The `storage aggregate resynchronization` command family manages the number and the order of aggregates that can start a resynchronization operation at any given time on a node. On SyncMirror enabled nodes, plexes of mirrored aggregates can go offline because of a variety of issues. When the disks of an offline plex come back online, we start a background resynchronization operation on the aggregate to make sure that the new plex is up to date again. These commands allow the user to control the number of resynchronization operations that can concurrently execute on a node, as well as the order in which the aggregates are picked for the resynchronization operation. On a node containing multiple data aggregates, the resynchronization of critical data aggregates can be prioritized by assigning a higher `resync-priority` value than the rest of the data aggregates.

The `storage aggregate resynchronization options` commands can be used to control the volume of background resynchronization I/O on a node after a storage or network outage by limiting the number of aggregates that can resynchronize at the same time on a node.

`storage aggregate resynchronization options` on page 840

storage aggregate resynchronization modify

Modify aggregate resynchronization priorities

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**

The `storage aggregate resynchronization modify` command can be used to modify the resynchronization priority of an aggregate.

When the number of aggregates pending resynchronization is higher than the maximum number of concurrent resynchronization operations allowed on a node, the aggregates get resynchronized in the order of their "`resync-priority`" values.

For example, let the `max-concurrent-resync` under the `storage aggregate resynchronization options` directory for a node be set to two. If there are three aggregates waiting to be resynchronized, where their respective `resync-priority` values are `high`, `medium`, and `low`, then the third aggregate is not allowed to start resynchronization until one of the first two aggregates has completed resynchronizing.
Parameters
- aggregate <aggregate name> - Aggregate
  This parameter specifies the aggregate that is to be modified.

[-resync-priority {high (fixed)|high|medium|low}] - Resynchronization Priority
  This parameter specifies the new resynchronization priority value for the specified aggregate. This field cannot
  be modified for unmirrored or Data ONTAP system aggregates.

  Possible values for this parameter are:
  • high: Mirrored data aggregates with this priority value start resynchronization first.
  • medium: Mirrored data aggregates with this priority value start resynchronization after all the system
    aggregates and data aggregates with 'high' priority value have started resynchronization.
  • low: Mirrored data aggregates with this priority value start resynchronization only after all the other
    aggregates have started resynchronization.

Examples
The following example changes the resync-priority of a specified aggregate to medium:

cluster1::> storage aggregate resynchronization modify -aggregate aggr1 -resync-priority medium

Related references
storage aggregate resynchronization options on page 840

storage aggregate resynchronization show
Display aggregate resynchronization priorities

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The storage aggregate resynchronization show command displays the relative resynchronization priority for each
aggregate in the cluster. When a particular node restricts how many resync operations can be active concurrently, these priorities
are used to prioritize the operations. The maximum concurrent resync operations for a node is displayed in the storage
aggregate resynchronization options show command. If no parameters are specified, the command displays the
following information about all the aggregates in the cluster:

  • Aggregate name
  • Node that owns the aggregate
  • Resync priority for the aggregate

Parameters
{ [-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified
  field or fields. You can use -fields '?' to display the fields to specify.

  | [-instance ]
  If you specify the -instance parameter, the command displays detailed information about all fields.}
[-aggregate <aggregate name>] - Aggregate

If this parameter is specified, the command displays the resynchronization priority only for the specified aggregate.

[-node (<nodename> | local)] - Node

If this parameter is specified, the command displays the resynchronization priority only for the aggregates owned by the specified node.

[=resync-priority (high (fixed) | high | medium | low)] - Resynchronization Priority

If this parameter is specified, the command displays only the resynchronization priority that matches the specified value. Possible values for this parameter are:

- high(fixed): This value is reserved for Data ONTAP system aggregates, which cannot have any other value for this field. These aggregates always start their resynchronization operation at the first available opportunity. This value cannot be assigned to a data aggregate.
- high: Mirrored data aggregates with this priority value start resynchronization first.
- medium: Mirrored data aggregates with this priority value start resynchronization after all the system aggregates and data aggregates with 'high' priority value have started resynchronization.
- low: Mirrored data aggregates with this priority value start resynchronization only after all the other aggregates have started resynchronization.

When the number of aggregates waiting for resynchronization is higher than the maximum number of resynchronization operations allowed on a node, then the resync-priority field is used to determine which aggregate starts resynchronization first. This field is not set for unmirrored aggregates.

Examples

The following command displays the resynchronization priorities for all the aggregates in the cluster:

```
cluster1::> storage aggregate resynchronization show
Aggregate     Node            Resync Priority
------------- --------------- -------------
aggr0_n1      cluster1-01    high (fixed)
aggr0_n2      cluster1-02    high (fixed)
aggr1         cluster1-01    low             
aggr2         cluster1-01    high             
aggr3         cluster1-01    medium          
4 entries were displayed.
```

storage aggregate resynchronization options show on page 841

storage aggregate resynchronization options commands

The options directory

storage aggregate resynchronization options modify

Modify node specific aggregate resynchronization options

Availability: This command is available to cluster administrators at the admin privilege level.
Description

The storage aggregate resynchronization options modify command can be used to modify the options that govern the resynchronization of aggregates on a given cluster node.

Modifying the max-concurrent-resyncs option changes the number of aggregates that are allowed to resynchronize concurrently. When the number of aggregates waiting for resynchronization is higher than this value, the aggregates are resynchronized in the order of their resync-priority. This value can be modified using the storage aggregate resynchronization modify command while specifying the -resync-priority parameter.

Parameters

- **-node {<nodename>|local} - Node**
  
  This parameter specifies the node for which the option is to be modified.

- **[-max-concurrent-resync <integer>] - Maximum Concurrent Resynchronizing Aggregates**
  
  This parameter specifies the new value for the maximum number of concurrent resync operations allowed on a node. This option must be specified along with the -node parameter. When a node has active resync operations, setting this parameter to a value that is lower than the number of currently resyncing aggregates will trigger a user confirmation.

Examples

The following example changes the maximum concurrent resync operations for the specified node to ten:

```
cluster1::> storage aggregate resynchronization options modify -node node1 -max-concurrent-resyncs 10
```

Related references

storage aggregate resynchronization modify on page 838

storage aggregate resynchronization options show

Display node specific aggregate resynchronization options

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The storage aggregate resynchronization options show command displays all the options that govern the resynchronization of aggregates on a given cluster node. If no parameters are specified, the command displays the following information about all nodes:

- Node for which the information is being displayed
- Maximum number of concurrent resynchronizing aggregates allowed

Parameters

- **{-fields <fieldname>, ...}**
  
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

- **{-instance}**
  
  If you specify the -instance parameter, the command displays detailed information about all fields.

- **{-node {<nodename>|local}} - Node**
  
  If this parameter is specified, the command displays resynchronization options only for the specified node.
[-max-concurrent-resync <integer>] - Maximum Concurrent Resynchronizing Aggregates

If this parameter is specified, the command displays only the resynchronization option that matches the specified value.

Examples
The following example displays the maximum number of concurrent resyncs allowed for each node in the cluster:

```
cluster1::> storage aggregate resynchronization options show
Node                      Maximum Concurrent Resynchronizing Aggregates
-------------------------- ---------------------------------------------
cluster1-01               15
cluster1-02               4
2 entries were displayed.
```

The following example displays the maximum number of concurrent resyncs allowed for a specified node:

```
cluster1::> storage aggregate resynchronization options show -node node1
Node                      Maximum Concurrent Resynchronizing Aggregates
-------------------------- ---------------------------------------------
cluster1-01               15
```

The following example displays all the nodes that allow more than five concurrent resync operations:

```
cluster1::> storage aggregate resynchronization options show -max-concurrent-resyncs >5
Node                      Maximum Concurrent Resynchronizing Aggregates
-------------------------- ---------------------------------------------
cluster1-01               15
```

storage array commands
The array directory

storage array modify
Make changes to an array’s profile.

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The storage array modify command lets the user change several array parameters.

Parameters
- name <text> - Name
  Storage array name, either generated by Data ONTAP or assigned by the user.

[ -prefix <text> ] - Prefix
  Abbreviation for the named array.

[ -vendor <text> ] - Vendor
  Array manufacturer.
[-model <text>] - Model
  Array model number.

[-options <text>] - options
  Vendor specific array settings.

[-max-queue-depth <integer>] - Target Port Queue Depth (privilege: advanced)
  The target port queue depth for all target ports on this array.

[-lun-queue-depth <integer>] - LUN Queue Depth (privilege: advanced)
  The queue depth assigned to array LUNs from this array.

{ [-is-upgrade-pending {true|false}] - Upgrade Pending (privilege: advanced)
  Set this parameter to true if the array requires additional Data ONTAP resilience for a pending firmware upgrade. Keep this parameter false during normal array operation. This value can not be set to true if -path-failover-time is greater than zero.

| [-path-failover-time <integer>] - Path Failover Time (sec)
  The time delay (in secs) before switching the I/O path when the path is deleted. The maximum time delay is 30 sec. The default is 0. This value can not be greater than zero if -is-upgrade-pending is true.

[-all-path-fail-delay <integer>] - Extend All Path Failure Event (secs)
  Use this parameter to increase the delay before Data ONTAP declares an "all path failure" event for an array. Delaying the "all path failure" event allows Data ONTAP to suspend I/O operations for a longer period of time before declaring a data access disruption, allowing for I/O operations to resume if any path comes back online within the specified duration. A valid delay is any value between 30 and 90 seconds. A value of 0 will reset the delay, resulting in default actions being taken whenever an "all path failure" event is detected.

**Examples**

This command changes the model to FastT.

```bash
cluster1::> storage array modify -name IBM_1722_1 -model FastT
```

**storage array remove**

Remove a storage array record from the array profile database.

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
The storage array remove command discards array profile records for a particular storage array from the cluster database. Upon command completion, if a storage array is still connected to the cluster, the array profile record is re-created with default values.

**Parameters**

- **-name <text>** - Name
  Name of the storage array you want to remove from the database.

**Examples**

```bash
cluster1::> storage array remove IBM_1722_1
```
**storage array rename**

Change the name of a storage array in the array profile database.

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
The `storage array rename` command permits substitution of the array profile name which Data ONTAP assigned during device discovery. By default, the name that Data ONTAP assigned to the storage array during discovery is shown in Data ONTAP displays and command output.

**Parameters**
- `-name <text>` - Name
  
  Storage array name either generated by Data ONTAP or assigned by the user.

- `-new-name <text>` - The new name to assign to this array profile. (28 chars max)
  
  New name to assign to the storage array.

**Examples**

```
cluster1::> storage array rename -name HITACHI_DF600F_1 -new-name MyArray
```

---

**storage array show**

Display information about SAN-attached storage arrays.

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
The `storage array show` command displays information about arrays visible to the cluster. If no parameters are specified, the command displays the following information about all storage arrays:

- Prefix
- Name
- Vendor
- Model
- Options

To display detailed information about a single array, use the `-name` parameter. The detailed view adds the following information:

- Serial Number
- Optimization Policy
- Affinity
- Errors
- Path Failover Time
- Extend All Path Failure Event
Parameters

{ [-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

| [-instance ]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-name <text>] - Name

Selects the arrays that match this parameter value.

[-prefix <text>] - Prefix

Abbreviation for the named array.

[-vendor <text>] - Vendor

Array manufacturer.

[-model <text>] - Model

Array model number.

[-options <text>] - options

Vendor specific array settings.

[-serial-number <text>] - Serial Number

Array product identifier.

[-max-queue-depth <integer>] - Target Port Queue Depth (privilege: advanced)

Selects the arrays that match this parameter value.

[-lun-queue-depth <integer>] - LUN Queue Depth (privilege: advanced)

Selects the arrays that match this parameter value.

[-optimization-policy {iALUA|eALUA|symmetric|proprietary|mixed|unknown}] - Optimization Policy

Selects the arrays that match this parameter value.

[-affinity {none|aaa|ap|mixed|unknown}] - Affinity

Selects the arrays that match this parameter value.

[-error-text <text>, ...] - Error Text

Selects the arrays that match this parameter value.

[-is-upgrade-pending {true|false}] - Upgrade Pending (privilege: advanced)

Selects the arrays that match this parameter value.

[-path-failover-time <integer>] - Path Failover Time (sec)

Use this parameter to list arrays that have path failover time set to the value you specify.

[-all-path-fail-delay <integer>] - Extend All Path Failure Event (secs)

Use this parameter to list arrays that have the all path failure event delay set to the value you specify.

Examples

The following example displays information about all arrays.

```
cluster1::> storage array show
Prefix       Name       Vendor    Model    Options
---------   -----------  --------  -------  --------
          HITACHI      HITACHI  DF600F  
          IBM_1722     IBM       1722     
2 entries were displayed.
```
The following example displays detailed information about a specific array:

```
cluster1::> storage array show -name HITACHI_DF600F_1
Name: HITACHI_DF600F_1
Prefix: abc
Vendor: HITACHI
Model: DF600F
options:
  Serial Number: 4291000000000000
  Optimization Policy: iALUA
  Affinity: aaa
  Error Text:
    Path Failover Timeout (sec): 30
    Extend All Path Failure Event (secs): 50
```

**storage array config commands**

The config directory

**storage array config show**

Display connectivity to back-end storage arrays.

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

The `storage array config show` command displays information about how the storage arrays connect to the cluster, LUN groups, number of LUNS, and more. Use this command to validate the configuration and to assist in troubleshooting.

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-switch]
```

If you specify this parameter, switch port information is shown.

```
[-instance]
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[-node {<nodename> | local}] - Controller Name
```

Selects the arrays that match this parameter value.

```
[-group <integer>] - LUN Group
```

Selects the arrays that match this parameter value. A LUN group is a set of LUNs that shares the same path set.

```
[-target-wwpn <text>] - Array Target Ports
```

Selects the arrays that match this parameter value (the World Wide Port Name of a storage array port).

```
[-initiator <text>] - Initiator
```

Selects the arrays that match this parameter value (the host bus adapter that the clustered node uses to connect to storage arrays).

```
[-array-name <array name>] - Array Name
```

Selects the arrays that match this parameter value.
[-target-side-switch-port <text>] - Target Side Switch Port
Selects the arrays that match this parameter value.

[-initiator-side-switch-port <text>] - Initiator Side Switch Port
Selects the arrays that match this parameter value.

[-lun-count <integer>] - Number of array LUNs
Selects the arrays that match this parameter value.

[-ownership {all|assigned|unassigned}] - Ownership
Selects the arrays that match this parameter value.

**Examples**

```
cluster1::> storage array config show

**storage array disk commands**

The storage array disk directory

**storage array disk paths commands**

The paths directory
storage array disk paths show

Display a list of LUNs on the given array

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The storage array disk paths show command displays information about disks and array LUNs. Where it appears in the remainder of this document, "disk" may refer to either a disk or an array LUN. By default, the command displays the following information about all disks:

- Disk Unique Identifier
- Controller name
- Initiator Port
- LUN ID
- Failover optimization type
- The Use State of the LUN on this path
- Target Port
- Target IQN
- TPGN
- Port speeds
- Kbytes/sec on Disk (Rolling Average)
- Number IOPS per second on disk (Rolling Average)

To display detailed information about a single disk, use the -disk parameter.

Parameters

{ [-fields <fieldname>, ...]  
  Displays the specified fields for all disks, in column style output. }

[[-switch]  
  Displays the switch port information for all disks, in column style output. }

[[-instance ]]  
  Displays detailed disk information. If no disk path name is specified, this parameter displays the same detailed information for all disks as does the -disk parameter. If a disk path name is specified, then this parameter displays the same detailed information for the specified disks as does the -disk parameter.

[[-uid <text>] - Disk Unique Identifier  
  Selects the disks whose unique id matches this parameter value. A disk unique identifier has the form:  

[-disk <disk path name>] - Disk Name  
  Displays detailed information about the specified disks.

[-array-name <array name>] - Array Name  
  Selects information about the LUNs presented by the specified storage array.
[-diskpathnames <disk path name>, ...] - Path-Based Disk Names
Selects information about disks that have all of the specified path names.

[-nodelist <nodename> | local], ...] - Controller name
Selects information about disks that are visible to all of the specified nodes.

[-initiator <text>, ...] - Initiator Port
Selects information about disks that are visible to the initiator specified. Disks that are not currently in use by that initiator are included.

[-lun <integer>, ...] - LUN ID
Selects information about the specified LUNs.

[-target-wwpn <text>, ...] - Target Port
Selects information about disks that are visible on target ports identified by their World Wide Port Name.

[-initiator-side-switch-port <text>, ...] - Initiator Side Switch Port
Selects information about disks visible to an initiator that is connected to the specified switch port.

[-lun-path-use-state <text>, ...] - The Use State of the LUN on this path
Selects information about LUNs reporting the specified in-use state.

[-tpgn <integer>, ...] - Target Port Group Number
Selects information about disks that belong to the specified Target Port Group Number.

[-port-speed <text>, ...] - Port Speed
Selects information about disks served by a Host Bus Adapter that is running at the specified port speed.

[-lun-io-kbps <integer>, ...] - Kbytes/sec on Disk (Rolling Average)
Selects information about the LUNs that have reached the specified I/O throughput.

[-lun-iops <integer>, ...] - Number IOPS per second on disk (Rolling Average)
Selects information about the LUNs that have reached the specified number of IOPs.

[-target-side-switch-port <text>, ...] - Target Side Switch Port
Selects information about disks that are visible on target ports identified by the switch port to which they are connected.

[-target-port-access-state <text>, ...] - Failover optimization type
Selects information about disks visible on target ports that have the specified access state.

[-initiator-io-kbps <integer>, ...] - Kbytes of I/O per second on Initiator (Rolling Average)
Selects information about disks visible to an initiator that has executed I/O at the specified throughput.

[-initiator-iops <integer>, ...] - Number of IOPS on Initiator (Rolling Average)
Selects information about disks visible to an initiator that has executed the specified number of IOPs.

[-target-io-kbps <integer>, ...] - Kbytes of I/O per second to Target (Rolling Average)
Selects information about disks visible on target ports that have reached the specified I/O throughput.

[-target-iops <integer>, ...] - Number of IOPS to Target (Rolling Average)
Selects information about disks visible on target ports that have performed the specified number of IOPs.

[-path-link-errors <integer>, ...] - Link Error count on path
Selects information about disks with paths that have incurred the specified number of FC link errors.

[-path-io-kbps <integer>, ...] - Kbytes of I/O per second on Path (Rolling Average)
Selects information about disk with paths that have reached the specified I/O throughput.

[-path-iops <integer>, ...] - Number of IOPS on Path (Rolling Average)
Selects information about disks on those paths that have reached the specified number of IOPs.
[-path-quality <integer>, ...] - Percentage of weighted error threshold
Selects information about disks on paths that have incurred the specified number of errors. The value displayed is a measure of the health of a path expressed as a percentage of an error threshold. Once a path has reached or surpassed the error threshold, another path will be selected for I/O transfer, if there is one available.

[-path-lun-in-use-count <integer>, ...] - Number of LUNs in the in-use state on this path
Selects information about disks with paths that have the specified in-use-count.

[-initiator-lun-in-use-count <integer>, ...] - Number of LUNs in the in-use state on this initiator
Selects information about disks with a path through an initiator that has the specified in-use-count.

[-target-lun-in-use-count <integer>, ...] - Number of LUNs in the in-use state on this target
Selects information about disks with a path through a target port that has the specified in-use-count.

[-preferred-target-port (true|false), ...] - Whether or not target port group is preferred
Selects information about disks that match the specified parameter value indicating whether the backing storage is ALUA (Asymmetric Logical Unit Access) capable and has specified the array target port on this path to be a preferred target port for I/O.

[-vmdisk-device-id <integer>, ...] - Virtual disk device ID
Selects information about disks that have the specified virtual disk device ID.

[-host-adapter <text>] - Primary Path Host Adapter
Selects information about disks that are currently using the specified Host Bus Adapter.

[-primary-port <text>] - Primary Path Disk Port
Selects information about disks that use the specified primary port.

[-secondary-name <disk path name>] - Secondary Path Name
Selects information about disks that use the specified secondary path name, for multipath configuration.

[-secondary-port <text>] - Secondary Path Disk Port
Selects information about disks that use the specified secondary port.

Examples
The following example displays information about all disks:

```
cluster1::> storage array disk paths show
Disk Name: 1.0.20
LUN  Link    Disk
I/O Controller     Initiator     ID  Acc  Use  Target Port    TPGN    Speed       (KB/s)  IOPS
node2              3a             0  AO   INU  5000c5000979e09d     83   9 Gb/    0   0
node2              3c             0  AO   RDY  5000c5000979e09e     12   9 Gb/    0   0

```

850 Commands: Manual Page Reference
storage array port commands

The port directory

storage array port modify

Make changes to a target port record.

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The storage array port modify command lets the user change array target port parameters.

Parameters

- **-name <text>** - Name
  
  Selects the array ports that match this parameter value. The storage array name is either generated by Data ONTAP or assigned by the user.

- **-wwnn <text>** - WWNN
  
  Selects the array ports that match this parameter value.

- **-wwpn <text>** - WWPN
  
  Selects the array ports that match this parameter value.

- **[-max-queue-depth <integer>]** - Target Port Queue Depth
  
  The target port queue depth for this target port.

- **[-utilization-policy {normal|defer}]** - Utilization Policy
  
  The policy used in automatically adjusting the queue depth of the target port based on its utilization.

Examples
This command changes the maximum queue depth for this target port to 32.
storage array port modify

Modify a port record in an array profile.

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The storage array port modify command modifies a port from the array database. This command can be used to update the information about a port, such as the name or WWPN, which is useful when port information changes after hardware replacement, rezone, or similar configuration activities. It also allows you to adjust the max-queue-depth parameter for the port.

Parameters
- name <text> - Name
  Selects the array ports that match this parameter value. The storage array name is either generated by Data ONTAP or assigned by the user.
- wwnn <text> - WWNN
  Selects the array ports that match this parameter value.
- wwpn <text> - WWPN
  Selects the array ports that match this parameter value.
- target-iqn <text> - Target IQN
  Selects the array ports that match this parameter value.
- tpgt <integer> - TPGT
  Selects the array ports that match this parameter value.

Examples
This command modifies a port record in the array profiles database.

calendar::> storage array port modify -name HITACHI_DF600F_1 -wwnn 50060e80004291c0 -wwpn 50060e80004291c0 -max-queue-depth 32

storage array port remove

Remove a port record from an array profile.

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The storage array port remove command removes a port from the array database. You might want to remove ports that are no longer connected to the clustered node. Port information can change after hardware replacement, rezone, or similar configuration activities. The database retains the records about previous ports unless you remove the information.

Parameters
- name <text> - Name
  Selects the array ports that match this parameter value. The storage array name is either generated by Data ONTAP or assigned by the user.
- wwnn <text> - WWNN
  Selects the array ports that match this parameter value.
- wwpn <text> - WWPN
  Selects the array ports that match this parameter value.
- target-iqn <text> - Target IQN
  Selects the array ports that match this parameter value.
- tpgt <integer> - TPGT
  Selects the array ports that match this parameter value.

Examples
This command removes a port record from the array profiles database.

cluster1::> storage array port remove -name HITACHI_DF600F_1 -wwnn 50060e80004291c0 -wwpn 50060e80004291c0

storage array port show

Display information about a storage array's target ports.

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The storage array port show command displays all the target ports known to the cluster for a given storage array (if an array name is specified) or for all storage arrays if no storage array name is specified. Target ports remain in the database as part of an array profile unless you explicitly remove them from the database.

Parameters
[-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.
If you specify the `--instance` parameter, the command displays detailed information about all fields.

`-name <text>` - Name

Selects the array ports that match this parameter value. The storage array name is either generated by Data ONTAP or assigned by the user.

`-wwnn <text>` - WWNN

Selects the array ports that match this parameter value.

`-wwpn <text>` - WWPN

Selects the array ports that match this parameter value.

`-max-queue-depth <integer>` - Target Port Queue Depth

Selects the array ports that match this parameter value.

`-node {<nodename> | local}, ...` - Controller Name

Selects the array ports that match this parameter value.

`-initiator-port <text>, ...` - Initiator Port

Selects the array ports that match this parameter value.

`-average-dynamic-queue-depth <integer>, ...` - Average Dynamic Queue Depth (privilege: advanced)

The average value of the dynamic target port queue depth.

`-average-latency-per-iop <integer>, ...` - Average Latency Per IOP

Selects the array ports that match this parameter value (average latency per I/O performed in microseconds).

`-average-pending <integer>, ...` - Average Pending (privilege: advanced)

Selects the array ports that match this parameter value (average over time of how many commands are on the outstanding queue).

`-average-waiting <integer>, ...` - Average Waiting (privilege: advanced)

Selects the array ports that match this parameter value (average over time of how many commands are on the waiting queue).

`-connection-type {direct | fabric | ISCSI}` - Connection Type

Selects the array ports that match this parameter value (type of connection between the controller and the back end storage).

`-dynamic-queue-depth <integer>, ...` - Dynamic Queue Depth (privilege: advanced)

Current dynamic target port queue depth, the maximum number of commands allowed outstanding.

`-max-pending <integer>, ...` - Max Pending (privilege: advanced)

Selects the array ports that match this parameter value (largest number of commands observed on the outstanding queue).

`-max-waiting <integer>, ...` - Max Waiting (privilege: advanced)

Selects the array ports that match this parameter value (largest number of commands observed on the waiting queue).

`-path-link-errors <integer>, ...` - Link Error count on path

Selects the array ports that match this parameter value.

`-percent-busy <integer>, ...` - Percent Busy

Selects the array ports that match this parameter value (percentage of time I/Os are outstanding on the port).

`-percent-waiting <integer>, ...` - Percent Waiting

Selects the array ports that match this parameter value (percentage of time there are I/Os waiting on the throttle list on the target port).
[-switch-port <text>] - Switch Port
   Selects the array ports that match this parameter value (for fabric attached connections, the switch port the
array target port is connected to; N/A for direct attached).

[-target-io-kbps <integer>, ...] - Kbytes of I/O per second to Target (Rolling Average)
   Selects the array ports that match this parameter value.

[-target-iops <integer>, ...] - Number of IOPS to Target (Rolling Average)
   Selects the array ports that match this parameter value.

[-target-lun-in-use-count <integer>, ...] - Target LUN In Use Count
   Selects the array ports that match this parameter value (number of IN-USE disks on this target port).

[-target-port-speed <text>] - Target Port Speed
   Selects the array ports that match this parameter value (speed that the target port has negotiated with its
connected switch port, or initiator port if direct attached).

[-utilization-policy {normal|defer}] - Utilization Policy
   The policy used when sending I/O to an array target port when it reaches maximum queue depth. Possible
values are:
   • normal - This policy aggressively competes for target port resources, in effect competing with other hosts.
     (default)
   • defer - This policy does not aggressively compete for target port resources, in effect deferring to other
     hosts.

Examples
The example below displays the port information for a single port.

```
cluster1::> storage array port show -wwpn 50060e80004291c0
Array Name: HITACHI_DF600F_1
WWNN: 50060e80004291c0
WWPN: 50060e80004291c0
Connection Type: fabric
Switch Port: vgbr300s89:9
Link Speed: 4 GB/s
Max Queue Depth: 1024
Utilization Policy: normal

storage automated-working-set-analyzer commands
Manage Automated Working Set Analyser

storage automated-working-set-analyzer show
Display running instances

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The automated-working-set-analyzer show command displays the Automated Working-set Analyzer running instances.
Parameters

{[-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified
  field or fields. You can use `-fields ?` to display the fields to specify.

[-instance ]
  If you specify the -instance parameter, the command displays detailed information about all fields.

[-node <nodename>] - Node Name
  This parameter indicates the node name that the AWA instance runs on.

[-flash-cache (true|false)] - Flash Cache Node-wide Modeling
  This parameter indicates whether the AWA is modeling flash-cache.

[-aggregate-uuid <UUID>] - Uuid of the Aggregate
  This parameter indicates the aggregate uuid that the AWA instance runs on.

[-aggregate <aggregate name>] - Aggregate
  This parameter indicates the aggregate name that the AWA instance runs on.

[-working-set-size {true|false}] - Working Set Size
  This parameter indicates whether the AWA instance is configured to find the working set size.

[-start-time <Date>] - Starting Time
  This parameter indicates the time when the AWA instance was started.

[-total-intervals <integer>] - Total Interval Count
  This parameter indicates the total number of intervals that the AWA instance has covered.

[-read-throughput {(<integer>|KBps|MBps|GBps])} - Read Throughput
  This parameter indicates the maximum read throughput over an interval that AWA has observed from the
  storage disks.

[-write-throughput {(<integer>|KBps|MBps|GBps])} - Write Throughput
  This parameter indicates the maximum write throughput over an interval that AWA has observed to the storage
  disks.

[-cacheable-read <percent>] - Cacheable Read
  This parameter indicates the maximum percent of cacheable read over an interval that AWA has observed.
  Cacheable reads are non-sequential reads, i.e., the percentage of data reads that could have been cached.

[-cacheable-write <percent>] - Cacheable Write
  This parameter indicates the maximum percent of cacheable write over an interval that AWA has observed.
  Cacheable writes are random overwrites, percentage of disk writes that could have been cached.

[-projected-cache-size {(<integer>|KB|MB|GB|TB|PB})] - Max Projected Cache Size
  This parameter indicates the projected Flash Pool cache usage.

[-projected-read-hit <percent>] - Projected Read Hit
  This parameter indicates the percentage of blocks that could be read from the Flash Pool cache instead of
  HDDs.

[-projected-write-hit <percent>] - Projected Write Hit
  This parameter indicates the percentage of block overwrites that could go to the Flash Pool cache instead of
  HDDs.

[-referenced-interval-id <integer>] - Referenced Interval ID
  This parameter indicates the interval in which the cache size effect information is derived from.
[-referenced-interval-time <Date>] - Referenced Interval Time

This parameter indicates the time when the referenced interval for the cache size effect information is derived from.

[-referenced-interval-cache-size <integer>[KB|MB|GB|TB|PB]] - Referenced Interval Cache Size

This parameter indicates the cache size at the end of the referenced interval from which the cache size effect information is based on.

[-read-hit-20 <percent>] - 20% Cache Read Hit

This parameter indicates the predicted read hit rate when the cache size is 20% of the referenced cache size.

[-read-hit-40 <percent>] - 40% Cache Read Hit

This parameter indicates the predicted read hit rate when the cache size is 40% of the referenced cache size.

[-read-hit-60 <percent>] - 60% Cache Read Hit

This parameter indicates the predicted read hit rate when the cache size is 60% of the referenced cache size.

[-read-hit-80 <percent>] - 80% Cache Read Hit

This parameter indicates the predicted read hit rate when the cache size is 80% of the referenced cache size.

[-read-hit-100 <percent>] - 100% Cache Read Hit

This parameter indicates the predicted read hit rate when the cache size is 100% of the referenced cache size.

[-write-hit-20 <percent>] - 20% Cache Write Hit

This parameter indicates the predicted write hit rate when the cache size is 20% of the referenced cache size.

[-write-hit-40 <percent>] - 40% Cache Write Hit

This parameter indicates the predicted write hit rate when the cache size is 40% of the referenced cache size.

[-write-hit-60 <percent>] - 60% Cache Write Hit

This parameter indicates the predicted write hit rate when the cache size is 60% of the referenced cache size.

[-write-hit-80 <percent>] - 80% Cache Write Hit

This parameter indicates the predicted write hit rate when the cache size is 80% of the referenced cache size.

[-write-hit-100 <percent>] - 100% Cache Write Hit

This parameter indicates the predicted write hit rate when the cache size is 100% of the referenced cache size.

Examples

The following example shows a running instance of automated-working-set-analyzer on node node1 for aggregate aggr0.

```
cluster1::> cluster-1::*> storage automated-working-set-analyzer show
    Node     FC   Aggregate    wss    Intervals Start Time
    ------- ---- ------------- ------ ------------------------
    node1   false aggr0      false        125 Wed Jul 22 13:58:17 2015
```

storage automated-working-set-analyzer start

Command to start Automated Working Set Analyzer on node or aggregate

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

The automated-working-set-analyzer start command enables the Automated Workload Analyzer that is capable of doing the following:

- Flash Pool modeling for an aggregate
• Flash Cache modeling for a node - can not specify an aggregate.
• Working set size estimation
• Workload monitoring

Parameters

- `-node <nodename>` - Node Name
  This parameter indicates the node name that the AWA instance runs on.

- `[-flash-cache {true|false}]` - Flash Cache Node-wide Modeling
  This parameter indicates whether the AWA is modeling flash-cache.

- `[-aggregate <aggregate name>]` - Aggregate
  This parameter indicates the aggregate name that the AWA instance runs on.

- `[-working-set-size {true|false}]` - Working Set Size
  This parameter indicates whether the AWA instance is configured to find the working set size.

Examples

```bash
cluster1::> storage automated-working-set-analyzer start -node vsim1 -aggregate aggr0
```

**storage automated-working-set-analyzer stop**

Command to stop Automated Working Set Analyzer on node or aggregate

**Availability:** This command is available to `cluster` administrators at the `advanced` privilege level.

**Description**
The `storage automated-working-set-analyzer stop` command terminates one or multiple Automated Workload Analyzer running instances.

**Parameters**

- `[-node <nodename>]` - Node Name
  This parameter indicates the node name that the AWA instance runs on.

- `[-flash-cache {true|false}]` - Flash cache node-wide modeling
  This parameter indicates whether the AWA is modeling flash-cache.

- `[-aggregate <aggregate name>]` - Aggregate
  This parameter indicates the aggregate name that the AWA instance runs on.

Examples

```bash
cluster1::> storage automated-working-set-analyzer stop -node vsim1 -aggregate aggr1
```

**storage automated-working-set-analyzer volume commands**

The volume directory
storage automated-working-set-analyzer volume show

Displays the Automated Working Set Analyzer volume table

**Availability:** This command is available to cluster administrators at the advanced privilege level.

**Description**
The automated-working-set-analyzer volume show command displays the volume statistics reported by the corresponding Automated Working-set Analyzer running instances.

**Parameters**

```
[-fields <fieldname>, ...]  # If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.
[-instance]                 # If you specify the -instance parameter, the command displays detailed information about all fields.
[-node <nodename>]         # Node
  This parameter indicates the node name that the AWA instance runs on.
[-flash-cache {true|false}]  # Flash Cache Node-wide Modeling
  This parameter indicates whether the AWA is modeling flash-cache.
[-vol-uuid <UUID>]       # Uuid of the Volume
  This parameter indicates the volume uuid that this command is issued on.
[-aggregate <aggregate name>]  # Aggregate
  This parameter indicates the aggregate name that the AWA instance runs on.
[-volume <volume name>]  # Volume
  This parameter indicates the volume name that this command is issued on.
[-rank <integer>]          # Cache Benefit Rank
  This parameter indicates the rank of this volume among all volumes that would be most benefited by the modeled cache technology based on the AWA prediction.
[-read-throughput {<integer> [Bps|KBps|MBps|GBps]}]  # Read Throughput
  This parameter indicates the maximum read throughput over an interval that AWA has observed from the storage disks for this volume.
[-write-throughput {<integer> [Bps|KBps|MBps|GBps]}]  # Write Throughput
  This parameter indicates the maximum write throughput over an interval that AWA has observed to the storage disks for this volume.
[-cacheable-read <percent>]  # Cacheable Read
  This parameter indicates the maximum percent of cacheable read over an interval that AWA has observed for this volume. Cacheable reads are non-sequential reads, i.e., the percentage of data reads that could have been cached.
[-cacheable-write <percent>]  # Cacheable Write
  This parameter indicates the maximum percent of cacheable write over an interval that AWA has observed. Cacheable writes are random overwrites, percentage of disk writes that could have been cached.
[-projected-cache-size {<integer> [KB|MB|GB|TB|PB]}]  # Max Projected Cache Size
  This parameter indicates the projected Flash Pool cache usage by this volume.
```
-Projected Read Hit
This parameter indicates the percentage of blocks that could be read from the Flash Pool cache instead of HDDs for this volume.

-Projected Write Hit
This parameter indicates the percentage of block overwrites that could go to the Flash Pool cache instead of HDDs for this volume.

Examples

cluster1::> storage automated-working-set-analyzer volume show

storage bridge commands
Storage bridge monitoring commands

storage bridge add
Add a bridge for monitoring

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The storage bridge add command enables you to add FC-to-SAS bridges for SNMP monitoring in a MetroCluster configuration.

Parameters
- address <IP Address> - Bridge Management Port IP Address
  This parameter specifies the IP address of the bridge that is being added for monitoring.

- snmp-community <text> - SNMP Community
  This parameter specifies the SNMP community set on the bridge that is being added for monitoring.

-veto-backend-fabric-check {true|false} - Veto Backend Fabric Check (privilege: advanced)
If specified, the storage bridge add command will not check if the bridge is present in the MetroCluster's backend fabric. By default, it does not let you add bridges that are not present.

Examples
The following command adds a bridge with IP address '10.226.197.16' for monitoring:

cluster1::> storage bridge add -address 10.226.197.16
cluster1::> storage bridge show

<table>
<thead>
<tr>
<th>Bridge</th>
<th>Symbolic Name</th>
<th>Vendor</th>
<th>Model</th>
<th>Bridge WWN</th>
<th>Is Monitored</th>
<th>Monitor Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>ATTO_10.226.197.16</td>

</tr>
</tbody>
</table>
storage bridge modify

Modify a bridge's configuration information

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The storage bridge modify enables you to modify certain parameters for identifying and accessing the FC-to-SAS bridges added for monitoring in a MetroCluster configuration.

Parameters

-name <text> - Bridge Name

This parameter specifies the name of the bridge.

[-address <IP Address>] - Bridge IP Address

This parameter specifies the IP address of the bridge.

[-snmp-community <text>] - SNMP Community Set on the Bridge

This parameter specifies the SNMP community set on the bridge.

Examples

The following command modifies 'ATTO_10.226.197.16' bridge SNMP community to 'public':

```
cluster1::> storage bridge modify -name ATTO_10.226.197.16 -address 10.226.197.16 -snmp-community public
cluster1::>
```

storage bridge refresh

Refresh storage bridge info

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

The storage bridge refresh command triggers a refresh of the SNMP data for the MetroCluster FC switches and FC-to-SAS bridges. It does not do anything if the refresh is already going on. The FC switches and FC-to-SAS bridges must have been previously added for monitoring by using the storage switch add and storage bridge add commands respectvely.

Examples

The following command triggers a refresh for the SNMP data:

**storage bridge remove**

Remove a bridge from monitoring

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The *storage bridge remove* enables you to remove FC-to-SAS bridges that were previously added for SNMP monitoring.

**Parameters**

- `-name <text>` - Bridge Name

  This parameter specifies the name of the bridge added for monitoring.

**Examples**
The following command removes 'ATTO_10.226.197.16' bridge from monitoring:

```bash
cluster1::> storage bridge remove -name ATTO_10.226.197.16
cluster1::> storage bridge show
```

**storage bridge show**

Display bridge information

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The *storage bridge show* command displays information about all the storage bridges in the MetroCluster configuration. The bridges must have been previously added for monitoring using the *storage bridge add* command. If no parameters are specified, the default command displays the following information about the storage bridges:
To display detailed profile information about a single storage bridge, use the `-name` parameter.

**Parameters**

`{-fields <fieldname>,...}`

Displays the specified fields for all the storage bridges, in column style output.

`{-connectivity}`

Displays the following details about the connectivity from different entities to the storage bridge:

- Node
- Initiator
- Initiator Side Switch Port
- Target Side Switch Port
- Target Port WWN
- Target Port Number

`{-cooling}`

Displays the following details about the chassis temperature sensor(s) on the storage bridge:

- Sensor Name
- Reading in degree Celsius (C)
- Fan operational status
- Minimum Safe Operating Temperature in degree Celsius (C)
- Maximum Safe Operating Temperature in degree Celsius (C)
- Sensor Status

`{-error}`

Displays the errors related to the storage bridge.

`{-ports}`

Displays the following details about the storage bridge FC ports:

- Port number
- Port administrative status
- Port operational status
- Port operating mode
- Port negotiated speed
- Peer world wide name

Displays the following details about the storage bridge SAS ports:
- Port number
- Port negotiated data rate
- Port data rate capability
- Port PHY1 operational status
- Port PHY2 operational status
- Port PHY3 operational status
- Port PHY4 operational status
- Port administrative status
- Port operational status
- Peer world wide name

[-power]
Displays the status of the replaceable power supplies for the FibreBridge 7500 only:
- Power supply name
- Power supply status

[-sfp]
Displays the following details about the storage bridge FC ports Small Form-factor Pluggable (SFP):
- Port number
- SFP vendor
- SFP serial number
- SFP part number
- SFP speed capability

Displays the following details about the storage bridge SAS ports Quad Small Form-factor Pluggable (QSFP):
- Port number
- QSFP vendor
- QSFP serial number
- QSFP type
- QSFP part number

Displays the following details about the storage bridge SAS ports Mini-SAS HD:
- Port number
- Mini-SAS HD vendor
- Mini-SAS HD serial number
• Mini-SAS HD type
• Mini-SAS HD part number

[-vendor {unknown|Atto}] - Bridge Vendor
Displays information only about the storage bridges that match the bridge vendor you specify.

[-fw-version <text>] - Bridge Firmware Version
Displays information only about the storage bridges that match the bridge firmware version you specify.

[-serial-number <text>] - Bridge Serial Number
Displays information only about the storage bridges that match the bridge serial number you specify.

[-address <IP Address>] - Bridge IP Address
Displays information only about the storage bridges that match the bridge IP address you specify.

[-is-monitoring-enabled {true|false}] - Is Monitoring Enabled for Bridge?
Displays information only about the storage bridges that match the bridge monitoring value you specify.

[-status {unknown|ok|error}] - Bridge Status
Displays information only about the storage bridges that match the bridge monitoring status you specify.

[-profile-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [+|-]hh:mm}] - Bridge Profile Data Last Successful Refresh Timestamp
Displays information only about the storage bridges that match the profile data last successful refresh timestamp you specify.

[-symbolic-name <text>] - Bridge Symbolic Name
Displays information only about the storage bridges that match the symbolic name you specify.

[-snmp-community <text>] - SNMP Community Set on the Bridge
Displays information only about the storage bridges that match the bridge SNMP community you specify.

[-error-text-list <text>, ...] - Bridge Error Description List
Displays information only about the storage bridges that have the errors you specify.

[-temp-sensor-name <text>] - Temperature Sensor Name
Displays information only about the storage bridges that have the temperature sensor with the name you specify.

[-min-safe-oper-temp <integer>] - Minimum Safe Operating Temperature in Degree Celsius
Displays information only about the storage bridges that have the temperature sensor with the minimum safe operating temperature you specify.

[-max-safe-oper-temp <integer>] - Maximum Safe Operating Temperature in Degree Celsius
Displays information only about the storage bridges that have the temperature sensor with the maximum safe operating temperature you specify.

[-temp-reading <integer>] - Chassis Temperature Sensor Reading in Degree Celsius
Displays information only about the storage bridges that have the temperature sensors with the reading you specify.

[-temp-sensor-status {normal|warning|critical}] - Chassis Temperature Sensor Status
Displays information only about the storage bridges that have the temperature sensor with the status you specify.

[-temp-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [+|-]hh:mm}] - Bridge Chassis Temperature Data Last Successful Refresh Timestamp
Displays information only about the storage bridges that match the temperature sensor data last successful refresh timestamp you specify.

[-fc-port-index-list <integer>, ...] - Bridge FC Port Index List
Displays information only about the storage bridges that have the ports with the indexes you specify.
Bridge FC Port Operational State List
Displays information only about the storage bridges that have the ports with the operational states you specify.

Bridge FC Port Admin State List
Displays information only about the storage bridges that have the ports with the administrative states you specify.

Bridge FC Port Negotiated Data Rate List
Displays information only about the storage bridges that have the ports with the negotiated data rates you specify.

Bridge FC Port Negotiated Connection Mode List
Displays information only about the storage bridges that have the ports with the negotiated connection modes you specify.

Bridge FC Port WWN List
Displays information only about the storage bridges that have the ports with the world wide names you specify.

Bridge FC Port Data Last Successful Refresh Timestamp
Displays information only about the storage bridges that match the FC ports data last successful refresh timestamp you specify.

Bridge FC Port Index List
Displays information only about the storage bridges that have the ports with the indexes you specify.

Bridge FC Port Transmitted Word Count List
Displays information only about the storage bridges that have the ports with the number of transmitted words you specify.

Bridge FC Port Received Word Count List
Displays information only about the storage bridges that have the ports with the number of received words you specify.

Bridge FC Port Link Failure Count List
Displays information only about the storage bridges that have the ports with the number of link failures you specify.

Bridge FC Port Sync Loss Count List
Displays information only about the storage bridges that have the ports with the number of synchronization losses you specify.

Bridge FC Port Invalid CRC Count List
Displays information only about the storage bridges that have the ports with the number of invalid CRCs you specify.

Bridge FC Port Stats Last Successful Refresh Timestamp
Displays information only about the storage bridges that match the FC port stats data last successful refresh timestamp you specify.

Bridge SAS Port Index List
Displays information only about the storage bridges that have the SAS ports with the indexes you specify.
[-sas-port-oper-state-list \{unknown|online|offline|degraded\}, ...] - Bridge SAS Port Operational State List

Displays information only about the storage bridges that have the SAS ports with the operational states you specify.

[-sas-port-phyl-oper-state-list \{unknown|online|offline\}, ...] - Bridge SAS Port PHY1 Operational State List

Displays information only about the storage bridges that have the SAS ports with the PHY1 operational states you specify.

[-sas-port-phyl2-oper-state-list \{unknown|online|offline\}, ...] - Bridge SAS Port PHY2 Operational State List

Displays information only about the storage bridges that have the SAS ports with the PHY2 operational states you specify.

[-sas-port-phyl3-oper-state-list \{unknown|online|offline\}, ...] - Bridge SAS Port PHY3 Operational State List

Displays information only about the storage bridges that have the SAS ports with the PHY3 operational states you specify.

[-sas-port-phyl4-oper-state-list \{unknown|online|offline\}, ...] - Bridge SAS Port PHY4 Operational State List

Displays information only about the storage bridges that have the SAS ports with the PHY4 operational states you specify.

[-sas-port-admin-state-list \{unknown|disabled|enabled\}, ...] - Bridge SAS Port Administrative State List

Displays information only about the storage bridges that have the SAS ports with the administrative states you specify.

[-sas-port-data-rate-capability-list \{unknown|1.5Gbps|3Gbps|6Gbps|12Gbps\}, ...] - Bridge SAS Port Data Rate Capability List

Displays information only about the storage bridges that have the SAS ports with the data rate capabilities you specify.

[-sas-port-negotiated-data-rate-list \{unknown|1.5Gbps|3Gbps|6Gbps|12Gbps\}, ...] - Bridge SAS Port Negotiated Data Rate List

Displays information only about the storage bridges that have the SAS ports with the negotiated data rates you specify.

[-sas-port-wwn-list \<text>, ...\] - Bridge SAS Port WWN List

Displays information only about the storage bridges that have the SAS ports with the world wide names you specify.

[-sas-port-data-last-successful-refresh-timestamp \{MM/DD/YYYY HH:MM:SS \(+|-hh:mm\)\}] - Bridge SAS Port DB Data Last Successful Refresh Timestamp

Displays information only about the storage bridges that match the SAS ports data last successful refresh timestamp you specify.

[-sas-port-stats-phy-index-list \<integer>, ...\] - Bridge SAS Port PHY Index List

Displays information only about the storage bridges that have the SAS ports with the PHY indexes you specify.

[-sas-port-link-changed-list \<integer>, ...\] - Bridge SAS Port Link Changed Count List

Displays information only about the storage bridges that have the SAS ports with the link changed count you specify.
~-sas-port-invalid-crc-list <integer>, ...~ - Bridge SAS Port Invalid CRC Count List
  Displays information only about the storage bridges that have the SAS ports with the invalid CRCs you specify.

~-sas-port-phy-reset-list <integer>, ...~ - Bridge SAS Port PHY Reset Count List
  Displays information only about the storage bridges that have the SAS ports with the PHY reset count you specify.

~-sas-port-sync-losses-list <integer>, ...~ - Bridge SAS Port Sync Loss Count List
  Displays information only about the storage bridges that have the SAS ports with the synchronization losses you specify.

~-sas-port-disparity-count-list <integer>, ...~ - Bridge SAS Port Disparity Count List
  Displays information only about the storage bridges that have the SAS ports with the disparity count you specify.

~-sas-port-invalid-dword-list <integer>, ...~ - Bridge SAS Port Invalid DWORD Count List
  Displays information only about the storage bridges that have the SAS ports with the invalid DWORD count you specify.

~-sas-port-stats-index-list <integer>, ...~ - Bridge SAS Port Index List
  Displays information only about the storage bridges that have the SAS ports with the indexes you specify.

~-sas-port-stats-data-rate-capability-list {unknown|1.5Gbps|3Gbps|6Gbps|12Gbps}, ...~ - Bridge SAS Port Data Rate Capability List
  Displays information only about the storage bridges that have the SAS ports with the data rate capabilities you specify.

~-sas-port-stats-negotiated-data-rate-list {unknown|1.5Gbps|3Gbps|6Gbps|12Gbps}, ...~ - Bridge SAS Port Negotiated Data Rate List
  Displays information only about the storage bridges that have the SAS ports with the negotiated data rates you specify.

  Displays information only about the storage bridges that match the SAS port stats data last successful refresh timestamp you specify.

~-fc-sfp-port-index-list <integer>, ...~ - Bridge FC Port Index List
  Displays information only about the storage bridges that have the FC ports with the indexes you specify.

~-fc-port-sfp-vendor-list <text>, ...~ - Bridge FC Port SFP Vendor List
  Displays information only about the storage bridges that have the FC ports with the SFP vendors you specify.

~-fc-port-sfp-serial-number-list <text>, ...~ - Bridge FC Port SFP Serial Number List
  Displays information only about the storage bridges that have the FC ports with the SFP serial numbers you specify.

~-fc-port-sfp-part-number-list <text>, ...~ - Bridge FC Port SFP Part Number List
  Displays information only about the storage bridges that have the FC ports with the SFP part numbers you specify.

~-fc-port-sfp-data-rate-capability-list {2Gb|4Gb|8Gb|16Gb}, ...~ - Bridge FC Port SFP Data Rate Capability List
  Displays information only about the storage bridges that have the FC ports with the SFP data rate capabilities you specify.
[-fc-port-sfp-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}] - Bridge FC Port SFP Data Last Successful Refresh Timestamp
Displays information only about the storage bridges that match the FC ports SFP data last successful refresh timestamp you specify.

[-sas-qsf-port-index-list <integer>, ...] - Bridge SAS Port Index List
Displays information only about the storage bridges that have the SAS ports with the indexes you specify.

[-sas-port-qsf-port-vendor-list <text>, ...] - Bridge SAS Port QSFP Vendor List
Displays information only about the storage bridges that have the SAS ports with the QSFP vendors you specify.

[-sas-port-qsf-port-serial-number-list <text>, ...] - Bridge SAS Port QSFP Serial Number List
Displays information only about the storage bridges that have the SAS ports with the QSFP serial numbers you specify.

[-sas-port-qsf-port-type-list {unknown|optical|active-copper|passive-copper}, ...] - Bridge SAS Port QSFP Type List
Displays information only about the storage bridges that have the SAS ports with the QSFP types you specify.

[-sas-port-qsf-port-part-number-list <text>, ...] - Bridge SAS Port QSFP Part Number List
Displays information only about the storage bridges that have the SAS ports with the QSFP part numbers you specify.

[-sas-port-qsf-port-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}] - Bridge SAS Port QSFP Data Last Successful Refresh Timestamp
Displays information only about the storage bridges that match the SAS ports QSFP data last successful refresh timestamp you specify.

[-mini-sas-hd-index-list <integer>, ...] - Bridge Mini-SAS HD Index List
Displays information only about the storage bridges that have SAS ports with the Mini-SAS HD indexes that you specify.

[-mini-sas-hd-vendor-list <text>, ...] - Bridge Mini-SAS HD Vendor List
Displays information only about the storage bridges that have SAS ports with the Mini-SAS HD vendors that you specify.

[-mini-sas-hd-serial-number-list <text>, ...] - Bridge Mini-SAS HD Serial Number List
Displays information only about the storage bridges that have SAS ports with the Mini-SAS HD serial numbers that you specify.

[-mini-sas-hd-type-list <text>, ...] - Bridge Mini-SAS HD Type List
Displays information only about the storage bridges that have SAS ports with the Mini-SAS HD types that you specify.

[-mini-sas-hd-part-number-list <text>, ...] - Bridge Mini-SAS HD Part Number List
Displays information only about the storage bridges that have SAS ports with the Mini-SAS HD part numbers that you specify.

Displays information only about the storage bridges that match the SAS ports Mini-SAS HD data with the last successful refresh timestamp that you specify.

[-power-supply-index-list <integer>, ...] - Bridge Power Supply Index List
Displays information only about the storage bridges that have power supplies with the indexes that you specify.
[-power-supply-name-list <text>, ...] - Bridge Power Supply Name List
Displays information only about the storage bridges that have power supplies with the name that you specify.

[-power-supply-status-list {unknown|down|up}, ...] - Bridge Power Supply Status List
Displays information only about the storage bridges that have power supplies with the status that you specify.

[-power-supply-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [+|-]hh:mm}], ... - Bridge Power Supply Data Last Successful Refresh Timestamp
Displays information only about the storage bridges that match the power supply last data with the last successful refresh timestamp that you specify.

[-node-list <nodename>|local], ... - Node Name List
Displays information only about the storage bridges that are connected to the nodes you specify.

[-initiator-list <text>, ...] - Initiator List
Displays information only about the storage bridges that are connected to the nodes hosting the initiators you specify.

[-initiator-side-switch-port-name-list <text>, ...] - Initiator Side Switch Port Name List
Displays information only about the storage bridges that are connected to the initiator side switch ports you specify.

[-target-side-switch-port-name-list <text>, ...] - Target Side Switch Port Name List
Displays information only about the storage bridges that are connected to the target side switch ports you specify.

[-target-port-wwn-list <text>, ...] - Target Port WWN List
Displays information only about the storage bridges that match the target ports with world wide names you specify.

[-target-port-index-list <integer>, ...] - Target Port Index List
Displays information only about the storage bridges that match the target ports with indexes you specify.

Examples
The following example displays information about all storage bridges:

```
cluster1::> storage bridge show
Is        Monitor

storage bridge config-dump commands

Manage bridge dumpconfiguration files
storage bridge config-dump collect

Retrieve and save bridge dumpconfiguration

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The storage bridge config-dump collect command retrieves a dumpconfiguration file from a storage bridge.

Parameters
-bridge <text> - Bridge Name
Use this parameter to retrieve a dumpconfiguration file from the specified storage bridge.

Examples
The following example retrieves a dumpconfiguration file from storage bridge ATTO_FibreBridge7500N_1:

```
cluster1::*> storage bridge config-dump collect -bridge ATTO_FibreBridge7500N_1
[Job 883] Job is queued: Collect the dumpconfiguration file from bridge "ATTO_FibreBridge7500N_1".
cluster1::*> 
```

storage bridge config-dump delete

Delete a dumpconfiguration file

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The storage bridge config-dump delete command deletes dumpconfiguration files previously retrieved with the storage bridge config-dump collect command.

Parameters
-node {<nodename>|local} - Node
Use this parameter to delete a dumpconfiguration file stored on the specified node.

-file <text> - Config File
Use this parameter to delete the dumpconfiguration file with the specified file name.

Examples
The following example deletes dsbridge_config.FB7500N100001.2017-04-28_14_49_30.txt from node1:

```
cluster1::*> storage bridge config-dump delete -node node1 -file dsbridge_config.FB7500N100001.2017-04-28_14_49_30.txt
cluster1::*> 
```

Related references
storage bridge config-dump collect on page 875
storage bridge config-dump show

Display a list of bridge dumpconfiguration files

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The storage bridge config-dump show command displays information about all the dumpconfiguration files previously retrieved with the storage bridge config-dump collect command. If no parameters are specified, the default command displays the following information about the dumpconfiguration files:

- Node
- File Name
- Timestamp
- Bridge
- Bridge Serial Number

To display detailed information about a single dumpconfiguration file, use the -node and -file parameters.

Parameters

{-fields <fieldname>, ...}
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use ‘-fields ?’ to display the fields to specify.

{-instance}
If you specify the -instance parameter, the command displays detailed information about all fields.

{-node <nodename> | local} - Node
Displays information about the dumpconfiguration files stored on the node that matches the specified node name.

{-file <text>} - Config File
Displays information about the dumpconfiguration files that match the specified file name.

{-bridge <text>} - Bridge Name
Displays information about the dumpconfiguration files from the storage bridge that matches the specified bridge name.

{-serial-number <text>} - Serial Number of Bridge
Displays information about the dumpconfiguration files from the storage bridge that matches the specified serial number.

{-timestamp <MM/DD/YYYY HH:MM:SS>} - Time of Collection
Displays information about the dumpconfiguration files that were collected at the specified time.

Examples
The following example displays information about all dumpconfiguration files:

cluster1:~$ storage bridge config-dump show
Bridge: ATTO_FibreBridge7500N_1
<table>
<thead>
<tr>
<th>Node</th>
<th>File Name</th>
<th>Timestamp</th>
</tr>
</thead>
<tbody>
<tr>
<td>node1</td>

**storage bridge coredump commands**

The coredump directory

**storage bridge coredump collect**

Retrieve and save coredump

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**

The `storage bridge coredump collect` command retrieves a core file from a storage bridge.

**Parameters**

- `-name <text>` - Bridge Name

  This parameter specifies the storage bridge name from which the coredump file is to be collected.

**Examples**

The following example retrieves a coredump from storage bridge ATTO_FibreBridge7500N_1:
storage bridge coredump delete

Delete a saved coredump file.

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The storage bridge coredump delete command deletes a coredump file previously retrieved with the storage bridge coredump collect command.

Parameters
- name <text> - Bridge Name
  This parameter specifies the name of the bridge that the coredump file belongs to.
- corename <text> - Coredump Filename
  This parameter specifies the name of the coredump file to be deleted.

Examples
The following example deletes coredump file core.FB7500N100018.1970-01-05_17_50_30.mem collected from bridge ATTO_FibreBridge7500N_1:

```
cluster1::> storage bridge coredump delete -name ATTO_FibreBridge7500N_1 -corename core.FB7500N100018.1970-01-05_17_50_30.mem
cluster1::>
```

storage bridge coredump show

Display a list of bridge coredumps

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The storage bridge coredump show command displays information about all the coredump files previously retrieved with the storage bridge coredump collect command. If no parameters are specified, the default command displays the following information about the coredump files:

- Bridge Name
- Bridge Serial Number
- Coredump Filename
- Located on Node
To display detailed information about a single coredump file, use the `−node` and `−corename` parameters.

**Parameters**

`{ [−fields <fieldname>, ...]`

If you specify the `−fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `−fields ?` to display the fields to specify.

`| [−instance ]}

If you specify the `−instance` parameter, the command displays detailed information about all fields.

`[−serial−number <text>] - Bridge Serial Number`

Use this parameter to select the coredump files from the storage bridge that matches the specified bridge serial number.

`[−corename <text>] - Coredump Filename`

Use this parameter to select the coredump files that matches the specified file name.

`[−name <text>] - Bridge Name`

Use this parameter to select the coredump files from the storage bridge that matches the specified bridge name.

`[−node <nodename>] - Located on Node`

Use this parameter to select the coredump files that are located on the specified node.

`[−panic−time <MM/DD/YYYY HH:MM:SS>] - Panic Timestamp`

Use this parameter to select the coredump files that were collected at the specified time.

`[−panic−string <text>] - Panic String`

Use this parameter to select the coredump files that matches the specified panic string.

**Examples**

The following example displays information about all coredump files:

```bash
cluster1::> storage bridge coredump show
Bridge Name: ATTO_FibreBridge7500N_1
Bridge Serial Number: FB7500N100018
Coredump Filename: core.FB7500N100018.1970-01-05.17_50_30.mem
Located on Node: stg-8020-6a
Panic Timestamp: 7/6/2017 11:03:37
Panic String: CoreDumpGenerate CLI Command
```

`storage bridge coredump collect` on page 877

**storage disk commands**

Manage physical disks
storage disk assign

Assign ownership of a disk to a system

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The storage disk assign command is used to assign ownership of an unowned disk or array LUN to a specific node. You can also use this command to change the ownership of a disk or an array LUN to another node. You can designate disk ownership by specifying disk names, array LUN names, wildcards, or all (for all disks or array LUNs visible to the node). For disks, you can also set up disk ownership autoassignment. You can also assign disks to a particular pool. You can also assign disks by copying ownership from another disk.

Parameters

|--{[−disk <disk path name>]}− Disk Path
This specifies the disk or array LUN that is to be assigned. Disk names take one of the following forms:

- Disks are named in the form <stack-id>.<shelf>.<bay>
- Disks on multi-disk carriers are named in the form <stack-id>.<shelf>.<bay>.<lun>
- Virtual disks are named in the form <prefix>.<number>, where prefix is the storage array’s prefix and number is a unique ascending number.

Disk names take one of the following forms on clusters that are not yet fully upgraded to Data ONTAP 8.3:

- Disks that are not attached to a switch are named in the form <node>:<host_adapter>.<loop_ID>. For disks with a LUN, the form is <node>:<host_adapter>.<loop_ID>.<LUN>. For instance, disk number 16 on host adapter 1a on a node named node0a is named node0a:1a.16. The same disk on LUN lun0 is named node0a:1a.16Llun0.
- Disks that are attached to a switch are named in the form <node>:<switch_name>:<switch_port>.<loop_ID>. For disks with a LUN, the form is <node>:<switch_name>:<switch_port>.<loop_ID>.<LUN>. For instance, disk number 08 on port 11 of switch fc1 on a node named node0a is named node0a:fc1:11.08. The same disk on LUN lun1 is named node0a:fc1:11.08Llun1.

Before the cluster is upgraded to Data ONTAP 8.3, the same disk can have multiple disk names, depending on how the disk is connected. For example, a disk known to a node named alpha as alpha:1a.19 can be known to a node named beta as beta:0b.37. All names are listed in the output of queries and are equally valid. To determine a disk’s unique identity, run a detailed query and look for the disk’s universal unique identifier (UUID) or serial number.

A subset of disks or array LUNs can be assigned using the wildcard character (*) in the −disk parameter. Either the −owner, the −sysid, or the −copy-ownership-from parameter must be specified with the −disk parameter. Do not use the −node parameter with the −disk parameter.

|−all [true]− Assign All Disks
This optional parameter causes assignment of all visible unowned disks or array LUNs to the node specified in the −node parameter. The −node parameter must be specified with the −all parameter. When the −copy-ownership-from parameter is specified with the −node parameter, it assigns disk ownership based on the −copy-ownership-from parameter; otherwise it assigns ownership of the disks based on the −node parameter. Do not use the −owner or the −sysid parameter with the −all parameter.

|−[−type | -T {ATA | BSAS | FCAL | FSAS | LUN | MSATA | SAS | SSD | VMDISK | SSD-NVM}]− Storage Type
This optional parameter assigns ownership of a specific type of disk or array LUN (or a set of disks/array LUNs) to a node. The −count parameter must be specified with the −type parameter.
-count | -n <integer> - Disk Count

This optional parameter assigns ownership of a number of disks or array LUNs specified in the -count parameter, to a node.

|-auto [true] - Auto Assign

This optional parameter causes all visible disks eligible for autoassignment to be immediately assigned to the node specified in the -node parameter, regardless of the setting of the disk:auto_assign option. Only unowned disks on loops or stacks owned wholly by that system and which have the same pool information will be assigned. The -node parameter must be specified with the -auto parameter. Do not use the -owner, the -sysid, or the -copy-ownership-from parameter with the -auto parameter. When possible, use the -auto parameter rather than the -all parameter to conform to disk ownership best practices. The -auto parameter is ignored for array LUNs.

|-pool | -p <integer> - Pool

This optional parameter specifies the pool to which a disk must be assigned. It can take values of Pool0 or Pool1.

{| -owner | -o <nodename> | Owner Name

This optional parameter specifies the node to which the disk or array LUN has to be assigned.

|-sysid | -s <nvramid> - New Owner ID

This optional parameter specifies the serial number (NVRAM ID) of the node to which the disk or array LUN has to be assigned.

{| -copy-ownership-from <disk path name> | Disk Name to Copy Ownership

This optional parameter specifies the disk name from where the node needs to copy disk ownership information. You can use this parameter for disks to have the same ownership as the provided input disk.

|-checksum | -c {block|zoned|advanced_zoned} - Checksum Compatibility

This optional parameter is used to set the checksum type for a disk or an array LUN. The possible values are block, zoned, and advanced_zoned. This operation will fail if the specified disk is incompatible with the specified checksum type. A newly created aggregate with zoned checksum array LUNs is assigned advanced zoned checksum (AZCS) checksum type. AZCS checksum type provides more functionality than the "version 1" zoned checksum type which has been supported in previous Data ONTAP releases. Zoned checksum spare array LUNs added to an existing zoned checksum aggregate continue to be zoned checksum. Zoned checksum spare array LUNs added to an AZCS checksum type aggregate use the AZCS checksum scheme for managing checksums. For some disks (e.g. FCAL, SSD, SAS disks), the checksum type cannot be modified. For more information on modifying the checksum type, refer to the "Physical Storage Management Guide".

|-force | -f [true] - Force Flag

This optional parameter forces the assignment of ownership of an already owned disk to a node. This parameter could also be used to assign an array LUN with a redundancy error, for example, if the array LUN is available on only one path. For a disk which is part of a live aggregate, even specification of the -force parameter would not force the assignment, since it would be catastrophic.

|-node | -N <nodename> - Node Name (For Auto Assign)

This optional parameter is used with either the -auto or the -all parameter. If used with the -auto parameter, all disks which are visible to the node specified in the -node parameter and which are eligible for autoassignment would be assigned to it. If used with the -all parameter, all unowned disks or array LUNs visible to the node would be assigned to it.

{| -root [true] | Root Partition of Root-Data or Root-Data1-Data2 Partitioned Disk (privilege: advanced)

This optional parameter assigns the root partition of a root-data/root-data1-data2 partitioned disk. You cannot use this parameter with disks that are part of a storage pool. The default value is false.

{| -data [true] | Data Partition of Root-Data Partitioned Disk (privilege: advanced)

This optional parameter assigns the data partition of a root-data partitioned disk. You cannot use this parameter with disks that are part of a storage pool. The default value is false.
| [-data1 [true]] - Data1 Partition of Root-Data1-Data2 Partitioned Disk (privilege: advanced) |
| This optional parameter assigns the data1 partition of a root-data1-data2 partitioned disk. You cannot use this parameter with disks that are part of a storage pool. The default value is `false`.

| [-data2 [true]] - Data2 Partition of Root-Data1-Data2 Partitioned Disk (privilege: advanced) |
| This optional parameter assigns the data2 partition of a root-data1-data2 partitioned disk. You cannot use this parameter with disks that are part of a storage pool. The default value is `false`.

**Examples**

The following example assigns ownership of an unowned disk named `1.1.16` to a node named `node1`:

```
cluster1::> storage disk assign -disk 1.1.16 -owner node1
```

The following example assigns all unowned disks or array LUNs visible to a node named `node1` to itself:

```
cluster1::> storage disk assign -all -node node1
```

The following example autoassigns all unowned disks (eligible for autoassignment) visible to a node named `node1` to itself:

```
cluster1::> storage disk assign -auto -node node1
```

The following two examples show the working of the `-force` parameter with a spare disk that is already owned by another system:

```
cluster1::> storage disk assign -disk 1.1.16 -owner node1
Error: command failed: Failed to assign disks. Reason: Disk 1.1.16 is already owned.
```

```
cluster1::> storage disk assign -disk 1.1.16 -owner node1 -force
Success.
```

The following example assigns ownership of the set of unowned disks on `<stack> 1`, to a node named `node1`:

```
cluster1::> storage disk assign -disk 1.* -owner node1
```

The following example assigns ownership of unowned disk `1.1.16` by copying ownership from disk `1.1.18`:

```
cluster1::> storage disk assign -disk 1.1.16 -copy-ownership-from 1.1.18
```

The following example assigns all unowned disks visible to a node named `node1` by copying ownership from disk `1.1.18`:

```
cluster1::> storage disk assign -all -node node1 -copy-ownership-from 1.1.18
```

The following example assigns the root partition of disk `1.1.16` to node1.
The following example assigns the data partition of root-data partitioned disk 1.1.16 to node1.

```
cluster1::> storage disk assign -disk 1.1.16 -owner node1 -data true
```

The following example assigns the data1 partition of root-data1-data2 partitioned disk 1.1.24 to node1.

```
cluster1::> storage disk assign -disk 1.1.24 -owner node1 -data1 true
```

The following example assigns the data2 partition of root-data1-data2 partitioned disk 1.1.24 to node1.z33

```
cluster1::> storage disk assign -disk 1.1.24 -owner node1 -data2 true
```

---

**storage disk fail**

Fail the file system disk

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The *storage disk fail* command can be used to manually force a file system disk to fail. It is used to remove a file system disk that may be logging excessive errors and requires replacement. To unfail a disk, use the *storage disk unfail* command.

**Parameters**
- `-disk <disk path name>` - Disk Name
  
  This parameter specifies the disk to be failed.

- `[-immediate | -i [true]]` - Fail immediately
  
  This parameter optionally specifies whether the disk is to be failed immediately. It is used to avoid Rapid RAID Recovery and remove the disk from the RAID configuration immediately. Note that when a file system disk has been removed in this manner, the RAID group to which the disk belongs enters degraded mode (meaning a disk is missing from the RAID group). If a suitable spare disk is available, the contents of the disk being removed are reconstructed onto that spare disk.

**Examples**
The following example fails a disk named 1.1.16 immediately:

```
cluster1::> storage disk fail -disk 1.1.16 -i true
WARNING: The system will not prefail the disk and its contents will not be copied to a replacement disk before being failed out. Do you want to fail out the disk immediately? {y|n}: y
```

**Related references**

*storage disk unfail* on page 907
storage disk reassign

(DEPRECATED)-Change the default owner of all disks from one node to another

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**
The *storage disk reassign* is deprecated and may be removed in a future release of Data ONTAP. Disk reassignment is no longer required as part of a controller replacement procedure. For further information, see the latest controller or NVRAM FRU replacement flyer for your system. This command changes the ownership of all disks on a node to the ownership of another node. Use this command only when a node has a complete failure (for instance, a motherboard failure) and is replaced by another node. If the node's disks have already been taken over by its storage failover partner, use the *-force* parameter.

**Parameters**
- **-homeid| -s <nvramid>** - Current Home ID
  This specifies the serial number of the failed node.
- **-newhomeid| -d <nvramid>** - New Home ID
  This specifies the serial number of the node that is to take ownership of the failed node's disks.
- 
  **[-force| -f [true]]** - Force
  This optionally specifies whether to force the reassignment operation. The default setting is *false*.

**Examples**
In the following example, a node named node0 and having serial number 12345678 has failed. Its disks have not been taken over by its storage failover partner. A replacement node with serial number 23456789 was installed and connected to node0's disk shelves. To assign node0's disks to the new node, start the new node and run the following command:

```
cluster::*> storage disk reassign -homeid 12345678 -newhomeid 23456789
node0's disks 1.1.11, 1.1.12, 1.1.13, 1.1.14, 1.1.15, 1.1.23 and 1.1.24 were reassigned to new owner with serial number 23456789.
```

In the following example, a similar failure has occurred, except that node0's disks have been taken over by its storage failover partner, node1. A new node with serial number 23456789 has been installed and configured. To assign the disks that previously belonged to node0 to this new node, run the following command:

```
cluster::*> storage disk reassign -homeid 12345678 -newhomeid 23456789 -force true
node0's disks 1.1.11, 1.1.12, 1.1.13, 1.1.14, 1.1.15, 1.1.23 and 1.1.24 were reassigned to new owner with serial number 23456789.
```

---

storage disk refresh-ownership

Refresh the disk ownership information on a node

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**
This command updates the disk ownership information for all the disks attached to a node to the latest view for all the nodes in the cluster. During normal operations, disk ownership is kept up to date automatically. In certain circumstances, however, disk ownership must be updated manually. If this is required, EMS messages will indicate that this command should be run. If the -node parameter is provided, the disk ownership information is updated only on the node specified.
Parameters

[-node {<nodename>|local}] - Node

If this parameter is provided, the disk ownership information is updated only on the node specified.

Examples

The following example refreshes the disk ownership information for all the nodes in the cluster:

```
cluster1::> storage disk refresh-ownership
```

---

**storage disk remove**

Remove a spare disk

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

The `storage disk remove` command removes the specified spare disk from the RAID configuration, spinning the disk down when removal is complete.

This command does not remove disk ownership information from the disk. Therefore, if you plan to reuse the disk in a different storage system, you should use the `storage disk removeowner` command instead. See the "Physical Storage Management Guide" for the complete procedure.

**NOTE:** For systems with multi-disk carriers, it is important to ensure that none of the disks in the carrier are filesystem disks before attempting removal. To convert a filesystem disk to a spare disk, see `storage disk replace`.

**Parameters**

- **-disk <disk path name> - Disk Name**

  This parameter specifies the disk to be removed.

**Examples**

The following example removes a spare disk named 1.1.16:

```
cluster1::> storage disk remove -disk 1.1.16
```

**Related references**

- `storage disk removeowner` on page 886
- `storage disk replace` on page 887

---

**storage disk remove-reservation**

Removes reservation from an array LUN marked as foreign.

**Availability:** This command is available to cluster administrators at the advanced privilege level.

**Description**

The `storage disk remove-reservation` command removes persistent reservation from a specified foreign array LUN.

**Parameters**

- **-disk <disk path name> - Disk Name**

  This specifies the disk from which persistent reservation is to be removed.
storage disk removeowner

Remove disk ownership

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The storage disk removeowner command removes ownership from a specified disk. Then disk can then be reassigned to a new owner.

Parameters
-disk <disk path name> - Disk Name
  This specifies the disk whose ownership is to be removed.

  { [-root [true]] - Root Partition of Root-Data/Root-Data1-Data2 Partitioned Disk (privilege: advanced)
    This optional parameter removes ownership of the root partition of a root-data/root-data1-data2 partitioned disk. You cannot use this parameter with disks that are part of a storage pool. The default value is false.

  | [-data [true]] - Data Partition of Root-Data Partitioned Disk (privilege: advanced)
    This optional parameter removes ownership of the data partition of a root-data partitioned disk. You cannot use this parameter with a root-data1-data2 partitioned disk or disks that are part of a storage pool. The default value is false.

  | [-data1 [true]] - Data1 Partition of a Root-Data1-Data2 Partitioned Disk (privilege: advanced)
    This optional parameter removes ownership of the data1 partition of a root-data1-data2 partitioned disk. You cannot use this parameter with a root-data partitioned disk or disks that are part of a storage pool. The default value is false.

  | [-data2 [true]]] - Data2 Partition of a Root-Data1-Data2 Partitioned Disk (privilege: advanced)
    This optional parameter removes ownership of the data2 partition of a root-data1-data2 partitioned disk. You cannot use this parameter with a root-data partitioned disk or disks that are part of a storage pool. The default value is false.

Examples
The following example removes the persistent reservation from a disk named node1:switch01:port.126L1.

    cluster1::> storage disk remove-reservation -disk node1:switch01:port.126L1

The following example removes ownership from a disk named 1.1.27.

    cluster1::> storage disk removeowner -disk 1.1.27

The following example removes ownership of the root partition on disk 1.1.16.

    cluster1::> storage disk removeowner -disk 1.1.16 -root true

The following example removes ownership of the data partition on disk 1.1.16.

    cluster1::> storage disk removeowner -disk 1.1.16 -data true

The following example removes ownership of the data1 partition on disk 1.1.23.
storage disk replace

Initiate or stop replacing a file-system disk

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The `storage disk replace` command starts or stops the replacement of a file system disk with spare disk. When you start a replacement, Rapid RAID Recovery begins copying data from the specified file system disk to a spare disk. When the process is complete, the spare disk becomes the active file system disk and the file system disk becomes a spare disk. If you stop a replacement, the data copy is halted, and the file system disk and spare disk retain their initial roles.

**Parameters**

- **-disk <disk path name>** - Disk Name
  
  This specifies the file system disk that is to be replaced. Disk names take one of the following forms:
  
  - Disks are named in the form `<stack-id>.<shelf>.<bay>`
  - Disks on multi-disk carriers are named in the form `<stack-id>.<shelf>.<bay>.<lun>`
  - Virtual disks are named in the form `<prefix>.<number>`, where prefix is the storage array's prefix and number is a unique ascending number.

  Disk names take one of the following forms on clusters that are not yet fully upgraded to Data ONTAP 8.3:
  
  - Disks that are not attached to a switch are named in the form `<node>:<host_adapter>:<loop_ID>`. For disks with a LUN, the form is `<node>:<host_adapter>:<loop_ID>L<LUN>`. For instance, disk number 16 on host adapter 1a on a node named node0a is named node0a:1a.16. The same disk on LUN lun0 is named node0a:1a.16L lun0.
  - Disks that are attached to a switch are named in the form `<node>:<switch_name>:<switch_port>:<loop_ID>`. For disks with a LUN, the form is `<node>:<switch_name>:<switch_port>:<loop_ID>L<LUN>`. For instance, disk number 08 on port 11 of switch fc1 on a node named node0a is named node0a:fc1:11.08. The same disk on LUN lun1 is named node0a:fc1:11.08L lun1.

  Before the cluster is upgraded to Data ONTAP 8.3, the same disk can have multiple disk names, depending on how the disk is connected. For example, a disk known to a node named alpha as alpha:1a.19 can be known to a node named beta as beta:0b.37. All names are listed in the output of queries and are equally valid. To determine a disk's unique identity, run a detailed query and look for the disk's universal unique identifier (UUID) or serial number.

- **-action {start | stop}** - Action
  
  This specifies whether to start or stop the replacement process.

- **[-replacement <disk path name>]** - Replacement
  
  This specifies the spare disk that is to replace the file system disk.

- **[-allow-same-carrier [true]]** - Allow Same RAID Group Within Carrier
  
  This parameter can be used to allow two disks housed in the same carrier to be in the same RAID group when you replace a disk in an aggregate.
Having disks in the same carrier in the same RAID group is not desirable because a carrier failure can cause a simultaneous outage for two disks in the same RAID group. You can replace a disk in an aggregate with a disk that causes this situation, but when an alternate disk becomes available, Data ONTAP automatically initiates a series of disk copy operations to put the disks into different RAID groups. For this reason, you should use this parameter only when necessary. When possible, ensure that disks housed in the same carrier are in different RAID groups.

This parameter affects only the disk replace operation. It is not a persistent attribute of the aggregate.

`[-allow-mixing | -m [true]]` - Allow Mixing of Disks of Different RPM or Pool

This optional parameter specifies whether the disk can be replaced with another disk of different RPM or from different Pool. This parameter affects only the current disk replacement operation.

**Examples**

The following example begins replacing a file system disk named `1.0.16` with a spare disk named `1.1.14`.

```
cluster1::> storage disk replace -disk 1.0.16 -replacement 1.1.14 -action start
```

**storage disk set-foreign-lun**

Sets or Unsets an array LUN as foreign

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

The `storage disk set-foreign-lun` command sets or unsets a specified array LUN as foreign. This command will enable/disable the feature of importing the data from foreign LUN.

**Parameters**

- `-disk <disk path name>` - Disk Name
  
  This parameter specifies the array LUN which is to be set or unset as foreign.

- `-is-foreign-lun [true]` - Is Foreign LUN
  
  If the parameter value specified is `true` then array LUN is set as foreign. If the parameter value specified is `false` then array LUN foreignness is cleared.

**Examples**

The following example shows how to set an array LUN as foreign:

```
cluster1::> storage disk set-foreign-lun -disk EMC-1.1 -is-foreign-lun true
```

The following example shows how to mark an array LUN as not foreign:

```
cluster1::> storage disk set-foreign-lun -disk EMC-1.1 -is-foreign-lun false
```

**storage disk set-led**

Identify disks by turning on their LEDs

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

The `storage disk set-led` command controls the LED of a specified disk.
You can turn an LED on or off, cause it to blink or stop blinking, or test it. This command is useful for locating a disk in its shelf.

**Parameters**

`-action {on|off|blink|blinkoff|testall|resetall} - Action`

This parameter specifies the state to which the LED is to be set. Possible values include the following:

- **on** - The LED is lit steadily
- **off** - The LED is not lit
- **blink** - The LED blinks
- **blinkoff** - The LED stops blinking and is not lit
- **testall** - This tests the operation of every disk enclosure's hardware and drivers per node. Do not use this value in normal operation.
- **resetall** - This resets the LED of every disk on the node and lights up the LED of disks with faults.

`{ [-disk <disk path name>] - Disk Name`

This specifies the disk whose LED is to be set. Disk names take one of the following forms:

- Disks are named in the form `<stack-id>.<shelf>.<bay>`
- Disks on multi-disk carriers are named in the form `<stack-id>.<shelf>.<bay>.<lun>`
- Virtual disks are named in the form `<prefix>.<number>`, where prefix is the storage array's prefix and number is a unique ascending number.

Disk names take one of the following forms on clusters that are not yet fully upgraded to Data ONTAP 8.3:

- Disks that are not attached to a switch are named in the form `<node>:<host_adapter>.<loop_ID>. For disks with a LUN, the form is `<node>:<host_adapter>.<loop_ID>L.<LUN>. For instance, disk number 16 on host adapter 1a on a node named node0a is named node0a:1a.16. The same disk on LUN lun0 is named node0a:1a.16L.lun0.
- Disks that are attached to a switch are named in the form `<node>:<switch_name>:<switch_port>.<loop_ID>. For disks with a LUN, the form is `<node>:<switch_name>:<switch_port>.<loop_ID>L.<LUN>. For instance, disk number 08 on port 11 of switch fc1 on a node named node0a is named node0a:fc1:11.08. The same disk on LUN lun1 is named node0a:fc1:11.08L.lun1.

Before the cluster is upgraded to Data ONTAP 8.3, the same disk can have multiple disk names, depending on how the disk is connected. For example, a disk known to a node named alpha as alpha:1a.19 can be known to a node named beta as beta:0b.37. All names are listed in the output of queries and are equally valid. To determine a disk's unique identity, run a detailed query and look for the disk's universal unique identifier (UUID) or serial number.

`{ -adapter <text>] - Adapter Name`

The name of the adapter to which the shelves of disks of interest are attached to.

`{-node {<nodename>|local}] - Node Name`

The node for which action is to be taken.

`{-duration <integer>] - Duration (minutes)`

This specifies the duration, in minutes, that the LED is to remain in the specified state. Only actions "on" and "blink" are supported.
[-iteration <integer>] - Test iterations

This specifies the number of iterations to run the action for. Only action "test-all" is supported.

**Examples**

The following example causes the LEDs on all disks whose names match the pattern Cluster1* to turn on for 5 minutes:

```bash
Cluster1::> storage disk set-led -disk Cluster1* -action on -duration 5
```

The following example causes the LEDs on all disks attached to adapter 0b on Node2 to turn on for 1 minute:

```bash
Cluster1::> storage disk set-led -node Node2 -adapter 0b -action on -duration 1
```

The following example resets the LEDs on all disks on the local node and causes the LEDs of disks with faults to turn on:

```bash
Cluster1::> storage disk set-led -action resetall
```

The following example causes the LEDs on all disks whose names match the pattern Cluster1* to turn on for 2 minutes:

```bash
Cluster1::> storage disk set-led -disk Cluster1* -action on -duration 2
```

The following example tests the LEDs on all disks owned by the local node for 3 iterations:

```bash
Cluster1::> storage disk set-led -action testall -iteration 3
```

---

**storage disk show**

Display a list of disk drives and array LUNs

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The `storage disk show` command displays information about disks and array LUNs. Where it appears in the remainder of this document "disk" may refer to either a disk or an array LUN. By default, the command displays the following information about all disks in column style output:

- Disk name
- Usable space on the disk, in human readable units
- Shelf number
- Bay number
- Container type (aggregate, broken, foreign, labelmaint, maintenance, mediator, remote, shared, spare, unassigned, unknown, volume, or unsupported)
- Position (copy, data, dparity, orphan, parity, pending, present, shared or tparity)
- Container name
- Owning node name

To display detailed information about a single disk, use the `-disk` parameter.
Parameters

\{ [-fields \texttt{<fieldname>}, ...] \}

Displays the specified fields for all disks, in column style output.

\{ [-broken] \}

Displays the following RAID-related information about broken disks:

- Original owning node name
- Checksum compatibility
- Disk name
- Outage reason
- Host bus adapter
- Shelf number
- Bay number
- Primary port / Channel
- Pool
- Disk type
- RPM (Revolutions per minute)
- Usable size in human readable units
- Physical size in human readable units
- Current owner node

\{ [-errors] \}

Displays the following disk information about the disks which have errors.

- Disk Name
- Error Type
- Error Description and corresponding corrective action

\{ [-longop] \}

Displays the following information about long-running disk operations, in column style output:

- Disk name
- Whether the disk is marked as prefailed
- Whether the disk is being replaced
- Whether the disk is zeroed
- Copy destination
- Percentage of copy complete
- Percentage of zeroing complete
- Percentage of reconstruction complete

<tr>
<td>• Owner system id of root partition on a partitioned disk</td>
</tr>
</tbody>
</table>
• Owner of data or data1 partition on a root-data or a root-data1-data2 partitioned disk respectively
• Owner system id of data or data1 partition on a root-data or a root-data1-data2 partitioned disk respectively
• Owner of data2 partition on a root-data1-data2 partitioned disk
• Owner system id of data2 partition on a root-data1-data2 partitioned disk
• Owner of the disk which is partitioned
• Owner system id of the disk which is partitioned

[-physical ]
Displays the following information about the disk's physical attributes, in column style output:
• Disk name
• Disk type
• Disk vendor
• Disk model
• Firmware revision level
• RPM (Revolutions per minute)
• BPS (Bytes per sector)

[-port ]
Displays the following path-related information:
• Disk name and disk port associated with disk primary path
• Disk name and disk port associated with the disk secondary path, for a multipath configuration
• Type, shelf, and bay information for the disks

[-raid ]
Displays the following RAID-related information:
• Disk name
• Container type (aggregate, broken, labelmaint, maintenance, mediator, remote, shared, spare, unassigned, unknown, or volume)
• Outage reason
• Position (copy, data, dparity, orphan, parity, pending, present, shared or tparity)
• RAID group name
• Aggregate name

[-raid-info-for-aggregate ]
Displays the following RAID-related information about the disks used in an aggregate:
• Owning node name
• Aggregate name
• Plex name
• RAID group name
• Position (copy, data, dparity, orphan, parity, pending, present, shared or tparity)
• Disk name
• Host bus adapter
• Shelf number
• Bay number
• Primary port / Channel
• Pool
• Disk type
• RPM (Revolutions per minute)
• Usable size in human readable units
• Physical size in human readable units

When this parameter is specified, RAID groups that use shared disks are not included. Use `storage aggregate show-status` to show information for all RAID groups and aggregates.

`[-spare]`
Displays the following RAID-related information about available spare disks:
• Original owning node name
• Checksum compatibility
• Disk name
• Host bus adapter
• Shelf number
• Bay number
• Primary port / Channel
• Pool
• Disk type
• Disk class
• RPM (Revolutions per minute)
• Usable size in human readable units
• Physical size in human readable units
• Current owner node

`[-ssd-wear]`
Displays the following wear life related information about solid state disks:
• Rated Life Used: An estimate of the percentage of device life that has been used, based on the actual device usage and the manufacturer's prediction of device life. A value greater than 99 indicates that the estimated endurance has been used, but this does not necessarily indicate a device failure. Omitted if value is unknown.
• Spare Blocks Consumed Limit: Spare blocks consumed percentage limit reported by the device. When the Spare Blocks Consumed percentage for the device reaches this read-only value, Data ONTAP initiates a disk copy operation to prepare to remove the device from service. Omitted if value is unknown.

• Spare Blocks Consumed: Percentage of device spare blocks that have been used. Each device has a number of spare blocks that will be used when a data block can no longer be used to store data. This value reports what percentage of the spares have already been consumed. Omitted if value is unknown.

</tbody>
</table>
Disk names take one of the following forms on clusters that are not yet fully upgraded to Data ONTAP 8.3:

- Disks that are not attached to a switch are named in the form `<node>:<host_adapter>:<loop_ID>`. For disks with a LUN, the form is `<node>:<host_adapter>:<loop_ID>L<LUN>`, For instance, disk number 16 on host adapter 1a on a node named node0a is named node0a:1a.16. The same disk on LUN lun0 is named node0a:1a.16Llun0.

- Disks that are attached to a switch are named in the form `<node>:<switch_name>:<switch_port>:<loop_ID>`. For disks with a LUN, the form is `<node>:<switch_name>:<switch_port>:<loop_ID>L<LUN>`. For instance, disk number 08 on port 11 of switch fc1 on a node named node0a is named node0a:fc1:11.08. The same disk on LUN lun1 is named node0a:fc1:11.08Llun1.

Before the cluster is upgraded to Data ONTAP 8.3, the same disk can have multiple disk names, depending on how the disk is connected. For example, a disk known to a node named alpha as alpha:1a.19 can be known to a node named beta as beta:0b.37. All names are listed in the output of queries and are equally valid. To determine a disk's unique identity, run a detailed query and look for the disk's universal unique identifier (UUID) or serial number.

```bash
[-owner {<nodename>|local}] - Owner
    Selects information about disks that are owned by the specified node.

[-owner-id <nvramid>] - Owner System ID
    Selects the disks that are owned by the node with the specified system ID.

[-is-foreign {true|false}] - Foreign LUN (privilege: advanced)
    Selects information about array LUNs that have been declared to be foreign LUNs.

[-uid <text>] - Disk Unique ID
    Selects the disks whose unique id matches this parameter value. A disk unique identifier has the form:

[-aggregate <aggregate name>] - Aggregate
    Selects information about disks that belong to the specified aggregate.

[-array-name <array name>] - Array Name
    Selects information about the LUNs presented by the specified storage array.

[-average-latency <integer>] - Average I/O Latency Across All Active Paths
    Selects information about disks that have the specified average latency.

[-bay <integer>] - Bay
    Selects information about disks that are located in the carrier within the specified shelf bay.

[-bps <integer>] - Bytes Per Sector
    Selects information about disks that have the specified number of bytes per sector. Possible settings are 512, 520, 4096, and 4160.

[-carrier-id <text>] - Carrier ID
    Selects information about disks that are located within the specified multi-disk carrier.

[-checksum-compatibility {advanced_zoned | block | none}] - Checksum Compatibility
    Selects information about disks that have the specified checksum compatibility.

[-class {capacity | performance | archive | solid-state | array | virtual}] - Disk Class
    Selects information about disks that have the specified disk class.
    - capacity = Capacity-oriented, near-line disk types. Includes disk types FSAS, BSAS and ATA.
    - performance = Performance-oriented, enterprise class disk types. Includes disk types FCAL and SAS.
```
- archive = Archive class SATA disks in multi-disk carrier storage shelves. Includes disk type MSATA.
- solid-state = Solid-state drives. Includes disk type SSD.
- array = Logical storage devices backed by storage arrays and used by Data ONTAP as disks. Includes disk type LUN.
- virtual = Virtual disks that are formatted and managed by the hypervisor. Includes disk type VMDISK.

[-container-type {aggregate | broken | foreign | labelmaint | maintenance | mediator | remote | shared | spare | unassigned | unknown | unsupported}] - Container Type
Selects information about disks that have the specified container type.
- Aggregate = Disk is used as a physical disk in an aggregate.
- Broken = Disk is in broken pool.
- Foreign = Array LUN has been marked foreign.
- Labelmaint = Disk is in online label maintenance list.
- Maintenance = Disk is in maintenance center.
- Mediator = A mediator disk is a disk used on non-shared HA systems hosted by an external node which is used to communicate the viability of the storage failover between non-shared HA nodes.
- Remote = Disk belongs to the remote cluster.
- Shared = Disk is partitioned or in a storage pool.
- Spare = Disk is a spare disk.
- Unassigned = Disk ownership has not been assigned.
- Unknown = Container is currently unknown. This is the default setting.
- Unsupported = Disk is not supported.

[-container-name <text>] - Container Name
Selects information about disks that have the specified container name.
If a disk is in an aggregate or storage pool, the container name is the name of the aggregate or storage pool.
Spare disks show the SyncMirror Pool to which they belong.
Partitioned disks could return multiple aggregate names.

[-copy-destination <disk path name>] - Copy Destination Name
Selects information about disks whose contents are being copied (due to either Rapid RAID Recovery or disk replacement) to the specified spare disk.

[-copy-percent <integer>] - Percentage of Copy Complete
Selects information about disks that are involved as either a source or destination of a copy operation, (due to either disk replacement or Rapid RAID Recovery) and that have the specified percentage of the copy operation completed.

[-data-owner {<nodename>|local}] - Owner of Data Partition of Root-Data Partitioned Disk
Selects information about disks that have the specified data partition owner name. Used with root-data partitioned disks.

[-data1-owner {<nodename>|local}] - Owner of Data1 Partition of Root-Data1-Data2 Partitioned Disk
Selects information about disks that have the specified data1 partition owner name. Used with root-data1-data2 partitioned disks.
[-data2-owner {<nodename>|local}] - Owner of Data2 Partition of Root-Data1-Data2 Partitioned Disk
Selects information about disks that have the specified data2 partition owner name. Used with root-data1-data2 partitioned disks.

[-data-home {<nodename>|local}] - Home Owner of Data Partition of Root-Data Partitioned Disk
Selects information about disks that have the specified data partition home owner name. Used with root-data partitioned disks.

[-data1-home {<nodename>|local}] - Home Owner of Data1 Partition of Root-Data1-Data2 Partitioned Disk
Selects information about disks that have the specified data1 partition home owner name. Used with root-data1-data2 partitioned disks.

[-data2-home {<nodename>|local}] - Home Owner of Data2 Partition of Root-Data1-Data2 Partitioned Disk
Selects information about disks that have the specified data2 partition home owner name. Used with root-data1-data2 partitioned disks.

[-data-owner-id <nvramid>] - Owner System ID of Data Partition of Root-Data Partitioned Disk
Selects information about disks that have the specified data partition owner system ID. Used with root-data partitioned disks.

[-data1-owner-id <nvramid>] - Owner System ID of Data1 Partition of Root-Data1-Data2 Partitioned Disk
Selects information about disks that have the specified data1 partition owner system ID. Used with root-data1-data2 partitioned disks.

[-data2-owner-id <nvramid>] - Owner System ID of Data2 Partition of Root-Data1-Data2 Partitioned Disk
Selects information about disks that have the specified data2 partition owner system ID. Used with root-data1-data2 partitioned disks.

[-data-home-id <nvramid>] - Home Owner System ID of Data Partition of Root-Data Partitioned Disk
Selects information about disks that have the specified data partition home owner system ID. Used with root-data partitioned disks.

[-data1-home-id <nvramid>] - Home Owner System ID of Data1 Partition of Root-Data1-Data2 Partitioned Disk
Selects information about disks that have the specified data1 partition home owner system ID. Used with root-data1-data2 partitioned disks.

[-data2-home-id <nvramid>] - Home Owner System ID of Data2 Partition of Root-Data1-Data2 Partitioned Disk
Selects information about disks that have the specified data2 partition home owner system ID. Used with root-data1-data2 partitioned disks.

[-disk-io-kbps-total <integer>] - Total Disk Throughput in KBPS Across All Active Paths
Selects information about disks that have attained the specified I/O throughput on all connected paths.

[-disk-iops-total <integer>] - Total Disk IOPs Across All Active Paths
Selects information about disks that have achieved the specified number of IOPs per second on all connected paths.

[-diskpathnames <disk path name>,...] - list of path based disk names
Selects information about disks that have all of the specified path names.

[-effective-rpm <integer>] - Effective RPM
Selects information about disks with the specified effective rotational speed.

[-dr-home {<nodename>|local}] - Disaster Recovery Home
Selects information about disks that have the specified Disaster home node.

[-dr-home-id <nvramid>] - Disaster Recovery Home System ID
Selects information about disks whose Disaster home node has the specified system id.
[-drawer <integer>] - Drawer
Selects information about disks that are located in the specified drawer.

[-error-type {onopath|onedomain|control|foreign|toobig|toosmall|invalidblocksize|targetasymmap|deviceassymmap|failovermisconfig|unknown|netapp|fwdownrev|qualfail|diskfail|notallflashdisk},... ] - Error Type
Selects information about disks that have the specified error types.
- onopath = The array LUN is accessible only via a single path.
- onedomain = The array LUN is accessible only via a single fault domain.
- control = The array LUN cannot be used because it is a control device.
- foreign = The array LUN is marked as foreign and has some external SCSI reservations other than those from Data ONTAP.
- toobig = The array LUN exceeds the maximum array LUN size that Data ONTAP supports.
- toosmall = The array LUN is less than the minimum array LUN size that Data ONTAP supports.
- invalidblocksize = The array LUN is not a valid block size.
- targetasymmap = The array LUN is presented more than once on a single target port.
- deviceassymmap = The array LUN is presented with multiple IDs.
- failovermisconfig = The array LUN is configured with inconsistent failover methods.
- unknown = The array LUN from a storage array that is not supported by this version of Data ONTAP.
- netapp = A SAN front-end LUN from one Data ONTAP system that is presented as external storage to another Data ONTAP system.
- fwdownrev = The disk firmware is a down version.
- qualfail = The disk is not supported.
- diskfail = The disk is in a failed state.
- notallflashdisk = The disk does not match the All-Flash Optimized personality of the system.

[-firmware-revision <text>] - Firmware Revision
Selects information about disks that have the specified firmware revision level.

[-home {<nodename>|local}] - Home
Selects information about disks that have the specified home node.

[-home-id <nvramid>] - Home System ID
Selects information about disks whose home node has the specified system ID.

[-host-adapter <text>] - Primary Path Host Adapter
Selects information about disks that are currently using the specified Host Bus Adapter.

[-hw-minimum-os <text>] - Hardware Minimum Supported Data ONTAP Version
Selects information about disks that have the specified hardware minimum supported Data ONTAP version.

[-import-in-progress {true|false}] - Foreign LUN import in progress
Selects information about the array LUNs that are currently being imported. If this parameter is specified, the command displays information only about the disk or disks that are currently being used for importing data.
[-initiator <text>, ...] - Initiator Port
   Selects information about disks that are visible to the initiator specified. Disks that are not currently in use by that initiator are included.

[-initiator-iops <integer>, ...] - Number of IOPS on Initiator (Rolling Average)
   Selects information about disks that are visible to an initiator that has executed the specified number of IOPs.

[-initiator-io-kbps <integer>, ...] - Kbytes of I/O per second on Initiator (Rolling Average)
   Selects information about disks visible to an initiator that has executed I/O at the specified throughput.

[-initiator-lun-in-use-count <integer>, ...] - Number of LUNs in the in-use state on this initiator
   Selects information about disks with a path through an initiator that has the specified in-use-count.

[-initiator-side-switch-port <text>, ...] - Initiator Side Switch Port
   Selects information about disks that are visible to an initiator connected to the specified switch port.

[-is-multidisk-carrier {true|false}] - Multi Disk Carrier?
   Selects information about disks that are located within a multi-disk carrier.

[-is-local-attach {true|false}] - Indicates If the Disk Is Local to This Cluster
   Selects information about disks attached to the local(true) or remote(false) MetroCluster site.

[-location <nodename> | local] - Physical Location
   Selects information about disks attached to the specified node.

[-location-id <nvramid>] - The system ID of the node where the disk is attached
   Selects information about disks attached to the node with the specified system ID.

[-lun <integer>, ...] - LUN ID
   Selects information about the specified LUNs.

[-lun-iops <integer>, ...] - Number IOPS per disk (Rolling Average)
   Selects information about the LUNs that have reached the specified number of IOPs.

[-lun-io-kbps <integer>, ...] - Kbytes/sec on Disk (Rolling Average)
   Selects information about the LUNs that have reached the specified I/O throughput.

[-lun-path-use-state <text>, ...] - The Use State of the LUN on this path
   Selects information about LUNs reporting the specified in-use state.

[-model <text>] - Model
   Selects information about disks of the specified model.

[-nodelist <nodename> | local], ...] - Controller name
   Selects information about disks that are visible to all of the specified nodes.

[-outage-reason <text>] - Outage Reason
   Selects information about disks that are not in service for the specified reason. Possible values are: admin failed, admin removed, admin testing, evacuated, bad label, bypassed, failed, init failed, label version, labeled broken, labelmaint, LUN resized, missing, not responding, predict failure, rsize failed, recovering, sanitizing, sanitized, SnapLock Disk, testing, unassigned, unknown.

[-path-error-count <integer>] - Path Error Count
   Selects information about disks that are visible on a path that has incurred the specified number of errors.

[-path-iops <integer>, ...] - Number of IOPS on Path (Rolling Average)
   Selects information about disks on those paths that have reached the specified number of IOPs.

[-path-io-kbps <integer>, ...] - Kbytes of I/O per second on Path (Rolling Average)
   Selects information about disk with paths that have reached the specified I/O throughput.
[-path-link-errors <integer>, ...] - Link Error count on path
   Selects information about disks with paths that have incurred the specified number of FC link errors.

[-path-lun-in-use-count <integer>, ...] - Number of LUNs in the in-use state on this path
   Selects information about disks with paths that have the specified in-use-count.

[-path-quality <integer>, ...] - Percentage of weighted error threshold
   Selects information about disks on paths that have incurred the specified number of errors. The value
   displayed is a measure of the health of a path expressed as a percentage of an error threshold. Once a path has
   reached or surpassed the error threshold, another path will be selected for I/O transfer, if there is one available.

[-physical-size-mb <integer>] - Physical Size (MB)
   Selects information about disks that have the specified physical capacity, in megabytes.

[-physical-size (<integer> [KB|MB|GB|TB|PB])] - Physical Size
   Selects information about disks that have the specified physical capacity, in human readable units.

[-physical-size-512b <integer>] - Physical Size in Units of 512 Bytes
   Selects information about disks that have the specified physical capacity, in 512-byte chunks. This parameter
   is present only for backwards compatibility with Data ONTAP 8.0.

[-plex <text>] - Plex Name
   Selects information about disks that belong to the specified RAID plex.

[-pool <text>] - Assigned Pool
   Selects information about disks that belong to the specified SyncMirror pool (pool0 or pool1).

[-port-speed <text>, ...] - Port Speed
   Selects information about disks that are served by a Host Bus Adapter that is running at the specified port
   speed.

[-position <diskPositionType>] - Disk Position
   Selects information about disks that have the specified position within their disk container.

[-prefailed {true|false}] - Marked for Rapid RAID Recovery?
   Selects information about disks that match the specified parameter value indicating whether the disk is either
   awaiting or is in process of Rapid RAID Recovery.

[-preferred-target-port {true|false}, ...] - Whether or not target port group is preferred (privilege:
   advanced)
   Selects information about disks that match the specified parameter value indicating whether the backing
   storage is ALUA (Asymmetric Logical Unit Access) capable and has specified the array target port on this
   path to be a preferred target port for I/O.

[-primary-port <text>] - Primary Path Disk Port
   Selects information about disks that use the specified primary port.

[-raid-group <text>] - Raid Group Name
   Selects information about disks that belong to the specified RAID group.

[-reconstruction-percent <integer>] - Percentage of Reconstruction Complete
   Selects information about disks that are being reconstructed and that have the specified percentage of the
   reconstruction operation completed.

[-replacing {true|false}] - Being Replaced?
   Selects information about disks that match the specified boolean value indicating whether the disk is either
   awaiting or in process of disk replacement.
[-reservation-key <text>] - Reservation Key
If this parameter is specified, the command displays information only about the disk or disks that have the specified persistent reservation key.

[-reservation-type {rs|we|re|ea|sa|wero|earo|wear|eaar|none}] - Reservation Type
If this parameter is specified, the command displays information only about the disk or disks that have the specified persistent reservation type. Possible values are: rs, we, re, ea, sa, wero, earo, wear, eaar, or none.

[-reserver-id <integer>] - Reservation System ID
Selects information about disks that are reserved by the node with the specified system ID.

[-root-owner {<nodename>|local}] - Owner of Root Partition of Root-Data/Root-Data1-Data2 Partitioned Disk
Selects information about disks that have the specified root partition owner name. Used with root-data/root-data1-data2 partitioned disks.

[-root-owner-id <nvramid>] - Owner System ID of Root Partition of Root-Data/Root-Data1-Data2 Partitioned Disk
Selects information about disks that have the specified root partition owner system ID. Used with root-data/root-data1-data2 partitioned disks.

[-root-home {<nodename>|local}] - Home Owner of Root Partition of Root-Data/Root-Data1-Data2 Partitioned Disk
Selects information about disks that have the specified root partition home owner name. Used with root-data/root-data1-data2 partitioned disks.

[-root-home-id <nvramid>] - Home Owner System ID of Root Partition of Root-Data/Root-Data1-Data2 Partitioned Disk
Selects information about disks that have the specified root partition home owner system ID. Used with root-data/root-data1-data2 partitioned disks.

[-rpm <integer>] - Revolutions Per Minute
Selects information about disks that have the specified rotational speed.

[-secondary-name <disk path name>] - Secondary Path Name
Selects information about disks that use the specified secondary path name, for multipath configuration.

[-secondary-port <text>] - Secondary Path Disk Port
Selects information about disks that use the specified secondary port.

[-serial-number <text>] - Serial Number
Selects information about the disk that has the specified serial number.

[-storage-pool <text>] - Storage Pool Name
Selects information about disks that belong to the specified SSD storage pool.

[-shelf <integer>] - Shelf
Selects information about disks that belong to the specified shelf.

[-shelf-uid <text>] - Shelf UID
Selects information about disks that are located within a shelf with the specified Shelf UID.

[-slot <integer>] - Slot
Selects information about disks that are located in a drawer with the specified slot.

[-stack-id <integer>] - Stack ID
A cluster unique id for a collection of one or more interconnected shelves.

[-target-iops <integer>, ...] - Number of IOPS to Target (Rolling Average)
Selects information about disks that are visible on target ports that have performed the specified number of IOPs.
[-target-io-kbps <integer>, ...] - Kbytes of I/O per second to Target (Rolling Average)
Selects information about disks that are visible on target ports that have reached the specified I/O throughput.

[-target-lun-in-use-count <integer>, ...] - Number of LUNs in the in-use state on this target
Selects information about disks with a path through a target port that has the specified in-use-count.

[-target-port-access-state <text>, ...] - Failover optimization type
Selects information about disks that are visible on target ports that have the specified access state.

[-target-side-switch-port <text>, ...] - Target Side Switch Port
Selects information about disks that are visible on target ports identified by the switch port to which they are connected.

[-target-wwpn <text>, ...] - Target Port
Selects information about disks that are visible on target ports identified by their World Wide Port Name.

[-tpgn <integer>, ...] - Target Port Group Number
Selects information about disks that belong to the specified Target Port Group Number.

[-type {ATA | BSAS | FCAL | FSAS | LUN | MSATA | SAS | SSD | VMDISK | SSD-NVM}] - Disk Type
Selects information about disks that have the specified disk type.

[-usable-size-mb <integer>] - Usable Size (MB)
Selects information about disks that have the specified usable space, in megabytes.

[-usable-size [<integer> [KB|MB|GB|TB|PB]]] - Usable Size
Selects information about disks that have the specified usable space, in human readable units.

[-vendor <text>] - Vendor Name
Selects information about disks that have the specified vendor.

[-vmdisk-device-id <integer>, ...] - Virtual Disk Device ID
Selects information about disks that have the specified virtual disk device ID.

[-zeroed {true|false}] - Zeroed?
Selects information about disks that have (true) or have not (false) been fully pre-zeroed.

[-zeroing-percent <integer>] - Percentage of Zeroing Complete
Selects information about disks that are zeroing and have the specified percentage complete.

[-carrier-serialno <text>] - Carrier Serial Number
Selects information about disks that are located within the multi-disk carrier specified by the serial number.

### Examples
The following example displays information about all disks:

```
cluster1::> storage disk show
Disk       Size   Shelf  Bay Type  Position  Aggregate  Owner
---------- ------- ------ ------ ------- ----------- ---------
1.1.1       10GB    1      1   spare  present    -         node1
1.1.4      78.59GB  1      4   spare  present    -         node1
1.1.12    78.59GB    1    12   spare  present    -         node1
1.2.12     78.59GB    2    12    broken present    -         node1
1.3.7      78.59GB    3     7  aggregate parity  aggr0_u23 node1
1.4.6      78.59GB    4     6  aggregate    data  aggr0_u23 node1
1.4.9      78.59GB    4     9  aggregate    data  aggr0_u23 node1
1.1.0      78.59GB    1     0  aggregate    parity  aggr0_u23 node2
1.4.1      78.59GB    4     1  aggregate    data  dp_degraded node2
1.1.2      78.59GB    1     2    spare  present    -         node2
1.1.3      20GB     1     3    spare  present    -         node2
1.4.4      20GB     4     4    spare  present    -         node2
1.4.6      10GB     4     6  aggregate    data  dp_sdc    node2
```

904 Commands: Manual Page Reference
The following example displays detailed information about a disk named 1.0.75

```
cluster1::> storage disk show -disk 1.0.75
Disk: 1.0.75
  Container Type: spare
  Owner/Home: node2 / node2
  Stack ID/Shelf/Bay: 1 / 0 / 75
  DR Home: -
  LUN: 0
  Array: N/A
  Vendor: NETAPP
  Model: X267_HKURO500SSX
  Serial Number: ZAKAS0GH
  BPS: 512
  Physical Size: 10.15GB
  Position: present
  Checksum Compatibility: block

### storage disk unfail

Unfail a broken disk

**Availability:** This command is available to cluster administrators at the *advanced* privilege level.

**Description**

The `storage disk unfail` command can be used to unfail a broken disk.

If the attempt to unfail the disk is unsuccessful, the disk remains in the broken state.

The disk unfail command prompts for confirmation unless you specify the `-quiet` parameter.

**Parameters**

- `-disk <disk path name>` - Disk Name
  
  This parameter specifies the disk to be unfailed.

- `[-spare | -s [true]]` - Make the Disk Spare
  
  This parameter specifies whether the unfailed disk will be made a spare disk. The disk is forced to become a spare disk if this parameter is specified.

  If this parameter is not specified, the disk is brought back into its parent aggregate. Setting this parameter might result in the aggregate coming back online if it is not complete or online. The default value is false.

- `[-quiet | -q [true]]` - Confirmations off
  
  You can set this parameter to true to suppress the confirmation messages. However, before proceeding with the command, you should be aware that the confirmation message contains important information about the effect of unfailing a disk. This command cannot be reversed once it is invoked. The default value is false.

**Examples**

The following example unfails a disk named 1.1.16 to become a spare disk:

```plaintext
storage disk unfail -disk 1.1.16
```
storage disk updatefirmware

(DEPRECATED) - Update disk firmware

Availability: This command is available to cluster administrators at the admin privilege level.

Description

Note: This command is deprecated and may be removed in a future release of Data ONTAP. Use the "storage disk firmware update" command.

The storage disk updatefirmware command updates the firmware on one or more disks. You can download the latest firmware by using the storage firmware download command. You can specify a list of one or more disks whose firmware is to be updated by using the -disk parameter, or you can update the firmware on all local disks by omitting the -disk parameter.

Parameters

[-disk <disk path name>,...] - Disk

This specifies the disk or disks whose firmware is to be updated.

If you do not specify this option, all local disks' firmware is updated.

Examples

The following example updates the firmware on all disks:

```
cluster1::> storage disk updatefirmware
```

storage disk firmware update on page 913
storage firmware download on page 964

storage disk zerospares

Zero non-zeroed spare disks

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The storage disk zerospares command zeroes all non-zeroed spare disks in all nodes or a specified node in the cluster. A node must be online to zero disks. This operation must be done before a disk can be reused in another aggregate. This version of ONTAP uses fast zeroing, which converts a spare disk from non-zeroed to zeroed without the long wait times required when physically zeroing a disk.

Parameters

[-owner {<nodename>|local}] - Owner

If this parameter is specified, only non-zeroed spares assigned to the specified node will be zeroed. Otherwise, all non-zeroed spares in the cluster will be zeroed.

Examples

The following example zeroes all non-zeroed spares owned by a node named node4, using fast zeroing:
cluster1::> storage disk zerospares -owner node4

The following example zeroes all non-zeroed spares owned by a node named node2 by physically writing zeros to the entire disk:

cluster1::> storage disk zerospares -owner node2 -use-physical-zeroing

**storage disk error commands**

The error directory

**storage disk error show**

Display disk component and array LUN configuration errors.

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
The `storage disk error show` command displays disk component and array LUN configuration errors.

**Parameters**

{ [-fields <fieldname>, ...]

  If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

  | [-instance ]

  If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-uid <text>] - UID

Displays the error information of the disk whose unique ID matches the value you specify. A disk unique identifier has the form:

[-array-name <array name>] - Array Name

Displays the errors of the storage array whose name you specified.

[-node {<nodename>|local}] - Controller Name

Displays the error information for the disks on the clustered node whose name you specified.

[-disk <disk path name>] - Disk

Displays detailed error information about the disk you specified.

[-serial-number <text>] - Serial Number

Displays the error information for the disk whose serial number you specified.

[-error-id <integer>, ...] - Error ID

Displays the error information for the disks whose Error IDs match IDs you specified.

[-error-type {onepath|onedomain|control|foreign|toobig|toosmall|invalidblocksize|targetasymmap|deviceasymmap|failovermisconfig|unknown|netapp|fwdownrev|qualfail|diskfail|notallflashdisk}, ...] - Error Type

Displays all disk errors of the error types you specified, grouped by type.

- onepath = The array LUN is accessible only via a single path.
- onedomain = The array LUN is accessible only via a single fault domain.
• control = The array LUN cannot be used because it is a control device.
• foreign = The array LUN is marked as foreign and has some external SCSI reservations other than those from Data ONTAP.
• toobig = The array LUN exceeds the maximum array LUN size that Data ONTAP supports.
• toosmall = The array LUN is less than the minimum array LUN size that Data ONTAP supports.
• invalidblocksize = The array LUN is not a valid block size.
• targetasymmap = The array LUN is presented more than once on a single target port.
• deviceassymmap = The array LUN is presented with multiple IDs.
• failovermisconfig = The array LUN is configured with inconsistent failover methods.
• unknown = The array LUN from a storage array that is not supported by this version of Data ONTAP.
• netapp = A SAN front-end LUN from one Data ONTAP system that is presented as external storage to another Data ONTAP system.
• fwdownrev = The disk firmware is a down version.
• qualfail = The disk is not supported.
• diskfail = The disk is in a failed state.
• notallflashdisk = The disk does not match the All-Flash Optimized personality of the system.

Examples

The following example displays configuration errors seen in the system:

```
cluster1::> storage disk error show
Disk             Error Type        Error Text
---------------- ----------------- --------------------------------------------
1.02.0           qualfail          This disk failed dynamic disk qualification. Update the Disk
                    Qualification Package.
```

storage disk firmware commands

The firmware directory

storage disk firmware revert

Revert disk firmware

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

The storage disk firmware revert command reverts firmware on all disks or a specified list of disks on a node.

You can specify a list of one or more disks whose firmware is to be reverted by using the -disk parameter.

You can revert the firmware on all the disks owned by a node by using the -node parameter.

This command can make the disks inaccessible for up to five minutes after the start of its execution. Therefore, the network sessions that use the concerned node must be terminated before running the storage disk firmware revert command.

This is particularly true for CIFS sessions that might be terminated when this command is executed.
If you need to view the current firmware versions, use the `storage disk show -fields firmware-revision` command. The following example displays partial output from the `storage disk show -fields firmware-revision` command, where the firmware version for the disks is NA02:

```
cluster1::> storage disk show -fields firmware-revision
disk     firmware-revision
-------- ----------------- 
1.0.0    NA02
1.0.1    NA02
1.0.2    NA02
1.0.3    NA02
1.0.4    NA02
1.0.5    NA02
```

The firmware files are stored in the `/mroot/etc/disk_fw` directory on the node. The firmware file name is in the form of "product-ID.revision.LOD". For example, if the firmware file is for Seagate disks with product ID X225_ST336704FC and the firmware version is NA01, the file name is X225_ST336704FC.NA01.LOD. If the node in this example contains disks with firmware version NA02, the `/mroot/etc/disk_fw/X225_ST336704FC.NA01.LOD` file is downloaded to every disk when you execute this command.

How to Revert the Firmware for an HA Pair in a Cluster

Use the following procedure to perform a revert on the disks in an HA environment:

- Make sure that the nodes are not in takeover or giveback mode.
- Download the latest firmware on both nodes by using the `storage firmware download` command.
- Revert the disk firmware on Node A's disks by entering the `storage disk firmware revert -node node-A` command.
- Wait until the `storage disk firmware revert` command completes on Node A, and then revert the firmware on Node B's disks by entering the `storage disk firmware revert -node node-B` command.

**Parameters**

- `-disk <disk path name>, ...` - Disk Name
  Specifies the disk or disks whose firmware is to be reverted.
- `|-node {<nodename>|local}]` - Node Name
  Specifies the node name. The disk firmware will be reverted on all the disks owned by the node specified by this parameter.

**Examples**

If you need to view the current firmware versions, use the `storage disk show -fields firmware-revision` command. The following example displays partial output from the `storage disk show -fields firmware-revision` command, where the firmware version for the disks is NA02:

```
cluster1::> storage disk show -fields firmware-revision
disk     firmware-revision
-------- ----------------- 
1.0.0    NA02
1.0.1    NA02
1.0.2    NA02
1.0.3    NA02
1.0.4    NA02
1.0.5    NA02
```

The following example reverts the firmware on all disks owned by cluster-node-01:

storage disk firmware show-update-status

Display disk firmware update status.

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

The storage disk firmware show-update-status command displays the state of the background disk firmware update process.

Parameters

{{-fields <fieldname>, ...}}

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?' to display the fields to specify.

{{-instance}}

If you specify the -instance parameter, the command displays detailed information about all fields.

[-node <nodename>] - Node

Selects the node that matches this parameter value.

[-num-waiting-download <integer>] - The Number of Disks Waiting to Download

Selects the nodes whose number of disks waiting to download by the BDFU process matches this parameter value.
[-total-completion-estimate <integer>] - Estimated Duration to Completion (mins)
   Selects the nodes whose Background Disk Firmware Update (BDFU) completion time estimate matches this parameter value. This indicates the amount of estimated time required for BDFU to complete the firmware update cycle.

[-average-duration-per-disk <integer>] - Average Firmware Update Duration per Disk (secs)
   Selects the nodes whose BDFU reports the average time required to update a single disk matches this parameter value. This indicates the average amount of time required by each disk drive.

[-unable-to-update <disk path name>, ...] - List of Disks with a Failed Update
   Selects the nodes whose unable to update disk list matches this parameter value. This is a list of disks that failed to update the firmware.

[-update-status {off|running|idle}] - Background Disk Firmware Update Status
   Selects the nodes whose BDFU process status matches this parameter value. Possible values are:

   • off - The BDFU process is off.
   • running - The BDFU process is on and currently running.
   • idle - The BDFU process is on and is currently idle.

</tbody>
</table>

storage disk firmware update

Update disk firmware

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

Use the storage disk firmware update command to manually update firmware on all disks or a specified list of disks on a node. However, the recommended way to update disk firmware in a cluster is to enable automatic background firmware update by enabling the -bkg-firmware-update parameter for all of the nodes in the cluster. You can do this by entering the storage disk option modify -node * -bkg-firmware-update on command.

You can download the latest firmware on the node by using the storage firmware download command.

You can specify a list of one or more disks whose firmware is to be updated by using the -disk parameter.

You can update the firmware on all the disks owned by a node by using the -node parameter.

This command can make the disks inaccessible for up to five minutes after the start of its execution. Therefore, the network sessions that use the concerned node must be terminated before running the storage disk firmware update command. This is particularly true for CIFS sessions that might be terminated when this command is executed.

The firmware is automatically downloaded to disks, which report previous versions of the firmware. For information on automatic firmware update downloads, see “Automatic versus Manual Firmware Download”.

storage disk commands
If you need to view the current firmware versions, use the `storage disk show -fields firmware-revision` command. The following example displays partial output from the `storage disk show -fields firmware-revision` command, where the firmware version for the disks is NA01:

```
cluster1::> storage disk show -fields firmware-revision
               disk     firmware-revision
-------------------------------------
               1.0.0    NA01
               1.0.1    NA01
               1.0.2    NA01
               1.0.3    NA01
               1.0.4    NA01
               1.0.5    NA01
```

The firmware files are stored in the `/mroot/etc/disk_fw` directory on the node. The firmware file name is in the form of "product-ID.revision.LOD". For example, if the firmware file is for Seagate disks with product ID X225_ST336704FC and the firmware version is NA02, the filename is X225_ST336704FC.NA02.LOD. The revision part of the file name is the number against which the node compares each disk's current firmware version. If the node in this example contains disks with firmware version NA01, the `/mroot/etc/disk_fw/X225_ST336704FC.NA02.LOD` file is used to update every eligible disk when you execute this command.

Automatic versus Manual Firmware Download

The firmware is automatically downloaded to those disks that report previous versions of firmware following a system boot or disk insertion. Note that:

- A manual download is a disruptive operation that makes disks inaccessible for up to five minutes after the download is started. Network sessions that use the node must be terminated before running the `storage disk firmware update` command.
- The firmware is not automatically downloaded to the node's partner node in an HA pair.
- The firmware is not automatically downloaded to unowned disks on nodes configured to use software-based disk ownership.
- The `bkg-firmware-update` parameter controls how the automatic firmware download feature works:
  - If the `bkg-firmware-update` parameter is set to off, then the `storage disk firmware update` will update the firmware on the drives in parallel.
  - If the `bkg-firmware-update` parameter is set to on, then the `storage disk firmware update` will update spares and filesystem disks in a nondisruptive manner in the background after boot. Firmware downloads for these disks will be done sequentially by temporarily taking them offline one at a time for the duration of the download. After the firmware is updated, the disk will be brought back online and restored to its normal operation.

During an automatic download to an HA environment, the firmware is not downloaded to the disks owned by the HA partner. When you use the `storage disk firmware update` command, the firmware is:

- Updated on every disk regardless of whether it is on the A-loop, the B-loop, or in an HA environment.
- If the node is configured in a software-based disk ownership system, only disks owned by this node are updated.

Follow the instructions in "How to Update the Firmware for an HA Pair in a Cluster" to ensure that the updating process is successful. Data ONTAP supports redundant path configurations for disks in a non-HA configuration. The firmware is automatically downloaded to disks on the A-loop or B-loop of redundant configurations that are not configured in an HA pair and are not configured to use software-based disk ownership.

Automatic Backgroud Firmware Update

The firmware can be updated in the background so that the firmware update process does not impact the clients. This functionality is controlled with the `bkg-firmware-update` parameter. You can modify the parameter by using the CLI `storage`
**disk option modify** -node node_name -bkg-firmware-update on|off command. The default value for this parameter is "on".

When disabled or set to "off", storage disk firmware update will update the firmware in automated mode. This means that all disks which had older firmware revision will be updated regardless of whether they are spare or filesystem disks.

When enabled or set to "on", the background storage disk firmware update will update firmware in automated mode only on disks that can be successfully taken offline from active filesystem RAID groups and from the spare pool. To ensure a faster boot process, the firmware is not downloaded to spares and filesystem disks at boot time.

This provides the highest degree of safety available, without the cost of copying data from each disk in the system twice. Disks are taken offline one at a time and then the firmware is updated on them. The disk is brought online after the firmware update and a mini/optimized reconstruct happens for any writes, which occurred while the disk was offline. Background disk firmware update will not occur for a disk if its containing RAID group or the volume is not in a normal state (for example, if the volume/plex is offline or the RAID group is degraded). However, due to the continuous polling nature of background disk firmware update, firmware updates will resume after the RAID group/plex/volume is restored to a normal mode. Similarly, background disk firmware updates are suspended for the duration of any reconstruction within the system.

**How to Update the Firmware for an HA Pair in a Cluster**

The best way to update the firmware in a cluster with HA pairs is to use automatic background firmware update by enabling the option bkg-firmware-update parameter for each node. Enable the -bkg-firmware-update parameter on all the nodes by entering the *storage disk option modify* -node node_name -bkg-firmware-update on command. Alternatively, use the following procedure to successfully perform a manual update on the disks in an HA environment:

- Make sure that the nodes are not in takeover or giveback mode.
- Download the latest firmware on both the nodes by using the *storage firmware download* command.
- Install the new disk firmware on Node A’s disks by entering the *storage disk firmware update* -node node-A command.
- Wait until the *storage disk firmware update* command completes on Node A, and then install the new disk firmware on Node B’s disks by entering the *storage disk firmware update* -node node-B command.

**Parameters**

`{-disk <disk path name>, ... - Disk`  
Specifies the disk or disks whose firmware is to be updated.

`| -node {<nodename>|local}) - node`  
Specifies the node name. The disk firmware will be updated on all the disks owned by the node specified by this parameter.

**Examples**

If you need to view the current firmware versions, use the *storage disk show* -fields firmware-revision command. The following example displays partial output from the *storage disk show* -fields firmware-revision command, where the firmware version for the disks is NA01:

```
cluster1::> storage disk show -fields firmware-revision
               disk     firmware-revision
--------------------------
  1.0.0    NA01
  1.0.1    NA01
  1.0.2    NA01
  1.0.3    NA01
  1.0.4    NA01
  1.0.5    NA01
```

The following example updates the firmware on all disks owned by cluster-node-01:

### Storage disk option Command

Manage disk options

The `storage disk option` command displays or modifies the settings of disk options.

#### storage disk option modify

Modify disk options

**Availability:** This command is available to cluster administrators at the `admin` privilege level.

**Description**

The `storage disk option modify` command modifies the background firmware update setting, automatic copy setting, controls automatic disk assignment of all disks assigned to a specified node, or modifies the policy of automatic disk assignment of unowned disks.

**Parameters**

- `-node <nodename>|local` - Node
  
  This parameter specifies the node that owns the disks whose options are to be modified.

- `[-bkg-firmware-update {on|off}]` - Background Firmware Update
  
  This parameter specifies whether firmware updates run as a background process. The default setting is `on`, which specifies that firmware updates to spare disks and file system disks is performed nondisruptively via a
background process. If the option is turned off, automatic firmware updates occur at system startup or during disk insertion.

[-autocopy {on|off}] - Auto Copy

This parameter specifies whether data is to be automatically copied from a failing disk to a spare disk in the event of a predictive failure. The default setting is on. It is sometimes possible to predict a disk failure based on a pattern of recovered errors that have occurred. In such cases, the disk reports a predictive failure. If this option is set to on, the system initiates Rapid RAID Recovery to copy data from the failing disk to an available spare disk. When data is copied, the disk is marked as failed and placed in the pool of broken disks. If a spare is not available, the node continues to use the disk until it fails. If the option is set to off, the disk is immediately marked as failed and placed in the pool of broken disks. A spare is selected and data from the missing disk is reconstructed from other disks in the RAID group. The disk does not fail if the RAID group is already degraded or is being reconstructed. This ensures that a disk failure does not lead to the failure of the entire RAID group.

[-autoassign {on|off}] - Auto Assign

This parameter specifies whether automatic assignment of unowned disks is enabled or disabled. The default setting is on. This parameter is used to set both a node-specific and a cluster-wide disk option.

[-autoassign-policy {default|bay|shelf|stack}] - Auto Assignment Policy

This parameter defines the granularity at which auto assign should work. This option is ignored if the -autoassign option is off. Auto assignment can be done at the stack/loop, shelf, or bay level. The possible values for the option are default, stack, shelf, and bay. The default value is platform dependent. It is stack for all non-entry platforms and single-node systems, whereas it is bay for entry-level platforms.

Examples

The following example sets the background firmware update setting to on for all disks belonging to a node named node0:

```
cluster1::> storage disk option modify -node node0 -bkg-firmware-update on
```

The following example shows how to enable auto assignment for the disks on node1:

```
cluster1::> storage disk option modify -node node1 -autoassign on
cluster1::> storage disk option show
```

<table>
<thead>
<tr>
<th>Node</th>
<th>BKg. FW. Upd.</th>

storage disk option show

Display a list of disk options

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The `storage disk option show` command displays the settings of the following disk options:
- Background firmware update
- Automatic copying of data to a spare disk in the event of a predictive failure
- Automatic assignment of disks
- Policy that governs automatic assignment of unowned disks

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance ]
```

If you specify the `[-instance ]` parameter, the command displays detailed information about all fields.

```
[-node <nodename>|local] - Node
```

Selects the node that owns the disks. If this parameter is not specified, the command displays information about the disk options on all the nodes.

```
[-bkg-firmware-update {on|off}] - Background Firmware Update
```

Selects the disks that match this parameter value.

```
[-autocopy {on|off}] - Auto Copy
```

Selects the disks that match this parameter value.

```
[-autoassign {on|off}] - Auto Assign
```

Displays the auto assignment status of unowned disks. The default value is `on`.

```
[-autoassign-policy {default|bay|shelf|stack}] - Auto Assignment Policy
```

Selects the disks that match the automatic assignment policy value:

- Default
- Stack/loop
- Shelf
- Bay

**Examples**

The following example displays disk-option settings for disks owned by all nodes in the cluster:

```
cluster1::> storage disk option show
Node           BKg. FW. Upd.  Auto Copy     Auto Assign     Auto Assign Policy
-------------  -------------  ------------  -------------    ------------------
node0          on             on            on            default
node1          on             on            on            stack
node2          on             on            on            bay
node3          on             on            on            bay
4 entries were displayed.
```

**storage encryption commands**

The encryption directory
storage encryption disk commands

Manage encryption objects for self-encrypting disks

storage encryption disk destroy

Cryptographically destroy a self-encrypting disk

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The `storage encryption disk destroy` command cryptographically destroys a self-encrypting disk (SED), making it incapable of performing I/O operations. This command performs the following operations:

- Employs the inherent erase capability of SEDs to cryptographically sanitize the disk
- Permanently locks the disk to prevent further data access
- Changes the data and FIPS authentication keys to random values that are not recorded except within the SED.

Use this command with extreme care. The only mechanism to restore the disk to usability (albeit without the data) is the `storage encryption disk revert-to-original-state` operation that is available only on disks that have the physical secure ID (PSID) printed on the disk label.

The destroy command requires you to enter a confirmation phrase before proceeding with the operation.

The command releases the cluster shell after launching the operation. Monitor the output of the `storage encryption disk show-status` command for command completion.

Upon command completion, remove the destroyed SED from the system.

Parameters

- `disk <disk path name>` - Disk Name
  
  This parameter specifies the name of the disk you want to cryptographically destroy. See the man page for the `storage disk modify` command for information about disk-naming conventions.

- `[-force-all-states [true]]` - Destroy All Matching Disks
  
  When this parameter is false or not specified, the operation defaults to spare and broken disks only, as reported in the output of the `storage disk show` command. When you specify this parameter as true, it allows you to cryptographically destroy all matching disk names regardless of their state, including those in active use in aggregates. This allows a quick destroy of all system disks if you use the `--disk` parameter with the asterisk wildcard (*). If you destroy active disks, the nodes might not be able to continue operation, and might halt or panic.

Examples

The following command cryptographically destroys the disk 1.10.20:

```
cluster1:~> storage encryption disk destroy 1.10.20
```

Warning: This operation will cryptographically destroy 1 spare or broken self-encrypting disks on 1 node.

You cannot reuse destroyed disks unless you revert them to their original state using the PSID value.

To continue, enter

```
destroy disk
```

```
:destroy disk
```

Info: Starting destroy on 1 disk.
View the status of the operation by using the "storage encryption disk show-status" command.

If you do not enter the correct confirmation phrase, the operation is aborted:

```bash
cluster1::> storage encryption disk destroy 1.10.2*
Warning: This operation will cryptographically destroy 5 spare or broken self-encrypting disks on 1 node.
   You cannot reuse destroyed disks unless you revert them to their original state using the PSID value.
   To continue, enter destroy disk
   :yes
No disks destroyed.
cluster1::>
```

The following command quickly cryptographically destroys all system disks:

```bash
cluster1::> storage encryption disk destroy -force-all-states -disk *
Warning: This operation will cryptographically destroy 96 self-encrypting disks on 4 nodes.
   To continue, enter destroy disk
   :destroy disk
Info: Starting destroy on 96 disks.
View the status of the operation by using the storage encryption disk show-status command.
```

**storage encryption disk modify**

Modify self-encrypting disk parameters

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**

The `storage encryption disk modify` command changes the data and FIPS-compliance protection parameters of self-encrypting disks (SEDs). The current data AK and FIPS AK of the SED are required to effect changes to the respective AKs and FIPS compliance, and must also be available from the key servers.

The command releases the cluster shell after launching the operation. Monitor the output of the `storage encryption disk show-status` command for command completion.

**Note:** To properly protect data at rest on a SED and place it into compliance with its FIPS certification requirements, set both the Data and FIPS-compliance AKs to a value other than the default manufacture secure ID (MSID), indicated by a key ID with the special value `0x0`. Verify the key IDs by using the `storage encryption disk show` and `storage encryption disk show-fips` commands.
Parameters

-disk <disk path name> - Disk Name

This parameter specifies the name of the SED that you want to modify.

{ [-data-key-id <text>] - Key ID of the New Data Authentication Key

This parameter specifies the key ID associated with the data AK that you want the SED to use for future authentications. When the provided key ID is the MSID, data at rest on the SED is not protected from unauthorized access. Setting this parameter to a non-MSID value automatically engages the power-on-lock protections of the device, so that when the device is power-cycled, the system must authenticate with the device using the AK to reenable I/O operations.

[-fips-key-id <text>] - Key ID of the New Authentication Key for FIPS Compliance

This parameter specifies the key ID associated with the FIPS AK that you want the SED to apply to SED credentials other than the one that protects the data. When the value is not the MSID, these credentials are changed to the indicated AK, and other security-related items are set to conform to the FIPS certification requirements ("FIPS compliance mode") of the device. You may set the -fips-key-id to any one of the key IDs known to the system. The FIPS key ID may, but does not have to, be the same as the data key ID parameter. Setting -fips-key-id to the MSID key ID value disables FIPS compliance mode and restores the FIPS-related authorities and other components as required (other than data) to their default settings. The MSID is required when reverting to a version of Data ONTAP that does not manipulate the FIPS-compliance device components.

Examples

The following command changes both the AK and the power-cycle protection to values that protect the data at rest on the disk. Note that the -data-key-id and -fips-key-id parameters require one of the key IDs that appear in the output of the security key-manager query command.

```
cluster1::> storage encryption disk modify -data-key-id 6A1E21D8000000000100000000000000F5A1EB48EF26FD6A8E76549C019F2350 -disk 2.10.*
Info: Starting modify on 14 disks.
View the status of the operation by using the storage encryption disk show-status command.
```

The following command changes the FIPS AK and sets the device into FIPS-compliance mode. Note that the -fips-key-id parameter requires one of the key IDs that appear in the output of the security key-manager query command.

```
cluster1::> storage encryption disk modify -fips-key-id 6A1E21D80000000001000000000000005A1FB4EE8F62FD6D8AE6754C9019F35A 2.10.*
Info: Starting modify on 14 disks.
View the status of the operation by using the storage encryption disk show-status command.
```

storage encryption disk revert-to-original-state

Revert a self-encrypting disk to its original, as-manufactured state

Availability: This command is available to cluster administrators at the admin privilege level.

Description
Some self-encrypting disks (SEDs) are capable of an operation that restores them as much as possible to their as-manufactured state. The storage encryption disk revert-to-original-state command invokes this special operation that is available only in SEDs that have the physical secure ID (PSID) printed on their labels.

The PSID is unique to each SED, meaning the command can revert only one SED at a time. The disk must be in a "broken" or "spare" state as shown by the output of the storage disk show command.

The operation in the SED accomplishes the following changes:

• Sanitizes all data by changing the disk encryption key to a new random value
• Sets the data authentication key (AK) and FTPS AK to the default manufacture secure ID (MSID)
• Unlocks the data band
• Resets the power-on lock state to false
• Initializes other vendor-unique encryption-related parameters

The command releases the cluster shell after launching the operation. Monitor the output of the storage encryption disk show-status command for command completion.

When the operation is complete, it is possible to return the SED to service using the storage disk unfail command in advanced privilege mode. To do so, you might also need to reestablish ownership of the SED using the storage disk assign command.

Parameters

-disk <disk path name> - Disk Name
The name of the SED to be reverted to its as-manufactured state. See the man page for the storage disk modify command for information about disk-naming conventions.

-psid <text> - Physical Secure ID
The PSID printed on the SED label.

Examples

The following command shows a SED being returned to its as-manufactured state:

```bash
cluster1:/> storage encryption disk revert-to-original-state -disk 01.10.0 -psid AC65PYF8CG45YZABUQJKM98WV2VZGRLD
```

storage encryption disk show-status on page 926
storage disk unfail on page 907
storage disk assign on page 880
storage encryption disk sanitize

Cryptographically sanitize a self-encrypting disk

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The storage encryption disk sanitize command cryptographically sanitizes one or more self-encrypting disks (SEDs), making the existing data on the SED impossible to retrieve. This operation employs the inherent erase capability of SEDs to perform all of the following changes:

- Sanitizes all data by changing the disk encryption key to a new random value
- Sets the data authentication key (AK) to the default manufacture secure ID (MSID)
- Unlocks the data band
- Resets the power-on lock state to false

There is no method to restore the disk encryption key to its previous value, meaning that you cannot recover the data on the SED. Use this command with extreme care.

The sanitize command requires you to enter a confirmation phrase before proceeding with the operation. The command releases the cluster shell after launching the operation. Monitor the output of the storage encryption disk show-status command for command completion. When the operation is complete, it is possible to return the SED to service using the storage disk unfail command in advanced privilege mode. To do so, you might also need to reestablish ownership of the SED using the storage disk assign command.

Parameters
-disk <disk path name> - Disk Name
This parameter specifies the name of the SEDs you want to cryptographically sanitize. See the man page for the storage disk modify command for information about disk-naming conventions.

-[-force-all-states [true]] - Sanitize All Matching Disks
When this parameter is false or not specified, the operation defaults to spare and broken disks only, as reported in the output of the storage disk show command. When you specify this parameter as true, it allows you to cryptographically sanitize all matching disk names regardless of their state, including those in active use in aggregates. This allows a quick erase of all system data if you use the -disk parameter with the asterisk wildcard (*). If you sanitize active disks, the nodes might not be able to continue operation, and might halt or panic.

Examples
The following command sanitizes the disk 1.10.20:

cluster1:/> storage encryption disk sanitize 1.10.20

Warning: This operation will cryptographically sanitize 1 spare or broken self-encrypting disk on 1 node.
To continue, enter
sanitize disk
:sanitize disk

Info: Starting sanitize on 1 disk.
View the status of the operation using the storage encryption disk show-status command.

cluster1:/>
If you do not enter the correct confirmation phrase, the operation is aborted:

```
cluster1::> storage encryption disk sanitize 1.10.2*
Warning: This operation will cryptographically sanitize 5 spare or broken self-encrypting disks on 1 node.
To continue, enter
sanitize disk
:yes
No disks sanitized.
cluster1::>
```

The following command quickly cryptographically sanitizes all system disks:

```
cluster1::> storage encryption disk sanitize -force-all-states -disk *
Warning: This operation will cryptographically sanitize 96 self-encrypting disks on 4 nodes.
To continue, enter
sanitize disk
:sanitize disk
Info: Starting sanitize on 96 disks.
View the status of the operation by using the `storage encryption disk show-status` command.
cluster1::>
```

- `storage disk assign` on page 880

**storage encryption disk show**

Display self-encrypting disk attributes

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The `storage encryption disk show` command displays information about self-encrypting disks (SEDs). By default, the command displays the following information about all SEDS:

- Disk name
- The protection mode of the SED
- The key ID associated with the data authentication key (data AK)

You can use the following parameters together with the `-disk` parameter to narrow the selection of displayed SEDs or the information displayed about them.

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.
If you specify this parameter, the command displays the key ID associated with the FIPS-compliance authentication key ("FIPS AK") instead of the data key ID.

If you specify this parameter, the command displays detailed disk information about all disks, or only those specified by a -disk parameter.

If you specify this parameter, the command displays information about the specified disks. If you specify a single disk path name, the output is the same as when you use the -instance parameter. See the man page for the storage disk modify command for information about disk-naming conventions. Default is all self-encrypting disks.

This parameter specifies the container name associated with a SED. If you specify an aggregate name or other container name, only the SEDs in that container are displayed. See the man page for the storage disk show command for a description of the container name. Use the storage aggregate show-status and storage disk show commands to determine which aggregates the SEDs are in.

This parameter specifies the container type associated with a SED. If you specify a container type, only the SEDs with that container type are displayed. See the man page for the storage disk show command for a description of the container type.

This parameter specifies the key ID associated with the data AK that the SED requires for authentication with the data-protection authorities in the SED. The special key ID 0x0 indicates that the current data AK of the SED is the default manufacture secure ID (MSID) that is not secret. To properly protect data at rest on the device, modify the data AK using a key ID that is not the MSID. When you modify the data AK with a non-MSID key ID, the system automatically sets the device's power-on lock enable control so that authentication with the data AK is required after a device power-cycle. Use storage encryption disk modify -data-key-id key-id to protect the data. Use storage encryption disk modify -fips-key-id key-id to place the SED into FIPS-compliance mode.

This parameter specifies the key ID associated with the FIPS authentication key ("FIPS AK") that the system must use to authenticate with FIPS-compliance authorities in the SED.

This parameter specifies the state of the SED control that determines whether the SED requires authentication with the data AK after a power-cycle. The system enables this control parameter automatically when you use the storage encryption disk modify -data-key-id command to set the data AK to a value other than the MSID. Data is protected only when this parameter is true and the data AK is not the MSID. Compare with the values of the -protection-mode parameter below.

The protection mode that the SED is in:
- open - data is unprotected; SED is not in FIPS-compliance mode
- data - data is protected; SED is not in FIPS-compliance mode
- part - data is unprotected; SED is in FIPS-compliance mode
- full - data is protected; SED is in FIPS-compliance mode
Examples

The following command displays information about all SEDs:

```
cluster1::> storage encryption disk show
Disk    Mode Data Key ID
------- ---- -----------------------------------------------------------------
0.0.0   open 0x0
0.0.1   part 0x0
0.0.2   data 0A9C9CFC0000000100000000000000345CFD1BAD310CA8EDB377D439FB5C9A
1.10.0  open 0A53ED2A00000000100000000000000BEDC1B27AD3F0DB88913755AED2F34D0B
1.10.1  part 0A9C9CFC0000000100000000000000345CFD1BAD310CA8EDB377D439FB5C9A
1.10.2  full 0A9C9CFC0000000100000000000000345CFD1BAD310CA8EDB377D439FB5C9A
[...]
```

Note in the example that only disk 1.10.2 is fully protected with FIPS mode, power-on-lock enable, and an AK that is not the default MSID.

The following command displays information about the protection mode and FIPS key ID for all SEDs:

```
cluster1::> storage encryption disk show -fips
Disk    Mode FIPS-Compliance Key ID
------- ---- -----------------------------------------------------------------
0.0.0   open 0x0
0.0.1   part 0A53ED2A00000000100000000000000BEDC1B27AD3F0DB88913755AED2F34D0B
0.0.2   data 0x0
1.10.0  open 0A53ED2A00000000100000000000000BEDC1B27AD3F0DB88913755AED2F34D0B
1.10.1  part 0A9C9CFC0000000100000000000000345CFD1BAD310CA8EDB377D439FB5C9A
1.10.2  full 0A9C9CFC0000000100000000000000345CFD1BAD310CA8EDB377D439FB5C9A
[...]
```

Note again that only disk 1.10.2 is fully protected with FIPS-compliance mode set, power-on-lock enabled, and a data AK that is not the default MSID.

The following command displays the individual fields for disk 1.10.1:

```
cluster1::> storage encryption disk show -disk 1.10.1
 Disk Name: 1.10.1
 Key ID of the Current Data Authentication Key: 0A9C9CFC0000000100000000000000345CFD1BAD310CA8EDB377D439FB5C9A
 Key ID of the Current FIPS Authentication Key: 0A9C9CFC0000000100000000000000345CFD1BAD310CA8EDB377D439FB5C9A
 Is Power-On Lock Protection Enabled?: true
 Mode of SED Data and FIPS-Compliance Protection: open
```

**storage encryption disk show-status**

Display status of disk encryption operation

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**

The `storage encryption disk show-status` command displays the results of the latest `destroy`, `modify`, or `sanitize` operation of the `storage encryption disk` command family. Use this command to view the progress of these operations on self-encrypting disks (SEDs).
Parameters

{
[-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance ]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-node <nodename>] - Node Name

If you specify this parameter, the command displays disk encryption status for the nodes that match this parameter.

[-is-sed-support {true|false}] - Node Supports Self-Encrypting Disks

If you specify this parameter, the command displays disk encryption status for the nodes that match this parameter (true means the node supports SEDs).

[-latest-op <Storage Disk Encryption Operation>] - Latest Operation Requested

If you specify this parameter, the command displays disk encryption status for the nodes with a most recent storage encryption disk operation that matches this parameter (one of destroy, modify, revert-to-original-state, sanitize, or unknown).

[-op-start-time <MM/DD/YYYY HH:MM:SS>] - Operation Start Time

Selects the nodes with operation start times that match this parameter.

[-op-execute-time <integer>] - Execution Time in Seconds

If you specify this parameter, the command displays disk encryption status for the nodes with operation execution time that matches this parameter. The operation may be partial or completed.

[-disk-start-count <integer>] - Number of Disks Started

If you specify this parameter, the command displays disk encryption status for the nodes that started this number of SEDs in their latest operation.

[-disk-done-count <integer>] - Number of Disks Done

Selects the nodes that report this number of SEDs having completed the latest operation, successfully or not.

[-disk-success-count <integer>] - Number of Disks Successful

If you specify this parameter, the command displays disk encryption status for the nodes that report this number of SEDs that successfully completed the latest operation. When the operation is finished, if the success count is not the same as the started count, some additional detail is available using the -instance or -node parameters.

[-disk-no-key-id-count <integer>] - Number of Disks with Key ID Not Found

If you specify this parameter, the command displays disk encryption status for the nodes that report this number of SEDs that failed the latest operation because Data ONTAP could not find the Key IDs associated with the required authentication key of the SED.

[-disk-no-authent-count <integer>] - Number of Disks Not Authenticated

If you specify this parameter, the command displays disk encryption status for the nodes that report this number of SEDs that failed the latest operation because the identified Authentication Key could not authenticate with the SED.

Examples

When no operation has been requested since node boot, the status for that node is empty. If you enter a node name, the output is in the same format as for the -instance parameter.

```
cluster1::> storage encryption disk show-status -node node

Node Name: node
```

storage encryption commands 927
Node Supports Self-Encrypting Disks: true
Latest Operation Requested: unknown
Operation Start Time: -
Execution Time in Seconds: -
Number of Disks Started: -
Number of Disks Done: -
Number of Disks Successful: -
Number of Disks with Key ID Not Found: -
Number of Disks Not Authenticated: -

Once an operation begins, the status is dynamic until all devices have completed. When disks are modified, sanitized, or destroyed, sequential executions of storage encryption disk show-status appear as in this example that shows the progress of a modify operation on three SEDs on each node of a two-node cluster:

```
cluster1::> storage encryption disk show-status
SED     Latest   Start               Execution  Disks  Disks      Disk
Node    Support Request  Timestamp          Time (sec)  Begun   Done Successful
------- ------- -------- ------------------ ---------- ------ ------ ----------
node    true    modify   9/22/2014 13:58:53          4      3      0          0
node1   true    modify   9/22/2014 13:58:53          4      3      0          0
```

```
cluster1::> storage encryption disk show-status
SED     Latest   Start               Execution  Disks  Disks      Disk
Node    Support Request  Timestamp          Time (sec)  Begun   Done Successful
------- ------- -------- ------------------ ---------- ------ ------ ----------
node    true    modify   9/22/2014 13:58:53          7      3      3          3
node1   true    modify   9/22/2014 13:58:53          7      3      3          3
```

storage errors commands

The errors directory

storage errors show

Display storage configuration errors.

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The storage errors show command displays configuration errors with back end storage arrays.

Parameters

```
[-fields <fieldname>, ...]
```
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance]
```
If you specify the -instance parameter, the command displays detailed information about all fields.
[-uid <text>] - UID
Selects the disks that match this parameter value.

[-array-name <array name>] - Array Name
Selects the disks that have the specified name for the storage array that is connected to the cluster.

[-node {<nodename>|local}] - Controller Name
Selects the disks that match this parameter value.

[-disk <disk path name>] - Disk
Selects the disks that match this parameter value.

[-serial-number <text>] - Serial Number
Selects the disks that match this parameter value.

[-error-id <integer>, ...] - Error ID
Selects the disks with error-id values that match this parameter value.

[-error-type {onepath|onedomain|control|foreign|toobig|toosmall|invalidblocksize|targetasymmap|deviceassymmap|failovermisconfig|unknown|netapp|fwdownrev|qualfail|diskfail|notallflashdisk}, ...] - Error Type
Selects the disks with error types values that match this parameter value.

Examples
The following example displays configuration errors seen in the system:

```
cluster1::> storage errors show
--------------------
vnci9124a54:1-24.126L23 (600a0b80019e99900036b24b3c983): This array LUN reports an invalid block size and is not usable. Only a block size of 512 is supported.
```

storage failover commands
Manage storage failover
This contains commands to display and modify storage failover related options of a node.

storage failover giveback
Return failed-over storage to its home node
Availability: This command is available to cluster administrators at the admin privilege level.

Description
The storage failover giveback command returns storage that has failed over to a node's partner back to the home node. This operation fails if other resource-intensive operations (for instance, system dumps) are running and make the giveback operation potentially dangerous or disruptive. Some options are available only at the advanced privilege level and higher. Run the storage failover show-giveback command to check the status of giveback operations.

Note:
- If the system ID of the partner has changed while the node is in takeover mode, the storage failover giveback command updates the ownership of the partner's disks to the new system ID while giving back.
- If the giveback operation fails due to the operation being vetoed by a subsystem, check the syslog or EMS output for a subsystem-specific reason for the abort. The corrective action is subsystem-specific and is detailed in the corrective action
portion of the message. Follow the corrective action specified by the subsystem and then reissue the `storage failover giveback` command. If you cannot perform the corrective action, then use the `override-vetoes` option in the `storage failover giveback` command to force the giveback.

- If the giveback operation fails because the node cannot communicate with its partner, check the EMS output for the corrective action. Follow the corrective action and then reissue the `storage failover giveback` command. If you cannot perform the corrective action, then use the `-require-partner-waiting false` option in the `storage failover giveback` command to force the giveback. This parameter is available only at the advanced privilege level and higher.

- If the node does not receive notification that the partner has brought online the given-back aggregate and its volumes, the `storage failover show-giveback` command displays the giveback status for the aggregate as failed. A possible reason for this failure is that the partner is overloaded and slow in bringing the aggregate online. Run the `storage aggregate show` command to verify that the aggregate and its volumes are online on the partner node. The node will not attempt the giveback operation for remaining aggregates. To force the giveback, use the `-require-partner-waiting false` option in the `storage failover giveback` command. This parameter is available only at the advanced privilege level and higher.

### Parameters

| `-ofnode {<nodename>|local}` - Node to which Control is Givenback |
|---|
| Specifies the node whose storage is currently taken over by its partner and will be given back by the giveback operation. |

| `-fromnode {<nodename>|local}` - Node Initiating Giveback |
|---|
| Specifies the node that currently holds the storage that is to be returned to the partner node. |

| `[-require-partner-waiting {true|false}]` - Require Partner in Waiting (privilege: advanced) |
|---|
| If this optional parameter is used and set to false, the storage is given back regardless of whether the partner node is available to take back the storage or not. If this parameter is used and set to true, the storage will not be given back if the partner node is not available to take back the storage. If this parameter is not used, the behavior defaults to the setting of the `-check-partner` option set with the `storage failover modify` command. |

<table>
<thead>
<tr>
<th><code>[-override-vetoes [true]]</code> - Override All Vetoes</th>
</tr>
</thead>
<tbody>
<tr>
<td>If this optional parameter is used, the system overrides veto votes during a giveback operation. If this parameter is not used, the system does not proceed with a giveback if it is vetoed. This parameter, if used, can only be set to true.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><code>[-only-cfo-aggregates [true]]</code> - Giveback Only CFO Aggregates</th>
</tr>
</thead>
<tbody>
<tr>
<td>If this optional parameter is used, giveback of only the CFO aggregates (root aggregate and CFO style data aggregates) will be attempted. If this parameter is not used, giveback of all the aggregates (CFO and SFO aggregates) will be attempted. This parameter, if used, can only be set to true.</td>
</tr>
</tbody>
</table>

### Examples

The following example gives back storage that is currently held by a node named node1. The partner must be available for the giveback operation to occur.

```
node::> storage failover giveback -fromnode node1
```

The following example gives back only the CFO aggregates to a node named node2 (the aggregates are currently held by a node named node1). The partner must be available for the giveback operation to occur, and the veto-giveback process can be overridden.

```

**storage failover modify**

Modify storage failover attributes

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

The *storage failover modify* command changes the storage-failover options for a node. Some options are available only at the advanced privilege level and higher.

**Parameters**

- `-node {<nodename>|local}` - Node
  
  This specifies the node whose storage-failover options are to be modified.

- `{[-enabled {true|false}] - Takeover Enabled}
  
  This optionally specifies whether storage failover is enabled. The default setting is `true`.

- `{[-mode {ha|non_ha}] - HA Mode}
  
  This specifies whether the node is set up in high-availability mode or stand-alone mode. If the node is a member of a high-availability configuration, set the value to `ha`. If the node is stand-alone, set the value to `non_ha`. Before setting the HA mode, you must complete the platform dependent steps to set up the system in a stand-alone or HA configuration as shown in the documentation for your platform.

- `[-auto-giveback {true|false}] - Auto Giveback Enabled`
  
  This optionally specifies whether automatic giveback operations are enabled. An automatic giveback operation is invoked when one node of a failover pair is in takeover mode and the failed node is repaired and restarts. When the repaired node boots, the node in takeover mode detects this and initiates a giveback operation. The default setting is `false`, except for two-node clusters where the default setting is `true`.

- `[-detection-time <integer>] - Takeover Detection Time (secs)`
  
  This optionally specifies the amount of time, in seconds, that a node remains unresponsive before its partner initiates a takeover operation. Possible values range from 10 to 180 seconds. The default setting is 15 seconds.

- `[-onfailure {true|false}] - Takeover on Failure Enabled (privilege: advanced)`
  
  This optionally specifies whether the node automatically takes over for its partner node if the partner node fails. The default setting is `true`. This parameter is available only at the advanced privilege level and higher.

- `[-onpanic {true|false}] - Takeover on Panic Enabled`
  
  This optionally specifies whether the node automatically takes over for its partner node if the partner node panics. The default setting is `true`. Changing this parameter on one node automatically makes the same change on its partner node.

- `[-onshort-uptime {true|false}] - Takeover on Short Uptime Enabled (privilege: advanced)`
  
  This optionally specifies whether the node takes over for its partner node if the partner node fails within 60 seconds of starting up; the time period is modifiable by using the `onshort-uptime` parameter. The default setting is `true`. This parameter is available only at the advanced privilege level and higher.
[-short-uptime <integer>] - Short Uptime (secs) (privilege: advanced)

This optionally specifies the time period used by the -onshort-uptime parameter. The default setting is 60 seconds. This parameter is available only at the advanced privilege level and higher.

[-attempts <integer>] - Number of Giveback Attempts (privilege: advanced)

This optionally specifies the number of times the node attempts an automatic giveback operation within 60 minutes; the time period is modifiable by using the -attempts-time parameter. The default setting is 2 attempts. This parameter is available only at the advanced privilege level and higher.

[-attempts-time <integer>] - Giveback Attempts Period (minutes) (privilege: advanced)

This optionally specifies the time period used by the -attempts parameter. The default setting is 60 minutes. This parameter is available only at the advanced privilege level and higher.

[-propagate {true|false}] - Propagate Status via Mailbox (privilege: advanced)

This optionally specifies whether storage-failover status is communicated via mailbox disks. The default setting is true. This parameter is available only at the advanced privilege level and higher.

[-read-interval <integer>] - Node Status Read Interval (secs) (privilege: advanced)

This optionally specifies, in seconds, how frequently the node reads its partner node's status from the mailbox disks. The default setting is 5 seconds. This parameter is available only at the advanced privilege level and higher.

[-write-interval <integer>] - Node Status Write Interval (secs) (privilege: advanced)

This optionally specifies, in seconds, how frequently the node writes its status to the mailbox disks. The default setting is 5 seconds. This parameter is available only at the advanced privilege level and higher.

[-onreboot {true|false}] - Takeover on Reboot Enabled

This optionally specifies whether the node automatically takes over for its partner if the partner reboots. The default setting is true. Takeover can occur if the partner exceeds the expected time to reboot even when this option is set to false. The expected time to reboot is different for different platforms. The minimum expected time to reboot is 180 seconds. The -inhibit-takeover option of the system node reboot command overrides this option: if a node is rebooted with -inhibit-takeover set to true then takeover does not occur, even if the takeover on reboot option is true. If a node does takeover due to the partner rebooting, then it will automatically giveback after the reboot, even if the -auto-giveback option is set to false. This is non-persistent behavior: if the node does takeover due to partner reboot and then itself reboots (prior to giveback) then it will not automatically giveback if the -auto-giveback option is set to false.

[-delay-seconds <integer>] - Delay Before Auto Giveback (secs)

This optionally specifies the minimum time that a node will stay in takeover state prior to performing an automatic giveback. If the taken over node recovers quickly (for example, if the takeover was due to a reboot), by delaying the giveback for a few minutes the outage during the takeover and giveback can be reduced to two short outages instead of one longer one. The allowed range is 0 to 600, inclusive. The default setting is 600 seconds. This option affects all types of auto-giveback. This parameter is available only at the advanced privilege level and higher.

   Note: This delay does not affect manual giveback.

[-hwassist {true|false}] - Hardware Assist Enabled

This optionally specifies whether the hardware assist feature is enabled. If set to true this feature helps in fast takeover detection times in certain cases.

[-hwassist-partner-ip <IP Address>] - Partner's Hwassist IP

This optionally specifies the IP address on which the partner node receives hardware assist alerts. For the hardware assist feature to be active, the value of this option should be equal to partner's node management IP address.
[-hwassist-partner-port <integer>] - Partner's Hwassist Port
This optionally specifies the port number on which partner node listens to hardware assist alerts. It is recommended to have this value to be between 4000-4500. The default value is 4444.

[-hwassist-health-check-interval <integer>] - Hwassist Health Check Interval (secs)
This optionally specifies, in seconds, how frequently the hardware assist hardware on a node sends a heartbeat to its partner. The default value is 180.

[-hwassist-retry-count <integer>] - Hwassist Retry Count
This optionally specifies the number of times we repeat sending an hardware assist alert. The default value is 2.

[-auto-giveback-after-panic {true|false}] - Auto Giveback After Takeover On Panic
This optionally specifies whether a node should attempt automatic giveback operations if takeover was because of a disruption in the partner's operation. An automatic giveback operation is invoked when one node of a failover pair is in takeover mode and the failed node is repaired and restarts. When the repaired node boots, the node in takeover mode detects this and initiates a giveback operation automatically. The default setting is true.

[-aggregate-migration-timeout <integer>] - Aggregate Migration Timeout (secs) (privilege: advanced)
This optionally specifies the amount of time, in seconds, the source node has to wait for the destination node to complete the aggregate migration before declaring the migration as failed. The default setting is 120 seconds.

**Examples**
The following example enables the storage-failover service on a node named node0:

```
node::> storage failover modify -node node0 -enabled true
```

The following examples enable storage-failover takeover on a short uptime of 30 seconds on a node named node0:

```
node::*> storage failover modify -node node0 -onshort-uptime true -short-uptime 30
```

**storage failover show**
Display storage failover status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The *storage failover show* command displays information about storage-failover configurations. By default, the command displays the following information:

- Node name.
- Partner node name.
- Whether storage failover is possible.
- The current state of storage failover. If the takeover is disabled the appropriate reason would be displayed.

To display detailed information about storage failover on a specific node, run the command with the *-node* parameter. The detailed view adds the following information:
- Node NVRAM ID.
- Partner NVRAM ID.
- Whether storage failover is enabled.
- Whether the storage-failover interconnect is available.
- Status of individual storage-failover interconnect links.
- Type and vendor of the storage-failover interconnect.
- Partner State
- Status codes from the takeover-by-partner process. Possible values include:
  - NVRAM_DOWN
  - OPERATOR_DISABLE_NVRAM
  - PARTNER_RESET
  - FM_TAKEOVER
  - NVRAM_MISMATCH
  - OPERATOR_DENY
  - CLUSTER_DISABLE
  - VERSION
  - SHELF_HOT
  - REVERT_IN_PROGRESS
  - HALT_NOTKOVER
  - TAKEOVER_ON_PANIC
- Reasons why takeover is not possible, if applicable. Possible values include:
  - NOT_INIT
  - DISABLED
  - DEGRADED
  - MBX_UNKNOWN
  - FM_VERSION
  - PARTNER_DISABLED
  - OPERATOR_DENY
  - NVRAM_MISMATCH
  - VERSION
  - IC_ERROR
  - BOOTING
  - SHELF_HOT
  - PARTNER_REVERT_IN_PROGRESS
• LOCAL_REVERT_IN_PROGRESS
• PARTNER_TAKEOVER
• LOCAL_TAKEOVER
• HALT_NOTKOVER
• LOG_UNSSYNC
• UNKNOWN
• WAITING_FOR_PARTNER
• LOW_MEMORY
• HALTING
• MBX_UNCERTAIN
• NO_AUTO_TKOVER

• Time until takeover, in seconds.
• Time until auto giveback, in seconds.
• Delay for auto giveback, in seconds.
• List of local mailbox disks.
• List of partner mailbox disks.
• Whether operator-initiated planned takeover will be optimized for performance by relocating SFO (non-root) aggregates serially to the partner prior to takeover.

You can specify additional parameters to select the displayed information. For example, to display information only about storage-failover configurations whose interconnect is down, run the command with `-interconnect-up false`.

Parameters

`{ [-fields <fieldname>, ...]`  
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

`| [[-options]`  
Displays the following information:

• Node name
• Whether automatic giveback operations are enabled
• Whether long-running operations are terminated when an automatic giveback operation is initiated
• Whether the node checks its partner's readiness before initiating a giveback operation
• The time, in seconds, that the node remains unresponsive before its partner initiates a takeover operation
• Whether the node automatically takes over for its partner if the partner fails
• Whether the node automatically takes over for its partner if the partner panics
• Whether the node automatically takes over for its partner if the partner reboots
• whether Hardware Assisted Takeover is enabled
• Ip address on which the partner node listens to the Hardware Assist alerts

• Port number on which the partner node listens to the Hardware Assist alerts

• Whether operator-initiated planned takeover will be optimized for performance by relocating SFO (non-root) aggregates serially to the partner prior to takeover

If this parameter is specified when the privilege level is set to advanced or higher, the command displays the information in the previous list and the following additional information:

• Whether the node takes over for its partner if its partner fails after a period of time, which is listed in the following field

• The number of seconds before the node takes over for its partner

• The number of times the node attempts an automatic giveback operation within a period of time

• The number of minutes in which the automatic giveback attempts can occur

• Whether storage-failover status is communicated via mailbox disks

• The interval at which the node reads its partner node's status from the mailbox disks

• The interval at which the node writes its status to the mailbox disks

• The interval at which Hardware assist h/w sends a heartbeat

• The number of times the Hardware assist alert is sent

<table>
<thead>
<tr>
<th>[-takeover-status ]</th>
</tr>
</thead>
</table>

Displays the following information:

• Node name

• Partner name

• Takeover enabled

• Takeover possible

• Interconnect up

• State

• Node NVRAM ID

• Partner NVRAM ID

• Reason Takeover Not Possible By Partner

• Reason Takeover Not Possible

• Time Until Takeover

<table>
<thead>
<tr>
<th>[-advanced ] (privilege: advanced)</th>
</tr>
</thead>
</table>

Displays the following information:

• Node name

• Whether kill messages are issued during a takeover operation

• Whether the node controls its partner's storage aggregates

• The time when firmware notification was received
• The time when booting notification was received
• The time at which the last takeover or giveback operation occurred, in microseconds
• The number of times the failover log was unsynchronized

[-iotime] (privilege: advanced)
Displays the following information:
• Node name
• Primary normal I/O time
• Primary transition I/O time
• Backup normal I/O time
• Backup transition I/O time

[-mailbox-status] (privilege: advanced)
Displays the following information:
• Node name
• Primary mailbox status
• Backup mailbox status

[-more-options] (privilege: advanced)
Displays the following information:
• Node name
• Whether takeover on short uptime is enabled
• Short uptime, in seconds
• Number of giveback attempts
• Interval of giveback attempts, in minutes
• Whether the primary mailbox is online
• Mailbox status read interval, in seconds
• Mailbox status write interval, in seconds

[-progress] (privilege: advanced)
Displays the following information:
• Node name
• Maximum resource-table index number
• Current resource-table index number
• Current resource-table entry

[-timeout] (privilege: advanced)
Displays the following information:
• Node name
• Fast timeout
• Slow timeout
• Mailbox timeout
• Connection timeout
• Operator timeout
• Firmware timeout
• Dump-core timeout
• Booting timeout
• Reboot timeout

[-transit] (privilege: advanced)
Displays the following information:
• Node name
• Transit Timer Enabled
• Transit Timeout

[-instance]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node
Selects the nodes whose name matches this parameter value.

[-partner-name <text>] - Partner Name
Selects the nodes that have the specified partner-name setting.

[-nvramid <integer>] - Node NVRAM ID
Selects the nodes that have the specified NVRAM ID setting.

[-partner-nvramid <integer>] - Partner NVRAM ID
Selects the nodes that have the specified partner NVRAM ID setting.

[-enabled {true|false}] - Takeover Enabled
Selects the nodes that have the specified takeover-enabled setting.

[-mode {ha|non_ha}] - HA Mode
Selects the nodes that have the specified HA-mode setting. If the value is set to ha then the node is a member of a storage-failover configuration. If it is set to non-ha then it is in a stand alone configuration.

[-possible {true|false}] - Takeover Possible
Selects the nodes that have the specified failover-possible setting.

[-reason <text>, ...] - Reason Takeover not Possible
Selects the nodes that have the specified reason-not-possible setting. Possible values include:
• NOT_INIT
• DISABLED
• DEGRADED
• MBX_UNKNOWN
• FM_VERSION
- PARTNER_DISABLED
- OPERATOR_DENY
- NVRAM_MISMATCH
- VERSION
- IC_ERROR
- BOOTING
- SHELF_HOT
- PARTNER_REVERT_IN_PROGRESS
- LOCAL_REVERT_IN_PROGRESS
- PARTNER_TAKEOVER
- LOCAL_TAKEOVER
- HALT_NOTKOVER
- LOG_UNSYNC
- UNKNOWN
- WAITING_FOR_PARTNER
- LOW_MEMORY
- HALTING
- MBX_UNCERTAIN
- NO_AUTO_TKOVER

[-interconnect-up {true|false}] - Interconnect Up
Selects the nodes that have the specified interconnect-up setting.

[-interconnect-links <text>] - Interconnect Links
Selects the nodes that have the specified interconnect-links setting.

[-interconnect-type <text>] - Interconnect Type
Selects the nodes that have the specified interconnect-type setting.

[-state-description <text>] - State Description
Selects the nodes that have the specified state-description setting.

[-partner-state <text>] - Partner State
Selects the nodes that have the specified partner-state setting. Possible values include:

- OPERATOR COMPLETED
- DEBUGGUER COMPLETED
- PROGRESS COUNTER
- I/O ERROR
- BAD CHECKSUM
- RESERVED
Unknown
INITIALIZING
IN POWER-ON SELF TEST
BOOTING
BOOT FAILED
WAITING
KERNEL LOADED
UP
IN DEBUGGER
WAITING FOR OPERATOR INPUT
DUMPING CORE
HALTED
REBOOTING
WAITING FOR GIVEBACK (DISK RESERVATIONS)
WAITING FOR GIVEBACK (HA MAILBOXES)

MULTI-DISK PANIC
IN TAKEOVER

[-time-until-takeover <integer>] - Time Until Takeover
Selects the nodes that have the specified time-until-takeover setting.

[-partner-reason <text>, ...] - Reason Takeover not Possible by Partner
Selects the nodes that have the specified partner-reason text setting.

[-killpackets {true|false}] - Issue Kill Packets (privilege: advanced)
Selects the nodes that have the specified kill packets setting.

[-partner-aggregates {true|false}] - Control Partner Aggregates (privilege: advanced)
Selects the nodes that have the specified partner aggregates setting.

[-current-index <integer>] - Current Progress Index (privilege: advanced)
Selects the nodes that have the specified current-progress index setting.

[-current-entry <text>] - Current Progress Entry (privilege: advanced)
Selects the nodes that have the specified current-progress entry setting.

[-maximum-index <integer>] - Maximum Progress Index (privilege: advanced)
Selects the nodes that have the specified maximum-progress index setting.

[-pmbox-status <text>, ...] - Primary Mailbox Status (privilege: advanced)
Selects the nodes that have the specified primary mailbox status setting. Possible values include:

- MBX_STATUS_NODISKS
- MBX_STATUS_UNCERTAIN
- **MBX_STATUS_STALE**
- **MBX_STATUS_CONFLICTED**
- **MBX_STATUS_OLD_VERSION**
- **MBX_STATUS_NOT_FOUND**
- **MBX_STATUS_WRONG_STATE**
- **MBX_STATUS_BACKUP**

**[-mbbox-status <text>,...]** - Backup Mailbox Status (privilege: advanced)

Selects the nodes that have the specified backup-mailbox status setting. See the description of the **-pmbox-status** parameter for a list of possible values.

