tr>
<tr>
<td>fdc_rpc</td>
<td>RPC to FC driver service</td>
</tr>
<tr>
<td>auth</td>
<td>Authentication</td>
</tr>
<tr>
<td>mover</td>
<td>NDMP MOVER (tape I/O)</td>

<td>NDMP extensions messages</td>
</tr>
<tr>
<td>ndmprpc</td>
<td>NDMP Mhost RPC server</td>
</tr>
</tbody>
</table>

The default value for this option is `none`. This option is persistent across reboots.

The `option-value` for this parameter can be `{all | none | normal | backend |'filter-expression'}`.

`[-dump-logical-find <text>]` - Enable Logical Find for Dump (privilege: advanced)

This option specifies whether to follow inode-file walk or tree walk for phase I of the dump. Choosing inode-file walk or tree walk affects the performance of the dump. This option can take following values:
If `default` is specified, then level 0 and incremental volume as well as qtree dumps will use inode walk. All the subtree dumps will use tree walk.

If `always` is specified, all dumps will follow treewalk.

A comma-separated list of values in any combination from the following list:

- `vol_baseline`: Level 0 full volume backup will follow treewalk.
- `vol_incr`: Incremental full volume backup will follow treewalk.
- `qtree_baseline`: Level 0 qtree backup will follow treewalk.
- `qtree_incr`: Incremental qtree backup will follow treewalk.

The default value for this option is `default`. This option is persistent across reboots.

The `-option-value` for this parameter could be `{default | always | 'vol_baseline' | 'vol_baseline,qtree_baseline' | ...}`.

`[-abort-on-disk-error {true|false}]` - Enable Abort on Disk Error (privilege: advanced)

If this option is `true`, dump will abort the backup operation on detection of irrecoverable data blocks in user files. If this option is `false`, dump will proceed with backup operation - even if irrecoverable data blocks in user files are detected. On detection of irrecoverable data blocks, dump will send a log message to DMA and also log an entry in `/mroot/etc/log/backup` file. The default value for this option is `false`. This option is persistent across reboots.

The `-option-value` for this parameter should be true/false.

`[-fh-dir-retry-interval <integer>]` - FH Throttle Value for Dir (privilege: advanced)

NDMP protocol sends back file history information for all directories in phase 3 of dump to DMA. In the presence of slow DMA or high latency networks, the amount of file history being generated exceeds the amount being consumed by the DMA. To handle a slow reader, a flow control mechanism is now introduced where file history generation is throttled when a DMA is slow in consuming them. The value for this option indicates how frequently should the file history be resent if it was throttled. The default value is 250 milliseconds. This option is persistent across reboots.

The `-option-value` for this parameter should be a number.

`[-fh-node-retry-interval <integer>]` - FH Throttle Value for Node (privilege: advanced)

NDMP protocol sends back file history information for all files in phase 4 of dump to DMA. In the presence of slow DMA or high latency networks, the amount of file history being generated exceeds the amount being consumed by the DMA. To handle slow reader conditions, a flow control mechanism is now introduced where file history generation is throttled when a DMA is slow in consuming them. The value for this option indicates how frequently should the file history be resent if it was throttled. The default value is 250 milliseconds. This option is persistent across reboots.

The `-option-value` for this parameter should be a number.

`[-restore-vm-cache-size <integer>]` - Restore VM File Cache Size (privilege: advanced)

This option mandates the number of WAFL buffers pinned in memory by various meta-files used by logical restore. The minimum and maximum values are 4 and 1024, respectively. The default value for this option is 64. This option is persistent across reboots.

Depending on the value of this option, various meta-files are assigned a number of WAFL buffers that need to be pinned in memory.

<table>
<thead>
<tr>
<th>Meta-filename</th>
<th>Number of WAFL buffers to be pinned in memory</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
The \texttt{-option-value} for this parameter should be a number between 4 and 1024.

\texttt{[-enable \{true\|false\}]} - Enable NDMP on Vserver

When the option is set to \texttt{true}, the NDMP daemon handles requests, and when set to \texttt{false}, the NDMP daemon does not handle requests. Enabling and disabling the option is equivalent to executing the following commands: \texttt{vserver services ndmp on} and \texttt{vserver services ndmp off} respectively. This option is persistent across reboots. The default value of this option is \texttt{false}.

The \texttt{-option-value} for this parameter is either true or false.

\texttt{[-preferred-interface-role \{cluster\|data\|node-mgmt\|intercluster\|cluster-mgmt\},...]} - Preferred Interface Role

This option allows the user to specify the preferred Logical Interface (LIF) role while establishing an NDMP data connection channel. The NDMP data server or the NDMP mover establishes a data channel from the node that owns the volume or the tape device respectively. This option is used on the node that owns the volume or the tape device. The order of IP addresses that are used to establish the data connection depends on the order of LIF roles specified in this option.

The default value for this option for the admin Vserver is \texttt{intercluster, cluster-mgmt, node-mgmt}
The default value for this option for a data Vserver is \texttt{intercluster, data}.

\texttt{[-secondary-debug-filter <text>]} - Secondary Debug Filter (privilege: advanced)

This option allows control on NDMP debug logging. This option takes a comma separated tag=value pairs. The supported tag is \texttt{IPADDR} which can be used to specify Vserver IP addresses for which NDMP debugging is required. If this option is set and the option \texttt{debug-enable} is set to true, then the debug-filter option is applicable to sessions whose control connection IP addresses match the IP addresses that are listed in the option. If this option is not set, the debug filter is applicable to all Vserver sessions. By default, this option does not have a value set.

\texttt{[-is-secure-control-connection-enabled \{true\|false\}]} - Is Secure Control Connection Enabled

This option enables NDMP service to accept control connections over secure sockets on TCP port 30000. This option is persistent across reboots. The default value of this option is \texttt{false}.

### Examples

The following example show how to enable NDMP on a Vserver and set authorization type to plaintext:

```
cluster1::> vserver services ndmp modify -vserver vs1 -enable true -authtype plaintext
cluster1::>
```
**vserver services ndmp off**

Disable NDMP service

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
This command is used to disable NDMP service on a specific Vserver.

**Parameters**
- `vserver <Vserver Name>` - Vserver
  
  This parameter specifies the name of the Vserver.

**Examples**

The following example disables NDMP on a specific Vserver:

```
cluster1::> vserver services ndmp off -vserver vs1
```

**vserver services ndmp on**

Enable NDMP service

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
This command is used to enable NDMP service on a specific Vserver.

**Parameters**
- `vserver <Vserver Name>` - Vserver
  
  This parameter specifies the name of the Vserver.

**Examples**

The following example enables NDMP service on a specific Vserver:

```
cluster1::> vserver services ndmp on -vserver vs1
```

**vserver services ndmp probe**

Display list of NDMP sessions

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `system services ndmp probe` command displays diagnostic information about NDMP sessions belonging to a specific Vserver in the cluster. The following fields are displayed for each of the sessions:

- Vserver
- Session identifier
- NDMP version
• Session authorized
• Data state
• Data operation
• Data server halt reason
• Data server connect type
• Data server connect address
• Data server connect port
• Data bytes processed
• Mover state
• Mover mode
• Mover pause reason
• Mover halt reason
• Mover record size
• Mover record number
• Mover bytes moved
• Mover seek position
• Mover bytes left to read
• Mover window offset
• Mover window length
• Mover position
• Mover SetRecordSize flag
• Mover SetWindow flag
• Mover connect type
• Mover connect address
• Mover connect port
• Effective host
• NDMP client address
• NDMP client port
• SCSI device ID
• SCSI hostadapter
• SCSI target ID
• SCSI LUN ID
• Tape device
• Tape mode
- Node
- Is Secure Control Connection
- Data Backup Mode
- Data Path
- NDMP Source Address

Parameters

[-vserver <vserver name>] - Vserver
This parameter specifies the Vserver context in which NDMP sessions are running.

[-session-id <text>] - Session Identifier
If this parameter is specified, the command displays information about a specific NDMP session. A session-id is a string used to identify a particular NDMP session.

[-ndmp-version <integer>] - NDMP Version
This parameter refers to the NDMP protocol version being used in the session.

[-session-authorized {true|false}] - Session Authorized
This parameter indicates whether an NDMP session is authenticated or not.

[-data-state <component state>] - Data State
This parameter identifies the current state of the data server's state machine.

[-data-operation <data operation>] - Data Operation
This parameter identifies the data server's current operation.

[-data-halt-reason <halt reason>] - Data Server Halt Reason
This parameter identifies the event that caused the data server state machine to enter the HALTED state.

[-data-con-addr-type <address type>] - Data Server Connect Type
This parameter specifies the type of data connection established by the data server. The data connection can be established locally within a given system or between remote networked systems.

[-data-con-addr <text>] - Data Server Connect Address
This parameter specifies the connection endpoint information for the data server's data connection.

[-data-con-port <integer>] - Data Server Connect Port
This parameter specifies the TCP/IP port that the data server will use when establishing a data connection.

[-data-bytes-processed <integer>] - Data Bytes Processed
This parameter represents the cumulative number of data stream bytes transferred between the backup or recovery method and the data connection during the current data operation.

[-mover-state <component state>] - Mover State
This parameter identifies the current state of the NDMP tape server's mover state machine.

[-mover-mode <mover mode>] - Mover Mode
This parameter identifies the direction of the mover data transfer.

[-mover-pause-reason <pause reason>] - Mover Pause Reason
This parameter identifies the event that caused the mover state machine to enter the PAUSED state.

[-mover-halt-reason <halt reason>] - Mover Halt Reason
This parameter identifies the event that caused the mover state machine to enter the HALTED state.

[-mover-record-size <integer>] - Mover Record Size
This parameter represents the current mover record size in bytes.
[-mover-record-num <integer>] - Mover Record Number
This parameter represents the last tape record processed by the mover.

[-mover-bytes-moved <integer>] - Mover Bytes Moved
This parameter represents the cumulative number of data stream bytes written to the data connection or the number of data stream bytes read from the data connection and written to the tape subsystem, depending on the mode of mover operation.

[-mover-seek-position <integer>] - Mover Seek Position
This parameter represents the data stream offset of the first byte the DMA requested the mover to transfer to the data connection during a mover read operation.

[-mover-bytes-left-to-read <integer>] - Mover Bytes Left to Read
This parameter represents the number of data bytes remaining to be transferred to the data connection to satisfy the current NDMP_MOVER_READ request.

[-mover-window-offset <integer>] - Mover Window Offset
This parameter represents the absolute offset of the first byte of the mover window within the overall data stream.

[-mover-window-length <integer>] - Mover Window Length
This parameter represents the length of the current mover window in bytes.

[-mover-position <integer>] - Mover Position
This parameter can be used to list only those sessions, whose mover position matches a specific value. Mover-position should be an integer.

[-mover-setrecordsize-flag {true|false}] - Mover SetRecordSize Flag
This parameter is used by the DMA to establish the record size used for mover-initiated tape read and write operations.

[-mover-setwindow-flag {true|false}] - Mover SetWindow Flag
This flag represents whether a mover window has been set or not. A mover window represents the portion of the overall backup stream that is accessible to the mover without intervening DMA tape manipulation.

[-mover-con-addr-type <address type>] - Mover Connect Type
This parameter specifies the type of data connection established by the mover. The data connection can be established locally within a given system or between remote networked systems.

[-mover-con-addr <text>] - Mover Connect Address
This parameter specifies the endpoint address or addresses that the mover will use when establishing a data connection.

[-mover-con-port <integer>] - Mover Connect Port
This parameter specifies the TCP/IP port that the mover will use when establishing a data connection.

[-eff-host <host type>] - Effective Host
This parameter indicates the host context in which the NDMP session runs. The valid values are: PRIMARY or PARTNER.

[-client-addr <text>] - NDMP Client Address
This parameter specifies the client's IP address.

[-client-port <integer>] - NDMP Client Port
This parameter specifies the client's port number.

[-spt-device-id <text>] - SCSI Device ID
This parameter specifies the SCSI device ID.
[-spt-ha <integer>] - SCSI Host Adapter
This parameter specifies the SCSI host adapter.

[-spt-scsi-id <integer>] - SCSI Target ID
This parameter specifies the SCSI target.

[-spt-scsi-lun <integer>] - SCSI LUN ID
This parameter specifies the SCSI LUN ID.

[-tape-device <text>] - Tape Device
This parameter specifies the name to identify the tape device.

[-tape-mode <mover mode>] - Tape Mode
This parameter specifies the mode in which tapes are opened.

[-node {<nodename>|local}] - Node
If this parameter is specified, the command displays information about the sessions running on the specified node only. Node should be a valid node name.

[-is-secure-control-connection {true|false}] - Is Secure Control Connection
This parameter specifies whether the control connection is secure or not.

[-data-backup-mode <text>] - Data Backup Mode
This parameter specifies whether the mode of data backup is Dump or SMTape.

[-data-path <text>] - Data Path
This parameter specifies the path of data being backed up.

[-source-addr <text>] - NDMP Source Address
This parameter specifies the control connection IP address of the NDMP session.

Examples

The following example displays diagnostic information about all the sessions in the cluster:

```
cluster1::> vserver services ndmp probe

  Vserver Name: vserver1
  Session Identifier: 1000:7445
  NDMP Version: 4
  Session Authorized: true
  Data State: IDLE
  Data Operation: NOACTION
  Data Server Halt Reason: NA
  ....
  ....

  Vserver Name: vserver2
  Session Identifier: 1000:7446
  NDMP Version: 4
  Session Authorized: true
  Data State: IDLE
  Data Operation: NOACTION
  Data Server Halt Reason: NA
  ....
  ....
```

The following example displays diagnostic information of sessions associated with Vserver vserver1 only:

```
cluster1::> vserver services ndmp probe -vserver vserver1

  Vserver Name: vserver1
  Session Identifier: 1000:7445
  NDMP Version: 4
  Session Authorized: true
```

vserver services commands
vserver services ndmp show

Display NDMP Properties

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

This command is used to display NDMP options on Vservers.

A combination of parameters can be optionally specified so as to list only a subset of Vservers where specific values of NDMP options are met. A short description of each of the options is provided in the parameters section.

Parameters

{-fields <fieldname>,...}

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

{-instance}

If you specify the -instance parameter, the command displays detailed information about all fields.

{-vserver <Vserver Name> - Vserver}

If this parameter is specified, the command displays NDMP options for that Vserver alone.

{-maxversion <integer> - NDMP Version}

If this parameter is specified, the command displays NDMP options for Vservers where the highest NDMP protocol version supported matches the specified input value. The only supported value is 4.

{-ignore-ctime-enabled {true|false} - Ignore Ctime}

If this parameter is specified, the command displays NDMP options for Vservers, where the value for ignore-ctime-enabled matches the specified input value.

This option, when true, allows user to exclude files with ctime changed from storage system' incremental dumps since other processes like virus scanning often alter the ctime of files. When this option is false, backup on the Vserver will include all files with a change or modified time later then the last dump in the previous level dump. The default value is false. This option is persistent across reboots.

Most WIN32 APIs are often unaware of the "last changed time", ctime, they often incorrectly set a later time for files, causing these files to be included in the Vserver's incremental dumps, making the incremental dump very large. This is partially defying the purpose of having incremental dumps, since one uses incremental dumps to speed up the backup by only dumping files that were truly changed since the last backup.

The possible value for this parameter is either true or false.
---offset-map-enable \{true|false\} - Enable Offset Map

If this parameter is specified, the command displays NDMP options for Vservers, where the value for offset-map-enable matches the specified input value.

This option is used to enable or disable generation of the inode offset map during NDMP based dump backups. The offset map is required to perform Enhanced Direct Access Restore (DAR) on the backup data. Enhanced DAR provides support for directory DAR and DAR of files with NT streams. The default value for this option is true. This option is persistent across reboots.

The possible value for this parameter is either true or false.

---tcpnodelay \{true|false\} - Enable TCP Nodelay

If this parameter is specified, the command displays NDMP options for Vservers, where the value for tcpnodelay matches the specified input value.

This parameter Enables/Disables the TCPNODELAY configuration parameter for the socket between the Vserver and the DMA. When set to true, the Nagle algorithm is disabled and small packets are sent immediately rather than held and bundled with other small packets. This optimizes the system for response time rather than throughput.

This option becomes active when the next NDMP session starts. Existing sessions are unaffected. The default value for this option is false. This option is persistent across reboots.

The possible value for this parameter is either true or false.

---tcpwinsize \<integer\> - TCP Window Size

If this parameter is specified, the command displays NDMP options for Vservers, where the value for tcpwinsize matches the specified input value.

This option shows the TCP buffer size of the NDMP data connection. The minimum and maximum values are 8192(8K) and 262,144(256K), respectively. The default value for this option is 32768(32K).

This option is persistent across reboots.

The possible value for this parameter is a number between 8192(8K) and 262,144(256K).

---data-port-range \<text\> - Data Port Range

If this parameter is specified, the command displays NDMP options for Vservers, where the value for data-port-range matches the specified input value.

This option shows the port range on which the NDMP server can listen for data connections.

The format of this option is start_port - end_port start_port, end_port can have values between [1024-65535]; start_port must be lesser than or equal to end_port. If a valid range is specified, NDMP uses a port within that range to listen for data connections. A listen request fails if no ports in the specified range are free.

This option is modifiable only from the admin Vserver context and the said option is applicable for all the data Vservers and the admin Vserver. For example, if the value of the above option is set with 2000-3000, the same value will be applicable throughout the cluster. The value all implies that any available port can be used to listen for data connections. The default value for this option is all. This option is persistent across reboots.

The value for this option is displayed in the format \{\<start_port>-\<end_port\> | all \} - where start_port, end_port can have values between [1024-65535]; start_port must be lesser than or equal to end_port.

---backup-log-enable \{true|false\} - Enable Backup Log

If this parameter is specified, the command displays NDMP options for Vservers, where the value for backup-log-enable matches the specified input value.

Backup logging captures important events during dump/restore and records them in /mroot/etc/log/backup on the root volume. The default value for this option is true. This option is persistent across reboots.

The possible value for this parameter is true/false.

vserver services commands
[-per-qtree-exclude-enable {true|false}] - Enable per Qtree Exclusion

If this parameter is specified, the command displays NDMP options for Vservers, where the value for `per-qtree-exclude-enable` matches the specified input value.

If this option is true, users can specify exclude list on a per qtree basis to be excluded from backup. This exclude list will override any values already present due to ‘EXCLUDE’ environment variable. The user can specify the exclusion list through a .exclude_list file which resides at the root of the qtree. The exclusion list can be a list of files or files that match a specified pattern. The default value for this option is false. This option is persistent across reboots.

The possible value for this parameter is either true or false.

[-authtype <NDMP Authentication types>, ...] - Authentication Type

If this parameter is specified, the command displays NDMP options for Vservers, where the value for `authtype` matches the specified input value.

Allows the administrator to choose the authentication method. NDMP supports three authentication types: challenge, plaintext and plaintext_sso. The plaintext_sso authentication type is mutually exclusive with the other authentication types. By setting the authentication type as plaintext_sso, the actual password for the user can be used to authenticate instead of having to generate an NDMP specific password. The default of this option is challenge. This option is persistent across reboots.

The possible value for this parameter can be {challenge | plaintext | plaintext_sso | challenge, plaintext | plaintext, challenge}.