**[-major-seq-num-local <integer>]** - Local Major Sequence Number (privilege: advanced)

Selects the nodes that have the specified mailbox heartbeat major sequence number on the local node.

**[-minor-seq-num-local <integer>]** - Local Minor Sequence Number (privilege: advanced)

Selects the nodes that have the specified mailbox heartbeat minor sequence number on the local node.

**[-major-seq-num-partner <integer>]** - Partner Major Sequence Number (privilege: advanced)

Selects the nodes that have the specified mailbox heartbeat major sequence number on the partner node.

**[-minor-seq-num-partner <integer>]** - Partner Minor Sequence Number (privilege: advanced)

Selects the nodes that have the specified mailbox heartbeat minor sequence number on the partner node.

**[-local-mbx-node-status <Mailbox Status>]** - Local Mailbox Node Status (privilege: advanced)

Selects the nodes that have the specified local mailbox node status. Possible values include:

- **MBX_UNKNOWN** - Local node is up, mailbox uninitialized
- **MBX_TAKEOVER_DISABLED** - Local node is up but takeover is disallowed
- **MBX_TAKEOVER_ENABLED** - Local node is up and takeover is allowed
- **MBX_TAKEOVER_ACTIVE** - Partner node has taken over
- **MBX_GIVEBACK_DONE** - Giveback completed, but local node has not yet restarted

**[-mbx-abs-time-local <integer>]** - Local Mailbox Absolute Time (privilege: advanced)

Selects the nodes that have the specified local mailbox channel absolute time. This time is measured in msecs since 1/1/1970 (epoch).

**[-mbx-sk-time-local <integer>]** - Local Mailbox Kernel Time (privilege: advanced)

Selects the nodes that have the specified local mailbox channel Kernel Time.

**[-mbx-sk-cycles-local <integer>]** - Local Mailbox CPU Cycles (privilege: advanced)

Selects the nodes that have the specified localmailbox channel CPU Cycle count.

**[-ic-abs-time-local <integer>]** - Local IC Absolute Time (privilege: advanced)

Selects the nodes that have the specified local Interconnect channel absolute time. This time is measured in msecs since 1/1/1970 (epoch).

**[-ic-sk-time-local <integer>]** - Local IC Kernel Time (privilege: advanced)

Selects the nodes that have the specified local Interconnect channel Kernel Time.

**[-ic-sk-cycles-local <integer>]** - Local IC CPU Cycles (privilege: advanced)

Selects the nodes that have the specified local Interconnect channel CPU Cycle count.
[<partner-mbx-node-status <Mailbox Status>>] - Partner Mailbox Node Status (privilege: advanced)
Selects the nodes that have the specified partner mailbox node status. Possible values include:
- MBX_UNKNOWN
- MBX_TAKEOVER_DISABLED
- MBX_TAKEOVER_ENABLED
- MBX_TAKEOVER_ACTIVE
- MBX_GIVEBACK_DONE

[<mbx-abs-time-partner <integer>]> - Partner Mailbox Absolute Time (privilege: advanced)
Selects the nodes that have the specified partner mailbox channel absolute time. This time is measured in msecs since 1/1/1970 (epoch).

[<mbx-sk-time-partner <integer>]> - Partner Mailbox Kernel Time (privilege: advanced)
Selects the nodes that have the specified partner mailbox channel Kernel Time.

[<mbx-sk-cycles-partner <integer>]> - Partner Mailbox CPU Cycles (privilege: advanced)
Selects the nodes that have the specified partner mailbox channel CPU Cycle count.

[<mbx-major-seq-num-partner <integer>]> - Partner Mailbox Major Sequence Number (privilege: advanced)
Selects the nodes that have the specified partner mailbox channel major sequence number.

[<mbx-minor-seq-num-partner <integer>]> - Partner Mailbox Minor Sequence Number (privilege: advanced)
Selects the nodes that have the specified partner mailbox channel minor sequence number.

[<ic-abs-time-partner <integer>]> - Partner IC Absolute Time (privilege: advanced)
Selects the nodes that have the specified partner Interconnect channel absolute time. This time is measured in msecs since 1/1/1970 (epoch).

[<ic-sk-time-partner <integer>]> - Partner IC Kernel Time (privilege: advanced)
Selects the nodes that have the specified partner Interconnect channel Kernel Time.

[<ic-sk-cycles-partner <integer>]> - Partner IC CPU Cycles (privilege: advanced)
Selects the nodes that have the specified partner Interconnect channel CPU Cycle count.

[<ic-major-seq-num-partner <integer>]> - Partner IC Major Sequence Number (privilege: advanced)
Selects the nodes that have the specified partner Interconnect channel major sequence number.

[<ic-minor-seq-num-partner <integer>]> - Partner IC Minor Sequence Number (privilege: advanced)
Selects the nodes that have the specified partner Interconnect channel minor sequence number.

[<local-takeover-info <text>]> - Local Takeover Info (privilege: advanced)
Selects the nodes that have the specified local node takeover information. This includes the type of negotiated failover request, or if takeover is not possible, the reason why takeover is disabled. Possible values include:
- NOTKOVER_NVRAM_DOWN - NVRAM mirror is down
- NOTKOVER_OPERATOR_DISABLE_NVRAM - Operator disabled
- NOTKOVER_PARTNER_RESET - A link reset is in progress
- NOTKOVER_FM_TAKEOVER - The failover monitor has declared takeover
- NOTKOVER_NVRAM_MISMATCH - NVRAM sizes mismatch
- NOTKOVER_OPERATOR_DENY - Operator denies takeover
- NOTKOVER_CLUSTER_DISABLE - Cluster is disabled
- NOTKOVER_VERSION - Version mismatch
- NOTKOVER_SHELF_HOT - Disk shelf is too hot
- NOTKOVER_REVERT_IN_PROGRESS - Revert is in progress
- NOTKOVER_HALT_NOTKOVER - Node halted in no-takeover mode
- TKOVER_ON_REBOOT - Enable takeover on reboot
- TKOVER_ON_PANIC - Enabled takeover on panic
- TKOVER_ON_STUTTER_DISABLED - Disable takeover on short uptime
- NFO_DISK_SHELF_ENABLED - Negotiated failover for disk shelf module is enabled
- NFO_ISCSI_ENABLED - Negotiated failover for network interfaces module is enabled
- NFO_FCP_TARGET_ENABLED - Negotiated failover for fcp target module is enabled

[-partner-takeover-info <text>] - Partner Takeover Info (privilege: advanced)
Selects the nodes that have the specified partner node takeover information. This includes the type of negotitated failover request, or if takeover is not possible, the reason why takeover is disabled. Possible values include:
- NOTKOVER_NVRAM_DOWN - NVRAM mirror is down
- NOTKOVER_OPERATOR_DISABLE_NVRAM - Operator disabled
- NOTKOVER_PARTNER_RESET - A link reset is in progress
- NOTKOVER_FM_TAKEOVER - The failover monitor has declared takeover
- NOTKOVER_NVRAM_MISMATCH - NVRAM sizes mismatch
- NOTKOVER_OPERATOR_DENY - Operator denies takeover
- NOTKOVER_CLUSTER_DISABLE - Cluster is disabled
- NOTKOVER_VERSION - Version mismatch
- NOTKOVER_SHELF_HOT - Disk shelf is too hot
- NOTKOVER_REVERT_IN_PROGRESS - Revert is in progress
- NOTKOVER_HALT_NOTKOVER - Node halted in no-takeover mode
- TKOVER_ON_REBOOT - Takeover on reboot is enabled
- TKOVER_ON_PANIC - Takeover on panic is enabled
- TKOVER_ON_STUTTER_DISABLED - Disable takeover on short uptime
- NFO_DISK_SHELF_ENABLED - Negotiated failover for disk shelf module is enabled
- NFO_ISCSI_ENABLED - Negotiated failover for network interfaces module is enabled
- NFO_FCP_TARGET_ENABLED - Negotiated failover for fcp target module is enabled

[-local-headswap-state <Headswap State>] - Local Head Swap State (privilege: advanced)
Selects the nodes that have the specified local node headswap state. Possible values are:
- HEADSWAP_NONE - head swap not in progress
- HEADSWAP_START - head swap started
- **HEADSWAP_CFO_START** - CFO phase of head swap started
- **HEADSWAP_CFO_END** - CFO phase of head swap completed
- **HEADSWAP_SFO_START** - SFO phase of head swap started

**[-partner-headswap-state <Headswap State>] - Partner Head Swap State (privilege: advanced)**

Selects the nodes that have the specified partner node headswap state. Possible values are:

- **HEADSWAP_NONE** - head swap not in progress
- **HEADSWAP_START** - head swap started
- **HEADSWAP_CFO_START** - CFO phase of head swap started
- **HEADSWAP_CFO_END** - CFO phase of head swap completed
- **HEADSWAP_SFO_START** - SFO phase of head swap started

**[-fast-timeout <integer>] - Fast Timeout (privilege: advanced)**

Selects the nodes that have the specified fast-timeout configuration setting.

**[-slow-timeout <integer>] - Slow Timeout (privilege: advanced)**

Selects the nodes that have the specified slow-timeout setting.

**[-mailbox-timeout <integer>] - Mailbox Timeout (privilege: advanced)**

Selects the nodes that have the specified mailbox-timeout setting.

**[-connect-timeout <integer>] - Connect Timeout (privilege: advanced)**

Selects the nodes that have the specified connect-timeout setting.

Selects the nodes that have the specified operator-timeout setting.

**[-firmware-timeout <integer>] - Firmware Timeout (privilege: advanced)**

Selects the nodes that have the specified firmware-timeout setting.

**[-dumpcore-timeout <integer>] - Dumpcore Timeout (privilege: advanced)**

Selects the nodes that have the specified dump-core timeout setting.

**[-booting-timeout <integer>] - Booting Timeout (privilege: advanced)**

Selects the nodes that have the specified booting-timeout setting.

**[-transit-timer {true|false}] - Transit Timer Enabled (privilege: advanced)**

Selects the nodes that have the specified transit-timer setting.

**[-transit-timeout <integer>] - Transit Timeout (privilege: advanced)**

Selects the nodes that have the specified transit timeout.

**[-firmware-received <integer>] - Firmware Received (privilege: advanced)**

Selects the nodes that have the specified firmware-reception time.

**[-firmware-received-cycles <integer>] - Firmware Received in CPU Cycles (privilege: advanced)**

Selects the nodes that have the specified firmware-reception time in CPU Cycles.

**[-booting-received <integer>] - Booting Received (privilege: advanced)**

Selects the nodes that have the specified booting-reception time.

**[-transit-time <integer>] - Transit Event Time (privilege: advanced)**

Selects the nodes whose last failover event occurred at the specified time.
[-pnormal <integer>] - Primary Normal IO Time (privilege: advanced)
  Selects the nodes that have the specified normal primary-mailbox I/O time.

[-ptransition <integer>] - Primary Transition IO Time (privilege: advanced)
  Selects the nodes that have the specified transitional primary-mailbox I/O time.

[-bnormal <integer>] - Backup Normal IO Time (privilege: advanced)
  Selects the nodes that have the specified normal backup-mailbox I/O time.

[-btransition <integer>] - Backup Transition IO Time (privilege: advanced)
  Selects the nodes that have the specified transitional backup-mailbox I/O time.

[-logs-unsynced <integer>] - Logs Unsynced Count (privilege: advanced)
  Selects the nodes that have the specified count of unsynchronized logs.

[-auto-giveback {true|false}] - Auto Giveback Enabled
  Selects the nodes that have the specified auto-giveback setting.

[-detection-time <integer>] - Takeover Detection Time (secs)
  Selects the nodes that have the specified detection-time setting.

[-onfailure {true|false}] - Takeover on Failure Enabled (privilege: advanced)
  Selects the nodes that have the specified takeover-on-failure setting.

[-onpanic {true|false}] - Takeover on Panic Enabled
  Selects the nodes that have the specified takeover-on-panic setting.

[-onshort-uptime {true|false}] - Takeover on Short Uptime Enabled (privilege: advanced)
  Selects the storage-failover configurations that match this parameter value.

[-short-uptime <integer>] - Short Uptime (secs) (privilege: advanced)
  Selects the nodes that have the specified short-uptime value.

[-attempts <integer>] - Number of Giveback Attempts (privilege: advanced)
  Selects the nodes that have the specified number of giveback attempts.

[-attempts-time <integer>] - Giveback Attempts Period (minutes) (privilege: advanced)
  Selects the nodes that have the specified time setting for giveback attempts.

[-propagate {true|false}] - Propagate Status via Mailbox (privilege: advanced)
  Selects the nodes that have the specified propagate-status-via-mailbox setting.

[-read-interval <integer>] - Node Status Read Interval (secs) (privilege: advanced)
  Selects the nodes that have the specified read interval.

[-write-interval <integer>] - Node Status Write Interval (secs) (privilege: advanced)
  Selects the nodes that have the specified write interval.

[-onreboot {true|false}] - Takeover on Reboot Enabled
  Selects the nodes that have the specified takeover-on-reboot setting.

[-delay-seconds <integer>] - Delay Before Auto Giveback (secs)
  Selects the nodes that have the specified delay (in seconds) for the auto giveback.

[-hwassist {true|false}] - Hardware Assist Enabled
  Selects the nodes that have the specified hwassist setting.

[-hwassist-partner-ip <IP Address>] - Partner's Hwassist IP
  Selects the nodes that have the specified hwassist-partner-ip setting.
[-hwassist-partner-port <integer>] - Partner's Hwassist Port
Selects the nodes that have the specified hwassist-partner-port setting.

[-hwassist-health-check-interval <integer>] - Hwassist Health Check Interval (secs)
Selects the nodes that have the specified hwassist health check interval, in seconds.

[-hwassist-retry-count <integer>] - Hwassist Retry Count
Selects the nodes that have the specified hwassist retry count, in seconds.

[-hwassist-status <text>] - Hwassist Status
Selects the nodes that have the specified hwassist-status setting.

[-time-until-autogiveback <integer>] - Time Until Auto Giveback (secs)
Selects the nodes that have the specified time(in seconds) until auto giveback.

[-local-mailbox-disks <text>] - Local Mailbox Disks
Selects the nodes that have the specified mailbox disks on the local node.

[-partner-mailbox-disks <text>] - Partner Mailbox Disks
Selects the nodes that have the specified mailbox disks on the partner node.

[-local-firmware-state <text>] - Local Firmware State (privilege: advanced)
Selects the nodes that have the specified firmware state on the local node.

[-local-firmware-progress <integer>] - Local Firmware Progress Counter (privilege: advanced)
Selects the nodes that have the specified firmware progress counter for the local node.

[-partner-firmware-state <text>] - Partner Firmware State (privilege: advanced)
Selects the nodes that have the specified firmware state of the partner node.

[-partner-firmware-progress <integer>] - Partner Firmware Progress Counter (privilege: advanced)
Selects the nodes that have the specified firmware progress counter for the partner node.

[-local-missing-disks <text>] - Missing Disks on Local Node
Selects the nodes that have the specified missing disks on the local node.

[-partner-missing-disks <text>] - Missing Disks on Partner Node
Selects the nodes that have the specified missing disks on the partner node.

[-reboot-timeout <integer>] - Reboot Timeout (privilege: advanced)
Selects the nodes that have the specified reboot timeout.

[-time-since-takeover <text>] - Time Since Takeover
Selects the nodes that have been in takeover mode for the specified amount of time.

[-auto-giveback-after-panic {true|false}] - Auto Giveback After Takeover On Panic
Selects the nodes that have the specified auto-giveback-after-panic setting. If true then an automatic giveback operation is invoked when the failover node of an HA pair is repaired and rebooted. The takeover node of the HA pair detects this and initiates a giveback operation automatically.

[-is-giveback-requested {true|false}] - Giveback Requested (privilege: advanced)
Selects the nodes that have the specified is-giveback-requested setting. If true, a deferred giveback request has been made by the local node.

[-auto-giveback-last-veto-check <integer>] - Auto Giveback Last Veto Check (privilege: advanced)
Selects the nodes that have the specified auto-giveback-last-veto-check time. This setting indicates the time, in milliseconds, when the local node made the most recent giveback veto check.
- `is-auto-giveback-attempts-exceeded {true|false}` - Auto Giveback Attempts Exceeded (privilege: advanced)
  Selects the nodes that have the specified is-auto-giveback-attempts-exceeded setting. If true, the local node has exceeded the maximum number of allowed auto giveback attempts.

- `was-auto-giveback-done {true|false}` - Was Auto Giveback Done (privilege: advanced)
  Selects the nodes that have the specified was-auto-giveback-done setting. If true, the last giveback was automatic (as opposed to a manual giveback).

- `is-cifs-auto-giveback-stopping {true|false}` - Is CIFS Auto Giveback Stopping (privilege: advanced)
  Selects the nodes that have the specified is-cifs-auto-giveback-stopping setting. If true, the local node has initiated CIFS termination as part of an automatic giveback.

- `aggregate-migration-timeout <integer>` - Aggregate Migration Timeout (secs) (privilege: advanced)
  Selects the nodes that have the specified aggregate migration timeout.

- `is-mirror-enabled {true|false}` - Is NVRAM Mirroring Enabled (privilege: advanced)
  Selects the nodes that have the specified is-mirror-enabled setting. If true, then NVRAM mirroring is enabled.

- `is-mirror-consistency-required {true|false}` - Is Mirror Consistency Required (privilege: advanced)
  Selects the nodes that have the specified is-mirror-consistency-required setting. If true, then NVRAM mirror consistency is required.

- `is-memory-insufficient {true|false}` - Is Memory Insufficient To Takeover (privilege: advanced)
  Selects the nodes that have the specified is-memory-insufficient setting. If true, the local node does not have enough memory to perform a takeover.

- `memio-state <memio status>` - Current State of Memio Link (privilege: advanced)
  Selects the nodes that have the specified memio layer link current state. Possible values are:
  - UNINIT - Uninitialized
  - CLOSED - Closed
  - HB_LISTEN - Listening for connect
  - SYN_SENT - Sent generation information
  - ESTABLISHED - Connection established

- `is-degraded {true|false}` - Are Partner Mailbox Disks Not Known (privilege: advanced)
  Selects the nodes that have the specified is-degraded setting. If true, takeovers are deferred because partner mailbox disks are not known.

- `reserve-policy <reserve policy>` - FM Reservation Policy (privilege: advanced)
  Selects the nodes that have the specified disk reservation policy. Possible values are:
  - RESERVE_NO_DISKS - no disk reservations made during takeover, nor are disk reservations released during giveback
  - RESERVE_LOCK_DISKS_ONLY - only mailbox disks are released during takeover and released during giveback
  - RESERVE_ONLY_AT_TAKEOVER - reservations are issued only at takeover time. All disks are reserved. All reservations are released at giveback
  - RESERVE_ALWAYS_AFTER_TAKEOVER - reservations are issued at at takeover. When disks are subsequently added, they are also reserved. All disks are released at giveback

storage failover commands
[\texttt{-reset-disks \{true|false\}] - Issue Disk Resets during Failover (privilege: advanced)

Selects the nodes that have the specified reset-disks setting. If \textit{true}, disks are reset during takeover/giveback.

[\texttt{-total-system-uptime <integer>}] - Total System Uptime (privilege: advanced)

Selects the nodes that have the specified total system uptime, in milliseconds.

[\texttt{-current-time <integer>}] - Current System Time (privilege: advanced)

Selects the nodes that have the specified current time on the node.

[\texttt{-fm-takeover-state <FM Takeover/Giveback Transition>}] - FM Takeover State (privilege: advanced)

Selects the nodes that have the specified takeover state. Possible values are:

- \texttt{FT\_NONE} - Not in takeover
- \texttt{FT\_TAKEOVER\_STARTED} - Local node has initiated takeover
- \texttt{FT\_TAKEOVER\_COMMITTED} - Takeover has been committed
- \texttt{FT\_TAKEOVER\_DONE\_OK} - Local node successfully completed takeover
- \texttt{FT\_TAKEOVER\_DONE\_FAILED} - Takeover failed

[\texttt{-fm-giveback-state <FM Takeover/Giveback Transition>}] - FM Giveback State (privilege: advanced)

Selects the nodes that have the specified giveback state. Possible values are:

- \texttt{FT\_NONE} - Not in giveback
- \texttt{FT\_GIVEBACK\_READY} - Partner node is ready for giveback
- \texttt{FT\_GIVEBACK\_STARTED} - Local node has initiated giveback
- \texttt{FT\_GIVEBACK\_COMMITTED} - Giveback has been committed
- \texttt{FT\_GIVEBACK\_DONE\_OK} - Giveback completed successfully

[\texttt{-takeover-reason <FM Takeover Reason>}] - Reason why takeover triggered (privilege: advanced)

Selects the nodes that have the specified takeover reason. Possible values are:

- \texttt{TAKEOVER\_NONE} - Not in takeover
- \texttt{TAKEOVER\_IMMEDIATE} - Operator initiated forced takeover
- \texttt{TAKEOVER\_NDU} - Takeover initiated as part of NDU
- \texttt{TAKEOVER\_FORCED} - Operator initiated forced takeover, possible data loss
- \texttt{TAKEOVER\_EARLY} - Takeover occurred during the boot process
- \texttt{TAKEOVER\_OPERATOR\_EXP} - Takeover occurred after the operator timeout expired
- \texttt{TAKEOVER\_POST\_FAILED} - Takeover occurred on POST failure
- \texttt{TAKEOVER\_PANIC} - Takeover on panic
- \texttt{TAKEOVER\_SHORTUPTIME} - Takeover after rapid toggling between up and down states
- \texttt{TAKEOVER\_SPARECORE\_EXP} - Takeover on panic timeout expiration
- \texttt{TAKEOVER\_REBOOT\_EXP} - Takeover on reboot timer expiration
- \texttt{TAKEOVER\_BOOTING\_EXP} - Takeover on booting timer expiration
- \texttt{TAKEOVER\_FIRMWARE\_EXP} - Takeover on firmware timer expiration
- TAKEOVER_NFO_SHUTDOWN - Takeover on negotiated failover shutdown
- TAKEOVER_NFO_TIMER - Takeover on negotiated failover timer expiration
- TAKEOVER_MDP - Takeover on multi-disk panic
- TAKEOVER_REBOOT - Takeover on reboot
- TAKEOVER_HALT - Takeover on halt
- TAKEOVER_CLAM - CLAM-triggered takeover
- TAKEOVER_HWASSIST - Hardware-assisted takeover
- TAKEOVER_NORMAL - Operator initiated takeover

[-ha-type {none|shared_storage|non_shared_storage}] - HA Type

If this parameter is specified, the command selects the nodes that have the specified HA-type setting. If the value is set to shared_storage, then the node is in a storage-failover configuration using the shared storage. If it is set to non_shared_storage, then the node is in a storage-failover configuration using the unshared storage. If it is set to none, then the node is not part of a storage-failover configuration.

### Examples

The following example displays information about all storage-failover configurations:

```
cluster1::> storage failover show
Takeover
-------- -------- -------- ------------------
node0    node1    true     Connected to node1
node2    node3    true     Connected to node3
node1    node0    true     Connected to node0
node3    node2    true     Connected to node2
4 entries were displayed.
```

### storage failover show-giveback

Display giveback status

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**

The `storage failover show-giveback` command displays information about the giveback status of high-availability (HA) partner aggregates. The command displays the following information when no parameters are specified:

- Node name
- Partner aggregate name
- Giveback Status

You can specify additional parameters to display only the information that matches those parameters. For example, to display information only about a particular aggregate, run the command with the `-aggregate aggregate_name` parameter.

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.
If you specify the `-instance` parameter, the command displays detailed information about all fields.

`-node <nodename>|local` - Node

If this parameter is used, the command displays information about the giveback status of the aggregates belonging to the HA partner of the specified node.

`-aggregate <text>` - Aggregate

If this parameter is used, the command displays information about the giveback status of the specified aggregate.

`-giveback-status <text>, ...` - Aggregates Giveback State

If this parameter is used, the command displays information about the aggregates with the specified giveback status.

`-destination <text>` - Destination for Giveback

If this parameter is used, the command displays information about the giveback status of the aggregates whose destination after the giveback is the specified node.

**Examples**

The following example displays information about giveback status on all nodes:

```bash
node::> storage failover show-giveback
Partner
Node  Aggregate         Giveback Status
-------  -----------------  -------------------------------------------
node0    -                No aggregates to give back
node1    -                No aggregates to give back
node2    -                No aggregates to give back
node3    -                No aggregates to give back
4 entries were displayed.
```

**storage failover show-takeover**

Display takeover status

**Availability:** This command is available to cluster administrators at the `admin` privilege level.

**Description**

The `storage failover show-takeover` command displays information about the takeover status of nodes in a cluster. The command also displays the takeover status of aggregates being taken over. During each phase of takeover, the takeover node and the node being taken over display their takeover status and the status of the aggregates being taken over. The command displays the following information when no parameters are specified:

- Node name
- Node takeover status - This contains a descriptive information about the phase of takeover.
- Aggregate
- Aggregate takeover status - This contains the following information:
  - Takeover status of the aggregate, such as "Done", "Failed", "In progress" and "Not attempted yet".
  - Reason for an aggregate takeover failure.
  - Corrective action, in case of an aggregate takeover failure.
You can specify additional parameters to display only the information that matches those parameters. For example, to display information only about a particular node, run the command with the `-node node_name` parameter.

**Parameters**

`{-fields <fieldname>,...]`

If this parameter is specified, the command displays the specified fields for all nodes, in column style output.

`{-instance}`

If this parameter is specified, the command displays the same detailed information as for the `-node` parameter, but for all nodes.

`{-node <nodename|local}> - Node Name`

If this parameter is specified, the command displays information about the takeover status of the specified node, and the takeover status of the aggregates being taken over.

`{-node-takeover-status <text>}` - Node's Takeover Status

If this parameter is specified, the command displays information about the takeover status of the nodes with the specified node-takeover-status. The command also displays the takeover status of the aggregates belonging to the node being taken over.

`{-aggregate <text>}` - Aggregate Being Taken Over

If this parameter is specified, the command displays information about the takeover status of the specified aggregate, and the takeover status of the nodes containing the specified aggregate.

`{-aggregate-takeover-status <text>}` - Aggregate's Takeover Status

If this parameter is specified, the command displays information about the takeover status of the aggregates with the specified aggregate takeover status, and the takeover status of the nodes containing those aggregates.

**Examples**

The following example shows the takeover status of two nodes, nodeA and nodeB, in an High Availability (HA) pair, when both are in normal mode; neither node has taken over its HA partner. In this case, there is no takeover status for the aggregates.

```
cluster1::> storage failover show-takeover
      Node       Node Status           Aggregate      Takeover Status
---------- --------------------- -------------- -------------------------------
      nodeA            Takeover not attempted. -
      nodeB            Takeover not attempted. -
```

The following example shows the takeover status of two nodes, nodeA and nodeB, in an HA pair, when nodeA is in the SFO phase of an optimized takeover of nodeB. In this case, nodeA does not have information about the takeover status of nodeB's aggregates.

```
cluster1::> storage failover show-takeover
      Node       Node Status           Aggregate      Takeover Status
---------- --------------------- -------------- -------------------------------
      nodeA      Optimized takeover of partner in progress. Partner, ("nodeB"), is relocating its SFO aggregates. Run the command "storage failover show-takeover -node nodeB" to display the relocation status of the partner.
      nodeB      -
```
nodeB      Being taken over.
  aggregator1  In progress, Module: backup.
  aggregator2  Not attempted yet
  CFO aggregates Not attempted yet.

The following example shows the takeover status of two nodes, nodeA and nodeB, in an HA pair, when nodeA has completed the SFO phase of an optimized takeover of nodeB (but has not completed the CFO phase of the optimized takeover). In this case, nodeA has information about the takeover status of nodeB’s aggregates.

```
cluster1::> storage failover show-takeover
Node       Node Status           Aggregate      Takeover Status
---------- --------------------- -------------- -------------------------------
nodeA      Partner has       aggregator1  Done
            relocated its     aggregator2  Done
            aggregates. Takeover
            in progress.

nodeB      Relocated aggregates
to partner. Waiting
for partner to
takeover.
  aggregator1 Done
  aggregator2 Done
  CFO aggregates Done.

Warning: Unable to list entries on node nodeB. RPC: Port mapper failure - RPC:
Timed out
```

The following example shows the takeover status of two nodes, nodeA and nodeB, in an HA pair, when nodeA has completed the SFO and CFO phases of an optimized takeover of nodeB. In this case, nodeA has information about the takeover status of nodeB’s aggregates. Since nodeB is not operational, an Remote Procedure Call (RPC) error is indicated in the command output.

```
cluster1::> storage failover show-takeover
Node       Node Status           Aggregate      Takeover Status
---------- --------------------- -------------- -------------------------------
nodeA      Partner has       aggregator1  Done
            relocated its     aggregator2  Done
            aggregates. In
            takeover.

nodeB      Optimized takeover
            by partner aborted.
            Warning: Unable to list entries on node nodeB. RPC: Port mapper failure - RPC:
            Timed out
```

The following example shows the takeover status of two nodes, nodeA and nodeB, in an HA pair, when nodeA has aborted the SFO phase of an optimized takeover of nodeB. In this case, nodeA does not have information about the takeover status of nodeB’s aggregates.

```
cluster1::> storage failover show-takeover
Node       Node Status           Aggregate      Takeover Status
---------- --------------------- -------------- -------------------------------
nodeA      Optimized takeover
            of partner aborted.
            Run the command
            "storage failover
            show-takeover -node
            nodeB" to display the
            relocation status of
            the partner.

nodeB      Optimized takeover
            by partner aborted.
            aggregator1 Failed: Destination node did not online the aggregate on
time. To takeover the
            remaining aggregates, run the
```
storage failover takeover

Take over the storage of a node's partner

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The storage failover takeover command initiates a takeover of the partner node's storage.

Parameters
{-ofnode <nodename>|local} - Node to Takeover
This specifies the node that is taken over. It is shut down and its partner takes over its storage.

{-bynode <nodename>|local} - Node Initiating Takeover
This specifies the node that is to take over its partner's storage.

{-option <takeover option>} - Takeover Option
This optionally specifies the style of takeover operation. Possible values include the following:

- normal - Specifies a normal takeover operation; that is, the partner is given the time to close its storage resources gracefully before the takeover operation proceeds. This is the default value.

- immediate - Specifies an immediate takeover. In an immediate takeover, the takeover operation is initiated before the partner is given the time to close its storage resources gracefully. The use of this option results in an immediate takeover which does not do a clean shutdown. In case of NDU this can result in a NDU failure.

  Attention: If this option is specified, negotiated takeover optimization is bypassed even if the -bypass-optimization option is set to false.

  Attention: If this option is specified, migration of data LIFs from the partner will be delayed even if the -skip-lif-migration-before-takeover option is not specified. If possible, migrate the data LIFs to another node prior to specifying this option.

- allow-version-mismatch - If this value is specified, the takeover operation is initiated even if the partner is running a version of software that is incompatible with the version running on the node. In this case, the partner is given the time to close its storage resources gracefully before the takeover operation proceeds. However, the takeover operation will not be allowed if the partner has higher WAFL or RAID label versions. Use this value as part of a nondisruptive upgrade or downgrade procedure.

- force - If this value is specified, the takeover operation is initiated even if the node detects an error that normally prevents a takeover operation from occurring. This value is available only at the advanced privilege level and higher.

  Attention: If this option is specified, negotiated takeover optimization is bypassed even if the -bypass-optimization option is set to false.

Caution: The use of this option can potentially result in data loss. If the HA interconnect is detached or inactive, or the contents of the failover partner's NVRAM cards are unsynchronized, takeover is
normally disabled. Using the -force option enables a node to take over its partner's storage despite the unsynchronized NVRAM, which can contain client data that can be lost upon storage takeover.

\[-bypass-optimization \{true|false\}] - Bypass Takeover Optimization

If this is an operator-initiated planned takeover, this parameter specifies whether the takeover optimization is bypassed. This parameter defaults to false.

**Attention:** This parameter is ignored and negotiated takeover optimization automatically bypassed if the -immediate option, the -force option, or the -allow-disk-inventory-mismatch parameter is specified as part of the same storage failover takeover command.

\[-allow-disk-inventory-mismatch \{true|false\}] - Disk inventory

If this parameter is specified, the takeover operation is initiated even if the local node cannot see the partner's filesystem disks.

**Attention:** If this parameter is specified, negotiated takeover optimization is bypassed even if the -bypass-optimization parameter is set to false.

**Caution:** The use of this parameter can potentially result in client outage.

\[-skip-lif-migration-before-takeover \{true\}] - Skip Migrating LIFs Away from Node Prior to Takeover

This parameter specifies that LIF migration prior to takeover is skipped. However if LIFs on this node are configured for failover, those LIFs may still failover after the takeover has occurred. Without this parameter, the command attempts to synchronously migrate data and cluster management LIFs away from the node prior to its takeover. If the migration fails or times out, the takeover is aborted.

\[-ignore-quorum-warnings \{true\}] - Skip Quorum Check Before Takeover

If this parameter is specified, quorum checks will be skipped prior to the takeover. The operation will continue even if there is a possible data outage due to a quorum issue.

**Examples**

The following example causes a node named node0 to initiate a negotiated optimized takeover of its partner's storage:

```
cluster1::> storage failover takeover -bynode node0
```

The following example causes a node named node0 to initiate an immediate takeover of its partner's storage:

```
cluster1::> storage failover takeover -bynode node0 -option immediate
```

**storage failover hwassist commands**

Hardware assist functionality related commands

In a high-availability configuration, a storage controller monitors its partner's health using heartbeats. On storage controller failures, the takeover starts after a storage controller misses several heartbeats - which by default can take up to 15 seconds after the failure occurs. When the hardware-assisted takeover (hwassist) feature is enabled, the service processor of the storage controller (SP, RLM or BMC) is able to detect various failures, such as: Power Loss, Power Cycle, and POST Error. In these cases, the failover detection time is less than a second, allowing the takeover to start much sooner. Use the "storage failover modify" command to configure the hwassist feature.

**storage failover hwassist show**

Display hwassist status

**Availability:** This command is available to cluster administrators at the admin privilege level.
Description
The `storage failover hwassist show` command displays information about hardware assisted takeover configurations. By default, the command displays the following information:

- Node name.
- Partner node name.
- Whether hardware assisted takeover is enabled.
- IP address on which the local node receives hardware assist alerts.
- Port on which local node receives hardware assist alerts.
- Hardware assist monitor status.
- If the monitor is inactive, the reason it is inactive.
- If the monitor is inactive, the corrective action to make it active.

Parameters

{[-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

[-instance]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Selects the hwassist configurations that match this parameter value.

[-partner-name {<nodename>|local}] - Name of the Partner Node

Selects the hwassist configurations that match this parameter value.

[-enabled {true|false}] - Local Hardware Assist Enabled

Selects the hwassist configurations that match this parameter value.

[-local-status <text>] - Local Node's Hwassist Status

Selects the hwassist configurations that match this parameter value (active or inactive).

[-local-ip <text>] - IP Address on Which Local Node is Listening

Selects the hwassist configurations that match this parameter value.

[-local-port <integer>] - Port on Which Local Node is Listening

Selects the hwassist configurations that match this parameter value.

[-local-inactive <text>] - Local Node's Hwassist Inactive Status Reason

Selects the hwassist configurations that match this parameter value.

[-local-action <text>] - Corrective Action on Local Node

Selects the hwassist configurations that match this parameter value.

Examples

The following example displays the hardware assist information for the local node and its partner:

```
cluster1::> storage failover hwassist show
Node
---------
ha1

          Partner : ha2
Hwassist Enabled : true
Hwassist IP : 10.225.248.19
```
**storage failover hwassist test**

Test the hwassist functionality

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The *storage failover hwassist test* command tests the Hardware Assist h/w connectivity between the two nodes in a HA pair. The test result can be one of the following.

- Hardware Assist is not initialized.
- HW assist is not supported.
- Partner is throttling alerts.
- Resource is busy.
- Hardware Assist h/w returned an error.
- No response from partner. Timed out.
- Unexpected abort.
- Partner has taken over.
- Interconnect is down between nodes.
- Partner is not booted up yet.

**Parameters**

- **-node <nodename> | local** - Node

  This specifies the node from which a test alert is initiated.

**Examples**

The following command issues a test alert from the node cluster1-01:

```
cluster1::> storage failover hwassist test -node cluster1-01
   Info: Operation successful.
```
storage failover hwassist stats commands

Hwassist statistics related commands

In a Hardware Assisted environment a node receives various alerts with from the partner node, periodically. Data ONTAP keeps track of all these alerts and maintains statistics about them. The user can see these statistics or clear them.

storage failover hwassist stats clear

Clear the hwassist statistics

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The storage failover hwassist stats clear command clears the statistics information maintained by Hardware Assist functionality.

Parameters
-node {<nodename>|local} - Node
This specifies the node on which the statistics are to be cleared.

Examples
The following example clears the hwassist statistics on the node cluster1-01:

```
cluster1:/> storage failover hwassist stats clear -node cluster1-01
```

storage failover hwassist stats show

Display hwassist statistics

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The storage failover hwassist stats show command displays statistics about the hardware assist alerts processed by a node. The command displays the following information for each alert:

- Locally enabled.
- Partner Inactive Reason.
- Alert type.
- Event that triggered the alert.
- The number of times the alert has been received.
- Whether takeover was possible on receiving the alert.
- The last time at which the alert was received.

Parameters
[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use ‘-fields?’ to display the fields to specify.
If you specify the `-instance` parameter, the command displays detailed information about all fields.

**-node {<nodename>|local}** - Node

Selects the hwassist statistics for the specified node.

### Examples

The following example displays the hwassist statistics for the node ha1:

```
cluster1::> storage failover hwassist stats show -node ha1
```

### storage failover internal-options commands

Display the internal options for storage failover

This contains commands related to displaying and modifying internal options for storage failover of a node.

### storage failover internal-options show

Display the internal options for storage failover

**Availability:** This command is available to `cluster` administrators at the `advanced` privilege level.

**Description**

The `storage failover internal-options show` command displays the following information about the storage failover configuration:
• Node name
• Whether automatic giveback is enabled
• Whether partner checking is enabled
• Takeover detection time, in seconds
• Whether takeover on failover is enabled
• Whether takeover on panic is enabled
• Whether takeover on reboot is enabled
• Whether hardware-assisted takeover is enabled
• IP address on which the partner node listens to the hardware-assisted takeover alerts
• Port on which the partner node listens to the hardware-assisted takeover alerts
• Whether takeover on short uptime is enabled (detailed view only)
• Short uptime interval, in seconds (detailed view only)
• Number of giveback attempts (detailed view only)
• Giveback attempt interval, in minutes (detailed view only)
• Whether status is propagated through SFO mailboxes (detailed view only)
• Status read interval, in seconds (detailed view only)
• Status write interval, in seconds (detailed view only)
• Hardware-assisted takeover retry count (detailed view only)
• Hardware-assisted takeover heartbeat period (detailed view only)
• Whether operator-initiated planned takeover is optimized

Parameters
\{ [-fields <fieldname>, ...] \}

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use ‘-fields ?’ to display the fields to specify.

This parameter displays the following additional information:

• Node name
• Whether takeover on short uptime is enabled
• Short uptime interval, in seconds
• Number of giveback attempts
• Giveback attempt interval, in minutes
• Whether status is propagated through SFO mailboxes
• Status read interval, in seconds
• Status write interval, in seconds
• Hardware-assisted takeover retry count
• Hardware-assisted takeover heartbeat period

| \ [-instance \] |
| If you specify the -instance parameter, the command displays detailed information about all fields.

| \ [-node \ {<nodename>|local}] \ - Node |
| Selects configuration information for the specified node.

| \ [-auto-giveback \ {true|false}] \ - Auto Giveback Enabled |
| Selects configuration information for nodes that have the specified automatic giveback setting.

| \ [-check-partner \ {true|false}] \ - Check Partner Enabled |
| Selects configuration information for nodes that have the specified partner-checking setting.

| \ [-detection-time \ <integer>] \ - Takeover Detection Time (secs) |
| Selects configuration information for nodes that have the specified takeover detection time setting.

| \ [-onfailure \ {true|false}] \ - Takeover on Failure Enabled |
| Selects configuration information for nodes that have the specified takeover-on-failure setting.

| \ [-onpanic \ {true|false}] \ - Takeover on Panic Enabled |
| Selects configuration information for nodes that have the specified takeover-on-panic setting.

| \ [-onshort-uptime \ {true|false}] \ - Takeover on Short Uptime Enabled |
| Selects configuration information for nodes that have the specified takeover-on-short-uptime setting.

| \ [-short-uptime \ <integer>] \ - Short Uptime (secs) |
| Selects configuration information for nodes that have the specified takeover-on-short-uptime time setting.

| \ [-attempts \ <integer>] \ - Number of Giveback Attempts |
| Selects configuration information for nodes that have the specified number of giveback attempts setting.

| \ [-attempts-time \ <integer>] \ - Giveback Attempts Minutes |
| Selects configuration information for nodes that have the specified giveback attempt time setting.

| \ [-propagate \ {true|false}] \ - Propagate Status via Mailbox |
| Selects configuration information for nodes that have the specified setting for propagation of status through Storage Failover mailboxes.

| \ [-read-interval \ <integer>] \ - Node Status Read Interval (secs) |
| Selects configuration information for nodes that have the specified status read interval setting.

| \ [-write-interval \ <integer>] \ - Node Status Write Interval (secs) |
| Selects configuration information for nodes that have the specified status write interval setting.

| \ [-onreboot \ {true|false}] \ - Takeover on Reboot Enabled |
| Selects configuration information for nodes that have the specified takeover-on-reboot setting.

| \ [-delay-seconds \ <integer>] \ - Delay Before Auto Giveback (secs) |
| If this parameter is specified, the command displays information only about the node or nodes that have the specified delay for auto giveback.

| \ [-hwassist \ {true|false}] \ - Hwassist Enabled |
| Selects configuration information for nodes that have the specified hardware-assisted takeover setting.

| \ [-hwassist-partner-ip \ <text>] \ - Partner's Hwassist IP |
| Selects configuration information for nodes that have the specified partner IP setting for hardware-assisted takeovers.
[-hwassist-partner-port <integer>] - Partner's Hwassist Port
Selects configuration information for nodes that have the specified partner port setting for hardware-assisted takeovers.

[-hwassist-health-check-interval <integer>] - Hwassist Health Check Interval (secs)
Selects configuration information for nodes that have the specified health check interval setting for hardware-assisted takeovers.

[-hwassist-retry-count <integer>] - Hwassist Retry Count
Selects configuration information for nodes that have the specified retry count (in seconds) for hardware-assisted takeovers.

[-mode {ha|non_ha}] - HA Mode
If this parameter is specified, the command displays information only about the node or nodes that have the specified HA mode.

[-bypass-takeover-optimization {true|false}] - Bypass Takeover Optimization Enabled
Selects configuration information for nodes that have the specified setting for bypass takeover optimization (true means that optimized operator-initiated planned takeover is bypassed, false means that it is enabled). Operator-initiated planned takeover is optimized when SFO aggregates are relocated serially to the partner prior to takeover. This reduces client outage.

Examples
The following example displays detailed information about the internal options for storage failover on a node named node2:

```
cluster1::*> storage failover internal-options show -node node2
```

storage failover mailbox-disk commands
Display the status of storage failover mailbox disks
Mailbox disks are part of root aggregate. High Availability related information is written persistently on mailbox disks. This directory contains command to display information related to local and partner mailbox disks.
storage failover mailbox-disk show

Display information about storage failover mailbox disks

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The storage failover mailbox-disk show command lists the mailbox disks that are used by storage failover. The command displays the following information:

- Node name
- Whether the mailbox disk is owned by the local node or by its partner
- Disk name
- Disk universal unique identifier (UUID)

This command is available only at the advanced privilege level and higher.

Parameters

{-fields <fieldname>,...}
If -fields <fieldname>,... is used, the command displays only the specified fields.

{-instance}
If this parameter is used, the command displays detailed information about all entries.

{-node <nodename>|local] - Node
Selects the mailbox disks that are associated with the specified node.

{-location {local|partner|tertiary] - Mailbox Owner
Selects the mailbox disks that have the specified relationship to the node.

{-diskindex <integer>] - Mailbox Disk Index
Selects the mailbox disk that has the specified index number.

{-diskname <text>] - Mailbox Disk Name
Selects the mailbox disks that match the specified disk name.

{-diskuuid <text>] - Mailbox Disk UUID
Selects the mailbox disks that match the specified UUID.

{-physical-location {local|partner|mediator]} - Mailbox Disk Physical Location
Selects the mailbox disks that match the specified physical location.

{-location-id <nvramid>] - System ID of the Node where the Disk is Attached
Selects the mailbox disks that match the specified location-id.

{-location-name <text>] - Mailbox Disk Location
Selects the mailbox disks that match the specified location-name.

Examples
The following example displays information about the mailbox disks on a node named node1:

```
cluster1:*> storage failover mailbox-disk show -node node1

<table>
<thead>
<tr>
<th>Node</th>
<th>Location</th>
<th>Index</th>

</tr>
</tbody>
</table>
```
storage failover progress-table commands

Display the storage failover progress table

storage failover progress-table show

Display status information about storage failover operations

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

The `storage failover progress-table show` displays status information about storage-failover operations. This information is organized in a resource table. The command displays the following information:

- Node name
- Resource-entry index number
- Resource-entry name
- Resource-entry state
- Resource-entry failure code
- Resource-entry time delta

This command is available only at the advanced privilege level and higher.

Parameters

`{ [ -fields <fieldname>, ... ]

If -fields <fieldname>, ... is used, the command will only displays only the specified fields.

| [ -instance ]

If this parameter is used, the command displays detailed information about all entries.

| -node <nodename> [ local ] - Node

Selects the status information for the specified node.

| -index <integer> - Resource Table Index

Selects the status information for the specified index number.

| -entryname <text> - Resource Table Entry Name

Selects the status information for the specified entry name.

| -state <text> - Resource Table Entry State

Selects the status information for the specified state. Possible values include UP, START_RUNNING, START_DONE, START_FAILED, STOP_RUNNING, STOP_FAILED, TAKEOVER_BARRIER, and ONLY_WHEN_INITD.

| -failurecode <text> - Entry Failure Code

Selects the status information for the specified failure code. Possible values include OK, FAIL, FAIL_ALWAYS, HANG, PANIC, and VETO.

| -timedelta <integer> - Entry Time Delta

Selects the status information for the specified time delta.
storage firmware commands

Download disk, ACP Processor and shelf firmware

**storage firmware download**

Download disk, ACP processor and shelf firmware

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**
The **storage firmware download** command downloads ACP processor, disk and shelf firmware to a specified node.

Use the **storage disk firmware update** command to install downloaded disk firmware.

Use the **system node run local storage download shelf** command to install downloaded disk shelf module firmware.

Use the **system node run local storage download acp** command to install downloaded ACP processor firmware.

**Parameters**

- **-node** `<nodename>|local` - Node
  
  This specifies the node to which the firmware is to be downloaded.

- **-package-url** `<text>` - Package URL
  
  This specifies the path to the firmware package.

  The following URL protocols are supported: ftp, http, tftp and file. The file URL scheme can be used to specify the location of the package to be fetched from an external device connected to the storage controller. Currently, only USB mass storage devices are supported. The USB device is specified as *file://usb0/* `<filename>`. The package must be present in the root directory of the USB mass storage device.
Examples
The following example downloads a disk firmware package with the path ftp://example.com/fw/disk-fw-1.2.LOD.zip to a node named node1:

```
cluster1::> storage firmware download -node node1 -package-url ftp://example.com/fw/disk-fw-1.2.LOD.zip
```

storage firmware acp commands
Manage storage ACP firmware files

storage firmware acp delete
Delete an ACP firmware file

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The `storage firmware acp delete` command deletes the specified ACP processor firmware file from all nodes that are currently part of the cluster.

Parameters
- `-filename <text>` - Firmware Filename
  
  Specifies the firmware file to delete.

Examples
The following example deletes the ACP processor firmware file with the name ACP-IOM3.0150.AFW.FVF on each node:

```
cluster1::*> storage firmware acp delete -filename ACP-IOM3.0150.AFW.FVF
```

Related references
- `storage firmware acp show` on page 966
- `storage firmware acp rename` on page 965

storage firmware acp rename
Rename an ACP firmware file

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The `storage firmware acp rename` command renames the specified ACP processor firmware file on each node.

Parameters
- `-oldname <text>` - Old Filename
  
  This parameter specifies the firmware file to rename.
-newname <text> - New Filename

This parameter specifies the new name of the firmware file.

### Examples

The following example renames the ACP processor firmware file with the name ACP-IOM3.0150.AFW.FVF to ACP-IOM3.AFW.FVF on each node:

```
cluster1::*> storage firmware acp rename -oldname ACP-IOM3.0150.AFW.FVF -newname ACP-IOM3.AFW.FVF
```

### storage firmware acp show

Display the list of ACP firmware files on the given node

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

The `storage firmware acp show` command displays the ACP processor firmware files present on each node.

**Parameters**

{ [-fields <fieldname>, ...]
  
  If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.
  
[-instance]
  
  If you specify the `-instance` parameter, the command displays detailed information about all fields.
  
[-node {<nodename>|local}] - Node
  
  Selects the files that match the specified node name.
  
[-filename <text>] - Storage Firmware File
  
  Selects the files that match the specified filename.

### Examples

The following example displays the ACP processor firmware files on each node:

```
cluster1::> storage firmware acp show

Node: Node1
ACP Firmware Files
----------------------------------------
ACP-IOM3.0150.AFW.FVF
ACP-IOM3.AFW
ACP-IOM6.0210.AFW
ACP-IOM6.0210.AFW.FVF

Node: Node2
ACP Firmware Files
----------------------------------------
ACP-IOM3.0150.AFW.FVF
```

storage firmware disk commands

Manage storage disk firmware files

storage firmware disk delete

Delete a disk firmware file

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

The storage firmware disk delete command deletes the specified disk firmware file on each node.

Parameters

- filename <text> - Storage Firmware Filename

  Specifies the firmware file to delete.

Examples

The following example deletes the disk firmware file with the name X262_SMOOST25SSX.NA06.LOD on each node:

  cluster1:~*> storage firmware disk delete -filename X262_SMOOST25SSX.NA06.LOD

Related references

  storage firmware disk show on page 968
  storage firmware disk rename on page 967

storage firmware disk rename

Rename a disk firmware file

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

The storage firmware disk rename command renames the specified disk firmware file on each node.

Parameters

- oldname <text> - Old Filename

  This parameter specifies the firmware file to rename.

- newname <text> - New Filename

  This parameter specifies the new name of the firmware file.
Examples
The following example renames the disk firmware file with the name X262_SMOOST25SSX.NA06.LOD to X262_SMOOST25SSX.LOD on each node:

```
cluster1::*> storage firmware disk rename -oldname X262_SMOOST25SSX.NA06.LOD -newname X262_SMOOST25SSX.LOD
```

**storage firmware disk show**

Display the list of disk firmware files on the given node

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**
The `storage firmware disk show` command displays the disk firmware files present on each node.

**Parameters**

```
[-fields <fieldname>, ...]  
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.
```

```
[-instance]  
If you specify the `-instance` parameter, the command displays detailed information about all fields.
```

```
[-node <nodename> | local] - Node  
Selects the files that match the specified node name.
```

```
[-filename <text>] - Storage Firmware File  
Selects the files that match the specified filename.
```

Examples
The following example displays the disk firmware files on each node:

```
cluster1::> storage firmware disk show
Node: Node1
Disk Firmware Files
----------------------------------------
X262_SMOOST25SSX.NA06.LOD
X262_SMOOST25SSX.NA06.LOD.FVF
X267_SMOOST50SSX.NA06.LOD
X267_SMOOST50SSX.NA06.LOD.FVF
8 entries were displayed.
```

```
Node: Node2
Disk Firmware Files
----------------------------------------
X262_SMOOST25SSX.NA06.LOD
X262_SMOOST25SSX.NA06.LOD.FVF
X267_SMOOST50SSX.NA06.LOD
X267_SMOOST50SSX.NA06.LOD.FVF
8 entries were displayed.
```

storage firmware disk rename on page 967

storage firmware shelf commands

Manage storage shelf firmware files

storage firmware shelf delete

Delete a shelf firmware file

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The `storage firmware shelf delete` command deletes the specified shelf firmware file from all nodes that are currently part of the cluster.

Parameters

- `-filename <text>` - Storage Firmware Filename
  
  Specifies the firmware file to delete.

Examples

The following example deletes the shelf firmware file with the name IOM12.0210.SFW on each node:

```
cluster1:.*> storage firmware shelf delete -filename IOM12.0210.SFW
```

Related references

storage firmware shelf show on page 970
storage firmware shelf rename on page 969

storage firmware shelf rename

Rename a shelf firmware file

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The `storage firmware shelf rename` command renames the specified shelf firmware file on each node.

Parameters

- `-oldname <text>` - Old Filename
  
  This parameter specifies the firmware file to rename.

- `-newname <text>` - New Filename
  
  This parameter specifies the new name of the firmware file.

Examples

The following example renames the shelf firmware file with the name IOM12.0210.SFW to IOM12.000.SFW on each node:

**storage firmware shelf show**

Display the list of shelf firmware files on the given node

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The *storage firmware shelf show* command displays the shelf firmware files present on each node.

Parameters

*[-fields <fieldname>, ...]*

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

*[-instance]*/

If you specify the `-instance` parameter, the command displays detailed information about all fields.

*[-node <nodename> | local]* - Node

Selects the files that match the specified node name.

*[-filename <text>] - Storage Firmware File*

Selects the files that match the specified filename.

Examples

The following example displays the shelf firmware files on each node:

```
cluster1::> storage firmware shelf show
Node: Node1
Shelf Firmware Files
----------------------------------------
AT-FCX.3800.SFW
AT-FCX.3800.SFW.FVF
ESH4.1400.SFW
ESH4.1400.SFW.FVF

Node: Node2
Shelf Firmware Files
----------------------------------------
AT-FCX.3800.SFW
AT-FCX.3800.SFW.FVF
ESH4.1400.SFW
ESH4.1400.SFW.FVF

8 entries were displayed.

storage iscsi-initiator commands

Configure the iSCSI initiator

The storage iscsi-initiator commands configure the list of iSCSI targets. These commands are only supported on high-availability shared-nothing virtualized platforms.

storage iscsi-initiator add-target

Add an iSCSI target

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The storage iscsi-initiator add-target command adds an iSCSI target to a node's list of targets. This command is only supported on high-availability shared-nothing virtualized platforms.

Parameters

- node {<nodename>|local} - Node
  Specifies the name of the Data ONTAP node to which the iSCSI target will be added.

- label <text> - User Defined Identifier
  Specifies a label for the target to be added.

- target-type {external|mailbox|partner|dr_auxiliary|dr_partner} - Target Type
  Specifies the type of the target. It is used by the node to determine how to use the LUNs. There are five target types:
  • partner - The partner target should belong to the node's HA partner. This allows the node to access its partner's disks.
  • mailbox - A mailbox target's LUNs are used exclusively as HA mailboxes.
  • external - External targets' LUNs can be used by the node but do not play a role in HA.
  • dr_auxiliary - The DR auxiliary target for MetroCluster over IP. Not a valid target type for the add-target command.
  • dr_partner - The DR partner target for MetroCluster over IP. Not a valid target type for the add-target command.

- target-portal <text> - Target Portal
  Specifies the target's IP address and listening TCP port. The port is not required if it is the default iSCSI port (3260). Examples of correct target portals are 10.0.0.2 and 10.0.0.2:860.

- target-name <text> - iSCSI Name
  Specifies the iSCSI target name such as an IQN (iSCSI qualified name).

[-status-admin (down|up)] - Administrative Status (default: up)
Use to specify whether the initial administrative status of the connection is up or down. The default setting is up.

Examples
The following example adds and connects to an iSCSI target from the specified node.
storage iscsi-initiator connect

Connect to an iSCSI target

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The storage iscsi-initiator connect command connects a node to the specified target. This command is only supported on high-availability shared-nothing virtualized platforms.

Parameters
-node {<nodename>|local} - Node
   Specifies the name of the Data ONTAP node to which the iSCSI target will be connected.

[-target-type {external|mailbox|partner|dr_auxiliary|dr_partner}] - Target Type
   Selects targets with the specified target type.

-label <text> - User Defined Identifier
   Specifies the label of the target to connect to.

Examples
The following example adds and connects to an iSCSI target from the specified node.

```
cluster1::*> storage iscsi-initiator add-target -node node1
   -label target1 -target-type external
   -target-portal 10.0.0.2:860
   -target-name iqn.2012-06.com.bsdctl:target0
```

storage iscsi-initiator disconnect

Disconnect from an iSCSI target

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The storage iscsi-initiator disconnect command disconnects a node from the specified target. This command is only supported on high-availability shared-nothing virtualized platforms.

Parameters
-node {<nodename>|local} - Node
   Specifies the name of the Data ONTAP node from which the iSCSI target will be disconnected.

[-target-type {external|mailbox|partner|dr_auxiliary|dr_partner}] - Target Type
   Selects targets with the specified target type.

-label <text> - User Defined Identifier
   Specifies the label of the target to disconnect from.
Examples
The following example adds and connects to an iSCSI target from the specified node.

```
cluster1:*> storage iscsi-initiator disconnect -node node1
   -label target1
```

storage iscsi-initiator remove-target
Remove an iSCSI target

**Availability:** This command is available to cluster administrators at the advanced privilege level.

**Description**
The `storage iscsi-initiator remove-target` command removes an iSCSI target from a node's list of targets. This command is only supported on high-availability shared-nothing virtualized platforms.

**Parameters**
- `-node <nodename>` - Node
  Specifies the name of the Data ONTAP node from which the iSCSI target will be removed.
- `[-target-type {external|mailbox|partner|dr_auxiliary|dr_partner}]` - Target Type
  Selects targets with the specified target type.
- `-label <text>` - User Defined Identifier
  Specifies the label of the target to be removed.

**Examples**
The following example adds and connects to an iSCSI target from the specified node.

```
cluster1:*> storage iscsi-initiator remove-target -node node1
   -label target1
```

storage iscsi-initiator show
Display the iSCSI targets

**Availability:** This command is available to cluster administrators at the advanced privilege level.

**Description**
The `storage iscsi-initiator show` displays the list of iSCSI targets configured for each Data ONTAP node in the cluster. This command is only supported on high-availability shared-nothing virtualized platforms.

**Parameters**
```
{ [-fields <fieldname>, ... ]
   If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

   | [-instance ]
   If you specify the -instance parameter, the command displays detailed information about all fields.
```

storage iscsi-initiator commands
[\-node \{\<nodename\>|local\}] - Node
Represents the name of the Data ONTAP node for which information is to be displayed. If this parameter is not specified, the command displays information about all nodes in the cluster.

[\-target\-type \{external|mailbox|partner|dr\_auxiliary|dr\_partner\}] - Target Type
Selects targets with the specified target type.

[\-label \<text\>] - User Defined Identifier
Selects targets with the specified label.

[\-target\-portal \<text\>] - Target Portal
Selects targets with the specified portal.

[\-target\-name \<text\>] - iSCSI Name
Selects targets with the specified target name.

[\-status\-admin \{down|up\}] - Administrative Status
Selects targets with the specified administrative status.

[\-status\-oper \{down|up\}] - Operational Status
Selects targets with the specified operational status.

[\-failure\-reason \<text\>] - Failure Reason
Selects targets with the specified failure reason.

### Examples
The following example displays the list of iSCSI targets for each node in the cluster.

```
cluster1::*> storage iscsi-initiator show
```

<table>
<thead>

---

**storage load commands**

The load directory

**storage load balance**

Balance storage I/O across controller’s initiator ports

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
This command is obsolete. I/O load is balanced automatically every five minutes.
storage load show

Display I/O statistics to array LUNs, grouped by initiator port.

Availability: This command is available to cluster administrators at the admin privilege level.

Description
This command is obsolete. The storage load show command displays the load distribution of I/O on the cluster.

Parameters

[-node {<nodename>|local} - Node to balance on

The name of the clustered node for which information is being displayed.

Examples

cluster1::> storage load show -switch
Initiator port: 0a connected to vnbr3850s4:7.

Target Side

storage load commands
storage path commands

The path directory

storage path quiesce

Quiesce I/O on a path to array

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The storage path quiesce command quiesces I/O on one path to a LUN. It also quiesces the given entire path immediately or can monitor the given path for error threshold before quiesce. After the I/O has been quiesced, no new I/O is sent on the path unless the storage path resume command is issued to continue I/O.

Parameters

-node {<nodename>|local} - Node name

The name of the clustered node for which information is being displayed.

-initiator <initiator name> - Initiator Port

Initiator port that the clustered node uses.

-target-wwpn <wwpn name> - Target Port

Target World Wide Port Name. Port on the storage array that is being used.
### Examples

The following example suspends I/O between node vbv3170f1b, port 0a and the array port 50001fe1500a8669, LUN 1.

```bash
node::> storage path quiesce -node vbv3170f1b -initiator 0a -target-wwpn 50001fe1500a8669 -lun-number 1
```

The following example suspends I/O immediately between node vbv3170f1b, port 0a and the array port 50001fe1500a8669.

```bash
node::> storage path quiesce -node vbv3170f1b -initiator 0a -target-wwpn 50001fe1500a8669
```

The following example suspends I/O between node vbv3170f1b, port 0a and the array port 50001fe1500a8669 after reaching 10 or more errors in duration of 5 mins.

```bash
node::> storage path quiesce -node vbv3170f1b -initiator 0a -target-wwpn 50001fe1500a8669 -path-failure-threshold 10 -wait-duration 5
```

## storage path resume

Resume I/O on a path to array

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

The `storage path resume` command continues I/O flow to an array LUN on a path or the entire path that was previously quiesced. It also disables the path failures monitoring feature, if it was enabled using the `storage path quiesce -path-failure-threshold count` command.

### Parameters

- `node [{<nodename>|local} - Node name

  The name of the clustered node for which information is being displayed.

- `initiator <initiator name>` - Initiator Port

  Initiator port that the clustered node uses.

- `target-wwpn <wwpn name>` - Target Port

  Target World Wide Port Name. Port on the storage array that is being used.

- `lun-number <integer>` - LUN Number

  Logical Unit number. The range is: [0...65535]. If this parameter is not specified, Data ONTAP resumes the entire path to an array.
Examples
The following example resumes I/O between node vbv3170f1b, port 0a and the array port 5001fe1500a8669, LUN 1

```
node::> storage path resume -node vbv3170f1b -initiator 0a -target-wwpn 5001fe1500a8669 -lun-number 1
```

The following example resumes I/O between node vbv3170f1b, port 0a and the array port 50001fe1500a8669

```
node::> storage path resume -node vbv3170f1b -initiator 0a -target-wwpn 50001fe1500a8669
```

Related references

*storage path quiesce* on page 976

**storage path show**

Display a list of paths to attached arrays.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The *storage path show* command displays path based statistics. The default command shows:

- Node name
- Initiator port
- Target port
- Target IQN
- TPGN
- Port speeds
- Path I/O in Kbytes/sec
- IOPs

**Parameters**

```
[ -fields <fieldname>, ... ]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[ -array ]
```

Using this option displays:

- Array name
- Target port
- Target IQN
- Target I/O in Kbytes/sec
- Target side switch port
- Path I/O in Kbytes/sec
- Initiator side switch port
- Initiator I/O in Kbytes/sec
- Initiator port

[-by-target ]
Using this option displays the same information as the array option, but grouped by target port.

[-detail ]
Using this option displays the same information as the array and by-target options, but adds the following:
- Target IOPs
- Target LUNs
- Path IOPs
- Path errors
- Path quality
- Path LUNs
- Initiator IOPs
- Initiator LUNs

[-switch ]
Using this option adds switch port information to the default display.

[-instance ]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Controller name
The name of the clustered node for which information is being displayed.

[-array-name <array name>] - Array Name
Name of the storage array that is connected to the cluster.

[-target-wwpn <text>] - Target Port
Target World Wide Port Name. Port on the storage array that is being used.

[-initiator <text>] - Initiator Port
Initiator port that the clustered node uses.

[-initiator-side-switch-port <text>] - Initiator Side Switch Port
Switch port connected to the clustered node.

[-tpgn <integer>] - Target Port Group Number
TPGN refers to the target port group to which the target port belongs. A target port group is a set of target ports which share the same LUN access characteristics and failover behaviors.

[-port-speed <text>] - Port Speed
Port Speed of the specified port.

[-path-io-kbps <integer>] - Kbytes of I/O per second on Path (Rolling Average)
Rolling average of I/O per second on the path.

[-path-iops <integer>] - Number of IOPS on Path (Rolling Average)
Rolling average of Kbytes of I/O per second on the path
[-initiator-io-kbps <integer>] - Kbytes of I/O per second on Initiator (Rolling Average)
      Rolling average of I/O per second on the initiator port.
[-initiator-iops <integer>] - Number of IOPS on Initiator (Rolling Average)
      Rolling average of Kbytes of I/O per second on the initiator port.
[-target-io-kbps <integer>] - Kbytes of I/O per second to Target (Rolling Average)
      Rolling average of I/O per second on the target port.
[-target-iops <integer>] - Number of IOPS to Target (Rolling Average)
      Rolling average of Kbytes of I/O per second on the target port.
[-target-side-switch-port <text>] - Target Side Switch Port
      Switch port connected to the array.
[-path-link-errors <integer>] - Link Error count on path
      Fibre Channel link error count.
[-path-quality <integer>] - Percentage of weighted error threshold
      A number representing the threshold of errors that is allowed on the path. Path quality is a weighted error value. When the error weight of a path exceeds the threshold, I/O is routed to a different path.
[-path-lun-in-use-count <integer>] - Number of LUNs in the in-use state on this path
      Number of LUNs on this path.
[-initiator-lun-in-use-count <integer>] - Number of LUNs in the in-use state on this initiator
      Number of LUNs on this initiator.
[-target-lun-in-use-count <integer>] - Number of LUNs in the in-use state on this target
      Number of LUNs on this target.
[-vmdisk-device-id <integer>] - Virtual disk device ID
      Common device identifier, shared by a VM and its hypervisor, of a virtual disk. On ESX servers, this is the Disk ID component of a virtual device node, with a value of 0 to 15.
[-path-failure-threshold <integer>] - Max number of path failures acceptable in wait-duration
      The path failure count, exceeding this value within wait duration will quiesce the path.
[-wait-duration <integer>] - Wait Duration in minutes
      The time duration(minutes) in which path is monitored for path failures.

Examples
The following example shows the default display.

```

storage path commands 981
storage path show-by-initiator

Display a list of paths to attached arrays from the initiator's perspective

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The `storage path show-by-initiator` command displays path based statistics. The output is similar to the `storage path show` command but the output is listed by initiator.

**Parameters**

```
[-fields <fieldname>, ...]
```
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance]
```
If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[-node {<nodename>|local}] - Controller name
```
The name of the clustered node for which information is being displayed.

```
[-initiator <text>] - Initiator Port
```
Initiator port that the clustered node uses.

```
[-target-wwpn <text>] - Target Port
```
Target World Wide Port Name. Port on the storage array that is being used.

```
[-initiator-side-switch-port <text>] - Initiator Side Switch Port
```
Switch port connected to the clustered node.

```
[-target-side-switch-port <text>] - Target Side Switch Port
```
Switch port connected to the array.

```
[-array-name <array name>] - Array Name
```
Name of the storage array that is connected to the cluster.

```
[-tpgn <integer>] - Target Port Group Number
```
TPGN refers to the target port group to which the target port belongs. A target port group is a set of target ports which share the same LUN access characteristics and failover behaviors.

```
[-port-speed <text>] - Port Speed
```
Port Speed of the specified port.

```
[-path-io-kbps <integer>] - Kbytes of I/O per second on Path (Rolling Average)
```
Rolling average of I/O per second on the path.

```
[-path-iops <integer>] - Number of IOPS on Path (Rolling Average)
```
Rolling average of Kbytes of I/O per second on the path.

```
[-initiator-io-kbps <integer>] - Kbytes of I/O per second on Initiator (Rolling Average)
```
Rolling average of Kbytes of I/O per second on the initiator port.

```
[-initiator-iops <integer>] - Number of IOPS on Initiator (Rolling Average)
```
Rolling average of Kbytes of I/O per second on the initiator port.
[\texttt{-target-io-kbps <integer>}] - Kbytes of I/O per second to Target (Rolling Average)

Rolling average of I/O per second on the target port.

[\texttt{-target-iops <integer>}] - Number of IOPS to Target (Rolling Average)

Rolling average of Kbytes of I/O per second on the target port.

**Examples**

```

### Storage pool Commands

**Manage storage pools**

The *storage pool* command family provides the ability to create and manage SSD storage pools. Storage pools are collections of solid-state disks (SSDs) that can be shared between multiple Flash Pool or All-Flash aggregates and between two nodes of an HA pair.

A storage pool’s capacity cannot be shared between Flash Pool and All-Flash aggregates at the same time.

For provisioning storage pool capacity into All-Flash aggregates, the *vserver* option `raid.storagepool.data.enable` must be set to `true`. The storage pool data enabled mode of operation is not currently supported by OnCommand management software.

The use of SSD storage pools is optional. Aggregates can use whole SSDs, or they can use SSD capacity from storage pools. When multiple aggregates share the SSD capacity from an SSD storage pool, there is a reduction in parity overhead and you have the ability to share high SSD performance across multiple aggregates and across both nodes of an HA pair. A storage pool contains a minimum of 3 and a maximum of 29 SSDs.

When an SSD storage pool is created using the *storage pool create* command, the SSDs are divided into four equal-sized partitions. The capacity of the group of disks is expressed in terms of allocation units. Each allocation unit is 25% of the capacity. The storage pool initially contains unprovisioned allocation units which can be displayed using the *storage pool show-available-capacity* command.

In an HA configuration, each node takes ownership of two allocation units representing 50% of the total capacity. If desired, the ownership of the allocation units can be adjusted using the *storage pool reassign* command before the capacity is used in an aggregate.

Storage pools do not have an associated RAID type. The RAID type is determined when an allocation unit is added to an aggregate using the *storage aggregate add-disks* command. A storage pool contains four allocation units, and they
might be used in up to four aggregates. You can add multiple allocation units to a Flash Pool or All-Flash aggregate to increase its cache or usable capacity respectively.

The space in an SSD storage pool can be expanded by adding SSDs to the storage pool using the `storage pool add` command. The size of each of the four allocation units will expand by 25% of the capacity of the disks being added. For example, if an SSD with a usable size of 745 GB is added to a storage pool that is part of four aggregates, each aggregate will grow its cache or usable capacity by 186.25 GB. If a different allocation is desired, create a new SSD storage pool using the `storage pool create` command.

All storage pool available capacity can be provisioned into aggregates. Available capacity within a storage pool is not used to protect against a disk failure. In the case of an SSD failure or predicted failure, Data ONTAP moves a suitable whole spare SSD from outside the storage pool into the storage pool and begins the recovery process (using either reconstruction or Rapid RAID Recovery, whichever is appropriate).

## storage pool add

Add disks to a storage pool

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**

The `storage pool add` command increases the total capacity of an existing storage pool by adding the specified SSDs to the storage pool. The disks are split into four equal partitions and added to each of the allocation units of the storage pool. If any allocation units from the storage pool have already been allocated to an aggregate, the cache or usable capacity of that aggregate is increased depending on whether it is a Flash Pool or an All-Flash aggregate.

If capacity from a storage pool is already provisioned into a Flash Pool aggregate, the same storage pool cannot be used to provision an All-Flash aggregate and vice-versa.

For provisioning storage pool capacity into All-Flash aggregates, the Vserver option `raid.storagepool.data.enable` must be set to `true`. The storage pool data enabled mode of operation is not currently supported by OnCommand management software.

For example, if an SSD with a usable size of 745 GB is added to a storage pool that is part of four aggregates, each aggregate will grow its cache or usable capacity by 186.2 GB. If a different allocation is desired, create a new storage pool using the `storage pool create` command.

**Parameters**

- `-storage-pool <storage pool name>` - Storage Pool Name
  
  This parameter specifies the storage pool to which disks are to be added.

- `{ -disk-count <integer> }` - Number of Disks to Add in Storage Pool
  
  This parameter specifies the number of disks that are to be added to the storage pool. The disks to be added come from the pool of spare disks.

- `[ -nodes <nodename> | local ], ...` - Nodes From Which Spares Should be Selected
  
  This parameter specifies a list of nodes from which SSD disks are selected for addition to the storage pool. If this parameter is not specified, disks to be added to the storage pool can be selected from both the nodes sharing the storage pool. Use this parameter to restrict the selection of spare disks to one particular node.
|-disk-list <disk path name>, ...} - List of Spare Disks
This parameter specifies a list of disks to be added to the storage pool. In an HA configuration, SSDs being added to a storage pool can be owned by either node in the HA pair.

{|quiet [true]} - Confirmations off (privilege: advanced)
When set to true, this parameter specifies the operation should be executed without pausing for confirmation.

|m-simulate [true]} - Simulate Storage Pool Addition
When set to true, this parameter specifies the operation should be performed as a simulation. The command reports which aggregates would grow automatically as a result of adding the disks to the storage pool. The disks are not added to the storage pool.

Examples
In this example, the user requests a report detailing the changes that would occur if a new disk is added to the storage pool SP1. In this case, 186.2 GB of cache is added to the Flash Pool aggregates nodeA_flashpool_1 and nodeB_flashpool_1. There are two unprovisioned allocation units in the storage pool and therefore the storage pool available capacity also grows by 372.5 GB.

```
cluster1::> storage pool add -storage-pool SP1 -disk-list 1.0.23 -simulate
```

This operation will result in capacity being allocated in the following way:

<table>

<tr>
<th>Container Name</th>
<th>Capacity To Be Added</th>
<th>Current Size</th>
<th>New Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>nodeA_flashpool_1</td>
<td>186.2GB</td>
<td>558.7GB</td>
<td>744.9GB</td>
</tr>
<tr>
<td>nodeB_flashpool_1</td>
<td>186.2GB</td>
<td>558.7GB</td>
<td>744.9GB</td>
</tr>
<tr>
<td>(Available Capacity)</td>
<td>372.5GB</td>
<td>1.09TB</td>
<td>1.45TB</td>
</tr>
</tbody>
</table>

Check via simulation whether there is available capacity within allocation units in storage pool SP1 for allocation units that are provisioned into aggregates.

```
cluster1::> storage pool add -storage-pool SP1 -simulate -auto-grow-aggregates true
```

Info: This operation results in capacity being allocated in the following way:

<table>
<thead>
<tr>
<th>Container Name</th>
<th>Capacity To Be Added</th>
<th>Current Size</th>
<th>New Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>nodeA_flashpool_1</td>
<td>186.2GB</td>
<td>558.7GB</td>
<td>744.9GB</td>
</tr>
<tr>
<td>nodeB_flashpool_1</td>
<td>186.2GB</td>
<td>558.7GB</td>
<td>744.9GB</td>
</tr>
</tbody>
</table>

The following example adds one disk to a storage pool named SP1. The spare disks are selected from either local node or its partner or both based on spare availability.

```
cluster-1::> storage pool add -storage-pool SP1 -disk-count 1
```

Info: The following disks will be added to storage pool "SP1":

<table>
<thead>
<tr>
<th>Disk</th>
<th>Size</th>
<th>Type</th>
<th>Owner</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.0.12</td>
<td>744.9GB</td>
<td>SSD</td>
<td>cluster-1-01</td>
</tr>
</tbody>
</table>

New Allocation Unit Size: 744.8GB
Capacity will be allocated in the following way:

<table>
<thead>
<tr>
<th>Container Name</th>
<th>Capacity To Be Added</th>
<th>Current Size</th>
<th>New Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>nodeA_flashpool_1</td>
<td>186.2GB</td>
<td>558.7GB</td>
<td>744.9GB</td>
</tr>
<tr>
<td>nodeB_flashpool_1</td>
<td>186.2GB</td>
<td>558.7GB</td>
<td>744.9GB</td>
</tr>
<tr>
<td>(Available Capacity)</td>
<td>372.5GB</td>
<td>1.09TB</td>
<td>1.45TB</td>
</tr>
</tbody>
</table>

*storage pool create* on page 986

**storage pool create**

Create a new storage pool

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The *storage pool create* command creates an SSD storage pool using a given list of spare SSDs.

When a storage pool is created, Data ONTAP splits the capacity provided by the SSDs into four equally-sized allocation units. In an HA configuration, two allocation units (containing 50% of the total capacity) are assigned to each node in the HA pair. This assignment can be modified using the *storage pool reassign* command.

After the storage pool is created, its allocation units can be provisioned into Flash Pool or All-Flash aggregates using the *storage aggregate add-disks* command and the *-storage-pool* parameter.

If capacity from a storage pool is already provisioned into a Flash Pool aggregate, the same storage pool cannot be used to provision an All-Flash aggregate and vice versa.

For provisioning storage pool capacity into All-Flash aggregates, the vserver option *raid.storagepool.data.enable* must be set to *true*. The storage pool data enabled mode of operation is not currently supported by OnCommand management software.

**Parameters**

*storage-pool <storage pool name>* - Storage Pool Name

This parameter specifies the name of the storage pool that is to be created. The SSDs are partitioned and placed into the new storage pool.

{ [-nodes {<nodename>|local}, ...]} - Nodes Sharing the Storage Pool

This parameter specifies a list of nodes from which SSD disks are selected to create the storage pool. If two nodes are specified then they need to be in HA configuration. Spare disks are selected from either node or its partner or both. If this parameter is not specified, storage pool will be created by selecting disks from either the node or its partner or both from where command is run.

*disk-count <integer>* - Number of Disks in Storage Pool

This parameter specifies the number of disks that are to be included in the storage pool. The disks in this newly created storage pool come from the pool of spare disks. The smallest disks in this pool are added to the storage pool first, unless you specify the *disk-size* parameter.

[-disk-size (<integer> [KB|MB|GB|TB|PB])]* - Disk Size

This parameter specifies the size of the disks on which the storage pool is to be created. Disks with a usable size between 95% and 105% of the specified size are selected.

| -disk-list <disk path name>, ...| - Disk List for Storage Pool Creation

This parameter specifies a list of SSDs to be included in the new storage pool. The SSDs must be spare disks and can be owned by either node in an HA pair.
[simulate [true]] - Simulate Storage Pool Creation

This option simulates the storage pool creation and prints the allocation unit size that would be used for the storage pool.

Examples

The following example creates a storage pool named SP1. The storage pool contains 3 SSD disks, the spare disks selected are from either local node, or its partner or both based on spare availability.

```bash
cluster1::> storage pool create -storage-pool SP1 -disk-count 3
```

The following example creates a storage pool named SP2. The storage pool contains 3 SSD disks, the spare disks selected are from either node0, or its partner node1 or both based on spare availability.

```bash
cluster1::> storage pool create -storage-pool SP2 -disk-count 3 -nodes node0,node1
```

The following example creates a storage pool named SP3 from four SSDs using disk list.

```bash
cluster1::> storage pool create -storage-pool SP3 -disk-list 1.0.13, 1.0.15, 1.0.17, 1.0.19
```

storage pool delete

Delete an existing storage pool

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The `storage pool delete` command deletes an existing SSD storage pool. At the end of the operation, the SSDs are converted back to spare disks.

Parameters

- `-storage-pool <storage pool name>` - Storage Pool Name
  This parameter specifies the storage pool that you want to delete. You can delete the storage pool only if all of the allocation units in the storage pool are available.

Examples

Verify that storage pool SP3 is ready for deletion by confirming it has four available allocation units and then delete it.

```bash
cluster1::> storage pool show-available-capacity -storage-pool SP3
```

<table>
<thead>
<tr>
<th>Node</th>
<th>Storage Pool</th>
<th>Type</th>
<th>SyncMirror Pool</th>
<th>Allocation Unit Size</th>
<th>Total Count</th>
<th>Available Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>node-a</td>
<td>SP3</td>
<td>SSD</td>
<td>Pool0</td>
<td>372.5GB</td>
<td>2</td>
<td>744.9GB</td>
</tr>
<tr>
<td>node-b</td>
<td>SP3</td>
<td>SSD</td>
<td>Pool0</td>
<td>372.5GB</td>
<td>2</td>
<td>744.9GB</td>
</tr>
</tbody>
</table>

2 entries were displayed.

```bash
cluster1::> storage pool delete -storage-pool SP3
```
storage pool reassign

Reassign capacity from one node to another node in storage pool

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The `storage pool reassign` command changes the ownership of unprovisioned (available) storage pool allocation units from one HA partner to the other for an existing storage pool.

**Parameters**

- `-storage-pool <storage pool name>` - Storage Pool Name
  
  This parameter specifies the storage pool within which available capacity is reassigned from one node to another.

- `-from-node {<nodename>|local}` - Reassign Available Capacity from This Node
  
  This parameter specifies the name of the node that currently owns the allocation units.

- `-to-node {<nodename>|local}` - Reassign Available Capacity to This Node
  
  This parameter specifies the name of the node that will now own the allocation units.

- `-allocation-units <integer>` - Allocation Units
  
  This parameter specifies the number of allocation units to be reassigned.

**Examples**

Move an available allocation unit from node-b to node-a in preparation for provisioning the allocation units on node-a.

```shell
cluster1::*> storage pool show-available-capacity -storage-pool SP2

<table>
<thead>
<tr>
<th>Node</th>
<th>Storage Pool</th>
<th>Storage SyncMirror Allocation Unit</th>
<th>Total</th>
</tr>
</thead>
<tbody>
<tr>
<td>node-a</td>
<td>SP2</td>
<td>SSD</td>
<td>Pool0</td>
</tr>
<tr>
<td>node-b</td>
<td>SP2</td>
<td>SSD</td>
<td>Pool0</td>
</tr>
</tbody>
</table>

2 entries were displayed.
```

```shell
cluster1::*> storage pool reassign -storage-pool SP2 -from-node node-b -to-node node-a -allocation-units 1

[Job 310] Job succeeded: storage pool reassign job for "SP2" completed successfully
```

```shell
cluster1::*> storage pool show-available-capacity -storage-pool SP2

<table>
<thead>
<tr>
<th>Node</th>
<th>Storage Pool</th>
<th>Storage SyncMirror Allocation Unit</th>
<th>Total</th>
</tr>
</thead>
<tbody>
<tr>
<td>node-a</td>
<td>SP2</td>
<td>SSD</td>
<td>Pool0</td>
</tr>
<tr>
<td>node-b</td>
<td>SP2</td>
<td>SSD</td>
<td>Pool0</td>
</tr>
</tbody>
</table>

2 entries were displayed.
```

*storage pool show-available-capacity* on page 992
storage pool show

Display details of storage pools

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The storage pool show command displays information about SSD storage pools in the cluster. By default, the command displays information about all storage pools in the cluster. You can specify parameters to limit the output to a specific set of storage pools.

Parameters
{-fields <fieldname>,...}
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

[-instance ]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-storage-pool <storage pool name>] - Storage Pool Name
Selects the storage pools that match this parameter value.

[-storage-pool-uuid <UUID>] - UUID of Storage Pool
Selects the storage pools that match this parameter value.

[-nodes {<nodename>|local},...] - Nodes Sharing the Storage Pool
Selects the storage pools that match this parameter value.

In an HA pair, either node name may be specified.

[-disk-count <integer>] - Number of Disks in Storage Pool
Selects the storage pools that match this parameter value.

[-allocation-unit-size <integer>[KB|MB|GB|TB|PB]] - Allocation Unit Size
Selects the storage pools that match this parameter value.

Allocation units represent the unit of storage allocated to aggregates from this storage pool.

[-allocation-unit-data-size-raid4 <integer>[KB|MB|GB|TB|PB]] - Allocation Unit Data Size for RAID4
This parameter shows the amount of additional data capacity provided if an allocation unit from this storage pool was added to an aggregate with -raidtype as raid4.

[-allocation-unit-data-size-raid-dp <integer>[KB|MB|GB|TB|PB]] - Allocation Unit Data Size for RAID-DP
This parameter shows the amount of additional data capacity provided if an allocation unit from this storage pool was added to an aggregate with -raidtype as raid_dp.

[-allocation-unit-data-size-raid-tec <integer>[KB|MB|GB|TB|PB]] - Allocation Unit Data Size for RAID-TEC
This parameter shows the amount of additional data capacity provided if an allocation unit from this storage pool was added to an aggregate with -raidtype as raid_tec.

[-storage-type <SSD>] - Storage Type
Selects the storage pools that match this parameter value.

Only the SSD type is supported for this version of Data ONTAP.
[--pool-usuable-size <integer>[KB|MB|GB|TB|PB]] - Storage Pool Usable Size
Selects the storage pools that match this parameter value.

The **pool-usuable-size** is the sum of the capacities of the allocation units that are assigned to nodes but not yet provisioned. The amount of **pool-usuable-size** that is contributed to the cache or usable capacity of an aggregate depends upon the RAID type used when provisioning the allocation units.

[--pool-total-size <integer>[KB|MB|GB|TB|PB]] - Storage Pool Total Size
Selects the storage pools that match this parameter value.

The **pool-total-size** is the sum of the capacities of allocation units belonging to this storage pool.

[--is-healthy [true|false]] - Is Pool Healthy?
Selects the storage pools that match this parameter value.

For storage pools with **is-healthy false**, the **unhealthy-reason** parameter provides more information. **is-healthy** must be **true** to provision allocation units from a storage pool into an aggregate.

[--pool-state <State of the Storage Pool>] - State of the Storage Pool
Selects the storage pools that match this parameter value. Possible states are:

- normal - the storage pool is operating normally.
- degraded - the storage pool has one or more failed disks.
- creating - the storage pool is being created.
- deleting - the storage pool is being deleted.
- reassigning - allocation units are being reassigned from one node to another.
- growing - allocation units in the storage pool are expanding due to the addition of new capacity into the storage pool.

[--unhealthy-reason <text>] - Reason for Storage Pool Being Unhealthy
Selects the storage pools that match this parameter value.

The message provided gives additional details about why the storage pool is unhealthy.

[--current-operation-job-id <integer>] - Job ID of the Currently Running Operation
Selects the storage pools that match this parameter value.

Long-running operations associated with storage pools will be managed via jobs. For example, if you provision allocation units from a storage pool into an aggregate and the disks associated with the storage pool need to be zeroed, the operation will be completed via a job.

---

### Examples

Display the storage pools in the cluster.

```
cluster1::> storage pool show
storage pool show
Storage Pool     Type  #Disks Nodes             Total Size
----------------  ----- ------ ----------------  ----------
LargeSP           SSD   10 noda-a,node-b         7.27TB
SmallSP           SSD    2 noda-a,node-b         1.45TB
2 entries were displayed.
```

The following example displays the details of a storage pool named SmallSP. Only one of its four allocation unit has been provisioned, so 75% of its size is available (usable).
storage pool show-aggregate

Display aggregates provisioned from storage pools

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The storage pool show-aggregate command displays allocation information for SSD storage pools in the cluster. The command output depends upon the parameter or parameters specified with the command. If no parameters are specified, the command displays information about allocations of all storage pools in the cluster.

Parameters

\(-\text{fields} \ <\text{fieldname}>\), ... \\
If you specify the \(-\text{fields} \ <\text{fieldname}>\), ... parameter, the command output also includes the specified field or fields. You can use \(-\text{fields} ?\) to display the fields to specify.

\(-\text{instance}\) \\
If you specify the \(-\text{instance}\) parameter, the command displays detailed information about all fields.

\(-\text{storage-pool} \ <\text{storage pool name}>\) - Name of Storage Pool \\
Selects the storage pools that match this parameter value.

\(-\text{aggregate} \ <\text{aggregate name}>\) - Aggregate \\
Selects the storage pools that match this parameter value.

\(-\text{capacity} \ <\text{integer}>[\text{KB}|\text{MB}|\text{GB}|\text{TB}|\text{PB}]\) - Capacity \\
Selects the storage pools that match this parameter value. Capacity includes space provided by data and parity portions of each allocation unit. Only the data portions of each allocation unit contribute to the cache or usable capacity of Flash Pool or All-Flash aggregates respectively.

\(-\text{allocated-unit-count} \ <\text{integer}>\) - Number of AU’s Assigned to This Aggregate \\
Selects the storage pools that match this parameter value.

\(-\text{original-owner} \ <\text{text}>\) - Original Owner Name \\
Selects the storage pools that match this parameter value.

\(-\text{node} \ <\text{nodename}>|\text{local}\) - Node \\
Selects the storage pools that match this parameter value.
Examples
Display information about the aggregate or aggregates using a storage pool called SP2:

```
cluster1:/> storage pool show-aggregate -storage-pool SP2 -instance
Name of Storage Pool: SP2
Aggregate: node2_flashpool_1
Capacity: 744.9GB
Number of AU's Assigned to This Aggregate: 1
Original Owner Name: node2
Node: node2
```

storage pool show-available-capacity
Display available capacity of storage pools

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The `storage pool show-available-capacity` command displays information about available capacity in SSD storage pools on each node in the cluster. The command output depends upon the parameter or parameters specified with the command. If no parameters are specified, the command displays information about available capacities in all shared pools in the cluster.

Storage pool available capacity is data storage space that has not yet been provisioned into Flash Pool or All-Flash aggregates. Allocation units might be provisioned into aggregates using the `storage aggregate add-disks` command and the `-storage-pool` parameter.

Note: All storage pool available capacity can be provisioned into aggregates. Available capacity within a storage pool is not used to protect against a disk failure. In the case of an SSD failure or predicted failure, Data ONTAP moves a suitable whole SSD spare disk from outside the storage pool into the storage pool and begins the recovery process (using either reconstruction or Rapid RAID Recovery, whichever is appropriate).

Parameters
{-fields <fieldname>,...}
If you specify the `-fields <fieldname>,...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

[-instance]
If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-storage-pool <storage pool name>] - Name of Storage Pool
Selects the available capacities that match this parameter value.

[-node {<nodename>|local}] - Node
Selects the available capacities that match this parameter value.

[-allocation-unit-size {<integer>[KB|MB|GB|TB|PB]}] - Allocation Unit Size
Selects the available capacities that match this parameter value.

Allocation units are the units of storage capacity that are available to be provisioned into aggregates.

[-storage-type <SSD>] - Type of Storage Pool
Selects the available capacities that match this parameter value. Only the SSD type is supported for this version of Data ONTAP.
[-allocation-unit-count <integer>] - Number of Allocation Units Available
Selects the available capacities that match this parameter value.
Allocation units are the units of storage capacity that are available to be provisioned into aggregates. Each allocation unit is one minimum unit of allocation (MUA) and its capacity is given as allocation-unit-size.

[-syncmirror-pool <text>] - Syncmirror Pool
Selects the available capacities that match this parameter value.
The SyncMirror pool of an allocation unit must match the SyncMirror pool of the disks of the aggregate when adding allocation units into an aggregate.
Mirroring of aggregates that are provisioned from SSD storage pools is not supported.

[-available-size {<integer> [KB|MB|GB|TB|PB]}] - Total Usable Available Size
Selects the available capacities that match this parameter value.
The available-size is the sum of the capacities of the allocation units that are assigned but not yet provisioned. The amount of available-size that is contributed to the cache or usable capacity of an aggregate depends upon the RAID type used when provisioning the allocation units.

Examples
In this example, two nodes of an HA pair share available capacity from two storage pools, SP1 and SP2. There are a total of 5 allocation units that have not yet been provisioned.

```
cluster1::> storage pool show-available-capacity
<table>
<thead>
<tr>
<th>Node</th>
<th>Storage Pool</th>
<th>Storage Type</th>
<th>SyncMirror Pool</th>
<th>Allocation Unit</th>
<th>Total Usable Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>node-a</td>
<td>SP1</td>
<td>SSD</td>
<td>Pool0</td>
<td>558.7GB</td>
<td>1 558.7GB</td>
</tr>
<tr>
<td>node-b</td>
<td>SP1</td>
<td>SSD</td>
<td>Pool0</td>
<td>558.7GB</td>
<td>1 558.7GB</td>
</tr>
<tr>
<td>node-a</td>
<td>SP2</td>
<td>SSD</td>
<td>Pool0</td>
<td>744.9GB</td>
<td>2 1.45TB</td>
</tr>
<tr>
<td>node-b</td>
<td>SP2</td>
<td>SSD</td>
<td>Pool0</td>
<td>744.9GB</td>
<td>1 744.9GB</td>
</tr>
</tbody>
</table>
```

storage aggregate add-disks on page 771

storage pool show-disks
Display disks in storage pools

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The storage pool show-disks command displays information about disks in storage pools in the cluster. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays information about all disks in all storage pools in the cluster.

Parameters
([-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance] |
If you specify the -instance parameter, the command displays detailed information about all fields.
[-storage-pool <storage pool name>] - Name of Storage Pool

Selects the storage pools that match this parameter value.

[-disk <disk path name>] - Name of the disk

Selects the storage pools with the disks that match this parameter value.

[-disk-type {ATA | BSAS | FCAL | FSAS | LUN | MSATA | SAS | SSD | VMDISK | SSD-NVM}] - Disk Type

Selects the storage pools with the disks that match this parameter value. Only the SSD type is supported for this version of Data ONTAP.

[-usable-size (<integer> [KB|MB|GB|TB|PB])] - Disk Usable Size

Selects the storage pools with the disks that match this parameter value.

In this command, usable-size refers to the sum of the capacities of all of the partitions on the disk.

[-total-size (<integer> [KB|MB|GB|TB|PB])] - Total Size

Selects the storage pools with the disks that match this parameter value.

[-node-list <nodename>, ...] - List of Nodes

Selects the storage pools with the disks that are visible to all of the specified nodes.

Examples

Show information about SSDs in a storage pool called SP2.

```
class1::> storage pool show-disks -storage-pool SP2
Storage Pool Name: SP2

<table>
<thead>
<tr>
<th>Disk</th>
<th>Type</th>
<th>Usable Size</th>
<th>Total Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.0.16</td>
<td>SSD</td>
<td>745.0GB</td>
<td>745.2GB</td>
</tr>
<tr>
<td>1.0.18</td>
<td>SSD</td>
<td>745.0GB</td>
<td>745.2GB</td>
</tr>
<tr>
<td>1.0.20</td>
<td>SSD</td>
<td>745.0GB</td>
<td>745.2GB</td>
</tr>
<tr>
<td>1.0.22</td>
<td>SSD</td>
<td>745.0GB</td>
<td>745.2GB</td>
</tr>
</tbody>
</table>
```

Storage Port Commands

Manage storage ports

The storage port command family manages the storage ports of the cluster. The command set allows you to view the current status of all storage ports. You can also enable, disable, reset, or rescan a given port or reset a device behind a port.

storage port disable

Disable a storage port

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The storage port disable command disables a specified storage port.

Parameters

- **-node (<nodename>|local) - Node**

  Use this parameter to specify the node on which the port resides.
-port <text> - Port
  Use this parameter to specify the port that needs to be disabled.

[-force [true]] - Force (privilege: advanced)
  Use this optional parameter to force the disabling of the storage port. The parameter can be used to disable the specified port even if some devices can only be accessed using this port. Note that doing so might cause multiple device failures.

Examples
The following example disables port 0a on node node1:

    cluster1::> storage port disable -node node1 -port 0a

storage port enable
Enable a storage port

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The storage port enable command enables a specified storage port.

Parameters
-node {<nodename>|local} - Node
  Use this parameter to specify the node on which the port resides.

-port <text> - Port
  Use this parameter to specify the port that needs to be enabled.

Examples
The following example enables port 0a on node node1:

    cluster1::> storage port enable -node node1 -port 0a

storage port rescan
Rescan a storage port

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The storage port rescan command rescans a specified storage port.

Parameters
-node {<nodename>|local} - Node
  Use this parameter to specify the node on which the port resides.

-port <text> - Port
  Use this parameter to specify the port that needs to be rescanned.
**Examples**

The following example rescans port 0a on node node1:

```bash
cluster1::> storage port rescan -node node1 -port 0a
```

---

**storage port reset**

Reset a storage port

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**
The `storage port reset` command resets a specified storage port.

**Parameters**
- `-node {<nodename>|local}` - Node
  
  Use this parameter to specify the node on which the port resides.

- `-port <text>` - Port
  
  Use this parameter to specify the port that needs to be reset.

**Examples**

The following example resets port 0a on node node1:

```bash
cluster1::> storage port reset -node node1 -port 0a
```

---

**storage port reset-device**

Reset a device behind a storage port

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**
The `storage port reset-device` command resets a device behind a port. If the device is behind a SAS port, you need to specify the shelf name and bay ID where the device resides. If the device is behind a FC port, you need to specify the loop ID of the device.

**Parameters**
- `-node {<nodename>|local}` - Node
  
  Use this parameter to specify the node on which the port resides.

- `-port <text>` - Port
  
  Use this parameter to specify the port used to reset the device.

- `{-shelf-name <text>}` - Shelf Name
  
  Use this parameter to specify the shelf where the device resides.

- `{-bay-id <integer>}` - Bay ID
  
  Use this parameter to specify the bay where the device resides.
| -loop-id <integer> | Loop ID

Use this parameter to specify the loop ID of the device.

---

**Examples**
The following example resets a device behind SAS port 0a on node node1:

```
cluster1::> storage port reset-device -node node1 -port 0a -shelf-name 1.0 -bay-id 10
```

The following example resets a device behind FC port 1b on node node1:

```
cluster1::> storage port reset-device -node node1 -port 1b -loop-id 20
```

---

**storage port show**

Show storage port information

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The **storage port show** command displays information about the storage ports in the cluster. If no parameters are specified, the default command displays the following information about the storage ports:

- Node
- Port
- Type
- Speed
- State
- Status

To display detailed profile information about a single storage port, use the `-node` and `-port` parameters.

**Parameters**

{-fields <fieldname>,...}

Displays the specified fields for all the storage ports, in column style output.

{-errors}

Displays the following error status information about the storage ports which have errors:

- Error type
- Error severity
- Error description

{-instance}

Displays expanded information about all the storage ports in the system. If a storage port is specified, then this parameter displays detailed information for that port only.
[-node {<nodename>|local}] - Node
Displays detailed information about the storage ports on the specified node.

[-port <text>] - Port
Selects the ports with the specified port name.

[-port-type {Unknown|SAS|FC}] - Port Type
Selects the ports of the specified type.

[-port-speed {0|1|1.5|2|3|4|6|8|10|12|16|32}] - Port Speed
Selects the ports with the specified speed.

[-state {enabled|disabled}] - Port State
Selects the ports with the specified state.

[-status {unknown|online|online-degraded|offline|link-down}] - Port Status
Selects the ports with the specified operational status.

[-description <text>] - Description
Selects the ports with the specified description.

[-firmware-rev <text>] - Firmware Revision
Selects the ports with the specified firmware revision.

[-serial-number <text>] - Serial Number
Selects the ports with the specified serial number.

[-connection-mode {Unknown|Loop|Point-to-point}] - Connection Mode
Selects the ports with the specified connection mode.

[-wwnn <FC WWN>] - World Wide Node Name
Selects the ports with the specified World Wide Node Name.

[-wwpn <FC WWN>] - World Wide Port Name
Selects the ports with the specified World Wide Port Name.

[-board-name <text>] - Board Name
Selects the ports with the specified board name.

[-connector-capabilities <integer>, ...] - Connector Capabilities
Selects the ports with the specified list of connector capabilities.

[-wwn <FC WWN>] - Base World Wide Name
Selects the ports with the specified World Wide Name.

[-mfg-part-number <text>] - MFG Part Number
Selects the ports with the specified manufacturer part number.

[-nvdata-rev <text>] - NVDATA Revision
Selects the ports with the specified NVDATA revision.

[-part-number <text>] - Part Number
Selects the ports with the specified part number.

[-date-code <text>] - Date Code
Selects the ports with the specified date code.

[-cable-length <text>] - Cable Length
Selects the ports with the specified cable length.
[-cable-identifier <text>] - Cable Identifier
Selects the ports with the specified cable identifier.

[-cable-end-id {end_0|end_1}] - Cable End Identifier
Selects the ports with the specified cable end identifier.

[-connector-technology {active-copper|passive-copper|optical}] - Connector Technology
Selects the ports with the specified connector technology.

[-phy-id <integer>, ...] - Phy ID
Selects the ports that have phys with the specified phy ID.

[-phy-state {enabled|disabled}, ...] - Phy State
Selects the ports that have phys with the specified state.

[-phy-status {unknown|online|offline|speed-negotiation-failed|sata-oob-failed}, ...] - Phy Status
Selects the ports that have phys with the specified status.

[-phy-speed {0|1|1.5|2|3|4|6|8|10|12|16|32}, ...] - Phy Speed
Selects the ports that have phys with the specified speed.

[-error-type {unknown|online|online-degraded|offline|link-down}] - Error Type
Selects the ports with the specified error type.

[-error-severity {unknown|notice|warning|error|critical}] - Error Severity
Selects the ports with the specified error severity.

[-error-text <text>] - Error Text
Selects the ports with the specified error text.

[-corrective-action <text>] - Corrective Action
Selects the ports with the specified corrective action.

[-connector-type {QSFP|QSFP+|Mini-SAS HD|SFP}] - Connector Type
Selects the ports with the specified connector type.

[-connector-vendor <text>] - Connector Vendor
Selects the ports with the specified connector vendor.

[-connector-part-number <text>] - Connector Part Number
Selects the ports with the specified connector part number.

[-connector-serial-number <text>] - Connector Serial Number
Selects the ports with the specified connector serial number.

Examples
The following example displays information about all storage ports in the cluster:

cluster1::> storage port show

<table>
<thead>
<tr>
<th>Node</th>
<th>Port</th>
<th>Type</th>
<th>State</th>
<th>Speed</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>node1</td>
<td>0a</td>
<td>SAS</td>
<td>0 disabled offline</td>
<td>0</td>
<td>offline</td>
</tr>
<tr>
<td></td>
<td>0b</td>
<td>SAS</td>
<td>6 enabled</td>
<td>6</td>
<td>online</td>
</tr>
<tr>
<td></td>
<td>1a</td>
<td>FC</td>
<td>0 disabled offline</td>
<td>0</td>
<td>offline</td>
</tr>
<tr>
<td></td>
<td>1b</td>
<td>FC</td>
<td>2 enabled</td>
<td>2</td>
<td>online</td>
</tr>
<tr>
<td>node2</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
The following example displays detailed information about port 0a on node node1:

```
cluster1::> storage port show -node node1 -port 0b
```

```
Node: node1
Port: 0b
Description: SAS Host Adapter 0b (PMC-Sierra PM8001 rev. C)
Firmware Revision: 01.12.06.00
Base WWN: 50:0a:09:80:00:82:47:b4
Connector Type: qsfp
Connector Vendor: Molex Inc.
Connector Part Number: 112-00177+A0
Connector Technology: passive_copper
Connector Serial Number: 017920547
Cable Length: 2m
Cable End Identifier: end_1
Cable Identifier: 500a0980008247b4
Phy State: [0] enabled, online, 6 Gb/s
Phy State: [1] enabled, online, 6 Gb/s
Phy State: [2] enabled, online, 6 Gb/s
Phy State: [3] enabled, online, 6 Gb/s
```

### Storage raid-options Commands

The raid-options directory

The sub commands `storage raid-options modify` and `storage raid-options show` are used to change and view the configurable node RAID options. Following are the RAID options that can be configured:

**raid.background_disk_fw_update.enable**

This option determines the behavior of automatic disk firmware update. Valid values are `on` or `off`. The default value is `on`. If the option is set to `on`, firmware updates to spares and file-system disks are performed in a non-disruptive manner in the background. If the option is turned `off` automatic firmware update occur when the system is booted or a disk is inserted.

**raid.disk.copy.auto.enable**

This option determines the action taken when a disk reports a predictive failure. Valid values for this option are `on` or `off`. The default value for this option is `on`.

Sometimes, it is possible to predict that a disk will fail soon based on a pattern of recovered errors that have occurred on the disk. In such cases, the disk reports a predictive failure to Data ONTAP. If this option is set to `on`, Data ONTAP initiates Rapid RAID Recovery to copy data from the failing disk to a spare disk. When data is copied, the disk is marked failed and placed in the pool of broken disks. If a spare is not available, the node will continue to use the prefailed disk until the disk fails.

If the option is set to `off`, the disk is immediately marked as failed and placed in the pool of broken disks. A spare disk is selected and data from the missing disk is reconstructed from other disks in the RAID group. The disk does not fail if the RAID group is already degraded or is being reconstructed. This ensures that a disk failure does not lead to the failure of the entire RAID group.

**raid.disktype.enable**

This option is obsolete. Use options `raid.mix.hdd.disktype.capacity` and `raid.mix.hdd.disktype.performance` instead.

**raid.media_scrub.rate**

1000
This option sets the rate of media scrub on an aggregate. Valid values for this option range from 300 to 3000 where a rate of 300 represents a media scrub of approximately 512 MB per hour, and 3000 represents a media scrub of approximately 5GB per hour. The default value for this option is 600, which is a rate of approximately 1GB per hour.

**raid.min_spare_count**

This option specifies the minimum number of spare drives required to avoid warnings about low spare drives. If every file-system drive has the minimum number of spare drives specified in raid.min_spare_count that are appropriate replacements, then no warning is displayed for low spares. This option can be set from 0 to 4. The default setting is 1. Setting this option to 0 means that no warnings will be displayed for low spares even if there are no spares available. This option can be set to 0 only on systems that have 16 or fewer attached drives and that are running with RAID-DP aggregates. A setting of 0 is not allowed on systems with RAID4 aggregates.

**raid.mirror_read_plex_pref**

This option specifies the plex preference when reading from a mirrored aggregate on a MetroCluster-configured system. There are three possible values:

- **local** indicates that all reads are handled by the local plex (plex consisting of disks from Pool0).
- **remote** indicates that all reads are handled by the remote plex (plex consisting of disks from Pool1).
- **alternate** indicates that the handling of read requests is shared between the two plexes.

This option is ignored if the system is not in a MetroCluster configuration. The option setting applies to all aggregates on the node.

**raid.mix.hdd.disktype.capacity**

Controls mixing of SATA, BSAS, FSAS and ATA disk types. The default value is on, which allows mixing.

When this option is set to on, SATA, BSAS, FSAS and ATA disk types are considered interchangeable for all aggregate operations, including aggregate creation, adding disks to an aggregate, and replacing disks within an existing aggregate, whether this is done by the administrator or automatically by Data ONTAP.

If you set this option to off, SATA, BSAS, FSAS and ATA disks cannot be combined within the same aggregate. If you have existing aggregates that combine those disk types, those aggregates will continue to function normally and accept any of those disk types.

**Note:** This option is ignored in `storage aggregate create` and `storage aggregate add-disks` commands, when either of `-disktype` or `-diskclass` parameters are used. It is better to use the `-disktype` or `-diskclass` parameter instead of relying on this option.

**raid.mix.hdd.disktype.performance**

Controls mixing of FCAL and SAS disk types. The default value is off, which prevents mixing.

If you set this option to on, FCAL and SAS disk types are considered interchangeable for all aggregate operations, including aggregate creation, adding disks to an aggregate, and replacing disks within an existing aggregate, whether this is done by the administrator or automatically by Data ONTAP.

When this option is set to off, FCAL and SAS disks cannot be combined within the same aggregate. If you have existing aggregates that combine those disk types, those aggregates will continue to function normally and accept either disk type.

**Note:** This option is ignored in `storage aggregate create` and `storage aggregate add-disks` commands, when either of `-disktype` or `-diskclass` parameter is used. It is better to use the `-disktype` or `-diskclass` parameter instead of relying on this option.

**raid.mix.hdd.rpm.capacity**

This option controls separation of capacity-based hard disk drives (ATA, SATA, BSAS, FSAS, MSATA) by uniform rotational speed (RPM). If you set this option to off, Data ONTAP always selects disks with the same RPM when creating new aggregates or when adding disks to existing aggregates using these disk types. If you set this option to on, Data ONTAP does
not differentiate between these disk types based on rotational speed. For example, Data ONTAP might use both 5400 RPM and 7200 RPM disks in the same aggregate. The default value is on.

**raid.mix.hdd.rpm.performance**

This option controls separation of performance-based hard disk drives (SAS, FCAL) by uniform rotational speed (RPM). If you set this option to off, Data ONTAP always selects disks with the same RPM when creating new aggregates or when adding disks to existing aggregates using these disk types. If you set this option to on, Data ONTAP does not differentiate between these disk types based on rotational speed. For example, Data ONTAP might use both 10K RPM and 15K RPM disks in the same aggregate. The default value is off.

**raid.reconstruct.perf_impact**

This option sets the overall performance impact of RAID reconstruction. When the CPU and disk bandwidth are not consumed by serving clients, RAID reconstruction consumes as much bandwidth as it needs. If the serving of clients is already consuming most or all of the CPU and disk bandwidth, this option allows control over the CPU and disk bandwidth that can be taken away for reconstruction, and thereby enables control over the negative performance impact on the serving of clients. As the value of this option is increased, the speed of reconstruction also increase. The possible values are low, medium, and high. The default value is medium. When mirror resync and reconstruction are running at the same time, the system does not distinguish between their separate resource consumption on shared resources (like CPU or a shared disk). In this case, the combined resource utilization of these operations is limited to the maximum resource entitlement for individual operations.

**raid.resync.num_concurrent_ios_per_rg**

This option changes the duration of a resync by modifying the number of concurrent resync I/Os in progress for each resync’ing raidgroup. The legacy, and default value, is 1. As the value of this option is increased, the speed of resync is increased. This will have a negative performance impact on the serving of clients.

**raid.resync.perf_impact**

This option sets the overall performance impact of RAID mirror resync (whether started automatically by the system or implicitly by an operator-issued command). When the CPU and disk bandwidth are not consumed by serving clients, a resync operation consumes as much bandwidth as it needs. If the serving of clients is already consuming most or all of the CPU and disk bandwidth, this option allows control over the CPU and disk bandwidth that can be taken away for resync operations, and thereby enables control over the negative performance impact on the serving of clients. As the value of this option is increased, the speed of resync also increases. The possible values are low, medium, and high. The default value is medium. When RAID mirror resync and reconstruction are running at the same time, the system does not distinguish between their separate resource consumption on shared resources (like CPU or a shared disk). In this case, the combined resource utilization of these operations is limited to the maximum resource entitlement for individual operations.

**raid.rpm.ata.enable**

This option is obsolete. Use option raid.mix.hdd.rpm.capacity instead.

**raid.rpm.fcal.enable**

This option is obsolete. Use option raid.mix.hdd.rpm.performance instead.

**raid.scrub.perf_impact**

This option sets the overall performance impact of RAID scrubbing (whether started automatically or manually). When the CPU and disk bandwidth are not consumed by serving clients, scrubbing consumes as much bandwidth as it needs. If the serving of clients is already consuming most or all of the CPU and disk bandwidth, this option allows control over the CPU and disk bandwidth that can be taken away for scrubbing, and thereby enables control over the negative performance impact on the serving of clients. As the value of this option is increased, the speed of scrubbing also increases. The possible values for this option are low, medium, and high. The default value is low. When scrub and mirror verify are running at the same time, the system does not distinguish between their separate resource consumption on shared resources (like CPU or a shared disk). In this case, the combined resource utilization of these operations is limited to the maximum resource entitlement for individual operations.

**raid.scrub.schedule**
This option specifies the weekly schedule (day, time and duration) for scrubs started automatically. On a non-AFF system, the default schedule is daily at 1 a.m. for the duration of 4 hours except on Sunday when it is 12 hours. On an AFF system, the default schedule is weekly at 1 a.m. on Sunday for the duration of 6 hours. If an empty string (""") is specified as an argument, it will delete the previous scrub schedule and add the default schedule. One or more schedules can be specified using this option. The syntax is duration[h|m]@weekday@start_time,[duration[h|m]@weekday@start_time,...] where duration is the time period for which scrub operation is allowed to run, in hours or minutes ('h' or 'm' respectively).

Weekday is the day on which the scrub is scheduled to start. The valid values are sun, mon, tue, wed, thu, fri, sat.

start_time is the time when scrub is schedule to start. It is specified in 24 hour format. Only the hour (0-23) needs to be specified.

For example, options raid.scrub.schedule 240m@tue@2,8h@sat@22 will cause scrub to start on every Tuesday at 2 a.m. for 240 minutes, and on every Saturday at 10 p.m. for 480 minutes.

raid.timeout

This option sets the time, in hours, that the system will run after a single disk failure in a RAID4 group or a two disk failure in a RAID-DP group has caused the system to go into degraded mode or double degraded mode respectively, or after NVRAM battery failure has occurred. The default is 24, the minimum acceptable value is 0 and the largest acceptable value is 4,294,967,295. If the raid.timeout option is specified when the system is in degraded mode or in double degraded mode, the timeout is set to the value specified and the timeout is restarted. If the value specified is 0, automatic system shutdown is disabled.

raid.verify.perf_impact

This option sets the overall performance impact of RAID mirror verify. When the CPU and disk bandwidth are not consumed by serving clients, a verify operation consumes as much bandwidth as it needs. If the serving of clients is already consuming most or all of the CPU and disk bandwidth, this option allows control over the CPU and disk bandwidth that can be taken away for verify, and thereby enables control over the negative performance impact on the serving of clients. As you increase the value of this option, the verify speed also increases. The possible values are low, medium, and high. The default value is low. When scrub and mirror verify are running at the same time, the system does not distinguish between their separate resource consumption on shared resources (like CPU or a shared disk). In this case, the combined resource utilization of these operations is limited to the maximum resource entitlement for individual operations.

storage raid-options modify

Modify a RAID option

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The storage raid-options modify command is used to modify the available RAID options for each node in a cluster. The options are described in the storage raid-options manual page.

Parameters

-node {<nodename>|local} - Node

This parameter specifies the node on which the RAID option is to be modified.

-name <text> - Option Name

This parameter specifies the RAID option to be modified. To see the list of RAID options that can be modified, use the storage raid-options show command.
[-value <text>] - Option Value

This parameter specifies the value of the selected RAID option.

Related references

storage raid-options show on page 1004
storage raid-options on page 1000

storage raid-options show

Display RAID options

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The storage raid-options show command displays information about all the RAID options in a cluster. The options are described in the storage raid-options manual page.

Parameters

[-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance ]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-node <nodename>|local] - Node

Selects information about all the RAID options on the specified node.

[-name <text>] - Option Name

Selects information about the RAID options that have the specified name.

[-value <text>] - Option Value

Selects information about all the RAID options that have the specified value.

[-constraint <text>] - Option Constraint

Selects information about all the RAID options that have the specified constraint. The 'constraint' field indicates the expected setting for a RAID option across both nodes of an HA pair. The possible values are:

- none - no constraint on the value of this RAID option; nodes can have different values
- same_preferred - the same value should be used on both nodes of an HA pair, otherwise the next takeover may not function correctly
- same_required - the same value must be used on both nodes of an HA pair, otherwise the next takeover will not function correctly
- only_one - the same value should be used on both nodes of an HA pair. If the values are different and a takeover is in progress, the value of the RAID option on the node that is taking over will be used
- unknown - no information about constraints for this RAID option

Examples

The following example shows the raid scrub settings for a node named node1:

storage shelf commands

Manage storage shelves

storage shelf show

Display a list of storage shelves

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The storage shelf show command displays information about all the storage shelves in the storage system. If no parameters are specified, the default command displays the following information about the storage shelves:

- Shelf Name
- Shelf ID
- Serial Number
- Model
- Module Type
- Status

To display detailed profile information about a single storage shelf, use the -shelf parameter.

Parameters

{ [-fields <fieldname>, ...] }

Displays the specified fields for all the storage shelves, in column style output.

| [-bay ]

Displays the following details about the disk bays in the storage shelf:

- The unique positional identifier of the disk bay
- Whether a disk drive is installed in the bay
- Bay type
- Operational status of the disk bay

| [-connectivity ]

Displays the following details about the connectivity from the node to the storage shelf:
• Node name
• Initiator side switch port
• Target side switch port
• World wide port name
• Target Port Group Number (TPGN)

[-cooling]
Displays the following details about the cooling elements and temperature sensors of the storage shelf:
• Element ID of the cooling fan
• The current speed of the cooling fan in revolutions per minute (rpm)
• Operational status of the cooling fan
• Sensor ID of the temperature sensor element
• Temperature at the sensor in degrees Celsius
• Whether the current temperature at the sensor is the ambient temperature
• Low critical threshold value for the temperature sensor
• Low warning threshold value for the temperature sensor
• High critical threshold value for the temperature sensor
• High warning threshold value for the temperature sensor
• Operational status for the temperature sensor

[-errors]
Displays the following error status information about the storage shelves which have errors:
• Error type
• Error description

[-module]
Displays the following details about the I/O modules attached to the storage shelf:
• Module ID
• Module Part number
• Serial number of the Enclosure Services Controller Electronics element
• Whether monitoring is enabled on this module
• Whether this module is the SAS expander master module
• Whether this module is the element reporting
• Version of the firmware installed on the module
• Latest firmware revision
• Number of times, since last boot, that this module has been swapped
• Operational status of the module
[-port ]
Displays the following details about the storage shelf ports:

- Expander phy element identifier
- SAS shelf port type
- World Wide Port Name of the SAS port
- Operational physical link rate of the SAS port in Gb/s
- Negotiated physical link rate of the SAS port in Gb/s
- Power status of the SAS port
- Status of the SAS port
- Fibre Channel shelf port ID
- Fibre Channel shelf port type
- Fibre Channel shelf port status

[-power ]
Displays the following details about the power supplies, voltage sensors and current sensors of the storage shelf:

- Power Supply Unit (PSU) number
- PSU type
- PSU part number
- PSU serial number
- PSU power rating in watts
- PSU crest factor
- Power drawn from the PSU in watts
- Whether the PSU can be reset via software control
- Whether the auto power reset of the PSU is enabled
- PSU firmware revision
- Operational status of the PSU
- Voltage sensor number
- Voltage detected by the voltage sensor, in volts (V)
- Operational status of the voltage sensor
- Current sensor number
- Current detected by the current sensor, in milliamps (mA)
- Operational status of the current sensor

[-instance ]
Displays expanded information about all the storage shelves in the system.
[-node \(<\text{nodename}|local>\)] - Node
Displays information only about the storage shelves that are attached to the node you specify.

[-shelf <text>] - Shelf Name
Displays information only about the storage shelves that match the names you specify.

[-shelf-uid <text>] - Shelf UID
Displays information only about the storage shelf that matches the shelf UID you specify. Example: 50:05:0c:c0:02:10:64:26

[-stack-id <integer>] - Stack ID
Displays information only about the storage shelves that are attached to the stack that matches the stack ID you specify

[-shelf-id <text>] - Shelf ID
Displays information only about the storage shelves that match the shelf ID you specify.

[-module-type \{unknown|atfcx|esh4|iom3|iom6|iom6e|iom12|iom12e|iom12f\}] - Shelf Module Type
Displays information only about the storage shelves that match the module-type you specify.

[-connection-type \{unknown|fc|sas\}] - Shelf Connection Type
Displays information only about the storage shelves that match the connection type you specify. Example: FC or SAS.

[-is-local-attach \{true|false\}] - Is the Shelf Local to This Cluster?
Displays information only about the storage shelves that are local (TRUE) or remote (FALSE) to this cluster.

[-vendor <text>] - Shelf Vendor
Displays information only about the storage shelves that match the vendor you specify.

[-product-id <text>] - Shelf Product Identification
Displays information only about the storage shelves that match the product ID you specify.

[-serial-number <text>] - Shelf Serial Number
Displays information only about the storage shelf that matches the serial number you specify.

[-disk-count <integer>] - Disk Count
Displays information only about the storage shelves that have the disk count you specify.

[-state \{unknown|no-status|init-required|online|offline|missing\}] - Shelf State
Displays information only about the storage shelves that are in the state you specify.

[-op-status \{unknown|normal|warning|error|critical|standby-power\}] - Shelf Operational Status
Displays information only about the storage shelves that are currently operating under the status condition you specify.

[-bay-id <integer>] - Bay ID
Displays information only about the storage shelves that have bays that match the bay ID you specify.

[-bay-type \{unknown|single-disk|multi-lun\}] - Bay Type
Displays information only about the storage shelves that have bays that match the type of bay you specify.

[-bay-has-disk \{true|false\}] - Bay Has Disk
Displays information only about the storage shelves that have bays with disk drives inserted in them (true) or empty bays (false).

[-bay-op-status \{unknown|normal|error\}] - Bay Operational Status
Displays information only about the storage shelves that have bays that match the operational state you specify.
[-controller {<nodename>|local}, ...] - Controller Name
Displays information only about the storage shelves that are connected to the node you specify.

[-controller-uuid <text>, ...] - Controller UUID
Displays information only about the storage shelves that are connected to the node UUID you specify.

[-initiator <text>, ...] - Initiator
Displays information only about the storage shelves that are visible to the initiator you specify.

[-initiator-wwpn <text>, ...] - Initiator WWPN
Displays information only about the storage shelves that are visible to the initiator WWPN you specify.

[-initiator-side-switch-port <text>, ...] - Initiator Side Switch Port
Displays information only about the storage shelves that are visible to an initiator connected to the switch port you specify.

[-target-side-switch-port <text>, ...] - Target Side Switch Port
Displays information only about the storage shelves visible on target ports identified by the switch port to which they are connected.

[-target-port <text>, ...] - Target Port
Displays information only about the storage shelves visible on the specified target ports identified by their World Wide Port Name (WWPN).

[-tpgn {<integer>|-}, ...] - Target Port Group Number
Displays information only about the storage shelves that belong to the Target Port Group Name (TPGN) you specify.

[-port-speed {<integer>|-}, ...] - Port Speed
Displays information only about the storage shelves with ports that match the port speed you specify.

[-io-kbps {<integer>|-}, ...] - Kbytes/sec on Storage Shelf
Displays information only about the storage shelves visible to an initiator that has executed I/O at the throughput you specify.

[-iops {<integer>|-}, ...] - Number IOPS per Second on Storage Shelf
Displays information only about the storage shelves visible to an initiator that has executed the number of IOPs you specify.

[-current-sensor-id {<integer>|-}, ...] - Current Sensor ID
Displays information only about the storage shelves with current sensor that matches the current sensor ID you specify.

[-current-sensor-location <text>, ...] - Current Sensor Location
Displays information only about the storage shelves with current sensors installed at the location you specify.

[-current-sensor-reading {<integer>|-}, ...] - Current Sensor Reading
Displays information only about the storage shelves with current sensors that match the current reading you specify.

[-current-op-status {unknown|normal|over-current-critical|under-current-critical|not-supported|not-installed}, ...] - Operational Status
Displays information only about the storage shelves with current sensors that match the operational status you specify.

[-fan-id {<integer>|-}, ...] - Fan ID
Displays information only about the storage shelves with a cooling fans that match the fan IDs you specify.

[-fan-location <text>, ...] - Fan Location
Displays information only about the storage shelves with cooling fans installed.
[-fan-rpm <integer> | -, ...] - Fan Rotation Per Minute
Displays information only about the storage shelves with cooling fans that match the rpm you specify.

[-fan-op-status {unknown|normal|off|error|not-supported|not-installed}, ...] - Fan Operational Status
Displays information only about the storage shelves with cooling fans that match the operational status you specify.

[-module-id <text>, ...] - Module ID
Displays information only about the storage shelves with an I/O module that matches the module ID you specify.

[-module-location <text>, ...] - Module Location
Displays information only about the storage shelves with I/O modules in the specified shelf module slots.

[-module-part-number <text>, ...] - Module Part Number
Displays information only about the storage shelves with I/O modules that match the module part numbers you specify.

[-is-sas-master-module {true|false}, ...] - Is SAS Expander Master Module?
Displays information only about the storage shelves with a SAS master I/O module (true) or an I/O module that is not a SAS master (false). This parameter applies only to SAS shelves.

[-is-monitor-active {true|false}, ...] - Is Monitor Active?
Displays information only about the storage shelves whose monitoring is enabled (true) or disabled (false).

[-enclosure-type <text>, ...] - Module Enclosure Type
Displays information only about the storage shelves that match the enclosure types you specify.

[-es-serial-number <text>, ...] - ES Electronics Element Serial Number
Displays information only about the storage shelves with I/O modules that match the electronics serial numbers you specify.

[-module-fru-id <text>, ...] - Field Replaceable Unit ID
Displays information only about the storage shelves with I/O modules that match the field replaceable unit (FRU) IDs you specify.

[-module-is-reporting-element {true|false}, ...] - Is Reporting Element?
Displays information only about the storage shelves with element reporting I/O modules (true) or not (false).

[-module-fw-revision <text>, ...] - Firmware Revision
Displays information only about the storage shelves with I/O modules that match the firmware revision you specify.

[-module-latest-fw-revision <text>, ...] - Latest Firmware Revision
Displays information only about the storage shelves with I/O modules that match the latest firmware revision you specify.

[-module-fw-progress {not-available|ready|in-progress|failed}, ...] - Module Firmware Progress
Displays information only about the storage shelves with I/O modules that match the specified firmware update progress.

[-module-swap-count <integer> | -, ...] - Module Swap Count
Displays information only about the storage shelves whose I/O modules have been swapped the specified number of times.

[-module-op-status {unknown|normal|warning|error}, ...] - Module Operational Status
Displays information only about the storage shelves with I/O modules that match the operational status you specify.
[-sas-port-id <text>, ...] - Port ID
Displays information only about the storage shelves with SAS Ports that match the port IDs you specify.

[-sas-port-type {unknown|circle|square|sil|disk|in|out|unused|host|dcm|aux1|aux2|hi_ho|a_to_b|b_to_a}, ...] - Port Type
Displays information only about the storage shelves with SAS Ports that match the SAS port type you specify.

[-sas-port-wwpn <text>, ...] - Port World Wide Port Name
Displays information only about the storage shelves with SAS Ports that match the World Wide Port Names you specify.

[-sas-port-speed <text>, ...] - Port Speed
Displays information only about the storage shelves with SAS Ports that match the port speed you specify.

[-sas-negotiated-port-speed <text>, ...] - Negotiated Port Speed
Displays information only about the storage shelves with SAS Ports that match the negotiated port speed you specify.

[-sas-port-power-status <text>, ...] - Port Power Status
Displays information only about the storage shelves with SAS Ports that match the power status you specify.

[-sas-port-op-status {error|normal|off|unknown|byp-bad-term|bad-zone-recovery|byp_clk_thr|byp_comma_los|byp_crc_brst_thr|byp_data_timeout|bypDrvFault|bypDrvPcycle|bypDrvPwr|bypDrvSelf|bypGen|bypInit|byp_Lip_brst_thr|byp_Lip_f8|byp_Lip_rate_thr|byp_Lipf7|byp_Lthi|byp_man|byp_no_drive|byp_Osc|byp_other_thr|byp_REC_los|byp_report|byp_stall_thr|byp_Wrd_brst_thr|byp_Wrd_rate_thr|byp_Xmit_fault|diag_transmit|inserted|loopback|status_unknown|warn_high_clk_delta|warn_high_crc_rate|warn_high_Lip|warn_high_Wrd_rate|term|phy_dis_clk_fault|phy_dis_crc_err|phy_dis_crc_err_burst|phy_dis_disparity| phy_dis_disparity_burst|phy_dis_emulate_reserve|phy_dis_inval_dword|phy_dis_inval_dword_burst|phy_dis_loss_dword|phy_dis_loss_dword_burst|phy_dis_man_smp|phy_dis_manual|phy_dis_mirrored|empty|phy_dis_phy_change|phy_dis_phy_change_burst|phy_dis_phy_reset|phy_dis_phy_reset_burst|phy_dis_phy_unused|phy_Ena|phy_Ena_not_attach|phy_Ena_unknown|phy_unknown}, ...] - Port Operational Status
Displays information only about the storage shelves with SAS Ports that match the operational status you specify. Displays information only about the storage shelves with SAS Ports that match the operational status you specify.

[-sas-port-module-id (A|B), ...] - Port Module ID
Displays information only about the storage shelves with SAS Ports that match the module ID you specify.

[-fc-port-id <text>, ...] - Fibre Channel Port ID
Displays information only about the storage shelves with FC Ports that match the FC IDs you specify.

[-fc-port-mode {unknown|circle|square|sil|disk|in|out|unused|host|dcm|aux1|aux2|hi_ho|a_to_b|b_to_a}, ...] - Fibre Channel Port Mode
Displays information only about the storage shelves with FC Ports that match the port modes you specify.

[-fc-port-op-status {error|normal|off|unknown|byp-bad-term|bad-zone-recovery|byp_clk_thr|byp_comma_los|byp_crc_brst_thr|byp_data_timeout|bypDrvFault|bypDrvPcycle|bypDrvPwr|bypDrvSelf|bypGen|bypInit|byp_Lip_brst_thr|byp_Lip_f8|byp_Lip_rate_thr|byp_Lipf7|byp_Lthi|byp_man|byp_no_drive|byp_Osc|byp_other_thr|byp_REC_los|byp_report|byp_stall_thr|byp_Wrd_brst_thr|byp_Wrd_rate_thr|byp_Xmit_fault|diag_transmit|inserted|loopback|status_unknown|warn_high_clk_delta|warn_high_crc_rate|warn_high_Lip|warn_high_Wrd_rate|term|phy_dis_clk_fault|phy_dis_crc_err|phy_dis_crc_err_burst|phy_dis_disparity| phy_dis_disparity_burst|phy_dis_emulate_reserve|phy_dis_inval_dword|phy_dis_inval_dword_burst|phy_dis_loss_dword|phy_dis_loss_dword_burst|phy_dis_man_smp|phy_dis_manual|phy_dis_mirrored|empty|phy_dis_phy_change|phy_dis_phy_change_burst|phy_dis_phy_reset|phy_dis_phy_reset_burst|phy_dis_phy_unused|phy_Ena|phy_Ena_not_attach|phy_Ena_unknown|phy_unknown}, ...] - Fibre Channel Port Operational Status
Displays information only about the storage shelves with FC Ports that match the port operational status you specify. Displays information only about the storage shelves with FC Ports that match the operational status you specify.
phy_dis_phy_reset|phy_dis_phy_reset_burst|phy_dis_phy_unused|phy_ena|phy_ena_not_attach|
phy_ena_unknown|phy_unknown}, ...] - Fibre Channel Port Operational Status

Displays information only about the storage shelves with FC Ports that match the operational status you specify.

[-psu-id {<integer>|-}, ...] - Power Supply Unit ID

Displays information only about the storage shelves with power supply units (PSU) that match the unit IDs you specify.

[-psu-location <text>, ...] - Power Supply Unit Location

Displays information only about the storage shelves with PSUs that are located at the specified location inside the shelf.

[-psu-type <text>, ...] - Power Supply Unit Type

Displays information only about the storage shelves with PSUs that match the PSU types you specify.

[-psu-part-number <text>, ...] - Power Supply Unit Part Number

Displays information only about the storage shelves with PSUs that match the PSU part number you specify.

[-psu-serial-number <text>, ...] - Power Supply Unit Serial Number

Displays information only about the storage shelves with PSUs that match the PSU serial numbers you specify.

[-psu-reset-capable {true|false}, ...] - Power Supply Unit Reset Capability

Displays information only about the storage shelves with reset capable PSUs (true) or reset incapable PSUs (false).

[-psu-is-enabled {true|false}, ...] - Power Supply Unit Enable/Disable Status

Displays information only about the storage shelves with PSUs that are enabled (true) or disabled (false).

[-psu-fw-version <text>, ...] - Power Supply Unit Firmware Version

Displays information only about the storage shelves with PSUs that have the firmware version you specify.

[-psu-op-status {unknown|normal|error|dc-over-voltage|dc-under-voltage|dc-over-current|
over-temperature-error|failed|off|not-supported|not-installed}, ...] - Operational Status

Displays information only about the storage shelves with PSUs that match the operational status you specify.

[-psu-power-rating {<integer>|-}, ...] - Power Supply Power Ratings In Watts

Displays information only about the storage shelves with PSUs that match the power rating you specify.

[-psu-crest-factor {<integer>|-}, ...] - Power Supply Crest Factor

Displays information only about the storage shelves with PSUs that match the crest factor value you specify.

[-psu-power-drawn {<integer>|-}, ...] - Power Drawn From PSU In Watts

Displays information only about the storage shelves with PSUs that match the drawn power you specify.

[-temp-sensor-id {<integer>|-}, ...] - Sensor Name

Displays information only about the storage shelves with temperature sensors that match the sensor IDs you specify.

[-temp-sensor-location <text>, ...] - Sensor Location

Displays information only about the storage shelves with temperature sensors that match the specified sensor locations inside the shelf.

[-temp-sensor-reading {<integer>|-}, ...] - Temperature Reading

Displays information only about the storage shelves with temperature sensors that match the temperature reading you specify.
[-temp-is-ambient \{true\|false\}, ...] - Temperature Reading at Ambient Value

Displays information only about the storage shelves with temperature sensors whose current temperature reading is ambient (true) or not (false).

[-temp-high-critical-threshold \{<integer>\ [-], ...] - High Critical Threshold

Displays information only about the storage shelves with temperature sensors that match the high critical threshold you specify.

[-temp-high-warning-threshold \{<integer>\ [-], ...] - High Warning Threshold

Displays information only about the storage shelves with temperature sensors that match the high warning threshold you specify.

[-temp-low-warning-threshold \{<integer>\ [-], ...] - Low Warning Threshold

Displays information only about the storage shelves with temperature sensors that match the low warning threshold you specify.

[-temp-low-critical-threshold \{<integer>\ [-], ...] - Low Critical Threshold

Displays information only about the storage shelves with temperature sensors that match the low critical threshold you specify.

[-temp-op-status \{unknown\|normal\|under-temperature\|over-temperature\|error\|not-supported\|not-installed\}, ...] - Operational Status

Displays information only about the storage shelves with temperature sensors that match the operational status you specify.

[-voltage-sensor-id \{<integer>\ [-], ...] - Voltage Sensor ID

Displays information only about the storage shelves with voltage sensors that match the sensor IDs you specify.

[-voltage-sensor-location <text>, ...] - Voltage Sensor Location

Displays information only about the storage shelves with voltage sensors that match the specified sensor locations inside the shelf.

[-voltage-sensor-reading <text>, ...] - Voltage Current Reading

Displays information only about the storage shelves with voltage sensors that match the voltage reading you specify.

[-voltage-op-status \{unknown\|normal\|over-voltage-critical\|under-voltage-critical\|not-supported\|not-installed\|not-recoverable\}, ...] - Operational Status

Displays information only about the storage shelves with voltage sensors that match the operational status you specify.

[-error-type \{unknown\|acpp\|bay\|configuration\|current\|disk\|internal\|fan\|module\|port\|power\|temperature\|voltage\}, ...] - Error Type

Displays information only about the storage shelves with errors that match the error type you specify.

[-error-severity \{unknown\|notice\|warning\|error\|critical\}, ...] - Error Severity

Displays information only about the storage shelves with errors that match the error severity you specify.

Examples

The following example displays information about all storage shelves:

```
cluster1::> storage shelf show

<table>
<thead>
<tr>
<th>Shelf Name</th>
<th>Shelf ID</th>
<th>Serial Number</th>
<th>Model</th>
<th>Module Type</th>
<th>Operational Status</th>
</tr>

Commands: Manual Page Reference
The following example displays error information about the storage shelves that have errors:

```
cluster1::> storage shelf show -errors
    Shelf Name: 1.1
    Shelf UID: 50:0a:09:80:01:cb:d6:84
    Serial Number: 6000832415
    Error Type          Description
    ------------------  ---------------------------
    Power               Critical condition is detected in storage shelf power supply unit "1". The
                        unit might fail.
    Temperature         Critical over temperature failure for temperature sensor "1". Current
                        temperature: "75" C ("167" F).
```

Storage ACP Commands

Manage alternate control path (ACP)

The `storage shelf acp` command family manages the alternate control path connectivity on the system. The command set allows you to view the current connectivity, and the ACP modules. You can also configure the connection or disable the connection across the cluster.

`storage shelf acp configure`

Configure alternate control path (ACP)

Availability: This command is available to `cluster` administrators at the `admin` privilege level.

Description

Configure the ACP connectivity on the cluster.

Parameters

- `--is-enabled {true|false}` - Is Enabled?
  Configures the connectivity to the specified state.

- `[--subnet <IP Address>]` - Subnet
  Configures the connectivity to the specified subnet.

- `[--netmask <IP Address>]` - Netmask
  Configures the connectivity to the specified netmask.

- `[--channel {out-of-band|in-band}]` - Channel
  Configures the connectivity to the specified channel.

Examples

The following example configures out-of-band ACP connectivity on each node:

```
```
The following example configures in-band ACP connectivity on each node:

```
cluster1::> storage shelf acp configure -is-enabled true -channel in-band
```

The following example disables ACP connectivity on each node:

```
cluster1::> storage shelf acp configure -is-enabled false
```

---

**storage shelf acp show**

Show connectivity information

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**
Displays information about the ACP connectivity on each node

**Parameters**

- `[[-fields <fieldname>, ...]]`
  If you specify the `-fields <field-name>"", ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

- `[-errors]`
  If you specify the `-errors` parameter, the command displays detailed information about all modules with errors.

- `[-instance]`
  If you specify the `-instance` parameter, the command displays detailed information about all fields.

- `[-node <nodename> | local]` - Node
  Selects the nodes that match this parameter value.

- `[-is-enabled {true | false}]` - Is Enabled?
  Selects the nodes that are enabled or disabled.

- `[-port <text>]` - Port
  Selects the nodes that match the specified port on which ACP is configured.

- `[-address <IP Address>]` - IP Address
  Selects the nodes with the specified IP address.

- `[-subnet <IP Address>]` - Subnet
  Selects the nodes with the specified subnet.

- `[-netmask <IP Address>]` - Netmask
  Selects the nodes with the specified netmask.

- `[-connection-status {no-connectivity | partial-connectivity | full-connectivity | additional-connectivity | unknown-connectivity | not-available | connection-disabled}]` - Connection Status
  Selects the nodes with the specified connection status.

- `[-error-id <integer>]` - Error ID
  Selects the node with the specified error ID.
[-error-type {No-Error|Connection-Issue|Connection-Activity|Module-Error|Shelf-Error}] - Error Type
The error type, in case of a connection error.

[-error-severity {unknown|notice|warning|error|critical}] - Error Severity
The error severity, in case of a connection error.

[-error-text <text>] - Error Text
Selects the node with the specified error text.

[-corrective-action <text>] - Corrective Action
Selects the node with the specified corrective action.

[-channel {unknown|out-of-band|in-band}] - Channel
Selects the nodes that have channel configured out-of-band or in-band.

Examples
The following example displays ACP connectivity on each node:

```
cluster1::> storage shelf acp show
Node                Channel                Connectivity
------------------  --------------------   ----------------------
stor-8020-1         in-band                active
stor-8020-2         in-band                active
stor-8060-1         out-of-band            full-connectivity
stor-8060-2         out-of-band            full-connectivity
4 entries were displayed.
```

The following example displays the -instance output of the storage acp show. More details on the connectivity and configuration can be seen here.

```
cluster1::> storage shelf acp show -instance
Node: stor-8020-1
Channel: out-of-band
Enable Status: enabled
Port: e0P
IP Address: 192.168.1.74
Subnet: 192.168.0.1
Netmask: 255.255.252.0
Connection Status: full-connectivity

Node: stor-8020-1
Channel: in-band
Enable Status: enabled
Connection Status: active
2 entries were displayed.
```

storage shelf acp module commands
Display the modules connected to the cluster

storage shelf acp module show
Show modules connected to the cluster

Availability: This command is available to cluster administrators at the admin privilege level.

Description
Displays information about the modules connected to each node
Parameters

`[-fields <fieldname>, ...]`
If you specify the `-fields <field-name>`, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

`[-errors]`
If you specify the `-errors` parameter, the command displays detailed information about all modules with errors.

`[-instance]`
If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-node <nodename> | local] - Node`
Selects the modules that match this parameter value.

`[-mac-address <text>] - MAC Address`
Selects the module that match the specified MAC address.

`[-module-name <text>] - Module name`
Selects the module that match the specified module name.

`[-module-address <IP Address>] - IP Address`
Selects the module that match the specified IP address.

`[-protocol-version <text>] - Protocol Version`
Selects the modules that match the specified protocol version.

`[-firmware-version <text>] - Firmware Version`
Selects the modules that match the specified firmware version.

`[-acpa-id <integer>] - ACPA assigner ID`
Selects the modules that match the specified ACPA ID.

`[-shelf-serial-number <text>] - Shelf Serial Number`
Selects the modules that match the specified shelf serial number.

`[-iom-type {Unknown|iom3|iom6|iom6e|iom12|iom12e|iom12f}] - IOM Type`
Selects the modules that match the specified IOM type (IOM3/IOM6/IOM6E).

`[-last-contact <integer>] - Last Contact (secs)`
Selects the modules that match the specified last contact.

`[-state {unknown|initializing|discovery-complete|awaiting-inband|no-inband|active|awaiting-bootp|updating-firmware|connection-error|firmware-update-required|rebooting|fail|unsupported|degraded|shelf-off}] - Local Node State`
Selects the modules that match the specified state.

`[-stack-id <integer> | -] - Stack ID`
Selects the modules that match the specified stack ID.

`[-shelf-id <text>] - Shelf ID`
Selects the modules that match the specified shelf ID.

`[-adapter-name <text>] - Adapter Name`
Selects the modules that match the specified adapter name.

`[-error-id <integer>, ...] - Error ID`
Selects the modules that match the specified error ID.

`[-error-text <text>, ...] - Error Text`
The error text, in case of a module error.
The corrective action, in case of a module error.

Selects the modules that match the specified error type.

Selects the modules that match the specified error severity.

Examples
The following example displays the ACP modules connected to each node:

```shell
cluster1::> storage shelf acp module show

<table>
<thead>
<tr>
<th>Node</th>
<th>Module Name</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>stor-v4-la-1b-01</td>

storage shelf drawer commands

The drawer directory

storage shelf drawer show

Display a list of drawers

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The storage shelf drawer show command displays information for storage shelf drawers in the storage system. If no parameters are specified, the default command displays the following information for the drawers:
- Shelf Name
- Drawer Number
- Status
- Closed/Open
- Disk Count
- Firmware

To display detailed information for a single drawer, use the `-shelf` and `-drawer` parameters.

**Parameters**

```bash
[-fields <fieldname>, ...]
  Displays the specified fields for all drawers, in column style output.

[-errors]
  Displays the following error status information about the drawers that have errors:
  - Status
  - Error Description

[-instance]
  Displays expanded information for all drawers in the system. If a shelf and drawer are specified, then this parameter displays the same detailed information for the specified drawer as does the -shelf and -drawer parameters.

[-shelf <text>] - Shelf Name
  Displays the drawers in the storage shelf that matches the specified shelf name.

[-drawer <integer>] - Drawer Number
  Displays the drawers that match the specified drawer number.

[-node (<nodename> | local)] - Node Name
  Displays the drawers that are present for the specified node.

[-disk-count <integer>] - Drawer Disk Count
  Displays the drawers that have the specified disk count.

[-part-number <text>] - Part Number
  Displays the drawers that have the specified part number.

[-serial-number <text>] - Serial Number
  Displays the drawer that matches the specified serial number.

[-is-closed {open | closed}] - Drawer is Closed?
  Displays the drawers that are closed or open.

[-firmware-a <text>] - Firmware A
  Displays the drawers for which module A has the specified firmware version.

[-firmware-b <text>] - Firmware B
  Displays the drawers for which module B has the specified firmware version.

[-path-a {unknown | ok | degraded | none}] - Path A
  Displays the drawers for which module A has the specified path status.
[-path-b {unknown|ok|degraded|none}] - Path B
Displays about drawers for which module B has the specified path status.

[-is-supported {yes|no}] - Drawer is Supported?
Displays the drawers that are supported (TRUE) or not supported (FALSE).

[-vendor <text>] - Vendor Name
Displays the drawers that match the specified vendor.

[-mfg-date <text>] - Mfg. Date
Displays the drawers that match the specified manufactured date.

[-fru-type <text>] - FRU Type
Displays the drawers that match the specified FRU type.

[-status-a {unknown|normal|warning|error|critical}] - Status A
Displays the drawers with module A currently operating under the specified status.

[-status-b {unknown|normal|warning|error|critical}] - Status B
Displays the drawers with module B currently operating under the specified status.

[-error <text>] - Error
Displays the drawers that match the specified error description.

Examples
The following example displays information about all drawers:

cluster1::> storage shelf drawer show

<table>

**storage shelf drawer show-phy**

Display a list of PHYs per drawer

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The `storage shelf drawer show-phy` command displays information for drawer PHYs in the storage system. If no parameters are specified, the default command displays the following information about PHYs:

- Shelf Name
- Drawer Number
- PHY Number
- Type
- SAS Address
- State

To display detailed information about a single PHY, use the `-shelf`, `-drawer`, and `-phy` parameters.

**Parameters**

```
[-fields <fieldname>, ...]
Displays the specified fields for all drawer PHYs, in column style output.

[-instance ]
Displays expanded information for all drawer PHYs in the system. If a shelf, drawer, and PHY are specified, then this parameter displays the same detailed information for the PHY you specify as does the -shelf, -drawer, and -phy parameters.

[-shelf <text>] - Shelf Name
Displays the PHYs in the storage shelf that matches the specified shelf name.

[-drawer <integer>] - Drawer Number
Displays the PHYs in the drawers that match the specified drawer number.

[-phy <integer>] - PHY Number
Displays the PHYs that match the specified PHY number.
```
-[node {<nodename>|local}] - Node Name
   Displays the PHYs that are present for the specified node.

-[type {unknown|disk|virtual|input}] - Type
   Displays the PHYs with the specified type.

-[physical-id <integer>] - Physical ID
   Displays the PHYs that match the specified physical-id.

-[sas-address <text>] - Attached SAS Address
   Displays the PHYs with the specified attached sas address.

-[state-a {unknown|enabled|disabled}] - State Module A
   Displays the PHYs for which module A has the specified state.

-[state-b {unknown|enabled|disabled}] - State Module B
   Displays the PHYs for which module B has the specified state.

-[status-a <Drawer PHY Status>] - Status Module A
   Displays the PHYs with module A currently operating under the specified status.

-[status-b <Drawer PHY Status>] - Status Module B
   Displays the PHYs with module B currently operating under the specified status.

**Examples**

The following example displays information about all drawer PHYs:

```

storage shelf drawer show-slot

Display a map between bay number and drawer/slot number

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The storage shelf drawer show-slot command maps each drawer and slot number to the corresponding bay number.

Parameters
\{-fields \<fieldname\>,...
Displays the specified fields in column style output.
\[-instance \}
Displays all slot information.
\[-shelf \<text\>\] - Shelf Name
Displays the slots in the shelf that matches the specified shelf name.
\[-bay \<integer\>\] - Bay Number
Displays the slots that have the specified bay number.
\[-node \<nodename\>|local\] - Node Name
Displays the slots that are present for the specified node.
\[-drawer \<integer\>\] - Drawer Number
Displays the slots in the drawers that match the specified drawer number.
\[-slot \<integer\>\] - Slot Number
Displays the slots that match the specified slot number.
\[-is-installed \{yes|no\}\] - Is Disk Installed
Displays the slots that have a disk installed.

Examples
The following example displays the mapping from drawer and slot number to bay number:

```
cluster1::> storage shelf drawer show-slot
<table>
<thead>
<tr>
<th>Shelf</th>
<th>Drawer</th>
<th>Slot</th>

```
storage shelf firmware commands

The firmware directory

storage shelf firmware show-update-status

Display the Shelf Firmware Update (SFU) Status.

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

The storage shelf firmware show-update-status command displays the state of the Shelf Firmware Update process.
**Parameters**

`{ [-fields <fieldname>, ...]`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

`[-instance]`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-node <nodename>] - Node`

Selects the node that matches this parameter value.

`[-update-status (running|idle)] - Disk Shelf Firmware Update Status`

Selects the nodes whose SFU process status matches this parameter value. Possible values are:

- running - Disk shelf firmware update is in progress.
- idle - Disk shelf firmware update is not in progress.

`[-in-progress-count <integer>] - Number of Shelves with Earlier Revisions Being Updated`

Selects the nodes that matches the number of shelves the SFU process is updating to this parameter value. This specifies the number of shelves with earlier revisions that are being updated.

---

**Examples**

```
cluster1:/> storage shelf firmware show-update-status

<table>
<thead>
<tr>
<th>Node</th>
<th>Update</th>
<th>Status</th>
<th>Count</th>
</tr>
</thead>
<tbody>
<tr>
<td>cluster-n1</td>
<td>running</td>
<td>10</td>
<td></td>
</tr>
<tr>
<td>cluster-n2</td>
<td>idle</td>
<td>-</td>
<td></td>
</tr>
<tr>
<td>cluster-n3</td>
<td>running</td>
<td>7</td>
<td></td>
</tr>
</tbody>
</table>
```

---

**storage shelf firmware update**

Update Shelf Firmware

Availability: This command is available to cluster administrators at the advanced privilege level.

**Description**

The `storage shelf firmware update` command updates the firmware on one or more shelves. You can download the latest firmware by using the `storage firmware download` command. You can specify a shelf whose firmware is to be updated by using the `-shelf` parameter. You can update the firmware on all the shelves by not providing the `-shelf` parameter. All the shelves of a specific module type can be updated by providing a value to the `-module-type` parameter.

**Parameters**

`{ [-shelf <text>] - Shelf Name`

This specifies the name of the shelf whose firmware is to be updated.

`[-module-type {atfcx|esh4|iom3|iom6|iom6e|iom12|iom12e}] - Shelf Module Type`

Update the firmware on the shelves that match the module-type you specify.

`[-refresh [true]] - Refresh`

Forces an update on the shelf with the highest revision of the applicable firmware, resulting in a refresh of the firmware image already present on the shelf.

---

**Examples**

The following example updates the firmware on all the shelves in the cluster:
cluster1::*> storage shelf firmware update

The following example updates the firmware on all shelves with the IOM6 module type:

cluster1::*> storage shelf firmware update -module-type IOM6

The following example updates the firmware on shelf 1.2:

cluster1::*> storage shelf firmware update -shelf 1.2

The following example refreshes the firmware on all shelves with the IOM6 module type:

cluster1::*> storage shelf firmware update -refresh -module-type IOM6

The following example refreshes the firmware on shelf 1.2:

cluster1::*> storage shelf firmware update -refresh -shelf 1.2

storage shelf location-led commands

Manage the shelf location led

storage shelf location-led modify

Modify the state of the shelf Location LED

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The storage shelf location-led modify command modifies the on/off state of the shelf location LED.

Parameters

- `shelf-name <text>` - Shelf Name
  This parameter specifies the shelf whose LED is to be turned on or turned off.

- `[-led-status [on|off]]` - Location LED
  This parameter specifies whether the shelf location LED needs to be turned on or turned off.

Examples

The following example turns on the shelf location LED of the specified shelf.
cluster1::> storage shelf location-led modify -node node1 -shelf-name 1.0 -led-status on
Info: Shelf locate request successful for shelf "1.0".

The following example turns off the shelf location LED of the specified shelf.

cluster1::> storage shelf location-led modify -node node1 -shelf-name 1.0 -led-status off
Info: Shelf locate request successful for shelf "1.0".

storage shelf location-led show

Display the Location LED status

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The storage shelf location-led show command displays the state of shelf location LED.

Parameters
{-fields <fieldname>,...}
If you specify the -fields <fieldname>,... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

{-instance}
If you specify the -instance parameter, the command displays detailed information about all fields.

{-shelf-name <text> } - Shelf Name
Selects the shelves whose shelf-name matches this parameter value.

{-node {<nodename>|local}} - Node Name
Selects the nodes that match this parameter value.

{-stack-id <integer> } - Stack ID
Selects the shelves whose stack-id matches this parameter value.

{-shelf-id <integer> } - Shelf ID
Selects the shelves whose shelf-id matches this parameter value.

{-led-status {on|off} } - Location LED
Shows the state of the shelf location LED.

Examples
The following example shows the state of the shelf location LED for each shelf.

<table>
<thead>
<tr>
<th>Shelf Name</th>
<th>Stack ID</th>
<th>Shelf ID</th>
<th>LED Status</th>
</tr>
</thead>
<tbody>
<tr>

<td>1</td>
<td>off</td>
</tr>
</tbody>
</table>

4 entries were displayed.
storage switch commands

Storage switch monitoring commands

storage switch add

Add a back-end switch for monitoring

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The `storage switch add` command enables you to add FC switches for SNMP monitoring in a MetroCluster configuration. Front end switches should not be added for monitoring and will result in a Monitor Status Error condition.

Parameters

- `-address <IP Address>` - FC Switch Management IP Address
  
  This parameter specifies the IP address of the back-end switch that is added for monitoring.

- `[-snmp-version {SNMPv1|SNMPv2c|SNMPv3}]` - Supported SNMP Version
  
  This parameter specifies the SNMP version that Data ONTAP uses to communicate with the back-end switch that is added for monitoring. The default SNMP version is SNMPv2c.

- `[-snmp-community <text>]` - (DEPRECATED)-SNMPv2c Community or SNMPv3 Username
  
  **Note:** This parameter is deprecated and may be removed in a future release of Data ONTAP. Use `snmp-community-or-username` instead.

  This parameter specifies the SNMPv2c community set or SNMPv3 username on the switch that is added for monitoring.

- `[-snmp-community-or-username <text>]` - SNMPv2c Community or SNMPv3 Username
  
  This parameter specifies the SNMPv2c community set or SNMPv3 username on the switch that is added for monitoring.

- `[-veto-backend-fabric-check {true|false}]` - Veto Back-end Fabric Check? (privilege: advanced)
  
  If specified, the `storage switch add` command will not check if the switch is present in the MetroCluster's back-end fabric. By default, it does not let you add switches that are not present.

- `[-blades <integer>, ...]` - Cisco Director Class Switch Blades to Monitor
  
  This parameter specifies the blades to monitor on the back-end switch that is added for monitoring. It is only applicable to director-class switches.

Examples

The following command adds a back-end switch with IP Address 10.226.197.34 for monitoring:

```
cluster1::> storage switch add -address 10.226.197.34 -snmp-community-or-username public
```

```
cluster1::> storage switch show

Symbolic Name    Vendor Model        Switch WWN       Is         Monitor Status
---------------- -------- ----------- ------------ ----- ------------------
Cisco_10.226.197.34 mcc-cisco-8Gb-fab-4 Cisco DS-C9148-16P-K9 2000547fee78f088 true ok
mcc-cisco-8Gb-fab-1 mcc-cisco-8Gb-fab-1 Cisco - - false -
mcc-cisco-8Gb-fab-2
```
The following command adds a Cisco Director Class switch for monitoring. Data ONTAP uses SNMPv3 and 'snmpuser1' username to communicate with this switch.

```
cluster1::> storage switch add -address 10.228.56.208 -snmp-version SNMPv3 -snmp-community-or-username snmpuser1 -blades 3,4
```

**storage switch modify**

Modify information about a back-end switch's configuration

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

The **storage switch modify** enables you to modify certain parameters for identifying and accessing the FC back-end switches added for monitoring in a MetroCluster configuration.

**Parameters**

- `-switch-name <text>` - FC Switch Name
  
  This parameter specifies the name of the switch.

- `[-snmp-version {SNMPv1|SNMPv2c|SNMPv3}]` - SNMP Version
  
  This parameter specifies the SNMP version that Data ONTAP uses to communicate with the switch.

- `[-switch-ipaddress <IP Address>]` - Switch IP Address
  
  This parameter specifies the IP address of the switch.

- `{ [-snmp-community <text>] | (-DEPRECATED)-SNMPv2c Community or SNMPv3 Username}
  
  **Note:** This parameter is deprecated and may be removed in a future release of Data ONTAP. Use `-snmp-community-or-username` instead.

  This parameter specifies the SNMPv2c community set or SNMPv3 username on the switch.

- `[-snmp-community-or-username <text>]` - SNMPv2c Community or SNMPv3 Username
  
  This parameter specifies the SNMIPv2c community set or SNMIPv3 username on the switch.

- `[-blades <integer>, ...]` - Director-Class Switch Blades to Monitor
  
  This parameter specifies the blades to monitor on the switch. It is only applicable to director-class switches.

**Examples**

The following command modifies Cisco_10.226.197.34 switch SNMP community to 'public':

```
cluster1::> storage switch modify -switch-name Cisco_10.226.197.34 -switch-ipaddress 10.226.197.34 -snmp-community-or-username public
```

1038  Commands: Manual Page Reference
The following command modifies the blades monitored on a director-class switch:

```bash
cluster1::> storage switch modify -switch-name Cisco_10.228.56.208 -blades 3,4
cluster1::>
```

The following command modifies Brocade 6505 switch SNMP version to SNMPv3 and SNMPv3 username to 'snmpuser1':

```bash
cluster1::> storage switch modify -switch-name Brocade6505 -switch-ipaddress 10.226.197.34 -snmp-version SNMPv3 -snmp-community-or-username snmpuser1
cluster1::>
```

### storage switch refresh

Refresh storage switch info

**Availability:** This command is available to cluster administrators at the advanced privilege level.

**Description**
The `storage switch refresh` command triggers a refresh of the SNMP data for the MetroCluster FC switches and FC-to-SAS bridges. It does not do anything if the refresh is already going on. The FC switches and FC-to-SAS bridges must have been previously added for monitoring by using the `storage switch add` and `storage bridge add` commands respectively.

**Examples**
The following command triggers a refresh for the SNMP data:

```bash
cluster1::*> storage switch refresh
cluster1::*> 
```

**Related references**

- `storage switch add` on page 1037
- `storage bridge add` on page 859

### storage switch remove

Remove a back-end switch from monitoring

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
The `storage switch remove` enables you to remove FC back-end switches that were previously added for SNMP monitoring.

**Parameters**

- `-switch-name <text>` - FC Switch Name

  This parameter specifies the name of the back-end switch added for monitoring.
### Examples

The following command removes ‘Cisco_10.226.197.34’ switch from monitoring:

```
cluster1::> storage switch show
Symbolic                                     Is        Monitor
Switch      Name     Vendor  Model      Switch WWN       Monitored Status

### storage switch show

Display switch information

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The `storage switch show` command displays information about all the storage switches in the MetroCluster configuration. The back-end switches must have been previously added for monitoring using the `storage switch add` command. If no parameters are specified, the default command displays the following information about the storage switches:

- **Switch**
- **Symbolic Name**
- **Vendor**
- **Model**
- **Switch WWN**
To display detailed profile information about a single storage switch, use the `-switch-name` parameter.

**Parameters**

`[-fields <fieldname>,...]

Displays the specified fields for all the storage switches, in column style output.

`[-connectivity]

Displays the following details about the connectivity from the storage switch to connected entities:

- Port name
- Port operating mode
- Port world wide name
- Peer port world wide name
- Peer type
- Additional information about peer

Displays the following details about the connectivity from the node to the storage switch:

- Node name
- Adapter name
- Switch port name
- Switch port speed
- Adapter type

`[-cooling]

Displays the following details about the fans and temperature sensors on the storage switch:

- Fan name
- Fan speed in rotations per minute (RPM)
- Fan operational status
- Temperature sensor name
- Temperature sensor reading in Celsius (C)
- Temperature sensor status

`[-error]

Displays the errors related to the storage switch.

`[-port]

Displays the following details about the storage switch ports:

- Port name
- Port world wide name
- Port administrative status
• Port operational status
• Port operating mode
• Whether SFP is present in the port
• Port speed in gigabits per second (Gbps)
• Port BB credit
• Peer port world wide name

[-power]
Displays the following details about the storage switch power supplies:
• Power supply name
• Power supply serial number
• Power supply operational status

[-san-config]
Displays the following details about the Virtual Storage Area Networks (VSAN) and Zones of the storage switch:
• VSAN identifier
• VSAN name
• VSAN operational status
• Type of load balancing configured for the VSAN
• Where in-order-delivery set for the VSAN
• Whether the auto power reset of the PSU is enabled
• VSAN member switch name and port
• Zone name
• VSAN ID of the zone
• Zone member switch name and port
• Zone member port id
• Zone member port world wide name

[-sfp]
Displays the following details about the storage switch ports Small Formfactor Pluggable (SFP):
• Port name
• Type of SFP
• SFP transmitter type
• SFP vendor
• SFP part number
• SFP serial number
[-stats]
Displays the following details about the storage switch ports:

• Port name
• Frames received through the port (Rx Frames)
• Frames transmitted through the port (Tx Frames)
• Octets received through the port (Rx Octets)
• Octets transmitted through the port (Tx Octets)
• Port error frames

[-instance]
Displays expanded information about all the storage switches in the system. If a storage switch is specified, then this parameter displays the same detailed information for the storage switch you specify as does the -switch-name parameter.

[-switch-name <text>] - FC Switch Name
Displays information only about the storage switches that match the name you specify.

[-switch-wwn <text>] - Switch World Wide Name
Displays information only about the storage switches that match the switch wwn you specify.

[-switch-symbolic-name <text>] - Switch Symbolic Name
Displays information only about the storage switches that match the switch symbolic name you specify.

[-switch-fabric-name <text>] - Fabric Name
Displays information only about the storage switches that match the switch fabric you specify.

[-domain-id <integer>] - Switch Domain ID
Displays information only about the storage switches that match the switch domain id you specify.

[-switch-role {unknown|primary|subordinate}] - Switch Role in Fabric
Displays information only about the storage switches that match the switch role you specify.

[-snmp-version {SNMPv1|SNMPv2c|SNMPv3}] - SNMP Version
Displays information only about the storage switches that match the switch SNMP version you specify.

[-switch-model <text>] - Switch Model
Displays information only about the storage switches that match the switch model you specify.

[-switch-vendor {unknown|Brocade|Cisco}] - Switch Vendor
Displays information only about the storage switches that match the switch vendor you specify.

[-fw-version <text>] - Switch Firmware Version
Displays information only about the storage switches that match the switch firmware version you specify.

[-serial-number <text>] - Switch Serial Number
Displays information only about the storage switches that match the switch serial number you specify.

[-switch-ipaddress <IP Address>] - Switch IP Address
Displays information only about the storage switches that match the switch IP address you specify.

[-switch-status {unknown|ok|error}] - Switch Status
Displays information only about the storage switches that match the switch status you specify.
[-snmp-community <text>] - (DEPRECATED)-SNMPv2c Community or SNMPv3 Username

Note: This parameter is deprecated and may be removed in a future release of Data ONTAP. Use -snmp-community-or-username instead.
Displays information only about the storage switches that match the switch SNMPv2c community or SNMPv3 username you specify.

[-snmp-community-or-username <text>] - SNMPv2c Community or SNMPv3 Username
Displays information only about the storage switches that match the switch SNMPv2c community or SNMPv3 username you specify.

[-profile-data-last-successful-refresh-timestamp \{MM/DD/YYYY HH:MM:SS \[\(+|-\)hh:mm]\}] - Switch Profile Data Last Successful Refresh Timestamp
Displays information only about the storage switches that match the profile data last successful refresh timestamp you specify.

[-is-monitoring-enabled {true|false}] - Is Monitoring Enabled for Switch
Displays information only about the storage switches that match the switch monitoring value you specify.

[-blades <integer>, ...] - Director-Class Switch Blades to Monitor
Displays information only about the storage switches that match the blade value you specify.

[-engine-id <Hex String>] - Engine ID of SNMPv3 Capable Switch
Displays information only about the storage switches that match the SNMPv3 engine-id you specify.

[-psu-name-list <text>, ...] - Switch Power Supply Name List
Displays information only about the storage switches that have the power supply units with the names you specify.

[-psu-serial-number-list <text>, ...] - Switch Power Supply Serial Number List
Displays information only about the storage switches that have the power supply units with the serial numbers you specify.

[-psu-status-list {unknown|normal|warning|faulty|not-present}, ...] - Switch Power Supply Status List
Displays information only about the storage switches that have the power supply units with the statuses you specify.

[-psu-data-last-successful-refresh-timestamp \{MM/DD/YYYY HH:MM:SS \[\(+|-\)hh:mm]\}] - Switch Power Supply Data Last Successful Refresh Timestamp
Displays information only about the storage switches that have the power supply unit data last successful refresh timestamp you specify.

[-temp-sensor-name-list <text>, ...] - Switch Temperature Sensor Name List
Displays information only about the storage switches that have the temperature sensors with the names you specify.
Displays information only about the storage switches that have the temperature sensors with the names you specify.
Displays information only about the storage switches that have the temperature sensors with the names you specify.

[-temp-sensor-reading-list <integer>, ...] - Switch Temperature Sensor Reading (C) List
Displays information only about the storage switches that have the temperature sensors with the readings you specify.

[-temp-sensor-status-list {unknown|normal|warning|critical}, ...] - Switch Temperature Sensor Status List
Displays information only about the storage switches that have the temperature sensors with the statuses you specify.
Temperature Sensor Data Last Successful Refresh Timestamp
Displays information only about the storage switches that match the temperature sensor data last successful
refresh timestamp you specify.

Fan Name List
Displays information only about the storage switches that match the fans with the names you specify.

Fan Speed (RPM) List
Displays information only about the storage switches that match the fans with the RPM speeds you specify.

Fan Operational Status List
Displays information only about the storage switches that match the fans with the statuses you specify.

Fan Data Last Successful Refresh Timestamp
Displays information only about the storage switches that match the fan data last successful refresh timestamp you specify.

VSAN Index List
Displays information only about the storage switches that have the VSANs with the indexes you specify.

VSAN Name List
Displays information only about the storage switches that have the VSANs with the names you specify.

VSAN Operational Status List
Displays information only about the storage switches that have the VSANs with the operational statuses you specify.

VSAN Load Balancing Type List
Displays information only about the storage switches that have the VSANs with the load balancing types you specify.

Is In-order Delivery Set for VSAN List
Displays information only about the storage switches that have the VSANs with the IOD setting you specify.

VSAN Data Last Successful Refresh Timestamp
Displays information only about the storage switches that match the VSAN data last successful refresh timestamp you specify.

Member Switch Name List
Displays information only about the storage switches that have the VSANs with the member switch names you specify.

Member Switch Port Name List
Displays information only about the storage switches that have the VSANs with the member switch port names you specify.

Zone VSAN ID List
Displays information only about the storage switches that have the VSANs with the IDs you specify.

Zone Name List
Displays information only about the storage switches that have the zones with the names you specify.

Zone Member Switch Port Domain ID List
Displays information only about the storage switches that have the zones with the member switch domain ids you specify.
[-zone-member-port-name-list <text>, ...] - Zone Member Port List
Displays information only about the storage switches that have the zones with the port names you specify.

[-zone-member-port-wwn-list <text>, ...] - Zone Member WWPN List
Displays information only about the storage switches that have the zones with the port WWNs you specify.

[-zone-member-port-switch-name-list <text>, ...] - Zone Member Switch WWN List
Displays information only about the storage switches that have the zones with the member port hosting switch names you specify.

[-zone-data-last-successful-refresh-timestamp (MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]) - Switch Zone Data Last Successful Refresh Timestamp
Displays information only about the storage switches that match the zone data last successful refresh timestamp you specify.

[-zone-member-wwn-list <text>, ...] - Zone Member WWN List
Displays information only about the storage switches that have the zones with the member WWNs you specify.

[-zone-member-port-id-list <text>, ...] - Zone Member Port ID List
Displays information only about the storage switches that have the zones with the member port ids you specify.

[-port-wwn-list <text>, ...] - Switch Port World Wide Name (WWPN) List
Displays information only about the storage switches that have the ports with the WWNs you specify.

[-port-name-list <text>, ...] - Switch Port Name List
Displays information only about the storage switches that have the ports with the names you specify.

[-port-admin-status-list {unknown|enabled|disabled}, ...] - Switch Port Admin Status List
Displays information only about the storage switches that have the ports with administrative statuses you specify.

[-port-oper-status-list {unknown|online|offline}, ...] - Switch Port Operational Status List
Displays information only about the storage switches that have the ports with operational statuses you specify.

[-port-mode-list {unknown|auto|F-port|FL-port|E-port|TE-port|U-port|G-port}, ...] - Switch Port Mode List
Displays information only about the storage switches that have the ports with the operating modes you specify.

[-port-oper-speed-list <integer>, ...] - Switch Port Current Speed (in Gbits/sec) List
Displays information only about the storage switches that have the ports with the operational speeds you specify.

[-port-bb-credit-list <integer>, ...] - Switch Port BB Credit List
Displays information only about the storage switches that have the ports with the BB credits you specify.

[-port-sfp-present-list {true|false}, ...] - Switch Port Is SFP Present List
Displays information only about the storage switches that have the ports with the SFP present values you specify.

[-port-peer-wwpn-list <text>, ...] - Switch Port Peer WWPN List
Displays information only about the storage switches that have the ports with the peer port WWPNs you specify.

[-port-data-last-successful-refresh-timestamp (MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]) - Switch Port Data Last Successful Refresh Timestamp
Displays information only about the storage switches that match the port data last successful refresh timestamp you specify.
[-port-stat-name-list <text>, ...] - Switch Port Name List
Displays information only about the storage switches that have the ports with the names you specify.

[-port-tx-frames-list <integer>, ...] - Switch Port Transmitted Frame Count List
Displays information only about the storage switches that have the ports with the transmitted frames values you specify.

[-port-rx-frames-list <integer>, ...] - Switch Port Received Frame Count List
Displays information only about the storage switches that have the ports with the received frames values you specify.

[-port-tx-octets-list <integer>, ...] - Switch Port Total Transmitted Octets List
Displays information only about the storage switches that have the ports with the transmitted octets values you specify.

[-port-rx-octets-list <integer>, ...] - Switch Port Total Received Octets List
Displays information only about the storage switches that have the ports with the received octets values you specify.