[-debug-enable {true|false}] - Enable Debug (privilege: advanced)

If this parameter is specified, the command displays NDMP options for Vservers, where the value for `debug-enable` matches the specified input value.

This option enables debug logging for NDMP. Debug messages will be logged to the ndmpd log file /mroot/etc/log/mlog/ndmpd.log. The default value for this option is false. This option is persistent across reboots.

The possible value for this parameter is either true or false.

[-debug-filter <text>] - Debug Filter (privilege: advanced)

If this parameter is specified, the command displays NDMP options for Vservers, where the value for `debug-filter` matches the specified input value.

This option controls the NDMP modules for which debug logging is to be enabled. option-value can take five values for this option : all, none, normal, backend or "filter-expression".

`all` enables debug logging for all modules.

`none` disables debug logging for all modules. It is equivalent to `modify -vserver vserver_name -debug-enable false`.

`normal` is a shortcut option that enables debug logging for all modules except verbose and io_loop. The equivalent filter string is all-verbose-io_loop.

`backend` is a short cut option that enables debug logging for all modules except verbose, io_loop, ndmps and ndmpd. The equivalent filter string is all-verbose-io_loop-ndmps-ndmpp.

`(filter-expression)` is a combination of one or more modules for which debug logs needs to be enabled. Multiple module names can be combined using following operators:

- ^ to add the given module or modules to the list of modules specified in the filter string. For example the filter ndmpp^mover^data will enable debug logging for ndmpp, mover and data.
The possible module names and a brief description is given below:

<table>
<thead>
<tr>
<th>Modules</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>verbose</td>
<td>verbose message</td>
</tr>
<tr>
<td>io</td>
<td>I/O process loop</td>
</tr>
<tr>
<td>io_loop</td>
<td>I/O process loop verbose messages</td>
</tr>
<tr>
<td>ndmps</td>
<td>NDMP service</td>
</tr>
<tr>
<td>ndmpp</td>
<td>NDMP Protocol</td>
</tr>
<tr>
<td>rpc</td>
<td>General RPC service</td>
</tr>
<tr>
<td>fdc_rpc</td>
<td>RPC to FC driver service</td>
</tr>
<tr>
<td>auth</td>
<td>Authentication</td>
</tr>
<tr>
<td>mover</td>
<td>NDMP MOVER (tape I/O)</td>
</tr>
<tr>
<td>data</td>
<td>NDMP DATA (backup/restore)</td>
</tr>
<tr>
<td>scsi</td>
<td>NDMP SCSI (robot/tape ops)</td>
</tr>
<tr>
<td>bkup_rpc</td>
<td>RPC to Backup service client</td>
</tr>
<tr>
<td>bkup_rpc_s</td>
<td>RPC to Backup service server</td>
</tr>
<tr>
<td>conf</td>
<td>Debug configure/reconfigure</td>
</tr>
<tr>

<tr>
<td>common</td>
<td>NDMP common state</td>
</tr>
<tr>
<td>ext</td>
<td>NDMP extensions messages</td>
</tr>
<tr>
<td>ndmprpc</td>
<td>NDMP Mhost RPC server</td>
</tr>
</tbody>
</table>

The default value for this option is *none*. This option is persistent across reboots.

The possible value for this parameter can be {all | none | normal | backend | 'filter-expression'}.  

[-dump-logical-find <text>] - Enable Logical Find for Dump (privilege: advanced)

If this parameter is specified, the command displays NDMP options for Vservers, where the value for *dump-logical-find* matches the specified input value.

This option specifies whether to follow inode-file walk or tree walk for phase I of the dump. Choosing inode-file walk or tree walk affects the performance of the dump. This option can take following values:

If *default* is specified, then level 0 and incremental volume as well as qtree dumps will use inode walk. All the subtree dumps will use tree walk.

If *always* is specified, all dumps will follow treewalk.

A comma-separated list of values in any combination from the following list:

- vol_baseline: Level 0 full volume backup will follow treewalk.
- vol_incr: Incremental full volume backup will follow treewalk.
- qtree_baseline: Level 0 qtree backup will follow treewalk.
- qtree_incr: Incremental qtree backup will follow treewalk.

The default value for this option is *default*. This option is persistent across reboots.

The possible value for this parameter could be {default | always | 'vol_baseline' | 'vol_baseline,qtree_baseline' | [...].}

[-abort-on-disk-error {true|false}] - Enable Abort on Disk Error (privilege: advanced)

If this parameter is specified, the command displays NDMP options for Vservers, where the value for *abort-on-disk-error* matches the specified input value.
If this option is `true`, dump will abort the backup operation on detection of irrecoverable data blocks in user files. If this option is `false`, dump will proceed with backup operation - even if irrecoverable data blocks in user files are detected. On detection of irrecoverable data blocks, dump will send a log message to DMA and also log an entry in `/mroot/etc/log/backup` file. The default value for this option is `false`. This option is persistent across reboots.

The value for this parameter is either true or false.

```
[-fh-dir-retry-interval <integer>] - FH Throttle Value for Dir (privilege: advanced)
```

If this parameter is specified, the command displays NDMP options for Vservers, where the value for `fh-dir-retry-interval` matches the specified input value.

NDMP protocol sends back file history information for all directories in phase 3 of dump to DMA. In the presence of slow DMA or high latency networks, the amount of file history being generated exceeds the amount being consumed by the DMA. To handle a slow reader, a flow control mechanism is now introduced where file history generation is throttled when a DMA is slow in consuming them. The value for this option indicates how frequently should the file history be resent if it was throttled. The default value is 250 milliseconds. This option is persistent across reboots.

The value for this parameter is a number.

```
[-fh-node-retry-interval <integer>] - FH Throttle Value for Node (privilege: advanced)
```

If this parameter is specified, the command displays NDMP options for Vservers, where the value for `fh-node-retry-interval` matches the specified input value.

NDMP protocol sends back file history information for all files in phase 4 of dump to DMA. In the presence of slow DMA or high latency networks, the amount of file history being generated exceeds the amount being consumed by the DMA. To handle slow reader conditions, a flow control mechanism is now introduced where file history generation is throttled when a DMA is slow in consuming them. The value for this option indicates how frequently should the file history be resent if it was throttled. The default value is 250 milliseconds. This option is persistent across reboots.

The value for this parameter is a number.

```
[-restore-vm-cache-size <integer>] - Restore VM File Cache Size (privilege: advanced)
```

If this parameter is specified, the command displays NDMP options for Vservers, where the value for `restore-vm-cache-size` matches the specified input value.

This option mandates the number of WAFL buffers pinned in memory by various meta-files used by logical restore. The minimum and maximum values are 4 and 1024, respectively. The default value for this option is 64. This option is persistent across reboots.

Depending on the value of this option, various meta-files are assigned a number of WAFL buffers that need to be pinned in memory.

<table>
<thead>
<tr>
<th>Meta-filename</th>
<th>Number of WAFL buffers to be pinned in memory</th>
</tr>
</thead>
<tbody>
<tr>
<td>dumpmap</td>
<td><code>ndmpd.restore.vm_cache_size</code></td>
</tr>
<tr>
<td>filemap</td>
<td><code>ndmpd.restore.vm_cache_size</code></td>
</tr>
<tr>
<td>aclfile_map</td>
<td><code>ndmpd.restore.vm_cache_size</code></td>
</tr>
<tr>
<td>inomap</td>
<td><code>ndmpd.restore.vm_cache_size / 2</code></td>
</tr>
<tr>
<td>basemap</td>
<td><code>ndmpd.restore.vm_cache_size / 2</code></td>
</tr>
<tr>
<td>flipmap</td>
<td><code>ndmpd.restore.vm_cache_size / 2</code></td>
</tr>
<tr>
<td>revmap</td>
<td><code>ndmpd.restore.vm_cache_size / 2</code></td>
</tr>
<tr>
<td>clrimap</td>
<td><code>ndmpd.restore.vm_cache_size / 4</code></td>
</tr>
<tr>
<td>mfp_for_inotab</td>
<td><code>ndmpd.restore.vm_cache_size / 4</code></td>
</tr>
<tr>
<td>map</td>
<td><code>ndmpd.restore.vm_cache_size / 4</code></td>
</tr>
<tr>
<td>offsetfile_map</td>
<td><code>ndmpd.restore.vm_cache_size / 4</code></td>
</tr>
</tbody>
</table>
The possible value for this parameter is a number between 4 and 1024.

[-enable {true|false}] - Enable NDMP on Vserver

If this parameter is specified, the command displays NDMP options for Vservers, where the value for enable matches the specified input value.

When the option is set to true, the NDMP daemon handles requests, and when set to false, the NDMP daemon does not handle requests. Enabling and disabling the option is equivalent to executing the following commands: vserver services ndmp on and vserver services ndmp off respectively. This option is persistent across reboots. The default value of this option is false.

The value for this parameter is either true or false.

[-preferred-interface-role {cluster|data|node-mgmt|intercluster|cluster-mgmt}, ...] - Preferred Interface Role

If this parameter is specified, the command displays NDMP options for Vservers, where the value for preferred-interface-role matches the specified input value.

This option allows the user to specify the preferred Logical Interface (LIF) role while establishing an NDMP data connection channel. The NDMP data server or the NDMP mover establishes a data channel from the node that owns the volume or the tape device respectively. This option is used on the node that owns the volume or the tape device. The order of IP addresses that are used to establish the data connection depends on the order of LIF roles specified in this option.

The default value for this option for the admin Vserver is intercluster, cluster-mgmt, node-mgmt.

The default value for this option for a data Vserver is intercluster, data.

[-secondary-debug-filter <text>] - Secondary Debug Filter (privilege: advanced)

If this parameter is specified, the command displays NDMP options for Vservers, where the value for secondary-debug-filter matches the specified input value.

This option allows control on NDMP debug logging. This option takes a comma separated tag=value pairs. The supported tag is IPADDR which can be used to specify Vserver IP addresses for which NDMP debugging is required. If this option is set and the option debug-enable is set to true, then the debug-filter option is applicable to sessions whose control connection IP addresses match the IP addresses that are listed in the option. If this option is not set, the debug filter is applicable to all Vserver sessions. By default, this option does not have a value set.

[-is-secure-control-connection-enabled {true|false}] - Is Secure Control Connection Enabled

If this parameter is specified, the command displays NDMP options for Vservers, where the value for is-secure-control-connection-enabled matches the specified input value.

This option enables NDMP service to accept control connections over secure sockets on TCP port 30000. This option is persistent across reboots. The default value of this option is false.

Examples

The following example displays NDMP options for the Vserver(s).

cluster1::> vserver services ndmp show
VServer     Enabled  Authentication type
-----------  ---------  -------------------
cluster      true     plaintext
v1           true     plaintext
v2           true     plaintext
3 entries were displayed.
cluster1::>

The following example displays detailed NDMP options for a Vserver.
vserver services ndmp show

Vserver: vs1
NDMP Version: 4
Ignore Ctime: false
Enable Offset Map: true
Enable TCP Nodelay: false
TCP Window Size: 32768
Data Port Range: all
Enable Backup Log: true
Enable per Qtree Exclusion: false
Authentication Type: plaintext
Enable Debug: false
Debug Filter: none
Enable Logical Find for Dump: default
Enable Abort on Disk Error: false
FH Throttle Value for Dir: 250
FH Throttle Value for Node: 250
Restore VM File Cache Size: 64
Enable Logging of VM Stats for Dump: false
Enable NDMP on Vserver: true
Preferred Interface Role: intercluster, data
Secondary Debug Filter: -
Is Secure Control Connection Enabled: false

vserver services ndmp status

Display list of NDMP sessions

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver services ndmp status command lists NDMP sessions belonging to a specific Vserver in the cluster. By default it lists the following details about the active sessions:

- Vserver Name
- Session ID

A combination of parameters can be optionally supplied so as to list only those sessions which match specific conditions. A short description of each of the parameter is provided in the parameters section.

Parameters

{ [-fields <fieldname>,...]

This optional parameter specifies which all additional fields to display. Any combination of the following fields are valid:

- ndmp-version
- session-authorized
- data-state
- data-operation
- data-halt-reason
- data-con-addr-type
- data-con-addr
- data-con-port}
• data-bytes-processed
• mover-state
• mover-mode
• mover-pause-reason
• mover-halt-reason
• mover-record-size
• mover-record-num
• mover-bytes-moved
• mover-seek-position
• mover-bytes-left-to-read
• mover-window-offset
• mover-window-length
• mover-position
• mover-setrecordsize-flag
• mover-setwindow-flag
• mover-con-addr-type
• mover-con-addr
• mover-con-port
• eff-host
• client-addr
• client-port
• spt-device-id
• spt-ha
• spt-scsi-id
• spt-scsi-lun
• tape-device
• tape-modes
• node
• is-secure-control-connection
• data-backup-mode
• data-path
• source-addr

| [-instance ] |

If this parameter is specified, the command displays detailed information about all the active sessions.
[-vserver <vserver name>] - Vserver
    Specifies the Vserver context in which NDMP sessions are running.

[-session-id <text>] - Session Identifier
    If this parameter is specified, the command displays information about specific NDMP session. A session-id is a string used to identify a particular NDMP session.

[-ndmp-version <integer>] - NDMP Version
    This parameter refers to the NDMP protocol version being used in the session.

[-session-authorized {true|false}] - Session Authorized
    This field indicates whether an NDMP session is authenticated or not.

[-data-state <component state>] - Data State
    This field identifies the current state of the data server's state machine.

[-data-operation <data operation>] - Data Operation
    This field identifies the data server's current operation.

[-data-halt-reason <halt reason>] - Data Server Halt Reason
    This field identifies the event that caused the data server state machine to enter the HALTED state.

[-data-con-addr-type <address type>] - Data Server Connect Type
    This field specifies the type of data connection established by the data server. The data connection can be established locally within a given system or between remote networked systems.

[-data-con-addr <text>] - Data Server Connect Address
    This specifies the connection endpoint information for the data server's data connection.

[-data-con-port <integer>] - Data Server Connect Port
    This specifies the TCP/IP port that the data server will use when establishing a data connection.

[-data-bytes-processed <integer>] - Data Bytes Processed
    This field represents the cumulative number of data stream bytes transferred between the backup or recovery method and the data connection during the current data operation.

[-mover-state <component state>] - Mover State
    This parameter identifies the current state of the NDMP tape server's mover state machine.

[-mover-mode <mover mode>] - Mover Mode
    This parameter identifies the direction of the mover data transfer.

[-mover-pause-reason <pause reason>] - Mover Pause Reason
    This parameter identifies the event that caused the mover state machine to enter the PAUSED state.

[-mover-halt-reason <halt reason>] - Mover Halt Reason
    This integer field identifies the event that caused the mover state machine to enter the HALTED state.

[-mover-record-size <integer>] - Mover Record Size
    This field represents the current mover record size in bytes.

[-mover-record-num <integer>] - Mover Record Number
    This field represents the last tape record processed by the mover.

[-mover-bytes-moved <integer>] - Mover Bytes Moved
    This field represents the cumulative number of data stream bytes written to the data connection or the number of data stream bytes read from the data connection and written to the tape subsystem, depending on the mode of mover operation.
[-mover-seek-position <integer>] - Mover Seek Position
This field represents the data stream offset of the first byte the DMA requested the mover to transfer to the data connection during a mover read operation.

[-mover-bytes-left-to-read <integer>] - Mover Bytes Left to Read
This field represents the number of data bytes remaining to be transferred to the data connection to satisfy the current NDMP_MOVER_READ request.

[-mover-window-offset <integer>] - Mover Window Offset
This field represents the absolute offset of the first byte of the mover window within the overall data stream.

[-mover-window-length <integer>] - Mover Window Length
This field represents the length of the current mover window in bytes.

[-mover-position <integer>] - Mover Position
This parameter can be used to list only those sessions, whose mover position matches a specific value. Mover-position should be an integer.

[-mover-setrecordsize-flag {true|false}] - Mover SetRecordSize Flag
This field is used by the DMA to establish the record size used for mover-initiated tape read and write operations.

[-mover-setwindow-flag {true|false}] - Mover SetWindow Flag
This flag represents whether a mover window has been set or not. A mover window represents the portion of the overall backup stream that is accessible to the mover without intervening DMA tape manipulation.

[-mover-con-addr-type <address type>] - Mover Connect Type
This field specifies the type of data connection established by the mover. The data connection can be established locally within a given system or between remote networked systems.

[-mover-con-addr <text>] - Mover Connect Address
This specifies the endpoint address or addresses that the mover will use when establishing a data connection.

[-mover-con-port <integer>] - Mover Connect Port
This specifies the TCP/IP port that the mover will use when establishing a data connection.

[-eff-host <host type>] - Effective Host
This field indicates the host context in which the NDMP session runs. The valid values are: PRIMARY or PARTNER.

[-client-addr <text>] - NDMP Client Address
This parameter specifies the client's IP address.

[-client-port <integer>] - NDMP Client Port
This parameter specifies the client's port number.

[-spt-device-id <text>] - SCSI Device ID
This parameter specifies the SCSI device ID.

[-spt-ha <integer>] - SCSI Host Adapter
This parameter specifies the SCSI host adapter.

[-spt-scsi-id <integer>] - SCSI Target ID
This parameter specifies the SCSI target.

[-spt-scsi-lun <integer>] - SCSI LUN ID
This parameter specifies the SCSI LUN ID.

[-tape-device <text>] - Tape Device
This parameter specifies the name to identify the tape device.
[-tape-mode <mover mode>] - Tape Mode
This parameter specifies the mode in which tapes are opened.

[-node {<nodename>|local}] - Node
If this parameter is specified, the command displays information about the sessions running on the specified node only. Node should be a valid node name.

[-is-secure-control-connection {true|false}] - Is Secure Control Connection
This parameter specifies whether the control connection is secure or not.

[-data-backup-mode <text>] - Data Backup Mode
This parameter specifies whether the mode of data backup is Dump or SMTape.

[-data-path <text>] - Data Path
This parameter specifies the path of data being backed up.

[-source-addr <text>] - NDMP Source Address
This parameter specifies the control connection IP address of the NDMP session.

---

**Examples**

The following example displays all the NDMP sessions on the cluster:

```
cluster1::> vserver services ndmp status
Session   Vserver             Id
------------------   -------------
vserver1       1000:7445
vserver2       1000:7446
vserver2       1000:7447
3 entries were displayed.
```

The following example shows how to display only the sessions running belonging to Vserver vserver2:

```
cluster1::> vserver services ndmp status -vserver vserver2
Session   Vserver             Id
------------------   -------------
vserver2       1000:7446
vserver2       1000:7447
2 entries were displayed.
```

**vserver services ndmp extensions commands**

The extensions directory

**vserver services ndmp extensions modify**

Modify NDMP extension status

**Availability:** This command is available to cluster and Vserver administrators at the advanced privilege level.

**Description**

This command is used to enable/disable an NDMP extension in the Vserver-aware NDMP mode.
Parameters
-\[-is-extension-0x2050-enabled \{true|false\}\] - Is Extension 0x2050 Enabled

If this parameter is specified, the command can be used to modify the status of the extension in the Vserver-aware mode.

Examples
The following example shows how to enable NDMP extenion 0x2050 in the Vserver-aware NDMP mode of operation:

```
cluster1::> vserver services ndmp extension modify -is-extension-0x2050-enabled true
cluster1::>
```

**vserver services ndmp extensions show**
Display NDMP extension status

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

**Description**
This command displays whether an NDMP extension is enabled in the Vserver-aware NDMP mode or not.

Examples
The following example shows how to check the status of NDMP extension 0x2050 in a cluster:

```
cluster1::> vserver services ndmp extension show
Is Extension 0x2050 Enabled: true
cluster1::>
```

**vserver services ndmp log commands**
The log directory

**vserver services ndmp log start**
Start logging for the specified NDMP session

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

**Description**
This command is used to start logging on an active NDMP session on a vs.erver.

**Parameters**
-\[-vserver \{vserver name\}\] - Vserver
  This parameter specifies the name of the Vserver.

-\[-session-id \{text\}\] - Session Identifier
  This parameter specifies the NDMP session-id on which logging needs to be started.
Use this parameter to specify the filter for a particular session ID. This parameter controls the NDMP modules for which logging is to be enabled. This parameter can take five values. They are as follow: \textit{all, none, normal, backend} or \textit{"filter-expression"}. The default value for this is \textit{none}.

- \textit{all} turns on logging for all modules.
- \textit{none} disables logging for all modules.
- \textit{normal} is a short cut parameter that enables logging for all modules except \textit{verbose} and \textit{io_loop}. The equivalent filter string is \textit{all-verbose-io_loop}.
- \textit{backend} is a short cut parameter that enables logging for all modules except \textit{verbose, io_loop, ndmps} and \textit{ndmpd}. The equivalent filter string is \textit{all-verbose-io_loop-ndmps-ndmpp}.
- \textit{(filter-expression)} is a combination of one or more modules for which logs needs to be enabled. Multiple module names can be combined using following operators:
  - \textit{-} to remove the given module from the list of specified modules in the filter string. For example the filter \textit{all-ndmpp} will enable logging for all modules but not \textit{ndmpp}.
  - \textit{^} to add the given module or modules to the list of modules specified in the filter string. For example the filter \textit{ndmpp^mover^data} will enable logging for \textit{ndmpp, mover} and \textit{data}.

The possible module names and a brief description is given below:

**Examples**

The following example shows how to start logging on a specific NDMP session 1000:35512, running on vserver cluster1-01 with filter all.
vserver services ndmp log stop

Stop logging for the specified NDMP session

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

**Description**
This command is used to stop logging on an active NDMP session on a *vserver*.

**Parameters**

- `-vserver <vserver name>` - **Vserver**
  This parameter specifies the name of the *Vserver*.

- `-session-id <text>` - **Session Identifier**
  This parameter specifies the NDMP session-id on which logging needs to be stopped.

**Examples**

The following example shows how to stop logging on a specific NDMP session 1000:35512, running on *vserver* cluster1-01.

```
cluster1::*> vserver services ndmp log stop -vserver cluster1-01 -session-id 1000:35512
```

vserver services ndmp restartable-backup commands

The restartable-backup directory

vserver services ndmp restartable-backup delete

Delete an NDMP restartable backup context

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The `vserver services ndmp restartable-backup delete` command deletes an NDMP restartable backup context. The `-force` flag can be used to forcibly destroy a NDMP restartable backup context.

**Parameters**

- `-vserver <Vserver Name>` - **Vserver**
  This parameter specifies the name of the *Vserver* for which NDMP restartable backup context is to be deleted.

- `-context-id <UUID>` - **Context Identifier**
  This parameter specifies the NDMP restartable backup context ID which needs to be deleted.

  **[-force [true]] - Force Delete (privilege: advanced)**
  If this parameter is specified, the context is deleted even if there are internal errors.
**Examples**

The following example shows how to delete an NDMP restartable backup context:

```
cluster1::> vserver services restartable-backup delete -vserver cluster1-01 -context-id 0f8f5c44-d540-11e5-8c45-005056963504
cluster1::>
```

### vserver services ndmp restartable-backup show

Display NDMP restartable backup contexts

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**

The `vserver services ndmp restartable-backup show` command lists the NDMP restartable backup contexts present in the cluster. By default it lists the following details about the context:

- Vserver Name
- Context Identifier
- Is Cleanup Pending?

A combination of parameters can be optionally supplied so as to list only those contexts which match specific conditions. A short description of each of the parameter is provided in the parameters section.

**Parameters**

```
[-fields <fieldname>, ...]
```

- If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance]
```

- If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[-vserver <Vserver Name>]
```

- If this parameter is specified, the command displays NDMP restartable backup contexts that match the specified Vserver.

```
[-context-id <UUID>]
```

- **Context Identifier**

  If this parameter is specified, the command displays NDMP restartable backup contexts where the value for `-context-id` matches the specified input value.

  This parameter specifies the UUID of NDMP restartable backup contexts.

```
[-volume <volume name>]
```

- **Volume Name**

  If this parameter is specified, the command displays NDMP restartable backup contexts where the value for volume matches the specified input value.

  This parameter specifies the volume path information.

```
[-is-cleanup-pending {true|false}]
```

- **Is Cleanup Pending?**

  If this parameter is specified, the command displays NDMP restartable backup contexts where the value for `-is-cleanup-pending` matches the specified input value.

  This parameter indicates whether the context is being deleted.
[-engine-type <text>] - Backup Engine Type
If this parameter is specified, the command displays NDMP restartable backup contexts where the value for engine-type matches the specified input value.
This parameter specifies the backup engine type.

[-auto-snapshot {true|false}] - Is Snapshot Copy Auto-created?
If this parameter is specified, the command displays NDMP restartable backup contexts where the value for auto-snapshot matches the specified input value.
This parameter indicates if the Snapshot copy was created by DUMP engine.

[-no-acls {true|false}] - Is NO_ACLS Set? (privilege: advanced)
If this parameter is specified, the command displays NDMP restartable backup contexts where the value for no-acls matches the specified input value.
This parameter specifies if NO_ACLS environment variable is set.

[-dump-path <text>] - Dump Path
If this parameter is specified, the command displays NDMP restartable backup contexts where the value for dumppath matches the specified input value.
This parameter represents the corresponding local volume path which is being backed up.

[-backup-level <integer>] - Incremental Backup Level ID
If this parameter is specified, the command displays NDMP restartable backup contexts where the value for backup-level matches the specified input value.
This parameter specifies the backup level.

[-dump-date <integer>] - Dump Date (privilege: advanced)
If this parameter is specified, the command displays NDMP restartable backup contexts where the value for dumpdate matches the specified input value.
This parameter specifies the dumpdate value in epoch.

[-base-date <integer>] - Base Date (privilege: advanced)
If this parameter is specified, the command displays NDMP restartable backup contexts where the value for basedate matches the specified input value.
This parameter specifies the basedate value in epoch.

[-update-dump-dates {true|false}] - Dump Dates Require Update? (privilege: advanced)
If this parameter is specified, the command displays NDMP restartable backup contexts where the value for update-dumpdates matches the specified input value.
This parameter indicates if dumpdates needs to be updated.

[-dump-name <text>] - Dump Name
If this parameter is specified, the command displays NDMP restartable backup contexts where the value for dumpname matches the specified input value.
This parameter indicates the name for the dump instance.

[-all-non-qtree {true|false}] - Is NON_QUOTA_QTREE Set? (privilege: advanced)
If this parameter is specified, the command displays NDMP restartable backup contexts where the value for all-non-qtree matches the specified input value.
This parameter indicates if NON_QUOTA_TREE environment variable is set.
[-print-options <integer>] - Backup Log Level (privilege: advanced)
If this parameter is specified, the command displays NDMP restartable backup contexts where the value for print-options matches the specified input value.
This parameter specifies the logging level during dump.

[-last-update <integer>] - Context Last Updated Time
If this parameter is specified, the command displays NDMP restartable backup contexts where the value for last-update matches the specified input value.
This parameter specifies the last time (in epoch) when the context was modified.

[-has-offset-map {true|false}] - Has Offset Map?
If this parameter is specified, the command displays NDMP restartable backup contexts where the value for has-offset-map matches the specified input value.
This parameter indicates if offset map is present in the backup image.

[-offset-verify {true|false}] - Offset Verify
If this parameter is specified, the command displays NDMP restartable backup contexts where the value for offset-verify matches the specified input value.
This parameter indicates if offset map is successfully verified during backup.

[-ndmp-env-keys <text>, ...] - NDMP Environment Keys (privilege: advanced)
If this parameter is specified, the command displays NDMP restartable backup contexts where the value for ndmpenvkeys matches the specified input value.
This parameter represents the list of NDMP environment variables set during backup.

[-ndmp-env-values <text>, ...] - NDMP Environment Values (privilege: advanced)
If this parameter is specified, the command displays NDMP restartable backup contexts where the value for ndmpenvvalues matches the specified input value.
This parameter represents the values set for the NDMP environment variables.

[-ndmp-env-count <integer>] - Count of NDMP Environment Variables (privilege: advanced)
If this parameter is specified, the command displays NDMP restartable backup contexts where the value for ndmpenvcount matches the specified input value.
This parameter represents the number of NDMP environment variables set during backup.

[-is-restartable {true|false}] - Is Context Restartable?
If this parameter is specified, the command displays NDMP restartable backup contexts where the value for is-restartable matches the specified input value.
This parameter indicates if the NDMP restartable backup context is restartable.

[-is-busy {true|false}] - Is Context Busy?
If this parameter is specified, the command displays NDMP restartable backup contexts where the value for is-busy matches the specified input value.
This parameter indicates if the NDMP restartable backup context is busy.

[-multi-subtree {true|false}] - Is MULTI_SUBTREE_NAMES Set? (privilege: advanced)
If this parameter is specified, the command displays NDMP restartable backup contexts where the value for multi-subtree matches the specified input value.
This parameter indicates if the NDMP environment variable MULTI_SUBTREE_NAMES is set.
[-logical-find \{true|false\}] - Is LOGICAL_FIND Set? (privilege: advanced)

If this parameter is specified, the command displays NDMP restartable backup contexts where the value for logical-find matches the specified input value.

This parameter indicates if the NDMP environment variable LOGICAL_FIND is set.

[-exclude-list <text>] - Is EXCLUDE Set? (privilege: advanced)

If this parameter is specified, the command displays NDMP restartable backup contexts where the value for exclude-list matches the specified input value.

This parameter represents the value of the the NDMP environment variable EXCLUDE.

[-restart-pass <integer>] - Restart Pass

If this parameter is specified, the command displays NDMP restartable backup contexts where the value for restart-pass matches the specified input value.

This parameter specifies the dump phase from which to restart.

[-backup-results <integer>] - Status of Backup

If this parameter is specified, the command displays NDMP restartable backup contexts where the value for backup-results matches the specified input value.

This parameter specifies the status of the backup.

[-snap-name <text>] - Snapshot Copy Name

If this parameter is specified, the command displays NDMP restartable backup contexts where the value for snap-name matches the specified input value.

This parameter specifies the name of the Snapshot copy.

[-is-dp-vol \{true|false\}] - Is DP Volume? (privilege: advanced)

If this parameter is specified, the command displays NDMP restartable backup contexts where the value for is-dp-vol matches the specified input value.

This parameter indicates if the volume specified in the NDMP restartable context is of type DP.

[-context-status <integer>] - State of the Context

If this parameter is specified, the command displays NDMP restartable backup contexts where the value for context-status matches the specified input value.

This parameter specifies the state of the NDMP restartable context.

**Examples**

The following example displays all the NDMP restartable contexts on the cluster:

```
cluster1::> vserver services ndmp restartable-backup show
Vserver    Context Identifier                   Is Cleanup Pending?
----------- ------------------------------------ ---------------
vservr1     53a6760e-d245-11e5-a33b-005056bb2685 false
vservr2     68902360-d245-11e5-a33b-005056bb2685 true
3 entries were displayed.
```

The following example shows how to display only the contexts belonging to Vserver vservr2:

```
cluster1::> vserver services ndmp restartable-backup show -vserver vservr2
Vserver    Context Identifier                   Is Cleanup Pending?
----------- ------------------------------------ ---------------
vserver2    68902360-d245-11e5-a33b-005056bb2685 true
```
Web Services Configuration

Manage web services

These commands manage the availability and authorization for all web services in the cluster.

vserver services web modify

Modify the configuration of web services

Availability: This command is available to cluster administrators at the admin privilege level.

Description

This command modifies the availability of the web services on Vservers. Only the services that are installed on every node in the cluster can be configured on Vservers whose type is not 'node'. Enabled services must include authorization configuration in the vserver services web access command for the services to be externally available.

Parameters

-vserver <Vserver Name> - Vserver

Identifies a Vserver for hosting a specific web service.

-name <text> - Service Name

Identifies the name of the web service.

[-enabled {true|false}] - Enabled

Defines the availability of a service on the Vserver. Disabled services are not accessible through the Vserver's network interfaces. This parameter's default value is dependent on the service. In general, services that provide commonly used features are enabled by default.

[-ssl-only {true|false}] - SSL Only

Defines the encryption enforcement policy for a service on the Vserver. Services for which this parameter is set to true support SSL only and cannot be used over unencrypted HTTP. The default for this value is 'false'.

Examples

The following command sets access to the web port to SSL only:

```
cluster1::> vserver services web modify -vserver vs1 -name portal -ssl-only true
```

Related references

vserver services web access on page 2124

vserver services web show

Display the current configuration of web services

Availability: This command is available to cluster administrators at the admin privilege level.
Description
This command displays the availability of the web services on Vservers. Only the services that are installed on every node in the cluster can be configured on Vservers whose type is not 'node'. Enabled services must include authorization configuration in the `vserver services web access` command for the services to be externally available.

Parameters

\{[-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

| [-instance ]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-vserver <Vserver Name>] - Vserver`

Identifies a Vserver for hosting a specific web service.

`[-name <text>] - Service Name`

Identifies the name of the web service.

`[-type <vserver type>] - Type of Vserver`

Identifies the type of Vserver on which the service is hosted.

`[-version <text>] - Version of Web Service`

Defines the version number of the service in the format of major.minor.patch.

`[-description <text>] - Description of Web Service`

Provides a short description of the web service.

`[-long-description <text>] - Long Description of Web Service`

Provides a long description of the web service.

`[-requires <requirement>, ...] - Service Requirements`

Defines the list of requirements that must be met for the service to be successfully executed. Requirements are defined as a service name, a comparison operator (<=), and a version number.

`[-default-roles <text>, ...] - Default Authorized Roles`

Defines the roles that are automatically granted access to the service in the `vserver services web access show` configuration.

`[-enabled {true|false}] - Enabled`

Defines the availability of a service on the Vserver. Disabled services are not accessible through the Vserver's network interfaces. This parameter's default value is dependent on the service. In general, services that provide commonly used features are enabled by default.

`[-ssl-only {true|false}] - SSL Only`

Defines the encryption enforcement policy for a service on the Vserver. Services for which this parameter is set to true support SSL only and cannot be used over unencrypted HTTP. The default for this value is 'false'.

Examples

This example displays the availability of the web services on the Vservers.

Web Services Authorization

Manage the authorization for web services

These commands manage the user authorizations for web services in the cluster.

`vserver services web access create`

Authorize a new role for web service access

**Availability:** This command is available to cluster administrators at the `admin` privilege level.

**Description**

This command authorizes roles to access the Vserver's web services. For the user to access services that require authentication, the user's roles, as defined by `security login show`, must be included in this configuration.

**Note:** Node Vserver services are authorized with the data Vserver's roles.

**Parameters**

- `-vserver <Vserver Name>` - Vserver
  
  Identifies a Vserver for hosting a specific web service.

- `-name <text>` - Service Name
  
  Identifies the name of the web service.

- `-role <text>` - Role Name
  
  Identifies the new role to be authorized for this service.

**Examples**

The following example authorizes the role `auditor` - created previously - for the web service:

```
cluster1:/> vserver services web access create -name ontapi -role auditor
```

Related references

`security login show` on page 504
vserver services web access delete

Remove role authorization for web service access

Availability: This command is available to cluster administrators at the admin privilege level.

Description
This command removes the authorization of a role from the Vserver's web services. A service for which no roles are defined has a single role of 'none' automatically displayed in this configuration.

Note: Node Vserver services are authorized with the data Vserver's roles.

Parameters
-vserver <Vserver Name> - Vserver
Identifies a Vserver for hosting a specific web service.

-name <text> - Service Name
Identifies the name of the web service.

-role <text> - Role Name
Identifies the role whose authorization is to be removed. You cannot remove the authorization of the role 'none'. Use vserver services web access create to authorize access for the role.

Examples
The following example removes authorization for the role auditor for the web service:

   cluster1:~> vserver services web access delete -name ontapi -role auditor

Related references
vserver services web access create on page 2124

vserver services web access show

Display web service authorization for user roles

Availability: This command is available to cluster administrators at the admin privilege level.

Description
This command displays the roles that are authorized to access the Vserver's web services. For the user to access services that require authentication, the user's roles, as defined by security login show, must be included in this configuration.

Note: Node Vserver services are authorized with the data Vserver's roles.

Parameters
{ [-fields <fieldname>,...]
   If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?' to display the fields to specify.

   [-instance ]
   If you specify the -instance parameter, the command displays detailed information about all fields.

   [ -vserver <Vserver Name> ] - Vserver
   Identifies a Vserver for hosting a specific web service.}
[-name <text>] - Service Name
Identifies the name of the service.

[-role <text>] - Role Name
Identifies a role assigned for accessing the service. A service without any authorizations has a role of 'none' assigned to it automatically.

[-type <vserver type>] - Type of Vserver
Identifies the type of Vserver on which the service is hosted.

Examples
The following example displays the roles that are authorized to access the web services.

```
cluster1::vserver services web access> show
Vserver  Type     Service Name     Role
-------- -------- ---------------- ----------------
cluster1 admin  cem              none
cluster1 admin  ontapi           readonly
cluster1 admin  portal           none
cluster1 admin  spi              none
cluster1 admin  supdiag          none
vs0       cluster  ontapi         admin
6 entries were displayed.
```

vserver smtape commands
The smtape directory

vserver smtape break
Make a restored volume read-write
Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command breaks the relationship between the tape backup of a volume and a restored volume, changing the restored volume from read-only to read/write.

Parameters
- `vserver <vserver name>` - Vserver Name
  Use this parameter to specify the Vserver name on which the volume is located.

- `volume <volume name>` - Volume Name
  Use this parameter to specify the name of the read-only volume that needs to be changed into a read/writeable volume after an smtape restore.

Examples
Make the read-only volume `datavol` on Vserver `vserver0` writeable after a restore.

## SnapDiff RPC Server Commands

SnapDiff RPC server configuration commands

The `vserver snapdiff-rpc-server` commands help you manage the SnapDiff RPC Servers for a Vserver

### vserver snapdiff-rpc-server off

Stop the SnapDiff RPC server

**Availability:** This command is available to cluster and Vserver administrators at the *advanced* privilege level.

**Description**
The `vserver snapdiff-rpc-server off` command turns the SnapDiff RPC server off.

**Parameters**

|-vserver <vserver name>- Vserver

  This parameter specifies the Vserver for which you want to turn the SnapDiff RPC server off.