[-port-frame-error-list <integer>, ...] - Switch Port Frame Error Count List
Displays information only about the storage switches that have the ports with the error frame values you specify.

[-port-stat-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}] - Switch Port Stat Data Last Update Timestamp
Displays information only about the storage switches that match the port statistics data last successful refresh timestamp you specify.

[-sfp-port-name-list <text>, ...] - Switch Port Name List
Displays information only about the storage switches that have the ports with the names you specify.

[-sfp-type-list {unknown|other|gbic|embedded|glm|gbic-without-serial-id|gbic-without-serial-id|sfp-with-serial-id|sfp-without-serial-id|x2|x2-short|x2-medium|x2-tall|xpak|xpak-short|xpak-medium|xpak-tall|xon|sfp-dw-dm|qsfp|x2-dw-dm|gbic-not-installed|small-form-factor}, ...] - Switch Port SFP Type List
Displays information only about the storage switches that have the ports with the SFP types you specify.

Displays information only about the storage switches that have the ports with the SFP transmitter types you specify.

[-sfp-vendor-list <text>, ...] - Switch Port SFP Vendor List
Displays information only about the storage switches that have the ports with the SFP vendors you specify.

[-sfp-part-number-list <text>, ...] - Switch Port SFP Part Number List
Displays information only about the storage switches that have the ports with the SFP part numbers you specify.

[-sfp-serial-number-list <text>, ...] - Switch Port SFP Serial Number List
Displays information only about the storage switches that have the ports with the SFP serial numbers you specify.

[-sfp-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}] - Switch Port SFP Data Last Successful Refresh Timestamp
Displays information only about the storage switches that match the port SFP data last successful refresh timestamp you specify.
Switch Error Text List
Displays information only about the storage switches that have the errors you specify.

Switch Port Name List
Displays information only about the storage switches that have the names you specify.

Switch Port Operating Mode List
Displays information only about the storage switches that have the ports with the operating modes you specify.

Switch Port WWN List
Displays information only about the storage switches that have the WWNs you specify.

Switch Port Peer Port WWN List
Displays information only about the storage switches that have the ports with the peer port WWNs you specify.

Switch Port Peer Host & Port Name List
Displays information only about the storage switches that have the ports with the peer information values you specify.

Switch Connectivity Data Last Successful Refresh Timestamp
Displays information only about the storage switches that match the switch connectivity data last successful refresh timestamp you specify.

Switch Port Peer Type List
Displays information only about the storage switches that have the ports connected to the peer types you specify.

Switch Port Name List
Displays information only about the storage switches that have the names you specify.

Switch Port Speed (in Gbps) List
Displays information only about the storage switches that have the speeds you specify.

Node Name List
Displays information only about the storage switches that are connected to the nodes you specify.

Node Adapter Name List
Displays information only about the storage switches that are connected to the adapters you specify.

Node Adapter Port Name List
Displays information only about the storage switches that are connected to the adapter ports you specify.

Node Adapter Type List
Displays information only about the storage switches that are connected to the types of adapters you specify.

Switch Path Data Last Successful Refresh Timestamp
Displays information only about the storage switches that match the node to switch path data last successful refresh timestamp you specify.

Switch Name List
Displays information only about the storage switches that match the names you specify.

Switch Domain ID List
Displays information only about the storage switches that match the domain ids you specify.
[-wwn-list <text>, ...] - Switch WWN List
Displays information only about the storage switches that match the switch WWNs you specify.

[-role-list {unknown|primary|subordinate}, ...] - Switch Role in Fabric List
Displays information only about the storage switches that match the switch roles you specify.

[-address-list <IP Address>, ...] - Switch IP Address List
Displays information only about the storage switches that match the switch IP addresses you specify.

Examples
The following example displays information about all storage switches:

```
cluster::> storage switch show

storage tape commands

Manage tape devices

**storage tape offline**

Take a tape drive offline

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

This command takes the specified tape drive offline.

**Parameters**

- **-node {<nodename>|local} - Node**
  
  Use this parameter to specify the node to which the tape drive is attached.

- **{ -name <text> - Tape Drive Device Name**
  
  Use this parameter to specify the device name of the tape drive that needs to be taken offline. The format of the device *-name* name includes a prefix to specify how the tape cartridge is handled and a suffix to describe the density of the tape. The prefix suggests 'r', 'nr' or 'ur' for rewind, no rewind, or unload/reload and a suffix shows density of 'l', 'm', 'h' or 'a'. For example, a tape device name for this operation might have the form "nrst8m" were 'nr' is the 'no rewind' prefix, 'st8' is the alias-name and 'm' is the tape density. You can use the 'storage tape show -device-names' command to find more information about device names of tape drives attached to a node.

- **| -device-id <text> } - Tape Drive Device ID**
  
  Use this parameter to specify the device ID of the tape drive that needs to be taken offline.

**Examples**

The following example takes the tape drive with device name 'nrst8m' offline. This tape drive is attached to cluster1-01.

```
cluster1::> storage tape offline -node cluster1-01 -name nrst8m
```

**storage tape online**

Bring a tape drive online

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

This command brings a specified tape drive online.

**Parameters**

- **-node {<nodename>|local} - Node**
  
  Use this parameter to specify the node to which the tape drive is attached.
-{device-id <text>} - Tape Drive Device ID
   Use this parameter to specify the device ID of the tape drive that needs to be brought online.

{name <text>} - Tape Drive Device Name
   Use this parameter to specify the device name of the tape drive that needs to be brought online. The format of
   the device {name name includes a prefix to specify how the tape cartridge is handled and a suffix to describe
   the density of the tape. The prefix suggests 'r', 'nr' or 'ur' for rewind, no rewind, or unload/reload and a suffix
   shows density of 'l', 'm', 'h' or 'a'. For example, a tape device name for this operation might have the form
   "nrst8l" were 'nr' is the 'no rewind' prefix, 'st8' is the alias-name and 'l' is the tape density. You can use the
   'storage tape show -device-names' command to find more information about device names of tape drives
   attached to a node.

Examples
The following example brings the tape drive with device id sw4:2.126L4 attached to the node, cluster1-01, online.

   cluster1::> storage tape online -node cluster1-01 -device-id sw4:2.126L4

storage tape position
Modify a tape drive cartridge position

Availability: This command is available to cluster administrators at the admin privilege level.

Description
This command changes the tape drive cartridge position.

Parameters
-node {<nodename>|local} - Node
   Use this parameter to specify the node to which the tape drive is attached.

{name <text>} - Tape Drive Device Name
   Use this parameter to specify the device name of the tape drive whose cartridge position needs to be changed.
   The format of the device {name name includes a prefix to specify how the tape cartridge is handled and a suffix to
   describe the density of the tape. The prefix suggests 'r', 'nr' or 'ur' for rewind, no rewind, or unload/reload and a
   suffix shows density of 'l', 'm', 'h' or 'a'. For example, a tape device name for this operation might have the form
   "nrst8l" were 'nr' is the 'no rewind' prefix, 'st8' is the alias-name and 'l' is the tape density. You can use the
   'storage tape show -device-names' command to find more information about device names of tape drives
   attached to a node.

-operation {weof|fsf|bsf|fsr|bsr|rewind|erase|eom} - Tape Position Operation
   Use this parameter to specify the tape positioning operation. The possible values for -operation are:
   • weof - Write end-of-file marks
   • fsf - Forward space end-of-file marks
   • bsf - Backward space end-of-file marks
   • fsr - Forward space records
   • bsr - Backward space records
   • rewind - Rewind the tape
   • erase - Erase then entire tape media from current position
• eom - Position the tape at end of data (end of media if full)

[-count <integer>] - Count for Positioning

Use this parameter to specify the count for a tape positioning operation. You can specify this parameter only with the following operations: weof, fsf, bsf, fsr, and bsr. The default value of this parameter is one.

**Examples**

The following example specifies a rewind operation on a tape device. Note the -count parameter does not need to be specified for this type of operation.

```
cluster1::> storage tape position -node cluster1-01 -name nrst8m -operation rewind
```

The following example specifies an fsf (forward space filemark) operation on a tape device. Note the -count parameter specifies 5 forward space filemarks for this operation.

```
cluster1::> storage tape position -node cluster1-01 -name nrst1a -operation fsf -count 5
```

The following example specifies an eom (end-of-media) operation on a tape device. The 'eom' positions a tape at end of data (end of media if full). Note the -count parameter does not need to be specified for this type of operation.

```
cluster1::> storage tape position -node cluster1-01 -name rst0h -operation eom
```

**storage tape reset**

Reset a tape drive

**Availability:** This command is available to `cluster` administrators at the `advanced` privilege level.

**Description**

This command resets a specified tape drive.

**Parameters**

- `-node {<nodename>|local}` - **Node**
  
  Use this parameter to specify the node to which the tape drive is attached.

- `-device-id <text>` - **Tape Drive Device ID**
  
  Use this parameter to specify the device ID of the tape drive is to be reset.

**Examples**

The following example resets the tape drive with device ID sw4:2.126L3 attached to the node, cluster1-01.

```
cluster1::> storage tape reset -node cluster1-01 -device-id sw4:2.126L3
```
**storage tape show**

Display information about tape drives and media changers

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The `storage tape show` command displays information about tape drives and media changers attached to the cluster. Where it appears in the remainder of this document "device" may refer to either a tape drive or a media changer. By default, this command displays the following information about all tape drives and media changers:

- Node to which the tape drive/media changer is attached
- Device ID of the tape drive/media changer
- Description of the tape drive/media changer
- Type of device: tape drive or media changer
- Functional status of the tape drive/media changer

**Parameters**

{ [-fields <fieldname>, ...] 
  If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify. 
}

{ [-alias] 
  Displays the tape drive/media changer alias with the following details:
  - Node to which tape drive/media changer is attached
  - Device ID of the tape drive/media changer
  - Alias name of the tape drive/media changer
  - Alias mapping for tape drive/media changer
}

{ [-connectivity] 
  Displays the connectivity from the node to the tape drive/media changer with the following details:
  - Node to which tape drive/media changer is attached
  - Device ID of the tape drive/media changer
  - Tape drive/media changer description
  - Type of device: tape drive or media changer
  - Interface type for the tape drive/media changer
  - World Wide Node Name of tape drive/media changer
  - World Wide Port Name of tape drive/media changer
  - Serial Number of tape drive/media changer
  - Tape drive/media changer errors
  - Initiator port which hosts the tape drive/media changer
  - Alias name of the tape drive/media changer
}
• Operational state of tape drive/media changer
• Functional status of tape drive/media changer

[-device-names]
Displays the tape drive names for used tape positioning using the following details: rewind, no rewind, unload/reload and density

• Node to which tape drive/media changer is attached
• Device ID of the tape drive/media changer
• Tape drive/media changer description
• Device Names that include Rewind, no Rewind, Unload/Reload

[-status]
Displays the status of tape drive/media changer with the following details:

• Device ID of the tape drive/media changer
• Tape drive/media changer description
• World Wide Node Name of tape drive/media changer
• World Wide Port Name of tape drive/media changer
• Serial Number of tape drive/media changer
• Alias name of the tape drive/media changer
• Format used for tape cartridge mounted by tape drive
• Tape drive/media changer errors
• Node to which tape drive/media changer is attached
• Operational state of tape drive/media changer
• File number following last tape drive I/O operation
• Block number following last tape drive I/O operation
• Residual count following last tape drive I/O operation

[-instance]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-device-id <text>] - Device ID
Selects the tape drive/media changer with the specified device ID.

[-node {<nodename> | local}] - Node
Displays detailed information about tape drives or media changers on the specified node.

[-device-type <text>] - Device Type
Selects the devices with the specified type of tape drive or media changer.

[-description <text>] - Description
Selects the tape drives/media changers with the specified description.

[-alias-name <text>] - Alias Name
Selects the tape drive/media changer with the specified alias name.
[-alias-mapping <text>] - Alias Mapping
Selects the tape drive/media changer with the specified alias mapping.

[-wwnn <text>] - World Wide Node Name
Selects the tape drives/media changers with the specified World Wide Node Name.

[-wwpn <text>] - World Wide Port Name
Selects the tape drive/media changer with the specified World Wide Port Name.

[-serial-number <text>] - Serial Number
Selects the tape drive/media changer with the specified serial number.

[-functional-status {unknown|normal|error}] - Functional Status
Selects the tape drives/media changers with the specified functional status of the device.

[-device-if-type {unknown|fibre-channel|SAS|pSCSI}] - Device Interface Type
Selects the tape drives/media changers with the specified interface type.

[-device-state {unknown|available|ready-write-enabled|ready-write-protected|offline|in-use|error|reserved-by-another-host|normal}] - Operational State of Device
Selects the tape drives/media changers with the specified operational state.

[-format <text>, ...] - Tape Cartridge Format
Selects the tape drives with the specified tape format.

[-error <text>] - Tape Error
Selects the tape drives/media changers with the specified error string.

[-initiator <text>] - Initiator Port
Selects the tape drives/media changers with the specified initiator port.

[-file-number <integer>] - File Number
Selects the tape drives/media changers with the specified file number. The file number is the number of file
marks between the beginning of media and current logical position. File number gets modified on write file
mark, and forward or backward space file operations. A value of -1 indicates unknown position on the tape
media or tape not loaded in the tape drive.

[-block-number <integer>] - Block Number
Selects the tape drives/media changers with the specified block number. The block number is the number of
logical blocks between the beginning of tape media or the prior file mark and the current logical position on
the tape media. Block number gets modified on writes, reads, and forward or backward space over records
(blocks). The block number also gets reset to zero when a file mark is crossed or another file mark is written
that designates a new file. If the tape is back spaced to a prior file mark, the block number might be zeroed. A
value of -1 indicates unknown position on the tape media or that a tape not loaded in the tape drive.

[-residual-count <integer>] - Residual Count of Last I/O Operation
Selects the tape drives with the specified residual count.

[-device-name-r <text>, ...] - Device Name for Rewind
Selects the tape drives with the specified device name for rewind.

[-device-name-nr <text>, ...] - Device Name for No Rewind
Selects the tape drives with the specified device name for no rewind.

[-device-name-ur <text>, ...] - Device Name for Unload Reload
Selects the tape drives with the specified device name for unload/reload.

[-resv-type {off|persistent|scsi}] - Reservation Type for device
Selects the tape drives with the specified type.
### Examples

The following example displays information about all tape drives and media changers attached to the cluster:

```plaintext
cluster1:~> storage tape show

Node: cluster1-01
Device ID               Device Type     Description                     Status
----------------------  --------------  ------------------------------  --------
sw4:10.11               tape drive      HP LTO-3                        error

Node: cluster1-01
Device ID               Device Type     Description                     Status
----------------------  --------------  ------------------------------  --------
sw4:10.11L1             media changer   PX70-TL                         normal
```

The following example displays detailed information about a tape drive named sw4:10.11

```plaintext
cluster1:~> storage tape show -device-id sw4:10.11

Node: cluster1-01
Device ID               Device Type     Description                     Status
----------------------  --------------  ------------------------------  --------
sw4:10.11               tape drive      HP LTO-3                        error
```

---

**storage tape show-errors**

Display tape drive errors

**Availability:** This command is available to cluster administrators at the *admin* privilege level.

**Description**

The `storage tape show-errors` command displays error information about tape drives attached to the cluster. By default, this command displays the following information about all tape drives:

- Node to which the tape drive is attached
- Device ID of the tape drive
- Type of device (tape drive)
- Description of the tape drive
- Alias name of the tape drive
- Tape drive errors

**Parameters**

```plaintext
[-fields <fieldname>, ...]  
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.
```

```plaintext
[-instance]  
If you specify the `-instance` parameter, the command displays detailed information about all fields.
```

```plaintext
[-node <nodename>|local] - Node  
Displays detailed information about tape drives on the specified node.
```

```plaintext
[-device-id <text>] - Device ID  
Selects the tape drive with the specified device ID.
```
-device-type <text> - Device Type
  Selects the devices with the specified type of tape drive.

-description <text> - Description
  Selects the tape drives with the specified description.

-alias-name <text> - Alias Name
  Selects the tape drive with the specified alias name.

-wwnn <text> - World Wide Node Name
  Selects the tape drives with the specified World Wide Node Name.

-wwpn <text> - World Wide Port Name
  Selects the tape drive with the specified World Wide Port Name.

-serial-number <text> - Serial Number
  Selects the tape drive with the specified serial number.

-error <text> - Tape Drive Error Description
  Selects the tape drives with the specified error string.

-initiator <text> - Initiator Port
  Selects the tape drives with the specified initiator port.

Examples

The following example shows error information for all tape drives attached to cluster1.

cluster1::> storage tape show-errors
  Node: node1
  Device ID: 0d.125
  Device Type: tape drive
  Description: Hewlett-Packard LTO-5
  Alias: st0
  Errors: hardware error; repair or replace tape drive

  Node: node1
  Device ID: 2d.0
  Device Type: tape drive
  Description: IBM LTO-6 ULT3580
  Alias: st2
  Errors: -

The following example shows error information for tape drive sw4:2.126L1 attached to the node, node1.

cluster1::> storage tape show-errors -device-id sw4:2.126L1 -node node1
  Node: node1
  Device ID: sw4:2.126L1
  Device Type: tape drive
  Description: Hewlett-Packard LTO-3
  Alias: st3
  Errors: -

storage tape show-media-changer

Display information about media changers

Availability: This command is available to cluster administrators at the admin privilege level.
Description
This storage tape show-media-changer command displays information about media changers attached to the cluster. By default, this command displays the following information about all media changers:

- Device ID of media changer
- Description of media changer
- World Wide Node Name of media changer
- World Wide Port Name of media changer
- Serial number of media changer
- Media changer errors
- Node to which the media changer is attached
- Initiator port which hosts the media changer
- Alias name of media changer
- Operational state of media changer
- Functional status of media changer

Parameters

[-fields <fieldname>, ...] If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance ]] If you specify the -instance parameter, the command displays detailed information about all fields.

[-device-id <text>] - Device ID
Selects the media changer with the specified device ID.

[-node {<nodename>|local}] - Node
Displays detailed information about media changers on the specified node.

[-description <text>] - Description
Selects the media changers with the specified description.

[-alias-name <text>] - Alias Name
Selects the media changer with the specified alias name.

[-wwnn <text>] - World Wide Node Name
Selects the media changers with the specified World Wide Node Name.

[-wwpn <text>] - World Wide Port Name
Selects the media changer with the specified World Wide Port Name.

[-serial-number <text>] - Serial Number
Selects the media changer with the specified serial number.

[-device-if-type {unknown|fibre-channel|SAS|pSCSI}] - Device If Type
Selects the media changers with the specified interface type.

[-device-state {unknown|available|ready-write-enabled|ready-write-protected|offline|in-use|error|reserved-by-another-host|normal}] - Operational State of Device
Selects the media changers with the specified operational state.
[-error <text>] - Media Changer Error Description
  Selects the media changers with the specified error string.

[-initiator <text>] - Initiator Port
  Selects the media changers with the specified initiator port.

Examples

The following example displays information about all media changers attached to the cluster:

```
cluster1::> storage tape show-media-changer
Media Changer: sw4:10.11L1
  Description: PX70-TL
  WWNN: 2:00a:000e11:10b919
  WWPN: 2:00b:000e11:10b919
  Serial Number: 00FRU7800000_LL1
  Errors: -
  Paths:
  Node          Initiator  Alias  Device State  Status
  ------------  --------  -----  ------------  ------
  cluster1-01   2b        mc0    in-use        normal

Media Changer: sw4:12.4L1
  Description: NEO-TL
  WWNN: 2:001:000e11:10b919
  WWPN: 2:002:000e11:10b919
  Serial Number: 00FRU7800000_LL0
  Errors: -
  Paths:
  Node          Initiator  Alias  Device State  Status
  ------------  --------  -----  ------------  ------
  cluster1-01   5a        mc1    available    normal
```

storage tape show-supported-status

Displays the qualification and supported status of tape drives

Availability: This command is available to cluster administrators at the admin privilege level.

Description

This command displays the supported and qualification status of all tape drives recognized by Data ONTAP attached to a node in the cluster. This includes nonqualified tape drives. Such tape drives do not have a Tape Configuration File (TCF) on the storage system. A nonqualified tape drive can be used if the tape drive emulates a qualified tape drive or if the appropriate TCF for the nonqualified tape drive is downloaded from the NetApp Support Site to the storage system.

Parameters

{ [-fields <fieldname>, ...]  
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use ‘-fields ?’ to display the fields to specify.

  | [-instance ]  
  If you specify the -instance parameter, the command displays detailed information about all fields.

[-node (<nodename> | local)] - Node
  Selects the tape drives that match this parameter value.

[-tape-drive <text>] - Tape Drive Name
  Selects the tape drives that match this parameter value.
[-is-supported (true|false)] - Tape Drive Supported

Selects the tape drives that match this parameter value.

[-status <text>] - Supported Status

Selects the tape drives that match this parameter value.

### Examples

The following example displays support and qualification status of tape drives recognized by Data ONTAP. The command also identifies tape drives attached to the node that are nonqualified (not supported).

```
cluster1::> storage tape show-supported-status
```

<table>
<thead>
<tr>
<th>Node: Node1</th>
<th>Is Tape Drive</th>
<th>Supported</th>
<th>Support Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>sw4:2.126L6</td>
<td>false</td>
<td>Nonqualified tape drive</td>
<td></td>
</tr>
<tr>
<td>Hewlett-Packard C1533A</td>
<td>true</td>
<td>Qualified</td>
<td></td>
</tr>
<tr>
<td>Hewlett-Packard C1553A</td>
<td>true</td>
<td>Qualified</td>
<td></td>
</tr>
<tr>
<td>Hewlett-Packard Ultrium 1</td>
<td>true</td>
<td>Qualified</td>
<td></td>
</tr>
<tr>
<td>Sony SDX-300C</td>
<td>true</td>
<td>Qualified</td>
<td></td>
</tr>
<tr>
<td>Sony SDX-500C</td>
<td>true</td>
<td>Qualified</td>
<td></td>
</tr>
<tr>
<td>StorageTek T9840C</td>
<td>true</td>
<td>Dynamically Qualified</td>
<td></td>
</tr>
<tr>
<td>StorageTek T9840D</td>
<td>true</td>
<td>Dynamically Qualified</td>
<td></td>
</tr>
<tr>
<td>Tandberg LTO-2 HH</td>
<td>true</td>
<td>Dynamically Qualified</td>
<td></td>
</tr>
</tbody>
</table>

The following example displays support and qualification status of tape drives selected by tape-drive. The command identifies the supported status of the selected tape drive.

```
cluster1::> storage tape show-supported-status -tape-drive "Sony SDX-300C"
```

<table>
<thead>
<tr>
<th>Node: Node1</th>
<th>Is Tape Drive</th>
<th>Supported</th>
<th>Support Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sony SDX-300C</td>
<td>true</td>
<td>Qualified</td>
<td></td>
</tr>
</tbody>
</table>

### storage tape show-tape-drive

Display information about tape drives

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**

This `storage tape show-tape-drive` command displays information about tape drives attached to the cluster. By default, this command displays the following information about all tape drives:

- Device ID of tape drive
- Description of tape drive
- World Wide Node Name of tape drive
- World Wide Port Name of tape drive
- Serial Number of tape drive
- Tape drive errors
- Node to which the tape drive is attached
- Initiator port which hosts the tape drive
- Alias name of tape drive
- Operational state of tape drive
- Functional status of tape drive

**Parameters**

```{-fields <fieldname>, ...}
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.
```

```{-instance}
If you specify the `-instance` parameter, the command displays detailed information about all fields.
```

```{-device-id <text>}``
Selects the tape drive with the specified device ID.

```{-node {<nodename>|local}}{-Node}
Displays detailed information about tape drives on the specified node.
```

```{-description <text>}``
Selects the tape drives with the specified description.

```{-alias-name <text>}``
Selects the tape drive with the specified alias name.

```{-wwnn <text>}``
Selects the tape drives with the specified World Wide Node Name.

```{-wwpn <text>}``
Selects the tape drive with the specified World Wide Port Name.

```{-serial-number <text>}``
Selects the tape drive with the specified serial number.

```{-device-if-type {unknown|fibre-channel|SAS|pSCSI}}{-Device If Type}
Selects the tape drives with the specified interface type.

```{-device-state {unknown|available|ready-write-enabled|ready-write-protected|offline|in-use|error|reserved-by-another-host|normal}}{-Operational State of Device}
Selects the tape drives with the specified operational state.

```{-error <text>}``
Selects the tape drives with the specified error string.

```{-initiator <text>}``
Selects the tape drives with the specified initiator port.

```{-resv-type {off|persistent|scsi}}{-Reservation type for device}
Selects the tape drives with the specified type.
```

**Examples**

The following example displays information about all tape drives attached to the cluster:

```
cluster1::> storage tape show-tape-drive
Tape Drive: sw4:11.126
Description: StorageTek T10000C
WWNN: 5:001:04f000:b39ec8
WWPN: 5:001:04f000:b39ec9
Serial Number: 576004000041
```

Commands: Manual Page Reference
storage tape trace

Enable/disable tape trace operations

Availability: This command is available to cluster administrators at the admin privilege level.

Description
This command enables or disables diagnostic tape trace operations for all tape drives attached to the node you have specified.

Parameters

- `-node <nodename>|local` - Node
  Use this parameter to specify the node on which the tape trace feature is enabled or disabled.

- `[-is-trace-enabled {true|false}]` - Tape Trace Enabled or Disabled
  Use this parameter to enable or disable the tape trace feature. By default, the tape trace feature is enabled.

Examples

The following example enables tape trace operation on the node, cluster1-01.

```
cluster1::> storage tape trace -node cluster1-01 -is-trace-enabled true
```

storage tape alias commands

Manage tape device aliases

storage tape alias clear

Clear alias names

Availability: This command is available to cluster administrators at the admin privilege level.

Description
This command clears alias names for a tape drive or media changer.
Parameters

- **node {<nodename>|local} - Node**
  
  Use this parameter to specify the node to which the tape drive is attached.

- **{ -name <text> - Alias Name That Is to Be Cleared**

  Use this parameter to specify the alias name that is to be cleared. You can use the 'storage tape show -alias' command to find more information about alias names of tape drives and media changers attached to a node.

  The **-clear-scope** and **-name** parameters are mutually exclusive. If you specify the **-name** parameter, a single alias name is cleared.

- **| -clear-scope {tape|media-changer|all}) - Scope of Alias Clear Operation**

  Use this parameter to specify the scope of the alias clear operation. The **-clear-scope** and **-name** parameters are mutually exclusive. If you specify the **-clear-scope** parameter, multiple aliases are cleared depending upon the value of the parameter.

  The possible values for **-clear-scope** are as follows:

  - tape - Clear all tape drive aliases
  - media-changer - Clear all media-changer aliases
  - all - Clear both tape drive and media-changer aliases

Examples

The following example clears an alias name 'st3' attached to the node, cluster1-01.

```
cluster1::> storage tape alias clear -node cluster1-01 -name st3
```

The following example clears all tape drive alias names attached to the node, cluster1-01.

```
cluster1::> storage tape alias clear -node cluster1-01 -clear-scope tape
```

The following example clears all media changer alias names attached to the node, cluster1-01.

```
cluster1::> storage tape alias clear -node cluster1-01 -clear-scope media-changer
```

The following example clears both tape and media changer alias names attached to the node, cluster1-01.

```
cluster1::> storage tape alias clear -node cluster1-01 -clear-scope all
```

**storage tape alias set**

Set an alias name for tape drive or media changer

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

This command sets an alias name for a tape drive or media changer.
Parameters

- **node** `<nodename>|local` - Node
  Use this parameter to specify the node to which the tape drive is attached.

- **name** `<text>` - Alias Name for Tape Drive or Media Changer
  Use this parameter to specify the alias name for tape drive or media changer. For a tape drive alias name, the format is 'st' followed by one or more digits. For a media changer alias name, the format is 'mc' followed by one or more digits.

- **mapping** `<text>` - Mapping for Alias Name
  Use this parameter to specify the mapping for an alias name. Use the format 'SN[<serial-number>]'. Valid mapping for serial numbers are in the format 'SN[<serial-number>]' where the `<serial-number>` is from 2 to 90 characters long and includes the following characters: 0-9, a-z, and A-Z.

Examples

The following example sets an alias name 'st3' for a tape drive with serial number SN[123456]L4 attached to the node, node1.

```
cluster1::storage tape alias> set -node node1 -name st3 -mapping SN[123456]L4.
```

The following example sets an alias name 'mc1' for a media changer with serial number SN[65432] attached to the node, node1.

```
cluster1::storage tape alias> set -node node1 -name mc1 -mapping SN[65432].
```

storage tape alias show

Displays aliases of all tape drives and media changers

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

This command displays aliases of all tape drives and media changers attached to every node in the cluster.

**Parameters**

```
[[-fields <fieldname>, ...]]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[[-instance]]
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

Examples

The following example shows the aliases of all tape drives and media changers attached to every node in the cluster:

```
cluster1::> storage tape alias show
Node: node1

Aliase Mapping
--------------- --------------------------------------------
mc0 SN[00FRU7800000_LL0]L1
mc1 SN[00FRU7800000_LL1]L1
mc2 SN[a6a64c69360a0980248c8]
```
storage tape config-file commands

Manage tape configuration files

storage tape config-file delete

Delete a tape config file

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

The storage tape config-file delete command deletes the specified tape drive configuration file from all nodes that are currently part of the cluster.

Parameters

-filename <text> - Config File Filename

This parameter specifies the name of the tape configuration file that will be deleted from all nodes that are currently part of the cluster.

Examples

The following example deletes the specified tape drive configuration files on every node that is currently part of the cluster:

```
cluster1::> storage tape config-file delete -filename XYZ_LTO-6.TCF
```

storage tape config-file get

Get a tape drive configuration file

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The storage tape config-file get command uploads a specified tape drive configuration file to each node that is currently part of the cluster.

Parameters

-url <text> - Config File URL

This parameter specifies the URL that provides the location of the package to be fetched. Standard URL schemes, including HTTP and TFTP, are accepted.
Examples

The following example uploads the specified tape drive configuration file to each node that is currently part of the cluster:

```
cluster1::> storage tape config-file get -url http://example.com/~tapeconfigfile/XYZ_LTO-6.TCF
```

storage tape config-file show

Display the list of tape drive configuration files on the given node

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The `storage tape config-file show` command lists the tape drive configuration files loaded onto each node in the cluster.

Parameters

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance]
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[-node <nodename>|local] - Node
```

Selects information about tape drive configuration files for the specified node.

```
[-config-file <text>] - Tape Config File
```

Selects information about the tape drive configuration file specified.

Examples

The following example lists the tape drive config files loaded onto each node in the cluster:

```
cluster1::> storage tape config-file show

Node: node1

Tape Config Files
----------------------------------------
CERTANCE_LTO2_ULTRIUM.TCF
CERTANCE_LTO3_ULTRIUM.TCF

```

storage tape library commands

View connectivity of tape libraries in cluster
storage tape library config commands

View configuration of tape LUNs attached to tape libraries

storage tape library config show

Display connectivity to back-end storage tape libraries.

Availability: This command is available to cluster administrators at the admin privilege level.

Description
This command displays information such as how the storage tape libraries connect to the cluster, LUN groups, number of LUNs, WWPN, and switch port information. Use this command to verify the cluster's storage tape library configuration or to assist in troubleshooting.

Parameters

[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

[-switch]
If you specify this parameter, switch port information is shown.

[-instance]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-node <nodename> | local] - Controller Name
The name of the clustered node for which information is being displayed.

[-group <integer>] - LUN Group
A LUN group is a set of LUNs that shares the same path set.

[-target-wwpn <text>] - Library Target Ports
The World Wide Port Name of a storage tape library port.

[-initiator <text>] - Initiator
The host bus adapter that the clustered node uses to connect to storage tape libraries.

[-array-name <array_name>] - Library Name
Name of the storage tape library that is connected to the clustered node.

[-target-side-switch-port <text>] - Target Side Switch Port
This identifies the switch port that connects to the tape library's target port.

[-initiator-side-switch-port <text>] - Initiator Side Switch Port
This identifies the switch port that connects to the node's initiator port.

[-lun-count <integer>] - Number of LUNS
This is a command-line switch (-lun-count) used to restrict what LUN groups are displayed in the output.

Examples

The following example displays the storage tape library configuration information.

```
cluster1:~> storage tape library config show
LUN Group Count Library Name Library Target Port Initiator
---------- ----- ---------------------------- ----------------------- ---------
cluster1-01
```
storage tape library path commands

View connectivity of tape libraries in cluster

storage tape library path show

Display a list of Tape Libraries on the given path

Availability: This command is available to cluster administrators at the admin privilege level.

Description
This command displays path information for a tape library and has the following parameters by default:

- Node name
- Initiator port
- Target port
- TPGN (Target Port Group Number)
- Port speeds
- Path I/O in Kbytes/sec
- IOPs

Parameters

{ [-fields <fieldname>,...]  
fields used to be used in this display

| [-detail ]  
Using this option displays the following:
  • Target IOPs
  • Target LUNs
  • Path IOPs
  • Path errors
  • Path quality
  • Path LUNs
  • Initiator IOPs
  • Initiator LUNs

| [-instance ]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-node <nodename> | local] - Controller name
The name of the clustered node for which information is being displayed.
[-array-name <array_name>] - Library Name
Name of the storage tape library that is connected to the cluster.

[-target-wwpn <text>] - Target Port
Target World Wide Port Name. Port on the storage tape library that is being used.

[-initiator <text>] - Initiator Port
Initiator port that the clustered node uses.

[-initiator-side-switch-port <text>] - Initiator Side Switch Port
Switch port connected to the clustered node.

[-tpgn <integer>] - Target Port Group Number
TPGN refers to the target port group to which the target port belongs. A target port group is a set of target ports which share the same LUN access characteristics and failover behaviors.

[-port-speed <text>] - Port Speed
Port Speed of the specified port.

[-path-io-kbps <integer>] - Kbytes of I/O per second on Path(Rolling Average)
Rolling average of Kbytes of I/O per second on the library path.

[-path-iops <integer>] - Number of I/O per second on Path(Rolling Average)
Rolling average of I/O per second on the library path.

[-initiator-io-kbps <integer>] - Kbytes of I/O per second on Initiator(Rolling Average)
Rolling average of Kbytes of I/O per second on the initiator port.

[-initiator-iops <integer>] - Number of I/O per second on Initiator(Rolling Average)
Rolling average of I/O per second on the initiator port.

[-target-io-kbps <integer>] - Kbytes of I/O per second to Target(Rolling Average)
Rolling average of Kbytes of I/O per second on the target port.

[-target-iops <integer>] - Number of I/O per second to Target(Rolling Average)
Rolling average of I/O per second on the target port.

[-target-side-switch-port <text>] - Target Side Switch Port
Switch port connected to the tape library.

[-path-link-errors <integer>] - Link Error count on path
Fibre Channel link error count.

[-path-quality <integer>] - Percentage of weighted error threshold
A number representing the threshold of errors that is allowed on the path. Path quality is a weighted error value. When the error weight of a path exceeds the threshold, I/O is routed to a different path.

[-path-lun-in-use-count <integer>] - Number of LUNs in the in-use state on this path
Number of LUNs on this path.

[-initiator-lun-in-use-count <integer>] - Number of LUNs in the in-use state on this initiator
Number of LUNs on this initiator.

[-target-lun-in-use-count <integer>] - Number of LUNs in the in-use state on this target
Number of LUNs on this target.

Examples
The following example displays the path information for a storage tape library
cluster1::> storage tape library path show
Node  Initiator  Target Port  TPGN  Speed  (KB/s)  IOPs
---------------------  ---------  -----------------------  ------  -------  ------------  
cluster1-01  3d    50050763124b4d6f  61   4 Gb/S  0   0
cluster1-01  0b    510a09800000412d  35   4 Gb/S  0   0
cluster1-01  0b    510a09820000412d  1    4 Gb/S  0   0
3 entries were displayed.

storage tape library path show-by-initiator

Display a list of LUNs on the given tape library

Availability: This command is available to cluster administrators at the admin privilege level.

Description
This command displays path information for every initiator port connected to a tape library. The output is similar to the storage library path show command but the output is listed by initiator.

Parameters
{[-fields <fieldname>, ...]  
fields used to be used in this display

| [-instance ]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-node <nodename> | local] - Controller name
The name of the clustered node for which information is being displayed.

[-initiator <text>] - Initiator Port
Initiator port that the clustered node uses.

[-target-wwpn <text>] - Target Port
Target World Wide Port Name. Port on the storage tape library that is being used.

[-initiator-side-switch-port <text>] - Initiator Side Switch Port
Switch port connected to the clustered node.

[-target-side-switch-port <text>] - Target Side Switch Port
Switch port connected to the tape library.

[-array-name <array name>] - Library Name
Name of the storage tape library that is connected to the cluster.

[-tpgn <integer>] - Target Port Group Number
TPGN refers to the target port group to which the target port belongs. A target port group is a set of target ports which share the same LUN access characteristics and failover behaviors.

[-port-speed <text>] - Port Speed
Port Speed of the specified port.

[-path-io-kbps <integer>] - Kbytes of I/O per second on Path (Rolling Average)
Rolling average of Kbytes of I/O per second on the library path.
[-path-iops <integer>] - Number of I/O per second on Path (Rolling Average)
Rolling average of I/O per second on the library path.

[-initiator-io-kbps <integer>] - Kbytes of I/O per second on Initiator (Rolling Average)
Rolling average of Kbytes of I/O per second on the initiator port.

[-initiator-iops <integer>] - Number of I/O per second on Initiator (Rolling Average)
Rolling average of I/O per second on the initiator port.

[-target-io-kbps <integer>] - Kbytes of I/O per second to Target (Rolling Average)
Rolling average of Kbytes of I/O per second on the target port.

[-target-iops <integer>] - Number of I/O per second to Target (Rolling Average)
Rolling average of I/O per second on the target port.

---

**Examples**

The following example displays the path information by initiator for a storage tape library.

```
cluster1::> storage tape library path show-by-initiator
Node: cluster1-01
Initiator I/O       Initiator Side     Path I/O          Target Side   Target I/O
Initiator        (KB/s)          Switch Port       (KB/s)          Switch Port       (KB/s)
Target Port Library Name
--------- ------------- -------------------- ------------ -------------------- ------------
---------------- ----------------
0b                    0 sw_tape:6                       0            sw_tape:0            0
510a09800000412d TAPE_LIB_1
sw_tape:1            0
510a09820000412d TAPE_LIB_1
3d                    0 N/A                             0                  N/A            0
50050763124b4d6f TAPE_LIB_2
3 entries were displayed.
```

---

**storage tape load-balance commands**

Manage tape load balance

**storage tape load-balance modify**

Modify the tape load balance configuration

*Availability:* This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The `storage tape load-balance modify` command modifies the tape load balance setting for a specified node in the cluster.

**Parameters**

- `-node <nodename>|local` - Node
  This parameter specifies the node on which the tape load balance setting is to be modified.

- `-is-enabled {true|false}]` - Is Tape Load Balance Enabled
  This parameter specifies whether tape load balancing is enabled on the node. The default setting is false.

---

**Examples**
The following example modifies the tape load balance setting on node1 in the cluster:
storage tape load-balance show

Displays the tape load balance configuration

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The `storage tape load-balance show` command displays tape load balance settings for each node in the cluster.

Parameters

`{-fields <fieldname>, ...}`
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

`{-instance []}`
If you specify the `-instance` parameter, the command displays detailed information about all fields.

`{-node <nodename>|local} - Node`
Selects information about tape load balancing for the specified node.

`{-is-enabled {true|false}} - Is Tape Load Balance Enabled`
Selects information about load balance configuration as specified by enabled or disabled setting.

Examples

The following example shows the load balance setting for each node in the cluster:

```
cluster1::> storage tape load-balance show
Node                        Enabled
--------------------------- ---------
nod1                         false
nod2                         false
2 entries were displayed.
```

System Commands

The system directory

The system commands enable you to monitor and control cluster nodes.

system chassis commands

Chassis health monitor directory

system chassis show

Display all the chassis in the cluster

Availability: This command is available to cluster administrators at the admin privilege level.
Description
The **system chassis show** command displays information about all the chassis in the cluster. By default, the command displays the following information about all the chassis in the cluster:

- Chassis ID
- Status
- List of nodes in the chassis

To display more details, use the `-instance` parameter.

Parameters

![Parameters](image)

| `-fields <fieldname>,...` | Selects the fields that you specify. |
| `-instance` | Displays detailed information about all the chassis in the cluster. |
| `-chassis-id <text>` | Chassis ID |
| Selects information about the specified chassis. |
| `-member-nodes {<nodename> | local},...` | List of Nodes in the Chassis |
| Selects information about the chassis with the specified member node list. |
| `-num-nodes <integer>` | Number of Nodes in the Chassis |
| Selects information about the chassis with the specified number of nodes. |
| `-status {ok|ok-with-suppressed|degraded|unreachable|unknown}` | Status |
| Selects information about the chassis with the specified status. |

Examples

The following example displays information about all the chassis in the cluster:

```
cluster1::> system chassis show

Chassis ID                 Status          List of Nodes
-------------------------- --------------- ----------------------------------
4591227214                 ok              node1,node2
4591227000                 ok              node1,node2
```

The following example displays detailed information about a specific chassis:

```
cluster1::> system chassis show -chassis-id 4591227214 -instance

Chassis ID: 4591227214
List of Nodes in the Chassis: node1,node2
Number of Nodes in the Chassis: 2
Status: ok
```

**system chassis fru commands**

The fru directory

**system chassis fru show**

Display the FRUs in the cluster

**Availability:** This command is available to cluster administrators at the admin privilege level.
Description
The `system chassis fru show` command displays information about all the major chassis specific FRUs in the cluster. By default, the command displays the following information about all the FRUs in the cluster:

- Chassis ID
- FRU name
- FRU type
- FRU state
- Nodes sharing the FRU

To display more details, use the `-instance` parameter.

Parameters

```bash
[-fields <fieldname>, ...]
   Selects the fields that you specify.
```

```bash
[-instance]
   Displays detailed information about FRUs.
```

```bash
[-node <nodename> | local] - Node
   Specifies the primary node name in the cluster on which Chassis health monitor is running.
```

```bash
[-serial-number <text>] - FRU Serial Number
   Selects information about the FRU with the specified serial number.
```

```bash
[-fru-name <text>] - FRU Name
   Selects information about the FRU with the specified FRU name.
```

```bash
[-type {controller|psu|fan|dimm|bootmedia|ioxm|nvram|nvdimm}] - FRU Type
   Selects information about all the FRUs with the specified FRU type.
```

```bash
[-name <text>] - FRU ID
   Selects information about the FRU with the specified FRU unique name.
```

```bash
[-state <text>] - FRU State
   Selects information about all the FRUs with the specified state.
```

```bash
[-status {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status
   Selects information about all the FRUs with the specified status.
```

```bash
[-display-name <text>] - Display Name for the FRU
   Selects information about all the FRUs with the specified FRU display name.
```

```bash
[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example}] - Monitor Name
   Selects information about all the FRUs with the specified monitor name.
```

```bash
[-model <text>] - Model Type
   Selects information about all the FRUs with the specified FRU model.
```

```bash
[-shared {shared|not_shared}] - Shared Resource
   Selects information about all the FRUs with the specified sharing type.
```

```bash
[-chassis-id <text>] - Chassis ID
   Selects information about all the FRUs in the specified chassis.
```
[-additional-info <text>] - Additional Information About the FRU
Selects information about all the FRUs with the specified additional information.

[-connected-nodes <nodename> | local], ...] - List of Nodes Sharing the FRU
Selects information about all the FRUs with the specified node list.

[-num-nodes <integer>] - Number of Nodes Sharing the FRU
Selects information about all the FRUs with the specified number of connected nodes.

Examples
The following example displays information about all major chassis specific FRUs in the cluster:

```
cluster1::> system chassis fru show
Chassis ID    FRU       Type     State       Nodes Sharing the FRU
------------------- ---------- -------- ----------- -----------------------
4591227214    node1    controller ok      node1
4591227214    node2    controller ok      node2
4591227214    PSU1 FRU psu      GOOD        node1,node2
4591227214    PSU2 FRU psu      GOOD        node1,node2
```

The following example displays detailed information about a specific FRU:

```
cluster1::> system chassis fru show -instance -fru-name "PSU1 FRU"
Node: node1
FRU Serial Number: XXT122737891
FRU Name: PSU1 FRU
FRU Type: psu
FRU Name: XXT122737891
FRU State: GOOD
Status: ok
Display Name for the FRU: PSU1 FRU
Monitor Name: chassis
Model Type: none
Shared Resource: shared
Chassis ID: 4591227214
Additional Information About the FRU: Part Number: 114-00065+A0
Revision: 020F
Manufacturer: NetApp
FRU Name: PSU
List of Nodes Sharing the FRU: node1,node2
Number of Nodes Sharing the FRU: 2
```

system cluster-switch commands

cluster switch health monitor directory

system cluster-switch create

Add information about a cluster switch or management switch

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system cluster-switch create command adds information about a cluster switch or management switch. The cluster switch health monitor uses this information to monitor the health of the switch.
Use this command if ONTAP cannot automatically discover a cluster or management switch. ONTAP relies on the Cisco Discovery Protocol (CDP) to discover the switches. CDP is always enabled on all cluster ports of a node by default, disabled on all non-cluster ports of a node. If the CDP is also enabled on your cluster switches, they will be automatically discovered.

If you want ONTAP to discover and monitor management switches, the CDP must be enabled on non-cluster ports. To verify whether the CDP is enabled or disabled, use the command `system node run -node <node_name> -command options cdpd.enable`.

Use the `system cluster-switch show` command to identify switches that the cluster switch health monitor is monitoring.

**Parameters**

- **-device <text>** - Device Name
  
  Specifies the device name of the switch that you want to monitor. Data ONTAP uses the device name of the switch to identify the SNMP agent with which it wants to communicate.

- **-address <IP Address>** - IP Address
  
  Specifies the IP address of switch's management interface.

- **-snmp-version {SNMPv1|SNMPv2c|SNMPv3}** - SNMP Version
  
  Specifies the SNMP version that Data ONTAP uses to communicate with the switch. The default is SNMPv2c.

- **{-community <text> | -community-or-username <text>}** - DEPRECATED-Community String or SNMPv3 Username
  
  Specifies the community string for SNMPv2 authentication or SNMPv3 user name for SNMPv3 security. The default community string for SNMPv2 authentication is cshm1!.

- **-model {NX5010|NX5020|CAT2960|OTHER|NX5596|CN1610|CN1601|NX3132|OT5548|NX3132V|OT9332|NX3132XL}** - Model Number
  
  Specifies the model number of the switch. You should not set this parameter to OTHER. Data ONTAP does not monitor switches that match this value. Data ONTAP sets this parameter to OTHER if a switch that it automatically discovers is not supported for health monitoring.

- **-type {cluster-network|management-network}** - Switch Network
  
  Specifies the switch type.

- **{-is-monitoring-enabled-admin {true|false}}** - Enable Switch Monitoring
  
  Specifies the switch admin monitoring status.

**Examples**

```
cluster1::> system cluster-switch create -device SwitchA -address 1.2.3.4 -snmp-version SNMPv2c -community-or-username cshm1! -model NX55596 -type cluster-network
```

Creates a new switch configuration for a switch named SwitchA.

```
cluster2::> system cluster-switch create -device SwitchB -address 5.6.7.8 -snmp-version SNMPv3 -community-or-username snmpv3u1 -model CN1601 -type management-network
```

**Related references**

- `system node run` on page 1189
- `system cluster-switch show` on page 1087
system cluster-switch delete

Delete information about a cluster switch or management switch

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system cluster-switch delete command disables switch health monitoring for a cluster or management switch.

Parameters
  -device <text> - Device Name
    Specifies the name of the switch.
  [-force [true]] - Force Delete (privilege: advanced)
    Specifies if force delete or not.

Examples

cluster1::> system cluster-switch delete -device SwitchA
Disables monitoring for the switch named SwitchA.

cluster1::> system cluster-switch delete -device SwitchA -force

system cluster-switch modify

Modify information about a switch's configuration

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system cluster-switch modify command modifies information about a cluster switch or management switch. The cluster switch health monitor uses this information to monitor the switch.

Parameters
  -device <text> - Device Name
    Specifies the device name of switch that you want to monitor.
  [-address <IP Address>] - IP Address
    Specifies the IP address of switch's management interface.
  [-snmp-version {SNMPv1|SNMPv2c|SNMPv3}] - SNMP Version
    Specifies the SNMP version that Data ONTAP uses to communicate with the switch. The default is SNMPv2c.

  [[-community <text>] - DEPRECATED-Community String or SNMPv3 Username
    Note: This parameter is deprecated and may be removed in a future release of Data ONTAP. Use -community-or-username instead.
    Specifies the community string for SNMPv2 authentication or SNMPv3 username for SNMPv3 security.

  | [[-community-or-username <text>] - Community String or SNMPv3 Username
    Specifies the community string for SNMPv2 authentication or SNMPv3 username for SNMPv3 security.
[-type {cluster-network|management-network}] - Switch Network
   Specifies the switch type.

[-is-monitoring-enabled-admin {true|false}] - Enable Switch Monitoring
   Specifies the switch admin monitoring status.

Examples

    cluster1::> system cluster-switch modify -device SwitchA -address 2.3.4.5

Modifies the IP address for the switch named SwitchA.

    cluster1::> system cluster-switch modify -device SwitchB -snmp-version SNMPv3 -community-or-
       username snmpv3u1

system cluster-switch prepare-to-downgrade

Remove unsupported switches in preparation for downgrade

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The system cluster-switch prepare-to-downgrade command changes switch information, so that it is compatible
with older versions of ONTAP. When executed, it removes cluster switch entries that are not supported in versions earlier than
ONTAP 9.1.

Examples

system cluster-switch show

Display the configuration for cluster and management switches

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system cluster-switch show command displays configuration details for the monitored cluster switches and
management switches.

Parameters

    [-fields <fieldname>,...]
       Selects the fields that have the specified name.

    [-snmp-config]
       Displays the following information about a switch:
       • Device Name
       • SNMPv2c Community String or SNMPv3 Username
       • SNMP Version

    [-status]
       Displays the following status information about a switch:
• Is Discovered
• SNMPv2c Community String or SNMPv3 Username
• Model Number
• Switch Network
• Software Version
• Reason For Not Monitoring
• Source Of Switch Version
• Is Monitored?

| [-instance ] |
| Selects detailed information for all the switches.

| [-device <text>] - Device Name |
| Selects the switches that match the specified device name.

| [-address <IP Address>] - IP Address |
| Selects the switches that match the specified IP address.

| [-snmp-version {SNMPv1|SNMPv2c|SNMPv3}] - SNMP Version |
| Selects the switches that match the specified SNMP version.

| [-is-discovered {true|false}] - Is Discovered |
| Selects the switches that match the specified discovery setting.

| [-community <text>] - DEPRECATED-Community String or SNMPv3 Username |
| Note: This parameter is deprecated and may be removed in a future release of Data ONTAP. Use -community-or-username instead. |
| Selects the switches that match the specified SNMPv2c community string or SNMPv3 username.

| [-community-or-username <text>] - Community String or SNMPv3 Username |
| Selects the switches that match the specified SNMPv2c community string or SNMPv3 username.

| [-model {NX5010|NX5020|CAT2960|OTHER|NX5596|CN1610|CN1601|NX3132|OT5548|NX3132V|OT9332|NX3132XL}] - Model Number |
| Selects the switches that match the specified model number.

| [-type {cluster-network|management-network}] - Switch Network |
| Selects the switches that match the specified switch type.

| [-sw-version <text>] - Software Version |
| Selects the switches that match the specified software version.

| [-reason <text>] - Reason For Not Monitoring |
| Selects the switches that match the specified reason.

| [-version-source <text>] - Source Of Switch Version |
| Selects the switches that match the specified version source (for example, from SNMP, CDP or ISDP).

| [-is-monitoring-enabled-operational {true|false}] - Is Monitored? |
| Selects the switches that match the specified operational monitoring status.

| [-serial-number <text>] - Serial Number of the Device |
| Selects the switches that match the specified serial number. |
system cluster-switch show-all

Displays the list of switches that were added and deleted

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The system cluster-switch show-all command displays configuration details for discovered monitored cluster switches and management switches, including switches that are user-deleted. From the list of deleted switches, you can delete a switch permanently from the database to re-enable automatic discovery of that switch.

Parameters
[-fields <fieldname>,...]
Selects the fields that have the specified name.

[-instance]
Selects detailed information for all the switches.

[device <text>] - Device Name
Selects the switches that match the specified device name.
[-address <IP Address>] - IP Address
Selects the switches that match the specified IP address.

[-snmp-version {SNMPv1|SNMPv2c|SNMPv3}] - SNMP Version
Selects the switches that match the specified SNMP version.

[-community <text>] - DEPRECATED-Community String or SNMPv3 Username
Note: This parameter is deprecated and may be removed in a future release of Data ONTAP. Use -community-or-username instead.
Selects the switches that match the specified community string or SNMPv3 username.

[-community-or-username <text>] - Community String or SNMPv3 Username
Selects the switches that match the specified community string or SNMPv3 username.

[-discovered {true|false}] - Is Discovered
Selects the switches that match the specified discovery setting.

[-model {NX5010|NX5020|CAT2960|OTHER|NX5596|CN1610|CN1601|NX3132|OT5548|NX3132v|OT9332|NX3132xl}] - Model Number
Selects the switches that match the specified model number.

[-type {cluster-network|management-network}] - Switch Network
Selects the switches that match the specified switch type.

[-sw-version <text>] - Software Version
Selects the switches that match the specified software version.

[-is-monitoring-enabled-operational {true|false}] - Switch Monitoring Status
Selects the switches that match the specified operational monitoring status.

[-reason <text>] - Reason For Not Monitoring
Selects the switches that match the specified reason.

[-version-source <text>] - Source Of Switch Version
Selects the switches that match the specified version source (for example, from SNMP, CDP or ISDP).

[-serial-number <text>] - Serial Number of the Device
Selects the switches that match the specified serial number.

Examples

 cluster1::> system cluster-switch show-all
Switch                      Type          Address          Model
--------------------------- ----------- ---------------- ---------------
SwitchA                     cluster       1.2.3.4          Nexus5010

   Is Monitored: yes
   Reason:
   Software Version: Cisco IOS 4.1N1
   Version Source: CDP

system cluster-switch polling-interval commands
The polling-interval directory
system cluster-switch polling-interval modify

Modify the polling interval for monitoring cluster and management switch health

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The `system cluster-switch polling-interval modify` command modifies the interval in which the cluster switch health monitor polls cluster and management switches.

Parameters
`[-polling-interval <integer>]` - Polling Interval
Specifies the interval in which the health monitor polls switches. The interval is in minutes. The default value is 5. The allowed range of values is 2 to 120.

Examples
```
cluster1::> system cluster-switch polling-interval modify -polling-interval 41
```

system cluster-switch polling-interval show

Display the polling interval for monitoring cluster and management switch health

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The `system cluster-switch polling-interval show` command displays the polling interval used by the health monitor.

Examples
```
cluster1::> system cluster-switch polling-interval show
Polling Interval (in minutes): 40
```

system cluster-switch threshold commands

The threshold directory

system cluster-switch threshold show

Display the cluster switch health monitor alert thresholds

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The `system cluster-switch threshold show` command displays thresholds used by health monitor alerts.
Examples

cluster1::> system cluster-switch threshold show
Per 0.10% values: 1 = 0.10%, 5 = 0.50%
In Errors Threshold (%) Out Errors Threshold (%)
----------------------- ------------------------
1                      1

system configuration commands

Manage configuration backup and recovery

system configuration backup commands

Configuration Backup

system configuration backup copy

Copy a configuration backup

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

The system configuration backup copy command copies a configuration backup from one node in the cluster to another node in the cluster.

Use the system configuration backup show command to display configuration backups to copy.

Parameters

- **-from-node** `<nodename>` | `local` - Source Node
  Use this parameter to specify the name of the source node where the configuration backup currently exists.

- **-backup** `<text>` - Backup Name
  Use this parameter to specify the name of the configuration backup file to copy.

- **-to-node** `<nodename>` | `local` - Destination Node
  Use this parameter to specify the name of the destination node where the configuration backup copy is created.

Examples

The following example copies the configuration backup file `node1.special.7z` from the node `node1` to the node `node2`.

cluster1::*> system configuration backup copy -from-node node1 -backup node1.special.7z -to-node node2
[Job 295] Job is queued: Copy backup job.

Related references

system configuration backup show on page 1095
system configuration backup create

Create a configuration backup

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The system configuration backup create command creates a new configuration backup file.

Parameters
- **node <nodename>|local** - Node
  Use this parameter to specify the node on which to create the backup file.

  [**-backup-name <text>**] - Backup Name
  Use this parameter to specify the name of the backup file to create. The backup name cannot contain a space or any of the following characters: * ? /

  [**-backup-type {node|cluster}**] - Backup Type
  Use this parameter to specify the type of backup file to create.

Examples
The following example creates a new cluster configuration backup file called *node1.special.7z* on the node *node1*.

```shell
cluster1::*> system configuration backup create -node node1 -backup-name node1.special.7z -backup-type cluster
```

system configuration backup delete

Delete a configuration backup

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The system configuration backup delete command deletes a saved configuration backup.

Use the system configuration backup show command to display saved configuration backups.

Parameters
- **node <nodename>|local** - Node
  Use this parameter to specify the name of the source node where the configuration backup currently exists.

  **-backup <text>** - Backup Name
  Use this parameter to specify the name of the configuration backup file to delete.

Examples
The following example shows how to delete the configuration backup file *node1.special.7z* from the node *node1*.

```shell
cluster1::*> system configuration backup delete -node node1 -backup node1.special.7z
```

*system configuration backup show* on page 1095
**system configuration backup download**

Download a configuration backup

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**
The `system configuration backup download` command copies a configuration backup from a source URL to a node in the cluster.

**Parameters**
- `-node <nodename>|local` - *Node*
  
  Use this parameter to specify the name of the node to which the configuration backup is downloaded.

- `-source <text>` - *Source URL*
  
  Use this parameter to specify the source URL of the configuration backup to download.

- `[-backup-name <text>]` - *Backup Name*
  
  Use this parameter to specify a new local file name for the downloaded configuration backup.

**Examples**
The following example shows how to download a configuration backup file from a URL to a file named `exampleconfig.download.7z` on the node `node2`.

```
cluster1:*> system configuration backup download -node node2 -source http://www.example.com/config/download/nodeconfig.7z -backup-name exampleconfig.download.7z
```

**system configuration backup rename**

Rename a configuration backup

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**
The `system configuration backup rename` command changes the file name of a configuration backup file.

Use the `system configuration backup show` command to display configuration backups to rename.

**Parameters**
- `-node <nodename>|local` - *Node*
  
  Use this parameter to specify the name of the source node where the configuration backup currently exists.

- `-backup <text>` - *Backup Name*
  
  Use this parameter to specify the name of the configuration backup file to rename.

- `-new-name <text>` - *New Name*
  
  Use this parameter to specify a new name for the configuration backup file.

**Examples**
The following example renames the saved configuration file `download.config.7z` on the node `node1` to `test.config.7z`.

```
```

`system configuration backup show` on page 1095

**system configuration backup show**

Show configuration backup information

**Availability:** This command is available to cluster administrators at the **advanced** privilege level.

**Description**

The `system configuration backup show` command displays information about saved configuration backups.

**Parameters**

```
[-fields <fieldname>, ...]  
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.
```

```
[-instance]  
If you specify the `-instance` parameter, the command displays detailed information about all fields.
```

```
[-node <nodename>|local] - Node  
Selects configuration backups that are saved on the node you specify.
```

```
[-backup <text>] - Backup Name  
Selects configuration backups that have the backup name you specify.
```

```
[-backup-type (node|cluster)] - Backup Type  
Selects configuration backups of the type you specify.
```

```
[-time <MM/DD HH:MM:SS>] - Backup Creation Time  
Selects configuration backups that were saved on the date and time you specify.
```

```
[-cluster-name <text>] - Cluster Name  
Selects configuration backups that were saved in the cluster that has the name you specify.
```

```
[-cluster-uuid <UUID>] - Cluster UUID  
Selects configuration backups that were saved in the cluster that has the UUID you specify.
```

```
[-size {<integer> [KB|MB|GB|TB|PB]}) - Size of Backup  
Selects configuration backups that have the file size you specify.
```

```
[-nodes-in-backup {<nodename>|local}, ...] - Nodes In Backup  
Selects configuration backups that include the configuration of the nodes you specify.
```

```
[-version <text>] - Software Version  
Selects configuration backups that have the software version you specify.
```

```
[-is-auto {true|false}] - Backup Created from Schedule (true or false)  
A value of true selects configuration backups that were created from a schedule. A value of false selects configuration backups that were created manually.
```

```
[-schedule <text>] - Name of Backup Schedule  
Selects configuration backups that were created by the schedule you specify.
```
Examples
The following example shows typical output for this command.

```
cluster1:*> system configuration backup show
Node       Backup Tarball                            Time               Size
---------  ----------------------------------------- ------------------ -----  
node1      cluster1.8hour.2011-02-22.18_15_00.7z     02/22 18:15:00     7.78MB
node1      cluster1.8hour.2011-02-23.02_15_00.7z     02/23 02:15:00     7.98MB
node1      cluster1.8hour.2011-02-23.10_15_00.7z     02/23 10:15:00     7.72MB
node1      cluster1.daily.2011-02-22.00_10_00.7z      02/22 00:10:00     7.19MB
node1      cluster1.daily.2011-02-23.00_10_00.7z      02/23 00:10:00     7.99MB
```

Press <space> to page down, <return> for next line, or 'q' to quit... q

system configuration backup upload
Upload a configuration backup

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The `system configuration backup upload` command copies a configuration backup from a node in the cluster to a remote URL.

Parameters
- `-node {<nodename>|local} - Node`
  Use this parameter to specify the name of the node from which the configuration backup is uploaded.
- `-backup <text> - Backup Name`
  Use this parameter to specify the file name of the configuration backup to upload.
- `-destination <text> - Destination URL`
  Use this parameter to specify the destination URL of the configuration backup.

Examples
The following example show how to upload the configuration backup file `testconfig.7z` from the node `node2` to a remote URL.

```
cluster1:*> system configuration backup upload -node node2 -backup testconfig.7z -destination ftp://www.example.com/config/uploads/testconfig.7z
```

system configuration backup settings commands
The settings directory

system configuration backup settings modify
Modify configuration backup settings

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The `system configuration backup settings modify` command changes settings for configuration backup.
Parameters

[-destination <text>] - Backup Destination URL
   Use this parameter to specify the destination URL for uploads of configuration backups. Use the value "" to remove the destination URL.

[-username <text>] - Username for Destination
   Use this parameter to specify the user name to use to log in to the destination system and perform the upload. Use the system configuration backup settings set-password command to change the password used with this user name.

[-numbackups1 <integer>] - Number of Backups to Keep for Schedule 1
   Use this parameter to specify the number of backups created by backup schedule 1 to keep on the destination system. If the number of backups exceeds this number, the oldest backup is removed.

[-numbackups2 <integer>] - Number of Backups to Keep for Schedule 2
   Use this parameter to specify the number of backups created by backup schedule 2 to keep on the destination system. If the number of backups exceeds this number, the oldest backup is removed.

[-numbackups3 <integer>] - Number of Backups to Keep for Schedule 3
   Use this parameter to specify the number of backups created by backup schedule 3 to keep on the destination system. If the number of backups exceeds this number, the oldest backup is removed.

Examples

The following example shows how to set the destination URL and user name used for uploads of configuration backups.

```
cluster1:*> system configuration backup settings modify -destination ftp://www.example.com/config/uploads/ -username admin
```

Related references

system configuration backup settings set-password on page 1097

system configuration backup settings set-password

Modify password for destination URL

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

The system configuration backup settings set-password command sets the password used for uploads of configuration backups. This password is used along with the username you specify using the system configuration backup settings modify command to log in to the system and perform the upload. Enter the command without parameters. The command prompts you for a password, and for a confirmation of that password. Enter the same password at both prompts. The password is not displayed.

Use the system configuration backup settings show command to display the destination URL for configuration backups. Use the system configuration backup settings modify command to change the destination URL and remote username for configuration backups.

Examples

The following example shows successful execution of this command.
system configuration backup settings show

Show configuration backup settings

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The system configuration backup settings show command displays current settings for configuration backup. These settings apply to backups created automatically by schedules. By default, the command displays the URL to which configuration backups are uploaded, and the user name on the remote system used to perform the upload.

Use the system configuration backup settings set-password command to change the password used with the user name on the destination. Use the system configuration backup settings modify command to change the destination URL and username for uploads of configuration backups, and to change the number of backups to keep for each schedule.

Parameters
[-instance]

Use this parameter to display detailed information about configuration backup settings, including the number of backups to keep for each backup schedule.

Examples
The following example displays basic backup settings information.

```
cluster1:~> system configuration backup settings show
Backup Destination URL: ftp://www.example.com/config/uploads/
Username: jdoe
```

The following example shows detailed output using the -instance parameter.

```
cluster1:~> system configuration backup settings show -instance
Backup Destination URL: ftp://www.example.com/config/uploads/
Username for Destination: admin
Schedule 1: 8hour
Number of Backups to Keep for Schedule 1: 2
Schedule 2: daily
Number of Backups to Keep for Schedule 2: 2
Schedule 3: weekly
Number of Backups to Keep for Schedule 3: 2
```

system configuration recovery commands

Configuration Recovery

system configuration recovery cluster commands

The cluster directory

system configuration recovery cluster modify

Modify cluster recovery status

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The system configuration recovery cluster modify command modifies the cluster recovery status. This command should be used to end the cluster recovery after all recovery procedures are applied.

Parameters

- `-recovery-status {complete|in-progress|not-in-recovery}` - Cluster Recovery Status
  Use this parameter with the value `complete` to set the cluster recovery status after the cluster has been recreated and all of the nodes have been rejoined to it. This enables each node to resume normal system operations. The `in-progress` and `not-in-recovery` values are not applicable to this command.

Examples

The following example modifies the cluster recovery status.

```
source::> system configuration recovery cluster modify -recovery-status complete
```

system configuration recovery cluster recreate

Recreate cluster

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The system configuration recovery cluster recreate command re-creates a cluster, using either the current node or a configuration backup as a configuration template. After you re-create the cluster, rejoin nodes to the cluster using the system configuration recovery cluster rejoin command.

Parameters

- `-from {node|backup}` - From Node or Backup
  Use this parameter with the value `node` to re-create the cluster using the current node as a configuration template. Use this parameter with the value `backup` to re-create the cluster using a configuration backup as a configuration template.

- `[-backup <text>]` - Backup Name
  Use this parameter to specify the name of a configuration backup file to use as a configuration template. If you specified the `-from` parameter with the value `backup`, you must use this parameter and specify a backup name. Use the system configuration backup show command to view available configuration backup files.
Examples
The following example shows how to re-create a cluster using the node node1 as a configuration template.

```
cluster1:~> system configuration recovery cluster recreate -from node node1
```

The following example shows how to re-create a cluster using the configuration backup siteconfig.backup.7z as a configuration template.

```
cluster1:~> system configuration recovery cluster recreate -from backup -backup siteconfig.backup.7z
```

Related references

- system configuration backup show on page 1095
- system configuration recovery cluster rejoin on page 1100

system configuration recovery cluster rejoin

Rejoin a cluster

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The system configuration recovery cluster rejoin command rejoins a node to a new cluster created earlier using the system configuration recovery cluster recreate command. Only use this command to recover a node from a disaster. Because this synchronization can overwrite critical cluster information, and will restart the node you specify, you are required to confirm this command before it executes.

Parameters
- `-node <nodename>|local` - Node to Rejoin

Use this parameter to specify the node to rejoin to the cluster.

Examples
This example shows how to rejoin the node node2 to the cluster.

```
cluster1:~> system configuration recovery cluster rejoin -node node2
```

Warning: This command will rejoin node "node2" into the local cluster, potentially overwriting critical cluster configuration files. This command should only be used to recover from a disaster. Do not perform any other recovery operations while this operation is in progress.

This command will cause node "node2" to reboot.

Do you want to continue? {y|n}: y

Related references

- system configuration recovery cluster recreate on page 1099

system configuration recovery cluster show

Show cluster recovery status

Availability: This command is available to cluster administrators at the advanced privilege level.

1100 Commands: Manual Page Reference
Description
The `system configuration recovery cluster show` command displays the cluster recovery status. Cluster recovery status is "not-in-recovery" under normal operations, and it becomes "in-progress" if a new cluster is created using the `system configuration recovery cluster recreate` command with the `-from backup` parameter. When cluster recovery status is "in-progress", wait until the output of the "Is Recovery Status Persisted" field is true before using the `system configuration recovery cluster rejoin` command to recover other nodes in the cluster.

Examples
The following example displays the cluster recovery status.

```
source::> system configuration recovery cluster show
Recovery Status: in-progress
Is Recovery Status Persisted: true
```

**system configuration recovery cluster sync**
Sync a node with cluster configuration

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**
The `system configuration recovery cluster sync` command synchronizes a node with the cluster configuration. Only use this command to recover a node from a disaster. Because this synchronization can overwrite critical cluster information, and will restart the node you specify, you are required to confirm this command before it executes.

**Parameters**
- `-node <nodename|local>` - Node to Synchronize
  Use this parameter to specify the name of the node to synchronize with the cluster.

```
Examples
The following example shows the synchronization of the node *node2* to the cluster configuration.

cluster1::*> system configuration recovery cluster sync -node node2
Warning: This command will synchronize node "node2" with the cluster configuration, potentially overwriting critical cluster configuration files on the node. This feature should only be used to recover from a disaster. Do not perform any other recovery operations while this operation is in progress. This command will cause all the cluster applications on node "node2" to restart, interrupting administrative CLI and Web interface on that node.
Do you want to continue? [y|n]: y
All cluster applications on node "node2" will be restarted. Verify that the cluster applications go online.
```

**system configuration recovery node commands**
The node directory
system configuration recovery node restore

Restore node configuration from a backup

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The system configuration recovery node restore command restores the configuration of the local node from a configuration backup file.

Use the system configuration backup show command to view available configuration backup files.

Parameters

- **-backup <text>** - Backup Name
  
  Use this parameter to specify the name of a configuration backup file to use as the configuration template.

- **[-nodename-in-backup <text>]** - Use Backup Identified by this Nodename
  
  Use this parameter to specify a node within the configuration backup file to use as a configuration template. Only specify this parameter if you are specifying a name other than the name of the local node.

- **[-force [true]]** - Force Restore Operation
  
  Use this parameter with the value true to force the restore operation and overwrite the current configuration of the local node. This overrides all compatibility checks between the node and the configuration backup. The configuration in the backup is installed even if it is not compatible with the node's software and hardware.

  Use this parameter with the value false to be warned of the specific dangers of restoring and be prompted for confirmation before executing the command. This value also assures that the command performs compatibility checks between configuration stored in the backup and the software and hardware of the node. The default is false.

Examples

The following example shows how to restore the configuration of the local node from the configuration backup of node3 that is stored in the configuration backup file example.backup.7z.

```
cluster1::*> system configuration recovery node restore -backup example.backup.7z
```

Warning: This command overwrites local configuration files with files contained in the specified backup file. Use this command only to recover from a disaster that resulted in the loss of the local configuration files. The node will reboot after restoring the local configuration. Do you want to continue? {y|n}: y

system configuration backup show on page 1095

system controller commands

Controller health monitor directory

system controller show

Display the controller information

Availability: This command is available to cluster administrators at the admin privilege level.
Description
The system controller show command displays information about all the controllers in the cluster. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported. By default, the command displays the following information about all the controllers in the cluster:

- Controller name
- System ID
- System serial number
- Controller model name
- Health monitor status

To display more details, use the -instance parameter.

Parameters

[-fields <fieldname>,...]
   Selects the fields that you specify.

[-instance ]
   Displays detailed information about all the controllers in the cluster.

 [-node {<nodename>|local}] - Node
   Selects information about the specified controller.

 [-system-id <text>] - System ID
   Selects information about the controller with the specified System ID.

 [-model <text>] - Model Name
   Selects information about the controllers with the specified model name.

 [-part-number <text>] - Part Number
   Selects information about the controllers with the specified part number.

 [-revision <text>] - Revision
   Selects information about the controllers with the specified revision.

 [-serial-number <text>] - Serial Number
   Selects information about the controller with the specified system serial number.

 [-controller-type <text>] - Controller Type
   Selects information about the controllers with the specified controller type.

 [-status {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status
   Selects information about the controllers with the specified health monitor status.

 [-chassis-id <text>] - Chassis ID
   Selects information about the controllers with the specified chassis ID.

Examples
The below example displays information about all controllers in the cluster.
The example below displays detailed information about specified controller in the cluster.

```
cluster1::> system controller show -instance -node node1
Node: node1
  System ID: 140733730268652
  Model Name: FAS2520
  Part Number: 111-01316
  Revision: 21
  Serial Number: 700001456939
  Controller Type: none
  Status: ok
  Chassis ID: 4591227214
```

**system controller bootmedia commands**

The bootmedia directory

**system controller bootmedia show**

Display the Boot Media Device Health Status

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**

The `system controller bootmedia show` command displays details of the bootmedia devices present in all the nodes in a cluster. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported. By default, the command displays the following information about the bootmedia:

- Node name
- Display name
- Vendor ID
- Device ID
- Memory size
- Bootmedia state
- Health monitor status

To display more details, use the `-instance` parameter.

**Parameters**

```
[-fields <fieldname>,...]  Selects the fields that you specify.

[-instance]                Displays detailed information for all the bootmedia devices.

[-node <nodename> | local] - Node
  Selects the bootmedia device that is present on the specified node.
```
[[-serial-num <text>]] - Serial Number
  Selects the bootmedia devices with the specified serial number.

[[-vendor-id <Hex Integer>]] - Vendor ID
  Selects the bootmedia devices with the specified vendor ID.

[[-device-id <Hex Integer>]] - Device ID
  Selects the bootmedia devices with the specified device ID.

[[-display-name <text>]] - Display Name
  Selects the bootmedia devices with the specified display name.

[[-unique-name <text>]] - Unique Name
  Selects the bootmedia device with the specified unique name.

[[-monitor (node-connect|system-connect|system|controller|chassis|cluster-switch|example)] - Health Monitor Name
  Selects the bootmedia devices with the specified health monitor.

[[-usbmon-status {present|not-present}]] - Bootmedia Health Monitor
  Selects the bootmedia devices with the specified USBMON status.

[[-device-state {good|warn|bad}]] - Bootmedia State
  Selects the bootmedia devices with the specified device state.

[[-size <integer>]] - Max Memory Size (MB)
  Selects the bootmedia devices with the specified memory size.

[[-health {ok|ok-with-suppressed|degraded|unreachable|unknown}]] - Status
  Selects the bootmedia devices with the specified health monitor status.

### Examples

The following example displays the information of the bootmedia devices present in all the nodes in a cluster:

```plaintext
cluster1::> system controller bootmedia show

<table>
<thead>
<tr>
<th>Node</th>
<th>Display Name</th>
<th>Vendor ID</th>
<th>Device ID</th>
<th>Size Bootmedia</th>

</tr>
<tr>
<td></td>
<td>0x655</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```

The example below displays the detailed information about the bootmedia present in a node.

```plaintext
cluster1::> system controller bootmedia show -instance -node node1

Node: node1
  Vendor ID: 634
  Device ID: 655
  Display Name: Micron Technology 0x655
  Unique Name: Micron Technology 0x655 (ad.0)
  Health Monitor Name: controller
  USBMON Health Monitor: present
  Bootmedia State: good
  Max memory size(in MB): 1929
  Status: ok
```
system controller bootmedia show-serial-number

Display the Boot Media Device serial number

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system controller bootmedia show-serial-number command displays the Boot Media Device serial number. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported. By default, the command displays the following information about the bootmedia:

- Node name
- Display name
- Serial Number
- Size
- Bootmedia state
- Status

To display more details, use the -instance parameter.

Parameters

[-fields <fieldname>,...]
Selects the fields that you specify.

[-instance]
Displays detailed information for all the bootmedia devices.

[-node {<nodename>|local}] - Node
Selects the bootmedia device that is present on the specified node.

[-serial-num <text>] - Serial Number
Selects the bootmedia devices with the specified serial number.

[-vendor-id <Hex Integer>] - Vendor ID
Selects the bootmedia devices with the specified vendor ID.

[-device-id <Hex Integer>] - Device ID
Selects the bootmedia devices with the specified device ID.

[-display-name <text>] - Display Name
Selects the bootmedia devices with the specified display name.

[-unique-name <text>] - Unique Name
Selects the bootmedia device with the specified unique name.

[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example}] - Health Monitor Name
Selects the bootmedia devices with the specified health monitor.

[-usbmon-status {present|not-present}] - Bootmedia Health Monitor
Selects the bootmedia devices with the specified USBMON status.

[-device-state {good|warn|bad}] - Bootmedia State
Selects the bootmedia devices with the specified device state.
[-size <integer>] - Max Memory Size (MB)

Selects the bootmedia devices with the specified memory size.

[-health {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status

Selects the bootmedia devices with the specified health monitor status.

**Examples**

The following example displays the information of the bootmedia devices present in all the nodes in a cluster:

```
cluster1::> system controller bootmedia show-serial-number

<table>
<thead>
<tr>
<th>Node</th>
<th>Display Name</th>
<th>Serial Number</th>
<th>(MB) State</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>or-12-01</td>
<td>BootMedia/SAMSUNG</td>
<td>S2J4NXAGA08186</td>
<td>122104 good</td>
<td>ok</td>
</tr>
<tr>
<td></td>
<td>MZVLV128HCGR-00000</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>BootMedia-2/SAMSUNG</td>
<td>S2J4NXAGA08198</td>
<td>122104 good</td>
<td>ok</td>
</tr>
<tr>
<td></td>
<td>MZVLV128HCGR-00000</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```

2 entries were displayed.

The following example displays the detailed information about the bootmedia present in a node:

```
cluster1::> system controller bootmedia show-serial-number -instance -node node1

Node: node1
Vendor ID: 8086
Device ID: 8d02
Display Name: TOSHIBA THNSNJ060GMCU
Unique Name: /dev/ad4s1 (TOSHIBA THNSNJ060GMCU)
Health Monitor Name: controller
Bootmedia Health Monitor: present
Bootmedia State: good
Max memory size(in MB): 16367
Status: ok
Serial number: Y4IS104FTNEW
```

**system controller clus-flap-threshold commands**

The clus-flap-threshold directory

**system controller clus-flap-threshold show**

Display the controller cluster port flap threshold

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The `system controller clus-flap-threshold show` command allows the display of the threshold for link flapping counts for all nodes. This threshold would be the number of times the cluster port links for a given node can flap (go down) within a polling period before triggering an alert.

**system controller config commands**

Configuration information directory

**system controller config show**

Display System Configuration Information

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.
Description
The `system controller config show` command displays system configuration information for the devices present in the controller. To display more details, use the `-instance` parameter.

Parameters

```
{ [-fields <fieldname>, ...]  
  If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

[-instance]  
  If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node
  Selects the nodes that match this parameter value.

[-device <text>] - Device
  Selects the configuration information that matches the specified device.

[-slot <integer>] - Slot Number
  Selects the configuration information that matches the specified slot.

[-subslot <integer>] - Subslot Number
  Selects the configuration information that matches the specified subslot.

[-info <text>] - Device Info
  Selects the configuration information that matches the specified device information.
```

Examples

The following example displays configuration information for slot 1 of the controller:

```
class: > system controller config show -slot 1
Node: node1
Sub- Device/Slot slot Information
------ ---- ------------------------------
  1 - NVRAM10 HSL
    Device Name: Interconnect HBA: Generic OFED Provider
    Port Name: ib1a

    QSFP Vendor: Amphenol
    QSFP Part Number: 112-00436+A0
    QSFP Type: Passive Copper 1m ID:00
    QSFP Serial Number: APF16130066857

class: >
```

system controller config show-errors

Display configuration errors

Availability: This command is available to cluster administrators at the admin privilege level.
Description
The system controller config show-errors displays configuration errors.

- node
- description

To display more details, use the -instance parameter.

Parameters

{ [-fields <fieldname>, ...]}
Selects the fields that you specify.

[ [-instance ]] Displays detailed information for all the PCI devices.

[-node <nodename>|local]] - Node
Displays configuration errors on the specified node.

[-verbose [true]] - Verbose Output?
The -verbose parameter enables verbose mode, resulting in the display of more detailed output.

[-description <text>] - Error Description
Displays the node with the specified configuration error.

Examples

The example below displays configuration errors on all the nodes in the cluster.

```
cluster1::> system controller config show-errors
Configuration Info and Errors for Node: cluster1-01
---------------------------------------------------------------------
Chelsio T320E 2x10G NIC card (PN X1008A) in slot 1 is not supported on model FAS3210
Configuration Info and Errors for Node: cluster1-02
---------------------------------------------------------------------
PCI-E Dual 10/100/1000 Ethernet G20 card (PN X1039A) in slot 2 is not supported on model FAS3210
cluster1::>
cluster1::> system controller config show-errors -verbose
Configuration Info and Errors for Node: cluster1-01
---------------------------------------------------------------------
sysconfig: Card in slot 2 (7-1275-0008-46848) is not supported.
sysconfig: slot 12 OK: X2067: Proprietary embedded SAS HBA
```

system controller config pci commands
PCI device information directory

system controller config pci show-add-on-devices
Display PCI devices in expansion slots

Availability: This command is available to cluster administrators at the admin privilege level.
Description
The system controller config pci show-add-on-devices command displays information about the PCIe devices in I/O expansion slots. The command displays the following information about the PCIe devices:

- Node
- Model
- Type
- Slot
- Device
- Vendor
- Sub-device ID

To display more details, use the -instance parameter.

Parameters

[[-fields <fieldname>,...]]
Selects the fields that you specify.

|[-instance]]
Displays detailed information about PCI devices.

[[-node {<nodename>|local}] - Node
Selects the PCI devices that are present in the specified node.

[[-model <text>] - Model String
Selects the PCI devices that are present on the system with the specified model name.

[[-type <integer>] - Device Type
Selects the PCI devices with the specified device type.

[[-slot-and-sub <text>] - PCI Slot Number
Selects the PCI devices present in the specified slot or slot-subslot combination.

[[-device <text>] - Device
Selects the PCI devices with the specified device ID.

[[-vendor <text>] - Vendor Number
Selects the PCI devices with the specified vendor ID.

[[-sub-device-id <integer>] - Sub Device ID
Selects the PCI devices with the specified sub-device ID.

Examples
The example below displays information about PCI devices found in I/O expansion slots of all the nodes in the cluster.

```
cluster1::> system controller config pci show-add-on-devices
<table>

```
system controller config pci show-hierarchy

Display PCI hierarchy

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system controller config pci show-hierarchy command displays the PCI Hierarchy of all PCI devices found in a controller. The command displays the following information about the PCI devices:

- Node
- Level
- Device
- Link Capability
- Link Status

To display more details, use the -instance parameter.

Parameters

```
{-fields <fieldname>,...}  Selects the fields that you specify.

[-instance]}  Displays detailed information for PCI devices.

[-node {<nodename>|local]} - Node
Displays the PCI hierarchy of the specified node.

[-level <integer>] - PCI Device Level
Displays the PCI devices that match the specified level within the PCI hierarchy.

[-pci-device <text>] - PCI Device
Displays the PCI devices that match the specified device description.

[-link-cap <text>] - Link Capability
Displays the PCI devices that match the specified link capability.

[-link-status <text>] - Link Status
Displays the PCI devices that match the specified link status.
```

Examples
The example below displays the PCI hierarchy for all of the nodes in the cluster.
cluster1::> system controller config pci show-hierarchy
PCI Hierarchy

Commands: Manual Page Reference
system controller environment commands

The environment directory

system controller environment show

Display the FRUs in the controller

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The system controller environment show displays information about all environment FRUs in the cluster. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported. By default, the command displays the following information about the environment FRUs in the cluster:

- Node
- FRU name
- FRU state

To display more details, use the -instance parameter.

Parameters

[-fields <fieldname>, ...]

Selects the fields that you specify.

[-instance ]

Displays detailed information about the environment FRUs.

[-node [<nodename> | local]] - Node

Selects information about all the environment FRUs that the specified node owns.

[-serial-number <text>] - FRU Serial Number

Selects information about all the environment FRUs with the specified serial number.

[-fru-name <text>] - FRU Name

Selects information about the environment FRU with the specified FRU name.
[-type {controller|psu|fan|dimm|bootmedia|ioxm|nvram|nvdimm}] - FRU Type
Selects information about all the environment FRUs with the specified FRU type.

[-name <text>] - Name
Selects information about all the environment FRUs with the specified unique name.

[-state <text>] - FRU State
Selects information about all the environment FRUs with the specified FRU state.

[-status {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status
Selects information about all the environment FRUs with the specified health monitor status.

[-display-name <text>] - Display Name for the FRU
Selects information about all the environment FRUs with the specified display name.

[-monitor (node-connect|system-connect|system|controller|chassis|cluster-switch|example)] - Monitor Name
Selects information about all the environment FRUs with the specified monitor.

[-model <text>] - Model Type
Selects information about all the environment FRUs with the specified FRU model.

[-shared {shared|not_shared}] - Shared Resource
Selects information about all the environment FRUs with the specified sharing type.

[-chassis-id <text>] - Chassis ID
Selects information about all the environment FRUs in the specified chassis.

[-additional-info <text>] - Additional Information About the FRU
Selects information about all the environment FRU with specified additional information.

Examples
The following example displays information about all major environment FRUs in the cluster:

```
cluster1::> system controller environment show

<table>
<thead>
<tr>
<th>Node</th>
<th>FRU Name</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>node1</td>
<td>PSU1 FRU</td>
<td>GOOD</td>
</tr>
<tr>
<td>node1</td>
<td>PSU2 FRU</td>
<td>GOOD</td>
</tr>
<tr>
<td>node2</td>
<td>PSU1 FRU</td>
<td>GOOD</td>
</tr>
<tr>
<td>node2</td>
<td>PSU2 FRU</td>
<td>GOOD</td>
</tr>
</tbody>
</table>
```

The following example displays detailed information about a specific environment FRU:

```
cluster1::> system controller environment show -node node1 -fru-name "PSU1 FRU" -instance

Node: node1
FRU Serial Number: XXT122737891
FRU Name: PSU1 FRU
FRU Type: psu
Name: XXT122737891
FRU State: GOOD
Status: ok
Display Name for the FRU: PSU1 FRU
Monitor Name: controller
Model Type: none
Shared Resource: shared
Chassis ID: 4591227214
Additional Information About the FRU: Part Number: 114-00065+A0
```
system controller flash-cache commands

The flash-cache directory

system controller flash-cache show

Display the Flash Cache device status

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system controller flash-cache show command displays the current Flash Cache device information.

Parameters

[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

[-instance ]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-node <nodename> | local] - Node
If this parameter is specified, only status information for the matching node is displayed.

[-slot <integer>] - Slot
If this parameter is specified, only status information for the matching slot is displayed.

[-subslot <integer>] - Subslot
If this parameter is specified, only status information for the matching subslot is displayed.

[-slot-string <text>] - Slot String
If this parameter is specified, only status information for the matching slot is displayed. Format can be slot or slot-subslot.

[-device-state {ok | erasing | erased | failed | removed | online | offline_failed | degraded | offline_threshold}] - Device State
If this parameter is specified, only status information for the matching device-state is displayed.

[-model-number <text>] - Model Number
If this parameter is specified, only status information for the matching model-number is displayed.

[-part-number <text>] - Part Number
If this parameter is specified, only status information for the matching part-number is displayed.

[-serial-number <text>] - Serial Number
If this parameter is specified, only status information for the matching serial-number is displayed.

[-firmware-version <text>] - Firmware Version
If this parameter is specified, only status information for the matching firmware-version is displayed.

[-hardware-revision <text>] - Hardware Revision
If this parameter is specified, only status information for the matching hardware-revision is displayed.
[-capacity <integer>] - Capacity
If this parameter is specified, only status information for the matching capacity is displayed.

[-last-change-time <integer>] - Time Last State Change
If this parameter is specified, only status information for the matching last-change-time is displayed.

[-service-time <integer>] - Service Time
If this parameter is specified, only status information for the matching service-time is displayed.

[-percent-online <integer>] - Percent Online
If this parameter is specified, only status information for the matching percent-online is displayed.

[-average-erase-cycle-count <integer>] - Avg Erase Cycle Count
If this parameter is specified, only status information for the matching average-erase-cycle-count is displayed.

[-threshold-profile <text>] - Threshold Profile
If this parameter is specified, only status information for the matching threshold-profile is displayed.

Examples
The following example displays the current state of all Flash Cache devices:

```
cluster1::> system controller flash-cache show
Model  Part      Serial               Firmware Capacity Device
Node       Slot Number Number    Number               Version      (GB) State
---------- ---- ------ --------- -------------------- -------- -------- ------
node1
6-1  X9172A 119-00209 A22P7061550000004    NA00         4096 ok
6-2  X9170A 119-00207 A22P5061550000135    NA00         1024 ok
node2
6-1  X9172A 119-00209 A22P7061550000007    NA00         4096 ok
6-2  X9170A 119-00207 A22P5061550000091    NA00         1024 ok
4 entries were displayed.
```

system controller flash-cache secure-erase commands

system controller flash-cache secure-erase run
Perform a secure-erase operation on the targeted devices

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system controller flash-cache secure-erase run command securely erases the given Flash Cache device.

Parameters
- `-node {<nodename>|local}` - Node
  Selects the node of the specified Flash Cache devices.

- `-slot <text>` - Slot
  Selects the slot or slot-subslot of the specified Flash Cache devices.

Examples
The following example securely erases the selected Flash Cache device:
**system controller flash-cache secure-erase show**

Display the Flash Cache card status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The `system controller flash-cache secure-erase show` command displays the current Flash Cache device secure-erase status.

**Parameters**

`[-fields <fieldname>, ...]`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

`[-instance ]`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-node {<nodename>|local}] - Node`

If this parameter is specified, only status information for the matching node is displayed.

`[-slot <text>] - Slot`

If this parameter is specified, only status information for the matching slot is displayed. Slot can have a format of slot or slot-subslot.

`[-device-state {ok|erasing|erased|failed|removed}] - Device State`

If this parameter is specified, only status information for the matching device-state is displayed.

**Examples**

The following example displays the current state of all the Flash Cache devices:

```
cluster1::> system controller flash-cache secure-erase show
Node      Slot Device State
--------- ---- ------------
node1     6-1  ok
          6-2  erasing
node2     6-1  erased
          6-2  ok
4 entries were displayed.
```

**system controller fru commands**

The fru directory

**system controller fru show**

Display Information About the FRUs in the Controller

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.
Description
The `system controller fru show` command displays information about all the controller specific Field Replaceable Units (FRUs) in the cluster. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported. By default, the command displays the following information about all the FRUs in the cluster:

- Node
- FRU name
- Health monitor subsystem
- Health monitor status

To display more details, use the `-instance` parameter.

Parameters

`[-fields <fieldname>,...]`
Selects the fields that you specify.

`[-instance ]`
Displays detailed information about the controller specific FRUs in the cluster.

`[-node <nodename>|local]` - Node
Selects information about the FRUs in the specified node.

`[-subsystem <Subsystem>]` - Subsystem
Selects information about the FRUs of the specified subsystem.

`[-serial-number <text>]` - FRU Serial Number
Selects information about the FRU with the specified serial number.

`[-fru-name <text>]` - Name of the FRU
Selects information about the FRU with the specified FRU name.

`[-type {controller|psu|fan|dimm|bootmedia|ioxm|nvram|nvdimm}]` - FRU Type
Selects information about the FRU with the specified FRU type.

`[-name <text>]` - FRU Name
Selects information about the FRU with the specified unique name.

`[-state <text>]` - FRU State
Selects information about the FRU with the specified state.

`[-status {ok|ok-with-suppressed|degraded|unreachable|unknown}]` - Status
Selects information about the FRU with the specified health monitor status.

`[-display-name <text>]` - Display Name for the Fru
Selects information about the FRU with the specified display name.

`[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example}]` - Monitor Name
Selects information about the FRU with the specified health monitor type.

`[-model <text>]` - Model Type
Selects information about the FRU with the specified model.

`[-chassis-id <text>]` - Chassis ID
Selects information about the FRU with the specified chassis ID.

`[-location <text>]` - Location of the FRU
Selects information about the FRU with the specified FRU location.
Additional Information About the FRU

Selects information about the FRU with the specified additional information.

### Examples

The example below displays information about all controller specific FRUs in the cluster.

```plaintext
cluster1::> system controller fru show

<table>
<thead>
<tr>
<th>Node</th>
<th>FRU Name</th>
<th>Subsystem</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>node1</td>
<td>PSU1 FRU</td>
<td>Environment</td>
<td>ok</td>
</tr>
<tr>
<td>node1</td>
<td>PSU2 FRU</td>
<td>Environment</td>
<td>ok</td>
</tr>
<tr>
<td>node1</td>
<td>DIMM-NV1</td>
<td>Memory</td>
<td>ok</td>
</tr>
<tr>
<td>node1</td>
<td>Micron Technology 0x655 (ad.0) Motherboard</td>
<td>ok</td>
<td></td>
</tr>
<tr>
<td>node2</td>
<td>PSU1 FRU</td>
<td>Environment</td>
<td>ok</td>
</tr>
<tr>
<td>node2</td>
<td>PSU2 FRU</td>
<td>Environment</td>
<td>ok</td>
</tr>
<tr>
<td>node2</td>
<td>DIMM-NV1</td>
<td>Memory</td>
<td>ok</td>
</tr>
<tr>
<td>node2</td>
<td>Micron Technology 0x655 (ad.0) Motherboard</td>
<td>ok</td>
<td></td>
</tr>
</tbody>
</table>

10 entries were displayed.
```

The example below displays information about the specific FRU.

```plaintext
cluster1::> system controller fru show -instance -serial-number AD-01-1306-2EA01E9A

Node: node1
Subsystem: Memory
FRU Serial Number: AD-01-1306-2EA01E9A
Name of the FRU: DIMM-1
FRU Type: dimm
FRU Name: DIMM-1
FRU State: ok
Status: ok
Display Name for the Fru: DIMM-1
Monitor Name: controller
Model Type: none
Chassis ID: 4591227214
Location of the FRU: Memory Slot: 1
Additional Information About the FRU: Part No: HMT82GV7MMR4A-H9
```

### system controller fru show-manufacturing-info

Display manufacturing information of FRUs

**Availability**: This command is available to cluster administrators at the admin privilege level.

**Description**

The `system controller fru show-manufacturing-info` command displays manufacturing information for field replaceable units (FRUs) installed in the system. The information includes FRU-description, serial number, part number, and revision number. To display more details, use the `–instance` parameter.

**Parameters**

- `[-fields <fieldname>, ...]`
  - If you specify the `–fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use ‘–fields ?’ to display the fields to specify.

- `[-instance]`
  - Displays detailed information about the installed FRUs in the system.

- `[-node <nodename> | local]` - Node
  - Selects a specific node's installed FRUs.
[-system-sn <text>] - System Serial Number
   Selects information about installed FRUs with the specified system serial number.

[-model-name <text>] - Model Name
   Selects information about installed FRUs with the specified model name.

[-system-id <text>] - System ID
   Selects information about installed FRUs with the specified system ID.

[-kernel-version <text>] - Kernel Version
   Selects information about installed FRUs with the specified kernel version.

[-firmware-release <text>] - Firmware Release
   Selects information about installed FRUs with the specified firmware release.

[-description <text>] - FRU Description
   Selects information about installed FRUs with the specified FRU description.

[-fru-subtype <text>] - FRU Sub-type
   Selects information about the FRU with the specified FRU subtype.

[-serial-number <text>] - FRU Serial Number
   Selects information about the FRU with the specified serial number.

[-part-number <text>] - FRU Part Number
   Selects information about the FRU with the specified part number.

[-revision <text>] - FRU Revision of Part Number
   Selects information about the FRU with the specified revision.

[-manufacturer <text>] - FRU Manufacturer
   Selects information about the FRU with the specified manufacturer.

[-manufacture-date <text>] - FRU Manufacturing Date
   Selects information about the FRU with the specified manufacture date.

[-product-id <text>] - FRU Product Identifier
   Selects information about the FRU with the specified product ID.

[-firmware-version <text>] - FRU Firmware Version
   Selects information about the FRU with the specified firmware version.

Examples

The following example displays all installed FRUs in the system:

classroom1::> system controller fru show-manufacturing-info
   Node: platsw-lodi-1-01
   System Serial Number: 791541000047
   Model Name: FAS9040

system controller fru led commands

FRU LED Commands

system controller fru led disable-all

Turn off all the LEDs Data Ontap has lit

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

The system controller fru led disable-all command turns off all the controller and IOX M FRU fault LEDs.

A FRU (Field Replaceable Unit) is any piece of the system that is designed to be easily and safely replaced by a field technician. Both the controller and IOX M FRUs have a number of internal FRUs for which there are corresponding fault LEDs. In addition, there is a summary FRU fault LED on the external face-plate of both the controller and IOX M; labeled with a "!". A summary fault LED will be on when any of the internal FRU fault LEDs are on. Only the controller and IOX M internal FRU fault LEDs can be controlled by the end-user. The summary fault LEDs are turned on and off based on the simple policy described above. If you want to turn off the summary fault LED, you must turn off all internal FRU fault LEDs.

All FRU fault LEDs are amber in color. However, not all amber LEDs in the system are FRU fault LEDs. Externally visible fault LEDs are labeled with a "!", and internal FRU fault LEDs remain on, even when the controller or IOX M is removed from the
chassis. In addition, internal FRU fault LEDs will remain on until explicitly turned off by the end-user, even after a FRU has been replaced.

FRUs are identified by a FRU ID and slot tuple. FRU IDs include: DIMMs, cards in PCI slots, boot media devices, NV batteries and coin cell batteries. For each FRU ID, the FRUs are numbered 1 through N, where N is the number of FRUs of that particular type that exist in the controller or IOXM. Both controller and IOXM have a FRU map label for use in physically locating internal FRUs. The FRU ID/slot tuple used by the `system controller fru led show` command matches that specified on the FRU map label.

### Examples

Turn off all FRU fault LEDs.

```bash
cluster1::*> system controller fru led disable-all
14 entries were modified.
```

### system controller fru led enable-all

Light all the LEDs

**Availability:** This command is available to `cluster` administrators at the `advanced` privilege level.

**Description**

The `system controller fru led enable-all` command turns on all the controller and IOXM FRU fault LEDs.

A FRU (Field Replaceable Unit) is any piece of the system that is designed to be easily and safely replaced by a field technician.

Both the controller and IOXM FRUs have a number of internal FRUs for which there are corresponding fault LEDs. In addition, there is a summary FRU fault LED on the external face-plate of both the controller and IOXM; labeled with a "!". A summary fault LED will be on when any of the internal FRU fault LEDs are on. Only the controller and IOXM internal FRU fault LEDs can be controlled by the end-user. The summary fault LEDs are turned on and off based on the simple policy described above. If you want to turn off the summary fault LED, you must turn off all internal FRU fault LEDs.

All FRU fault LEDs are amber in color. However, not all amber LEDs in the system are FRU fault LEDs. Externally visible fault LEDs are labeled with a "!", and internal FRU fault LEDs remain on, even when the controller or IOXM is removed from the chassis. In addition, internal FRU fault LEDs will remain on until explicitly turned off by the end-user, even after a FRU has been replaced.

FRUs are identified by a FRU ID and slot tuple. FRU IDs include: DIMMs, cards in PCI slots, boot media devices, NV batteries and coin cell batteries. For each FRU ID, the FRUs are numbered 1 through N, where N is the number of FRUs of that particular type that exist in the controller or IOXM. Both controller and IOXM have a FRU map label for use in physically locating internal FRUs. The FRU ID/slot tuple used by the `system controller fru led show` command matches that specified on the FRU map label.

### Examples

Turn on all FRU fault LEDs.

```bash
cluster1::*> system controller fru led enable-all
14 entries were modified.
```
system controller fru led modify

Modify the status of FRU LEDs

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

The `system controller fru led modify` command modifies the current state of the controller and IOXM FRU fault LEDs.

A FRU (Field Replaceable Unit) is any piece of the system that is designed to be easily and safely replaced by a field technician.

Both the controller and IOXM FRUs have a number of internal FRUs for which there are corresponding fault LEDs. In addition, there is a summary FRU fault LED on the external face-plate of both the controller and IOXM; labeled with a "!". A summary fault LED will be on when any of the internal FRU fault LEDs are on. Only the controller and IOXM internal FRU fault LEDs can be controlled by the end-user. The summary fault LEDs are turned on and off based on the simple policy described above. If you want to turn off the summary fault LED, you must turn off all internal FRU fault LEDs.

All FRU fault LEDs are amber in color. However, not all amber LEDs in the system are FRU fault LEDs. Externally visible fault LEDs are labeled with a "!" and internal FRU fault LEDs remain on, even when the controller or IOXM is removed from the chassis. In addition, internal FRU fault LEDs will remain on until explicitly turned off by the end-user, even after a FRU has been replaced.

FRUs are identified by a FRU ID and slot tuple. FRU IDs include: DIMMs, cards in PCI slots, boot media devices, NV batteries and coin cell batteries. For each FRU ID, the FRUs are numbered 1 through N, where N is the number of FRUs of that particular type that exist in the controller or IOXM. Both controller and IOXM have a FRU map label for use in physically locating internal FRUs. The FRU ID/slot tuple used by the `system controller fru led show` command matches that specified on the FRU map label.

Parameters

- **-node** `<nodename>|local>` - Node
  Selects FRU fault LEDs on the specified nodes.

- **-fru-id** `<FRU LED key>` - FRU ID
  Selects the FRU fault LEDs that match the specified FRU type.

- **-fru-slot** `<integer>` - FRU Slot
  Selects the FRU fault LEDs that match the specified slot.

- **[-fru-state (on|off|unknown)]** - FRU State
  Specifies the target state for the FRU fault LED.

Examples

Turn off DIMM 3's FRU fault LED.

```
cluster1::*> system controller fru led modify -node node1 -fru-id dimm -fru-slot 3 -fru-state on
```

The example below turns on all PCI FRU fault LEDs.

```
cluster1::*> system controller fru led modify -node node1 -fru-id pci -fru-slot * -fru-state on
```
system controller fru led show

Display the status of FRU LEDs

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

The `system controller fru led show` command displays information about the current state of the controller and IOXM FRU fault LEDs.

A FRU (Field Replaceable Unit) is any piece of the system that is designed to be easily and safely replaced by a field technician. Both the controller and IOXM FRUs have a number of internal FRUs for which there are corresponding fault LEDs. In addition, there is a summary FRU fault LED on the external face-plate of both the controller and IOXM; labeled with a "!". A summary fault LED will be on when any of the internal FRU fault LEDs are on.

All FRU fault LEDs are amber in color. However, not all amber LEDs in the system are FRU fault LEDs. Externally visible fault LEDs are labeled with a "!", and internal FRU fault LEDs remain on, even when the controller or IOXM is removed from the chassis.

FRUs are identified by a FRU ID and slot tuple. FRU IDs include: DIMMs, cards in PCI slots, boot media devices, NV batteries and coin cell batteries. For each FRU ID, the FRUs are numbered 1 through N, where N is the number of FRUs of that particular type that exist in the controller or IOXM. Both controller and IOXM have a FRU map label for use in physically locating internal FRUs. The FRU ID/slot tuple used by the `system controller fru led show` command matches that specified on the FRU map label.

Parameters

```markdown
[-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

[-instance]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node [<nodename>|local]] - Node

Selects FRU fault LEDs on the specified nodes.

[-fru-id <FRU LED key>] - FRU ID

Selects the FRU fault LEDs that match the specified FRU type.

[-fru-slot <integer>] - FRU Slot

Selects the FRU fault LEDs that match the specified slot.

[-fru-bay <text>] - FRU Bay

Selects the FRU fault LEDs that match the specified bay.

[-fru-state {on|off|unknown}] - FRU State

Selects the FRU fault LEDs that match the specified status.

[-lit-by <text>] - Lit By

Selects the FRU fault LEDs that were lit by the specified source.
```

Examples

List the current state of all FRU fault LEDs.

1124

Commands: Manual Page Reference
The example below displays the status of only a specific FRU.

```
class> system controller fru led show -node host1 -fru-id controller -fru-slot 1
```

```
class> system controller fru led show -node host1 -fru-id controller -fru-slot 1
```

### system controller ioxm commands

The ioxm directory

### system controller ioxm show

Displays IOXM Device Health Status

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

The `system controller ioxm show` command displays the details of the IO expansion modules (IOXMs) that are connected to the nodes in a cluster. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported. By default, the command displays the following information about the IOXMs:

- Node name
- Display name
- Is IOXM present?
- Power status
- Health monitor status

To display more details, use the -instance parameter.

**Parameters**

```
[-fields <fieldname>,...]
```

Selects the fields that you specify.
[-instance]
Displays detailed information for all the IOXMs.

[-node {<nodename> | local}] - Node
Selects the IOXMs that is connected to the specified node.

[-chassis-config {c-i | c-c | c-b}] - Controller-IOXM or Controller-Controller or Controller-Blank
Selects the IOXMs with the specified chassis configuration.

[-is-present {present | not-present}] - IOXM Presence
Selects the IOXMs that are connected and detected (present) or connected but not detected (not-present).

[-power {good | bad}] - Power to IOXM
Selects the IOXMs with the specified power state.

[-display-name <text>] - Display Name
Selects the IOXMs with the specified display name.

[-unique-name <text>] - Unique Name
Selects the IOXM with the specified unique name.

[-monitor {node-connect | system-connect | system | controller | chassis | cluster-switch | example}] - Health Monitor Name
Selects the IOXMs with the specified health monitor.

[-status {ok | ok-with-suppressed | degraded | unreachable | unknown}] - IOXM Health
Selects the IOXMs with the specified health monitor status.

**Examples**

The example below displays the information of all the IOXMs that are connected to the nodes in a cluster.

```
cluster1::> system controller ioxm show

<table>
<thead>
<tr>
<th>Node</th>
<th>Display Name</th>
<th>Is-Present?</th>
<th>Power</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>node1</td>
<td>IOXM</td>
<td>present</td>
<td>good</td>
<td>ok</td>
</tr>
<tr>
<td>node2</td>
<td>IOXM</td>
<td>present</td>
<td>good</td>
<td>ok</td>
</tr>
</tbody>
</table>
```

The example below displays detailed information of an IOXM that is connected to a node.

```
cluster1::> system controller ioxm show -instance -node node1

Node: node1
Controller-IOXM or Controller-Controller or Controller-Blank: c-i
IOXM Presence: present
Power to IOXM: good
Display Name: node1/IOXM
Unique Name: 8006459930
Health Monitor Name: controller
IOXM Health: ok
```

**system controller location-led commands**

The location-led directory

**system controller location-led modify**

Modify the location LED state of a controller

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.
Description
The `system controller location-led modify` command modifies the current state of the location LED. When lit, the location LED can help you find the controller in the data center.

There is a blue location LED on every controller and on the front of the chassis. When you turn on the location LED for either controller, the chassis location LED automatically turns on. When both controller location LEDs are off, the chassis location LED automatically turns off.

After the location LED is turned on, it stays illuminated for 30 minutes and then automatically shuts off.

Parameters

`-node {<nodename>|local} - Node`
Selects the location LED on the specified filers.

`[-state {on|off}] - LED State`
Modifies the state of the location LED on the filer.

Examples

The following example turns on the location LED:

```
cluster1:*> system controller location-led modify -node node1 -state on
```

Turn off Location LED.

```
cluster1:*> system controller location-led modify -node node1 -state off
```

system controller location-led show

Display the location LED state on controllers

Availability: This command is available to `cluster` administrators at the `admin` privilege level.

Description
The `system controller location-led show` command shows the current state of the location LED. When lit, the location LED can help you find the controller in the data center.

There is a blue location LED on every controller and on the front of the chassis. When you turn on the location LED for either controller, the chassis location LED automatically turns on. When both controller location LEDs are off, the chassis location LED automatically turns off.

After the location LED is turned on, it stays illuminated for 30 minutes and then automatically shuts off.

Parameters

`{ [-fields <fieldname>,...]
If you specify the `-fields <fieldname>,...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

`[-instance ]`
If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-node {<nodename>|local}] - Node`
Selects the location LED on the specified filers.

`[-state {on|off}] - LED State`
Displays the location LED's status.
Examples
The following example lists the current state of the location LED:

```
cluster1::*> system controller location-led show
Node            Location LED State
--------------  -------------------
nodel           Off
node2           Off
```

system controller memory commands
The memory directory

system controller memory dimm commands
The dimm directory

system controller memory dimm show
Display the Memory DIMM Table

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system controller memory dimm show command displays information about the DIMMs in all the nodes in the cluster. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported. By default, the command displays the following information about all the DIMMs in the cluster:

- Node
- DIMM name
- Uncorrectable ECC error count
- Correctable ECC error count
- CPU socket
- Channel
- Slot number
- Health monitor status

To display more details, use the -instance parameter.

Parameters

`{ [-fields <fieldname>,...]`  
Selects the fields that you specify.

`[-instance ]}`  
Displays detailed information about the DIMMs in all the controllers in the cluster.

`[-node <nodename> | local] - Node`  
Selects information about the DIMMs in the specified node.

`[-pds-id <integer>] - DIMM ID`  
Selects information about the DIMMs with the specified DIMM ID.
[-slotname <text>] - Slot Name
Selects information about the DIMMs with the specified slot name.

[-socket <integer>] - CPU Socket
Selects information about the DIMMs with the specified socket ID.

[-channel <integer>] - Channel
Selects information about the DIMMs with the specified channel number.

[-slot-no <integer>] - Slot Number on a Channel
Selects information about the DIMMs with the specified slot number.

[-serial <text>] - Serial Number
Selects information about the DIMMs with the specified serial number.

[-part-no <text>] - Part Number
Selects information about the DIMMs with the specified part number.

[-cecc-count <integer>] - Correctable ECC Error Count
Selects information about the DIMMs with the specified correctable ECC error count.

[-uecc-count <integer>] - Uncorrectable ECC Error Count
Selects information about the DIMMs with the specified uncorrectable ECC error count.

[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example}] - Health Monitor Name
Selects information about the DIMMs with the specified health monitor.

[-status {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status
Selects information about the DIMMs with the specified health monitor status.

[-name <text>] - Unique Name of DIMM
Selects information about the DIMMs with the specified unique name.

[-display-name <text>] - Display Name for the DIMM
Selects information about the DIMMs with the specified display name.

Examples
The example below displays information about the DIMMs in all the nodes in the cluster.

```
cluster1::> system controller memory dimm show
    Node   DIMM Name  UECC Count CECC Count CPU Socket Channel Slot Number Status
    node1  DIMM-1    0        0        0        0       0  ok
    node1  DIMM-NV1  0        0        1        1       1  ok
    node2  DIMM-1    1        0        0        0       0  ok
    node3  DIMM-NV1  0        0        1        1       1  ok
    4 entries were displayed.
```

The example below displays detailed information about a specific DIMM in a specific controller.

```
cluster1::> system controller memory dimm show -instance -node node1 -pds-id 1
    Node: node1    DIMM ID: 1
    Slot Name: DIMM-1
    CPU Socket: 0
    Channel: 0
    Slot Number on a Channel: 0
    Serial Number: AD-01-1306-2EA01E9A
    Part Number: HMT82GV7MMR4A-H9
    Correctable ECC Error Count: 0
    Uncorrectable ECC Error Count: 0
```
system controller nvram-bb-threshold commands

The nvram-bb-threshold directory

system controller nvram-bb-threshold show

Display the controller NVRAM bad block threshold

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system controller nvram-bb-threshold show command displays the threshold for the NVRAM bad block counts for a node.

system controller pci commands

The pci directory

system controller pci show

Display the PCI Device Table

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system controller pci show command displays details of the PCI devices present in all of the nodes in a cluster. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported. By default, the command displays the following information about the PCI devices:

- Node name
- Display name
- Correctable error count
- Functional link width
- Functional link speed
- Health monitor status

To display more details, use the -instance parameter.

Parameters

{-fields <fieldname>, ...}
Selects the fields that you specify.

[-instance]
Displays detailed information for all of the PCI devices.

[-node (<nodename> | local)] - Node
Selects the PCI devices that are present in the specified node.
[-bus-number <integer>] - Bus Number
Selects the PCI devices with the specified bus number.

[-device-number <integer>] - Device Number
Selects the PCI devices with the specified device number.

[-function-number <integer>] - Function Number
Selects the PCI devices with the specified function number.

[-slot-number <integer>] - Slot Info
Selects the PCI devices with the specified slot number.

[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example}] - Health Monitor Name
Selects the PCI devices monitored by the specified health monitor.

[-vendor-id <Hex Integer>] - Vendor ID
Selects the PCI devices with the specified vendor ID.

[-device-id <Hex Integer>] - Device ID
Selects the PCI devices with the specified device ID.

[-physical-link-width <integer>] - Physical Link Width
Selects the PCI devices with the specified physical link width.

[-functional-link-width <integer>] - Functional Link Width
Selects the PCI devices with the specified functional link width.

[-physical-link-speed <text>] - Physical Link Speed(GT/s)
Selects the PCI devices with the specified physical link speed.

[-functional-link-speed <text>] - Functional Link Speed(GT/s)
Selects the PCI devices with the specified functional link speed.

[-unique-name <text>] - Unique Name
Selects the PCI devices with the specified unique name.

[-corr-err-count <integer>] - Correctable Error Count
Selects the PCI devices with the specified correctable error count.

[-health {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status
Selects the PCI devices with the specified health monitor status.

[-display-name <text>] - Display Name
Selects the PCI devices with the specified display name.

[-cerr-diff <integer>] - Correctable Error Difference
Selects the PCI devices with the specified difference in correctable error count.

Examples
The example below displays the information about the PCIe devices present in all of the nodes in the cluster.

```
cluster1::> system controller pci show
Display                  Correctable Functional Functional
Node          Name                     Error Count Link Width Link Speed Status
------------- ------------------------ ----------- ---------- ---------- ------
cluster1-01   Ontap PCI Device 0                 0          4      5GT/s ok
cluster1-02   Ontap PCI Device 4                 0          4      5GT/s ok
```

The example below displays detailed information about a PCIe device in a node.
cluster1::> system controller pcie show -instance -node cluster1-01 -bus-number 1

Node: cluster1-01
Bus Number: 1
Device Number: 0
Function Number: 0
Slot Info: 0
Health Monitor Name: controller
Vendor ID: 11f8
Device ID: 8001
Physical Link Width: 4
Functional Link Width: 4
Physical Link Speed(GT/s): 5GT/s
Functional Link Speed(GT/s): 5GT/s
Unique Name: ontap0@pci0:1:0:0
Correctable Error Count: 0
Status: ok
Display Name: Ontap PCI Device 0
Correctable Error Difference: 0

system controller pcicerr commands
The pcicerr directory

system controller pcicerr threshold commands
The threshold directory

system controller pcicerr threshold modify
Modify the Node PCIe error alert threshold
Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The system controller pcicerr threshold modify command modifies node-wide PCIe correctable error threshold counts in the cluster.

Parameters
   The PCIe error threshold count that would trigger an alert if exceeded.
[-nvram-bb-threshold <integer>] - NVRAM Bad Block limit
   The NVRAM bad block threshold count that would trigger an alert if exceeded.

Examples
The example below displays the information about setting node-wide PCIe error threshold count in the cluster:

cluster1::> system controller threshold modify -pcie-cerr-threshold 100

system controller pcicerr threshold show
Display the Node PCIe error alert threshold
Availability: This command is available to cluster administrators at the admin privilege level.
Description
The `system controller pcicerr threshold show` command displays information about node-wide PCIe correctable error threshold counts in the cluster.

Examples
The example below displays the information about node-wide PCIe error threshold count in the cluster:

```bash
cluster1::> system controller pcicerr threshold show
PCIe Error Threshold
-----------------------
                        200
```

**system controller platform-capability commands**
The platform-capability directory

**system controller platform-capability show**
Display platform capabilities

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**
The `system controller platform-capability show` command displays information about all platform capabilities for each controller in the cluster. By default, the command displays the following information about all controllers in the cluster:

- Controller Name
- Capability ID
- Capability Supported?
- Capability Name

**Parameters**

```bash
{-fields <fieldname>, ...}
```
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```bash
{-instance}
```
Displays detailed information about all controllers in the cluster.

```bash
{-node <nodename> | local} - Node
```
Selects information about the specified controller.

```bash
{-capability-id <integer>} - Capability ID
```
Selects the desired capability ID.

```bash
{-supported <text>} - Supported?
```
Selects the desired capability support state (true or false).

```bash
{-name <text>} - Capability Name
```
Selects the desired capability name.
Examples

The following example displays platform capability information for the controller:

```
cluster1::> system controller platform-capability show
```

<table>
<thead>
<tr>
<th>Node</th>
<th>Capability ID</th>
<th>Supported?</th>
<th>Capability Name</th>
</tr>

7 entries were displayed.

system controller service-event commands

The service-event directory

system controller service-event delete

Manually clear a selected service event

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The system controller service-event delete command removes the service event from the list and extinguishes all related FRU attention LEDs.

In some cases, where the underlying fault condition remains, the service event might be reported again, causing it to reappear in the list. In such cases, it is necessary to remedy the underlying fault condition in order to clear the service event.

Parameters

- `-node {<nodename>|local}` - Node
  Selects service events on the specified nodes.

- `-event-id <integer>` - Service Event ID
  Selects the service events that match the specified event identifier. Together with the node, this field uniquely identifies the row to delete. Use the system controller service-event show command to find the event identifier for the service event to delete.

Examples

The following example lists the currently active service events. Then, using the listed Service Event ID, the service event is deleted:

```
cluster1::> system controller service-event show
```

<table>
<thead>
<tr>
<th>Node</th>
<th>ID</th>
<th>Event Location</th>
<th>Event Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>plata4-la</td>
<td>1</td>
<td>DIMM in slot 1 on Controller A</td>
<td>Uncorrectable ECC</td>
</tr>
</tbody>
</table>

```
cluster1::> system controller service-event delete -event-id 1
```

*system controller service-event show* on page 1135

**system controller service-event show**

Display the active service events causing attention LEDs to be lit

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The *system controller service-event show* command displays one or more events that have been detected by the system for which a physical service action might be required. Physical service actions sometimes involve replacing or re-seating misbehaving FRUs. In such cases FRU attention LEDs will be illuminated to assist in physically locating the FRU in need of attention. When the FRU in question is contained within another FRU, both the inner and outer FRU attention LEDs will be lit. It creates a path of LEDs that starts at the chassis level and leads to the FRU in question. For example, if a DIMM is missing from the controller motherboard, the storage OS will detect this and log a service event whose location is the DIMM slot on the controller. The DIMM slot LED, controller LED and chassis LED will all be lit to create a path of LEDs to follow.

FRU Attention LEDs that are not visible from outside of the system (e.g. those on the controller motherboard such as DIMMs, boot device etc.) will remain on for a few minutes, even after power is removed from the containing FRU. As such, when the controller is removed from the chassis, a DIMM slot FRU attention LED will remain on, helping to locate the FRU in need of attention.

Generally, service events are cleared automatically when the issue is resolved. The corresponding FRU attention LEDs are extinguished accordingly. In cases where the service event request is caused by an environmental issue, it might be necessary to manually remove the service event from the list. This can be done using the *system controller service-event delete* command.

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[[-instance]]
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[-node {<nodename>|local}] - Node
```

Selects service events on the specified nodes.

```
[-event-id <integer>] - Service Event ID
```

Selects the service events that match the specified event identifier. Together with the node, this field uniquely identifies the row for use with the *system controller service-event delete* command.

```
[-event-loc <text>] - Location
```

Selects the service events that match the specified event location.

```
[-event-desc <text>] - Description
```

Selects the service events that match the specified event description.

```
[-event-timestamp <text>] - Timestamp
```

The time that the event occurred, recorded by the Service Processor

---

**Examples**

The following example lists the currently active service events.
cluster1::> system controller service-event show

<table>
<thead>
<tr>
<th>Node</th>
<th>ID</th>
<th>Event Location</th>
<th>Event Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>plata4-1a</td>
<td>1</td>
<td>DIMM in slot 1 on Controller A</td>
<td>Uncorrectable ECC</td>

system controller sp commands

The sp directory

system controller sp config commands

The config directory

system controller sp config show

Display the Service Processor Config Table

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system controller sp config show command displays the following configuration information of the service processor for all nodes in the cluster:

- Node name
- Service processor status
- Service processor firmware version
- Booted firmware version
- Service processor configuration status
- Physical Ethernet link status of service processor
- Health monitor status

To display more details, use the -instance parameter. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported.

Parameters

[-fields <fieldname>, ...]
  Selects the field that you specify.

[-instance]
  Displays detailed configuration information of the service processor.

[-node {<nodename> | local}] - Node
  Use this parameter to list the service processor configuration of the specific node.

[-version <text>] - Firmware Version
  Selects the service processor configuration with the specified firmware version.
[-boot-version {primary|backup}] - Booted Version
Selects the service processor configuration with the specified version of the currently booted partition.

[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example}] - Health Monitor Name
Selects the service processor configuration with the specified monitor name.

[-sp-status {online|offline|sp-daemon-offline|node-offline|degraded|rebooting|unknown|updating}] - SP Status
Selects the service processor configuration with the specified status of service processor.

[-sp-config {true|false}] - Auto Update Configured
Selects information about the service processor with the specified configuration status of the service processor.

[-status {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status
Selects information about the service processor with the specified service processor status.

[-link-status {up|down|disabled|unknown}] - Public Link Status
Selects the service processor configuration with the specified physical ethernet link status.

[-name <text>] - Display Name
Selects the service processor configuration with the specified unique name.

**Examples**

The example below displays configuration of the service processor in all the nodes in the cluster:

```
cluster1::> system controller sp config show

Firmware   Booted    Auto Update  SP       Link
Node  Version    Version   Configured   Status   Status    Status
----  --------   --------- ------------ -------- --------- ------
node1  2.2.2     primary   true         online   up        ok
node2  2.2.2     primary   true         online   up        ok
```

The example below displays configuration of the service processor of a particular node in detail:

```
cluster1::> system controller sp config show -instance -node node1

Node: node1
  Firmware Version: 2.2.2
  Booted Version: primary
  Health Monitor Name: controller
  SP Status: online
  Auto Update Configured: true
  Status: ok
  Public Link Status: up
  Display Name: SP Config
```

**system controller sp upgrade commands**

The upgrade directory

**system controller sp upgrade show**

Display the Service Processor Upgrade Table

**Availability:** This command is available to cluster administrators at the admin privilege level.
Description
The `system controller sp upgrade show` command displays the following information about the service processor firmware of all the nodes in the cluster:

- Node name
- Is new firmware available?
- Is autoupdate enabled?
- Status of autoupdate
- Health monitor status

To display more details, use the `-instance` parameter. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported.

Parameters

```
[-fields <fieldname>,...]
   Selects the fields that you specify.

[-instance]
   Displays detailed upgrade information of the service processor.

[-node {<nodename>|local}] - Node
   Use this parameter to list the upgrade information of the service processor on the specified node.

[-new-fw-avail {true|false}] - New Firmware Available
   Selects the information of the service processors which have new firmware available.

[-new-fw-version <text>] - New Firmware Version
   Selects the information about service processors with the specified firmware version.

[-auto-update {true|false}] - Auto Update
   Selects the information about service processors with the specified state.

[-auto-update-stat {installed|corrupt|updating|auto-updating|none}] - Auto Update Status
   Selects the information about service processors with the specified auto update status.

   Selects the information about service processors with the specified start time.

   Selects the information about service processors with the specified end time.

[-auto-update-per <integer>] - Auto Update Percent Done
   Selects the information about service processors with the specified auto update percentage completed.

[-auto-update-maxret <integer>] - Auto Update Maximum Retries
   Selects the information about service processors with the specified maximum number of retries.

[-auto-update-curret <integer>] - Auto Update Current Retries
   Selects the information about service processors with the specified number of current retries.

[-auto-update-prevstat {failed|passed}] - Previous AutoUpdate Status
   Selects the information about service processors with the specified automatic update status.

[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example}] - Health Monitor Name
   Selects the information about service processors with the specified monitor name.
```
- **status {ok|ok-with-suppressed|degraded|unreachable|unknown}** - Status
  Selects the information about service processors with the specified health monitor status.

- **-name <text>** - Display Name
  Selects the information about service processors with the specified display name.

### Examples

The example below displays service processor upgrade information for all nodes in the cluster:

```
cluster1::> system controller sp upgrade show
New Firmware Available Auto Update Auto Update
Node: ------------ Feature Status Status
----: -------- -------------- -------- -------
node1 false true installed ok
node2 false true installed ok
2 entries were displayed.
```

The example below displays the detailed service processor upgrade information for a specific node:

```
cluster1::> system controller sp upgrade show -instance -node node1
Node: node1
    New Firmware Available: false
    New Firmware Version: Not Applicable
    Auto Update: true
    Auto Update Status: installed
    Auto Update Start Time: Thu Oct 20 20:06:03 2012 Etc/UTC
    Auto Update End Time: Thu Oct 20 20:09:19 2012 Etc/UTC
    Auto Update Percent Done: 0
    Auto Update Maximum Retries: 5
    Auto Update Current Retries: 0
    Previous AutoUpdate Status: passed
    Health Monitor Name: controller
    Status: ok
    Display Name: SP Upgrade
```

### system feature-usage commands

Display feature information

### system feature-usage show-history

Display Feature Usage History

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
Display feature usage information in the cluster on a per-node and per-week basis.

**Parameters**

{ [-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

  [-instance ]
  If you specify the -instance parameter, the command displays detailed information about all fields.}
[ -node <nodename>|local] - Node
Displays feature usage information for the specified node name.

[-serial-number <Node Serial Number>] - Node Serial Number
Displays feature usage information for the specified serial number.

[-feature-name <Managed Feature>] - Feature Name
Displays feature usage information for the specified feature name.

[-week-number <Sequence Number>] - Week Number
Displays feature usage information for the specified week number.

[-usage-status {not-used|configured|in-use|not-available}] - Usage Status
Displays feature usage information that matches the specified usage status.

[-date-collected <MM/DD/YYYY HH:MM:SS>] - Collection Date
Displays feature usage information that is collected on the day matching the specified date.

[-owner <text>] - Owner
Displays feature usage information for the specified owner name.

[-feature-message <text>] - Feature Message
Displays feature usage information that contains the specified feature message.

**Examples**

The following example displays a usage output filtered by the serial number and feature name:

```
cluster1::> system feature-usage show-history -serial-number 1-81-0000000000000001122334455 -
feature-name NFS
Node Serial Number: 1-81-0000000000000001122334455
Feature Name: NFS
Owner: node1
Week # Usage Status      Date Collected       Feature Message
------ ----------------- -------------------- --------------------------
4 in-use            01/22/13 10:00:00
3 in-use            01/15/13 10:00:00
2 not-used          01/08/13 10:00:00
1 configured        01/01/13 10:00:00
```

4 entries were displayed.

**system feature-usage show-summary**

Display Feature Usage Summary

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

Display usage summary information about features in the cluster on a per-node basis. The summary information includes counter information such as the number of weeks the feature was in use and the last date and time the feature was used. Additional information can also be displayed by using the -instance parameter.

**Parameters**

```
[[ -fields <fieldname>, ...] 
   If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

| [-instance ]] 
   If you specify the -instance parameter, the command displays detailed information about all fields.
```
system fru-check commands

The fru-check directory

**system fru-check show**

Display Information About the FRUs in the Controller

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

The system fru-check show command checks and displays the results of quick diagnostic tests done for certain FRUs of each controller in the cluster. The tests are not intended to be exhaustive, but simply to do a quick check of certain FRUs especially after replacement.
Parameters

{-fields <fieldname>,...}
Selects the fields that have the specified name.

[-instance ]
Selects detailed information (if available) for all the FRUs.

[-node {<nodename>|local}] - Node
Selects the FRUs that belong to the node that has the specified name.

[-serial-number <text>] - FRU Serial Number
Selects the FRU matching the specified serial number.

[-fru-name <text>] - FRU Name
Selects the FRU matching the specified fru-name.

[-ftype {controller|dimm|bootmedia|nvram|nvdimm}] - FRU Type
Selects the FRUs of the specified type.

[-fru-status {pass|fail|unknown}] - Status
Selects the FRUs whose FRU check status matches that specified. "pass" indicates the FRU is operational. "fail" indicates the FRU is not operating correctly. "unknown" indicates a failure to obtain FRU information during the check.

[-display-name <text>] - Display Name
Selects the FRU matching the specified display name.

[-location <text>] - Location
Selects the FRUs whose location matches that specified. Example: Memory Slot: 1

[-additional-info <text>] - Additional Info
Selects the FRUs whose additional information matches that specified. Example: Part No: 69003140-I00-NTA-T

[-reason <text>] - Details
Selects the FRUs whose failure reason matches that specified.

system ha commands

The ha directory

High-Availability interconnect device nic reset

Manage high-availability interconnect

The system ha interconnect status directory displays the interconnect device nic reset configuration information.

High-Availability interconnect device status information

The status directory

The system ha interconnect status directory displays the interconnect device status information. At instance level, these commands displays detailed information about the interconnect device.
system ha interconnect status show

Display the high-availability interconnect connection status

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The system ha interconnect status show command displays the high-availability interconnect connection status. Connection status information displayed by this command varies by controller model. For nodes with two HA interconnect links over the backplane or connected externally, this command displays the following information:

- Node
- Link status on the first port
- Link status on the second port
- Is the link on first port active?
- Is the link on second port active?
- Interconnect RDMA status

For nodes with a single HA interconnect link, this command displays following the information:

- Node
- Link status
- Interconnect RDMA status

Running the command with the -instance or -node parameter displays detailed information about the interconnect device and its ports.

Parameters

[[-fields <fieldname>,...]]
If you specify the -fields <fieldname>,... parameter, the command displays only the fields that you specify.

[[-instance]]
Use this parameter to display all the fields for the specified node or all the nodes.

[-node {<nodename>|local}] - Node
Use this parameter to display all the fields for the specified node.

[-link-status {up|down}] - Link Status
Selects the nodes that match this parameter value. The value up means link is online.

[-link0-status {up|down}] - Link 0 Status
Selects the nodes that match this parameter value. The value up means link is online.

[-link1-status {up|down}] - Link 1 Status
Selects the nodes that match this parameter value. The value up means link is online.

[-ic-rdma {up|down}] - IC RDMA Connection
Selects the nodes that match this parameter value. The value up means active interconnect connection with its partner.
- **is-link0-active** (true/false) - Is Link 0 Active
  Selects the nodes that match this parameter value. The value `true` means the interconnect data channels are established on this link.

- **is-link1-active** (true/false) - Is Link 1 Active
  Selects the nodes that match this parameter value. The value `true` means the interconnect data channels are established on this link.

- **slot** (<integer>) - Slot Number
  Selects the nodes that match this PCI slot number.

- **driver-name** (<text>) - Driver Name
  Selects the nodes that match this interconnect device driver name.

- **firmware** (<text>) - Firmware Revision
  Selects the nodes that match this firmware version.

- **version** (<text>) - Version Number
  Selects the nodes that match this parameter value.

- **device-type** (<text>) - Device Type
  Selects the nodes that match this interconnect device type.

- **serial-number** (<text>) - Serial Number
  Selects the nodes that match this interconnect device serial number.

- **debug-firmware** (yes/no) - Debug Firmware
  Selects the nodes that match this parameter value.

- **command-revision** (<integer>) - Command Revision
  Selects the nodes that match this interconnect device command revision.

- **hardware-revision** (<integer>) - Hardware Revision
  Selects the nodes that match this interconnect device hardware revision.

- **port1** (<integer>) - Port Number 1
  Selects the nodes that match this parameter value.

- **port1-port-name** (<text>) - Port Name
  Selects the nodes that match this port name.

- **port1-gid** (<text>) - Global Identifier
  Selects the nodes that match this global identifier value.

- **port1-base-lid** (<text>) - Base Local Identifier
  Selects the nodes that match this base local identifier value.

- **port1-rm-lid** (<text>) - Remote Local Identifier
  Selects the nodes that match this remote local identifier value.

- **port1-mtu** (<integer>) - Maximum Transmission Unit
  Selects the nodes that match this parameter value.

- **port1-data-rate** (<text>) - Data Rate
  Selects the nodes that match this parameter value.

- **port1-link-info** (<text>) - Link Information
  Selects the nodes that match this parameter value.

- **port1-qsfp-vendor** (<text>) - QSFP Vendor
  Selects the nodes that match this QSFP (Quad Small Form-factor Pluggable) vendor name.
[-port1-qsfp-part-number <text>] - QSFP Part Number
Selects the nodes that match this QSFP (Quad Small Form-factor Pluggable) part-number.

[-port1-qsfp-type <text>] - QSFP Type
Selects the nodes that match this QSFP (Quad Small Form-factor Pluggable) type.

[-port1-qsfp-serial-number <text>] - QSFP Serial Number
Selects the nodes that match this QSFP (Quad Small Form-factor Pluggable) serial number.

[-port2 <integer>] - Port Number 2
Selects the nodes that match this parameter value.

[-port2-port-name <text>] - Port Name
Selects the nodes that match this port name.

[-port2-gid <text>] - Global Identifier
Selects the nodes that match this global identifier value.

[-port2-base-lid <text>] - Base Local Identifier
Selects the nodes that match this base local identifier value.

[-port2-rm-lid <text>] - Remote Local Identifier
Selects the nodes that match this remote local identifier value.

[-port2-mtu <integer>] - Maximum Transmission Unit
Selects the nodes that match this parameter value.

[-port2-data-rate <text>] - Data Rate
Selects the nodes that match this parameter value.

[-port2-link-info <text>] - Link Information
Selects the nodes that match this parameter value.

[-port2-qsfp-vendor <text>] - QSFP Vendor
Selects the nodes that match this QSFP (Quad Small Form-factor Pluggable) vendor name.

[-port2-qsfp-part-number <text>] - QSFP Part Number
Selects the nodes that match this QSFP (Quad Small Form-factor Pluggable) part number.

[-port2-qsfp-type <text>] - QSFP Type
Selects the nodes that match this QSFP (Quad Small Form-factor Pluggable) type.

[-port2-qsfp-serial-number <text>] - QSFP Serial Number
Selects the nodes that match this QSFP (Quad Small Form-factor Pluggable) serial number.

**Examples**

The following example displays status information about the HA interconnect connection on FAS8000 series nodes with two HA interconnect links in the cluster:

```
cluster1::*> system ha interconnect status show

    Node: ic-f8040-01
    Link 0 Status: up
    Link 1 Status: up
    Is Link 0 Active: true
    Is Link 1 Active: false
    IC RDMA Connection: up

    Node: ic-f8040-02
    Link 0 Status: up
    Link 1 Status: up
    Is Link 0 Active: true
```

system ha commands
Is Link 1 Active: false
IC RDMA Connection: up
2 entries were displayed.

The following example displays status information about the HA interconnect connection on FAS2500 series nodes with a single HA interconnect link in the cluster:

```
cluster1:*> system ha interconnect status show
    Node: ic-f2554-01
    Link Status: up
    IC RDMA Connection: up
    Node: ic-f2554-02
    Link Status: up
    IC RDMA Connection: up
2 entries were displayed.
```

The following example displays detailed information about the HA interconnect link when parameters like `-instance`, `-node` are used with the `system ha interconnect status show` command:

```
cluster1:*> system ha interconnect status show -instance -node ic-f8040-01
    Node: ic-f8040-01
    Link 0 Status: up
    Link 1 Status: up
    Is Link 0 Active: true
    Is Link 1 Active: false
    IC RDMA Connection: up
    Slot: 0
    Driver Name: IB Host Adapter i0 (Mellanox ConnectX MT27518 rev. 0)
    Firmware: 2.11.534
    Debug Firmware: no
    Interconnect Port 0 :
      Port Name: ib0a
      GID: fe80:0000:0000:0000:00a0:9800:0030:33ec
      Base LID: 0x3ec
      MTU: 4096
      Data Rate: 40 Gb/s (4X) QDR
      Link Information: ACTIVE
    Interconnect Port 1 :
      Port Name: ib0b
      GID: fe80:0000:0000:0000:00a0:9800:0030:33ed
      Base LID: 0x3ed
      MTU: 4096
      Data Rate: 40 Gb/s (4X) QDR
      Link Information: ACTIVE
```

### High-Availability interconnect basic configuration information

The config directory

The `system ha interconnect config` directory displays the interconnect device basic configuration information.

### System ha interconnect config show

Display the high-availability interconnect configuration information

**Availability:** This command is available to `cluster` administrators at the `advanced` privilege level.
Description
The system ha interconnect config show command displays the high-availability interconnect device basic
configuration information.
Parameters
{ [-fields <fieldname>, ...]
If you specify the -fields <fieldname>,... parameter, the command displays only the fields that you
specify.
| [-instance ]}
Use this parameter to display all the fields from all nodes in cluster.
[-node {<nodename>|local}] - Node
Use this parameter to display all the fields from the specified node in the cluster.
[-transport <text>] - Interconnect Type
Selects the nodes that match this HA interconnect transport type.
[-local-sysid <integer>] - Local System ID
Selects the nodes that match this local system unique identifier.
[-partner-sysid <integer>] - Partner System ID
Selects the nodes that match this partner system unique identifier.
[-initiator {local|partner}] - Connection Initiator
Selects the nodes that match this parameter value. The value is the initiator of the connection request.
[-port-name <text>, ...] - Port
Selects the nodes that match this port name.
[-ipaddress <text>, ...] - IP Address
Selects the nodes that match this IP address.
[-interface {backplane|external}] - Interface
Selects the nodes that match this parameter value. external means the HA interconnect links between
partner nodes are connected externally. backplane means the HA interconnect links between partner nodes
are connected over the backplane.
Examples
The following example displays the HA interconnect configuration information on FAS8000 series nodes in the cluster:
cluster1::*> system ha interconnect config show

High-Availability interconnect device link operation

The link directory
The system ha interconnect link directory toggles the interconnect links.

system ha interconnect link off

Turn off the interconnect link

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The system ha interconnect link off command turns off the specified link on the high-availability interconnect device. For the nodes in the cluster with two external high-availability interconnect links, you must specify the link number (0-based) to turn off the specified link. For the nodes in the cluster with interconnect links over the backplane, you must specify the link number 1 to turn off the link.

Parameters
- **-node <nodename>** - Node
  This mandatory parameter specifies the node on which the interconnect link is to be turned off. The value "local" specifies the current node.
- **-link {0|1}** - Link
  This mandatory parameter specifies the interconnect link number (0-based) to turn off.
**Examples**
The following example displays output of the command on the nodes with a single interconnect link or nodes with interconnect links over the backplane:

```
cluster1::*> system ha interconnect link off -node ic-f3250-02 -link 0
Error: command failed: Invalid link value 0. Specify 1.
cluster1::*> system ha interconnect link off -node ic-f3250-02 -link 1
```

The following example displays output of the command on the nodes with two interconnect links connected externally:

```
cluster1::*> system ha interconnect link off -node ic-f3250-02 -link 0
cluster1::*> system ha interconnect link off -node ic-f3250-02 -link 1
```

---

**system ha interconnect link on**

Turn on the interconnect link

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**
The `system ha interconnect link on` command turns on the specified link on the high-availability interconnect device. For the nodes in the cluster with two external high-availability interconnect links, you must specify the link number (0-based) to turn on the specified link. For the nodes in the cluster with interconnect links over the backplane, you must specify the link number 1 to turn on the link.

**Parameters**
- `-node <nodename>` - *Node*
  - This mandatory parameter specifies the node on which the interconnect link is to be turned on. The value "local" specifies the current node.
- `-link {0|1}` - *Link*
  - This mandatory parameter specifies the interconnect link number (0-based) to turn on.

---

**Examples**
The following example displays output of the command on the nodes with a single interconnect link or nodes with interconnect links over the backplane:

```
cluster1::*> system ha interconnect link on -node ic-f3250-02 -link 0
Error: command failed: Invalid link value 0. Specify 1.
cluster1::*> system ha interconnect link on -node ic-f3250-02 -link 1
```

The following example displays output of the command on the nodes with two interconnect links connected externally:
High-Availability interconnect device out-of-order delivery capability configuration

The ood directory

The system ha interconnect ood directory manages the interconnect device out-of-order delivery capability configuration. These command are only supported on FAS2500 series nodes in the cluster.

system ha interconnect ood clear-error-statistics

Clear error statistics

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

The system ha interconnect ood clear-error-statistics command enables you to clear all the error statistics collected for the out-of-order delivery-capable high-availability interconnect device. This command is only supported on FAS2500 series nodes in the cluster.

Parameters

-node <nodename> - Node

This mandatory parameter specifies which node will have the error statistics cleared. The value "local" specifies the current node.

Examples

cluster1::*> system ha interconnect ood clear-error-statistics -node ic-f2554-03

system ha interconnect ood clear-performance-statistics

Clear performance statistics

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

The system ha interconnect ood clear-performance-statistics command enables you to clear all the performance statistics collected for the out-of-order delivery-capable high-availability interconnect device. This command is only supported on FAS2500 series nodes in the cluster.

Parameters

-node <nodename> - Node

This mandatory parameter specifies which node will have the performance statistics cleared. The value "local" specifies the current node.
system ha interconnect ood disable-optimization

Disable coalescing work requests

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The `system ha interconnect ood disable-optimization` command disables the optimization capability on the high-availability interconnect device. The command is only supported on FAS2500 series nodes in the cluster.

Parameters
`-node <nodename>` - Node
This mandatory parameter specifies which node will have the optimization disabled. The value "local" specifies the current node.

Examples
```
cluster1:*> system ha interconnect ood disable-optimization -node ic-f2554-03
```

system ha interconnect ood disable-statistics

Disable detailed statistics collection

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The `system ha interconnect ood disable-statistics` command disables collection of the statistics on the out-of-order delivery-capable high-availability interconnect device. This command is only supported on FAS2500 series nodes in the cluster.

Parameters
`-node <nodename>` - Node
This mandatory parameter specifies which node will have the statistics collection disabled. The value "local" specifies the current node.

Examples
```
cluster1:*> system ha interconnect ood disable-statistics -node ic-f2554-03
```
system ha interconnect ood enable-optimization

Enable coalescing work requests

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The system ha interconnect ood enable-optimization command enables you to turn on optimization (coalescing out-of-order delivery requests) on the high-availability interconnect device. This command is only supported on FAS2500 series nodes in the cluster.

Parameters
-node <nodename> - Node

This mandatory parameter specifies which node will have the optimization enabled. The value "local" specifies the current node.

Examples

cluster1::*> system ha interconnect ood enable-optimization -node ic-f2554-03

system ha interconnect ood enable-statistics

Enable detailed statistics collection

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The system ha interconnect ood enable-statistics command enables collection of the statistics on the out-of-order delivery-capable high-availability interconnect device. This command is only supported on FAS2500 series nodes in the cluster.

Parameters
-node <nodename> - Node

This mandatory parameter specifies which node will have the statistics collection enabled. The value "local" specifies the current node.

Examples

cluster1::*> system ha interconnect ood enable-statistics -node ic-f2554-03

system ha interconnect ood send-diagnostic-buffer

Send diagnostic buffer to partner

Availability: This command is available to cluster administrators at the advanced privilege level.
Description
The `system ha interconnect ood send-diagnostic-buffer` command enables you to run a short out-of-order delivery diagnostic test. The command sends a buffer to the partner controller over the high-availability interconnect. This command is only supported on FAS2500 series nodes in the cluster.

Parameters
- `-node <nodename>` - Node
  
  This mandatory parameter specifies which node will send the diagnostic buffer to its partner. The value "local" specifies the current node.

Examples
The following example demonstrates how to use this command to send a diagnostic buffer to the partner:

```
cluster1:*> system ha interconnect ood send-diagnostic-buffer -node ic-f2554-03
```

### system ha interconnect ood status commands

The status directory

Displays the high-availability interconnect device out-of-order delivery configuration information. This command is supported only on FAS2500 series nodes in the cluster.

#### system ha interconnect ood status show

Display the high-availability interconnect device out-of-order delivery (OOD) information

**Availability:** This command is available to cluster administrators at the advanced privilege level.

Description
The `system ha interconnect ood status show` command displays configuration information of the out-of-order delivery-capable high-availability interconnect devices. This command is supported only on FAS2500 series nodes in the cluster.

Parameters

```
   { [-fields <fieldname>, ...] 
     If you specify the `-fields <fieldname>, ...` parameter, the command displays only the fields that you specify. 
   | [-instance ] } 
     Use this parameter to display all the fields from all nodes in cluster. 
   [-node {<nodename> | local}] - Node 
     Use this parameter to display all the fields from the specified node in the cluster. 
   [-is-ood-enabled {true | false}] - Is OOD Enabled 
     Selects the nodes that match this parameter value. 
   [-is-coalescing-enabled {true | false}] - Is Coalescing Enabled 
     Selects the nodes that match this parameter value. 
```

Examples
The following example displays the HA interconnect device out-of-order delivery configuration information on FAS2500 series nodes in the cluster.
cluster1:~$> system ha interconnect ood status show

Node: ic-f2554-03
  NIC Used: 0
  Is OOD Enabled: true
  Is Coalescing Enabled: true

Node: ic-f2554-04
  NIC Used: 0
  Is OOD Enabled: true
  Is Coalescing Enabled: true

2 entries were displayed.

High-Availability interconnect device port information

The port directory

The system ha interconnect port directory displays the interconnect device port information.

system ha interconnect port show

Display the high-availability interconnect device port information

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

The system ha interconnect port show command displays the high-availability interconnect device port physical layer and link layer status information.

Parameters

\{-fields \<fieldname\>, ...\}

If you specify the \fields \<fieldname\>, ... parameter, the command displays only the fields that you specify.

\{-instance\}

Use this parameter to display all the fields from all nodes in the cluster.

\{-node \<nodename\>|local\} - Node

Use this parameter to display all the fields from the specified node in the cluster.

\{-link-monitor \on|off\} - Link Monitor Detection

Selects the nodes that match this parameter value.

\{-port \integer\}, ...\} - Port Number

Selects the nodes that match this parameter value.

\{-phy-layer-state \{invalid|sleep|polling|disabled|port-configuration-testing|linkup|link-error-recovery|phytest|reserved\}, ...\} - Physical Layer State

Selects the nodes that match this parameter value.

\{-link-layer-state \{invalid|down|initialize|armed|active|reserved\}, ...\} - Link Layer State

Selects the nodes that match this parameter value.

\{-phy-link-up-count \integer\}, ...\} - Physical Link Up Count

Selects the nodes that match this parameter value. The value is total number of times the link on a given port is transitioned up.
[-phy-link-down-count <integer>, ...] - Physical Link Down Count

Selects the nodes that match this parameter value. The value is total number of times the link on a given port is transitioned down.

[-is-active-link (true|false), ...] - Is the Link Active

Selects the nodes that match this parameter value. The value true means the interconnect data channels are established on this link.

### Examples

The following example displays the HA interconnect device port information on FAS8000 series nodes in the cluster:

```
cluster1:*> system ha interconnect port show

<table>
<thead>
<tr>
<th>Node</th>
<th>Link Monitor</th>
<th>Port</th>
<th>Physical Link State</th>
<th>Layer State</th>
<th>Physical Link Up</th>
<th>Physical Link Down</th>
<th>Active Link</th>
</tr>

### High-Availability interconnect device scatter-gather list statistics

The statistics directory

The `system ha interconnect statistics show-scatter-gather-list` directory displays the interconnect device scatter-gather list statistics.

### Related references

- `system ha interconnect statistics show-scatter-gather-list` on page 1156

### system ha interconnect statistics clear-port

Clear the high-availability interconnect port counters

**Availability:** This command is available to cluster administrators at the advanced privilege level.

**Description**

The `system ha interconnect statistics clear-port` command clears the high-availability interconnect device port statistics. This command is supported only on FAS2500 series and FAS8000 series nodes in the cluster.

**Note:** To display the high-availability interconnect device port statistics, use the `statistics show -object ic_hw_port_stats` command.

### Parameters

- `-node <nodename>` - Node

  Selects the nodes that match this parameter value.
Examples

```
cluster1:~> system ha interconnect statistics clear-port -node ic-f8040-01
```

**system ha interconnect statistics clear-port-symbol-error**

Clear the high-availability interconnect port symbol errors

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**

The `system ha interconnect statistics clear-port-symbol-error` command clears the high-availability interconnect device port symbol errors. This command is supported only on FAS2500 series nodes in the cluster.

**Note:** To display the high-availability interconnect device port statistics, use the `statistics show -object ic_hw_port_stats` command.

**Parameters**

- **-node <nodename>** - *Node*

  Selects the nodes that match this parameter value.

**Examples**

```
cluster1:~> system ha interconnect statistics clear-port-symbol-error -node ic-f2554-03
```

**system ha interconnect statistics show-scatter-gather-list**

Display the high-availability interconnect scatter-gather list entry statistics

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**

The `system ha interconnect statistics show-scatter-gather-list` command displays the high-availability interconnect device scatter-gather list entry statistics. Out of all possible 32 entries in a scatter-gather list, the command displays only the entries that have valid data.

**Parameters**

- **{-fields <fieldname>,...}**

  If you specify the `-fields <fieldname>,...` parameter, the command displays only the fields that you specify.

- **[-instance]**

  Use this parameter to display all the fields from all nodes in cluster.

- **[-node (<nodename>|local)]** - *Node*

  Use this parameter to display all the fields from the specified node in the cluster.

- **[-sge <integer>,...]** - *Scatter-Gather Entry*

  Selects the nodes that match this scatter-gather element index value.
[-total-count <integer>, ...] - Total Count

Selects the nodes that match this parameter value. The value is the total number of times a particular scatter-gather list element is used.

[-total-size <integer>, ...] - Total Size

Selects the nodes that match this parameter value. The value is the total number of bytes written by the high-availability interconnect device using a particular scatter-gather list element.

Examples

cluster1::*> system ha interconnect statistics show-scatter-gather-list

High-Availability interconnect device performance statistics

The performance directory

The system ha interconnect statistics performance displays the high-availability interconnect device performance statistics.

system ha interconnect statistics performance show

Display the high-availability interconnect device performance statistics

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

The system ha interconnect statistics performance show command displays the high-availability interconnect device performance statistics.

Parameters

{-fields <fieldname>, ...}

If you specify the -fields <fieldname>, ... parameter, the command displays only the fields that you specify.

{-instance}

Use this parameter to display all the fields from all nodes in cluster.
[node <nodename>|local] - Node
Use this parameter to display all the fields from the specified node in the cluster.

[elapsed <integer>] - Elapsed Time (secs)
Selects the nodes that match this parameter value. Displays the total elapsed time between statistics collection start time to end time. During the initialization stage, statistics collection starts when the partner node is up and ready. After the initialization stage, the statistics collection start time is reset after every execution of this command. This means that after the initialization stage, elapsed time represents the time between current command execution and previous command execution.

[qmax-wait <integer>] - Maximum Queue Wait Count
Selects the nodes that match this wait value. The queue maximum wait value is the total number of times the interconnect device waited to post requests on the send queue.

[qmax-wait-time <integer>] - Average Queue Wait Time (usecs)
Selects the nodes that match this average wait time value. The queue maximum wait time is the average amount of time the interconnect device waited to post requests on the send queue.

[qmax-timeout <integer>] - Maximum Queue Timeouts
Selects the nodes that match this parameter value. The queue maximum timeout value is the total number of times the interconnect device timed out waiting to post requests on the send queue.

[preempt-timeout <integer>] - Preempt Timeouts
Selects the nodes that match this parameter value. The timeout value is the total number of times polling on the given transfer ID is preempted.

[nonpreempt-timeout <integer>] - Non-Preempt Timeouts
Selects the nodes that match this parameter value. The timeout value is the total number of times polling on the given transfer ID stopped due to interconnect device read/write timeout.

[notify-timeout <integer>] - Notify Timeouts
Selects the nodes that match this parameter value. The timeout value is the total number of times data transfer on the HA interconnect timed out.

[avg-rnv-msgs-time <integer>] - Remote NV Messages Average Time (usecs)
Selects the nodes that match this parameter value. The value is the average time between remote NV messages.

[rnv-transfers <integer>] - Total Remote NV Transfers
Selects the nodes that match this parameter value. The value is the total number of remote NV transfers attempted.

[avg-rnv-transfer-size <integer>] - Remote NV Average Transfer Size
Selects the nodes that match this parameter value. The value is the average remote NV message transfer size.

[avg-rnv-transfer-time <integer>] - Remote NV Transfers Average Time (usecs)
Selects the nodes that match this parameter value. The value is the average transfer time taken by remote NV messages.

[ic-waits <integer>] - Total Count of IC waits for Given ID
Selects the nodes that match this parameter value. The value is the total number of times the interconnect device waits until the transfer of a given ID is successful.

[ic-waitdone-time <integer>] - Average IC Waitdone Time (usecs)
Selects the nodes that match this parameter value. The value is the average time the interconnect device spent waiting for the IDs to be transferred successfully.
[ic-isdone <integer>] - Total IC isdone Checks
Selects the nodes that match this parameter value. The value is the total number of times the interconnect client checked for the completion of a given transfer ID.

[ic-isdone-pass <integer>] - Total IC isdone Checks Success
Selects the nodes that match this parameter value. The value is the total number of times the check for the completion of a given transfer ID is successful.

[ic-isdone-fail <integer>] - Total IC isdone Checks Failed
Selects the nodes that match this parameter value. The value is the total number of times the check for the completion of a given transfer ID is not successful.

[ic-small-writes <integer>] - IC Small Writes
Selects the nodes that match this parameter value. The value is the total number of <4K size writes performed by the interconnect device.

[ic-4k-writes <integer>] - IC 4K Writes
Selects the nodes that match this parameter value. The value is the total number of 4K size writes performed by the interconnect device.

[ic-8k-writes <integer>] - IC 8K Writes
Selects the nodes that match this parameter value. The value is the total number of 8K size writes performed by the interconnect device.

[ic-16k-writes <integer>] - IC 16K+ Writes
Selects the nodes that match this parameter value. The value is the total number of 16K or more size writes performed by the interconnect device.

[ic-xorder-writes <integer>] - IC XORDER Writes
Selects the nodes that match this parameter value. The value is the total number of out-of-order writes performed by the interconnect device.

[ic-xorder-reads <integer>] - IC XORDER Reads
Selects the nodes that match this parameter value. The value is the total number of out-of-order reads performed by the interconnect device.

[rdma-read <integer>] - RDMA Reads Count
Selects the nodes that match this parameter value. The value is the total number of RDMA reads performed by the interconnect device.

[rdma-read-waitdone-time <integer>] - Average IC Waitdone RDMA-READ Time (usecs)
Selects the nodes that match this parameter value. The value is the average time the interconnect device spent polling for transfer IDs on the RDMA-read channel.

[avg-mbytes-second <text>] - Average MegaBytes Transferred per second
Selects the nodes that match this parameter value. The value is the average megabytes (MB) transferred per second.

[avg-bytes-transfer <integer>] - Average Bytes per Transfer
Selects the nodes that match this parameter value. The value is the average amount of bytes sent per transfer.

[total-transfers <integer>] - Total Transfers
Selects the nodes that match this parameter value. The value is the total number of transfers made through the interconnect device.

[avg-nvlog-sync-time <integer>] - Average Time for NVLOG Sync (msecs)
Selects the nodes that match this parameter value. The value is the average time taken to sync NVLOG between HA partner nodes.
[\-max-nvlog-sync-time \langle\text{integer}\rangle] - Maximum Time for NVLOG Sync (msecs)
  Selects the nodes that match this parameter value. The value is the maximum time taken to sync NVLOG between HA partner nodes.

[\-max-sgl-length \langle\text{integer}\rangle] - Maximum Scatter-Gather Elements in a List
  Selects the nodes that match this parameter value. The value is the maximum length of the scatter-gather list supported by the interconnect device.

[\-ic-recq-waits \langle\text{integer}\rangle] - Total Receive Queue Waits to Post Buffer
  Selects the nodes that match this parameter value. The value is the total number of times the interconnect device waited to post an empty buffer into the receive queue.

[\-avg-recq-wait-time \langle\text{integer}\rangle] - Average Time Receive Queue Waited (usecs)
  Selects the nodes that match this parameter value. The value is the average amount of time the interconnect device waited to post an empty buffer into the receive queue.

**Examples**

The following example displays the HA interconnect device performance statistics for FAS8000 series nodes in the cluster:

```
cluster1:~*> system ha interconnect statistics performance show
  Node: ic-f8040-01
    Elapsed Time (secs): 6

system health commands

System Health Management and Diagnosis commands

system health alert commands

The alert directory

system health alert delete

Delete system health alert

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The `system health alert delete` command deletes all the alerts on the cluster with the specified input parameters.

Parameters

- `-node <nodename>|local` - Node
  
  Use this parameter to delete alerts generated on a cluster only on the node you specify.

- `-monitor <hm_type>` - Monitor
  
  Use this parameter to delete alerts generated on a cluster only on the monitor you specify.

- `-alert-id <text>` - Alert ID
  
  Use this parameter to delete alerts generated on a cluster only on the alert ID you specify.

- `-alerting-resource <text>` - Alerting Resource
  
  Use this parameter to delete alerts generated on a cluster on the alerting resource you specify.

Examples

This example shows how to delete an alert with the specified alert-id:

```
   cluster1::> system health alert delete -alert-id DualPathToDiskShelf_Alert -alerting-resource *
```

system health alert modify

Modify system health alert

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The `system health alert modify` command suppresses alerts generated on the cluster and sets the acknowledgement state for an alert.
Parameters

- `node{<nodename>|local}` - Node
  
  Use this parameter to specify the node on which you want to change the state.

- `monitor<hm_type>` - Monitor
  
  Use this parameter to specify the monitor name on which you want to change the state.

- `alert-id<text>` - Alert ID
  
  Use this parameter to specify the alert ID on which you want to change the state.

- `alerting-resource<text>` - Alerting Resource
  
  Use this parameter to specify the alerting resource name on which you want to change the state.

- `[-acknowledge{true|false}]` - Acknowledge
  
  Use this parameter to set the acknowledgement state to true or false.

- `[-suppress{true|false}]` - Suppress
  
  Use this parameter to set the suppress state to true or false.

- `[-acknowledger<text>]` - Acknowledger
  
  Use this parameter to set the acknowledger as the filter for setting state.

- `[-suppressor<text>]` - Suppressor
  
  Use this parameter to set the suppressor as the filter for setting state.

Examples

This example modifies the alert field states on the cluster:

```
cluster1::> system health alert modify -node * -alert-id DualPathToDiskShelf_Alert -suppress true
```

**system health alert show**

View system health alerts

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

The `system health alert show` command displays information about all the alerts generated on the system. Using `-instance` will add detailed information.

**Parameters**

```
[[-fields<fieldname>,...]

Selects the fields that you specify.

| [-instance ]

Displays the following additional information about each alert:
```

- Node name
- Resource name
- Severity of the alert
- Time of alert generation
- Suppress state of the alert
- Acknowledge state of the alert
• Probable cause for the alert
• Possible effect due to the alert
• Recommended corrective actions to follow

[-node <nodename>|local] - Node
Selects the alerts generated for the specified node.

[-monitor <hm_type>] - Monitor
Selects the alerts with the specified monitor name.

[-alert-id <text>] - Alert ID
Selects the alerts with the specified alert ID.

[-alerting-resource <text>] - Alerting Resource
Selects the alerts with the specified alerting resource name.

[-subsystem <hm_subsystem>] - Subsystem
Selects the alerts generated on the monitoring subsystem.

[-indication-time <Date>] - Indication Time
Selects the alerts with the specified indicated time.

[-perceived-severity <hm_perceived_sev>] - Perceived Severity
Selects the alerts with the perceived severity level.

[-probable-cause <hm_probable_cause>] - Probable Cause
Selects the alerts that contain the specified probable cause.

[-probable-cause-description <text>] - Description
Selects the alerts containing the specified probable cause description.

[-corrective-actions <text>] - Corrective Actions
Selects the alerts with the specified recommended corrective action.

[-possible-effect <text>] - Possible Effect
Selects the alerts with the specified possible effect.

[-acknowledge {true|false}] - Acknowledge
Selects the alerts with the specified acknowledgement status.

[-suppress {true|false}] - Suppress
Selects the alerts with the specified suppressor field status of true or false.

[-policy <text>] - Policy
Selects the alerts with the specified policy name.

[-acknowledger <text>] - Acknowledger
Selects the alerts with the specified acknowledger field.

[-supressor <text>] - Suppressor
Selects the alerts with the specified suppressor field.

[-additional-info <text>,...] - Additional Information
Selects the alerts with the specified additional information.

[-alerting-resource-name <text>] - Alerting Resource Name
Selects the alerts with the specified alerting resource name.

[-tags <hm_alert_type>,...] - Additional Alert Tags
Selects the alerts with the specified keywords.
Examples
The example below displays information about all the alerts generated in the cluster:

```
cluster1::> system health alert show

Node: node1
Resource: Shelf ID 2
Severity: Major
Suppress: false
Acknowledge: false
Tags: quality-of-service, nondisruptive-upgrade
Probable Cause: Disk shelf 2 does not have two paths to controller node1.
Possible Effect: Access to disk shelf 2 via controller node1 will be lost with a single hardware component failure (e.g. cable, HBA, or IOM failure).
Corrective Actions: 1. Halt controller node1 and all controllers attached to disk shelf 2.
               2. Connect disk shelf 2 to controller node1 via two paths following the rules in the Universal SAS and ACP Cabling Guide.
               3. Reboot the halted controllers.
               4. Contact support personnel if the alert persists.
```

The example below displays additional information about a specific alert generated in the cluster:

```
cluster1::> system health alert show -monitor node-connect -alert-id DualPathToDiskShelf_Alert -instance

Node: node1
Monitor: node-connect
Alert ID: DualPathToDiskShelf_Alert
Alerting Resource: 50:05:0c:c1:02:00:0f:02
Subsystem: SAS-connect
Indication Time: Mon Mar 21 10:26:38 2011
Perceived Severity: Major
Probable Cause: Connection_establishment_error
Description: Disk shelf 2 does not have two paths to controller node1.
Corrective Actions: 1. Halt controller node1 and all controllers attached to disk shelf 2.
               2. Connect disk shelf 2 to controller node1 via two paths following the rules in the Universal SAS and ACP Cabling Guide.
               3. Reboot the halted controllers.
               4. Contact support personnel if the alert persists.
               Possible Effect: Access to disk shelf 2 via controller node1 will be lost with a single hardware component failure (e.g. cable, HBA, or IOM failure).
               Acknowledge: false
               Suppress: false
               Policy: DualPathToDiskShelf_Policy
               Acknowledger: -
               Suppressor: -
               Additional Information: Shelf uuid: 50:05:0c:c1:02:00:0f:02
               Shelf id: 2
               Shelf Name: 4d.shelf2
               Number of Paths: 1
               Number of Disks: 6
               Adapter connected to IOMA: Adapter connected to IOMB: 4d
               Alerting Resource Name: Shelf ID 2
               Additional Alert Tags: quality-of-service, nondisruptive-upgrade
```

**system health alert definition commands**

The definition directory

**system health alert definition show**

Display system health alert definition

**Availability:** This command is available to cluster administrators at the admin privilege level.
Description
The system health alert definition show command displays information about the various alerts defined in the system health monitor policy file. Using -instance will display additional details.

Parameters

[-fields <fieldname>, ...]
Selects the fields that you specify.

[-instance ]
Use this parameter to display additional information on each alert definition.

• Node name
• Monitor name
• Subsystem identifier
• Alert ID
• Severity of the alert
• Probable cause
• Probable cause description
• Possible effect due the error state
• Recommended corrective actions to be followed
• Any additional information
• Additional alert tags

[{-node {<nodename>|local}] - Node
Selects the alert definitions for the specified node.

[-monitor <hm_type>] - Monitor
Selects the alert definitions with the specified monitor name.

[-alert-id <text>] - Class of Alert
Selects the alert definitions with the specified alert identifier.

[-perceived-severity <hm_perceived_sev>] - Severity of Alert
Selects the alert definitions with the specified perceived severity.

[-probable-cause <hm_probable_cause>] - Probable Cause
Selects the alert definitions with the specified probable cause of the alert.

[-probable-cause-description <text>] - Probable Cause Description
Selects the alert definitions with the specified probable cause description.

[-possible-effect <text>] - Possible Effect
Selects the alert definitions with the specified possible effect.

[-corrective-actions <text>] - Corrective Actions
Selects the alert definitions with the specified corrective action.

[-subsystem <hm_subsystem>] - Subsystem Name
Selects the alert definitions with the specified subsystem.

[-additional-information <text>] - Additional Relevant Data
Selects the alert definitions with the specified additional information.
[-tags <hm_alert_type>, ...] - Additional Alert Tags

Selects the alert definitions with the specified keywords.

**Examples**

The example below displays information about all the definitions in the alert definition file:

```
cluster1::> system health alert definition show
Node          Monitor                Subsystem         Alert ID
------------- ---------------------- ----------------- -----------------------
node-01       system-connect         SAS-connect       DualControllerNonHa_Alert

Severity: Major
Probable Cause: Configuration_error
Probable Cause Description: Disk shelf $(sschm_shelf_info.id) is connected to two controllers $(sschm_shelf_info.connected-nodes) that are not an HA pair.
Possible Effect: Access to disk shelf $(sschm_shelf_info.id) may be lost with a single controller failure.
Corrective Actions: 1. Halt all controllers that are connected to disk shelf $(sschm_shelf_info.id).
2. Connect disk shelf $(sschm_shelf_info.id) to both HA controllers following the rules in the Universal SAS and ACP Cabling Guide.
3. Reboot the halted controllers.
4. Contact support personnel if the alert persists.
Additional Info: -
Tags: quality_of_service, nondisruptive-upgrade
```

The example below displays detailed information about the definitions in the alert definition file:

```
cluster1::> system health alert definition show -instance
Node: krivC-01
Monitor: system-connect
Class of Alert: DualControllerNonHa_Alert
Severity of Alert: Major
Probable Cause: Configuration_error
Probable Cause Description: Disk shelf $(sschm_shelf_info.id) is connected to two controllers $(sschm_shelf_info.connected-nodes) that are not an HA pair.
Possible Effect: Access to disk shelf $(sschm_shelf_info.id) may be lost with a single controller failure.
Corrective Actions: 1. Halt all controllers that are connected to disk shelf $(sschm_shelf_info.id).
2. Connect disk shelf $(sschm_shelf_info.id) to both HA controllers following the rules in the Universal SAS and ACP Cabling Guide.
3. Reboot the halted controllers.
4. Contact support personnel if the alert persists.
Subsystem Name: SAS-connect
Additional Relevant Data: -
Additional Alert Tags: quality_of_service, nondisruptive-upgrade
```

**system health autosupport commands**

The autosupport directory

**system health autosupport trigger commands**

The trigger directory

**system health autosupport trigger history commands**

The history directory
**system health autosupport trigger history show**

View system health alert history

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
The `system health autosupport trigger history show` command displays all the alert triggers in the cluster that generated the AutoSupport messages. The following fields are displayed in the output:

- Node name
- Monitor name
- Subsystem
- Alert identifier
- Alerting resource
- Severity
- If an AutoSupport has been sent due to this alert

**Parameters**

```
[-fields <fieldname>, ...]  
Use this parameter to display only the fields you specify.
```

```
[-instance ]  
Use this parameter to display additional information about all of the alerts that were generated.
```

```
[-node {<nodename>|local}] - Node  
Use this parameter to display AutoSupport trigger history on the specified node.
```

```
[-monitor <hm_type>] - Monitor  
Use this parameter to display AutoSupport trigger history with the specified monitor name.
```

```
[-alert-id <text>] - Alert ID  
Use this parameter to display the AutoSupport message that was triggered by the specified alert ID.
```

```
[-alerting-resource <text>] - Alerting Resource  
Use this parameter to display the AutoSupport message that was triggered by the specified alerting resource.
```

```
[-subsystem <hm_subsystem>] - Subsystem  
Use this parameter to display the AutoSupport message that was triggered by the specified subsystem.
```

```
[-indication-time <Date>] - Indication Time  
Use this parameter to display the AutoSupport message that was triggered at the indicated time.
```

```
[-perceived-severity <hm_perceived_sev>] - Perceived Severity  
Use this parameter to display the AutoSupport message that was triggered by alerts with the specified perceived severity.
```

```
[-autosupport-triggered {true|false}] - AutoSupport Triggered  
Use this parameter to display the alerts that generated AutoSupport messages.
```

```
[-probable-cause <hm_probable_cause>] - Probable Cause  
Use this parameter to display the alerts that were generated with the specified probable cause.
```

```
[-corrective-actions <text>] - Corrective Actions  
Use this parameter to display the AutoSupport alerts with the specified corrective actions.
```
**[-asup-enable {true|false}] - Enable Asup for This Alert**

Use this parameter to enable or disable an AutoSupport message for this alert.

**[-alert-clear-time <Date>] - Alert Clear Time**

Use this parameter to display the alerts that were cleared at a given time.

### Examples

This example displays information about the AutoSupport trigger history

```
cluster1::> system health autosupport trigger history show
Node           Monitor                Subsystem         Alert ID
------------   ---------------------- ----------------- ----------------------
node1          node-connect           SAS-connect       DualPathToDiskShelf_Alert
Resource: 50:05:0c:c1:02:00:0f:02
Severity: Major
AutoSupport sent: true
```

This example displays info about the autosupport trigger history in detail

```
cluster1::> system health autosupport trigger history show -instance
Node: node1
Monitor: node-connect
Alert ID: DualPathToDiskShelf_Alert
Alerting Resource: 50:05:0c:c1:02:00:0f:02
Subsystem: SAS-connect
Indication Time: Thu Mar 17 11:59:09 2011
Perceived Severity: Major
AutoSupport Triggered: true
Probable Cause: Connection_establishment_error
Corrective Actions: 1. Halt controller node1 and all controllers attached to disk shelf 2.
2. Connect disk shelf 2 to controller node1 via two paths following the rules in the Universal SAS and ACP Cabling Guide.
3. Reboot the halted controllers.
4. Contact support personnel if the alert persists.
Enable asup for this alert: true
Alert Clear Time: Wed May 29 16:10:13 2013
```

### system health config commands

The config directory

**system health config show**

Display system health configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The *system health config show* command displays the configuration and status of each health monitor in the cluster. The command shows a health status for each health monitor. The health status is an aggregation of the subsystem health for each subsystem that the health monitor monitors. For example, if a health monitor monitors two subsystems and the health status of one subsystem is "ok" and the other is "degraded", the health status for the health monitor is "degraded".

**Parameters**

{ [-fields <fieldname>, ...] }

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

{ [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.
[-node [{nodename}|local]} - Node
Use this parameter to list the health monitors present on the specified node.

[-monitor {hm_type}] - Monitor
Use this parameter to display the health monitors with the specified monitor name.

[-subsystem {hm_subsystem}, ...] - Subsystem
Selects the health monitors with the specified subsystems.

[-health {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Health
Selects the health monitors with the specified health status.

[-mon-version {text}] - Monitor Version
Selects the health monitors with the specified monitor version.

[-pol-version {text}] - Policy File Version
Selects the health monitors with the specified health monitor policy version.

[-context {Node |Cluster}] - Context
Selects the health monitors with the specified running context.

[-aggregator {hm_type}] - Aggregator
Selects the health monitors with the specified aggregator.

[-resources {text}, ...] - Resource
Selects the health monitors with the specified resource name.

[-init-state {Invalid|Initializing|Initialized|Starting_Discovery|Starting_Re-Discovery|Discovery.Done_Partially|Discovery.Done}] - Subsystem Initialization Status
Selects the health monitors with the specified subsystem initialization state.

[-sub-pol-versions {text}] - Subordinate Policy Versions
Selects the health monitors with the specified subordinate policy version.

Examples
The example below displays information about health monitor configuration:

```
cluster1::> system health config show
                       Node  Monitor                Subsystem         Health
--------------------- ---------------------- ----------------- ------------------
node1                 node-connect           SAS-connect       degraded
node1                 system-connect         SAS-connect       degraded
node1                 system                  SAS-connect       degraded
```

The example below displays detailed information about health monitor configuration:

```
cluster1::> system health config show -instance

  Node: node1
  Monitor: node-connect
  Subsystem: SAS-connect
  Health: degraded
  Monitor Version: 1.0
  Policy File Version: 1.0
  Context: node_context
  Aggregator: system-connect
  Resource: SasAdapter, SasDisk, SasShelf
  Subsystem Initialization Status: initialized
  Subordinate Policy Versions: 1.0 SAS, 1.0 SAS multiple adapters
```
**system health policy commands**

The policy directory

**system health policy definition commands**

The definition directory

**system health policy definition modify**

Modify system health policy definition

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

The `system health policy definition modify` command enables or disables health monitoring policies based on input parameters the user provides.

**Parameters**

- `--node <nodename> | local` - Node
  
  Use this parameter to specify the node on which you want to enable or disable the policy.

- `--monitor <hm_type>` - Monitor
  
  Use this parameter to specify the monitor name for which you want to be enable or disable the policy.

- `--policy-id <text>` - Policy
  
  Use this parameter to specify the policy identifier that you want to enable or disable.

- `[-enable {true true}]` - Policy Status
  
  Use this parameter with the value "true" to enable the policy. Set the value to "false" to disable the policy.

- `[-asup-enable {true false}]` - Enable AutoSupport for This Alert
  
  Use this parameter to enable or disable an AutoSupport message for this alert.

**Examples**

This example modifies policy state on the cluster:

```
cluster1::> system health policy definition modify --node node1 --policy-id ControllerToShelfIomA_Policy --enable false --monitor *
```

**system health policy definition show**

Display system health policy definitions

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

The `system health policy definition show` command lists the health monitor policy definitions as described by the health monitor policy file. The command displays the following fields:

- Node name
- Monitor name
- Policy name
- Policy rule expression
- Expression for joining two tables
- Policy status
- Alert identifier
- Responsible resource name

Parameters

[-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-node (<nodename> | local)] - Node

Selects policy definitions for the specified node.

[-monitor <hm_type>] - Monitor

Selects policy definitions with the specified monitor name.

[-policy-id <text>] - Policy

Selects policy definitions with the specified policy identifier.

[-rule-expression <ArithExpr>] - Rule Expression

Selects policy definitions with the specified rule of expression.

[-where <ArithExpr>] - Variable Equivalence

Selects rules that match the provided expression. This expression is part of the alert definition. It is shown for reference only and cannot be changed.

[-enable {true|false}] - Policy Status

Use this parameter with the value set to "true" to select policy definitions that are enabled. Set the value to "false" to select policy definitions that are disabled.

[-alert-id <text>] - Alert ID

Selects all policy definitions of the specified alert identifier.

[-responsible-resource-info <text>] - Table and ID of Resource at Fault

Selects all policy definitions with the specified responsible resource.

[-asup-enable {true | false}] - Enable AutoSupport for This Alert

Selects policy definitions for which AutoSupport messages are either enabled or disabled.

Examples

The example below displays information about all the policy definitions present in the cluster:

```
cluster1::> system health policy definition show
Node          Monitor                Policy
------------- ---------------------- ----------------------
node1         node-connect           ControllerToShelfIomA_Policy
Policy Rule Expression: nschm_shelf_info.num-paths == 2 &&
nschm_shelf_info.iomb-adapter == NULL
Where: -
Enable: true
```

Commands: Manual Page Reference
The example below displays detailed information about all the policy definitions present in the cluster:

```
cluster1::> system health policy definition show -instance

Node: node1
Monitor: node-connect
Policy: ControllerToShelfIomA_Policy
Rule Expression: nschm_shelf_info.num-paths == 2 && nschm_shelf_info.iorb-adapter == NULL
Variable Equivalence: -
Policy Status: true
Alert ID: ControllerToShelfIomA_Alert
Table and ID of Resource at Fault: nschm_shelf_info.name
```

**system health status commands**

The status directory

**system health status show**

Display system health monitoring status

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
The `system health status show` command displays the health monitor status. The possible states are:

- ok
- ok-with-suppressed
- degraded
- unreachable

**Examples**
This example displays information about health monitoring status:

```
cluster1::> system health status show
Status
----------
degraded
```

**system health subsystem commands**

The subsystem directory

**system health subsystem show**

Display the health of subsystems

**Availability:** This command is available to cluster administrators at the admin privilege level.
Description
The `system health subsystem show` command displays the health status of each subsystem for which health monitoring is available. This command aggregates subsystem health status from each node in the cluster. A subsystem's health status changes to "degraded" when a health monitor raises an alert. You can use the `system health alert show` command to display information about generated alerts.

Parameters
```
[-fields <fieldname>, ...]
```
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance]
```
If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[-subsystem <hm_subsystem>] - Subsystem
```
Selects the specified subsystem.

```
[-health {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Health
```
Selects subsystems that have the specified health status.

```
[-init-state {Invalid|Initializing|Initialized|Starting_Discovery|Starting_Re-Discovery|Discovery.Done.Partially|Discovery.Done}] - Initialization State
```
Selects subsystems that have the specified initialization state.

```
[-outstanding-alert-count <integer>] - Number of Outstanding Alerts
```
Selects subsystems that have the specified number of outstanding alerts.

```
[-suppressed-alert-count <integer>] - Number of Suppressed Alerts
```
Selects subsystems that have the specified number of suppressed alerts.

```
[-node <nodename> | local], ...] - Node
```
Selects subsystems for the specified node.

```
[-refresh-interval <[<integer>h] [<integer>m] [<integer>s], ...] - Subsystem Refresh Interval
```
The refresh interval is in minutes. A value of zero disables the sub-system refresh until a reboot or restart of the subsystem process.

Examples
The example below displays the health status of each subsystem:

```
cluster1::> system health subsystem show
Subsystem    Health
------------- ---------------
SAS-connect  degraded
Switch-Health OK
CIFS-NDO     OK
```

The example below displays detailed information about the health status of each subsystem:

```
cluster1::> system health subsystem show -instance
          Subsystem: SAS-connect
          Initialization State: initialized
          Number of Outstanding Alerts: 0
          Number of Suppressed Alerts: 0
          Node: node1,node2
          Subsystem Refresh Interval: 30m, 30m
          Subsystem: Switch-Health
          Health: ok
          Initialization State: initialized
```

system health alert show on page 1163

system license commands

Manage licenses

system license add

Add one or more licenses

Availability: This command is available to cluster administrators at the admin privilege level.

Description
This command adds a license to a cluster. To add a license you must specify a valid license key, which you can obtain from your sales representative.

Parameters

-license-code <License Code V2>, ... - License Code V2

This parameter specifies the key of the license that is to be added to the cluster. The parameter accepts a list of 28 digit upper-case alphanumeric character keys.

Examples

The following example adds a list of licenses with the keys AAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAA and BBBBBBBBbbbbbbbbBBBBBBBBBBBBBBBBB to the cluster

```
cluster1:/> system license add -license-code AAAAAAAAAAAAAAAAAAAAAAAAAAA, BBBBBBBBbbbbbbbbBBBBBBBBBBBBBBBBB
```

system license clean-up

Remove unnecessary licenses

Availability: This command is available to cluster administrators at the admin privilege level.

Description
This command manages licenses in the cluster that have no effect, and so can be removed. Licenses that have expired or are not affiliated with any controller in the cluster are deleted by this command.

```
Parameters

`-unused [true]` - Remove unused licenses
    If you use this parameter, the command removes licenses in the cluster that are not affiliated with any controller in the cluster.

`-expired [true]` - Remove expired licenses
    If you use this parameter, the command removes licenses in the cluster that have expired.

`-simulate | -n [true]` - Simulate Only
    If you use this parameter, the command will not remove the licenses. Instead it will display the licenses that will be removed if this parameter was not provided.

Examples

The following example simulates and displays the licenses that can be cleaned up:

```
cluster1::> system license clean-up -n -unused -expired
Serial number: 1-80-000011
Owner: cluster1
Package                   Reason
------------------------- -----------------------------------------------------
SnapLock                  Demo License has expired
SnapProtectApps           Demo License has expired
Serial number: 1-81-00000000000000004062522917
Owner: none
Package                   Reason
------------------------- -----------------------------------------------------
NFS                       Serial number is not used by any node in the cluster
CIFS                      Serial number is not used by any node in the cluster
```

The following example deletes the expired licenses:

```
cluster1::> system license clean-up -expired
2 demo licenses deleted.
```

The following example deletes the unused licenses:

```
cluster1::> system license clean-up -unused
2 unused licenses deleted.
```

system license delete

Delete a license

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

This command deletes a license from a cluster.

**Parameters**

`-serial-number <text>` - Serial Number
    This parameter specifies the serial number of the license that is to be deleted from the cluster. If this parameter is not provided, the default value is the serial number of the cluster.

`-package <Licensable Package>` - Package
    This parameter specifies the name of the package that is to be deleted from the cluster.
Examples
The following example deletes a license named CIFS and serial number 1-81-00000000000000000123456 from the cluster:

```
cluster1::> system license delete -serial-number 1-81-00000000000000000123456 -package CIFS
```

**system license show**

Display licenses

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The `system license show` command displays the information about licenses in the system.

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

```
[-instance ]
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[-serial-number <text>] - Serial Number
```

If you use this parameter, the command displays information only about the licenses that matches the serial number you specify.

```
[-package <Licensable Package>] - Package
```

If you use this parameter, the command displays information only about the specified package.

```
[-owner <text>] - Owner
```

If you use this parameter, the command displays information only about the packages that matches the owner name you specify.

```
[-expiration <MM/DD/YYYY HH:MM:SS>] - Expiration
```

If you use this parameter, the command displays information only about the licenses that have the expiration date you specify.

```
[-description <text>] - Description
```

If you use this parameter, the command displays information only about the licenses that matches the description you specify.

```
[-type {license|site|demo|subscr|capacity}] - Type
```

If you use this parameter, the command displays information only about the licenses that have the license type you specify.

```
[-legacy {yes|no}] - Legacy
```

If you use this parameter, the command displays information only about the licenses that matches the legacy field you specify.

```
[-customer-id <text>] - Customer ID
```

If you use this parameter, the command displays information only about the licenses that have the customer-id you specify.
Examples
The following example displays default information about all licensed packages in the cluster:

```
cluster1::> system license show
Serial Number: 1-80-123456
Owner: cluster1
Package           Type    Description           Expiration
----------------- ------- --------------------- --------------------
Base              site    Cluster Base License  -
NFS               site    NFS License           -
iSCSI             site    iSCSI License         -

Serial Number: 1-81-0000000000000001122334455
Owner: node1
Package           Type    Description           Expiration
----------------- ------- --------------------- --------------------
NFS               license NFS License           -
SnapRestore       license SnapRestore License   -
```

system license show-status
Display license status

Availability: This command is available to cluster administrators at the admin privilege level.

Description
This command displays the status of all Data ONTAP licenses.

Parameters

```
[-fields <fieldname>, ...]
      If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

[-instance]
      If you specify the -instance parameter, the command displays detailed information about all fields.

[-status {not-compliant|eval|partially-installed|valid|not-installed|not-applicable}]
      Current state
      If you use this parameter, the command displays information only about licenses that match the given status.

[-license <Licensable Package>]
      License
      If you use this parameter, the command displays information only about licenses that match the given license.

[-scope {site|cluster|node}]
      License Scope
      If you use this parameter, the command displays information only about licenses that match the given scope.

[-detailed-status <text>, ...]
      Detailed Status
      If you use this parameter, the command displays information only about licenses that match the given detailed-status.
```

Examples
The following example displays the license status of the cluster:

```
cluster1::> system license show-status
Status    License              Scope     Detailed Status
--------- -------------------  --------- ----------------------
partially-installed
      CIFS               node      License missing on: Node2-Cluster1.
      SnapRestore       node      License missing on: Node2-Cluster1.
```
system license capacity commands

(DEPRECATED)-The capacity directory

system license capacity show

(DEPRECATED)-Show license capacity status

Availability: This command is available to cluster administrators at the admin privilege level.

Description

Note: This command is deprecated and may be removed in a future release of Data ONTAP. Use the "system license show-status" command.

The system license capacity show command displays the information about the licenses in the system that are specifically related to storage capacity limits.

Parameters

`[-fields <fieldname>, ...]`
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

`[-instance]`
If you specify the -instance parameter, the command displays detailed information about all fields.

`[-serial-number <Node Serial Number>] - Serial Number`
If you use this parameter, the command displays information only about the capacity-related licenses that matches the serial number you specify.

`[-package <Licensable Package>] - Package`
If you use this parameter, the command displays information only about the package you specify.

`[-owner <text>] - Owner`
If you use this parameter, the command displays information only about the capacity-related licenses that have the owner you specify.

`[-max-capacity <integer>[KB|MB|GB|TB|PB]] - Maximum Capacity`
If you use this parameter, the command displays information only about the capacity-related licenses that have the maximum amount of attached storage capacity you specify.
[-current-capacity \(\{KB|MB|GB|TB|PB\}\)] - Current Capacity

If you use this parameter, the command displays information only about the capacity-related licenses that apply to the node with the current attached capacity you specify.

[-expiration \(\text{MM/DD/YYYY HH:MM:SS}\)] - Expiration Date

If you use this parameter, the command displays information only about the capacity-related licenses that have the expiration date you specify.

[-reported-state \{evaluation|warning|missing|enforcement|installed\}] - Reported State

If you use this parameter, the command displays information only about the capacity-related licenses that have the reported state you specify.

[-node \{<nodename>|local\}] - Node Name

If you use this parameter, the command displays information only about the capacity-related licenses that apply to the node you specify.

### Examples

The following example displays information about all capacity-related licensed packages in the cluster, for a hypothetical cluster of four nodes:

Note that for some nodes below, the maximum capacity is displayed as "." (meaning "unlimited"). This happens when there is no capacity license for the node - the node is operating with a limited-time temporary capacity license.

```
cluster1::> system license capacity show

Node:          node1
Serial Number: 1-81-00000000000001234567890123456
Max  Current
Package                  Capacity Capacity Expiration
------------------------ -------- -------- -------------------
Select                        2TB  15.81GB 4/11/2016 00:00:00

Node:          node2
Serial Number: 1-81-00000000000000000123456788
Max  Current
Package                  Capacity Capacity Expiration
------------------------ -------- -------- -------------------
Select                          -  10.40TB 4/11/2016 00:00:00

Node:          node3
Serial Number: 1-81-00000000000000000123456789
Max  Current
Package                  Capacity Capacity Expiration
------------------------ -------- -------- -------------------
Select                          -  10.40TB 4/11/2016 00:00:00

Node:          node4
Serial Number: 1-81-0000000000000123456790123456
Max  Current
Package                  Capacity Capacity Expiration
------------------------ -------- -------- -------------------
Select                        2TB  15.81GB 4/11/2016 00:00:00
```

### Related references

- system license show-status on page 1178

### system license entitlement-risk commands

The entitlement-risk directory
system license entitlement-risk show

Display Cluster License Entitlement Risk

Availability: This command is available to cluster administrators at the admin privilege level.

Description

This command displays information about license entitlement risk of the cluster for each license package. The command displays license package name, entitlement risk, corrective action to reduce the entitlement risk for each package, and the names and serial numbers for the nodes that do not have a node-locked license for a given package. If command is used with the "-detail" parameter, the output displays the names and serial numbers for all nodes in the cluster instead of only the nodes missing a node-locked license. It also displays whether each node has a license and if the features corresponding to the package are used in the past week.

License entitlement risk does not apply to base license. If a node has a site or a valid demo license for the given package, the entitlement risk will be shown as "medium" and the nodes missing a node-locked license will be displayed. The corrective action, if the cluster has a site license for the given package is, "Verify all controllers are entitled". If the entitlement risk is high, the corrective action is "Acquire node-locked license". For the low entitlement risk and if the cluster is unlicensed for a given package, the corrective action is "None". If the license entitlement risk cannot be computed because of infrastructure issues, the entitlement risk is shown as "unknown" and the corrective action is displayed as "Verify system health".

For more information regarding license entitlement risk, see http://mysupport.netapp.com/licensing/ontapentitlementriskstatus

Parameters

[-fields <fieldname>, ...]  
With this parameter, you can specify which fields should be displayed by the command. License package names and node serial numbers are always displayed.

[-detail]  
If you use this parameter, the command displays the license package name, entitlement risk, corrective action, all nodes' names, their serial numbers, whether a node-locked license is present and whether a given license package has been in use in the past week for each node in the cluster.

[-instance]]  
If this parameter is used, the command displays values for all fields for each license package and each node in the cluster individually.

[ -package <Licensable Package>] - Package Name  
If you use this parameter, the command displays information only for the specified license package.

[-serial-number <Node Serial Number>] - Node Serial Number  
If you use this parameter, the command displays information only for the node with the specified serial number. The displayed entitlement risk and corrective action apply to the entire cluster.

[ -node-name <text>] - Node Name  
If you use this parameter, the command displays information only for the node with the specified name. The displayed entitlement risk and corrective action apply to the entire cluster.

[-risk {high|medium|low|unlicensed|unknown}] - Entitlement Risk  
If you use this parameter, the command displays information only for the license packages that have the specified license entitlement risk.

[-action <text>] - Corrective Action  
If you use this parameter, the command displays information only for the license packages which need the specified corrective action to reduce entitlement risk.
[-is-licensed {true|false}] - Is Node-Locked License Present
If you use this parameter, the command displays information only for the license packages for which at least
one node in the cluster has a node-locked license. It also displays the nodes in the cluster which do not have a
node-locked license.

[-in-use {true|false}] - Usage Status
If you use this parameter, the command displays information only for the license packages with corresponding
features in use.

[-missing-serial-numbers <text>,...] - Serial Numbers Missing a Node-Locked License
If you use this parameter, the command displays the packages for which the node with the specified serial
number does not have a node-locked license.

[-missing-node-names <text>,...] - Node Names Missing a Node-Locked License
If you use this parameter, the command displays all the packages for which the node with the specified name
does not have a node-locked license.

[-action-code {acquire-license|adjust-capacity|verify-entitlement|verify-system-health|none}] - Corrective Action Code
If you use this parameter, the command displays information only for the license packages which need
specified corrective action code to reduce entitlement risk. This parameter is same as the parameter "action".

Examples

The following example displays the information for license package NFS. NFS is unlicensed in the cluster and no action
is necessary to reduce the entitlement risk. The nodes, cluster1-01 and cluster-02, are missing a node-locked license. The
serial numbers for both nodes are also displayed.

```
cluster1::> system license entitlement-risk show
Package             Entitlement Risk Corrective Action
------------------- ---------------- -----------------------------------
NFS                 unlicensed       None
Nodes Without a Node-Locked License
-------------------------------------------------------------
cluster1-01                    1-81-0000000000000004073806282
cluster1-02                    1-81-0000000000000004073806283
```

The following example displays the information for license package CIFS. The cluster has high entitlement risk for CIFS.
The command displays serial numbers for all nodes in the cluster. Both nodes are missing a node-locked CIFS license.
Node with serial number 1-81-0000000000000004073806282 has used CIFS feature in the past week, and the node with
serial number 1-81-0000000000000004073806283 has not used this feature in the past week.

```
cluster1::> system license entitlement-risk show -detail
Package             Entitlement Risk Corrective Action
------------------- ---------------- -----------------------------------
CIFS                high             Acquire a node-locked license
Serial Numbers     Licensed Usage
-------------------------------  ------
1-81-0000000000000004073806282 false true
1-81-0000000000000004073806283 false false
```

system license status commands

(DEPRECATED)-Display license status
system license status show

(DEPRECATED)-Display license status

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

**Note:** This command is deprecated and may be removed in a future release of Data ONTAP. Use the "system license show-status" command.

This command displays the list of licensable packages in the system and their current licensing status.

**Parameters**

[-fields <fieldname>,...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance]]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-package <Licensable Package>] - Package Name

If you use this parameter, the command displays information only about the specified package.

[-method {none|license|site|demo|subscr|capacity}] - Licensed Method

If you use this parameter, the command displays information only about the packages with the specified licensed method.

[-expiration <MM/DD/YYYY HH:MM:SS>] - Expiration Date

If you use this parameter, the command displays information only about the licenses that have the expiration date you specify.

[-description <text>] - Description

If you use this parameter, the command displays information only about the licenses that match the description you specify.

[-status-details <text>] - Additional Information About Status

This option displays additional information regarding the cluster-level license status for license methods.

### Examples

The following example displays the license status of the cluster:

<table>
<thead>
<tr>
<th>Package</th>
<th>Licensed Method</th>
<th>Expiration</th>
<th>Status Details</th>
</tr>
</thead>
<tbody>

</tbody>
</table>
system node commands

The system node directory

system node halt

Shut down a node

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system node halt command stops all activity on a node. You may supply a reason for the shutdown, which will be stored in the audit log. You may also keep partner nodes from performing storage takeover during the shutdown.

Parameters
-node {<nodename>|local} - Node
Use this mandatory parameter to specify the node that you want to shut down. The value local specifies the current node.

-[reason <text>] - Reason for Shutdown
Use this parameter to enter a brief note to indicate the reason for the restart, which will be stored in the audit log. Providing this information assists support personnel with troubleshooting efforts.

-[inhibit-takeover | -f [true]] - Disallow Storage Takeover by Partner
This parameter optionally forces the shutdown and prevents storage failover. In a two-node MetroCluster configuration, this parameter prevents automatic unplanned switchover.

    Note: If -inhibit-takeover is set to true, the default behavior as seen with command storage failover show --fields onreboot is ignored.

If you enter this command without using this parameter, its effective value is false and storage takeover is allowed. If you enter this parameter without a value, it is automatically set to true and storage takeover is disabled during reboot.

-[dump | -d [true]] - Create a Core Dump
If this parameter is set to true, it forces a dump of the kernel core when halting the node.

-[skip-lif-migration-before-shutdown [true]] - Skip Migrating LIFs Away from Node Prior to Shutdown
If this parameter is specified, LIF migration prior to the shutdown will be skipped. However if LIFs on this node are configured for failover, those LIFs may still failover after the shutdown has occurred. The default is to migrate LIFs prior to the shutdown. In the default case, the command attempts to synchronously migrate data and cluster management LIFs away from the node prior to shutdown. If the migration fails or times out, the shutdown will be aborted.

-[ignore-quorum-warnings [true]] - Skip Quorum Check Before Shutdown
If this parameter is specified, quorum checks will be skipped prior to the shutdown. The operation will continue even if there is a possible data outage due to a quorum issue.
Examples
The following example shuts down the node named cluster1 for hardware maintenance:

```
cluster1::> system halt -node cluster1 -reason 'hardware maintenance'
```

Related references

*storage failover show* on page 933

**system node migrate-root**

Start the root aggregate migration on a node

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**
The *system node migrate-root* command migrates the root aggregate of a node to a different set of disks. You need to specify the node name and the list of disks on which the new root aggregate will be created. The command starts a job that backs up the node configuration, creates a new aggregate, set it as new root aggregate, restores the node configuration and restores the names of original aggregate and volume. The job might take as long as a few hours depending on time it takes for zeroing the disks, rebooting the node and restoring the node configuration.

**Parameters**

- **-node** `<nodename>|local` - Node
  
  Specifies the node that owns the root aggregate that you wish to migrate. The value *local* specifies the current node.

- **{-disklist <disk path name>, ...}** - List of Disks for New Root Aggregate
  
  Specifies the list of disks on which the new root aggregate will be created. All disks must be spares and owned by the same node. Minimum number of disks required is dependent on the RAID type.

- **-raid-type {raid_tec|raid_dp|raid4}** - RAID Type for the New Root Aggregate
  
  Specifies the RAID type of the root aggregate. The default value is *raid-dp*.

- **{-resume [true]}** - Resume a Failed Migrate Operation
  
  Resumes a failed migrate-root operation if the new_root aggregate is created and the old root aggregate is in the restricted state.

Examples
The command in the following example starts the root aggregate migration on node node1:

```
cluster1::> system node migrate-root -node node1 -disklist 1.11.8,1.11.9,1.11.10,1.11.11,1.11.12 -
             raid-type raid-dp
```

**system node modify**

Modify node attributes

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The *system node modify* command sets the attributes of a node.
The owner, location, and asset tag attributes are informational only, and do not affect the operation of the node or the cluster. The cluster eligibility attribute marks a node as eligible to participate in a cluster. The epsilon attribute marks a node as the tie-breaker vote if the cluster has an even number of nodes.

Any field of type <text> may be set to any text value. However, if the value contains spaces or other special characters, you must enter it using double-quotes as shown in the example below.

Use the `system node show` command to display the field values that this command modifies.

### Parameters
- **-node \(<\text{nodename}|\text{local}\) - Node**
  
  This mandatory parameter specifies which node will have its attributes modified. The value "local" specifies the current node.

  [-**owner <text>] - Owner**
  
  This optional text string identifies the node’s owner. Fill it in as needed for your organization.

  [-**location <text>] - Location**
  
  Use this text string to identify the physical location of the node. This text string is optional; fill it in as needed for your organization.

  [-**assettag <text>] - Asset Tag**
  
  If your organization uses asset tags to track equipment, you can use this text string to store that tag’s value.

  [-**eligibility \{true|false\}] - Eligibility (privilege: advanced)**
  
  This parameter specifies whether the node is eligible to participate in a cluster. If you modify another node’s eligibility to false, it will no longer be visible from other nodes in the cluster. If you modify the local node's eligibility to false, the node will no longer be active in the cluster and you will not be able to see any cluster nodes from it.

  [-**epsilon \{true|false\}] - Epsilon (privilege: advanced)**
  
  If specified as true for a node, this value designates the specified node as epsilon for this cluster. In a cluster, only one node can be designated as epsilon at any given time. A node can be designated as Epsilon to add weight to its voting in a cluster with an even number of nodes.

  [-**skip-quorum-check-before-ineligible \{true\}] - Skip Quorum Check Before Setting Node Ineligible (privilege: advanced)**
  
  If this parameter is specified, quorum checks will be skipped prior to setting a node ineligible. When setting a node to ineligible, the operation will continue even if there is a possible data outage due to a quorum issue.

  [-**is-diff-svcs \{true|false\}] - Differentiated Services**
  
  If set to true this means that the specified node and its HA partner is part of differentiated services storage infrastructure. The default value for this setting is false.

### Examples

The following example modifies the attributes of a node named node0. The node’s owner is set to "IT" and its location to "Data Center 2."

```
cluster1::> system node modify -node node0 -owner "IT" -location "Data Center 2"
```

### Related references

- `system node show` on page 1191
system node reboot

Reboot a node

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system node reboot command restarts a node. You can supply a reason for the reboot, which is stored in the audit log. You can also keep partner nodes from performing storage takeover during the reboot and instruct the rebooted node to create a core dump.

Parameters
- node {<nodename>|local} - Node
  Specifies the node that is to be restarted. The value "local" specifies the current node.

  [-inhibit-takeover | -f [true]] - Disallow Storage Takeover by Partner
  If set to true, this parameter specifies that the node's failover partner is not allowed to take over for the node when the node is rebooted. In a two-node MetroCluster configuration, this parameter prevents automatic unplanned switchover. If you enter this command without using this parameter, its effective value is false and storage takeover is allowed. If you enter this parameter without a value, it is automatically set to true and storage takeover is disabled during reboot.

  [-reason <text>] - Reason for Reboot
  Use this parameter to enter a brief note to indicate the reason for the restart, which will be stored in the audit log. Providing this information assists support personnel with troubleshooting efforts.

  [-dump | -d [true]] - Create a Core Dump
  If you would like the node to create a core dump before restarting, specify the true value with this parameter. If you enter this command without using this parameter, its effective value is false and the node doesn't create a core dump. If you enter this parameter without a value, it is automatically set to true and the node creates a core dump.

  [-skip-lif-migration-before-reboot [true]] - Skip Migrating LIFs Away from Node Prior to Reboot
  If this parameter is specified, LIF migration prior to the reboot will be skipped. However if LIFs on this node are configured for failover, those LIFs may still failover after the reboot has occurred. The default is to migrate LIFs prior to the reboot. In the default case, the command attempts to synchronously migrate data and cluster management LIFs away from the node prior to reboot. If the migration fails or times out, the reboot will be aborted.

  [-ignore-quorum-warnings [true]] - Skip Quorum Check Before Reboot
  If this parameter is specified, quorum checks will be skipped prior to the reboot. The operation will continue even if there is a possible data outage due to a quorum issue.

Examples
The command in the following example restarts the node named cluster1 for a software upgrade:

```
cluster1:~> system node reboot -node cluster1 -reason "software upgrade"
```

system node rename

Rename a node

Availability: This command is available to cluster administrators at the admin privilege level.
Description
The `system node rename` command changes a node's name. Both the node to be modified and the new name of that node must be specified with the following parameters. This command is best executed from the node that is being renamed, using the `-node local` parameter.

Use the `system node show` command to display the names of all the nodes in the current cluster.

Parameters
- **-node** `{<nodename>|local}` - Node
  This parameter specifies which node you are renaming. The value `local` specifies the current node.
- **-newname** `<text>` - New Name
  Use this parameter to specify the new name of the node.
  - The name must contain only the following characters: A-Z, a-z, 0-9, "." or ".".
  - The first character must be one of the following characters: A-Z or a-z.
  - The last character must be one of the following characters: A-Z, a-z or 0-9.
  - The maximum supported length is 47 characters.
  - The system reserves the following names: "all", "cluster", "local" and "localhost".

Examples
The following example changes the name of the node named node3 to node4.

```
cluster1::> system node rename -node node3 -newname node4
```

Related references
- `system node show` on page 1191

**system node restore-backup**

Restore the original backup configuration to the HA target node

**Availability:** This command is available to `cluster` administrators at the `advanced` privilege level.

Description
The `system node restore-backup` command restores the backup configuration file that is stored on the partner node to the specified target node in an HA pair. The backup configuration file is restored after Data ONTAP has been installed on the target node.

The backup configuration file is stored on the HA partner node while the target node is down. After the target node has been installed, the partner node sends this backup configuration file to the target node through the management network by using the `system node restore-backup` command to restore the original configuration. This procedure is commonly used when replacing the target node's boot device.

The target IP address should be the address of the target node used for netboot installation.

Parameters
- **-node** `{<nodename>|local}` - Node
  Specifies the partner node that sends the backup configuration file to the target node. The value "local" specifies the current node.
system node revert-to

Revert a node to a previous release of Data ONTAP

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The system node revert-to command reverts a node’s cluster configuration to the given version. After the system node revert-to command has finished, the revert_to command must be run from the nodeshell. The revert_to command reverts the filesystem on individual nodes to the target release. Before running revert-to in the cluster shell, the target release must be installed on the node.

Parameters
-node {<nodename>|local} - Node
  Specifies the node that is to be reverted. The value local specifies the current node.

-version <revert version> - Data ONTAP Version
  Specifies the version of Data ONTAP to which the node is to be reverted.

[-check-only [true]] - Capability Check
  If set to true, this parameter specifies that the cluster configuration revert should perform checks to verify all of the preconditions necessary for revert-to to complete successfully. Setting the parameter to true does not run through the actual revert process. By default this option is set to false.

Examples
The command in the following example reverts cluster configuration of a node named node1 to Data ONTAP version 9.2

    cluster1::*> system node revert-to -node node1 -version 9.2

system node run

Run interactive or non-interactive commands in the nodeshell

Availability: This command is available to cluster administrators at the admin privilege level.

Description
Use the system node run command to run certain commands from the nodeshell CLI on a specific node in the cluster. You can run a single nodeshell command from the clustershell that returns immediately, or you can start an interactive nodeshell session from which you can run multiple nodeshell commands.

Nodeshell commands are useful for root volume management and system troubleshooting. Commands that are available through the nodeshell are scoped to a single node in the cluster. That is, they affect only the node specified by the value of the -node parameter and do not operate on other nodes in the cluster. To see a list of available nodeshell commands, type '?' at the interactive nodeshell prompt. For more information on the meanings and usage of the available commands, use the man command in the nodeshell.

Only one interactive nodeshell session at a time can be run on a single node. Up to 24 concurrent, non-interactive sessions can be run at a time on a node.

When running the nodeshell interactively, exit the nodeshell and return to the clustershell by using the exit command. If the nodeshell does not respond to commands, terminate the nodeshell process and return to the clustershell by pressing Ctrl-D.

The system node run command is not available from the GUI interface.
Note: An alternate way to invoke the `system node run` command is by typing the `run` as a single word.

Parameters

- **-node `<nodename>|local`** - Node
  
  Use this parameter to specify the name of the node on which you want to run the nodeshell command. If you specify only this parameter, the command starts an interactive nodeshell session that lasts indefinitely. You can exit the nodeshell to the clustershell by pressing Ctrl-D or by typing the `exit` command.

- `{ [-command <text>, ...] - Command to Run}

  This optionally specifies the name of a single nodeshell command to run on the specified node. To see a list of available nodeshell commands, type `?` at an interactive nodeshell prompt.

- `| [-reset [true]]` - Reset Existing Connection

  If this parameter is specified with the `true` value, it terminates any existing interactive nodeshell session on the specified node. The default value is `false`.

Examples

The following example runs the nodeshell command `sysconfig -V` on a node named node1:

```
cluster1::> system node run -node node1 -command sysconfig -V
volume node1_aggr0 (1 RAID group):
  group 0: 3 disks
```

The following example starts a nodeshell session on a node named node2 and then runs the nodeshell `sysconfig -V` command. The system remains in the nodeshell after running the `sysconfig -V` command.

```
cluster1::> run -node node2
Type 'exit' or 'Ctrl-D' to return to the CLI
node2> sysconfig -V
volume node2_aggr0 (1 RAID group):
  group 0: 3 disks
node2>
```

The following example starts a nodeshell session on a node named node1 and then runs two nodeshell commands, `aggr status` first and `vol status` second. Use quotation marks and semicolons when executing multiple nodeshell commands with a single `run` command.

```
cluster1::> run -node node1 -command "aggr status; vol status"
Aggr State Status Options
aggr0 online raid_dp, aggr root
  parity uninit'd! 32-bit
aggr1 online raid_dp, aggr parity uninit'd!
  parity uninit'd! 32-bit
Volume State Status Options
vol0 online raid_dp, flex root, nvfail=on
  parity uninit'd!
root_vs0 online raid_dp, flex create_ucode=on,
  cluster convert_ucode=on,
  parity uninit'd!
```

`system node run-console`

Access the console of a node

Availability: This command is available to `cluster` administrators at the `admin` privilege level.
Description
This command allows you to access the console of any remote node on the same cluster. The remote access is helpful in situations where the node cannot be booted up or has network issues. This command establishes an SSH session with the Service Processor of a remote node and accesses that node's console over the serial channel. This command works even if Data ONTAP is not booted up on the remote node. You can get back to the original node by pressing Ctrl+D. This command works only on SSH sessions and not on physical console sessions.

Parameters

- \texttt{-node \{<nodename>|local\}} - Node

  This parameter specifies the node whose physical console you want to access.

Examples

The following example accesses the console of node2 in the same cluster.

```
cluster1::> system node run-console -node node2
Pressing Ctrl-D will end this session and any further sessions you might open on top of this session.
Type Ctrl-D.
SP-login: admin
Password:
*******************************************************************************
* This is an SP console session. Output from the serial console is also mirrored on this session. *
*******************************************************************************
ode2::>
node2::> Connection to 192.168.1.202 closed.
cluster1::>
```

\textbf{system node show}

Display the list of nodes in the cluster

\textbf{Availability:} This command is available to \textit{cluster} administrators at the \textit{admin} privilege level.

Description

The \texttt{system node show} command displays information about the nodes in a cluster. You can limit output to specific types of information and specific nodes in the cluster, or filter output by specific field values.

To see a list of values that are in use for a particular field, use the \texttt{-fields} parameter of this command with the list of field names you wish to view. Use the \texttt{system node modify} command to change some of the field values that this command displays.

Parameters

\{ \texttt{-fields <fieldname>,...} \}

  If you specify the \texttt{-fields <fieldname>,...} parameter, the command output also includes the specified field or fields. You can use \texttt{-fields ?} to display the fields to specify.

\texttt{[-inventory]}

  Use this parameter to display inventory information such as serial numbers, asset tags, system identifiers, and model numbers.

\texttt{[-messages]}

  Use this parameter to display system messages for each node.
If you specify the `--instance` parameter, the command displays detailed information about all fields.

`-node {<nodename>|local}` - Node
Selects information for node names that match this parameter value.

`-owner <text>` - Owner
Selects nodes that have owner values that match this parameter value.

`-location <text>` - Location
Selects nodes at specific physical locations that match this parameter value.

`-model <text>` - Model
Selects nodes that have model numbers that match this parameter value.

`-serialnumber <text>` - Serial Number
Selects nodes that have serial numbers that match this parameter value.

`-assettag <text>` - Asset Tag
Selects nodes that have asset tags that match this parameter value.

`-uptime {<seconds>| [<d> days] <hh>:<mm>:<ss>]}` - Uptime
Selects nodes that have uptimes that match this parameter value. This parameter is most useful when used with a range indicator such as less than or greater than, as in:

```
show -uptime >"30 days 00:00"
```

`-nvramid <nvramid>` - NVRAM System ID
Selects nodes that have NVRAM system IDs that match this parameter value.

`-systemid <text>` - System ID
Selects nodes that have system IDs that match this parameter value.

`-vendor <text>` - Vendor
Selects nodes that have vendor names that match this parameter value.

`-health {true|false}` - Health
Selects nodes that have health values that match this parameter value. Specify `true` to display healthy nodes, and `false` to display unhealthy nodes.

`-eligibility {true|false}` - Eligibility
Selects nodes that have voting eligibility values that match this parameter value.

`-epsilon {true|false}` - Epsilon (privilege: advanced)
Selects nodes that have epsilon holding designations that match this parameter value. This is useful to find out which node, if any, in the current cluster has been designated as epsilon. Specify `true` to display the node holding epsilon, and `false` to display nodes not holding epsilon.

`-uuid <UUID>` - UUID (privilege: advanced)
Selects nodes that have the specified universal unique identifiers that match this parameter value.

`-is-diff-svcs {true|false}` - Differentiated Services
If true, the corresponding node is considered to be part of differentiated services storage infrastructure.
[\text{-is-all-flash-optimized (true|false)}] - All-Flash Optimized

Selects nodes that have "All-Flash Optimized" personality values that match this parameter value. Specify \text{true} to display nodes which support only SSD drives, and \text{false} to display nodes which support all kinds of drives.

### Examples

```
cluster1::> system node show
Node  Health Eligibility Uptime       Model    Owner  Location
------ ------ ----------- ------------- -------- ------ -------------
node0  true   true        89 days 23:47 MODELXX  IT     Data Center 2
node1  true   true        15 days 22:37 MODELXX  Data Center 2
node2  true   true        15 days 23:00 MODELXX  Data Center 2
node3  true   true        15 days 22:37 MODELXX  Data Center 2
4 entries were displayed.
```

This example displays the locations and model numbers of all nodes that are in physical locations that have names beginning with "Lab":

```
cluster1::> system node show -location lab* -fields location, model
node                  location model
------------- -------- ------
node5         Lab 1    MODELXX
node7         Lab 3    MODELXX
node9         Lab 5    MODELXX
```

```
cluster1::> system node show
Node  Health Eligibility Uptime       Model    Owner  Location
------ ------ ----------- ------------- -------- ------ -------------
node0  true   true        89 days 23:47 MODELXX  IT     Data Center 2
node1  true   true        15 days 22:37 MODELXX  Data Center 2
node2  true   true        15 days 23:00 MODELXX  Data Center 2
node3  true   true        15 days 22:37 MODELXX  Data Center 2
4 entries were displayed.
```

This example displays the locations and model numbers of all nodes that are in physical locations that have names beginning with "Lab":

```
cluster1::> system node show -location lab* -fields location, model
node                  location model
------------- -------- ------
node5         Lab 1    MODELXX
node7         Lab 3    MODELXX
node9         Lab 5    MODELXX
```

system node show-discovered

Display all nodes discovered on the local network

**Availability:** This command is available to \text{cluster} administrators at the \text{admin} privilege level.

**Description**

The \text{system node show-discovered} command displays information about all the detectable nodes on the local cluster network. This includes both nodes in a cluster and nodes that do not belong to a cluster. You can filter the output to show only nodes that do not belong to a cluster or nodes that are in a cluster.

To see a list of values that are in use for a particular field, use the \text{-fields} parameter of this command with the list of field names you wish to view.
Parameters

\{[-fields <fieldname>, ...] \}

If you specify the -fields <fieldname>, ... parameter, the command only displays the fields that you specify.

\{[-instance] \}

If the -instance parameter is specified, the command displays detailed information about each node.

[-node <text>] - Node Name

This parameter specifies the name of a node for which information is to be displayed. If this parameter is not specified, the command displays information about all discovered nodes.

[-is-in-cluster {true|false}] - Is in a Cluster

If this parameter is set to false, the command lists only nodes that do not belong to a cluster.

[-cluster-uuid <UUID>] - Cluster UUID

Displays information about nodes belonging to the cluster that has the UUID you specify.

[-cluster-name <text>] - Cluster Name

Displays information about nodes belonging to the cluster that has the name you specify.

[-serial-number <text>] - Node Serial Number

Displays information about the node that has the serial number you specify.

[-addresses <IP Address>, ...] - Cluster IP Addresses

Displays information about the node that has the cluster IP addresses you specify.

[-netmask <IP Address>] - Cluster Address Mask

Displays information about the nodes that have the netmask address you specify.

[-nvramid <nvramid>] - Node NVRAM ID

Displays information about the node that has the NVRAM ID you specify.

[-partner-nvramid <nvramid>] - Partner NVRAM ID

Displays information about the node that has an HA partner with the NVRAM ID you specify.

[-model <text>] - Model

Displays the nodes that have the specified model number.

[-version <text>] - Software Version

Displays the nodes that have the specified version of Data ONTAP.

Examples

The following example displays information about all discovered nodes in the cluster network:

```
cluster1::*> system node show-discovered
Node          Cluster       Addresses       NVRAM ID    Partner NVRAM
------------- ------------- --------------- ----------- --------------
4069114-60-0  -             169.254.232.178 4069114600  -
4069114-60-2  -             169.254.79.38    4069114602  -
4069114-60-3  -             169.254.195.76   4069114603  -
cluster1-01   cluster1      169.254.140.39  4069114628  4069114629
cluster1-02   cluster1      169.254.138.137 4069114629  4069114628
```

system node show-memory-errors

Display Memory Errors on DIMMs

Availability: This command is available to cluster administrators at the advanced privilege level.
Description

system node show-memory-errors prints the history of memory (storage controller’s RAM) errors since boot. This command can be useful in diagnosing memory problems or determining which DIMM, if any, might need replacement. Some correctable ECC errors are to be expected under normal operation, but many occurring on a particular DIMM might indicate a problem. All the fields are read only and can be used to filter the output. The maximum number of physical address and timestamps reported is 160.

Parameters

{ [-fields <fieldname>, ...] }  
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-verbose]  
The -verbose parameter enables verbose mode, resulting in the display of more detailed output.

[-instance]  
If you specify the -instance parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node  
When provided, the -node parameter specifies the nodes for which the memory error statistics are to be displayed. When the -node is not provided, the command is applied to all the nodes in the cluster.

[-id <integer>] - DIMM ID
This parameter refers to the DIMM ID. It can be used to look at the correctable ECC error count on a specific DIMM.

[-name <text>] - DIMM Name
This parameter specifies the DIMM name for which the memory error statistics are to be displayed.

[-cecc <integer>] - Correctable ECC Error Count
This parameter can be used to get all the DIMMs with the specified correctable ECC error count.

[-merr {true|false}] - Multiple Errors on Same Address
Use this parameter with the values true to specify whether the error was seen multiple times on the same physical address. It can also be used to look at all the DIMMs with multiple errors on same address.

[-timestamp <text>, ...] - Error Time
This specifies the time at which the error was seen on the DIMM.

[-addr <text>, ...] - Error Address
This specifies the physical address on which the error was seen.

Examples

```bash
cluster1::*> system node show-memory-errors
Correctable ECC Memory Errors:

Node: localhost

<table>
<thead>
<tr>
<th>DIMM</th>
<th>CECC</th>
<th>Multiple Err</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Count</td>
<td>Same Address</td>
</tr>
<tr>
<td>------</td>
<td>------</td>
<td>--------------</td>
</tr>
<tr>
<td>DIMM-1</td>
<td>0</td>
<td>false</td>
</tr>
<tr>
<td>DIMM-2</td>
<td>0</td>
<td>false</td>
</tr>
<tr>
<td>DIMM-3</td>
<td>0</td>
<td>false</td>
</tr>
<tr>
<td>DIMM-4</td>
<td>0</td>
<td>false</td>
</tr>
<tr>
<td>DIMM-5</td>
<td>4</td>
<td>true</td>
</tr>
<tr>
<td>DIMM-6</td>
<td>1</td>
<td>false</td>
</tr>
<tr>
<td>DIMM-7</td>
<td>1</td>
<td>false</td>
</tr>
<tr>
<td>DIMM-8</td>
<td>0</td>
<td>false</td>
</tr>
</tbody>
</table>

8 entries were displayed.
```

system node commands
system node autosupport commands

Manage AutoSupport service

system node autosupport invoke

Generate and send an AutoSupport message

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system node autosupport invoke command sends an AutoSupport message from a node.

Parameters
-node {<nodename>|local} - Node

Use this parameter to specify the node from which the AutoSupport message is sent.

[-message <text>] - Message Included in the AutoSupport Subject

Use this parameter to specify text sent in the subject line of the AutoSupport message. This parameter is not available when the -type parameter is set to performance.

-type {test|performance|all} - Type of AutoSupport Collection to Issue

Use this parameter to specify the type of AutoSupport collection to issue. There is no default; you must specify a -type.

- test - The message contains basic information about the node. When the AutoSupport message is received by technical support, an e-mail confirmation is sent to the system owner of record. This enables you to confirm that the message is being received by technical support.
- all - The message contains all collected information about the node.
- performance - The message contains only performance information about the node. This parameter has effect only if performance AutoSupport messages are enabled, which is controlled by the -perf parameter of the system node autosupport modify command.

- uri <text> - Alternate Destination for This AutoSupport

Use this parameter to send the AutoSupport message to the destination you specify instead of the configured destination. Only "file", "mailto", "http", and "https" protocols are supported. If this parameter is omitted, the message is sent to the all of the recipients defined by the system node autosupport modify command.
Use this parameter to generate and send the message even if AutoSupport is disabled on the node.

**Examples**

The following example sends a test AutoSupport message from a node named node0 with the text "Testing ASUP":

```bash
cluster1::> system node autosupport invoke -node node0 -type test -message "Testing ASUP"
```

**Related references**

*system node autosupport modify* on page 1199

### system node autosupport invoke-core-upload

Generate and send an AutoSupport message with an existing core file.

**Availability:** This command is available to cluster administrators at the *admin* privilege level.

**Description**

The `system node autosupport invoke-core-upload` command sends two AutoSupport messages. The first AutoSupport message contains the content relevant to this core upload. This AutoSupport message has subject line with prefix "CORE INFO:". The second AutoSupport message contains the core file specified by the `-core-filename` option. This AutoSupport message has subject line with prefix "CORE UPLOAD:". The command requires that the specified file be present while the AutoSupport message is being transmitted.

**Parameters**

- `-node <nodename>|local` - Node
  
  Use this parameter to specify the node from which the AutoSupport message is sent. Defaults to localhost.

- `-message <text>` - Message Included in the AutoSupport Subject
  
  Use this parameter to specify the text in the subject line of the AutoSupport message.

- `-uri <text>` - Alternate Destination for This AutoSupport
  
  Use this parameter to send the AutoSupport message to an alternate destination. Only "http" and "https" protocols are supported. If this parameter is omitted, the message is sent to all the recipients defined by the `system node autosupport modify` command.

- `-force [true]` - Generate and Send Even if Disabled
  
  Use this parameter to generate and send the AutoSupport message even if AutoSupport is disabled on the node.

- `-case-number <text>` - Case Number for This Core Upload
  
  Use this parameter to specify the optional case number to be associated with this AutoSupport message.

- `-core-filename <text>` - The Existing Core Filename to Upload
  
  Use this parameter to specify the core file to be included in the AutoSupport message. Use the `system node coredump show` command to list the core files by name.

**Examples**

Use this command to list the core files from a node:
Use this command to invoke an AutoSupport message with the corefile core.4073000068.2013-09-11.15_05_01.nz:

```
cluster1::> system node autosupport invoke-core-upload -core-filename core.4073000068.2013-09-11.15_05_01.nz -node local
```

**system node autosupport invoke-performance-archive**

Generate and send an AutoSupport message with performance archives.

**Availability:** This command is available to cluster administrators at the `admin` privilege level.

**Description**

The `system node autosupport invoke-performance-archive` command sends an AutoSupport message with the performance archives from a node. The command requires that the performance archives in the specified date range be present while the AutoSupport message is being transmitted.

**Parameters**

- `-node {<nodename>|local}` - Node
  
  Use this parameter to specify the node from which the AutoSupport message is sent. The default setting is localhost.

- `[-message <text>]` - Message Included in the AutoSupport Subject
  
  Use this parameter to specify the text in the subject line of the AutoSupport message.

- `[-uri <text>]` - Alternate Destination for This AutoSupport
  
  Use this parameter to send the AutoSupport message to an alternate destination. Only "file," "http," and "https" protocols are supported. If this parameter is omitted, the message is sent to the all of the recipients defined by the `system node autosupport modify` command.

- `[-force [true]]` - Generate and Send Even if Disabled
  
  Use this parameter to generate and send the AutoSupport message even if AutoSupport is disabled on the node.

- `[-case-number <text>]` - Case Number for This Performance Archive Upload
  
  Use this parameter to specify the optional case number to be associated with this AutoSupport message.

- `[-start-date <MM/DD/YYYY HH:MM:SS>]` - Start Date for Performance Archive Dataset
  
  Use this parameter to specify the start date for the files in the performance archive dataset to be included in the AutoSupport message.

- `{ [-end-date <MM/DD/YYYY HH:MM:SS>]` - End Date for Performance Archive Dataset
  
  Use this parameter to specify the end date for the files in the performance archive dataset to be included in the AutoSupport message. The end date should be within six hours of the start date.

- `[-duration <[<integer>h][<integer>m][<integer>s]>]` - Duration of Performance Archive Dataset
  
  Use this parameter with start-date to specify the duration of the performance archive dataset to be included in the AutoSupport message. The maximum duration limit is six hours from the start date.
Examples
Use this command to invoke an AutoSupport message to include the performance archives in the given date range:

<table>
<thead>
<tr>

<th>Description</th>
</tr>
</thead>
</table>

system node autosupport invoke-splog
Generate and send an AutoSupport message with collected service-processor log files

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system node autosupport invoke-splog command sends an AutoSupport message with the Service Processor log files from a specified node in the cluster.

Parameters
- **-remote-node** `<nodename>|local>` - Node
  Use this parameter to specify the node from which Service Processor log files are to be collected.

  - **[-log-sequence `<integer>`]** - Log File Sequence Number
    Use this parameter to specify the sequence number of the Service Processor log files to be collected. If this parameter is omitted, the latest Service Processor log files are collected.

  - **[-uri `<text>`]** - Alternate Destination for This AutoSupport
    Use this parameter to send the AutoSupport message to an alternate destination. Only "file," "http," and "https" protocols are supported. If this parameter is omitted, the message is sent to the all of the recipients defined by the system node autosupport modify command.

  - **[-force [true]]** - Generate and Send Even if Disabled
    Use this parameter to generate and send the AutoSupport message even if AutoSupport is disabled on the node.

Examples
Use this command to invoke an AutoSupport message to include the Service Processor log files collected from node cluster1-02.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cluster1::&gt; system node autosupport invoke-splog -remote-node cluster1-02</td>
<td>Generate and send an AutoSupport message with the Service Processor log files collected from node cluster1-02.</td>
</tr>
</tbody>
</table>

*system node autosupport modify* on page 1199

system node autosupport modify
Modify AutoSupport configuration

Availability: This command is available to cluster administrators at the admin privilege level.
The system node autosupport modify command modifies the AutoSupport configuration of a node.

**Parameters**

- `-node {<nodename>|local} - Node`
  
  Use this parameter to specify the node being configured.

- `[ -state {enable|disable} ] - State`
  
  Use this parameter to specify whether AutoSupport is enabled or disabled on the node. The default setting is `enable`. When AutoSupport is disabled, messages are not sent to anyone, including the vendor's technical support, your internal support organization, or partners.

- `[ -mail-hosts <text>,... ] - SMTP Mail Hosts`
  
  Use this parameter to specify up to five SMTP mail hosts through which the node sends AutoSupport messages. This parameter is required if you specify e-mail addresses in the `-to`, `-noteto`, or `-partner-address` parameters or if you specify smtp in the `-transport` parameter. Separate multiple mail hosts with commas with no spaces in between. The AutoSupport delivery engine attempts to use these hosts for delivery in the order that you specify.

  You can optionally specify a port value for each mail server. A port value can be specified on none, all, or some of the mail hosts. The port specification for a mail host consists of a colon (":") and a decimal value between 1 and 65335, and follows the mailhost name (for example, `mymailhost.example.com:5678`). The default port value is `25`.

  Also, you can optionally prepend a user name and password combination for authentication to each mail server. The format of the username and password pair is `user1:pw1@mymailhost.example.com`. The username and password can be specified on none, all, or some of the mail hosts.

  The default value for this parameter is `mailhost`.

- `[ -from <mail address> ] - From Address`
  
  Use this parameter to specify the e-mail address from which the node sends AutoSupport messages. The default is Postmaster@xxx where xxx is the name of the system.

- `[ -to <mail address>,... ] - List of To Addresses`
  
  Use this parameter to specify up to five e-mail addresses to receive AutoSupport messages that are most relevant for your internal organization. Separate multiple addresses with commas with no spaces in between. For this parameter to have effect, the `-mail-hosts` parameter must be configured correctly. Individual trigger events can change the default usage of this parameter using the `-to` parameter of the `system node autosupport trigger modify` command. By default, no list is defined.

- `[ -noteto <mail address>,... ] - (DEPRECATED) List of Noteto Addresses`
  
  **Note:** This parameter has been deprecated and might be removed in a future version of Data ONTAP.

  Use this parameter to specify up to five addresses to receive a short-note version of AutoSupport messages that are most relevant for your internal organization. Short-note e-mails contain only the subject line of the AutoSupport message, which is easier to view on a mobile device. For this parameter to have effect, the `-mail-hosts` parameter must be configured correctly. Individual trigger events can change the default usage of this parameter using the `-noteto` parameter of the `system node autosupport trigger modify` command. By default, no list is defined.

- `[ -partner-address <mail address>,... ] - List of Partner Addresses`
  
  Use this parameter to specify up to five e-mail addresses to receive all AutoSupport messages including periodic messages. This parameter is typically used for support partners. For this parameter to have effect, the `-mail-hosts` parameter must be configured correctly. By default, no list is defined.

- `[ -support {enable|disable} ] - Send AutoSupport Messages to Vendor Support`
  
  Use this parameter to specify whether to send all AutoSupport messages to your vendor's technical support. (Destination information is pre-defined and does not require configuration.) When `-state` is enabled and `-
support is disabled, messages are sent to the addresses specified in the -to, -noteto, or -partner-address parameters but are not sent to your vendor's technical support. The default is enable.

[-transport {smtp|http|https}] - Protocol to Contact Support

Use this parameter to specify the protocol used to deliver AutoSupport messages to your vendor's technical support. This parameter applies only when the -support parameter is set to enable. If you specify http or https and your network uses a proxy, you must also set the -proxy-url parameter. If you specify smtp, you must also configure the -mail-hosts parameter.

[-proxy-url <text>] - Support Proxy URL

Use this parameter to specify an HTTP or HTTPS proxy if the -transport parameter is set to HTTP or HTTPS and your organization uses a proxy. Enter the URL without an http:// or https:// prefix. If authentication is required, use the format "[username]@[host][:[port]]". You will be prompted for the password. The default is an empty string. To specify a proxy that contains a question mark, press ESC followed by the "?". This field can be cleared by setting the value to an empty string using two double quotes (""").

[-hostname-subj {true|false}] - Hostname Subject

Use this parameter to specify whether the hostname of the node is included in the subject line of the AutoSupport message. The default is false. This parameter applies only if the -remove-private-data parameter is true.

[-nht {true|false}] - NHT Enable

Use this parameter to specify whether NHT disk drive health data is sent to technical support and addresses specified in the -partner-address parameter when disk drives fail. The default is true.

[-perf {true|false}] - Performance Data Enable

Use this parameter to specify whether performance data is sent to technical support and addresses specified in the -partner-address parameter. The default is true.

[-retry-interval <[<integer>h][<integer>m][<integer>s]>] - Retry Interval

Use this parameter to specify the amount of time to delay before trying to send an AutoSupport message again after a sending failure. Values may end with "s", "m", or "h" to indicate seconds, minutes, or hours, respectively. The minimum interval is 30 seconds and the maximum is 1 day. The default is 4 minutes.

[-retry-count <integer>] - Retry Count

Use this parameter to specify the number of times to try resending mail before dropping it. The minimum number is 5 and the maximum is 30. The default is 15 times.

[-reminder {true|false}] - Reminder Enable

Use this parameter to enable or disable a reminder message that is sent when AutoSupport is not configured to send messages to technical support. This reminder is logged as an EMS event called "autosupport.general.reminder" every 24 hours. The default is true.

[-max-http-size <integer> [KB|MB|GB|TB|PB]] - Maximum HTTP Size

Use this parameter to specify the maximum file size (in bytes by default, but can also be specified in KB, MB, TB or PB) for HTTP and HTTPS transfers. This parameter applies only to messages sent to technical support and only if the -transport parameter is set to HTTP or HTTPS. Setting the value to 0 disables the delivery size budget. The default is 50 MB and the minimum supported size is 2 MB.

If the size of the AutoSupport message exceeds this value, AutoSupport will deliver as much of the message as possible. You can use the "system node autosupport manifest show" command to identify the sections of the message that AutoSupport sent. AutoSupport collects and sends the content in order of priority. The priority is predefined for each AutoSupport message. To identify the collection order for an AutoSupport trigger, use the "system node autosupport trigger show" command with the -instance parameter.

[-max-smtp-size <integer> [KB|MB|GB|TB|PB]] - Maximum SMTP Size

Use this parameter to specify the maximum file size (in bytes by default, but can also be specified in KB, MB, TB or PB) for SMTP (e-mail) transfers. This parameter applies to messages sent to the addresses specified in "system node autosupport message show" command with the -instance parameter.
the -to, -noteto, and -partner-address parameters. If the -transport parameter is set to smtp, this parameter also
applies to messages sent to the vendor's technical support. Setting the value to 0 disables the delivery size
budget. The default is 5 MB and the minimum supported size is 2 MB.

If the size of the AutoSupport message exceeds this value, AutoSupport will deliver as much of the message as
possible. You can use the "system node autosupport manifest show" command to identify the sections of the
message that AutoSupport sent. AutoSupport collects and sends the content in order of priority. The priority is
predefined for each AutoSupport message. To identify the collection order for an AutoSupport trigger, use the
"system node autosupport trigger show" command with the -instance parameter.

[-remove-private-data {true|false}] - Remove Sensitive Data

Use this parameter with the value true to remove, encode, or mask sensitive data from AutoSupport
attachments and headers. Use this feature to eliminate private data from all AutoSupport messages.

Eliminated data might include: IP addresses, MAC addresses, URIs, DNS names, e-mail addresses, port
numbers, node names, Vserver names, cluster names, aggregate names, volume names, junction paths, policy
names, user IDs, group IDs, LUNs, and qtree names.

The default is false.

Note: Changing this value from false to true deletes the AutoSupport history and all files associated with it.

[-validate-digital-certificate {true|false}] - Validate Digital Certificate Received

Use this parameter with the value true to force the node to validate digital certificates that it receives. The
default is true. When this value is true the certificate might be validated by OCSP. The OCSP validation for
these certificates is controlled by security config ocsp enable -app autosupport and security
config ocsp disable -app autosupport.

[-ondemand-state {enable|disable}] - AutoSupport OnDemand State (privilege: advanced)

Use this parameter to specify whether the AutoSupport OnDemand feature is enabled or disabled on the node.
The default is enable. When AutoSupport OnDemand is enabled, support personnel can remotely trigger new
AutoSupport messages, re-send existing AutoSupport messages and decline the delivery of unwanted
AutoSupport messages. When this option is disabled, this node will not respond to any AutoSupport
OnDemand requests from support personnel.

[-ondemand-remote-diagnostics-state {enable|disable}] - AutoSupport OnDemand Remote Diagnostics
State (privilege: advanced)

Use this parameter to specify whether the AutoSupport OnDemand Remote Diagnostics feature is enabled or
disabled on the node. The default is enable. When AutoSupport OnDemand Remote Diagnostics is enabled,
support personnel can remotely trigger new AutoSupport messages on this node to gather information during
troubleshooting scenarios. When this option is disabled, support personnel will still be able to re-send existing
AutoSupport messages that may not have been transmitted correctly.

Examples

The following example enables AutoSupport on a node named node3 with the following settings:

- SMTP mail host named smtp.example.com.
- E-mail "from" address of alerts@node3.example.com
- E-mail "to" address of support@example.com
- AutoSupport messages sent to support personnel
- HTTPS set as transport protocol
- Short-note address of pda@example.com
- If sending fails, the system will wait 23 minutes before retrying.
The following examples show how to modify AutoSupport URLs when using IPv6 address literals:

```shell
cluster1::> system node autosupport modify -node node3 -state enable -mail-hosts smtp.example.com -from alerts@node3.example.com -to support@example.com -support enable -transport https -noteto pda@example.com -retry-interval 23m
```

```shell
cluster1::> system node autosupport modify -node node1 -mail-hosts [2620:10a:4002:6004::bbbb]:25
```

```shell
cluster1::> system node autosupport modify -node node1 -proxy-url username:password@[2620:10a:4002:6004::bbbb]:8080
```

### system node autosupport show

Display AutoSupport configuration

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

The `system node autosupport show` command displays the AutoSupport configuration of one or more nodes.

**Parameters**

- `[-fields <fieldname>,...]`
  
  If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

- `[-config]`
  
  Use this parameter to display the retry interval, retry count, throttle, and reminder settings of all nodes in the cluster.

- `[-nht-performance]`
  
  Use this parameter to display NHT and performance information about all nodes in the cluster.

- `[-recent]`
  
  Use this parameter to display the subject and time of the last AutoSupport message generated by each node in the cluster.

- `[-support-http]`
  
  Use this parameter to display whether HTTP support is enabled for each node in the cluster, and identify the transport protocol and the support proxy URL used by each node.

- `[-support-smtp]`
  
  Use this parameter to display whether SMTP (e-mail) support is enabled for each node in the cluster, and identify the transport protocol and the "to" mail address used by each node.

- `[-instance]`
  
  If you specify the `-instance` parameter, the command displays detailed information about all fields.

- `[-node {<nodename>|local}] - Node`

  Use this parameter to display detailed information about the node you specify.

- `[-state {enable|disable}] - State`

  Use this parameter to display information only about nodes that have the AutoSupport state you specify.
[=mail-hosts <text>, ...] - SMTP Mail Hosts
Use this parameter to display information only about nodes that use the mail hosts you specify.

[from <mail address>] - From Address
Use this parameter to display information only about nodes that have the “from” e-mail address you specify.

to <mail address>, ...] - List of To Addresses
Use this parameter to display information only about nodes that have the “to” e-mail addresses you specify.

[=noteto <mail address>, ...] - (DEPRECATED) List of Noteto Addresses
Note: This parameter has been deprecated and might be removed in a future version of Data ONTAP.
Use this parameter to display information only about nodes that send short-note e-mail messages to the e-mail addresses you specify. Short-note e-mails contain only the subject line of the AutoSupport message, which is easier to view on a mobile device.

[=partner-address <mail address>, ...] - List of Partner Addresses
Use this parameter to display information only about nodes that have the "partner-address" e-mail addresses you specify. These addresses are not subject to the delivery limitations configured for the “-to” addresses of AutoSupport triggers.

[=support {enable|disable}] - Send AutoSupport Messages to Vendor Support
Use this parameter with the value "enable" to display information only about nodes that send AutoSupport messages to your vendor's technical support. Use this parameter with the value "disable" to display information only about nodes that do not send AutoSupport messages to your vendor's technical support.

[=transport {smtp|http|https}] - Protocol to Contact Support
Use this parameter to display information only about nodes that use the protocol you specify to send AutoSupport messages.

[=url <text>] - Support URL for HTTP/HTTPS
Use this parameter to display information only about nodes that use the URL you specify to send messages through HTTP and HTTPS POST operations.

[=put-url <text>] - Support URL for HTTP/S PUT
Use this parameter to display information only about nodes that use the URL you specify to send messages through HTTP PUT operations.

[=proxy-url <text>] - Support Proxy URL
Use this parameter to display information only about nodes that use the proxy URL you specify.

[=support-address <mail address>, ...] - Support Address
Use this parameter to display information only about nodes that use the external support address you specify.

[=hostname-subj {true|false}] - Hostname Subject
Use this parameter to display information only about nodes that include their hostname in the "Subject:" line of AutoSupport messages. If the parameter "remove-private-data" is false, this parameter has no effect.

[=nht {true|false}] - NHT Enable
Use this parameter with the value "true" to display information only about nodes that send NHT disk drive data. Use this parameter with the value "false" to display information only about nodes that do not send NHT data.

[=perf {true|false}] - Performance Data Enable
Use this parameter with the value "true" to display information only about nodes that send periodic performance AutoSupport messages. Use this parameter with the value "false" to display information only about nodes that do not send periodic performance messages.

Use this parameter to display information only about nodes that use the retry interval you specify.
[--retry-count <integer>] - Retry Count
Use this parameter to display information only about nodes that use the retry count you specify.

[--reminder {true|false}] - Reminder Enable
Use this parameter with the value "true" to display information only about nodes that send messages
reminding administrators to enable AutoSupport if AutoSupport is not enabled. Use this parameter with the
value "false" to display information only about nodes that do not send reminder messages.

[--last-subject <text>] - Last Subject Sent
Use this parameter to display information only about nodes whose last AutoSupport message had the
"Subject:" line you specify.

[--last-time <MM/DD/YYYY HH:MM:SS>] - Last Time Sent
Use this parameter to display information only about nodes whose last AutoSupport message was sent at the
date and time you specify. Specify the date and time in the format "MM/DD/YYYY HH:MM:SS".

[--max-http-size <integer>[KB|MB|GB|TB|PB]] - Maximum HTTP Size
Use this parameter to display information only about nodes that limit the maximum size of HTTP transfers to
the file size you specify.

[--max-smtp-size <integer>[KB|MB|GB|TB|PB]] - Maximum SMTP Size
Use this parameter to display information only about nodes that limit the maximum size of SMTP (e-mail)
transfers to the file size you specify.

[--remove-private-data {true|false}] - Remove Sensitive Data
Use this parameter with the value "true" to display information only about nodes that remove sensitive data
from AutoSupport messages. Use this parameter with the value "false" to display information only about
nodes that do not remove sensitive data.

[--validate-digital-certificate {true|false}] - Validate Digital Certificate Received
Use this parameter with the value "true" to display information only about nodes that validate digital
certificates they receive. Use this parameter with the value "false" to display information only about nodes that
do not validate digital certificates.

[--ondemand-state {enable|disable}] - AutoSupport OnDemand State (privilege: advanced)
Use this parameter to display information only about nodes that have the AutoSupport OnDemand state you
specify.

[--ondemand-remote-diagnostics-state {enable|disable}] - AutoSupport OnDemand Remote Diagnostics
State (privilege: advanced)
Use this parameter to display information only about nodes that have the AutoSupport OnDemand Remote
Diagnostics state you specify.

[--ondemand-server-url <text>] - AutoSupport OnDemand Server URL
Use this parameter to display information only about nodes that have the AutoSupport OnDemand Server
URL you specify.

Examples
The following example displays the AutoSupport configuration for a node named node3:

```bash
cluster1:/> system node autosupport show -node node3
    Node: node3
    State: enable
    SMTP Mail Hosts: smtp.example.com
    From Address: alerts@node3.example.com
    List of To Addresses: support@example.com
    List of Noteto Addresses: -
    List of Partner Addresses: partner@node4.example.com
    Send AutoSupport Messages to Vendor Support: enable
    Protocol to Contact Support: https
    Support Proxy URL: support.proxy.example.com
```

**system node autosupport check commands**

Check AutoSupport connectivity and configuration

**system node autosupport check show**

Display overall status of AutoSupport subsystem

*Availability*: This command is available to cluster administrators at the `admin` privilege level.

**Description**

The `system node autosupport status check show` command displays the overall status of the AutoSupport subsystem.

**Parameters**

`{ [-fields <fieldname>, ...]`  
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

`| [-instance ]`  
If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-node <nodename>] - Node`  
Selects the nodes that match this parameter value. This parameter specifies the node whose status is being displayed.

`[-http-status (ok|warning|failed|not-run)] - Overall Status of AutoSupport HTTP/HTTPS Destinations`  
Selects the nodes that match this parameter value. This parameter specifies whether connectivity to the AutoSupport HTTP destination was established.

`[-aod-status (ok|warning|failed|not-run)] - Overall Status of AutoSupport OnDemand Server`  
Selects the nodes that match this parameter value. This parameter specifies the detailed description of the connectivity status to the AutoSupport OnDemand Server.

`[-smtp-status (ok|warning|failed|not-run)] - Overall Status of AutoSupport SMTP Destinations`  
Selects the nodes that match this parameter value. This parameter specifies whether connectivity to the AutoSupport mailhost was established.
[-config-status {ok|warning|failed|not-run}] - Overall Status of AutoSupport Configuration

Selects the nodes that match this parameter value. This parameter specifies whether the AutoSupport configuration check succeeded or not.

[-warning-text <text>] - Conditional Warning Message

Selects the nodes that match this parameter value. This parameter specifies how to get more details regarding the status of the AutoSupport subsystem, in case of any errors.

Examples

The following example displays the overall status of the AutoSupport subsystem on a node named node2:

```
cluster1::> system node autosupport check show -node node2
```

<table>
<thead>
<tr>
<th>Node</th>
<th>HTTP/HTTPS Server</th>
<th>On Demand Server</th>
<th>SMTP</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>node2</td>
<td>ok</td>
<td>ok</td>
<td>ok</td>
<td>ok</td>
</tr>
</tbody>
</table>

**system node autosupport check show-details**

Display detailed status of AutoSupport subsystem

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

The `system node autosupport check show-details` command displays the detailed status of the AutoSupport subsystem. This includes verifying connectivity to your vendor's AutoSupport destinations by sending test messages and providing a list of possible errors in your AutoSupport configuration settings.

**Parameters**

{-fields <fieldname>, ...}

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

[-instance]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node <nodename>] - Node

Selects the check results that match this parameter value. This parameter specifies the node whose status is being displayed.

[-check-type <Type of AutoSupport Check>] - AutoSupport Check Type

Selects the check results that match this parameter value. This parameter specifies the type of AutoSupport check being performed.

[-status {ok|warning|failed|not-run}] - Status of the Check

Selects the check results that match this parameter value. This parameter specifies the result of this AutoSupport check.

[-error-detail <text>] - Detailed Description of Error

Selects the check results that match this parameter value. This parameter specifies the detailed error message for this AutoSupport check.

[-corrective-action <text>] - Corrective Action

Selects the check results that match this parameter value. This parameter specifies a description of how to correct any errors seen as part of this AutoSupport Check
### Examples

The following example displays the detailed status of the AutoSupport subsystem for a node named node2:

```bash
cluster1::> system node autosupport check show-details -node node2
```

<table>
<thead>
<tr>
<th>Node: node2</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Category:</strong> http-https</td>
</tr>
<tr>
<td><strong>Component:</strong> http-put-destination</td>
</tr>
<tr>
<td><strong>Status:</strong> ok</td>
</tr>
<tr>
<td><strong>Detail:</strong> Successfully connected to &quot;support.netapp.com/put&quot;.</td>
</tr>
<tr>
<td><strong>Component:</strong> http-post-destination</td>
</tr>
<tr>
<td><strong>Status:</strong> ok</td>
</tr>
<tr>
<td><strong>Detail:</strong> Successfully connected to &quot;support.netapp.com/post&quot;.</td>
</tr>
</tbody>
</table>

| Category: smtp |
| Component: mail-server |
| **Status:** ok |
| **Detail:** Successfully connected to "mailhost.netapp.com". |

| Component: mail-server |
| **Status:** ok |
| **Detail:** Successfully connected to "sendmail.domain.com". |

| Component: mail-server |
| **Status:** ok |
| **Detail:** Successfully connected to "qmail.domain.com". |

| Category: on-demand |
| Component: ondemand-server |
| **Status:** ok |
| **Detail:** Successfully connected to "support.netapp.com/aods". |

| Category: configuration |
| Component: configuration |
| **Status:** ok |
| **Detail:** No configuration issues found. |

---

**system node autosupport destinations commands**

The AutoSupport Destinations directory

**system node autosupport destinations show**

Display a summary of the current AutoSupport destinations

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

The `system node autosupport destinations show` command displays a list of all message destinations used by AutoSupport. The command provides you with a quick summary of all addresses and URLs that receive AutoSupport messages from all nodes in the cluster.

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance]
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.
[-node \(<\text{nodename}\>|\text{local}\)] - Node

Use this parameter to display only destinations that receive AutoSupport messages from the node you specify.

[-destinations \(<\text{text}\>,\ldots\)] - Destinations

Use this parameter to display only destination lists for nodes that send AutoSupport messages to the destinations you specify.

Examples

This example displays all of the destinations in use by the current cluster. Each node uses the same destination for HTTP POST, HTTP PUT, and e-mail notifications.

```
class1::> system node autosupport destinations show
Node Destinations
node1 https://asuppost.example.com/cgi-bin/asup.cgi
     https://asupput.example.com/cgi-bin/asup.cgi
     support@example.com
node2 https://asuppost.example.com/cgi-bin/asup.cgi
     https://asupput.example.com/cgi-bin/asup.cgi
     support@example.com
```

system node autosupport history commands

The AutoSupport History Directory

system node autosupport history cancel

Cancel an AutoSupport Transmission.

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The `system node autosupport history cancel` command cancels an active AutoSupport transmission. This command is used to pause or abandon a long running delivery of an AutoSupport message. The cancelled AutoSupport message remains available for retransmission using the `system node autosupport history retransmit` command.

Parameters

-[-node \(<\text{nodename}\>|\text{local}\)] - Node
  Use this parameter to specify the node on which to cancel the AutoSupport message. The default setting is localhost.

-[-seq-num \(<\text{Sequence Number}\)] - AutoSupport Sequence Number
  Use this parameter to specify the sequence number of the AutoSupport message you want to cancel.

-[-destination \(<\text{smtp}|\text{http}|\text{noteto}|\text{retransmit}\)] - Destination for This AutoSupport
  Use this parameter to specify the destination type for the AutoSupport message you want to cancel.

Examples

Use this command to cancel the AutoSupport message delivery with seq-num 10 to all destinations.

```
class1::> system node autosupport history cancel -node local -seq-num 10
```

Use this command to cancel the AutoSupport message delivery with seq-num 10 via HTTP only.
Related references

system node autosupport history retransmit on page 1210

system node autosupport history retransmit

Selectively retransmit a previously collected AutoSupport.

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system node autosupport history retransmit command retransmits a locally stored AutoSupport message.

Support personnel might ask you to run this command to retransmit an AutoSupport message. You might also retransmit an AutoSupport message if you run the system node autosupport history show command and notice that a message was not delivered.

If you retransmit an AutoSupport message, and if support already received that message, the support system will not create a duplicate case. If, on the other hand, support did not receive that message, then the AutoSupport system will analyze the message and create a case, if necessary.

Use the system node autosupport history show command to display the 50 most recent AutoSupport messages, which are available for retransmission.

Parameters
-node {<nodename>|local} - Node
    Use this parameter to specify the node from which the AutoSupport message is sent.

-seq-num <Sequence Number> - AutoSupport Sequence Number
    Use this parameter to specify the sequence number of the AutoSupport message to retransmit.

-uri <text> - Destination to Send this AutoSupport
    Use this parameter to specify the HTTP, HTTPS, FILE, or MAILTO uniform resource indicator (URI) to which the AutoSupport message is sent.

[ -size-limit {<integer>[KB|MB|GB|TB|PB]} ] - Transmit Size Limit for this AutoSupport.
    Use this parameter to specify a size limit for the retransmitted AutoSupport message. If the message information exceeds this limit, it will be trimmed to fit the limit you specify. Omit the size limit or set it to 0 to disable it, which is useful to retransmit an AutoSupport message that was truncated by a mail or Web server due to the default size limits.

Examples
The following example retransmits the AutoSupport message with sequence number 45 on the node "node1" to a support address by e-mail.

    cluster1::> system node autosupport history retransmit -node node1 -seq-num 45 -uri mailto:support@example.com

Related references

system node autosupport history show on page 1211
system node autosupport history show

Display recent AutoSupport messages

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system node autosupport history show command displays information about the 50 most recent AutoSupport messages sent by nodes in the cluster. By default, it displays the following information:

- AutoSupport sequence number
- Destination type, such as smtp
- Status of delivery, such as sent-successful
- Attempt count
- Time of last update

Parameters
[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-delivery]
Use this parameter to display destination information about each AutoSupport message.

[-detail]
Use this parameter to display trigger and subject information about each AutoSupport message.

[-instance]]
Use this parameter to display the following detailed information about all entries:

- Trigger event
- Subject of the message
- Delivery URI
- Last error
- Compressed Size
- Decompressed Size
- Total Collection Time (in ms)

[-node {<nodename>|local}] - Node
Use this parameter to display only AutoSupport messages sent from the node you specify.

[-seq-num <Sequence Number>] - AutoSupport Sequence Number
Use this parameter to display only AutoSupport messages with the sequence number you specify. Sequence numbers are unique to a node. Use this parameter with the -node parameter to display information about an individual message.

[-destination {smtp|http|noteto|retransmit}] - Destination for This AutoSupport
Use this parameter to display only AutoSupport messages that were sent to the destination type you specify.

[-trigger <Message Name>] - Trigger Event
Use this parameter to display only AutoSupport messages that match the trigger event you specify.
[-last-update <MM/DD/YYYY HH:MM:SS>] - Time of Last Update
Use this parameter to display only AutoSupport messages that were updated most recently at the time you
specify. Specify time in "MM/DD/YYYY HH:MM:SS" format.

[-status <AutoSupport general status>] - Status of Delivery
Use this parameter to display only AutoSupport messages with the status you specify. Possible statuses are:
• initializing - The AutoSupport message request is being processed.
• collection-failed - The AutoSupport collection failed. View the 'Last Error' field of this message for more
  information.
• collection-in-progress - The AutoSupport collection is in progress.
• queued - The AutoSupport message is queued for delivery.
• transmitting - The AutoSupport message transmission is in progress.
• sent-successful - The AutoSupport message was sent successfully.
• ignore - The AutoSupport message was processed successfully, but the trigger event is not configured for
  delivery to the current destination type.
• re-queued - The AutoSupport message transmission failed, has been re-queued, and will be retried.
• transmission-failed - The AutoSupport message transmission failed, and the retry limit was exceeded.
• ondemand-ignore - The AutoSupport message was processed successfully, but the AutoSupport On Demand server chose to ignore it.

[-attempt-count <integer>] - Delivery Attempts
Use this parameter to display only AutoSupport messages that the system has attempted to send the number of
times you specify. This parameter is most useful when given a range, such as ">5".

[-subject <text>] - AutoSupport Subject
Use this parameter to display only AutoSupport messages of the type you specify.

[-uri <text>] - Delivery URI
Use this parameter to display only AutoSupport messages sent to the destination URI you specify.

[-error <text>] - Last Error
Use this parameter to display only AutoSupport messages that failed with the "Last Error" description you
specify.

[-generated-on <MM/DD/YYYY HH:MM:SS>] - Time of Generation
Use this parameter to display only AutoSupport messages that were generated (collected) at a particular time.

[-size {<integer>[KB|MB|GB|TB|PB]}] - AutoSupport Compressed Size
Use this parameter to display only AutoSupport messages of the compressed size you specify.

[-percent-complete <integer>] - Percent Complete
Use this parameter to display the percentage completed for any active (incomplete) AutoSupport message.

[-upload-rate {<integer>[Bps|Kbps|Mpbs|Gbps]|unlimited}] - Rate of Upload
Use this parameter to display the rate in bytes per second that upload is using currently, otherwise zero when
not active.

[-time-remaining {<integer>h|[<integer>m]<[<integer>s]>]} - Time Remaining for Upload
Use this parameter to display the estimated time for the transmission of the AutoSupport message to complete.

[-decompressed-size {<integer>[KB|MB|GB|TB|PB]}] - AutoSupport Decompressed Size
Use this parameter to display only AutoSupport messages of the decompressed size you specify.
[-total-time <integer>] - Total Collection Time (ms)

Use this parameter to display only AutoSupport messages of total collection time you specify. A value is only shown when the collection has completed.

Examples

The following example shows the first three results output by the history command. Note that "q" was pressed at the prompt.

```
cluster1::> system node autosupport history show -node nodel
Node  Seq  Destination Status          Attempt Count  Last Update
------ ---- --------------- ---------- -------- -----------------  
nodel 56  smtp  ignore         1  11/18/2010 01:10:01
       55  smtp  ignore         1  11/18/2010 00:53:59
       54  smtp  ignore         1  11/17/2010 12:18:58

Press <space> to page down, <return> for next line, or 'q' to quit... q

9 entries were displayed.
```

system node autosupport history show-upload-details

Display upload details of recent AutoSupport messages

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The `system node autosupport history show-upload-details` command displays upload details of the 50 most recent AutoSupport messages sent by nodes in the cluster. By default, it displays the following information:

- AutoSupport Sequence Number
- Destination
- Compressed Size
- Percentage Complete
- Rate of upload
- Time Remaining

Parameters

`{[-fields <fieldname>, ...]}

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

`{| [-instance] |}

Use this parameter to display the following detailed information about all entries:

- AutoSupport Sequence Number
- Destination
- Compressed Size`
- Percentage Complete
- Rate of Upload
- Time Remaining

[-node {<nodename>|local}] - Node

Use this parameter to display details of AutoSupport messages sent from the node you specify.

[-seq-num <Sequence Number>] - AutoSupport Sequence Number

Use this parameter to display details of AutoSupport messages with the sequence number you specify. Sequence numbers are unique to a node. Use this parameter with the -node parameter to display information about an individual message.

[-destination {smtp|http|noteto|retransmit}] - Destination for this AutoSupport

Use this parameter to display details of AutoSupport messages that were sent to the destination type you specify.

[-size {<integer>[KB|MB|GB|TB|PB]}] - Autosupport Compressed Size

Use this parameter to display details of AutoSupport messages of the compressed size you specify.

[-percent-complete <integer>] - Percent Complete

Use this parameter to display the percentage completed for any active (incomplete) AutoSupport message.

[-upload-rate {<integer>[Bps|KBps|MBps|GBps]|unlimited}] - Rate of Upload

Use this parameter to display the rate in bytes per second that upload is using currently, otherwise zero when not active.

[-time-remaining <[<integer>h][<integer>m][<integer>s]>] - Time remaining for Upload

Use this parameter to display the estimated time for the transmission of the AutoSupport message to complete.

Examples
The following example shows the first three results output by the history show-upload-details command. Note that "q" was pressed at the prompt.

```
cluster1::> system node autosupport history show-upload-details -node node1

Seq            Percent        Time
Node    Num Destination Size      Complete Rate        Remaining
------------ ----- ----------- --------- ---------- ----------- --------
node1
13 smtp       755.9KB   100        142.88KBps 0s
             http      755.8KB   80         125.97KBps 10s
             noteto    -         -          -          -
12 smtp       -         -          -          -
             http      316.4KB   100        158.22KBps 0s
             noteto    201B      100        201Bps      0s
11 smtp       -         -          -          -
             http      626.1MB   100        649.56KBps 0s
             noteto    -         -          -          -

Press <space> to page down, <return>> for next line, or 'q' to quit... q
9 entries were displayed.
```

system node autosupport manifest commands

The AutoSupport Manifest directory
system node autosupport manifest show

Display AutoSupport content manifest

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The `system node autosupport manifest show` command reports what information is contained in AutoSupport messages. The name and size of each file collected for the message is reported, along with any errors.

Parameters

```
{-fields <fieldname>, ...}
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-content]
```

Use this parameter to display detailed information about the content of the files contained in the report.

```
[-instance]
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[-node <nodename> | local] - Node
```

Use this parameter to display information about only AutoSupport messages sent from the node you specify.

```
[-seq-num <Sequence Number>] - AutoSupport Sequence Number
```

Use this parameter to display information about only AutoSupport message content with the sequence number you specify. Sequence numbers are unique to a node. Use this parameter with the `-node` parameter to display information about an individual message.

```
[-prio-num <integer>] - Priority Order of Collection
```

Use this parameter to display information about only AutoSupport message content with the collection priority you specify. Content is collected in order, by priority number.

```
[-subsys <subsys1,subsys2,...>] - Subsystem
```

Use this parameter to display information about only AutoSupport message content collected by the AutoSupport subsystem you specify.

```
[-cmd-tgt <Execution domain of AutoSupport content>] - Execution Domain for Command
```

Use this parameter to display information about only AutoSupport message content produced in the execution domain you specify.

```
[-body-file <text>] - The AutoSupport Content Filename for this Data
```

Use this parameter to display information about only AutoSupport message content stored in the body file with the file name you specify.

```
[-cmd <text>] - Actual Data Being Collected
```

Use this parameter to display information about only AutoSupport message content produced by the D-Blade command, BSD command, file, or XML table you specify.

```
[-query <text>] - Table Query for XML Collection
```

Use this parameter to display information about only AutoSupport message content produced by the table query you specify.

```
[-size-collected {<integer> [KB|MB|GB|TB|PB]}] - Number of Bytes Collected
```

Use this parameter to display information about only AutoSupport message content collected in files with the file size you specify.
[-time-collected <integer>] - Collection Time for this Data Item (ms)
Use this parameter to display information about only AutoSupport message content collected in the amount of
time you specify, in milliseconds.

[-status <AutoSupport manifest collection status>] - Status of this Data Item
Use this parameter to display information about only AutoSupport message content with the collection status
you specify. Possible statuses are:
  • requested - The AutoSupport request has been added to the queue and is waiting processing by the
    collector.
  • working - The AutoSupport collector is actively gathering the needed data.
  • file-not-found - AutoSupport data collection failed because a necessary file is missing.
  • no-such-table - The AutoSupport collector was unable to find the requested SMF table.
  • collection-truncated-size-limit - AutoSupport data was truncated due to size limits, but partial
data is available.
  • collection-truncated-file-size-limit - AutoSupport data for a particular data item or file was
    truncated due to file size limits, but partial data is available.
  • collection-skipped-size-limit - AutoSupport data was skipped due to size limits, and no data is
    available.
  • collection-truncated-time-limit - AutoSupport data was truncated due to time limits, but partial
data is available.
  • collection-skipped-time-limit - AutoSupport data was skipped due to time limits, and no data is
    available.
  • delivery-skipped-size-limit - AutoSupport data was skipped at delivery time due to size limits.
  • general-error - AutoSupport data collection failed. Additional information (if any) is in the Error
    String field.
  • completed - AutoSupport data collection is complete, and the AutoSupport message is ready for delivery.
  • content-not-collected-precheck - AutoSupport content was not collected due to pre-check
    function violation.
  • content-not-collected-privacy - AutoSupport content was not collected because the operation is
    disabled in privacy mode.
  • content-empty - AutoSupport content was collected successfully, but the output was empty.
  • collection-aborted - AutoSupport data collection was aborted.

[-error <text>] - Textual Description of Error
Use this parameter to display information about only AutoSupport message content with the error text you
specify. If data collection has failed, the error text contains a description of the failure. If data collection
completes successfully, this field is empty.

[-content-type <Type of AutoSupport content>] - AutoSupport Content Type for this Data
Use this parameter to display information about only AutoSupport message content of the type you specify.
Types supported are:
  • basic - Configuration data about this subsystem
  • troubleshooting - Detailed diagnostic data about this subsystem
[-orig-size-collected {<integer> [KB|MB|GB|TB|PB]}] - Initial Number of Bytes Collected

Use this parameter to display information about only AutoSupport message content collected in files with the original file size you specify.

[-size-compressed {<integer> [KB|MB|GB|TB|PB]}] - Compressed Size

Use this parameter to display information about only AutoSupport message content collected in files with the compressed file size you specify.

**Examples**

This example displays the content of AutoSupport message number 372 on the node "node1".

```
cluster1::> system node autosupport manifest show -node node1 -seq-num 372
```

<table>

system node autosupport trigger commands

The AutoSupport Trigger directory

system node autosupport trigger modify

Modify AutoSupport trigger configuration

Availability: This command is available to cluster administrators at the admin privilege level.

Description
Use the `system node autosupport trigger modify` command to enable and disable AutoSupport messages for individual triggers, and to specify additional subsystem reports to include if an individual trigger sends an AutoSupport message.

Parameters
- `-node <nodename> | local` - Node
  Use this parameter to specify the node whose AutoSupport trigger configuration is modified.

- `-autosupport-message <Autosupport Message>` - EMS Message
  Use this parameter to specify the AutoSupport trigger to modify. AutoSupport triggers are EMS messages whose names begin with "callhome.". However, for the purposes of this command, "callhome." is implied, does not need to be entered, and will not be displayed in command output.

- `[ -to {enabled|disabled} ]` - Deliver to AutoSupport -to Addresses
  Use this parameter with the value "enabled" to enable sending AutoSupport messages to the configured "to" addresses.

- `[ -noteto {enabled|disabled} ]` - (DEPRECATED) Deliver to AutoSupport -noteto Addresses
  Note: This parameter has been deprecated and might be removed in a future version of Data ONTAP.
  Use this parameter with the value "enabled" to enable sending short notes to the configured "noteto" addresses.

- `[ -basic-additional <subsys1, subsys2, ...>, ... ]` - Additional Subsystems Reporting Basic Info
  Use this parameter to include basic content from the additional subsystems you specify. Content is collected from these subsystems in addition to the default list of subsystems.

- `[ -troubleshooting-additional <subsys1, subsys2, ...>, ... ]` - Additional Subsystems Reporting Troubleshooting Info
  Use this parameter to include troubleshooting content from the additional subsystems you specify. Content is collected from these subsystems in addition to the default list of subsystems.

- `[ -suppress {true|false} ]` - Suppress all occurrences of this trigger
  Use this parameter with the value "true" to suppress the collection when the AutoSupport message is triggered.

Examples
The following example enables messages to the configured "to" addresses from the battery.low trigger on the node node1.
cluster1::> system node autosupport trigger modify -node node1 -autosupport-message battery.low -to enabled

Related references

system node autosupport manifest show on page 1215

system node autosupport trigger show

Display AutoSupport trigger configuration

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The system node autosupport trigger show command displays what system events trigger AutoSupport messages. When a trigger event occurs, the node may send an AutoSupport message to a predefined destination, and a short note to another destination. The full AutoSupport message contains detail for troubleshooting. The short message is meant for short pager or SMS text messages.

Use the system node autosupport destinations show command to view available destinations.

Parameters

{[-fields <fieldname>, ...]
   If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

    |[-basic]
    Use this parameter to display which subsystem information is included as basic content when the AutoSupport message is triggered.

    |[-troubleshooting]
    Use this parameter to display which subsystem information is included as troubleshooting content when the AutoSupport message is triggered.

    |[-instance]}
    If you specify the -instance parameter, the command displays detailed information about all fields.

 [-node {<nodename> | local}] - Node
   Use this parameter to display AutoSupport triggers only on the node you specify.

 [-autosupport-message <Autosupport Message>] - EMS Message
   Use this parameter to display only AutoSupport triggers with the name you specify. AutoSupport triggers are EMS messages whose names begin with "callhome.". However, for the purposes of this command, "callhome." is implied, does not need to be entered, and will not be displayed in command output.

 [-to {enabled|disabled}] - Deliver to AutoSupport -to Addresses
   Use this parameter with the value "enabled" to display only AutoSupport messages that send full messages to the "to" address when triggered. Use this parameter with the value "disabled" to display only AutoSupport messages that do not send full messages.

 [-noteto {enabled|disabled}] - (DEPRECATED) Deliver to AutoSupport -noteto Addresses
   Note: This parameter has been deprecated and might be removed in a future version of Data ONTAP.
   Use this parameter with the value "enabled" to display only AutoSupport messages that send short notes to the "noteto" address when triggered. Use this parameter with the value "disabled" to display only AutoSupport messages that do not send short notes.
[-basic-default <subsys1, subsys2, ...>, ...] - Default Subsystems Reporting Basic Info

Use this parameter to display only AutoSupport triggers that include in their messages, by default, basic content from the subsystems you specify.

[-troubleshooting-default <subsys1, subsys2, ...>, ...] - Default Subsystems Reporting Troubleshooting Info

Use this parameter to display only AutoSupport triggers that include in their messages, by default, troubleshooting content from the subsystems you specify.

[-additional-content <Type of AutoSupport content>, ...] - Additional Content Flag

Use this parameter to display only AutoSupport triggers that have been configured to include additional basic or troubleshooting content.

[-basic-additional <subsys1, subsys2, ...>, ...] - Additional Subsystems Reporting Basic Info

Use this parameter to display only AutoSupport triggers that have been configured to include additional basic content from the subsystems you specify.

[-troubleshooting-additional <subsys1, subsys2, ...>, ...] - Additional Subsystems Reporting Troubleshooting Info

Use this parameter to display only AutoSupport triggers that have been configured to include additional troubleshooting content from the subsystems you specify.

[-suppress {true|false}] - Suppress all occurrences of this trigger

Use this parameter with the value "true" to display only AutoSupport messages that have been suppressed.

### Examples

This example shows the first page of output from the command. Note that "q" was pressed at the prompt to quit.

```
cluster1::> system node autosupport trigger show

system node environment commands
Display fan and temperature information

system node environment sensors commands
Display environment sensors

system node environment sensors show
Display the sensor table

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The `system node environment sensors show` command displays the following information:

- Node name
- Sensor name
- Sensor state
- Sensor value
- Sensor units
- Critically Low threshold for the sensor
- Warning Low threshold for sensor
- Warning High threshold for sensor
- Critically High threshold for the sensor
- FRU name (detailed view only)

Parameters

`[-fields <fieldname>, ...]`
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

`[-instance]`
If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-node <nodename>|local] - Node`
Selects information about the sensors on the specified node. If this parameter is specified with the `-name` parameter, the command displays information only about the specified sensor.

`[-name <text>] - Sensor Name`
Selects information about the sensors that have the specified name. If this parameter is specified with the `-node` parameter, the command displays information only about the specified sensor.

`[-fru <text>] - FRU`
Selects information about the sensors associated with the specified Field Replaceable Unit (FRU).
- **type** *(fan|thermal|voltage|current|battery-life|discrete|fru|nvram|counter|minutes|percent|agent|unknown)* - Sensor Type
  Selects information about the sensors that have the specified sensor type. Possible values vary among platforms but may include *fan*, *temperature*, *thermal* and *voltage*.

- **-units <text>** - Value Units
  Selects information about the sensors that have readings displayed in the specified units of measure. Possible values vary among platforms but may include *RPM*, *C* and *mV*.

- **-state** *(normal|warn-low|warn-high|crit-low|crit-high|disabled|uninitialized|init-failed|not-available|invalid|retry|bad|not-present|failed|ignored|fault|unknown)* - Sensor State
  Selects information about the sensors that have the specified state. Possible values vary among platforms but may include *normal*, *warn_lo*, *warn_hi*, *crit_lo*, *crit_hi* and *failed*.

- **-discrete-state** *(normal|warn-low|warn-high|crit-low|crit-high|disabled|uninitialized|init-failed|not-available|invalid|retry|bad|not-present|failed|ignored|fault|unknown)* - Discrete Sensor State
  Selects information about the discrete-valued sensors that are in the specified state. A discrete-valued sensor has a set of possible discrete values rather than a range of possible values. For example, a presence sensor which has the discrete values PRESENT and NOT_PRESENT is a discrete-valued sensor. Possible values vary among platforms but may include *normal* and *failed*.

- **-value <integer>** - Last Sensor Value
  Selects information about the sensors that have the specified sensor value.

- **-discrete-value <text>** - Discrete Sensor Value
  Selects information about the discrete-valued sensors that have the specified discrete value. Possible values vary among sensors but may include *PRESENT*, *NOT_PRESENT*, *ON*, *OFF*, *OK* and *FAULT*.

- **-crit-low <integer>** - Critical Low Threshold
  Selects information about the sensors that have the specified critically low threshold.

- **-warn-low <integer>** - Warning Low Threshold
  Selects information about the sensors that have the specified warning-low threshold.

- **-warn-hi <integer>** - Warning Hi Threshold
  Selects information about the sensors that have the specified warning-high threshold.

- **-crit-hi <integer>** - Critical Hi Threshold
  Selects information about the sensors that have the specified critically high threshold.

- **-inactive** *(true|false)* - Show Inactive Sensors
  Specify *true* to include inactive sensors in the output. By default, only sensors with the value *false* are shown.

- **-hidden** *(true|false)* - Show Hidden Sensors
  Specify *true* to include hidden sensors in the output. By default, only sensors with the value *false* are shown.

---

**Examples**

The following example displays information about all sensors on a cluster named cluster1:

```
cluster1::> system node environment sensors show
---------------------- -------------- ----------- ---------- ---------- ----------
mynode
   Partner IO Pre                  NOT_PRESENT
   Partner Ctrl Pre                PRESENT
```

system node coredump commands

Manage coredumps

system node coredump delete

Delete a coredump

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system node coredump delete command deletes a specified core dump. If the command is issued while the specified core dump is being saved, the command prompts you before stopping the save operation and deleting the core dump.

Parameters
- node {<nodename>|local} - Node That Owns the Coredump
  This specifies the node from which core files are to be deleted.

[-type {kernel|ancillary-kernel-segment|application}] - Coredump Type
  This specifies the type of core file to be deleted. If the type is kernel, the specified kernel core file will be deleted. If the type is application, the specified application core file will be deleted.

- corename <text> - Coredump Name
  This specifies the core file that is to be deleted.

Examples
The following example deletes a core dump named core.101268397.2010-05-30.19_37_31.nz from a node named node0:

  cluster1::> system node coredump delete -node node0 -corename core.101268397.2010-05-30.19_37_31.nz

system node coredump delete-all

Delete all coredumps owned by a node

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system node coredump delete-all command deletes either all unsaved core dumps or all saved core files on a node. You can specify whether saved core files or unsaved core dumps are deleted by using the optional -saved parameter. If the command is issued while a core dump is being saved, the command prompts you before stopping the save operation and deleting the core dump.

Parameters
- node <nodename> - Node That Owns the Coredump
  This specifies the node from which core files or core dumps are to be deleted.
[-type {unsaved-kernel|saved-kernel|kernel|application|all}] - Type of Core to delete

This parameter specifies the type of core file to be deleted. If the type is unsaved, all unsaved core dumps will be deleted. If the type is saved, all saved core files will be deleted. If the type is kernel, all kernel core files and kernel core dumps will be deleted. If the type is application, all application core files will be deleted. If the type is all, all core files will be deleted. The default setting is to delete only unsaved kernel core dumps and core files.

**Examples**

The following example deletes all unsaved kernel core dumps on a node named node0:

```
cluster1::> system node coredump delete-all -node node0
```

**system node coredump save**

Save an unsaved kernel coredump

**Availability**: This command is available to cluster administrators at the admin privilege level.

**Description**

The `system node coredump save` command saves a specified core dump. If the node has already attempted to save the core dump by the value specified by the `-save-attempts` parameter, the command prompts you before continuing. The `-save-attempts` parameter is set by invoking the command `system node coredump config modify`. A saved core dump can be uploaded to a remote site for support analysis; see the `system node coredump upload` command man page for more information.

**Parameters**

- `-node {<nodename>|local}` - Node That Owns the Coredump
  
  This specifies the node on which the core dump is located.

- `-corename <text>` - Coredump Name
  
  This specifies the core dump that is to be saved.

**Examples**

The following example saves a core dump named core.101268397.2010-05-30.19_37_31.nz on a node named node0:

```
cluster1::> system node coredump save -node node0 -corename core.101268397.2010-05-30.19_37_31.nz
```

**Related references**

- `system node coredump config modify` on page 1233
- `system node coredump upload` on page 1232
- `system node coredump save-all` on page 1225

**system node coredump save-all**

Save all unsaved kernel coredumps owned by a node

**Availability**: This command is available to cluster administrators at the admin privilege level.

**Description**

The `system node coredump save-all` command saves all unsaved core dumps on a specified node. If the node has already attempted to save the core dump by the value set by the `-save-attempts` parameter, the command prompts you before continuing. The `-save-attempts` parameter is set by invoking the command `system node coredump config modify`.
Parameters

- **node `<nodename>` - Node That Owns the Coredump**

  This specifies the node on which unsaved core dumps are to be saved.

### Examples

The following example saves all unsaved core dumps on a node named node0:

```
cluster1::> system node coredump save-all -node node0
```

### Related references

*system node coredump save* on page 1225

### system node coredump show

Display a list of coredumps

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The *system node coredump show* command displays basic information about core dumps, such as the core dump name, time of panic that triggered the core dump and whether the core file is saved. You can specify optional parameters to display information that matches only those parameters. For example, to display the list of kernel core files, run the command with -type kernel.

#### Parameters

```
{ [-fields <fieldname>, ...]}

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.
```

```
{ [-system]}

If you specify this parameter, the command displays the following information:

- Node name
- Core dump name
- Core dump ID
- Node that panicked and generated the core
- System ID of the node that panicked and generated the core
- Version of the core
```

```
{ [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.
```

```
[-node {<nodename>|local}] - Node That Owns the Coredump

If you specify both this parameter and the **-corename** parameter, the command displays detailed information about the specified core. If you specify this parameter by itself, the command displays information about the core files on the specified node.
```

```
[-type {kernel|ancillary-kernel-segment|application}] - Coredump Type

This parameter specifies the type of core files to be displayed. If the type is kernel and the system supports segmented core files, the command displays information about primary kernel core segment files. If the type is kernel and the system does not support segmented core files, the command displays information about full
```
core files. If the type is ancillary-kernel-segment, the command displays information about ancillary kernel
core segment files. If the type is application, the command displays information about application core files. If
no type is specified, the command displays information about core files of type kernel or application.

```
[-corename <text>] - Coredump Name
```

If you specify both this parameter and the -node parameter, the command displays detailed information about
the specified core. If you specify this parameter by itself, the command displays information about the core
files that match the specified name.

```
[-panic-node <text>] - Node That Generated Core
```

If you specify this parameter with a node name, the command displays information only about the core files
that were generated when the specified node panicked.

```
[-panic-systemid <integer>] - System ID of Node That Generated Core
```

If you specify this parameter, the command displays information only about the core files that were generated
when the node with the specified system ID panicked.

```
[-version <text>] - Data ONTAP Version of Core
```

If you specify this parameter, the command displays information only about the core files that match the
specified version.

```
[-panic-time <MM/DD/YYYY HH:MM:SS>] - Time of Panic That Generated Core
```

If you specify this parameter, the command displays information only about the core files that were generated
by a panic at the specified time. Specify time in the format of MM/DD/YYYY HH:MM:SS [+- HH:MM]. You
can use [+- HH:MM] to specify the time range within which all core files triggered by a panic are displayed.
[+- HH:MM] is relative to UTC.

```
[-panic-string <text>] - Panic String
```

If you specify this parameter, the command displays information only about the core files that match the
specified panic string.

```
[-is-saved {true|false}] - Saved Core
```

If you specify this parameter, the command displays information only about the core dumps that are or are not
saved yet to a core file.

```
[-is-partial {true|false}] - Partial Core
```

If you specify this parameter, the command displays information only about the core dumps that are or are not
partially saved.

```
[-save-attempts <integer>] - Number of Attempts to Save Core
```

If you specify this parameter, the command displays information only about the core dumps that have the
specified number of successful or failed save attempts.

```
[-space-needed (<integer> {KB|MB|GB|TB|PB})] - Space Needed To Save Core
```

If you specify this parameter, the command displays information only about the core dumps that need the
specified amount of disk space to save into a core file.

```
[-size <text>] - Size of Core (bytes)
```

If you specify this parameter, the command displays information only about the saved core files that are of the
specified size.

```
[-md5-data-chksum <text>] - MD5 Checksum of the Compressed Data of Core
```

If you specify this parameter, the command displays information only about the saved core files that have the
specified MD5 checksum for compressed data of the core.

```
[-ancillary-segment-directory <text>] - Directory Holding Ancillary Kernel Core Segments
```

If you specify this parameter, the command displays information only about the saved core files that have the
specified ancillary segment directory.
Examples

The following examples display information about the core files:

```
cluster1::> system node coredump show
Node      Core Name                  Saved   Panic Time
-------- ------------------------------------------- ------- -----------------
node0     core.101182345.2010-02-01.14_19_08.nz    false  2/1/2010 09:19:08
          Partial Core: false
          Number of Attempts to Save Core: 2
          Space Needed To Save Core: 4.45GB
node2     core.101270930.2010-09-06.18_40_03.nz    true   9/6/2010 14:40:03
node3     core.101271326.2010-09-06.19_06_18.nz    true   9/6/2010 15:06:18
          core.101271326.2010-09-06.19_09_49.nz    true   9/6/2010 15:09:49
4 entries were displayed.
```

```
cluster1::> system node coredump show -panic-time 9/6/2010 15:00:00+3:00
Node      Core Name                  Saved   Panic Time
-------- ------------------------------------------- ------- -----------------
node3     core.101271326.2010-09-06.19_06_18.nz    true   9/6/2010 15:06:18
          core.101271326.2010-09-06.19_09_49.nz    true   9/6/2010 15:09:49
2 entries were displayed.
```

system node coredump status on page 1228

system node coredump status

Display kernel coredump status

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The system node coredump status command displays status information about core dumps. The command output depends on the parameters specified with the command. If a core dump is in the process of being saved into a core file, the command also displays its name, the total number of blocks that are to be saved, and the current number of blocks that are already saved.

You can specify additional parameters to display only information that matches those parameters. For example, to display coredump status information about the local node, run the command with the parameter -node local.

Parameters

```
[-fields <fieldname>, ...]  
```

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

```
[-disks ]
```

If you specify this parameter, the command displays the following information:

- Node name
- Total number of disks
- Number of spare disks
• Number of disks used
• Number of disks with partial cores

[-spraycore]
If you specify this parameter, the command displays the following information:
• Node name
• Whether spray cores are supported
• Number of spray-core disks
• Number of spray-core blocks
• Number of disks needed for spray core
• Estimated number of blocks needed for spray core

[-instance]]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-node (<nodename> | local)] - Node
If you specify this parameter, the command displays the following information:
• Node name
• State of the core-dump process
• Space available on the internal file system
• Name of the core being saved, if applicable
• Total number of blocks in the core being saved, if applicable
• Number of blocks currently saved, if applicable
• Type of core dump
• Number of unsaved complete cores on the node
• Number of unsaved partial cores on the node
• Whether spray cores are supported on the node
• Whether any spare disks are available on the node
• Number of disks that have cores
• Number of unsaved cores
• Number of disks that have partial cores
• Number of partial cores
• Number of unused spray-core disks
• Number of spray-core blocks
• Number of disks available for core dumps
• Estimated number of blocks needed for spray core
• Number of disks needed for spray core
### -state <text> - State
If you specify this parameter, the command displays information only about the nodes that are in the specified core dump state. Possible values include: nocore, idle, init, saving, and waitdump.

### -space-available <integer> [KB|MB|GB|TB|PB] - Space Available On Internal Filesystem
If you specify this parameter, the command displays information only about the nodes that have the specified amount of available space, in bytes, on their internal file systems.

### -corename <text> - Name of Core Being Saved
If you specify this parameter, the command displays information only about the node that is currently saving the specified core file name.

### -total-blocks <integer> - Total Number of Blocks in Core Being Saved
If you specify this parameter, the command displays information only about the nodes that have the specified number of blocks in the core dump being saved.

### -blocks-saved <integer> - Number of Blocks saved
If you specify this parameter, the command displays information only about the nodes that have the specified number of blocks saved.

### -type <text> - Type of Core Dump
If you specify this parameter, the command displays information only about the nodes that have the specified core dump type. Possible values include zipped, sprayed, and spare.

### -spraycore-supported [true|false] - Spray Core Supported on Node
If you specify this parameter, the command displays information only about the nodes that do or do not support the spray method of dumping core.

### -spares-available [true|false] - Spare Disk(s) Available on Node
If you specify this parameter, the command displays information only about the nodes that do or do not have spare disks available.

### -disks-used <integer> - Number of Disks with Cores
If you specify this parameter, the command displays information only about the nodes that have the specified number of disks that contain core dumps.

### -unsaved-cores <integer> - Number of Unsaved Complete Cores
If you specify this parameter, the command displays information only about the nodes that have the specified number of complete core dumps that are not yet saved into a core file.

### -partial-disks <integer> - Number of Disks with Partial Cores
If you specify this parameter, the command displays information only about the nodes that have the specified number of disks with partial core dumps.

### -partial-cores <integer> - Number of Unsaved Partial Cores
If you specify this parameter, the command displays information only about the nodes that have the specified number of partial core dumps that are not yet saved into a core file.

### -spraycore-disks <integer> - Number of Unused Spray Core Disks
If you specify this parameter, the command displays information only about the nodes that have the specified number of unused spray-core disks.

### -spraycore-blocks <integer> - Number of Spray Core Blocks
If you specify this parameter, the command displays information only about the nodes that have the specified number of spray-core blocks.

### -numdisks <integer> - Total Number of Disks Available for Core Dump
If you specify this parameter, the command displays information only about the nodes that have the specified total number of disks available for core dump.
[-blocks-needed <integer>] - Estimated Number of Blocks Needed for Spray Core
If you specify this parameter, the command displays information only about the nodes that have the specified number of estimated blocks needed for the spray method of dumping core.

[-disks-needed <integer>] - Number of Disks Needed for Spray Core
If you specify this parameter, the command displays information only about the nodes that have the specified number of disks needed for the spray method of dumping core.

[-space-needed {<integer>[KB|MB|GB|TB|PB]}] - Space Needed to Save All Unsaved Cores
If you specify this parameter, the command displays information only about the nodes that require the specified amount of disk space to save all unsaved core dumps.

[-min-free {<integer>[KB|MB|GB|TB|PB]}] - Minimum Free Bytes on Root Filesystem
If you specify this parameter, the command displays information only about the nodes that need to have the specified number of bytes available on the root filesystem after a core dump is saved.

Examples
The following example displays core dump information about the node named node0:

```
cluster1::> system node coredump status -node node0 -instance
Node: node0
State: idle
Space Available On Internal Filesystem: 132.1GB
Name of Core Being Saved: -
Total Number of Blocks in Core Being Saved: -
Number of Blocks saved: -
Type of core dump: spray
Number of Unsaved Complete Cores: 0
Number of Unsaved Partial Cores: 1
Space Needed To Save All Unsaved Cores: 4.81GB
Minimum Free Bytes On Internal Filesystem: 250MB
```

system node coredump show on page 1226

system node coredump trigger
Make the node dump system core and reset

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
This command triggers a Non-maskable Interrupt (NMI) on the specified node via the Service Processor of that node, causing a dirty shutdown of the node. This operation forces a dump of the kernel core when halting the node. LIF migration or storage takeover occurs as normal in a dirty shutdown. This command is different from the -dump parameter of the system node shutdown, system node halt, or system node reboot command in that this command uses a control flow through the Service Processor of the remote node, whereas the -dump parameter uses a communication channel between Data ONTAP running on the nodes. This command is helpful in cases where Data ONTAP on the remote node is hung or does not respond for some reason. If the panic node reboots back up, then the generated coredump can be seen by using the system node coredump show command. This command works for a single node only and the full name of the node must be entered exactly.

Parameters
-node {<nodename>|local} - Node
This parameter specifies the node for which you want to trigger a coredump.
Examples
The following example triggers a NMI via the Service Processor and causes node2 to panic and generate a coredump. Once node2 reboots back up, the command `system node coredump show` can be used to display the generated coredump.

```sh
cluster1::> set advanced
Warning: These advanced commands are potentially dangerous; use them only when directed to do so by NetApp personnel.
Do you want to continue? {y|n}: y
cluster1::*> system node coredump trigger -node node2
Warning: The Service Processor is about to perform an operation that will cause a dirty shutdown of node "node2". This operation can cause data loss. Before using this command, ensure that the cluster will have enough remaining nodes to stay in quorum. To reboot or halt a node gracefully, use the "system node reboot" or "system node halt" command instead. Do you want to continue? {yes|no}: yes
Warning: This operation will reboot the current node. You will lose this login session. Do you want to continue? {y|n}: y
cluster1::>
```

```
cluster1::> system coredump show
Node:Type Core Name                                   Saved Panic Time
--------- ------------------------------------------- ----- -----------------
Partial Core: false
Number of Attempts to Save Core: 0
Space Needed To Save Core: 3.60GB
1 entries were displayed.
```

system node coredump upload
(DEPRECATED)-Upload a coredump to a remote site

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

**Attention:** This command is deprecated and might be removed in a future release of Data ONTAP. Use "`system node autosupport invoke-core-upload`" instead.

The `system node coredump upload` command uploads a saved core file to a specified URL. You should use this command only at the direction of technical support.

**Parameters**

- `-node {<nodename>|local}` - Node That Owns the Coredump

  This specifies the node on which the core file is located.
[-type {kernel|ancillary-kernel-segment|application}] - Coredump Type
This specifies the type of core files to be uploaded. If the type is kernel, kernel core files will be uploaded. If the type is application, application core file will be uploaded.

-corename <text> - Coredump Name
This specifies the name of the core file that is to be uploaded.

-[location <text>] - URL for Coredump Upload Directory
This specifies the URL to which the core file is to be uploaded. If this parameter is not specified, the command uploads the core file to the location specified by the -upload-location parameter of the system node coredump config modify command. The following protocols are supported: ftp and http. (By default, the location is set to ftp://ftp.netapp.com/to-ntap/)

-[casenum <integer>] - Case Number
This specifies the support case number that will be prefixed to the core file name at the destination. The case number is critical information for quick and automated processing of the received core file.

Examples
The following example uploads a core file named core.07142005145732.2010-10-05.19_03_41.nz on a node named node0 to the default location. The support case number is 2001234567.

```
cluster1::> system node coredump upload -node node0 -corename core.07142005145732.2010-10-05.19_03_41.nz -casenum 2001234567
```

system node coredump config commands
Manage the coredump configuration

system node coredump config modify
Modify coredump configuration

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system node coredump config modify command modifies the cluster's core dump configuration.

Parameters
-node {<nodename>|local} - Node
This parameter specifies the node whose coredump configuration you want to modify.

-[sparsecore-enabled {true|false}] - Enable Sparse Cores
If you set this parameter to true, the command enables sparse cores. A sparse core omits all memory buffers that contain only user data.

-[min-free {<integer>[KB|MB|GB|TB|PB]}] - Minimum Free Bytes On Root Filesystem
If you specify this parameter, the command displays the number of bytes that need to be made available in the root file system after saving the core dump. If the minimum number of bytes cannot be guaranteed, core dumps are not generated. The default setting is 250 MB.
[-coredump-attempts <integer>] - Maximum Number Of Attempts to Dump Core
If you specify this parameter, the command displays the maximum number of times the system will attempt to generate a core dump when encountering repeated disk failures. The default setting is 2.

[-save-attempts <integer>] - Maximum Number Attempts to Save Core
If you specify this parameter, the command displays the maximum number of times the system will attempt to save a core dump. The default setting is 2.

[-save-onstartup {true|false}] - Enable Auto Save of Coredumps on Startup
If you set this parameter to true, the system will automatically start saving the core dump after reboot.

[-upload-location <text>] - URL for Coredump Upload Directory
Attention: This option is deprecated and might be removed in a future release of Data ONTAP. Use the -uri parameter of the "system node autosupport invoke-core-upload" command instead.
If you specify this parameter, the system uploads the core dumps to the specified URL. The following protocols are supported: ftp and http. (The default setting is ftp://ftp.netapp.com/to-ntap/.)

Examples
The following example sets the maximum number of core dump attempts to 5 and the maximum number of save attempts to 5:

```
cluster1::> system node coredump config modify -coredump-attempts 5 -save-attempts 5
```

system node autosupport invoke-core-upload on page 1197

system node coredump config show
Display coredump configuration

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system node coredump config show command displays basic information about a cluster's core dump configuration, such as whether sparse cores are enabled, minimum number of free bytes on the root volume file system that need to be available after saving the core files, maximum number of times the process attempts to generate a core dump when encountering repeated disk failures, maximum number of times the process attempts to save a core dump, the URL to which core dumps are uploaded, and whether core dumps are automatically saved when a node restarts.

Parameters
{ [-fields <fieldname>, ...]  
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

| [-instance ] |
If you specify the -instance parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node
If you specify this parameter, the command displays the coredump configuration information of the specified node.

[-sparsecore-enabled {true|false}] - Enable Sparse Cores
If you specify this parameter, the command displays only the coredump information that matches the specified spare core setting. A sparse core omits all memory buffers that contain only user data.
Minimum Free Bytes On Root Filesystem

If you specify this parameter, the command displays only the core dump information that matches the specified number of bytes that need to be made available in the root file system after saving the core dump.

Maximum Number Of Attempts to Dump Core

If you specify this parameter, the command displays only the core dump information that matches the specified maximum number of times the system will attempt to generate a core dump when encountering repeated disk failures.

Maximum Number Attempts to Save Core

If you specify this parameter, the command displays only the core dump information that matches the maximum number of times the system will attempt to save a core dump.

Enable Auto Save of Coredumps on Startup

If you specify this parameter, the command displays only the core dump information that matches the specified configuration of whether the system will automatically start saving the core dump after reboot.

URL for Coredump Upload Directory

Attention: This option is deprecated and might be removed in a future release of Data ONTAP. Use the ~uri parameter of the "system node autosupport invoke-core-upload" command instead.

If you specify this parameter, the command displays only the core dump information that matches the specified URL where core dumps are uploaded.

Examples

The following example displays information about the cluster's core dump configuration:

```
cluster1::> system node coredump config show
Sparse       Min      Max      Max On
Core        Free     Dump     Save Startup
Node  Enabled    Bytes Attempts Attempts Enabled Coredump Location
----- ------- -------- -------- -------- ------- -----------------------------
node0    true       250MB        2        2 true    ftp://ftp.example.com/to-example/
node1    true       250MB        2        2 true    ftp://ftp.example.com/to-example/
node2    true       250MB        2        2 true    ftp://ftp.example.com/to-example/
node3    true       250MB        2        2 true    ftp://ftp.example.com/to-example/
4 entries were displayed.
```

system node autosupport invoke-core-upload on page 1197

Manage application core reports

Delete an application core report

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The system node coredump reports delete command deletes the specified application core report.
Parameters

- **node \{<nodename>|local\} - Node That Owns the Coredump**
  
  This specifies the node from which reports are to be deleted.

- **reportname <text> - Report Name**
  
  This specifies the report that is to be deleted.

Examples

The following example shows how a report named notifyd.1894.80335005.2011-03-25.09_59_43.ucore.report is deleted from a node named node0:

```
cluster1::> system node coredump reports delete -node node0 -reportname notifyd.1894.80335005.2011-03-25.09_59_43.ucore.report
```

**system node coredump reports show**

Display a list of application core reports

**Availability:** This command is available to cluster administrators at the *admin* privilege level.

**Description**

The `system node coredump reports show` command displays basic information about application core reports, such as the report name and time of the panic that triggered the application core dump. You can specify optional parameters to display information that matches only those parameters. For example, to display the list of reports in the local node, run the command with `-node local`.

**Parameters**

\{\[-fields <fieldname>, ...\]}

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

\{\[-instance\]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

\[-node \{<nodename>|local\} - Node That Owns the Coredump\]

Selects information about all the reports on the specified node. If you specify both this parameter and the `-reportname` parameter, the command displays detailed information about the specified report.

\[-reportname <text>] - Report Name

Selects information about the reports that match the specified name. If you specify both this parameter and the `-node` parameter, the command displays detailed information about the specified report.

\[-panic-node <text>] - Node That Generated Core

Selects information about the reports that were generated by the specified node.

\[-panic-systemid <integer>] - System ID of Node That Generated Core

Selects information about the reports that were generated by the node with the specified system ID.

\[-version <text>] - Data ONTAP Version of Core

Selects information about the reports that match the specified version.

\[-panic-time <MM/DD/YYYY HH:MM:SS>] - Time of Panic That Generated Core

Selects information about the reports that were generated by a panic at the specified time. Specify time in the format of `MM/DD/YYYY HH:MM:SS [+ - HH:MM]`. You can use ` [+ - HH:MM]` to specify the time range within which all core files triggered by a panic are displayed. `[+ - HH:MM]` is relative to UTC.
[–panic-string <text>] - Panic String

Selects information about the reports that match the specified panic string.

**Examples**

The following example displays information about the reports:

```
cluster1::> system node coredump reports show
            Node     Report Name                                    Panic Time
            -------- -------------------------------------------  -----------------
```

**system node coredump reports upload**

(DEPRECATED)-Upload an application core report to a remote site

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

**Attention:** This command is deprecated and might be removed in a future release of Data ONTAP. See core report information in the SmartSoft tool.

The `system node coredump reports upload` command uploads an application report to a specified URL. You should use this command only at the direction of technical support.

**Parameters**

- `-node <nodename>|local` - Node That Owns the Coredump
  
  This specifies the node on which the report is located.

- `-reportname <text>` - Report Name
  
  This specifies the name of the report that is to be uploaded.

- `[location <text>]` - URL for Coredump Upload Directory
  
  This specifies the URL to which the report is to be uploaded. The following protocols are supported: ftp and http. (By default, the location is set to ftp://ftp.netapp.com/to-ntap/)

- `[casenum <integer>]` - Case Number
  
  This specifies the support case number that is be prefixed to the core file name at the destination. The case number is critical information for quick and automated processing of the received core file.

**Examples**

The following example shows how a report named notifyd.1894.80335005.2011-03-25.09_59_43.ucore.bz2 is uploaded on a node named node0 to the default location. The support case number is 2001234567.

```
cluster1::> system node coredump reports upload -node node0 -corename notifyd.1894.80335005.2011-03-25.09_59_43.ucore.bz2 -casenum 2001234567
```

**system node coredump segment commands**

Manage Core Segments

**system node coredump segment delete**

Delete a core segment

**Availability:** This command is available to cluster administrators at the admin privilege level.
Description
This command deletes a core segment.

Parameters
- **node {<nodename>|local} - Node**
  This specifies the node on which to delete the core segments.
- **segment <text> - Core Segment**
  This specifies the core segment to delete. The pathname is relative to the coredump directory. If a directory is specified, all core segment files within it are deleted. If the directory is empty, it is deleted.
- **[-owner-node <text>] - Node That Owns the Core Segment File**
  This specifies the node that owns the core segment. Use this parameter only in takeover mode to delete a partner's coredump segment.

Examples
This deletes all core segments in the directory, core.151708240.2012-01-11.05_56_52.
```
cluster1::> system node coredump segment delete -node node1 -segment core.151708240.2012-01-11.05_56_52
```

**system node coredump segment delete-all**
Delete all core segments on a node

Availability: This command is available to cluster administrators at the admin privilege level.

Description
This command deletes all the core segments on a node.

Parameters
- **node {<nodename>|local} - Node**
  This specifies the node on which to delete the core segments.

Examples
This deletes all the core segments for node1.
```
cluster1::> system node coredump segment delete-all -node node1
```

**system node coredump segment show**
Display a list of core segments

Availability: This command is available to cluster administrators at the admin privilege level.

Description
This command displays the following information about core segments:

- name of the core segment directory
- time of the panic that generated the core segment
- total number of core segment files
- core segment file name

**Parameters**

\[ \{-fields <fieldname>, ...\} \]

If you specify the \(-fields <fieldname>, ...\) parameter, the command output also includes the specified field or fields. You can use \(-fields ?\) to display the fields to specify.

\[ \{-instance\} \]

Displays the following details:

- Core segment file name
- Node that owns the core segment file
- System ID of the node that generated the core
- MD5 checksum of the compressed data of the core segment file
- Name of the core segment
- Total number of core segments for the core file
- Timestamp of the panic that triggered the core segment

\[ \{-node <nodename> \{local\}\} \] - Node

Selects information about the core segments on the specified node.

\[ \{-segment <text>\} \] - Core Segment

Selects information about the specified core segment. If segment is a directory, the command displays the information for the first core segment file. If segment is a file, the command displays the file information.

\[ \{-owner-node <text>\} \] - Node That Owns the Core Segment File

Selects information about the core segments owned by the specified node. This parameter should only be used in takeover mode to display information about the partner's core segments.

\[ \{-panic-system-id <integer>\} \] - System ID of Node That Generated Core

Selects information about the core segments that were generated when the node with the specified system ID panicked.

\[ \{-md5-data-chksum <text>\} \] - Md5 Checksum of the Compressed Data of the Core Segment

Selects information about the core segments whose data segment's MD5 checksum matches the specified checksum.

\[ \{-segment-name <text>\} \] - Name of the Core Segment

Selects information about the core segments with the specified name.

\[ \{-total-segment-count <integer>\} \] - Number of Segments Generated

Selects information about the core segments with the specified name.

\[ \{-panic-time <MM/DD/YYYY HH:MM:SS>\} \] - Time of Panic That Generated Core

Selects information about the core segments that were generated by a panic at the specified time.

\[ \{-size <text>\} \] - Size of Core Segment (bytes)

Selects information about the core segments that are of the specified size.

\[ \{-panic-string <text>\} \] - Panic String of Panic That Generated Core

Selects information about the core segments that match the specified panic string.

**Examples**

The example below displays the core segments on node1.
system node external-cache commands

The external-cache directory

system node external-cache modify

Modify external cache settings.

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The system node external-cache modify command can be used to modify the following attributes of external-cache for a node:

- is-enabled
- is-rewarm-enabled
- is-mbuf-inserts-enabled
- pcs-size
- is-hya-enabled

Parameters

- `-node <nodename>|local` - Node
  This specifies the node on which the modifications need to be made.

- `-is-enabled [true|false]` - Is Enabled
  Enables external-cache module (Flash Cache Family) on the storage system. Valid values for this option are true and false. If external-cache hardware is present, then this option will enable external-cache functionality in WAFL. If no hardware is present, this option will enable external-cache pcs (Predictive Cache Statistics). The default value for this option is false.
[-is-rewarm-enabled {true|false}] - Is rewarm on

Specifies whether an external-cache module should attempt to preserve data across reboots. Valid values for this option are true and false. This option applies only to cache hardware with persistent media. It does not apply to Predictive Cache Statistics (PCS). Enabling this option will marginally increase the duration of system boot and shutdown, but it will reduce or eliminate the time required for cache warming. The default value for this option is determined by the cache hardware type. The option is disabled by default.

[-is-mbuf-inserts-enabled {true|false}] - Is Mbuf inserts on

Specifies whether the external-cache module allows insert of mbuf data as part of a network write. In rare cases, inserting mbuf data may cause excessive CPU usage. We provide this workaround to disable the behavior, if necessary. Do not change the value of this option unless directed to do so by technical support. The data from the mbuf network writes can still be stored in the external cache, but only after a subsequent disk read of that data.

[-pcs-size <integer>] - PCS size

Controls the size of the cache emulated by external-cache PCS. Valid values for this option are integers between 16 and 16383. This option is only used when PCS is enabled. The default value for this option is chosen automatically based on the amount of memory in the controller, and the upper limit is further restricted on controllers with smaller amounts of memory.

[-is-hya-enabled {true|false}] - Is hya caching enabled

Specifies whether the external-cache module allows caching of blocks targeted for hybrid aggregates. This option is set to true by default when the external-cache is enabled.

Examples

```
cluster::> system node external-cache modify -node node1 -is-enabled true
```

### system node external-cache show

Display external cache settings.

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**

The `system node external-cache show` command displays external-cache information for each of the nodes available.

**Parameters**

```
[-fields <fieldname>, ...]
```

Valid values for this option are `{node|is-enabled|is-rewarm-enabled|is-mbuf-inserts-enabled|pcs-size|is-hya-enabled}`. Specifying the value will display all entries that correspond to it.

```
[-instance]
```

This option does not need an input value. Specifying this option will display the information about all the entries.

```
[-node <nodename>|local]) - Node
```

Specify this parameter to display external-cache parameters that match the specified node.

```
[-is-enabled {true|false}] - Is Enabled
```

Valid values for this option are true and false. Specifying the value will display all entries that correspond to it.

```
[-is-rewarm-enabled {true|false}] - Is rewarm on
```

Valid values for this option are true and false. Specifying the value will display all entries that correspond to it.
[-is-mbuf-inserts-disabled {true|false}] - Is Mbuf inserts on
Valid values for this option are true and false. Specifying the value will display all entries that correspond to it.

[-pcs-size <integer>] - PCS size
Valid values for this option are integers between 16 and 16383. Specifying the value will display all entries that correspond to it.

[-is-hya-enabled {true|false}] - Is hya caching enabled
Valid values for this option are true and false. Specifying the value will display all entries that correspond to it.

Examples

```text
cluster1:> system node external-cache show -node node1

Node: node1
  Is Enabled: false
  Is rewarm on: false
  Is Mbuf inserts on: true
  PCS size: 256
  Is hya caching enabled: true
```

system node firmware commands

The system node firmware directory

system node firmware download

Download motherboard firmware and system diagnostics

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The system node firmware download command downloads new system firmware to the boot device. A reboot followed by the 'update_flash' command at the firmware prompt is required for the firmware to take effect.

Parameters
- `node <nodename>|local` - Node
  This specifies the node or nodes on which the firmware is to be updated.

- `package <text>` - Package URL
  This parameter specifies the URL that provides the location of the package to be fetched. Standard URL schemes, including HTTP, FTP and FILE, are accepted. The FILE URL scheme can be used to specify location of the package to be fetched from an external device connected to the storage controller. Currently, only USB mass storage devices are supported. The USB device is specified as `file://usb0/<filename>`. Typically, the file name is `image.tgz`. The package must be present in the root directory of the USB mass storage device.

Examples
The following example downloads firmware to node-01 from a web server:

```text
cluster1:*> system node firmware download -node node-01 -package http://example.com/serviceimage.zip
```
system node hardware commands

The system node hardware directory

system node hardware nvram-encryption commands

Manage the encryption key when copying NVRAM data to flash device

Commands to configure the encryption feature of NVRAM device.

system node hardware nvram-encryption modify

Configure NVRAM device encryption

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The system node hardware nvram-encryption modify command configures the encryption feature for the NVRAM or NVMEM data that is destaged to non-volatile flash storage.

**Note:** This feature might be restricted in some countries due to local regulations concerning encrypted data.

**Parameters**
- **-node** `<nodename>|local` - Node
  
  Specifies the node containing the NVRAM or NVMEM subsystem.

- **-[is-enabled]** `{true|false}` - Is Encryption Enabled
  
  Specifies whether the NVRAM or NVMEM encryption is disabled or enabled.

**Examples**
The following commands enable or disable the NVRAM encryption:

```
cluster1::> system node hardware nvram-encryption modify  -node node1 -is-enabled false
cluster1::> system node hardware nvram-encryption modify  -node node1 -is-enabled true
```

system node hardware nvram-encryption show

Show NVRAM device encryption information

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The system node hardware nvram-encryption show command displays the configuration of the encryption feature for the NVRAM or NVMEM data that is destaged to non-volatile flash storage.

**Parameters**

{-fields `<fieldname>`, ...} 
If you specify the -fields `<fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

|-instance |

If you specify the -instance parameter, the command displays detailed information about all fields.
[\text{-node } \{<\text{nodename}> | \text{local}\}] - \text{Node}

If this parameter is specified, the command displays information about the NVRAM encryption configuration on the specified node.

[\text{-nvram-device-name } <\text{text}>] - \text{NVRAM Device Name}

If this parameter is specified, the command displays information about the NVRAM encryption configuration for the specified NVRAM device. Current platforms only support one device - NVRAM.0.

[\text{-is-supported } \{\text{true} | \text{false}\}] - \text{Is Encryption Support}

If this parameter is specified, the command displays information about the NVRAM encryption configuration for platforms that support it.

[\text{-is-enabled } \{\text{true} | \text{false}\}] - \text{Is Encryption Enabled}

If this parameter is specified, the command displays information about the NVRAM encryption configuration for the NVRAM or NVMEM devices where the device has the specified enabled value.

[\text{-key-id } <\text{text}>] - \text{Key ID of the Encryption Key}

If this parameter is specified, the command displays information about the NVRAM encryption configuration with the specified encryption Key ID used to encrypt the NVRAM or NVMEM data on flash storage.

\textbf{Examples}

The following example displays information about the NVRAM encryption configuration on all nodes of the cluster:

```
cluster1::> system node hardware nvram-encryption show
Node: node1
  NVRAM-Device: NVRAM.0
  Supported: true
  Enabled: true
  Key-ID: 0000000000000000000000000000000000000000000000000000000000000000
Node: node2
  NVRAM-Device: NVRAM.0
  Supported: true
  Enabled: true
  Key-ID: 0000000000000000000000000000000000000000000000000000000000000000
2 entries are displayed.
```

\textbf{system node hardware tape commands}

Manage tape related devices

\textbf{system node hardware tape drive commands}

The drive directory

\textbf{system node hardware tape drive show}

Displays information about tape drives

\textbf{Availability:} This command is available to \emph{cluster} administrators at the \emph{admin} privilege level.

\textbf{Description}

This command displays the following information about tape drives:

- Node to which the tape drive is attached
- Device ID of the tape drive
- Description of the tape drive
• NDMP path of the tape drive

Parameters

\[-fields <fieldname>, ...\]
If you specify the \[-fields <fieldname>, ...\] parameter, the command output also includes the specified field or fields. You can use ‘-fields ?’ to display the fields to specify.

\[-instance\]
If you specify the \[-instance\] parameter, the command displays detailed information about all fields.

\[-node {<nodename>|local}] - Node
Displays detailed information about tape drives on the specified node.

\[-device-id <text>] - Device ID
Selects information about the tape drive that has the specified device ID.

\[-description <text>] - Description
Selects information about the tape drive or drives that have the specified description.

\[-wwn <text>] - World Wide Name
Selects information about the tape drive that has the specified worldwide name.

\[-serial-number <text>] - Serial Number
Selects information about the tape drive that has the specified serial number.

\[-ndmp-path <text>, ...] - NDMP Path
Selects information about the tape drive or drives that have the specified NDMP path.

Examples

The following example displays information about all tape drives in the cluster:

```
cluster1::> system node hardware tape drive show
Node   Device Id Drive Description    NDMP Path
------ --------- -------------------- ---------------------------------

**system node hardware tape library commands**

The library directory

**system node hardware tape library show**

Display information about tape libraries

**Availability:** This command is available to cluster administrators at the admin privilege level.
**Description**
This command displays the following information about tape libraries:

- Node to which the tape library is attached
- Device ID of the tape library
- Description of the tape library
- NDMP path of the tape library

**Parameters**

{[-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

| [-instance]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node (<nodename>|local)] - Node
Displays detailed information about tape libraries on the specified node.

[-device-id <text>] - Device ID
Selects information about the tape library that has the specified device ID.

[-description <text>] - Description
Selects information about the tape library or libraries that have the specified description.

[-wwn <text>] - World Wide Name
Selects information about the tape library that has the specified worldwide name.

[-serial-number <text>] - Serial Number
Selects information about the tape library that has the specified serial number.

[-ndmp-path <text>] - NDMP Path
Selects information about the tape library or libraries that have the specified NDMP path.

**Examples**
The following example displays information about all tape libraries attached to the cluster:

```
cluster1::> system node hardware tape library show
Node   Device Id Drive Description    NDMP Path
------ --------- -------------------- ------------------
cluster1-00
  0b.125L1  HP       MSL G3      mc1
   Series
  0c.125L1  HP       MSL G3      mc0
   Series
2 entries were displayed.
```

**system node hardware unified-connect commands**
Manage Fibre Channel and converged networking adapters

Commands used for managing Fibre Channel and converged networking adapters.

**system node hardware unified-connect modify**
Modify the Fibre Channel and converged networking adapter configuration

**Availability:** This command is available to cluster administrators at the `admin` privilege level.
Description
The `system node hardware unified-connect modify` command changes the adapter configuration. Any changes to the adapter mode or type will require a reboot for the changes to take effect. The adapter must also be offline before you can make any changes.

The adapter argument is in the form Xy where X is an integer and y is a letter. For example: `4a`

For a target adapter, use the `network fcp adapter modify` command to bring the adapter offline.

For an initiator adapter, use the `system node run local storage disable adapter` command to take the adapter offline.

The `-mode` parameter refers to the mode of the adapter and can be either `fc` or `cna`.

The `-type` parameter refers to the FC-4 type of the adapter and can be `initiator`, `target`, or `fcvi`.

The `-force` parameter suppresses confirmation prompts.

**Note:** The adapter type `fcvi` is supported only on platforms with FCVI adapters.

Parameters
- `-node {<nodename>|local}` - Node
  Specifies the node of the adapter.
- `-adapter <text>` - Adapter
  Specifies the adapter.
- `[ -mode | -m {fc|cna} ]` - Configured Mode
  Specifies the mode.
- `[ -type | -t {initiator|target|fcvi} ]` - Configured Type
  Specifies the FC-4 type.
- `[ -force | -f [true] ]` - Force
  Suppresses warnings and confirmation prompts.

Examples
```
cluster1::> system node hardware unified-connect modify -node node1 -adapter 0d -mode cna
```

Related references
`network fcp adapter modify` on page 329

**system node hardware unified-connect show**
Displays information about Fibre Channel and converged networking adapters

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**
This command manages Fibre Channel and converged networking adapters used by the storage subsystem. Use the command to show the current mode and FC-4 type of adapters or the capabilities of adapters.

**Parameters**
```
{ [-fields <fieldname>, ...]
  If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.
```
If this parameter is specified, the command displays the capabilities of the adapters.

If you specify the \texttt{-instance} parameter, the command displays detailed information about all fields.

If this parameter is specified, the command displays information about Fibre Channel and converged networking adapters on the specified node.

If this parameter is specified, the command displays information about the specified adapter.

If this parameter is specified, the command displays adapters configured to the specified mode.

If this parameter is specified, the command displays adapters configured to the specified FC-4 type.

If this parameter is specified, the command displays adapters configured to the specified mode on the next reboot.

If this parameter is specified, the command displays adapters configured to the specified FC-4 on the next reboot.

If this parameter is specified, the command displays adapters with the specified status.

The list of modes that the adapter supports.

The list of FC-4 types the adapter supports when configured into fc mode.

The list of FC-4 types the adapter supports when configured into cna mode.

\textbf{Examples}

The following example displays information about all Fibre Channel and converged networking adapters in the cluster:

\begin{verbatim}
cluster1::> system node hardware unified-connect show

16 entries were displayed.
\end{verbatim}
system node image commands
Manage software images

system node image abort-operation
Abort software image 'update' or 'get' operation

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The system node image abort-operation command aborts software installation ("update") or download ("get") operation on the specified node.

Parameters
- node {<nodename>|local} - Node
  This specifies the node on which to abort the operation.

Examples
The following example aborts the software installation operation on a node named node1.

    cluster1::> system node image abort-operation -node node1

system node image get
Fetch a file from a URL

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
This command fetches a file from the specified URL and stores it in the /mroot/etc/software directory.

Parameters
- node {<nodename> | local} - Node
  This parameter specifies the node that fetches and stores the package.

- package <text> - Package URL
  This parameter specifies the URL that provides the location of the package to be fetched. Standard URL schemes, including HTTP, FTP and FILE, are accepted. The FILE URL scheme can be used to specify the location of the package to be fetched from an external device connected to the storage controller. Currently, only USB mass storage devices are supported. The USB device is specified as file://usb0/<filename>. Typically, the file name is image.tgz. The package must be present in the root directory of the USB mass storage device.

- replace-package [true] - Replace the Local File
  Specifies whether an existing package is deleted and replaced with a new package. If you enter this command without using this parameter, its effective value is false and an existing package is not replaced with the new one. If you enter this parameter without a value, it is set to true and an existing package is replaced with the new one.

- rename-package <text> - Rename the File
  Use this parameter to enter a package name that is different than the file name in the URL.
[-background true] - Run in the background

This parameter allows the operation to run in the background. The progress of the operation can be checked with the command system image show-update-progress. If this command is entered without using this parameter, its effective value is false and the operation runs in the foreground. If this parameter is used without a value, it is set to true.

Examples

system image get http://example.com/image.tgz -rename-package image2.tgz -replace-package

system node image modify

Modify software image configuration

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

The system node image modify command sets the default software image on a specified node. The default software image is the image that is run when the node is started. A node holds two software images; when you set one as the default image, the other image is automatically unset as the default. Conversely, if you unset a software image as the default, the other image is automatically set as the default.

Parameters

-node <nodename> local - Node

This specifies the node on which the software image is located.

-image image1 image2 remote - Image Name

This specifies the software image that is to be set or unset as the default.

[-isdefault true false] - Is Default Image

This optionally specifies whether the specified image is the default.

Examples

The following example sets the software image named image2 as the default image on a node named node0.

node::> system node image modify -node node0 -image image2 -isdefault true
Default Image Changed.

system node image show

Display software image information

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

The system node image show command displays information about software images. By default, the command displays the following information:

- Node name
- Image name
- Whether the image is the default image
• Whether the image is the current image
• Software version
• Installation date

To display detailed information about a specific software image, run the command with the -node and -image parameters. The detailed view adds information about the kernel image path, and the root file system image path.

You can specify additional parameters to select specific information. For example, to display information only about software images that are currently running, run the command with the -iscurrent true parameter.

Parameters

{ [-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.
}

[[-instance]]
  If you specify the -instance parameter, the command displays detailed information about all fields.

[-node (<nodename>|local)] - Node
  Selects information about the software images on the specified node. If this parameter and the -image parameter are both used, the command displays detailed information about the specified software image.

[-image (image1|image2|remote)] - Image Name
  Selects information about the software images that match the specified name. If this parameter and the -node parameter are specified, the command displays detailed information about the specified software image.

[-isdefault (true|false)] - Is Default Image
  Selects information about the software images with the specified default setting.

[-iscurrent (true|false)] - Is Current Image
  Selects information about the software images that have the specified currency value.

[-kernel-path <text>] - Kernel Image Path
  Selects information about the software images that have the specified kernel image path.

[-rootfs-path <text>] - Root Filesystem Image Path
  Selects information about the software images that have the specified root file system image path.

[-version <text>] - Software Version
  Selects information about the software images that have the specified root file system image path.

[-installdate <MM/DD/YYYY HH:MM:SS>] - Install Date
  Selects information about the software image that have the specified installation date. Specify the date in the format MM/DD/YYYY HH:MM:SS [+/- HH:MM].

Examples

The following example displays information about the software images on a node named node1:

```
class1::> system node image show -node node1
   Is     Is               Install
Node    Image  Default  Current Version   Date
------- ------ -------- ------- --------- ------------------
node1
   image1 true  true    8.0       8/20/2009 17:42:42
   image2 false false   8.0       6/26/2009 17:44:50
2 entries were displayed.
```
system node image show-update-progress

Show progress information for a currently running update

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The system node image show-update-progress command displays the progress of a software-image update initiated by using the system node image update command. The command displays progress until the update completes; you can also interrupt it by pressing Ctrl-C.

Parameters
- -node {<nodename>|local} - Node
This optionally specifies the name of a node whose image-update progress is to be displayed.

[-follow [true]] - Follow the Progress in the Foreground
Do use not use background processing for this command. If you do not use this parameter, the value is true.

Examples
The following example displays image-update progress:

node::> system node image show-update-progress
ERROR: command failed: There is no update/install in progress

Related references
system node image update on page 1252

system node image update

Perform software image upgrade/downgrade

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The system node image update command downloads the software image from a specified location and updates the alternate software image (that is, the image that is not currently running on the node). By default, validation of the software image is not performed. Use the "-validate-only" parameter to validate the software image first, before performing the update on the cluster nodes.

At the advanced privilege level, you can specify whether to disable version-compatibility checking.

Parameters
- -node {<nodename>|local} - Node
This specifies the node on which the software image is located.

- -package <text> - Package URL
This specifies the location from which the software image is to be downloaded. The location can be specified in any of the following ways:

  - As an HTTP URL in the form http://host_name[:port]/path_to_file. For instance, http://example.com/downloads/image.tgz. The management utility prompts you for a user name and password before beginning the download.
**Note:** If you use HTTP to transfer software images, be aware that the management utility does not check whether the Web server is password protected; if it is not, press Enter at the prompt for user name and password.

- As an FTP URL in the form `ftp://host_name[:port]/path_to_file`. For instance, `ftp://example.com/downloads/image.tgz`. If required, the management utility prompts you for a user name and password before beginning the download.

- As a filename of a package left behind by a previous installation, or a package fetched using `system node image get`. For example, `image.tgz`. Available packages can be displayed using `system node image package show`.

- As a path to a package in a mounted file system in the form `file://localhost/path_to_file`. For example, `file://localhost/mroot/etc/software/image.tgz`.

- The FILE URL scheme can be used to specify the location of the package to be fetched from an external device connected to the storage controller. Currently, only USB mass storage devices are supported. The USB device is specified as `file://usb0/<filename>`. Typically, the file name is `image.tgz`. The package must be present in the root directory of the USB mass storage device.

### Parameters

- `[replace {image1|image2}]` - Image to Replace
  
  This optionally specifies the image that is to be replaced when the node is booted from the network.

- `[setdefault [true]]` - Set Newly Updated Image as Default
  
  This optionally specifies whether to set the newly updated image as the default image (that is, the image that runs the next time the node is restarted). Note that for this parameter to work correctly, the cluster must be in quorum when the image is updated.

- `[replace-package [true]]` - Replace the Local File
  
  Specifies whether an existing package is deleted and replaced with a new package. If this command is entered without using this parameter, its effective value is false and an existing package is not replaced with the new one. If this parameter is used without a value, it is set to true and an existing package is replaced with the new one.

- `[rename-package <text>]` - Rename the File
  
  Use this parameter to enter a package name that is different than the file name in the URL.

- `[background [true]]` - Run in the Background
  
  This parameter will allow the operation to run in the background. The progress of the operation can be checked with the command `system node image show-update-progress`. If this command is entered without using this parameter, its effective value is false and the operation will run in the foreground. If this parameter is used without a value, it is set to true.

- `[validate-only [true]]` - Validate the Package before Installation
  
  Use this parameter to validate the package. Validation consists of verifying whether there is enough space on the system to install the package, verifying the checksum for each component within the package and so on. Validation usually takes from 30 to 60 minutes. If you specify this parameter, the package will be validated only, not installed.

### Examples

The following example updates the software image on a node named node0 from a software package located at `ftp://ftp.example.com/downloads/image.tgz`:

```
node::> system node image update -node node0 -package ftp://ftp.example.com/downloads/image.tgz -setdefault true
```

- system node image show-update-progress on page 1252

system node image package commands

The package directory

system node image package delete

Delete a software package

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The delete command will delete the specified software package.

Parameters
- **-node {<nodename>|local} - Node**
  The package will be deleted from the repository belonging to the node specified with this parameter. The local node is used as the default if this parameter is omitted.

- **-package <text> - Package File Name**
  This parameter specifies the package to be deleted.

Examples

::> system image package delete image.tgz
1 entry was deleted.

system node image package show

Display software package information

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The package show command displays details of the software packages residing on the storage controller.

Parameters
- **{ [-fields <fieldname>, ...]**
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

- **| [-instance ]**
  If you specify the -instance parameter, the command displays detailed information about all fields.

- **[-node {<nodename>|local}] - Node**
  Selects which node's packages are displayed. The local node is the default if this parameter is omitted.

- **[-package <text>] - Package File Name**
  This parameter specifies which package's information will be displayed.
### system node image package external-device commands

The external-device directory

#### system node image package external-device delete

Delete file on external device

**Availability:** This command is available to cluster administrators at the advanced privilege level.

**Description**
The delete command deletes the specified file on the external device.

**Parameters**
- **-node** `<nodename>|local` - Node
  
  The file is deleted from the external device of the node specified with this parameter. If this parameter is omitted, then the local node is used as the default node.
- **-package** `<text>` - File Name
  
  This parameter specifies the file to be deleted.
- **-device** `<usb0>` - Device
  
  This parameter specifies the name of the external device. Currently, only usb0 is supported.

```
::> system image package external delete -package image.tgz
```

#### Examples

```
::> system image package external delete -package image.tgz
```

### system node image package external-device show

Display file listing on external device

**Availability:** This command is available to cluster administrators at the advanced privilege level.

**Description**
The external-device show command displays files residing on the external storage device.

**Parameters**
```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.
If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

This parameter selects the node that has files that are to be displayed on the external storage device. If this parameter is omitted, then the local node is the default node.

**[-package <text>] - File Name**

This parameter specifies the file for which the information is displayed.

**[-device <usb0>] - Device**

This parameter specifies the name of the external device. Currently, only usb0 is supported.

### Examples

```bash
cluster1::> system image package external-device show

+------------+------------+------------+--------------------------+
<table>
<thead>
<tr>
<th>Node</th>
<th>Device</th>
<th>Package</th>
<th>File Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>node-01</td>
<td>usb0</td>
<td>image.tgz</td>
<td></td>
</tr>
<tr>
<td>node-01</td>
<td>usb0</td>
<td>netboot.tgz</td>
<td></td>
</tr>
</tbody>
</table>
|            |            |            | 2 entries were displayed.
```

### system node internal-switch commands

Manage onboard switches

### system node internal-switch show

Display onboard switch attributes

**Availability:** This command is available to cluster administrators at the `admin` privilege level.

**Description**
The `system node internal-switch show` command is used to display the internal switch state information and the link status.

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

| [-instance ] |

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Use this parameter to specify the node the switch resides on.

**[-switch-id <integer>] - Switch**

Use this parameter to specify the switch id. For example, 1.

**[-port-id <integer>] - Port**

Use this parameter to specify the port id. For example, 0.

**[-port-name <text>] - Port Name**

Use this parameter to specify the port name. For example, e0M.
[auto-admin <Auto-negotiation setting>] - Auto-Negotiation Administrative
Use this parameter to show the auto-negotiation administrative setting. 'enable' or 'disable'.

[auto-op <Auto-negotiation setting>] - Auto-Negotiation Operational
Use this parameter to show the auto-negotiation operational setting. 'unknown', 'complete', 'incomplete', 'failed' or 'disabled'.

duplex-admin <Duplex> - Duplex Mode Administrative
Use this parameter to show the duplex mode administrative setting. 'half' or 'full'.

duplex-op <Duplex> - Duplex Mode Operational
Use this parameter to show the duplex mode operational setting. 'half' or 'full'.

[speed-admin <Link speed>] - Speed Administrative
Use this parameter to show the speed administrative setting. '10', '100' or '1000'.

[speed-op <Link speed>] - Speed Operational
Use this parameter to show the speed operational setting. '10', '100' or '1000'.

<link <Link Status>] - Link State
Use this parameter to show the link state, 'up' or 'down'.

[up-admin <Link Status>] - Up Administrative
Use this parameter to show the up administrative setting, 'up' or 'down'.

[fc-op <Flow control>] - Flow Control Operational
Use this parameter to show the flow control operational setting, 'full', 'send', 'receive' or 'none'.

**Examples**
The example shows the attributes of the internal switch 0 on the node Node1.

```
cluster1::> system node internal-switch show -node Node1 -switch-id 0
Port Role    Link    Auto-Negot     Duplex     Speed(Mbps)
---  -------  ----------  ----------  -----------
0    sw-wrench up      enable/complete full/full 1000/1000
1    sw-locked-wrench down  enable/incomplete full/full 1000/1000
2    sw-e0M        up      enable/complete full/full 1000/1000
3    sw-e0P        down  enable/incomplete full/full 1000/1000
4    sw-midplane-1 down  enable/incomplete full/full 1000/1000
5    sw-expander-1 up      enable/unknown full/full 1000/1000
6    sw-sp-1        up      enable/unknown full/full 1000/1000
7 entries were displayed.
```

**system node internal-switch dump commands**
Dump onboard switch info

**system node internal-switch dump eeprom**
Display onboard switch eeprom config

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
The `system node internal-switch dump eeprom` command is used to show the internal switch eeprom firmware content.
**Parameters**

```
{ [-fields <fieldname>, ...] }
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance ]
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[-node <nodename>] - Node
```

Use this parameter to specify the node the internal switch resides on.

```
[-switch-id <integer>] - Switch
```

Use this parameter to specify the switch id. For example, 1.

```
[-version <text>] - Version
```

Use this parameter to specify the version of firmware needs to be dumped.

```
[-eeprom <text>] - Firmware
```

Use this parameter to specify the firmware content needs to be dumped.

**Examples**

The following example shows the internal switch eeprom firmware content of the internal switch 0 on Node1.

```
cluster1::> system node internal-switch dump eeprom -node Node1 -switch-id 0
EEPROM Configuration
---------------------------------------
Node: Node1 , Switch: 0 , Version: Version2 SB_XX Switch0

```

**system node internal-switch dump port-mapping**

Display onboard switch port mapping

**Availability:** This command is available to cluster administrators at the `admin` privilege level.

**Description**

The `system node internal-switch dump port-mapping` command is used to show the internal switch port connections.

**Parameters**

```
{ [-fields <fieldname>, ...] }
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.
If you specify the `-instance` parameter, the command displays detailed information about all fields.

`-node <nodename>` - Node

Use this parameter to specify the node the switch resides on.

`-switch-id <integer>` - Switch

Use this parameter to specify the switch id. For example, 1.

`-port-id <integer>` - Port

Use this parameter to specify the port id. For example, 0.

`-role <text>` - Port Name

Use this parameter to specify the port name. For example, eOM.

### Examples

The following example shows the port connections of the internal switch 0 on Node1.

```
cluster1::> system node internal-switch dump port-mapping -node Node1 -switch-id 0
Port   Port Name
----   -----------------
        Node: Node1   , Switch: 0
0      sw-wrench
1      sw-locked-wrench
2      sw-eOM
3      sw-e0P
4      sw-midplane-1
5      sw-expander-1
6      sw-sp-1
7 entries were displayed.
```

### system node internal-switch dump stat

Display onboard switch port statistics counter

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

The `system node internal-switch dump stat` command is used to display the counter information of the internal switch ports.

**Parameters**

```
[-fields <fieldname>,...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance]
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`-node <nodename>` - Node

Use this parameter to specify the node the switch resides on.

`-switch-id <integer>` - Switch

Use this parameter to specify the switch id. For example, 1.

`-port-id <integer>` - Port

Use this parameter to specify the port id. For example, 0.
- **-stat-id <text>** - Counter Name
  Use this parameter to specify the counter name.

- **-valued <integer>** - Counter Value
  Use this parameter to show the value of specified counter.

- **-port-name <text>** - Port Name
  Use this parameter to specify the port name. For example, e0M.

### Examples
The following example shows partial counter information of the internal switch 0 on Node1

```
class1::> system node internal-switch dump stat -node Node1 -switch-id 0
```

<table>
<thead>
<tr>
<th>Port</th>
<th>Port Name</th>

### system node power commands

The power directory

### system node power on

Power nodes on

**Availability:** This command is available to cluster administrators at the advanced privilege level.

**Description**
This command switches on the power of the main controller of the specified node. This command works for a single node only and the full name of the node must be entered exactly.

**Parameters**

- **-node (<nodename>|local)** - Node
  This parameter specifies the node whose power you want to switch on.

### Examples
The following example switches on the power of node2.

```
class1::> set advanced
Warning: These advanced commands are potentially dangerous; use them only when directed to do so by NetApp personnel.
Do you want to continue? {y|n}: y
```
**system node power show**

Display the current power status of the nodes

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
This command displays the power status of the main controller in each node across the cluster.

**Parameters**

```
[-fields <fieldname>, ...]
```
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance]
```
If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[-node <nodename>|local] - Node
```
This optional parameter specifies the name of a node for which information is to be displayed. If this parameter is not specified, the command displays information about all nodes in the cluster.

```
[-status {on|off}] - Current Power Status
```
If the `-status parameter is specified, the command only lists information about the node with the power status value you enter.

**Examples**
The following example displays power status of all the nodes in cluster1.

```
cluster1::> system node power show

Node     Status
----------
node1    on
node2    on
2 entries were displayed.
cluster1::>
```

**system node root-mount commands**
The root-mount directory

**system node root-mount create**
Create a mount from one node to another node's root volume.

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
The `system node root-mount create` command produces a root-mount from one node in the cluster to another node's root volume. The root-mount is marked for immediate creation by a background task. Use the `system node root-mount show` command to view the current status of root-mount or verify task completion.
Parameters

- **<nodename>* - Owner of the Root-mount
  The node name where the root-mount will be created.

- **<nodename>* - Root-mount Destination Node
  The node name that the root-mount will access.

Examples

The following example shows the creation of a root-mount from *cluster1::nodeA* to *cluster1::nodeB* and the verification of the successful completion.

```plaintext
cluster1::> system node root-mount show
This table is currently empty.

cluster1::> system node root-mount create -node nodeA -root-node nodeB

cluster1::> system node root-mount show
Node              Root Node         State       Last Error
----------------- ----------------- ----------- -------------------------------
nodeA             nodeB                   ready
```

Related references

- *system node root-mount show* on page 1263
- *system node root-mount delete* on page 1262

**system node root-mount delete**

Delete a mount from one node to another node's root volume.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The *system node root-mount delete* command removes a root-mount from one node in the cluster to another node's root volume. The root-mount is marked for immediate deletion by a background task. Use the *system node root-mount show* command to view the current status of root-mount or verify task completion.

Parameters

- **<nodename>* - Owner of the Root-mount
  The node which has the mount.

- **<nodename>* - Root-mount Destination Node
  The node accessed by the mount.

Examples

This example shows the deletion of a root-mount from *cluster1::nodeA* to *cluster1::nodeB* and the verification of the command's successful completion.

```plaintext
cluster1::> system node root-mount show
Node              Root Node         State       Last Error
----------------- ----------------- ----------- -------------------------------
nodeA             nodeB                   ready

cluster1::> system node root-mount delete -node nodeA -root-node nodeB
```
system node root-mount show

Show the existing mounts from any node to another node's root volume.

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system node root-mount show command displays the status of current root-mounts from any node to another node's root volume. These root-mounts are used by cluster services to access data on other nodes in the cluster. These root-mounts are not pre-created, but are created as they are needed. They can also be manually created or deleted.

Parameters
{-fields <fieldname>,...}
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-node <nodename>] - Owner of the Root-mount
Selects information about root-mounts that exist on the specified node.

[-root-node <nodename>] - Root-mount Destination Node
Selects information about root-mounts that connect to the specified node.

[-create-time <MM/DD/YYYY HH:MM:SS>] - Mount Creation Time
Selects information about root-mounts that were created at the specified time.

[-state <Mount State>] - State of the Root-Mount
Selects information about root-mounts that have the specified state. The states are:

• unknown: The state of the root-mount is being determined.
• initializing: A root-mount was found and needs testing to determine the correct state.
• mount-requested: The root-mount has been requested, but is not ready.
• mounting: The root-mount is being created, but is not ready.
• ready: The root-mount is ready to be used.
• not-responding: The root-mount exists but is not responding.
• does-not-exist: No root-mount is possible to this node’s root volume.
• ha-busy: The root-mount is busy pending completion of an HA event.
• clean-up-requested: The root-mount is being deleted.
• cleaning-up: The root-mount is being deleted.
create-error: The root-mount could not be created.

[-last-error <text>] - Last Error

Selects information about root-mounts that have the specified last-error value.

**Examples**

The following example shows the default state of the root-mounts on a cluster that is not using root-node services:

```bash
cluster1::> system node root-mount show
This table is currently empty.
```

The following example displays the root-mounts that exist for a cluster that has nodeA mounted to nodeB, and nodeB mounted to nodeA:

```bash
cluster1::> system node root-mount show
Node              Root Node         State       Last Error
----------------- ----------------- ----------- -------------------------------
nodeA             nodeB                   ready
nodeB             nodeA                   ready
2 entries were displayed.
```

**system node upgrade-revert commands**

The upgrade-revert directory

**system node upgrade-revert show**

Display upgrade/revert node status.

**Availability:** This command is available to cluster administrators at the advanced privilege level.

**Description**

The `system node upgrade-revert show` command displays information about the status of upgrades or reversions. If an upgrade has failed, this command enables you to determine which phase of the upgrade contains the failed upgrade task and the reason for the failure.

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance]
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[-node <nodename> | local] - Node
```

Use this parameter to display status information only about upgrades or reversions that are slated to occur on the nodes you specify.

```
[-upgrade-version <integer>] - Cluster Upgrade Version
```

Selects status information about upgrades or reversions that are to the version number you specify.
[\textbf{-startup-phase \{pre-root|pre-apps|post-apps\}] - Startup Phase

Selects status information about upgrades or reversions that are slated to occur during the startup phase you specify. Startup phases are:

\begin{itemize}
\item pre-root - Upgrade is applied before mroot is mounted
\item pre-apps - Upgrade is applied before other cluster apps are started
\item post-apps - Upgrade is applied after all RDB apps are online
\end{itemize}

\textbf{[\textbf{-status \langle Upgrade/Revert Execution Status\rangle}] - Execution Status}

Selects status information about upgrades or reversions that have the execution status you specify. Execution statuses are:

\begin{itemize}
\item prepared - Ready to upgrade
\item applied - Successful upgrade
\item reverted - Successful reversion
\item failed - Unsuccessful upgrade or reversion
\item aborted - Unsuccessful upgrade or reversion
\item skipped - Upgrade or reversion was skipped for that phase
\item locked - Upgrading or reverting
\end{itemize}

\textbf{[\textbf{-status-msg \langle text\rangle}] - Status Message}

Selects status information about upgrades or reversions that have the status message you specify. The status message displays the current status of the phase with which it appears.

\textbf{[\textbf{-direction \{upgrade|revert\}] - Upgrade/Revert Direction}

Use this parameter with the value \texttt{upgrade} to select status information about upgrades. Use this parameter with the value \texttt{revert} to select status information about reversions.

\textbf{[\textbf{-node-status \{reverting|complete|not-needed|aborted|failed|waiting|in-progress|stopped\}] - Node Status}

Selects status information about upgrades or reversions that have the status you specify on nodes where they are slated to occur. Node statuses are:

\begin{itemize}
\item aborted - Upgrade process aborted. Contact support personnel.
\item failed - Upgrade process failed. Contact support personnel.
\item stopped - Upgrade process stopped due to node or management application restart. Use the system node upgrade-revert upgrade command to complete the upgrade manually.
\item complete - Upgrade process completed successfully.
\item waiting - Upgrade process is waiting the replication database to come online or for applications to be stable. If the RDB is not online, check network connectivity using \text{cluster show} and \text{cluster ping-}\text{cluster} to ensure that all nodes are healthy and in communication.
\end{itemize}

\textbf{[\textbf{-node-status-msg \langle text\rangle}] - Node Status Message}

Selects status information about upgrades or reversions that have the node status message you specify. The node status message displays the upgrade or reversion status of the node with which it appears. If the upgrade or reversion fails, this message provides information that helps to diagnose the cause of the failure.
Examples
The following example shows typical output for a cluster with two nodes. Status messages for each phase display information about the tasks in that phase.

```
cluster1:~> system node upgrade-revert show
Node: node1                                           Status: complete
Status Message: The upgrade is complete.
Vers Phase      Status   Upgrade Phase Status Message
---- ---------- -------- ------------------------------------------------------
200  pre-root   applied  No upgrade is required for this phase.
200  pre-apps   applied  Upgrade successful.
200  post-apps  applied  Upgrade successful.

Node: node2                                           Status: complete
Status Message: The upgrade is complete.
Vers Phase      Status   Upgrade Phase Status Message
---- ---------- -------- ------------------------------------------------------
200  pre-root   applied  No upgrade is required for this phase.
200  pre-apps   applied  Upgrade successful.
200  post-apps  applied  Upgrade successful.
6 entries were displayed.
```

- `cluster show` on page 43
- `cluster ping-cluster` on page 38

**system node upgrade-revert upgrade**

Run the upgrade at a specific phase.

**Availability:** This command is available to `cluster` administrators at the `advanced` privilege level.

**Description**
The `system node upgrade-revert upgrade` command manually executes an upgrade. Use this command to execute an upgrade after issues that caused an upgrade failure are resolved. If the upgrade is successful, no messages display.

Before the command executes upgrades, it checks the configuration of the nodes in the cluster. If no upgrades are needed, the command displays a message and does not execute any upgrades.

**Parameters**
- `-node <nodename>|local` - Node
  Specifies the node that is to be upgraded. The value `local` specifies the current node.

**Examples**
This example shows command output of a node named `node0` if node configuration is current.

```
cluster1:~> system node upgrade-revert upgrade -node node0
The node configuration is up-to-date. No upgrade is needed.
```

system node virtual-machine commands

Configure Data ONTAP virtual machine settings

The system node virtual-machine commands enable virtual machine and hypervisor management.

system node virtual-machine hypervisor commands

View and configure hypervisor information

The system node virtual-machine hypervisor commands enable you to view and manage information about the hypervisor on which Data ONTAP resides.

system node virtual-machine hypervisor modify-credentials

Modify hypervisor IP address and its credentials

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The system node virtual-machine hypervisor modify-credentials command is used to set the IP address of the hypervisor on which the node is running or vSphere credentials (i.e. -new-username or -new-password).

Parameters

- `node {<nodename>|local}` - Node
  Name of the Data ONTAP node running in a virtual machine. It is a required field and the node must exist in the cluster.

  [ -new-server <text>] - New Hypervisor IP Address
  New vSphere server controlling this virtual machine. It can be either an IP address or (if name resolution is enabled) a hostname.

  [ -new-username <text>] - New Hypervisor Username
  New vSphere username for the -new-server specified above.

  [ -new-password <text>] - New Hypervisor Password
  New vSphere password for the -new-server specified above.

Examples

The following example sets the IP address and the credentials of the vSphere server on which the node is running.

```
cluster1:~> system node virtual-machine hypervisor modify-credentials
   -node node1 -new-server 192.168.0.1 -new-username admin -new-password pass123
```

system node virtual-machine hypervisor show

Display hypervisor information about Data ONTAP-v nodes

Availability: This command is available to cluster administrators at the admin privilege level.
Description
The `system node virtual-machine hypervisor show` command displays information for each hypervisor that is hosting a Data ONTAP virtual machine. The output contains the hypervisor-specific information, such as host name and IP address, as well as network configuration details. The command only scans hypervisors on which Data ONTAP virtual machines are installed. To filter command output, specify any number of optional fields listed below.

Parameters
{
[-fields <fieldname>, ...]
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

[[-instance]]
If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node
The name of the Data ONTAP node running in a virtual machine for which information is to be displayed. If this optional parameter is not specified, the command displays information about all nodes in the cluster.

[-vm-uuid <UUID>] - UUID of the Virtual Machine
The hypervisor-supplied unique ID for this virtual machine. This optional parameter selects information about the hypervisor on which the Data ONTAP virtual machine is running with the specified UUID. Since UUID is unique per host, an alternative and easier way is to use `-node` to filter out the same information.