**Examples**
The following example turns the SnapDiff RPC server off for a Vserver named vs0:

```
cluster1::> vserver snapdiff-rpc-server off -vserver vs0
```

### vserver snapdiff-rpc-server on

Start the SnapDiff RPC Server

**Availability:** This command is available to cluster and Vserver administrators at the *advanced* privilege level.

**Description**
The `vserver snapdiff-rpc-server on` command turns the SnapDiff RPC server on.

**Parameters**

|-vserver <vserver name>- Vserver

  This parameter specifies the Vserver for which you want to turn the SnapDiff RPC server on.

**Examples**
The following example enables the SnapDiff RPC server access for a Vserver named vs0:

```
cluster1::> vserver snapdiff-rpc-server on -vserver vs0
```
vserver snapdiff-rpc-server show

Display the SnapDiff RPC server configurations of Vservers

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The vserver snapdiff-rpc-server show command displays the state of the SnapDiff RPC server for all the Vservers. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays the following information about all the configured Vservers:

- Vserver name
- Whether SnapDiff RPC server access is enabled

You can specify additional parameters to display only the information that matches those parameters. For instance, to display the information only for the Vservers that have access enabled, enter the command with the -state on parameter.

Parameters

{-fields <fieldname>, ...}
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

[-instance ]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver
If you specify this parameter, the command displays information only about the specified Vserver.

[-state (on|off)] - SnapDiff RPC Server state
If you specify this parameter, the command displays information only about the specified SnapDiff RPC server state.

Examples
The following example displays information about all the Vservers with SnapDiff RPC server configured:

```
cluster1::> vserver snapdiff-rpc-server show
Vserver            SnapDiff RPC Server State
----------------- --------------------------
vs0                on
vs1                off
2 entries were displayed.
```

vserver vscan commands

Manage Vscan

vserver vscan disable

Disable Vscan on a Vserver

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver vscan disable command disables Vscan on a Vserver.
**Note:** This command is not supported on a Vserver with Infinite Volume.

**Parameters**

- **-vserver <vserver name> - Vserver**

  This parameter specifies the name of the Vserver on which you want to disable Vscan.

**Examples**

The following example disables Vscan on Vserver vs1.

```bash
cluster1::> vserver vscan disable -vserver vs1
cluster1::> vserver vscan show -vserver vs1
  Vserver: vs1
  Vscan Status: off
```

---

**vserver vscan enable**

Enable Vscan on a Vserver

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The vserver vscan enable command enables Vscan on a Vserver.

**Note:** This command is not supported on a Vserver with Infinite Volume.

**Parameters**

- **-vserver <vserver name> - Vserver**

  This parameter specifies the name of the Vserver on which you want to enable Vscan. The Vscan configuration must already exist.

**Examples**

The following example enables Vscan on Vserver vs1.

```bash
cluster1::> vserver vscan enable -vserver vs1
cluster1::> vserver vscan show -vserver vs1
  Vserver: vs1
  Vscan Status: on
```

---

**vserver vscan reset**

Discard cached scan information

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.
**Description**

The `vserver vscan reset` command discards the cached information of the files that have been successfully scanned. After running this command, the files are scanned again when they are accessed.

**Note:** This command is not supported on a Vserver with Infinite Volume.

**Parameters**

`-vserver <vserver name> - Vserver`

This parameter specifies the name of the Vserver for which you want to discard the cached information.

### Examples

The following example discards the cached information of the successfully scanned files.

```
cluster1::> vserver vscan reset -vserver vs1
Warning: Running this command can cause performance degradation because files are scanned again when they are accessed.
```

**vserver vscan show**

Display Vscan status

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The `vserver vscan show` command displays Vscan status information of the Vservers. If you do not specify any parameters, the command displays the following information about all Vservers:

- Vserver name
- Vscan status

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**

`{ [-fields <fieldname>,...]}`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

`{ [-instance ]}`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-vserver <vserver name>] - Vserver`

If you specify this parameter, the command displays information only about the specified Vserver.

`[-vscan-status {on|off}] - Vscan Status`

If you specify this parameter, the command displays information only about the Vservers that have the specified status.

### Examples

The following example displays the Vscan status information.
vserver vscan show-events

Display Vscan events

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description

The vserver vscan show-events command displays contents of the event log, which is generated by the cluster to capture important events. If you do not specify any parameters, the command displays the following information for all Vscan servers:

- Vserver name
- Node name
- Vscan server
- Event type
- Event time

You can specify the -fields parameter to specify which fields of information to display. In addition to the fields above, you can display the following fields:

- File path
- Vscan server vendor
- Vscan server version
- Disconnect reason
- Scan engine status code
- Vserver LIF used for connection
- Consecutive occurrence count

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters

[-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-node (<nodename> | local)] - Node

If you specify this parameter, the command displays information only about the events that have occurred on the specified node.

cluster1:/> vserver vscan show
Vserver          Vscan Status
--------------   ------------
vs1              on
vs2              off
2 entries were displayed.
[-vserver <vserver name>] - Vserver
   If you specify this parameter, the command displays information only about the events that have occurred for
   the specified Vserver.

[-event-time <MM/DD/YYYY HH:MM:SS>] - Event Log Time
   If you specify this parameter, the command displays information only about the events that have occurred at
   the specified time.

[-server <IP Address>] - Server
   If you specify this parameter, the command displays information only about the events that have occurred for
   the specified server.

[-event-type <event-type>] - Event Type
   If you specify this parameter, the command displays information only about the events that are of the specified
   event type.

[-file-path <text>] - File Path
   If you specify this parameter, the command displays information only about the events that have the specified
   file path.

[-vendor <text>] - Vscanner Vendor
   If you specify this parameter, the command displays information only about the events that have the specified
   scan-engine vendor.

[-version <text>] - Vscanner Version
   If you specify this parameter, the command displays information only about the events that have the specified
   scan-engine version.

[-disconnect-reason <reason>] - Server Disconnect Reason
   If you specify this parameter, the command displays information only about the events that have the specified
   reason of the server disconnection.

[-lif <IP Address>] - Vserver LIF Used for Connection
   If you specify this parameter, the command displays information only about the events that have the specified
   IP address, which is used for connecting clustered Data ONTAP with the Vscan server.

Examples

The following example displays all the events captured in the cluster:

classer1::*> vserver vscan show-events

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Node</th>
<th>Server</th>
<th>Event Type</th>
<th>Event Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>
<td>Cluster-01</td>
<td>192.168.1.1</td>
<td>file-infected</td>
<td>9/5/2014 11:37:38</td>
</tr>
<tr>
<td>vs1</td>
<td>Cluster-01</td>
<td>192.168.1.1</td>
<td>scanner-updated</td>
<td>9/5/2014 11:37:08</td>

</tr>
</tbody>
</table>

3 entries were displayed.

The following example displays detailed event information about all the infected files:

cluster1::*> vserver vscan show-events -event-type file-infected -instance

   Node: Cluster-01
   Vserver: vs1
   Server: 192.168.1.1
   Event Type: file-infected
   File Path: \\1
   Vscanner Vendor: mighty master anti-evil scanner
   Vscanner Version: 1.0
Vserver Vscan Connection-status Commands

Display connection status of Vscan servers

The `vserver vscan connection-status` commands display connection status of external virus-scanning servers, or "Vscan servers".

**vserver vscan connection-status show**

Display Vscan servers connection status summary

**Availability:** This command is available to cluster and Vserver administrators at the `admin` privilege level.

**Description**

The `vserver vscan connection-status show` command displays connection status summary of the external virus-scanning servers, or "Vscan servers" for a Vserver. If you do not specify any parameters, the command displays the following information for all Vservers:

- Vserver name
- Node name
- List of connected Vscan servers
- Connected count

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**

\{[-fields <fieldname>,...]

If you specify the `[-fields <fieldname>, ...]` parameter, the command output also includes the specified field or fields. You can use `[-fields ?]` to display the fields to specify.

\[-instance \}

If you specify the `[-instance]` parameter, the command displays detailed information about all fields.

\[-node (<nodename>|local)\] - Node

If you specify this parameter, the command displays information only about the Vscan servers attached to the specified node.

\[-vserver <vserver name>\] - Vserver

If you specify this parameter, the command displays information only about the Vscan servers for the specified Vserver.

\[-servers <IP Address>,...\] - List of Connected Vscan Servers

If you specify this parameter, the command displays information only about the Vservers that have the specified server or servers.

\[-connection-count <integer>\] - Number of Connected Vscan Servers Serving the Vserver

If you specify this parameter, the command displays information only about the Vservers that have the specified connection count.
Examples
The following example displays connection-status summary for all Vservers.

```
cluster1::> vserver vscan connection-status show
Connected                 Connected
Vserver                  Node                Server-Count       Servers
------------------------- ------------------- ------------ -----------------------------
vs1                      Cluster-01                     2 1.1.1.1, 2.2.2.2
vs2                      Cluster-01                     0 -
2 entries were displayed.
```

vserver vscan connection-status show-all
Display Vscan servers connection status

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The *vserver vscan connection-status show-all* command displays connection status information of the external virus-scanning servers, or "Vscan servers". If you do not specify any parameters, the command displays the following information for all Vscan servers:

- Vserver name
- Node name
- Vscan server
- Connection status
- Disconnect reason

You can specify the `-fields` parameter to specify which fields of information to display. In addition to the fields above, you can display the following fields:

- Server type
- Vscan server vendor
- Vscan server version
- Privileged user
- Vscan server connected since
- Vscan server disconnected since
- Vserver LIF used for connection

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.
If you specify the **-instance** parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

If you specify this parameter, the command displays information only about the Vscan servers attached to the specified node.

**[-vserver <vserver name>] - Vserver**

If you specify this parameter, the command displays information only about the Vscan servers for the specified Vserver.

**[-server <IP Address>] - Server**

If you specify this parameter, the command displays information only about the Vscan server that you specify.

**[-server-status <Status>] - Server Status**

If you specify this parameter, the command displays information only about the Vscan servers that have the specified status.

**[-server-type <Server type>] - Server Type**

If you specify this parameter, the command displays information only about the Vscan servers that have the specified server type.

**[-vendor <text>] - Vscanner Vendor**

If you specify this parameter, the command displays information only about the Vscan servers that are running scan-engine of the specified vendor.

**[-version <text>] - Vscanner Version**

If you specify this parameter, the command displays information only about the Vscan servers that are running scan-engine of the specified version.

**[-disconnect-reason <reason>] - Server Disconnect Reason**

If you specify this parameter, the command displays information only about the Vscan servers that are disconnected because of the specified reason.

**[-disconnected-since <MM/DD/YYYY HH:MM:SS>] - Time When Vscanner Was Disconnected**

If you specify this parameter, the command displays information only about the Vscan servers that have been disconnected since the specified time.

**[-privileged-user <text>] - Privileged User Used for Connection**

If you specify this parameter, the command displays information only about the Vscan servers that are connected to clustered Data ONTAP using the specified privileged user.

**[-connected-since <MM/DD/YYYY HH:MM:SS>] - Time When Vscanner Was Connected**

If you specify this parameter, the command displays information only about the Vscan servers that have been connected since the specified time.

**[-lif <IP Address>] - Vserver LIF Used for Connection**

If you specify this parameter, the command displays information only about the Vscan servers that have used the specified IP address for connecting to clustered Data ONTAP.

### Examples

The following example displays connection-status information about all Vscan servers.

```
cluster1::> vserver vscan connection-status show-all

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Node</th>
<th>Server</th>
<th>Status</th>
<th>Disconnect Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>
<td>Cluster-01</td>
<td>1.1.1.1</td>
<td>disconnected</td>
<td>remote-closed</td>
</tr>
</tbody>
</table>
```

vserver vscan commands
The following example displays detailed connection-status information about all Vscan servers which are connected.

```
cluster1::> vserver vscan connection-status show-all -instance
-server-status connected

    Node: Cluster-01
    Vserver: vs1
    Server: 2.2.2.2
    Server Status: connected
    Server Type: primary
    Vscanner Vendor: XYZ
    Vscanner Version: 1.12.2
    Server Disconnect Reason: -
    Time When Server Was Disconnected: -
    Privileged User Used for Connection: cifs\u2
    Time When Server Was Connected: 6/3/2013 08:44:21
    Vserver LIF Used for Connection: 10.238.41.223
```

**vserver vscan connection-status show-connected**

Display connection status of connected Vscan servers

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The `vserver vscan connection-status show-connected` command displays connection status information of the connected external virus-scanning servers, or "Vscan servers". If you do not specify any parameters, the command displays the following information for all Vscan servers:

- Vserver name
- Node name
- Vscan server
- Vscan server vendor
- Privileged user

You can specify the `-fields` parameter to specify which fields of information to display. In addition to the fields above, you can display the following fields:

- Server type
- Vscan server version
- Vscan server connected since
- Vserver LIF used for connection

**Note:** This command is not supported for a Vserver with Infinite Volume.
Parameters

\{[-fields <fieldname>, ...] - If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

[-instance] - If you specify the -instance parameter, the command displays detailed information about all fields.

[-node {<nodename> | local}] - Node

- If you specify this parameter, the command displays information only about the Vscan servers attached to the specified node.

[-vserver <vserver name>] - Vserver

- If you specify this parameter, the command displays information only about the Vscan servers for the specified Vserver.

[-server <IP Address>] - Server

- If you specify this parameter, the command displays information only about the Vscan server that you specify.

[-vendor <text>] - Vscan Server Vendor

- If you specify this parameter, the command displays information only about the Vscan servers that are running scan-engine of the specified vendor.

[-version <text>] - Vscan Server Version

- If you specify this parameter, the command displays information only about the Vscan servers that are running scan-engine of the specified version.

[-privileged-user <text>] - Privileged User Used for Connection

- If you specify this parameter, the command displays information only about the Vscan servers that are connected to clustered Data ONTAP using the specified privileged user.

[-connected-since <MM/DD/YYYY HH:MM:SS>] - Time When Vscan Server Was Connected

- If you specify this parameter, the command displays information only about the Vscan servers that have been connected since the specified time.

[-server-type <Server type>] - Server Type

- If you specify this parameter, the command displays information only about the Vscan servers that have the specified server type.

[-lif <IP Address>] - Vserver LIF Used for Connection

- If you specify this parameter, the command displays information only about the Vscan servers that have used the specified IP address for connecting to clustered Data ONTAP.

Examples

The following example displays connection-status information about all connected Vscan servers.

```
cluster1::> vserver vscan connection-status show-connected

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Node</th>
<th>Server</th>
<th>Vendor</th>
<th>Privileged User</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>
<td>Cluster-01</td>
<td>1.1.1.1</td>
<td>ABC</td>
<td>cifs\u2</td>
</tr>
<tr>
<td>vs1</td>
<td>Cluster-01</td>
<td>2.2.2.2</td>
<td>XYZ</td>
<td>cifs\u2</td>
</tr>
</tbody>
</table>

2 entries were displayed.
```

The following example displays detailed connection-status information about connected Vscan servers which are running XYZ scan-engine.
vserver vscan connection-status show-not-connected

Display connection status of Vscan servers which are allowed to connect but not yet connected

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver vscan connection-status show-not-connected command displays connection status information of the external virus-scanning servers, or "Vscan servers" that are ready to accept connection but are not yet connected. This command could be useful for troubleshooting. If you do not specify any parameters, the command displays the following information for all Vscan servers:

- Vserver name
- Node name
- Vscan server
- Connection status
- Disconnect reason

You can specify the -fields parameter to specify which fields of information to display. In addition to the fields above, you can display the following fields:

- Server type
- Vscan server disconnected since

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters

{ [-fields <fieldname>, ...]
   If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

| [-instance ]
   If you specify the -instance parameter, the command displays detailed information about all fields.

[-node <nodename> |local] - Node
   If you specify this parameter, the command displays information only about the Vscan servers attached to the specified node.

[-vserver <vserver name>] - Vserver
   If you specify this parameter, the command displays information only about the Vscan servers for the specified Vserver.
If you specify this parameter, the command displays information only about the Vscan server that you specify.

If you specify this parameter, the command displays information only about the Vscan servers that have the specified status.

If you specify this parameter, the command displays information only about the Vscan servers that are disconnected because of the specified reason.

If you specify this parameter, the command displays information only about the Vscan servers that have been disconnected since the specified time.

If you specify this parameter, the command displays information only about the Vscan servers that have the specified server type.

Examples

The following example displays connection-status information about all Vscan servers which are ready to accept connection but not yet connected.

```
cluster1::> vserver vscan connection-status show-not-connected
Vserver   Node              Server           Connection Status   Disconnect Reason
---------- ----------------- ---------------- ------------- ---------------
vs2        Cluster-01        3.3.3.3          disconnected      invalid-session-id
vs2        Cluster-01        4.4.4.4          disconnected      remote-closed
2 entries were displayed.
```

The following example displays detailed connection-status information about Vscan servers which are disconnected because the connection is remotely closed.

```
cluster1::> vserver vscan connection-status show-not-connected -instance
-disconnect-reason remote-closed
Node: Cluster-01
Vserver: vs2
Server: 4.4.4.4
Server Status: disconnected
Server Disconnect Reason: remote-closed
Server Type: primary
```

vserver vscan on-access-policy commands

Manage Vscan On-Access policies

vserver vscan on-access-policy create

Create an On-Access policy

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.
Description
The `vserver vscan on-access-policy create` command creates an On-Access policy.

**Note:** This command is not supported for a Vserver with Infinite Volume.

Parameters

- `vserver <vserver name>` - Vserver
  This parameter specifies the name of the Vserver on which you want to create an On-Access policy.

- `policy-name <Policy name>` - Policy
  This parameter specifies the name of the On-Access policy that you want to create. An On-Access policy name can be up to 256 characters long and is a string that can only contain any combination of ASCII-range alphanumeric characters (a-z, A-Z, 0-9), "_", "-" and ".".

- `protocol <CIFS>` - File-Access Protocol
  This parameter specifies the protocol name for which the On-Access policy will be created. Currently only CIFS is supported.

- `filters {scan-ro-volume|scan-execute-access}, ...` - Filters
  This parameter specifies a list of filters which can be used to define the scope of the On-Access policy more precisely. The list can include one or more of the following:
  - `scan-ro-volume` - Enable scans for read-only volume.
  - `scan-execute-access` - Scan only files opened with execute-access (CIFS only).

- `scan-mandatory {on|off}` - Mandatory Scan
  This parameter specifies whether access to a file is allowed if there are no external virus-scanning servers available for virus scanning. By default, it is on.

- `max-file-size <integer> [KB|MB|GB|TB|PB]` - Max File Size Allowed for Scanning
  This parameter specifies the maximum size of the file which will be considered for virus scanning. By default, it is 2GB.

- `paths-to-exclude <File path>, ...` - File Paths Not to Scan
  This parameter specifies a list of paths, separated by commas, to exclude from virus scanning. This path is given from the root of the Vserver and can be up to 255 characters long. By default, no paths are excluded. CIFS protocol based On-Access policies must use "\" as the path separator. The path can be in one of the following forms:
  - `\dir1\dir2\name` - This would match "\dir1\dir2\name" as well as "\dir1\dir2\name\...".
  - `\dir1\dir2\name\` - This would only match "\dir1\dir2\name\".