[-vmhost-bios-release-date <text>] - Release Date for the Hypervisor BIOS
The release date for the currently running hypervisor BIOS. This optional parameter selects information about the hypervisors that have the specified BIOS release date.

[-vmhost-bios-version <text>] - Current BIOS Version of the Hypervisor Physical Chassis
The current BIOS version of the hypervisor physical chassis. This optional parameter selects information about the hypervisors that are running with the specified BIOS version.

[-vmhost-boot-time <text>] - Time When Hypervisor was Last Booted
The time when the hypervisor was last booted. This optional parameter selects information about the hypervisors which were last booted at the specified boot time.

[-vmhost-cpu-clock-rate <integer>] - Speed of the Hypervisor CPU Cores (MHz)
The speed of the hypervisor CPU cores. This optional parameter selects information about the hypervisors that are running with the specified CPU clock rate.

[-vmhost-cpu-core-count <integer>] - Number of Physical CPU Cores on the Hypervisor
The number of physical CPU cores on the hypervisor. Physical CPU cores are the processors contained by a CPU package. This optional parameter selects information about the hypervisors that are running with the specified CPU cores.

[-vmhost-cpu-socket-count <integer>] - Number of Physical CPU Packages on the Hypervisor
The number of physical CPU packages on the hypervisor. Physical CPU packages are chips that contain one or more processors. Processors contained by a package are also known as CPU cores. For example, one dual-core package is comprised of one chip that contains two CPU cores. This optional parameter selects information about the hypervisors that are running with the specified CPU sockets.

[-vmhost-cpu-thread-count <integer>] - Number of Physical CPU Threads on the Hypervisor
The number of physical CPU threads on the hypervisor. This optional parameter selects information about the hypervisors that are running with the specified CPU threads.

[-vmhost-gateway <text>] - Default Gateway for the Hypervisor
The default gateway for the hypervisor. This optional parameter selects information about the hypervisors with the specified gateway address.
[vmhost-hardware-vendor <text>] - Hardware Vendor of the Hypervisor
The name of hypervisor hardware manufacturer. This optional parameter selects information about the
hypervisors with the specified hardware vendor.

[vmhost-hypervisor <text>] - Complete Product Name, including the Version Information for the Hypervisor
The complete product name, including the version information for the hypervisor. This optional parameter
selects information about the hypervisors that are running with the specified hypervisor version.

[vmhost-ip-address <text>] - Primary IP Address Assigned to the Hypervisor
The primary IP address assigned to the hypervisor. This optional parameter selects information about the
hypervisors with the specified IP address.

[vmhost-memory <integer>] - Physical Memory Size of the Hypervisor (Bytes)
The physical memory size of the hypervisor in bytes. This optional parameter selects information about the
hypervisors that are running with the specified physical memory.

[vmhost-model <text>] - Hypervisor Manufacturer-Supplied Hardware Model Name
The hypervisor manufacturer-supplied hardware model name. This optional parameter selects information
about the hypervisors with the specified hardware model.

[vmhost-name <text>] - Hostname of the Hypervisor
The host name assigned to the hypervisor. This optional parameter selects information about the hypervisor
with the specified host name.

[vmhost-netmask <text>] - Subnet Mask Address for the Hypervisor
The subnet mask address for the hypervisor. This optional parameter selects information about the hypervisors
with the specified netmask address.

[vmhost-processor-id <text>] - Processor ID of the Hypervisor
The processor ID of the hypervisor. This optional parameter selects information about the hypervisors with the
specified processor ID.

[vmhost-processor-type <text>] - CPU Model of the Hypervisor
The CPU model of the hypervisor. This optional parameter selects information about the hypervisors that are
running with the specified processor type.

[vmhost-software-vendor <text>] - Name of the Virtual Machine Software Manufacturer
The name of the virtual machine software manufacturer. This optional parameter selects information about the
hypervisors with the specified software vendor.

[vmhost-uuid <UUID>] - UUID of the Hypervisor
A unique ID for the hypervisor. This optional parameter selects information about the hypervisor with the
specified UUID.

[vmhost-error <text>] - Error in case Hypervisor Info Retrieval Fails
Displays a list of nodes on which the hypervisor has received the specified error. This parameter is most useful
when entered with wildcards.

The maximum system capacity (in TB) that can be configured on the VM. This optional parameter selects
information about the node's storage capacity.

Examples
The following example shows typical output from the system node virtual-machine hypervisor show
command for the Data ONTAP virtual machines running in the cluster.
```
cluster1::> system node virtual-machine hypervisor show

system node virtual-machine instance commands

View virtual machine instance information

The system node virtual-machine instance commands enable virtual machine instance management.

system node virtual-machine instance show

Display virtual machine instance information per node

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The system node virtual-machine instance show command displays virtual machine information. With this information you can determine the relationship between a Data ONTAP node and its associated virtual machine instance running within a cloud provider. Several other details about the virtual machine can be extracted as well, such as the cloud provider account ID to which it belongs. To filter command output, specify any number of optional fields listed below.

Parameters

| [-fields <fieldname>, ...] |
| If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify. |

| [-instance ] |
| If you specify the -instance parameter, the command displays detailed information about all fields. |

[-node {<nodename>|local}] - Node

This optional parameter represents the name of the Data ONTAP node running in a virtual machine for which information is to be displayed. If this parameter is not specified, the command displays information about all nodes in the cluster.

[-instance-id <text>] - ID of This Instance

A cloud provider-supplied unique instance ID for this virtual machine, for example "i-a9d42f89" or "db00a7755a5e4e8a8e4b19bc3b330c3.1".

[-account-id <text>] - ID of This Account

The cloud provider-associated account ID for this virtual machine. This parameter is usually associated with a cloud provider login ID and password.

[-image-id <text>] - ID Of The Image in Use on This Instance

The image ID installed on this virtual machine instance. It identifies a pre-defined template of a computing device's software environment. It contains the operating system and can also include application software, such as database servers, middleware, and web servers. In this case, the ID refers to an image that contains everything required to run Data ONTAP in the cloud.
instance-type <text> - Specifies System Attributes and Use Cost
A specification (as defined by the cloud provider) that defines the memory, CPU, storage capacity and usage cost for a virtual machine instance. Some instance types are designed for standard applications, whereas others are designed for CPU-intensive or memory-intensive applications and so on.

region <text> - Set of Resources in the Same Geographic Area
A named set of resources in the same geographical area. For example "us-east-1" might be the name for a collection of compute and storage resources on the eastern coast of the United States. Typically, a region contains multiple availability zones.

version <text> - Version of This VM Instance Information
The version of the Instance Metadata or Agent Wire Protocol as defined by the cloud provider.

availability-zone <text> - Distinct Location within a Region
A distinct location within a region that is insulated from failures in other availability zones. It provides low-latency network connectivity to other availability zones in the same region.

primary-ip <text> - Primary IP Address Assigned to this Instance
The primary IP address assigned to this virtual machine instance.

deployment-id <text> - Deployment ID of This Instance
A cloud provider-supplied unique deployment ID for this virtual machine, for example "2831c724-97ca-4395-b8d3-a65c2a65b502".

fault-domain <integer> - Fault Domain of This Instance
A cloud provider-assigned numerical fault domain ID for this virtual machine within an Availability Set.

update-domain <integer> - Update Domain of This Instance
A cloud provider-assigned numerical update domain ID for this virtual machine within an Availability Set.

provider <text> - Provider on which this instance is running.
The provider on which this instance is running.

Examples
The following examples illustrate typical output from the system node virtual-machine instance show command for a virtual machine running in a cloud provider environment.

```
cluster1::> system node virtual-machine instance show
   Node: node1
   Instance ID: i-b9c42e97
   Account ID: 751083215869
   Image ID: ami-7fb4a1c6
   Instance Type: m3.xlarge
   Region: us-east-1
   Version: 2010-08-31
   Availability Zone: us-east-1d
   Primary IP: 192.168.0.1
   Provider: AWS

cluster1::> system node virtual-machine instance show
   Node: node1
   Instance ID: 2831c724-97ca-4395-b8d3-a65c2a65b502._cloudontap-vm
   Deployment ID: 2831c724-97ca-4395-b8d3-a65c2a65b502
   Version: 2012-11-30
   Availability Zone: Fault Domain: 0

system node virtual-machine instance show-system-disks

Display information about Data ONTAP-v system disks

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system node virtual-machine instance show-system-disks command displays the system disks information of the Data ONTAP node running on the virtual machine. There are three types of Data ONTAP-v system disks - boot, core and log. The details contain the physical properties of the disk and its backing information (e.g. backing store name, iSCSI Lun UUID, etc). To filter command output, specify any number of optional fields listed below.

Parameters

{ [-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance ]}
If you specify the -instance parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node Name
The name of the Data ONTAP node running in a virtual machine for which information is to be displayed. If this optional parameter is not specified, the command displays information about all nodes in the cluster.

[-vmdisk-type <text>] - Type of the System Disk
The type of the system disk, for example "Boot", "Core" or "Log". This optional parameter selects the information about the system disk with the specified type.

[-vmdisk-name <text>] - Data ONTAP Supplied Name of the System Disk
The Data ONTAP-supplied name of the system disk. This optional parameter selects the information about the system disk with the specified name.

[-vmdisk-serial-number <text>] - Data ONTAP Supplied Serial Number of the System Disk
The Data ONTAP-supplied serial number of the system disk. This optional parameter selects the information about system disk with the specified serial number.

[-vmdisk-capacity <integer> [KB|MB|GB|TB|PB]] - Size of the System Disk
The size of the system disk. This optional parameter selects the information about system disks with the specified size.

[-vmdisk-area-name <text>] - Name of the System Disk Backing Store
The name of the disk backing store. A backing store represents a storage location for virtual machine files. It can be a VMFS volume, a directory on network-attached storage, or a local file system path. This optional parameter selects the information about the system disks that reside on the specified backing store.

[-vmdisk-file-name <text>] - File Name of the System Disk Used By the Hypervisor
The file name of the virtual disk used by the hypervisor. Each Data ONTAP disk is mapped to a unique VM disk file. This optional parameter selects the information about the system disk mapped to the specified file name.

[-vmdisk-backing-store-type <text>] - Type of the System Disk Backing Store
The type of the disk backing store. It can be a VMFS volume, a directory on network-attached storage, or a local file system path. This optional parameter selects the information about the system disks that are backed by the specified type.

[-vmdisk-backing-store-capacity <integer> [KB|MB|GB|TB|PB]] - Size of the System Disk Backing Store
The size of the disk backing store. This optional parameter selects the information about the system disks that are backed by stores with the specified capacity.
[-vmdisk-backing-store-nas-path <text>] - Full Path to the Backing Store for NAS
The full path to the backing store for network-attached storage. This optional parameter selects the information about the system disks with the specified NAS path.

[-vmdisk-backing-adapter-pci <text>] - Backing Adapter PCI Device ID
The backing adapter PCI device ID for the virtual disk. This optional parameter selects the information about the system disks that have the specified ID as their backing adapter PCI ID.

[-vmdisk-backing-adapter-device <text>] - Name of the Backing Adapter Device
The name of the backing adapter device. This optional parameter selects the information about the system disks that have the specified name as their backing adapter device name.

[-vmdisk-backing-adapter-model <text>] - Type of the Backing Adapter Model
The type of the backing adapter model. This optional parameter selects the information about the system disks that have the specified type as their backing adapter model type.

[-vmdisk-backing-adapter-driver <text>] - Backing Adapter Driver Name of the Initiator
The backing adapter driver name of the initiator. This optional parameter selects the information about the system disks that have the specified name as their initiator's backing adapter driver name.

[-vmdisk-backing-target-iscsi-name <text>] - iSCSI Name of the System Disk Backing Target
The iSCSI name of the disk backing target. This field is valid only for iSCSI connections. This optional parameter selects the information about the system disks that have the specified name as their backing device iSCSI target name.

[-vmdisk-backing-target-iscsi-address <text>] - iSCSI IP Address of the System Disk Backing Target
The iSCSI IP address of the disk backing target. This field is valid only for iSCSI connections. This optional parameter selects the information about the system disks that have the specified IP as their backing device iSCSI target IP address.

[-vmdisk-backing-device-address <text>] - SCSI Device Name (target-id:lun-id) for the Backing Disk
The SCSI device name for the backing disk. It takes the form target-id:lun-id, for example "2:1". This optional parameter selects the information about the system disks that have the specified backing device address.

[-vmdisk-backing-device-uuid <text>] - Hypervisor-Assigned Unique ID of the Backing Device
The hypervisor-assigned unique ID of the backing device (disk or LUN). This optional parameter selects the information about system disks that are backed by a device with the specified UUID.

[-vmdisk-backing-device-partition <integer>] - Backing Disk Partition Number for the VM Disk File
The backing disk partition number where the corresponding VM disk file resides. This optional parameter selects the information about the system disks that reside on the specified partition number on any disk.

[-vmdisk-backing-device-capacity <integer>[KB|MB|GB|TB|PB]] - Size of the Backing Device (Disk or LUN)
The size of the backing device (disk or LUN) in bytes. This optional parameter selects the information about the system disks that have backing devices with the specified capacity.

Examples
The following example shows typical output from the system node virtual-machine instance show-system-disks command for the Data ONTAP node running on a virtual machine.

```
cluster1::> system node virtual-machine instance show-system-disks
Disk Disk Disk Store
Node Type Name Capacity Name VM Disk File Name
---- ---- ----- -------- ------ -------------------------------
node1 Boot ad0 1.032 GB store1 store1/node1/DataONTAP.vmdk
Core ad1 1.505 GB store2 store2/node1/DataONTAP-var.vmdk
Log ad2 5.001 GB store3 store3/node1/DataONTAP-nvram.vmdk
```

system node commands
Warning: Unable to list entries on node node2. Access to the vSphere server is failing since the server hostname or IP address is not set. Correct the vSphere credentials with the "system node virtual-machine hypervisor modify-credentials" command.

system script commands

Capture CLI session to a file for later upload. Analogous to the unix `script` command

system script delete

Delete saved CLI session logs

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The system script delete command deletes files that contain CLI session records. Use the system script show command to display saved CLI sessions.

Parameters

-username <text> - Log Owner Username
  Use this parameter to specify the name of the user whose CLI session record files are deleted. The default is the username is that of the logged in user.

-filename <text> - Log Filename
  Use this parameter to specify the names of CLI session record files to delete.

Examples

The following example shows how to delete the files named sessionlog2 and sessionlog3.

```
cluster1:~> system script delete -filename sessionlog2,sessionlog3
```

The following example deletes all saved script files.

```
cluster1:~> system script delete *
```

system script show

Display saved CLI session logs

Availability: This command is available to cluster administrators at the admin privilege level.
Description
The system script show command displays information about files that contain records of CLI sessions.

For security reasons, the command normally displays only the script files created by the logged in user. Administrative users can display all log files using the -user parameter.

Parameters
[[-fields <fieldname>, ...]
   If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[[-user ]
   Use this parameter to display all script files created by all users, along with the username associated with each file.

[[-instance ]]()
   If you specify the -instance parameter, the command displays detailed information about all fields.

[-username <text>] · Log Owner Username
   Use this parameter to display information only about files saved by the user you specify. The default username is that of the logged in user.

[-filename <text>] · Log Filename
   Use this parameter to display information only about files that have the file name you specify.

[-size-limit {<integer>[KB|MB|GB|TB|PB]}] · Logfile Size Limit
   Use this parameter to display information only about files that have the size limit you specify.

[-state <State of CLI session log>] · Current State
   Use this parameter to display information only about files that have the state you specify. Valid values for this parameter are open-and-logging, file-full, and file-closed.

[-size {<integer>[KB|MB|GB|TB|PB]}] · Current Logfile Size
   Use this parameter to display information only about files that are the size you specify.

[-mtime <MM/DD/YYYY HH:MM:SS>] · Last Modification Time
   Use this parameter to display information only about files that were last modified at the date and time you specify.

[-this-session (yes|no)] · Session is Logging
   Use this parameter with the value yes to display information only about files that are recording the current CLI session. Use this parameter with the value no to display information only about files that are not recording the current CLI session.

Examples
The following example displays typical system script information.

<table>
<thead>
<tr>
<th>FileName</th>
<th>Sess State</th>
<th>Size</th>
<th>Last Mod Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>sessionlog1</td>
<td>no</td>
<td>file-closed</td>
<td>435B</td>
</tr>
<tr>
<td>sessionlog2</td>
<td>yes</td>
<td>open-and-logging</td>
<td>193B</td>
</tr>
</tbody>
</table>

2 entries were displayed.
system script start

Start logging all CLI I/O to session log

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The `system script start` command starts creating a record of your CLI session. The record is stored in a file. Use the `system script show -this-session yes` command to display files that are recording the current CLI session. Use the `system script stop` command to stop recording the current CLI session.

**Parameters**
- `-filename <text>` - *Filename to Log To*
  
  Use this parameter to specify the file name to which the CLI session record is saved.

- `-size-limit <integer>[KB|MB|GB|TB|PB]` - *Logfile Size Limit Max:2GB*
  
  Use this parameter to specify the maximum size of the file that contains the CLI session record. When the file size reaches this limit, recording stops. The default file size limit is 1 MB. The maximum file size limit is 2 GB.

**Examples**
The following example shows how to start creating a record of the CLI session in a file named `sessionlog3`. The size limit of this file is 20 MB.

```
cluster1::> system script start -filename sessionlog3 -size-limit 20MB
```

---

system script stop

Stops logging CLI I/O

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The `system script stop` command stops creating a record of your CLI session, if you started creating the record by using the `system script start` command. Use the `system script show -this-session yes` command to display files that are recording the current CLI session.

**Examples**
The following example shows how to stop creating a record of your CLI session.

```
cluster1::> system script stop
```

**Related references**
- `system script start` on page 1278
- `system script show` on page 1276
system script upload

Upload the selected CLI session log

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system script upload command uploads a CLI session record file to a remote location. Specify the remote location using an FTP or HTTP URI. Use the system script show command to display saved CLI sessions. Use the system script start command to record a CLI session and save it to a file.

Parameters
-username <text> - Username If Not Your Own
  Use this parameter to specify the name of the user who owns the file to upload. By default, this is the user who is logged in.

-filename <text> - Filename to Log To
  Use this parameter to specify the name of a file to be uploaded.

-destination {ftp|http://(hostname|IPv4 Address|'['IPv6 Address']')}... - URI to Send File To
  Use this parameter to specify the FTP or HTTP destination of the file.

Examples
The following example shows how to upload the file named sessionlog3 to the destination ftp://now.example.com/cli_sessions.

cluster1::> system script upload -filename sessionlog3 -destination ftp://now.example.com/cli_sessions

system service-processor commands

Display and configure the Service Processor

system service-processor reboot-sp

Reboot the Service Processor on a node

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system service-processor reboot-sp command reboots the Service Processor of the specified node.

Parameters
-node {<nodename>|local} - Node
  This parameter specifies the node whose Service Processor is to be rebooted.
[-image {primary|backup}] - Image to Boot with After Reboot

This parameter specifies the image that the Service Processor uses after the reboot. By default, the primary image is used. Avoid booting the SP from the backup image. Booting from the backup image is reserved for troubleshooting and recovery purposes only. It might require that the SP automatic firmware update be disabled, which is not a recommended setting. You should contact technical support before attempting to boot the SP from the backup image.

Examples

The following command reboots the Service Processor of node "node1" into the primary image.

```
cluster1::> system service-processor reboot-sp -node node1 -image primary
NOTE : If your console connection is through the SP, it will be disconnected.
Do you want to reboot the SP ? {y|n}: y
cluster1::>
```

The following command reboots the Service Processors of all nodes. Since -image is not specified, the Service Processors will boot into the primary image.

```
cluster1::> system service-processor reboot-sp -node *
NOTE : If your console connection is through the SP, it will be disconnected.
Do you want to reboot the SP ? {y|n}: y
2 entries were acted on.
cluster1::>
```

system service-processor show

Display the Service Processor information

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The system service-processor show command displays information about the Service Processor of each node in a cluster. You can limit output to specific types of information and specific nodes in the cluster, or filter output by specific field values.

In case a node is offline or its Service Processor management daemon is down, the command displays the last known IP address of its Service Processor. Only the IP address is displayed in such cases.

Parameters

{ [-fields <fieldname>, ...] }  
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?' to display the fields to specify.

[ [-instance ] ]  
If you specify the -instance parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node
Selects information for the Service Processor of the specified node.

[-type {SP|NONE|BMC}] - Type of Device
Selects information for the Service Processors of the specified type.
[-status {online|offline|sp-daemon-offline|node-offline|degraded|rebooting|unknown|updating}] - Status
Selects information for the Service Processors whose status matches the specified value.

[-ip-configured {true|false}] - Is Network Configured
Selects information for the Service Processors whose network is configured (true) or not configured (false).

[-address <IP Address>, ...] - Public IP Address
Selects information for the Service Processors that use the specified IP address or addresses.

[-mac <MAC Address>] - MAC Address
Selects information for the Service Processors that use the specified MAC address.

[-fw-version <text>] - Firmware Version
Selects information for the Service Processors that are running the specified firmware version.

[-part-num <text>] - Part Number
Selects information for the Service Processors that have the specified part number.

[-serial-num <text>] - Serial Number
Selects information for the Service Processors that have the specified serial number.

[-dev-rev <text>] - Device Revision
Selects information for the Service Processors that have the specified device revision.

[-autoupdate-enabled {true|false}] - Is Firmware Autoupdate Enabled
Selects information for the Service Processors that have the specified status for firmware automatic update.

Examples
The following example displays basic information for the Service Processors of all the nodes.

```
cluster1::> system service-processor show
Node   Type Status   IP Configured Firmware Version IP Address
nodenode1  SP online   true         2.2X5     192.168.1.201
node2   SP online   true         2.2X5     192.168.1.202
2 entries were displayed.
cluster1::>
```

The following example displays all available information for the Service Processors of all the nodes.

```
cluster1::> system service-processor show -instance
   Node: node1
   Type of Device: SP
   Status: online
   Is Network Configured: true
   Public IP Address: 192.168.1.201
   MAC Address: ab:cd:ef:fe:ed:01
   Firmware Version: 2.2X5
   Part Number: Not Applicable
   Serial Number: Not Applicable
   Device Revision: Not Applicable
   Is Firmware Autoupdate Enabled: true
   
   Node: node2
   Type of Device: SP
   Status: online
   Is Network Configured: true
   Public IP Address: 192.168.1.202
   MAC Address: ab:cd:ef:fe:ed:02
```
Firmware Version: 2.2X5
Part Number: Not Applicable
Serial Number: Not Applicable
Device Revision: Not Applicable
Is Firmware Autoupdate Enabled: true
2 entries were displayed.

cluster1::>

The following example displays only the type, status and firmware version for the Service Processors of all the nodes.

cluster1::> system service-processor show -fields type,status,fw-version
node          type status fw-version
------------- ---- ------ ----------
node1         SP   online 2.2X5
node2         SP   online 2.2X5
2 entries were displayed.

system service-processor api-service commands
Display and configure the Service Processor API service

system service-processor api-service modify
Modify service processor API service configuration

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The system service-processor api-service modify command modifies SP API service configuration. The SP API is a secure network API that enables Data ONTAP to communicate with the Service Processor over the network.

Parameters
[-is-enabled {true|false}] - Is SP API Service Enabled
This parameter enables or disables the API service of the Service Processor. When the API service is disabled, features like network-based firmware updates and network-based down filer log collection will not be available, and the slower serial-interface will be used for firmware updates and down filer log collections.

[-port <integer>] - SP API Service Port
This parameter specifies the port number on the Service Processor used for the API service. By default, port 50000 is used.

Examples
The following example modifies the port number used for the SP API service and then disables the SP API service.

cluster1::*>system service-processor api-service modify -port 50001
cluster1::*>system service-processor api-service show
Service Processor API service configuration
is-enabled: true
port: 50001
system service-processor api-service renew-certificates

Renew SSL and SSH certificates used for secure communication with Service Processor API service

**Availability:** This command is available to cluster administrators at the *advanced* privilege level.

**Description**
The `system service-processor api-service renew-certificates` command renews the internal SSL and SSH certificates used for secure communication with the Service Processor API service. If the parameter `-renew-all` is not specified, only host certificates are renewed.

**Parameters**

`[-renew-all {true|false}]` - Renew CA Certificates Also

This parameter specifies the type of certificates that needs to be renewed. If this parameter is set to false, only the host certificates (that is, the client and server certificates) are renewed. If this parameter is set to true, the root-ca certificate is renewed along with the host certificates.

**Examples**
The following example renews the host certificates and the root-ca certificates. The second command renews only the host certificates.

```
cluster1:*>system service-processor api-service renew-certificates -renew-all true
cluster1:*>system service-processor api-service renew-certificates
```

system service-processor api-service show

Display service processor API service configuration

**Availability:** This command is available to cluster administrators at the *advanced* privilege level.

**Description**
The `system service-processor api-service show` command displays the Service Processor API service configuration.

**Examples**
The following example displays the SP API service configuration:

```
cluster1:*>system service-processor api-service show
Service Processor API service configuration
is-enabled: true
port: 50000
```
system service-processor image commands

Service Processor Firmware Image commands

system service-processor image modify

Enable/Disable automatic firmware update

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system service-processor image modify command enables or disables automatic firmware update on the Service Processor of specified node or nodes.

Parameters
- node {<nodename>|local} - Node
  The parameter specifies the node on which automatic Service Processor firmware update is to be enabled or disabled.

[-autoupdate {true|false}] - Firmware Autoupdate
  Setting this parameter to true enables automatic firmware update. Setting this parameter to false disables automatic firmware update. This is a mandatory parameter.

Examples
The following command enables automatic firmware update for the Service Processor on the local node.

```bash
cluster1::> system service-processor image modify -node local -autoupdate true
```

The following command enables automatic firmware update for the Service Processors on all the nodes.

```bash
cluster1::> system service-processor image modify -node * -autoupdate true
2 entries were modified.
```

system service-processor image show

Display the details of currently installed Service Processor firmware image

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system service-processor image show command displays information about the currently installed firmware images on the Service Processor of each node in a cluster. You can limit output to specific types of information and specific nodes in the cluster, or filter output by specific field values.

Parameters

[-fields <fieldname>,...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.
If you specify the `-instance` parameter, the command displays detailed information about all fields.

`-node {<nodename>|local}` - Node
Selects firmware image information for the Service Processor of the specified node.

`-image {primary|backup}` - Image
Selects firmware image information for the Service Processors that are running the primary or backup image as specified.

`-type {SP|NONE|BMC}` - Type
Selects firmware image information for the Service Processors of the specified type.

`-status {installed|corrupt|updating|auto-updating|none}` - Image Status
Selects firmware image information for the Service Processors whose image status matches the specified value.

`-is-current {true|false}` - Is Image Current
Selects firmware image information for the SP whose current image matches the specified status. This parameter indicates the partition (primary or backup) that the SP is currently booted from, not whether the installed firmware version is most current.

`-version <text>` - Firmware Version
Selects firmware image information for the Service Processors running the specified firmware version.

`-autoupdate {true|false}` - Firmware Autoupdate
Selects firmware image information for the Service Processors whose automatic update matches the specified configuration.

`-last-update-status {failed|passed}` - Last Update Status
Selects firmware image information for the Service Processors whose last update is of the specified status.

### Examples
The following command displays basic firmware information for the Service Processors of all the nodes.

```
cluster1::> system service-processor image show

Is
Node             Type  Image   Status      Current Version
---------------- ----- ------- ----------- ------- --------
node1            SP     primary installed   true    2.2X8      
                 backup installed   false   2.2X5      
node2            SP     primary installed   true    2.2X8      
                 backup installed   false   2.2X5      
4 entries were displayed.
```

The following command displays all available firmware information for the Service Processors of all the nodes.

```
cluster1::> system service-processor image show -instance

Node: node1
Image: primary
Type: SP
Image Status: installed
Is Image Current: true
Firmware Version: 2.2X8
Firmware Autoupdate: true
Last Update Status: passed
```
system service-processor image update

Update Service Processor firmware

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system service-processor image update command installs a new firmware version on the Service Processor of specified node in a cluster. If this command fails, it will display and log an appropriate error message and abort. No automatic command retries will be performed. This command also specifies which firmware image is to be installed on the Service Processor and how.

You can use the command system service-processor image update-progress show to check the progress of the update.

The following parameter combinations are not supported for this command:

- -update-type differential with -clear-logs true
- -baseline true with -package <text>

Parameters

-node {<nodename>|local} - Node

This parameter specifies the node whose Service Processor's firmware is to be updated.

[-package <text>] - Firmware Package

This parameter specifies the package that will be installed. You can find the package file in the SP Update Repository field of the system node image package show command. If you do not specify this parameter, the Service Processor is updated to the most recent version of the firmware that is available in the update repository. You must specify this parameter if baseline is false or omitted.

[-baseline {true|false}] - Install Baseline

If you set this parameter to true, the command installs the Service Processor firmware version that is bundled with the currently running release of Data ONTAP. This is a safety mechanism that allows you to revert the SP
firmware to the version that was qualified and bundled with the currently running version of Data ONTAP on your system. If not specified, this parameter defaults to false.

- **update-type** *(serial-full|serial-differential|network-full) - Type*
  This parameter specifies the type of update to be performed.

  - If you set the value to *serial-full*, the command transfers contents of the entire SP firmware image to the SP via the packetized serial interface, and the contents are written to the SP primary partition.
  - If you set the value to *serial-differential*, the command transfers the SP firmware files that are different between the old SP firmware image and the new SP firmware image to the SP via the packetized serial interface, and the contents are written to SP primary partition.
  - If you set the value to *network-full*, the command transfers the entire SP firmware image to the SP via the SP network interface, and the contents are written to the SP primary partition.
  - If you do not specify the update-type option, the command checks for dependencies of network-based SP firmware updates. If the dependencies are satisfied, then the command uses the SP network interface to update the SP firmware. If the dependencies are not satisfied, then the serial interface is used.

- **[-clear-logs (true|false)] - Clear Logs After Update**
  If you set this parameter to *true*, the command resets log settings to factory default and clears contents of all logs maintained by the Service Processor, including:
  - Event logs
  - IPMI logs
  - Forensics logs

### Examples

The following command reverts the firmware on the Service Processor of the local node to the version that was packaged with the currently running release of Data ONTAP. A complete install will be performed, clearing all logs maintained by the Service Processor. The second command displays the status of the in-progress firmware install.

```
cluster1::> system service-processor image update -node local -update-type full -baseline true -clear-logs true

cluster1::>
```

```
cluster1::> system service-processor image update-progress show

<table>
<thead>
<tr>
<th>Node</th>
<th>In Progress</th>
<th>Start Time</th>
<th>Percent</th>
<th>End Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>node1</td>
<td>yes</td>
<td>8/28/2012 20:00:34</td>
<td>99</td>
<td>-</td>
</tr>
<tr>
<td>node2</td>
<td>no</td>
<td>-</td>
<td>0</td>
<td>-</td>
</tr>
</tbody>
</table>

2 entries were displayed.

cluster1::>
```

---

*system service-processor commands*
system service-processor image update-progress commands

The update-progress directory

system service-processor image update-progress show

Display status for the latest Service Processor firmware update

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system service-processor image update-progress show command displays the progress information of firmware updates on the Service Processor of the specified nodes. The "in-progress" field displays "no" if no update is in progress. This command does not display the progress of an SP firmware update that is triggered from the SP CLI.

Parameters
{[-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

[[-instance]]
  If you specify the -instance parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node
  This parameter displays the status of Service Processor firmware update for the specified node.

[-start-time <MM/DD/YYYY HH:MM:SS>] - Latest SP Firmware Update Start Timestamp
  This parameter displays the status of the Service Processor whose firmware update start time matches the specified value.

[-percent-done <integer>] - Latest SP Firmware Update Percentage Done
  This parameter displays the status of the Service Processor whose update completion percentage matches the specified value.

[-end-time <MM/DD/YYYY HH:MM:SS>] - Latest SP Firmware Update End Timestamp
  This parameter displays the status of the Service Processor whose firmware update end time matches the specified value.

[-in-progress {yes|no}] - Is Update in Progress
  This parameter displays the update status of the Service Processor that matches the specified in-progress status.

Examples
The following example starts a firmware update on the local node and then uses the command system service-processor image update-progress show to display progress of firmware updates on Service Processors of all nodes in the system.

```
cluster1::> system service-processor image update -node local -update-type full -baseline true -clear-logs true
cluster1::>
cluster1::> system node service-processor image update-progress show

<table>

Commands: Manual Page Reference
system service-processor log commands

Service Processor Logs

system service-processor log show-allocations

Display the Service Processor log allocation map

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The `system service-processor log show-allocations` command displays the allocation map of the Service Processor logs collected in the cluster. The Service Processor logs of a node are archived in the mroot directory of the collecting node. This command displays the sequence numbers for the Service Processor log files that reside in each collecting node.

Parameters
{-fields <fieldname>, ...}
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

[-instance ]
If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node <nodename>|local] - Node
If you specify this parameter, the command displays the sequence numbers of Service Processor log files that the specified node has collected.

[-remote-node <text>] - Remote Node
If you specify this parameter, the command displays the sequence numbers of Service Processor log files that have been collected from the specified remote node.

[-seqList <integer>, ...] - Log File Sequence Numbers
If you specify this parameter, the command displays information about Service Processor log files with the specified sequence number.

Examples
The following example displays the allocation map of the Service Processor log files in the cluster.

```
cluster1::> system service-processor log show-allocations
Node                From Which Node     Log File Sequence
------------------- ------------------- ----------------------------------
cluster1-01          cluster1-01      10, 11, 12, 13, 15
cluster1-01          cluster1-02      14, 15, 16, 17
cluster1-02          cluster1-01      14
cluster1-02          cluster1-02      11, 12, 13
4 entries were displayed.

```
system service-processor network commands

Display and configure the Service Processor Network

system service-processor network modify

Modify the network configuration

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system service-processor network modify command modifies the network configuration of the Service Processor of specified node or nodes in a cluster. If the SP automatic network configuration has been enabled, the system service-processor network modify command allows you to only enable or disable the SP IPv4 or Ipv6 network interface.

Parameters
- node {<nodename>|local} - Node
  This parameter specifies the node whose Service Processor's network configuration is to be modified.
- address-family {IPv4|IPv6} - Address Family
  This parameter specifies whether the IPv4 or the IPv6 configuration is to be modified.
- [enable {true|false}] - Interface Enabled
  This parameter enables or disables the underlying network interface for the specified address-family. This is a mandatory parameter.
- [dhcp {v4|none}] - DHCP Status
  If this parameter is set to v4, the Service Processor uses network configuration from the DHCP server. Otherwise, the Service Processor uses the network address you specify. If this parameter is not set to v4 or is not specified, you must specify the IP address, netmask, prefix-length, and gateway in the command. DHCP is not supported for IPv6 configuration.
- [ip-address <IP Address>] - IP Address
  This parameter specifies the public IP address for the Service Processor. You must specify this parameter when the -dhcp parameter is not set to v4.
- [netmask <IP Address>] - Netmask
  This parameter specifies the netmask for a Service Processor that uses an IPv4 address. This parameter has no effect if the IP address family is set to IPv6. You must specify this parameter when DHCP is not v4 and the address family is IPv4.
- [prefix-length <integer>] - Prefix Length of Subnet Mask
  This parameter specifies the network prefix-length of the Service Processor if the address family is set to IPv6. The parameter has no effect when the address family is set to IPv4. You must specify this parameter when DHCP is not set to v4 and when the address family is set to IPv6.
- [gateway <IP Address>] - Gateway IP Address
  This parameter specifies network gateway of the Service Processor. You must specify this parameter when DHCP is not set to v4.

Examples
The following example enables the network interface for IPv4 on the Service Processor of the local node. It first displays the current network configuration information of the local node to show the network interface is initially disabled, and then enables it with IP address 192.168.1.202, netmask as 255.255.255.0 and gateway as 192.168.1.1. It displays the
interim state with SP Network Setup Status field showing "in-progress". It finally displays the network configuration again to confirm the specified values took effect.

```
cluster1::> system service-processor network show -instance -node local

cluster1::>

**system service-processor network show**

Display the network configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The `system service-processor network show` command displays the network configuration of the Service Processor of each node in a cluster. You can limit output to specific types of information and specific nodes in the cluster, or filter output by specific field values.
In case a node is offline or its Service Processor management daemon is down, the command displays the last known IP address of its Service Processor. Only the IP address is displayed in such cases.

**Parameters**

[-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

[-instance]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Selects network configuration information for the Service Processor of the specified node.

[-address-family {IPv4|IPv6}] - Address Family

Selects network configuration information for the Service Processors that have the specified IP address family.

[-enable {true|false}] - Interface Enabled

Selects network configuration information for the Service Processors whose network interface for the given `address-family` is enabled or disabled as specified.

[-type {SP|NONE|BMC}] - Type of Device

Selects network configuration information for the Service Processors of the specified type.

[-status {online|offline|sp-daemon-offline|node-offline|degraded|rebooting|unknown|updating}] - Status

Selects network configuration information for the Service Processors whose status matches the specified value.

[-link-status {up|down|disabled|unknown}] - Link Status

Selects network configuration information for the Service Processors whose link status matches the specified value.

[-dhcp {v4|none}] - DHCP Status

Selects network configuration information for the Service Processors whose DHCP status matches the specified value.

[-ip-address <IP Address>] - IP Address

Selects network configuration information for the Service Processors that use the specified IP address.

[-mac <MAC Address>] - MAC Address

Selects network configuration information for the Service Processors that use the specified MAC address.

[-netmask <IP Address>] - Netmask

This parameter displays information only for the Service Processors that use the specified netmask.

[-prefix-length <integer>] - Prefix Length of Subnet Mask

Selects network configuration information for the Service Processors whose prefix length of subnet mask matches the specified value.

[-router-ip <IP Address>] - Router Assigned IP Address

Selects network configuration information for the Service Processors whose router-assigned IP address matches the specified value.

[-link-local-ip <IP Address>] - Link Local IP Address

Selects network configuration information for the Service Processors whose link local IP address matches the specified value.
[-gateway <IP Address>] - Gateway IP Address
Selects network configuration information for the Service Processors whose gateway IP address matches the specified value.

[-time-last-updated <text>] - Time Last Updated
Selects network information for the Service Processors that have the specified time stamp showing when configuration was last updated.

[-subnet-name <text>] - Subnet Name
Selects network information for the Service Processors that use the specified subnet-name for SP automatic configuration.

[-is-ipv6-ra-enabled {true|false}] - Enable IPv6 Router Assigned Address
Selects network information for the Service Processors that have the specified status for IPv6 router-assigned address.

[-setup-status {not-setup|succeeded|in-progress|failed}] - SP Network Setup Status
Selects network information for the Service Processors that have the specified status for network interface setup.

[-setup-failure-reason {success|subnet-out-of-address|invalid-subnet|other-error}] - SP Network Setup Failure Reason
Selects network information for the Service Processors that have the specified reason for network interface setup failure.

**Examples**

The following example displays basic network configuration information for the Service Processors of all the nodes.

```
cluster1::> system service-processor network show

<table>

system service-processor commands
system service-processor network auto-configuration commands

Manage Service Processor Auto-Configuration Resource

system service-processor network auto-configuration disable

Disable Service Processor Auto-Configuration

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system service-processor network auto-configuration disable command disables the SP's use of subnet resource for the automatic configuration of its networking port. This command is a cluster-wide configuration. When you disable the SP automatic network configuration, all SPs in the cluster will be configured to use IPv4 DHCP. Any addresses previously allocated from the subnet to the SP will be released. If the SP fails to obtain an IPv4 IP address from the DHCP server, an EMS message warns you about the failure. The IPv6 interface will be disabled.

Parameters
- address-family {IPv4|IPv6} - Subnet Address Family
  This parameter specifies whether the IPv4 or the IPv6 automatic configuration is to be disabled for the SP.

Examples
The following example disables the automatic configuration for IPv4 on the SP. It first displays the current network configuration and then disables the SP IPv4 automatic network configuration.

```
cluster1::> system service-processor network show
Address   Status  Family  Link State  IP Address
---------  -------  ------  -----------  ------------------------
nodel     online  IPv4    up         192.168.1.2
           DHCP: none
           MAC Address: ab:cd:ef:fe:ed:01

cluster1::> system service-processor network auto-configuration disable
```

1296  Commands: Manual Page Reference
system service-processor network auto-configuration enable

Enable Service Processor Auto-Configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The *system service-processor network auto-configuration enable* command enables the automatic network configuration for the SP. This is a cluster-wide configuration. Every node in the cluster will use the specified subnet to allocate IP address, subnet mask and gateway address for the SP configuration. When the SP automatic network configuration is enabled, you do not need to manually manage the SP network of individual nodes. A node that subsequently joins the cluster uses the specified subnet to configure its SP network automatically.

Prior to running this command, the subnet you want to use for the SP automatic network configuration must already be defined in the cluster and must have no resource conflicts with the SP network interface.

**Parameters**

- **-address-family** *(IPv4|IPv6)* - Subnet Address Family
  
  This parameter specifies whether the IPv4 or the IPv6 automatic configuration is to be enabled for the SP.

- **-subnet-name <text>* - Subnet Name

  This parameter specifies the network subnet that the SP will use for automatic network configuration.
Examples
The following example enables the automatic network configuration for IPv4 on the SP. It first displays the current SP network configuration, displays available network subnet in the cluster, and then enable the SP to use the subnet for IPv4 automatic configuration.

```
cluster1::>system service-processor network show
  
  Address
  Node          Status         Family    Link State  IP Address
  ------------- -------------- --------- ----------- ------------------------
  node1          online         IPv4      up          192.168.1.201
                  DHCP: v4
                  MAC Address: ab:cd:ef:fe:ed:01
                  Network Gateway: 192.168.1.1
                  Network Mask (IPv4 only): 255.255.255.0
                  Prefix Length (IPv6 only): -
                  IPv6 RA Enabled: -
                  Subnet Name: -
                  SP Network Setup Status: succeeded

cluster1::> network subnet show

cluster1          ipv4_test             -
```

system service-processor ssh commands

The ssh directory

system service-processor ssh add-allowed-addresses

Add IP addresses to the list that is allowed to access the Service Processor

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system service-processor ssh add-allowed-addresses command grants IP addresses access to the Service Processor.

Parameters
-allowed-addresses <IP Address/Mask>, ... - Public IP Addresses

Use this parameter to specify one or more IP addresses with corresponding netmasks. The value should be specified in the format of address/netmask, for example, 10.98.150.10/24, fd20:8b1e:b255:c09b::/64. Use commas to separate multiple address/netmask pairs. If "0.0.0.0/0, ::/0" is specified in the parameter, any IP address is allowed to access the Service Processor.

Examples
The following examples grant the specified IP addresses access to the Service Processor and display the list of public IP addresses that are allowed to access the Service Processor.

```
cluster1::> system service-processor ssh show
Allowed Addresses: 0.0.0.0/0, ::/0
cluster1::> system service-processor ssh add-allowed-addresses -allowed-addresses
192.168.1.202/24, 192.168.10.201/24
Warning: The default "allow all" setting (0.0.0.0/0, ::/0) will be replaced with your changes. Do you want to continue? {y|n}: y
cluster1::> system service-processor ssh show
Allowed Addresses: 192.168.1.202/24, 192.168.10.201/24

The following example enables all IP addresses to access the Service Processor.
cluster1::> system service-processor ssh add-allowed-addresses -allowed-addresses 0.0.0.0/0, ::/0
cluster1::> system service-processor ssh show
Allowed Addresses: 0.0.0.0/0, ::/0

cluster1::>
```
**system service-processor ssh remove-allowed-addresses**

Remove IP addresses from the list that is allowed to access the Service Processor

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The `system service-processor ssh remove-allowed-addresses` command blocks the specified IP address from accessing the Service Processor. If all IP addresses are removed from the access list, then the Service Processor is not accessible from any IP address.

**Parameters**

`-allowed-addresses <IP Address/Mask>, ...` - Public IP Addresses

Use this parameter to specify one or more IP addresses with corresponding netmasks. The value should be specified in the format of address/netmask, for example, 10.98.150.10/24, fd20:8b1e:b255:c09b::/64. Use commas to separate multiple address/netmask pairs.

**Examples**

The following example prevents the specified IP addresses from accessing the Service Processor. It also displays the list of public IP addresses that are allowed to access the Service Processor.

```
cluster1::> system service-processor ssh show
Allowed Addresses: 192.168.1.202/24, 192.168.10.201/24

cluster1::> system service-processor ssh remove-allowed-addresses -allowed-addresses
192.168.1.202/24, 192.168.10.201/24

Warning: If all IP addresses are removed from the allowed address list, all IP addresses will be denied access. To restore the "allow all" default, use the "system service-processor ssh add-allowed-addresses -allowed-addresses 0.0.0.0/0, ::/0" command. Do you want to continue? {y|n}: y

cluster1::> system service-processor ssh show
Allowed Addresses: -

cluster1::>
```

**system service-processor ssh show**

Display SSH security information about the Service Processor

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The `system service-processor ssh show` command displays the IP addresses that are allowed to access the Service Processor by using SSH.

**Examples**

The following example displays SSH security information about the Service Processor.
system services commands

Manage system services

system services firewall commands

Manage local firewall configuration

system services firewall modify

Modify firewall status

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
The `system services firewall modify` command modifies a node's firewall configuration.

**Parameters**
- `-node <nodename>|local` - Node
  
  Use this parameter to specify the node on which to modify firewall configuration.

- `[-enabled {true|false}]` - Service Enabled
  
  Use this parameter to specify whether firewall protection is enabled ("true") or disabled ("false") for the node's network ports. The default setting is `true`.

- `[-logging {true|false}]` - (DEPRECATED)-Enable Logging
  
  Use this parameter to specify whether logging is enabled ("true") or disabled ("false") for the firewall service. The default setting is `false`.

**Examples**
The following example enables firewall protection and logging for a node named `node1`:

```
cluster1::> system services firewall modify -node node1 -enabled true -logging true
```

system services firewall show

Show firewall status

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
The `system services firewall show` command displays firewall configuration and logging information. If the command is issued without any parameters, it displays information about all nodes in the cluster. You can also query specific nodes for their firewall information by running the command with the `-node` parameter.
Parameters

{[-fields <fieldname>, ...]}

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

| [-instance ]] |

If you specify the -instance parameter, the command displays detailed information about all fields.

[-node (<nodename> | local)] - Node

Selects information about the firewall settings on the node you specify.

[-enabled (true | false)] - Service Enabled

Selects information about the nodes with the firewall enabled ("true") or disabled ("false").

[-logging (true | false)] - (DEPRECATED)-Enable Logging

Note: This parameter is deprecated and may be removed in a future version of Data ONTAP.

Selects information about the nodes with firewall logging enabled ("true") or disabled ("false").

Examples

The following example displays information about firewall configuration for all nodes in the cluster:

```
  cluster1::> system services firewall show
  Node           Enabled Logging
  -------------- ------- -------
  node0          true    false
  node1          true    false
  node2          true    false
  node3          true    false
  4 entries were displayed.
```

system services firewall policy commands

Manage firewall policy configuration

system services firewall policy clone

Clone an existing firewall policy

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The system services firewall policy clone command creates a new firewall policy that is an exact copy of an existing policy, but has a new name.

Parameters

-vserver <text> - Vserver owning the Policy

Use this parameter to specify the name of the Vserver owning the existing policy to copy.

-policy <text> - Firewall Policy to be Cloned

Use this parameter to specify the name of the existing policy to copy.

[-destination-vserver <text>] - Vserver owning the New Firewall Policy

Use this parameter to specify the name of the Vserver that will own the new policy to create.

-destination-policy <text> - Name of New Firewall Policy

Use this parameter to specify the name of the new policy to create.
system services firewall policy create

Create a firewall policy entry for a network service

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
The `system services firewall policy create` command creates a firewall policy entry with the specified name and network service. This command is used both to create the first network service associated with a new firewall policy, or to add to an existing firewall policy by associating another network service with an existing policy. You can optionally specify one or more IP addresses with corresponding netmasks that are allowed to use the firewall policy entry.

You can use the `network interface modify` command with the `-firewall-policy` parameter to put a firewall policy into effect for a given logical interface by modifying that logical interface to use the specified firewall policy.

**Parameters**

- `vserver <vserver>` - Vserver Name
  Use this parameter to specify the name of the Vserver on which the policy is to be created.

- `policy <textpolicy_name>` - Policy
  Use this parameter to specify the name of the policy that is to be created.

- `service <service>` - Service
  Use this parameter to specify the network service that is associated with the policy. Possible values include:
  - default - The default protocol or protocols for the port to which the firewall is applied
  - http - The HTTP protocol
  - https - The HTTPS protocol
  - ntp - The NTP protocol
  - rsh - The RSH protocol
  - snmp - The SNMP protocol
  - ssh - The SSH protocol
  - telnet - The Telnet protocol

- `allow-list <IP Address/Mask>, ...` - Allowed IPs
  Use this parameter to specify one or more IP addresses with corresponding netmasks that are to be allowed by this firewall policy. The correct format for this parameter is address/netmask, similar to "192.0.2.128/25". Multiple address/netmask pairs should be separated with commas. Use the value 0.0.0.0/0 for "any".

**Examples**
The following example creates a firewall policy named data that uses the SSH protocol and enables access from all IP addresses on the 192.0.2.128/25 subnet:
The following example adds an entry to the firewall policy named data, associating the HTTPS protocol with that policy and enabling access from all IP addresses on the 192.0.2.128/25 subnet:

```
cluster1::> system services firewall policy create -policy data -service https -allow-list 192.0.2.128/25
```

Related references

`network interface modify` on page 342

**system services firewall policy delete**

Remove a service from a firewall policy

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**

The `system services firewall policy delete` command deletes a firewall policy. You cannot delete a policy that is being used by a logical interface. Use the `network interface modify` command with the `-firewall-policy` parameter to change a network interface's firewall policy.

**Parameters**

- `-vserver <vserver>` - Vserver Name
  
  Use this parameter to specify the Vserver of the policy to delete.

- `-policy <textpolicy_name>` - Policy
  
  Use this parameter to specify the name of the policy to delete.

- `-service <service>` - Service
  
  Use this parameter to specify the policy's network service to delete.

**Examples**

The following example deletes a firewall policy that uses the Telnet protocol on the policy named data:

```
cluster1::> system services firewall policy delete -policy data -service telnet
```

Use wildcards to delete entire policies at once, or particular services from every policy. This example deletes the entire intercluster policy.

```
cluster1::> system services firewall policy delete -policy intercluster -service *
```

This example deletes the telnet service from every policy.

```
cluster1::> system services firewall policy delete -policy * -service telnet
```

Related references

`network interface modify` on page 342
system services firewall policy modify

Modify a firewall policy entry for a network service

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system services firewall modify command enables you to modify the list of IP addresses and netmasks associated with a firewall policy.

Parameters
-vserver <vserver> - Vserver Name
Use this parameter to specify the Vserver of the policy to modify.

-policy <textpolicy_name> - Policy
Use this parameter to specify the name of the policy to modify.

-service <service> - Service
Use this parameter to specify the policy's network service to modify.

[ -allow-list <IP Address/Mask>, ...] - Allowed IPs
Use this parameter to specify one or more IP addresses with corresponding netmasks that are allowed by this firewall policy. The correct format for this parameter is address/netmask, similar to "192.0.2.128/25". Multiple address/netmask pairs should be separated with commas. Use the value 0.0.0.0/0 for "any".

Examples
The following example modifies the firewall policy named data that uses the SSH protocol to enable access from all addresses on the 192.0.2.128 subnet:

```
cluster1::> system services firewall policy modify -policy data -service ssh -allow-list 192.0.2.128/25
```

system services firewall policy show

Show firewall policies

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The system services firewall policy show command displays information about firewall policies.

Parameters
{ [-fields <fieldname>, ...]
   If you specify the -fields <fieldname>, ... parameter, the command displays only the fields that you specify.

   | [-instance ]
   Use this parameter to display all the fields for the specified policies.

   [-vserver <vserver>] - Vserver Name
   Use this parameter to display information only about the Vserver you specify.}
[-policy <textpolicy_name>] - Policy
Use this parameter to display information about the policy you specify.

[-service <service>] - Service
Use this parameter to display information about the services you specify.

[-allow-list <IP Address/Mask>, ...] - Allowed IPs
Use this parameter to display information about the firewall policies that match the list of allowed IP addresses and netmasks you specify. The correct format for this parameter is address/netmask, similar to "192.0.2.128/25". Multiple address/netmask pairs should be separated with commas.

[-ipspace <text>] - IPspace
Use this parameter to display information only about the IPspace you specify.

Examples
The following example displays information about all firewall policies:

```
cluster1::> system services firewall policy show
Vserver Policy  Service   Allowed
----------       -------- -------------------
cluster1         data     dns  0.0.0.0/0, ::/0
                  ndmp     0.0.0.0/0, ::/0
                  ndmps    0.0.0.0/0, ::/0
cluster1         intercluster ndmp  0.0.0.0/0, ::/0
                  ndmps    0.0.0.0/0, ::/0
cluster1         mgmt     dns  0.0.0.0/0, ::/0
                  http     0.0.0.0/0, ::/0
                  https    0.0.0.0/0, ::/0
                  ndmp     0.0.0.0/0, ::/0
                  ndmps    0.0.0.0/0, ::/0
                  ntp      0.0.0.0/0, ::/0
                  snmp     0.0.0.0/0, ::/0
                  ssh      0.0.0.0/0, ::/0
```

system services manager commands
Manage services in a cluster

system services manager install commands
Manage installed services

system services manager install show
Display a list of installed services

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The `system services manager install show` command displays information about installed services.

Parameters
```
[-fields <fieldname>, ...]
```
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.
If you specify the \texttt{-instance} parameter, the command displays detailed information about all fields.

\texttt{-service <text>} - Service
Selects information about installed services that have the name you specify.

\texttt{-version <service version>} - Version
Selects information about installed services that have the version number you specify.

\texttt{-constituent <text>} - Constituent
Selects information about installed services that have the constituent process you specify.

\texttt{-nodes (<nodename>|local), ...} - Nodes
Selects information about services that are installed on the nodes you specify.

\texttt{-description <text>} - Description
Selects information about installed services that match the description you specify.

\section*{Examples}
The following example shows typical output from a two-node cluster.

\begin{verbatim}
cluster1::> system services manager install show
Service           Version Constituent Nodes
----------------- ------- ----------- ---------------------------------------
diagnosis        1.0     schmd       node1, node2
diagnosis        1.0     shmd        node1, node2
2 entries were displayed.
\end{verbatim}

\section*{system services manager policy commands}
Manage service policies

\section*{system services manager policy add}
Add a new service policy

\textbf{Availability}: This command is available to \textit{cluster} administrators at the \textit{admin} privilege level.

\textbf{Description}
The \texttt{system services manager policy add} command adds a new service policy to the services manager. Policies determine which versions of a service can run on the nodes of the cluster.

\textbf{Parameters}
\begin{itemize}
  \item \texttt{-service <text>} - Service
    \begin{itemize}
      \item Use this parameter to specify the name of the service for which to add a policy.
    \end{itemize}
  \item \texttt{-version <service version>} - Version
    \begin{itemize}
      \item Use this parameter to specify the minimum version number of the service to run.
    \end{itemize}
\end{itemize}

\textbf{Examples}
This example adds a service manager policy for version 1.0 of the diagnosis service.

\begin{verbatim}
cluster1::> system services manager policy add -service diagnosis -version 1.0
\end{verbatim}
**system services manager policy remove**

Remove a service policy

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
The `system services manager policy remove` command removes a policy from the services manager. Policies determine which versions of a service can run on the nodes of the cluster.

**Parameters**

- `service <text>` - Service  
  Use this parameter to specify the name of the service from which to remove a policy.

- `version <service version>` - Version  
  Use this parameter to specify the version number that is configured by the policy to remove.

**Examples**
The following example shows the removal of the service policy for version 1.0 of the diagnosis service.

```
cluster1::> system services manager policy remove -service diagnosis -version 1.0
```

**system services manager policy setstate**

Enable/disable a service policy

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
The `system services manager policy setstate` command enables or disables services manager policies. Use the `system services manager policy show` command to display information about configured policies.

**Parameters**

- `service <text>` - Service  
  Use this parameter to set the state of the policy you specify.

- `version <service version>` - Version  
  Use this parameter to set the state of the policy with the version number you specify.

- `state {on|off}` - State  
  Use this parameter with the value "on" to enable the policy. Use this parameter with the value "off" to disable the policy.

**Examples**
The following example sets the policy for version 1.0 of the diagnosis service to off.

```
cluster1::> system services manager policy setstate -service diagnosis -version 1.0 -state off
```

**Related references**

`system services manager policy show` on page 1309
system services manager policy show

Display service policies

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system services manager policy show command displays information about policies that determine which versions of a service can run on the nodes of the cluster.

Use the system services manager status show command to view information about services that are configured to run in the cluster.

Parameters

{ [-fields <fieldname>, ...]  
   If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[ -instance ] 
   If you specify the -instance parameter, the command displays detailed information about all fields.

[ -service <text> ] - Service 
   Selects policies that apply to the service you specify.

[ -version <service version> ] - Version 
   Selects policies that have the version number you specify.

[ -constituent <text> ] - Constituent 
   Selects policies that have the constituent process you specify.

[ -state {on|off} ] - State 
   Use this parameter with the value "on" to select information about policies that are currently active. Use this parameter with the value "off" to select information about policies that are not currently active.

[ -num-active <integer> ] - Number Active 
   Selects policies that have the number of active (running) instances you specify.

[ -target-nodes <service affinity>, ... ] - Target Nodes 
   Selects policies that are configured to run on the nodes you specify.

[ -tag <UUID> ] - Tag (privilege: advanced) 
   Selects policies that have the UUID you specify. Use this parameter with the -fields parameter to display a list of the UUIDs of configured services.

Examples
The following example shows typical output for this command.

```
cluster1::> system services manager policy show
Service   Version State Constituent Number Target Active Nodes
---------- ---------- --------- ------------ ---------- --------------------------
diagnosis  1.0   on    shmd       1      any
           1.0   on    schmd      1      any
2 entries were displayed.
```

system services commands
system services manager status commands

Display service status

system services manager status show

Display the status of a service

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system services manager status show command displays the status of system services that are configured to run in the cluster.

System services run on the nodes of the cluster based on policies. Policies determine which versions of a service can run on the nodes of the cluster. Use the system services manager policy show command to view existing policies.

Parameters
{ [-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields '?' to display the fields to specify.
 |
[ -instance ]
  If you specify the -instance parameter, the command displays detailed information about all fields.
 |
[-service <text>] - Service
  Selects information about services that match the service name you specify.
 |
[-version <service version>] - Version
  Selects information about services that are configured to run the version number you specify. The configured version is the minimum version that is allowed to run in the cluster according to a policy. Use the system services manager policy show command to view information about service policies.
 |
[-constituent <text>] - Constituent
  Selects information about services that have the constituent process you specify.
 |
[-actual-version <service version>] - Actual Version
  Selects information about services that are running the version number you specify. This number can be higher than the configured version if a more recent version is installed on the node that is running the service.
 |
[-node <nodename>] - Node
  Selects information about services that the services manager has assigned to run on the nodes you specify. If the service state is "running", the service is running on these nodes.
 |
[-state <svc_state>] - State
  Selects information about services that are in the state you specify.
 |
[-is-running {true|false}] - Is Running
  Use this parameter with the value "true" to select information about services that are currently running. Use this parameter with the value "false" to select information about services that are not currently running.

Examples
The example below shows typical output for a simple cluster.

system services manager policy show on page 1309

**system services ndmp commands**

Manage NDMP services

These commands can be used to view or modify the configurations of NDMP service across all the nodes in the cluster. These commands are not supported on Infinite Volumes.

**system services ndmp kill**

Kill the specified NDMP session

**Availability:** This command is available to cluster administrators at the `admin` privilege level.

**Description**
The `system services ndmp kill` command is used to terminate a specific NDMP session on a particular node in the cluster. This command is not supported on Infinite Volumes.

**Parameters**

<integer> - Session Identifier

Session ID of the NDMP session.

**Examples**
The following example shows how a specific NDMP session on the node named node1 can be terminated:

```
cluster1::> system services ndmp kill 4323 -node node1
```

**system services ndmp kill-all**

Kill all NDMP sessions

**Availability:** This command is available to cluster administrators at the `admin` privilege level.

**Description**
The `system services ndmp kill-all` command is used to terminate all NDMP sessions on a particular node in the cluster. This command is not supported on Infinite Volumes.

**Parameters**

-node (<nodename>|local) - Node

Node on which all NDMP sessions needs to be terminated.
Examples
The following example shows how all NDMP sessions on the node named node1 can be terminated:

```
cluster1::> system services ndmp kill-all -node node1
```

system services ndmp modify

(DEPRECATED)-Modify NDMP service configuration

Availability: This command is available to cluster administrators at the admin privilege level.

Description

Note: This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of Data ONTAP. Use the Vserver-aware “vserver services ndmp modify” command.

The system services ndmp modify command allows you to modify the NDMP configurations for a node in the cluster. One or more of the following configurations can be modified:

- Enable/disable NDMP service
- Enable/disable sending the NDMP password in clear text. Note that MD5 authentication mode is always enabled.
- NDMP user ID

This command is not supported on Infinite Volumes.

Parameters

- `-node {<nodename>|local}` - Node
  This specifies the node whose NDMP configuration is to be modified.

- `[--enable {true|false}]` - NDMP Service Enabled
  This optionally specifies whether NDMP is enabled on the node. The default setting is `true`.

- `[--clear-text {true|false}]` - Allow Clear Text Password
  This optionally specifies whether the NDMP password can be sent in clear text. The default setting is `true`.

- `[--user-id <text>]` - NDMP User ID
  This optionally specifies the ID of the NDMP user.

Examples
The following example modifies the NDMP configuration on a node named node1. The configuration enables NDMP, disables sending the password in clear text, and specifies an NDMP user named ndmp:

```
cluster1::> system services ndmp modify -node node1 -enable true
          -clear-text false -user-id ndmp
```

system services ndmp off

(DEPRECATED)-Disable NDMP service

Availability: This command is available to cluster administrators at the admin privilege level.
Description

Note: This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of Data ONTAP. Use the Vserver-aware "vserver services ndmp off" command.

The `system services ndmp off` command is used to disable the NDMP service on any node in the cluster. This command is not supported on Infinite Volumes.

Parameters

- `node {<nodename>|local} - Node`

  The specific node on which NDMP service is to be disabled.

Examples

The following example is used to turn off the NDMP service on node named node1:

```
cluster1::> system services ndmp off -node node1
```

Related references

vserver services ndmp off on page 2099

system services ndmp on

(DEPRECATED)-Enable NDMP service

Availability: This command is available to cluster administrators at the admin privilege level.

Description

Note: This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of Data ONTAP. Use the Vserver-aware "vserver services ndmp on" command.

The `system services ndmp on` command is used to enable the NDMP service across any node in the cluster. This command is not supported on Infinite Volumes.

Parameters

- `node {<nodename>|local} - Node`

  The specific node on which the NDMP service is to be enabled.

Examples

The following example is used to turn on the NDMP service on node named node1:

```
cluster1::> system services ndmp on -node node1
```

vserver services ndmp on on page 2099

system services ndmp password

(DEPRECATED)-Change the NDMP password for the node

Availability: This command is available to cluster administrators at the admin privilege level.
Description

Note: This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of Data ONTAP. Use the Vserver-aware "vserver services ndmp generate-password" command.

The system services ndmp password command is used to change the NDMP password for a node in the cluster. This command is not supported on Infinite Volumes.

Parameters

-node {<nodename>|local} - Node

The specific node for which the password is to be changed.

Examples

The following example is used to change the NDMP password for the node named node1:

```bash
cluster1:/> system services ndmp password -node node1
Please enter password:
Confirm password:
```

vserver services ndmp generate-password on page 2092

system services ndmp probe

Display list of NDMP sessions

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The system services ndmp probe command displays diagnostic information about all the NDMP sessions in the cluster. The following fields are displayed for each of the sessions:

- Node
- Session identifier
- NDMP version
- Session authorized
- Data state
- Data operation
- Data server halt reason
- Data server connect type
- Data server connect address
- Data server connect port
- Data bytes processed
- Mover state
- Mover mode
- Mover pause reason
- Mover halt reason
- Mover record size
- Mover record number
- Mover bytes moved
- Mover seek position
- Mover bytes left to read
- Mover window offset
- Mover window length
- Mover position
- Mover SetRecordSize flag
- Mover SetWindow flag
- Mover connect type
- Mover connect address
- Mover connect port
- Effective host
- NDMP client address
- NDMP client port
- SCSI device ID
- SCSI hostadapter
- SCSI target ID
- SCSI LUN ID
- Tape device
- Tape mode
- Is Secure Control Connection
- Data Backup Mode
- Data Path
- NDMP Source Address

This command is not supported on Infinite Volumes.

Parameters
[-node {<nodename>|local}] - Node
If this parameter is specified, the command displays information about the sessions running on the specified node only. Node should be a valid node name.

[-session-id <integer>] - Session Identifier
If this parameter is specified, the command displays information only about the specified session.
[-ndmp-version <integer>] - NDMP Version
This parameter refers to the NDMP protocol version being used in the session.

[-session-authorized (true|false)] - Session Authorized
This parameter indicates whether an NDMP session is authenticated or not.

[-data-state <component state>] - Data State
This parameter identifies the current state of the data server's state machine.

[-data-operation <data operation>] - Data Operation
This parameter identifies the data server's current operation.

[-data-halt-reason <halt reason>] - Data Server Halt Reason
This parameter identifies the event that caused the data server state machine to enter the HALTED state.

[-data-con-addr-type <address type>] - Data Server Connect Type
This parameter specifies the type of data connection established by the data server. The data connection can be established locally within a given system or between remote networked systems.

[-data-con-addr <text>] - Data Server Connect Address
This parameter specifies the connection endpoint information for the data server's data connection.

[-data-con-port <integer>] - Data Server Connect Port
This parameter specifies the TCP/IP port that the data server will use when establishing a data connection.

[-data-bytes-processed <integer>] - Data Bytes Processed
This parameter represents the cumulative number of data stream bytes transferred between the backup or recovery method and the data connection during the current data operation.

[-mover-state <component state>] - Mover State
This parameter identifies the current state of the NDMP tape server's mover state machine.

[-mover-mode <mover mode>] - Mover Mode
This parameter identifies the direction of the mover data transfer.

[-mover-pause-reason <pause reason>] - Mover Pause Reason
This parameter identifies the event that caused the mover state machine to enter the PAUSED state.

[-mover-halt-reason <halt reason>] - Mover Halt Reason
This parameter identifies the event that caused the mover state machine to enter the HALTED state.

[-mover-record-size <integer>] - Mover Record Size
This parameter represents the current mover record size in bytes.

[-mover-record-num <integer>] - Mover Record Number
This parameter represents the last tape record processed by the mover.

[-mover-bytes-moved <integer>] - Mover Bytes Moved
This parameter represents the cumulative number of data stream bytes written to the data connection or the number of data stream bytes read from the data connection and written to the tape subsystem, depending on the mode of mover operation.

[-mover-seek-position <integer>] - Mover Seek Position
This parameter represents the data stream offset of the first byte the DMA requested the mover to transfer to the data connection during a mover read operation.

[-mover-bytes-left-to-read <integer>] - Mover Bytes Left to Read
This parameter represents the number of data bytes remaining to be transferred to the data connection to satisfy the current NDMP_MOVER_READ request.
- mover-window-offset <integer> - Mover Window Offset
  This parameter represents the absolute offset of the first byte of the mover window within the overall data stream.

- mover-window-length <integer> - Mover Window Length
  This parameter represents the length of the current mover window in bytes.

- mover-position <integer> - Mover Position
  This parameter can be used to list only those sessions, whose mover position matches a specific value. Mover-position should be an integer.

- mover-setrecordsize-flag [true|false] - Mover SetRecordSize Flag
  This parameter is used by the DMA to establish the record size used for mover-initiated tape read and write operations.

- mover-setwindow-flag [true|false] - Mover SetWindow Flag
  This parameter represents whether a mover window has been set or not. A mover window represents the portion of the overall backup stream that is accessible to the mover without intervening DMA tape manipulation.

- mover-con-addr-type <address type> - Mover Connect Type
  This parameter specifies the type of data connection established by the mover. The data connection can be established locally within a given system or between remote networked systems.

- mover-con-addr <text> - Mover Connect Address
  This parameter specifies the endpoint address or addresses that the mover will use when establishing a data connection.

- mover-con-port <integer> - Mover Connect Port
  This parameter specifies the TCP/IP port that the mover will use when establishing a data connection.

- eff-host <host type> - Effective Host
  This parameter indicates the host context in which the NDMP session runs. The valid values are: PRIMARY or PARTNER.

- client-addr <text> - NDMP Client Address
  This parameter specifies the client's IP address.

- client-port <integer> - NDMP Client Port
  This parameter specifies the client's port number.

- spt-device-id <text> - SCSI Device ID
  This parameter specifies the SCSI device ID.

- spt-ha <integer> - SCSI Host Adapter
  This parameter specifies the SCSI host adapter.

- spt-scsi-id <integer> - SCSI Target ID
  This parameter specifies the SCSI target.

- spt-scsi-lun <integer> - SCSI LUN ID
  This parameter specifies the SCSI LUN ID.

- tape-device <text> - Tape Device
  This parameter specifies the name to identify the tape device.

- tape-mode <mover mode> - Tape Mode
  This parameter specifies the mode in which tapes are opened.
[-is-secure-control-connection {true|false}] - Is Secure Control Connection

This parameter specifies whether the control connection is secure or not.

[-data-backup-mode <text>] - Data Backup Mode

This parameter specifies whether the mode of data backup is Dump or SMTape.

[-data-path <text>] - Data Path

This parameter specifies the path of data being backed up.

[-source-addr <text>] - NDMP Source Address

This parameter specifies the control connection IP address of the NDMP session.

Examples

The following example displays diagnostic information about all the sessions in the cluster:

```
cluster1::> system services ndmp probe

Node: cluster1-01
  Session identifier: 4952
  NDMP version: 4
  Session authorized: true
  Data state: IDLE
  Data operation: NOACTION
  Data server halt reason: NA
  Data server connect type: LOCAL
  ....
  ....

Node: cluster1-02
  Session identifier: 5289
  NDMP version: 4
  Session authorized: true
  Data state: IDLE
  Data operation: NOACTION
  Data server halt reason: NA
  Data server connect type: LOCAL
  ....
  ....
```

The following example displays diagnostic information of sessions running on the node cluster1-01 only:

```
cluster1::> system services ndmp probe -node cluster1-01

Node: cluster1-01
  Session identifier: 4952
  NDMP version: 4
  Session authorized: true
  Data state: IDLE
  Data operation: NOACTION
  Data server halt reason: NA
  Data server connect type: LOCAL
  ....
  ....
```

system services ndmp show

(DEPRECATED)-Display NDMP service configuration

Availability: This command is available to cluster administrators at the admin privilege level.
Description

Note: This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of Data ONTAP. Use the Vserver-aware "vserver services ndmp show" command.

The system services ndmp show command displays the following information about the NDMP configuration across all the nodes in the cluster:

- Node name
- Whether NDMP is enabled on the node
- Whether sending the NDMP password in clear text is enabled on the node
- NDMP user ID

A combination of parameters can be optionally supplied to filter the results based on specific criteria. This command is not supported on Infinite Volumes.

Parameters

\[-fields \langle\text{fieldname}\rangle,\ldots\]  
If this parameter is specified, the command displays only the fields that you specify.

\[-instance\]  
If this parameter is specified, the command displays detailed information about all entries.

\[-node \langle\text{nodename}\rangle|\text{local}\\] - Node
Selects information about the specified node.

\[-enable \langle\text{true|false}\rangle\] - NDMP Service Enabled
Selects information about the nodes where NDMP is enabled/disabled.

\[-clear-text \langle\text{true|false}\rangle\] - Allow Clear Text Password
Selects information about the nodes whose clear-text setting matches the specified value.

\[-user-id \langle\text{text}\rangle\] - NDMP User ID
Selects information about the nodes that have the specified NDMP user ID.

Examples

The following example displays information about the NDMP configuration of all nodes in the cluster:

```
cluster1::> system services ndmp show
Node   Enabled Clear Text User ID
------- ---------- ---------- -------
nod0   true       true       ndmp
node1  true       true       ndmp
node2  true       true       ndmp
node3  true       true       ndmp
4 entries were displayed.
```

system services ndmp status

Display list of NDMP sessions

Availability: This command is available to cluster administrators at the admin privilege level.
Description
The `system services ndmp status` command lists all the NDMP sessions in the cluster. By default it lists the following details about the active sessions:

- Node
- Session ID

A combination of parameters can be optionally supplied so as to list only those sessions which match specific conditions. A short description of each of the parameter is provided in the parameters section. This command is not supported on Infinite Volumes.

Parameters

`{ [-fields <fieldname>,...] }

This optional parameter specifies which all additional fields to display. Any combination of the following fields are valid:

- ndmp-version
- session-authorized
- data-state
- data-operation
- data-halt-reason
- data-con-addr-type
- data-con-addr
- data-con-port
- data-bytes-processed
- mover-state
- mover-mode
- mover-pause-reason
- mover-halt-reason
- mover-record-size
- mover-record-num
- mover-bytes-moved
- mover-seek-position
- mover-bytes-left-to-read
- mover-window-offset
- mover-window-length
- mover-position
- mover-setrecordsize-flag
- mover-setwindow-flag
- mover-con-addr-type`
• mover-con-addr
• mover-con-port
• eff-host
• client-addr
• client-port
• spt-device-id
• spt-ha
• spt-scsi-id
• spt-scsi-lun
• tape-device
• tape-modes
• is-secure-control-connection
• data-backup-mode
• data-path
• source-addr

[-instance]
If this parameter is specified, the command displays detailed information about all the active sessions.

[-node {<nodename>|local}] - Node
If this parameter is specified, the command displays information about the sessions running on the specified node only. Node should be a valid node name.

[-session-id <integer>] - Session Identifier
If this parameter is specified, the command displays information about specific NDMP session. A session-id is a number used to identify a particular NDMP session.

[-ndmp-version <integer>] - NDMP Version
This parameter refers to the NDMP protocol version being used in the session.

[-session-authorized {true|false}] - Session Authorized
This field indicates whether an NDMP session is authenticated or not.

[-data-state <component state>] - Data State
This field identifies the current state of the data server's state machine.

[-data-operation <data operation>] - Data Operation
This field identifies the data server's current operation.

[-data-halt-reason <halt reason>] - Data Server Halt Reason
This field identifies the event that caused the data server state machine to enter the HALTED state.

[-data-con-addr-type <address type>] - Data Server Connect Type
This field specifies the type of data connection established by the data server. The data connection can be established locally within a given system or between remote networked systems.

[-data-con-addr <text>] - Data Server Connect Address
This specifies the connection endpoint information for the data server's data connection.
[-data-con-port <integer>] - Data Server Connect Port
This specifies the TCP/IP port that the data server will use when establishing a data connection.

[-data-bytes-processed <integer>] - Data Bytes Processed
This field represents the cumulative number of data stream bytes transferred between the backup or recovery method and the data connection during the current data operation.

[-mover-state <component state>] - Mover State
This parameter identifies the current state of the NDMP tape server's mover state machine.

[-mover-mode <mover mode>] - Mover Mode
This parameter identifies the direction of the mover data transfer.

[-mover-pause-reason <pause reason>] - Mover Pause Reason
This parameter identifies the event that caused the mover state machine to enter the PAUSED state.

[-mover-halt-reason <halt reason>] - Mover Halt Reason
This integer field identifies the event that caused the mover state machine to enter the HALTED state.

[-mover-record-size <integer>] - Mover Record Size
This field represents the current mover record size in bytes.

[-mover-record-num <integer>] - Mover Record Number
This field represents the last tape record processed by the mover.

[-mover-bytes-moved <integer>] - Mover Bytes Moved
This field represents the cumulative number of data stream bytes written to the data connection or the number of data stream bytes read from the data connection and written to the tape subsystem, depending on the mode of mover operation.

[-mover-seek-position <integer>] - Mover Seek Position
This field represents the data stream offset of the first byte the DMA requested the mover to transfer to the data connection during a mover read operation.

[-mover-bytes-left-to-read <integer>] - Mover Bytes Left to Read
This field represents the number of data bytes remaining to be transferred to the data connection to satisfy the current NDMP_MOVER_READ request.

[-mover-window-offset <integer>] - Mover Window Offset
This field represents the absolute offset of the first byte of the mover window within the overall data stream.

[-mover-window-length <integer>] - Mover Window Length
This field represents the length of the current mover window in bytes.

[-mover-position <integer>] - Mover Position
This parameter can be used to list only those sessions, whose mover position matches a specific value. Mover-position should be an integer.

[-mover-setrecordsize-flag {true|false}] - Mover SetRecordSize Flag
This field is used by the DMA to establish the record size used for mover-initiated tape read and write operations.

[-mover-setwindow-flag {true|false}] - Mover SetWindow Flag
This flag represents whether a mover window has been set or not. A mover window represents the portion of the overall backup stream that is accessible to the mover without intervening DMA tape manipulation.

[-mover-con-addr-type <address type>] - Mover Connect Type
This field specifies the type of data connection established by the mover. The data connection can be established locally within a given system or between remote networked systems.
[-mover-con-addr <text>] - Mover Connect Address
This specifies the endpoint address or addresses that the mover will use when establishing a data connection.

[-mover-con-port <integer>] - Mover Connect Port
This specifies the TCP/IP port that the mover will use when establishing a data connection.

[-eff-host <host type>] - Effective Host
This field indicates the host context in which the NDMP session runs. The valid values are: PRIMARY or PARTNER.

[-client-addr <text>] - NDMP Client Address
This parameter specifies the client's IP address.

[-client-port <integer>] - NDMP Client Port
This parameter specifies the client's port number.

[-spt-device-id <text>] - SCSI Device ID
This parameter specifies the SCSI device ID.

[-spt-ha <integer>] - SCSI Host Adapter
This parameter specifies the SCSI host adapter.

[-spt-scsi-id <integer>] - SCSI Target ID
This parameter specifies the SCSI target.

[-spt-scsi-lun <integer>] - SCSI LUN ID
This parameter specifies the SCSI LUN ID.

[-tape-device <text>] - Tape Device
This parameter specifies the name to identify the tape device.

[-tape-mode <mover mode>] - Tape Mode
This parameter specifies the mode in which tapes are opened.

[-is-secure-control-connection {true|false}] - Is Secure Control Connection
This parameter specifies whether the control connection is secure or not.

[-data-backup-mode <text>] - Data Backup Mode
This parameter specifies whether the mode of data backup is Dump or SMTape.

[-data-path <text>] - Data Path
This parameter specifies the path of data being backed up.

[-source-addr <text>] - NDMP Source Address
This parameter specifies the control connection IP address of the NDMP session.

Examples
The following example displays all the NDMP sessions on the cluster:

```
cluster1::> system services ndmp status
            Session
   Node             Id
  ---------------  ------
      node-01   17479
      node-01   19769
      node-02   21118
3 entries were displayed.
```

The following example shows how to display only the sessions running on node-01:
system services ndmp status -node node-01

<table>
<thead>
<tr>
<th>Node</th>
<th>Id</th>
</tr>
</thead>
<tbody>
<tr>
<td>node-01</td>
<td>17479</td>
</tr>
<tr>
<td>node-01</td>
<td>19769</td>
</tr>
</tbody>
</table>

2 entries were displayed.

system services ndmp log commands

system services ndmp log start

(DEPRECATED)-Start logging for the specified NDMP session

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

Note: This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of Data ONTAP. Use the Vserver-aware "vserver services ndmp log start" command.

This command is used to start logging on an active NDMP session on a node. You can start logging two different kinds of sessions. The NDMP server session manages all NDMP tasks on the node. If you want to log information regarding the NDMP server, use server with the -session-id parameter to enable logging. If you want to log information about a particular NDMP session, for example a restore operation, then determine the session ID for the session using the "system services ndmp status" command and use that ID with the -session-id parameter to enable logging.

Parameters

-node {<nodename>|local} - Node
   This parameter specifies the node.

-session-id {<integer>|server} - Session Identifier
   This parameter specifies the NDMP session-id on which logging needs to be started. The session-id is associated with a unique NDMP session. Specify server to start logging on the NDMP server session.

-filter <text> - Level Filter
   Use this parameter to specify the filter for a particular session ID. This parameter controls the NDMP modules for which logging is to be enabled. This parameter can take five values. They are as follow: all, none, normal, backend or "filter-expression". The default value for this is none.

   • all turns on logging for all modules.
   • none disables logging for all modules.
   • normal is a short cut parameter that enables logging for all modules except verbose and io_loop. The equivalent filter string is all-verbose-io_loop
   • backend is a short cut parameter that enables logging for all modules except verbose, io_loop, ndmps and ndmpd. The equivalent filter string is all-verbose-io_loop-ndmps-ndmpd
   • (filter-expression) is a combination of one or more modules for which logs needs to be enabled. Multiple module names can be combined using following operators:
     • - to remove the given module from the list of specified modules in the filter string. For example the filter all-ndmpp will enable logging for all modules but not ndmpp.
• ^ to add the given module or modules to the list of modules specified in the filter string. For example the filter \textit{ndmpp}^mover^data will enable logging for \textit{ndmpp}, \textit{mover} and \textit{data}.

The possible module names and a brief description is given below:

<table>
<thead>
<tr>
<th>Modules</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>verbose</td>
<td>verbose message</td>
</tr>
<tr>
<td>io</td>
<td>I/O process loop</td>

<td>NDMP Mhost RPC server</td>
</tr>
</tbody>
</table>

\textbf{Examples}

The following example shows how to start logging on a specific NDMP session 33522, running on the node cluster1-01 with filter normal.

```
cluster1::*> system services ndmp log start -node cluster1-01 -session-id 33522 -filter normal
```

The following example shows how to start logging on the NDMP server session, on the node cluster1-01 with filter all.

```
cluster1::*> system services ndmp log start -session-id server -filter all -node cluster1-01
```

\textbf{Related references}

\textit{vserver services ndmp log start} on page 2115

\textbf{system services ndmp log stop}

(DEPRECATED)-Stop logging for the specified NDMP session

\textbf{Availability}: This command is available to \textit{cluster} administrators at the \textit{advanced} privilege level.
Description

Note: This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of Data ONTAP. Use the Vserver-aware "vserver services ndmp log stop" command.

This command is used to stop logging on an active NDMP session on a node. The NDMP server session manages all NDMP tasks on the node. If you want to stop logging information regarding the NDMP server, use server with the -session-id parameter to disable logging. If you want to stop logging information about a particular NDMP session, for example a restore operation, then determine the session ID for the session using the "system services ndmp status" command and use that ID with the -session-id parameter to disable logging.

Parameters

- **-node** \(<\text{nodename}>|\text{local}\> - Node
  This parameter specifies the node.

- **-session-id** \(<\text{integer}>|\text{server}\> - Session Identifier
  This parameter specifies the NDMP session-id on which logging needs to be stopped. The session-id is associated with a unique NDMP session. Specify server to stop logging on the NDMP server session.

Examples

The following example shows how to stop logging on a specific NDMP session 35512, running on node cluster1-01.

```
cluster1:/> system services ndmp log stop -session-id 35512 -node cluster1-01
```

The following example shows how to stop logging on the NDMP server session, running on node cluster1-01.

```
cluster1:/> system services ndmp log stop -session-id server -node cluster1-01
```

vserver services ndmp log stop on page 2117

system services ndmp node-scope-mode commands

The node-scope-mode directory

Note: These node-scoped NDMP commands are deprecated. Node-scoped NDMP functionality may be removed in a future release of Data ONTAP. Use the Vserver-aware "vserver services ndmp" commands.

Related references

vserver services ndmp on page 2092

system services ndmp node-scope-mode off

(DEPRECATED)-Disable NDMP node-scope-mode

Availability: This command is available to cluster administrators at the admin privilege level.

Description

Note: This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of Data ONTAP. Use the Vserver-aware "vserver services ndmp" command.
This command puts NDMP server in Vserver-aware mode. The Vserver-aware commands are available under `vserver services ndmp`.

### Examples

The following example shows how to disable the node-scope-mode of NDMP server.

```
cluster1::> system services ndmp node-scope-mode off
NDMP node-scope-mode is disabled.
```

### Related references

- `vserver services ndmp` on page 2092

---

**system services ndmp node-scope-mode on**

(DEPRECATED)—Enable NDMP node-scope-mode

**Availability**: This command is available to cluster administrators at the `admin` privilege level.

**Description**

**Note**: This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of Data ONTAP. Use the Vserver-aware "`vserver services ndmp`" command.

This command puts the NDMP server in the node-scope-mode. In the node-scope-mode, NDMP server has the following behavior:

- All NDMP operations are restricted to resources on the node
- Vserver-aware NDMP commands are disabled
- NDMP authentication falls back to DATA ONTAP 8.1 NDMP authentication scheme

```
cluster1::> system services ndmp node-scope-mode on
NDMP node-scope-mode is enabled.
```

### Related references

- `vserver services ndmp` on page 2092

---

**system services ndmp node-scope-mode status**

(DEPRECATED)—Status of NDMP node-scope-mode

**Availability**: This command is available to cluster administrators at the `admin` privilege level.

**Description**

**Note**: This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of Data ONTAP. Use the Vserver-aware "`vserver services ndmp`" command.

This command displays whether the NDMP server is operating in node-scope-mode or not.

- NDMP node-scope-mode is disabled - NDMP server is Vserver-aware
• NDMP node-scope-mode is enabled - NDMP server is node scoped

Examples

The following example shows how to check the status of NDMP server in a cluster

```
cluster1::> system services ndmp node-scope-mode status
NDMP node-scope-mode is disabled.
```

system services ndmp service commands

The service directory

system services ndmp service modify

Modify NDMP service configuration

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

The system services ndmp service modify command allows you to modify the NDMP service configurations for a node in the cluster. The following configuration can be modified:

• NDMP Common Sessions

This command is not supported on Infinite Volumes.

Parameters

- `node {<nodename>|local}` - Node

  This specifies the node whose NDMP configuration is to be modified.

- `[-common-sessions <integer>]` - NDMP Common Sessions

  This optional parameter specifies the number of extra common NDMP sessions supported, in addition to the number of backup and restore sessions supported for a platform. The default value is 4 for all platforms. The number of backup and restore sessions are platform dependent.

  Caution:

  Increasing this parameter can make the storage system unresponsive.

Examples

The following example modifies the NDMP configuration on a node named node1. The configuration sets the NDMP Common Sessions to 16:

```
cluster1::> system services ndmp modify -node node1
            -common-sessions 16
```
system services ndmp service show

Display NDMP service configuration

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The system services ndmp service show command displays the following information about the NDMP service configuration across all the nodes in the cluster:

- Node name
- NDMP Common Sessions

A combination of parameters can be optionally supplied to filter the results based on specific criteria. This command is not supported on Infinite Volumes.

Parameters

{ [-fields <fieldname>, ...]  
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

  | [-instance]  
  If you specify the -instance parameter, the command displays detailed information about all fields.

  [ -node {<nodename>|local}] - Node  
  Selects information about the specified node.

  [ -common-sessions <integer>] - NDMP Common Sessions  
  Selects information about the nodes that have the specified number of NDMP common sessions.

Examples
The following example displays information about the NDMP configuration of all nodes in the cluster:

```
cluster1::> system services ndmp service show
Node            Common Sessions
----------------- ---------------
node0            16
node1            16
node2            16
node3            16
4 entries were displayed.
```

system services ndmp service start

Start the NDMP service

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The system services ndmp service start command starts the NDMP service daemon for a node. This is different from the system services ndmp on command. The system services ndmp on command enables the daemon to accept NDMP requests. The NDMP service daemon starts automatically on a node when it boots up. Use this command to start the NDMP service daemon that has been stopped by the system services ndmp service stop command. This command is not supported on Infinite Volumes.
Parameters

- `node {<nodename>|local}` - Node

  The node on which the NDMP service needs to be started.

Examples

```
cluster1:/> system services ndmp service start -node node0
```

Related references

- `system services ndmp on` on page 1313
- `system services ndmp service stop` on page 1330

`system services ndmp service stop`

Stop the NDMP service

**Availability:** This command is available to `cluster` administrators at the `advanced` privilege level.

**Description**

The `system services ndmp service stop` command stops the NDMP service daemon on a node. This is a disruptive command and should not be used in normal scenarios. Processing of active sessions continues but the ability to view or kill sessions is lost. This is different from the `system services ndmp off` command. The `system services ndmp off` command disables new NDMP connections on the node but does not stop the NDMP service daemon. This command is not supported on Infinite Volumes.

Parameters

- `node {<nodename>|local}` - Node

  The node on which the NDMP service needs to be stopped.

Examples

```
cluster1:/> system services ndmp service stop -node node0
```

Related references

- `system services ndmp off` on page 1312
- `system services ndmp service start` on page 1329

`system services ndmp service terminate`

Terminate all NDMP sessions

**Availability:** This command is available to `cluster` administrators at the `advanced` privilege level.

**Description**

The `system services ndmp service terminate` command terminates all active sessions on the node. This command forcefully terminates all NDMP sessions without an opportunity for a graceful shutdown. Use `system services ndmp kill-all` for a clean termination of all active sessions on a node. This command is not supported on Infinite Volumes.

Parameters

- `node {<nodename>|local}` - Node

  The node on which the NDMP sessions need to be terminated
Manage Web Protocols

Manage web protocols

These commands manage the availability of web protocols (HTTP/HTTPs) in the cluster, including the port and encryption configurations for those protocols.

**system services web modify**

Modify the cluster-level configuration of web protocols

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

This command modifies the overall availability of web services in the cluster, including the core protocol configurations for those services. In a pre-root or unclustered scenario, its scope applies to the local node.

**Parameters**

- **[-external {true|false}] - External Web Services**
  
  Defines whether remote clients can access HTTP or HTTPS service content. Along with the *system services firewall* configuration, this parameter controls the visibility for client connections. The default value for this parameter after installation is 'true', which exports web protocols for remote access. If no value is provided during modification, its behavior does not change.

- **[-per-address-limit <integer>] - Per Address Limit (privilege: advanced)**
  
  Limits the number of connections that can be processed concurrently from the same remote address. If more connections are accepted, those in excess of the limit are delayed and processed after the number of connections being processed drops below the limit. The default value is 96.

- **[-http-enabled {true|false}] - HTTP Enabled (privilege: advanced)**
  
  Defines whether HTTP is enabled. The default value for this parameter is *false*.

**Examples**

The following command changes the maximum size of the wait queue:

```
cluster1:/> system services web modify -wait-queue-capacity 256
```

*system services firewall* on page 1301

system services web show

Display the cluster-level configuration of web protocols

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.
**Description**
This command displays the overall availability of web services in the cluster, including the core protocol configurations for those services. In a pre-root or unclustered scenario, its output applies to the local node. The following information explains the **External Web Services** and **Status** attributes, two features of web services' availability.

The **External Web Services** field indicates whether remote clients are allowed to access the HTTP or HTTPS service content. Along with the `system services firewall` configuration, the **External Web Services** field indicates the visibility for client connections.

The **Status** field describes the aggregated operational state of cluster-level web services as retrieved from the `system services web node` command. The **Status** field does not reflect whether the protocols are externally visible, but whether the server processes are running correctly. For detailed information about individual servers, use the `system services web node show` command. The following are the possible values for the **Status** in node configuration or availability:

- **online**, all web services are consistently configured and working correctly.
- **partial**, one or more nodes' web services are unavailable due to an error condition.
- **mixed**, the nodes in the cluster do not share the same web services configuration. This situation might occur if individual nodes were reconfigured with the `system services web node` command.
- **offline**, all of the nodes' web services are unavailable due to an error condition.
- **unclustered**, the current node is not part of an active cluster.

The **HTTP Enabled** field indicates whether HTTP is enabled.

The **per-address-limit** field is the limit of the number of connections that can be processed concurrently from the same remote address. If more connections are accepted, those in excess of the limit are delayed and processed after the number of connections being processed drops below the limit.

**Examples**
The following example displays the availability of web services for the cluster.

```
cluster1::> system services web show
External Web Services: true
   Status: online
HTTP Protocol Port: 80
HTTPS Protocol Port: 443
HTTP Enabled: true
```

- `system services web node show` on page 1332

**Manage Node Web Servers**
Manage the nodes' web servers
These commands manage the availability of web protocols (HTTP/HTTPs) on specific nodes in the cluster, including the port and encryption configurations for those protocols.

**system services web node show**
Display the status of the web servers at the node level

**Availability**: This command is available to cluster administrators at the admin privilege level.
Description
This command displays operational configuration for the web server processes on the nodes in the cluster. This output is aggregated to produce the content for the system services web show command.

Parameters

[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-node <nodename> | local] - Node
Selects the nodes that match this parameter value. Identifies the node where the web server process is being executed.

[-external {true | false}] - External Web Services
Selects the nodes that match this parameter value. Defines whether remote clients can access the HTTP or HTTPS service content. Along with the system services firewall command configuration, this parameter controls the visibility for client connections. The default value for this parameter after installation is true, which exports web protocols for remote access.

[-http-port <integer>] - HTTP Port
Selects the nodes that match this parameter value. Defines the HTTP port for the node-level web services.

[-https-port <integer>] - HTTPS Port
Selects the nodes that match this parameter value. Defines the encrypted HTTP (HTTPS) port for the node-level web services.

[-http-enabled {true | false}] - HTTP Enabled
Selects the nodes that match this parameter value. Defines whether HTTP is enabled.

[-per-address-limit <integer>] - Per Address Limit (privilege: advanced)
Selects the nodes that match this parameter value. Limits the number of connections that can be processed concurrently from the same remote address. If more connections are accepted, those in excess of the limit are delayed and processed after the number of connections being processed drops below the limit.

[-status {offline | partial | mixed | online | unclustered}] - Protocol Status
Selects the nodes that match this parameter value. Describes the operational state of node-level web services. This parameter does not reflect whether protocols are externally visible, but whether the server processes are running correctly. The following are the possible values that describe the service availability:

• online, indicates that web services are working correctly.
• offline, indicates that web services are unavailable due to an error condition.
• unclustered, indicates that the current node is not part of an active cluster.

[-total-hits <integer>] - Total HTTP Requests
Selects the nodes that match this parameter value. Indicates the total number of requests serviced by the web server.

[-total-bytes <integer>] - Total Bytes Served
Selects the nodes that match this parameter value. Indicates the total number of bytes returned by the web server.

Examples
The following example displays the status of web servers for nodes in the cluster.
cluster1::system services web node> show

<table>
<thead>
<tr>
<th>Node</th>
<th>External</th>
<th>HTTP Port</th>
<th>HTTPS Port</th>
<th>Status</th>
<th>Total HTTP Requests</th>
<th>Total Bytes Served</th>
</tr>
</thead>
<tbody>
<tr>
<td>node1</td>
<td>true</td>
<td>80</td>
<td>443</td>
<td>online</td>
<td>5</td>
<td>1362</td>
</tr>
<tr>
<td>node2</td>
<td>true</td>
<td>80</td>
<td>443</td>
<td>online</td>
<td>5</td>
<td>1362</td>
</tr>
</tbody>
</table>

2 entries were displayed.

SMTape Commands

Manage SMTape operations

smtape commands description

system smtape abort

Abort an active SMTape session

Availability: This command is available to cluster administrators at the admin privilege level.

Description
This command aborts the backup or restore operations based on the session identifier. You can perform SMTape operations using the system smtape backup or system smtape restore commands. A unique session identifier is assigned for each new SMTape operation. This command aborts sessions that are in active and waiting states.

Parameters

- `session <Sequence Number>` - Session Identifier
  
  Use this parameter to specify the session identifier for a backup or restore session.

Examples

Abort the SMTape session with the session identifier 20

```
cluster1::> system smtape abort -session 20
Abort posted to session 20.
```

Related references

system smtape backup on page 1334

system smtape restore on page 1337

system smtape backup

Backup a volume to tape devices

Availability: This command is available to cluster administrators at the admin privilege level.
Description

This command performs a baseline backup of a specified volume path to a tape device. You can use the command `system hardware tape drive show` to view the list of tape devices in the cluster. You must specify a Snapshot copy name to perform an SMTape backup operation. The Snapshot copy name specified is used as the base Snapshot copy. A new unique session ID is assigned for this SMTape operation and the status of the session can be monitored using the command `system smtape status`. This session ID can be subsequently used to perform other operations such as to find the SMTape status, abort an SMTape operation, and continue an SMTape operation.

The volume and tape device must reside on the same node in the cluster. You must retain the base Snapshot copy created during this backup operation in order to use this Snapshot copy to re-establish a SnapMirror relationship upon a restore.

Parameters

-`-vserver <vserver name>` - Vserver Name
  Use this parameter to specify the Vserver name on which the volume is located. You need not specify this parameter if only one cluster Vserver exists.

-`-volume <volume name>` - Volume Name
  Use this parameter to specify the name of the volume that needs to be backed up to tape.

-`-backup-snapshot <snapshot name>` - Snapshot Name
  Use this parameter to specify the name of the Snapshot copy while performing an SMTape backup operation.

-`-tape </node_name/tape_device>` - Tape Name
  Use this parameter to specify the name of the tape device which is used for this SMTape operation. The format of the tape device name is `/node_name/tape_device`, where `node_name` is the name of the cluster node owning the tape and `tape_device` is the name of the tape device.

-`-[tape-block-size <integer>]` - Tape Record Size in KB
  Use this parameter to specify the tape record size in KB for backup and restore operations. The tape record size is in multiples of 4KB, ranging from 4KB to 256KB. The default tape record size is 240KB unless it is specified.

Examples

The following example will start the backup of a volume `datavol` in a Vserver `vserver0` to a tape `rst0a`. Both the volume and tape reside on the same node `cluster1-01`. The Snapshot copy to be backed up is `datavol_snapshot` and the tape record size has the value of 256KB.

```
cluster1::> system smtape backup -vserver vserver0 -volume datavol
    -backup-snapshot datavol_snapshot -tape /cluster1-01/rst0a
    -tape-block-size 256
Session 21 created successfully
```

The following example will start the backup of a volume `datavol` in a Vserver `vserver0` to a tape `rst0a`. The volume `datavol` is in a Vserver `vserver0`. Both the volume and tape reside on the same node `cluster1-01`. The Snapshot copy to be backed up is `datavol_snapshot` and the tape record size has the default value of 240KB.

```
cluster1::> system smtape backup -vserver vserver0 -volume datavol
    -backup-snapshot datavol_snapshot -tape /cluster1-01/nrst0l
Session 22 created successfully
```

-`system smtape status` on page 1340
-`system smtape restore` on page 1337
system smtape break

Make a restored volume read-write

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command breaks the relationship between the tape backup of a volume and a restored volume, changing the restored volume from read-only to read/write.

Parameters
- **-vserver <vserver name>** - Vserver Name
  
  Use this parameter to specify the Vserver name on which the volume is located. You need not specify this parameter if only one cluster Vserver exists.

- **-volume <volume name>** - Volume Name
  
  Use this parameter to specify the name of the read-only volume that needs to be made read/writeable after a restore.

Examples
Make the read-only volume datavol on Vserver vserver0 writeable after a restore.

```
cluster1::> system smtape break -vserver vserver0 -volume datavol
[Job 84] Job succeeded: SnapMirror Break Succeeded
```

- system node hardware tape drive show on page 1244

system smtape continue

Continue SMTape session waiting at the end of tape

Availability: This command is available to cluster administrators at the admin privilege level.

Description
This command continues the SMTape backup and restore operations using the specified tape device. You can use this command when an SMTape operation has reached the end of current tape and is in the wait state to write to or read from a new tape.

If a tape device is not specified, the original tape device will be used.

User has to make sure that the correct tape media is inserted in the device and positioned appropriately before issuing this command.
Parameters

- **-tape <node_name/tape_device>** - Tape Name
  
  Use this parameter to specify the name of the tape device which is used for this SMTape operation. The format of the tape device name is /node_name/tape_device, where node_name is the name of the cluster node owning the tape and tape_device is the name of the tape device.

- **-session <Sequence Number>** - Session Identifier
  
  Use this parameter to specify the session identifier for the SMTape backup or restore operations.

### Examples

Continues an SMTape session having session ID 20 on tape device rst0a on the node node1 in the cluster.

```
cluster1::> system smtape continue -session 20 -tape /node1/rst0a
continue on session 20 succeeded
```

The following example continues session 40 on the same tape device that was being used by the session.

```
cluster1::> system smtape continue -session 40
continue on session 40 succeeded
```

**system smtape restore**

Restore a volume from tape devices

**Availability:** This command is available to cluster administrators at the *admin* privilege level.

**Description**

This command performs restore of a backup image created using the command `system smtape backup` in the specified tape device to a destination volume path. A new unique session ID is assigned for this operation; the status of the session can be monitored using the command `system smtape status`. It is required that the volume and tape device reside in the same cluster node. The volume must be of type DP (Data Protection) and should be placed in the restricted mode prior to a restore. Any existing data on the volume will get overwritten upon a restore. The volume will remain as read-only and of type DP after the restore. You can use the command `system smtape break` to get read/write permissions on the volume. Restore to an Infinite Volume is not supported. Restore can be done to a non-root DP volume.

**Parameters**

- **-vserver <vserver name>** - Vserver Name
  
  Use this parameter to specify the Vserver name on which the volume is located. You need not specify this parameter if only one cluster Vserver exists.

- **-volume <volume name>** - Volume Name
  
  Use this parameter to specify the volume name on which the tape content will be restored.

- **-tape </node_name/tape_device>** - Tape Name
  
  Use this parameter to specify the name of the tape device which is used for this SMTape operation. The format of the tape device name is /node_name/tape_device, where node_name is the name of the cluster node owning the tape and tape_device is the name of the tape device.

- **[-tape-block-size <integer>]** - Tape Record Size in KB
  
  Use this parameter to specify the tape record size in KB for backup and restore operations. The tape record size is in multiples of 4KB, ranging from 4KB to 256KB. The default tape record size is 240KB unless it is specified. Use the same record size which was used during the backup. If the tape record size is different from the tape record size that was used at the time of backup then `system smtape restore` will fail.
Examples

The following example will start the restore to a volume `datavol` from a tape `rst0a`. The volume `datavol` is in a Vserver `vserver0`. Both `vserver0` and `rst0a` reside on the same node `cluster1-01`.

```
cluster1::> system smtape restore -vserver vserver0 -volume datavol -tape /cluster1-01/rst0a -tape-block-size 256
Session 2 created successfully
```

The following example will start the restore to a volume `datavol` from a tape `rst0a`. The volume `datavol` is in a Vserver `vserver0`. Both `vserver0` and `rst0a` reside on the same node `cluster1-01`. The default tape record size of 240KB was used during backup.

```
cluster1::> system smtape restore -vserver vserver0 -volume datavol -tape /cluster1-01/rst0a
Session 5 created successfully
```

**system smtape showheader**

Display SMTape header

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**

This command displays the image header of a tape. The tape must have a valid backup of data. The following information about the backup is displayed:

- Tape Number - the tape number if the backup spans multiple tape devices.
- WAFL Version - WAFL version of the storage system when the volume was backed up on tape.
- Backup Set ID - a unique backup set ID for the baseline backup.
- Source Storage System - the source storage system where the volume resided when the backup was performed.
- Source Volume - the source volume that was backed up to tape.
- Source Volume Capacity - the capacity of the source volume that was backed up to tape.
- Source Volume Used Size - the used size of the source volume that was backed up to tape.
- Source Snapshot - name of the Snapshot copy used for the backup.
- Volume Type - type of the volume.
- Is SIS Volume - this field is true if the backed up volume was a SIS volume.
- Backup Version - the SMTape backup version.
• Backup Sequence No - the backup sequence number.
• Backup Mode - this field describes the backup mode.
• Time of Backup - the time at which the backup was performed.
• Time of Previous Backup - the time at which the previous backup was performed; this information is displayed only if the previous backup was an incremental backup.
• Volume Total Inodes - number of inodes of the backed up volume.
• Volume Used Inodes - number of used inodes of the backed up volume.
• Number of Snapshots - number of Snapshot copies present in this backup.
• Snapshot ID - is the Snapshot ID of the backup Snapshot.
• Snapshot Time - time at which the backup Snapshot copy was created.
• Snapshot Name - name of the Snapshot copy which was backed up to tape.

Parameters

-tape </node_name/tape_device> - Tape Name

Use this parameter to specify the name of the tape device which is used for this SMTape operation. The format of the tape device name is /node_name/tape_device, where node_name is the name of the cluster node owning the tape and tape_device is the name of the tape device.

[-tape-block-size <integer>] - Tape Record Size in KB

Use this parameter to specify the tape record size in KB for backup and restore operations. The tape record size is in multiples of 4KB, ranging from 4KB to 256KB. The default tape record size is 240KB unless it is specified.

Examples

The following example reads the image header from the tape nrst0l residing on the node cluster1-01 and displays relevant tape header information.

```
cluster1:~> system smtape showheader -tape /cluster1-01/nrst0l
   -tape-block-size 240
Tape record size in KB: 240
    Tape Number: 1
    WAFL Version: 23577
    Backup Set ID: 7d0c9a15-8e20-11e1-8741-123478563412
    Source Storage System: cluster1-01
    Source Volume: /vs1/srcvol
    Source Volume Capacity: 400.00MB
    Source Volume Used Size: 0.00
    Source Snapshot: mysnap
    Volume Type: Flex
    Is SISVolume: no
    Backup Version: 1:3
    Backup Sequence No: 0
    Backup Mode: dw-data
    Time of Backup: 4/24/2012 15:16:38
    Time of Previous Backup: 0/0/0 00:00:00
    Volume Total Inodes: 12789
    Volume Used Inodes: 100
    Number of Snapshots: 1
    Snapshot ID: 1
    Snapshot Time: 4/24/2012 15:16:10
    Snapshot Name: mysnap
```
system smtape status commands

The status directory

system smtape status clear

Clear SM Tape sessions

Availability: This command is available to cluster administrators at the admin privilege level.

Description

This command clears SM Tape sessions which are completed, failed or Unknown state.

Parameters

- `-session <Sequence Number>` - Session Identifier
  Use this parameter to clear the SM Tape sessions with the specified session identifier.

- `-node {<nodename>|local}` - Node Name
  Use this parameter to clear the SM Tape sessions related to the specified node.

- `-type {backup|restore}` - Operation Type
  Use this parameter to clear the SM Tape sessions of the specified operation type. These can be either backup or restore sessions.

- `-status {COMPLETED|FAILED|UNKNOWN}` - Session Status
  Use this parameter to clear the SM Tape sessions which have the status as specified in the parameter.

- `-path <text>` - Path Name
  Use this parameter to clear the SM Tape sessions which have path as specified in the parameter.

- `-device <text>` - Device Name
  Use this parameter to clear the SM Tape sessions on a specific tape device.

- `-backup-snapshot <snapshot name>` - Snapshot Name
  Use this parameter to clear the SM Tape sessions using the Snapshot copy name as specified in the parameter.

- `-tape-block-size <integer>` - Tape Block Size
  Use this parameter to clear the SM Tape sessions with the tape block size as specified in the parameter.

Examples

The following example clears all the completed SM Tape sessions in the cluster:

```
cluster1::> system smtape status clear
5 sessions are purged.
```

The SM Tape sessions on the node node1 in the cluster are cleared.

```
cluster1::> system smtape status clear -node node1
3 sessions are purged.
```
**system smtape status show**

Show status of SMTape sessions

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

This command lists the status of all SMTape sessions in the cluster. By default, this command lists the following information:

- Session
- Type
- Status
- Progress
- Path
- Device
- Node

**Parameters**

`[-fields <fieldname>,...]`

Use this parameter to display additional fields about each session apart from the default entries. This parameter is optional. Any combination of the following fields is valid:

- Session
- Node
- Type
- Status
- Path
- Device
- Progress
- Start-time
- End-time
- Update-time
- Backup-snapshot
- Tape-block-size
- Error

`[-instance]`

Displays detailed information about the specified sessions.

`[-session <Sequence Number>] - Session Identifier`

Selects information about a specific SMTape session. A Session Identifier is a number that is used to identify a particular SMTape session.
[-node {<nodename>|local}] - Node Name
Selects information about sessions related to the specified node.

[-type {backup|restore}] - Operation Type
Selects information about SM{Tape sessions of the specified operation type.

[-status {COMPLETED|FAILED|ACTIVE|WAITING|ABORTING|UNKNOWN}] - Session Status
Selects information about SM{Tape sessions having the specified status in the parameter.

[-path <text>] - Path Name
Selects information about SM{Tape sessions on a volume which is at the specified path name. This is the
logical path of the volume and you must specify the path name in the following format: /vserver_name/
volume_name.

[-device <text>] - Device Name
Selects information about the SM{Tape sessions on the specified tape device. You must specify the tape device
name in the following format: /node_name/tape_device.

[-progress {<integer>[KB|MB|GB|TB|PB]}] - Bytes Transferred
Selects information about SM{Tape sessions in which the number of data bytes transferred in a particular
session matches with the number specified in this parameter.

[-start-time <MM/DD/YYYY HH:MM:SS>] - Start Time
Selects information about SM{Tape sessions whose starting time matches the specified starting time.

[-end-time <MM/DD/YYYY HH:MM:SS>] - End Time
Selects information about SM{Tape sessions whose ending time matches the specified ending time.

[-backup-snapshot <snapshot name>] - Snapshot Name
Selects information about SM{Tape sessions that use a particular Snapshot copy name which matches the
specified Snapshot copy name in the parameter in backup or restore operations.

[-tape-block-size <integer>] - Tape Block Size
Selects information about SM{Tape sessions that use a particular tape block size which matches the specified
tape block size parameter in backup or restore operations.

[-error <text>] - Error Description
Selects information about SM{Tape sessions that have a particular error description which matches the
specified error description in the parameter.

Examples
Displays default entries about the five SM{Tape sessions.

```bash
cluster1::> system smtape status show

<table>
<thead>
<tr>
<th>Session</th>
<th>Type</th>
<th>Status</th>
<th>Progress</th>
<th>Path</th>
<th>Device</th>
<th>Node</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td>Backup</td>
<td>COMPLETED</td>
<td>50MB</td>
<td>/vsrvr1/vol1</td>
<td>/cls1-01/nrst01</td>
<td>cluster1-01</td>
</tr>
<tr>
<td>4</td>
<td>Restore</td>
<td>FAILED</td>
<td>0B</td>
<td>/vsrvr1/vol3</td>
<td>/cls1-02/nrst21</td>
<td>cluster1-02</td>
</tr>
<tr>
<td>3</td>
<td>Backup</td>
<td>COMPLETED</td>
<td>50MB</td>
<td>/vsrvr1/vol3</td>
<td>/cls1-01/nrst01</td>
<td>cluster1-01</td>
</tr>
<tr>
<td>2</td>
<td>Backup</td>
<td>COMPLETED</td>
<td>50MB</td>
<td>/vsrvr1/vol2</td>
<td>/cls1-03/nrst0m</td>
<td>cluster1-03</td>
</tr>
<tr>
<td>1</td>
<td>Backup</td>
<td>COMPLETED</td>
<td>50KB</td>
<td>/vsrvr1/vol15</td>
<td>/cls1-01/nrst0n</td>
<td>cluster1-01</td>
</tr>
</tbody>
</table>

5 entries were displayed.
```

The following example shows the output with the -instance argument.

```bash
cluster1::> system smtape status show -instance

Session Identifier: 1
Node Name: node1
Operation Type: Backup
Status: COMPLETED
```
system snmp commands

The snmp directory

Manage cluster-wide SNMP settings.
SetRequest PDU is not supported. There is no default community for the SNMP agent.
SNMPv3 users are created using "security login create" CLI.

system snmp authtrap

Enables or disables SNMP authentication traps

Availability: This command is available to cluster administrators at the admin privilege level.

Description
Use this command to either enable or disable the standard SNMP authentication failure traps.

Parameters

[-authtrap <integer>] - Enables SNMP Authentication Trap

Enter the value of 1 to enable SNMP authentication failure traps. By default, SNMP authentication trap is disabled and the value is 0.

Examples
The following example demonstrates how to set the SNMP authtrap.

    cluster1::> system snmp authtrap -authtrap 1
    cluster1::> system snmp show
    contact:
    private
    location:
    NB
    authtrap:
    1
    init:
    0
    traphosts:
    
    community:

system snmp contact

Displays or modifies contact details

Availability: This command is available to cluster administrators at the admin privilege level.
Description
Sets the contact name as the System.sysContact.0 MIB-II variable.

Parameters
[-contact <text>] - Contact

Specifies the contact name. Without any value specified, this command displays current setting of contact name.

Examples
The following example sets the contact name for SNMP.

cluster1::> system snmp contact -contact private
cluster1::> system snmp show
    contact: private
    location: NB
    authtrap: 1
    init: 0
    traphosts: community: _ _

system snmp enable-snmpv3
Enables SNMPv3 cluster-wide

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The system snmp enable-snmpv3 command enables SNMPv3 server on the entire cluster. When this command is run, SNMP users and SNMP traphosts that are non-compliant to FIPS will be deleted automatically, since cluster FIPS mode is enabled. Any SNMPv1 user, SNMPv2c user or SNMPv3 user (with none or MD5 as authentication protocol or none or DES as encryption protocol or both) is non-compliant to FIPS. Any SNMPv1 traphost or SNMPv3 traphost (configured with an SNMPv3 user non-compliant to FIPS) is non-compliant to FIPS.

Examples
The following command enables SNMPv3 server on the entire cluster, within a cluster named cluster1:

cluster1::> set -privilege advanced
Warning: These advanced commands are potentially dangerous; use them only when directed to do so by NetApp personnel.
Do you want to continue? {y|n}: y
cluster1::*> system snmp enable-snmpv3
Warning: If you enable SNMPv3 using this command, any SNMP users and SNMP traphosts that are non-compliant to FIPS will be deleted automatically, since cluster FIPS mode is enabled. Any SNMPv1 user, SNMPv2c user or SNMPv3 user (with none or MD5 as authentication protocol or none or DES as encryption protocol or both) is non-compliant to FIPS. Any SNMPv1 traphost or SNMPv3 traphost (configured with an SNMPv3 user non-compliant to FIPS) is non-compliant to FIPS.
Do you want to continue? {y|n}: y
system snmp init

Enables or disables SNMP traps

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
Initializes or disables sending of traps by the SNMP daemon from the cluster.

**Parameters**

[-init <integer>] - Initialize Traps

Use the value of 1 to initialize SNMP daemon to send traps or use a value of 0 to stop sending traps from the cluster. If no value is specified, this command displays the current setting of init. Traps are enabled by default.

**Examples**
The following command initializes SNMP daemon to send traps.

```
cluster1::> system snmp init -init 1
cluster1::> system snmp show
contact:  
private
location: NB
authtrap: 1
init: 1
traphosts: 
community: 
```

system snmp location

Displays or modifies location information

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
Sets the location name as the System.sysLocation.0 MIB-II variable.

**Parameters**

[-location <text>] - Location

Specifies the location details. If no value is specified, this command displays the current setting of location.

**Examples**

This command sets the location name.
system snmp prepare-to-downgrade

Change SNMP configuration to the default settings for releases earlier than Data ONTAP 9.3.0

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The system snmp prepare-to-downgrade command prepares the SNMP subsystem for a downgrade or a revert. More specifically, it prepares the SNMPv3 client feature for a downgrade or a revert. It deletes all storage switches that were explicitly added for monitoring and are using SNMPv3 as the underlying protocol. It also deletes any cluster switches that are using SNMPv3 for monitoring. Finally, it deletes any remote switch SNMPv3 users configured in ONTAP.

Examples
The following command prepares the SNMP subsystem for a downgrade or a revert, within a cluster named cluster1:

```
cluster1:*> system snmp prepare-to-downgrade
```

system snmp show

Displays SNMP settings

Availability: This command is available to cluster administrators at the admin privilege level.

Description
Lists the current values of all the SNMP parameters.

Examples
The example below shows a typical command display.

```
cluster1:~> system snmp show
contact: private
location: NB
authtrap: 1
init: 1
traphosts: 
community: 
```
system snmp community commands

The community directory
Adds, deletes and displays communities.

system snmp community add

Adds a new community with the specified access control type

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system snmp community add command adds communities with the specified access control type. Only read-only communities are supported. There is no limit for the number of communities supported.

Parameters
-vserver <Vserver Name> -Vserver
This parameter specifies the Vserver to which the community will be added. If no Vserver is specified, the community is added to the admin Vserver.

-community-name <text> - Community
This parameter specifies the name of the community.

-type <ctype> - access type
This parameter specifies 'ro' for read-only community.

Examples
The following example adds the read-only community name 'private'.

```
cluster1::> system snmp community add -type ro
 -community-name private
cluster1::> system snmp community show
  ro  private
```

system snmp community delete

Deletes community with the specified access control type

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The system snmp community delete command deletes communities with the specified access control type. Only read-only communities are supported.

Parameters
-vserver <Vserver Name> - Vserver
This parameter specifies the Vserver from which you wish to delete the community. If no Vserver is specified, the community is deleted from the admin Vserver.
-community-name <text> - Community
   Specify the name of the community.

-type <ctype> - access type
   Specify 'ro' for a read-only community.

Examples
The following example deletes the read-only community 'private':

```
cluster1::> system snmp community delete -type ro
   -community-name private
cluster1::> system snmp community show
   This table is currently empty.
```

system snmp community show
Displays communities

Availability: This command is available to cluster administrators at the admin privilege level.

Description
Displays the current list of SNMP communities.

Parameters
`{ [-fields <fieldname>, ...]  
   If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

   [-instance ]  
   If you specify the -instance parameter, the command displays detailed information about all fields.

   [-vserver <Vserver Name>] - Vserver
   Selects the Vserver to which the SNMP community belongs

   [-community-name <text>] - Community
   Selects the SNMP v1/v2c community string

   [-access <ctype>] - access
   Selects the access type of the SNMP v1/v2c community. Read-only (ro) is the only access type supported

Examples
```
cluster1::> system snmp community show
cluster1
 ro private
```

system snmp traphost commands
The traphost directory
Adds, deletes and displays SNMP managers.
system snmp traphost add

Add a new traphost

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
Adds the SNMP manager who receives the SNMP trap PDUs. The SNMP manager can be a hostname or IP address. There is no limit on the number of traphosts supported.

**Parameters**
- `-peer-address <Remote InetAddress>` - Remote IP Address
  
  Specifies the IP address or hostname of the traphost. If the USM user is associated, then the SNMPv3 traps are generated for this traphost using the associated USM user’s authentication and privacy credentials. If no USM user is associated, then the SNMP v1/v2c traps are generated for this traphost. For the SNMP v1/v2c traps, the default community string is ‘public’, when no community is defined. When the community strings are defined, then the first community string is chosen for the SNMP v1/v2c traps.

- `[-usm-username <text>]` - USM User Name
  
  Specifies a predefined SNMPv3 USM user. The SNMPv3 traps are generated using this USM user’s authentication and privacy credentials for the traphost identified by the peer-address parameter.

**Examples**

In the following example, the command adds a hostname 'yyy.example.com' for the SNMPv3 traps:

```
cluster1::> system snmp traphost add -peer-address yyy.example.com -usm-username MyUsmUser
cluster1::> system snmp traphost show
    yyy.example.com(yyy.example.com) (192.168.xxx.xxx) USM User: MyUsmUser
```

In the following example, the command adds a hostname 'xxx.example.com' for the SNMP v1/v2c traps:

```
cluster1::> system snmp traphost add xxx.example.com
cluster1::> system snmp traphost show
    yyy.example.com(yyy.example.com) (192.168.xxx.xxx) USM User: MyUsmUser
    xxx.example.com(xxx.example.com) (xxx.xxx.xxx.xxx) Community: public
```

system snmp traphost delete

Delete a traphost

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
Deletes the SNMP manager, who receives the SNMP trap PDUs. The SNMP manager can be a hostname or IP address. There is no limit on the number of traphosts supported.

**Parameters**
- `-peer-address <Remote InetAddress>` - Remote IP Address
  
  Specifies the IP address or hostname of the traphost. If the USM user is associated, then specify the USM user to delete the traphost.
[\texttt{-usm-username <text>}] - USM User Name

Specifies the USM user associated with traphost.

**Examples**

In the following example, the command deletes the SNMPv3 traphost 'yyy.example.com' associated with the USM user:

```
cluster1::> system snmp traphost delete -peer-address yyy.example.com -usm-username MyUsmUser
```

In the following example, the command deletes the SNMP v1/v2c traphost 'xxx.example.com' associated with a community string:

```
cluster1::> system snmp traphost delete -peer-address xxx.example.com
```

**system snmp traphost show**

Displays traphosts

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

Displays list of the SNMP v1/v2c and SNMP v3 managers, that receive trap PDUs.

**Examples**

In the following example, the command displays all the host names or IP addresses that have been added until now:

```
cluster1::> system snmp traphost show
    yyy.example.com(yyy.example.com)(192.168.xxx.xxx)    USM User: MyUsmUser
    xxx.example.com(xxx.example.com)(xxx.xxx.xxx.xxx)    Community: public
```

**system status commands**

System Status service

Display the ONTAP system status.

**system status show**

Display System Status

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

The system status show command displays information about the status of objects in Data ONTAP. You can limit output to specific types of information and specific status in Data ONTAP, or filter output by specific field values.

To see a list of values that are in use for a particular field, use the `--fields` parameter of this command with the list of field names you wish to view.
Parameters

{[-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

[-instance ]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-internal-name <text>] - Internal Full Name

Selects status of objects that match this parameter value.

[-name <text>] - Name

Selects status of objects that match this parameter value.

[-vserver-id <text>] - Vserver ID

Selects status of objects that match this parameter value.

[-cluster-id <text>] - Cluster ID

Selects status of objects that match this parameter value.

[-is-cluster-scope {true|false}] - Cluster Scope

Selects status of objects that match this parameter value.

[-status <text>] - Status Value

Use this parameter to display the status.

[-update-time <MM/ DD/ YYYY HH:MM:SS>] - Update Time

Use this parameter to display the status last update time.

Examples

cluster1::> system status show
cluster::tfarrellnscluster-1
Node::tfarrell-vm1
   Hypervisor system name: vsimesxrtp060.gdl.englab.netapp.com
      Version:5.5.0
    Cpu count:20
      Cpu version:CPU Pkg/ID/Node: 0/0/0 Intel(R) Xeon(R) CPU E5-2680 v2 @ 2.80GH
      Cpu count (virtual):40
    ONTAP guests:5
      Total guests:7
    Memory configured:255.9GB
      Memory used:52.08GB
      Physical Interface count:2

          speed:unlimited
        Virtual Interface:vmk2
          adminStatus:up
          speed:unlimited
      Physical NIC:vmnic0
        adminStatus:up
        Mtu size:9000
        operStatus:up

system status commands
system timeout commands

Manage the timeout value for CLI sessions

system timeout modify

Set the CLI inactivity timeout value

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The system timeout modify command sets the timeout value for CLI sessions. If there is no CLI activity during the length of the timeout interval, the logged in user is logged out. The default value is 30 minutes. To prevent CLI sessions from timing out, specify a value of 0 (zero).

Parameters

[-timeout <integer>] - Timeout (in minutes)

Use this parameter to specify the timeout value, in minutes.

Examples

The following example shows how to modify the timeout value for CLI sessions to be 10 minutes:

```
cluster1::> system timeout modify -timeout 10
```

The following example shows how to prevent CLI sessions from timing out:

```
cluster1::> system timeout modify -timeout 0
```

system timeout show

Display the CLI inactivity timeout value

Availability: This command is available to cluster administrators at the admin privilege level.

1352

Commands: Manual Page Reference
Description
The `system timeout show` command displays the timeout value for CLI sessions. If there is no CLI activity during the length of the timeout interval, the logged in user is logged out. A timeout value of 0 minutes means that the CLI sessions never time out.

Examples
The following example displays the timeout value for CLI sessions:
```
cluster1::> system timeout show
CLI session timeout: 15 minute(s)
```

Template Commands

The Templates directory
The `template` commands enable you to manage Templates and their parameters.

template copy
Copy a template

Availability: This command is available to `cluster` administrators at the `admin` privilege level.

Description
Use this command to copy an existing template. The copied template becomes a readwrite template and can be customized using template parameter family of commands.

Parameters
- `-name <template name>` - Name of the template
  This parameter specifies the name of the template.
- `-destination-name <template name>` - Destination template
  This parameter specifies the name of the destination template.

Examples
The following example copies template1 to template2. The template2 will be a readwrite template:
```
cluster1::> template copy -name template1 -destination-name template2
```

template delete
Delete an existing template

Availability: This command is available to `cluster` administrators at the `admin` privilege level.

Description
Use this command to delete an existing template.
Parameters
- `name <template name>` - Name of the template

This parameter specifies the name of the template.

Examples
The following example deletes a template named template1 from the cluster:

```
cluster1::> template delete -name template1
```

**template download**

Download a template

**Availability:** This command is available to cluster administrators at the advanced privilege level.

**Description**
Use this command to download a template from an external server to the cluster.

**Parameters**
- `uri {ftp|http}://(hostname|IPv4 Address|'[IPv6 Address']')...` - URI of the template
  
  This parameter specifies the URI from which the template will be downloaded.
- `[-name <template name>]` - Name of the template
  
  This parameter specifies the name that will be assigned to the template in the cluster.

**Examples**
The following example downloads the template specified in the -uri parameter value and names the template as template1:

```
cluster1::> template download -uri http://www.example.com/netapp-templates/mysample -name template1
```

The following example downloads the template specified in the -uri parameter value:

```
cluster1::> template download -uri http://www.example.com/netapp-templates/template1
```

**template provision**

Provision Data ONTAP resources using the template

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
The command `template provision` provisions ONTAP system based on the template that is passed as an input to the template parameter. A wizard is presented which will accept the required inputs.

**Parameters**
- `name <template name>` - Name of the template
  
  This parameter specifies the name of the template
[-simulate \texttt{(true|false)}] - Simulate

If this parameter is specified, the provisioning is just simulated and there will be no changes done to the system.

**Examples**

The following example provisions a vserver with required protocols using template.

```
  cluster-1:> template provision -name VserverEnvironmentSetup
  Press Ctrl+C to abort.
  ***********************
  * Setup of vserver *

```
template rename

Rename a template

Availability: This command is available to cluster administrators at the admin privilege level.

Description
Use this command to rename an existing template.

Parameters
- **-name <template name>** - Name of the template
  This parameter specifies the name of the template.
- **-new-name <template name>** - New name of the template
  This parameter specifies the template's new name.

Examples
The following example renames a template template1 as template2:

```
cluster1::> template rename -name template1 -new-name template2
```

template show

Display templates

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The template show command displays information about templates. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, then the command displays the following information about all the templates:

- Template Name
- Permission (readonly or readwrite)

To display detailed information about a single template, run the command with the **-name** parameter. The detailed view provides all of the information in the previous list with the following additional information:

- Parent Template Name
- Description
- Version
- UUID of the Template

To display detailed information about all templates, run the command with the **-instance** parameter.

You can specify additional parameters to display information that matches only those parameters. For example, to display information only about templates with readonly permissions, run the command with the **-permission readonly** parameter.
Parameters

```
{ [ -fields <fieldname>, ... ]
    This parameter specifies the fields that need to be displayed.
[ -instance ]
    If this parameter is specified, the command displays information about all entries.
[ -name <template name> ] - Name of the template
    If this parameter is specified, the command displays the detailed information about the template that matches
    the specified name.
[ -permission <template_permission> ] - Permission
    If this parameter is specified, the command displays information about the template or templates that matches
    the specified permission.
[ -parent-template <text> ] - Parent template name
    If this parameter is specified, the command displays information about the template or templates that matches
    the specified parent template name.
[ -description <text> ] - Description
    If this parameter is specified, the command displays information about the template or templates that matches
    the specified description.
[ -version <text> ] - Version
    If this parameter is specified, the command displays information about the template or templates that matches
    the specified version.
[ -uuid <UUID> ] - UUID of the template
    If this parameter is specified, the command displays information about the template or templates that matches
    the specified uuid.
```

Examples

The following example displays information about all templates in the cluster:

```
cluster1::> template show
Template                       Permission
------------------------------------------ ----------
template1                      readonly
template2                      readwrite
```

The following example displays detailed information about a template named template1:

```
cluster1::> template show -name template1
Name of the Template: template1
Permission: readonly
Parent Template Name:
    Description: Template to configure Vserver Environment
    Version: 1.0
UUID of the Template: c8dfeb58-b5c5-5697-a829-18d4ee0ba202
```

template show-permissions

Display Template Allowed and Disallowed System Objects

**Availability:** This command is available to cluster administrators at the admin privilege level.
Description
The template show-permission command shows all the system objects that are allowed and disallowed for the current user.

Parameters
[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

[-instance]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-name <text>]
If you specify this parameter, only permissions that match the specified name are displayed.

[-object-name <text>]
If you specify this parameter, only permissions that match the specified object-name are displayed.

[-permission <text>]
If you specify this parameter, only permissions that match the specified permission are displayed.

[-command-name <text>]
If you specify this parameter, only permissions that match the specified command-name are displayed.

Examples
The following example shows all the the allowed and disallowed system objects

<table>
<thead>
<tr>
<th>Object Name</th>
<th>Command Name</th>
<th>Permission</th>
</tr>
</thead>
<tbody>
<tr>
<td>access.dns</td>
<td>vserver services name-service dns create</td>
<td>allowed</td>
</tr>
<tr>
<td>network.interface</td>
<td>network interface create</td>
<td>allowed</td>
</tr>
<tr>
<td>network.routes</td>
<td>network route create</td>
<td>allowed</td>
</tr>
<tr>
<td>protocols.CIFS</td>
<td>vserver cifs create</td>
<td>allowed</td>
</tr>
</tbody>
</table>

**template upload**

Upload an existing template to an external server

**Availability:** This command is available to cluster administrators at the advanced privilege level.

**Description**
Use this command to upload an existing template on to an external server.

**Parameters**
- **-name <template name>** - Name of the template
  This parameter specifies the name of the template.

- **-uri {(ftp|http)://(hostname|IPv4 Address}{IPv6 Address}...}** - URI to upload the template
  This parameter specifies the URI to which the template will be uploaded.

**Examples**
The following example uploads a template template1 on to an external server specified in the uri input parameter:
Template Parameter Commands

The template parameter directory

The template parameter commands enable you to manage Parameters of Templates.

template parameter modify

Modify the template parameters

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The template parameter modify command can be used to modify the following attributes of a template parameter:

• Default value of the parameter

Parameters

-template <template name> - Name of the template
  Name of the template.

-name <text> - Name of the parameter
  This parameter specifies the name of the parameter.

[default-value <text>] - Default value of the parameter
  This parameter specifies the default value of the parameter. This value is used by the template provision command when it provisions the system using this template.

Examples

The following example modifies the default value of the parameter param1 in template template1 to value1:

    cluster1:/> template parameter modify -template template1 -parameter param1 -default-value value1

Related references

template provision on page 1354

template parameter show

Display template parameters

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The template parameter show command displays information about the parameters of a template. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays the following information about all the parameters of all the templates in the system:

• Name of the template
• Name of the parameter
• Permission (readonly or readwrite)
• Default Value for the parameter
• Readonly
• Description

To display detailed information about a single parameter of the template run the command with the -name parameter. The detailed view provides all of the information in the previous list with the following additional information:

• Recommended Value for the parameter
• Maximum Length
• Range Maximum
• Range Minimum
• Allowed Values

To display detailed information about all the parameters of the template, run the command with the -instance parameter.

You can specify additional parameters to display information that matches only those parameters. For example, to display information about all the parameters of the templates with readonly permissions, run the command with the -permission readonly parameter.

Parameters

{ [-fields <fieldname>, ...] 
  This parameter specifies the fields that need to be displayed.

  | [-instance ]] 
  If this parameter is specified, the command displays information about all entries.

  [-template <template name>] - Name of the template 
  Name of the template.

  [-name <text>] - Name of the parameter 
  If this parameter is specified, the command displays information about the parameter of all the templates that matches the specified parameter name.

  [-permission <text>] - Template permission 
  If this parameter is specified, the command displays information about the parameter or parameters of all the templates that matches the specified permission.

  [-type <text>] - Type of the parameter 
  If this parameter is specified, the command displays information about the parameter or parameters of all the templates that matches the specified type.

  [-description <text>] - Parameter description 
  If this parameter is specified, the command displays information about the parameter or parameters of all the templates that matches the specified description.

  [-recommended-value <text>] - Recommended value of the parameter 
  If this parameter is specified, the command displays information about the parameter or parameters of all the templates that matches the specified recommended value.
[-default-value <text>] - Default value of the parameter
If this parameter is specified, the command displays information about the parameter or parameters of all the templates that matches the specified default value.

[-readonly {yes|no}] - Read-only parameter
If this parameter is specified with a value of true, then all the parameters that cannot be modified of all templates are displayed. If the value specified is false, then all the parameters that can be modified of all templates are displayed.

[-max-length <integer>] - Maximum length
If this parameter is specified, the command displays information about the parameter or parameters of all the templates that matches the specified maximum length.

[-range-max <integer>] - Maximum range
If this parameter is specified, the command displays information about the parameter or parameters of all the templates that matches the specified maximum range.

[-range-min <integer>] - Minimum range
If this parameter is specified, the command displays information about the parameter or parameters of all the templates that matches the specified minimum range.

[-allowed-vals <text>] - Allowed values
If this parameter is specified, the command displays information about the parameter or parameters of all the templates that matches the specified allowed values.

Examples
The following example displays information about all the parameters of all the templates in the cluster:

```
cluster1::> template parameter show
Template: template1
Permission: readonly
Parameter           Type         Default Value        Read Only Description
------------------- ------------ ------------ ---- ----------------------
parameter1          string       -            No   Parameter1
parameter2          IPAddress    -            No   Parameter2
```

Volume Commands

Manage virtual storage, including volumes, snapshots, and mirrors

The volume commands enable you to manage volumes, mirrors, and Snapshot(tm) copies.

volume autosize

Set/Display the autosize settings of the flexible volume.

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The volume autosize command allows the user to specify the maximum size that a volume will automatically grow to when it is out of space or the minimum size that it will shrink to when the amount of used space is below a certain threshold. If only the volume/Vserver name is specified then the current settings are displayed. This command is not supported on Infinite Volumes.
Parameters

- **vserver** `<vserver name>` - Vserver Name
  This parameter can be used to specify the Vserver on which the volume is located.

- **volume** `<volume name>` - Volume Name
  This parameter specifies the volume for which the user wants to set or display the autosize configuration.

  { [-**maximum-size** `<integer>[KB|MB|GB|TB|PB]`] - Maximum Autosize
    This parameter allows the user to specify the maximum size to which a flexible volume can grow. The default for FlexVol volumes is 120% of the volume size. If the value of this parameter is invalidated by manually resizing the volume or is invalid when the autosize feature is enabled, the maximum size is reset to 120% of the volume size. The value for `-maximum-size` cannot be set larger than the platform-dependent maximum FlexVol volume size. If you specify a larger value, the value of `-maximum-size` is automatically reset to the supported maximum without returning an error. This parameter is not supported on Infinite Volumes.

  [-**minimum-size** `<integer>[KB|MB|GB|TB|PB]`] - Minimum Autosize
    This parameter specifies the minimum size to which the volume can automatically shrink. If the volume was created with the `grow_shrink` autosize mode enabled, then the default minimum size is equal to the initial volume size. If the value of the `-minimum-size` parameter is invalidated by a manual volume resize or is invalid when autosize is enabled, the minimum size is reset to the volume size. This parameter is not supported on Infinite Volumes.

  [-**grow-threshold-percent** `<percent>`] - Grow Threshold Used Space Percentage
    This parameter specifies the used space threshold for the automatic growth of the volume. When the volume’s used space becomes greater than this threshold, the volume will automatically grow unless it has reached the maximum autosize. This parameter is not supported on Infinite Volumes.

  [-**shrink-threshold-percent** `<percent>`] - Shrink Threshold Used Space Percentage
    This parameter specifies the used space threshold for the automatic shrinking of the volume. When the amount of used space in the volume drops below this threshold, the volume will shrink unless it has reached the specified minimum size. This parameter is not supported on Infinite Volumes.

  [-**mode** `{off|grow|grow_shrink}`] - Autosize Mode
    This parameter specifies the autosize mode for the volume. The supported autosize modes are:
    - off - The volume will not grow or shrink in size in response to the amount of used space.
    - grow - The volume will automatically grow when used space in the volume is above the grow threshold.
    - grow_shrink - The volume will grow or shrink in size in response to the amount of used space.

    By default, `-mode` is `off` for new FlexVol volumes, except for DP mirrors, for which the default value is `grow_shrink`. The `grow` and `grow_shrink` modes work together with Snapshot autodelete to automatically reclaim space when a volume is about to become full. The volume parameter `-space-mgmt-try-first` controls the order in which these two space reclamation policies are attempted. This parameter is not supported on Infinite Volumes.

  | [-**reset** `[true]`]] - Autosize Reset
    This option allows the user to reset the values of autosize, max-autosize, min-autosize, autosize-grow-threshold-percent, autosize-shrink-threshold-percent and autosize-mode to their default values based on the current size of the volume. For example, the max-autosize value will be set to 120% of the current size of the volume.

Examples

The following example sets the autosize settings on a volume named vol1. The maximum size to grow is 1TB and autogrow is enabled.
The following example shows the autosize settings on a volume named vol1. The maximum size to grow is 1TB and autogrow is enabled.

```
cluster1::> vol autosize vol1
(volume autosize)
Volume autosize is currently ON for volume 'vsl:vol1'.
The volume is set to grow to a maximum of 1t.
```

**volume create**

Create a new volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `volume create` command creates a volume on a specified Vserver and storage aggregates. You can optionally specify the following attributes for the new volume:

- Size
- State (online, offline, or restricted)
- Type (read-write or data-protection)
- Export policy
- User ID
- Group ID
- Security style (All volume types: UNIX mode bits, CIFS ACLs, or mixed NFS and CIFS permissions. Only Infinite Volumes can use unified.)
- Default UNIX permissions for files on the volume
- Language
- Junction path
- Whether the junction path is active (advanced privilege level or higher only)
- Whether the volume is the root volume for its Vserver (advanced privilege level or higher only)
- Comment
- Whether autosizing is enabled for FlexVols
- Maximum size for autosizing FlexVols
- Minimum size for autosize
- Grow used space threshold percentage for autosize
- Shrink used space threshold percentage for autosize
- Whether autosizing is enabled for FlexVols
- Current mode of operation of volume autosize
- Maximum directory size (advanced privilege level or higher only)
- Space guarantee style (none or volume)
- Space SLO type (none, thick or semi-thick)
- Snapshot policy
- Snapshot reserve percentage
- Whether the volume create operation runs as a foreground or background process
- Caching policy
- Encrypt
- Cache retention priority
- Efficiency policy

Note: The ability to create Infinite Volumes is deprecated and may be removed in a future release of Data ONTAP. If you are using Infinite Volumes it is recommended that you do not upgrade the cluster to a release that is later than Data ONTAP 9.3.0.

Parameters

- `vserver <vserver name> - Vserver Name`
  This specifies the Vserver on which the volume is located. If only one data Vserver exists, you do not need to specify this parameter.

- `volume <volume name> - Volume Name`
  This specifies the name of the volume that is to be created. A volume's name must start with an alphabetic character (a to z or A to Z) and be 150 or fewer characters in length for Infinite Volumes, 197 or fewer characters in length for FlexGroups, and 203 or fewer characters in length for all other volume types. Volume names must be unique within a Vserver.

{ `-aggregate <aggregate name> - Aggregate Name`  
  This specifies the storage aggregate on which the volume is to be created. This parameter only applies to FlexVol volumes.

| `-aggr-list <aggregate name>, ... - List of Aggregates for FlexGroup Constituents`  
  Specifies an array of names of aggregates to be used for FlexGroup constituents. Each entry in the list will create a constituent on the specified aggregate. An aggregate may be specified multiple times to have multiple constituents created on it. This parameter only applies to FlexGroups.

[-`aggr-list-multiplier <integer>`] - Aggregate List Repeat Count
  Specifies the number of times of iterate over the aggregates listed with the `-aggr-list` parameter when creating a FlexGroup. The aggregate list will be repeated the specified number of times. Example:

  ```
  -aggr-list aggr1,aggr2 -aggr-list-multiplier 2
  ```

  will cause four constituents to be created in the order aggr1, aggr2, aggr1, aggr2.

  The default value is 4.

  This parameter only applies to FlexGroups
<table>
<thead>
<tr>
<th>-auto-provision-as &lt;FlexGroup&gt;</th>
<th>Automatically Provision as Volume of Type</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Use this parameter to automatically select existing aggregates for provisioning FlexGroup volumes. Note that the fastest aggregate type with at least one aggregate on each node of the cluster will be selected. When auto provisioning a FlexGroup volume, the size of the FlexGroup volume should be a minimum of 800 GB per node.</td>
</tr>
<tr>
<td></td>
<td>This parameter only applies to FlexGroups.</td>
</tr>
</tbody>
</table>

| -size \{<integer> [KB|MB|GB|TB|PB]\} | Volume Size |
|---------------------------------|-------------|
| This optionally specifies the size of the volume. The size is specified as a number followed by a unit designation: k (kilobytes), m (megabytes), g (gigabytes), or t (terabytes). If the unit designation is not specified, bytes are used as the unit, and the specified number is rounded up to the nearest 4 KB. The minimum size for a FlexVol volume is 20 MB. The minimum size for a FlexGroup volume is 200 MB per constituent. However, the recommended size for a FlexGroup volume is a minimum of 100 GB per constituent. For Infinite Volumes, the minimum size is 1.33 TB per node that will host a data constituent. For all volumes, the default size is set to the platform maximum. If the volume's guarantee is set to volume, the volume's maximum size can also be limited by the available space in the hosting aggregates. Volumes can be increased and decreased in size with the volume modify command. The maximum number of files a volume is configured for is listed under "Total Files" when running the command volume show -instance. |

| -state \{online|restricted|offline|force-online|force-offline|mixed\} | Volume State |
|-------------------------------------------------|-------------|
| This optionally specifies the volume's state. A restricted volume does not provide client access to data but is available for administrative operations. |
| **Note:** The mixed state applies to FlexGroups and Infinite Volumes only and cannot be specified as a target state. |

<table>
<thead>
<tr>
<th>-policy &lt;text&gt;</th>
<th>Export Policy</th>
</tr>
</thead>
<tbody>
<tr>
<td>This optionally specifies the ID number of the export policy associated with the volume. For information on export policies, see the documentation for the vserver export-policy create command. FlexGroups do not support policies that allow NFSv4 protocol access.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>

<table>
<thead>
<tr>
<th>-security-style &lt;security style&gt;</th>
<th>Security Style</th>
</tr>
</thead>
<tbody>
<tr>
<td>This optionally specifies the security style for the volume. Possible values include unix (for UNIX mode bits), ntfs (for CIFS ACLs), mixed (for mixed NFS and CIFS permissions) and unified (for mixed NFS and CIFS permissions with unified ACLs). Regardless of the security style, both NFS and CIFS clients can read from and write to the volume. The unified security style can only be used on Infinite Volumes.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>-unix-permissions &lt;unix perm&gt;</th>
<th>UNIX Permissions</th>
</tr>
</thead>
<tbody>
<tr>
<td>This optionally specifies the default UNIX permissions for files on the volume. Specify UNIX permissions either as a four-digit octal value (for example, 0700) or in the style of the UNIX ls command (for example, -rwxr-x---). For information on UNIX permissions, see the UNIX or Linux documentation. The default setting is 0755 or ---rwxr-xr-x.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>-junction-path &lt;junction path&gt;</th>
<th>Junction Path</th>
</tr>
</thead>
<tbody>
<tr>
<td>This optionally specifies the volume's junction path. The junction path name is case insensitive and must be unique within a Vserver's namespace.</td>
<td></td>
</tr>
</tbody>
</table>
[-junction-active {true|false}] - Junction Active (privilege: advanced)

This optionally specifies whether the volume's junction path is active. The default setting is true. If the junction path is inactive, the volume does not appear in the Vserver's namespace. This parameter is available only at the advanced privilege level and higher.

[-vsroot {true|false}] - Vserver Root Volume (privilege: advanced)

This optionally specifies whether the volume is the root volume of its Vserver. The default setting is false. If this parameter is set to true, the default size of the newly created volume is 1GB. This parameter is not supported on FlexGroups or Infinite Volumes.

[-comment <text>] - Comment

This optionally specifies a comment for the volume.

[-max-autosize {<integer>[KB|MB|GB|TB|PB]}] - Maximum Autosize

This parameter allows the user to specify the maximum size to which a volume can grow. The default for volumes is 120% of the volume size. If the value of this parameter is invalidated by manually resizing the volume, the maximum size is reset to 120% of the volume size. The value for -max-autosize cannot be set larger than the platform-dependent maximum volume size. If you specify a larger value, the value of -max-autosize is automatically reset to the supported maximum without returning an error. This parameter is not supported on Infinite Volumes.

[-min-autosize {<integer>[KB|MB|GB|TB|PB]}] - Minimum Autosize

This parameter specifies the minimum size to which the volume can automatically shrink. If the volume was created with the grow_shrink autosize mode enabled, then the default minimum size is equal to the initial volume size. If the value of the -min-autosize parameter is invalidated by a manual volume resize, the minimum size is reset to the volume size. This parameter is not supported on Infinite Volumes.

[-autosize-grow-threshold-percent <percent>] - Autosize Grow Threshold Percentage

This parameter specifies the used space threshold for the automatic growth of the volume. When the volume’s used space becomes greater than this threshold, the volume will automatically grow unless it has reached the maximum autosize. This parameter is not supported on Infinite Volumes.

[-autosize-shrink-threshold-percent <percent>] - Autosize Shrink Threshold Percentage

This parameter specifies the used space threshold for the automatic shrinking of the volume. When the amount of used space in the volume drops below this threshold, the volume will shrink unless it has reached the specified minimum size. This parameter is not supported on Infinite Volumes.

[-autosize-mode {off|grow|grow_shrink}] - Autosize Mode

This parameter specifies the autosize mode for the volume. The supported autosize modes are:

- off - The volume will not grow or shrink in size in response to the amount of used space.
- grow - The volume will automatically grow when used space in the volume is above the grow threshold.
- grow_shrink - The volume will grow or shrink in size in response to the amount of used space.

By default, -autosize-mode is off for new volumes, except for data protection mirrors, for which the default value is grow_shrink. The grow and grow_shrink modes work together with Snapshot autodelete to automatically reclaim space when a volume is about to become full. The volume parameter -space-mgmt-try-first controls the order in which these two space reclamation policies are attempted. This parameter is not supported on Infinite Volumes.

[-maxdir-size {<integer>[KB|MB|GB|TB|PB]}] - Maximum Directory Size (privilege: advanced)

This optionally specifies the maximum directory size. The default maximum directory size is model-dependent and optimized for the size of system memory.

{ [ -space-slo {none|thick|semi-thick}] } - Space SLO

This optionally specifies the Service Level Objective for space management (the space SLO setting) for the volume. The space SLO value is used to enforce volume settings so that sufficient space is set aside to meet
the space SLO. This parameter is not supported on Infinite Volumes. The default setting is none. There are three supported values: none, thick and semi-thick.

- none: The value of none does not provide any guarantee for overwrites or enforce any restrictions. It should be used if the admin plans to manually manage space consumption in the volume and aggregate, and out of space errors.

- thick: The value of thick guarantees that the hole fills and overwrites to space-reserved files in this volume will always succeed by reserving space. To meet this space SLO, the following volume-level settings are automatically set and cannot be modified:
  - Space Guarantee: volume - The entire size of the volume is preallocated in the aggregate. Changing the volume's space-guarantee type is not supported.
  - Fractional Reserve: 100 - 100% of the space required for overwrites is reserved. Changing the volume's fractional-reserve setting is not supported.

- semi-thick: The value of semi-thick is a best-effort attempt to ensure that overwrites succeed by restricting the use of features that share blocks and auto-deleting backups and Snapshot copies in the volume. To meet this space SLO, the following volume-level settings are automatically set and cannot be modified:
  - Space Guarantee: volume - The entire size of the volume is preallocated in the aggregate. Changing the volume's space-guarantee type is not supported.
  - Fractional Reserve: 0 - No space will be reserved for overwrites by default. However, changing the volume's fractional-reserve setting is supported. Changing the setting to 100 means that 100% of the space required for overwrites is reserved.
  - Snapshot Autodelete: enabled - Automatic deletion of Snapshot copies is enabled to reclaim space. To ensure that the overwrites can be accommodated when the volume reaches threshold capacity, the following volume snapshot autodelete parameters are set automatically to the specified values and cannot be modified:
    - enabled: true
    - commitment: destroy
    - trigger: volume
    - defer-delete: none
    - destroy-list: vol_clone, lun_clone, file_clone, cifs_share

In addition, with a value of semi-thick, the following technologies are not supported for the volume:

- File Clones with autodelete disabled: Only full file clones of files or LUNs that can be autodeleted can be created in the volume. The use of autodelete for file clone create is required.

- Partial File Clones: Only full file clones of files or LUNs that can be autodeleted can be created in the volume. The use of range for file clone create is not supported.

- Volume Efficiency: Enabling volume efficiency is not supported to allow autodeletion of Snapshot copies.

```
[-space-guarantee] -s {none|volume} - Space Guarantee Style
```

This optionally specifies the space guarantee style for the volume. A value of volume reserves space on the aggregates for the entire volume. A value of none reserves no space on the aggregates, meaning that writes can fail if an aggregate runs out of space. Because CIFS does not handle out-of-space conditions, do not use the value none if the volume is accessible to CIFS clients. The default setting for the volumes on All Flash FAS systems is none, otherwise the default setting is volume. The file setting is no longer supported.
[-type {RW|DP}] - Volume Type
This optionally specifies the volume's type, either read-write (RW) or data-protection (DP). If you do not specify a value for this parameter, a RW volume is created by default.

[-percent-snapshot-space <percent>] - Space Reserved for Snapshot Copies
This optionally specifies the amount of space that is reserved in the volume for Snapshot copies. The default setting is 5 percent, except for data protection mirrors for which the default is 0 percent.

[-snapshot-policy <snapshot policy>] - Snapshot Policy
This optionally specifies the Snapshot policy for the volume. The default is the Snapshot policy for all volumes on the Vserver, as specified by the -snapshot-policy parameter of the vserver create and vserver modify commands. The schedules associated with the snapshot-policy for an Infinite Volume cannot have an interval shorter than hourly. The schedules associated with the snapshot-policy for a FlexGroup cannot have an interval shorter than 30 minutes.

[-language <Language code>] - Language
This optionally specifies the language encoding setting for the volume. By default, the volume inherits the Vserver language encoding setting. You cannot specify the language encoding setting for an Infinite Volume.

Note: You cannot modify the language encoding setting of a volume.

[-foreground {true|false}] - Foreground Process
This specifies whether the operation runs in the foreground. The default setting is true (the operation runs in the foreground). When set to true, the command will not return until the operation completes. This parameter applies only to FlexGroups and Infinite Volumes. For FlexVol volumes, the command always runs in the foreground.

[-nvfail {on|off}] - NVFAIL Option
Setting this optional parameter to true causes the volume to set the in-nvfailed-state flag to true, if committed writes to the volume are lost due to a failure. The in-nvfailed-state flag fences the volume from further data access and prevents possible corruption of the application data. Without specifying a value, this parameter is automatically set to false.

[-storage-service <storage service name>] - Storage Service Name (privilege: advanced)
The name of the initial storage service for the Infinite Volume. This is required if the parameter -is-managed-by-service is set to true. This parameter applies to Infinite Volumes only.

[-enable-snapdiff {true|false}] - Create Namespace Mirror Constituents For SnapDiff Use
When set to true for an Infinite Volume that spans three or more nodes, namespace mirror constituents are created for SnapDiff use. One namespace mirror constituent is created on every node that contains a data constituent for the Infinite Volume. A namespace constituent is not created on nodes that contain either the namespace constituent or a namespace mirror constituent used for data protection of the namespace constituent. An automatic daily replication schedule is set up for every namespace mirror constituent created. The default setting is false. This parameter applies to Infinite Volumes only.

[-unreachable-attr-action {return-generated|wait}] - Action When Attributes Are Not Reachable (privilege: advanced)
This parameter specifies the information that an Infinite Volume returns when a client lists a directory that contains one or more files with inaccessible attributes, which can happen when a data constituent is not online. When this parameter is set to return-generated, the Infinite Volume returns default values for the attributes, which appear to the client as a file size of 0 and timestamps that are in the past. When this parameter is set to wait, the Infinite Volume returns a RETRY error, which may cause some clients to hang. When the inaccessible file attributes become available, the Infinite Volume returns them to the client. The default setting is return-generated. This parameter applies to Infinite Volumes only.
[[-namespace-aggregate <aggregate name>]] - Namespace Aggregate (privilege: advanced)

The name of the aggregate in which to create the Infinite Volume namespace constituent. If a name is not provided, Data ONTAP picks the aggregate assigned to the Vserver that has the most usable space. This parameter applies to Infinite Volumes only.

[[-max-namespace-constituent-size {<integer>[KB|MB|GB|TB|PB]}]] - Maximum Size of Namespace Constituent (privilege: advanced)

The maximum size of the namespace constituent. The default value is 10TB. This parameter applies to Infinite Volumes only.

[[-ns-mirror-aggr-list <aggregate name>, ...]] - List of Aggregates for Namespace Mirrors (privilege: advanced)

Specifies the aggregates that can be used to create Infinite Volume namespace mirror constituents. No other aggregate will be chosen for this purpose. Aggregates in this list will remain available for other uses in the Infinite Volume. This parameter applies to Infinite Volumes only.

[[-data-aggr-list <aggregate name>, ...]] - List of Aggregates for Data Constituents (privilege: advanced)

Specifies the aggregates that can be used to create Infinite Volume data constituents. No other aggregate will be chosen for this purpose. Aggregates in this list will remain available for other uses in the Infinite Volume. This parameter applies to Infinite Volumes only.

[[-max-data-constituent-size {<integer>[KB|MB|GB|TB|PB]}]] - Maximum Size of Each Data Constituent (privilege: advanced)

This optionally specifies the maximum size of an Infinite Volume data constituent. The default value is determined by checking the maximum FlexVol size setting on all nodes used by the Infinite Volume. The smallest value found is selected as the default for the max-data-constituent-size for the Infinite Volume. This parameter applies to Infinite Volumes only.

[[-qos-policy-group <text>]] - QoS Policy Group Name

This optional parameter specifies which QoS policy group to apply to the volume. This policy group defines measurable service level objectives (SLOs) that do not adjust based on the volume allocated space or used space. If you do not assign a policy group to a volume, the system will not monitor and control the traffic to it. This parameter is not supported on Infinite Volumes.

[[-qos-adaptive-policy-group <text>]] - QoS Adaptive Policy Group Name

This optional parameter specifies which QoS adaptive policy group to apply to the volume. This policy group defines measurable service level objectives (SLOs) and Service Level Agreements (SLAs) that adjust based on the volume allocated space or used space. This parameter is not supported on FlexGroups or Infinite Volumes.

[[-caching-policy <text>]] - Caching Policy Name

This optionally specifies the caching policy to apply to the volume. A caching policy defines how the system caches this volume's data in a Flash Pool aggregate or Flash Cache modules. If a caching policy is not assigned to this volume, the system uses auto as the default caching policy. This parameter is not supported on Infinite Volumes.

Both metadata and user data are eligible for caching. Metadata consists of directories, indirect blocks and system metafiles. They are eligible for read caching only. When a random write pattern is detected on user data, the first such write is eligible for read caching while all subsequent overwrites are eligible for write caching. The available caching policies are:

- none - Does not cache any user data or metadata blocks.
- auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
- meta - Read caches only metadata blocks.
- random_read - Read caches all metadata and randomly read user data blocks.
- random_read_write - Read caches all metadata, randomly read and randomly written user data blocks.
- **all_read** - Read caches all metadata, randomly read and sequentially read user data blocks.
- **all_read_random_write** - Read caches all metadata, randomly read, sequentially read and randomly written user data.
- **all** - Read caches all data blocks read and written. It does not do any write caching.
- **noread-random_write** - Write caches all randomly overwritten user data blocks. It does not do any read caching.
- **meta-random_write** - Read caches all metadata and write caches randomly overwritten user data blocks.
- **random_read_write-random_write** - Read caches all metadata, randomly read and randomly written user data blocks. It also write caches randomly overwritten user data blocks.
- **all_read-random_write** - Read caches all metadata, randomly read and sequentially read user data blocks. It also write caches randomly overwritten user data blocks.
- **all_read_random_write-random_write** - Read caches all metadata, randomly read, sequentially read and randomly written user data. It also write caches randomly overwritten user data blocks.
- **all-random_write** - Read caches all data blocks read and written. It also write caches randomly overwritten user data blocks.

Note that in a caching-policy name, a hyphen (-) separates read and write policies. Default caching-policy is auto.

```markdown
[-cache-retention-priority {normal|low|high}] - Cache Retention Priority (privilege: advanced)
```

This optionally specifies the cache retention priority to apply to the volume. A cache retention priority defines how long the blocks of a volume will be cached in flash pool once they become cold. If a cache retention priority is not assigned to this volume, the system uses the default policy. This parameter is available only at the advanced privilege level and higher. This parameter is not supported on Infinite Volumes.

The available cache retention priority are:

- **low** - Cache the cold blocks for the lowest time.
- **normal** - Cache the cold blocks for the default time.
- **high** - Cache the cold blocks for the highest time.

```markdown
[-is-autobalance-eligible {true|false}] - Is Eligible for Auto Balance Aggregate (privilege: advanced)
```

If the Auto Balance feature is enabled, this parameter specifies whether the volume might be considered for system workload balancing. When set to `true`, the Auto Balance Aggregate feature might recommend moving this volume to another aggregate. The default value is `true`.

```markdown
[-max-constituent-size {<integer>|KB|MB|GB|TB|PB}] - Maximum size of a FlexGroup Constituent (privilege: advanced)
```

This optionally specifies the maximum size of a FlexGroup constituent. The default value is determined by checking the maximum FlexVol size setting on all nodes used by the FlexGroup. The smallest value found is selected as the default for the `-max-constituent-size` for the FlexGroup. This parameter applies to FlexGroups only.

```markdown
[-efficiency-policy <efficiency policy>] - Storage Efficiency Policy (privilege: advanced)
```

This optionally specifies which storage efficiency policy to apply to the volume. This parameter is applicable only for All-Flash FAS. This parameter is not supported on Infinite Volumes or data protection volumes on any platform. To disable compression on the volume in All-Flash FAS, use the value `none`. The default value is `inline-only`.
[-vserver-dr-protection {protected|unprotected}] - Vserver DR Protection

This optionally specifies whether the volume should be protected by Vserver level SnapMirror. This parameter is applicable only if the Vserver is the source of a Vserver level SnapMirror relationship. The default value for a volume of type “RW” is protected. This parameter is not supported on Infinite Volumes.

[-encrypt [true]] - Enable Encryption

This parameter allows the user to create an encrypted volume. When it is set to true, a new key is generated, and the volume will be encrypted using the generated key. By default, volume created is not encrypted.

[-tiering-policy {snapshot-only|none|backup}] - Volume Tiering Policy

This optional parameter specifies the tiering policy to apply to the volume. This policy determines whether the user data blocks of a volume in a FabricPool will be tiered to the capacity tier when they become cold. FabricPool combines flash (performance tier) with an object store (external capacity tier) into a single aggregate. If a tiering policy is not assigned to this volume, then 'snapshot-only' is assigned as the default policy. Temperature of a volume block increases if it is accessed frequently and decreases when it is not.

The available tiering policies are:

- snapshot-only - This policy allows tiering of only the volume Snapshot copies not associated with the active file system.
- none - Volume blocks will not be tiered to the capacity tier.
- backup - On DP volumes this policy allows all transferred user data blocks to start in the capacity tier.

### Examples

Specifies the number of times to iterate over the aggregates listed with the -aggr-list parameter when creating a FlexGroup. The aggregate list will be repeated the specified number of times. Example:

```
-aggr-list aggr1,aggr2 -aggr-list-multiplier 2
```

The following example creates a new volume named user_jdoe on a Vserver named vs0 and a storage aggregate named aggr1. Upon its creation, the volume is placed in the online state. It uses the export policy named default_expolicy. The owner of the volume's root is a user named jdoe whose primary group is named dev. The volume's junction path is /user/jdoe. The volume is 250 GB in size, space for the entire volume is reserved on the aggregate, and the create operation runs in the background.

```
cluster1::> volume create -vserver vs0 -volume user_jdoe -aggregate aggr1
-state online -policy default_expolicy -user jdoe -group dev
-junction-path /user/jdoe -size 250g -space-guarantee volume
-percent-snapshot-space 20 -foreground false
```

The following example creates a new volume named vol_cached on a Vserver named vs0 and a Flash Pool storage aggregate named aggr1. The newly created volume is placed online and uses auto as the caching policy.

```
cluster1::> volume create -vserver vs0 -volume vol_cached -aggregate aggr1
-state online -caching-policy auto
```

The following example creates a new FlexGroup named media_vol on a Vserver named vs0 with four constituents on aggregates aggr1 and aggr2. Upon its creation, the volume is placed in the online state. The volume’s junction path is /media. The volume is 200 TB in size, no space for the volume is reserved on the aggregates, and the create operation runs in the background.

```
cluster1::> volume create
```
cluster1::> volume create -vserver vs0 -volume media_vol
   -aggr-list aggr1,aggr1,aggr2,aggr2 -junction-path /media -size 200TB
   -space-guarantee none -foreground false

The following example creates a new FlexGroup volume named fg on a Vserver named vs0 on aggregates selected by Data ONTAP.

cluster1::> volume create -vserver vs0 -volume fg -auto-provision-as flexgroup

volume delete
Delete an existing volume

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The volume delete command deletes the specified volumes. Before deleting a volume, the user is prompted to confirm the operation unless the -force flag is specified. If this volume was associated with a policy group the underlying qos workload is deleted.

Note:
• If there is a qtree or quota policy associated with a volume, it is deleted when you delete the volume.
• A volume must be offline (see volume offline) to be deleted.

Parameters
-vserver <vserver name> - Vserver Name
This specifies the name of the Vserver from which the volume is to be deleted. If only one data Vserver exists, you do not need to specify this parameter.

-volume <volume name> - Volume Name
This specifies the name of the volume that is to be deleted.

[-force [true]] - Force Delete (privilege: advanced)
If this parameter is specified, the user is not prompted to confirm each deletion operation. In addition, the operation is run only on the local node, and several potential errors are ignored. By default, this setting is false. This parameter is available only at the advanced privilege level and higher.

[-foreground [true|false]] - Foreground Process
This specifies whether the operation runs in the foreground. The default setting is true (the operation runs in the foreground). When set to true, the command will not return until the operation completes.
Examples
The following example deletes a volume named vol1_old from a Vserver named vs0:

```bash
cluster1::> volume delete -vserver vs0 -volume vol1_old
```

volume offline on page 1386

volume expand

Expand the size of a volume by adding constituents

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The volume expand command allows the user to increase the size of a FlexGroup by adding constituents. The size of the new constituents is determined by the size of the smallest existing constituent. This command only applies to FlexGroups.

Parameters

- `vserver <vserver name>` - Vserver Name
  This parameter can be used to specify the Vserver on which the volume is located.

- `volume <volume name>` - Volume Name
  This parameter specifies the volume for which the user wants to expand.

- `aggr-list <aggregate name>, ...` - List of Aggregates for FlexGroup Constituents
  Specifies an array of names of aggregates to be used for new FlexGroup constituents. Each entry in the list will create a constituent on the specified aggregate. An aggregate may be specified multiple times to have multiple constituents created on it.

- `[-aggr-list-multiplier <integer>]` - Aggregate List Repeat Count
  Specifies the number of times to iterate over the aggregates listed with the `aggr-list` parameter when expanding a FlexGroup. The aggregate list will be repeated the specified number of times. Example:

  ```bash
  -aggr-list aggr1,aggr2 -aggr-list-multiplier 2
  ```

  will cause four constituents to be created in the order `aggr1, aggr2, aggr1, aggr2`. The default value is 1.

- `[-foreground {true|false}]` - Foreground Process
  If false is specified for this parameter, the command runs as a job in the background. If true is specified, the command will not return until the operation is complete. The default value is true.

Examples

Specifies the number of times to iterate over the aggregates listed with the `aggr-list` parameter when expanding a FlexGroup. The aggregate list will be repeated the specified number of times. Example:

```bash
-aggr-list aggr1,aggr2 -aggr-list-multiplier 2
```

The following example increases the size of a FlexGroup by adding 3 constituents:
volume make-vsroot

Designate a non-root volume as a root volume of the Vserver

**Availability:** This command is available to cluster administrators at the **advanced** privilege level.

**Description**

The `volume make-vsroot` command promotes a non-root volume of the Vserver to be the Vserver's root volume. The Vserver's root volume must be a FlexVol volume with a size of at least 1 GB.

For instance, if you run this command on a volume named `user` that is located on a Vserver named `vs0`, the volume `user` is made the root volume of the Vserver `vs0`.

If you run this command on a Vserver with Infinite Volume, you must create a new root volume. You cannot promote an existing non-root volume to be the root volume of the Vserver with Infinite Volume. When the command executes, the new root volume is created on the aggregate specified by the `aggregate` parameter, and the old root volume is deleted.

This command is available only at the advanced privilege level and higher.
Parameters

- `vserver <vserver name>` - Vserver Name
  This specifies the Vserver on which a non-root volume is to be made the root volume.

- `volume <volume name>` - Volume Name
  This specifies the non-root volume that is to be made the root volume of its Vserver. For Vservers with FlexVol volume this must be an existing FlexVol volume. For Vservers with Infinite Volume this must be a non-existent volume that will be created during the execution of the command. Using a SnapLock volume as the root volume for a Vserver is not supported.

- `aggregate <aggregate name>` - Aggregate Name
  This specifies the aggregate that the new root volume will be created on for Vservers with Infinite Volume. This parameter is not supported for Vservers with FlexVol volumes.

Examples

The following example makes a volume named `root_vs0_backup` the root volume of its Vserver with FlexVol volumes, which is named `vs0`.

```
node::> volume make-vsroot -vserver vs0 -volume root_vs0_backup
```

The following example makes a volume named `root_vs1` the root volume of the Vserver with Infinite Volume `vs1`.

```
node::> volume make-vsroot -vserver vs1 -volume root_vs1 -aggregate aggr1
```

volume modify

Modify volume attributes

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The `volume modify` command can be used to modify the following attributes of a volume:

- Size
- State (online, offline, restricted, force-online or force-offline)
- Export policy
- User ID
- Group ID
- Security style (All volume types: UNIX mode bits, CIFS ACLs, or mixed NFS and CIFS permissions. Only Infinite Volumes can use unified.)
- Default UNIX permissions for files on the volume
- Whether the junction path is active
- Comment
- Volume nearly full threshold percent
- Volume full threshold percent
- Maximum size for autosizing
• Minimum size for autosize
• Grow used space threshold percentage for autosize
• Shrink used space threshold percentage for autosize
• Whether autosizing is enabled
• Current mode of operation of volume autosize
• Reset the autosize values to their defaults
• Total number of files for user-visible data permitted on the volume
• Space guarantee style (none or volume)
• Space SLO type (none, thick or semi-thick)
• Snapshot policy
• Convert ucode
• Caching policy
• Cache retention priority

You can use the `volume move` command to change a volume's aggregate or node. You can use the `volume rename` command to change a volume's name. You can use the `volume make-vsroot` command to make a volume the root volume of its Vserver.

You can change additional volume attributes by using this command at the advanced privilege level and higher.

**Parameters**

`-vserver <vserver name>` - Vserver Name

This specifies the Vserver on which the volume is located. If only one data Vserver exists, you do not need to specify this parameter. Although node Vservers are not displayed when using <Tab> completion, this parameter supports node Vservers for modifying the root volume of the specified node Vserver.

`-volume <volume name>` - Volume Name

This specifies the volume that is to be modified.

`[-size <integer [KB|MB|GB|TB|PB]]` - Volume Size

This optionally specifies the new size of the volume. The size is specified as a number followed by a unit designation: k (kilobytes), m (megabytes), g (gigabytes), or t (terabytes). If the unit designation is not specified, bytes are used as the unit, and the specified number is rounded up to the nearest 4 KB. A relative rather than absolute size change can be specified by adding + or - before the given size: for example, specifying +30m adds 30 megabytes to the volume's current size. The minimum size for a volume is 20 MB (the default setting). The volume's maximum size is limited by the platform maximum. If the volume's guarantee is set to `volume`, the volume's maximum size can also be limited by the available space in the hosting aggregate. If the volume's guarantee is currently disabled, its size cannot be increased. This parameter is not supported on Infinite Volumes that are managed by storage services.

`[-state {online|restricted|offline|force-online|force-offline|mixed}]` - Volume State

This optionally specifies the volume's state. A restricted volume does not provide client access to data but is available for administrative operations.

**Note:** The `mixed` state applies to Infinite Volumes only and cannot be specified as a target state.
[-policy <text>] - Export Policy
This optionally specifies the ID number of the export policy associated with the volume. For information on export policy, see the documentation for the `vserver export-policy create` command. FlexGroups do not support export policies that allow NFSv4 protocol access.

[-user <user name>] - User ID
This optionally specifies the name or ID of the user that is set as the owner of the volume's root.

[-group <group name>] - Group ID
This optionally specifies the name or ID of the group that is set as the owner of the volume's root.

[-security-style <security style>] - Security Style
This optionally specifies the security style for the volume. Possible values include `unix` (for UNIX mode bits), `ntfs` (for CIFS ACLs), `mixed` (for mixed NFS and CIFS permissions) and `unified` (for mixed NFS and CIFS permissions with unified ACLs). Regardless of the security style, both NFS and CIFS clients can read from and write to the volume. The `unified` security style can only be used on Infinite Volumes.

[-unix-permissions <unix perm>] - UNIX Permissions
This optionally specifies the default UNIX permissions for files on the volume. Specify UNIX permissions either as a four-digit octal value (for example, 0700) or in the style of the UNIX `ls` command (for example, `-rwxr-x---`). For information on UNIX permissions, see the UNIX or Linux documentation. The default setting is 0755 or `-rwxr-xr-x`.

[-junction-active {true|false}] - Junction Active (privilege: advanced)
This optionally specifies whether the volume's junction path is active. The default setting is `true`. If the junction is inactive, the volume does not appear in the Vserver's namespace.

[-comment <text>] - Comment
This optionally specifies a comment for the volume.

[-space-nearly-full-threshold-percent <percent>] - Volume Nearly Full Threshold Percent
This optionally specifies the percentage at which the volume is considered nearly full, and above which an EMS warning will be generated. This parameter is not supported on Infinite Volumes. The default value is 95%. The maximum value for this option is 99%. Setting this threshold to 0 disables the volume nearly full space alerts.

[-space-full-threshold-percent <percent>] - Volume Full Threshold Percent
This optionally specifies the percentage at which the volume is considered full, and above which a critical EMS error will be generated. This parameter is not supported on Infinite Volumes. The default value is 98%. The maximum value for this option is 100%. Setting this threshold to 0 disables the volume full space alerts.

{ [-max-autosize <integer>[KB|MB|GB|TB|PB]] - Maximum Autosize
This parameter allows the user to specify the maximum size to which a volume can grow. The default for volumes is 120% of the volume size. If the value of this parameter is invalidated by manually resizing the volume, the maximum size is reset to 120% of the volume size. The value for -max-autosize cannot be set larger than the platform-dependent maximum volume size. If you specify a larger value, the value of -max-autosize is automatically reset to the supported maximum without returning an error. This parameter is not supported on Infinite Volumes.

[-min-autosize <integer>[KB|MB|GB|TB|PB]] - Minimum Autosize
This parameter specifies the minimum size to which the volume can automatically shrink. If the volume was created with the `grow_shrink autosize` mode enabled, then the default minimum size is equal to the initial volume size. If the value of the -min-autosize parameter is invalidated by a manual volume resize, the minimum size is reset to the volume size. This parameter is not supported on Infinite Volumes.
[[-autosize-grow-threshold-percent <percent>]] - Autosize Grow Threshold Percentage

This parameter specifies the used space threshold for the automatic growth of the volume. When the volume’s used space becomes greater than this threshold, the volume will automatically grow unless it has reached the maximum autosize. This parameter is not supported on Infinite Volumes.

[[-autosize-shrink-threshold-percent <percent>]] - Autosize Shrink Threshold Percentage

This parameter specifies the used space threshold for the automatic shrinking of the volume. When the amount of used space in the volume drops below this threshold, the volume will shrink unless it has reached the specified minimum size. This parameter is not supported on Infinite Volumes.

[[-autosize-mode {off|grow|grow_shrink}]] - Autosize Mode

This parameter specifies the autosize mode for the volume. The supported autosize modes are:

- **off**: The volume will not grow or shrink in size in response to the amount of used space.
- **grow**: The volume will automatically grow when used space in the volume is above the grow threshold.
- **grow_shrink**: The volume will grow or shrink in size in response to the amount of used space.

By default, **-autosize-mode** is **off** for new volumes, except for DP mirrors, for which the default value is **grow_shrink**. The **grow** and **grow_shrink** modes work together with Snapshot autodelete to automatically reclaim space when a volume is about to become full. The volume parameter **-space-mgmt-try-first** controls the order in which these two space reclamation policies are attempted. This parameter is not supported on Infinite Volumes.

[[-autosize-reset [true]]] - Autosize Reset

This allows the user to reset the values of autosize, max-autosize, min-autosize, autosize-grow-threshold-percent, autosize-shrink-threshold-percent and autosize-mode to their default values. For example, the max-autosize value will be set to 120% of the current size of the volume. This parameter is not supported on Infinite Volumes.

[-files <integer>] - Total Files (for user-visible data)

This optionally specifies the total number of files for user-visible data permitted on the volume. This value can be raised or lowered. Raising the total number of files does not immediately cause additional disk space to be used to track files. Instead, as more files are created on the volume, the system dynamically increases the number of disk blocks that are used to track files. The space assigned to track files is never freed, and the **files** value cannot be decreased below the current number of files that can be tracked within the assigned space for the volume.

[-maxdir-size <integer> [KB|MB|GB|TB|PB]] - Maximum Directory Size (privilege: advanced)

This optionally specifies the maximum directory size. The default maximum directory size is model-dependent, and optimized for the size of system memory. You can increase it for a specific volume by using this option, but doing so could impact system performance. If you need to increase the maximum directory size, work with customer support. This parameter is not supported on Infinite Volumes.

{ [-space-slo {none|thick|semi-thick}] } - Space SLO

This optionally specifies the Service Level Objective for space management (the space SLO setting) for the volume. The space SLO value is used to enforce volume settings so that sufficient space is set aside to meet the space SLO. This parameter is not supported on Infinite Volumes. The default setting is **none**. There are three supported values: **none**, **thick** and **semi-thick**.

- **none**: The value of **none** does not provide any guarantee for overwrites or enforce any restrictions. It should be used if the admin plans to manually manage space consumption in the volume and aggregate, and out of space errors.

- **thick**: The value of **thick** guarantees that the hole fills and overwrites to space-reserved files in this volume will always succeed by reserving space. To meet this space SLO, the following volume-level settings are automatically set and cannot be modified:
Space Guarantee: volume - The entire size of the volume is preallocated in the aggregate. Changing the volume's space-guarantee type is not supported.

Fractional Reserve: 100 - 100% of the space required for overwrites is reserved. Changing the volume's fractional-reserve setting is not supported.

semi-thick: The value of semi-thick is a best-effort attempt to ensure that overwrites succeed by restricting the use of features that share blocks and auto-deleting backups and Snapshot copies in the volume. To meet this space SLO, the following volume-level settings are automatically set and cannot be modified:

- Space Guarantee: volume - The entire size of the volume is preallocated in the aggregate. Changing the volume's space-guarantee type is not supported.
- Fractional Reserve: 0 - No space will be reserved for overwrites by default. However, changing the volume's fractional-reserve setting is supported. Changing the setting to 100 means that 100% of the space required for overwrites is reserved.
- Snapshot Autodelete: enabled - Automatic deletion of Snapshot copies is enabled to reclaim space. To ensure that the overwrites can be accommodated when the volume reaches threshold capacity, the following volume snapshot autodelete parameters are set automatically to the specified values and cannot be modified:
  - enabled: true
  - commitment: destroy
  - trigger: volume
  - defer-delete: none
  - destroy-list: vol_clone, lun_clone, file_clone, cifs_share

In addition, with a value of semi-thick, the following technologies are not supported for the volume:

- File Clones with autodelete disabled: Only full file clones of files or LUNs that can be autodeleted can be created in the volume. The use of autodelete for file clone create is required.
- Partial File Clones: Only full file clones of files or LUNs that can be autodeleted can be created in the volume. The use of range for file clone create is not supported.
- Volume Efficiency: Enabling volume efficiency is not supported to allow autodeletion of Snapshot copies.

[-space-guarantee | -s {none|volume}] - Space Guarantee Style

This option controls whether the volume is guaranteed some amount of space in the aggregate. The default setting for the volumes on All Flash FAS systems is none, otherwise the default setting is volume. The file setting is no longer supported. Volume guaranteed means that the entire size of the volume is preallocated. The none value means that no space is preallocated, even if the volume contains space-reserved files or LUNs; if the aggregate is full, space is not available even for space-reserved files and LUNs within the volume. Setting this parameter to none enables you to provision more storage than is physically present in the aggregate (thin provisioning). When you use thin provisioning for a volume, it can run out of space even if it has not yet consumed its nominal size and you should carefully monitor space utilization to avoid unexpected errors due to the volume running out of space. For flexible root volumes, to ensure that system files, log files, and cores can be saved, the space-guarantee must be volume. This is to ensure support of the appliance by customer support, if a problem occurs. Disk space is preallocated when the volume is brought online and, if not used, returned to the aggregate when the volume is brought offline. It is possible to bring a volume online even when the aggregate has insufficient free space to preallocate to the volume. In this case, no space is preallocated, just as if the none option had been selected. In this situation, the vol options and vol status command display the
actual value of the space-guarantee option, but indicate that it is disabled. This parameter is not supported on FlexGroups or Infinite Volumes that are managed by storage services.

\[-\text{fractional-reserve} \langle \text{percent} \rangle \}\] - Fractional Reserve

This option changes the amount of space reserved for overwrites of reserved objects (LUNs, files) in a volume. This parameter is not supported on Infinite Volumes. The option is set to 100 by default with guarantee set to volume. A setting of 100 means that 100% of the required reserved space is actually reserved so the objects are fully protected for overwrites. The value is set to 0 by default with guarantee set to none. The value can be either 0 or 100 when guarantee is set to volume or none. Using a value of 0 indicates that no space will be reserved for overwrites. This returns the extra space to the available space for the volume, decreasing the total amount of space used. However, this does leave the protected objects in the volume vulnerable to out of space errors. If the percentage is set to 0%, the administrator must monitor the space usage on the volume and take corrective action.

\[-\text{min-readahead} \langle \text{true} | \text{false} \rangle \}\] - Minimum Read Ahead (privilege: advanced)

This optionally specifies whether minimum readahead is used on the volume. The default setting is false.

\[-\text{atime-update} \langle \text{true} | \text{false} \rangle \]\ - Access Time Update Enabled (privilege: advanced)

This optionally specifies whether the access time on inodes is updated when a file is read. The default setting is true.

\[-\text{snapdir-access} \langle \text{true} | \text{false} \rangle \]\ - Snapshot Directory Access Enabled

This optionally specifies whether clients have access to .snapshot directories. The default setting is true.

\[-\text{percent-snapshot-space} \langle \text{percent} \rangle \]\ - Space Reserved for Snapshot Copies

This optionally specifies the amount of space that is reserved on the volume for Snapshot copies. The default setting is 5 percent.

\[-\text{snapshot-policy} \langle \text{snapshot policy} \rangle \]\ - Snapshot Policy

This optionally specifies the Snapshot policy for the volume. The default is the Snapshot policy for all volumes on the Vserver, as specified by the -snapshot-policy parameter of the vserver create and vserver modify commands. The schedules associated with the snapshot-policy for an Infinite Volume cannot have an interval shorter than hourly. When replacing a snapshot-policy on a volume, any existing Snapshot copies on the volume that do not match any of the prefixes of the new snapshot-policy will not be deleted. This is because the Snapshot scheduler will not clean up older Snapshot copies if the prefixes do not match. Once the new snapshot-policy takes effect, depending on the new retention count, any existing Snapshot copies that continue to use the same prefixes may be deleted. For example, if your existing snapshot-policy is setup to retain 150 weekly snapshot copies and you create a new snapshot-policy that uses the same prefixes but changes the retention count to 50 snapshot copies. Once the new snapshot-policy takes effect it will start deleting older snapshot copies until there are only 50 remaining.

\[-\text{foreground} \langle \text{true} | \text{false} \rangle \]\ - Foreground Process

This specifies whether the operation runs in the foreground. The default setting is true (the operation runs in the foreground). When set to true, the command will not return until the operation completes. This parameter applies only to Infinite Volumes. For FlexVol volumes, the command always runs in the foreground.

\[-\text{nvfail} \langle \text{on} | \text{off} \rangle \]\ - NVFAIL Option

Setting this optional parameter to true causes the volume to set the in-nvfailed-state flag to true, if committed writes to the volume are lost due to a failure. The in-nvfailed-state flag fences the volume from further data access and prevents possible corruption of the application data. Without specifying a value, this parameter is automatically set to false.

\[-\text{in-nvfailed-state} \langle \text{true} | \text{false} \rangle \]\ - Volume's NVFAIL State (privilege: advanced)

This field is automatically set to true on a volume when committed writes to the volume are possibly lost due to a failure, and the volume has the nvfail option enabled. With this field set, the client access to the volume is fenced to protect against possible corruptions that result from accessing stale data. The administrator needs to take appropriate recovery actions to recover the volume from the possible data loss. After the recovery is
completed, the administrator can clear this field and restore the client access to the volume. This field can be cleared using the CLI but it cannot be set.

```
[-dr-force-nvfail {on|off}] - Force NVFAIL on MetroCluster Switchover
```

Setting this optional parameter to true on a volume causes the MetroCluster switchover operation to set the in-nvfailed-state flag to true on that volume. The in-nvfailed-state flag prevents further data access to the volume. The default value is false. This parameter has no effect on a negotiated or an automatic switchover, and is not supported on FlexGroups or Infinite Volumes.

```
[-filesys-size-fixed {true|false}] - Is File System Size Fixed
```

This option causes the file system to remain the same size and not grow or shrink when a SnapMirrored volume relationship is broken, or when a volume add is performed on it. It is automatically set to true when a volume becomes a SnapMirrored volume. It stays set to true after the snapmirror break command is issued for the volume. This allows a volume to be SnapMirrored back to the source without needing to add disks to the source volume. If the volume is a traditional volume and the size is larger than the file system size, setting this option to false forces the file system to grow to the size of the volume. If the volume is a flexible volume and the volume size is larger than the file system size, setting this option to false forces the volume size to equal the file system size. The default setting is false.

```
[-extent-enabled {off|on|space-optimized}] - (DEPRECATED)-Extent Option
```

Note: This parameter has been deprecated and may be removed in a future release of Data ONTAP.

Setting this option to on or space-optimized enables extents in the volume. This causes application writes to be written in the volume as a write of a larger group of related data blocks called an extent. Using extents may help workloads that perform many small random writes followed by large sequential reads. However, using extents may increase the amount of disk operations performed on the controller, so this option should only be used where this trade-off is desired. If the option is set to space-optimized then the reallocation update will not duplicate blocks from Snapshot copies into the active file system, and will result in conservative space utilization. Using space-optimized may be useful when the volume has Snapshot copies or is a SnapMirror source, when it can reduce the storage used in the volume and the amount of data that SnapMirror needs to move on the next update. The space-optimized value can result in degraded read performance of Snapshot copies. The default value is off; extents are not used.

```
[-space-mgmt-try-first {volume_grow|snap_delete}] - Primary Space Management Strategy
```

A flexible volume can be configured to automatically reclaim space in case the volume is about to run out of space, by either increasing the size of the volume using autogrow or deleting Snapshot copies in the volume using Snapshot autodelete. If this option is set to volume_grow the system will try to first increase the size of volume before deleting Snapshot copies to reclaim space. If the option is set to snap_delete the system will first automatically delete Snapshot copies and in case of failure to reclaim space will try to grow the volume. This parameter is not supported on Infinite Volumes.

```
[-read-realloc {off|on|space-optimized}] - Read Reallocation Option
```

Setting this option to on or space-optimized enables read reallocation in the volume. This results in the optimization of file layout by writing some blocks to a new location on disk. The layout is updated only after the blocks have been read because of a user read operation, and only when updating their layout will provide better read performance in the future. Using read reallocation may help workloads that perform a mixture of random writes and large sequential reads. If the option is set to space-optimized then the reallocation update will not duplicate blocks from Snapshot copies into the active file system, and will result in conservative space utilization. Using space-optimized may be useful when the volume has Snapshot copies or is a SnapMirror source, when it can reduce the storage used in the volume and the amount of data that snapmirror needs to move on the next update. The space-optimized value can result in degraded read performance of Snapshot copies. The default value is off.

```
[-sched-snap-name {create-time|ordinal}] - Naming Scheme for Automatic Snapshot Copies
```

This option specifies the naming convention for automatic Snapshot copies. If set to create-time, automatic Snapshot copies are named using the format `<schedule_name>._yyyy-mm-dd_hhmm`. Example: "hourly. 2010-04-01_0831". If set to ordinal, only the latest automatic Snapshot copy is named using the format
<schedule_name>.<n>. Example: "hourly.0". Older automatic Snapshot copies are named using the format <schedule_name>.yyyy-mm-dd_hhmm. Example: "hourly.2010-04-01_0831".

[-storage-service <storage service name>] - Storage Service Name (privilege: advanced)

The name of the storage service for the Infinite Volume. This parameter applies to Infinite Volumes only.

[-enable-snapdiff {true|false}] - Create Namespace Mirror Constituents For SnapDiff Use

When set to true for an Infinite Volume that spans three or more nodes, namespace mirror constituents are created for SnapDiff use. One namespace mirror constituent is created on every node that contains a data constituent for the Infinite Volume. A namespace mirror constituent is not created on nodes that contain either the namespace constituent or a namespace mirror constituent used for data protection of the namespace constituent. An automatic daily replication schedule is set up for every namespace mirror constituent created. If set to false, all existing namespace mirror constituents used by SnapDiff are deleted. The namespace mirror constituent used for namespace data protection is not affected. This parameter applies to Infinite Volumes only.

[-unreachable-attr-action {return-generated|wait}] - Action When Attributes Are Not Reachable (privilege: advanced)

This parameter specifies the information that an Infinite Volume returns when a client lists a directory that contains one or more files with inaccessible attributes, which can happen when a data constituent is not online. When this parameter is set to return-generated, the Infinite Volume returns default values for the attributes, which appear to the client as a file size of 0 and timestamps that are in the past. When this parameter is set to wait, the Infinite Volume returns a RETRY error, which may cause some clients to hang. When the inaccessible file attributes become available, the Infinite Volume returns them to the client. The default setting is return-generated. This parameter applies to Infinite Volumes only.

[-namespace-aggregate <aggregate name>] - Namespace Aggregate (privilege: advanced)

The name of the aggregate in which to create the Infinite Volume namespace constituent. If a name is not provided, Data ONTAP picks the aggregate assigned to the Vserver that has the most usable space. This parameter can only be specified for DP Infinite Volumes that do not have an existing namespace constituent. This parameter applies to Infinite Volumes only.

[-max-namespace-constituent-size {<integer>[KB|MB|GB|TB|PB]}] - Maximum Size of Namespace Constituent (privilege: advanced)

The maximum size of the namespace constituent. The default value is 10TB. This parameter applies to Infinite Volumes only.

[-ns-mirror-aggr-list <aggregate name>, ...] - List of Aggregates for Namespace Mirrors (privilege: advanced)

Specifies the aggregates that can be used to create Infinite Volume namespace mirror constituents. No other aggregate will be chosen for this purpose. Aggregates in this list will remain available for other uses in the Infinite Volume. This parameter applies to Infinite Volumes only.

[-max-data-constituent-size {<integer>[KB|MB|GB|TB|PB]}] - Maximum Size of Each Data Constituent (privilege: advanced)

This parameter specifies the maximum size of an Infinite Volume data constituent. The default value is determined by checking the maximum FlexVol size setting on all nodes used by the Infinite Volume. The smallest value found is selected as the default for the maximum constituent size. This parameter applies to Infinite Volumes only.

{-qos-policy-group <text>} - QoS Policy Group Name

This optional parameter specifies which QoS policy group to apply to the volume. This policy group defines measurable service level objectives (SLOs) that apply to the storage objects with which the policy group is associated. If you do not assign a policy group to a volume, the system will not monitor and control the traffic to it. To remove this volume from a policy group, enter the reserved keyword "none". This parameter is not supported on Infinite Volumes.
| [-qos-adaptive-policy-group <text>] - QoS Adaptive Policy Group Name |
This optional parameter specifies which QoS adaptive policy group to apply to the volume. This policy group defines measurable service level objectives (SLOs) and Service Level Agreements (SLAs) that adjust based on the volume allocated space or used space. To remove this volume from an adaptive policy group, enter the reserved keyword "none". This parameter is not supported on FlexGroups or Infinite Volumes.

| [-caching-policy <text>] - Caching Policy Name |
This parameter specifies the caching policy to apply to the volume. A caching policy defines how the system caches this volume's data in a Flash Pool aggregate or Flash Cache modules. This parameter is not supported on Infinite Volumes.

Both metadata and user data are eligible for caching. Metadata consists of directories, indirect blocks and system metafiles. They are eligible for read caching only. When a random write pattern is detected on user data, the first such write is eligible for read caching while all subsequent overwrites are eligible for write caching. The available caching policies are:

- none - Does not cache any user data or metadata blocks.
- auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
- meta - Read caches only metadata blocks.
- random_read - Read caches all metadata and randomly read user data blocks.
- random_read_write - Read caches all metadata, randomly read and randomly written user data blocks.
- all_read - Read caches all metadata, randomly read and sequentially read user data blocks.
- all_read_random_write - Read caches all metadata, randomly read, sequentially read and randomly written user data.
- all - Read caches all data blocks read and written. It does not do any write caching.
- noread-random_write - Write caches all randomly overwritten user data blocks. It does not do any read caching.
- meta-random_write - Read caches all metadata and write caches randomly overwritten user data blocks.
- random_read_write-random_write - Read caches all metadata, randomly read and randomly written user data blocks. It also write caches randomly overwritten user data blocks.
- all_read-random_write - Read caches all metadata, randomly read and sequentially read user data blocks. It also write caches randomly overwritten user data blocks.
- all_random_write - Read caches all metadata, randomly read, sequentially read and randomly written user data. It also write caches randomly overwritten user data blocks.

Note that in a caching-policy name, a hyphen (-) separates read and write policies. Default caching-policy is auto.

| [-cache-retention-priority {normal|low|high}] - Cache Retention Priority (privilege: advanced) |
This parameter specifies the cache retention priority to apply to the volume. A cache retention priority defines how long the blocks of a volume will be cached in flash pool once they become cold. If a cache retention priority is not assigned to this volume, the system uses the default policy. This parameter is not supported on Infinite Volumes.

The available cache retention priority are:
• low - Cache the cold blocks for the lowest time.
• normal - Cache the cold blocks for the default time.
• high - Cache the cold blocks for the highest time.

[-is-autobalance-eligible {true|false}] - Is Eligible for Auto Balance Aggregate (privilege: advanced)
If the Auto Balance feature is enabled, this parameter specifies whether the volume might be considered for system workload balancing. When set to true, the Auto Balance Aggregate feature might recommend moving this volume to another aggregate. The default value is true.

[-max-constituent-size {<integer>[KB|MB|GB|TB|PB]}] - Maximum size of a FlexGroup Constituent (privilege: advanced)
This optionally specifies the maximum size of a FlexGroup constituent. The default value is determined by checking the maximum FlexVol size setting on all nodes used by the FlexGroup. The smallest value found is selected as the default for the -max-constituent-size for the FlexGroup. This parameter applies to FlexGroups only.

[-vserver-dr-protection {protected|unprotected}] - Vserver DR Protection
This optionally specifies whether the volume should be protected by Vserver level SnapMirror. This parameter is applicable only if the Vserver is the source of a Vserver level SnapMirror relationship. This parameter is not supported on Infinite Volumes.

[-tiering-policy {snapshot-only|none|backup}] - Volume Tiering Policy
This optional parameter specifies the tiering policy to apply to the volume. This policy determines whether the user data blocks of a volume in a FabricPool will be tiered to the capacity tier when they become cold. FabricPool combines flash (performance tier) with an object store (external capacity tier) into a single aggregate. Temperature of a volume block increases if it is accessed frequently and decreases when it is not.
The available tiering policies are:
• snapshot-only - This policy allows tiering of only the volume Snapshot copies not associated with the active file system.
• none - Volume blocks will not be tiered to the capacity tier.
• backup - On DP volumes this policy allows all transferred user data blocks to start in the capacity tier.

Examples
The following example modifies a volume named vol4 on a Vserver named vs0. The volume's export policy is changed to default_expolicy and its size is changed to 500 GB.

cluster1::> volume modify -vserver vs0 -volume vol4 -policy default_expolicy -size 500g

The following example modifies a volume named vol2. It enables autogrow and sets the maximum autosize to 500g

cluster1::> volume modify -volume vol2 -autosize-mode grow -max-autosize 500g

The following example modifies a volume named vol2 to have a space guarantee of none.

cluster1::> volume modify -space-guarantee none -volume vol2

The following example modifies all volumes in Vserver vs0 to have a fractional reserve of 30%.
The following example modifies a volume named vol2 to grow in size by 5 gigabytes:

```
cluster1::> volume modify -volume vol2 -size +5g
```

The following example modifies a volume named vol2 to have a different caching policy. The volume must be on a Flash Pool aggregate:

```
cluster1::> volume modify -volume vol2 -caching-policy none
```

**volume mount**

Mount a volume on another volume with a junction-path

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `volume mount` command mounts a volume at a specified junction path.

**Parameters**

- `-vserver <vserver name>` - Vserver Name
  This specifies the Vserver on which the volume is located.

- `-volume <volume name>` - Volume Name
  This specifies the volume that is to be mounted.

- `-junction-path <junction path>` - Junction Path Of The Mounting Volume
  This specifies the junction path of the mounted volume. The junction path name is case insensitive and must be unique within a Vserver's namespace.

- `[-active {true|false}]` - Activate Junction Path
  This optionally specifies whether the mounted volume is accessible. The default setting is false. If the mounted path is not accessible, it does not appear in the Vserver's namespace.

- `[-policy-override {true|false}]` - Override The Export Policy
  This optionally specifies whether the parent volume's export policy overrides the mounted volume's export policy. The default setting is false.
Examples
The following example mounts a volume named user_tsmith on a Vserver named vs0. The junction path for the mounted volume is /user/tsmith. The mounted volume is accessible, and the mounted volume's export policy is not overridden by the parent volume's export policy.

```
node::> volume mount -vserver vs0 -volume user_tsmith
    -junction-path /user/tsmith -active true -policy-override false
```

volume offline
Take an existing volume offline

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The volume offline command takes the volume offline. If the volume is already in restricted or iron_restricted state, then it is already unavailable for data access, and much of the following description does not apply. The current root volume may not be taken offline. A number of operations being performed on the volume in question can prevent volume offline from succeeding for various lengths of time. If such operations are required, the command may take additional time to complete. If they do not, the command is aborted. The -force flag can be used to forcibly offline a volume.

Parameters
- `vserver <vserver name>` - Vserver Name
  This specifies the name of the Vserver from which the volume is to be taken offline. If only one data Vserver exists, you do not need to specify this parameter.

- `volume <volume name>` - Volume Name
  This specifies the name of the volume that is to be taken offline.

- `[-force | -f [true]]` - Force Offline
  This specifies whether the offline operation is forced. Using this option to force a volume offline can potentially disrupt access to other volumes. The default setting is false.

- `[-foreground {true|false}]` - Foreground Process
  This specifies whether the operation runs in the foreground. The default setting is true (the operation runs in the foreground). When set to true, the command will not return until the operation completes. This parameter applies only to Infinite Volumes. For FlexVol volumes, the command always runs in the foreground.

- `[-disable-luns-check [true]]` - Disable Check for Existing LUNs
  Taking the volume offline will make all associated LUNs unavailable, which normally requires a user confirmation. If this parameter is specified, the command proceeds without a confirmation. The default setting is false

Examples
The following example takes the volume named vol1 offline:

```
cluster1::> volume offline vol1
Volume 'vs1:vol1' is now offline.
```
volume online

Bring an existing volume online

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The volume online command brings the volume online. A volume can only be brought online if it is offline or restricted. If the volume is inconsistent but has not lost data, the user will be cautioned and prompted before bringing it online. It is advisable to run waf-iron (or do a snapmirror initialize in case of a replica volume) prior to bringing an inconsistent volume online. Bringing an inconsistent volume online increases the risk of further file system corruption. If the containing aggregate cannot honor the space guarantees required by this volume, the volume online operation will fail. It is not advisable to use volumes with their space guarantees disabled. Lack of free space can lead to failure of writes which in turn can appear as data loss to some applications.

Parameters
- vserver <vserver name> - Vserver Name
  This parameter specifies the name of the Vserver from which the volume is to be brought online. If only one data Vserver exists, you do not need to specify this parameter.

- volume <volume name> - Volume Name
  This parameter specifies the name of the volume that is to be brought online.

- [force | -f [true]] - Force Online
  When this parameter is used, the volume will be brought online even if there is not enough space available in the aggregate to honor the volume's space guarantee.

- [foreground [true | false]] - Foreground Process
  This parameter specifies whether the operation runs in the foreground. The default setting is true (the operation runs in the foreground). When set to true, the command will not return until the operation completes. This parameter applies only to Infinite Volumes. For FlexVol volumes, the command always runs in the foreground.

Examples
The following example brings a volume named vol1 online:

```
cluster1::> volume online vol1
Volume 'vsl:vol1' is now online.
```

volume rehost

Rehost a volume from one Vserver into another Vserver

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The volume rehost command rehosts a volume from source Vserver onto destination Vserver. The volume name must be unique among the other volumes on the destination Vserver.
Parameters

-vserver <vserver name> - Source Vserver name
This specifies the Vserver on which the volume is located.

-volume <volume name> - Target volume name
This specifies the volume that is to be rehosted.

-destination-vserver <vserver name> - Destination Vserver name
This specifies the destination Vserver where the volume must be located post rehost operation.

{-force-unmap-luns {true|false}} - Unmap LUNs in volume
This specifies whether the rehost operation should unmap LUNs present on volume. The default setting is false (the rehost operation shall not unmap LUNs). When set to true, the command will unmap all mapped LUNs on the volume.

{[-auto-remap-luns {true|false}]} - Automatic Remap of LUNs
This specifies whether the rehost operation should perform LUN mapping operation at the destination Vserver for the LUNs mapped on the volume at the source Vserver. The default setting is false (the rehost operation shall not map LUNs at the destination Vserver). When set to true, at the destination Vserver the command will create initiators groups along with the initiators (if present) with same name as that of source Vserver. Then the LUNs on the volume are mapped to initiator groups at the destination Vserver as mapped in source Vserver.

Examples
The following example rehosts a volume named vol3 on Vserver named vs1 to a destination Vserver named vs2:

ccluster::> volume rehost -vserver vs1 -volume vol3 -destination-vserver vs2

volume rename

Rename an existing volume

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The volume rename command renames a volume. The volume name must be unique among the other volumes on the same Vserver. The volume rename command is not supported for FlexGroups.

Parameters

-vserver <vserver name> - Vserver Name
This specifies the Vserver on which the volume is located. For a node's root volume, use the name of the node for this parameter.

-volume <volume name> - Volume Name
This specifies the volume that is to be renamed.

-newname <volume name> - Volume New Name
This specifies the volume's new name. A volume's name must start with an alphabetic character (a to z or A to Z) and be 203 or fewer characters in length.

{-foreground {true|false}} - Foreground Process
This specifies whether the operation runs in the foreground. The default setting is true (the operation runs in the foreground). When set to true, the command will not return until the operation completes. This parameter applies only to Infinite Volumes. For FlexVol volumes, the command always runs in the foreground.
Examples
The following example renames a volume named vol3_backup as vol3_save on a Vserver named vs0:

```
node::> volume rename -vserver vs0 -volume vol3_backup -newname vol3_save
```

volume restrict
Restrict an existing volume

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**
The `volume restrict` command puts the volume in restricted state. If the volume is online, then it will be made unavailable for data access as described under `volume offline`.

**Parameters**
- `-vserver <vserver name>` - Vserver Name
  This specifies the name of the Vserver from which the volume is to be restricted. If only one data Vserver exists, you do not need to specify this parameter.
- `-volume <volume name>` - Volume Name
  This specifies the name of the volume that is to be restricted.
- `[-foreground {true|false}]` - Foreground Process
  This specifies whether the operation runs in the foreground. The default setting is `true` (the operation runs in the foreground). When set to true, the command will not return until the operation completes. This parameter applies only to Infinite Volumes. For FlexVol volumes, the command always runs in the foreground.

Examples
The following example restricts a volume named vol1:

```
cluster1::> volume restrict vol1
Volume 'vs1:vol1' is now restricted.
```

Related references
- `volume offline` on page 1386

volume show
Display a list of volumes

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**
The `volume show` command displays information about volumes. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays the following information about all volumes:
- Vserver name
• Volume name
• Aggregate name
• State (online, offline, restricted, or mixed)
• Type (RW for read-write or DP for data-protection)
• Size
• Available size
• Percentage of space used

To display detailed information about a single volume, run the command with the `-vserver` and `-volume` parameters. The detailed view provides all of the information in the previous list and the following additional information:

• Name ordinal
• Volume data set ID
• Volume master data set ID
• Volume style (trad, flex or infinitevol)
• Whether the volume is a Cluster volume or Node volume
• Export policy name
• User ID
• Group ID
• Security style (unix, ntfs, mixed or unified)
• UNIX permissions
• Junction path
• Junction path source
• Whether the junction path is active
• Parent volume name
• Vserver root volume
• Comment
• Filesystem size
• Total user-visible size
• Used size
• Used percentage
• Volume nearly full threshold percent
• Volume full threshold percent
• Autosize enabled
• Maximum autosize
• Minimum autosize
• Autosize grow threshold percent
• Autosize shrink threshold percent
• Autosize mode
• Total files
• Files used
• Expected available size
• Over provisioned size
• Snapshot reserve available size
• Maximum directory size
• Space guarantee style
• Whether a space guarantee is in effect
• Space SLO type (none, thick or semi-thick)
• Whether space SLO is in effect
• Whether minimum readahead is enabled
• Whether access time update is enabled
• Whether Snapshot directory access is enabled
• Percentage of space reserved for Snapshot Copies
• Percentage of Snapshot copy space used
• Snapshot policy name
• Creation time
• If the filesystem size is fixed
• Overwrite reserve
• Fractional reserve
• Which space management strategy to try first
• Language
• Whether there's one data volume per member aggregate
• Concurrency level
• Optimization policy
• Whether the volume is a clone
• Volume UUID
• Whether failover is enabled
• Failover state
• (DEPRECATED)-Extent option
• Read reallocation option
- Consistency state
- Whether volume is quiesced on disk
- Whether volume is quiesced in memory
- Whether volume contains shared or compressed data
- Space saved by storage efficiency
- Percentage of space saved by storage efficiency
- Space saved by deduplication
- Percentage of space saved by deduplication
- Space shared by deduplication
- Space saved by compression
- Percentage of space saved by compression
- Volume Size Used by Snapshot Copies
- Caching policy
- FlexGroup master data set ID
- FlexGroup index
- FlexGroup UUID
- Maximum size of the FlexGroup constituent
- Whether the volume has FlexGroup enabled
- Whether a FlexGroup is Qtree enabled
- List of the aggregates used by the FlexGroup
- List of the nodes used by the FlexGroup
- SnapLock Type
- Is in pre-commit phase of Copy-Free Transition
- Application that the volume belongs to
- Application UUID

To display detailed information about all volumes, run the command with the `-instance` parameter. Fields not supported by Infinite Volumes will display a value of ".".

You can specify additional parameters to display information that matches only those parameters. For example, to display information only about data-protection volumes, run the command with the `-type DP` parameter.

**Parameters**

```
[-fields <fieldname>,...]
```
This specifies the fields that need to be displayed. The fields Vserver and policy are the default fields (see example).

```
[-encryption]
```
If this parameter is specified, the command displays the following information:

- Vserver name
- Volume name
- Aggregate name
- Volume state
- Encryption state

|--junction
If this parameter is specified, the command displays the following information:

- Vserver name
- Volume name
- Whether the volume's junction is active
- Junction path
- Junction path source (if the volume is a mirror)

|--settings (privilege: advanced)
If this parameter is specified, the command displays the following information:

- Vserver name
- Volume name
- Whether minimum readahead is enabled on the volume
- Whether the access time is updated on inodes when a file on the volume is read
- Whether clients have access to .snapshot directories
- Whether automatic Snapshot copies are enabled on the volume

|--instance
If this parameter is specified, the command displays information about all entries.

|--vserver <vserver name> - Vserver Name
If this parameter and the --volume parameter are specified, the command displays detailed information about the specified volume. If this parameter is specified by itself, the command displays information about volumes on the specified Vserver.

|--volume <volume name> - Volume Name
If this parameter and the --vserver parameter are specified, the command displays detailed information about the specified volume. If this parameter is specified by itself, the command displays information about all volumes matching the specified name.

|--aggregate <aggregate name> - Aggregate Name
If this parameter is specified, the command displays information only about the volume or volumes that are located on the specified storage aggregate. This field is displayed as "." for FlexGroups.

|--aggr-list <aggregate name>, ... - List of Aggregates for FlexGroup Constituents
If this parameter is specified, the command displays information only about the FlexGroup or FlexGroups that are located on the specified list of storage aggregates. This parameter applies to FlexGroups only.

|--size <integer> [KB|MB|GB|TB|PB] - Volume Size
If this parameter is specified, the command displays information only about the volume or volumes that have the specified size. Size is the maximum amount of space a volume can consume from its associated aggregate(s), including user data, metadata, Snapshot copies, and Snapshot reserve. Note that for volumes
without a `space-guarantee` of `volume`, the ability to fill the volume to this maximum size depends on the space available in the associated aggregate or aggregates.

`[-name-ordinal <text>]` - Name Ordinal (privilege: advanced)
If this parameter is specified, it denotes the ordinal assignment used in relation to this volume's name. Ordinals are used to disambiguate volumes that have the same base name on the same controller. A value of "0" indicates that the base volume name is unique on the controller. A value greater than zero indicates that the volume's base name is used by two or more volumes on the same controller, and that appending "(n)" to this volume's name uniquely identifies it on this controller.

`[-dsid <integer>]` - Volume Data Set ID
If this parameter is specified, the command displays information only about the volume or volumes that match the specified data set ID. This field is displayed as "-" for FlexGroups.

`[-msid <integer>]` - Volume Master Data Set ID
If this parameter is specified, the command displays information only about the volume or volumes that match the specified master data set ID.

`[-state {online|restricted|offline|force-online|force-offline|mixed}]` - Volume State
If this parameter is specified, the command displays information only about the volume or volumes that have the specified state. The `mixed` state only applies to FlexGroups and Infinite Volumes. If the state of a FlexGroup or Infinite Volume is `mixed`, that indicates that not all of the constituents are in the same state. If this is the case use the "volume show -is-constituent true" command to find out which constituents are not in the proper state.

`[-volume-style {flex|infinitevol}]` - Volume Style
If this parameter is specified, the command displays information only about the volumes that have the specified style. Possible values are `flex` for FlexVol volumes, and `infinitevol` for Infinite Volumes.

`[-volume-style-extended {flexvol|infinitevol|infinitevol-constituent|flexgroup|flexgroup-constituent}]` - Extended Volume Style
If this parameter is specified, the command displays information only about the volumes that are configured with the specified extended style. Possible values are `flexvol` for FlexVol volumes, `infinitevol` for Infinite Volumes, `infinitevol-constituent` for Infinite Volume constituents, `flexgroup` for FlexGroups and `flexgroup-constituent` for FlexGroup constituents.

`[-is-cluster-volume {true|false}]` - Is Cluster-Mode Volume
If this parameter is specified, the command displays information only about cluster volumes (true) or node root volumes and other node scoped volumes (false).

`[-is-constituent {true|false}]` - Is Constituent Volume
If this parameter is specified, the command displays information only about volumes that either are or are not constituents of a FlexGroup or Infinite Volume, depending on the value provided.

`[-policy <text>]` - Export Policy
If this parameter is specified, the command displays information only about the volume or volumes that use the specified export policy.

`[-user <user name>]` - User ID
If this parameter is specified, the command displays information only about the volume or volumes whose root is owned by the specified user.

`[-group <group name>]` - Group ID
If this parameter is specified, the command displays information only about the volume or volumes whose root is owned by the specified group.
-security-style <security style> - Security Style
  If this parameter is specified, the command displays information only about the volume or volumes that have
  the specified security style (unix for UNIX mode bits, ntfs for CIFS ACLs, mixed for both styles or
  unified for Unified UNIX, NFS and CIFS permissions).

-unix-permissions <unix perm> - UNIX Permissions
  If this parameter is specified, the command displays information only about the volume or volumes whose
default UNIX permissions match the specified permissions. Specify UNIX permissions either as a four-digit
octal value (for example, 0700) or in the style of the UNIX ls command (for example, -rwxr-x---). For
information on UNIX permissions, see the UNIX or Linux documentation.

-junction-path <junction path> - Junction Path
  If this parameter is specified, the command displays information only about the volume or volumes that have
the specified junction path.

-junction-path-source {RW volume|LS mirror} - Junction Path Source
  If this parameter is specified, the command displays information only about the volume or volumes that have
the specified junction path source.

-junction-active {true|false} - Junction Active
  If this parameter is specified, the command displays information only about the volume or volumes whose
junction paths have the specified status.

-junction-parent <volume name> - Junction Parent Volume
  If this parameter is specified, the command displays information only about the volume or volumes that have
the specified parent volume.

-vsroot {true|false} - Vserver Root Volume (privilege: advanced)
  If this parameter is specified, the command displays information only about the volume or volumes that match
the specified setting; that is, whether they are the root volumes for their Vservers.

-comment <text> - Comment
  If this parameter is specified, the command displays information only about the volume or volumes that match
the specified comment text.

-available <integer> [KB|MB|GB|TB|PB] - Available Size
  If this parameter is specified, the command displays information only about the volume or volumes that have
the specified available size. Available is the amount of free space currently available to be used by this volume.
For a volume with a -space-guarantee of type volume, available is always -total minus -used. For
volumes that do not have a -space-guarantee of type volume, available could be reduced if the volume’s
associated aggregate or aggregates are space constrained.

-filesystem-size <integer> [KB|MB|GB|TB|PB] - Filesystem Size
  If this parameter is specified, the command displays information only about the volume or volumes that have
the specified filesystem size. Filesystem size is the same as the volume’s -size unless the volume is or was a
physical replica destination. In this case, the file system size corresponds to the -size of the source volume,
until -filesystem-size-fixed is set to false.

-total <integer> [KB|MB|GB|TB|PB] - Total User-Visible Size
  If this parameter is specified, the command displays information only about the volume or volumes that have
the specified total size. Total is the total space available for user data and file system metadata. It does not
include the Snapshot reserve.

-used <integer> [KB|MB|GB|TB|PB] - Used Size
  If this parameter is specified, the command displays information only about the volume or volumes that have
the specified used size. Used is the amount of space occupied by user data and file system metadata. It includes
Snapshot spill (the amount of space by which Snapshot copies exceed Snapshot reserve). It does not
include the Snapshot reserve.
[-percent-used <percent>] - Used Percentage
If this parameter is specified, the command displays information only about the volume or volumes that have
the specified percentage of used space. This row is based on a value of used space that includes the space used
by Snapshot copies or the Snapshot reserve (whichever is greater) in relation to the current volume size.

[-space-nearly-full-threshold-percent <percent>] - Volume Nearly Full Threshold Percent
If this parameter is specified, the command displays information only about the volume or volumes that have
the specified nearly full threshold percent.

[-space-full-threshold-percent <percent>] - Volume Full Threshold Percent
If this parameter is specified, the command displays information only about the volume or volumes that have
the specified full threshold percent.

[-max-autosize <integer> [KB|MB|GB|TB|PB]] - Maximum Autosize
If this parameter is specified, the command displays information only about the volume or volumes that have
the specified maximum automatic size.

[-min-autosize <integer> [KB|MB|GB|TB|PB]] - Minimum Autosize
If this parameter is specified, the command displays information only about the volume or volumes that have
the specified minimum automatic size. This field is displayed as "." for FlexGroups.

[-autosize-grow-threshold-percent <percent>] - Autosize Grow Threshold Percentage
If this parameter is specified, the command displays information only about the volume or volumes that have
the specified automatic grow used space threshold percentage. This field is displayed as "." for FlexGroups.

[-autosize-shrink-threshold-percent <percent>] - Autosize Shrink Threshold Percentage
If this parameter is specified, the command displays information only about the volume or volumes that have
the specified automatic shrink used space threshold percentage. This field is displayed as "." for FlexGroups.

[-autosize-mode {off|grow|grow_shrink}] - Autosize Mode
If this parameter is specified, the command displays information only about the volume or volumes that have
the specified automatic sizing mode setting. This field is displayed as "." for FlexGroups.

[-files <integer>] - Total Files (for user-visible data)
If this parameter is specified, the command displays information only about the volume or volumes that have
the specified number of files.

[-files-used <integer>] - Files Used (for user-visible data)
If this parameter is specified, the command displays information only about the volume or volumes that have
the specified number of files used.

[-maxdir-size <integer> [KB|MB|GB|TB|PB]] - Maximum Directory Size (privilege: advanced)
If this parameter is specified, the command displays information only about the volume or volumes that have
the specified maximum directory size.

[-space-guarantee-enabled {true|false}] - Space Guarantee in Effect
If this parameter is specified, the command displays information only about the volume or volumes that have
the specified space-guarantee setting. If the value of -space-guarantee is none, the value of -space-
guarantee-enabled is always true. In other words, because there is no guarantee, the guarantee is always
in effect. If the value of -space-guarantee is volume, the value of -space-guarantee-enabled can be
ture or false, depending on whether the guaranteed amount of space was available when the volume was
mounted.

[-is-space-slo-enabled {true|false}] - Space SLO in Effect
If this parameter is specified, the command displays information only about the volume or volumes that have
their space-slo setting in effect or not, depending on the value specified for this parameter. If the value of
space-slo is none, the space SLO is always considered to be in effect. If the value of space-slo is semi-
thick or thick, the space SLO may be in effect depending on whether the required amount of space was
available when the volume was mounted.
[-space-slo {none|thick|semi-thick}] - Space SLO
   If this parameter is specified, the command displays information only about the volume or volumes that have
   the specified space-slo setting. The space SLO setting is the Service Level Objective for space management
   for the volume.

[-space-guarantee |{-none|volume}] - Space Guarantee Style
   If this parameter is specified, the command displays information only about the volume or volumes that have
   the specified space guarantee style. If the value of -space-guarantee is none, the value of -space-
   guarantee-enabled is always true. In other words, because there is no guarantee, the guarantee is always
   in effect. If the value of -space-guarantee is volume, the value of -space-guarantee-enabled can be
   true or false, depending on whether the guaranteed amount of space was available when the volume was
   mounted.

[-fractional-reserve <percent>] - Fractional Reserve
   If this parameter is specified, the command displays information only about the volume or volumes that have
   the specified fractional-reserve setting.

[-type {RW|DP}] - Volume Type
   If this parameter is specified, the command displays information only about the volume or volumes of the
   specified type (RW for read-write or DP for data-protection).

[-min-readahead {true|false}] - Minimum Read Ahead (privilege: advanced)
   If this parameter is specified, the command displays information only about the volume or volumes that have
   the specified minimum-readahead setting.

[-atime-update {true|false}] - Access Time Update Enabled (privilege: advanced)
   If this parameter is specified, the command displays information only about the volume or volumes that have
   the specified access-time update setting.

[-snapdir-access {true|false}] - Snapshot Directory Access Enabled
   If this parameter is specified, the command displays information only about the volume or volumes that have
   the specified Snapshot-copy access setting.

[-percent-snapshot-space <percent>] - Space Reserved for Snapshot Copies
   If this parameter is specified, the command displays information only about the volume or volumes that have
   the specified percentage of space reserved for Snapshot copies.

[-snapshot-space-used <percent_no_limit>] - Snapshot Reserve Used
   If this parameter is specified, the command displays information only about the volume or volumes that have
   the specified used percentage of the reserve for Snapshot copies.

[-snapshot-policy <snapshot policy>] - Snapshot Policy
   If this parameter is specified, the command displays information only about the volume or volumes that use
   the specified Snapshot policy.

[-create-time <Date>] - Creation Time
   If this parameter is specified, the command displays information only about the volume or volumes that have
   the specified creation time.

[-language <Language code>] - Language
   If this parameter is specified, the command displays information only about the volume or volumes that store
   data in the specified language. To determine the available languages, enter volume show-language at the
   clustershell command prompt.

[-clone-volume {true|false}] - Clone Volume
   If this parameter is specified, the command displays information only about volumes that are clones (true) or
   not clones (false).
[-node {<nodename> | local}] - Node name
If this parameter is specified, the command displays information only the volume or volumes that are located on the specified storage system. This field is displayed as "-" for FlexGroups.

[-clone-parent-vserver <vserver name>] - Clone Parent Vserver Name
If this parameter is specified, the command displays information only about the volumes with a matching FlexClone parent Vserver name.

[-clone-parent-name <volume name>] - FlexClone Parent Volume
If this parameter is specified, the command displays information only about the volumes with a matching FlexClone parent volume name.

[-uuid <UUID>] - UUID of the Volume (privilege: advanced)
If this parameter is specified, the command displays information only about the volume or volumes that match the specified UUID.

[-nvfail {on|off}] - NVFAIL Option
If this parameter is specified, the command displays information only about volumes for which failover is enabled (on) or disabled (off).

[-in-nvfailed-state {true|false}] - Volume’s NVFAIL State
If this parameter is specified, the command displays information only about volumes which are in the failed over state (true) or not (false).

[-dr-force-nvfail {on|off}] - Force NVFAIL on MetroCluster Switchover
If this parameter is specified, the command displays information only about volumes for which dr-force-nvfail is enabled (on) or disabled (off).

[-filesys-size-fixed {true|false}] - Is File System Size Fixed
If this parameter is specified, the command displays information only about the volume or volumes that have the specified filesys-size-fixed setting.

[-extent-enabled {off|on|space-optimized}] - (DEPRECATED)-Extent Option
Note: This parameter has been deprecated and may be removed in a future release of Data ONTAP.
If this parameter is specified, the command displays information only about volumes that have extents enabled (on), not enabled (off) or space optimized (space-optimized).

[-overwrite-reserve {<integer>[KB|MB|GB|TB|PB]}] - Reserved Space for Overwrites
If this parameter is specified, the command displays information only about the volume or volumes that have the specified overwrite-reserve setting.

[-space-mgmt-try-first {volume_grow|snap_delete}] - Primary Space Management Strategy
If this parameter is specified, the command displays information only about the volume or volumes that have the specified space-mgmt-try-first setting. Possible values are volume_grow and snap_delete. This field is displayed as "-" for FlexGroups.

[-read-realloc {off|on|space-optimized}] - Read Reallocation Option
If this parameter is specified, the command displays information only about volumes that have read reallocation enabled (on), not enabled (off) or space optimized (space-optimized).

[-sched-snap-name {create-time|ordinal}] - Naming Scheme for Automatic Snapshot Copies
If this parameter is specified, the command displays information only about the volume or volumes that have the specified automatic Snapshot-copy naming convention.

[-is-inconsistent {true|false}] - Inconsistency in the File System
If this parameter is specified, the command displays information only about volumes that are inconsistent (true) or consistent (false) in the file system.
[-is-quiesced-on-disk (true|false)] - Is Volume Quiesced (On-Disk)
If this parameter is specified, the command displays information only about volumes that are quiesced (true) or not quiesced (false) on disk.

[-is-quiesced-in-memory (true|false)] - Is Volume Quiesced (In-Memory)
If this parameter is specified, the command displays information only about volumes that are quiesced (true) or not quiesced (false) in memory.

[-transition-state <state>] - Transition Operation State (privilege: advanced)
If this parameter is specified, the command displays information only about the volume or volumes that match the specified transition state.

[-transition-behavior {data-move|data-protection|none}] - Transition Behavior (privilege: advanced)
If this parameter is specified, the command displays information only about the volume or volumes that match the specified transition behavior. Possible values are:

• data-move: Volumes that are being moved from a system operating in 7-Mode.
• data-protection: Volumes that are being replicated from a system operating in 7-Mode for disaster recovery.
• none: Volumes that are not part of transition.

[-is-copied-for-transition (true|false)] - Copied for Transition (privilege: advanced)
If this parameter is specified, the command displays information only about the volume or volumes that match the specified value based on whether the volume is copied for transition or not.

[-is-transitioned (true|false)] - Transitioned (privilege: advanced)
If this parameter is specified, the command displays information only about the volume or volumes that match the specified value based on whether the volume is transitioned or not.

[-is-sis-volume (true|false)] - Volume Contains Shared or Compressed Data
If this parameter is specified, the command displays information only about those volumes that match the specified storage efficiency setting. Infinite Volumes will report the aggregated setting of their constituent data volumes as true or false if all constituents have the same setting, otherwise no value will be reported.

[-sis-space-saved (<integer> [KB|MB|GB|TB|PB])] - Space Saved by Storage Efficiency
If this parameter is specified, the command displays information only about those volumes that have the specified amount of space saved by the storage efficiency technology.

[-sis-space-saved-percent <percent>] - Percentage Saved by Storage Efficiency
If this parameter is specified, the command displays information only about those volumes that have the specified percentage of space saved by the storage efficiency technology.

[-dedupe-space-saved (<integer> [KB|MB|GB|TB|PB])] - Space Saved by Deduplication
If this parameter is specified, the command displays information only about those volumes that have the specified amount of space saved due to deduplication.

[-dedupe-space-saved-percent <percent>] - Percentage Saved by Deduplication
If this parameter is specified, the command displays information only about those volumes that have the specified percentage of space saved due to deduplication.

[-dedupe-space-shared (<integer> [KB|MB|GB|TB|PB])] - Space Shared by Deduplication
If this parameter is specified, the command displays information only about those volumes that have the specified amount of shared space due to deduplication.

[-compression-space-saved (<integer> [KB|MB|GB|TB|PB])] - Space Saved by Compression
If this parameter is specified, the command displays information only about those volumes that have the specified amount of space saved due to compression.
[-compression-space-saved-percent <percent>] - Percentage Space Saved by Compression
  If this parameter is specified, the command displays information only about those volumes that have the
  specified percentage of space saved due to compression.

[-size-used-by-snapshots {<integer>[KB|MB|GB|TB|PB]}] - Volume Size Used by Snapshot Copies
  If this parameter is specified, the command displays information about those volumes that have the specified
  volume size used by Snapshot copies.

[-block-type {64-bit|extent|32-bit}] - Block Type
  If this parameter is specified, the command displays information about only the volumes with the specified
  indirect block format. Possible values are 32-bit to display 32-bit volumes and 64-bit to display 64-bit
  volumes.

[-is-moving {true|false}] - Is Volume Moving
  If this parameter is specified, the command displays information only about volumes that are moving (true) or
  not moving (false).

[-hybrid-cache-eligibility {read|read-write}] - Flash Pool Caching Eligibility
  If this parameter is specified, the command displays information only about the volume or volumes with the
  specified Flash Pool caching attributes. Possible caching attributes are:
  - 'read' ... Indicates that the volume cannot participate in write caching.
  - 'read-write' ... Indicates that the volume can participate in read and write caching.

[-hybrid-cache-write-caching-ineligibility-reason <text>] - Flash Pool Write Caching Ineligibility
Reason
  If this parameter is specified, the command displays information only about the volume or volumes which are
  ineligible to participate in write caching due to the specified reason.

[-is-managed-by-service {true|false}] - Managed By Storage Service
  If this parameter is specified as true, only display volumes that are managed by storage services. This field is
  displayed as "-" for FlexGroups.

[-storage-service <storage service name>] - Storage Service Name (privilege: advanced)
  If this parameter is specified, the command displays information only about volumes that match the specified
  storage service.

[-enable-snapdiff {true|false}] - Create Namespace Mirror Constituents For SnapDiff Use
  Setting this parameter displays information only about Infinite Volumes that either do or do not have
  namespace mirror constituents for SnapDiff use, depending on the value provided. This parameter applies to
  Infinite Volumes only.

[-unreachable-attr-action {return-generated|wait}] - Action When Attributes Are Not Reachable
  (privilege: advanced)
  This parameter specifies the information that an Infinite Volume returns when a client lists a directory that
  contains one or more files with inaccessible attributes. If this parameter is specified, the command displays
  information only about volumes that match the specified action. This parameter is not supported for FlexVol
  volumes.

[-constituent-role <Constituent Roles>] - Constituent Volume Role
  If this parameter is specified, the command displays information only about the constituent volume or volumes
  that are of the specified role. This parameter applies to Infinite Volumes and FlexGroups only.

[-max-namespace-constituent-size {<integer>[KB|MB|GB|TB|PB]}] - Maximum Size of Namespace
Constituent (privilege: advanced)
  If this parameter is specified, the command displays information only about volumes that match the specified
  namespace constituent size.
[-max-data-constituent-size \(<integer>\) [KB|MB|GB|TB|PB]] - Maximum Size of Each Data Constituent (privilege: advanced)

If this parameter is specified, the command displays information only about the Infinite Volume or Infinite Volumes that have the specified maximum data constituent size. This parameter applies to Infinite Volumes only.

[-is-cft-precommit [true|false]] - Is in the precommit phase of Copy-Free Transition (privilege: advanced)

If this parameter is specified with the true value, it displays information only about the volumes that are in the precommit phase of a Copy-Free Transition workflow.

[-qos-policy-group <text>] - QoS Policy Group Name

If this parameter is specified, the command displays information only about volumes that match the specified QoS policy group.

[-qos-adaptive-policy-group <text>] - QoS Adaptive Policy Group Name

If this parameter is specified, the command displays information only about volumes that match the specified QoS adaptive policy group.

[-caching-policy <text>] - Caching Policy Name

If this parameter is specified, the command displays the volumes that match the specified caching policy.

A caching policy defines how the system caches a volume’s data in a Flash Pool aggregate. Both metadata and user data are eligible for caching. The available caching policies are:

- none - Does not cache any user data or metadata blocks.
- auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
- meta - Read caches only metadata blocks.
- random_read - Read caches all metadata and randomly read user data blocks.
- random_read_write - Read caches all metadata, randomly read and randomly written user data blocks.
- all_read - Read caches all metadata, randomly read and sequentially read user data blocks.
- all_read_random_write - Read caches all metadata, randomly read, sequentially read, and randomly written user data.
- all - Read caches all data blocks read and written. It does not do any write caching.
- noread-random_write - Write caches all randomly overwritten user data blocks. It does not do any read caching.
- meta-random_write - Read caches all metadata and write caches randomly overwritten user data blocks.
- random_read_write-random_write - Read caches all metadata, randomly read and randomly written user data blocks. It also write caches randomly overwritten user data blocks.
- all_read-random_write - Read caches all metadata, randomly read and sequentially read user data blocks. It also write caches randomly overwritten user data blocks.
- all_read_random_write-random_write - Read caches all metadata, randomly read, sequentially read, and randomly written user data. It also write caches randomly overwritten user data blocks.
- all-random_write - Read caches all data blocks read and written. It also write caches randomly overwritten user data blocks.

Note that in a caching-policy name, a hyphen (-) separates read and write policies. Default caching-policy is auto.
[–cache-retention-priority {normal|low|high}] - Cache Retention Priority (privilege: advanced)

If this parameter is specified, the command displays the volumes that match the specified cache retention priority policy.

A cache retention priority defines how long the blocks of a volume will be cached in flash pool once they become cold. This parameter is not supported on Infinite Volumes. The available cache retention priority are:

- low - Cache the cold blocks for the lowest time.
- normal - Cache the cold blocks for the default time.
- high - Cache the cold blocks for the highest time.

[–is-volume-in-cutover {true|false}] - Is Volume Move in Cutover Phase

If this parameter is specified, the command displays information only about volumes that are in the cutover phase (true) or not in the cutover phase (false) of a volume move. This field is displayed as "-" for FlexGroups.

[–snapshot-count <integer>] - Number of Snapshot Copies in the Volume

If this parameter is specified, the command displays information only about the volumes that have the specified number of Snapshot copies.

[–vbn-bad-present {true|false}] - VBN_BAD may be present in the active filesystem

If this parameter is specified, the command displays information only about volumes that may have VBN_BAD present in its active filesystem (true) or do not have VBN_BAD present in its active filesystem (false).

[–is-autobalance-eligible {true|false}] - Is Eligible for Auto Balance Aggregate (privilege: advanced)

If this parameter is specified, the command displays information only about the volume or volumes that are eligible for consideration by the Auto Balance Aggregate feature.

[–is-vol-on-hybrid-aggr {true|false}] - Is Volume on a hybrid aggregate

If this parameter is specified, the command displays information only about volumes associated with a Flash Pool aggregate (true) or not (false). This field is displayed as "-" for FlexGroups.

[–physical-used <integer> [MB|GB|TB|PB]] - Total Physical Used Size

If this parameter is specified, the command displays information only about the volume or volumes that have the specified physical used size. This differs from total-used space by the space that is reserved for future writes. The value includes blocks in use by Snapshot copies.

[–physical-used-percent <percent_no_limit>] - Physical Used Percentage

If this parameter is specified, the command displays information only about the volume or volumes that have the specified physical used percent based on volume size including the space reserved for Snapshot copies.

[–flexgroup-maid <integer>] - FlexGroup Master Data Set ID (privilege: advanced)

If this parameter is specified, the command displays information only about the FlexGroup or FlexGroup constituents that have the specified FlexGroup master data-set ID. This parameter applies to FlexGroups and FlexGroup constituents only.

[–flexgroup-index <integer>] - FlexGroup Index (privilege: advanced)

If this parameter is specified, the command displays information only about the FlexGroup constituents that have the specified FlexGroup index. This parameter applies to FlexGroup constituents only.

[–flexgroup-uuid <UUID>] - UUID of the FlexGroup (privilege: advanced)

If this parameter is specified, the command displays information only about the FlexGroup or FlexGroup constituents that have the specified FlexGroup UUID. This parameter applies to FlexGroups and FlexGroup constituents only.
[-max-constituent-size <integer>[KB|MB|GB|TB|PB]] - Maximum size of a FlexGroup Constituent
   (privilege: advanced)
   If this parameter is specified, the command displays information only about the FlexGroup or FlexGroups that
   have the specified maximum constituent size. This parameter applies to FlexGroups only.

[-inodefile-version <integer>] - Inofile Version (privilege: advanced)
   If this parameter is specified, the command displays information only about the volumes whose inode files are
   at the specified version.

[-nodes <nodename>|local], ...] - List of Nodes
   If this parameter is specified, the command displays information only about the FlexGroup or FlexGroups that
   are located on the specified list of storage systems. This parameter applies to FlexGroups only.

[-is-flexgroup {true|false}] - Is Volume a FlexGroup
   If this parameter is specified, the command displays information only about the volume or volumes that are
   either FlexGroups or not, depending on the value provided.

[-is-flexgroup-qtree-enabled {true|false}] - Is FlexGroup Qtree Support Enabled (privilege: advanced)
   If this parameter is specified, the command displays information only about the FlexGroups with Qtrees
   enabled or disabled, depending on the value provided.

[-snaplock-type {non-snaplock|compliance|enterprise}] - SnapLock Type
   If this parameter is specified, the command displays information only about volumes that match the specified
   snaplock-type.

[-vserver-dr-protection {protected|unprotected}] - Vserver DR Protection
   If this parameter is specified, the command displays information only about the volumes having the specified
   Vserver Snapmirror protection. This parameter is not supported on Infinite Volumes.

[-encrypt {true}] - Enable Encryption
   If this parameter is specified, the command displays information only about the volumes that are encrypted.

[-is-encrypted {true|false}] - Is Volume Encrypted
   If this parameter is specified, the command displays information only about the volumes that are encrypted
   (true) or not encrypted (false).

[-encryption-state {none|full|partial|converting_to_encrypted|converting_to_plaintext|rekeying}] - Volume Encryption State
   If this parameter is specified, the command displays information only about the volumes that have the
   specified encryption state. The possible values are none, full, and partial. The value partial is used for
   FlexGroups, which indicates that some constituents are encrypted and some are not. If this parameter is
   specified, the command displays the encryption state of the volume.

[-key-id <text>] - Encryption Key ID
   If this parameter is specified, the command displays information only about the volume whose encryption key-
   id matches the specified key-id.

[-application <text>] - Application
   Selects the volumes that are part of an application that matches the parameter value.

[-single-instance-data-logging {off|on}] - Is SIDL enabled
   If this parameter is specified, the command displays whether Single Instance Data Logging feature is enabled
   on the specified volume.

[-over-provisioned <integer>[KB|MB|GB|TB|PB]] - Over Provisioned Size
   If this parameter is specified, the command displays information only about the volume or volumes that have
   the specified size not available in the aggregate. This applies only for a 'none' guaranteed volume when it's
   unused size exceeds available space in the aggregate. This value is always zero for 'volume' guaranteed
   volumes. This parameter is not supported on Infinite Volumes.
Available Snapshot Reserve Size

If this parameter is specified, the command displays information only about the volume or volumes that have the specified size available for Snapshot copies within the Snapshot reserve. This value is zero if Snapshot spill is present. For 'none' guaranteed volumes, this may get reduced due to less available space in the aggregate. This parameter is not supported on Infinite Volumes.

Volume Tiering Policy

If this parameter is specified, the command displays information only about the volumes whose tiering policy matches the specified value. Tiering policies determine whether the user data blocks of a volume in a FabricPool will be tiered to the capacity tier when they become cold. FabricPool combines flash (performance tier) with an object store (external capacity tier) into a single aggregate. Temperature of a volume block increases if it is accessed frequently and decreases when it is not.

The available tiering-policies are:

- snapshot-only - This policy allows tiering of only the volume Snapshot copies not associated with the active file system.
- none - Volume blocks will not be tiered to the capacity tier.
- backup - On DP volumes this policy allows all transferred user data blocks to start in the capacity tier.

Examples

The following example displays information about all volumes on the Vserver named vs1:

```
cluster1::> volume show -vserver vs1

Vserver   Volume       Aggregate    State      Type       Size  Available Used%
--------- ------------ ------------ ---------- ---- ---------- ---------- -----  
vs1       vol1         aggr1        online     RW          2GB      1.9GB    5%    
vs1       vol1_dr      aggr0_dp     online     DP        200GB    160.0GB   20%   
vs1       vol2         aggr0        online     RW        150GB    110.3GB   26%   
vs1       vol2_dr      aggr0_dp     online     DP        150GB    110.3GB   26%   
vs1       vol3         aggr1        online     RW        150GB    120.0GB   20%   
vs1       vol3_dr      aggr1_dp     online     DP        150GB    120.0GB   20%   
vs1       vol4         aggr1        online     RW        200GB    159.8GB   20%   
vs1       vol4_dr      aggr1_dp     online     DP        200GB    159.8GB   20%   
vs1       vol5         aggr2        online     RW        150GB    117.2GB   21%   
vs1       vol5_dr      aggr2_dp     online     DP        150GB    117.2GB   21%   
vs1       vol6         aggr3        online     RW        150GB    118.5GB   20%   
vs1       vol6_dr      aggr3_dp     online     DP        150GB    118.5GB   20%   
vs1       vol7         aggr4        online     RW        150GB    90.03GB   39%   
vs1       vol7_dr      aggr4_dp     online     DP        150GB    90.03GB   39%   
vs1       vol8         aggr5        online     RW        150GB    43.67GB   70%   
vs1       vol8_dr      aggr5_dp     online     DP        150GB    43.67GB   70%   
vs1       vol9         aggr6        online     RW        150GB    108.7GB   27%   
vs1       vol9_dr      aggr6_dp     online     DP        150GB    108.7GB   27%   
vs1       vol10        aggr7        online     RW        150GB    45.65GB   81%   
vs1       vol10_dr     aggr7_dp     online     DP        150GB    45.65GB   81%   
```

The following example displays detailed information about a volume named vol1 on an SVM named vs1:

```
cluster1::*> volume show -vserver vs1 -volume vol1

volume show-footprint

Display a list of volumes and their data and metadata footprints in their associated aggregate.

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The volume show-footprint command displays information about the space used in associated aggregates by volumes and features enabled in volumes. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays the following information about all volumes.

The volume show-footprint command is not supported for Infinite Volumes. However, the command displays information about Infinite Volume constituents as if the constituents were FlexVol volumes.

If the associated aggregates have an object-store attached to them, then the command displays a more detailed split up of the space used in each tier. This additional information is useful to show per-tier space usage which can be used to estimate the space requirements and transfer duration when moving a volume to a different tier with volume move.

Parameters

[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use ‘-fields ?’ to display the fields to specify.

[-instance]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver
If this parameter and the -volume parameter are specified, the command displays detailed information about the specified volume. If this parameter is specified by itself, the command displays information about volumes on the specified Vserver.

[-volume <volume name>] - Volume Name
If this parameter and the -vserver parameter are specified, the command displays detailed information about the specified volume. If this parameter is specified by itself, the command displays information about all volumes matching the specified name.

[-volume-msid <integer>] - Volume MSID
If this parameter is specified, the command displays information only about the volume that has the specified MSID.

[-volume-dsid <integer>] - Volume DSID
If this parameter is specified, the command displays information only about the volume that has the specified DSID.

[-vserver-uuid <UUID>] - Vserver UUID
If this parameter is specified, the command displays information only about the volume on the vserver which has the specified UUID.
If this parameter is specified, the command displays information only about the volumes that are associated with the specified aggregate.

If this parameter is specified, the command displays information only about the volumes on the aggregate which have the specified UUID.

If this parameter is specified, the command displays information only about the volumes that belong to the specified host.

If this parameter is specified, the command displays information only about the volumes whose tape backup metatiles use the specified amount of space in the aggregate.

If this parameter is specified, the command displays information only about the volumes whose tape backup metatiles use the specified percentage of space in the aggregate.

If this parameter is specified, the command displays information only about the volumes whose deduplication metatiles use the specified amount of space in the aggregate.

If this parameter is specified, the command displays information only about the volumes whose deduplication metatiles use the specified percentage of space in the aggregate.

If this parameter is specified, the command displays information only about the volumes whose data blocks use the specified amount of space in the aggregate.

This field is the total amount of data written to the volume. It includes data in the active file system in the volume as well as data that is consumed by volume Snapshot copies. This row only includes data and not reserved space, so when volumes have reserved files, the volume's total used in the show-space command output can exceed the value in this row.

If this parameter is specified, the command displays information only about the volumes whose temporary deduplication metatiles use the specified percentage of space in the aggregate.

If this parameter is specified, the command displays information only about the volumes whose temporary deduplication metatiles use the specified percentage of space in the aggregate.

If this parameter is specified, the command displays information only about the volumes whose file system metadata uses the specified amount of space in the aggregate.

This field includes the space used or reserved in the aggregate for metadata associated with this volume.

If this parameter is specified, the command displays information only about the volumes whose file system metadata uses the specified percentage of space in the aggregate.
[-delayed-free-footprint \{<integer>\{KB|MB|GB|TB|PB\}\}] - Delayed Free Blocks

If this parameter is specified, the command displays information only about the volumes whose delayed free blocks use the specified amount of space in the aggregate.

When Data ONTAP frees space in a volume, this space is not always immediately shown as free in the aggregate. This is because the operations to free the space in the aggregate are batched for increased performance. Blocks that are declared free in the FlexVol volume but which are not yet free in the aggregate are called "delayed free blocks" until the associated delayed free blocks are processed. For SnapMirror destinations, this row will have a value of 0 and will not be displayed.

[-delayed-free-footprint-percent <percent>] - Delayed Free Blocks Percent

If this parameter is specified, the command displays information only about the volumes that have the specified amount of blocks waiting to be freed in the aggregate. This space is called "delayed free blocks".

[-snapmirror-destination-footprint \{<integer>\{KB|MB|GB|TB|PB\}\}] - SnapMirror Destination Footprint

If this parameter is specified, the command displays information only about the volumes whose SnapMirror transfer uses the specified amount of space in the aggregate.

During a SnapMirror transfer, this row will include incoming SnapMirror data and SnapMirror-triggered delayed free blocks from previous SnapMirror transfers.

[-snapmirror-destination-footprint-percent <percent>] - SnapMirror Destination Footprint Percent

If this parameter is specified, the command displays information only about the volumes whose SnapMirror transfer uses the specified percentage of space in the aggregate.

[-volume-guarantee-footprint \{<integer>\{KB|MB|GB|TB|PB\}\}] - Volume Guarantee

If this parameter is specified, the command displays information only about the volumes whose guarantees use the specified amount of space in the aggregate.

This field includes the amount of space reserved by this volume in the aggregate for future writes. The amount of space reserved depends on the guarantee type (the provisioning mode) of the volume. For a “volume” guaranteed volume, this is the size of the volume minus the amount in the Volume Data Footprint row.

For a “file” guaranteed volume, this is the sum of all of the space reserved for hole fills and overwrites in all of the space reserved files in the volume.

[-volume-guarantee-footprint-percent <percent>] - Volume Guarantee Percent

If this parameter is specified, the command displays information only about the volumes whose guarantees use the specified percentage of space in the aggregate.

[-file-operation-metadata \{<integer>\{KB|MB|GB|TB|PB\}\}] - File Operation Metadata

If this parameter is specified, the command displays information only about the volumes that have file operation metadata using the specified amount of space in the aggregate.

This metadata is used by file move and copy operations. Although it is not returned as free space once the operations are complete, it can be reused by future file operations.

[-file-operation-metadata-percent <percent>] - File Operation Metadata Percent

If this parameter is specified, the command displays information only about the volumes that have file operation metadata using the specified percentage of space in the aggregate.

[-total-footprint \{<integer>\{KB|MB|GB|TB|PB\}\}] - Total Footprint

If this parameter is specified, the command displays information only about the volumes which use the specified amount of space in the aggregate. This field is the sum of the other rows in this table.

[-total-footprint-percent <percent>] - Total Footprint Percent

If this parameter is specified, the command displays information only about the volumes which use the specified percentage of space in the aggregate.
[-aggregate-size {<integer>[KB|MB|GB|TB|PB]}] - Containing Aggregate Size

If this parameter is specified, the command displays information only about the volumes that are associated with an aggregate of the specified size.

[-bin0-name <text>] - Name for bin0

If this parameter is specified, the command displays information only about volumes whose associated aggregate has an object store attached to it with an active file system tier name matches the specified value.

[-volume-blocks-footprint-bin0 {<integer>[KB|MB|GB|TB|PB]}] - Volume Footprint for bin0

If this parameter is specified, the command displays information only about volumes whose space in use in the performance tier of the aggregate matches the specified value.

[-volume-blocks-footprint-bin0-percent <percent>] - Volume Footprint bin0 Percent

If this parameter is specified, the command displays information only about volumes whose percentage space in use in the performance tier of the aggregate matches the specified value.

[-bin1-name <text>] - Name for bin1

If this parameter is specified, the command displays information only about volumes whose associated aggregate has an external capacity tier attached to it with a configuration name that matches the specified value.

[-volume-blocks-footprint-bin1 {<integer>[KB|MB|GB|TB|PB]}] - Volume Footprint for bin1

If this parameter is specified, the command displays information only about volumes whose space in use in the first external capacity tier bucket attached to the associated aggregate matches the specified value. This includes the space used by the blocks in the volume that are staged before being moved to the capacity tier.

[-volume-blocks-footprint-bin1-percent <percent>] - Volume Footprint bin1 Percent

If this parameter is specified, the command displays information only about volumes whose percentage space in use in the first external capacity tier bucket attached to associated aggregate matches the specified value. This includes the space used by the blocks in the volume that are staged before being moved to the capacity tier.

**Examples**

The following example displays information about all volumes in the system.

```
cluster1::> volume show-footprint

Vserver : nodevs
Volume : vol0

volume show-space

Display space usage for volume(s)

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The volume show-space command displays information about space usage within the volume. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays the following information about all volumes.

The volume show-space command is not supported for Infinite Volumes; however, the command displays information about Infinite Volume constituents as if the constituents were FlexVol volumes.

Parameters

[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver
If this parameter and the -volume parameter are specified, the command displays detailed information about the specified volume. If this parameter is specified by itself, the command displays information about volumes on the specified Vserver.

[-volume <volume name>] - Volume Name
If this parameter and the -vserver parameter are specified, the command displays detailed information about the specified volume. If this parameter is specified by itself, the command displays information about all volumes matching the specified name.

[-volume-msid <integer>] - Volume MSID
If this parameter is specified, the command displays information only about the volume that has the specified MSID.

[-volume-dsid <integer>] - Volume DSID
If this parameter is specified, the command displays information only about the volume that has the specified DSID.

[-vserver-uuid <UUID>] - Vserver UUID
If this parameter is specified, the command displays information only about the volume on the vserver which has the specified UUID.

[-aggregate <aggregate name>] - Aggregate Name
If this parameter is specified, the command displays information only about the volumes that are associated with the specified aggregate.
[-aggregate-uuid <UUID>] - Aggregate UUID
   If this parameter is specified, the command displays information only about the volumes on the aggregate which have the specified UUID.

[-hostname <text>] - Hostname
   If this parameter is specified, the command displays information only about the volumes that belong to the specified host.

[-user-data (<integer> [KB|MB|GB|TB|PB])] - User Data
   If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by user data in the volume.
   This is the amount of data written to the volume via CIFS, NFS or SAN protocols plus the metadata (for example indirect blocks, directory blocks) directly associated with user files plus the space reserved in the volume for these files (hole and overwrite reserves). This is the same information displayed by running the Unix du command on the mount point.

[-user-data-percent <percent_no_limit>] - User Data Percent
   If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use by user data in the volume.

[-dedupe-metafiles (<integer> [KB|MB|GB|TB|PB])] - Deduplication
   If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by deduplication metafiles in the volume.

[-dedupe-metafiles-percent <percent>] - Deduplication Percent
   If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use by deduplication metafiles in the volume.

[-dedupe-metafiles-temporary (<integer> [KB|MB|GB|TB|PB])] - Temporary Deduplication
   If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by temporary deduplication metafiles in the volume.

[-dedupe-metafiles-temporary-percent <percent>] - Temporary Deduplication Percent
   If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use by temporary deduplication metafiles in the volume.

[-filesystem-metadata (<integer> [KB|MB|GB|TB|PB])] - Filesystem Metadata
   If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by file system metadata in the volume.

[-filesystem-metadata-percent <percent>] - Filesystem Metadata Percent
   If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use by file system metadata in the volume.

[-snapmirror-metadata (<integer> [KB|MB|GB|TB|PB])] - SnapMirror Metadata
   If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by SnapMirror metafiles in the volume.
   Between SnapMirror transfers, some metadata is maintained to support storage-efficient transfers. During transfers, some additional space is used temporarily. This space is used in all SnapMirror destination volumes.

[-snapmirror-metadata-percent <percent>] - SnapMirror Metadata Percent
   If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use by SnapMirror metafiles inside the volume.

[-tape-backup-metadata (<integer> [KB|MB|GB|TB|PB])] - Tape Backup Metadata
   If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by tape backup metafiles in the volume.
[\texttt{-tape-backup-metadata-percent <\texttt{percent}>}] \textbf{- Tape Backup Metadata Percent}

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use by tape backup metafiles in the volume.

[\texttt{-quota-metafiles \{<\texttt{integer}> [KB|MB|GB|TB|PB]\}] \textbf{- Quota Metadata}

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by quota metafiles.

[\texttt{-quota-metafiles-percent <\texttt{percent}>}] \textbf{- Quota Metadata Percent}

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use by quota metafiles.

[\texttt{-inodes \{<\texttt{integer}> [KB|MB|GB|TB|PB]\}] \textbf{- Inodes}

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by the inode metafile in the volume.

This is the amount of space required to store inodes in the file system and is proportional to the maximum number of files ever created in the volume. The inode file is not compacted or truncated, so if a large number of files are created and then deleted, the inode file does not shrink.

[\texttt{-inodes-percent <\texttt{percent}>}] \textbf{- Inodes Percent}

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use by the inode metafile in the volume.

[\texttt{-inodes-upgrade \{<\texttt{integer}> [KB|MB|GB|TB|PB]\}] \textbf{- Inodes Upgrade}

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by the inode subsystem for the purpose of upgrading.

This is the amount of space required to store upgrading inodes in the file system and is proportional to the size of the inode metafile. Once the upgrade is complete, the space used by 'inodes' will be replaced with the space used for upgrade.

[\texttt{-inodes-upgrade-percent <\texttt{percent}>}] \textbf{- Inodes Upgrade Percent}

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use for upgrading the inode metafile in the volume.

[\texttt{-snapshot-reserve \{<\texttt{integer}> [KB|MB|GB|TB|PB]\}] \textbf{- Snapshot Reserve}

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by the Snapshot reserve in the volume.

[\texttt{-snapshot-reserve-percent <\texttt{percent}>}] \textbf{- Snapshot Reserve Percent}

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use by the Snapshot reserve in the volume.

[\texttt{-snapshot-reserve-unusable \{<\texttt{integer}> [KB|MB|GB|TB|PB]\}] \textbf{- Snapshot Reserve Unusable}

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space reserved but unusable in the volume.

Snapshot reserve can be diminished under certain conditions to accommodate volume metadata. Creating space in the volume will make this space available.

[\texttt{-snapshot-reserve-unusable-percent <\texttt{integer}>}] \textbf{- Snapshot Reserve Unusable Percent}

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space reserved but unusable.

[\texttt{-snapshot-spill \{<\texttt{integer}> [KB|MB|GB|TB|PB]\}] \textbf{- Snapshot Spill}

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by their Snapshot spill.
If Snapshot used space exceeds the Snapshot reserve it is considered to spill out of the reserve. This space cannot be used by the active file system until Snapshots are deleted.

`[-snapshot-spill-percent <percent>]` - Snapshot Spill Percent
If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use by the Snapshot spill.

`[-performance-metadata [<integer> {KB|MB|GB|TB|PB}]]` - Performance Metadata
If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use for performance optimization in the volume.

`[-performance-metadata-percent <percent>]` - Performance Metadata Percent
If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use for performance optimization in the volume.

`[-total-used [<integer> {KB|MB|GB|TB|PB}]]` - Total Used
If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by the volume, including the space used by the Snapshot reserve.

This is equivalent to the used field in the output of the `volume show` command.

`[-total-used-percent <percent_no_limit>]` - Total Used Percent
If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use by the volume, including the space used by the Snapshot reserve.

`[-physical-used [<integer> {KB|MB|GB|TB|PB}]]` - Total Physical Used Size
If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of physical space in use by the volume.

This differs from `total-used` space by the space that is reserved for future writes. The value includes blocks in use by Snapshot copies.

`[-physical-used-percent <percent_no_limit>]` - Physical Used Percentage
If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of physical space in use in the volume based on volume size including the space reserved for Snapshot copies.

### Examples
The following example shows how to display details for all volumes.

```
cluster1::> volume show-space
Vserver : nodevs
Volume : vol0

<table>
<thead>
<tr>
<th>Feature</th>
<th>Used</th>
<th>Used%</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Data</td>
<td>163.4MB</td>
<td>3%</td>
</tr>
<tr>
<td>Filesystem Metadata</td>
<td>172KB</td>
<td>0%</td>
</tr>
<tr>
<td>Inodes</td>
<td>2.93MB</td>
<td>0%</td>
</tr>
<tr>
<td>Snapshot Reserve</td>
<td>292.9MB</td>
<td>5%</td>
</tr>
<tr>
<td>Total Used</td>
<td>459.4MB</td>
<td>8%</td>
</tr>
<tr>
<td>Total Physical Used</td>
<td>166.4MB</td>
<td>3%</td>
</tr>
</tbody>
</table>

Vserver : thevs
Volume : rootvol

<table>
<thead>
<tr>
<th>Feature</th>
<th>Used</th>
<th>Used%</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Data</td>
<td>100KB</td>
<td>0%</td>
</tr>
</tbody>
</table>
```
The following example shows all Volumes that have a snap reserve greater than 2 MB:

```
cluster1::> volume show-space -snapshot-reserve >2m
Vserver : nodevs
Volume  : vol0
Feature                                    Used    Used%
----------------------------------------    -------    -----
User Data                                 163.4MB   3%
Filesystem Metadata                      172KB     0%
Inodes                                   2.93MB    0%
Snapshot Reserve                         292.9MB    5%
Total Used                               459.4MB    8%
Total Physical Used                      166.4MB    3%
```

2 entries were displayed.

*volume show* on page 1389
volume size

Set/Display the size of the volume.

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The volume size command allows the user to set or display the volume size. If new-size is not specified then the current volume size is displayed.

Parameters
-vserver <vserver name> - Vserver Name
This parameter can be used to specify the Vserver on which the volume is located.

-volume <volume name> - Volume Name
This parameter specifies the volume for which the user wants to set or display the size.

[-new-size <text>] - [+|-]<New Size>
This optional parameter specifies the size of the volume. It can be used to set the volume size to a particular number or grow/shrink the size by a particular amount. The size is specified as a number (preceded with a sign for relative growth/shrinkage) followed by a unit designation: k (kilobytes), m (megabytes), g (gigabytes), or t (terabytes). If the unit designation is not specified, bytes are used as the unit, and the specified number is rounded up to the nearest 4 KB. The minimum size for a flexible volume is 20 MB, and the maximum size depends on hardware platform and free space in the containing aggregate. If the volume’s space guarantee is currently disabled, its size cannot be increased. This parameter is not supported on Infinite Volumes that are managed by storage services.

Examples
The following example shows the size of a volume called vol1.

cluster1::> vol size vol1
(volume size)
vol size: Flexible volume 'vs1:vol1' has size 2g.

The following example sets the size of a volume called vol1 to 1GB.

cluster1::> vol size vol1 1g
(volume size)
vol size: Flexible volume 'vs1:vol1' size set to 1g.

The following example increases the size of a volume called vol1 by 500MB.

cluster1::> vol size vol1 +500m
(volume size)
vol size: Flexible volume 'vs1:vol1' size set to 1.49g.

The following example decreases the size of a volume called vol1 by 250MB.

cluster1::> vol size vol1 -250m
(volume size)
vol size: Flexible volume 'vs1:vol1' size set to 1.24g.
**volume transition-prepare-to-downgrade**

Verifies that there are no volumes actively transitioning from 7-mode to clustered Data ONTAP, and configures the transition feature for downgrade.

**Availability:** This command is available to `cluster` administrators at the `advanced` privilege level.

**Description**

The `volume transition-prepare-to-downgrade` command is used to verify that a volume is not currently being transitioned from 7-Mode to clustered Data ONTAP. This check must be done before reverting or downgrading a node.

**Examples**

**volume unmount**

Unmount a volume

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**

The `volume unmount` command unmounts a volume from its parent volume. The volume can be remounted at the same or a different location by using the `volume mount` command.

**Parameters**

- `-vserver <vserver name>` - Vserver Name
  
  This specifies the Vserver on which the volume is located.

- `-volume <volume name>` - Volume Name
  
  This specifies the volume that is to be unmounted.

**Examples**

The following example unmounts a volume named vol2 on a Vserver named vs0:

```
node::> volume unmount -vserver vs0 -volume vol2
```

**Related references**

- `volume mount` on page 1385

**volume aggregate commands**

Manage Infinite Volume aggregate operations

**volume aggregate vacate**

Move all Infinite Volume constituents from one aggregate to another.

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.
Description
The `volume aggregate vacate` command moves all constituents belonging to a given Infinite Volume from the source aggregate to the destination aggregate.

The `volume aggregate vacate` command is only supported for Infinite Volumes.

Parameters
- `vserver <vserver name>` - Vserver Name
  The name of the Vserver that owns the volume.

- `volume <volume name>` - Volume Name
  The name of the volume.

- `source-aggregate <aggregate name>` - Source Aggregate
  The source aggregate from which all Infinite Volume constituents are being moved.

- `destination-aggregate <aggregate name>` - Destination Aggregate
  The destination aggregate to which the Infinite Volume constituents are being moved.

- `foreground | -w (true|false)` - Foreground Process
  This specifies whether the operation runs as a foreground process. If this parameter is not specified, the default setting is `false` (the operation runs in the background). When set to `true`, the command will not return until the process completes.

Examples
The following example moves all constituents of Infinite Volume repo_vol from aggr1 to aggr2.

```
cluster1::> volume aggregate vacate -vserver vs0 -volume repo_vol -source-aggregate aggr1 -destination-aggregate aggr2
```

volume clone commands
Manage FlexClones

volume clone create
Create a FlexClone volume

Availability: This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

Description
The `volume clone create` command creates a FlexClone volume on the aggregate containing the specified parent volume. This command is only supported for flexible volumes. The maximum volume clone hierarchy depth is 500 and the default depth is 60. You can optionally specify the following attributes for the new FlexClone volume:

- Vserver on which the parent volume resides
- Name of the FlexClone parent snapshot
- Junction path where FlexClone volume should be mounted
- State of the junction path
- Space guarantee style (none, volume or file)
Comment

Whether the volume clone create command runs as a foreground or background process

Parameters

\(-vserver \text{ <vserver name> }\) - Vserver Name

This parameter specifies the Vserver on which the FlexClone volume is to be created. If only one data Vserver exists, you do not need to specify this parameter.

\(-\text{flexclone} \text{ <volume name> }\) - FlexClone Volume

This parameter specifies the name of the FlexClone volume. The name must be unique within the hosting Vserver.

\([-\text{type} \{\text{RW|DP}\}]\) - FlexClone Type

This parameter specifies the type of FlexClone volume. A read-only FlexClone volume is created if you specify the type as DP; otherwise a read-write FlexClone volume is created.

\(-\text{parent-vserver} \text{ <vserver name> }\) - FlexClone Parent Vserver

This parameter specifies the name of the Vserver to which the FlexClone parent volume belongs. If it is different from the Vserver on which the FlexClone volume is to be created, then the FlexClone volume inherits the export policies from the residing Vserver, and not from the FlexClone parent volume.

\(-\text{parent-volume} \text{ -b} \text{ <volume name> }\) - FlexClone Parent Volume

This parameter specifies the name of parent volume from which the FlexClone clone volume is derived.

\(-\text{parent-snapshot} \text{ <snapshot name> }\) - FlexClone Parent Snapshot

This specifies the name of the parent snapshot from which the FlexClone clone volume is derived.

\(-\text{junction-path} \text{ <junction path> }\) - Junction Path

This specifies the junction path at which the new FlexClone clone volume should be mounted.

\(-\text{junction-active} \{\text{true|false}\}\) - Junction Active

This optionally specifies whether the volume's junction path is active. The default setting is true. If the junction path is inactive, the volume does not appear in the Vserver's namespace. This parameter is available only at the advanced privilege level and higher.

\(-\text{space-guarantee} \{-s \{\text{none|volume}\}\}\) - Space Guarantee Style

This optionally specifies the space guarantee style for the FlexClone volume. A value of volume reserves space on the aggregate for the entire volume. A value of none reserves no space on the aggregate, meaning that writes can fail if the aggregate runs out of space. The default setting is inherited from the parent volume.

\(-\text{comment} \text{ <text> }\) - Comment

This optionally specifies a comment for the FlexClone volume.

\(-\text{foreground} \{\text{true|false}\}\) - Foreground Process

This optionally specifies whether the FlexClone volume create operation runs as a foreground process. The default setting is true (that is, the operation runs in the foreground).

\{ [-qos-policy-group <text>] \} - QoS Policy Group Name

This parameter optionally specifies which QoS policy group to apply to the FlexClone volume. The policy group defines measurable service level objectives (SLOs) that apply to the storage objects with which the policy group is associated. If you do not assign a policy group to the FlexClone volume, the system does not monitor and control the traffic to the volume.

\{ [-qos-adaptive-policy-group <text>]\} - QoS Adaptive Policy Group Name

This optionally specifies which QoS adaptive policy group to apply to the volume. This policy group defines measurable service level objectives (SLOs) and Service Level Agreements (SLAs) that adjust based on the volume allocated space or used space. This parameter is not supported on FlexGroups or Infinite Volumes.
[-caching-policy <text>] - Caching Policy Name

This optionally specifies the caching policy to apply to the volume. A caching policy defines how the system caches this volume's data in Flash Cache modules. If a caching policy is not assigned to this volume, the system uses the caching policy that is assigned to the containing Vserver. If a caching policy is not assigned to the containing Vserver, the system uses the default cluster-wide policy. This parameter is not supported on Infinite Volumes. The available caching policies are:

- none - Does not cache any user data or metadata blocks.
- auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
- meta - Read caches only metadata blocks.
- random_read - Read caches all metadata and randomly read user data blocks.
- random_read_write - Read caches all metadata, randomly read and randomly written user data blocks.
- all_read - Read caches all metadata, randomly read, and sequentially read user data blocks.
- all_read_random_write - Read caches all metadata, randomly read, sequentially read and randomly written user data.
- all - Read caches all data blocks read and written. It does not do any write caching.
- noread-random_write - Write caches all randomly overwritten user data blocks. It does not do any read caching.
- meta-random_write - Read caches all metadata and write caches randomly overwritten user data blocks.
- random_read-write_random_write - Read caches all metadata, randomly read and randomly written user data blocks. It also write caches randomly overwritten user data blocks.
- all_read-random_write - Read caches all metadata, randomly read, and sequentially read user data blocks. It also write caches randomly overwritten user data blocks.
- all_read_random_write-random_write - Read caches all metadata, randomly read, sequentially read and randomly written user data. It also write caches randomly overwritten user data blocks.
- all-random_write - Read caches all data blocks read and written. It also write caches randomly overwritten user data blocks.

Note that in a caching-policy name, a hyphen (-) separates read and write policies. Default caching-policy is auto.

[-vserver-dr-protection {protected|unprotected}] - Vserver DR Protection

This optionally specifies whether the volume should be protected by Vserver level SnapMirror. This parameter is applicable only if the Vserver is the source of a Vserver level SnapMirror relationship. By default the clone volume will inherit this value from the parent volume. This parameter is not supported on Infinite Volumes.

[-uid <integer>] - Volume-Level UID

This parameter optionally specifies a volume-level user ID (UID). All files and directories in a FlexClone volume will inherit this UID.

[-gid <integer>] - Volume-Level GID

This parameter optionally specifies a volume-level group ID (GID). All files and directories in a FlexClone volume will inherit this GID.
volume clone show
Display a list of FlexClones

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The volume clone show command displays information about FlexClone clone volumes. This command is only supported for flexible volumes. By default, the command displays the following information about all FlexClone volume clones:

- Vserver name
- FlexClone volume name
- Parent volume name
- Parent snapshot name
- Whether a FlexClone volume is online or offline

To display detailed information about all FlexClone volumes, run the command with the -instance parameter.

Parameters
[-fields <fieldname>, ...]
Selects the fields to be displayed.

[-estimate]
Displays an estimate of the free disk space required in the aggregate to split the indicated clone volume from its underlying parent volume. The value reported may differ from the space actually required to perform the split, especially if the clone volume is changing when the split is being performed.

[-instance]
Displays detailed information about FlexClone volumes. If -flexclone is also specified, the command displays detailed information about the FlexClone volume.

-vserver <vserver name> - Vserver Name
Selects summary information for the FlexClone volumes on the specified Vserver. If -flexclone is also specified, the command displays detailed information about the specified FlexClone volume.

-flexclone <volume name> - FlexClone Volume
Selects summary information for the specified FlexClone volume. If -vserver is also specified, the command displays detailed information about the specified FlexClone volume.

-type {RW|DP} - FlexClone Type
Selects information for the specified type of FlexClone volume. The type can be specified as either read-only (DP) or read-write (RW).

-parent-vserver <vserver name> - FlexClone Parent Vserver
Selects summary information for the FlexClone volumes that are clone volumes in the specified parent Vserver.

-parent-volume -b <volume name> - FlexClone Parent Volume
Selects summary information for the FlexClone volumes that are clones of the specified parent volume.
[-parent-snapshot <snapshot name>] - FlexClone Parent Snapshot
Selects summary information for the FlexClone volumes that are clones of the parent volume to which the specified snapshot belongs.

[-state {online|restricted|offline|force-online|force-offline|mixed}] - FlexClone Volume State
Selects summary information for the FlexClone volumes that are in the specified state.

[-junction-path <junction path>] - Junction Path
Selects summary information for the FlexClone volumes that have the specified junction path.

[-junction-active {true|false}] - Junction Active
Selects summary information for the FlexClone volumes that have the specified junction path status.

[-space-guarantee |-s {none|volume}] - Space Guarantee Style
If this parameter is specified, the command displays information only about the volumes that have the specified space guarantee style.

[-space-guarantee-enabled {true|false}] - Space Guarantee In Effect
Selects summary information for the FlexClone volumes that have the specified space-guarantee setting.

[-aggregate <aggregate name>] - FlexClone Aggregate
Selects summary information for the FlexClone volumes that reside on the specified storage aggregate.

[-dsid <integer>] - FlexClone Data Set ID
Selects summary information for the FlexClone volumes that have the specified Data Set ID.

[-msid <integer>] - FlexClone Master Data Set ID
Selects summary information for the FlexClone volumes that have the specified Master Data Set ID.

[-size {<integer>[KB|MB|GB|TB|PB]}] - FlexClone Size
Selects summary information for the FlexClone volumes that have the specified size.

[-used {<integer>[KB|MB|GB|TB|PB]}] - Used Size
Selects summary information for the FlexClone volumes that have the specified amount of used space.

[-split-estimate {<integer>[KB|MB|GB|TB|PB]}] - Split Estimate
Selects summary information for the FlexClone volumes that require the specified amount of free disk space for splitting from the parent.

[-inodes-processed <integer>] - Inodes Processed
Selects summary information for the FlexClone volumes that have the specified number of Inodes processed for splitting the FlexClone volume from its parent volume.

[-inodes-total <integer>] - Total Inodes
Selects summary information for the FlexClone volumes that have the specified number of total Inodes.

[-inode-percentage-complete <integer>] - Inode Percentage Complete
Selects summary information for the FlexClone volumes that have specified percentage of Inodes processed for splitting the FlexClone volume from its parent volume.

[-blocks-scanned <integer>] - Blocks Scanned
Selects summary information for the FlexClone volumes that have the specified number of blocks scanned for splitting the FlexClone volume from its parent volume.

[-blocks-updated <integer>] - Blocks Updated
Selects summary information for the FlexClone volumes that have the specified number of blocks updated for after splitting the FlexClone volume from its parent volume.

[-comment <text>] - Comment
Selects summary information for the FlexClone volumes that have the specified comment.
[\texttt{-qos-policy-group <text>}] - QoS Policy Group Name
Selects summary information for the FlexClone volumes that have the specified QoS policy group.

[\texttt{-qos-adaptive-policy-group <text>}] - QoS Adaptive Policy Group Name
Selects summary information for the FlexClone volumes that have the specified QoS adaptive policy group.

[\texttt{-caching-policy <text>}] - Caching Policy Name
This optionally specifies the caching policy to apply to the volume. A caching policy defines how the system caches this volume's data in Flash Cache modules. If a caching policy is not assigned to this volume, the system uses the caching policy that is assigned to the containing Vserver. If a caching policy is not assigned to the containing Vserver, the system uses the default cluster-wide policy. This parameter is not supported on Infinite Volumes. The available caching policies are:

- none - Does not cache any user data or metadata blocks.
- auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
- meta - Read caches only metadata blocks.
- random_read - Read caches all metadata and randomly read user data blocks.
- random_read_write - Read caches all metadata, randomly read and randomly written user data blocks.
- all_read - Read caches all metadata, randomly read, and sequentially read user data blocks.
- all_read_random_write - Read caches all metadata, randomly read, sequentially read and randomly written user data.
- all - Read caches all data blocks read and written. It does not do any write caching.
- noread_random_write - Write caches all randomly overwritten user data blocks. It does not do any read caching.
- meta_random_write - Read caches all metadata and write caches randomly overwritten user data blocks.
- random_read_random_write - Read caches all metadata, randomly read and randomly written user data blocks. It also write caches randomly overwritten user data blocks.
- all_read_random_write - Read caches all metadata, randomly read, and sequentially read user data blocks. It also write caches randomly overwritten user data blocks.
- all_random_write - Read caches all data blocks read and written. It also write caches randomly overwritten user data blocks.
- meta_random_write_random_write - Read caches all metadata, randomly read, sequentially read and randomly written user data.
- all_read_random_write_random_write - Read caches all metadata, randomly read, sequentially read and randomly written user data. It also write caches randomly overwritten user data blocks.
- all_random_write - Read caches all data blocks read and written. It also write caches randomly overwritten user data blocks.

Note that in a caching-policy name, a hyphen (-) separates read and write policies. Default caching-policy is auto.

[\texttt{-parent-vol-type <volAccessType>}] - Parent volume type (privilege: advanced)
Selects summary information for the FlexClone volumes that are clones of the parent volumes with the specified type.

[\texttt{-flexclone-used-percent <percent>}] - FlexClone Used Percentage
Selects summary information for the FlexClone volumes that have the specified percentage of used space.

[\texttt{-vserver-dr-protection [protected|unprotected]}] - Vserver DR Protection
Selects summary information for the FlexClone volumes that have the specified type of Vserver SnapMirror protection. This parameter is applicable only if the Vserver is the source of a Vserver level SnapMirror relationship.
[-block-percentage-complete <integer>] - Block Percentage Complete
Selects summary information for the FlexClone volumes that have specified percentage of Blocks processed for splitting the FlexClone volume from its parent volume.

[-uid <integer>] - Volume-Level UID
Selects summary information for the FlexClone volumes that are created with the specified volume-level UID.

[-gid <integer>] - Volume-Level GID
Selects summary information for the FlexClone volumes that are created with the specified volume-level GID.

Examples

**volume clone split commands**

Commands to manage FlexClone split

**volume clone split estimate**

Estimates the space required by the containing-aggregate to split the FlexClone volume

*Availability:* This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

*Description*
The `volume clone split estimate` command displays an estimate of the free disk space required in the aggregate to split the indicated clone volume from its underlying parent volume. The value reported might differ from the space actually required to perform the split, especially if the clone volume is changing when the split is being performed. This command is only supported for flexible volumes.

*Parameters*

[-vserver <vserver name>] - Vserver Name
This specifies the estimates for free disk space required for splitting FlexClone volumes residing on this Vserver. If the `-flexclone` option is also specified, then the command displays the free disk space estimate only for the specified FlexClone volume residing on the specified Vserver.

[-flexclone <volume name>] - FlexClone Volume
This specifies the free disk space estimate for splitting this FlexClone volume.

[-type {RW|DP}] - FlexClone Type
This parameter specifies the type of FlexClone volume. A read-only FlexClone volume is created if you specify the `type` as DP; otherwise a read-write FlexClone volume is created.

[-parent-vserver <vserver name>] - FlexClone Parent Vserver
This specifies the free disk space estimates for splitting the FlexClone volumes that are clones in the specified parent Vserver.

[-parent-volume |-b <volume name>] - FlexClone Parent Volume
This specifies the free disk space estimates for splitting the FlexClone volumes cloned off this parent volume.

[-parent-snapshot <snapshot name>] - FlexClone Parent Snapshot
This specifies the free disk space estimates for splitting the FlexClone volumes cloned off this parent snapshot.

[-state {online|restricted|offline|force-online|force-offline|mixed}] - FlexClone Volume State
This specifies the free disk space estimates for splitting the FlexClone volumes with the specified state.

[-junction-path <junction path>] - Junction Path
This specifies the free disk space estimates for splitting the FlexClone volumes mounted at this junction path.
[-junction-active {true|false}] - Junction Active
  If this specified, the command displays the free disk space estimate for splitting the FlexClone volumes with
  the specified junction path status.

[-space-guarantee -s {none|volume}] - Space Guarantee Style
  This specifies the free disk space estimates for splitting the FlexClone volumes with the specified type of
  space guarantee.

[-space-guarantee-enabled {true|false}] - Space Guarantee In Effect
  This specifies the free disk space estimates for splitting the FlexClone volumes with the specified state of
  space guarantee.

[-aggregate <aggregate name>] - FlexClone Aggregate
  This specifies the free disk space estimates for splitting the FlexClone volumes residing on the specified
  aggregate.

[-dsid <integer>] - FlexClone Data Set ID
  This specifies the free disk space estimates for splitting the FlexClone volume with the specified DSID (data
  set ID).

[-msid <integer>] - FlexClone Master Data Set ID
  This specifies the free disk space estimates for splitting the FlexClone volumes with the specified MSID
  (master data set ID).

[-size {<integer> [KB|MB|GB|TB|PB]}] - FlexClone Size
  This specifies the free disk space estimates for splitting FlexClone volumes with the specified size.

[-used {<integer> [KB|MB|GB|TB|PB]}] - Used Size
  This specifies the free disk space estimates for splitting the FlexClone volumes with the specified amount of
  used disk space.

[-split-estimate {<integer> [KB|MB|GB|TB|PB]}] - Split Estimate
  This specifies the free disk space estimates for splitting the FlexClone volumes which match with the specified
  free disk space estimate for splitting.

[-inodes-processed <integer>] - Inodes Processed
  This specifies the free disk space estimates for splitting the FlexClone volumes for which the specified number
  of Inodes have been processed already.

[-inodes-total <integer>] - Total Inodes
  This specifies the free disk space estimates for splitting the FlexClone volumes for which the specified total
  number of inodes need to be processed.

[-inode-percentage-complete <integer>] - Inode Percentage Complete
  This specifies the free disk space estimates for splitting the FlexClone volumes for which the specified
  percentage of Inode processing has been completed.

[-blocks-scanned <integer>] - Blocks Scanned
  This specifies the free disk space estimates for splitting the FlexClone volumes for which the specified number
  of blocks have been scanned.

[-blocks-updated <integer>] - Blocks Updated
  This specifies the free disk space estimates for splitting the FlexClone volumes for which the specified number
  of blocks have been updated.

[-comment <text>] - Comment
  This specifies the free disk space estimates for splitting the FlexClone volumes that have the specified value
  for the comment field.
[-qos-policy-group <text>] - QoS Policy Group Name
This parameter optionally specifies which QoS policy group to apply to the FlexClone volume. The policy group defines measurable service level objectives (SLOs) that apply to the storage objects with which the policy group is associated. If you do not assign a policy group to the FlexClone volume, the system does not monitor and control the traffic to the volume.

[-qos-adaptive-policy-group <text>] - QoS Adaptive Policy Group Name
This optionally specifies which QoS adaptive policy group to apply to the volume. This policy group defines measurable service level objectives (SLOs) and Service Level agreements (SLAs) that adjust based on the volume allocated space or used space. This parameter is not supported on FlexGroups or Infinite Volumes.

[-caching-policy <text>] - Caching Policy Name
This specifies the free disk space estimates for splitting the FlexClone volumes that are clones with the specified caching policy.

[-parent-vol-type <volAccessType>] - Parent volume type (privilege: advanced)
This specifies the free disk space estimates for splitting the FlexClone volumes that are clones of the parent volumes with the specified type.

[-flexclone-used-percent <percent>] - FlexClone Used Percentage
This specifies the free disk space estimates for splitting the FlexClone volumes that are clones with the specified percentage of used space.

[-vserver-dr-protection {protected|unprotected}] - Vserver DR Protection
This specifies the free disk space estimates for splitting the FlexClone volumes that are clones with the specified Vserver SnapMirror protection. This parameter is not supported on Infinite Volumes.

[-block-percentage-complete <integer>] - Block Percentage Complete
This specifies the free disk space estimates for splitting the FlexClone volumes for which the specified percentage of Block processing has been completed.

[-uid <integer>] - Volume-Level UID
This specifies the free disk space estimates for splitting the FlexClone volumes that are clones with the specified volume-level UID.

[-gid <integer>] - Volume-Level GID
This specifies the free disk space estimates for splitting the FlexClone volumes that are clones with the specified volume-level GID.

Examples

volume clone show on page 1421

volume clone split show
Show the status of FlexClone split operations in-progress

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The volume clone split show command displays the progress information of all the active FlexClone volume splitting jobs. This command is only supported for flexible volumes. By default, this command displays the following information:

• Vserver name
• FlexClone volume name
- Number of inodes processed during clone splitting
- Total inodes to be processed during clone splitting
- Percentage of inodes processed
- Percentage of blocks processed
- Total number of blocks scanned for clone splitting
- Total number of blocks updated for clone splitting

If the -instance option is also specified, detailed information about all splitting jobs is displayed.

**Parameters**

[-fields <fieldname>, ...]
This specifies the fields to be displayed, for all the ongoing FlexClone splitting jobs.

[-instance]
This specifies the command to display detailed information about the ongoing FlexClone volume splitting jobs.

[-vserver <vserver name>] - Vserver Name
Selects information about the ongoing FlexClone volume splitting jobs for all FlexClone volumes on this Vserver.

[-flexclone <volume name>] - FlexClone Volume
Selects information about the ongoing FlexClone volume splitting jobs for this FlexClone volume.

[-inodes-processed <integer>] - Inodes processed
Selects information about all the ongoing FlexClone splitting jobs which have the specified number of Inodes processed.

[-inodes-total <integer>] - Total Inodes
Selects information about all the ongoing FlexClone splitting jobs that have the specified number of total Inodes to be processed.

[-inode-percentage-complete <integer>] - Inode Percentage complete
Selects information about all the ongoing FlexClone splitting jobs that have the specified percentage of Inode processing completed.

[-block-percentage-complete <integer>] - Block Percentage complete
Selects information about all the ongoing FlexClone splitting jobs that have the specified percentage of Block processing completed.

[-blocks-scanned <integer>] - Blocks Scanned
Selects information about all the ongoing FlexClone splitting jobs that have the specified number of blocks scanned.

[-blocks-updated <integer>] - Blocks Updated
Selects information about all the ongoing FlexClone splitting jobs that have the specified number of blocks updated.

**Examples**

**volume clone split start**

Split a FlexClone from the parent volume

**Availability**: This command is available to cluster and Vserver administrators at the admin privilege level.
**Description**

The `volume clone split start` command starts a job to separate the FlexClone volume from the underlying parent volume. Both, the parent and the FlexClone volumes will be available for the duration of the split operation. After the job starts, you can stop it using the `volume clone split stop` command. You can also stop the job using the `job stop` command. You can monitor the current progress of the job using the `volume clone split show` and `job show` commands. This command is only supported for flexible volumes. This command is not supported on volumes that are being protected as part of a Vserver level SnapMirror.

**Parameters**

- `-vserver <vserver name>` - Vserver Name
  
  This specifies the Vserver that the FlexClone volume exists on.

- `-flexclone <volume name>` - FlexClone Volume
  
  This specifies the FlexClone volume that will be split from its parent volume.

- `[-foreground [true]]` - Foreground Process
  
  This specifies whether the clone splitting job will run as a foreground job. The default value of this option is `true`.

**Examples**

**Related references**

- `volume clone split stop` on page 1428
- `job stop` on page 162
- `volume clone split show` on page 1426
- `job show` on page 155

**volume clone split stop**

Stop an ongoing FlexClone split job

**Availability:** This command is available to cluster and Vserver administrators at the `admin` privilege level.

**Description**

The `volume clone split stop` command stops the process of separating the FlexClone volume from its underlying parent volume, but does not lose any of the progress achieved while the split process was active. That is, all the clone volume blocks already separated from the parent volume remain separated. If you restart the split operation, splitting process begins from the beginning because no information about previously achieved progress is saved, but previously split blocks are not re-split. This command is only supported for flexible volumes.

**Parameters**

- `-vserver <vserver name>` - Vserver Name
  
  This specifies the Vserver that the FlexClone volume exists on.

- `-flexclone <volume name>` - FlexClone Volume
  
  This specifies the FlexClone volume whose separation from the parent volume will be stopped.
volume efficiency commands

Manage volume efficiency

The volume efficiency commands enable you to manage efficiency on volumes. The stat command is not supported on Infinite Volumes. The volume efficiency commands are not supported on Infinite Volumes that are managed by storage services.

volume efficiency check

Scrub efficiency metadata of a volume

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description

This command verifies and updates the fingerprint database for the specified volume. This command is not supported on FlexGroups or Infinite Volumes that are managed by storage services.

Parameters

-vserver <vserver name> - Vserver Name
    Specifies the Vserver on which the volume is located.

{-volume <volume name> - Volume Name
    Specifies the volume on which the verify operation needs to be started.

|-path </vol/volume> - Volume Path
    Specifies the volume path on which the verify operation needs to be started.

[-delete-checkpoint | -d {true|false}] - Delete Checkpoint
    Deletes existing checkpoint.

Examples

The following example runs volume efficiency check with delete checkpoint option turned on.

    cluster1::> volume efficiency check -vserver vs1 -volume voll -delete-checkpoint true

volume efficiency modify

Modify the efficiency configuration of a volume

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

This command is used to set or modify the schedule, policy and various other efficiency configuration options on a volume. This command is not supported on Infinite Volumes that are managed by storage services.

Parameters

-vserver <vserver name> - Vserver Name
    This specifies the Vserver on which the volume is located.
{-volume <volume name> - Volume Name
   This specifies the volume on which efficiency options need to be modified.
}
{-path </vol/volume> - Volume Path
   This specifies the volume path on which efficiency options need to be modified.
}
{-schedule <text> - Schedule
   This option is used to set and modify the schedule.

   schedule is [day_list][@hour_list] or [hour_list][@day_list] or - or auto or manual

   The day_list specifies the days of the week that an efficiency operation should run. It is a list of the first three letters of the day (sun, mon, tue, wed, thu, fri, sat), separated by a comma. Day ranges such as mon-fri can also be used. The default day_list is sun-sat. The names are not case sensitive.

   The hour_list specifies the hours of each scheduled day that an efficiency operation should run. The hour_list is from 0 to 23, separated by a comma. Hour ranges such as 8-17 are allowed. Step values can be used in conjunction with ranges (For example, 0-23/2 means every two hours in a day). The default hour_list is 0, i.e. at midnight of each scheduled day.

   When efficiency is enabled on a volume for the first time, an initial schedule is assigned to the volume. This initial schedule is sun-sat@0, which means run once every day at midnight.

   If "-" is specified, no schedule is set on the volume. The auto schedule string triggers an efficiency operation depending on the amount of new data written to the volume. The manual schedule string prevents SIS from automatically triggering any operations and disables change-logging. This schedule string can only be used on SnapVault destination volumes. The use of this schedule is mainly desirable when inline compression is enabled on a SnapVault destination volume and background processing is not necessary.

   Note that schedule and policy are mutually exclusive options.
}
{-policy <text> - Efficiency Policy Name
   This option is used to set an efficiency policy. The policy cannot be changed to the predefined inline-only policy when there is an active background operation on the volume.

   Note that schedule and policy are mutually exclusive options.
}
{-compression-type {none|secondary|adaptive} - Compression Type (privilege: advanced)
   This option is used to specify the size of compression group on the volume. The default value is determined based on the platform.
}
{-compression {true|false} - Compression
   This option is used to enable and disable compression. The default value is false.
}
{-inline-compression {true|false} - Inline Compression
   This option is used to enable and disable inline compression. Inline compression can be enabled only if compression is enabled. The default value is false.

   You can use the inline-only predefined efficiency policy to run inline compression without the need of any background efficiency operations.
}
{-inline-dedupe {true|false} - Inline Dedupe
   This option is used to enable and disable inline deduplication. The default value is false.

   You can use the inline-only predefined efficiency policy to run inline deduplication without the need of any background efficiency operations.
}
{-data-compaction {true|false} - Data Compaction
   This option is used to enable and disable data compaction. The default value is false.
}
{-cross-volume-inline-dedupe {true|false} - Cross Volume Inline Deduplication
   This option is used to enable and disable cross volume inline deduplication. The default value is false.
[-cross-volume-background-dedupe {true|false}]- Cross Volume Background Deduplication

This option is used to enable and disable cross volume background deduplication. The default value is false.

Examples
The following examples modify efficiency options on a volume.

```bash
cluster1::> volume efficiency modify -vserver vs1 -volume vol1 -schedule sun-sat@12
cluster1::> volume efficiency modify -vserver vs1 -volume vol1 -policy policy1
cluster1::> volume efficiency modify -vserver vs1 -volume vol1 -compression true -inline-compression true -inline-dedupe true -data-compaction true -cross-volume-inline-dedupe true -cross-volume-background-dedupe true
```

volume efficiency off

Disables efficiency on a volume

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The `volume efficiency off` command disables efficiency on a volume. This command is not supported on Infinite Volumes that are managed by storage services.

Parameters
- `vserver <vserver name>` - Vserver Name
  Specifies the Vserver on which the volume is located.
- `{ -volume <volume name> - Volume Name
  Specifies the name of the volume on which efficiency needs to be disabled.
- `| -path </vol/volume> } - Volume Path
  Specifies the volume path on which efficiency needs to be disabled.

Examples
The following examples disable efficiency on a volume:

```bash
cluster1::> volume efficiency off -vserver vs1 -volume vol1
cluster1::> volume efficiency off -vserver vs1 -path /vol/vol1
```

volume efficiency on

Enable efficiency on a volume

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The `volume efficiency on` command enables efficiency on a volume. The specified volume must be online. Efficiency operations will be started periodically according to a per volume schedule or policy. The `volume efficiency modify` command can be used to modify schedule and the `volume efficiency policy modify` command can be used to modify
policy. You can also manually start an efficiency operation with the `volume efficiency start` command. This command is not supported on Infinite Volumes that are managed by storage services.

**Parameters**

- `-vserver <vserver name>` - Vserver Name
  This specifies the Vserver on which the volume is located.

- `{ -volume <volume name> }` - Volume Name
  This specifies the name of the volume on which efficiency needs to be enabled.

- `-path </vol/volume>` - Volume Path
  This specifies the volume path on which efficiency needs to be enabled.

**Examples**
The following examples enable efficiency on a volume.

```
cluster1::> volume efficiency on -vserver vs1 -volume vol1
cluster1::> volume efficiency on -vserver vs1 -path /vol/vol1
cluster1::> volume efficiency on -vserver vs1 -volume vol1 -needs-upgrade true
cluster1::> volume efficiency on -vserver vs1 -path /vol/vol1 -needs-upgrade true
```

**volume efficiency prepare-to-downgrade**

Identify any incompatible volumes or Snapshot copies before downgrade

**Availability:** This command is available to cluster and Vserver administrators at the advanced privilege level.

**Description**
The `volume efficiency prepare-to-downgrade` command updates efficiency configurations and metadata to be compatible with releases prior to ONTAP 9. This command also disables the use of incompatible efficiency features. This command is not supported on FlexGroups.

**Parameters**

- `-disable-feature-set <downgrade version>` - Data ONTAP Version
  This parameter specifies the Data ONTAP version that introduced new volume efficiency feature set.

**Examples**
The following example disables the features introduced in Data ONTAP 8.3.1

```
cluster1::*> volume efficiency prepare-to-downgrade -disable-feature-set 8.3.1
```

The following example disables the features introduced in Data ONTAP 8.3.2.
volume efficiency promote

Add a volume to the preferred set of volumes for efficiency processing

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
Use the volume efficiency promote command to promote a volume from deprioritized state back to auto state. This command is not supported on Infinite Volumes that are managed by storage services.

Parameters
- vserver <vserver name> - Vserver Name
  This specifies the Vserver on which the volume is located.

  { -volume <volume name> - Volume Name
    This specifies the name of the volume on which auto scheduling needs to be restarted.
  | -path </vol/<volume>} - Volume Path
    This specifies the volume path on which auto scheduling needs to be restarted.

Examples
The following examples promote a volume from deprioritized state back to auto state.

cluster1::> volume efficiency promote -vserver vs1 -volume voll

volume efficiency revert-to

Reverts volume efficiency metadata

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The volume efficiency revert-to command reverts the format of volume efficiency metadata for the volume to the given version of Data ONTAP. This command is not supported on FlexGroups.

Parameters
- vserver <vserver name> - Vserver Name
  This specifies the Vserver on which the volume is located.
{ -volume <volume name> - Volume Name
  This specifies the name of the volume for which volume efficiency metadata needs to be reverted.
}

| -path </vol/volume> | Volume Path
|---------------------|
| This specifies the volume path for which volume efficiency metadata needs to be reverted.

[ -version <revert version> ] - Revert to Version
|---------------------|
| Specifies the version of Data ONTAP to which the volume efficiency metadata needs to be formatted.

[ -delete | -d {true|false} ] - Delete Existing Metatfile on Revert
|---------------------|
| If set to true, this parameter specifies that the volume efficiency metadata be deleted instead of reverting its format. By default this parameter is set to false.

[ -clean-up | -c {true|false} ] - Delete Previously Downgraded Metafiles
|---------------------|
| If set to true, this parameter specifies that the volume efficiency metadata already reverted using volume efficiency revert-to be deleted. By default this parameter is set to false.

[ -revert-adaptive-compression {true|false} ] - Downgrade to minor version
|---------------------|
| If set to true, this parameter Specifies that the volume efficiency metadata needs to be reverted to minor version of Data ONTAP. By default this parameter is set to false.

[ -check-snapshot {true|false} ] - Revert ignore snapshots
|---------------------|
| If set to false, this parameter specifies that the volume efficiency revert will not check for Snapshot copies created by previous releases of Data ONTAP. By default this parameter is set to true.

**Examples**

The following examples reverts volume efficiency metadata on a volume named vol1 located in vserver vs1 to version 8.3.

```
cluster1::> volume efficiency revert-to -vserver vs1 -volume vol1 -version 8.3
```
```
cluster1::> volume efficiency revert-to -vserver vs1 -path /vol/vol1 -version 8.3
```

**volume efficiency show**

Display a list of volumes with efficiency

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The volume efficiency show command displays the information about storage efficiency of volumes. The command output depends on the parameter or parameters specified. If no parameters are specified, the command displays the following information for all volumes with efficiency:

- Vserver: Vserver the volume belongs to.
- Volume: Name of the volume.
- State: Current state of efficiency on the volume (Enabled, Disabled, or Mixed).
- Status: Status of the efficiency on the volume. Following are the possible values:
  - Active: An efficiency operation is currently running.
  - Idle: There are no efficiency operations running.
  - Initializing: An efficiency operation is being initialized.
Undoing: Efficiency is being undone on the volume.

Pending: An efficiency operation is queued.

Downgrading: An efficiency operation necessary to downgrade the efficiency metafiles to a previous Data ONTAP release is active.

Disabled: Efficiency is disabled on the volume.

Status is not supported for Infinite Volumes and will display a value of "."

- Progress: The progress of the current efficiency operation with information as to which stage of the efficiency process is currently in progress and how much data is processed for that stage. For example: "25 MB Scanned", "20 MB Searched", "500 KB (2%) Compressed", "40 MB (20%) Done", "30 MB Verified". Progress is not supported for Infinite Volumes and will display a value of "."

To display detailed information, run the command with the -l or -instance parameter. The detailed view provides all information in the previous list and the following additional information (fields not supported by Infinite Volumes will display a value of "."):  

- Path: Volume Path.
- Compression: Current state of compression on the volume (Enabled or Disabled).
- Inline Compression: Current state of inline compression on the volume (Enabled or Disabled).
- Type: Type of volume (Regular or SnapVault).
- Schedule: The schedule of efficiency operation for the volume.
- Policy: Efficiency policy for the volume.
- Minimum Blocks Shared: The minimum number of adjacent blocks in a file that can be shared.
- Blocks Skipped Sharing: Blocks skipped sharing because of the minimum block share value. This parameter is not supported on Infinite Volumes.
- Last Operation State: Status of the last operation (Success or Failure). Not supported on Infinite Volumes.
- Last Successful Operation Begin: The time and date at which the last successful operation began. This parameter is not supported on Infinite Volumes.
- Last Successful Operation End: The time and date at which the last successful operation ended. This parameter is not supported on Infinite Volumes.
- Last Operation Begin: The time and date at which the last operation began. This parameter is not supported on Infinite Volumes.
- Last Operation End: The time and date at which the last operation ended. This parameter is not supported on Infinite Volumes.
- Last Operation Size: The size of the last operation. This parameter is not supported on Infinite Volumes.
- Last Operation Error: The error encountered by the last operation. This parameter is not supported on Infinite Volumes.
- Change Log Usage: The percentage of the change log that is used. This parameter is not supported on Infinite Volumes.
- Logical Data: The total logical data in the volume, and how much is reached compared to the deduplication logical data limit. This parameter is not supported on Infinite Volumes.
- Queued Job: The job that is queued. Following are the possible values:
  - -: There are no queued jobs.
- **scan**: A job to process existing data is queued.
- **start**: A job to process newly added data is queued.
- **check**: A job to eliminate stale data from the fingerprint database is queued.
- **downgrading**: An efficiency operation necessary to downgrade the efficiency metafiles to a previous Data ONTAP release is queued.

- Stale Fingerprints: The percentage of stale entries in the fingerprint database. If this is greater than 20 percent a subsequent `volume efficiency start` operation triggers the verify operation, which might take a long time to complete. This parameter is not supported on Infinite Volumes.

- Inline Dedupe: Current state of inline deduplication on the volume (Enabled or Disabled).
- Cross Volume Inline Deduplication: Current state of cross volume inline deduplication on the volume (Enabled or Disabled).
- Cross Volume Background Deduplication: Current state of cross volume background deduplication on the volume (Enabled or Disabled).
- Inline Adaptive Data Compaction: Whether Inline Adaptive Data Compaction is enabled or disabled on the volume. When enabled, Data ONTAP combines data fragments to reduce on-disk block consumption.

You can specify additional parameters to display information that matches only those parameters. For example, to display information only about volumes with efficiency in Vserver vs1, run the command with the `-vserver vs1` parameter.

No information is displayed for Infinite Volumes that are managed by storage services.

**Parameters**

```
[-fields <fieldname>, ...]  # This specifies the fields that need to be displayed. The fields Vserver and volume name are the default fields.

[-1]  # This option displays detailed information about the volumes with efficiency.

[-instance]  # If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver Name  # Displays information only for those volumes that match the specified Vserver.

[-volume <volume name>] - Volume Name  # Displays information only for those volumes that match the specified volume.

[-path </vol/volume>] - Volume Path  # Displays information only for those volumes that match the specified volume path.

[-state {Disabled|Enabled|Mixed}] - State  # Displays information only for those volumes that match the specified state.

[-op-status <Efficiency status>] - Status  # Displays information only for those volumes that match the specified operation status. This parameter is not supported on Infinite Volumes.

[-progress <text>] - Progress  # Displays information only for those volumes that match the specified progress. This parameter is not supported on Infinite Volumes.

[-type {Regular|SnapVault}] - Type  # Displays information only for those volumes that match the specified type of volume.
```
[-schedule <text>] - Schedule
Displays information only for those volumes that match the specified schedule.

[-policy <text>] - Efficiency Policy Name
Displays information only for those volumes that match the specified policy.

[-compression-type {none|secondary|adaptive}] - Compression Type (privilege: advanced)
Displays information about the type of compression on the volume[adaptive or secondary].

[-blks-skipped-sharing <integer>] - Blocks Skipped Sharing
Displays information only for those volumes that match the specified blocks skipped sharing. This parameter is not supported on Infinite Volumes.

[-last-op-state <text>] - Last Operation State
Displays information only for those volumes that match the specified last operation state. This parameter is not supported on Infinite Volumes.

[-last-success-op-begin <Date>] - Last Success Operation Begin
Displays information only for those volumes that match the specified last successful operation begin time. This parameter is not supported on Infinite Volumes.

[-last-success-op-end <Date>] - Last Success Operation End
Displays information only for those volumes that match the specified last successful operation end time. This parameter is not supported on Infinite Volumes.

[-last-op-begin <Date>] - Last Operation Begin
Displays information only for those volumes that match the specified last operation begin time. This parameter is not supported on Infinite Volumes.

[-last-op-end <Date>] - Last Operation End
Displays information only for those volumes that match the specified last operation end time. This parameter is not supported on Infinite Volumes.

[-last-op-size {<integer>[KB|MB|GB|TB|PB]}] - Last Operation Size
Displays information only for those volumes that match the specified last operation size. This parameter is not supported on Infinite Volumes.

[-last-op-error <text>] - Last Operation Error
Displays information only for those volumes that match the specified last operation error. This parameter is not supported on Infinite Volumes.

[-changelog-usage <percent_no_limit>] - Changelog Usage
Displays information only for those volumes that match the specified change log usage. This parameter is not supported on Infinite Volumes.

[-logical-data-size {<integer>[KB|MB|GB|TB|PB]}] - Logical Data Size
Displays information only for those volumes that match the specified logical data size. This parameter is not supported on Infinite Volumes.

[-logical-data-limit {<integer>[KB|MB|GB|TB|PB]}] - Logical Data Limit
Displays information only for those volumes that match the specified logical data limit. This parameter is not supported on Infinite Volumes.

[-logical-data-percent <percent_no_limit>] - Logical Data Percent
Displays information only for those volumes that match the specified logical data percentage. This parameter is not supported on Infinite Volumes.

[-queued-job <text>] - Queued Job
Displays information only for those volumes that match the specified number of queued jobs. This parameter is not supported on Infinite Volumes.
[-stale-fingerprint-percentage <integer>] - Stale Fingerprint Percentage
Displays information only for those volumes that match the specified stale fingerprint percentage. This parameter is not supported on Infinite Volumes.

[-compression (true|false)] - Compression
Displays information only for those volumes that match the specified compression setting.

[-inline-compression (true|false)] - Inline Compression
Displays information only for those volumes that match the specified inline compression setting.

[-is-constituent (true|false)] - Constituent Volume
Displays information only for those volumes that either are or are not constituents of an Infinite Volume, depending on the value provided.

[-inline-dedupe (true|false)] - Inline Dedupe
Displays information only for those volumes that match the specified inline deduplication setting.

[-data-compaction (true|false)] - Data Compaction
Displays information only for those volumes that match the specified data compaction setting.

[-cross-volume-inline-dedupe (true|false)] - Cross Volume Inline Deduplication
Displays information only for those volumes that match the specified cross volume inline deduplication setting.

[-cross-volume-background-dedupe (true|false)] - Cross Volume Background Deduplication
Displays information only for those volumes that match the specified cross volume background deduplication setting.

### Examples

The following example displays information about all volumes with efficiency on the Vserver named vs1:

```
cluster1::> volume efficiency show -vserver vs1
Vserver     Volume              State    Status       Progress
----------- ------------------- -------- ------------ -------------------
vs1         vol1                Enabled  Idle         Idle for 22:37:53
vs1         vol2                Enabled  Idle         Idle for 22:37:53
vs1         vol3                Enabled  Idle         Idle for 22:37:49
vs1         vol4                Enabled  Idle         Idle for 22:37:53
vs1         vol5                Enabled  Idle         Idle for 22:37:53
vs1         volham              Enabled  Idle         Idle for 22:37:53
vs1         volham1             Enabled  Idle         Idle for 22:37:53
7 entries were displayed.
```

The following example displays detailed information about a volume named vol1 on a Vserver named vs1:

```
cluster1::> volume efficiency show -vserver vs1 -volume vol1
Vserver Name: vs1
Volume Name: vol1
Volume Path: /vol/vol1
State: Enabled
Status: Idle
Progress: Idle for 00:00:14
Type: Regular
Schedule: sun-sat@0
Efficiency Policy Name: -
Blocks Skipped Sharing: 0
Last Operation State: Success
Last Success Operation Begin: Mon Nov 15 20:13:26 UTC 2010
Last Success Operation End: Mon Nov 15 20:13:26 UTC 2010
Last Operation Begin: Mon Nov 15 20:13:26 UTC 2010
Last Operation End: Mon Nov 15 20:13:26 UTC 2010
Last Operation Size: 0.00B
Last Operation Error: -
Change Log Usage: 0%
Logical Data Size: 156KB
Logical Data Limit: 50.00TB
```

volume efficiency start on page 1439

volume efficiency start

Starts efficiency operation on a volume

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

Use the volume efficiency start command to start an efficiency operation. The volume must be online and have efficiency enabled. If there is an efficiency operation already active on the volume, this command fails.

When the volume efficiency start command is issued, a checkpoint is created at the end of each stage or sub-stage, or on an hourly basis in the gathering phase. If at any point the volume efficiency start operation is stopped, the system can restart the efficiency operation from the execution state saved in the checkpoint. The delete-checkpoint parameter can be used to delete the existing checkpoint and restart a fresh efficiency operation. The checkpoint corresponding to gathering has a validity period of 24 hours. If the user knows that significant changes have not been made on the volume, then such a gatherer checkpoint whose validity has expired can be used with the help of the use-checkpoint parameter. There is no time restriction for checkpoints of other stages.

This command is not supported on Infinite Volumes that are managed by storage services.

When the volume is configured to use the inline-only efficiency policy, the system will stop monitoring changes to the data for the purpose of running background efficiency operations. The background deduplication operations will be disabled. The user can still execute compression specific efficiency operation with -scan-old-data and -compression parameters to compress the existing data on the volume.

Parameters

-vserver <vserver name> - Vserver Name

Specifies the Vserver on which the volume is located.

{-volume <volume name> - Volume Name

Specifies the name of the volume.

|--path </vol/volume> - Volume Path

Specifies the complete path of the volume.

|--scan-old-data | -s [true] - Scan Old Data

This option scans the file system and processes all existing data. It prompts for user confirmation before proceeding. Use the force option to suppress this confirmation.

{[-use-checkpoint | -p [true]] - Use Checkpoint (if scanning old data)

Use the checkpoint when scanning existing data. Valid only if scan-old-data parameter is true.

[[-delete-checkpoint | -d [true]]] - Delete Checkpoint

Deletes the existing checkpoint and restarts a new volume efficiency start operation.
[-qos-policy <sis_qos>] - QoS Policy
  Specifies the qos-policy, which indicates how the efficiency operations are throttled. This option can be configured to be background or best-effort. Default value is best-effort. If background is specified, the efficiency operations are run with minimum or no impact on the data serving client operations. If best-effort is specified, the efficiency operations might have some impact on the data serving client operations.

[-compression | -C [true]] - Start Compression (if scanning old data) (privilege: advanced)
  Compresses existing data. Deduplication is not run unless the dedupe option is also specified. Valid only if scan-old-data parameter is true.

[-dedupe | -D [true]] - Start Deduplication (if scanning old data) (privilege: advanced)
  Deduplicates existing data on disk. Similarly, compression is not run unless the compression option is also specified. Valid only if scan-old-data parameter is true.

[-compaction | -P [true]] - Start Compaction (if scanning old data) (privilege: advanced)
  Compacts existing data on disk. Valid only if scan-old-data parameter is true.

[-build-metadata | -m [true]] - Build metadata without sharing(if scanning old data)
  Builds deduplication metadata by scanning the entire file system. You will not achieve any space savings with this option. Once the metadata is built, existing data can be shared with newly written data on subsequent deduplication runs.

[-scan-all | -o [true]] - Scan all the data without shared block optimization(if scanning old data)
  Scans the entire file system and processes the shared blocks also. You may be able to achieve additional space savings using this option. Where as, by default the option -scan-old-data saves some time by skipping the shared blocks.

[-shared-blocks | -a [true]] - Compress Shared Blocks (if scanning old data) (privilege: advanced)
  Compresses the Compression Groups that have shared blocks created by deduplication or cloning data. Valid only if scan-old-data parameter is true.

[-snapshot-blocks | -b [true]] - Compress Blocks In Snapshots (if scanning old data) (privilege: advanced)
  Compresses data blocks locked in a Snapshot copy. Valid only if scan-old-data parameter is true.

[-queue | -q [true]] - Operation Should Be Queued
  Queues an efficiency operation. It will be queued only if an operation is already in progress. Valid only if scan-old-data is false.

[-force | -f [true]] - Force Operation
  Suppresses all confirmation messages.

[-skip-zero-replacement | -z [true]] - Skip Zero block detection and replacement (privilege: advanced)
  Skip the zero block detection and replacement during the gatherer scan. Valid only if scan-old-data parameter is true.

Examples
  The following examples start efficiency on a volume:

  cluster1::> volume efficiency start -volume vol1 -vserver vs1

  cluster1::> volume efficiency start -scan-old-data -volume vol1 -vserver vs1

  cluster1::> volume efficiency start -volume vol1 -vserver vs1 -queue -delete-checkpoint
volume efficiency stat

Show volume efficiency statistics

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The *volume efficiency stat* command displays efficiency statistics. This command is not supported on Infinite Volumes. The output depends on the parameters specified with the command. If no parameters are specified, the command displays the following efficiency statistics fields for all the volumes:

- Vserver: The Vserver that the volume belongs to.
- Volume Name: Name of the volume.
- Inline Compression Attempts: Number of inline compression attempts done.
- Inline Incompressible CGs: Number of compression groups that cannot be compressed by inline compression.

To display detailed information, run the command with *-instance* parameter.

Parameters

{ [-fields <fieldname>, ...]
  This specifies the fields that need to be displayed. The Vserver and volume name are the default fields.

[-instance ]
  If you specify the *-instance* parameter, the command displays detailed information about all fields.

[-vserver <vserver name> ] - Vserver Name
  Displays statistics only for those volume(s) that match the specified Vserver.

{ [-volume <volume name> ] - Volume Name
  Displays statistics only for those volume(s) that match the specified volume name.

[-path </vol/volume>] ] - Volume Path
  Displays statistics only for those volume(s) that match the specified volume path.

[-b [true]] - Display In Blocks
  Displays usage size in 4k block counts.

[-num-compressed-inline <integer>] - Inline Compression Attempts
  Displays statistics only for those volume(s) that match the specified number of Compression Groups attempted inline.

Examples

The following example displays default efficiency statistics for all the volumes.

```
cluster1::> volume efficiency stat
Vserver:      vs1
Volume:       vol12
Inline Compression Attempts: 0
Inline Incompressible CGs: 0

Vserver:      vs1
Volume:       vol13
Inline Compression Attempts: 0
Inline Incompressible CGs: 0
```

At the diagnostic level, the output displays the information below.
cluster1::*> volume efficiency stat

volume efficiency stop

Stop efficiency operation on a volume

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
Use the volume efficiency stop command to stop an efficiency operation. This command is not supported on Infinite Volumes that are managed by storage services.

Parameters
-vserver <vserver name> - Vserver Name
This specifies the Vserver on which the volume is located.

{-volume <volume name> - Volume Name
This specifies the name of the volume on which efficiency operation needs to be stopped.

| -path </vol/volume> - Volume Path
This specifies the volume path on which efficiency operation needs to be stopped.

[-all | -a [true]] - Stop All Operations
This specifies both active and queued efficiency operations to be aborted.

Examples
The following examples stop efficiency on a volume.

```
cluster1::> volume efficiency stop -vserver vs1 -volume voll

cluster1::> volume efficiency stop -vserver vs1 -volume voll -all
```

volume efficiency undo

Undo efficiency on a volume

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The command volume efficiency undo removes volume efficiency on a volume by undoing compression, undoing compaction and removing all the block sharing relationships, and cleaning up any volume efficiency specific data structures. Any efficiency operations on the volume must be disabled before issuing this command. The volume efficiency configuration is deleted when the undo process completes. The command is used to revert a volume to an earlier version of Data ONTAP where some of the efficiency features are not supported. During this revert not all efficiencies needs to be undone but only those gained by that particular feature (for example, compaction), which is not supported in the earlier version.
This command is not supported on Infinite Volumes that are managed by storage services.

**Parameters**

- **vserver <vserver name>** - Vserver Name
  
  This specifies the Vserver on which the volume is located.

- **-volume <volume name>** - Volume Name
  
  This specifies the volume name.

- **-path */vol/volume** - Volume Path
  
  This specifies the volume path.

- **-compressed [true]** - Decompress Data in the Volume
  
  Undo the effects of compression. This requires efficiency to be disabled (by performing `volume efficiency off`).

- **-dedupe [true]** - Undo Block Sharing in the Volume
  
  Undo the effects of deduplication. This requires efficiency to be disabled (by performing `volume efficiency off`).

- **-inode <integer>** - Inode Number to Undo Sharing
  
  Remove the block sharings from a specified inode. This parameter is not supported on Infinite Volumes.

- **-undo-type [all|wrong]** - Selective Undo
  
  This specifies to remove either all or only invalid block sharing. When `all` is used, all block sharings are removed. When `wrong` is used, only invalid sharings present in the volume are removed. When used along with `log` option, it logs information about all or wrong block sharings without sharing removal.

- **-log [true]** - Only Log Incorrect Savings
  
  If specified, information about invalid block sharing relationships will only be logged. Invalid sharings will not be removed. This parameter is only valid when the parameter `-undo-type` is specified as `wrong`.

- **-data-compaction [true]** - Undo Data Compaction in the Volume
  
  Undo the effects of data compaction.

- **-cross-volume-dedupe [true]** - Undo Cross Volume Deduplication
  
  Undo the effects of cross volume deduplication.

**Examples**

The following are examples of how to use efficiency undo.

To undo deduplication savings, but not compaction or compression savings in a volume name vol1 on a Vserver named vs1:

```
cluster1::> volume efficiency undo -vserver vs1 -volume vol1
```

To rewrite compressed blocks and undo compression savings in a volume name vol1 on a Vserver named vs1:

```
cluster1::> volume efficiency undo -vserver vs1 -volume vol1 -compression
```

To rewrite compressed and deduped blocks without any efficiency in a volume name vol1 on a Vserver named vs1:

```
cluster1::> volume efficiency undo -vserver vs1 -volume vol1 -dedup -compression
```

To rewrite compacted blocks in a volume name vol1 on an SVM named vs1:

```
```

**volume efficiency policy commands**

Manage efficiency policies

The volume efficiency policy commands enable you to manage efficiency policies.

**volume efficiency policy create**

Create an efficiency policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The *volume efficiency policy create* creates an efficiency policy.

**Parameters**

-vserver <vserver name> - Vserver

Specifies the Vserver on which the volume is located.

-policy <text> - Efficiency Policy Name

This specifies the policy name.

[-type <Efficiency policy type>] - Policy Type

This specifies the policy type. The policy type defines when the volume using this policy will start processing a changelog. There are two possible values:

- *threshold* means changelog processing occurs when the changelog reaches a certain percentage.
- *scheduled* means changelog processing will be triggered by time.

The default value is *scheduled*.

[-schedule <text>] - Job Schedule Name

This specifies the job schedule. Use *job schedule* commands to manage job schedules. Only cron job schedules are supported.

[-duration <text>] - Duration

This specifies the duration that an efficiency operation can run (in hours). The possible values are "-" or a number between 1 and 999 inclusive. Default value is "-", which means no duration.

[-start-threshold-percent <percent>] - Threshold Percentage

The percentage at which the changelog will be processed. The percentage is checked on an hourly basis. The default value is 20. Valid only if -type parameter is set as threshold.

[-qos-policy <Efficiency QoS policy>] - QoS Policy

This specifies how the efficiency operations are throttled. This option can be configured to be background or best-effort. Default value is best-effort. If background is specified, the efficiency operations are run with minimum or no impact on the data serving client operations. If best-effort is specified, the efficiency operations might have some impact on the data serving client operations.

[-enabled {true|false}] - Enabled

This specifies whether the policy is enabled or not. The policy is enabled by default.
Examples
The following example creates an efficiency policy.

```
cluster1::> volume efficiency policy create -vserver vs1 -policy policy1 -schedule daily -duration 100
```

*job schedule* on page 174

**volume efficiency policy delete**

Delete an efficiency policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The *volume efficiency policy delete* command deletes an efficiency policy. An efficiency policy can be deleted only when it is not associated with any volume. The pre-defined policies *default* and *inline-only* cannot be deleted.

**Parameters**

- `-vserver <vserver name>` - Vserver
  - This specifies the Vserver on which the volume is located.

- `-policy <text>` - Efficiency Policy Name
  - This specifies the policy name.

**Examples**
The following example deletes an efficiency policy:

```
cluster1::> volume efficiency policy delete -vserver vs1 -policy policy1
```

**volume efficiency policy modify**

Modify an efficiency policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The *volume efficiency policy modify* command can be used to modify the policy attributes.

The attributes of the *inline-only* predefined policy cannot be modified.

**Parameters**

- `-vserver <vserver name>` - Vserver
  - This specifies the Vserver on which the volume is located.

- `-policy <text>` - Efficiency Policy Name
  - This specifies the policy name.
- **Policy Type**
  This specifies the policy type. The policy type defines when the volume using this policy will start processing a changelog. There are two possible values:
  - `threshold` means changelog processing occurs when the changelog reaches a certain percentage.
  - `scheduled` means changelog processing will be triggered by time.
  The default value is `scheduled`.

- **Job Schedule Name**
  This specifies the job schedule. Use `job schedule show` to show all the jobs.

- **Duration**
  This specifies the duration that an efficiency operation can run in hours. The possible value is between 1 and 999 inclusive.

- **Threshold Percentage**
  The percentage at which the changelog will be processed. The percentage is checked on an hourly basis. The default value is 20. Valid only if `-type` parameter is set as `threshold`.

- **QoS Policy**
  This specifies how the efficiency operations are throttled. This option can be configured to be `background` or `best-effort`. Default value is `best-effort`. If `background` is specified, the efficiency operations are run with minimum or no impact on the data serving client operations. If `best-effort` is specified, the efficiency operations might have some impact on the data serving client operations.

- **Enabled**
  This specifies whether the policy is enabled or not. Default value is true.

- **Comment**
  User specified comment.

---

**Examples**

The following example modifies efficiency policy.

```
cluster1::> volume efficiency policy modify -policy policy1 -schedule hourly
```

**Related references**

- `job schedule show` on page 175

**volume efficiency policy show**

Show efficiency policies

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**

The `volume efficiency policy show` command displays information about efficiency policies. By default, the command displays the following information about all policies:

- Vserver: Name of the Vserver that the policy belongs to.
- Policy Name: Efficiency policy name.
- Job Schedule: Job schedule name.
• Duration (Hours): The duration in hours that the efficiency operation can run.

• Enable: Whether the policy is enabled or not.

• Comment: User specified comment.

You can specify additional parameters to select the displayed information. For example, to display efficiency policies only with duration 5 hours, run the command with the `-duration 5` parameter.

The pre-defined policies `default` and `inline-only` are available when all the nodes in the cluster are running Data ONTAP version 8.3 or later.

The `inline-only` pre-defined policy must be used when the user wants to use the inline compression feature without any regularly scheduled or manually started background storage efficiency operations. When a volume is configured to use the `inline-only` efficiency policy, the system will stop monitoring changes to the data for running the background efficiency operations on the volume. Volumes cannot be configured with the `inline-only` policy if there is a currently active background efficiency operation.

Parameters

```
[[-fields <fieldname>, ...]
   Selects the fields to be displayed. Vserver and policy are the default fields (see example).

[-instance ]
   If this parameter is specified, the command displays information about all entries.

[-vserver <vserver name>] - Vserver
   Selects information about the policies that match the specified Vserver.

[-policy <text>] - Efficiency Policy Name
   Selects information about the policies that match the specified policy name.

[-type <Efficiency policy type>] - Policy Type
   Selects information about the policies that match the specified policy type. There are two possible values - `threshold` and `scheduled`.

[-schedule <text>] - Job Schedule Name
   Selects information about the policies that match the specified schedule.

[-duration <text>] - Duration
   Selects information about the policies that match the specified duration hours.

[-start-threshold-percent <percent>] - Threshold Percentage
   Selects information about the policies that match the specified start-threshold-percent. Valid only if `-type` parameter is set as `threshold`.

[-qos-policy <Efficiency QoS policy>] - QoS Policy
   Selects information about the policies that match the specified throttling method. The values can be `background` or `best-effort`.

[-enabled {true|false}] - Enabled
   Selects information about the policies that have the specified enabled setting.

[-comment <text>] - Comment
   Selects information about the policies that match the specified comment.

[-policy-owner {cluster-admin|vserver-admin}] - Owner of the Policy
   Selects information about the policies that match the specified owner. The values can be `cluster-admin` or `vserver-admin`.
```

volume efficiency commands
Examples

The following example shows all the efficiency policies with the matching Vserver vs1.

```bash
cluster1::> volume efficiency policy show -vserver vs1
```

<table>

volume encryption commands

The encryption directory

volume encryption prepare-to-downgrade

Prepares volume encryption for releases earlier than Data ONTAP 9.1.0

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

The `volume encryption prepare-to-downgrade` command prepares nodes to downgrade to a release earlier than ONTAP 9.1.0. Prior to disabling the features, the command checks whether the features are in use and if they are then, the command provides instructions for removing the use of the features.

Examples

The following example will disable the Volume Encryption features that are new to Data ONTAP 9.1.0 in the local cluster:

```bash
cluster1::> volume encryption prepare-to-downgrade
```

volume encryption conversion commands

Manage volume encryption conversion operation

volume encryption conversion pause

Pause a running volume encryption conversion operation

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.
Description
The `volume encryption conversion pause` command pauses the running encryption conversion operation on a volume.

Parameters

- `-vserver <vserver name>` - Vserver Name
  This parameter specifies the Vserver on which the volume is located.

- `-volume <volume name>` - Volume Name
  This parameter specifies the name of the volume being encrypted.

`[-ignore-warning {true|false}]` - Ignore Warning for Conversion Pause
If this parameter is set, the command ignores the confirmation message.

Examples

`volume encryption conversion resume`
Resume a paused volume encryption conversion operation

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The `volume encryption conversion resume` command resumes the paused encryption conversion operation on a volume.

Parameters

- `-vserver <vserver name>` - Vserver Name
  This parameter specifies the Vserver on which the volume is located.

- `-volume <volume name>` - Volume Name
  This parameter specifies the name of the volume being encrypted.

Examples

`volume encryption conversion show`
Show status of a volume encryption conversion

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The `volume encryption conversion show` command displays information about volume encryption conversion in the cluster. By default, with no parameters, it only shows volume encryption operations that have failed or are currently running. The command display output depends on the parameters passed. If `-vserver` and `-volume` are specified, the following information is displayed:

- Vserver Name: The Vserver on which the volume is located.
- Volume Name: The volume that is part of a completed or running volume move operation.
- Start Time: The date and time when the volume encryption operation was started.
- Status of Operation: The status of the operation.
- Percentage Completed: The amount of work to encrypt the volume completed thus far in terms of percentage.
Parameters

{[-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

[[-instance]]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver Name

This parameter specifies the Vserver on which the volume is located.

[-volume <volume name>] - Volume Name

This parameter specifies the name of the volume being encrypted.

[-start-time <MM/DD/YYYY HH:MM:SS>] - Start Time

If this parameter is specified, the command displays encryption operations that match the specified date and time in the cluster time zone when the volume move operation started.

[-status <text>] - Status

If this parameter is specified, the command displays encryption operations that match the specified status of the encryption operation.

Examples

The following example shows a sample output for this command:

```
cluster1::> volume encryption conversion show

Vserver  Volume       Start Time            Status
---------- ------------ --------------------- -----------------------
vs1        p2           9/18/2017 17:44:36    Phase 2 of 2 is in progress.
```

volume encryption conversion start

Start a volume encryption conversion operation

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The volume encryption conversion start command converts a non-encrypted volume to encrypted volume.

Parameters

-vserver <vserver name> - Vserver Name

This parameter specifies the Vserver on which the volume is located.

-volume <volume name> - Volume Name

This parameter specifies the name of the volume being encrypted.

[ignore-warning {true|false}] - Ignore Warning for Conversion Start

If this parameter is set, the command ignores the confirmation message.
volume encryption rekey commands

Manage volume encryption operation

volume encryption rekey pause

Pause a running volume encryption rekey operation

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The volume encryption rekey pause command pauses the running encryption rekey operation on a volume.

Parameters
- **-vserver <vserver name>** - Vserver Name
  This parameter specifies the Vserver on which the volume is located.
- **-volume <volume name>** - Volume Name
  This parameter specifies the name of the volume being encrypted.
- **[-ignore-warning {true|false}]** - Ignore Warning for Rekey Pause
  If this parameter is set, the command ignores the confirmation message.

Examples

volume encryption rekey resume

Resume a paused volume encryption rekey operation

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The volume encryption rekey resume command resumes the paused encryption rekey operation on a volume.

Parameters
- **-vserver <vserver name>** - Vserver Name
  This parameter specifies the Vserver on which the volume is located.
- **-volume <volume name>** - Volume Name
  This parameter specifies the name of the volume being encrypted.

Examples

volume encryption rekey show

Show status of a volume encryption rekey

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The volume encryption rekey show command displays information about volume encryption rekey in the cluster. By default, with no parameters, it only shows volume encryption rekey operations that have failed or are currently running. The
command display output depends on the parameters passed. If `vserver` and `volume` are specified, the following information is displayed:

- **Vserver Name**: The Vserver on which the volume is located.
- **Volume Name**: The volume that is part of a completed or running volume move operation.
- **Start Time**: The date and time when the volume encryption operation was started.
- **Status of Operation**: The status of the operation.
- **Percentage Completed**: The amount of work to encrypt the volume completed thus far in terms of percentage.

**Parameters**

`{ [-fields <fieldname>, ...]`  
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

`[-instance]`  
If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-vserver <vserver name>] - Vserver Name`  
This parameter specifies the Vserver on which the volume is located.

`[-volume <volume name>] - Volume Name`  
This parameter specifies the name of the volume being encrypted.

`[-start-time <MM/DD/YYYY HH:MM:SS>] - Start Time`  
If this parameter is specified, the command displays encryption operations that match the specified date and time in the cluster time zone when the volume move operation started.

`[-status <text>] - Status`  
If this parameter is specified, the command displays encryption operations that match the specified status of the encryption operation.

**Examples**

The following example shows a sample output for this command:

```
cluster1::> volume encryption rekey show
+----------+----------+-------------------+----------------------+
<table>
<thead>
<tr>
<th>Vserver</th>
<th>Volume</th>
<th>Start Time</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>
<td>vol2</td>
<td>9/18/2017 17:51:41</td>
<td>Phase 2 of 2 is in progress.</td>
</tr>
</tbody>
</table>
```

**volume encryption rekey start**

Start a volume encryption rekey operation

**Availability**: This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**

The `volume encryption rekey start` command changes the encryption key of a volume.

**Parameters**

`-vserver <vserver name> - Vserver Name`  
This parameter specifies the Vserver on which the volume is located.
-volume <volume name> - Volume Name
   This parameter specifies the name of the volume being rekeyed.

[-ignore-warning {true|false}] - Ignore Warning for Rekey Start
   If this parameter is set, the command ignores the confirmation message.

---

volume file commands
File related commands

volume file compact-data
Apply Adaptive Data Compaction to a Snapshot copy of a file

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The volume file compact-data command applies the Adaptive Data Compaction feature to the Snapshot copy of a file such that partially filled blocks from that file will merge and consume less storage space.

Parameters
- -node <nodename> - Node
   This parameter indicates the node name that the AWA instance runs on.

- -vserver <vserver name> - Vserver Name
   This specifies the Vserver in which the target file is located.

- -file </vol/<volume name>/<file path> - File Path
   This specifies the complete file path. The Snapshot copy name can be specified as part of the path or by specifying the -snapshot parameter.

- [-volume <volume name>] - Volume Name
   This specifies the volume in which the targeted file is located.

- [-snapshot <snapshot name>] - Snapshot Copy Name
   This specifies the Snapshot copy name in which the file will be compacted.

Examples
The following command applies the Adaptive Data Compaction feature to the Snapshot copy snap1 of the file /file1 in volume vol1:

    cluster1::> volume file compact-data -vserver vs1 -volume vol1 -file /vol/vol1/file1 -snapshot snap1

volume file modify
Manage the association of a QoS policy group with a file

Availability: This command is available to cluster administrators at the admin privilege level.
Description
This command adds and removes files from QoS policy groups. QoS policy groups define measurable service level objectives (SLOs) that apply to the storage objects with which the policy group is associated. A QoS policy group associated with this file can be created, modified, and deleted. You cannot associate a file to a QoS policy group if a LUN was created from the file.

This command is not supported on FlexGroups or Infinite Volumes.

Parameters
- `vserver <vserver name>` - Vserver Managing Volume
  This specifies the Vserver on which the volume (containing the file) resides.
- `volume <volume name>` - Volume Name
  This specifies the name of the volume. The name must be unique within the hosting Vserver.
- `file <text>` - File Path
  This specifies the actual path of the file with respect to the volume.
- `[-qos-policy-group <text>]` - QoS Policy Group Name
  This option associates the file with a QoS policy group. This policy group manages storage system resources to deliver your desired level of service. If you do not assign a policy to a file, the system will not monitor and control the traffic to it. To remove this file from a QoS policy group, enter the reserved keyword “none”.
- `[-caching-policy <text>]` - Caching Policy Name
  This optionally specifies the caching policy to apply to the file. A caching policy defines how the system caches this volume's data in Flash Cache modules. If a caching policy is not assigned to this file, the system uses the caching policy that is assigned to the containing volume. If a caching policy is not assigned to the containing volume, the system uses the caching policy that is assigned to the containing Vserver. If a caching policy is not assigned to the containing Vserver, the system uses the default cluster-wide policy. The available caching policies are:
  - none - Does not cache any user data or metadata blocks.
  - auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
  - meta - Read caches only metadata blocks.
  - random_read - Read caches all metadata and randomly read user data blocks.
  - random_read_write - Read caches all metadata, randomly read and randomly written user data blocks.
  - all_read - Read caches all metadata, randomly read and sequentially read user data blocks.
  - all_read_random_write - Read caches all metadata, randomly read, sequentially read, and randomly written user data.
  - all - Read caches all data blocks read and written. It does not do any write caching.

Default caching-policy is auto.

Examples
```
cluster1::> vol file modify -vserver vs0 -volume vs0_vol56 -file l.txt -qos-policy-group fast -cache all-read
```
**volume file privileged-delete**

Perform a privileged-delete operation on unexpired WORM files on a SnapLock enterprise volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `volume file privileged-delete` command is used to perform a privileged-delete operation on unexpired WORM files on a SnapLock enterprise volume. The only built-in role that has access to the command is "vsadmin-snaplock".

**Parameters**
- `-vserver <vserver name>` - Vserver
  
  Specifies the Vserver which hosts the SnapLock enterprise volume.

- `-file <vol/<volume name>/<file path>>` - File Path
  
  Specifies the absolute path of the file to be deleted. The value begins with /vol/<volumename>.

**Examples**
The following example deletes the unexpired WORM file "/vol/vol1/wormfile". The file wormfile is stored in volume vol1 under Vserver vserver1.

```
 vserver1::> volume file privileged-delete -file /vol/vol1/wormfile
```

**volume file reservation**

Get/Set the space reservation info for the named file.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `volume file reservation` command can be used to query the space reservation settings for the named file, or to modify those settings. This command is not supported on Infinite Volumes. With no further modifiers, the command will report the current setting of the space reservation flag for a file. This tells whether or not space is reserved to fill holes in the file and to overwrite existing portions of the file that are also stored in a snapshot. For symlinks, the link is followed and the command operates on the link target.

**Parameters**
- `-vserver <vserver name>` - Vserver Name
  
  Specifies the Vserver on which the volume is located. If only one data Vserver exists, you do not need to specify this parameter.

- `-path <vol/<volume name>/<file path>>` - File Name
  
  Specifies the complete file path for which we want to get/set the space reservation settings.

- `[-is-enabled <text>]` - enable | disable
  
  Specifying enable or disable will turn the reservation setting on or off accordingly for the file.

**Examples**
The following example enables the file reservation setting for the file named file1. The file file1 is stored in volume testvol on Vserver vs0.
volume file show-disk-usage

Show disk usage of file

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command requires a path to a file in a volume and displays the following information:
- Vserver name
- Total bytes used by the file in kilobytes
- Full Path to the file

If not logged in as Vserver administrator, the command also requires a Vserver name. This command is not supported on an Infinite Volume.

Note: The "-instance" option provides the same result as the default as there are no extra fields to display.

Parameters
{ [-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.
}

| [-h ]
If this parameter is specified, the command displays total bytes used by the file in human readable form.

| [-k ]
If this parameter is specified, the command displays total bytes used by the file in kilobytes.

| [-m ]
If this parameter is specified, the command displays total bytes used by the file in megabytes.

| [-u ]
If this parameter is specified, the command displays the unique bytes used by the file (bytes that are not shared with any other file in the volume due to deduplication or FlexClone files) in kilobytes.

| [-uh ]
If this parameter is specified, the command displays the unique bytes used by the file in human readable form.

| [-uk ]
If this parameter is specified, the command displays the unique bytes used by the file in kilobytes.

| [-um ]
If this parameter is specified, the command displays the unique bytes used by the file in megabytes.

| [-instance ]
If you specify the -instance parameter, the command displays detailed information about all fields.

-vserver <vserver name> - Vserver
This parameter is used to specify the Vserver that contains the file for which the command displays the total bytes used. It is required if not logged in as Vserver administrator.
-path </vol/<volume name>/<file path>> - Full Path

This required parameter is used to specify the path of the file for which the command displays the total bytes used.

[<range> | -r <<start offset>:<end offset>>] - Block Range

If this parameter is specified, the command displays the total bytes used by the file in the specified block range.

**Examples**

The following example displays the disk-usage of the file file1.txt in volume /vol/root_vs0.

```bash
cluster1::> volume file show-disk-usage -vserver vs0 -path /vol/root_vs0/file1.txt
Vserver | Total | Path
-------- | ------ | -----
vs0 | 1408KB | /vol/root_vs0/file1.txt

cluster1::> volume file show-disk-usage -m -vserver vs0 -path /vol/root_vs0/file1.txt
Vserver | Total | Path
-------- | ------ | -----
vs0 | 1MB | /vol/root_vs0/file1.txt

vs0::> volume file show-disk-usage -um -path /vol/root_vs0/file1.txt
Vserver | Total | Unique | Path
-------- | ------ | ------ | -----
vs0 | 1MB | 1MB | /vol/root_vs0/file1.txt
```

---

**volume file show-filehandle**

Show the file handle of a file

**Availability:** This command is available to cluster and Vserver administrators at the advanced privilege level.

**Description**

This command requires a path to a file in a volume and displays the file handle information described below:

- Vserver name
- Path to the file
- File handle flags
- Snapshot ID of the file (snapid)
- File ID
- File handle generation number
- File system ID (fsid)
- Master data set ID (msid)
- Data set ID (dsid)

If not logged in as a Vserver administrator, the command also requires a Vserver name.

**Parameters**

```bash
[[-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use ‘-fields ?’ to display the fields to specify.
```
If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-vserver <vserver name>]` - Vserver Managing Volume

This specifies the Vserver where the file resides.

`[-path <text>]` - Path to File

This specifies the path to the file.

### Examples

The following example displays the file handle information of a file named `file1.txt` in the volume `/vol/vol1`.

```
cluster1::> volume file show-filehandle -vserver vs0 -path /vol/vol1/file1.txt
```

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Path</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs0</td>
<td>/vol/vol1/file1.txt</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>flags</th>
<th>snapid</th>
<th>fileid</th>
<th>generation</th>
<th>fsid</th>
<th>msid</th>
<th>dsid</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x0</td>
<td>0</td>
<td>0x60</td>
<td>0x206b6</td>
<td>0x402</td>
<td>0x80000402</td>
<td>0x402</td>
</tr>
</tbody>
</table>

### volume file show-inode

Display file paths for a given inode

#### Availability

This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

#### Description

This command displays information about all the files having a given inode in a volume of a Vserver. If the `-snapshot-id` or `-snapshot-name` parameter is specified, the command displays file information from the Snapshot copy; otherwise, it displays the information from the active file system. The `-vserver`, `-volume` and `-inode-number` are mandatory parameters.

If no optional parameter is specified, the command displays the following fields for all the files having the given inode:

- Vserver Name
- Volume Name
- Inode Number
- File Path

The `volume file show-inode` command is only supported on flexible volumes and FlexGroup constituents.

#### Parameters

```
[-fields <fieldname>, ...]
```  

If you specify the `-fields` parameter, the command output also includes the specified field or fields.

```
[-snapshot]
```  

If this parameter is specified, the command displays the following information:

- Vserver Name
- Volume Name
- Inode Number
- Snapshot Name
• Snapshot ID
• File Path

If this parameter is specified, the command displays detailed information about the files matching the specified inode number. The following information is displayed:

• Vserver Name
• Volume Name
• Inode Number
• File Path
• Snapshot Name
• Snapshot ID
• File Name
• Parent Inode Number
• Parent Directory Cookie

-vserver <vserver name> - Vserver Name
This specifies the Vserver in which the volume or Snapshot copy is located.

-volume <volume name> - Volume Name
This specifies the volume in which the inode number is located.

-inode-number <integer> - Inode Number
This specifies the inode number whose information has to be retrieved.

{{ [ -snapshot-name <snapshot name> ] - Snapshot Name
If this parameter or -snapshot-id is specified, information about the files is retrieved from the Snapshot copy instead of the active file system.

[ [ -snapshot-id <integer> ] ] - Physical Snapshot ID
If this parameter or -snapshot-name is specified, information about the files is retrieved from the Snapshot copy instead of the active file system.

[ -file-path <text> ] - File Path
If this parameter is specified, the command displays information only about the files that match the specified file path.

[ -file-name <text> ] - File Name
If this parameter is specified, the command displays information only about the files that match the specified file name.

[ -parent-inode-number <integer> ] - Parent Inode Number
The inode number of the parent directory of the file associated with the inode. If this parameter is specified, the command displays information only about the files that match the specified parent inode number.

The index of the directory entry of the file in its parent directory tree. If this parameter is specified, the command displays information only about the files that match the specified parent directory cookie.
Examples

The following example displays information about all the files having the inode number 96 in the active file system of a volume named vol1 on a Vserver named vs1:

```
cluster1::> volume file show-inode -vserver vs1 -volume vol1 -inode-number 96

<table>
<thead>
<tr>
<th>Inode</th>
<th>Vserver</th>
<th>Volume</th>
<th>Number</th>
<th>File Path</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>
<td>vol1</td>
<td>96</td>
<td></td>
<td>/vol/vol1/file1</td>
</tr>
<tr>
<td>vs1</td>
<td>vol1</td>
<td>96</td>
<td></td>
<td>/vol/vol1/file2</td>
</tr>
<tr>
<td>vs1</td>
<td>vol1</td>
<td>96</td>
<td></td>
<td>/vol/vol1/A/file2</td>
</tr>
</tbody>
</table>
```

3 entries were displayed.

The following example displays information about all the files with inode number 96 in a Snapshot copy named mysnap. The Snapshot copy is present in a volume named vol1 on a Vserver named vs1:

```
cluster1::> volume file show-inode -vserver vs1 -volume vol1 -inode-number 96 -snapshot-name mysnap

<table>
<thead>
<tr>
<th>Inode</th>
<th>Snapshot</th>
<th>Snapshot</th>
<th>Vserver</th>
<th>Volume</th>
<th>Number</th>
<th>Name</th>
<th>ID</th>
<th>File Path</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>
<td>mysnap</td>
<td>131</td>
<td>vs1</td>
<td>vol1</td>
<td>96</td>
<td></td>
<td></td>
<td>/vol/vol1/.snapshot/mysnap/file1</td>
</tr>
<tr>
<td>vs1</td>
<td>mysnap</td>
<td>131</td>
<td>vs1</td>
<td>vol1</td>
<td>96</td>
<td></td>
<td></td>
<td>/vol/vol1/.snapshot/mysnap/file2</td>
</tr>
</tbody>
</table>
```

2 entries were displayed.

The following example displays detailed information about all the files with inode number 96 in a Snapshot copy named mysnap. The Snapshot copy is present in a volume named vol1 on a Vserver named vs1:

```
cluster1::> volume file show-inode -vserver vs1 -volume vol1 -inode-number 96 -snapshot-name mysnap -instance

Vserver Name: vs1
Volume Name: vol1
Inode number: 96
File Path: /vol/vol1/.snapshot/mysnap/file1
Snapshot Name: mysnap
Physical Snapshot ID: 131
File Name: file1
Parent Inode Number: 64
Parent Directory Cookie: 2

Vserver Name: vs1
Volume Name: vol1
Inode number: 96
File Path: /vol/vol1/.snapshot/mysnap/file2
Snapshot Name: mysnap
Physical Snapshot ID: 131
File Name: file2
Parent Inode Number: 64
Parent Directory Cookie: 3
```

2 entries were displayed.

---

**volume file clone commands**

- **Manage File Clones**
  - **volume file clone autodelete**
    - **Enable/Disable autodelete**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.
Description
The `volume file clone autodelete` command enables or disables the automatic deletion of a file or LUN clone. Newly created file and LUN clones are disabled for automatic deletion by default. This command is not supported on Infinite volumes.

Parameters
- `vserver <vserver name>` - Vserver Name
  
  This specifies the Vserver on which the volume resides. If only one data Vserver exists, you do not need to specify this parameter.

- `[volume <volume name>]` - Volume Name
  
  This specifies the name of the volume in which the file or LUN is present.

- `clone-path <text>` - Clone Path
  
  This specifies the path where clone resides. If you use the volume parameter, then specify the relative path to the file or LUN clone. Otherwise, specify the absolute path.

- `enable {true|false}` - Enable or Disable Autodelete
  
  This parameter enables or disables the autodelete feature for the file or LUN clones in a specified volume if the clones are already added for automatic deletion. If you set the parameter to true, the specified file or LUN clones gets automatically deleted in the 'try' or 'disrupt' mode. If the value is false, the clones get automatically deleted only in the 'destroy' mode.

- `force [true]` - Force Enable or Disable Autodelete
  
  If `enable` is `true` then this parameter forces automatic deletion of a specified file or LUN, or a file or LUN clone. If `enable` is `false` then specifying this parameter disables autodeletion on a file or LUN - or a file or LUN clone - even if `commitment destroy` is specified.

Examples

The following command enables for automatic deletion a LUN Clone named `lun_clone` contained in a volume named `volume1`. This volume is present on a Vserver named `vs1`.

```
caller1:/> volume file clone autodelete /vol/volume1/lun_clone -enable true -vserver vs1
```

The following command specifies the relative clone path when the volume parameter is specified in the command.