  **Note:** If you are using the CLI, you must delimit all paths with double quotation marks ("). For instance, to add the paths "\vol\a b\" and "\vol\a,b\" to the `paths-to-exclude` in the CLI, type "\vol\a b \", "\vol\a,b\" at the command prompt. To add a "?" to the expression, press ESC followed by the "?".

- `file-ext-to-exclude <File extension>, ...` - File Extensions Not to Scan
  This parameter specifies a list of file extensions, separated by commas, to exclude from virus scanning. By default, no file extensions are excluded. Each file extension can be up to 16 characters long. The `file-ext-to-exclude` supports wildcard patterns containing "*" and "?". Pattern matching is defined as:
  - "*" - Matches any string, including the empty string. For example, `mp*` would match mp, mp3, mp4, mpeg etc.
  - "?" - Matches any single character. For example, `mp?` would match mp3, mp4 but not mp and mpeg.
**Note:** If you are using the CLI, you must delimit all patterns with double quotation marks ("."). For instance, to enter the pattern mp* in the CLI, type "mp*" at the command prompt. To add a "?" to the expression, press ESC followed by the "?".

- **-file-ext-to-include <File extension>, ...** - File Extensions to Scan
  
  This parameter specifies a list of file extensions, separated by commas, to include for virus scanning. By default it is *, which means all the file extensions are considered for virus scanning except those which match one of the patterns provided in -file-ext-to-exclude list. Each file extension can be up to 16 characters long. The -file-ext-to-include supports wildcard patterns containing "+*" and "+?". Pattern matching is defined as:
  
  - * - Matches any string, including the empty string. For example, mp* would match mp, mp3, mp4, mpeg etc.
  - ? - Matches any single character. For example, mp? would match mp3, mp4 but not mp and mpeg.

  **Note:** If you are using the CLI, you must delimit all patterns with double quotation marks ("."). For instance, to enter the pattern mp* in the CLI, type "mp*" at the command prompt. To add a "?" to the expression, press ESC followed by the "?".

  **Note:** If you specify both -file-ext-to-include and -file-ext-to-exclude lists, then only those file extensions are considered for virus scanning which match one of the patterns provided in -file-ext-to-include list but do not match any of the patterns provided in -file-ext-to-exclude list.

- **-scan-files-with-no-ext {true|false}** - Scan Files with No Extension
  
  This parameter specifies if the files without any extension are considered for virus scanning or not. By default, it is true.

**Examples**

The following example creates an On-Access policy.

```
cluster1::> vserver vscan on-access-policy create -vserver vs1 -policy-name test
   -protocol CIFS -scan-mandatory on -filters scan-ro-volume -max-file-size 3GB
   -file-ext-to-exclude "mp3","txt" -file-ext-to-include "mp*","tx*"
   -paths-to-exclude "\vol\a b\", "\vol\a,b\"
```

```
cluster1::> vserver vscan on-access-policy show -instance -vserver vs1 -policy-name test

  Vserver: vs1
  Policy: test
  Policy Status: off
  Policy Config Owner: vserver
  File-Access Protocol: CIFS
  Filters: scan-ro-volume
  Mandatory Scan: on
  Max File Size Allowed for Scanning: 3GB
  File Paths Not to Scan: \vol\a b\, \vol\a,b\n  File Extensions Not to Scan: mp3, txt
  File Extensions to Scan: mp*, tx*
  Scan Files with No Extension: true
```

**vserver vscan on-access-policy delete**

Delete an On-Access policy

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The vserver vscan on-access-policy delete command deletes an On-Access policy.
Note: This command is not supported for a Vserver with Infinite Volume.

Parameters
- **vserver <vserver name>** - Vserver
  This parameter specifies the name of the Vserver from which you want to delete an On-Access policy.

- **-policy-name <policy name>** - Policy
  This parameter specifies the name of the On-Access policy that you want to delete.

Examples
The following example deletes an On-Access policy.

```
cluster1::> vserver vsan on-access-policy delete -vserver vs1 -policy-name test
```

```
cluster1::> vserver vsan on-access-policy show -vserver vs1 -policy-name test
There are no entries matching your query.
```

**vserver vsan on-access-policy disable**

Disable an On-Access policy

Availability: This command is available to cluster and Vserver administrators at the **admin** privilege level.

Description
The `vserver vsan on-access-policy disable` command disable an On-Access policy for the specified Vserver.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters
- **vserver <vserver name>** - Vserver
  This parameter specifies the name of the Vserver on which you want to disable an On-Access policy. The Vserver administrator can disable On-Access policies created within the scope of the Vserver and can also disable an On-Access policy created by the cluster administrator. The cluster administrator can disable On-Access policies for any Vserver.

- **policy-name <policy name>** - Policy
  This parameter specifies the name of the On-Access policy you want to disable.

Examples
The following command disable an On-Access policy on specified Vserver.

```
cluster1::> vserver vsan on-access-policy disable -vserver vs1 -policy-name new
```

```
cluster1::> vserver vsan on-access-policy show -instance -vserver vs1 -policy-name new

Vserver: vs1
Policy: new
Policy Status: off
Policy Config Owner: vserver
File-Access Protocol: CIFS
Filters: scan-ro-volume
Mandatory Scan: on
Max File Size Allowed for Scanning: 4GB
```
vserver vscan on-access-policy enable

Enable an On-Access policy

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver vscan on-access-policy enable` command enables an On-Access policy for the specified Vserver. Only one On-Access policy of a specific protocol can be enabled at one time.

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**
- **-vserver** `<vserver name>` - Vserver
  
  This parameter specifies the name of the Vserver on which you want to enable an On-Access policy. The Vserver administrator can enable On-Access policy created within the scope of the Vserver or the cluster. The cluster administrator can enable On-Access policy for any Vserver but cannot enable them with a scope of cluster. The scope is determined at a Vserver level.

- **-policy-name** `<Policy name>` - Policy
  
  This parameter specifies the name of the On-Access policy you want to enable.

**Examples**
The following command enables an On-Access policy on specified Vserver.

```
cluster1::> vserver vscan on-access-policy enable -vserver vs1 -policy-name new
cluster1::> vserver vscan on-access-policy show -instance -vserver vs1 -policy-name new

Vserver: vs1
Policy: new
Policy Status: on
Policy Config Owner: vserver
File-Access Protocol: CIFS
Filters: scan-ro-volume
Mandatory Scan: on
Max File Size Allowed for Scanning: 4GB
File-Paths Not to Scan: \vol\temp
File-Extensions Not to Scan: txt
```

vserver vscan on-access-policy modify

Modify an On-Access policy

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver vscan on-access-policy modify` command modifies an On-Access policy.

**Note:** This command is not supported for a Vserver with Infinite Volume.
Parameters

-vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver on which you want to modify an On-Access policy.

-policy-name <Policy name> - Policy

This parameter specifies the name of the On-Access policy that you want to modify.

[-filters {scan-ro-volume|scan-execute-access}, ...] - Filters

This parameter specifies a list of filters which can be used to define the scope of the On-Access policy more precisely. The list can include one or more of the following:

- scan-ro-volume - Enable scans for read-only volume.
- scan-execute-access - Scan only files opened with execute-access (CIFS only).

[-scan-mandatory {on|off}] - Mandatory Scan

This parameter specifies whether access to a file is allowed if there are no external virus-scanning servers available for virus scanning.

[-max-file-size {<integer>[KB|MB|GB|TB|PB]}] - Max File Size Allowed for Scanning

This parameter specifies the maximum size of the file which will be considered for virus scanning.

[-paths-to-exclude <File path>, ...] - File Paths Not to Scan

This parameter specifies a list of paths, separated by commas, to exclude from virus scanning. This path is given from the root of the Vserver and can be up to 255 characters long. CIFS protocol based On-Access policies must use "\" as the path separator. The path can be in one of the following forms:

- \dir1\dir2\name - This would match "\dir1\dir2\name" as well as "\dir1\dir2\name\...".
- \dir1\dir2\name\ - This would only match "\dir1\dir2\name\...".

**Note:** If you are using the CLI, you must delimit all paths with double quotation marks ("). For instance, to add the paths "\vol\a\b" and "\vol\a\b1\" to the -paths-to-exclude in the CLI, type "\vol\a b \", "\vol\a,b\" at the command prompt. To add a "?" to the expression, press ESC followed by the "?".

[-file-ext-to-exclude <File extension>, ...] - File Extensions Not to Scan

This parameter specifies a list of file extensions, separated by commas, to exclude from virus scanning. Each file extension can be up to 16 characters long. The -file-ext-to-exclude supports wildcard patterns containing "*" and "?". Pattern matching is defined as:

- * - Matches any string, including the empty string. For example, mp* would match mp, mp3, mp4, mpeg etc.
- ? - Matches any single character. For example, mp? would match mp3, mp4 but not mp and mpeg.

**Note:** If you are using the CLI, you must delimit all patterns with double quotation marks ("). For instance, to enter the pattern mp* in the CLI, type "mp*" at the command prompt. To add a "?" to the expression, press ESC followed by the "?".

[-file-ext-to-include <File extension>, ...] - File Extensions to Scan

This parameter specifies a list of file extensions, separated by commas, to include for virus scanning. Each file extension can be up to 16 characters long. The -file-ext-to-include supports wildcard patterns containing "*" and "?". Pattern matching is defined as:

- * - Matches any string, including the empty string. For example, mp* would match mp, mp3, mp4, mpeg etc.
- ? - Matches any single character. For example, mp? would match mp3, mp4 but not mp and mpeg.
**Note:** If you are using the CLI, you must delimit all patterns with double quotation marks (""). For instance, to enter the pattern *mp* in the CLI, type "mp*" at the command prompt. To add a "?" to the expression, press ESC followed by the "?".

**Note:** If you specify both `-file-ext-to-include` and `-file-ext-to-exclude` lists, then only those file extensions are considered for virus scanning which match one of the patterns provided in `-file-ext-to-include` list but do not match any of the patterns provided in `-file-ext-to-exclude` list.

```
[-scan-files-with-no-ext {true|false}] - Scan Files with No Extension
```

This parameter specifies if the files without any extension are considered for virus scanning or not.

### Examples

The following example modifies an On-Access policy.

```bash
cluster1::> vserver vscan on-access-policy modify -vserver vs1 -policy-name test
   -protocol CIFS -scan-mandatory on -filters scan-ro-volume -max-file-size 10GB
   -file-ext-to-exclude "mp3" -file-ext-to-include "mp*" -scan-files-with-no-ext false
   -paths-to-exclude "\vol1\temp","\vol2\a"
```

```bash
cluster1::> vserver vscan on-access-policy show -instance -vserver vs1 -policy-name test

Vserver: vs1
Policy: test
Policy Status: off
Policy Config Owner: vs-server
File-Access Protocol: CIFS
Filters: scan-ro-volume
Mandatory Scan: off
Max File Size Allowed for Scanning: 10GB
File Paths Not to Scan: \vol1\temp, \vol2\a
File Extensions Not to Scan: mp3
File Extensions to Scan: mp*
Scan Files with No Extension: false
```

**vserver vscan on-access-policy show**

Display On-Access policies

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The `vserver vscan on-access-policy show` command displays information about the On-Access policies belonging to the Vserver. It also displays the current status in Vserver scope. If you do not specify any parameters, the command displays the following information about all On-Access policies:

- Vserver name
- Policy name
- Policy status
- Policy owner
- Protocol
- File paths to exclude
- File extensions to exclude
You can specify the `-fields` parameter to specify which fields of information to display about On-Access policies. In addition to the fields above, you can display the following fields:

- List of filters
- Mandatory scan
- Max file size
- File extensions to include
- Scan files without extension

**Note:** This command is not supported for a Vserver with Infinite Volume.

### Parameters

* [[-fields <fieldname>, ...]]
  
  If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

* [[-instance]]
  
  If you specify the `-instance` parameter, the command displays detailed information about all fields.

* [-vserver <vserver name>] - Vserver
  
  If you specify this parameter, the command displays information only about the On-Access policies for the specified Vserver.

* [-policy-name <Policy name>] - Policy
  
  If you specify this parameter, the command displays information only about the specified On-Access policy.

* [-policy-status {on|off}] - Policy Status
  
  If you specify this parameter, the command displays information only about the On-Access policies that have the specified status.

* [-owner <Configuration owner>] - Policy Config Owner
  
  If you specify this parameter, the command displays information only about the On-Access policies that have the specified owner.

* [-protocol <CIFS>] - File-Access Protocol
  
  If you specify this parameter, the command displays information only about the On-Access policies that have the specified protocol.

* [-filters {scan-ro-volume|scan-execute-access}, ...] - Filters
  
  If you specify this parameter, the command displays information only about the On-Access policies that have the specified filter or filters in the filter list.

* [-scan-mandatory {on|off}] - Mandatory Scan
  
  If you specify this parameter, the command displays information only about the On-Access policies that have mandatory scanning enabled.

* [-max-file-size {<integer>[KB|MB|GB|TB|PB]}] - Max File Size Allowed for Scanning
  
  If you specify this parameter, the command displays information only about the On-Access policies that have the specified max-file-size.

* [-paths-to-exclude <File path>, ...] - File Paths Not to Scan
  
  If you specify this parameter, the command displays information only about the On-Access policies that have the specified path or paths in the exclude list.
[-file-ext-to-exclude <File extension>, ...] - File Extensions Not to Scan

If you specify this parameter, the command displays information only about the On-Access policies that have the specified file extension or extensions in the exclude list.

[-file-ext-to-include <File extension>, ...] - File Extensions to Scan

If you specify this parameter, the command displays information only about the On-Access policies that have the specified file extension or extensions in the include list.

[-scan-files-with-no-ext {true|false}] - Scan Files with No Extension

If you specify this parameter, the command displays information only about the On-Access policies that have the specified value.

Examples

The following example displays information about all On-Access policies.

cluster1::> vserver vscan on-access-policy show

4 entries were displayed.

The following example displays detailed information about an On-Access policy.

cluster1::> vserver vscan on-access-policy show -instance -vserver vs1 -policy-name new

Vserver: vs1
Policy: new
Policy Status: off
Policy Config Owner: vservers
File-Access Protocol: CIFS
Filters: scan-ro-volume
Mandatory Scan: on
Max File Size Allowed for Scanning: 4GB
File Paths Not to Scan: \vol\temp
File Extensions Not to Scan: txt
File Extensions to Scan: *
Scan Files with No Extension: true

vserver vscan on-access-policy file-ext-to-exclude commands

Manage list of file extensions to be excluded in an On-Access policy

vserver vscan on-access-policy file-ext-to-exclude add

Add to the list of file extensions to exclude

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver vscan on-access-policy file-ext-to-exclude add command adds a file extension or a list of file extensions that must be excluded from scanning to the specified policy name.
Note: This command is not supported for a Vserver with Infinite Volume.

Parameters

-vserver <vserver name> - Vserver
This parameter specifies the name of the Vserver containing the specified on-access policy to which you want to add a file extension or a list of file extensions that must be excluded from scanning.

-policy-name <Policy name> - Policy
This parameter specifies the name of the on-access policy to which you want to add a file extension or a list of file extensions that must be excluded from scanning.

-file-ext-to-exclude <File extension>, ... - File Extensions Not to Scan
This parameter specifies the file extension or a list of file extensions that must be excluded from scanning.

Examples

The following example adds a list of file extensions that must be excluded from scanning to the specified on-access policy:

```bash
cluster1::> vserver vsscan on-access-policy file-ext-to-exclude add -vserver vs1
          -policy-name policy1 -file-ext-to-exclude txt,mp4
cluster1::> vserver vsscan on-access-policy file-ext-to-exclude show -vserver vs1
          -policy-name policy1
   Vserver: vs1
     Policy: policy1
File-Extensions Not to Scan: mp3, mp4, txt, wav
```

vserver vsscan on-access-policy file-ext-to-exclude remove
Remove from the list of file extensions to exclude

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver vsscan on-access-policy file-ext-to-exclude remove command removes a file extension or a list of file extensions that are excluded from scanning from the specified policy name.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters

-vserver <vserver name> - Vserver
This parameter specifies the name of the Vserver containing the specified on-access policy from which you want to remove a file extension or a list of file extensions that are excluded from scanning.

-policy-name <Policy name> - Policy
This parameter specifies the name of the on-access policy from which you want to remove a file extension or a list of file extensions that are excluded from scanning.

-file-ext-to-exclude <File extension>, ... - File Extensions Not to Scan
This parameter specifies the file extension or a list of file extensions that must be removed from the on-access policy.
Examples
The following example removes a list of file extensions that are to be excluded from scanning from the specified on-access policy:

```
cluster1::> vserver vscan on-access-policy file-ext-to-exclude remove -vserver vs1 -policy-name policy1 -file-ext-to-exclude mp3,txt
cluster1::> vserver vscan on-access-policy file-ext-to-exclude show -vserver vs1 -policy-name policy1
Vserver: vs1
Policy: policy1
File-Extensions Not to Scan: mp4, wav
```

vserver vscan on-access-policy file-ext-to-exclude show
Display list of file extensions to exclude

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver vscan on-access-policy file-ext-to-exclude show command displays the list of file extensions that are excluded from scanning belonging to the Vserver. If you do not specify any parameters, the command displays the following information about all on-access policies:

- Vserver name
- Policy name
- List of File-Extensions to exclude

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters

```
[-fields <fieldname>, ...]
```
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance]
```
If you specify the -instance parameter, the command displays detailed information about all fields.

```
[-vserver <vserver name>] - Vserver
```
If you specify this parameter, the command displays information only about the policy names for the specified Vserver.

```
[-policy-name <Policy name>] - Policy
```
If you specify this parameter, the command displays information only about the specified policy name.

```
[-file-ext-to-exclude <File extension>, ...] - File Extensions Not to Scan
```
If you specify this parameter, the command displays information only about the policies that have the specified file extensions that are excluded from scanning.

Examples
The following example displays the list of file extensions that are excluded from scanning for all the policies:
vserver vscan on-access-policy file-ext-to-exclude commands

Manage list of file extensions to be excluded in an On-Access policy

vserver vscan on-access-policy file-ext-to-exclude show

vserver vscan on-access-policy file-ext-to-exclude commands

Manage list of file extensions to be included in an On-Access policy

vserver vscan on-access-policy file-ext-to-include add

Add to the list of file extensions to include

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver vscan on-access-policy file-ext-to-include add command adds a file extension or list of file extensions to include for virus scanning to the specified policy.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters
-vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver containing the specified on-access policy to which you want to add a file extension or a list of file extensions to include for virus scanning.

-policy-name <Policy name> - Policy

This parameter specifies the name of the on-access policy to which you want to add a file extension or a list of file extensions to include for virus scanning.

-file-ext-to-include <File extension>, ... - File Extensions to Scan

This parameter specifies the file extension or a list of file extensions to include for virus scanning.

Examples
The following example adds a list of file extensions to include for virus scanning to the specified on-access policy.

cluster1::> vserver vscan on-access-policy file-ext-to-include add -vserver vs1
-policy-name policy1 -file-ext-to-include "mp*", "tx*"

cluster1::> vserver vscan on-access-policy file-ext-to-include show -vserver vs1
-policy-name policy1

Vserver: vs1
Policy: policy1
File Extensions to Scan: mp*, tx*, wav
vserver vscan on-access-policy file-ext-to-include remove

Remove from the list of file extensions to include

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver vscan on-access-policy file-ext-to-include remove command removes a file extension or list of file extension that are included for virus scanning from the specified policy.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters
-vserver <vserver name> - Vserver
This parameter specifies the name of the Vserver containing the specified on-access policy from which you want to remove a file extension or list of file extensions that are included for virus scanning.

-policy-name <Policy name> - Policy
This parameter specifies the name of the on-access policy from which you want to remove a file extension or a list of file extensions that are included for virus scanning.

-file-ext-to-include <File extension>, ... - File Extensions to Scan
This parameter specifies the file extension or a list of file extensions that you want to remove from the specified on-access policy.

Examples
The following example removes a list of file extensions from the specified on-access policy.

cluster1::> vserver vscan on-access-policy file-ext-to-include remove -vserver vs1
-policy-name policy1 -file-ext-to-include "txt","wav"

cluster1::> vserver vscan on-access-policy file-ext-to-include show -vserver vs1
-policy-name policy1

Vserver: vs1
Policy: policy1
File Extensions to Scan: mp*

vserver vscan on-access-policy file-ext-to-include show

Display list of file extensions to include

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver vscan on-access-policy file-ext-to-include show command displays the list of file extensions to include for virus scanning belonging to the Vserver. If you do not specify any parameters, the command displays the following information about all on access policies:

• Vserver name
• Policy name
• List of File-Extensions to Scan
Note: This command is not supported for a Vserver with Infinite Volume.

Parameters

[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

[-instance]]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver
If you specify this parameter, the command displays information only about the policies for the specified Vserver.

[-policy-name <Policy name>] - Policy
If you specify this parameter, the command displays information only about the specified policy.

[-file-ext-to-include <File extension>, ...] - File Extensions to Scan
If you specify this parameter, the command displays information only about the policies that have the specified file extensions that are included for virus scanning.

Examples

The following example displays the list of file extensions that are included for virus scanning for all policies.

```
cluster1::> vserver vscan on-access-policy file-ext-to-include show
Vserver  Policy Name       File-Ext Included
--------------- ----------------- --------------------------------------------
cluster1   default_CIFS      *
vs1        default_CIFS      *
vs1        policy1           mp*
vs1        policy3           doc*, xl*
vs2        default_CIFS      *
vs2        policy2           d*, m*, t*
6 entries were displayed.
```

vserver vscan on-access-policy paths-to-exclude commands
Manage list of paths to be excluded in an On-Access policy

vserver vscan on-access-policy paths-to-exclude add
Add to the list of paths to exclude

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver vscan on-access-policy paths-to-exclude add command adds a path or a list of paths that must be excluded from scanning to the specified policy name.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters

-vserver <vserver name> - Vserver
This parameter specifies the name of the Vserver containing the specified on-access policy to which you want to add a path or a list of paths that must be excluded from scanning.
-policy-name <Policy name> - Policy

This parameter specifies the name of the on-access policy to which you want to add a path or a list of paths that must be excluded from scanning.

-path-to-exclude <File path>, ... - Paths Not to Scan

This parameter specifies the path or list of paths that must be excluded from scanning.

Examples

The following example adds a list of paths that must be excluded from scanning to the specified on-access policy:

```
cluster1::> vserver vsan on-access-policy paths-to-exclude add -vserver vs1
-policy-name policy1 -paths-to-exclude \test\test2,\test\test3
```

```
cluster1::> vserver vsan on-access-policy paths-to-exclude show -vserver vs1
-policy-name policy1
Vserver: vs1
Policy: policy1
File-Paths Not to Scan: \test\test1, \test\test2, \test\test3
```

vserver vsan on-access-policy paths-to-exclude remove

Remove from the list of paths to exclude

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver vsan on-access-policy paths-to-exclude remove command removes a path or a list of paths that are excluded from scanning from the specified policy name.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver containing the specified on-access policy from which you want to remove a path or list of paths that are excluded from scanning.

-policy-name <Policy name> - Policy

This parameter specifies the name of the on-access policy from which you want to remove a path or a list of paths that are excluded from scanning.

-path-to-exclude <File path>, ... - Paths Not to Scan

This parameter specifies the path or list of paths that must be removed from the on-access policy.

Examples

The following example removes a list of paths that are excluded from scanning from the specified policy name:

```
cluster1::> vserver vsan on-access-policy paths-to-exclude remove -vserver vs1
-policy-name policy1 -paths-to-exclude \test\test2,\test\test3
```

```
cluster1::> vserver vsan on-access-policy paths-to-exclude show -vserver vs1
-policy-name policy1
```
vserver vscan on-access-policy paths-to-exclude show

Display list of paths to exclude

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver vscan on-access-policy paths-to-exclude show command displays the list of paths that are excluded from scanning belonging to the Vserver. If you do not specify any parameters, the command displays the following information about all on-access policies:

- Vserver name
- Policy name
- List of Paths to exclude

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters

{-fields <fieldname>, ...} If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

{-instance} If you specify the -instance parameter, the command displays detailed information about all fields.

{-vserver <vserver name>} - Vserver

If you specify this parameter, the command displays information only about the policy names for the specified Vserver.

{-policy-name <Policy name>} - Policy

If you specify this parameter, the command displays information only about the specified policy name.

{-paths-to-exclude <File path>, ...} - File Paths Not to Scan

If you specify this parameter, the command displays information only about the policies that have the specified paths that are excluded from scanning.

Examples

The following example displays the list of paths that are excluded from scanning for all the policies:

```bash
cluster1::> vserver vscan on-access-policy paths-to-exclude show
Vserver         Policy Name       Paths Excluded
--------------- ----------------- --------------------------------------------
cluster1        default_CIFS      \test\test1
vs1             default_CIFS      \test\test1,\test\test2,\test\test3
vs1             policy1           \test\test2
vs1             policy3           \test\test4
vs2             default_CIFS      \test\test1
vs2             policy2           \test\test5
6 entries were displayed.
```
vserver vscan on-demand-task commands
Manage Vscan On-Demand scans

vserver vscan on-demand-task create
Create an On-Demand task

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver vscan on-demand-task create command creates an On-Demand task. The On-Demand task consists of a set of attributes that are used for configuring the scope of scanning. It also specifies the cron schedule at which the task should run.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters
-vserver <vserver name> - Vserver
This parameter specifies the name of the Vserver on which you want to create an On-Demand task.

-task-name <text> - Task Name
This parameter specifies the name of the On-Demand task that you want to create. An On-Demand task name can be up to 256 characters long.

-scan-paths <text>, ... - List of Scan Paths
This parameter specifies a list of paths, separated by commas, for virus scanning. This path is given from the root of the Vserver using UNIX path delimiter "/".

-report-directory <text> - Report Directory Path
This parameter specifies a directory path where the On-Demand report file is created. Each run for a task creates a new file. The report directory path is given from the root of the Vserver using UNIX path delimiter "/".

[-schedule <text>] - Job Schedule
This parameter specifies the already existing cron schedule. The On-Demand task triggers virus scanning for the specified scan-paths at the time configured in the schedule.

Note: A Vserver can have only one scheduled task at a time.

[-max-file-size {<integer>[KB|MB|GB|TB|PB]}] - Max File Size Allowed for Scanning
This parameter specifies the maximum size of the file that will be considered for virus scanning. By default, it is 10GB.

[-paths-to-exclude <text>, ...] - File Paths Not to Scan
This parameter specifies a list of paths, separated by commas, to exclude from virus scanning. This path is given from the root of the Vserver using UNIX path delimiter "/". By default, no paths are excluded. The path can be in one of the following forms:

- /dir1/dir2/name - This would match "/dir1/dir2/name" as well as "/dir1/dir2/name/".
- /dir1/dir2/name/ - This would only match "/dir1/dir2/name/".

Note: If you are using the CLI, you must delimit all paths with double quotation marks ("). For instance, to add the paths "/vol/a b/" and "/vol/a,b/" to the -paths-to-exclude in the CLI, type "/vol/a b/ ", "/vol/a,b/" at the command prompt.
[-file-ext-to-exclude <File extension>, ...] - File Extensions Not to Scan

This parameter specifies a list of file extensions, separated by commas, to exclude from virus scanning. By default, no file extensions are excluded. Each file extension can be up to 16 characters long. The `-file-ext-to-exclude` supports wildcard patterns containing "*" and "?". Pattern matching is defined as:

- * - Matches any string, including the empty string. For example, `mp*` matches mp, mp3, mp4, mpeg etc.
- ? - Matches any single character. For example, `mp?` matches mp3, mp4 but not mp and mpeg.

**Note:** If you are using the CLI, you must delimit all patterns with double quotation marks ("). For instance, to enter the pattern `mp*` in the CLI, type "mp*" at the command prompt. To add a "?" to the expression, press ESC followed by the "?".

[-file-ext-to-include <File extension>, ...] - File Extensions to Scan

This parameter specifies a list of file extensions, separated by commas, to include for virus scanning. By default it is *, which means all the file extensions are considered for virus scanning except those that match one of the patterns provided in `-file-ext-to-exclude` list. Each file extension can be up to 16 characters long. The `-file-ext-to-include` supports wildcard patterns containing "*" and "?". Pattern matching is defined as:

- * - Matches any string, including the empty string. For example, `mp*` matches mp, mp3, mp4, mpeg etc.
- ? - Matches any single character. For example, `mp?` matches mp3, mp4 but not mp and mpeg.

**Note:** If you are using the CLI, you must delimit all patterns with double quotation marks ("). For instance, to enter the pattern `mp*` in the CLI, type "mp*" at the command prompt. To add a "?" to the expression, press ESC followed by the "?".

**Note:** If you specify both `-file-ext-to-include` and `-file-ext-to-exclude` lists, then only those file extensions are considered for virus scanning which match one of the patterns provided in `-file-ext-to-include` list but do not match any of the patterns provided in `-file-ext-to-exclude` list.

[-scan-files-with-no-ext {true|false}] - Scan Files with No Extension

This parameter specifies if the files without any extension are considered for virus scanning or not. By default, it is true.

[-request-timeout <[<integer>h][<integer>m][<integer>s]>] - Request Service Timeout

This parameter specifies the timeout value for a scan request. It is used to specify the time interval in which the node waits for a response from the Vscan server. Beyond this timeout period, the scan request is considered as failed. The value for this field must be between 10s and 1h. By default, it is 5m.

[-cross-junction {true|false}] - Cross Junction

This parameter specifies if the On-Demand task is allowed to cross volume junctions. If the parameter is set to false, crossing junctions is not allowed. By default, it is true.

[-directory-recursion {true|false}] - Directory Recursion

This parameter specifies if the On-Demand task is allowed to recursively scan through sub-directories. If the parameter is set to false, recursive scanning is not allowed. By default, it is true.

[-scan-priority {low|normal}] - Scan Priority

This parameter specifies the priority of the On-Demand scan requests generated by this task compared to On-Access scan requests. By default, it is low.

[-report-log-level {verbose|info|error}] - Report Log Level

This parameter specifies the log level of the On-Demand report. By default, it is info.

---

**Examples**

The following example creates an On-Demand task:
vserver vscan on-demand-task delete

Delete an On-Demand task

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `vserver vscan on-demand-task delete` command deletes an On-Demand task.

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**
- `-vserver <vserver name>` - *Vserver*
  
  This parameter specifies the name of the Vserver from which you want to delete an On-Demand task.

- `-task-name <text>` - *Task Name*
  
  This parameter specifies the name of the On-Demand task that you want to delete.

**Examples**
The following example deletes an On-Demand task:

```bash
cluster1::> vserver vscan on-demand-task delete -vserver vs1 -task-name t1
```

```bash
cluster1::> vserver vscan on-demand-task show -vserver vs1 -task-name t1
There are no entries matching your query.
```

vserver vscan on-demand-task modify

Modify an On-Demand task

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.
The vserver vscan on-demand-task modify command modifies an On-Demand task. The On-Demand task consists of a set of attributes that are used for configuring the scope of scanning. It also specifies the cron schedule at which the task should run.

**Note:** This command is not supported for a Vserver with Infinite Volume.

### Parameters

- **-vserver <vserver name>** - Vserver
  
  This parameter specifies the name of the Vserver on which you want to modify an On-Demand task.

- **-task-name <text>** - Task Name
  
  This parameter specifies the name of the On-Demand task that you want to modify.

- **[-scan-paths <text>,...]** - List of Scan Paths
  
  This parameter specifies a list of paths, separated by commas, for virus scanning. This path is given from the root of the Vserver using UNIX path delimiter "/".

- **[-report-directory <text>]** - Report Directory Path
  
  This parameter specifies a directory path where the On-Demand report file is created. Each run for a task creates a new file. The report directory path is given from the root of the Vserver using UNIX path delimiter "/".

- **[-schedule <text>]** - Job Schedule
  
  This parameter specifies the already existing cron schedule. The On-Demand task triggers virus scanning for the specified scan-paths at the time configured in the schedule. Providing empty schedule (""") unschedules the task.

  **Note:** A Vserver can have only one scheduled task at a time.

- **[-max-file-size {<integer>[KB|MB|GB|TB|PB]}]** - Max File Size Allowed for Scanning
  
  This parameter specifies the maximum size of the file which will be considered for virus scanning.

- **[-paths-to-exclude <text>,...]** - File Paths Not to Scan
  
  This parameter specifies a list of paths, separated by commas, to exclude from virus scanning. This path is given from the root of the Vserver using UNIX path delimiter "/". The path can be in one of the following forms:

  - /dir1/dir2/name - This would match "/dir1/dir2/name" as well as "/dir1/dir2/name/...".

  - /dir1/dir2/name/ - This would only match "/dir1/dir2/name/...".

  **Note:** If you are using the CLI, you must delimit all paths with double quotation marks (""). For instance, to add the paths "/vol/a b/" and "/vol/a,b/" to the -paths-to-exclude in the CLI, type "/vol/a b/","/vol/a,b/" at the command prompt.

- **[-file-ext-to-exclude <File extension>,...]** - File Extensions Not to Scan
  
  This parameter specifies a list of file extensions, separated by commas, to exclude from virus scanning. Each file extension can be up to 16 characters long. The -file-ext-to-exclude supports wildcard patterns containing "*" and "?". Pattern matching is defined as:

  - * - Matches any string, including the empty string. For example, mp* matches mp, mp3, mp4, mpeg etc.
  
  - ? - Matches any single character. For example, mp? matches mp3, mp4 but not mp and mpeg.

  **Note:** If you are using the CLI, you must delimit all patterns with double quotation marks (""). For instance, to enter the pattern mp* in the CLI, type *mp* at the command prompt. To add a "?" to the expression, press ESC followed by the "?".
-file-ext-to-include <file extension>, ... - File Extensions to Scan

This parameter specifies a list of file extensions, separated by commas, to include for virus scanning. Each file extension can be up to 16 characters long. The -file-ext-to-include supports wildcard patterns containing "*" and "?". Pattern matching is defined as:

- * - Matches any string, including the empty string. For example, mp* matches mp, mp3, mp4, mpeg etc.
- ? - Matches any single character. For example, mp? matches mp3, mp4 but not mp and mpeg.

**Note:** If you are using the CLI, you must delimit all patterns with double quotation marks ("). For instance, to enter the pattern mp* in the CLI, type "mp*" at the command prompt. To add a "?" to the expression, press ESC followed by the "?".

**Note:** If you specify both -file-ext-to-include and -file-ext-to-exclude lists, then only those file extensions are considered for virus scanning which match one of the patterns provided in -file-ext-to-include list but do not match any of the patterns provided in -file-ext-to-exclude list.

-scan-files-with-no-ext [true|false] - Scan Files with No Extension

This parameter specifies if the files without any extension are considered for virus scanning or not.

-request-timeout <[integer]h/[integer]m/[integer]s> - Request Service Timeout

This parameter specifies the timeout value for a scan request. It is used to specify the time interval in which the node waits for a response from the Vscan server. Beyond this timeout period, the scan request is considered as failed. The value for this field must be between 10s and 1h.

-cross-junction [true|false] - Cross Junction

This parameter specifies if the On-Demand task is allowed to cross volume junctions. If the parameter is set to false, crossing junctions is not allowed.

-directory-recursion [true|false] - Directory Recursion

This parameter specifies if the On-Demand task is allowed to recursively scan through sub-directories. If the parameter is set to false, recursive scanning is not allowed.

-scan-priority [low|normal] - Scan Priority

This parameter specifies the priority of the On-Demand scan requests generated by this task compared to On-Access scan requests.

-report-log-level [verbose|info|error] - Report Log Level

This parameter specifies the log level of the On-Demand report.

---

**Examples**

The following example modifies an On-Demand task:

```
cluster1::> vserver vscan on-demand-task modify -vserver vs1 -task-name t1
   -scan-paths "/vol3/", "/vol4/cifs/" -report-directory "/report-dir"
   -schedule custom -max-file-size 2GB -paths-to-exclude "/vol1/cold-files/"
   -file-ext-to-include "*" -file-ext-to-exclude "mp3", "mp4"
   -scan-files-with-no-ext true -request-timeout 1m -cross-junction true

[Job 136]: Vscan On-Demand job is queued. Use the "job show -id 136" command to view the status.

cluster1::> vserver vscan on-demand-task show -instance -vserver vs1 -task-name t1

Vserver: vs1
Task Name: t1
List of Scan Paths: /vol3/, /vol4/cifs/
Report Directory Path: /report-dir
Job Schedule: custom
Max File Size Allowed for Scanning: 2GB
File Paths Not to Scan: /vol1/cold-files/
File Extensions Not to Scan: mp3, mp4
File Extensions to Scan: *
Scan Files with No Extension: true
```
vserver vscan on-demand-task run

Run an On-Demand task

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver vscan on-demand-task run command start virus scanning immediately for an On-Demand task.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver on which you want to start virus scanning.

-task-name <text> - Task Name

This parameter specifies the name of the On-Demand task that you want to start virus scanning.

Examples

The following example starts virus scanning an On-Demand task:

```
cluster1::> vserver vscan on-demand-task run -vserver vs1 -task-name t1
[Job 161]: Vscan On-Demand job is queued. Use the "job show -id 161" command to view the status.
```

vserver vscan on-demand-task schedule

Schedule an On-Demand task

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver vscan on-demand-task schedule command schedules an On-Demand task.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver on which you want to schedule an On-Demand task.

-task-name <text> - Task Name

This parameter specifies the name of the On-Demand task that you want to schedule.

-schedule <text> - Schedule Name

This parameter specifies the already existing cron schedule. The On-Demand task triggers virus scanning for the specified scan-paths at the time configured in the schedule.
Note: A Vserver can have only one scheduled task at a time.

Examples

The following example schedules an On-Demand task:

```bash
cluster1::> vserver vscan on-demand-task schedule -vserver vs1 -task-name t1 -schedule daily
[Job 150]: Vscan On-Demand job is queued. Use the "job show -id 150" command to view the status.

cluster1::> vserver vscan on-demand-task show -instance -vserver vs1 -task-name t1