```
caller1:/> volume file clone autodelete lun_clone -enable true
     -vserver vs1 -volume volume1
```

volume file clone create

Create file or LUN full or sub file clone

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The `volume file clone create` command creates a clone of a file or a LUN. This command is not supported on Infinite Volumes. You can optionally specify the following parameters for the clone file creation process:

- Vserver in which the volume resides
- Name of the parent snapshot
- The range of blocks to be cloned
- The option to avoid space reservations for the new file or LUN clone
- The option to assign a QoS policy group to the new file or LUN clone
• The option to assign a caching policy to the new file or LUN clone
• The option to mark the new file or LUN clone created for auto deletion
• The option to overwrite an existing file or LUN clone

File or LUN clones create a duplicate copy of another file or LUN, but don't require copying the data itself. This allows the clone operation to occur in constant time, taking the same amount of time to complete no matter the size of the file being cloned. This also means that clones require only a small amount of additional storage space because the clone shares the data with the source file or LUN.

Parameters

-vserver <vserver name> - Vserver Name
    This specifies the Vserver in which the parent volume resides. If only one data Vserver exists, you do not need to specify this parameter.

[-volume <volume name>] - Volume
    This specifies the name of volume in which a file or LUN is going to be cloned.

-source-path <text> - Source Path
    This specifies the path to the file or LUN to be cloned relative to the specified volume.

-destination-path <text> - Destination Path
    This specifies the path for the newly-created cloned file or LUN relative to the specified volume. If the file or LUN clone to be created is a whole file or LUN, the destination file or LUN must not exist. If the range parameter is specified, the destination file or LUN must exist. If the snapshot-name parameter is specified, this option is mandatory.

[-snapshot-name | -s <snapshot name>] - Source Snapshot
    The name of the Snapshot copy to use as the source for the clone operation. If this value is not specified, the active filesystem will be used instead.

{[ -range | -r <<source start block>:<destination start block>:<block length>>, ...] - Block Range
    This specifies the block range to be cloned. If the range is not specified, the entire file or LUN is cloned. The block range should be specified in the format s:d:n where s is the source start block number, d is the destination start block number, and n is the length in blocks to be cloned. The range of n should be from 1 to 32768 or 1 to 16777216 in case of clone from Active File System or Snapshot copy respectively. If this parameter is used in the path provided by the destination-path parameter must refer to a file or LUN which already exists. If either the source or destination are a LUN then the block size is measured in 512-byte LBA blocks. If neither the source nor destination are a LUN then the block size will be 4KB. If 512-byte sectors are used the source and destination offsets must have the same offset within 4KB blocks.
    This option is most likely to be used by external automated systems in managing virtual disk configurations and not by human administrators.

| [-no-reserve | -o [true]] - Do not reserve clone
    If this option is used, the clone file or LUN will not be guaranteed space in the underlying aggregate. While this out-of-space condition persists, writes to the clone file or LUN would fail. This option may be useful if few writes to the clone are expected to be needed, or to allow a file or LUN clone to be created under space-constrained conditions for recovery purposes. If this option is not specified the clone will inherit the space reservation properties from the source.

[-ignore-streams | -i [true]] - Ignore streams
    This parameter specifies whether streams should be ignored during cloning of files or LUNs. If you set this parameter to false, the streams are ignored; otherwise, they are included in the clones. The default value is false.
[--ignore-locks | -k true] - Ignore locks
   This parameter specifies whether byte-range locks and shared-mode locks on files or LUNs should be ignored
during cloning. If you set this parameter to true, the locks are ignored; otherwise, clone operation fails if locks
are present on files or LUNs. The default value is false.

[--overwrite-destination | -d true] - Overwrite Destination
   Specify this parameter to overwrite the destination file, if it exists. The default is to fail the command if the
destination exists.

[--qos-policy-group <text>] - QoS Policy Group Name
   This optionally specifies which QoS policy group to apply to the file or LUN. This policy group defines
measurable service level objectives (SLOs) that apply to the storage objects with which the policy group is
associated. If you do not assign a policy group to a file or LUN, the system will not monitor and control the
traffic to it. You cannot associate a file to a QoS policy group if a LUN was created from the file.

[--caching-policy <text>] - Caching Policy Name
   This optionally specifies the caching policy to apply to the file. A caching policy defines how the system
caches this volume's data in Flash Cache modules. If a caching policy is not assigned to this file, the system
uses the caching policy that is assigned to the containing volume. If a caching policy is not assigned to the
containing volume, the system uses the caching policy that is assigned to the containing Vserver. If a caching
policy is not assigned to the containing Vserver, the system uses the default cluster-wide policy. The available
caching policies are:
   • none - Does not cache any user data or metadata blocks.
   • auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly
     overwritten user data blocks.
   • meta - Read caches only metadata blocks.
   • random_read - Read caches all metadata and randomly read user data blocks.
   • random_read_write - Read caches all metadata, randomly read and randomly written user data blocks.
   • all_read - Read caches all metadata, randomly read and sequentially read user data blocks.
   • all_read_random_write - Read caches all metadata, randomly read, sequentially read, and randomly written
     user data.
   • all - Read caches all data blocks read and written. It does not do any write caching.

   Default caching-policy is auto.

[--autodelete {true|false}] - Mark Clone for Autodeletion
   This parameter marks the file or LUN clones created for auto deletion. When set to true, the file or LUN
clones get automatically deleted when the volume runs out of space. The default value is false.

[--bypass-throttle {true|false}] - Bypass Throttle Checks (privilege: advanced)
   This parameter specifies whether clone throttle checks should be skipped during clone creation. When set to
true, clones are created without enforcing any clone throttle checks. The default value is false.

[--is-backup {true|false}] - Is a Clone for Backup
   This parameter is used to mark the destination file as a backup clone, where divergence is expected on the
source file and no divergence is expected on the destination file. It is applicable only for full-file clones created
from Active File System volumes. The default value is false.

[--destination-volume <volume name>] - Destination Volume
   This specifies the name of the volume where the destination file resides. This can be different from parameter
'volume', whereas parameter 'volume' specifies the volume on which source file resides. This is an optional
argument applicable only for Metawafl volume where the source and destination volumes for the clone
operation can be different. If this parameter is not given the destination file will gets created in the volume where source_file resides.

Examples
The following command creates a FlexClone file of the file named myfile contained in a volume named vol. The file myfile is located in the root directory of that volume. The cloned file myfile_copy resides in the root directory same volume.

```
cluster1::> volume file clone create -volume vol -source-path /myfile -destination-path /myfile_copy
```

The following command optionally associates the FlexClone file named myfile_copy with the fast QoS policy group and the caching policy named random-read.

```
cluster1::> volume file clone create -volume vol -source-path /myfile -destination-path /myfile_copy -qos-policy-group fast -caching-policy random-read
```

**volume file clone show-autodelete**

Show the autodelete status for a file or LUN clone

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `volume file clone show-autodelete` command displays the autodelete details of a file or LUN clone. The command displays the following information about a file or LUN clone:

- Vserver Name
- Clone Path
- Whether auto deletion of file or LUN clone is enabled

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[[-instance]]
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
-vserver <vserver name> - Vserver Name
```

This specifies the Vserver to which the file or LUN clone belongs.

```
-clone-path <text> - Clone Path
```

This specifies the path of the file or LUN clone.

```
[-autodelete-enabled {true|false}] - Autodelete Enabled
```

If this parameter is true, the file or LUN clone gets automatically deleted in the 'try' or 'disrupt' mode. If the value is false, the clones get automatically deleted only in the 'destroy' mode.

**Examples**
The following example displays the autodelete information about a file or LUN clone.
volume file clone deletion commands

The deletion directory

volume file clone deletion add-extension

Add new supported file extensions to be deleted with clone delete

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The volume file clone deletion add-extension command can be used to add new supported file extensions for clone delete. This command is not supported on Infinite Volumes.

Parameters
-vserver <vserver name> - Vserver Name
   Name of the vserver.
-volume <volume name> - Volume Name
   Name of the volume.
-extensions <text> - Supported Extensions for Clone Delete
   List of supported file extensions for clone delete.

Examples
The following example adds the new supported vmdk, vhd file extensions to volume vol1 of vserver vs1.

    cluster1::> volume file clone deletion add-extension -vserver vs1 -volume vol1 -extensions vmdk,vhd

volume file clone deletion modify

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The volume file clone deletion modify command can be used to change the required minimum clone file size of a volume for clone delete. This is not applicable on Infinite volumes.

Parameters
-vserver <vserver name> - Vserver Name
   Name of the vserver.
-volume <volume name> - Volume Name
   Name of the volume.

[-minimum-size {<integer>[KB|MB|GB|TB|PB]}] - Minimum Size Required for Clone delete
   Minimum clone file size required for clone delete.
Examples
The following example changes the required minimum file size to 100M for volume vol1 of vserver vs1.

```
cluster1::> volume file clone deletion modify -volume vol1 -vserver vs1 -minimum-size 100M
```

volume file clone deletion remove-extension
Remove unsupported file extensions for clone delete

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The volume file clone deletion remove-extension command can be used to remove the existing file extensions that are no longer supported for clone delete. This command is not supported on Infinite Volumes.

Parameters
- `-vserver <vserver name>` - Vserver Name
  Name of the vserver.
- `-volume <volume name>` - Volume Name
  Name of the volume.
- `[-extensions <text>]` - Unsupported Extensions for Clone Delete
  List of unsupported file extensions for clone delete.

Examples
The following example removes the existing unsupported vmdk, vhd file extensions to volume vol1 of vserver vs1.

```
cluster1::> volume file clone deletion remove-extension -vserver vs1 -volume vol1 -extensions vmdk,vhd
```

volume file clone deletion show
Show the supported file extensions for clone delete

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The volume file clone deletion show command displays the following information for clone delete:

- Vserver Name
- Volume Name
- Minimum File Size Required for Clone Delete
- List of Supported File Extensions for Clone Delete

Parameters
```
[-fields <fieldname>, ...]
```
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.
If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[-instance]
```

- `vserver <vserver name>` - Vserver Name
  - Name of the vserver.

- `volume <volume name>` - Volume Name
  - Name of the volume.

- `extensions <text>, ...` - Supported Extensions for Clone Delete
  - List of supported file extensions for Clone Delete.

- `minimum-size {<integer>{KB|MB|GB|TB|PB}}` - Minimum Size Required for Clone delete
  - Minimum file size required for Clone Delete.

### Examples

The following example displays the clone deletion information for all volumes of all vservers.

```
cluster1::> volume file clone deletion show

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Volume</th>
<th>Minimum Size</th>
<th>Extensions</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs0</td>
<td>testvol</td>
<td>100B</td>
<td>vmdk, vhd, vhdx, vswp</td>
</tr>
<tr>
<td>vs0_root</td>
<td>0B</td>
<td></td>
<td></td>
</tr>
<tr>
<td>vs1</td>
<td>testvol</td>
<td>100G</td>
<td>vmdk, vhd, vhdx, vswp</td>
</tr>
<tr>
<td>vs1_root</td>
<td>0B</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```

The following example displays the clone deletion information for volume `vol1` of vserver `vs1`.

```
cluster1::> volume file clone deletion show -vserver vs0 -volume testvol

Vserver Name: vs0
Volume Name: testvol
Supported Extensions for Clone Delete: vmdk, vhd, vhdx, vswp
Minimum Size Required for Clone delete: 100B
```

---

### Volume File Clone Split Commands

Manage file clone split operations

### Volume File Clone Split Load Commands

Manage load due to file clone split operations

#### Volume File Clone Split Load Modify

Modify maximum split load on a node

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `advanced` privilege level.

**Description:** The `volume file clone split load modify` command can be used to change the maximum split load (file or LUN clones) of a node.

**Parameters**

- `node {<nodename>|local}` - Node Name
  - Node name on which the new maximum split load is being applied.
[-max-split-load {<integer>[KB|MB|GB|TB|PB]}] - Maximum Clone Split Load

This specifies the new maximum split load of a node. This is the amount of clone create load, the node can take at any point of time. If it crosses this limit, then the clone create requests will not be allowed, till the split load is less than maximum split load.

Examples
The following example changes the new maximum limit to 10TB on node1.

```
cluster1:*> volume file clone split load*> modify -node clone-01 -max-split-load 100KB
```

volume file clone split load show
Show split load on a node

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The volume file clone split load show command displays the corresponding file or LUN clone split loads on nodes. If no parameters are specified, the command displays the following information:

- Node
- Max Split Load
- Current Split Load
- Token Reserved Load
- Allowable Split Load

Parameters

-[fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?' to display the fields to specify.

-[-instance]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-node [<nodename>|local]] - Node Name
Node on which the file or LUN Clone split load is displayed.

[-max-split-load {<integer>[KB|MB|GB|TB|PB]}] - Maximum Clone Split Load
This specifies the maximum allowable split load on the node.

[-current-split-load {<integer>[KB|MB|GB|TB|PB]}] - Current Clone Split Load
This specifies the current on going split load on the node.

[-token-reserved-load {<integer>[KB|MB|GB|TB|PB]}] - Load Reserved for Clone Creation
This specifies the reserved split load of the node using the tokens.

[-allowable-split-load {<integer>[KB|MB|GB|TB|PB]}] - Allowable Clone Split Load
This specifies the available split load of the node.

Examples
The following example displays the current and allowable file or LUN clone split load on a node.
volume file fingerprint commands

File fingerprint related commands

volume file fingerprint abort

Abort a file fingerprint operation

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The volume file fingerprint abort command aborts an in-progress fingerprint operation. This command only aborts the fingerprint operations that have not yet completed. This command takes session-id as input and aborts the fingerprint operation that is associated with that particular session-id.

Parameters
- **-session-id <integer>** - Session ID of Fingerprint Operation

  Specifies the session-id of the fingerprint operation that needs to be aborted. It is an unique identifier for the fingerprint operation. This session-id is returned when the fingerprint operation is started on a file.

Examples
The following example aborts the fingerprint operation identified by 17039361:

```
ccluster1::> volume file fingerprint abort -session-id 17039361
```

volume file fingerprint dump

Display fingerprint of a file

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The volume file fingerprint dump command displays the following information given the **-session-id** of the fingerprint operation:

- Vserver:
  The Vserver on which the file exists.
- Session-ID:
A unique identifier for the fingerprint operation. This session-id is returned when the fingerprint operation is started on a file. The session-id of the fingerprint operation can be used to get the progress of an ongoing fingerprint operation as well as the complete fingerprint output for the file once the operation is completed.

- **Volume:**
  The name of the volume on which the file resides.

- **Path:**
  The absolute path of the file on which the fingerprint is calculated. The value begins with `/vol/<volumename>`.

- **Data Fingerprint:**
  The digest value of data of the file. The fingerprint is base64 encoded. This field is not included if the scope is `metadata-only`.

- **Metadata Fingerprint:**
  The digest value of metadata of the file. The metadata fingerprint is calculated for file size, file ctime, file mtime, file crtime, file retention time, file uid, file gid, and file type. The fingerprint is base64 encoded. This field is not included if the scope is `data-only`.

- **Fingerprint Algorithm:**
  The digest algorithm which is used for the fingerprint computation. Fingerprint is computed using `md5` or `sha-256` digest algorithm.

- **Fingerprint Scope:**
  The scope of the file which is used for the fingerprint computation. Fingerprint is computed over `data-only`, `metadata-only`, or `data-and-metadata`.

- **Fingerprint Start Time:**
  The start time of the fingerprint computation in seconds since 1 January 1970 00:00:00 in GMT timezone.

- **Formatted Fingerprint Start Time:**
  The start time of the fingerprint computation in a human-readable format `<day> <month> <day of month> <hour>:<min>:<sec><year>` in GMT timezone.

- **Fingerprint Version:**
  The version of the fingerprint output format.

- **SnapLock License:**
  The status of the SnapLock license.

- **Vserver UUID:**
  A universal unique identifier for the Vserver on which the file exists.

- **Volume MSID:**
  The mirror set identifier of the volume where the file resides.

- **Volume DSID:**
  The data set identifier of the volume where the file resides.

- **Hostname:**
  The name of the storage system where the fingerprint operation is performed.

- **Filer ID:**
  The NVRAM identifier of the storage system.

- **Volume Containing Aggregate:**
  The name of the aggregate in which the volume resides.

- **Aggregate ID:**
  A universal unique identifier for the aggregate on which the file resides.
A universal unique identifier for the aggregate containing the volume.

- SnapLock System ComplianceClock:
  The System ComplianceClock time in seconds since 1 January 1970 00:00:00 in GMT timezone if it is initialized.

- Formatted SnapLock System ComplianceClock:
  The System ComplianceClock time in a human-readable format <day> <month> <day of month> <hour>:<min>:<sec><year> in GMT timezone if it is initialized.

- Volume SnapLock Type:
  The type of the SnapLock volume. This value is only given for SnapLock volumes. Possible values are compliance and enterprise.

- Volume ComplianceClock:
  The volume ComplianceClock time in seconds since 1 January 1970 00:00:00 in GMT timezone. This has a value only for SnapLock volumes.

- Formatted Volume ComplianceClock:
  The volume ComplianceClock time in a human-readable format <day> <month> <day of month> <hour>:<min>:<sec><year> in GMT timezone. This has a value only for SnapLock volumes.

- Volume Expiry Date:
  The expiry date of the SnapLock volume in seconds since 1 January 1970 00:00:00 in GMT timezone. The volume expiry date can be in wraparound format.

- Is Volume Expiry Date Wraparound:
  The value is true if the volume expiry date is in wraparound format. The wraparound format indicates that dates after 19 January 2038 are mapped from 1 January 1970 through 31 December 2002 to 19 January 2038 through 19 January 2071.

- Formatted Volume Expiry Date:
  The expiry date of the SnapLock volume in a human-readable format <day> <month> <day of month> <hour>:<min>:<sec><year> in GMT timezone. The volume expiry date can be in wraparound format.

- Filesystem ID:
  The filesystem identifier of the volume on which the file resides.

- File ID:
  A unique number within the filesystem identifying the file.

- File Type:
  The type of the file. Possible values include: worm, worm_appendable, worm_active_log, worm_log, and regular.

- File Size:
  The size of the file in bytes.

- Creation Time:
  The creation time of the file in seconds since 1 January 1970 00:00:00 in GMT timezone.

- Formatted Creation Time:
  The creation time of the file in a human-readable format <day> <month> <day of month> <hour>:<min>:<sec><year> in GMT timezone.

- Modification Time:
  The last modification time of the file in seconds since 1 January 1970 00:00:00 in GMT timezone.

- Formatted Modification Time:
  The last modification time of the file in a human-readable format <day> <month> <day of month> <hour>:<min>:<sec><year> in GMT timezone.
• Changed Time:
The last changed time of the file attributes in seconds since 1 January 1970 00:00:00 in GMT timezone. Time is taken from the system clock for regular files and from the volume ComplianceClock for WORM files when they are committed. The changed time can be in wraparound format.

• Is Changed Time Wraparound:
The value is true if the last changed time of the file attributes is in wraparound format. The wraparound format indicates that dates after 19 January 2038 are mapped from 1 January 1970 through 31 December 2002 to 19 January 2038 through 19 January 2071.

• Formatted Changed Time:
The last changed time of the file attributes in a human-readable format <day> <month> <day of month> <hour>:<min>:<sec><year> in GMT timezone. The changed time can be in wraparound format.

• Retention Time:
The retention time of the files committed to WORM on SnapLock volumes in seconds since 1 January 1970 00:00:00 in GMT timezone. The retention time can be in wraparound format.

• Is Retention Time Wraparound:
The value is true if the retention time of the file is in wraparound format. The wraparound format indicates that dates after 19 January 2038 are mapped from 1 January 1970 through 31 December 2002 to 19 January 2038 through 19 January 2071.

• Formatted Retention Time:
The retention time of the files protected by SnapLock in a human-readable format <day> <month> <day of month> <hour>:<min>:<sec><year> in GMT timezone. The retention time can be in wraparound format.

• Access Time:
The last access time of the regular files on SnapLock volumes and files on non-SnapLock volumes attributes in seconds since 1 January 1970 00:00:00 in GMT timezone.

• Formatted Access Time:
The last access time of the regular files on SnapLock volumes and files on non-SnapLock volumes attributes in a human-readable format <day> <month> <day of month> <hour>:<min>:<sec><year> in GMT timezone.

• Owner ID:
The integer identifier of the owner of the file.

• Group ID:
The integer identifier of the group owning the file.

• Owner SID:
The security identifier of the owner of the file when it has NTFS security style.

• Fingerprint End Time:
The end time of the fingerprint computation in seconds since 1 January 1970 00:00:00 in GMT timezone.

• Formatted Fingerprint End Time:
The end time of the fingerprint computation in a human-readable format <day> <month> <day of month> <hour>:<min>:<sec><year> in GMT timezone.

• Litigation Count:
The number of litigations on the file.

Parameters
[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.
If you specify the `-instance` parameter, the command displays detailed information about all fields.

**-session-id <integer>** - Session ID of Fingerprint Operation

Specifies the session-id of the fingerprint operation whose output is to be displayed. It is a unique identifier for the fingerprint operation. This session-id is returned when the fingerprint operation is started on a file.

### Examples

The following example displays the fingerprint information of the fingerprint session identified by session-id 17039367:

```bash
cluster1::> volume file fingerprint dump -session-id 17039367

Vserver:val1
Session-ID:17039367
Volume:nfs_slc
Path:/vol/nfs_slc/worm

### volume file fingerprint show

Display fingerprint operation status

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.
Description
The `volume file fingerprint show` command returns information for one or several fingerprint operations. This command requires either `-session-id` or `-vserver` and `-volume`.

Parameters

```
[-fields <fieldname>, ...]
```
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance]
```
If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[-session-id <integer>]
```
- Session ID of Fingerprint Operation

If this parameter is specified, the command returns the progress of the fingerprint operation of the specified session-id. The session-id is a unique identifier for the fingerprint operation that is returned when the fingerprint operation is started on a file.

```
[-vserver <vserver name>]
```
- Vserver

If this parameter is specified, -volume must also be specified. When queried with `-vserver` and `-volume`, the command returns the progress of all the fingerprint operations running on that particular volume.

```
[-volume <volume name>]
```
- Volume Name

If this parameter is specified, `-vserver` must also be specified. When queried with `-vserver` and `-volume`, the command returns the progress of all the fingerprint operations running on that particular volume.

```
[-file </vol/<volume name>/<file path>>]
```
- File Path

If this parameter is specified, the command returns the progress of all fingerprint operations on the specified file.

```
[-operation-status {Unknown|In-Progress|Failed|Aborting|Completed}]
```
- Operation Status

If this parameter is specified, the command returns the progress of all fingerprint operations with matching status value.

```
[-progress-percentage <integer>]
```
- Progress Percentage

If this parameter is specified, the command returns the progress of all fingerprint operations with matching progress percentage value.

Examples

The following example displays the progress of all the fingerprint operations running on volume `nfs_slc`:

```
cluster1::> volume file fingerprint show -vserver vs0 -volume nfs_slc

<table>
<thead>
<tr>
<th>File-Path</th>
<th>Session-ID</th>
<th>Status</th>
<th>Percentage</th>
</tr>
</thead>
<tbody>
<tr>
<td>/vol/nfs_slc/worm</td>
<td>17104897</td>
<td>Completed</td>
<td>100</td>
</tr>
<tr>
<td>/vol/nfs_slc/worm_appedable</td>
<td>17104898</td>
<td>Completed</td>
<td>100</td>
</tr>
<tr>
<td>/vol/nfs_slc/regular</td>
<td>17104899</td>
<td>In-Progress</td>
<td>30</td>
</tr>
</tbody>
</table>
3 entries were displayed.
```

`volume file fingerprint start`

Start a file fingerprint computation on a file

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.
Description
The `volume file fingerprint start` command starts the fingerprint computation on a file. The fingerprint computation is started on the file, and a session-id is returned. This session-id is an unique identifier for the fingerprint operation and can be used to get the progress of an ongoing fingerprint operation as well as the complete fingerprint output for the file once the operation is completed.

Parameters

-vserver <vserver name> - Vserver
  Specifies the name of the vserver which owns the volume on which the file resides.

-file /vol/<volume name>/<file path> - Path
  Specifies the absolute path of the file on which fingerprint needs to be calculated. The value begins with /vol/ <volumename>.

[-algorithm MD5|SHA256] - Fingerprint Algorithm
  Specifies the digest algorithm which is used for the fingerprint computation.
  Fingerprint can be computed using one of the following digest algorithms:
  • md5
  • sha-256

[-scope data-and-metadata|data-only|metadata-only] - Fingerprint Scope
  Specifies the scope of the file which is used for the fingerprint computation.
  Fingerprint can be computed using one of the following scope:
  • data-only
  • metadata-only
  • data-and-metadata

Examples
The following example starts computing fingerprint over data and metadata for file /vol/nfs_slc/worm using md5 hash algorithm. The file /vol/nfs_slc/worm is stored in volume nfs_slc on Vserver vs0.

```
cluster1::> volume file fingerprint start -vserver vs0 -scope data-and-metadata -algorithm md5 -
file /vol/nfs_slc/worm
File fingerprint operation is queued. Run "volume file fingerprint show -session-id 16973825" to
view the fingerprint session status.
```

volume file retention commands
SnapLock file retention-related commands

volume file retention show
Display retention time of a file protected by SnapLock.

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The `volume file retention show` command displays the retention time of a file protected by SnapLock given -vserver and -file.
Parameters

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance ]
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[-vserver <vserver name>] - Vserver Name
```

Specifies the name of the Vserver which has the file.

```
[-file </vol/<volume name>/<file path>>] - File path
```

Specifies the absolute path of the file. The value begins with /vol/<volumename>.

```
[-retention-time <integer>] - Retention Time of the File
```

If this parameter is specified, the command returns the retention time of the file protected by SnapLock if its retention time in seconds since 1 January 1970 00:00:00 matches the specified value.

```
[-formatted-retention-time <text>] - Formatted Retention Period
```

If this parameter is specified, the command returns the retention time of the file protected by SnapLock if its expiry date matches the specified value. The expiry date format is `<day> <month> <day of month> <hour>:<min>:<sec><year>` in GMT timezone taking care of wraparound. A value of `infinite` indicates that this file has infinite retention time. A value of `indefinite` indicates that this file has indefinite retention time.

```
[-is-wraparound {true|false}] - Is Retention Time Wraparound
```

If this parameter is specified, the command returns the retention time of the file protected by SnapLock if it has a matching `-is-wraparound` value. The value is `true` if the date represented in retention time is in wraparound format. The wraparound format indicates that dates after 19 January 2038 are mapped from 1 January 1970 through 31 December 2002 to 19 January 2038 through 19 January 2071.

### Examples

The following example displays the retention time of the file `/vol/nfs_sle/f12`:

```
cluster1::> volume file retention show -vserver vs0 -file /vol/nfs_sle/f12

Vserver : vs0
Path : /vol/nfs_sle/f12
Retention Time (Secs from Epoch) : 1439111404
Formatted Retention Time : Sun Aug  9 09:10:04 GMT 2015
Is Retention Time Wraparound : false
```

### volume flexgroup commands

Manage FlexGroup operations

**volume flexgroup deploy**

Deploy a FlexGroup on the cluster

**Availability:** This command is available to cluster and Vserver administrators at the `admin` privilege level.

**Description**
The `volume flexgroup deploy` command deploys a FlexGroup on the cluster.
The FlexGroup is created with 8 constituents on each node in the cluster. The constituents are split equally between the two largest aggregates on each node. If using two aggregates per node is not possible, all of the constituents are created on the largest aggregate on each node.

The `volume flexgroup deploy` command is only supported on clusters with 4 nodes or less. On clusters with more than 4 nodes, use the `volume create` command to create FlexGroups.

**Parameters**

- `-vserver <vserver name>` - Vserver Name
  
  This specifies the Vserver on which the FlexGroup will be located.

- `-size {<integer>{KB|MB|GB|TB|PB}}` - Size of the FlexGroup
  
  This specifies the size of the FlexGroup. The size is specified as a number followed by a unit designation: k (kilobytes), m (megabytes), g (gigabytes), t (terabytes), or p (petabytes). If the unit designation is not specified, bytes are used as the unit and the specified number is rounded up to the nearest 4 KB. The minimum size is 160 MB multiplied by the number of nodes in the cluster. The maximum size of the FlexGroup is limited by the platform maximum FlexVol size multiplied by 8 and multiplied by the number of nodes in the cluster. The size of the FlexGroup is also limited by the available space in the hosting aggregates. FlexGroups can be increased in size with the `volume modify` command and more constituents can be added with the `volume expand` command.

- `[--volume <volume name>]` - Name of the FlexGroup to Create
  
  This specifies the name of the FlexGroup. The name of the FlexGroup must start with an alphabetic character (a to z or A to Z) and must have 197 or fewer characters. The default value for the FlexGroup name is "fg".

- `[--type {RW|DP}]` - Volume Type
  
  This optionally specifies the FlexGroup's type, either read-write (RW) or data-protection (DP). If you do not specify a value for this parameter, a RW volume is created by default.

- `[--space-guarantee {none|volume}]` - Space Guarantee Style
  
  This optionally specifies the space guarantee style for the FlexGroup. A value of `volume` reserves space on the aggregates for the entire volume. A value of `none` reserves no space on the aggregates, meaning that writes can fail if an aggregate runs out of space. Because CIFS does not handle out-of-space conditions, do not use the value `none` if the volume is accessible to CIFS clients. The default setting for volumes on All Flash FAS systems is `none`, otherwise the default setting is `volume`.

- `[--foreground {true|false}]` - Foreground Process
  
  If this parameter is specified with `false`, the command runs in the background as a job. Otherwise, the command does not return until the operation is complete. The default value is `true`.

**Examples**

The following example deploys a FlexGroup named "flexgroup" in the Vserver named "vs1.example.com":

```
class::> volume flexgroup deploy -size 400TB -vserver vs1.example.com -volume flexgroup
```
Description
The `volume flexgroup qtree-disable` command disables qtree support on a FlexGroup.

Parameters
- `vserver <vserver name> - Vserver Name
  This specifies the Vserver in which the FlexGroup is located.
- `volume <volume name> - Volume Name
  This specifies the name of the FlexGroup.

Examples
The following example disables the qtree support on a FlexVol named "fg" in Vserver "vs0":

```
cluster::*> volume flexgroup qtree-disable -vserver vs0 -volume fg
```

volume inode-upgrade commands
Manage volume inode upgrade

volume inode-upgrade prepare-to-downgrade
Prepare volume to downgrade to a release earlier than Data ONTAP 9.0.0

Availability: This command is available to `cluster` administrators at the `advanced` privilege level.

Description
The `volume inode-upgrade prepare-to-downgrade` command prepares volumes to downgrade to a release earlier than Data ONTAP 9.0.0. It is used when there are still volumes in the middle of the inode upgrade process when revert is issued.

Parameters
- `node {<nodename>|local} - Node Name
  This specifies the node on which the command will run. Default is the local node.

Examples
The following example prepares volumes to revert to an earlier release.

```
cluster1::> volume inode-upgrade prepare-to-downgrade -node node1
```

volume inode-upgrade resume
Resume suspended inode upgrade

Availability: This command is available to `cluster` administrators at the `advanced` privilege level.

Description
The `volume inode-upgrade resume` command resumes suspended inode upgrade process. The inode upgrade process may be suspended earlier due to performance reasons.
Parameters

-vserver <vserver name> - VServer Name

This specifies the Vserver on which the volume is located.

-volume <volume name> - Volume Name

This specifies the volume for which the inode upgrade process is to be resumed.

Examples

The following example resumes a volume upgrade process.

```
cluster1::> volume inode-upgrade resume -vserver vs0 -volume vol1
```

### volume inode-upgrade show

Display Inode Upgrade Progress

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**

The `volume inode-upgrade show` command displays information about volumes in the middle of the inode upgrade process. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays the default fields about all volumes in the middle of the inode upgrade process. Default fields are *vserver, volume, aggregate, status, scan-percent, remaining-time, space-needed, and scanner-progress.*

**Parameters**

```
[-fields <fieldname>, ...]

This specifies the fields that need to be displayed.

[-instance]

If this parameter is specified, the command displays information about all entries.

[-vserver <vserver name>] - Vserver

If this parameter and the -volume parameter are specified, the command displays detailed information about the specified volume. If this parameter is specified by itself, the command displays information about volumes on the specified Vserver.

[-volume <volume name>] - Volume

If this parameter and the -vserver parameter are specified, the command displays detailed information about the specified volume. If this parameter is specified by itself, the command displays information about all volumes that match the specified name.

[-node <nodename>] - Node Name

If this parameter is specified, the command displays information only about the volume or volumes that are located on the specified storage system.

[-vol-dsid <integer>] - Volume DSID

If this parameter is specified, the command displays information only about the volume or volumes that match the specified data set ID.

[-vol-uuid <UUID>] - Volume UUID

If this parameter is specified, the command displays information only about the volume or volumes that match the specified UUID.

[-volume-msid <integer>] - Volume MSID

If this parameter is specified, the command displays information only about the volume or volumes that match the specified master data set ID.
[-vserver-uuid <UUID>] - Vserver UUID

If this parameter is specified, the command displays information only about the volume on the Vserver that has the specified UUID.

[-aggregate <aggregate name>] - Aggregate Name

If this parameter is specified, the command displays information only about the volume or volumes that are located on the specified storage aggregate.

[-aggregate-uuid <UUID>] - Aggregate UUID

If this parameter is specified, the command displays information only about the volume or volumes that are located on the storage aggregate with the specified UUID.

[-status {pending|scanning|suspended-initializing|suspended|cleanup-pending|cleanup|cleanup-done|suspended-aborting|suspended-removing|suspended-while-removing|suspended-ironing}] - Upgrade Status

If this parameter is specified, the command displays information only about the volume or volumes that match the specified inode upgrade status.

[-scan-percent <percent>] - Upgrade Scan Percent Complete

If this parameter is specified, the command displays information only about the volume or volumes that match the specified inode upgrade progress percentage.

[-space-needed <integer>[KB|MB|GB|TB|PB]] - Space Needed to Complete Upgrade

If this parameter is specified, the command displays information only about the volume or volumes where the space needed to complete the upgrade process match the specified size.

[-remaining-time <[<integer>h][<integer>m][<integer>s]>] - Remaining Upgrade Time

If this parameter is specified, the command displays information only about the volume or volumes where the remaining time to complete the inode upgrade process match the specified time.

[-scanner-progress <text>] - Scanner Progress

If this parameter is specified, the command displays information only about the volume or volumes where the progress of the inode upgrade process match the input.

Examples

The following example displays information about all volumes in the middle of the inode upgrade process on the Vserver named vs0:

```
cluster1::> volume inode-upgrade show -vserver vs0
Vserver Volume Aggregate Status %Complete Time      Space  Inode
                 --------------- ------ --------- ------ --------- ------ --------
vs0           vol1   aggr1     pending   0%     -         3.07MB Public : Inode 0 out of 3822
```

Volume Move commands

Manage volume move operations

The volume move commands enable you to manage operations regarding moving a volume from one storage aggregate to another storage aggregate
**volume move abort**

Stop a running volume move operation

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The "volume move abort" command sends an abort message to the volume move operation and returns immediately. The volume move operation might not abort immediately depending on the stage it is in. For example, if the volume move operation is in a cut-over or clean-up phase, the abort is ignored. You invoke the "volume move show" command to view the list of running volume move operations and monitor the progress of the abort operation. This command has the same behavior as the *job stop -id <job-id>* command where the job-id is the identifier of the volume move job.

**Parameters**

- **-vserver <vserver name>** - Vserver Name
  
  This specifies the Vserver on which the volume is located.

- **-volume <volume name>** - Volume Name
  
  This specifies the name of the volume being moved.

**Examples**

The following example aborts running volume move operation on volume *vol1*

```
cluster1::> volume move show
Vserver Volume State Move Phase Percent-Complete Time-To-Complete
--------------- ------- -------------- ------------------ ------------------
vs0 vol1 alert cutover_hard_deferred 0% -
vs0 vol2 failed failed - -
2 entries were displayed.

cluster1::> volume move abort -vserver vs0 -volume vol1

cluster1::> volume move show -vserver vs0 -volume vol1 -fields completion-status
vserver volume completion-status
------- ------ --------------------------
vs0     vol1   "Volume move job stopped."
```

The following example shows command failed to abort on *vol2* as volume move operation is completed.

```
cluster1::> volume move show
Vserver Volume State Move Phase Percent-Complete Time-To-Complete
--------------- ------- -------------- ------------------ ------------------
vs0 vol1 alert cutover_hard_deferred 0% -
vs0 vol2 failed failed - -
2 entries were displayed.

cluster1::> volume move abort -vserver vs0 -volume vol2

Error: command failed: There is no volume move operation running on the specified volume.
```

**Related references**

*job stop* on page 162
volume move modify

Modify parameters for a running volume move operation

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The volume move modify command modifies the parameters used by the volume move operation in progress. These modified values can be verified by invoking the volume move show command. The volume move operation will use the modified cutover parameters in its next cutover attempt. Note that the modifications to the job are not applied if the move is in the "finishing" state.

Parameters
-vserver <vserver name> - Vserver Name
This specifies the Vserver on which the volume is located.

-volume <volume name> - Volume Name
This specifies the name of the volume being moved.

[-cutover-action {abort_on_failure|defer_on_failure|force|wait|retry_on_failure}] - Specified Action For Cutover
Specifies the action to be taken for cutover. If the effective cluster version is Data ONTAP 8.3 and later, the default is retry_on_failure; otherwise the default is defer_on_failure. If the abort_on_failure action is specified, the job will try to cutover until cutover attempts are exhausted. If it fails to cutover, it will cleanup and end the operation. If the defer_on_failure action is specified, the job will try to cutover until the cutover attempts are exhausted. If it fails to cutover, it will move into the "cutover_hard_deferred" state. The volume move job waits for a volume move trigger-cutover command to restart the cutover process. If the force action is specified, the job will try to cutover until the cutover attempts are exhausted and force the cutover at the expense of disrupting the clients. If the wait action is specified, when the job hits the decision point, it will not go into cutover automatically, instead it will wait for a volume move trigger-cutover command as the signal to try the cutover.

[-cutover-window <integer>] - Specified Cutover Time Window
This specifies the time interval in seconds to completely cutover operations from the original volume to the moved volume. The default value is 30 seconds. The range for valid input is from 30 to 300 seconds, inclusive.

Examples
The following example modifies the parameters for volume move operation on volume vol2.

cluster1::*> volume move show -vserver vs0 -volume vol2

Vserver Name: vs0
Volume Name: vol2
Actual Completion Time: -
Bytes Remaining: 172KB
Specified Action For Cutover: wait
Specified Cutover Time Window: 40
Time Cutover was Triggered: -
Time Cutover was last triggered: -
Destination Aggregate: node_1_aggr1
Destination Node: node_1
Detailed Status: Cutover Deferred, Waiting for user intervention(69.79MB Sent)::Volume move job preparing transfer

cluster1::*> volume move modify -vserver vs0 -volume vol1 -cutover-action abort_on_failure -cutover-window 40

Error: command failed: There is no volume move operation running on the specified volume.
volume move show

Show status of a volume moving from one aggregate to another aggregate

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The `volume move show` command displays information about volume moves in the cluster. By default, with no parameters, it only shows volume moves that have failed or are currently running. The command display output depends on the parameters passed. If `-vserver` and `-volume` are specified, the following information is displayed:

- Vserver Name: The Vserver on which the volume is located.
- Volume Name: The volume that is part of a completed or running volume move operation.
- Actual Completion Time: The date and time in the cluster time zone when the volume move completed.
- Bytes Remaining: The number of bytes remaining to be sent during volume move. This is an approximate number and lags the current status by a few minutes while the volume move is in operation.
- Specified Action for Cutover: The action to be taken for cutover or during cutover failure. This is the input given during the start of volume move or the value specified during a volume move modification.
- Specified Cutover Time Window: The time window in seconds given as an input for the cutover phase of volume move. This is the input given during the start of volume move or the value specified during a volume move modification.
- Job ID: The Job-ID of move job.
- Destination Node: The name of the node where the destination aggregate is present.
- Source Node: The name of the node where the source aggregate is present.
- Prior Issues Encountered: The latest issues or transient errors encountered causing the move operation to retry the data copy phase or the cutover phase.
- Move Initiated by Auto Balance Aggregate: The value “true” indicates the move is initiated by Auto Balance Aggregate feature.
- Destination Aggregate: The name of the aggregate to which the volume is moved.
- Detailed Status: The detail about any warnings, errors, and state of the move operation.
- Estimated Time of Completion: The approximate date and time in the cluster time zone when the entire volume move operation is expected to complete. Note that this time may keep increasing when the move goes into cutover-deferred mode. In those cases where the input for cutover-action is wait, during the data copy phase, the estimated time of completion will approximate the time to reach the cutover point and wait for user intervention.
- Managing Node: The node in the cluster on which the move job is or was running. This is usually on the node hosting the volume to be moved.
- Percentage Complete: The amount of work to move the volume completed thus far in terms of percentage.
- Move Phase: The phase of the move operation.
- Estimated Remaining Duration: The approximate amount of time in terms of days, hours, minutes and seconds remaining to complete the volume move.
- Replication Throughput: The current replication throughput of the move operation in terms of Kb/s, Mb/s or Gb/s.
• Duration of Move: The duration in days, hours and minutes for which the volume move was or is in progress.
• Source Aggregate: The name of the aggregate where the volume being moved originally resides or resided.
• Start Time of Move: The date and time in the cluster time zone when the volume move operation started.
• Move State: The state of the volume move at the time of issuing the command and the system gathering up the information about the move.
• Original Job ID: The job-id assigned when the job was first created. This value will only be populated when the original job-id differs from the current job-id.

Parameters

{ [-fields <fieldname>, ...]  
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?' to display the fields to specify.
[-instance ]]  
If you specify the -instance parameter, the command displays detailed information about all fields.

[vserver <vserver name>] - Vserver Name
This specifies the Vserver on which the volume is located. If this parameter and the -volume parameter are specified, the command displays detailed information about latest move performed on the specified volume. If this parameter is specified by itself, the command displays information about latest moves performed on volumes of the specified Vserver.

[volume <volume name>] - Volume Name
This specifies the volume that is part of a completed or running volume move operation. If this parameter and the -vserver parameter are specified, the command displays detailed information about latest move performed on the specified volume. If this parameter is specified by itself, the command displays information about the latest move on all volumes matching the specified name.

[actual-completion-time <Date>] - Actual Completion Time
If this parameter is specified, the command displays move operations that match the specified date and time in the cluster time zone when the volume move completed.

[bytes-remaining {<integer> [KB|MB|GB|TB|PB]}] - Bytes Remaining
If this parameter is specified, the command displays move operations that match the specified number of bytes remaining to be sent during volume move.

[cutover-action {abort_on_failure|defer_on_failure|force|wait|retry_on_failure}] - Specified Action For Cutover (privilege: advanced)
If this parameter is specified, the command displays move operations that match the specified action to be taken for cutover or during cutover failure.

[cutover-window <integer>] - Specified Cutover Time Window (privilege: advanced)
If this parameter is specified, the command displays move operations that match the specified time window in seconds for the cutover phase of volume move.

[destination-aggregate <aggregate name>] - Destination Aggregate
If this parameter is specified, the command displays move operations that match the specified name of the aggregate to which the volume is being moved.

[destination-node <nodename>] - Destination Node (privilege: advanced)
If this parameter is specified, the command displays move operations that match the specified name of the node where the destination aggregate is present.
[--details <text>] - Detailed Status
If this parameter is specified, the command displays move operations that match the specified detail about any
warnings, errors and state of the move operation.

[--estimated-completion-time <Date>] - Estimated Time of Completion
If this parameter is specified, the command displays move operations that match the specified date and time in
the cluster time zone when the entire volume move operation is expected to complete.

[--job-id <integer>] - Job ID (privilege: advanced)
If this parameter is specified, the command displays move operations that match the specified Job-ID of the
move job.

[--managing-node <nodename>] - Managing Node
If this parameter is specified, the command displays move operations that match the specified node in the
cluster on which the move job is or was running.

[--percent-complete <percent>] - Percentage Complete
If this parameter is specified, the command displays move operations that match the specified amount of work
to move the volume completed thus far in terms of percentage.

[--phase {queued|initializing|replicating|cutover|cutover_hard_deferred|
cutover_soft_deferred|aborting|completed|cleaning_up|failed|restarting|finishing}] - Move Phase
If this parameter is specified, the command displays move operations that match the specified phase of the
move operation.

[--prior-issues <text>] - Prior Issues Encountered (privilege: advanced)
If this parameter is specified, the command displays move operations that match the specified issues or
transient errors encountered causing the move operation to retry the data copy phase or the cutover phase.

[--estimated-remaining-duration {<seconds> | [<d> days] <hh>:<mm>[:<ss>]}] - Estimated Remaining Duration
If this parameter is specified, the command displays move operations that match the specified time.

[--replication-throughput <text>] - Replication Throughput
If this parameter is specified, the command displays move operations that match the specified replication
throughput of the move operation in terms of Kb/s, Mb/s or Gb/s.

[--actual-duration {<seconds> | [<d> days] <hh>:<mm>[:<ss>]}] - Duration of Move
If this parameter is specified, the command displays move operations that match the specified duration for
which the volume move was or is in progress.

[--source-aggregate <aggregate name>] - Source Aggregate
If this parameter is specified, the command displays move operations that match the specified name of the
aggregate where the volume being moved originally resides or resided.

[--source-node <nodename>] - Source Node (privilege: advanced)
If this parameter is specified, the command displays move operations that match the specified name of the
node where the source aggregate is present.

[--start-time <Date>] - Start Time of Move
If this parameter is specified, the command displays move operations that match the specified date and time in
the cluster time zone when the volume move operation started.

[--state {healthy|warning|alert|failed|done}] - Move State
If this parameter is specified, the command displays move operations that match the specified state of the
volume move operation.
[-moved-by-autobalance {true|false}] - Move Initiated by Auto Balance Aggregate (privilege: advanced)
If this parameter is specified, the command displays move operations that match the specified value of this parameter.

[-original-job-id <integer>] - Original Job ID (privilege: advanced)
If this parameter is specified, the command displays move operations that match the specified value of this parameter.

[-is-source-encrypted {true|false}] - Is Source Volume Encrypted
If this parameter is specified, the command displays move operations that match the specified value of this parameter.

[-source-key-id <text>] - Encryption Key ID of Source Volume
If this parameter is specified, the command displays move operations that match the specified value of this parameter.

[-is-destination-encrypted {true|false}] - Is Destination Volume Encrypted
If this parameter is specified, the command displays move operations that match the specified value of this parameter.

[-destination-key-id <text>] - Encryption Key ID of Destination Volume
If this parameter is specified, the command displays move operations that match the specified value of this parameter.

**Examples**
The following example lists status of volume move operation for a volume vol2 on a Vserver vs0

```bash
cluster1::> volume move show -vserver vs0 -volume vol2
Vserver Name: vs0
  Volume Name: vol2
  Actual Completion Time: -
  Bytes Remaining: 6.37GB
  Destination Aggregate: cluster1_aggr2
  Detailed Status: Transferring data: 3.67GB sent.
  Estimated Time of Completion: Sat Jul 16 20:25:50 2011
  Managing Node: node1
  Percentage Complete: 36%
  Move Phase: replicating
  Estimated Remaining Duration: 00:01
  Replication Throughput: 61.08MB/s
  Duration of Move: 00:02
  Source Aggregate: cluster1_aggr1
  Move State: healthy
```

The following example lists status of volume move operation for a volume vol2 on a Vserver vs0 in advanced mode

```bash
cluster1::*> volume move show -vserver vs0 -volume vol2
Vserver Name: vs0
  Volume Name: vol2
  Actual Completion Time: -
  Bytes Remaining: 156KB
  Specified Action For Cutover: wait
  Specified Cutover Time Window: 30
  Destination Aggregate: cluster1_aggr2
  Destination Node: node2
  Detailed Status: Cutover Deferred, Waiting for user intervention (2.04MB Sent):Volume move job preparing transfer.
  Estimated Time of Completion: -
    Job ID: 265
  Managing Node: node1
```

vs0       s2         done     completed 100%             -
```

Volume Move commands
volume move start

Start moving a volume from one aggregate to another aggregate

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The volume move start command moves a flexible volume from one storage aggregate to another. The destination aggregate can be located on the same node as the original aggregate or on a different node. The move occurs within the context of the same Vserver.

Parameters
-vserver <vserver name> - Vserver Name
This specifies the Vserver on which the volume is located.

-volume <volume name> - Volume Name
This specifies the volume that will be moved.

-destination-aggregate <aggregate name> - Destination Aggregate
This specifies the aggregate to which the volume will be moved.

[-cutover-window <integer>] - Cutover time window in seconds (privilege: advanced)
This specifies the time interval to completely cutover operations from the original volume to the moved volume. The default value is 30 seconds. The range for valid input is from 30 to 300 seconds, inclusive.

[-cutover-action {abort_on_failure|defer_on_failure|force|wait|retry_on_failure}] - Action for Cutover (privilege: advanced)
Specifies the action to be taken for cutover. If the effective cluster version is Data ONTAP 8.3 and later, the default is retry_on_failure; otherwise the default is defer_on_failure. If the abort_on_failure action is specified, the job tries to cutover until cutover attempts are exhausted. If it fails to cutover, it cleans up and ends the operation. If the defer_on_failure action is specified, the job tries to cutover until the cutover attempts are exhausted. If it fails to cutover, it moves into the "cutover deferred" state. The volume move job waits to issue a volume move trigger-cutover command to restart the cutover process. If the force action is specified, the job tries to cutover until the cutover attempts are exhausted and forces the cutover at the expense of disrupting the clients. If the wait action is specified, when the job hits the decision point, it does not go into cutover automatically, instead it waits to issue a volume move trigger-cutover command as the signal to try the cutover. Once cutover is manually triggered, the cutover action changes to defer_on_failure. If the retry_on_failure action is specified, the job retries to cutover indefinitely and it never enters a "hard-deferred" state. After exhausting cutover attempts, the move job waits one hour before trying to cutover again. Issue a volume move trigger-cutover command at any time to restart the cutover process.

[-perform-validation-only [true]] - Performs validation checks only
This is a boolean option allowing to perform pre-move validation checks for the intended volume. When set to true, the command only performs the checks without creating a move job. The default value is false.

[-foreground (true|false)] - Foreground Process
This specifies whether the volume move operation runs as a foreground process. The default setting is false (that is, the operation runs in the background). Note that using this parameter will not affect how long it takes for the operation to complete.
[-encrypt-destination {true|false}] - Encrypt Destination Volume

This specifies whether the move operation should result in creating an encrypted volume on the destination aggregate. When this option is set to true, the destination volume will be encrypted. When it is set to false, the destination volume will be a plain-text volume. When this parameter is not specified, then destination will be same as the source type.

[-generate-destination-key {true|false}] - Generate New Encryption Key for Destination Volume

This option is specified along with -encrypt-destination, a new key will be generated, and that new key will be used for encrypting the destination volume.

[-tiering-policy {snapshot-only|none|backup}] - Volume Tiering Policy

This optional parameter specifies the tiering policy to apply to the destination volume. Tiering policies decide whether the user data blocks of a volume in a FabricPool will be tiered to the capacity tier when they become cold. FabricPool combines flash (performance tier) with an object store (external capacity tier) into a single aggregate. Temperature of a volume block increases if it is accessed frequently and decreases when it is not.

The available tiering-policies are:

- snapshot-only - This policy allows tiering of only the volume Snapshot copies not associated with the active file system.
- none - Volume blocks will not be tiered to the capacity tier.
- backup - This policy transfers all user data blocks directly to the capacity tier. In the case of DP volumes, the tiering policy is retained as backup after the move. For non-DP volumes, the policy is switched back to snapshot-only.

Examples

The following examples perform a validation-check for a volume named volume_test on a Vserver named vs0 to determine if it can be moved to a destination-aggregate named dest_aggr.

```
cluster1::> volume move start -vserver vs0 -volume volume_test -destination-aggregate dest_aggr -perform-validation-only true
Error: command failed: There is 2.54GB of available space on the aggregate dest_aggr which is not enough to accommodate a volume.
```

```
cluster1::> volume move start -vserver vs0 -volume volume_test -destination-aggregate dest_aggr -perform-validation-only true
Validation succeeded.
```

The following example performs a volume move start operation to move a volume named volume_test on a Vserver name vs0 to a destination-aggregate named dest_aggr.

```
cluster1::> volume move start -vserver vs0 -volume volume_test -destination-aggregate dest_aggr
[Job 267] Job is queued: Move "volume_test" in Vserver "vs0" to aggregate "dest_aggr".
Use the "volume move show -vserver vs0 -volume volume_test" command to view the status of this operation.
```

The following example performs a volume move start operation to move a plain-text volume named vol1 to an encrypted volume on destination-aggregate aggr1.
Related references

volume move trigger-cutover on page 1494

volume move trigger-cutover

Trigger cutover of a move job

Availability: This command is available to cluster administrators at the admin privilege level.

Description

This command causes a replicating or deferred volume move job to attempt cutover. Unless the force option is set, cutover entry is not guaranteed.

Parameters

-vserver <vserver name> - Vserver Name
The Vserver on which the volume is located.

-volume <volume name> - Volume Name
The volume that is being moved.

[-force [true]] - Force Cutover
If this parameter is specified, the cutover is done without confirming the operation - even if the operation could cause client I/O disruptions.

Examples

volume move recommend commands

The recommend directory

volume move recommend show

Display Move Recommendations

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

The volume move recommend show command displays moves that were recommended by the Auto Balance Aggregate feature.

Parameters

{ [-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use ‘-fields?’ to display the fields to specify.
  | [-instance]
  If you specify the -instance parameter, the command displays detailed information about all fields.
- [vserver <vserver name> ] - Vserver Name
  If this parameter is specified, the display will be limited to only those recommendations with a Vserver that matches the specified value.

- [volume <volume name> ] - Volume Name
  If this parameter is specified, the display will be limited to only those recommendations with a volume that matches the specified value.

- [creation-time <MM/DD/YYYY HH:MM:SS> ] - Time Stamp of Recommendation
  If this parameter is specified, the display will be limited to only those recommendations with a creation-time that matches the specified value.

- [source-aggregate <aggregate name> ] - Unbalanced Aggregate Name
  If this parameter is specified, the display will be limited to only those recommendations with a source-aggregate that matches the specified value.

- [source-space-after <percent> ] - Space Free After Move (%)
  If this parameter is specified, the display will be limited to only those recommendations with a source-space-after that matches the specified value.

- [destination-aggregate <aggregate name> ] - Destination Aggregate Name
  If this parameter is specified, the display will be limited to only those recommendations with a destination-aggregate that matches the specified value.

- [destination-space-after <percent> ] - Space Bump After Move (%)
  If this parameter is specified, the display will be limited to only those recommendations with a destination-space-after that matches the specified value.

### Examples

The following example displays information about the recommendations made by the Auto Balance Aggregate feature.

```bash
cluster1::*> volume move recommend show -instance
  Vserver Name: vs0.example.com
  Volume Name: ro10
  Time Stamp of Recommendation: 3/13/2014 16:26:39
  Unbalanced Aggregate Name: aggr_1
  Space Free After Move (%): 36%
  Destination Aggregate Name: aggr_3
  Space Bump After Move (%): 36%
```

### volume move target-aggr commands

Manage target aggregates for volume move

The `volume move target-aggr` command enables you to list the aggregates where a volume could be moved.

### volume move target-aggr show

List target aggregates compatible for volume move

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**

The `volume move target-aggr show` displays information about compatible target aggregates for the specified volume to be moved to.
Parameters

\{-fields <fieldname>\}, ...

If you specify the \{-fields <fieldname>\}, ... parameter, the command output also includes the specified field or fields. You can use \{-fields ?\} to display the fields to specify.

\{-instance \}

If you specify the \{-instance\} parameter, the command displays detailed information about all fields.

\{-vserver <vserver name>\} - Vserver Name (Required field)
Selects information about compatible target aggregates for volumes of the specified Vserver.

\{-volume <volume name>\} - Volume Name (Required field)
Selects information about compatible target aggregates that have enough space for the specified volume.

\{-aggregate <aggregate name>\} - Aggregate Name
Selects information about compatible target aggregates with the specified aggregate name (to which the volume might be moved).

\{-tiering-policy \{snapshot-only\|none\|backup\}\} - Volume Tiering Policy
Selects information about compatible target aggregates with the specified destination tiering policy.

\{-availsize \{<integer>\[KB\|MB\|GB\|TB\|PB\]\}\} - Available size
Selects information about compatible target aggregates that have the specified available size.

\{-storagetype <text>\} - Storage Type
Selects information about compatible target aggregates with the specified storage type. Examples of storage types are “ATA”, ”BSAS”, “FCAL”, “LUN”, “SATA”, “SAS” and “SSD”.

Examples

The following example lists target aggregates compatible for moving a volume vol1 on a Vserver vs1.

```
class1::> volume move target-aggr show -vserver vs1 -volume vol1

<table>

```

**volume qtree commands**

Manage qtrees

**volume qtree create**

Create a new qtree

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

This command creates a qtree in the Vserver and volume you specify. You can create up to 4,994 qtrees per volume. This command is not supported on Infinite Volumes.

You can optionally specify the following attributes when creating a new qtree:

- Security style
• Opportunistic lock mode
• UNIX permissions
• Export Policy

Parameters

-vserver <vserver name> - Vserver Name
This specifies the name of the Vserver on which the volume containing the qtree belongs.

{ -volume <volume name> - Volume Name
This specifies the name of the volume that will contain the qtree you are creating.

-qtree <qtree name> - Qtree Name
This specifies the name of the qtree you are creating.
A qtree name cannot contain a forward slash (/). The qtree name cannot be more than 64 characters long.

-qtree-path <qtree path> - Actual (Non-Junction) Qtree Path
The qtree path argument in the format /vol/<volume name>/<qtree name> can be specified instead of specifying volume and qtree as separate arguments.

[-security-style <security style>] - Security Style
This optionally specifies the security style for the qtree, which determines how access to the qtree is controlled. The supported values are unix (for UNIX uid, gid and mode bits), ntfs (for CIFS ACLs), and mixed (for NFS and CIFS access). The unified security style, which applies only to Infinite Volumes, cannot be applied to a qtree. If you do not specify a security style for the qtree, it inherits the security style of its containing volume.

[-oplock-mode {enable|disable}] - Oplock Mode
This optionally specifies whether oplocks are enabled for the qtree. If you do not specify a value for this parameter, it inherits the oplock mode of its containing volume.

[-unix-permissions | -m <unix perm>] - Unix Permissions
This optionally specifies the UNIX permissions for the qtree when the -security-style is set to unix or mixed. You can specify UNIX permissions either as a four-digit octal value (for example, 0700) or in the style of the UNIX ls command (for example, -rwxr-x--- ). For information on UNIX permissions, see the UNIX or Linux documentation. If you do not specify UNIX permissions for the qtree, it inherits the UNIX permissions of its containing volume.

[-export-policy <text>] - Export Policy
This optional parameter specifies the name of the export policy associated with the qtree. For information on export policies, see the documentation for the vserver export-policy create command. If you do not specify a value for this parameter, it inherits the export policy of its containing volume.

Examples

The following example creates a qtree named qtree1. The Vserver name is vs0 and the volume containing the qtree is named vol1. The qtree has a mixed security style. Its other attributes are inherited from volume vol1.

```
cluster1::> volume qtree create -vserver vs0 -volume vol1 -qtree qtree1 -security-style mixed
```

The following example uses a 7G-compatible command to create the qtree.

```
cluster1::> vserver context vs0
vs0::> qtree create /vol/vol1/qtree1
```
volume qtree delete

Delete a qtree

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command deletes a qtree. The length of time that it takes to delete a qtree depends on the number of directories and files it contains. You can monitor the progress of the delete operation by using the job show and job watch-progress commands, respectively. This command is not supported on Infinite Volumes.

The automatically created qtree in the volume - qtree0, listed in CLI output as "" - cannot be deleted.

Note: Quota rules associated with this qtree in all the quota policies will be deleted when you delete this qtree. Qtree deletion will not be allowed if Storage-level Access Guard (SLAG) is configured.

Parameters

-vserver <vserver name> - Vserver Name
This specifies the name of the Vserver on which the volume containing the qtree belongs.

{ -volume <volume name> - Volume Name
This specifies the name of the volume containing the qtree to be deleted.

-qtree <qtree name> - Qtree Name
This specifies the name of the qtree to be deleted.

| -qtree-path <qtree path> - Actual (Non-Junction) Qtree Path
The qtree path argument in the format /vol/<volume name>/<qtree name> can be specified instead of specifying volume and qtree as separate arguments.

[-force [true]] - Force Delete (privilege: advanced)
This optionally forces the qtree delete operation to proceed when the qtree contains files. The default setting is false (that is, the qtree will not be deleted if it contains files). This parameter is available only at the advanced privilege and higher.

[-foreground [true]] - Foreground Process
This optionally specifies whether the qtree delete operation runs as a foreground process. The default setting is false (that is, the operation runs in the background).

Examples

The following example deletes a qtree named qtree4. The Vserver name is vs0 and the volume containing the qtree is named vol1.

cluster1:> volume qtree delete -vserver vs0 -volume vol1 -qtree qtree4
WARNING: Are you sure you want to delete qtree qtree4 in volume vol1 vserver vs0? {y|n}: y
[Job 38] Job is queued: Delete qtree qtree4 in volume vol1 vserver vs0.

job watch-progress on page 163
volume qtree modify

Modify qtree attributes

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command allows you to modify the following attributes of an existing qtree in the given Vserver and volume:

• Security style
• Opportunistic lock mode
• UNIX permissions
• Export policy

This command is not supported by Infinite Volumes.

Parameters

-vserver <vserver name> - Vserver Name
This specifies the name of the Vserver on which the volume containing the qtree belongs.

{-volume <volume name> - Volume Name
This specifies the name of the volume containing the qtree to be modified.

-qtree <qtree name> - Qtree Name
This specifies the name of the qtree to be modified. You can modify the attributes of qtree0 (represented as "" in the CLI) by omitting the -qtree parameter from the command or by specifying the value "" for the -qtree parameter.

| -qtree-path <qtree path> - Actual (Non-Junction) Qtree Path
The qtree path argument in the format /vol/<volume name>/<qtree name> can be specified instead of specifying volume and qtree as separate arguments. The automatically created qtree0 can be represented as /vol/<volume name>.

[-security-style <security style>] - Security Style
This optionally modifies the security style for the qtree. The supported values are unix (for UNIX uid, gid and mode bits), ntfs (for CIFS ACLs), and mixed (for NFS and CIFS access). The unified security style, which applies only to Infinite Volumes, cannot be applied to a qtree. Modifying a qtree's security style will not affect any of the files in the other qtrees of this volume.

[ -oplock-mode {enable|disable}] - Oplock Mode
This optionally modifies whether oplocks are enabled for the qtree.

Modifying qtree0's oplock mode will not affect any of the files in the other qtrees of this volume.

[-unix-permissions <unix perm>] - Unix Permissions
This optionally modifies the UNIX permissions for the qtree. You can specify UNIX permissions either as a four-digit octal value (for example, 0700) or in the style of the UNIX ls command (for example, -rwxr--x---). For information on UNIX permissions, see the UNIX or Linux documentation.

The unix permissions can be modified only for qtrees with unix or mixed security style.

[-export-policy <text>] - Export Policy
This optional parameter modifies the export policy associated with the qtree. If you do not specify an export policy name, the qtree inherits the export policy of the containing volume. For information on export policy, see the documentation for the vserver export-policy create command.
Examples
The following example modifies a qtree named qtree1. The Vserver name is vs0 and the volume containing the qtree is named vol1. The qtree now has a UNIX security style and oplocks are enabled.

```bash
cluster1::> volume qtree modify -vserver vs0 -volume vol1 -qtree qtree1 -security-style unix -oplocks enabled
```

vserver export-policy create on page 1737

volume qtree oplocks
Modify qtree oplock mode

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command allows you to display or modify the opportunistic lock mode of a qtree. This command is not supported on Infinite Volumes.

Parameters
- `vserver <vserver name>` - Vserver Name
  This specifies the name of the Vserver on which the volume containing the qtree belongs.

{ `-volume <volume name>` - Volume Name
  This specifies the name of the volume containing the qtree.

- `qtree <qtree name>` - Qtree Name
  This specifies the name of the qtree for which the oplock mode is being displayed or modified.

| `-qtree-path <qtree path>` - Actual (Non-Junction) Qtree Path
  The qtree path argument in the format /vol/<volume name>/<qtree name> can be specified instead of specifying volume and qtree as separate arguments. The automatically created qtree0 can be represented as /vol/<volume name>.

[ `-oplock-mode {enable|disable}` ] - Oplock Mode
  This specifies the new oplock mode of the qtree. If this parameter is not specified, then the current oplock mode of the qtree is displayed.

Modifying qtree0's oplock mode will not affect any of the files in the other qtrees of this volume.

Examples
The following example displays the oplock mode of a qtree called qtree1. The Vserver name is vs0 and the volume containing the qtree is named vol1.

```bash
cluster1::> volume qtree oplocks -vserver vs0 -volume vol1 -qtree qtree1
/vol/vol1/qtree1 has mixed security style and oplocks are disabled.
```

The following example modifies the oplock mode of a qtree called qtree2 to enabled. The Vserver name is vs0 and the volume containing the qtree is named vol1.

```bash
cluster1::> volume qtree oplocks -vserver vs0 -volume vol1 -qtree qtree2 -oplock-mode enable
```

The following example uses a 7G-compatible command to display and modify the oplock mode of a qtree.
volume qtree rename

Rename an existing qtree

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
This command allows you to rename an existing qtree. This command is not supported on Infinite Volumes.

The automatically created qtree in the volume - qtree0, listed in CLI output as "" - cannot be renamed.

**Parameters**
- **-vserver <vserver name>** - Vserver Name
  This specifies the name of the Vserver on which the volume containing the qtree belongs.

- **{ -volume <volume name> - Volume Name**
  This specifies the name of the volume containing the qtree to be renamed.

- **-qtree <qtree name> - Qtree Name**
  This specifies the name of the qtree to be renamed.

- **| -qtree-path <qtree path> - Actual (Non-Junction) Qtree Path**
  The qtree path argument in the format /vol/<volume name>/<qtree name> can be specified instead of specifying volume and qtree as separate arguments.

- **-newname <qtree name> - Qtree New Name**
  This specifies the new name of the qtree. The new qtree name cannot contain a forward slash (/) and cannot be more than 64 characters long.

**Examples**
The following example renames a qtree named qtree3 to qtree4. The Vserver name is vs0 and the volume containing the qtree is named vol1.

```
cluster1::> volume qtree rename -vserver vs0 -volume vol1 -qtree qtree3 -newname qtree4
```

volume qtree security

Modify qtree security style

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
This command allows you to display or modify the security style of a qtree. This command is not supported on Infinite Volumes.

**Parameters**
- **-vserver <vserver name>** - Vserver Name
  This specifies the name of the Vserver on which the volume containing the qtree belongs.
{ -volume <volume name> - Volume Name
  This specifies the name of the volume containing the qtree.

-qtree <qtree name> - Qtree Name
  This specifies the name of the qtree for which the security style is being displayed or modified.

| -qtree-path <qtree path>| - Actual (Non-Junction) Qtree Path
  The qtree path argument in the format /vol/<volume name>/<qtree name> can be specified instead of specifying volume and qtree as separate arguments. The automatically created qtree0 can be represented as /vol/<volume name>.

[ -security-style <security style>] - Security Style
  This specifies the new security style of the qtree. If this parameter is not specified, then the current security style of the qtree is displayed. The supported values are unix (for UNIX uid, gid and mode bits), ntfs (for CIFS ACLs), and mixed (for NFS and CIFS access). The unified security style, which applies only to Infinite Volumes, cannot be applied to a qtree. Modifying a qtree's security style will not affect any of the files in the other qtrees of this volume.

Examples
The following example displays the security style of a qtree called qtree1. The Vserver name is vs0 and the volume containing the qtree is named vol1.

    cluster1::> volume qtree security -vserver vs0 -volume voll -qtree qtree1
    /vol/voll/qtree1 has mixed security style and oplocks are disabled.

The following example modifies the security style of a qtree called qtree2 to unix. The Vserver name is vs0 and the volume containing the qtree is named vol1.

    cluster1::> volume qtree security -vserver vs0 -volume voll -qtree qtree2 -security-style unix

The following example uses a 7G-compatible command to display and modify the security style of a qtree.

    cluster1::> vserver context vs0
    vs0::> qtree security /vol/voll/qtree1
    /vol/voll/qtree1 has mixed security style and oplocks are disabled.
    vs0::> qtree security /vol/voll/qtree2 unix

volume qtree show
Display a list of qtrees

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command displays information about qtrees for online volumes. By default, the command displays the following information about all qtrees in the cluster:

- Vserver name
- Volume name
- Qtree name
- Security style (unix, ntfs, mixed or unified)
- Whether oplocks is enabled
• Status (normal or readonly)

The display will also include information about Qtree 0. When you create a volume, a special qtree referred to as "qtree0", also
called the default qtree is automatically created for the volume. It represents all of the data stored in a volume that is not
contained in a qtree. In the CLI output, qtree0 is denoted by empty quotation marks (""") and has the ID zero (0). The qtree called
qtree0 cannot be manually created or deleted. This command is not supported on Infinite Volumes.

The qtree status indicates readonly for data protection and load sharing volumes.

To display detailed information about a single qtree, run the command with the -instance and -qtree parameters. The detailed
view adds the following information:
• UNIX permissions
• Qtree ID
• Export policy
• Is Export Policy Inherited

Parameters
{-fields <fieldname>,...}
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified
field or fields. You can use '-fields ?' to display the fields to specify.

[-exports]
Displays the following information about qtree exports:
• Vserver - The name of the Vserver the qtree belongs to
• Volume - The name of the volume the qtree resides on
• Qtree name - The name of the qtree
• Policy Name - The name of the export policy assigned to the qtree
• Is Export Policy Inherited - Whether the export policy assigned to the qtree is inherited

[-id]
Displays qtree IDs in addition to the default output.

[-instance]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver Name
Selects information about the qtrees in the specified Vserver.

[-volume <volume name>] - Volume Name
Selects information about the qtrees in the specified volume.

[-qtree <qtree name>] - Qtree Name
Selects information about the qtrees that have the specified name.

[-qtree-path <qtree path>] - Actual (Non-Junction) Qtree Path
Selects information about the qtrees that have the specified path.

[-security-style <security style>] - Security Style
Selects information about the qtrees that have the specified security style. The unified security style, which applies only to Infinite Volumes, cannot be applied to a qtree.
[-oplock-mode {enable|disable}] - Oplock Mode
Selects information about the qtrees that have the specified oplock mode.
[-unix-permissions | -m <unix perm>] - Unix Permissions
Selects information about the qtrees that have the specified UNIX permissions.
[-qtree-id <integer>] - Qtree Id
Selects information about the qtrees that have the specified ID. A valid qtree ID is an integer from 0 to 4994.
All qtree0 (automatically created) qtrees have an ID of zero (0).
[-status {normal|readonly}] - Qtree Status
Selects information about the qtrees that have the specified status.
[-export-policy <text>] - Export Policy
Selects information about the qtrees that use the specified export policy.
[-is-export-policy-inherited {true|false}] - Is Export Policy Inherited
Selects information about the qtrees that inherit (true) or not inherit (false) the export policy of containing
volume.
Examples
The following example displays default information about all qtrees along with each qtree ID. Note that on vs0, no qtrees
have been manually created, so only the automatically created qtrees referred to as qtree 0 are shown. On vs1, the volume
named vs1_vol1 contains qtree 0 and two manually created qtrees, qtree1 and qtree2.

volume qtree statistics
Display qtree statistics
Availability: This command is available to cluster and Vserver administrators at the admin privilege level.
Description
This command displays NFS and CIFS operations statistics for qtrees. Note that qtree statistics are available only when the
volume containing the qtree is online. This command is not supported on Infinite Volumes.
Statistics are cumulative values from the time the volume is brought online or when the statistics have been reset by using the
"volume qtree statistics-reset" command.
The command output depends on the parameters specified with the command. If no parameters are specified, the command
displays the following statistics information about all qtrees:

1504

•

Vserver name

•

Volume name

•

Qtree name

Commands: Manual Page Reference


NFS operations

CIFS operations

Note:

Qtree statistics are not persistent. If you restart a node, if a storage takeover and giveback occurs, or if the containing volume is set to offline and then online, qtree statistics are set to zero.

Parameters

[-fields <fieldname>,...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-internal] (privilege: advanced)

If this parameter is specified, the output will also include the internal operation statistics. Internal operation is any operation on the qtree that originated within Data ONTAP software.

[-no-reset] (privilege: advanced)

If this parameter is specified, the output will display the NFS and CIFS op statistics since the time the volume was online.

[-no-reset-internal] (privilege: advanced)

If this parameter is specified, the output will also include the internal op statistics since the time the volume was online.

[-instance]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver Name

If this parameter is specified, the command displays information about the qtrees on the specified Vserver.

[-volume <volume name>] - Volume Name

If this parameter is specified, the command displays information about the qtrees on the specified volume.

[-qtree <qtree name>] - Qtree Name

If this parameter is specified, the command displays information about the specified qtree.

[-qtree-path <qtree path>] - Actual (Non-Junction) Qtree Path

The qtree path argument in the format /vol/<volume name>/<qtree name> can be specified instead of specifying volume and qtree as separate arguments. The automatically created qtree0 can be represented as /vol/<volume name>.

Examples

The following example displays statistics information for all qtrees on the Vserver named vs0.

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Volume</th>
<th>Qtree</th>
<th>NFS Ops</th>
<th>CIFS Ops</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs0</td>
<td>vol0</td>
<td>qtree1</td>
<td>10876</td>
<td>2678</td>
</tr>
<tr>
<td>vs0</td>
<td>vol1</td>
<td>qtree1a</td>
<td>16543</td>
<td>0</td>
</tr>
<tr>
<td>vs0</td>
<td>vol2</td>
<td>qtree2</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>vs0</td>
<td>vol2</td>
<td>qtree2a</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

4 entries were displayed.

The following example displays statistics information for qtrees on Vserver vs0 that have NFS ops more than 15000.

volume qtree statistics-reset on page 1506

volume qtree statistics-reset

Reset qtree statistics in a volume

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command resets qtree statistics for all qtrees in a volume. This command is not supported on Infinite Volumes.

Parameters
-vserver <vserver name> - Vserver Name
This specifies the name of the Vserver on which the volume containing the qtree belongs.

-volume <volume name> - Volume Name
This specifies the name of the volume containing the qtrees whose statistics you want to reset.

Examples
The following example resets statistics for all qtrees on the volume named vol1 on the Vserver named vs0.

cluster1::> volume qtree statistics-reset -vserver vs0 -volume vol1

volume quota commands

Manage Quotas, Policies, Rules and Reports

volume quota modify

Modify quota state for volumes

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command allows you to modify the following quota attributes for one or more volumes:

• Quota state
• Whether quota exceeded messages are logged or not
• Frequency with which quota exceeded messages are logged

Modifications to the quota state for a volume creates a job to perform the quota state changes for that volume. You can monitor the progress of the job by using the job show and job watch-progress commands. This command is not supported on Infinite Volumes.
Parameters

-vserver <vserver name> - Vserver Name
   This specifies the name of the Vserver on which the volume whose quota attributes you are modifying is located.

-volume <volume name> - Volume Name
   This specifies the name of the volume whose quota attributes you are modifying.

[-state <quota_state>] - Quota State
   This parameter optionally modifies the quota state to one of the following:
   - off - This indicates that quotas be deactivated for the specified volume.
   - on - This indicates that quotas be activated for the specified volume.
   - resize - This indicates that the quota limits be resized according to the values specified in the quota policy assigned to the Vserver. Note that quotas must be activated first for a volume before a resize operation can be performed.

Both quota activation and quota resize operations apply the quota rules configured for the volume within the quota policy that is currently assigned to the Vserver. These quota rules are managed by using the commands in the volume quota policy rule menu. Quotas, when activated for a volume, go through an initialization process. As part of the quota initialization all the quota rules are applied to the volume. In addition, a filesystem scanner is started to scan the entire filesystem within the volume to bring the quota accounting and reporting up to date. The quota job finishes after the filesystem scanner is started on the volume. The quota state for the volume is initializing until the filesystem scanner finishes scanning the entire filesystem. After the scanning is complete, the quota state will be on.

When quotas are resized, the quota state is resizing until the resizing operation finishes. As part of this operation, the quota limits for quotas currently in effect are resized to the limits currently configured for the volume. After the quota resize operation finishes, the quota state will be on.

Quota state changes can also be performed using the commands volume quota on, volume quota off and volume quota resize.

[-logging {on|off}] - Logging Messages
   This parameter optionally specifies whether quota exceeded syslog/EMS messages are logged in the system log messages. When it is set to on, quota exceeded messages are generated when the user exceeds the quota's disk limit or the file limit through a NFS/CIFS operation or any operation within the Data ONTAP software. When set to off no quota exceeded messages are generated. This parameter can be changed only after quotas are activated for a volume.

[-logging-interval <text>] - Logging Interval
   This parameter optionally specifies a logging interval, which indicates the frequency with which quota exceeded messages are generated. You can specify a logging interval in the <integer><suffix> format, where suffix can be minutes (m), hours (h), or days (d), but not combinations thereof (in other words, 90m is a valid logging interval, but 1h30m is not a valid logging interval). You can modify the logging interval only when the logging is on. When quotas are first activated, the logging parameter is automatically set to on, and the logging interval set to 1h. If continuous logging is required, an interval of 0m should be specified. This parameter can be changed only after quotas are activated for a volume.

   Note: quota message logging may not occur at exactly the same interval rate as specified by the user, especially for very small intervals. This is due to the behavior of the logging system that buffers messages instead of outputting them immediately. Setting the logging interval to 0m can cause lots of quota exceeded messages to be logged in the system log messages.
-foreground [true] - Foreground Process

This parameter optionally specifies whether the job created by quota state modify operation runs as a foreground process. The default setting is false (that is, the quota state modify operation runs in the background). When set to true, the command will not return until the job completes.

Examples

The following example activates quotas on the volume named vol1, which exists on Vserver vs0.

```
cluster1::> volume quota modify -vserver vs0 -volume vol1 -state on
[Job 24] Job is queued: Quota ON Operation on vserver vs0 volume vol1.
```

The following example turns on quota message logging and sets the logging interval to 4 hours.

```
cluster1::> volume quota modify -vserver vs0 -volume vol1 -logging on -logging-interval 4h
```

The following example resizes quota limits on a volume.

```
cluster1::> volume quota modify -vserver vs0 -volume vol1 -state resize -foreground true
[Job 80] Job succeeded: Successful
```

volume quota off

Turn off quotas for volumes

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

This command creates a job to deactivate quotas for the specified volume. This command is not supported on Infinite Volumes. You can monitor the progress of the job by using the job show and job watch-progress commands.

Parameters

- `vserver <vserver name>` - Vserver Name
  This specifies the name of the Vserver on which the volume is located.

- `volume <volume name>` - Volume Name
  This specifies the name of the volume on which you are deactivating quotas.
-foreground [true] - Foreground Process

This optionally specifies whether the job created for deactivating quotas runs as a foreground process. The default setting is false (that is, the operation runs in the background). When set to true, the command will not return until the job completes.

Examples

The following example deactivates quotas on the volume named vol1, which exists on Vserver vs0.

```
cluster1::> volume quota off -vserver vs0 -volume vol1
[Job 23] Job is queued: Quota OFF Operation on vserver vs0 volume vol1.
```

The following example uses a 7G-compatible command to deactivate quotas on the volume named vol1 which exists on Vserver vs0.

```
cluster1::> vserver context vs0
vs0::> quota off vol1
```

volume quota on

Turn on quotas for volumes

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

This command creates a job to activate quotas for the specified volume. This command is not supported on Infinite Volumes. You can monitor the progress of the job by using the job show and job watch-progress commands.

Parameters

-vserver <vserver name> - Vserver Name
This specifies the name of the Vserver on which the volume is located.

-volume <volume name> - Volume Name
This specifies the name of the volume on which you are activating quotas.

[foreground | -w [true]] - Foreground Process
This optionally specifies whether the job created for activating quotas runs as a foreground process. The default setting is false (that is, the operation runs in the background). When set to true, the command will not return until the job completes. The quota job finishes after the filesystem scanner is started. The quota state for the volume is initializing until the filesystem scanner finishes scanning the entire filesystem. After the scanning is complete, the quota state will be on.

Examples

The following example activates quotas on the volume named vol1, which exists on Vserver vs0.

```
volume quota commands
```
The following example uses a 7G-compatible command to activate quotas on the volume named `vol1` which exists on Vserver `vs0`.

```
cluster1::> volume quota on -vserver vs0 -volume vol1
[Job 23] Job is queued: Quota ON Operation on vserver vs0 volume vol1.
```

```
[Job 25] Job is queued: Quota ON Operation on vserver vs0 volume vol1.
[Job 25] Job succeeded: Successful
```

**volume quota report**

Display the quota report for volumes

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**

This command displays the quota report for all volumes in each Vserver that are online and for which quotas are activated. Quota report includes the quota rules (default, explicit, and derived) in effect and the associated resource usage (disk space and files). If quotas are still initializing for a specific volume, that volume is not included. This command is not supported on Infinite Volumes.

This command displays the following information:

- Vserver name
- Volume name
- Index - This is a unique number within a volume assigned to each quota rule displayed in the quota report.
- Tree name - This field gives the name of the qtree if the quota rule is at the qtree level. It is empty if the quota rule is at the volume level.
- Quota type - Type of quota rule (`tree` or `user` or `group`).
- Quota target - This field gives the name of the target of the quota rule. For tree quota rules, it will be the qtree ID of the qtree. For user quota rules, it will be the UNIX user name or the Windows user name. For group quota rules, it will be the UNIX group name. For default rules (tree or user or group), this will display "*". If the UNIX user identifier, UNIX group identifier, or Windows security identifier no longer exists or if the identifier-to-name conversion fails, the target appears in numeric form.
- Quota target ID - This field gives the target of the quota rule in numeric form. For tree quota rules, it will be the qtree ID of the qtree. For group quota rules, it will be the UNIX group identifier. For UNIX user quota rules, it will be the UNIX user identifier. For Windows user quota rules, it will be the Windows security identifier in its native format. For default rules (tree or user or group), "*" will be displayed.
- Disk space used - For a default quota, the value is 0.
• Disk space limit
• Soft disk space limit
• Threshold for disk space limit
• Files used - For a default quota, the value is 0.
• File limit
• Soft file limit
• Quota specifier - For an explicit quota, this field shows how the quota target was configured by the administrator using the volume quota policy rule command. For a default quota, the field shows "*". For a derived tree quota, this field shows the qtree path. For a derived user and group quota, the field is either blank or "*".

The following parameters: -soft, -soft-limit-thresholds, -target-id, -thresholds, -fields and -instance display different set of fields listed above. For example, -soft will display the soft disk space limit and soft file limit apart from other information. Similarly -target-id will display the target in the numeric form.

A quota report is a resource intensive operation. If you run it on many volumes in the cluster, it might take a long time to complete. A more efficient way would be to view the quota report for a particular volume in a Vserver.

Depending upon the quota rules configured for a volume, the quota report for a single volume can be large. If you want to monitor the quota report entry for a particular tree/user/group repeatedly, find the index of that quota report entry and use the -index field to view only that quota report entry. See the examples section for an illustration.

Parameters

{ [-fields <fieldname>, ...]  
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

| [-soft ]  
If this parameter is specified, the command display will include the soft disk space limit and the soft file limit.

| [-soft-limit-thresholds ]  
If this parameter is specified, the command display will include the soft disk space limit, threshold for disk space limit and soft file limit.

| [-target-id ]  
If this parameter is specified, the command will display the target of a user or group quota rule in numeric form.

| [-thresholds ]  
If this parameter is specified, the command display will include the threshold for disk space limit.

| [-instance ]  
If you specify the -instance parameter, the command displays detailed information about all fields.

[vserver <vserver name>] - Vserver Name  
If this parameter is specified, the command displays the quota report for volumes in the specified Vserver.

[-volume <volume name>] - Volume Name  
If this parameter is specified, the command displays the quota report for the specified volume.

[-index <integer>] - Index  
If this parameter is specified, the command displays the quota report for the quota rules that have the specified index.
[-tree <qtree name>] - Qtree Name
If this parameter is specified, the command displays the quota report for the quota rules that have the specified qtree name.

[-quota-type <text>] - Quota Type
If this parameter is specified, the command displays the quota report for the quota rules of the given type.

[-quota-target <text>, ...] - Quota Target
If this parameter is specified, the command displays the quota report for the quota rules that have the specified quota target.

[-quota-target-id <text>, ...] - Quota Target ID
If this parameter is specified, the command displays the quota report for the quota rules that have the specified quota target identifier.

[-disk-used {<integer>[KB|MB|GB|TB|PB]}] - Disk Space Used
If this parameter is specified, the command displays the quota report for the quota rules that have the specified disk space used value.

[-disk-limit {<integer>[KB|MB|GB|TB|PB]}] - Disk Space Limit
If this parameter is specified, the command displays the quota report for the quota rules that have the specified disk space limit.

[-files-used <integer>] - Files Used
If this parameter is specified, the command displays the quota report for the quota rules that have the specified files used value.

[-file-limit <integer>] - Files Limit
If this parameter is specified, the command displays the quota report for the quota rules that have the specified file limit.

[-threshold {<integer>[KB|MB|GB|TB|PB]}] - Disk Space Threshold
If this parameter is specified, the command displays the quota report for the quota rules that have the specified threshold for disk space limit.

[-soft-disk-limit {<integer>[KB|MB|GB|TB|PB]}] - Soft Disk Space Limit
If this parameter is specified, the command displays the quota report for the quota rules that have the specified soft disk space limit.

[-soft-file-limit <integer>] - Soft Files Limit
If this parameter is specified, the command displays the quota report for the quota rules that have the specified soft file limit.

[-quota-specifier <text>] - Quota Specifier
If this parameter is specified, the command displays the quota report for the quota rules that have the specified quota specifier.

[-path <text>] - Path
If this parameter is specified, the command will display the quota report for the quota rules that are applicable for the file in the specified path. The format of the path to the file should begin with /vol/<volume name>/.. The quota rules that are applicable typically consists of the tree quota rule corresponding to the qtree in which the file resides within the volume, user quota rule at the volume and qtree level corresponding to the UNIX user identifier or the Windows security identifier associated with the file and the group quota rule at the volume and qtree level corresponding to the UNIX group identifier associated with the file.

[-disk-used-pct-soft-disk-limit <percent_no_limit>] - Disk Space Used % Soft Disk Space Limit
If this parameter is specified, the command displays the quota report for entries that have the specified percent utilization. The attribute value is computed from disk-used and soft-disk-limit.
[-disk-used-pct-threshold <percent_no_limit>] - Disk Space Used % Disk Space Threshold

If this parameter is specified, the command displays the quota report for entries that have the specified percent utilization. The attribute value is computed from disk-used and threshold.

[-disk-used-pct-disk-limit <percent_no_limit>] - Disk Space Used % Disk Space Limit

If this parameter is specified, the command displays the quota report for entries that have the specified percent utilization. The attribute value is computed from disk-used and disk-limit.

[-files-used-pct-soft-file-limit <percent_no_limit>] - Files Used % Soft File Limit

If this parameter is specified, the command displays the quota report for entries that have the specified percent utilization. The attribute value is computed from files-used and soft-file-limit.

[-files-used-pct-file-limit <percent_no_limit>] - Files Used % File Limit

If this parameter is specified, the command displays the quota report for entries that have the specified percent utilization. The attribute value is computed from files-used and file-limit.

Examples

The following example displays the quota report for all the volumes.

```
cluster1::> volume quota report
Vsaserver: vs0

</table>
```

The following example displays the quota report for the quota rules that are applicable for the given path to a file.

volume quota commands
The following example displays the quota report with the target in the numeric form for the given path to a file.

```bash
cluster1::> volume quota report -path /vol/vol2/q1/file1 -target-id
```

The following example shows how to monitor the quota report for a particular user/tree/group. First, the quota report command is issued with `-instance` to see the index field for the quota report entry we are interested in. Next, the quota report is issued with the `-index` field specified to fetch only that particular quota report entry repeatedly to view the usage over time.

```bash
cluster1::> volume quota report -vserver vs0 -volume vol1 -quota-type user -quota-target john -tree q1 -instance
```
Quota Target ID: 5433
Disk Space Used: 55MB
Files Used: 410
Files Limit: -
Disk Space Limit: 100MB
Soft Disk Space Limit: 80MB
Soft Files Limit: -
Quota Specifier: john
Disk Space Used % Soft Disk Space Limit: 69%
Disk Space Used % Disk Space Threshold: 58%
Disk Space Used % Disk Space Limit: 55%
Files Used % Soft File Limit: -
Files Used % File Limit: -

volume quota resize

Resize quotas for volumes

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

This command resizes the quota limits for the quotas currently in effect for the specified volume. It creates a job to resize quotas. This command is not supported on Infinite Volumes. You can monitor the progress of the job by using the job show and job watch-progress commands.

Note: Quotas must be activated before quota limits can be resized.

Parameters

-vserver <vserver name> - Vserver Name

This specifies the name of the Vserver on which the volume is located.

-volume <volume name> - Volume Name

This specifies the name of the volume on which you are resizing the quota limits and threshold.
[-foreground {true}] - Foreground Process

This optionally specifies whether the job created for resizing quotas runs as a foreground process. The default setting is false (that is, the operation runs in the background). When set to true, the command will not return until the job completes.

Examples

The following example resizes quotas on the volume named vol1, which exists on Vserver vs0.

```
cluster1::> volume quota resize -vserver vs0 -volume vol1
[Job 34] Job is queued: Quota RESIZE Operation on vserver vs0 volume vol1.
```

The following example uses a 7G-compatible command to resize quotas on the volume named vol1 which exists on Vserver vs0.

```
cluster1::> vserver context vs0
vs0::> quota resize vol1
[Job 35] Job is queued: Quota RESIZE Operation on vserver vs0 volume vol1.
```

volume quota show

Display quota state for volumes

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

This command displays information about quotas for online volumes. The command output depends on the parameters specified with the command. Quotas can only be administered on FlexVol volumes. This command is not supported on Infinite Volumes. If no parameters are specified, the command displays the following information for all volumes:

- Vserver name
- Volume name
- Quota state - quota state for this volume. The possible values are as follows:
  - off - this state indicates that quotas are deactivated for the volume.
  - on - this state indicates that quotas are activated for the volume.
  - initializing - this state indicates that quotas are being initialized for the volume.
  - resizing - this state indicates that quota limits are being resized for the volume.
  - corrupt - this state indicates that quotas are corrupt for this volume.
  - mixed - this state may only occur for FlexGroups, and indicates that the constituent volumes are not all in the same state.
- Scan status - percentage of the files in the volume scanned by the quota scanner that runs as part of activating quotas.
• Last error - most recently generated error message as part of the last quota operation (on or resize). Present only if an error has been generated.

To display detailed information about all volumes, run the command with the -instance parameter. The detailed view provides all of the information in the previous list and the following additional information:

• Logging messages - whether quota exceeded syslog/EMS messages are logged or not. For volumes where the quota logging parameter is set to on, quota exceeded messages are generated when a NFS/CIFS operation or any internal Data ONTAP operation is being prevented because the quota disk usage is exceeding the disk limit or the quota file usage is exceeding the file limit. For quotas where the logging parameter is set to off, no quota exceeded messages are generated.

• Logging interval - frequency with which quota exceeded messages are logged. This parameter only applies to volumes that have the logging parameter set to on.

• Sub status - additional status about quotas for this volume. Following are the possible values reported:
  ◦ upgrading - this indicates that the quota metadata format is being upgraded from an older version to a newer version for the volume.
  ◦ setup - this indicates that the quotas are being setup on the volume.
  ◦ transferring rules - this indicates that the quota rules are being transferred to the volume.
  ◦ scanning - this indicates that the quota filesystem scanner is currently running on the volume.
  ◦ finishing - this indicates that the quota on or resize operation is in the final stage of the operation.
  ◦ done - this indicates that the quota operation is finished.
  ◦ none - this indicates that there is no additional status.

• All errors - collection of all the error messages generated as part of the last quota operation (on or resize) since the volume was online.

• User quota enforced (advanced privilege only) - indicates whether there are user quota rules being enforced.

• Group quota enforced (advanced privilege only) - indicates whether there are group quota rules being enforced.

• Tree quota enforced (advanced privilege only) - indicates whether there are tree quota rules being enforced.

Parameters

{ [-fields <fieldname>, ...]  
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

[ [-logmsg ]  
If this parameter is specified, the command displays whether quota exceeded messages are logged and the logging interval for the quota messages.

[ [-instance ]]  
If you specify the -instance parameter, the command displays detailed information about all fields.

[ -vserver <vserver name> ] - Vserver Name  
If this parameter is specified, the command displays information for the volumes in the specified Vserver.

[ -volume <volume name> ] - Volume Name  
If this parameter is specified, the command displays information for the specified volume.

[ -state <quota_state> ] - Quota State  
If this parameter is specified, the command displays information for the volumes that have the specified quota state.
[-scan-status <percent>] - Scan Status
If this parameter is specified, the command displays information about the volumes whose scan-status matches
the specified percentage value. The scan status is displayed in the format [0-100]%.

[-logging {on|off}] - Logging Messages
If this parameter is specified, the command displays information about the volumes that have the specified
logging setting.

[-logging-interval <text>] - Logging Interval
If this parameter is specified, the command displays information about the volumes that have the specified
quota logging interval.

[-sub-status <text>] - Sub Quota Status
If this parameter is specified, the command displays information about the volumes that have the specified
quota sub-status.

[-last-error <text>] - Last Quota Error Message
If this parameter is specified, the command displays information about the volumes whose last error matches
the specified error message.

[-errors <text>] - Collection of Quota Errors
If this parameter is specified, the command displays information about the volumes whose collection of errors
match the specified error message.

[-is-user-quota-enforced {true|false}] - User Quota enforced (privilege: advanced)
If this parameter is specified, the command displays information about the volumes that have the specified
value for this field.

[-is-group-quota-enforced {true|false}] - Group Quota enforced (privilege: advanced)
If this parameter is specified, the command displays information about the volumes that have the specified
value for this field.

[-is-tree-quota-enforced {true|false}] - Tree Quota enforced (privilege: advanced)
If this parameter is specified, the command displays information about the volumes that have the specified
value for this field.

Examples
The following example displays information about all volumes on the Vserver named vs0.

```
cluster1::> volume quota show -vserver vs0
Vserver    Volume        State            Status       Scan
---------  ------------  ---------------  ----------  ------
vs0        root_vs0      off              -            -
vs0        vol1          off              -            -
Last Error: Volume vol1 has no valid quota rules
vs0        vol2          on               initializing 30%
vs0        vol3          on               initializing 30%
4 entries were displayed.
```

The following example displays the logging information for all the volumes.

```
cluster1::> volume quota show -logmsg
Vserver    Volume        State            Message   Interval
---------  ------------  ---------------  -------   --------
vs0        root_vs0      off              -                -
vs0        vol1          off              -                -
vs0        vol2          on               -                -
vs0        vol3          on               initializing 30%
```

  Logging Interval: -
```

---

**volume quota commands**
The following example displays the "Last Quota Error Message" and the "Collection of Quota Errors" for volume vol1, which exists on Vserver vs0.

```
class1::> volume quota show -instance -vserver vs0 -volume vol1
  Vserver Name: vs0
  Volume Name: vol1
  Quota State: on
  Scan Status: -
  Logging Messages: on
  Logging Interval: 1h
  Sub Quota Status: none
  Last Quota Error Message: second definition for user2 (type:user target:user2,user4 qtree:").
  Collection of Quota Errors: second definition for user1 (type:user target:user1,user3 qtree:").
```

### volume quota policy commands

Manage quota policies for a Vserver

#### volume quota policy copy

Copy a quota policy

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

This command copies a quota policy and the rules it contains. This command is not supported on Infinite Volumes. You must enter the following information to copy a quota policy:

- Vserver name
- Policy name
- New policy name

**Parameters**

- `vserver <vserver name>` - Vserver
  
  This parameter specifies the Vserver from which you are copying the quota policy.

- `policy-name <text>` - Policy Name
  
  This parameter specifies the name of the quota policy you are copying.

- `new-policy-name <text>` - New Policy Name
  
  This parameter specifies the name of the new quota policy you are copying to. The new name cannot have more than 32 characters.

**Examples**

The following example copies a quota policy named quota_policy_0 on Vserver vs0. It is copied to quota_policy_1.

```
class1::> volume quota policy copy -vserver vs0 -policy-name quota_policy_0 -new-policy-name quota_policy_1
```

1520

Commands: Manual Page Reference
volume quota policy create

Create a quota policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
A quota policy is collection of quota rules for all the volumes in a specific Vserver. This command creates a quota policy for a specific Vserver. Multiple quota policies can be created for a Vserver, but only one of them can be assigned to the Vserver. A Vserver can have a maximum of five quota policies. If five quota policies already exist, the command fails and a quota policy must be deleted before another quota policy can be created. This command is not supported on Infinite Volumes.

When you turn on quotas for a volume, the quota rules to be enforced on that volume will be picked from the quota policy that is assigned to the Vserver containing that volume. The quota policy for clustered volumes is equivalent to the /etc/quotas file in 7G.

You must enter the following information to create a quota policy:

- Vserver name
- Policy name

**Parameters**

```
-vserver <vserver name> - Vserver
```

This parameter specifies the Vserver for which you are creating the quota policy. You can create a quota policy only for a data Vserver. Quota policies cannot be created for a node or admin Vserver.

```
-policy-name <text> - Policy Name
```

This parameter specifies the name of the quota policy you are creating. The quota policy name cannot be more than 32 characters long and must be unique within the Vserver.

**Examples**
The following example creates a quota policy named quota_policy_0 on Vserver vs0.

```
cluster1::> volume quota policy create -vserver vs0 -policy-name quota_policy_0
```

volume quota policy delete

Delete a quota policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
This command deletes a quota policy and all the rules it contains. The policy can be deleted only when it is not assigned to the Vserver. This command is not supported on Infinite Volumes. You must enter the following information to delete a quota policy:

- Vserver name
- Policy name

**Parameters**

```
-vserver <vserver name> - Vserver
```

This parameter specifies the Vserver containing the quota policy you want to delete.

```
-policy-name <text> - Policy Name
```

This parameter specifies the name of the quota policy you want to delete.
Examples
The following example deletes a quota policy named quota_policy_5 on Vserver vs0.

```
cluster1::> volume quota policy delete -vserver vs0 -policy-name quota_policy_5
```

**volume quota policy rename**

Rename a quota policy

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
This command renames a quota policy. This command is not supported on Infinite Volumes. You must enter the following information to rename a quota policy:

- Vserver name
- Policy name
- New policy name

**Parameters**
- `-vserver <vserver name>` - **Vserver**
  
  This parameter specifies the Vserver containing the quota policy you want to rename.

- `-policy-name <text>` - **Policy Name**
  
  This parameter specifies the name of the quota policy you are renaming.

- `-new-policy-name <text>` - **New Policy Name**
  
  This parameter specifies the new name of the quota policy. The new name cannot be more than 32 characters long.

**Examples**
The following example renames a quota policy named quota_policy_0 on Vserver vs0. The policy's new name is quota_policy_1.

```
cluster1::> volume quota policy rename -vserver vs0 -policy-name quota_policy_0 -new-policy-name quota_policy_1
```

**volume quota policy show**

Display the quota policies

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
This command displays information about quota policies. This command is not supported on Infinite Volumes. The command displays the following information about all quota policies:

- Vserver name
- Policy name
- When the policy was last modified
Parameters

{[-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?' to display the fields to specify.

[[-instance ]]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver

If this parameter is specified, the command displays information about the quota policies for the specified Vserver.

[-policy-name <text>] - Policy Name

If this optional parameter is specified, the command displays information about quota policies that match the specified name.

[-last-modified <MM/DD/YYYY HH:MM:SS>] - Last Modified

If this optional parameter is specified, the command displays information about quota policies with the last modified time that match the given time.

Examples

The following example displays information about all quota policies.

```
cluster1::> volume quota policy show
Vserver       Policy Name           Last Modified
--------------- --------------------   ----------------
vs0           quota_policy_vs0       10/16/2008 17:40:05
vs1           quota_policy_vs1       10/16/2008 17:47:45
vs2           quota_policy_vs2       10/16/2008 17:44:13
vs3           quota_policy_vs3       10/16/2008 17:44:13
4 entries were displayed.
```

The following example displays information about all quota policies along with the policy ID in the diagnostic privilege.

```
cluster1::> set -privilege diagnostic
Warning: These diagnostic commands are for use by NetApp personnel only.
Do you wish to continue? (y or n): y
cluster1::*> volume quota policy show
Vserver       Policy Name           Last Modified             Policy ID
--------------- --------------------     --------------
vs0           quota_policy_vs0       10/16/2008 17:40:05     8589934594
vs1           quota_policy_vs1       10/16/2008 17:47:45     8589934593
vs2           quota_policy_vs2       10/16/2008 17:44:13     8589934595
vs3           quota_policy_vs3       10/16/2008 17:44:13     12884901889
4 entries were displayed.
```

volume quota policy rule commands

Manage the rules for a quota policy

volume quota policy rule create

Create a new quota rule

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

This command creates a quota policy rule. This command is not supported on Infinite Volumes. You must enter the following information to create a quota policy rule:
• Vserver name
• Quota policy name
• Volume name
• Quota target type
• Target to which the rule applies
• Qtree to which the rule applies

You can optionally specify the following additional attributes for the quota policy rule:
• User mapping
• Hard disk limit
• Hard file limit
• Threshold for disk limit
• Soft disk limit
• Soft file limit

Note: For a new quota policy rule to get enforced on the volume, you should create the rule in the quota policy assigned to the Vserver. Additionally, a quota off and on or a quota resize operation must be done using the "volume quota modify" command.

Parameters
-vserver <vserver name> - Vserver
   This parameter specifies the Vserver containing the quota policy for which you are creating a rule.
-policy-name <text> - Policy Name
   This parameter specifies the name of the quota policy in which you are creating a rule.
-volume <volume name> - Volume Name
   This parameter specifies the name of the volume for which you are creating a rule.
-type {tree|user|group} - Type
   This parameter specifies the quota target type of the rule you are creating.
-target <text> - Target
   This parameter specifies the target to which the quota policy rule applies. For default quota rules, this parameter should be specified as "". For explicit tree quotas rules, this parameter should indicate the qtree name. For explicit user quota rules, this parameter can contain UNIX user name, UNIX user identifier, Windows user name, Windows Security Identifier or a path to an existing object within the volume. If a name contains a space, enclose the entire value in quotes. A UNIX user name cannot include a backslash (\) or an @ sign; user names with these characters are treated as Windows names. For multi-user quotas, this parameter can contain multiple user targets separated by a comma. For explicit group quota rules, this parameter can contain UNIX group name or UNIX group identifier or a path to an existing object within the volume. When a path is specified as the target, it should be of the format /vol/<vol-name>/<path to file from volume root> where the volume matches that of the -volume parameter.
-qtree <qtree name> - Qtree Name
   This parameter specifies the name of the qtree to which the quota rule applies. This parameter is not applicable for tree type rules. For user or group type rules at the volume level, this parameter should contain "".

Note: For a new quota policy rule to get enforced on the volume, you should create the rule in the quota policy assigned to the Vserver. Additionally, a quota off and on or a quota resize operation must be done using the "volume quota modify" command.
[-user-mapping {on|off}] - User Mapping

This parameter optionally specifies if user mapping needs to be performed for a user quota rule. If this parameter is "on", the UNIX user name specified as the quota target will be mapped to the corresponding Windows user name or vice-versa and quota accounting will be performed for the users together. The mapping will be obtained as configured in "vserver name-mapping".

Note that this parameter can be specified only for quota policy rules of type user. A value of "on" can be specified for this parameter only if the quota target is a UNIX user name or a Windows user name and cannot be specified for multi-user quota targets.

[-disk-limit {<size>|-}] - Disk Limit

This parameter optionally specifies a hard limit for the disk space that can be consumed by the quota target. The default unit for the disk limit is assumed to be Kilobytes if no units are specified. When the hard disk space limit is reached, no additional disk space can be consumed by the specified target. The value that you specify for this parameter should be greater than or equal to the threshold and soft disk limit. A disk limit of unlimited can be specified with a "." for this parameter or by not specifying this parameter and will be indicated by a ".". The maximum value is 1,125,899,906,842,620 KB, which is approximately 1,023 PB. The value should be a multiple of 4 KB. If it is not, this field can appear incorrect in quota reports. This happens because the field is always rounded up to the nearest multiple of 4 KB to match disk space limits, which are translated into 4-KB disk blocks. The value can be larger than the amount of disk space available in the volume.

[-file-limit {<integer>|-}] - Files Limit

This parameter optionally specifies a hard limit for the number of files permitted on the quota target. When the hard number of files limit is reached, no additional files can be created by the specified target. The value that you specify for this parameter should be greater than or equal to the soft file limit. A file limit of unlimited can be specified with a "." for this parameter or by not specifying this parameter and will be indicated by a ".". The maximum value is 4,294,967,295.

[-threshold {<size>|-}] - Threshold for Disk Limit

This parameter optionally specifies the disk limit threshold for the quota target. The default unit for the disk limit threshold is assumed to be Kilobytes if no units are specified. When the disk limit threshold is exceeded, a console message, EMS events, and SNMP traps are generated. The value that you specify for this parameter should be greater than or equal to the soft disk limit and equal to or less than the disk limit. A threshold of unlimited can be specified with a "." for this parameter or by not specifying this parameter and will be indicated by a ".". The maximum value is 1,125,899,906,842,620 KB, which is approximately 1,023 PB. The value should be a multiple of 4 KB. If it is not, this field can appear incorrect in quota reports. This happens because the field is always rounded up to the nearest multiple of 4 KB to match disk space limits, which are translated into 4-KB disk blocks.

[-soft-disk-limit {<size>|-}] - Soft Disk Limit

This parameter optionally specifies a soft limit for the disk space that can be consumed by the quota target. The soft disk limit indicates that the hard limit for the disk space will soon be exceeded. The default unit for the soft disk limit is assumed to be Kilobytes if no units are specified. When the soft limit for the disk space is exceeded, a console message, EMS events and SNMP traps are generated. The same happens when the disk space used goes below the specified limit. The value that you specify for this parameter should be equal to or less than the threshold and the disk limit. A soft disk limit of unlimited can be specified with a "." for this parameter or by not specifying this parameter and will be indicated by a ".". The maximum value is 1,125,899,906,842,620 KB, which is approximately 1,023 PB. The value should be a multiple of 4 KB. If it is not, this field can appear incorrect in quota reports. This happens because the field is always rounded up to the nearest multiple of 4 KB to match disk space limits, which are translated into 4-KB disk blocks.

[-soft-file-limit {<integer>|-}] - Soft Files Limit

This parameter optionally specifies a soft limit for the number of files permitted on the quota target. The soft file limit indicates that the hard limit for the number of files will soon be exceeded. When the soft limit for the number of files is exceeded, a console message, EMS events and SNMP traps are generated. The same happens when the files used goes below the specified limit. The value that you specify for this parameter
should be equal to or less than the file limit. A soft file limit of unlimited can be specified with a "-" for this parameter or by not specifying this parameter and will be indicated by a "-". The maximum value is 4,294,967,295.

**Examples**

The following example creates a default tree quota rule for volume `vol0` in Vserver `vs0` and in the quota policy named `quota_policy_0`. This quota policy applies to all qtrees on volume `vol0`.

```bash
cluster1::> volume quota policy rule create -vserver vs0 -policy-name quota_policy_0 -volume vol0 -type user -target ""
```

The following example creates a quota policy rule for volume `vol0` in Vserver `vs0` and in the quota policy named `quota_policy_0`. This quota policy applies to the UNIX user `myuser` for a qtree named `qtree1` on volume `vol0` with a disk limit of 20 Gigabytes, soft disk limit of 15.4 Gigabytes and threshold limit of 15.4 Gigabytes. User mapping is turned on for this rule.

```bash
cluster1::> volume quota policy rule create -vserver vs0 -policy-name quota_policy_0 -volume vol0 -type user -target myuser -qtree qtree1 -user-mapping on -disk-limit 20GB -soft-disk-limit 15.4GB -threshold 15.4GB
```

The following example creates a quota policy rule for volume `vol0` in Vserver `vs0` and in the quota policy named `quota_policy_0`. This quota policy applies to the Windows user `DOMXYZ\myuser` for a qtree named `qtree1` on volume `vol0` with a file limit of 40000 and a soft file limit of 26500. User mapping is turned on for this rule.

```bash
cluster1::> volume quota policy rule create -vserver vs0 -policy-name quota_policy_0 -volume vol0 -type user -target DOMXYZ\myuser -qtree qtree1 -user-mapping on -file-limit 40000 -soft-file-limit 26500
```

The following example creates a quota policy rule for volume `vol0` in Vserver `vs0` and in the quota policy named `quota_policy_0`. This quota policy applies to the UNIX user identifier `12345` for a qtree named `qtree1` on volume `vol0`.

```bash
cluster1::> volume quota policy rule create -vserver vs0 -policy-name quota_policy_0 -volume vol0 -type user -target 12345 -qtree qtree1
```

The following example creates a quota policy rule for volume `vol0` in Vserver `vs0` and in the quota policy named `quota_policy_0`. This quota policy applies to the Windows Security Identifier `S-123-456-789` for a qtree named `qtree1` on volume `vol0`.

```bash
cluster1::> volume quota policy rule create -vserver vs0 -policy-name quota_policy_0 -volume vol0 -type user -target S-123-456-789 -qtree qtree1
```

The following example creates a quota policy rule for volume `vol0` in Vserver `vs0` and in the quota policy named `quota_policy_0`. This quota policy applies to the UNIX group `engr` for a qtree named `qtree1` on volume `vol0`.

```bash
cluster1::> volume quota policy rule create -vserver vs0 -policy-name quota_policy_0 -volume vol0 -type group -target engr -qtree qtree1
```

The following example creates a quota policy rule for volume `vol0` in Vserver `vs0` and in the quota policy named `quota_policy_0`. This quota policy applies to the user who is the owner of the file `/vol/vol0/qtree1/file1.txt` for qtree `qtree1` on volume `vol0`.

```bash
cluster1::> volume quota policy rule create -vserver vs0 -policy-name quota_policy_0 -volume vol0 -type user -qtree qtree1
```
cluster1::> volume quota policy rule create -vserver vs0 -policy-name quota_policy_0 -volume vol0 -type user -target /vol/vol0/qtree1/file1.txt -qtree qtree1

The following example creates a quota policy rule for volume vol0 in Vserver vs0 and in the quota policy named quota_policy_0. This quota policy applies to the users specified in the target for qtree qtree1 on volume vol0.

cluster1::> volume quota policy rule create -vserver vs0 -policy-name quota_policy_0 -volume vol0 -type user -target user1,DOMXYZ\user2,23457,S-126-098-567,/vol/vol0/qtree1/file2.txt -qtree qtree1

volume quota policy rule delete

Delete an existing quota rule

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The volume quota policy rule delete command deletes a quota policy rule. This command is not supported on Infinite Volumes. You must enter the following information to delete a quota policy rule:

- Vserver name
- Quota policy name
- Volume name
- Quota target type
- Target to which the rule applies
- Qtree to which the rule applies

Note: If the rule being deleted belongs to the quota policy that is currently assigned to the Vserver, enforcement of the rule on the volume must be terminated by performing a quota off and on or a quota resize operation using the "volume quota modify" command.

Parameters

-vserver <vserver name> - Vserver
This parameter specifies the Vserver containing the quota policy for which you are deleting a rule.

-policy-name <text> - Policy Name
This parameter specifies the name of the quota policy in which you are deleting a rule.

-volume <volume name> - Volume Name
This parameter specifies the name of the volume for which you are deleting a rule.

-type {tree|user|group} - Type
This parameter specifies the quota target type for the rule.

-target <text> - Target
This parameter specifies the target to which the quota policy rule applies.
-qtree <qtree name> - Qtree Name
   This parameter specifies the name of the qtree for which you are deleting a rule.

Examples
The following example deletes a quota policy rule on Vserver vs1 for the quota policy named quota_policy_1. This quota policy applies to the group named engr for the qtree named qtree1 on volume vol1.

```
cluster1::> volume quota policy rule delete -vserver vs1
  -policy-name quota_policy_1 -volume vol1 -type group -target engr
  -qtree qtree1
```

volume quota modify on page 1506

volume quota policy rule modify
Modify an existing quota rule

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command can be used to modify the following attributes of a quota policy rule:

- User mapping
- Hard disk limit
- Hard file limit
- Threshold for disk limit
- Soft disk limit
- Soft file limit

Note: If the rule being modified belongs to the quota policy that is currently assigned to the Vserver, rule enforcement on the volume must be enabled by performing a quota off and on or a quota resize operation using the "volume quota modify" command.

This command is not supported on Infinite Volumes.

Parameters
-vserver <vserver name> - Vserver
   This parameter specifies the Vserver containing the quota policy for which you are modifying a rule.

-policy-name <text> - Policy Name
   This parameter specifies the name of the quota policy in which you are modifying a rule.

-volume <volume name> - Volume Name
   This parameter specifies the name of the volume for which you are modifying a rule.

-type {tree|user|group} - Type
   This parameter specifies the quota target type for the rule you are modifying.

-target <text> - Target
   This parameter specifies the target to which the quota policy rule applies. If the target is a user, the user ID or username must be the same one that was used to create the quota. The same restriction is there for both group ID or groupname and Windows SID or Windows account name.
-qtree <qtree name> - Qtree Name
  This parameter specifies the name of the qtree to which the quota policy rule applies.

-<user-mapping {on|off}> - User Mapping
  This parameter optionally modifies the user mapping for a user quota rule. The value for this parameter can be modified only for quota policy rules of type user. A value of "on" can be specified for this parameter only if the quota target is a unix user name or a Windows user name and cannot be specified for multi-user quota targets. If this parameter is "on", the unix user name specified as the quota target will be mapped to the corresponding Windows user name or vice-versa and quota accounting will be performed for the users together.

-<disk-limit {<size>|-}> - Disk Limit
  This parameter optionally modifies the hard limit for the disk space that can consumed by the quota target. The default unit for the disk limit is assumed to be Kilobytes if no units are specified. The value that you specify for this parameter should be greater than or equal to the threshold and soft disk limit. A disk limit of unlimited can be specified with a "-" for this parameter.

-<file-limit {<integer>|-}> - Files Limit
  This parameter optionally modifies the hard limit for the number of files permitted on the quota target. The value that you specify for this parameter should be greater than or equal to the soft file limit. A file limit of unlimited can be specified with a "-" for this parameter.

-<threshold {<size>|-}> - Threshold for Disk Limit
  This parameter optionally modifies the disk limit threshold for the quota target. The default unit for the disk limit threshold is assumed to be Kilobytes if no units are specified. The value that you specify for this parameter should be greater than or equal to the soft disk limit and equal to or less than the disk limit. A threshold limit of unlimited can be specified with a "-" for this parameter.

-<soft-disk-limit {<size>|-}> - Soft Disk Limit
  This parameter optionally modifies the soft limit for the disk space that can be consumed by the quota target. The default unit for the soft disk limit is assumed to be Kilobytes if no units are specified. The value that you specify for this parameter should be equal to or less than the threshold and the disk limit. A soft disk limit of unlimited can be specified with a "-" for this parameter.

-<soft-file-limit {<integer>|-}> - Soft Files Limit
  This parameter optionally modifies the soft limit for the number of files permitted on the quota target. The value that you specify for this parameter should be equal to or less than the file limit. A soft file limit of unlimited can be specified with a "-" for this parameter.

Examples
The following example modifies a quota policy rule for the quota policy named quota_policy_0. This quota policy exists on Vserver vs0 and applies to the user named myuser for qtree named qtree1 on volume vol0. The user mapping is turned on, the hard disk limit is set to 20 GB and the hard file limit is set to 100,000 files.

```
cluster1::> volume quota policy rule modify -vserver vs0
  -policy-name quota_policy_0 -volume vol0 -type user -target myuser
  -qtree qtree1 -user-mapping on -disk-limit 20GB -file-limit 100000
```

volume quota modify on page 1506

volume quota policy rule show

Display the quota rules

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.
Description
This command displays the following information about quota policy rules by default.

• Vserver name
• Quota policy name
• Volume name
• Type of quota policy rule
• Target of the quota policy rule
• Qtree name
• User mapping
• Hard disk limit
• Soft disk limit
• Hard file limit
• Soft file limit
• Threshold for disk limit

This command is not supported on Infinite Volumes.

Parameters

{ [-fields <fieldname>, ...] 
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

| [-instance ]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver
If this parameter is specified, the command displays information about quota rules for the quotas contained on volumes on the specified Vserver.

[-policy-name <text>] - Policy Name
If this parameter is specified, the command displays information about quota rules for the specified quota policy.

[-volume <volume name>] - Volume Name
If this parameter is specified, the command displays information about quota rules for the quota policy associated with the specified volume.

[-type {tree|user|group}] - Type
If this parameter is specified, the command displays information about quota rules for the specified quota type.

[-target <text>] - Target
If this parameter is specified, the command displays information about quota rules for the specified target.

[-qtree <qtree name>] - Qtree Name
If this parameter is specified, the command displays information about quota rules for the specified qtree.

[-user-mapping {on|off}] - User Mapping
If this parameter is specified, the command displays information about quota rules having the specified user-mapping value.
[-disk-limit {<size>|-}] - Disk Limit
   If this parameter is specified, the command displays information about quota rules having the specified hard
   disk limit.

[-file-limit {<integer>|-}] - Files Limit
   If this parameter is specified, the command displays information about quota rules having the specified hard
   file limit.

[-threshold {<size>|-}] - Threshold for Disk Limit
   If this parameter is specified, the command displays information about quota rules having the specified disk
   limit threshold.

[-soft-disk-limit {<size>|-}] - Soft Disk Limit
   If this parameter is specified, the command displays information about quota rules having the specified soft
   disk limit.

[-soft-file-limit {<integer>|-}] - Soft Files Limit
   If this parameter is specified, the command displays information about quota rules having the specified soft
   file limit.

Examples
The following example displays information about all the quota policy rules in a cluster. There is one user rule that exists
on Vserver vs0 for the quota policy named quota_policy_0. This quota policy applies to the user named myuser for qtree
named qtree0 on volume vol0.

```
cluster1::> volume quota policy rule show
Vserver: vs0   Policy: quota_policy_0   Volume: vol0

volume quota policy rule count commands
Display count of quota rules

```
volume quota policy rule count show
```
Display count of quota rules

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command displays various counts of quota policy rules defined within a quota policy. By default, the subtotal for each
volume is displayed. Optionally, the command can provide the total rule count across the entire quota policy or detailed
subtotals organized by qtree and quota rule type.

Parameters

```
[-fields <fieldname>,...]
```
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified
field or fields. You can use ‘-fields ?’ to display the fields to specify.

```
[-detail]
```
Displays rule count subtotals for each quota rule type. The subtotals for each type are computed for a specific
volume and qtree.
| [-hierarchy ] | Displays rule count subtotals in hierarchical format with subtotals at the quota policy, volume, qtree, and quota rule type levels. |
| [-total ] | Displays the total rule count for each Vserver and quota policy. |
| [-instance ] | Displays detailed information about all fields. |
| [-vserver <vserver name>] - Vserver | Displays quota rule counts for the specified Vserver. |
| [-policy-name <text>] - Policy Name | Displays quota rule counts for the specified quota policy. |
| [-volume <volume name>] - Volume Name | Displays quota rule counts for the specified volume. |
| [-qtree <qtree name>] - Qtree Name | Displays quota rule counts for the specified qtree. |
| [-type {tree|user|group}] - Type | Displays quota rule counts for the specified quota rule type. |
| [-count-where-policy-volume-qtree-type <integer>] - Qtree/Type Subtotal | Subtotal of rules matching the given Vserver, quota policy, volume, qtree, and quota rule type. If specified as input, only matching totals are displayed. |
| [-count-where-policy-volume-qtree <integer>] - Qtree Subtotal | Subtotal of rules matching the given Vserver, quota policy, volume, and qtree. All quota rule types are included. If specified as input, only matching totals are displayed. |
| [-count-where-policy-volume-type <integer>] - Volume/Type Subtotal | Subtotal of rules matching the given Vserver, quota policy, volume, and quota rule type. All qtrees are included. If specified as input, only matching totals are displayed. |
| [-count-where-policy-volume <integer>] - Volume Subtotal | Subtotal of rules matching the given Vserver, quota policy, and volume. All qtrees and quota rule types are included. If specified as input, only matching totals are displayed. |
| [-count-where-policy-type <integer>] - Policy/Type Subtotal | Subtotal of rules matching the given Vserver, quota policy, and quota rule type. All volumes and qtrees are included. If specified as input, only matching totals are displayed. |
| [-count-where-policy <integer>] - Policy Total | Total rule count matching the given Vserver and quota policy. All volumes, qtrees, and quota rule types are included. If specified as input, only matching totals are displayed. |

### Examples

The following example shows quota rule counts for Vserver vs0, quota policy `default`. The total number of rules in quota policy `default` is 7500. There are two volumes with quota rules configured. Volume `volume0` has a total of 1000 rules, and `volume1` has a total of 6500 rules.

```
cluster1::> volume quota policy rule count show -vserver vs0 -policy-name default
Vserver: vs0       Policy: default
       Rule
       Volume       Count
```
volume reallocation commands

Commands for measuring and optimizing data layout

volume reallocation measure

Start reallocate measure job

Availability: This command is available to cluster administrators at the admin privilege level.

Description
Performs a measure-only reallocation check on a LUN, file, or volume. At the end of each check, the system logs the optimization results in the Event Message System (EMS). If you use the logfile, the system records detailed information about the LUN, file, or volume layout in the log file. To view previous measure-only reallocation checks, use the volume reallocation show command.

Note: This command is not supported for FlexGroups, FlexGroup Constituents, Infinite Volumes, or Infinite Volume constituents.

Parameters

-vserver <vserver name> - Vserver
  Specifies the Vserver.

-path <text> - Path
  Specifies the path of the reallocation for a LUN, file, or volume.

{ [ -interval | -i <text>] - Interval Schedule
  Specifies the reallocation scan interval in
  • m for minutes
  • h for hours
  • d for days
  For example, 30m is a 30 minute interval. The countdown to the next scan begins after the first scan is complete.
  The default interval is 24 hours.

[ [-once | -o [true]]] - Once
  Specifies that the job runs once and then is automatically removed from the system when set to true. If you use this command without specifying this parameter, its effective value is false and the reallocation scan runs as scheduled. If you enter this parameter without a value, it is set to true and a reallocation scan runs once.

-logpath | -l <text> - Log Path
  Specifies the path for reallocation logs.
[\texttt{-threshold \{t \textless integer\}}] - Threshold

Specifies the threshold when a LUN, file, or volume is considered unoptimized and a reallocation should be performed. Once the threshold is reached, the system creates a diagnostic message that indicates that a reallocation might improve performance.

The threshold range is from 3 (the layout is moderately optimized) to 10 (the layout is not optimal). The threshold default is 4.

**Examples**

\begin{verbatim}
cluster1::> volume reallocation measure -path /vol/vol2 -once
[Job 167] Job is queued: Reallocate Job.
\end{verbatim}

**Related references**

volume reallocation show on page 1537

---

**volume reallocation off**

Disable reallocate jobs

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

Disables all reallocation jobs globally in a cluster. After you use this command, you cannot start or restart any reallocation jobs. All jobs that are executing when you use this command are stopped. You must use the \texttt{reallocate on} command to enable or restart reallocation jobs globally in a cluster.

**Note:** This command is not supported for FlexGroups, FlexGroup constituents, Infinite Volumes, or Infinite Volume constituents.

**Examples**

\begin{verbatim}
cluster1::> volume reallocation off
\end{verbatim}

**Related references**

volume reallocation on on page 1534

---

**volume reallocation on**

Enable reallocate jobs

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

Globally enables all reallocation jobs in a cluster. You must globally enable reallocation scans in the cluster before you can run a scan or schedule regular scans. Reallocation scans are disabled by default.

**Note:** This command is not supported for FlexGroups, FlexGroup constituents, Infinite Volumes, or Infinite Volume constituents.
volume reallocation quiesce

Quiesce reallocate job

Availability: This command is available to cluster administrators at the admin privilege level.

Description
Temporarily stops any reallocation jobs that are in progress. When you use this command, the persistent state is saved. You can use the volume reallocation restart command to restart a job that is quiesced.

There is no limit to how long a job can remain in the quiesced state.

Note: This command is not supported for FlexGroups, FlexGroup constituents, Infinite Volumes, or Infinite Volume constituents.

Parameters
-vserver <vserver name> - Vserver
  Specifies the Vserver.

-path <text> - Path
  Specifies the file path of the LUN, file, or volume that you want to stop temporarily.

Examples
cluster1::> volume reallocation quiesce /vol/vol2
2 entries were acted on.

Related references
volume reallocation restart on page 1535

volume reallocation restart

Restart reallocate job

Availability: This command is available to cluster administrators at the admin privilege level.

Description
Starts a reallocation job. Use this command to start a quiesced (temporarily stopped) job or a scheduled scan that is idle.

Note: This command is not supported on FlexGroups, FlexGroup constituents, or Infinite Volumes.

Parameters
-vserver <vserver name> - Vserver
  Specifies the Vserver.

-path <text> - Path
  Specifies the file path of the LUN, file, or volume on which you want to restart reallocation scans.
[-ignore-checkpoint | -i [true]] - Ignore Checkpoint

Restarts the job at the beginning when set to true. If you use this command without specifying this parameter, its effective value is false and the job starts the scan at the point where it stopped. If you specify this parameter without a value, it is set to true and the scan restarts at the beginning.

Examples

```
cluster1::> volume reallocation restart /vol/vol2
2 entries were acted on.
```

volume reallocation schedule

Modify schedule of reallocate job

Availability: This command is available to cluster administrators at the admin privilege level.

Description

Schedules a reallocation scan for an existing reallocation job. If the reallocation job does not exist, use the `volume reallocation start` command to define a reallocation job.

You can delete an existing reallocation scan schedule. However, if you do this, the job's scan interval reverts to the schedule that was defined for it when the job was created with the `volume reallocation start` command.

Note: This command is not supported for FlexGroups, FlexGroup constituents, Infinite Volumes, or Infinite Volume constituents.

Parameters

- `-vserver <vserver name>` - Vserver
  Specifies the Vserver.

- `-path <text>` - Path
  Specifies the path of the reallocation for a LUN, file, or volume.

- `[-del | -d [true]]` - Delete
  Deletes an existing reallocation schedule when set to true. If you use this command without specifying this parameter, its effective value is false and the reallocation schedule is not deleted. If you specify this parameter without a value, it is set to true and the reallocation schedule is deleted.

- `[-cron | -s <text>]` - Cron Schedule
  Specifies the schedule with the following four fields in sequence. Use a space between field values. Enclose the values in double quotes.
  • minute is a value from 0 to 59.
  • hour is a value from 0 (midnight) to 23 (11:00 p.m.).
  • day of week is a value from 0 (Sunday) to 6 (Saturday).
  • day of month is a value from 1 to 31.

  Note: If you specify 31 as the value for the day of month, reallocation scans will not run in any months with fewer than 31 days.

  Use an asterisk "*" as a wildcard to indicate every value for that field. For example, an * in the day of month field means every day of the month. You cannot use the wildcard in the minute field.

  You can enter a number, a range, or a comma-separated list of values for a field.
volume reallocation show

Show reallocate job status

Availability: This command is available to cluster administrators at the admin privilege level.

Description
Displays the status of a reallocation scan, including the state, schedule, interval, optimization, and log files. If you do not specify the path for a particular reallocation scan, then the command displays all the reallocation scans.

Parameters
{-fields <fieldname>, ...}
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-v ]
Specify this parameter to display the output in a verbose format.

[-instance ]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver
Specify this parameter to display reallocation scans that match the Vserver that you specify.

[-path <text>] - Path
Specify this parameter to display reallocation scans that match the path that you specify.

[-threshold -t <integer>] - Threshold
Specify this parameter to display reallocation scans that match the threshold that you specify.

[-id <integer>] - Job ID
Specify this parameter to display reallocation scans that match the reallocation job ID that you specify.

[-description <text>] - Job Description
Specify this parameter to display reallocation scans that match the text description that you specify.

[-state {Initial|Queued|Running|Waiting|Pausing|Paused|Quitting|Success|Failure|Reschedule|Error|Quit|Dead|Unknown|Restart|Dormant}] - Job State
Specify this parameter to display reallocation jobs that match the state that you specify.

[-progress <text>] - Execution Progress
Specify this parameter to list the running reallocation jobs whose progress indicator matches the text that you provide. For example, if you specify "Starting ..." as the text string for the progress option, then the system lists all of the jobs that are starting.

[-schedule <job_schedule>] - Schedule Name
Specify this parameter to display reallocation scans that match the schedule name that you specify. If you want a list of all job schedules, use the job schedule show command.
[-global-status <text>] - Global State of Scans

Specify this parameter to indicate if reallocation scans are on or off globally. You must type either of the following text strings:

- "Reallocation scans are on"
- "Reallocation scans are off"

</tr>
</tbody>
</table>

Related references

`job schedule show` on page 175

volume reallocation start

Start reallocate job

Availability: This command is available to `cluster` administrators at the `admin` privilege level.

Description

 Begins a reallocation scan on a LUN, file, or volume when you specify the path. If a volume has several small files that would benefit from periodic optimization, specify the /vol/volname.

Before performing a reallocation scan, the reallocation job normally performs a check of the current layout optimization. If the current layout optimization is less than the threshold, then the system does not perform a reallocation on the LUN, file, or volume.

You can define the reallocation scan job so that it runs at a specific interval, or you can use the `volume reallocation schedule` command to schedule reallocation jobs.

Note: This command is not supported for FlexGroups, FlexGroup constituents, Infinite Volumes, or Infinite Volume constituents.

Parameters

- `-vserver <vserver name>` - Vserver
  Specifies the Vserver.

- `-path <text>` - Path
  Specifies the path of the reallocation for a LUN, file, or volume.

- `{ [-interval | -i <text>] }` - Interval Schedule
  Specifies the reallocation scan interval in
  - m for minutes
  - h for hours
  - d for days

For example, `30m` is a 30 minute interval. The countdown to the next scan begins after the first scan is complete.
The default interval is 24 hours.

<table>
<thead>
<tr>
<th>[-once] -o [true]</th>
<th>Once</th>
</tr>
</thead>
</table>
| Specifies that the job runs once and then is automatically removed from the system when set to true. If you use this command without specifying this parameter, its effective value is false and the reallocation scan runs as scheduled. If you enter this parameter without a value, it is set to true and a reallocation scan runs once.

<table>
<thead>
<tr>
<th>[-force] -f [true]]</th>
<th>Force</th>
</tr>
</thead>
</table>
| Performs a one-time full reallocation on a LUN, file, or volume when set to true. A forced reallocation rewrites blocks on a LUN, file, or volume unless the reallocation would result in worse performance. If you use this command without specifying this parameter, its effective value is false and a forced reallocation is not performed. If you specify this parameter without a value, it is set to true, and a forced reallocation is performed.

<table>
<thead>
<tr>
<th>[-space-optimized] -p [true]</th>
<th>Space Optimized</th>
</tr>
</thead>
</table>
| Specifies that snapshot blocks are not copied to save space when set to true. If you use this command without specifying this parameter, its effective value is false and snapshot blocks are copied. However, reads from snapshots might have a slightly higher latency. If you specify this parameter without a value, it is set to true and snapshot blocks are not copied. You cannot use the space-optimized option with the unshare option.

<table>
<thead>
<tr>
<th>[-unshare] -u [true]]</th>
<th>Unshare Deduplicated Blocks</th>
</tr>
</thead>
</table>
| Specifies that blocks that are shared by deduplication will be unshared. This option can help remove fragmentation caused on dense volumes. This may result in increased disk usage, especially for full reallocation. You cannot use the unshare option with the space-optimized option.

<table>
<thead>
<tr>
<th>[-threshold] -t &lt;integer&gt;</th>
<th>Threshold</th>
</tr>
</thead>
</table>
| Specifies the threshold when a LUN, file, or volume is considered unoptimized and a reallocation should be performed. Once the threshold is reached, the system creates a diagnostic message that indicates that a reallocation might improve performance.

The threshold range is from 3 (the layout is moderately optimized) to 10 (the layout is not optimal). The threshold default is 4.

<table>
<thead>
<tr>
<th>[-no-check] -n [true]]</th>
<th>No Threshold Check</th>
</tr>
</thead>
</table>
| Does not check the current layout to determine if a reallocation is needed when set to true. If you use this command without specifying this parameter, its effective value is false and the system does check the current layout to determine if a reallocation is needed. If you specify this parameter without a value, it is set to true and the system does not check the current layout to determine if a reallocation is needed.

Examples

```
cluster1::> volume reallocation start -path /vol/vol2 -interval 30m
[Job 165] Job is queued: Reallocate Job.
```

Related references

volume reallocation schedule on page 1536

volume reallocation stop

Stop reallocate job

Availability: This command is available to cluster administrators at the admin privilege level.

Description

Stops and deletes any reallocation scans on a LUN, file, or volume. This command stops and deletes in-progress, scheduled, and quiesced scans.
Note: This command is not supported for FlexGroups, FlexGroup constituents, Infinite Volumes, or Infinite Volume constituents.

Parameters

- `vserver <vserver name>` - Vserver
  Specifies the Vserver.

- `path <text>` - Path
  Specifies the path of the reallocation for a LUN, file, or volume.

Examples

```
cluster1::> volume reallocation stop /vol/vol2
1 entry was deleted.
```

volume schedule-style commands

The schedule-style directory

volume schedule-style prepare-to-downgrade

Disables volume schedule style feature and sets schedule style to default (create-time)

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

This command will disable the volume schedule style feature and set schedule style to default (create-time).

Examples

```
The following example prepares the schedule-style on all volumes for revert/downgrade.

cluster1::*> volume schedule-style prepare-to-downgrade
```

Volume SnapLock Commands

Manages SnapLock attributes of a SnapLock volume
Manages SnapLock attributes in the system.

volume snaplock modify

Modify SnapLock attributes of a SnapLock volume

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The volume snaplock modify command modifies one or more SnapLock attributes of a SnapLock volume.

Parameters

- `vserver <vserver name>` - Vserver
  This specifies the vservver which owns the required SnapLock volume.
-volume <volume name> - Volume

This specifies the SnapLock volume whose attribute needs to be modified.

{[-minimum-retention-period {{<integer> seconds|minutes|hours|days|months|years} | infinite]} - Minimum Retention Period

Specifies the minimum allowed retention period for files committed to WORM state on the volume. Any files committed with a retention period shorter than this minimum value, is assigned this minimum value.

If this option value is infinite, then every file committed to the volume will have a retention period that never expires.

Otherwise, the retention period is specified as a number followed by a suffix. The valid suffixes are seconds, minutes, hours, days, months, and years. For example, a value of 6months represents a retention period of 6 months. The maximum allowed retention period is 70 years. This option is not applicable while extending retention period of an already committed WORM file.

[-default-retention-period {{<integer> seconds|minutes|hours|days|months|years} | min | max | infinite]} - Default Retention Period

Specifies the default retention period that is applied to files while committing to WORM state without an associated retention period.

If this option value is min, then minimum-retention-period is used as the default retention period. If this option value is max, then maximum-retention-period is used as the default retention period. If this option value is infinite, then a retention period that never expires will be used as the default retention period.

The retention period can also be explicitly specified as a number followed by a suffix. The valid suffixes are seconds, minutes, hours, days, months, and years. For example, a value of 6months represents a retention period of 6 months. The maximum valid retention period is 70 years.

[-maximum-retention-period {{<integer> seconds|minutes|hours|days|months|years} | infinite]} - Maximum Retention Period

Specifies the maximum allowed retention period for files committed to WORM state on the volume. Any files committed with a retention period longer than this maximum value, is assigned this maximum value.

If this option value is infinite, then files that have retention period that never expires might be committed to the volume.

Otherwise, the retention period is specified as a number followed by a suffix. The valid suffixes are seconds, minutes, hours, days, months, and years. For example, a value of 6months represents a retention period of 6 months. The maximum allowed retention period is 70 years. This option is not applicable while extending retention period of an already committed WORM file.

[-autocommit-period {{<integer> hours|days} | none]} - Autocommit Period

Specifies the autocommit period for SnapLock volume. All files which are not modified for a period greater the autocommit period of the volume are committed to WORM state.

The autocommit period option is specified as a number followed by a suffix. The valid suffixes for autocommit period are days and hours. For example, a value of 2hours represents an autocommit period of 2 hours. The minimum allowed autocommit period is 2 hours and the maximum allowed autocommit period is 7 days.

If this option value is none, then autocommit is disabled on the SnapLock volume.

[-is-volume-append-mode-enabled (true|false)] - Is Volume Append Mode Enabled

Specifies if the volume append mode is enabled or disabled.

It can be modified only when the volume is not mounted and does not have any data or Snapshot copies.

The volume append mode is not supported on SnapLock audit log volumes.
When it is enabled, all the files created with write permissions on the volume are WORM appendable files by default. All the WORM appendable files that are not modified for a period greater than the autocommit period of the volume are also committed to the WORM read-only state.

If it is set to `true`, then the volume append mode is enabled.

If it is set to `false`, then the volume append mode is disabled.

Volume append mode is disabled by default when the volume is created.

```
|--privileged-delete {disabled|enabled|permanently-disabled]} - Privileged Delete
```

Specifies the privileged-delete attribute of a SnapLock volume. This parameter must be specified alone.

If it is set to `enabled` then the privileged-delete operation can be performed using the `volume file privileged-delete` command.

If it is set to `disabled`, then the privileged-delete operation is not supported.

Once it is set to `permanently-disabled`, then neither the privileged-delete operation nor any change in the volume privileged-delete attribute is permitted.

Examples

The following command sets `default-retention-period` of a given SnapLock volume:

```
cluster1::> volume snaplock modify -volume vol_slc -default-retention-period 2years
cluster1::>
```

The following command sets `maximum-retention-period` of a given SnapLock volume to `infinite`:

```
cluster1::> volume snaplock modify -volume vol_slc -maximum-retention-period infinite
cluster1::>
```

The following command enables the privileged-delete operation on a SnapLock volume.

```
cluster1::> volume snaplock modify -vserver vs1 -volume vol_sle -privileged-delete enabled
cluster1::>
```

```
cluster1::>volume snaplock show -vserver vs1 -volume vol_sle -fields privileged-delete
---------- ---------------------
vs1       vol_sle enabled
```

Related references

`volume file privileged-delete` on page 1457

**volume snaplock prepare-to-downgrade**

Prepares the system for downgrade

**Availability:** This command is available to `cluster` administrators at the `advanced` privilege level.
Description
The `volume snaplock prepare-to-downgrade` command prepares nodes to downgrade to a release without SnapLock volume append mode feature. Prior to disabling the feature, the command disables volume append mode on all SnapLock volumes in the cluster.

Examples
The following example disables the SnapLock volume append mode feature in the local cluster:

```
cluster1:/> volume snaplock prepare-to-downgrade
```

**volume snaplock show**

Display SnapLock attributes of a SnapLock volume

**Availability**: This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

Description
The `volume snaplock show` command displays following information:

- Vserver name
- Volume name
- SnapLock Type of the volume
- Minimum retention period applicable of the volume
- Default retention period applicable of the volume
- Maximum retention period applicable of the volume
- Autocommit period of the volume
- Volume Append Mode attribute of the volume
- Privileged Delete attribute of the volume
- Litigation count on the volume
- Volume expiry time of the volume
- Volume ComplianceClock

This command is applicable only for SnapLock volumes.

Parameters
```
[-fields <fieldname>, ...]
```
If you specify the `[-fields <fieldname>, ...]` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

```
[-instance ]
```
If you specify the `[-instance ]` parameter, the command displays detailed information about all fields.

```
[-vserver <vserver name>] - Vserver
```
If this parameter is specified, the command displays information for all the SnapLock volumes that match the specified `vserver` value.
[-valueset {non-snaplock|compliance|enterprise}] - SnapLock Type
  If this parameter is specified, the command displays all the volumes that match the specified -type value.

[-minimum-retention-period {{<integer> seconds|minutes|hours|days|months|years} | infinite}] - Minimum Retention Period
  If this parameter is specified, the command displays all the volumes that match the specified -minimum-retention-period value.

[-default-retention-period {{<integer> seconds|minutes|hours|days|months|years} | min | max | infinite}] - Default Retention Period
  If this parameter is specified, the command displays all the volumes that match the specified -default-retention-period value.

[-maximum-retention-period {{<integer> seconds|minutes|hours|days|months|years} | infinite}] - Maximum Retention Period
  If this parameter is specified, the command displays all the volumes that match the specified -maximum-retention-period value.

[-autocommit-period {{<integer> hours|days} | none}] - Autocommit Period
  If this parameter is specified, the command displays all the volumes that match the specified -autocommit-period value.

[-is-volume-append-mode-enabled {true|false}] - Is Volume Append Mode Enabled
  If this parameter is specified, the command displays all the volumes that match the specified -is-volume-append-mode-enabled value.

[-privileged-delete {disabled|enabled|permanently-disabled}] - Privileged Delete
  If this parameter is specified, the command displays all the volumes that match the specified -privileged-delete value.

[-expiry-time <text>] - Expiry Time
  If this parameter is specified, the command displays all the volumes that match the specified -expiry-time value.

[-compliance-clock-time <text>] - ComplianceClock Time
  If this parameter is specified, the command displays all the volumes that match the specified -compliance-clock-time value.

[-litigation-count <integer>] - Litigation Count
  If this parameter is specified, the command displays all the volumes that match the specified -litigation-count value.

Examples
The following command shows summary of SnapLock volumes on a vserver:

```
cluster1::> volume snaplock show
Vserver       Volume          SnapLock Type ComplianceClock Time
------------- --------------- ------------- -----------------------------------
vs1           vol_slc         compliance    Mon Jan 19 14:12:34 IST 2015 +05:30
vs1           vol_sle         enterprise    Mon Jan 19 14:12:34 IST 2015 +05:30
2 entries were displayed.
cluster1::>
```

The following commands lists the complete SnapLock attributes of two given SnapLock volumes:
volume snapshot commands

Manage snapshots

The volume snapshot command enables you to manage volume Snapshot copies.

volume snapshot compute-reclaimable

Calculate the reclaimable space if specified snapshots are deleted

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The volume snapshot compute-reclaimable command calculates the volume space that can be reclaimed if one or more specified Snapshot copies are deleted.

The command heavily uses system’s computational resources so it can reduce the performance for client requests and other system processes. Therefore, the queries that use queries that use query operators (•, |, etc.), are disabled for this command. You should not specify more than three Snapshot copies per query. Snapshot copies must be specified as a comma-separated list with no spaces after the commas.

This command is not supported on Infinite Volumes.

Parameters

-vserver <vserver name> - Vserver Name

This specifies the Vserver on which the volume is located.

-volume <volume name> - Volume Name

This specifies the volume for which reclaimable space is to be calculated.
-snapshots <snapshot name>, ... - List of Snapshots

This specifies one or more than one Snapshot copies that are to be considered for deletion. If you list more than one Snapshot copy, specify a comma-separated list with no spaces after the commas.

Examples
The following example calculates the space that can be reclaimed if the Snapshot copy named hourly.2008-01-10_1505 is deleted on a volume named vol3, which is a part of the Vserver named vs0:

```
cluster1::> volume snapshot compute-reclaimable -vserver vs0
         -volume vol3 -snapshots hourly.2008-01-10_1505
```

volume snapshot create

Create a snapshot

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The `volume snapshot create` command creates a Snapshot copy of a specified volume.

Parameters
- `vserver <vserver name>` - Vserver
  This specifies the Vserver that contains the volume on which the snapshot is to be created.
- `volume <volume name>` - Volume
  This specifies the volume where a Snapshot copy is to be created.
- `snapshot <snapshot name>` - Snapshot
  This specifies the name of the Snapshot copy that is to be created.
- `[comment <text>]` - Comment
  This optionally specifies a comment for the Snapshot copy.
- `[foreground {true|false}]` - Foreground Process
  If you use this option and select false, the Snapshot copy creation process runs in the background. If you use this option and select true, the Snapshot copy creation process runs in the foreground. This option applies only to Infinite Volumes, and is ignored for other volumes. The default is true.
- `[snapmirror-label <text>]` - Label for SnapMirror Operations
  If you specify this option, the Snapshot copy is created with the SnapMirror Label that you specify. If this option is not specified, the Snapshot copy is created with no SnapMirror Label. The SnapMirror Label is used by the Vaulting subsystem when you back up Snapshot copies to the Vault Destination.
- `[expiry-time <MM/DD/YYYY HH:MM:SS>]` - Expiry Time
  If you specify this option, the Snapshot copy is created with the expiry time that you specify. The expiry time indicates the time at which the Snapshot copy becomes eligible for deletion.

Examples
The following example creates a Snapshot copy named vol3_snap on a volume named vol3 on a Vserver named vs0. The Snapshot copy is given the comment "Single snapshot" and the operation runs in the background.

```
cluster1::> volume snapshot create -vserver vs0 -volume vol3 -snapshot vol3_snap -comment "Single snapshot" -foreground false
```
**volume snapshot delete**

Delete a snapshot

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `volume snapshot delete` command deletes a Snapshot copy from a specified volume.

**Parameters**
- `-vserver <vserver name>` - Vserver
  This specifies the Vserver that contains the volume on which the specified Snapshot copy is saved.
- `-volume <volume name>` - Volume
  This specifies the volume from which a Snapshot copy is to be deleted.
- `-snapshot <snapshot name>` - Snapshot
  This specifies the Snapshot copy that is to be deleted.
- `[-foreground {true|false}]` - Foreground Process
  If you use this option and set it to `false`, the delete operation runs as a background process. If you specify this option and set it to `true`, the operation runs as a foreground process. This option applies only to Infinite Volumes, and is ignored for other volumes. The default is `true`.
- `[-force [true]]` - Force Delete (privilege: advanced)
  If you use this switch, the Snapshot copy is immediately deleted without generating any confirmation messages. If you do not use this option the operation generates confirmation messages and the operation is disallowed on application tagged volumes. Passing in a value of `true` is supported, but not required. The `force` switch is typically used for scripting applications where users cannot directly confirm the delete operation.
- `[-ignore-owners [true]]` - Ignore Snapshot Owners (privilege: advanced)
  If you use this switch, the command ignores other processes that might be accessing the Snapshot copy. If you do not use this option the operation exhibits default behavior and checks the owners tags before allowing the deletion to occur. Passing in a value of `true` is supported, but not required.

**Examples**
The following example deletes a Snapshot copy named vol3_daily from a volume named vol3 on a Vserver named vs0:

```
cluster1::> volume snapshot delete -vserver vs0 -volume vol3 -snapshot vol3_daily
```

---

**volume snapshot modify**

Modify snapshot attributes

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `volume snapshot modify` command enables you to change the text comment associated with a Snapshot copy.

This command is not supported on Infinite Volumes.
Parameters

-vserver <vserver name> - Vserver
This specifies the Vserver that contains the volume on which the specified Snapshot copy is saved.

-volume <volume name> - Volume
This specifies the volume whose Snapshot copy is to be modified.

-snapshot <snapshot name> - Snapshot
This specifies the Snapshot copy whose text comment is to be modified.

[-comment <text>] - Comment
This specifies the new comment for the Snapshot copy.

[-snapmirror-label <text>] - Label for SnapMirror Operations
This specifies the SnapMirror Label for the Snapshot copy. The SnapMirror Label is used by the Vaulting subsystem when you back up Snapshot copies to the Vault Destination. If an empty label ("") is specified, the existing label will be deleted.

[-expiry-time <MM/DD/YYYY HH:MM:SS> | {+|-}hh:mm | infinite] - Expiry Time
This specifies the expiry time for the Snapshot copy. The expiry time indicates the time at which the Snapshot copy becomes eligible for deletion. If an expiry time of ("0") is specified, the existing expiry time will be deleted.

Examples
The following example modifies the comment of a Snapshot copy named vol3_snapshot of a volume named vol3 on a Vserver named vs0. The comment is changed to "Pre-upgrade snapshot".

```
cluster1::> volume snapshot modify -vserver vs0 -volume vol3
-snapshot vol3_snapshot -comment "Pre-upgrade snapshot"
```

volume snapshot modify-snaplock-expiry-time
Modify expiry time of a SnapLock Snapshot copy

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The volume snapshot modify-snaplock-expiry-time extends snaplock expiry time of an existing Snapshot copy.

Parameters

-vserver <vserver name> - Vserver
This specifies the Vserver that contains the volume on which the Snapshot copy is located.

-volume <volume name> - Volume
This specifies the volume where a Snapshot copy is to be located.

-snapshot <text> - Snapshot
This specifies the name of the Snapshot copy locked by SnapLock whose snaplock expiry time needs to be modified.

[-expiry-time <MM/DD/YYYY HH:MM:SS | {+|-}hh:mm | infinite>] - SnapLock Expiry Time
Specifies the new snaplock expiry that is applied to Snapshot copy locked by SnapLock.
If this option value is infinite, then a retention period that never expires is applied to the Snapshot copy.
Examples

The following example extends the retention period of a Snapshot copy `snap1` to "03/03/2020 00:00:00":

```
cluster1::> volume snapshot modify-snaplock-expiry-time -vserver vs1 -volume vol1 -snap
    shot snap1 -expiry-time "03/03/2020 00:00:00"
```

The following example extends the retention period of a Snapshot copy `snap2` to `infinite`:

```
cluster1::> volume snapshot modify-snaplock-expiry-time -vserver vs1 -volume vol1 -snap
    shot snap2 -expiry-time infinite
```

```
cluster1::> volume snapshot show -vserver vs1 -fields snaplock-expiry-time
vserver volume snapshot snaplock-expiry-time
------- ------ -------- ------------------------
vs1     vol1   snap1    3/3/2020 00:00:00 +05:30
vs1     vol1   snap2    infinite
```

volume snapshot partial-restore-file

Restore part of a file from a snapshot

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The `volume snapshot partial-restore-file` command enables you to restore a range of bytes in a file from the version of the file saved in the Snapshot copy. This command is intended to be used to restore particular pieces of LUNs and NFS or CIFS container files that are used by a host to store multiple sources of data. For example, a host may be storing multiple user databases in the same LUN. A partial file restore can be used to restore one of those databases in the LUN without touching other databases stored in the LUN. This command is not intended for restoring parts of normal user-level files that are stored in the volume. You should use `volume snapshot restore-file` command to restore normal user-level files. The volume for the partial-restore should be online during this operation.

This command is not supported on Infinite Volumes.

Parameters

- **-vserver <vserver name>** - Vserver Name
  This specifies the Vserver which contains the volume.

- **[-volume <volume name>]** - Volume Name
  This specifies the volume in which the Snapshot copy is saved.

- **-snapshot | < <snapshot name>** - Snapshot Name
  This specifies the Snapshot copy which contains the version of file from which a range of bytes is restored. The source file must be present in the Snapshot copy.

- **-path <text>** - Filepath
  This specifies the relative path to the file which is partially restored from the Snapshot copy. You should specify the `volume` option so that the file is searched and restored from the Snapshot copy of the specified volume. If you do not specify the `volume` then the file is searched and restored from the Snapshot copy of the root volume. The destination file must be present in the active file system.
-start-byte <integer> - Starting Byte Offset (Multiple of 4096)

This specifies the starting byte offset in the file to partially restore. The first byte of the file is byte zero. The start byte must be a multiple of 4096. In addition, the start byte must not exceed the size of the source or destination file.

-byte-count <integer> - Number of Bytes to Restore (Multiple of 4096)

This specifies the total number of bytes to restore, beginning at the -start-byte value. The -byte-count option must be a multiple of 4096. The maximum number of bytes that can be restored is 16 MB. The byte count must not exceed the range of the source or destination file.

**Examples**

The following example restores first 4096 bytes in the file `foo.txt` inside the volume `vol3` from the Snapshot copy `vol3_snap`:

```
cluster1::> volume snapshot partial-restore-file -vserver vs0 -volume vol3
-snapshot vol3_snap -volume vol3 -path /foo.txt -start-byte 0 -byte-count 4096
```

`volume snapshot restore-file` on page 1552

---

**volume snapshot prepare-for-revert**

Deletes multiple Snapshot copies of the current File System version.

**Availability:** This command is available to `cluster` administrators at the `advanced` privilege level.

**Description**

This command will delete all Snapshot copies that have the format used by the current version of Data ONTAP. It will fail if any Snapshot copy polices are enabled, or if any Snapshot copies have an owner.

**Note:** Snapshot policies must be disabled prior to running this command.

**Parameters**

- **-node <nodename>** - Node

  The name of the node.

**Examples**

The following example prepares the Snapshot copies for revert.

```
cluster1::*> volume snapshot prepare-for-revert -node node1
```

---

**volume snapshot rename**

Rename a snapshot

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**

The `volume snapshot rename` command renames a Snapshot copy.
**Note:** You cannot rename a Snapshot copy that is created as a reference copy during the execution of the `volume move` command.

This command is not supported on Infinite Volumes.

**Parameters**

- `-vserver <vserver name>` - Vserver
  This specifies the Vserver that contains the volume on which the specified Snapshot copy is to be renamed.

- `-volume <volume name>` - Volume
  This specifies the volume that contains the Snapshot copy to be renamed.

- `-snapshot <snapshot name>` - Snapshot
  This specifies the Snapshot copy that is to be renamed.

- `-new-name <snapshot name>` - Snapshot New Name
  This specifies the new name for the Snapshot copy.

[-force [true]] - Force Rename (privilege: advanced)
If this parameter is specified, the Snapshot copy rename operation is allowed on application tagged volumes. Otherwise, the operation is disallowed on application tagged volumes.

**Examples**

The following example renames a Snapshot copy named vol3_snap on a volume named vol3 and a Vserver named vs0. The Snapshot copy is renamed to vol3_snap_archive.

```
cluster1:/> volume snapshot rename -vserver vs0 -volume vol3
-snapshot vol3_snap -new-name vol3_snap_archive
```

**Related references**

`volume move` on page 1482

**volume snapshot restore**

Restore the volume to a snapshot.

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The `volume snapshot restore` command restores a Snapshot copy to be the read-write parent volume for the volume family. This replaces the current working copy of the volume with the Snapshot copy that results in a loss of all changes made since the Snapshot copy was created.

**Note:** You should manually update all the SnapMirror relationships of a volume immediately after you restore its Snapshot copy. Not doing so can result in unusable SnapMirror relationships that must be deleted and re-created.

Before running this command on an Infinite Volume, unmount the volume. Any namespace mirror constituents present in the system are resynchronized to the restored Snapshot copy.

After the restore is complete, the size of the flexible volume will be set to either the current volume size or the snapshot size - whichever is greater.
Parameters

- `vserver <vserver name>` - Vserver
  This specifies the Vserver that contains the volume on which the specified Snapshot copy to be restored is saved.

- `volume <volume name>` - Volume
  This specifies the parent read-write volume whose Snapshot copy is to be restored to take its place.

- `snapshot <snapshot name>` - Snapshot
  This specifies the Snapshot copy that is to be restored to be the read-write parent volume.

- `force [true]` - Force Restore
  If you use this parameter, the Snapshot copy is restored even if the volume has one or more newer Snapshot copies which are currently used as reference Snapshot copy by SnapMirror. If a restore is done in this situation, this will cause future SnapMirror transfers to fail. The SnapMirror relationship may be repaired using `snapmirror resync` command if a common Snapshot copy is found between the source and destination volume. If there is no common Snapshot copy between the source and the destination volume, a baseline SnapMirror copy would be required. If you use this parameter, the operation is also allowed on application tagged volumes.

- `preserve-lun-ids {true|false}` - Preserve LUN Identifiers
  This option enables you to select whether the Snapshot copy restore needs to be non-disruptive to clients due to LUN identifiers changing. If you use this option and set it to `true`, or choose to not use this option at all, the `volume snapshot restore` command fails if the system determines that it cannot be non-disruptive with regards to LUN identifiers. If you use this option and set it to `false`, the restore operation proceeds even if this might cause client-visible effects. In this case, administrators should take the LUNs offline before proceeding.

Examples

The following example restores a Snapshot copy named vol3_snap_archive to be the parent read-write volume for the volume family. The existing read-write volume is named vol3 and is located on a Vserver named vs0:

```
cluster1::> volume snapshot restore -vserver vs0 -volume vol3
-snapshot vol3_snap_archive
```

`snapmirror resync` on page 633

`volume snapshot restore-file`

Restore a file from a snapshot

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The `volume snapshot restore-file` command enables you to restore a single file to a version saved in the Snapshot copy. You can restore a file over an existing copy of the file in the parent read-write volume or to a different location within the same parent read-write volume. If the destination file for the restore operation does not exist, a new file is created with the same version as the one saved in the Snapshot copy. If the destination file for the restore operation exists, then it is overwritten by the version from the Snapshot copy. This operation is used to restore normal user-level files and LUNs. The command also supports restoring normal user-level files with streams. The command fails if you try to restore directories (and their contents). During the restore operation the parent read-write volume should remain online. The command fails if the destination path for the restore operation is in a different volume than the source volume.

This command is not supported on Infinite Volumes.
**Parameters**

- `vserver <vserver name>` - Vserver Name
  This specifies the Vserver which contains the volume.

- `volume <volume name>` - Volume Name
  This specifies the volume which contains the specified Snapshot copy.

- `snapshot | -s <snapshot name>` - Snapshot Name
  This specifies the Snapshot copy from which the file is restored.

- `path <text>` - Filepath
  This specifies the relative path to the file which is restored from the Snapshot copy. You should specify the `volume` option so that the file is searched and restored from the Snapshot copy of the specified volume. If you do not specify the `volume` then the file is searched and restored from the Snapshot copy of the root volume.

- `restore-path | -r <text>` - Restore Filepath
  This option specifies the destination location inside the volume where the file is restored. If you do not specify this option, the file is restored at the same location referred by `path` option. If you specify `restore-path` option, then it should refer to a relative path location within the same volume which contains the source file. If you do not specify `volume` along with the relative path, the file is restored in the root volume.

- `split-disabled [true]` - Disable Space Efficient LUN Splitting
  If you use this option and set it to `true`, space efficient LUN clone split is not allowed during the restore operation. If you use this option and set it to `false` or do not use this option, then space efficient LUN clone split is allowed during the restore operation.

- `ignore-streams [true]` - Ignore Streams
  If you use this parameter, the file is restored without its streams. By default, the streams are restored.

---

**Examples**

The following example restores a file `foo.txt` from the Snapshot copy `vol3_snap` inside the volume `vol3` contained in a Vserver `vs0`:

```
cluster1::> volume snapshot restore-file -vserver vs0 -volume vol3 -snapshot vol3_snap -path /foo.txt
```

---

**volume snapshot show**

Display a list of snapshots

**Availability:** This command is available to `cluster` and Vserver administrators at the `admin` privilege level.

**Description**

The `volume snapshot show` command displays information about Snapshot copies. The command output depends on the parameters specified with the command. If no parameters are specified, the command displays a table with the following information about all the available Snapshot copies:

- Vserver name
- Volume name
- Snapshot copy name
- State
- Size
• Percentage of total blocks in the parent volume
• Percentage of used blocks in the parent volume

To display a detailed list view with additional information, run the command and select the `-instance` view. In addition to the above mentioned information about the Snapshot copies, the detailed list view provides the following additional information:

• Creation time
• Snapshot busy
• List of the Snapshot copy's owners
• Comment associated with the Snapshot copy
• SnapMirror Label associated with the Snapshot copy
• 7-Mode Snapshot
• Constituent Snapshot
• Expiry Time
• SnapLock Expiry Time

At the advanced or higher privilege level the detailed view provides the following additional information:

• Snapshot copy's Dataset ID
• Snapshot copy's master Dataset ID
• Number of consistency points in the Snapshot copy
• Internal status of the Snapshot copy
• File system version
• File system block format
• Physical Snap ID
• Logical Snap ID
• Database record owner
• Snapshot tags
• Instance UUID
• Version UUID
• Node
• AFS used size
• Compression savings size
• Deduplication savings size
• Vbn0 savings size
• Status of FlexGroup Qtree support in the Snapshot copy

**Note:** For Snapshot copies whose parent volume is a FlexGroup, some information is not available and empty values will be displayed. This information includes:
• State
• Size
• Percentage of total blocks in the parent volume
• Percentage of used blocks in the parent volume

All information is available for Snapshot copies whose parent volume is a FlexGroup Constituent.

At the admin and advanced privilege level, Snapshot copies whose parent volume is a FlexGroup Constituent are not displayed by default. To display these, run the command and set the `is-constituent` to `true`. At the diagnostic or higher privilege level, all Snapshot copies are displayed by default.

The list view is automatically enabled if a single Snapshot copy is specified by using the `-vserver`, `-volume` and `-snapshot` options together.

A preformatted query for displaying the time-related information is available by specifying the `-time` format specifier. This displays a table that contains the following fields for all the available Snapshot copies:

- Vserver name
- Volume name
- Snapshot copy name
- Creation time

By using the `-fields` option you can choose to print only the certain fields in the output. This presents the selected fields in a table view. This is ideal when you want additional information to be different from the information that is provided by the default table view, but would like it in a format which is visually easy to compare.

You can specify additional parameters to display the information that matches only those parameters. For example, to display information only about Snapshot copies of the load-sharing volumes, run the command with the `-volume-type LS` parameter.

If you specify multiple filtering parameters, only those Snapshot copies that match all the specified parameters are displayed.

**Parameters**

```
{ [-fields <fieldname>, ...]
  If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.
  
  [-time ]
  If the `-time` format is specified, the command displays time related information about all entries.
  
  [-instance ]
  If you specify the `-instance` parameter, the command displays detailed information about all fields.
  
  [-vserver <vserver name>] - Vserver
  If you use this parameter, the Snapshot copies located only on the specified Vserver will be displayed.
  
  [-volume <volume name>] - Volume
  If you use this parameter only Snapshot copies located on the specified volume will be displayed.
  
  [-snapshot <snapshot name>] - Snapshot
  If you use this parameter only Snapshot copies matching the specified name will be displayed.
  
  [-dsid <integer>] - Snapshot Data Set ID (privilege: advanced)
  If this parameter is specified, the command displays information only about the Snapshot copy that has the specified data set ID.
```
[-msid <integer>] - Snapshot Master Data Set ID (privilege: advanced)
   If this parameter is specified, the command displays information only about the Snapshot copy that has the
   specified master data set ID.

[-create-time <Date>] - Creation Time
   If this parameter is specified, the command displays information only about the Snapshot copies that match the
   specified creation time.

[-busy {true|false}] - Snapshot Busy
   If this parameter is specified, the command displays information only about the Snapshot copies that have the
   specified busy status.

[-owners <text>,...] - List of Owners
   If this parameter is specified, the command displays information only about the Snapshot copies that are
   owned by the specified list of owners.

[-size (<integer>[KB|MB|GB|TB|PB])] - Snapshot Size
   If this parameter is specified, the command displays information only about the Snapshot copies that have the
   specified size. The size is specified as a character specifying the unit of measurement followed by a number
   specifying the size in the mentioned unit of measurement: k (kilobytes), m (megabytes), g (gigabytes), or t
   (terabytes). If the unit of measurement is not specified, bytes are used as the unit, and the specified number is
   rounded up to the nearest 4 KB. You may also use an inequality such as >10 MB as input.

[-blocks <percent>] - Percentage of Total Blocks
   If this parameter is specified, the command displays information only about the Snapshot copies that have the
   specified percentage of total blocks on their parent volumes. You may also use an inequality such as >10 as
   input.

[-usedblocks <percent>] - Percentage of Used Blocks
   If this parameter is specified, the command displays information only about the Snapshot copies that have the
   specified percentage of used blocks on their parent volumes. You may also use an inequality such as >10 as
   input.

[-cpcount <integer>] - Consistency Point Count (privilege: advanced)
   If this parameter is specified, the command displays information only about the Snapshot copies that have the
   specified number of consistency points. You may also use an inequality such as <100 as input.

[-comment <text>] - Comment
   If this parameter is specified, the command displays information only about the Snapshot copies that have the
   specified comment text. You may also specify an inequality such as /"-" as input.

[-fs-version <text>] - File System Version (privilege: advanced)
   If you use this parameter the only Snapshot copies displayed are those that were created when the file system
   was of a specific release. This parameter is helpful especially when you need to upgrade to newer software
   release and want to know the Snapshot copies that will be impacted by the upgrade process.

[-is-7-mode {true|false}] - 7-Mode Snapshot
   If you use this parameter only those Snapshot copies which have the specified value are shown. This value is
   true for the Snapshot copies that exist on the volume that was in 7-mode configuration and then transitioned
   to a clustered configuration. In such a scenario, the volume is in a clustered configuration and the existing
   Snapshot copies are still in the 7-mode configuration.

[-snapmirror-label <text>] - Label for SnapMirror Operations
   If you use this parameter, only those Snapshot copies that have the specified SnapMirror Label value are
   shown.

[-state {valid|invalid|partial}] - Snapshot State
   If you use this parameter only those Snapshot copies which have the specified state will be shown.
[-is-constituent \{true|false\}] - Constituent Snapshot
   If you use this parameter, only those Snapshot copies whose parent volume is a constituent volume of a
   FlexGroup or an Infinite Volume will be shown.

[-node <nodename>] - Node (privilege: advanced)
   If you use this parameter only those Snapshot copies that are located on the specified storage system are
   shown.

[-inode-version <integer>] - Snapshot Inofile Version (privilege: advanced)
   If this parameter is specified, the command displays information only about the Snapshot copies whose inode
   files are at the specified version.

[-expiry-time \{MM/DD/YYYY HH:MM:SS\}] - Expiry Time
   If you use this parameter only those Snapshot copies that have the specified expiry time are shown.

[-compression-type \{none|secondary|adaptive\}] - Compression Type (privilege: advanced)
   If you use this parameter only those Snapshot copies that have the specified compression type are shown.

[-snaplock-expiry-time \{MM/DD/YYYY HH:MM:SS \{+|-\}hh:mm \| infinite\}] - SnapLock Expiry Time
   If you use this parameter only those Snapshot copies that have the specified snaplock expiry time are shown.

[-application-io-size \{default|8K|16K|32K\}] - Application IO Size (privilege: advanced)
   If you use this parameter only those Snapshot copies that have the specified application IO size are shown.

[-is-flexgroup-qtree-enabled \{true|false\}] - Is FlexGroup Qtree Support Enabled (privilege: advanced)
   If you use this parameter only those Snapshot copies that have the specified FlexGroup Qtree support status
   are shown.

Examples
The following example displays default information about all Snapshot copies of a volume named vol1:

```
cluster1::> volume snapshot show -volume vol1
---Blocks---
Vserver  Volume  Snapshot                  Size Total%  Used%
--------  --------  ----------------------  ------  ------
cluster1  vol1    one                       68KB     0%    33%
two       72KB     0%    34%
2 entries were displayed.
```

The following example displays Snapshot copies which are older than 1 hour, limiting the output to wanted fields:

```
cluster1::> volume snapshot show -create-time <1h -fields create-time, size
vserver  volume snapshot create-time  size
---------- -------- ------------------------ ----
cluster1 vol1 one      Mon Nov 17 10:23:42 2014 68KB
two      Mon Nov 17 10:23:44 2014 72KB
2 entries were displayed.
```

The following example displays detailed information about a specific Snapshot copy, using the ‘snap’ alias:

```
cluster1::> snap show -volume vol1 -snapshot one -instance
Vserver: cluster1
Volume: vol1
Snapshot: one
Snapshot Data Set ID: 4294968322
Snapshot Master Data Set ID: 6442451970
Creation Time: Mon Nov 17 10:23:42 2014
Snapshot Busy: false
List of Owners: -
Snapshot Size: 68KB
Percentage of Total Blocks: 0%
Percentage of Used Blocks: 33%
```
volume snapshot show-delta

Computes delta between two Snapshot copies

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The volume snapshot show-delta command returns the number of bytes that changed between two Snapshot copies or a Snapshot copy and the active filesystem. This is calculated from the number of blocks that differ multiplied by the block size. The command also shows the time elapsed between the Snapshot copies in seconds.

Queries that use query operators (*, |, etc.) are disabled for this command to avoid performance degradation for client requests.

This command is not supported on Infinite Volumes.

Parameters

-vserver <vserver name> - Vserver Name
This specifies the Vserver on which the volume is located.

-volume <volume name> - Volume Name
This specifies the volume for which the delta is to be calculated.

-snapshot1 <snapshot name> - First Snapshot Name
This specifies the first Snapshot copy for the comparison.

[-snapshot2 <snapshot name>] - Second Snapshot Name
This specifies the second Snapshot copy for the comparison. If the field is not specified, it is assumed to be the Active File System.

Examples

The following example shows the bytes changed and the time separating the two Snapshots copies:

```
cluster1::> volume snapshot show-delta -vserver vs0 -volume vol2 -snapshot1 one snapshot2 two
A total of 139264 bytes (34 blocks) are different. Elapsed time between the Snapshot copies: 1s.
```
Description
The `volume snapshot autodelete modify` command enables you to modify Snapshot autodelete and LUN or file clone autodelete policy settings. Based on the defined policy, automatic deletion of Snapshot copies and LUN or file clones is triggered. Automatic deletion of Snapshot copies and LUN or file clones is useful when you want to automatically reclaim space consumed by the Snapshot copies and LUN or file clones from the volume when it is low in available space. LUN or file clone autodelete follows Snapshot copy autodelete. This command works only on a read-write parent volume. You cannot setup automatic Snapshot copy deletion and automatic LUN or file clone deletion for Infinite Volumes and read-only volumes.

Parameters

`-vserver <vserver name>` - Vserver Name
This specifies the Vserver on which the volume is located.

`-volume <volume name>` - Volume Name
This specifies the volume whose autodelete policy has to be modified.

`[-enabled {true|false}]` - Enabled
This option specifies whether automatic deletion of Snapshot copies and LUN or file clones is enabled or disabled. If set to `true`, automatic deletion of Snapshot copies and LUN or file clones is enabled. If set to `false`, automatic deletion of Snapshot copies and LUN or file clones is disabled.