    Vserver: vs1
    Task Name: t1
    List of Scan Paths: /test
    Report Directory Path: /report
    Job Schedule: daily
    Max File Size Allowed for Scanning: 2GB
    File Paths Not to Scan: /vol1/cold-files/
    File Extensions Not to Scan: mp3, mp4
    File Extensions to Scan: *
    Scan Files with No Extension: true
    Request Service Timeout: 1m
    Cross Junction: true
    Directory Recursion: true
    Scan Priority: low
    Report Log Level: verbose
```

vserver vscan on-demand-task show

Display On-Demand tasks

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver vscan on-demand-task show command displays information about the On-Demand tasks belonging to the Vserver. If you do not specify any parameters, the command displays the following information about all On-Demand tasks:

- Vserver name
- Task name
- Scan paths
- Report directory path
- Schedule

You can specify the -fields parameter to specify which fields of information to display about On-Demand tasks. In addition to the fields above, you can display the following fields:

- Max file size
- File paths to exclude
- File extensions to exclude
- File extensions to include
- Scan files without extension
- Scan timeout

vserver vscan commands 2161
• Cross junction
• Directory recursion
• Scan priority
• Report log level

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters

{ [-fields <fieldname>, ...]
    If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

| [-instance ]
    If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver
    If you specify this parameter, the command displays information only about the On-Demand tasks for the specified Vserver.

[-task-name <text>] - Task Name
    If you specify this parameter, the command displays information only about the specified On-Demand task.

[-scan-paths <text>, ...] - List of Scan Paths
    If you specify this parameter, the command displays information only about the On-Demand tasks that have the specified path or paths in the scan-paths list.

[-report-directory <text>] - Report Directory Path
    If you specify this parameter, the command displays information only about the On-Demand tasks that have the specified report-directory.

[-schedule <text>] - Job Schedule
    If you specify this parameter, the command displays information only about the On-Demand tasks that have the specified schedule.

[-max-file-size <integer> [KB|MB|GB|TB|PB]] - Max File Size Allowed for Scanning
    If you specify this parameter, the command displays information only about the On-Demand tasks that have the specified max-file-size.

[-paths-to-exclude <text>, ...] - File Paths Not to Scan
    If you specify this parameter, the command displays information only about the On-Demand tasks that have the specified path or paths in the exclude list.

[-file-ext-to-exclude <File extension>, ...] - File Extensions Not to Scan
    If you specify this parameter, the command displays information only about the On-Demand tasks that have the specified file extension or extensions in the exclude list.

[-file-ext-to-include <File extension>, ...] - File Extensions to Scan
    If you specify this parameter, the command displays information only about the On-Demand tasks that have the specified file extension or extensions in the include list.

[-scan-files-with-no-ext {true|false}] - Scan Files with No Extension
    If you specify this parameter, the command displays information only about the On-Demand tasks that have the specified value.

[-request-timeout <[integer]h][integer]m[/integer]s] - Request Service Timeout
    If you specify this parameter, the command displays information only about the On-Demand tasks that have the specified request-timeout.
- Cross Junction
  If you specify this parameter, the command displays information only about the On-Demand tasks that have the specified value.

- Directory Recursion
  If you specify this parameter, the command displays information only about the On-Demand tasks that have the specified value.

- Scan Priority (low|normal)
  If you specify this parameter, the command displays information only about the On-Demand tasks that have the specified scan-priority.

- Report Log Level (verbose|info|error)
  If you specify this parameter, the command displays information only about the On-Demand tasks that have the specified report-log-level.

Examples

The following example displays information about all On-Demand tasks:

```
cluster1::> vserver vscan on-demand-task show

Vserver     Task Name  Scan Paths    Directory Path  Schedule
----------- ----------  -------------------- ----------------- --------------
vs1         t1         /test            /report           -
vs2         t2         /, /test/        /report           daily
2 entries were displayed.
```

The following example displays detailed information about an On-Demand task:

```
cluster1::> vserver vscan on-demand-task show -instance -vserver vs1 -task-name t1

Vserver: vs1
Task Name: t1
List of Scan Paths: /test
Report Directory Path: /report
Job Schedule: -
Max File Size Allowed for Scanning: 2GB
File Paths Not to Scan: /vol1/cold-files/
File Extensions Not to Scan: mp3, mp4
File Extensions to Scan: *
Scan Files with No Extension: true
Request Service Timeout: 1m
Cross Junction: true
Directory Recursion: true
Scan Priority: low
Report Log Level: verbose
```

vserver vscan on-demand-task unschedule

Unschedule an On-Demand task

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver vscan on-demand-task unschedule command unschedules an On-Demand task.

Note: This command is not supported for a Vserver with Infinite Volume.
Parameters

-vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver on which you want to unschedule an On-Demand task.

-task-name <text> - Task Name

This parameter specifies the name of the On-Demand task that you want to unschedule.

Examples

The following example unschedules an On-Demand task:

```
cluster1::> vserver vscan on-demand-task unschedule -vserver vs1 -task-name t1
cluster1::> vserver vscan on-demand-task show -instance -vserver vs1 -task-name t1
```

```
Vserver: vs1
Task Name: t1
List of Scan Paths: /test
Report Directory Path: /report
Job Schedule: -
Max File Size Allowed for Scanning: 2GB
File Paths Not to Scan: /vol1/cold-files/
File Extensions Not to Scan: mp3, mp4
File Extensions to Scan: *
Scan Files with No Extension: true
Request Service Timeout: 1m
Cross Junction: true
Directory Recursion: true
Scan Priority: low
Report Log Level: verbose
```

vserver vscan on-demand-task report commands

Manage Vscan On-Demand reports

vserver vscan on-demand-task report delete

Delete an On-Demand report

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver vscan on-demand-task report delete command deletes an On-Demand report.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver from which you want to delete an On-Demand report.

-task-name <text> - Task Name

This parameter specifies the name of the On-Demand task whose report you want to delete.

-report-file <text> - Report File Path

This parameter specifies the path of the report-file whose report record you want to delete.

[-delete-report-file {true|false}] - Delete Report File Also

This parameter specifies if the corresponding report file is also to be deleted. By default, it is false.
vserver vscan on-demand-task report show

Display On-Demand reports

**Availability:** This command is available to *cluster* and Vserver administrators at the *admin* privilege level.

**Description**

The `vserver vscan on-demand-task report show` command displays information about the On-Demand reports belonging to the Vserver. A new report record is generated at the end of an On-Demand task run. If you do not specify any parameters, the command displays the following information about all On-Demand tasks:

- Vserver name
- Task name
- Report file path
- Number of clean files
- Number of infected files
- Number of attempted scans
- Number of files skipped from scanning
- Number of already scanned files
- Number of successful scans
- Number of failed scans

You can specify the `-fields` parameter to specify which fields of information to display about On-Demand report. In addition to the fields above, you can display the following fields:

- Job ID
- Job duration
- Number of attempted scans
- Number of files skipped from scanning
- Number of already scanned files
- Number of successful scans
- Number of failed scans
- Number of timed-out scans
- Job start time
- Job end time

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters

- **[-fields <fieldname>, ...]**
  If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

- **[-instance]**
  If you specify the `-instance` parameter, the command displays detailed information about all fields.

- **[-vserver <vserver name>] - Vserver**
  If you specify this parameter, the command displays information only about the On-Demand reports for the specified Vserver.

- **[-task-name <text>] - Task Name**
  If you specify this parameter, the command displays information only about the On-Demand reports for the specified task.

- **[-report-file <text>] - Report File Path**
  If you specify this parameter, the command displays information only about the On-Demand reports that have the specified report file-path.

- **[-job-id <integer>] - Job ID**
  If you specify this parameter, the command displays information only about the On-Demand reports that have the specified job ID.

- **[-job-duration <[<integer>h][<integer>m][<integer>s]>] - Job Duration**
  If you specify this parameter, the command displays information only about the On-Demand reports that have the specified value.

- **[-attempted-scans <integer>] - Number of Attempted Scans**
  If you specify this parameter, the command displays information only about the On-Demand reports that have the specified value.

- **[-skipped-scans <integer>] - Number of Files Skipped from Scanning**
  If you specify this parameter, the command displays information only about the On-Demand reports that have the specified value.

- **[-already-scanned-files <integer>] - Number of Already Scanned Files**
  If you specify this parameter, the command displays information only about the On-Demand reports that have the specified value.

- **[-successful-scans <integer>] - Number of Successful Scans**
  If you specify this parameter, the command displays information only about the On-Demand reports that have the specified value.

- **[-failed-scans <integer>] - Number of Failed Scans**
  If you specify this parameter, the command displays information only about the On-Demand reports that have the specified value.

- **[-timedout-scans <integer>] - Number of Timedout Scans**
  If you specify this parameter, the command displays information only about the On-Demand reports that have the specified value.
[-files-cleaned <integer>] - Number of Clean Files
    If you specify this parameter, the command displays information only about the On-Demand reports that have the specified value.

[-files-infected <integer>] - Number of Infected Files
    If you specify this parameter, the command displays information only about the On-Demand reports that have the specified value.

[-internal-error <integer>] - Number of Internal Error (privilege: advanced)
    If you specify this parameter, the command displays information only about the On-Demand reports that have the specified value.

[-scan-retries <integer>] - Number of Scan Retries (privilege: advanced)
    If you specify this parameter, the command displays information only about the On-Demand reports that have the specified value.

[-job-start-time <MM/DD/YYYY HH:MM:SS>] - Job Start Time
    If you specify this parameter, the command displays information only about the On-Demand reports that have the specified value.

[-job-end-time <MM/DD/YYYY HH:MM:SS>] - Job End Time
    If you specify this parameter, the command displays information only about the On-Demand reports that have the specified value.

Examples

The following example displays information about all On-Demand reports:

```
classroom1::> vscan on-demand-task report show

+---------+----------+-------------------------------------------------+----------+----------+
<table>
<thead>
<tr>
<th>Vserver</th>
<th>Task Name</th>
<th>Report File Path</th>
<th>Cleaned</th>
<th>Infected</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>
<td>t1</td>
<td>/rep/avod_146_20150902_161439.log</td>
<td>6240</td>
<td>5</td>
</tr>
<tr>
<td>vs1</td>
<td>t1</td>
<td>/rep/avod_149_20150903_160313.log</td>
<td>115</td>
<td>0</td>
</tr>
</tbody>
</table>
+---------+----------+-------------------------------------------------+----------+----------+
2 entries were displayed.
```

The following example displays detailed information about an On-Demand task:

```
classroom1::> vscan on-demand-task report show -vserver vs1 -task-name t1 -report-file /rep/avod_146_20150902_161439.log

Vserver: vs1
Task Name: t1
Report File Path: /rep/avod_146_20150902_161439.log
Job ID: 146
Job Duration: 76s
Number of Attempted Scans: 6245
Number of Files Skipped from Scanning: 1286
Number of Already Scanned Files: 987
Number of Successful Scans: 6245
Number of Failed Scans: 0
Number of Timedout Scans: 0
Number of Clean Files: 6240
Number of Infected Files: 5
Job Start Time: 9/2/2015 16:14:39
Job End Time: 9/2/2015 16:15:55
```
vserver vscan scanner-pool commands

Manage Vscan scanner pools

vserver vscan scanner-pool apply-policy

Apply scanner-policy to a scanner pool

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver vscan scanner-pool apply-policy command applies a scanner policy to the specified scanner pool on a specified Vserver.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters
-vserver <vserver name> - Vserver
This parameter specifies the name of the Vserver on which you want to apply the scanner policy. The Vserver administrator can apply the scanner policy to a scanner pool created within the scope of the Vserver or the cluster. The cluster administrator can apply the scanner policy to a scanner pool for any Vserver but cannot apply it within the scope of cluster. The scope is determined at a Vserver level.

-scanner-pool <Scanner pool> - Scanner Pool
This parameter specifies the name of the scanner pool.

-scanner-policy <Scanner policy> - Scanner Policy
This parameter specifies the scanner policy that you want to apply to the specified scanner pool on a Vserver. Currently only system policies are available. Available system policies are:

- primary - Makes it active always.
- secondary - Makes it active only when none of the primary external virus-scanning servers are connected.
- idle - Makes it inactive always.

[-cluster <Cluster name>] - Cluster on Which Policy Is Applied
This parameter specifies the name of the cluster on which you want to apply the scanner policy of a scanner pool. By default, it is applied on the local cluster. This parameter does not have any significance if the cluster is not in a DR relationship.

Examples
The following command applies a scanner policy to the specified scanner pool on a specified Vserver.

```
cluster1::> vserver vscan scanner-pool apply-policy -vserver vs1
   -scanner-pool pl -scanner-policy primary -cluster cluster2
cluster1::> vserver vscan scanner-pool show -vserver vs1 -scanner-pool pl

   Vserver: vs1
   Scanner Pool: pl
   Applied Policy: primary
   Current Status: on
   Cluster on Which Policy Is Applied: cluster2
   Scanner Pool Config Owner: vserver
```
vserver vscan scanner-pool create

Create a scanner pool

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `vserver vscan scanner-pool create` command creates a Vscan scanner pool. Scanner pool is a set of attributes which are used to validate and manage connection between clustered Data ONTAP and external virus-scanning server, or "Vscan server". It also specifies other parameters which are used for connection management. After creating a scanner pool, a scanner-policy must be applied to it using the command `vserver vscan scanner-pool apply-policy`. The default applied policy is *idle*, which means the scanner pool is inactive.

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**
- `vserver <vserver name>` - *Vserver*
  
  This parameter specifies the name of the Vserver on which you want to create a scanner pool.

- `scanner-pool <Scanner pool>` - *Scanner Pool*
  
  This parameter specifies the name of the scanner pool. Scanner pool name can be up to 256 characters long and is a string that can only contain any combination of ASCII-range alphanumeric characters (a-z, A-Z, 0-9), "," "$" and ".".

- `hostnames <text>, ...` - *List of Host Names of Allowed Vscan Servers*
  
  This parameter specifies a list of host names or IP addresses of the Vscan servers which are allowed to connect to clustered Data ONTAP.

- `privileged-users <Privileged user>, ...` - *List of Privileged Users*
  
  This parameter specifies a list of privileged users. A valid form of privileged user-name is "domain-name\user-name" and can be up to 256 characters long. Privileged user-names are stored and treated as case-insensitive strings. Virus scanners must use one of the registered privileged users for connecting to clustered Data ONTAP for exchanging virus-scanning protocol messages and to access file for scanning,remedying and quarantining operations.

[- `request-timeout <[<integer>h] [<integer>m] [<integer>s]>` - Request Service Timeout (privilege: advanced)]

  This parameter specifies the timeout value for a scan request. It specifies the time interval in which the node waits for a response from the Vscan server. If the timeout is reached, the node allows the file-operation if the applicable On-Access policy has scan-mandatory set to 'off'. If the policy has scan-mandatory set to 'on', then the node will retry the scan or disallow the file-operation depending on the remaining lifetime of the CIFS request. Valid values for this field are from 10s to 40s. However, if scan-mandatory is set to 'off', the effective value is limited to a maximum of 35s. The default value is 30s.

[- `scan-queue-timeout <[<integer>h] [<integer>m] [<integer>s]>` - Scan Queue Timeout (privilege: advanced)]

  This parameter specifies the timeout value for a scan request in scan-engine's queue. The value for this field must be between 10s and 30s. By default, it is 20s.
[-session-setup-timeout <[<integer>h] [<integer>m] [<integer>s]> ] - Session Setup Timeout (privilege: advanced)

This parameter specifies the timeout value for a response for session-setup-message. The value for this field must be between 5s and 10s. By default, it is 10s.

[-session-teardown-timeout <[<integer>h] [<integer>m] [<integer>s]> ] - Session Teardown Timeout (privilege: advanced)

This parameter specifies the timeout value for a response for session-teardown-message, or for any message to be received for a session-id, after the underlying connection has been disconnected. The value for this field must be between 5s and 10s. By default, it is 10s.

[-max-session-setup-retries <integer>] - Max Number of Consecutive Session Setup Attempts (privilege: advanced)

This parameter specifies the maximum number of consecutive session-setup attempts. The value for this field must be between 1 and 10. By default, it is 5.

Examples

The following example creates a scanner pool.

```bash
Cluster1::> vserver vscan scanner-pool create -vserver vs1 -scanner-pool SP
    -hostnames 1.1.1.1,vmwin204-27.fsct.nb -privileged-users cifs\u1,cifs\u2

Cluster1::> vserver vscan scanner-pool show -vserver vs1 -scanner-pool SP

    Vserver: vs1
    Scanner Pool: SP
    Applied Policy: idle
    Current Status: off
    Scanner Pool Config Owner: vserver
    Cluster on Which Policy Is Applied: -
    List of IPs of Allowed Vscan Servers: 1.1.1.1, 10.72.204.27
    List of Host Names of Allowed Vscan Servers: 1.1.1.1, vmwin204-27.fsct.nb
    List of Privileged Users: cifs\u1, cifs\u2
```

vserver vscan scanner-pool delete

Delete a scanner pool

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver vscan scanner-pool delete command deletes a scanner pool.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters

- **vserver <vserver name>** - Vserver
  
  This parameter specifies the name of the Vserver from which you want to delete a scanner pool.

- **scanner-pool <Scanner pool>** - Scanner Pool
  
  This parameter specifies the name of the scanner-pool that you want to delete.
Examples

The following example deletes a scanner pool.

```
cluster1::> vserver vscan scanner-pool delete -vserver vs1 -scanner-pool test
cluster1::> vserver vscan scanner-pool show -vserver vs1 -scanner-pool test
```

vserver vscan scanner-pool modify

Modify a scanner pool

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The `vserver vscan scanner-pool modify` command modifies a Vscan scanner pool. Scanner pool is a set of attributes which are used to validate and manage connection between clustered Data ONTAP and external virus-scanning server, or "Vscan server". It also specifies other parameters which are used for connection management.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters

- `-vserver <vserver name>` - Vserver
  This parameter specifies the name of the Vserver on which you want to modify a scanner pool.

- `-scanner-pool <Scanner pool>` - Scanner Pool
  This parameter specifies the name of the scanner pool. Scanner pool name can be up to 256 characters long and is a string that can only contain any combination of ASCII-range alphanumeric characters (a-z, A-Z, 0-9), ".", "," and ".".

- `-hostnames <text>, ...` - List of Host Names of Allowed Vscan Servers
  This parameter specifies a list of host names or IP addresses of the Vscan servers which are allowed to connect to clustered Data ONTAP.

- `-privileged-users <Privileged user>, ...` - List of Privileged Users
  This parameter specifies a list of privileged users. A valid form of privileged user-name is "domain-name\user-name" and can be up to 256 characters long. Privileged user-names are stored and treated as case-insensitive strings. Virus scanners must use one of the registered privileged users for connecting to clustered Data ONTAP for exchanging virus-scanning protocol messages and to access file for scanning, remedying and quarantining operations.

- `-request-timeout <[<integer>h][<integer>m][<integer>s]>` - Request Service Timeout (privilege: advanced)
  This parameter specifies the timeout value for a scan request. It specifies the time interval in which the node waits for a response from the Vscan server. If the timeout is reached, the node allows the file-operation if the applicable On-Access policy has scan-mandatory set to 'off'. If the policy has scan-mandatory set to 'on', then the node will retry the scan or disallow the file-operation depending on the remaining lifetime of the CIFS request. Valid values for this field are from 10s to 40s. However, if scan-mandatory is set to 'off', the effective value is limited to a maximum of 35s.

- `-scan-queue-timeout <[<integer>h][<integer>m][<integer>s]>` - Scan Queue Timeout (privilege: advanced)
  This parameter specifies the timeout value for a scan request in scan-engine's queue. The value for this field must be between 10s and 30s.
[-session-setup-timeout <[<integer>h] [<integer>m] [<integer>s]> ] - Session Setup Timeout (privilege: advanced)

This parameter specifies the timeout value for a response for session-setup-message. The value for this field must be between 5s and 10s.

[-session-teardown-timeout <[<integer>h] [<integer>m] [<integer>s]> ] - Session Teardown Timeout (privilege: advanced)

This parameter specifies the timeout value for a response for session-teardown-message, or for any message to be received for a session-id, after the underlying connection has been disconnected. The value for this field must be between 5s and 10s.

[-max-session-setup-retries <integer>] - Max Number of Consecutive Session Setup Attempts (privilege: advanced)

This parameter specifies the maximum number of consecutive session-setup attempts. The value for this field must be between 1 and 10.

**Examples**

The following example modifies a scanner pool.

```
Cluster1::> vserver vscan scanner-pool modify -vserver vs1 -scanner-pool SP -hostnames 2.2.2.2,vmwin204-29.fsct.nb -privileged-users cifs\u3
Cluster1::> vserver vscan scanner-pool show -vserver vs1 -scanner-pool SP

Vserver: vs1
Scanner Pool: SP
Applied Policy: idle
Current Status: off
Cluster on Which Policy Is Applied: -
Scanner Pool Config Owner: vserver
List of IPs of Allowed Vscan Servers: 2.2.2.2, 10.72.204.29
List of Host Names of Allowed Vscan Servers: 2.2.2.2, vmwin204-29.fsct.nb
List of Privileged Users: cifs\u3
```

**vserver vscan scanner-pool resolve-hostnames**

Resolve the hostnames configured in the scanner pool

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The vserver vscan scanner-pool resolve-hostnames command resolves the host names configured in the scanner pool and update it with the IP addresses. This command also updates the active scanner pool configuration of the Vserver if the scanner pool is part of that. You must run this command for the scanner pool whose host name entry is modified in the DNS server.

**Note:** This command is not supported on a Vserver with Infinite Volume.

**Parameters**

- **-vserver <vserver>** - Vserver
  
  This parameter specifies the name of the Vserver for which you want to resolve host names.

- **-scanner-pool <Scanner pool>** - Scanner Pool
  
  This parameter specifies the name of the scanner pool for which you want to resolve host names.
Examples

The following example resolves the host names of a scanner pool:

```
cluster1::> vserver vscan scanner-pool resolve-hostnames -vserver vs1 -scanner-pool SP
Cluster1::> vserver vscan scanner-pool show -vserver vs1 -scanner-pool SP
```

vserver vscan scanner-pool show

Display scanner pools

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The `vserver vscan scanner-pool show` command displays information about the Vscan scanner pools belonging to the Vserver. It also displays the scanner policy applied to the scanner pool and its current status in Vserver scope. If you do not specify any parameters, the command displays the following information about all scanner pools:

- Vserver name
- Scanner pool
- Scanner pool owner
- Scanner policy
- Current status
- Cluster on which policy is applied
- List of servers
- List of host names
- List of privileged user

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance]
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.
[-vserver <vserver name>] - Vserver
If you specify this parameter, the command displays information only about the scanner pools for the specified Vserver.

[-scanner-pool <Scanner pool>] - Scanner Pool
If you specify this parameter, the command displays information only about the specified scanner pool.

[-scanner-policy <Scanner policy>] - Applied Policy
If you specify this parameter, the command displays information only about the scanner pools for the specified scanner policy.

[-current-status {on|off}] - Current Status
If you specify this parameter, the command displays information only about the scanner pools that have the specified status.

[-cluster <Cluster name>] - Cluster on Which Policy Is Applied
If you specify this parameter, the command displays information only about the scanner pools that are applied to the specified cluster.

[-owner <Configuration owner>] - Scanner Pool Config Owner
If you specify this parameter, the command displays information only about the scanner pools that have the specified owner.

[-servers <IP Address>, ...] - List of IPs of Allowed Vscan Servers
If you specify this parameter, the command displays information only about the scanner pools that have the specified IP address or IP addresses.

[-hostnames <text>, ...] - List of Host Names of Allowed Vscan Servers
If you specify this parameter, the command displays information only about the scanner pools that have the specified host name or host names.

[-privileged-users <Privileged user>, ...] - List of Privileged Users
If you specify this parameter, the command displays information only about the scanner pools that have the specified privileged user or users.

[-request-timeout <[<integer>h][<integer>m][<integer>s]>] - Request Service Timeout (privilege: advanced)
If you specify this parameter, the command displays information only about the scanner pools that have the specified request-timeout.

[-scan-queue-timeout <[<integer>h][<integer>m][<integer>s]>] - Scan Queue Timeout (privilege: advanced)
If you specify this parameter, the command displays information only about the scanner pools that have the specified scan-queue-timeout.

[-session-setup-timeout <[<integer>h][<integer>m][<integer>s]>] - Session Setup Timeout (privilege: advanced)
If you specify this parameter, the command displays information only about the scanner pools that have the specified session-setup-timeout.

[-session-teardown-timeout <[<integer>h][<integer>m][<integer>s]>] - Session Teardown Timeout (privilege: advanced)
If you specify this parameter, the command displays information only about the scanner pools that have the specified session-teardown-timeout.

[-max-session-setup-retries <integer>] - Max Number of Consecutive Session Setup Attempts (privilege: advanced)
If you specify this parameter, the command displays information only about the scanner pools that have the specified max-session-setup-retries.
Examples

The following example displays information about all scanner pools.

```
Cluster1::> vserver vscan scanner-pool show

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Pool</th>
<th>Owner</th>
<th>Servers</th>
<th>Privileged</th>
<th>Scanner</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>SP</td>
<td>vserver</td>
<td>1.1.1.1, 10.72.204.27</td>
<td>cifs\u1,</td>
<td>primary</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>cifs\u2</td>
<td></td>
</tr>
<tr>
<td>vs1</td>
<td>p1</td>
<td>vserver</td>
<td>3.3.3.3</td>
<td>cifs\u1,</td>
<td>secondary</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>cifs\u2</td>
<td></td>
</tr>
</tbody>
</table>
```

2 entries were displayed.

The following example displays detailed information about one scanner pool.

```
Cluster1::> vserver vscan scanner-pool show -vserver vs1 -scanner-pool SP

Vserver: vs1
Scanner Pool: SP
Applied Policy: primary
Current Status: on
Cluster on Which Policy Is Applied: Cluster1
Scanner Pool Config Owner: vserver
List of IPs of Allowed Vscan Servers: 1.1.1.1, 10.72.204.27
List of Host Names of Allowed Vscan Servers: 1.1.1.1, vmwin204-27.fsct.nb
List of Privileged Users: cifs\u1, cifs\u2
```

vserver vscan scanner-pool show-active

Display active scanner pools

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**

The `vserver vscan scanner-pool show-active` command displays active scanner pool information available to the Vserver. The active scanner pool configuration is derived by merging the information of the scanner pools which are currently active on a Vserver. If you do not specify any parameters, the command displays the following information about all Vservers:

- Vserver name
- List of scanner pools
- List of servers
- List of privileged user

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**

```
[-fields <fieldname>, ...]  
[-instance]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

If you specify the `-instance` parameter, the command displays detailed information about all fields.
[-vserver <vserver name>] - Vserver

If you specify this parameter, the command displays information only about the specified Vserver.

[-scanner-pools <Scanner pool>, ...] - List of Enabled Scanner Pools

If you specify this parameter, the command displays information only about the Vservers that have the specified scanner pool or pools. A scanner pool becomes part of this list if it is active at this time.

[-servers <IP Address>, ...] - Merged List of IPs of Allowed Vscan Servers

If you specify this parameter, the command displays information only about the Vservers that have the specified server or servers. Servers of all active scanner pools on a Vserver are merged to derive this effective server list.

[-privileged-users <Privileged user>, ...] - Merged List of Privileged Users

If you specify this parameter, the command displays information only about the Vservers that have the specified privileged user or users. Privileged users of all active scanner pools on a Vserver are merged to derive this effective privileged user list.

[-request-timeout <[<integer>h][<integer>m][<integer>s]>] - Request Service Timeout (privilege: advanced)

If you specify this parameter, the command displays information only about the Vservers that have the specified request-timeout. This is set to the maximum value of the request-timeout of all active scanner pools on a Vserver.

[-scan-queue-timeout <[<integer>h][<integer>m][<integer>s]>] - Scan Queue Timeout (privilege: advanced)

If you specify this parameter, the command displays information only about the Vservers that have the specified scan-queue-timeout. This is set to the maximum value of the scan-queue-timeout of all active scanner pools on a Vserver.

[-session-setup-timeout <[<integer>h][<integer>m][<integer>s]>] - Session Setup Timeout (privilege: advanced)

If you specify this parameter, the command displays information only about the Vservers that have the specified session-setup-timeout. This is set to the maximum value of the session-setup-timeout of all active scanner pools on a Vserver.

[-session-teardown-timeout <[<integer>h][<integer>m][<integer>s]>] - Session Teardown Timeout (privilege: advanced)

If you specify this parameter, the command displays information only about the Vservers that have the specified session-teardown-timeout. This is set to the maximum value of the session-teardown-timeout of all active scanner pools on a Vserver.

[-max-session-setup-retries <integer>] - Max Number of Consecutive Session Setup Attempts (privilege: advanced)

If you specify this parameter, the command displays information only about the Vservers that have the specified max-session-setup-retries. This is set to the maximum number of the max-session-setup-retry of all active scanner pools on a Vserver.

Examples

The following example displays information about active scanner pool on all Vservers.

```
cluster1::> vserver vsan scanner-pool show
Vserver   Pool     Owner   Servers     Privileged Users   Scanner Policy
----------- ------- ------- ------------ -------------- ------------- -----
Cluster    clus  cluster  5.5.5.5     cifs\u5            idle
vs1        new  vserver 1.1.1.1, 2.2.2.2 cifs\u1            primary
vs1        clus  cluster  5.5.5.5     cifs\u5            idle
vs1        pl    vserver 3.3.3.3     cifs\u4            primary
vs2        clus  cluster  5.5.5.5     cifs\u5            primary
```

2176  Commands: Manual Page Reference
vserver vscan scanner-pool privileged-users commands

Manage list of privileged users of a scanner pool

vserver vscan scanner-pool privileged-users add

Add to the list of privileged users

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver vscan scanner-pool privileged-users add` command adds one privileged user or list of privileged users to the specified scanner pool.

**Note:** This command is not supported for a Vserver with Infinite Volume.

**Parameters**
- `-vserver <vserver name>` - Vserver
  
  This parameter specifies the name of the Vserver containing the specified scanner pool on which you want to add a privileged user or users.

- `-scanner-pool <Scanner pool>` - Scanner Pool
  
  This parameter specifies the name of the scanner pool to which you want to add a privileged user or users.

- `-privileged-users <Privileged user>, ...` - List of Privileged Users
  
  This parameter specifies the privileged user or users that you want to add to the specified scanner pool.

**Examples**
The following example adds a list of privileged users to the specified scanner pool.

```
cluster1::> vserver vscan scanner-pool privileged-users add -vserver vs1 -scanner-pool p1 -privileged-users cifs\u2, cifs\u3

cluster1::> vserver vscan scanner-pool privileged-users show -vserver vs1 -scanner-pool p1
Vserver: vs1
Scanner Pool: p1
List of Privileged Users: cifs\u2, cifs\u3
```

vserver vscan scanner-pool privileged-users remove

Remove from the list of privileged users

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.
Description
The `vserver vscan scanner-pool privileged-users remove` command removes one privileged user or list of privileged users from the specified scanner pool. All the existing privileged users of a scanner pool cannot be removed.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters
- `vserver <vserver name>` - Vserver
  This parameter specifies the name of the Vserver containing the specified scanner pool on which you want to remove a privileged user or users.
- `scanner-pool <Scanner pool>` - Scanner Pool
  This parameter specifies the name of the scanner pool from which you want to remove a privileged user or users.
- `privileged-users <Privileged user>, ...` - List of Privileged Users
  This parameter specifies the privileged user or users that you want to remove from the specified scanner pool.

Examples
The following example removes a list of privileged users from the specified scanner pool.

```
cluster1::> vserver vscan scanner-pool privileged-users remove -vserver vs1
        -scanner-pool p1 -privileged-users cifs\u2,cifs\u3
cluster1::> vserver vscan scanner-pool privileged-users show -vserver vs1
        -scanner-pool p1
        Vserver: vs1
        Scanner Pool: p1
        List of Privileged Users: cifs\u1
```

`vserver vscan scanner-pool privileged-users show`
Display list of privileged users

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The `vserver vscan scanner-pool privileged-users show` command displays the list of privileged users of the Vscan scanner pools belonging to the Vserver. If you do not specify any parameters, the command displays the following information about the scanner pools:

- Vserver name
- Scanner pool
- List of privileged users

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters

```
[-fields <fieldname>, ...]
```
If you specify the `[-fields <fieldname>, ...]` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.
If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver
If you specify this parameter, the command displays information only about the scanner pools for the specified Vserver.

[-scanner-pool <Scanner pool>] - Scanner Pool
If you specify this parameter, the command displays information only for the specified scanner pool.

[-privileged-users <Privileged user>, ...] - List of Privileged Users
If you specify this parameter, the command displays information only about the scanner pools that have the specified privileged user or users.

Examples
The following example displays the list of privileged users of all scanner pools.

```
class1:/> vserver vscan scanner-pool privileged-users show
Vserver   Scanner Pool   Privileged Users
-----------   ---------------   --------------------------------------------
Cluster     clus           cifs\u5
vs1         new             cifs\u7
vs1         clus            cifs\u5
vs1         p1              cifs\u1, cifs\u2
vs2         clus            cifs\u5
vs2         p2              cifs\u2
6 entries were displayed.
```

vserver vscan scanner-pool servers commands
Manage list of servers of a scanner pool

vserver vscan scanner-pool servers add
Add to the list of hostnames

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver vscan scanner-pool servers add command adds one server or list of servers to the specified scanner pool.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters
  -vserver <vserver name> - Vserver
  This parameter specifies the name of the Vserver containing the specified scanner pool on which you want to add a server or servers.

  -scanner-pool <Scanner pool> - Scanner Pool
  This parameter specifies the name of the scanner pool to which you want to add a server or servers.

  -hostnames <text>, ... - List of Host Names for Vscan Servers
  This parameter specifies the host name or host names that you want to add to the specified scanner pool.
The following example adds a list of servers to the specified scanner pool.

Cluster1::> vserver vscan scanner-pool servers add -vserver vs1 -scanner-pool SP -hostnames 2.2.2.2, vmwin204-27.fsct.nb

Cluster1::> vserver vscan scanner-pool servers show -vserver vs1 -scanner-pool SP

Vserver: vs1
Scanner Pool: SP
List of IPs of Allowed Vscan Servers: 1.1.1.1, 2.2.2.2, 10.72.204.27
List of Host Names of Allowed Vscan Servers: 1.1.1.1, 2.2.2.2, vmwin204-27.fsct.nb

The following example removes a list of servers from the specified scanner pool.

Cluster1::> vserver vscan scanner-pool servers remove -vserver vs1 -scanner-pool SP -hostnames vmwin204-27.fsct.nb

Cluster1::> vserver vscan scanner-pool servers show -vserver vs1 -scanner-pool SP

Vserver: vs1
Scanner Pool: SP
List of IPs of Allowed Vscan Servers: 1.1.1.1, 2.2.2.2
List of Host Names of Allowed Vscan Servers: 1.1.1.1, 2.2.2.2

vserver vscan scanner-pool servers remove

Remove from the list of hostnames

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver vscan scanner-pool servers remove command removes one server or list of servers from the specified scanner pool. All the existing servers of a scanner pool cannot be removed.

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters

- vserver <vserver name> - Vserver
  This parameter specifies the name of the Vserver containing the specified scanner pool on which you want to remove a server or servers.

- scanner-pool <Scanner pool> - Scanner Pool
  This parameter specifies the name of the scanner pool from which you want to remove a server or servers.

- hostnames <text>, ... - List of hostnames for Vscan Servers
  This parameter specifies the host name or host names that you want to remove from the specified scanner pool.

Examples

The following example removes a list of servers from the specified scanner pool.

Cluster1::> vserver vscan scanner-pool servers remove -vserver vs1 -scanner-pool SP -hostnames vmwin204-27.fsct.nb

Cluster1::> vserver vscan scanner-pool servers show -vserver vs1 -scanner-pool SP

Vserver: vs1
Scanner Pool: SP
List of IPs of Allowed Vscan Servers: 1.1.1.1, 2.2.2.2
List of Host Names of Allowed Vscan Servers: 1.1.1.1, 2.2.2.2
vserver vscan scanner-pool servers show

Display list of servers

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver vscan scanner-pool servers show command displays the list of servers of the Vscan scanner pools belonging to the Vserver. If you do not specify any parameters, the command displays the following information about all scanner pools:

- Vserver name
- Scanner pool
- List of servers

Note: This command is not supported for a Vserver with Infinite Volume.

Parameters

{ [-fields <fieldname>, ...]  
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.}

| [-instance ]]  
  If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver
  If you specify this parameter, the command displays information only about the scanner pools for the specified Vserver.

[-scanner-pool <Scanner pool>] - Scanner Pool
  If you specify this parameter, the command displays information only for the specified scanner pool.

[-servers <IP Address>, ...] - List of IPs of Allowed Vscan Servers
  If you specify this parameter, the command displays information only about the scanner pools that have the specified IP address or IP addresses.

[-hostnames <text>, ...] - List of Host Names of Allowed Vscan Servers
  If you specify this parameter, the command displays information only about the scanner pools that have the specified host name or host names.

Examples

The following example displays the list of servers of all scanner pools.

```
ccluster1:/> vserver vscan scanner-pool servers show

Vserver        Scanner Pool    Servers
--------------- ----------------- --------------------------------------------
vs1             SP               1.1.1.1, 10.72.204.27
vs2             p1               10.72.204.29
6 entries were displayed.
```

The following example displays the list of servers and host names of all scanner pools.

How to send comments about documentation and receive update notifications

You can help us to improve the quality of our documentation by sending us your feedback. You can receive automatic notification when production-level (GA/FCS) documentation is initially released or important changes are made to existing production-level documents.

If you have suggestions for improving this document, send us your comments by email.

doccomments@netapp.com

To help us direct your comments to the correct division, include in the subject line the product name, version, and operating system.

If you want to be notified automatically when production-level documentation is released or important changes are made to existing production-level documents, follow Twitter account @NetAppDoc.

You can also contact us in the following ways:

• NetApp, Inc., 495 East Java Drive, Sunnyvale, CA 94089 U.S.
• Telephone: +1 (408) 822-6000
• Fax: +1 (408) 822-4501
• Support telephone: +1 (888) 463-8277