`[-commitment {try|disrupt|destroy}]` - Commitment
This option specifies which Snapshot copies and LUN or file clones can be automatically deleted to reclaim back space. When set to `try`, the Snapshot copies which are not locked by any application and the LUN or file clones which are not configured as preserved are deleted. When set to `disrupt`, the Snapshot copies which are not locked by data backing functionalities (such as volume clones, LUN clones and file clones) and LUN or file clones which are not configured as preserved are deleted. In the `destroy` mode, the Snapshot copies locked by data protection utilities such as Snapmirror and Volume Move can be deleted. If such a locked Snapshot copy is deleted during the data transfer, the transfer is aborted. When set to `destroy`, the Snapshot copies locked by the data backing functionalities are deleted. In addition, all the LUN or file clones in the volume are deleted.

`[-defer-delete {scheduled|user_created|prefix|none}]` - Defer Delete
This option determines the order in which Snapshot copies can be deleted. Possible values are as follows:

- When set to `scheduled`, scheduled Snapshot copies are the last to be deleted.
- When set to `user_created`, user Snapshot copies are the last to be deleted.
- When set to `prefix`, Snapshot copies matching a certain prefix are the last to be deleted.
- When set to `none`, no defer deletion order is honored.

This option is not applicable for LUN or file clones.

`[-delete-order {newest_first|oldest_first}]` - Delete Order
This option specifies if the oldest Snapshot copy and the oldest LUN or file clone or the newest Snapshot copy and the newest LUN or file clone are deleted first.

`[-defer-delete-prefix <text>]` - Defer Delete Prefix
This option specifies the prefix string for the `-defer-delete prefix` parameter. The option is not applicable for LUN or file clones.
[-target-free-space <percent>] - Target Free Space

This option specifies the free space percentage at which the automatic deletion of Snapshot copies and LUN or file clones must stop. Depending on the -trigger Snapshot copies and LUN or file clones are deleted until you reach the target free space percentage.

[-trigger {volume|snap_reserve|(DEPRECATED)-space_reserve}] - Trigger

This option specifies the condition which starts the automatic deletion of Snapshot copies and LUN or file clones.

Setting this option to volume triggers automatic deletion of Snapshot copies and LUN or file clones when the volume reaches threshold capacity and the volume space reserved for Snapshot copies is exceeded.

Setting the option to snap_reserve triggers automatic deletion of Snapshot copies and LUN or file clones when the space reserved for Snapshot copies reaches threshold capacity.

Setting the option to (DEPRECATED)-space_reserve triggers automatic deletion of Snapshot copies when reserved space in the volume reaches threshold capacity and the volume space reserved for Snapshot copies is exceeded.

**Note:** The option space_reserve is deprecated.

The threshold capacity is determined by the size of the volume as follows:

- If the volume size is less than 20 GB, the autodelete threshold is 85%.
- If the volume size is equal to or greater than 20 GB and less than 100 GB, the autodelete threshold is 90%.
- If the volume size is equal to or greater than 100 GB and less than 500 GB, the autodelete threshold is 92%.
- If the volume size is equal to or greater than 500 GB and less than 1 TB, the autodelete threshold is 95%.
- If the volume size is equal to or greater than 1 TB, the autodelete threshold is 98%.

[-destroy-list <text>] - Destroy List

This option specifies a comma separated list of data backing functions which are affected if the automatic deletion of the Snapshot copy backing that service is triggered. The possible values for this option are lun_clone, file_clone, lun_clone, sfsr, vol_clone, cifs_share, or none. Except none, all the other options can be combined as a comma separated list. Note that "lun_clone", "file_clone" and "sfsr" individually are not valid values. Only pairs "lun_clone,file_clone" and "lun_clone,sfsr" are supported.

If you specify vol_clone, the cloned volume backed by the Snapshot copy is deleted.

If you specify lun_clone, and the LUN is in the process of being cloned when autodelete is triggered, the cloning operation is aborted. Any access to this LUN will result in an error being reported to the client.

If you specify file_clone, and the file cloning operation is in progress when autodelete is triggered, the cloning operation is aborted. Any access to this file will result in an error being reported to the client.

If you specify sfsr, and the file restore is in progress when autodelete is triggered, the restore operation is aborted.

If the Snapshot copy is locked either by a lun_clone or file_clone or both, the -destroy-list must be set to lun_clone, file_clone.

If the Snapshot copy is locked either by a lun_clone or sfsr operation or both, the -destroy-list must be set to lun_clone, file_clone. The options file_clone and sfsr are equivalent to each other.

If you set -destroy-list to lun_clone, file_clone and the Snapshot copy is backing a file clone or sfsr operation, both the operations are aborted. This is also the case when you set -destroy-list to lun_clone, sfsr.

LUN or file clone autodelete is applicable only if -destroy-list contains lun_clone and file_clone.

**Examples**

The following example enables Snapshot autodelete and sets the trigger to snap_reserve for volume vol3 which is part of the Vserver vs0:

```bash
Command: manual_page_reference
```
volume snapshot autodelete modify

The following example enables Snapshot autodelete and LUN or file clone autodelete for volume vol3 which is part of the Vserver vs0:

cluster1::> volume snapshot autodelete modify -vserver vs0 -volume vol3 -enabled true -trigger snap_reserve

cluster1::> volume snapshot autodelete modify -vserver vs0 -volume vol3 -enabled true -trigger volume -commitment try -delete-order oldest_first -destroy-list lun_clone,file_clone

volume snapshot autodelete show

Display autodelete settings

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The volume snapshot autodelete show command displays information about Snapshot autodelete policies. The command output depends on the parameters specified with the command. If no parameters are specified, the command displays a table with the following information about all the available Snapshot autodelete policies:

- Vserver name
- Volume name
- Option name
- Option value

To display a detailed list view with additional information, run the command and select the -instance view. The detailed list view provides the following information:

- Vserver name
- Volume name
- Enabled
- Commitment
- Defer Delete
- Delete Order
- Defer Delete Prefix
- Target Free Space
- Trigger
- Destroy List
- Is Constituent Volume

By using the -fields option you can choose to print only the certain fields in the output. This presents the selected fields in a table view. This is ideal when you want additional information to be different from the information that is provided by the default table view, but would like it in a format which is visually easy to compare.

You can specify additional parameters to display the information that matches only those parameters. For example, to display information only about Snapshot autodelete policies which are enabled, run the command with -enabled true parameter. If you specify multiple filtering parameters, only those policies that match all the specified parameters are displayed.
Parameters

{{[-fields <fieldname>,...]
This option allows you to print only certain fields in the output.

|[-instance]]
This option allows you to print a detailed list view.

[-vserver <vserver name>] - Vserver Name
If this parameter and the -volume parameter are specified, the command displays detailed autodelete policy information about the specified volume. If this parameter is specified by itself, the command displays autodelete policy information about volumes on the specified Vserver.

[-volume <volume name>] - Volume Name
If this parameter and the -vserver parameter are specified, the command displays detailed autodelete policy information about the specified volume. If this parameter is specified by itself, the command displays autodelete policy information about all volumes matching the specified name.

[-enabled {true|false}] - Enabled
If this parameter is specified, the command displays information about autodelete policies that match the specified parameter value.

[-commitment {try|disrupt|destroy}] - Commitment
If this parameter is specified, the command displays information about autodelete policies that match the specified commitment value.

[-defer-delete {scheduled|user_created|prefix|none}] - Defer Delete
If this parameter is specified, the command displays information about autodelete policies that match the specified defer deletion criterion.

[-delete-order {newest_first|oldest_first}] - Delete Order
If this parameter is specified, the command displays information about autodelete policies that match the specified deletion order.

[-defer-delete-prefix <text>] - Defer Delete Prefix
If this parameter is specified, the command displays information about autodelete policies that match the prefix used for deferring deletion.

[-target-free-space <percent>] - Target Free Space
If this parameter is specified, the command displays information about autodelete policies that match the specified target free space.

[-trigger {volume|snap_reserve} (DEPRECATED)-space_reserve}] - Trigger
If this parameter is specified, the command displays information about autodelete policies that match the specified trigger condition.

[-destroy-list <text>] - Destroy List
If this parameter is specified, the command displays information about autodelete policies that match the specified value.

[-is-constituent {true|false}] - Is Constituent Volume
If this parameter is specified, the command displays information about autodelete policies for the constituent volumes of Infinite Volumes.

Examples
The following example displays Snapshot autodelete policy settings for volume vol3 which is inside the Vserver vs0:
volume snapshot policy commands

Manage snapshot policies

The `volume snapshot policy` command enables you to manage Snapshot scheduling policies.

volume snapshot policy add-schedule

Add a schedule to snapshot policy

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**
The `volume snapshot policy add-schedule` command adds a schedule to a Snapshot policy. You can create a schedule by using the `job schedule cron create` or `job schedule interval create` commands.

**Parameters**

-vserver <vserver name> - Vserver Name
This specifies the Vserver on which a Snapshot policy schedule is to be added.

-policy <snapshot policy> - Snapshot Policy Name
This specifies the Snapshot policy to which a schedule is to be added.

-schedule <text> - Schedule Name
This specifies the schedule that is to be added to the Snapshot policy.

-count <integer> - Maximum Snapshot Copies for Schedule
This specifies the maximum number of Snapshot copies that can be taken by the specified schedule. The total count of all the Snapshot copies to be retained for the policy cannot be more than 255.

-[prefix <text>] - Snapshot Copy Name Prefix for Schedule
This option specifies the prefix with which Snapshot copies will be created for the added schedule. Every schedule has only one prefix. Once a prefix gets associated with a schedule, you cannot update the prefix. If some prefix is already associated with the schedule and you do not specify this parameter, then the previously defined prefix is used. The command fails if you try to update an existing prefix for a schedule. If no prefix is associated with the schedule and you do not specify this parameter, then schedule name is be used as the prefix.

-[snapmirror-label <text>] - Label for SnapMirror Operations
This specifies the SnapMirror Label identified with a Snapshot copy when it is created for the added schedule. The SnapMirror Label is used by the Vaulting subsystem when you back up Snapshot copies to the Vault Destination.
Examples
The following example adds a schedule named midnight to the Snapshot policy named snappolicy_nightly on Vserver vs0. The schedule can take a maximum of five Snapshot copies.

```
class1::> volume snapshot policy add-schedule -vserver vs0 -policy snappolicy_nightly -schedule midnight -count 5
```

volume snapshot policy create
Create a new snapshot policy

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**
The `volume snapshot policy create` command creates a Snapshot policy. A Snapshot policy includes at least one schedule, up to a maximum of five schedules, and a maximum number of Snapshot copies per schedule. You can create a schedule by using the `job schedule cron create` or `job schedule interval create` commands. When applied to a volume, the Snapshot policy specifies the schedule on which Snapshot copies are taken and the maximum number of Snapshot copies that each schedule can take. The total count of all the Snapshot copies to be retained for the policy cannot be more than 255.

**Parameters**

- `-vserver <vserver name>` - Vserver Name
  This specifies the Vserver on which the Snapshot policy is to be created.

- `-policy <snapshot policy>` - Snapshot Policy Name
  This specifies the Snapshot policy that is to be created.

- `-enabled {true|false}` - Snapshot Policy Enabled
  This specifies whether the Snapshot policy is enabled.

- `[-comment <text>]` - Comment
  This option specifies a text comment for the Snapshot policy.

- `-schedule1 <text>` - Schedule1 Name
  This specifies the name of the first schedule associated with the Snapshot policy.

- `-count1 <integer>` - Maximum Snapshot Copies for Schedule1
  This specifies the maximum number of Snapshot copies that can be taken by the first schedule.

- `[-prefix1 <text>]` - Snapshot Copy Name Prefix for Schedule1
  This option specifies the prefix associated with the first schedule. Every schedule has only one prefix. The command fails if you try to update an existing prefix. If you do not specify this parameter and there is no prefix associated with the schedule, the schedule name is used as the prefix. If you do not specify this parameter and there is already a prefix associated with the schedule from a previous invocation of the command, then that prefix is used.

- `[-snapmirror-label1 <text>]` - Label for SnapMirror Operations for Schedule1
  This specifies the SnapMirror Label of the first schedule associated with the Snapshot policy. Once specified, all Snapshot copies created for that schedule have the SnapMirror Label assigned to them. The SnapMirror Label is used by the Vaulting subsystem when you back up Snapshot copies to the Vault Destination.
[-schedule2 <text>] - Schedule2 Name
This option specifies the name of the second schedule associated with the Snapshot policy. If this parameter is specified, the -count2 parameter must also be specified.

[-count2 <integer>] - Maximum Snapshot Copies for Schedule2
This option specifies the maximum number of Snapshot copies that can be taken by the second schedule. If this parameter is specified, the -schedule2 parameter must also be specified.

[-prefix2 <text>] - Snapshot Copy Name Prefix for Schedule2
This option specifies the prefix associated with the second schedule. If this parameter is specified, -schedule2 and -count2 parameters must also be specified. Every schedule has only one prefix. The command fails if you try to update an existing prefix. If you do not specify this parameter and there is no prefix associated with the schedule, the schedule name is used as the prefix. If you do not specify this parameter and there is already a prefix associated with the schedule from a previous invocation of the command, then that prefix is used.

[-snapmirror-label2 <text>] - Label for SnapMirror Operations for Schedule2
This specifies the SnapMirror Label of the second schedule associated with the Snapshot policy. Once specified, all Snapshot copies created for that schedule have the SnapMirror Label assigned to them. The SnapMirror Label is used by the Vaulting subsystem when you back up Snapshot copies to the Vault Destination.

[-schedule3 <text>] - Schedule3 Name
This option specifies the name of the third schedule associated with the Snapshot policy. If this parameter is specified, the -count3 parameter must also be specified.

[-count3 <integer>] - Maximum Snapshot Copies for Schedule3
This option specifies the maximum number of Snapshot copies that can be taken by the third schedule. If this parameter is specified, the -schedule3 parameter must also be specified.

[-prefix3 <text>] - Snapshot Copy Name Prefix for Schedule3
This option specifies the prefix associated with the third schedule. If this parameter is specified, -schedule3 and -count3 parameters must also be specified. Every schedule has only one prefix. The command fails if you try to update an existing prefix. If you do not specify this parameter and there is no prefix associated with the schedule, the schedule name is used as the prefix. If you do not specify this parameter and there is already a prefix associated with the schedule from a previous invocation of the command, then that prefix is used.

[-snapmirror-label3 <text>] - Label for SnapMirror Operations for Schedule3
This specifies the SnapMirror Label of the third schedule associated with the Snapshot policy. Once specified, all Snapshot copies created for that schedule have the SnapMirror Label assigned to them. The SnapMirror Label is used by the Vaulting subsystem when you back up Snapshot copies to the Vault Destination.

[-schedule4 <text>] - Schedule4 Name
This option specifies the name of the fourth schedule associated with the Snapshot policy. If this parameter is specified, the -count4 parameter must also be specified.

[-count4 <integer>] - Maximum Snapshot Copies for Schedule4
This option specifies the maximum number of Snapshot copies that can be taken by the fourth schedule. If this parameter is specified, the -schedule4 parameter must also be specified.

[-prefix4 <text>] - Snapshot Copy Name Prefix for Schedule4
This option specifies the prefix associated with the fourth schedule. If this parameter is specified, -schedule4 and -count4 parameters must also be specified. Every schedule has only one prefix. The command fails if you try to update an existing prefix. If you do not specify this parameter and there is no prefix associated with the schedule, the schedule name is used as the prefix. If you do not specify this parameter and there is already a prefix associated with the schedule from a previous invocation of the command, then that prefix is used.
[-snapmirror-label4 <text>] - Label for SnapMirror Operations for Schedule4

This specifies the SnapMirror Label of the fourth schedule associated with the Snapshot policy. Once specified, all Snapshot copies created for that schedule have the SnapMirror Label assigned to them. The SnapMirror Label is used by the Vaulting subsystem when you back up Snapshot copies to the Vault Destination.

[-schedule5 <text>] - Schedule5 Name

This option specifies the name of the fifth schedule associated with the Snapshot policy. If this parameter is specified, the -count5 parameter must also be specified.

[-count5 <integer>] - Maximum Snapshot Copies for Schedule5

This option specifies the maximum number of Snapshot copies that can be taken by the fifth schedule. If this parameter is specified, the -schedule5 parameter must also be specified.

[-prefix5 <text>] - Snapshot Copy Name Prefix for Schedule5

This option specifies the prefix associated with the fifth schedule. If this parameter is specified, -schedule5 and -count5 parameters must also be specified. Every schedule has only one prefix. The command fails if you try to update an existing prefix. If you do not specify this parameter and there is no prefix associated with the schedule, the schedule name is be used as the prefix. If you do not specify this parameter and there is already a prefix associated with the schedule from a previous invocation of the command, then that prefix is used.

[-snapmirror-label5 <text>] - Label for SnapMirror Operations for Schedule5

This specifies the SnapMirror Label of the fifth schedule associated with the Snapshot policy. Once specified, all Snapshot copies created for that schedule have the SnapMirror Label assigned to them. The SnapMirror Label is used by the Vaulting subsystem when you back up Snapshot copies to the Vault Destination.

Examples

The following example creates a Snapshot policy named snappolicy_4hrs on a Vserver named vs0. The policy runs on a single schedule named 4hrs with a prefix every_4_hour and has a maximum number of five Snapshot copies.

```
cluster1::> volume snapshot policy create -vserver vs0 -policy snappolicy_4hrs
-schedule1 4hrs -count1 5 -prefix1 every_4_hour
```

- `job schedule cron create` on page 177
- `job schedule interval create` on page 180

volume snapshot policy delete

Delete a snapshot policy

Availability: This command is available to `cluster` and Vserver administrators at the `admin` privilege level.

Description

The `volume snapshot policy delete` command deletes a Snapshot policy.

Parameters

- `vserver <vserver name>` - Vserver Name
  
  This specifies the Vserver on which the Snapshot policy is to be deleted.

- `policy <snapshot policy>` - Snapshot Policy Name
  
  This specifies the Snapshot policy that is to be deleted.
Examples
The following example deletes a Snapshot policy named snappolicy_hourly on Vserver vs0:

```
cluster1::> volume snapshot policy delete -vserver vs0 -policy snappolicy_hourly
```

**volume snapshot policy modify**

Modify a snapshot policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The *volume snapshot policy modify* command enables you to modify the description associated with a Snapshot policy and whether the policy is enabled or disabled.

**Parameters**
- `-vserver <vserver name>` - Vserver Name
  
  This specifies the Vserver on which the Snapshot policy is to be modified.

- `-policy <snapshot policy>` - Snapshot Policy Name
  
  This specifies the Snapshot policy that is to be modified.

- `[-enabled {true|false}]` - Snapshot Policy Enabled
  
  This optionally specifies whether the Snapshot policy is enabled.

- `[-comment <text>]` - Comment
  
  This specifies the comment text for the Snapshot policy.

- `[-snapmirror-labels <text>, ...]` - Label for SnapMirror Operations
  
  This optionally specifies a comma separated list of SnapMirror labels that are applied to the schedules in the Snapshot policy. Each label in the list applies to only one schedule in the Snapshot policy (maximum of 5 SnapMirror labels), the first label applying to the first schedule, the second label applying to the second schedule, and so on. You can have a maximum of five SnapMirror labels, which corresponds to the maximum number of schedules a Snapshot policy can have. If an empty string (""") is specified, the existing labels will be deleted from all the schedules.

Examples
The following example changes the description of a Snapshot policy named snappolicy_wknd on Vserver vs0 to "Runs only on weekends":

```
cluster1::> volume snapshot policy modify -vserver vs0 -policy snappolicy_wknd -comment "Runs only on weekends"
```

**volume snapshot policy modify-schedule**

Modify a schedule within snapshot policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The *volume snapshot policy modify-schedule* command modifies the maximum number of Snapshot copies that can be taken by a Snapshot policy's schedule.
Parameters

- **vserver <vserver name>** - Vserver Name
  This specifies the Vserver on which a Snapshot policy schedule is to be modified.

- **policy <snapshot policy>** - Snapshot Policy Name
  This specifies the Snapshot policy whose schedule is to be modified.

- **schedule <text>** - Schedule Name
  This specifies the schedule that is to be modified.

- **[newcount <integer>]** - Maximum Snapshot Copies for Schedule
  This specifies the maximum number of Snapshot copies that can be taken by the specified schedule. The total count of all the Snapshot copies to be retained for the policy cannot be more than 255.

- **[newsnapmirror-label <text>]** - Label for SnapMirror Operations
  This specifies the SnapMirror Label identified with a Snapshot copy when it is created for the specified schedule. The SnapMirror Label is used by the Vaulting subsystem when you back up Snapshot copies to the Vault Destination. If an empty label ("") is specified, the existing label will be deleted.

Examples

The following example changes the maximum number of Snapshot copies from five to four for a schedule named midnight on a Snapshot policy named snappolicy_nightly on Vserver vs0:

```
cluster1::> volume snapshot policy modify-schedule -vserver vs0 -policy snappolicy_nightly -schedule midnight -newcount 4
```

**volume snapshot policy remove-schedule**

Remove a schedule from snapshot policy

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The `volume snapshot policy remove-schedule` command removes a schedule from a Snapshot policy.

Parameters

- **vserver <vserver name>** - Vserver Name
  This specifies the Vserver on which a Snapshot policy schedule is to be removed.

- **policy <snapshot policy>** - Snapshot Policy Name
  This specifies the Snapshot policy from which a schedule is to be removed.

- **schedule <text>** - Schedule Name
  This specifies the schedule that is to be removed from the Snapshot policy.

Examples

The following example removes a schedule named hourly from a Snapshot policy named snappolicy_daily on Vserver vs0:

```
cluster1::> volume snapshot policy remove-schedule -vserver vs0 -policy snappolicy_daily -schedule hourly
```
volume snapshot policy show

Show snapshot policies

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The volume snapshot policy show command displays the following information about Snapshot policies:

- Vserver name
- Snapshot policy name
- Number of schedules in the policy
- Comment for the policy
- Individual schedule names
- Maximum number of Snapshot copies associated with each schedule
- Snapshot copy name prefixes for the schedules
- SnapMirror Labels associated with the schedules

Parameters
{[-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

[-revert-incompatible] (privilege: advanced)
  If this parameter is specified, the command displays Snapshot policies that are not supported in Data ONTAP 8.2. The total Snapshot copy count in the policy needs to be reduced to be equal to or less than the supported count for the revert operation to succeed.

[-instance]
  If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver Name
  If this parameter is specified, the command displays Snapshot policies on the specified Vserver.

[-policy <snapshot policy>] - Snapshot Policy Name
  If this parameter is specified, the command displays detailed information about the specified Snapshot policy.

[-enabled {true|false}] - Snapshot Policy Enabled
  If this parameter is specified, the command displays detailed information only about the Snapshot policy or policies that have the specified enabled value.

[-comment <text>] - Comment
  If this parameter is specified, the command displays information only about the Snapshot policy or policies that have the specified comment.

[-total-schedules <integer>] - Total Number of Schedules in This Policy
  If this parameter is specified, the command displays information only about the Snapshot policy or policies that have the specified total number of schedules.

[-schedules <text>, ...] - Schedule Name
  If this parameter is specified, the command displays information only about the Snapshot policy or policies that have the specified list of schedules.
Parameters:

[-counts <integer>, ...] - Maximum Snapshots for the Schedule
   If this parameter is specified, the command displays information only about the Snapshot policy or policies that have the specified list of maximum numbers of Snapshot copies per schedule.

[-prefixes <text>, ...] - Prefix Name
   If this parameter is specified, the command displays information only about the Snapshot policy or policies that have the specified list of prefixes.

[-snapmirror-labels <text>, ...] - Label for SnapMirror Operations
   If this parameter is specified, the command displays information only about the Snapshot policies that have the specified SnapMirror Label. When you specify a list of SnapMirror labels, the command displays all the Snapshot policies that contain any of the SnapMirror Labels specified in the list.

[-policy-owner <text>] - Owner of the policy
   If this parameter is specified, the command displays information only about the Snapshot policies that have the specified policy owner.

[-total-count <integer>] - Total Number of Snapshots in This Policy
   If this parameter is specified, the command displays information only about the Snapshot policies that have the specified total number of Snapshot copies.

Examples

The following example displays information about all Snapshot policies:

```
cluster1::> volume snapshot policy show
Vserver: cm

```
volume transition-convert-dir commands

Manage conversion of a 7-mode directory into a Cluster-mode

volume transition-convert-dir show

Display 7-Mode directories being converted

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description

The `volume transition-convert-dir show` command displays information about ongoing directory copy conversion operations.

Parameters

- `-fields <fieldname>, ...`
  
  If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

- `[-instance]`
  
  If you specify the `-instance` parameter, the command displays detailed information about all fields.

- `[-vserver <vserver name>]` - Vserver Name
  
  Displays summary information about the ongoing copy conversions of directories for the volumes in the specified Vserver.

- `[-volume <volume name>]` - Volume Name
  
  Displays summary information about the ongoing copy conversions of directories that are occurring on the specified volume.

- `[-path <text>]` - Directory Being Converted
  
  Displays summary information for the ongoing copy conversions of directories that have the specified directory path to convert.

- `[-job-id <integer>]` - Convert Job ID
  
  Displays summary information for the ongoing copy conversions of directories that have the specified job ID.

- `[-state {Initial|Queued|Running|Waiting|Pausing|Paused|Quitting|Success|Failure|Reschedule|Error|Quit|Dead|Unknown|Restart|Dormant}]` - Operation State
  
  Displays summary information for the copy conversions of directories that have the specified job state.

- `[-bytes-total <integer>]` - Bytes Total
  
  Displays summary information for copy conversions which have the estimated number of bytes of directory content to convert.

- `[-bytes-completed <integer>]` - Bytes Completed
  
  Displays summary information for copy conversions which have the estimated number of bytes of directory content that have completed conversion. The value of this field will be updated approximately once per minute.

Examples

The following example illustrates how to show directory conversions for a volume:
volume transition-convert-dir start

Start converting a 7-Mode directory to Cluster-mode

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `advanced` privilege level.

**Description**

The `volume transition-convert-dir start` command moves the directory entries in an existing directory to a new temporary directory and then replaces the existing directory with the temporary directory. This command only has a use for directories that were created in a non-Unicode format on a 7-Mode storage system and then transitioned to clustered Data ONTAP by using a SnapMirror relationship of type TDP. This command converts the directories to the Unicode format in a way that is less likely to disrupt the operation of the Data ONTAP systems than the existing directory conversion mechanisms. The temporary directory is visible from clients. Attempting to manipulate the directory being copied or the temporary directory might result in expected side-effects and should be avoided.

**Parameters**

- `-vserver <vserver name>` - Vserver Name
  Specifies the Vserver on which the volume is located.

- `-volume <volume name>` - Volume Name
  Specifies the volume in which the directory to be converted is located.

- `-path <file path>` - Directory Path
  Specifies the path to the directory to be converted from the root of the volume specified with the `-volume` parameter. The root directory of a volume might not be converted using this command. Also, the path must not have a symbolic link as the last component in the path.

**Examples**

The following example shows how to start a 7-mode directory conversion for a given path in a volume:

```
cluster1:*> volume transition-convert-dir start -vserver vs0 -volume vol1 -path /data/large_dir
```

**Vserver Commands**

Manage Vservers

The `vserver` commands enable you to manage Vservers and their attributes, including the configuration of the CIFS and NFS protocols, export policies, name mappings between CIFS and NFS users, and network services.

**vserver add-aggregates**

Add aggregates to the Vserver

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.
Description
The `vserver add-aggregates` command adds aggregates to the Vserver.

Parameters
- **-vserver <vserver>** - Vserver
  Specifies the Vserver for which aggregates have to be added.
- **-aggregates <aggregate name>, ...** - List of Aggregates to Be Added
  Specifies the list of aggregates to add to the Vserver. The root aggregates should not be specified in this list because though the command will return success, volumes cannot be created on root aggregates. In a MetroCluster configuration, this command does not honor the remote cluster's aggregates.

Examples
The following example illustrates how to add aggregates `aggr1` and `aggr2` to a Vserver named `vs.example.com`:

```
cluster1::> vserver add-aggregates -vserver vs.example.com -aggregates aggr1,aggr2
```

**vserver add-protocols**
Add protocols to the Vserver

Availability: This command is available to `cluster` administrators at the `admin` privilege level.

Description
The `vserver add-protocols` command adds given protocols to a specified Vserver.

Parameters
- **-vserver <vserver>** - Vserver
  This specifies the Vserver that is to be modified.
- **-protocols {nfs|cifs|fcp|iscsi|ndmp}, ...** - Protocols
  This parameter specifies the list of protocols to be allowed to run on the Vserver. Possible values include `nfs`, `cifs`, `fcp`, `iscsi`, and `ndmp`.

Examples
The following example shows adding protocol 'cifs' to a vserver named vs0.example.com.

```
cluster1::> vserver add-protocols -vserver vs0.example.com -protocols cifs
```

**vserver context**
Set Vserver context

Availability: This command is available to `cluster` administrators at the `admin` privilege level.

Description
Cluster administrators can use the `vserver context` command to login to a specified Vserver with a specified Vserver user name. All subsequent commands will be issued in the context of that Vserver. The role of the cluster administrator will be the same as that of the user name with which the Vserver context was set. The context is valid for the duration of the CLI or Web UI session in which it is specified. The `exit` command can be used to return to the original context.
Parameters

-vserver <vserver> - Vserver

Use this parameter to specify the Vserver.

[-username <text>] - Vserver Administrator User Name

Use this parameter to specify a Vserver administrator user name for the context. The default value vsadmin is used if one is not specified.

Examples

The following example sets the CLI context to Vserver vs0.example.com. All subsequently issued commands will be executed in the context of that Vserver:

```
cluster1::> vserver context -vserver vs0.example.com
Info: Use 'exit' command to return.
vs0.example.com::>
```

exit on page 1

vserver create

Create a Vserver

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The vserver create command creates a Vserver.

Parameters

-vserver <vserver> - Vserver

This specifies the name of the Vserver that is to be created. Use a fully qualified domain name (FQDN) - for example, "data.example.com" - for the Vserver to ensure unique Vserver names across cluster leagues.

Note: Maximum number of characters supported is 47, and 41 for a Vserver with subtype "sync-source". "all" is a reserved name and must not be used as a Vserver name.

[-subtype <vserver subtype>] - Vserver Subtype

This specifies the subtype of the Vserver being created. Possible values are:

- default - For default data Vservers
- dp-destination - For Data Protection destination Vservers
- sync-source - For MetroCluster source Vservers
- sync-destination - For MetroCluster destination Vservers

[-rootvolume <volume name>] - Root Volume

This parameter optionally specifies the name of the Vserver's root volume, which is created when the Vserver is created. The default name is svm_root. The size of the Vserver's root volume is 1GB

[-aggregate <aggregate name>] - Aggregate

This parameter optionally specifies the storage aggregate that holds the Vserver's root volume. Selection of the aggregate is based on the Vserver setup algorithm.
• Creating a root volume on the SnapLock aggregate is not supported.

• Creating a root volume of sync-source Vserver on the unmirrored aggregate is not supported.

[-rootvolume-security-style <security style>] - Root Volume Security Style
This parameter optionally specifies the security style for the Vserver's root volume. Possible values include unix (for UNIX mode bits), ntfs (for CIFS ACLs), and mixed (for mixed NFS and CIFS access). The default value is unix. Regardless of the security style, both NFS and CIFS clients can read from and write to the root volume. The unified security style, which applies only to Infinite Volumes, cannot be applied to a Vserver's root volume.

[-language <Language code>] - Default Volume Language Code
This optionally specifies the default language encoding setting for the Vserver and its volumes. The recommended format is to append .UTF-8 for the language encoding values. For example, for the en_US language, the recommended format is en_US.UTF-8. The default setting is C.UTF-8.

[-snapshot-policy <snapshot policy>] - Snapshot Policy
This optionally specifies the Snapshot policy for new volumes created on the Vserver. If no value is specified, the default Snapshot policy is used. You can use the -snapshot-policy parameter on the volume create or volume modify commands to set the Snapshot policy on a specific volume, regardless of its Vserver's Snapshot policy setting.

[-comment <text>] - Comment
This optionally specifies a comment for the Vserver.

[-quota-policy <text>] - Quota Policy
This optionally specifies a quota policy for the Vserver. This parameter is not supported on a Vserver with Infinite Volume.

[-is-repository {true|false}] - Is Vserver with Infinite Volume
Note: This parameter is deprecated and may be removed in a future release of Data ONTAP. If you are using Infinite Volumes it is recommended that you do not upgrade the cluster to a release that is later than Data ONTAP 9.3.0.
This specifies that the Vserver will contain an Infinite Volume.

[-caching-policy <text>] - Caching Policy Name
This optionally specifies the caching policy to apply to the Vserver. A caching policy defines how the system caches this volume's data in Flash Cache modules. If a caching policy is not assigned to this Vserver, the system uses the default cluster-wide policy. The available caching policies are:

• none - Does not cache any user data or metadata blocks.
• auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
• meta - Read caches only metadata blocks.
• random_read - Read caches all metadata and randomly read user data blocks.
• random_read_write - Read caches all metadata, randomly read and randomly written user data blocks.
• all_read - Read caches all metadata, randomly read, and sequentially read user data blocks.
• all_read_random_write - Read caches all metadata, randomly read, sequentially read, and randomly written user data.
• all - Read caches all data blocks read and written. It does not do any write caching.

Default caching-policy is auto.
[-ipspace <IPspace>] - IPspace Name
This optionally specifies the IPspace the Vserver will be assigned to. If left unspecified, the Vserver will be assigned to the default IPspace.

[-foreground {true|false}] - Foreground Process
This parameter optionally specifies whether the Vserver create operation can be executed in the background. If nothing is specified, by default the Vserver create operation is executed in the foreground.

Examples
The following example creates a Vserver named vs0.example.com in the IPspace ipspace123. The Vserver's root volume is named root_vs0 and is located on aggregate aggr0. The Vserver uses NIS for network information, a file for name mapping information, and the language is U.S. English:

```bash
cluster1::> vserver create -vserver vs0.example.com -ipspace ipspace123 -rootvolume root_vs0 -aggregate aggr0 -language en_US.UTF-8 -rootvolume-security-style mixed
```

The following example creates a Vserver named vs1 using default values. The default name for the Vserver's root volume is svm_root and the Vserver is located on an aggregate selected on the basis of the Vserver setup algorithm. The default root volume's security style is set to unix.

```bash
cluster1::> vserver create -vserver vs1
cluster1::> vserver show -vserver vs1 -fields rootvolume, rootvolume-security-style, aggregate
vserver rootvolume aggregate rootvolume-security-style
-------- -------- -------------------------
vs1      svm_root  aggr1     unix
```

vserver delete
Delete an existing Vserver

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The `vserver delete` command deletes a specified Vserver. If the Vserver is associated with one or more volumes, you must manually delete volumes (including root and mirror volumes) before you delete the Vserver. If the Vserver subtype is `dp-destination`, change the Vserver subtype to `default` by specifying the Vserver as the destination in the `snapmirror break` command before deleting the objects owned by the Vserver.

Parameters
- `-vserver <vserver>` - Vserver
  This specifies the Vserver that is to be deleted.

- `[-foreground {true|false}]` - Foreground Process
  This optionally specifies the Vserver delete operation can be executed in the background. If nothing is specified, by default the Vserver delete operation is executed in the foreground.
Examples
The following example deletes a Vserver named vs2.example.com:

```
cluster1::> vserver delete -vserver vs2.example.com
```

Related references
snapmirror break on page 593

vserver modify
Modify a Vserver

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The vserver modify command modifies the attributes of a specified Vserver. If the Vserver subtype is of type dp-destination, then only the -aggr-list parameter can be modified.

Parameters
- **-vserver <vserver>** - Vserver
  This specifies the Vserver that is to be modified.

- **[-language <Language code>] - Default Volume Language Code**
  This optional parameter specifies the default language encoding setting for the Vserver and its volumes. The recommended format is to append .UTF-8 for the language encoding values. For example, for the en_US language, the recommended format is en_US.UTF-8. The default setting is C.UTF-8. This field is not modifiable on a Vserver with Infinite Volume.

- **[-snapshot-policy <snapshot policy>] - Snapshot Policy**
  This optional parameter specifies the Snapshot policy for a Vserver being modified.

- **[-comment <text>] - Comment**
  This optional parameter specifies a comment for the Vserver.

- **[-quota-policy <text>] - Quota Policy**
  This optional parameter specifies a quota policy to be used for all volumes associated with a Vserver. You can create and configure multiple, different quota policies, but each Vserver must have one and only one associated quota policy. This parameter is not supported on a Vserver with Infinite Volume.

- **[-aggr-list <aggregate name>, ...] - List of Aggregates Assigned**
  This optional parameter specifies a confined list of aggregates on which volumes can be created for a Vserver by the Vserver administrator. But these aggregates do not become exclusive property of the Vserver, i.e. they might be assigned for use to other Vservers. If the value of this parameter is specified as "-", then the Vserver administrator cannot create any volumes for that Vserver. Note that the cluster administrator will still be able to create volumes on any aggregate and assign them to this Vserver.

- **[-max-volumes <unsigned32_or_unlimited>] - Limit on Maximum Number of Volumes allowed**
  This optional parameter specifies the maximum number of volumes that can be created for the Vserver, including the root volume. This value is not modifiable on a Vserver with Infinite Volume.

- **[-admin-state {running|stopped|starting|stopping}] - Vserver Admin State (privilege: advanced)**
  Use this parameter to set the admin state of the Vserver if the Vserver start or stop job fails. Possible values include running and stopped.
[-allowed-protocols {nfs|cifs|fcp|iscsi|ndmp}, ...] - Allowed Protocols

This optional parameter specifies the list of protocols to be allowed to run on the Vserver. When part of vserver-modify, this field should include the existing list along with the new protocol list to be added to prevent data disruptions. Possible values include nfs, cifs, fcp, iscsi, and ndmp. Possible values for a Vserver with Infinite Volume include nfs and cifs.

[-disallowed-protocols {nfs|cifs|fcp|iscsi|ndmp}, ...] - Disallowed Protocols

This optional parameter specifies the list of protocols to be disallowed to run on the Vserver. When part of vserver-modify, this field should include the existing list along with the new protocol list to be added to prevent data disruptions. Possible values include nfs, cifs, fcp, iscsi, and ndmp. Only the protocols configured for Vservers with Infinite Volume can be disallowed.

[-qos-policy-group <text>] - QoS Policy Group

This optionally specifies which QoS policy group to apply to the Vserver. This policy group defines measurable service level objectives (SLOs) that apply to the storage objects with which the policy group is associated. If you do not assign a policy group to a Vserver, the system will not monitor and control the traffic to it. To remove this Vserver from a policy group, enter the reserved keyword "none". This parameter is not supported on a Vserver with Infinite Volume.

[-caching-policy <text>] - Caching Policy Name

This optionally specifies the caching policy to apply to the Vserver. A caching policy defines how the system caches this volume’s data in Flash Cache modules. If a caching policy is not assigned to this Vserver, the system uses the default cluster-wide policy. The available caching policies are:

- none - Does not cache any user data or metadata blocks.
- auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
- meta - Read caches only metadata blocks.
- random_read - Read caches all metadata and randomly read user data blocks.
- random_read_write - Read caches all metadata, randomly read and randomly written user data blocks.
- all_read - Read caches all metadata, randomly read, and sequentially read user data blocks.
- all_read_random_write - Read caches all metadata, randomly read, sequentially read, and randomly written user data.
- all - Read caches all data blocks read and written. It does not do any write caching.

Default caching-policy is auto.

[-foreground {true|false}] - Foreground Process

This optionally specifies whether the Vserver modify operation can be executed in the background. If nothing is specified, by default the Vserver modify operation is executed in the foreground.

**Examples**

The following example modifies the quota policy for a Vserver named vs0.example.com to pol1, specifies a Snapshot policy named daily, adds the comment "Sales team access".

```
cluster1::> vserver modify -vserver vs0.example.com -snapshot-policy daily
                -comment "Sales team access" -quota-policy pol1
```
vserver prepare-for-revert
Prepares Vservers to be reverted

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The vserver prepare-for-revert command prepares Vservers to be reverted to the previous version of Data ONTAP. It disables any operations that cannot be scheduled during revert.

Examples
The following example prepares all Vservers to be reverted.

```
cluster1::*> vserver prepare-for-revert
```

vserver remove-aggregates
Remove aggregates from the Vserver

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The vserver remove-aggregates command removes aggregates from the Vserver.

Parameters
- `vserver <vserver>` - Vserver
  
  Specifies the Vserver from which aggregates have to be removed.
  
- `aggregates <aggregate name>, ...` - List of Aggregates to Be Removed
  
  Specifies the list of aggregates to remove from the Vserver.

Examples
The following example illustrates how to remove aggregates `aggr1` and `aggr2` from a Vserver named `vs.example.com`:

```
cluster1::> vserver remove-aggregates -vserver vs.example.com -aggregates aggr1,aggr2
```

vserver remove-protocols
Remove protocols from the Vserver

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The vserver remove-protocols command removes the specified protocols from the specified Vserver. When you remove the protocols from a Vserver, the data access with respect to the removed protocols is disrupted.
Parameters
-vserver <vserver> - Vserver
   Specifies the Vserver that is to be modified.

-protocols {nfs|cifs|fcp|iscsi|ndmp},... - Protocols
   This parameter specifies the list of protocols to be removed. on the Vserver. Possible values include nfs, cifs, fcp, iscsi, and ndmp.

Examples
The following example shows removing protocol 'cifs' from a Vserver named vs0.example.com.

   cluster1::> vserver remove-protocols -vserver vs0.example.com -protocols cifs

vserver rename
Rename a Vserver

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The vserver rename command renames the Vserver. If the vserver being renamed is participating in an Inter-cluster Vserver peer relationship, all the corresponding remote clusters will be updated with the new peer Vserver name.

Parameters
-vserver <text> - Vserver
   This specifies the Vserver that is to be renamed.

-newname <vserver> - New Vserver name (Use Fully Qualified Domain Name, For example: data.example.com)
   This specifies the Vserver's new name. The name must be a unique Vserver name in the cluster. Use a fully qualified domain name (FQDN) - for example, "data.example.com" - for the Vserver name to reduce name collisions in cluster leagues.

   Note: Maximum number of characters supported is 47, and 41 for a Vserver with subtype "sync-source". "all" is a reserved name and must not be used as a Vserver name.

[-foreground {true|false}] - Foreground Process
   This specifies whether the rename job will be run in foreground or background. By default, the job runs in foreground.

Examples
The following examples rename a Vserver named vs1.example.com as vs2.example.com, and then finally back to its original name:

   (When there is no intercluster Vserver peer relationship with the vserver)
   cluster1::> vserver rename -vserver vs1.example.com -newname vs2.example.com

   (When there is at least one intercluster peer relationship with the Vserver)
   cluster1::> vserver rename -vserver vs1.example.com -newname vs2.example.com
   [Job 277] Job succeeded: Vserver rename completed successfully
   cluster1::> vserver rename -vserver vs2.example.com -newname vs1.example.com -
vserver restamp-msid

The `vserver restamp-msid` command restamps MSIDs of all volumes in a Vserver to make them either identical to the VserverDR source Vserver. The command is run on secondary VserverDR site and automatically updates the MSID preserve behavior for the Vserver. A `snapmirror resync` must be run after this command completes.

**Parameters**

- `vserver <vserver name>` - Vserver name
  - The name of the dp-destination Vserver.

- `preserve-msid {true|false}` - Make MSID same as that of source Vserver. False sets the values as different.
  - Boolean value through which the user can specify whether to make the MSIDs of the volumes same as that of Source Vserver. Specifying true will make the MSIDs same and specifying false will make them different.

**Examples**

This example will stamp all the volumes of Vserver vs1dp with the same MSID as the source Vserver.

```
cluster1::>vserver restamp-msid -vserver vs1dp -preserve-msid true
```

**Related references**

---

vserver show

The `vserver show` command displays the following information:

- Vserver name
- Vserver type (`data`, `admin`, `node` or `system` - detailed view only)
- Vserver subtype (`default`, `dp-destination`, `sync-source`, and `sync-destination` - detailed view only)
- Vserver universal unique identifier (detailed view only)
- Root volume name
• Aggregate on which the root volume is located
• Associated NIS domain
• Root volume security style (unix for UNIX mode bits, ntfs for CIFS ACLs, mixed for both (detailed view only), or unified (Infinite Volumes only))
• LDAP client
• Language (detailed view only)
• Snapshot policy (detailed view only)
• Comment text (detailed view only)
• Quota policy (detailed view only)
• Aggregate list (detailed view only)
• Maximum Volumes (detailed view only)
• Qos-policy-group (detailed view only)
• Config-lock (detailed view only)
• Admin state (running, stopped, starting, stopping, initializing, or deleting)
• Operational state (running, or stopped)
• Operational state stopped reason (sync-destination-and-switchover-not-done, or cluster-reboot-done, or admin-state-stopped)
• Allowed Protocols (nfs, cifs, fcp, iscsi, ndmp - detailed view only)
• Disallowed Protocols (nfs, cifs, fcp, iscsi, ndmp - detailed view only)
• Whether the Vserver is a Vserver with Infinite Volume (detailed view only)
• IPspace to which the Vserver belongs (detailed view only)
• Caching policy

Parameters
{ [-fields <fieldname>, ...]  
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

  [-protocols ]  
  If this optional parameter is specified, the command displays the allowed and disallowed set of protocols for the Vserver(s).

  [-instance ]  
  If you specify the -instance parameter, the command displays detailed information about all fields.

  [-vserver <vserver> ] - Vserver  
  If this parameter is specified, the command displays detailed information about the specified Vserver.

  [-type <vserver type> ] - Vserver Type  
  If this parameter is specified, the command displays information only about the Vserver or Vservers that have the specified Vserver type. Types include admin for the cluster-wide management Vserver, system for cluster-level communications in an IPspace, data for data serving Vserver, and node for node management Vserver.
[-subtype <vserver subtype>] - Vserver Subtype
If this parameter is specified, the command displays information only about the Vserver or Vservers that have the specified Vserver subtype. Types include:

- default for default data Vserver
- dp-destination for Data Protection destination Vserver.
- sync-source for MetroCluster source Vserver,
- sync-destination for MetroCluster destination Vserver.

[-uuid <UUID>] - Vserver UUID
If this parameter is specified, the command displays information only about the Vserver that match the specified UUID.

[-rootvolume <volume name>] - Root Volume
If this parameter is specified, the command displays information only about the Vserver or Vservers that have the specified root volume.

[-aggregate <aggregate name>] - Aggregate
If this parameter is specified, the command displays information only about the Vserver or Vservers that have their root volumes contained by the specified aggregate.

[-nisdomain <nis domain>] - NIS Domain
If this parameter is specified, the command displays information only about the Vserver or Vservers that use the specified NIS domain.

[-rootvolume-security-style <security style>] - Root Volume Security Style
If this parameter is specified, the command displays information only about the Vserver or Vservers that have the specified root-volume security style. The unified security style, which applies only to Infinite Volumes, cannot be applied to a Vserver's root volume.

[-ldap-client <text>] - LDAP Client
If this parameter is specified, the command displays information only about the Vserver or Vservers that use the specified LDAP client.

[-language <Language code>] - Default Volume Language Code
If this parameter is specified, the command displays information only about the Vserver or Vservers that use the specified language. To determine the available languages, enter "vserver show -language ?" at the clustershell command prompt and at the Vserver prompt.

[-snapshot-policy <snapshot policy>] - Snapshot Policy
If this parameter is specified, the command displays information only about the Vserver or Vservers that have the specified Snapshot policy.

[-comment <text>] - Comment
If this parameter is specified, the command displays information only about the Vserver or Vservers that match the specified comment.

[-quota-policy <text>] - Quota Policy
If this parameter is specified, the command displays information only about the Vserver or Vservers that use the specified quota policy.

[-aggr-list <aggregate name>, ...] - List of Aggregates Assigned
If this parameter is specified, the command displays information only about the Vserver or Vservers to which the specified aggregate(s) are assigned for use.
[-max-volumes <unsigned32_or_unlimited>] - Limit on Maximum Number of Volumes allowed

If this parameter is specified, the command displays information only about the Vserver or Vservers on which
the specified maximum volume count is configured.

[-admin-state {running|stopped|starting|stopping}] - Vserver Admin State

If this parameter is specified, the command displays information only about the Vserver or Vservers that
match the specified admin-state.

[-operational-state {running|stopped}] - Vserver Operational State

If this parameter is specified, the command displays information only about the Vserver or Vservers that
match the specified operational-state. This field determines the state of the Vserver LIFs. New LIFs created on
a Vserver, which is in running state, will be operationally up and the LIFs created on a Vserver, which is in
stopped state, will be operationally down.

[-operational-state-stopped-reason {sync destination and switchover is not done|cluster
reboot is done|admin state stopped| dp destination not started}] - Vserver Operational State
Stopped Reason

If this parameter is specified, the command displays information only about the Vserver or Vservers that are
operationally stopped due to the specified reason. This field indicates the reason for the operational-state of the
Vserver being stopped.

[-allowed-protocols {nfs|cifs|fcp|iscsi|ndmp},...] - Allowed Protocols

If this parameter is specified, the command displays information only about the Vserver or Vservers on which
the specified protocols are allowed to run.

[-disallowed-protocols {nfs|cifs|fcp|iscsi|ndmp},...] - Disallowed Protocols

If this parameter is specified, the command displays information only about the Vserver or Vservers on which
the specified protocols are disallowed to run.

[-is-repository {true|false}] - Is Vserver with Infinite Volume

If this parameter is specified, the command displays information only about the Vservers which have the
specified is-repository value. This will be true for Vservers with Infinite Volume.

[-qos-policy-group <text>] - QoS Policy Group

Display the Vservers that match the specified qos-policy-group.

A policy group defines measurable service level objectives (SLOs) that apply to the storage objects with which
the policy group is associated. If you do not assign a policy group to a Vserver, the system will not monitor
and control the traffic to it.

[-caching-policy <text>] - Caching Policy Name

Display the Vservers that match the specified caching-policy.

A caching policy defines the caching behavior of this Vserver at the Flash Cache level. If a caching policy is
not assigned to this Vserver, the system uses the default cluster-wide policy. The available caching policies
are:

• none - Does not cache any user data or metadata blocks.
• auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly
  overwritten user data blocks.
• meta - Read caches only metadata blocks.
• random_read - Read caches all metadata and randomly read user data blocks.
• random_read_write - Read caches all metadata, randomly read, and randomly written user data blocks.
• all_read - Read caches all metadata, randomly read, and sequentially read user data blocks.
- **all_read_random_write** - Read caches all metadata, randomly read, sequentially read, and randomly written user data.
- **all** - Read caches all data blocks read and written. It does not do any write caching.

Default caching-policy is auto.

**[-config-lock {true|false}] - Config Lock**

This parameter specifies if the Vserver is locked or unlocked for modification. If the config-lock is set to true, then modifying the Vserver's configuration is not allowed.

**[-ipspace <IPspace>] - IPspace Name**

If this parameter is specified, the command displays information only about the Vservers that are assigned to the specified IPspace.

**[-foreground {true|false}] - Foreground Process**

This optionally specifies whether the Vserver show operation can be executed in the background. If nothing is specified, by default the Vserver show operation is executed in the foreground.

### Examples

The following example displays information about all Vservers.

```
cluster1::> vserver show

non mcc setup:
Vserver    Type  Subtype            Admin     Operational Root     Volume  Aggregate
-----------  ------- --------------- ----------- ----------- ----------- ---------
cluster     admin    -                -          -         -             -        -
node1       node     -                -          -         -             -        -
vs0         data    default     running    running        root_vs1    aggr0
vs1         data    dp-destination stopped    stopped        -        -
4 entries were displayed.
```

```
mcc setup:
cluster1::> vserver show

Vserver    Type  Subtype             Admin     Operational Root     Volume  Aggregate
-----------  ------- --------------- ----------- ----------- ----------- ---------
cluster     admin    -                -          -         -             -        -
node1       node     -                -          -         -             -        -
vs2         data    sync-source     running    running   rv           data_aggr
tvs3-mc     data    sync-destination running    stopped        -        -
4 entries were displayed.
```

---

### vserver show-aggregates

Show details of aggregates in a Vserver

**Availability:** This command is available to **cluster** and **Vserver** administrators at the **admin** privilege level.

**Description**

The **vserver show-aggregates** command displays the details of all the aggregates that are associated with Vservers. The aggregate details displayed are the aggregate name, state, available size, the type of aggregate and the SnapLock type.
Parameters
{ [-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?' to display the fields to specify.

[-instance]}

If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver>] - Vserver

If this optional parameter is specified, the command displays the details of aggregates that are associated with the specified Vserver.

[-aggregate <aggregate name>] - Aggregate

If this optional parameter is specified, the command displays all of the Vservers configured with the specified aggregate.

Examples
The following example displays the aggregates configured for Vserver vs.

```
cluster1::> vserver show-aggregates -vserver vs
Available
<table>

vserver show-protocols

Show protocols for Vserver

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver show-protocols command displays the running protocols on a given Vserver.

Parameters
{ [-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?' to display the fields to specify.

[-instance]}

If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver>] - Vserver

If this parameter is specified, the command displays the allowed set of protocols for the specified Vserver.

[-protocol {nfs|cifs|fcp|iscsi|ndmp}, ...] - Protocols

If this optional parameter is specified, the command displays all the Vservers configured with the specified protocols.

Examples
The following example displays the protocols configured for Vserver vs1.
vserver start

Start a Vserver

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The vserver start command starts data access on a Vserver.

Parameters
-vserver <vserver> - Vserver
This specifies the name of the Vserver on which the data access is to be started. This operation is only supported on a data Vserver.

Note: The name must be of 47 characters length or less.

-foreground {true|false} - Foreground Process
This specifies if the vserver start command should be executed in the foreground or background. If you do not enter this parameter, it is set to true, and the vserver start command is executed in the foreground.

-force [true] - Force Vserver Start
In case of a MetroCluster configuration or Vserver disaster recovery, by using this parameter you can start the Vserver that is either locked (which prevents any configuration changes) or its partner Vserver is operationally running. If you do not enter this parameter, it is set to false.

Examples
The following example starts data access on Vserver vs0.example.com in the background.

cluster1::> vserver start -vserver vs0.example.com -foreground false

vserver stop

Stop a Vserver

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The vserver stop command stops data access on a Vserver.

Parameters
-vserver <vserver> - Vserver
This specifies the name of the Vserver on which the data access is to be stopped. This operation is only supported on a data Vserver.

Note: The name must be of 47 characters length or less.
**foreground (true|false)** - Foreground Process

This specifies if `vserver stop` command should be executed in the foreground or background. If you do not enter this parameter, it is set to `true`, and the `vserver stop` command is executed in the foreground.

### Examples

The following example stops data access on Vserver `vs0.example.com` in the background.

```
cluster1::> vserver stop -vserver vs0.example.com -foreground false
```

---

**vserver unlock**

Unlock Vserver configuration

**Availability:** This command is available to `cluster` administrators at the *advanced* privilege level.

**Description**

The `vserver unlock` command revokes the administrative lock on the Vserver configuration. When a Vserver is unlocked, changes to the configuration are permitted. The unlock operation fails if the Vserver is not locked by the administrator or if it is locked by internal applications. If the Vserver fails to unlock due to an error condition, you can use the `-force` option.

**Parameters**

- `-vserver <vserver>` - Vserver
  
  The name of the Vserver that has to be unlocked.

- `[-force [true]]` - Force Unlock
  
  This option is specified to unlock the Vserver when the Vserver fails to unlock due to an error condition.

### Examples

The following example illustrates how to unlock the Vserver named `vs123.example.com`, forcefully:

```
cluster1::> vserver unlock -vserver vs1.example.com -force true
```

---

**vserver active-directory commands**

Manage Active Directory

**vserver active-directory create**

Create an Active Directory account. If joining a domain, this command may take several minutes to complete.

**Availability:** This command is available to `cluster` and Vserver administrators at the *admin* privilege level.

**Description**

The `vserver active-directory create` command creates an Active Directory account for a Vserver. When you create the Active Directory account, you must add it to an existing Windows Active Directory domain. When you enter this command, you are prompted to provide the credentials of a user account that has sufficient privileges to add computers to the `-ou` container within the `-domain` domain. The user account must have a password that cannot be empty. When joining a domain, this command may take several minutes to complete.

**Note:** Each Vserver can have only one Active Directory account.
### Parameters

- **-vserver `<vserver>`** - Vserver
  
  This parameter specifies the name of the Vserver for which you want to create the Active Directory account. The Vserver must already exist.

- **-account-name `<NetBIOS>`** - Active Directory NetBIOS Name
  
  This parameter specifies the name of the Active Directory account (up to 15 characters).

- **-domain `<TextNoCase>`** - Fully Qualified Domain Name
  
  This parameter specifies the name of the Active Directory domain.

- **[--ou `<text>`]** - Organizational Unit
  
  This parameter specifies the organizational unit within the Active Directory domain. By default, this parameter is set to `CN=Computers`. When specifying this parameter, specify only the organizational unit portion of the distinguished name. Data ONTAP appends the value provided for the required `-domain` parameter onto the value provided for `-ou` parameter to produce the Active Directory distinguished name, which is used when creating the Vserver’s Active Directory account in the domain.

### Examples

The following example creates an Active Directory account `ADSERVER1` for Vserver `vs1` and domain `example.com`.

```bash
cluster1::> vserver active-directory create -vserver vs1 -account-name ADSERVER1 -domain example.com
```

In order to create an Active Directory machine account, you must supply the name and password of a Windows account with sufficient privileges to add computers to the "CN=Computers" container within the "example.com" domain.

Enter the user name: Administrator
Enter the password:

The following example creates an Active Directory account `ADSERVER2` for Vserver `vs2`, domain `example.com` and organizational unit `sample_ou`.

```bash
cluster1::> vserver active-directory create -vserver vs2 -account-name ADSERVER2 -domain example.com -ou OU=sample_ou
```

In order to create an Active Directory machine account, you must supply the name and password of a Windows account with sufficient privileges to add computers to the "OU=sample_ou" container within the "example.com" domain.

Enter the user name: Administrator
Enter the password:

### vserver active-directory delete

Delete an Active Directory account

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The `vserver active-directory delete` command deletes the Active Directory account for a specified Vserver.

**Parameters**

- **-vserver `<vserver>`** - Vserver
  
  This parameter specifies the Vserver for the Active Directory account you want to delete.
Examples

The following example deletes the Active Directory account for a Vserver named vs1:

```
cluster1:/> vserver active-directory delete -vserver vs1
In order to delete an Active Directory machine account, you must supply the
name and password of a Windows account with sufficient privileges to remove
computers from the "example.com" domain.

Enter the user name: Administrator
Enter the password:
```

vserver active-directory modify

Modify the domain of an Active Directory account. If re-joining the current domain or joining a new one, this command may take several minutes to complete.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The *vserver active-directory modify* command modifies the domain of an Active Directory account. You can also re-join the current domain or join a new one. When joining a domain, this command may take several minutes to complete.

**Parameters**

- **-vserver <vserver>** - Vserver
  
  This parameter specifies the Vserver for the Active Directory account whose associated domain you want to modify.

- **[-domain <TextNoCase>]** - Fully Qualified Domain Name
  
  This parameter specifies the fully qualified name of the Active Directory domain to associate with the Active Directory account.

**Examples**
The following example modifies the Active Directory domain associated with Vserver vs1.

```
cluster1:/> vserver active-directory modify -vserver vs1 -domain example.com
In order to create an Active Directory machine account, you must supply the
name and password of a Windows account with sufficient privileges to add
computers to the "CN-Computers" container within the "example.com" domain.

Enter the user name: administrator
Enter the password:
```

vserver active-directory password-change

Change the domain account password for an Active Directory account

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The *vserver active-directory password-change* command changes the domain account password for the specified Vserver's Active Directory account.
Parameters

-vserver <vserver> - Vserver

This parameter specifies the name of the Vserver associated with the Active Directory account whose domain account password you want to change.

Examples

The following example changes the password for the Active Directory account for a Vserver named vs1.

    cluster1:/> vserver active-directory password-change -vserver vs1

vserver active-directory password-reset

Reset the domain account password for an Active Directory account

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver active-directory password-reset command resets the domain account password for the Active Directory account. This may be required if the password stored along with the machine account in the Windows Active Directory domain is changed or reset without the Vserver's knowledge. The operation requires the credentials for a user with permission to reset the password in the organizational unit (OU) that contains the machine account.

Parameters

-vserver <vserver> - Vserver

This parameter specifies the name of the Vserver associated with the Active Directory account whose domain account password you want to reset.

Examples

The following example resets the password for the Active Directory account for a Vserver named vs1.

    cluster1:/> vserver active-directory password-reset -vserver vs1
    Enter your user ID: Administrator
    Enter your password:

vserver active-directory show

Display Active Directory accounts

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver active-directory show command displays information about Active Directory accounts. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all Active Directory accounts:

- Vserver name
- Active Directory account NetBIOS name
- Domain or workgroup name
You can specify the `-fields` parameter to specify which fields of information to display about Active Directory accounts. You can use `-fields ?` to display the valid values for the `-fields` parameter. In addition to the fields above, you can display the following fields:

- Fully-qualified domain name
- Organizational unit

You can specify additional parameters to display only information that matches those parameters. For instance, to display information only about Active Directory accounts that are in the Windows Active Directory domain named RUBY, run the command with the value of the `-domain-workgroup` parameter set to RUBY.

You can specify the `-instance` parameter to display all information for all Active Directory accounts in list form.

**Parameters**

`[-fields <fieldname>, ...]`

If you specify the `-fields <fieldname>, ...` parameter, the command only displays the fields that you specify.

`[-instance]`

If you specify the `-instance` parameter, the command displays detailed information about all entries.

`[-vserver <vserver>` - Vserver

If you specify this parameter, the command displays information only about the Active Directory account for the specified Vserver.

`[-account-name <NetBIOS>` - Active Directory NetBIOS Name

If you specify this parameter, the command displays information only for the Active Directory accounts that match the specified NetBIOS account name.

`[-domain-workgroup <CIFS domain>` - NetBIOS Domain/Workgroup Name

If you specify this parameter, the command displays information only for the Active Directory accounts that are in the specified NetBIOS domain or workgroup.

**Note:** Workgroups are not supported in this release.

`[-domain <TextNoCase>` - Fully Qualified Domain Name

If you specify this parameter, the command displays information only for the Active Directory accounts that are in the specified domain.

`[-ou <text>` - Organizational Unit

If you specify this parameter, the command displays information only for the Active Directory accounts that are in the specified organizational unit.

`[-auth-style {domain|workgroup|realm}]` - Authentication Style

If you specify this parameter, the command displays information only for the Active Directory accounts that are in the specified authentication style.

**Examples**

The following example displays a subset of the information about all Active Directory accounts.

```
cluster1::> vserver active-directory show
Vserver   Account   Domain/Workgroup
---------- --------- ----------------
            Name          Name
vs1         ADSERVER1 EXAMPLE
```

The following example displays all information about all Active Directory Vservers in list form.
Vserver Audit Commands

Manage auditing of protocol requests that the Vserver services

The vserver audit commands enable you to manage auditing of protocol requests that the Vserver services.

vserver audit create

Create an audit configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver audit create command creates an audit configuration for a Vserver.

When you create an audit configuration, you can also specify the rotation method. By default, the audit log is rotated based on size.

You can use the time-based rotation parameters in any combination (-rotate-schedule-month, -rotate-schedule-dayofweek, -rotate-schedule-day, -rotate-schedule-hour, and -rotate-schedule-minute). The -rotate-schedule-minute parameter is mandatory. All other time-based rotation parameters are optional.

The rotation schedule is calculated by using all the time-related values. For example, if you specify only the -rotate-schedule-minute parameter, the audit log files are rotated based on the minutes specified on all days of the week, during all hours on all months of the year. If you specify only one or two time-based rotation parameters (say -rotate-schedule-month and -rotate-schedule-minutes), the log files are rotated based on the minute values that you specified on all days of the week, during all hours, but only during the specified months. For example, you can specify that the audit log is to be rotated during the months January, March, and August on all Mondays, Wednesdays, and Saturdays at 10:30.

If you specify values for both -rotate-schedule-dayofweek and -rotate-schedule-day, they are considered independently. For example if you specify -rotate-schedule-dayofweek as Friday and -rotate-schedule-day as 13 then the audit logs would be rotated on every Friday and on the 13th day of the specified month, not just on every Friday the 13th.

This command is not supported on a Vserver with Infinite Volume.

Parameters
-vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver on which to create the audit configuration. The Vserver must already exist.

-destination <text> - Log Destination Path

This parameter specifies the audit log destination path where consolidated audit logs are stored. If the path is not valid, the command fails. The path can be up to 864 characters in length and must have read-write permissions.
- **events {file-ops|cifs-logon-logoff|cap-staging|file-share|audit-policy-change|user-account|authorization-policy-change|security-group},...}** - Categories of Events to Audit

This parameter specifies the categories of events to be audited. Supported event categories are: file access events (both CIFS and NFS), CIFS logon and logoff events, Central Access Policy (CAP) staging events, File share events, Audit policy change events, Local User Account Management Events, Local Security Group Management Events and Authorization Policy Change Events. The corresponding parameter values are: file-ops, cifs-logon-logoff, cap-staging, file-share, audit-policy-change, user-account, security-group and authorization-policy-change. By default, file-ops, cifs-logon-logoff and audit-policy-change events are enabled. The support for audit-policy-change event can be modified from diag prompt using `vserver audit modify` command.

- **format {xml|evtx}** - Log Format

This parameter specifies the output format of the audit logs. The output format can be either Data ONTAP-specific XML or Microsoft Windows EVTX log format. By default, the output format is EVTXX.

- **[-rotate-size <integer> [KB|MB|GB|TB|PB]}** - Log File Size Limit

This parameter specifies the audit log file size limit. By default, the audit log is rotated based on size. The default audit log size is 100 MB.

- **[-rotate-schedule-month <cron_month>,...]}** - Log Rotation Schedule: Month

This parameter specifies the monthly schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated during the months January, March, and August, or during all the months. Valid values are January, February, March, April, May, June, July, August, September, October, November, December, and all. Specify "all" to rotate the audit logs every month.

- **[-rotate-schedule-dayofweek <cron_dayofweek>,...]}** - Log Rotation Schedule: Day of Week

This parameter specifies the daily (day of the week) schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated on Tuesdays and Fridays, or during all the days of a week. Valid values are Sunday, Monday, Tuesday, Wednesday, Thursday, Friday, Saturday, and all. Specify "all" to rotate the audit logs every day.

- **[-rotate-schedule-day <cron_dayofmonth>,...]}** - Log Rotation Schedule: Day

This parameter specifies the day of the month schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated on the 10th and 20th days of a month, or all days of a month. Valid values range from 1 to 31.

- **[-rotate-schedule-hour <cron_hour>,...]}** - Log Rotation Schedule: Hour

This parameter specifies the hourly schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated at 6 a.m and 10 a.m. Valid values range from 0 (midnight) to 23 (11:00 p.m.). Specify "all" to rotate the audit logs every hour.

- **[-rotate-schedule-minute <cron_minute>,...]}** - Log Rotation Schedule: Minute

This parameter specifies the minute schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated at the 30th minute. Valid values range from 0 to 59.

- **[-rotate-limit <integer>]** - Log Files Rotation Limit

This parameter specifies the audit log files rotation limit. A value of 0 indicates that all the log files are retained. The default value is 0. For example, if you enter a value of 5, the last five audit logs are retained.

### Examples

The following examples create an audit configuration for Vserver vs1 using size-based rotation.

```
cluster1::> vserver audit create -vserver vs1 -destination /audit_log -rotate-size 10MB -rotate-limit 5
```

**Commands: Manual Page Reference**
The following example creates an audit configuration for Vserver vs1 using time-based rotation. The audit logs are rotated monthly, all days of the week, at 12:30.

```
cluster1::> vserver audit create -vserver vs1 -destination /audit_log -rotate-schedule-month all -rotate-schedule-dayofweek all -rotate-schedule-hour 12 -rotate-schedule-minute 30
```

The following example creates an audit configuration for Vserver vs1 using time-based rotation. The audit logs are rotated in January, March, May, July, September, and November on Monday, Wednesday, and Friday, at 6:15, 6:30, 6:45, 12:15, 12:30, 12:45, 18:15, 18:30, and 18:45. The last 6 audit logs are retained.

```
cluster1::> vserver audit create -vserver vs1 -destination /audit_log -rotate-schedule-month January, March, May, July, September, November -rotate-schedule-dayofweek Monday, Wednesday, Friday -rotate-schedule-hour 6,12,18 -rotate-schedule-minute 15,30,45 -rotate-limit 6
```

The following example creates an audit configuration for Vserver vs1 for auditing CIFS and NFS file access events in the output log format EVTX.

```
cluster1::> vserver audit create -vserver vs1 -destination /audit_log -format evtx -events file-ops
```

**Related references**

-vserver audit modify on page 1596

### vservce audit delete

Delete audit configuration

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The `vserver audit delete` command deletes the audit configuration for a Vserver.

**Parameters**

- `vserver <vserver name>` - Vserver
  
  This parameter specifies the name of the Vserver associated with the audit configuration to be deleted.

- `[-force [true]]` - Force Delete (privilege: advanced)
  
  This parameter is used to forcibly delete the audit configuration. By default the setting is false.

**Examples**

The following example deletes the audit configuration for Vserver vs1.

```
cluster1::> vserver audit delete -vserver vs1
```

### vservce audit disable

Disable auditing

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The `vserver audit disable` command disables auditing for a Vserver.
Parameters
-vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver for which auditing is to be disabled. The Vserver audit configuration must already exist.

Examples
The following example disables auditing for Vserver vs1.

```
cluster1::> vserver audit disable -vserver vs1
```

vserver audit enable

Enable auditing

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver audit enable command enables auditing for a Vserver.

Note: Events on FlexGroup volumes are not emitted to the audit log.

Parameters
-vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver for which auditing is to be enabled. The Vserver audit configuration must already exist.

[-force [true]] - Force Enable (privilege: advanced)

This parameter is used to ignore errors while enabling auditing.

Examples
The following example enables auditing for Vserver vs1:

```
cluster1::> vserver audit enable -vserver vs1
```

vserver audit modify

Modify the audit configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver audit modify command modifies an audit configuration for a Vserver.

Parameters
-vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver for which the audit configuration is to be modified. The Vserver audit configuration must already exist.

If you have configured time-based rotation, modifying one parameter of time-based rotation schedule does not affect the other parameters. For example, if the rotation schedule is set to run at Monday 12:30 a.m., and you modify the -rotate-schedule-dayofweek parameter to Monday, Wednesday, Friday, the new rotation-schedule rotates the audit logs on Monday, Wednesday, and Friday at 12:30 a.m. To clear time-based rotation parameters, you must explicitly set that portion to "-". Some time-based parameters can also be set to "all".
[-destination <text>] - Log Destination Path
This parameter specifies the audit log destination path where consolidated audit logs are stored. If the path is not valid, the command fails. The path can be up to 864 characters in length and must have read-write permissions.

[-events {file-ops|cifs-logon-logoff|cap-staging|file-share|audit-policy-change|user-account|authorization-policy-change|security-group}, ...] - Categories of Events to Audit
This parameter specifies the categories of events to be audited. Supported event categories are: file access events (both CIFS and NFS), CIFS logon and logoff events, Central Access Policy (CAP) staging events, File share events, Audit policy change events, Local User Account Management Events, Local Security Group Management Events and Authorization Policy Change Events. The corresponding parameter values are: file-ops, cifs-logon-logoff, cap-staging, file-share, audit-policy-change, user-account, security-group and authorization-policy-change. By default, file-ops, cifs-logon-logoff and audit-policy-change events are enabled.

[-format {xml|evtx}] - Log Format
This parameter specifies the output format of the audit logs. The output format can be either Data ONTAP-specific XML or Microsoft Windows EVTX log format. By default, the output format is EVTX.

{ [-rotate-size <integer> [KB|MB|GB|TB|PB]] } - Log File Size Limit
This parameter specifies the audit log file size limit. By default, the audit log is rotated based on size. The default audit log size is 100 MB.

{ [-rotate-schedule-month <cron_month>, ...] } - Log Rotation Schedule: Month
This parameter specifies the monthly schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated during the months January, March, and August, or during all the months. Valid values are January, February, March, April, May, June, July, August, September, October, November, December, and all. Specify "all" to rotate the audit logs every month.

{ [-rotate-schedule-dayofweek <cron_dayofweek>, ...] } - Log Rotation Schedule: Day of Week
This parameter specifies the daily (day of the week) schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated on Tuesdays and Fridays, or during all the days of a week. Valid values are Sunday, Monday, Tuesday, Wednesday, Thursday, Friday, Saturday, and all. Specify "all" to rotate the audit logs every day.

{ [-rotate-schedule-day <cron_dayofmonth>, ...] } - Log Rotation Schedule: Day
This parameter specifies the day of the month schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated on the 10th and 20th days of a month, or all days of a month. Valid values range from 1 to 31.

{ [-rotate-schedule-hour <cron_hour>, ...] } - Log Rotation Schedule: Hour
This parameter specifies the hourly schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated at 6 a.m and 10 a.m. Valid values range from 0 (midnight) to 23 (11:00 p.m.). Specify "all" to rotate the audit logs every hour.

{ [-rotate-schedule-minute <cron_minute>, ...] } - Log Rotation Schedule: Minute
This parameter specifies the minute schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated at the 30th minute. Valid values range from 0 to 59.

[-rotate-limit <integer>] - Log Files Rotation Limit
This parameter specifies the audit log files rotation limit. A value of 0 indicates that all the log files are retained. The default value is 0.

Examples
The following example modifies the rotate-size and rotate-limit field for Vserver vs1.
The following example modifies an audit configuration for Vserver vs1 using the time-based rotation method. The audit logs are rotated monthly, all days of the week, at 12:30.

```
cluster1::> vserver audit modify -vserver vs1 -destination /audit_log -rotate-schedule-month all -rotate-schedule-dayofweek all -rotate-schedule-hour 12 -rotate-schedule-minute 30
```

The following example modifies an audit configuration for Vserver vs1 for auditing CIFS and NFS file access events in the output log format EVTXML.

```
cluster1::> vserver audit modify -vserver vs1 -format evtx -events file-ops
```

### vserver audit prepare-to-downgrade

**Restore the Audit configuration to Earlier Release of Data ONTAP**

**Availability:** This command is available to cluster administrators at the advanced privilege level.

**Description**

The `vserver audit prepare-to-downgrade` command restores the Audit configurations for ONTAP based on the input parameter `disable-feature-set`.

**Parameters**

`-disable-feature-set <downgrade version>` - Data ONTAP Version

This parameter specifies the ONTAP version that introduced the new Audit features and needs to be removed. The value can be one of the following:

- 9.0.0 - Disables the Audit features introduced in the ONTAP release 9.0.0. The following events are removed from the `event` list:
  - File share event. The corresponding parameter value is `file-share`.
  - Audit policy change event. The corresponding parameter value is `audit-policy-change`.
  - Local user account management event. The corresponding parameter value is `user-account`.
  - Local security group management event. The corresponding parameter value is `security-group`.
  - Authorization policy change event. The corresponding parameter value is `authorization-policy-change`.

**Examples**

```
cluster1::*> vserver audit prepare-to-downgrade -disable-feature-set 9.0.0
```

### vserver audit rotate-log

**Rotate audit log**

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.
Description
The `vserver audit rotate-log` command rotates audit logs for a Vserver.

Parameters
`-vserver <vserver name> - Vserver`

This parameter specifies the name of the Vserver for which audit logs are to be rotated. The Vserver audit configuration must already exist. Auditing must be enabled for the Vserver.

Examples
The following example rotates audit logs for Vserver vs1.

```
cluster1::> vserver audit rotate-log -vserver vs1
```

**vserver audit show**

Display the audit configuration

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The `vserver audit show` command displays audit configuration information about Vservers. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all the Vservers:

- Vserver name
- Audit state
- Target directory

You can specify the `-fields <fieldname>, ...` parameter to specify which audit configuration information to display about Vservers. You can specify additional parameters to display only information that matches those parameters. For instance, to display information about the log file rotation size of a Vserver whose value matches 10 MB, run the command with the `-rotate-size 10MB` parameter.

You can specify the `-instance` parameter to display audit configuration information for all Vservers in list form.

Parameters

```
{ [-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command only displays the fields that you specify.

  [-log-save-details]
  You can specify the -log-save-details parameter to display the following information about all the Vservers:
  • Vserver name
  • Rotation file size
  • Rotation schedules
  • Rotation limit

  [-instance]
  If you specify the -instance parameter, the command displays detailed information about all entries.
```
[-vserver <vserver name>] - Vserver
If you specify this parameter, the command displays information about the specified Vserver.

[-state {true|false}] - Auditing State
If you specify this parameter, the command displays information about the Vservers that use the specified
audit state value.

[-destination <text>] - Log Destination Path
If you specify this parameter, the command displays information about the Vservers that use the specified
destination path.

[-events {file-ops|cifs-logon-logoff|cap-staging|file-share|audit-policy-change|user-account|
authorization-policy-change|security-group}, ...] - Categories of Events to Audit
If you specify this parameter, the command displays information about the Vservers that use the specified
category of events that are audited. Valid values are file-ops, cifs-logon-logoff, cap-staging,
file-share, audit-policy-change, user-account, security-group and authorization-
policy-change. audit-policy-change will appear only in diag mode.

[-format {xml|evtx}] - Log Format
If you specify this parameter, the command displays information about the Vservers that use the specified log
format.

[-rotate-size <integer> [KB|MB|GB|TB|PB]] - Log File Size Limit
If you specify this parameter, the command displays information about the Vservers that use the specified log
file rotation size.

[-rotate-schedule-month <cron_month>, ...] - Log Rotation Schedule: Month
If you specify this parameter, the command displays information about the Vservers that use the specified
month of the time-based log rotation scheme. Valid values are January, February, March, April, May, June,
July, August, September, October, November, and December.

[-rotate-schedule-dayofweek <cron_dayofweek>, ...] - Log Rotation Schedule: Day of Week
If you specify this parameter, the command displays information about the Vservers that use the specified
day of the week of the time-based log rotation scheme. Valid values are Sunday, Monday, Tuesday, Wednesday,
Thursday, Friday, and Saturday.

[-rotate-schedule-day <cron_dayofmonth>, ...] - Log Rotation Schedule: Day
If you specify this parameter, the command displays information about the Vservers that use the specified day
of the month of the time-based log rotation scheme. Valid values range from 1 to 31.

[-rotate-schedule-hour <cron_hour>, ...] - Log Rotation Schedule: Hour
If you specify this parameter, the command displays information about the Vservers that use the specified hour
of the time-based log rotation scheme. Valid values range from 0 (midnight) to 23 (11:00 p.m.).

[-rotate-schedule-minute <cron_minute>, ...] - Log Rotation Schedule: Minute
If you specify this parameter, the command displays information about the Vservers that use the specified
minute of the time-based log rotation scheme. Valid values range from 0 to 59.

[-rotate-schedule-description <text>] - Rotation Schedules
If you specify this parameter, the command displays information about the Vservers that use the specified
rotation schedules. This field is derived from the rotate-time fields.

[-rotate-limit <integer>] - Log Files Rotation Limit
If you specify this parameter, the command displays information about the Vservers that use the specified
rotation limit value.

Examples
The following example displays the name, audit state, event types, log format, and target directory for all Vservers.
The following example displays the Vserver names and details about the audit log for all Vservers.

```
cluster1::> vserver audit show

<table>
<thead>
<tr>
<th>Vserver</th>
<th>State</th>
<th>Event Types</th>
<th>Log Format</th>
<th>Target Directory</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>
<td>false</td>
<td>file-ops</td>
<td>evtx</td>
<td>/audit_log</td>
</tr>
</tbody>
</table>
```

The following example displays the Vserver names and details about the audit log for all Vservers.

```
cluster1::> vserver audit show -log-save-details

<table>
<thead>
<tr>
<th>Vserver</th>
<th>File Size</th>
<th>Rotation Schedule</th>
<th>Rotation Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>
<td>100MB</td>
<td>-</td>
<td>0</td>
</tr>
</tbody>
</table>
```

The following example displays in list form all audit configuration information about all Vservers.

```
cluster1::> vserver audit show -instance

Vserver: vs1
Auditing state: true
Log Destination Path: /audit_log
Categories of Events to Audit: file-ops
Log Format: evtx
Log File Size Limit: 100MB
Log Rotation Schedule: Month: -
Log Rotation Schedule: Day of Week: -
Log Rotation Schedule: Day: -
Log Rotation Schedule: Hour: -
Log Rotation Schedule: Minute: -
Rotation Schedules: -
Log Files Rotation Limit: 0
```

### vserver check commands

The check directory

### vserver check lif-multitenancy commands

The lif-multitenancy directory

### vserver check lif-multitenancy run

Run check for LIF multitenancy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The run command checks the specified Vserver to verify that it has connectivity to the configured external servers providing services such as Active Directory, NIS, and DNS. The output can consist of three types of messages. Failure messages indicate that a Vserver does not have the connectivity required to a server exporting a service. Warning messages indicate configuration or operational issues that are possible causes of the failures. A success message is displayed if the Vserver has network connectivity to each of the configured servers for each service.

You can use this command to verify configuration changes such as creating a Vserver or changing the configured servers for one or more services. It is also useful for diagnosing operational problems that result from failures that could be caused by the inability to make network connections to configured servers.

The services that are checked are DNS, NIS, CIFS preferred domain controllers, CIFS discovered domain controllers, KDC, Active Directory, Admin, Password, LDAP, and LDAP preferred Active Directory.
Only a single run for a Vserver is allowed to run in a cluster. If multiple runs are attempted for a Vserver, a message will be displayed indicating that a run is already in progress.

For each service, this command will ping each configured server until a successful ping is completed. In certain circumstances where a subnet is offline or LIFs are operationally down, this command may take a long time to run. In order to show that forward progress is being made, an activity indicator of a '.' is displayed for each ping sent.

The following fields are reported in table format. Some fields may not be relevant to a type of message and will consist of the text "-".

- Vserver name
- Service external server is exporting
- Address of external server
- Connectivity to that external server
- More information describing the problem
- Suggestions to remediate the problems
- Success when there are no problems

**Parameters**

`-vserver <vserver>` - Vserver

Use this parameter to specify the Vserver to check.

`[-verbose {true|false}]` - Show Positive and Negative Result (privilege: advanced)

When this parameter is specified the results of all connectivity tests will be displayed in the success and failure cases.

**Examples**

This is an example of a successful run:

```
cluster1::> vserver check lif-multitenancy run -vserver vs0
.
SUCCESS: All external servers are reachable.
```

This is an example of a run with warnings and failures that need to be corrected:

```
cluster1::> vserver check lif-multitenancy run -vserver vs0

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Severity</th>
<th>Service</th>
<th>Address</th>
<th>LIF</th>
<th>Connected</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs0</td>
<td>warning</td>
<td>-</td>
<td>-</td>
<td>vs0_lif1</td>
<td>-</td>
<td></td>
</tr>
<tr>
<td>vs0</td>
<td>warning</td>
<td>-</td>
<td>-</td>
<td>vs0_lif2</td>
<td>-</td>
<td></td>
</tr>
<tr>
<td>vs0</td>
<td>failure</td>
<td>DNS</td>
<td>10.98.200.20</td>
<td>-</td>
<td>no</td>
<td>cache</td>
</tr>
<tr>
<td>vs0</td>
<td>failure</td>
<td>NIS domain</td>
<td>10.98.13.53</td>
<td>-</td>
<td>no</td>
<td>cache</td>
</tr>
</tbody>
</table>

Error: command failed: FAILURES FOUND.
You must correct these failures to avoid service disruptions in DOT 8.3 and above.
Corrective actions may include:
- removing decommissioned external servers from the vserver configuration
- restoring network interfaces that are down
- adding network interfaces or routes
```
- modifying the locations where network interfaces may reside
  (through adjusting failover groups/policies or changing the home-node or auto-revert settings).
  For assistance, please consult the 8.3 Upgrade Document, or contact support personnel.

At advanced privilege, additional information for messages at all severities is displayed.

```
cluster1::*> vserver check lif-multitenancy run -vserver vs0 -verbose true
....
Vserver         Severity Service            Address         LIF             Connected  Details
--------------- -------- ------------------ --------------- --------------- ----------
---------------
vs0             info     DNS                10.98.200.20    vs0_lif1        yes        ping
....
vs0             info     NIS domain         10.98.13.53     vs0_lif1        yes        ping
SUCCESS: All external servers are reachable.
```

**vserver check lif-multitenancy show**

Show the summary of the latest multitenancy network run

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

You can view summary information about the latest completed run, or the run in progress for a Vserver. It will show the following fields:

- **Vserver** - Name of Vserver that was checked for LIF connectivity
- **Start Time** - Date And Time the run was started
- **Status** - Not Started, In Progress, Complete, or Aborted
- **Success** - Yes if the run has a Status of Complete with no failures. No if the run has a status of Complete with one or more failures.
- **Updated** - The date and time the scan was last updated.

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance]
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[vserver <vserver>] - Vserver
```

Selects the summary information matching the specified Vserver.

```
[<start-time <MM/DD/YYYY HH:MM:SS>] - Start Time
```

Selects the summary information matching the specified date and time the run was started

```
[status {not started|in progress|complete|aborted}] - Run Status
```

Selects the summary information matching the specified status of the run.

```
[success {yes|no}] - Successful Run
```

Selects the summary information matching the specified success or failure of the run.
Selects the summary information matching the last time the run was still in progress.

**Examples**

This is what a successful run looks like:

```bash
cluster1::> vserver check lif-multitenancy show
Vserver | Start Time | Status | Success
----------|------------|--------|--------
vs0       | 7/16/2014 14:28:35 | complete | yes
```

This is what a failed run looks like:

```bash
cluster1::> vserver check lif-multitenancy show
Vserver | Start Time | Status | Success
----------|------------|--------|--------
vs0       | 7/16/2014 14:40:55 | complete | no
```

This is what specifying the Vserver looks like:

```bash
cluster1::> vserver check lif-multitenancy show -vserver vs0
Vserver: vs0
Start Time: 7/16/2014 14:40:55
Run Status: complete
Successful Run: no
```

Advanced privilege adds in the Updated field.

```bash
cluster1::*> vserver check lif-multitenancy show
Vserver | Start Time | Status | Success | Updated
----------|------------|--------|---------|--------
vs0       | 7/16/2014 14:40:55 | complete | no | 7/16/2014 14:40:56
```

Diagnostic privilege adds in the Details field:

```bash
cluster1::*> vserver check lif-multitenancy show
Vserver | Start Time | Status | Success | Updated | Details
----------|------------|--------|---------|---------|----------
vs0       | 7/16/2014 14:40:55 | complete | no | 7/16/2014 14:40:56 | exit code is 1
```

**vserver check lif-multitenancy show-results**

Show the results of the latest multitenancy network run

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.
**Description**
You can view detailed information about the latest completed run, or the run for a Vserver.

- **Vserver** - name of vserver run was for
- **Severity** - severity of the message which is failure, warning, or info.
- **Service** - name of service that is being checked for connectivity
- **Address** - address of server configured for the above service that is being
- **LIF** - the LIF a successful connectivity check to the above server was made from
- **Connected** - true of there is connectivity, false if there is not
- **Status** - additional information useful for resolving issues

**Parameters**

{ [-fields <fieldname>, ...]  
  If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.}

{ [-instance ]]  
  If you specify the `-instance` parameter, the command displays detailed information about all fields.

{ [-vserver <vserver>] - Vserver  
  Selects the messages matching the specified Vserver}

{ [-severity <text>] - Severity  
  Selects the messages matching the specified severity of failure, warning, and info.}

{ [-service <text>] - Service Name  
  Selects the messages matching the specified service.}

{ [-address <text>] - Address of Server  
  Selects the messages matching the specified address.}

{ [-lif <lif-name>] - Logical Interface  
  Selects the messages matching the specified LIF.}

{ [-connected {yes|no}] - Vserver Connectivity  
  Selects the messages matching the specified connectivity.}

{ [-status <text>] - Additional Information  
  Selects the messages matching the specified search criteria.}

**Examples**
Runs that are successful will not have any content.

```
cluster1::> vserver check lif-multitenancy show-results -vserver vs0
This table is currently empty.
```

Successful runs made with `-verbose` true will show the LIF used to Ping the nework address from.

```
cluster1::> vserver check lif-multitenancy show-results -vserver vs0
 Vserver     Severity   Service     Network   Logical      Interface  Connected  Status
----------  --------  -----------  ---------  -----------  ---------- ------- -------
 vs0
vserver check commands
```
Successful runs made with -verbose true will show the LIF used to Ping the network address from.

<table>

### vserver cifs commands

Manage the CIFS configuration of a Vserver

#### vserver cifs add-netbios-aliases

Add NetBIOS aliases for the CIFS server name

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver cifs add-netbios-aliases` command creates or adds a list of NetBIOS aliases for the CIFS server name.

**Parameters**

- `-vserver <vserver name>` - Vserver
  
  This parameter specifies the name of the Vserver for which NetBIOS alias are to be created or added.

- `-netbios-aliases <NetBIOS>,...` - List of NetBIOS Aliases
  
  This parameter specifies one or more NetBIOS aliases to be added to an existing list of NetBIOS aliases. A new list of NetBIOS aliases is created if the list is currently empty.

**Examples**
The following example creates a new list of NetBIOS aliases for Vserver vs_a.
vserver cifs create

Create a CIFS server

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs create command creates a CIFS server on a Vserver. When you create the CIFS server, you can add it to an existing CIFS domain, or you can join it to a workgroup. When you add it to an existing CIFS domain, the storage system prompts you to provide the credentials of a user account that has sufficient privileges to add computers to the -ou container within the -domain domain. The user account must have a password that cannot be empty. If the new CIFS server is joining a domain, this command might take several minutes to complete.

Note: Each Vserver can have only one CIFS server.

Parameters
-vserver <vserver name> - Vserver
This parameter specifies the name of the Vserver on which to create the CIFS server. The Vserver must already exist.

-cifs-server <NetBIOS> - CIFS Server NetBIOS Name
This parameter specifies the name of the CIFS server (up to 15 characters).
{-domain <TextNoCase> - Fully Qualified Domain Name
This parameter specifies the name of the Active Directory domain to associate with the CIFS server.
}

{ -ou <text> - Organizational Unit
This parameter specifies the organizational unit within the Active Directory domain to associate with the CIFS server. By default, this parameter is set to CN=Computers.
}

{ -default-site <text> - Default Site Used by LIFs Without Site Membership
This parameter specifies the site within the Active Directory domain to associate with the CIFS server if Data ONTAP cannot determine an appropriate site.
}

{ -workgroup <NetBIOS> - Workgroup Name
This parameter specifies the name of the workgroup (up to 15 characters).
}

{ -status-admin (down|up) - CIFS Server Administrative Status
Use this parameter to specify whether the initial administrative status of the cifs server is up or down. The default setting is up.
}

{ -comment <text> - CIFS Server Description
This optional parameter specifies a text comment for the server. CIFS clients can see this CIFS server description when browsing servers on the network. The comment can be up to 48 characters long. If there is a space in the descriptive remark or the path, you must enclose the entire string in quotation marks.
}

{ -netbios-aliases <NetBIOS>, ... - List of NetBIOS Aliases
This parameter specifies a list of NetBIOS aliases, which are alternate names to the CIFS server name.
}

Examples
The following example creates a CIFS server CIFSSERVER1 for Vserver vs1 and domain EXAMPLE.com.

```
cluster1::> vserver cifs create -vserver vs1 -cifs-server CIFSSERVER1 -domain EXAMPLE.com
```

In order to create an Active Directory machine account for the CIFS server, you must supply the name and password of a Windows account with sufficient privileges to add computers to the "CN=Computers" container within the "EXAMPLE.com" domain.

Enter the user name: Administrator
Enter the password:

The following example creates a CIFS server CIFSSERVER1 for Vserver vs1 and workgroup Sales:

```
cluster1::> vserver cifs create -vserver vs1 -cifs-server CIFSSERVER1 -workgroup Sales
```

vserver cifs delete
Delete a CIFS server

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs delete command deletes a CIFS server.

Parameters
-vserver <vserver name> - Vserver
This parameter specifies the Vserver for the CIFS server you want to delete.

1608 Commands: Manual Page Reference
Examples
The following example deletes the CIFS server from a Vserver named vs1:

```
cluster1::> vserver cifs delete -vserver vs1
```

vserver cifs modify

Modify a CIFS server

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The `vserver cifs modify` command modifies the site within the Active Directory domain to associate with the CIFS server if Data ONTAP cannot determine an appropriate site. You also can modify the name and ou of the CIFS server, join to a new domain or a workgroup, or rejoin to current domain. When a CIFS server is joining a domain, this command might take several minutes to complete.

Parameters

- `-vserver <vserver name>` - Vserver
  This parameter specifies the Vserver for the CIFS server whose associated site you want to modify.

- `[--cifs-server <NetBIOS>]` - CIFS Server NetBIOS Name
  This parameter specifies the name of the CIFS server (up to 15 characters). Before setting this parameter, the CIFS server must be stopped using the `vserver cifs modify --status-admin down` command. When the command completes successfully, the administrative status of the CIFS server is automatically set to up.

- `{ [-domain <TextNoCase>] }` - Fully Qualified Domain Name
  This parameter specifies the fully qualified name of the Active Directory domain to associate with the CIFS server. Before setting this parameter, the CIFS server must be stopped using the `vserver cifs modify --status-admin down` command. When the command completes successfully, the administrative status of the CIFS server is automatically set to up. Modifications to this parameter are not supported for workgroup CIFS servers.

- `[--ou <text>]` - Organizational Unit
  This parameter specifies the organization unit within the Active Directory domain to associate with the CIFS server. By default, this parameter is set to CN=Computers. Before setting this parameter, the CIFS server must be stopped using the `vserver cifs modify --status-admin down` command. When the command completes successfully, the administrative status of the CIFS server is automatically set to up. Modifications to this parameter are not supported for workgroup CIFS servers.

- `[--default-site <text>]` - Default Site Used by LIFs Without Site Membership
  This parameter specifies the site within the Active Directory domain to associate with the CIFS server if Data ONTAP cannot determine an appropriate site. Modifications to this parameter are not supported for workgroup CIFS servers.

- `[--workgroup <NetBIOS>]` - Workgroup Name
  This parameter specifies the name of the workgroup (up to 15 characters).

- `[--status-admin {down|up}]` - CIFS Server Administrative Status
  Use this parameter to modify the administrative status of the cifs server. Modify the administrator status to down to stop cifs access.

- `[--comment <text>]` - CIFS Server Description
  Use this parameter to modify the comment of the server.
Examples

The following example changes the default site and administrative status of the CIFS server associated with Vserver "vs1":

```
cluster1::> vserver cifs modify -vserver vs1 -default-site default -status-admin up
```

The following example modifies the Active Directory domain and ou for the CIFS server associated with Vserver "vs1". The administrative status of the CIFS server must be set to "down" to proceed with Active Directory domain modification. If the command completes successfully, the administrative status is automatically set to "up".

```
cluster1::> vserver cifs modify -vserver vs1 -domain example.com -ou ou=example_ou -cifs-server example -status-admin down

In order to create an Active Directory machine account for the CIFS server, you must supply the name and password of a Windows account with sufficient privileges to add computers to the "ou=example_ou" container within the "example.com" domain.

Enter the user name: administrator
Enter the password:
```

The following example modifies the CIFS server associated with Vserver "vs1" from a domain to a workgroup. The administrative status of the CIFS server must be set to "down" for this command. If the command completes successfully, the administrative status is automatically set to "up".

```
cluster1::> vserver cifs modify -vserver vs1 -workgroup Sales -status-admin down

Warning: To enter workgroup mode, all domain-based features must be disabled and their configuration removed automatically by the system, including continuously-available shares, shadow copies, and AES. However, domain-configured share ACLs such as "EXAMPLE.COM\userName" will not work properly, but cannot be removed by Data ONTAP. Remove these share ACLs as soon as possible using external tools after the command completes. If AES is enabled, you may be asked to supply the name and password of a Windows account with sufficient privileges to disable it in the "EXAMPLE.COM" domain.

Do you want to continue? {y|n}: y
```

The following example modifies the CIFS server associated with Vserver "vs1" from a workgroup to a domain. The administrative status of the CIFS server must be set to "down" for this command. If the command completes successfully, the administrative status is automatically set to "up".

```
cluster1::> vserver cifs modify -vserver vs1 -domain example.com -status-admin down

In order to create an Active Directory machine account for the CIFS server, you must supply the name and password of a Windows account with sufficient privileges to add computers to the "ou=example_ou" container within the "example.com" domain.

Enter the user name: administrator
Enter the password:
```

The following example modifies the CIFS server name associated with Vserver "vs1" from above example. The administrative status of the CIFS server must be set to "down" to proceed with Active Directory domain modification. If
Cluster1: > vserver cifs modify -vserver vs1 -cifs-server new_example -status-admin down

In order to create an Active Directory machine account for the CIFS server, you must supply the name and password of a Windows account with sufficient privileges to add computers to the "ou-example_ou" container within the "example.com" domain.

Enter the user name: administrator
Enter the password:

Successfully queued CIFS Server Modify job [id: xx] for CIFS server "NEW_EXAMPLE". To view the status of the job, use the "job show -id <jobid>" command.

Cluster1: >

vserver cifs nbtstat

Display NetBIOS information over TCP connection

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The vserver cifs nbtstat command displays information about NetBIOS over TCP (NBT) connections for the cluster. It displays the IP address associated with the interfaces, the IP addresses of the WINS servers in use, and information about the registered NetBIOS names for the cluster. You can use this command to troubleshoot NetBIOS name resolution problems.

**Note:** NetBIOS name service (NBNS) over IPv6 is not supported.

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance]
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[-node <nodename>|local]
```

If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified node.

```
[-vserver <vservername>]
```

If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified Vserver.

```
[-netbios-name <text>]
```

If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified NetBIOS name.

```
[-netbios-suffix <Hex String>]
```

If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified NetBIOS suffix.
[-interface <IP Address>, ...] - Interfaces
If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified IP address.

[-wins-servers <IP Address>, ...] - Servers
If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified WINS servers.

[-server-state <text>, ...] - Server State (active, inactive)
If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified WINS server state. The following are possible values for this parameter:
- active
- inactive

[-nbt-scope <text>] - NBT Scope
If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified NetBIOS name scope.

[-nbt-mode <text>] - NBT Mode
If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified NetBIOS name service mode. The following are possible values for this parameter:
- 'p' - Point to Point
- 'h' - Hybrid
- 'm' - Mixed
- 'b' - Broadcast

[<text>] - State
If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified NetBIOS name registration state. The following are possible values for this parameter:
- must_register
- must_unregister
- wins
- broadcast
- name Released
- wins_conflict
- broadcast_conflict

[-time-left <integer>] - Time Left
If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified registration time left in minutes with the WINS server.

[-type <text>] - Type
If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified name registration type. The following are possible values for this parameter:
- registered
- active
• permanent
• group

Examples

The following example displays the NetBIOS name service information.

```
cluster1::> nbtstat
  (vserver cifs nbtstat)

Vserver: vs1
Node:    cluster1-01
Interfaces:
  10.10.10.32
  10.10.10.33
Servers: 17.17.1.2  (active )
NBT Scope: [ ]
NBT Mode: [h]
               NetBIOS Suffix  State  Time Left   Type

vserver cifs prepare-to-downgrade

Restore the CIFS Configurations to Earlier Release of Data ONTAP Version

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

The vserver cifs prepare-to-downgrade command restores the CIFS configurations for Data ONTAP based on the input parameter disable-feature-set.

Parameters

```
–disable-feature-set <downgrade version> - Data ONTAP Version
```

This parameter specifies the Data ONTAP release for which the CIFS configurations are restored. The value can be one of the following:

• 8.3.1 - Restores the CIFS configurations for Data ONTAP release 8.3.1. These features include:
  ◦ FPolicy "close with read" filters from FPolicy events.
  ◦ CIFS server options –guest-unix-user and –is-admin-users-mapped-to-root-enabled.
  ◦ CIFS security option is-smb-encryption-required.
  ◦ Storage-Level Access Guard (SLAG) for qtrees.
  ◦ CIFS share property encrypt-data.

• 8.3.2 - Restores the CIFS configurations for Data ONTAP release 8.3.2. These features include:
- CIFS server option `-grant-unix-group-perms-to-others`.

- 9.0.0 - Restores the CIFS configurations for Data ONTAP release 9.0.0. These features include:
  - Disable CIFS multichannel feature and close all multichannel connections.
  - Delete all the name-mapping entries that have a hostname or an address field configured.
  - Terminate all SMB 3.1 client connections.
  - Terminate all client connections that have large MTU negotiated.
  - Remove the symlink property `no-strict-security`.
  - Remove all symlink pathmap entries with locality `freelink`.

### Examples

```
cluster1::*> vserver cifs prepare-to-downgrade -disable-feature-set 8.3.1
```

```
cluster1::*> vserver cifs prepare-to-downgrade -disable-feature-set 8.3.2
```

```
cluster1::*> vserver cifs prepare-to-downgrade -disable-feature-set 9.0.0
```

---

### vserver cifs remove-netbios-aliases

Remove NetBIOS aliases

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**
The `vserver cifs remove-netbios-aliases` command deletes NetBIOS aliases for the CIFS server.

**Parameters**
- `-vserver <vserver name>` - Vserver
  
  This parameter specifies the name of the Vserver from which the list of NetBIOS aliases are deleted.

- `-netbios-aliases <NetBIOS>, ...` - List of NetBIOS Aliases

  This parameter specifies one or more NetBIOS aliases to be deleted. To delete all the NetBIOS aliases of a Vserver use `-'.

**Examples**
The following example deletes NetBIOS aliases for the CIFS server CIFS_SERVER on Vserver vs_a.

```
cluster1::> cifs show -display-netbios-aliases
Vserver: vs_a
  Server Name: CIFS_SERVER
  NetBIOS Aliases: ALIAS_1, ALIAS_2, ALIAS_3, ALIAS_4, ALIAS_5, ALIAS_6, ALIAS_7
```

```
cluster1::> cifs remove-netbios-aliases -netbios-aliases alias_1,alias_3,alias_5
```
vserver cifs repair-modify

Repair a partially-failed Vserver CIFS server modify operation

**Availability:** This command is available to cluster and Vserver administrators at the advanced privilege level.

**Description**
Use this vserver cifs repair-modify -vserver <vserver name> command when the background job created during a Vserver CIFS server modify operation fails.

**Parameters**
- **-vserver <vserver name>** - Vserver

  This parameter specifies a Vserver containing a configured CIFS server that has been modified.

**Examples**
The following example starts the CIFS server modify job on Vserver vs1 successfully:

```
cluster1::*> vserver cifs repair-modify -vserver vs1
Successfully queued CIFS Server Modify job [id: 10] for CIFS server "CIFSNAME1". To view the status of the job, use the "job show -id <jobid>" command.
cluster1::>*
```

The following example fails the command with specific error:

```
cluster1::*> vserver cifs repair-modify -vserver vs2
Error: Job Out of memory. Failed to queue CIFS Server Modify Job for CIFS server "CIFSNAME2". Retry the operation by running (privilege: advanced) "vserver cifs repair-modify -vserver vs2".
```
**vserver cifs show**

Display CIFS servers

**Availability:** This command is available to cluster and Vserver administrators at the *admin* privilege level.

**Description**

The `vserver cifs show` command displays information about CIFS servers. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all CIFS servers:

- Vserver name
- CIFS server NetBIOS name
- Domain or workgroup name
- Authentication style

You can specify the `-fields <fieldname>, ...` parameter to specify which fields of information to display about CIFS servers. In addition to the fields above, you can display the following fields:

- Default site
- Fully-qualified domain name

You can specify additional parameters to display only information that matches those parameters. For instance, to display information only about CIFS servers that are in the CIFS domain named RUBY, run the command with the `-domain-workgroup RUBY` parameter.

You can specify the `-instance` parameter to display all information for all CIFS servers in list form.

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command only displays the fields that you specify.

```
[-display-netbios-aliases]
```

If you specify this parameter, the command displays information about configured NetBIOS aliases.

```
[-instance]
```

If you specify the `-instance` parameter, the command displays detailed information about all entries.

```
[-vserver <vserver name>] - Vserver
```

If you specify this parameter, the command displays information only about the CIFS servers for the specified Vserver.

```
[-cifs-server <NetBIOS>] - CIFS Server NetBIOS Name
```

If you specify this parameter, the command displays information only for CIFS servers that match the specified CIFS server NetBIOS name.

```
[-domain-workgroup <CIFS domain>] - NetBIOS Domain/Workgroup Name
```

If you specify this parameter, the command displays information only for CIFS servers that are in the specified NetBIOS domain or workgroup.
[-domain <TextNoCase>] - Fully Qualified Domain Name
   If you specify this parameter, the command displays information only for CIFS servers that are in the specified domain.

[-ou <text>] - Organizational Unit
   If you specify this parameter, the command displays information only for CIFS servers that are in the specified organizational unit.

[-default-site <text>] - Default Site Used by LIFs Without Site Membership
   If you specify this parameter, the command displays information only for CIFS servers that have the specified default site.

[-workgroup <NetBIOS>] - Workgroup Name
   If you specify this parameter, the command displays information only for CIFS servers that are in the specified workgroup.

[-auth-style {domain|workgroup|realm}] - Authentication Style
   If you specify this parameter, the command displays information only for CIFS servers that match the specified authentication style.

[-status-admin {down|up}] - CIFS Server Administrative Status
   If you specify this parameter, the command displays information only for CIFS servers that match the specified administrative status.

[-comment <text>] - CIFS Server Description
   If you specify this parameter, the command displays information only for CIFS servers that match the specified comment field.

[-netbios-aliases <NetBIOS>, ...] - List of NetBIOS Aliases
   If you specify this parameter, the command displays information only for CIFS servers that have specified NetBIOS alias.

**Examples**

The following example displays a subset of the information about all CIFS servers:

```
cluster1::> vserver cifs show

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Server Name</th>
<th>Domain/Workgroup Name</th>
<th>Authentication Style</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>
<td>CIFSSERVER1</td>
<td>EXAMPLE</td>
<td>domain</td>
</tr>
</tbody>
</table>
```

The following example displays all information about all CIFS-enabled Vservers in list form:

```
cluster1::> vserver cifs show -instance

Vserver: vs1
   CIFS Server NetBIOS Name: CIFSSERVER1
   NetBIOS Domain/Workgroup Name: EXAMPLE
   Fully Qualified Domain Name: EXAMPLE.COM
   Organizational Unit: CN=Computers
   Default Site Used by LIFs Without Site Membership:
      Workgroup Name: -
      Authentication Style: domain
   CIFS Server Administrative Status: up
   CIFS Server Description:
   List of NetBIOS Aliases: ALIAS_2, ALIAS_4, ALIAS_6
```

The following example displays the NetBIOS aliases for the CIFS server CIFSSERVER1
vserver cifs start

Start a CIFS server

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command starts the CIFS server on the specified Vserver. The CIFS server must already exist. To create a CIFS server, run vserver cifs create.

Parameters
-vserver <vserver name> - Vserver

This parameter specifies a Vserver containing a configured CIFS server that has been stopped.

Examples
The following example starts the CIFS server on Vserver vs1:

```
cluster1::> cifs start -vserver vs1
```

Related references
vserver cifs create on page 1607

vserver cifs stop

Stop a CIFS server

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command stops the CIFS server on the specified Vserver.

Note: Established sessions will be terminated and their open files closed. Workstations with cached data will not be able to save those changes, which could result in data loss.

Parameters
-vserver <vserver name> - Vserver

This parameter specifies a Vserver containing a configured CIFS server that is running.

Examples
The following example stops the CIFS server on Vserver vs1:

```
cluster1::> cifs stop -vserver vs1
```
BranchCache Commands

Manage CIFS BranchCache settings

The `vserver cifs branchcache` commands are used to manage the CIFS BranchCache service. BranchCache permits clients at a remote location to cache data locally to avoid repeated transfer of large data sets that are updated infrequently. CIFS BranchCache is disabled by default.

**vserver cifs branchcache create**

Create the CIFS BranchCache service

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The `vserver cifs branchcache create` command creates the configuration for computing and retrieving BranchCache hash data. Only a single instance of the BranchCache service can be created on a Vserver.

The `vserver cifs branchcache create` command is not supported for Vservers with Infinite Volume.

**Parameters**

-vserver `<vserver name>` - Vserver

This parameter specifies the CIFS-enabled Vserver on which you want to set up the BranchCache service.

-versions `{v1-enable|v2-enable|enable-all},...` - Supported BranchCache Versions

This optional parameter specifies a list of versions of the BranchCache protocol that the storage system supports. The default is `enable-all`. This list can include one or more of the following:

- `v1-enable` - This option enables BranchCache Version 1.
- `v2-enable` - This option enables BranchCache Version 2.
- `enable-all` - This option enables all supported versions of BranchCache.

-hash-store-path `<text>` - Path to Hash Store

This parameter specifies an existing directory into which the hash data is stored. Read-only paths, such as snapshot directories, are not allowed.

-hash-store-max-size `{<integer>[KB|MB|GB|TB|PB]}` - Maximum Size of the Hash Store

This optional parameter specifies the maximum size to use for the hash data. If the size of the hash data exceeds this value, older hashes are deleted to make room for newer hashes. The default is 1 GB.

-server-key `<text>` - Encryption Key Used to Secure the Hashes

This optional parameter specifies a server key that the BranchCache service uses to prevent clients from impersonating the BranchCache server.

-operating-mode `<BranchCache Mode>` - CIFS BranchCache Operating Modes

This optional parameter specifies the mode in which the BranchCache service operates. The default is `per-share`. Possible values include:

- `disable` - This option disables the BranchCache service for the Vserver.
- `all-shares` - This option enables the BranchCache service for all the shares on this Vserver.
- `per-share` - This option enables the BranchCache service on a per-share basis. You can enable the BranchCache service on an existing share by adding the `branchcache` flag in the `vserver cifs share modify` command.
Examples

The following example creates the BranchCache service on the Vserver named vs1. The path to the hash store is /vs1_hash_store.

```
cluster1::> vserver cifs branchcache create -vserver vs1 -hash-store-path /vs1_hash_store
```

The following example creates the BranchCache service on the Vserver vs1. The path to the hash store is /vs_hash_store. The service is enabled on all the shares of the Vserver, supports BranchCache version 2, supports a maximum of 1 GB of BranchCache hashes, and secures the hashes using the key "vs1 secret".

```
cluster1::> vserver cifs branchcache create -vserver vs1 -hash-store-path /vs1_hash_store -operating-mode all-shares -versions v2-enable -hash-store-max-size 1GB -server-key "vs1 secret"
```

vserver cifs share modify on page 1696

vserver cifs branchcache delete

Stop and remove the CIFS BranchCache service

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver cifs branchcache delete command stops and removes the Vserver BranchCache configuration.

The vserver cifs branchcache delete command is not supported for Vservers with Infinite Volume.

Parameters

- `vserver <vserver name>` - Vserver
  
  This parameter specifies the CIFS-enabled Vserver whose BranchCache configuration you want to remove.

- `flush-hashes {true|false}` - Delete Existing Hashes
  
  This parameter specifies whether to keep or delete all existing hashes after deleting the BranchCache service.

Examples

The following example stops and removes the BranchCache service on the Vserver vs1. It also deletes all existing hashes.

```
cluster1::> vserver cifs branchcache delete -flush-hashes true -vserver vs1
```

vserver cifs branchcache hash-create

Force CIFS BranchCache hash generation for the specified path or file

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver cifs branchcache hash-create command causes the BranchCache service to compute hashes for a single file, for a directory, or for all the files in a directory structure if you specify the ` recurse` option.

The vserver cifs branchcache hash-create command is not supported for Vservers with Infinite Volume.
**Parameters**

- **vserver <vserver name> - Vserver**
  
  This parameter specifies the CIFS-enabled Vserver on which the hash is computed.

- **path <text> - Path of File or Directory to Hash**
  
  This parameter specifies the path of the directory or file for which hashes are to be computed. If a file is specified, the hashes are computed on the whole file. If a directory is specified, hashes are computed on all files within the directory.

- **recurse {true|false} - Process All Files in the Directory Recursively**
  
  If this option is set to true and the `path` parameter specifies a directory, hashes are computed recursively for all directories in the path.

**Examples**

The following example creates hashes for the file "report.doc":

```
cluster1::> vserver cifs branchcache hash-create -vserver vs1 -path /repository/report.doc -recurse false
```

The following example creates hashes for all the files in the directory "repository":

```
cluster1::> vserver cifs branchcache hash-create -vserver vs1 -path /repository -recurse false
```

The following example recursively creates hashes for all the files and directories inside the directory "documents":

```
cluster1::> vserver cifs branchcache hash-create -vserver vs1 -path /documents -recurse true
```

**vserver cifs branchcache hash-flush**

Flush all generated BranchCache hashes

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**

The `vserver cifs branchcache hash-flush` command deletes all hash data from the configured hash store.

The `vserver cifs branchcache hash-flush` command is not supported for Vservers with Infinite Volume.

**Parameters**

- **vserver <vserver name> - Vserver**
  
  This parameter specifies the CIFS-enabled Vserver whose hash data is to be deleted.

**Examples**

The following example flushes all the hashes for Vserver vs1:

```
cluster1::> vserver cifs branchcache hash-flush -vserver vs1
```

**vserver cifs branchcache modify**

Modify the CIFS BranchCache service settings

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.
Description

The `vserver cifs branchcache modify` command modifies the configuration for computing and retrieving BranchCache hash data.

The `vserver cifs branchcache modify` command is not supported for Vservers with Infinite Volume.

Parameters

`-vserver <vserver name>` - Vserver

This parameter specifies the CIFS-enabled Vserver whose BranchCache service is to be modified.

`[-versions {v1-enable|v2-enable|enable-all}, ...]` - Supported BranchCache Versions

This optional parameter specifies a list of versions of the BranchCache protocol that the storage system supports. The default is `enable-all`. This list can include one or more of the following:

- v1-enable - This option enables BranchCache Version 1.
- v2-enable - This option enables BranchCache Version 2.
- enable-all - This option enables all supported versions of BranchCache.

`[-operating-mode <BranchCache Mode>]` - CIFS BranchCache Operating Modes

This optional parameter specifies the mode in which the BranchCache service operates. The default is `per-share`. Possible values include:

- disable - This option disables the BranchCache service for the Vserver.
- all-shares - This option enables the BranchCache service for all the shares on this Vserver.
- per-share - This option enables the BranchCache service on a per-share basis. You can enable the BranchCache service on an existing share by adding the `branchcache` flag in the `vserver cifs share modify` command.

`[-hash-store-max-size <integer> [KB|MB|GB|TB|PB]]` - Maximum Size of the Hash Store

This optional parameter specifies the maximum size to use for the hash data. If the size of the hash data exceeds this value, older hashes are deleted to make room for newer hashes. The default is 1 GB.

`[-flush-hashes {true|false}]` - Delete Existing Hashes

This parameter specifies whether to keep or delete all the existing hashes. This must be set to true when modifying the server key.

`[-hash-store-path <text>]` - Path to Hash Store

This parameter specifies an existing directory into which the hash data is stored. Read-only paths, such as snapshot directories, are not allowed.

`[-server-key <text>]` - Encryption Key Used to Secure the Hashes

This optional parameter specifies a server key that the BranchCache service uses to prevent clients from impersonating the BranchCache server. If you specify this parameter, all existing hashes for the Vserver are deleted.

Examples

The following example modifies the BranchCache service on the Vserver named vs1. The path to the hash store is `/vs1_hash_store_2`, the server key used to secure the hashes is set to "new vserver secret", all existing hashes are removed, the service supports all BranchCache versions, and is enabled on a per-share basis.

```
cluster1::> vserver cifs branchcache modify -vserver vs1 -hash-store-path /vs1_hash_store_2 -server-key "new vserver secret" -flush-hashes true -versions enable-all -operating-mode per-share
```
The following example modifies the BranchCache service on the Vserver vs1. The service is enabled on all the shares of the Vserver, supports BranchCache version 1, and supports a maximum of 1 TB of BranchCache hashes.

```
cluster1::> vserver cifs branchcache modify -vserver vs1 -operating-mode all-shares -versions v1-enable -hash-store-max-size 1TB
```

### vserver cifs branchcache show

Display the CIFS BranchCache service status and settings

**Availability:** This command is available to cluster and Vserver administrators at the `admin` privilege level.

**Description**
The `vserver cifs branchcache show` command displays information about the BranchCache configuration for the Vserver. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information:

- Operating Mode
- Allowed Versions
- Maximum Size
- Path

You can specify additional parameters to display only information that matches those parameters.

**Parameters**

- `[ -fields <fieldname>, ... ]`
  
  If you specify the `-fields <fieldname>, ...` parameter, the command displays only the fields that you specify.
- `[ -instance ]`
  
  If you specify the `-instance` parameter, the command displays detailed information about all entries.
- `[ -vserver <vserver name> ] - Vserver`
  
  If you specify this parameter, the command displays information for the specified Vserver.
- `[ -versions {v1-enable|v2-enable|enable-all}, ... ] - Supported BranchCache Versions`
  
  If you specify this parameter, the command displays information for the Vservers that support the specified BranchCache versions.
- `[ -hash-store-path <text> ] - Path to Hash Store`
  
  If you specify this parameter, the command displays information for Vservers that store their hashes at the specified location.
- `[ -hash-store-max-size {<integer>[KB|MB|GB|TB|PB]} ] - Maximum Size of the Hash Store`
  
  If you specify this parameter, the command displays information for Vservers that have a maximum hash store size that is set to the specified value.
- `[ -server-key <text> ] - Encryption Key Used to Secure the Hashes`
  
  If you specify this parameter, the command displays information for Vservers that have the specified server key.
[\texttt{\textbf{-operating-mode <BranchCache\ Mode>}}] - CIFS BranchCache Operating Modes

If you specify this parameter, the command displays information for Vservers whose BranchCache configuration operates in the specified mode.

### Examples

The following example displays a subset of the information about the BranchCache service in the cluster.

```
cluster1::> vserver cifs branchcache show

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Operating Mode</th>
<th>Allowed Versions</th>
<th>Max Size</th>
<th>Path</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>
<td>per_share</td>
<td>enable_all</td>
<td>1GB</td>
<td>/hash_dir/</td>
</tr>
</tbody>
</table>
```

The following example displays all information about all the Vservers with BranchCache configurations.

```
cluster1::> vserver cifs show -instance

  Vserver: vs1
  Supported Versions of BranchCache: enable_all
  Path to Hash Store: /hash_dir/
  Maximum Size of the Hash Store: 1GB
  Encryption Key Used to Secure the Hashes: asdad
  CIFS BranchCache Operating Modes: per_share
```

The following example displays information about BranchCache configurations that store the hash data at the location /branchcache_hash_store.

```
cluster1::> vserver cifs branchcache show -hash-store-path /branchcache_hash_store

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Operating Mode</th>
<th>Allowed Versions</th>
<th>Max Size</th>
<th>Path</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>
<td>per_share</td>
<td>enable_all</td>
<td>1GB</td>
<td>/branchcache_hash_store</td>
</tr>
</tbody>
</table>
```

### vserver cifs character-mapping commands

Manage character mappings for invalid characters

#### vserver cifs character-mapping create

Create character mapping on a volume

**Availability:** This command is available to \textit{cluster} and \textit{Vserver} administrators at the \textit{admin} privilege level.

**Description**

The \texttt{vserver cifs character-mapping create} command creates the CIFS character mapping for the specified volume on a particular Vserver.

**Note:** Choose target characters in the "Private Use Area" of Unicode in the following range: U+E0000...U+F8FF.

**Caution:** The target Unicode characters must not appear in existing file names; otherwise, unwanted character mappings would occur, resulting in clients being unable to access mapped files. For example, if ":" is mapped to ":" but ":" appears in files normally, a Windows client using the mapped share to access a file named "a-b" would have its request mapped to the NFS name "a:b", which is not the desired file.

The \texttt{vserver cifs character-mapping create} command is not supported for FlexGroups or Vservers with Infinite Volume.
Parameters

-vserver <vserver name> - Vserver

This parameter specifies the Vserver on which a volume is located for which you are creating the character mapping. If only one data Vserver exists, you do not need to specify this parameter.

-volume <volume name> - Volume Name

This parameter specifies the name of the volume for which you are creating the character mapping.

-mapping <text>, ... - Character Mapping

This parameter specifies the mapping of the invalid CIFS filename characters to valid CIFS filename characters. The mapping consists of a list of source-target character pairs separated by ":". The characters are Unicode characters entered using hexadecimal digits. For example: 3C:E03C.

Note: The permissible Unicode character set for source mapping is: 0x01-0x19, 0x5C, 0x3A, 0x2A, 0x3F, 0x22, 0x3C, 0x3E, 0x7C, 0xB1.

Examples

The following example creates a character mapping for a volume vol1 on Vserver vs1.

cluster1::> vserver cifs character-mapping create -volume vol1 -mapping 3c:e17c, 3e:f17d, 2a:f745
cluster1::> vserver cifs character-mapping show

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Volume Name</th>
<th>Character Mapping</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>
<td>vol1</td>
<td>3c:e17c, 3e:f17d, 2a:f745</td>
</tr>
</tbody>
</table>

vserver cifs character-mapping delete

Delete character mapping on a volume

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver cifs character-mapping delete command deletes the CIFS character mapping for the specified volume on a particular Vserver.

The vserver cifs character-mapping delete command is not supported for FlexGroups or Vservers with Infinite Volume.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the Vserver on which a Volume is located for which you are deleting the character mapping. If only one data Vserver exists, you do not need to specify this parameter.

-volume <volume name> - Volume Name

This parameter specifies the name of the volume for which you are deleting the character mapping.

Examples

The following example deletes all character mappings for a volume vol1 on Vserver vs1.

cluster1::> vserver cifs character-mapping delete -volume vol1
vserver cifs character-mapping modify

Modify character mapping on a volume

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver cifs character-mapping modify` command modifies the CIFS character mapping for the specified volume on a particular Vserver.

You can modify a particular volume's character mapping by specifying the following two parameters in the modify command:

- Vserver associated with the volume
- Name of the Volume

**Note:** Choose target characters in the "Private Use Area" of Unicode in the following range: U+E0000...U+F8FF.

**Caution:** The target Unicode characters must not appear in existing file names; otherwise, unwanted character mappings would occur, resulting in clients being unable to access mapped files. For example, if ":" is mapped to ":" but ":" appears in files normally, a Windows client using the mapped share to access a file named "a-b" would have its request mapped to the NFS name "a:b", which is not the desired file.

The `vserver cifs character-mapping modify` command is not supported for FlexGroups or Vservers with Infinite Volume.

**Parameters**

- `-vserver <vserver name>` - Vserver
  
  This parameter specifies the Vserver on which a Volume is located for which you are modifying the character mapping. If only one data Vserver exists, you do not need to specify this parameter.

- `-volume <volume name>` - Volume Name
  
  This parameter specifies the name of the volume for which you are modifying the character mapping.

- `[<-mapping <text>, ...]]` - Character Mapping
  
  This parameter specifies the mapping of the invalid CIFS filename characters to valid CIFS filename characters. The mapping consists of a list of source-target character pairs separated by ":". The characters are Unicode characters entered using hexadecimal digits. For example: 3C:E03C.

  **Note:** The permissible Unicode character set for source mapping is: 0x01-0x19, 0x5C, 0x3A, 0x2A, 0x3F, 0x22, 0x3C, 0x3E, 0xB1.

**Examples**
The following example modifies a character mapping for a volume vol1 on Vserver vs1.

```
cluster1::> vserver cifs character-mapping modify -volume vol1 -mapping 3c:e17d, 3e:f17e, 2a:f746
cluster1::> vserver cifs character-mapping show

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Volume Name</th>
<th>Character Mapping</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>
<td>vol1</td>
<td>3c:e17d, 3e:f17e, 2a:f746</td>
</tr>
</tbody>

**Commands:** Manual Page Reference
vserver cifs character-mapping show

Display character mapping on volumes

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver cifs character-mapping show command displays information about character mapping configured for volumes. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about character mapping configured for volumes:

- Vserver name
- Volume name
- Character mapping

Parameters

[-fields <fieldname>, ...]

If you specify this parameter, the command displays only the fields that you specify.

[-instance ]

If you specify the -instance parameter, the command displays detailed information about all entries.

[-vserver <vserver name>] - Vserver

If you specify this parameter, the command displays information about character mapping configured for all the volumes that belong to the specified Vserver.

[-volume <volume name>] - Volume Name

If you specify this parameter, the command displays information about the character mapping configured for all the volumes that match the specified volume name.

[-mapping <text>, ...] - Character Mapping

If you specify this parameter, the command displays information about the character mapping configured for all volumes that match the specified mapping.

Examples

The following example displays information about all character mappings configured for volumes

```
cluster1:/> vserver cifs character-mapping show
Vserver   Volume Name  Character Mapping
----------  -------------  ------------------------------------------
vs1        vol1         3c:e17d, 3e:f17e
```

vserver cifs connection commands

Manage CIFS connections

vserver cifs connection show

Displays established CIFS connections

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.
Description
The `vserver cifs connection show` command displays information about established CIFS connections.

Parameters
{-fields <fieldname>,...}
Use this parameter to display only the specified fields

[-instance]
If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node
Use this parameter to display information about CIFS connections on the specified node.

[-vserver <vserver name>] - Vserver
Use this parameter to display information about CIFS connections on the specified CIFS-enabled SVM.

[-connection-id <integer>] - Connection ID
Use this parameter to display information about CIFS connections that match the specified connection ID.

[-session-id <integer>,... ] - Session ID
Use this parameter to display information about CIFS connections that match the specified session ID.

[-workstation-ip <IP Address>] - Workstation IP Address
Use this parameter to display information about CIFS connections that are established through the specified data LIF IP address.

[-workstation-port <integer>] - Workstation Port Number
Use this parameter to display information about CIFS connections that are opened from the specified Port number.

[-lif-ip <IP Address>] - Incoming Data LIF IP Address
Use this parameter to display information about CIFS connections that are opened from the specified IP address.

[-network-context-id <integer>] - Network Context ID (privilege: advanced)
Use this parameter to display information about CIFS connections that match the specified network context ID.

Examples
The following example displays information about all CIFS connections:

```
cluster1::> vserver cifs connection show
Node:    node1
Vserver: vs1
Connection Session                           Workstation             Network
ID         IDs                Workstation IP Port        LIF IP      Context ID
---------- ------------------ -------------- ----------- ----------- ----------
127834     1,2                172.17.193.172 15536       10.53.50.42 2
```

The following example displays information about a CIFS connection at advanced privilege level:

```
cluster1:*> vserver cifs connection show
Node:    node1
Vserver: vs1
Connection Session                           Workstation             Network
ID         IDs                Workstation IP Port        LIF IP      Context ID
---------- ------------------ -------------- ----------- ----------- ----------
127834     1,2                172.17.193.172 15536       10.53.50.42 2
```
The following example displays information about a CIFS connection with session-id 1:

```
class1::*> vserver cifs connection show -session-id 1 -instance
Vserver: vs1
    Node: node1
    Connection ID: 127834
    Session ID: 1
    Workstation IP Address: 172.17.193.172
    Workstation Port Number: 15536
    Incoming Data LIF IP Address: 10.53.50.42
    Network Context ID: 2
```

### vserver cifs domain commands

Manage domain interaction

### vserver cifs domain discovered-servers commands

Manage discovered servers

#### vserver cifs domain discovered-servers reset-servers

Reset and rediscover servers for a Vserver

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The `vserver cifs domain discovered-servers reset-servers` command discards information the storage system has stored about domain controllers, LDAP, and NIS servers. After that, it begins the discovery process to reacquire current information about external servers.

**Parameters**

- `-vserver <vserver name>` - Vserver

  This parameter specifies the name of the Vserver.

**Examples**

The following is an example use of this command. It produces no output.

```
class1::> vserver cifs domain discovered-servers reset-servers
class1::>
```

#### vserver cifs domain discovered-servers show

Display discovered server information

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The `vserver cifs domain discovered-servers show` command displays information about the discovered servers for the CIFS domains of one or more Vservers. Server displays are grouped by node and Vserver, and each group is preceded by the
node and Vserver identification. Within each grouping, the server display is limited to those associated with the domain specified by the domain parameter, if it is present.

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[[-instance]]
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[-node [<nodename>|local]] - Node
```

If you use this parameter, the command only displays servers for the specified node.

```
[-vserver <vserver name>] - Vserver
```

If you use this parameter, the command only displays servers for the specified Vserver.

```
[-domain <TextNoCase>] - Fully Qualified Domain Name
```

If you use this parameter, the command only displays servers in the specified domain.

```
[-type {Unknown|KERBEROS|MS-LDAP|MS-DC|LDAP|NIS}] - Server Type
```

If you use this parameter, the command only displays servers of the specified type.

```
[-name <text>] - Server Name
```

If you use this parameter, the command only displays servers the with the specified name. This can result in multiple lines because the same server may provide multiple services.

```
[-address <InetAddress>] - Server Address
```

If you use this parameter, the command only displays servers with the specified IP address. This can result in multiple lines because the same server may provide multiple services.

```
[-preference {unknown|preferred|favored|adequate}] - Preference
```

If you use this parameter, the command only displays servers of the specified preference level.

```
[-status {OK|unavailable|slow|expired|undetermined|unreachable}] - Status
```

If you use this parameter, the command only displays servers of the specified status.

```
```

If you use this parameter, the command only displays servers with the specified functional level.

```
[-is-dc-read-only {true|false}] - Is DC Read Only
```

If this parameter is set to true, the command only displays servers with read only domain controller. If set to false, the command only displays servers with writable domain controller.

**Examples**

The following example display shows the information provided by this command.

```
cluster1::> vserver cifs domain discovered-servers show
Node: node1
Vserver: vs1
<table>
<thead>
<tr>
<th>Domain Name</th>
<th>Type</th>
<th>Preference</th>
<th>DC-Name</th>
<th>DC-Address</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>example.com</strong></td>
<td>MS-LDAP</td>
<td>adequate</td>
<td>DC-1</td>
<td>192.168.192.24</td>
<td>OK</td>
</tr>
</tbody>
</table>
```

**Cluster Name:**

```
cluster1::> vserver cifs domain discovered-servers show
Node: node1
Vserver: vs1
<table>
<thead>
<tr>
<th>Domain Name</th>
<th>Type</th>
<th>Preference</th>
<th>DC-Name</th>
<th>DC-Address</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>example.com</strong></td>
<td>MS-LDAP</td>
<td>adequate</td>
<td>DC-1</td>
<td>192.168.192.24</td>
<td>OK</td>
</tr>
</tbody>
</table>
```

**Cluster Name:**
vserver cifs domain discovered-servers discovery-mode commands

The discovery-mode directory

**vserver cifs domain discovered-servers discovery-mode modify**

Modify Server Discovery Mode

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

**Description**

The `vserver cifs domain discovered-servers discovery-mode modify` command modifies the configuration for the server discovery mode of one or more Data Vservers.

**Parameters**

- `vserver <vserver name>` - Vserver
  
  Use this parameter to specify the Vserver for which you want to modify the server discovery mode.

- `[-mode {all|site|none}]` - Server Discovery Mode
  
  Use this parameter to specify the server discovery mode for the Vserver. Following are the possible values for this parameter:
  
  - all - Discover all the servers in the domain.
  - site - Discover the servers local to the site.
  - none - Discover nothing. Depend only on preferred-dc configured.

**Examples**

The following example disables server discovery for a Vserver.

```
cluster1::> vserver cifs domain discovered-servers discovery-mode modify -vserver vs1 -mode none
```

**vserver cifs domain discovered-servers discovery-mode show**

Display Server Discovery Mode

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

**Description**

The `vserver cifs domain discovered-servers discovery-mode show` command displays information about the discovery mode servers for the CIFS domains of one or more Vservers.

**Parameters**

{ [-fields <fieldname>, ...]  
  
  If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

  | [-instance ]]  
  
  If you specify the `-instance` parameter, the command displays detailed information about all fields.
[--vserver \<vserver name\>] - Vserver

If you use this parameter, the command only displays discovery mode for the specified Vserver.

[--mode \{all|site|none\}] - Server Discovery Mode

If you use this parameter, the command only displays Vservers with the specified mode.

**Examples**

The following example shows the server discovery mode for all Vservers.

```
cluster1::> vserver cifs domain discovered-servers discovery-mode show
Vserver     Mode
----------   ----------
vs1          all
vs2          site
vs3          none
3 entries were displayed.
```

**vserver cifs domain name-mapping-search commands**

Manage the list of trusted domains for name-mapping search

**vserver cifs domain name-mapping-search add**

Add to the list of trusted domains for name-mapping

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The *vserver cifs domain name-mapping-search add* command adds one or more trusted domains to the list of trusted domains to be used in preference to all others by the specified Vserver for looking up Windows user names when performing Windows user to UNIX user name-mapping. If a list already exists for the specified vserver, the new list is merged with the existing list. This command is not supported for workgroup CIFS servers.

**Parameters**

[--vserver \<vserver name\>] - Vserver

This parameter specifies the name of the Vserver for which you want to add trusted domains.

[--trusted-domains \<domain name\>,...] - Trusted Domains

This parameter specifies a comma-delimited list of fully-qualified domain names of the trusted domains for the home domain.

**Examples**

The following example adds two trusted domains (cifs1.example.com and cifs2.example.com) to the preferred list used by Vserver vs1:

```
cluster1::> vserver cifs domain name-mapping-search add --vserver vs1 --trusted-domains
cifs1.example.com, cifs2.example.com
```

**vserver cifs domain name-mapping-search modify**

Modify the list of trusted domains for name-mapping search

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.
Description
The `vserver cifs domain name-mapping-search modify` command modifies the current list of trusted domains to be used in preference to all others by the specified Vserver to lookup Windows user names when performing Windows user to UNIX user name-mapping. The new list overwrites the existing list. This command is not supported for workgroup CIFS servers.

Parameters

`–vserver <vserver name> - Vserver`
This parameter specifies the name of the Vserver for which you want to modify the trusted domain list.

`–trusted-domains <domain name>,... - Trusted Domains`
This parameter specifies a comma-delimited list of fully qualified domain names of the trusted domains of the home domain.

Examples
The following example modifies the trusted domain list used by Vserver vs1:

```
cluster1::> vserver cifs domain name-mapping-search modify –vserver vs1 –trusted-domains cifs3.example.com
```

vserver cifs domain name-mapping-search remove
Remove from the list of trusted domains for name-mapping search

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The `vserver cifs domain name-mapping-search remove` command removes one or more trusted domains from the list used by the specified Vserver to lookup Windows user names when performing Windows user to UNIX user name-mapping. If a list of trusted domains is not provided, the entire trusted domain list for the specified Vserver is removed. This command is not supported for workgroup CIFS servers.

Parameters

`–vserver <vserver name> - Vserver`
This parameter specifies the name of the Vserver from which you want to remove trusted domains.

`[–trusted-domains <domain name>,...] - Trusted Domains`
This parameter specifies a comma-delimited list of trusted domains of the home domain.

Examples
The following example removes two trusted domains from the list used by Vserver vs1:

```
cluster1::> vserver cifs domain name-mapping-search remove –trusted-domains cifs1.example.com, cifs2.example.com
```

vserver cifs domain name-mapping-search show
Display the list of trusted domains for name-mapping searches

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.
Description
The `vserver cifs domain name-mapping-search show` command displays information about trusted domains of the home domain by Vserver.

Parameters

`{ [-fields <fieldname>, ...]`  
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

`|-instance []`  
If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-vserver <vserver name>] - Vserver`  
This parameter specifies the name of the Vserver for which you want to display information about the trusted domains.

`[-trusted-domains <domain name>, ...] - Trusted domains`  
This parameter specifies a comma-delimited list of fully qualified domain names of trusted domains for which you want to display information.

Examples

The following example displays information about all preferred trusted domains:

```
cluster1::> vserver cifs domain name-mapping-search show
Vserver         Trusted Domains
--------------  ----------------------------------
Vserver_1       CIFS1.EXAMPLE.COM
```

vserver cifs domain password commands

Manage domain account password configuration for a CIFS server

vserver cifs domain password change

Generate a new password for the CIFS server's machine account and change it in the Windows Active Directory domain.

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The `vserver cifs domain password change` changes the domain account password for a CIFS server. This command is not supported for workgroup CIFS servers.

Parameters

`-vserver <vserver name> - Vserver`  
This parameter specifies the name of the Vserver for whose CIFS server you want to change the domain account password.

Examples

The following example changes the password for the CIFS server on a Vserver named vs1.

```
cluster1::> vserver cifs domain password change -vserver vs1
cluster1::>
```
**vserver cifs domain password reset**

Reset the CIFS server's machine account password in the Windows Active Directory domain.

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver cifs domain password reset` command resets the domain account password for a CIFS server. This may be required if the password stored along with the machine account in the Windows Active Directory domain is changed or reset without the Vserver's knowledge. The operation requires the credentials for a user with permission to reset the password in the organizational unit (OU) that the machine account is a member of. This command is not supported for workgroup CIFS servers.

**Parameters**

- `vserver <vserver name>` - Vserver

  This parameter specifies the name of the Vserver for whose CIFS server you want to reset the domain account password.

**Examples**
The following example resets the password for the CIFS server on a Vserver named vs1.

```
cluster1::> vserver cifs domain password reset -vserver vs1
Enter your user ID: Administrator
Enter your password:
cluster1::>
```

**vserver cifs domain password schedule commands**

The schedule directory

**vserver cifs domain password schedule modify**

Modify the domain account password change schedule

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver cifs domain password schedule modify` command enables you to modify a domain account password change schedule for a CIFS server. This command is not supported for workgroup CIFS servers.

**Parameters**

- `vserver <vserver name>` - Vserver

  This specifies the name of the Vserver containing the CIFS server for which you want to change the domain account password.

- `[-is-schedule-enabled {true|false}]` - Is Password Change Schedule Enabled

  This specifies whether the domain account password change schedule is enabled.

- `[-schedule-weekly-interval <integer>]` - Interval in Weeks for Password Change Schedule

  This specifies the number of weeks after which the scheduled domain account password change must occur.

- `[-schedule-randomized-minute <integer>]` - Minutes Within Which Schedule Start Can be Randomized

  This specifies the minutes within which the scheduled domain account password change must begin.
-schedule-day-of-week <cron_dayofweek> - Day of Week for Password Change Schedule

This sets the day of week when the scheduled domain account password change occurs.

-schedule-time-of-day <HH:MM:SS> - Start Time for Password Change Schedule

This sets the time in HH:MM:SS at which the scheduled domain account password change starts.

Examples

The following example enables the domain account password change schedule and configures it to run at any time between 23:00:00 to 00:59:00 (one hour before midnight to one hour after midnight) on every 4th Sunday.

```
cluster1::> vserver cifs domain password schedule modify -is-schedule-enabled true -schedule-randomized-minute 120 -schedule-weekly-interval 4 -schedule-time-of-day 23:00:00 -schedule-day-of-week sunday
```

vserver cifs domain password schedule show

Display the domain account password change schedule

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver cifs domain password schedule show command displays the domain account password change schedule configuration. It displays the following fields:

- Vserver: Vserver for which the schedule is configured
- Schedule Enabled: Whether the schedule is enabled or disabled for this Vserver
- Schedule Interval: Weeks after which the password change schedule occurs again for this Vserver
- Schedule Randomized Within: Minutes within which the schedule must begin for this Vserver
- Schedule: Password change schedule currently set on this Vserver
- Last Successful Password Change/Reset Time: Time at which the last password change or reset happened successfully on this Vserver
- Warning: Warning message, applicable only when the change password job is deleted with the feature still enabled on this Vserver

Parameters

```
{ [-fields <fieldname>, ...]  
   If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [ -instance ] } 
   If you specify the -instance parameter, the command displays detailed information about all fields.

[ -vserver <vserver name> ] - Vserver 
   If you specify this parameter, the command displays information for the specified Vserver.

[ -is-schedule-enabled {true | false} ] - Is Password Change Schedule Enabled 
   If you specify this parameter, the command displays information for all the Vservers on which the is-schedule-enabled value applies.

[ -schedule-weekly-interval <integer> ] - Interval in Weeks for Password Change Schedule 
   If you specify this parameter, the command displays information for all the Vservers on which the schedule-weekly-interval value applies.
```
[\texttt{-schedule-randomized-minute <integer>}] - Minutes Within Which Schedule Start Can be Randomized

If you specify this parameter, the command displays information for all the Vservers on which the schedule-randomized-minute value applies.

[\texttt{-schedule-last-changed <text>}] - Last Successful Password Change/Reset Time

If you specify this parameter, the command displays information for all the Vservers on which the schedule-last-changed value applies.

[\texttt{-schedule-description <text>}] - Schedule Description

If you specify this parameter, the command displays information for all the Vservers on which the schedule-description value applies.

[\texttt{-schedule-warn-msg <text>}] - Warning Message in Case Job Is Deleted

If you specify this parameter, the command displays information for all the Vservers on which the schedule-warn-msg value applies.

Examples

The following example shows the domain account password change schedule configuration when the password change feature is enabled for Vserver vs1.

\begin{verbatim}
cluster1::> vserver cifs domain password schedule show
  Vserver: vs1
    Schedule Enabled: true
    Schedule Interval: 4 week
    Schedule Randomized Within: 120 min
    Schedule: Fri@23:00
    Last Changed At: Thu Apr  4 02:35:23 2013
\end{verbatim}

The following example shows the domain account password change schedule configuration when the password change job has been accidently deleted.

\begin{verbatim}
cluster1::> vserver cifs domain password schedule show
  Vserver: vs1
    Schedule Enabled: true
    Schedule Interval: 4 week
    Schedule Randomized Within: 120 min
    Schedule: Fri@23:00
    Last Changed At: Thu Apr  4 02:35:23 2013
  Warning: Password change job was deleted. Re-enable the password change schedule.
\end{verbatim}

\textbf{vserver cifs domain preferred-dc commands}

Manage preferred domain controllers

\textbf{vserver cifs domain preferred-dc add}

Add to a list of preferred domain controllers

**Availability:** This command is available to \textit{cluster} and \textit{Vserver} administrators at the \textit{admin} privilege level.
Description
The vserver cifs domain preferred-dc add command adds one or more domain controllers to be used in preference to all others by the specified Vserver for interactions with the specified domain. If a list already exists for the specified domain, the new list is merged with the existing list. This command is not supported for workgroup CIFS servers.

Note: Each Vserver discovers domain controllers and attempts to sort them internally based on real-world performance. Therefore it should not be necessary to create a preferred list of domain controllers under most circumstances.

Parameters
-vserver <vserver name> - Vserver
This parameter specifies the name of the Vserver for which you want to add preferred domain controllers.

-domain <TextNoCase> - Fully Qualified Domain Name
This parameter specifies the fully-qualified name of the domain that the domain controllers belong to.

-preferred-dc <InetAddress>, ... - Preferred Domain Controllers
This parameter specifies a comma-delimited list of IP addresses for domain controllers that belong to the domain specified in the -domain parameter.

Examples
The following example adds two domain controllers (192.168.0.100 and 192.168.0.101) to the preferred list used by Vserver vs1 when connecting to the example.com domain:

```
cluster1:/> vserver cifs domain preferred-dc add -vserver vs1 -domain example.com -preferred-dc 192.168.0.100,192.168.0.101
```

vserver cifs domain preferred-dc remove
Remove from a list of preferred domain controllers

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs domain preferred-dc remove command removes one or more domain controllers from the list used by the specified Vserver for interactions with the specified domain. If a list of preferred domain controllers is not provided, the entire list for the specified domain is removed. This command is not supported for workgroup CIFS servers.

Parameters
-vserver <vserver name> - Vserver
This parameter specifies the name of the Vserver from which you want to remove preferred domain controllers.

-domain <TextNoCase> - Fully Qualified Domain Name
This parameter specifies the fully-qualified name of the domain that the domain controllers belong to.

[-preferred-dc <InetAddress>, ...] - Preferred Domain Controllers
This parameter specifies a comma-delimited list of IP addresses for domain controllers that belong to the domain specified in the -domain parameter.

Examples
The following example removes one domain controller (192.168.0.101) from the preferred list used by Vserver vs1 when connecting to the example.com domain:
vserver cifs domain preferred-dc show

Display a list of preferred domain controllers

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `vserver cifs domain preferred-dc show` command displays lists of preferred domain controllers by Vserver and domain.

**Parameters**

`[-fields <fieldname>, ...]`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

`[-instance]`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-vserver <vserver name>] - Vserver`

This parameter specifies the name of the Vserver for which you want to display preferred domain controllers.

`[-domain <TextNoCase>] - Fully Qualified Domain Name`

This parameter specifies the fully-qualified name of the domain of the domain controllers to display.

`[-preferred-dc <InetAddress>, ...] - Preferred Domain Controllers`

This parameter specifies a comma-delimited list of IP addresses for domain controllers to display.

**Examples**
The following example displays all preferred domain controllers for all Vservers:

```plaintext
cluster1::> vserver cifs domain preferred-dc show
Vserver  Domain Name                          Preferred Domain Controllers
----------------- ----------------------------- ----------------------------------
vs1            example.com                   192.168.0.100, 192.168.0.101
```

vserver cifs domain trusts commands

Manage discovered trusted domains

vserver cifs domain trusts rediscover

Reset and rediscover trusted domains for a Vserver

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `vserver cifs domain trusts rediscover` command discards information the Vserver has stored about trusted domains. After that, it begins the discovery process to reacquire current information about trusted domains. This command is not supported for workgroup CIFS servers.
Parameters
-vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver.

Examples
The following example redisCOVERs trusted domains. It produces no output.

```
cluster1::> vserver cifs domain trusts redisCOVER
```

vserver cifs domain trusts show

Display discovered trusted domain information

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs domain trusts show command displays information about the trusted domains for the CIFS home domain of one or more Vservers. The displayed trusted domain information is grouped by node and Vserver, and each group is preceded by the node and Vserver identification. This command is not supported for workgroup CIFS servers.

Parameters
{-fields <fieldname>, ...}
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance ]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-node <nodename> | local] - Node
If you use this parameter, the command displays information only about trusted domains of the home domains for the specified node.

[-vserver <vserver name>] - Vserver
If you use this parameter, the command displays information only about trusted domains of the home domain for the specified Vserver.

[-home-domain <domain name>] - Home Domain Name
If you use this parameter, the command displays information only about trusted domains of the home domain with the specified name.

[-trusted-domain <domain name>, ...] - Trusted Domain Name
If you use this parameter, the command displays information only about trusted domains with the specified name.

Examples
The following example displays information about all the bidirectional trusted domains for node-01 and vserver_1.

```
cluster1::> vserver cifs domain trusts show -node node-01 -vserver vserver_1
        Node: node-01
        Vserver: vserver_1
        Home Domain  Trusted Domain
```
vserver cifs group-policy commands

Manage group policies

vserver cifs group-policy modify

Change group policy configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs group-policy modify command modifies the group policy configuration of a CIFS server. This command is not supported for workgroup CIFS servers.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the Vserver whose group policy configuration you want to modify.

[-status {enabled|disabled}] - Group Policy Status

This parameter specifies whether the CIFS-enabled Vserver's group policy is enabled or disabled.

Examples

The following example enables the group policy for CIFS-enabled Vserver vs1.

cluster1::> vserver cifs group-policy modify -vserver vs1 -status enabled

vserver cifs group-policy show

Show group policy configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs group-policy show command displays information about group policy configuration for CIFS-enabled Vserver. It displays all or a subset of the group policy configuration matching the criteria that you specify.

Parameters

{ [-fields <fieldname>, ...] 
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.
  | [-instance ] 
  If you specify the -instance parameter, the command displays detailed information about all fields.
  [-vserver <vserver name>] - Vserver
  If you specify this parameter, the command displays group policy configuration only for the Vserver that you specify. }
[-status {enabled|disabled}] - Group Policy Status

If you specify this parameter, the command displays group policy configuration only for the Vservers that
match the status you specify.

Examples
The following example displays group policy configuration for all Vservers:

```
class/1::> vserver cifs group-policy show
Vserver         GPO Status
--------------   ----------
vs1              disabled
```

vserver cifs group-policy show-applied

Show currently applied group policy setting

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs group-policy show-applied command displays information about group policies assigned to a
Vserver. It displays all or a subset of the group policy information matching the criteria that you specify.

If you do not specify any parameters, the command displays the following information about all group policies applied to
Vservers in the cluster:

• GPO Name: Specifies the name of the Group Policy object.
• Level: Specifies the level in which the Group Policy is configured. It could be either site level, domain level, or OU level.
• Status: Specifies whether or not this Group Policy object is enabled.

Advanced Audit Settings:

• Object Access:
• Central Access Policy Staging: Specifies the type of events to be audited for central access policy staging. Possible values are:

  o none - Do not audit.
  o success - Audit only success events.
  o failure - Audit only failure events.
  o both - Audit both success and failure events.

Registry Settings:

• Refresh Time Interval: Specifies how often the Group Policy is updated.
• Refresh Random Offset: Specifies a random time that is added to the refresh interval to prevent all clients from requesting
  Group Policy updates at the same time.
• Hash Publication Mode for BranchCache: Specifies the hash generation mode used to generate hashes for data stored in
  shared folders on which BranchCache is enabled, which is then provided to clients. Possible values are:

  o per-share - Allow hash publication only for shared folders on which BranchCache is enabled.
  o disabled - Disallow hash publication on all shared folders.
  o all-shares - Allow hash publication for all shared folders.
• Hash Version Support for BranchCache: Specifies the version supported by the BranchCache hash generation service. Possible values are:
  ◦ all-versions - Both versions 1 and 2 (V1 and V2).
  ◦ version1 - Version 1 (V1).
  ◦ version2 - Version 2 (V2).

Security Settings:
• Event Audit and Event Log:
  • Audit Logon Events: Specifies the type of logon events to be audited. Possible values are:
    ◦ none - Do not audit.
    ◦ success - Audit only success events.
    ◦ failure - Audit only failure events.
    ◦ both - Audit both success and failure events.
  • Audit Object Access: Specifies the type of object access to be audited. Possible values are:
    ◦ none - Do not audit.
    ◦ success - Audit only success events.
    ◦ failure - Audit only failure events.
    ◦ both - Audit both success and failure events.
  • Log Retention Method: Specifies the audit log retention method. Possible values are:
    ◦ overwrite-as-needed - Overwrite the event log when size of the log file exceeds the maximum log size.
    ◦ overwrite-by-days - Not supported.
    ◦ do-not-overwrite - Do not overwrite the event log.
• Max Log Size: Specifies the maximum size of the audit log. This size is displayed in kbytes.
• File Security: Specifies a list of files or directories on which file security is applied.
• Kerberos:
• Max Clock Skew: Specifies maximum tolerance in hours for computer clock synchronization.
• Max Ticket Age: Specifies maximum lifetime in minutes for user ticket.
• Max Renew Age: Specifies maximum lifetime in days for user ticket renewal.
• Privilege Rights:
• Take Ownership: List of users and groups that have the right to take ownership of any securable object in the system.
• Security Privilege: List of users and groups that can specify auditing options for object access of individual resources, such as files, folders, and Active Directory objects.
• Change Notify: List of users and groups that can traverse directory trees even though the users and groups might not have permissions on the traversed directory.
• Registry Values:
• Signing Required: Specifies whether SMB signing is on or off.
• Restrict Anonymous:

• No enumeration of Security Account Manager (SAM) accounts: This security setting determines what additional permissions are granted for anonymous connections to the computer. This option displays as 'no-enumeration' in Data ONTAP if enabled.

• No enumeration of SAM accounts and shares: This security setting determines whether anonymous enumeration of SAM accounts and shares is allowed. This option displays as 'no-enumeration' in Data ONTAP if enabled.

• Restrict anonymous access to shares and named pipes: This security setting restricts anonymous access to shares and pipes. This option displays as 'no-access' in Data ONTAP if enabled.

• Combined restriction for anonymous user: The combined restriction for the anonymous user is derived from the above three settings:
  ◦ If 'no-access' is enabled, 'Combined restriction for anonymous user' is set to 'no-access'. The anonymous user is denied access to the specified shares and named pipes, and cannot use enumeration of SAM accounts and shares.
  ◦ If 'no-enumeration' is enabled and 'no-access' is disabled, 'Combined restriction for anonymous user' is set to 'no-enumeration'. The anonymous user has access to the specified shares and named pipes, but cannot use enumeration of SAM accounts and shares.
  ◦ If 'no-enumeration' is disabled and 'no-access' is disabled, 'Combined restriction for anonymous user' is set to 'no-restriction'. The anonymous user has full access and can use enumeration.

• Restricted Groups:

• List of restricted groups. For more information on each group, refer to the man page for the "vserver cifs group-policy restricted-group show-applied" command. Each group specifies two properties for restricted groups. The "Members" list defines who belongs and who does not belong to the restricted group. The "MemberOf" list ensures that the restricted group is added to the groups listed in "MemberOf" field. A group can be a member of groups other than those listed in "MemberOf" section.

Central Access Policy Settings:

• Policies:
  ◦ Specifies a list of central access policies. Central access policies and rules determine access permissions for multiple files on the Vserver.

Parameters
[-fields <fieldname>, ...]  
If you specify the -fields <fieldname>, ... parameter, the command only displays the fields that you specify.

[-instance ]  
If you specify the -instance parameter, the command displays detailed information about all entries.

[-vserver <vserver name>] - Vserver  
If you specify this parameter, the command displays only group policy information that has been applied to the Vserver you specify.

[-gpo-index <integer>] - GPO Index  
If you specify this parameter, the command displays only group policy information at gpo-index.

Examples
The following example displays all group policy information about all group policies that have been applied to a Vserver:

cluster1::> vserver cifs group-policy show-applied
Vserver: vs1
--------------------------------
GPO Name: Default Domain Policy
Level: Domain
Status: enabled
Advanced Audit Settings:
Object Access:
  Central Access Policy Staging: failure

vserver cifs group-policy show-defined

Show applicable group policy settings defined in Active Directory

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs group-policy show-defined command displays information about group policies that have been defined in Active Directory. It displays all or a subset of the group policy configuration matching the criteria that you specify.

If you do not specify any parameters, the command displays the following information about all group policies defined in Active Directory:

- GPO Name: Specifies the name of the Group Policy object.
- Level: Specifies the level in which the Group Policy is configured. It could be either site level, domain level, or OU level.
- Status: Specifies whether or not this Group Policy object is enabled.

Advanced Audit Settings:

- Object Access:
- Central Access Policy Staging: Specifies the type of events to be audited for central access policy staging. Possible values are:
  - none - Do not audit.
  - success - Audit only success events.
  - failure - Audit only failure events.
  - both - Audit both success and failure events.

Registry Settings:

- Refresh Time Interval: Specifies how often the Group Policy is updated.
- Refresh Random Offset: Specifies a random time that is added to the refresh interval to prevent all clients from requesting Group Policy updates at the same time.
- Hash Publication Mode for BranchCache: Specifies the hash generation mode used to generate hashes for data stored in shared folders on which BranchCache is enabled, which is then provided to clients. Possible values are:
  - per-share - Allow hash publication only for shared folders on which BranchCache is enabled.
  - disabled - Disallow hash publication on all shared folders.
  - all-shares - Allow hash publication for all shared folders.
- Hash Version Support for BranchCache: Specifies the version supported by the BranchCache hash generation service. Possible values are:
  - all-versions - Both versions 1 and 2 (V1 and V2).
  - version1 - Version 1 (V1).
  - version2 - Version 2 (V2).
Security Settings:

- Event Audit and Event Log:
  - Audit Logon Events: Specifies the type of logon events to be audited. Possible values are:
    - none - Do not audit.
    - success - Audit only success events.
    - failure - Audit only failure events.
    - both - Audit both success and failure events.
  - Audit Object Access: Specifies the type of object access to be audited. Possible values are:
    - none - Do not audit.
    - success - Audit only success events.
    - failure - Audit only failure events.
    - both - Audit both success and failure events.
  - Log Retention Method: Specifies the audit log retention method. Possible values are:
    - overwrite-as-needed - Overwrite the event log when size of the log file exceeds the maximum log size.
    - overwrite-by-days - Not supported.
    - do-not-overwrite - Do not overwrite the event log.
  - Max Log Size: Specifies the maximum size of the audit log. This size is displayed in kbytes.
  - File Security: Specifies a list of files or directories on which file security is to be applied.
  - Kerberos:
    - Max Clock Skew: Specifies maximum tolerance in hours for computer clock synchronization.
    - Max Ticket Age: Specifies maximum lifetime in minutes for user ticket.
    - Max Renew Age: Specifies maximum lifetime in days for user ticket renewal.
  - Privilege Rights:
    - Take Ownership: List of users and groups that have the right to take ownership of any securable object in the system.
    - Security Privilege: List of users and groups that can specify auditing options for object access of individual resources, such as files, folders, and Active Directory objects.
    - Change Notify: List of users and groups that can traverse directory trees even though the users and groups might not have permissions on the traversed directory.
  - Registry Values:
    - Signing Required: Specifies whether SMB signing is on or off.
    - Restrict Anonymous:
      - No enumeration of Security Account Manager (SAM) accounts: This security setting determines what additional permissions are granted for anonymous connections to the computer. This option displays as 'no-enumeration' in Data ONTAP if enabled.
      - No enumeration of SAM accounts and shares: This security setting determines whether anonymous enumeration of SAM accounts and shares is allowed. This option displays as 'no-enumeration' in Data ONTAP if enabled.
• Restrict anonymous access to shares and named pipes: This security setting restricts anonymous access to shares and pipes. This option displays as 'no-access' in Data ONTAP if enabled.

• Combined restriction for anonymous user: The combined restriction for the anonymous user is derived from the above three settings:
  ◦ If 'no-access' is enabled, 'Combined restriction for anonymous user' is set to 'no-access'. The anonymous user is denied access to the specified shares and named pipes, and cannot use enumeration of SAM accounts and shares.
  ◦ If 'no-enumeration' is enabled and 'no-access' is disabled, 'Combined restriction for anonymous user' is set to 'no-enumeration'. The anonymous user has access to the specified shares and named pipes, but cannot use enumeration of SAM accounts and shares.
  ◦ If 'no-enumeration' is disabled and 'no-access' is disabled, 'Combined restriction for anonymous user' is set to 'no-restriction'. The anonymous user has full access and can use enumeration.

• Restricted Groups:

• List of restricted groups. For more information on each group, refer to the man page for the "vserver cifs group-policy restricted-group show-defined" command. Each group specifies two properties for restricted groups. The "Members" list defines who belongs and who does not belong to the restricted group. The "MemberOf" list ensures that the restricted group is added to the groups listed in "MemberOf" field. A group can be a member of groups other than those listed in "MemberOf" section.

Central Access Policy Settings:

• Policies:
  ◦ Specifies a list of central access policies. Central access policies and rules determine access permissions for multiple files on the Vserver.

Parameters
{
[-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command only displays the fields that you specify.

[-instance ]
  If you specify the -instance parameter, the command displays detailed information about all entries.

[vserver <vserver name>] - Vserver
  If you specify this parameter, the command displays only group policy information that has been defined in Active Directory for the Vserver that you specify.

[gpo-index <integer>] - GPO Index
  If you specify this parameter, the command displays only group policy information at gpo-index.

Examples
The following example displays all group policy information for all group policies that have been defined in Active Directory:

cluster1::> vserver cifs group-policy show-defined
Vserver: vs1
----------------------------------------
GPO Name: Default Domain Policy
  Level: Domain
  Status: enabled
Advanced Audit Settings:
  Object Access:
    Central Access Policy Staging: failure
Registry Settings:
  Refresh Time Interval: 22
  Refresh Random Offset: 8
  Hash Publication Mode for BranchCache: per-share
Hash Version Support for BranchCache: version1

Security Settings:

vserver cifs group-policy update

Apply group policy settings defined in Active Directory

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs group-policy update command applies the group-policy settings defined in Active Directory for the given Vserver. This command is not supported for workgroup CIFS servers.

Parameters
-vserver <vserver name> - Vserver Name
This parameter specifies the CIFS-enabled Vserver to which the group-policy settings be applied.

[-force-reapply-all-settings {true|false}] - Force Re-apply All Settings
This parameter specifies whether to ignore all processing optimizations and re-apply all settings. The default is false.

Examples
The following example applies the group-policy settings defined in Active Directory for Vserver vs1.

```
cluster1::> vserver cifs group-policy update -vserver vs1 -force-reapply-all-settings true
```

vserver cifs group-policy central-access-policy commands

Manage central access policy

vserver cifs group-policy central-access-policy show-applied

Show currently applied central access policies

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs group-policy central-access-policy show-applied command displays information about the central access policies assigned to Vservers. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all CIFS servers:

- Vserver name
- Name of the central access policy
- SID
- Description
- Creation time
- Modification time
- Member rules

Parameters
{ [-fields <fieldname>,...] }
If you specify the -fields <fieldname>, ... parameter, the command only displays the fields that you specify.
If you specify the -instance parameter, the command displays detailed information about all entries.

[-vserver <vserver name>] - Vserver

If you specify this parameter, the command displays information only for central access policies for the specified Vserver.

[-name <TextNoCase>] - Name

If you specify this parameter, the command displays information only for central access policies that match the specified name.

[-sid <windows sid>] - Identifier

If you specify this parameter, the command displays information only for central access policies that match the specified SID.

[-description <text>] - Description

If you specify this parameter, the command displays information only for central access policies that match the specified description.

[-ctime <Date>] - Creation Time

If you specify this parameter, the command displays information only for central access policies that match the specified creation time.

[-mtime <Date>] - Modification Time

If you specify this parameter, the command displays information only for central access policies that match the specified modification time.

[-rules <TextNoCase>, ...] - Central Access Rules

If you specify this parameter, the command displays information only for central access policies that match the specified member rules.

### Examples

The following example displays information for all central access policies:

```
cluster1::> vserver cifs group-policy central-access-policy show-applied

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Name</th>
<th>SID</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>
<td>p1</td>
<td>S-1-17-3386172923-1132988875-3044489393-3993546205</td>
</tr>
<tr>
<td></td>
<td>Description: policy #1</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Creation Time: Tue Oct 22 09:34:13 2013</td>

</table>

2 entries were displayed.
```

### vserver cifs group-policy central-access-policy show-defined

Show applicable central access policies defined in the Active Directory

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.
**Description**

The `vserver cifs group-policy central-access-policy show-defined` command displays information about the central access policies that are defined in the Active Directory. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all CIFS servers:

- Vserver name
- Name of the central access policy
- SID
- Description
- Creation time
- Modification time
- Member rules

**Parameters**

`{-fields <fieldname>, ...}`

If you specify the `-fields <fieldname>, ...` parameter, the command only displays the fields that you specify.

`{-instance}`

If you specify the `-instance` parameter, the command displays detailed information about all entries.

`{vserver <vserver name>}` - Vserver

If you specify this parameter, the command displays information only for central access policies for the specified Vserver.

`{name <TextNoCase>}` - Name

If you specify this parameter, the command displays information only for central access policies that match the specified name.

`{sid <windows sid>}` - Identifier

If you specify this parameter, the command displays information only for central access policies that match the specified SID.

`{description <text>}` - Description

If you specify this parameter, the command displays information only for central access policies that match the specified description.

`{ctime <Date>}` - Creation Time

If you specify this parameter, the command displays information only for central access policies that match the specified creation time.

`{mtime <Date>}` - Modification Time

If you specify this parameter, the command displays information only for central access policies that match the specified modification time.

`{rules <TextNoCase>, ...}` - Central Access Rules

If you specify this parameter, the command displays information only for central access policies that match the specified member rules.

**Examples**

The following example displays information for all central access policies:
vserver cifs group-policy central-access-rule commands

Manage central access rule

vserver cifs group-policy central-access-rule show-applied

Show currently applied central access rules

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver cifs group-policy central-access-rule show-applied command displays information about the central access rules assigned to Vservers. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all CIFS servers:

- Vserver name
- Name of the central access rule
- Description
- Creation time
- Modification time
- Current permissions
- Proposed permissions
- Target resources

Parameters

`[-fields <fieldname>, ...]`

If you specify the -fields <fieldname>, ... parameter, the command only displays the fields that you specify.

`[-instance ]`

If you specify the -instance parameter, the command displays detailed information about all entries.

`[-vserver <vserver name>] - Vserver`

If you specify this parameter, the command displays information only for central access rules for the specified Vserver.
If you specify this parameter, the command displays information only for central access rules that match the specified name.

- **Description**
  If you specify this parameter, the command displays information only for central access rules that match the specified description.

- **Creation Time**
  If you specify this parameter, the command displays information only for central access rules that match the specified creation time.

- **Modification Time**
  If you specify this parameter, the command displays information only for central access rules that match the specified modification time.

- **Effective Security Policy**
  If you specify this parameter, the command displays information only for central access rules that match the specified effective security policy.

- **Proposed Security Policy**
  If you specify this parameter, the command displays information only for central access rules that match the specified proposed security policy.

- **Resource Condition**
  If you specify this parameter, the command displays information only for central access rules that match the specified resource condition.

**Examples**

The following example displays information for all central access rules:

```
cluster1::> vserver cifs group-policy central-access-rule show-applied

Vserver   Name
---------- ------------------------
vs1        r1
           Description: rule #1
           Creation Time: Tue Oct 22 09:33:48 2013
           Modification Time: Tue Oct 22 09:33:48 2013
vs1        r2
           Description: rule #2
           Creation Time: Tue Oct 22 10:27:57 2013
           Modification Time: Tue Oct 22 10:27:57 2013

2 entries were displayed.
```

**vserver cifs group-policy central-access-rule show-defined**

Show applicable central access rules defined in the Active Directory

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The vserver cifs group-policy central-access-rule show-defined command displays information about the central access rules that are defined in the Active Directory. The command output depends on the parameter or parameters
specified with the command. If you do not specify any parameters, the command displays the following information about all CIFS servers:

- Vserver name
- Name of the central access rule
- Description
- Creation time
- Modification time
- Current permissions
- Proposed permissions
- Target resources

**Parameters**

```bash
[-fields <fieldname>, ...]  
If you specify the -fields <fieldname>, ... parameter, the command only displays the fields that you specify.
```

```bash
[-instance ]
If you specify the -instance parameter, the command displays detailed information about all entries.
```

```bash
[-vserver <vserver name>] - Vserver
If you specify this parameter, the command displays information only for central access rules for the specified Vserver.
```

```bash
[-name <TextNoCase>] - Name
If you specify this parameter, the command displays information only for central access rules that match the specified name.
```

```bash
[-description <text>] - Description
If you specify this parameter, the command displays information only for central access rules that match the specified description.
```

```bash
[-ctime <Date>] - Creation Time
If you specify this parameter, the command displays information only for central access rules that match the specified creation time.
```

```bash
[-mtime <Date>] - Modification Time
If you specify this parameter, the command displays information only for central access rules that match the specified modification time.
```

```bash
[-effective <text>] - Effective Security Policy
If you specify this parameter, the command displays information only for central access rules that match the specified effective security policy.
```

```bash
[-proposed <text>] - Proposed Security Policy
If you specify this parameter, the command displays information only for central access rules that match the specified proposed security policy.
```

```bash
[-resource <text>] - Resource Condition
If you specify this parameter, the command displays information only for central access rules that match the specified resource condition.
```
Examples
The following example displays information for all central access rules:

```
cluster1::> vserver cifs group-policy central-access-rule show-defined
Vserver   Name
---------- ----------------------
vs1        r1
     Description: rule #1
     Creation Time: Tue Oct 22 09:33:48 2013
     Modification Time: Tue Oct 22 09:33:48 2013

vs1        r2
     Description: rule #2
     Creation Time: Tue Oct 22 10:27:57 2013
     Modification Time: Tue Oct 22 10:27:57 2013
```

2 entries were displayed.

**vserver cifs group-policy restricted-group commands**

Manage restricted group

**vserver cifs group-policy restricted-group show-applied**

Show the applied restricted-group settings.

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver cifs group-policy restricted-group show-applied` command displays settings of all the restricted groups applied to a Vserver.

If you do not specify any parameters, the command displays the following information about all the restricted groups applied to all the Vservers in the cluster.

- **Group Policy Name:** Specifies the name of the group policy.
- **Version:** Specifies the version of the group policy.
- **Link:** Specifies the level in which the group policy is configured. Possible values are:
  - Local: Group policy is configured in Data ONTAP.
  - Site: Group policy is configured at the site level in the Domain Controller.
  - Domain: Group policy is configured at the domain level in the Domain Controller.
  - OrganizationalUnit: Group policy is configured at the OU level in the Domain controller.
  - RSOP: Resultant set of policies derived from all the group policies defined at various levels.
- **Group Name:** Specifies the name of a restricted group.
- **Members:** Specifies users and groups who belong to and who do not belong to the restricted group.
- **MemberOf:** Specifies list of groups to which the restricted group is added. A group can be a member of groups other than the groups listed here.
Parameters

{[-fields <fieldname>, ...]}

If you specify the \-fields \<fieldname\>, \...\ parameter, the command output also includes the specified field or fields. You can use \-fields ?\ to display the fields to specify.

[[-instance]]

If you specify the \-instance\ parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver

If this parameter is specified, the command displays the restricted-group information that has been applied to the specified Vserver.

[-index <integer>] - Index

If this parameter is specified, the command displays the specified index for the group policy in the restricted group. The restricted-group information for the group policy at the specified index.

[-group-name <text>] - Group Name

If this parameter is specified, the command displays the restricted-group information for the specified group name.

[-group-policy-name <text>] - Group Policy Name

If this parameter is specified, the command displays the restricted-group information for the specified group policy name.

[-uuid <UUID>] - UUID

If this parameter is specified, the command displays the restricted-group information for the specified UUID of the group policy.

[-version <integer>] - Version

If this parameter is specified, the command displays the restricted-group information for the specified version of the group policy.

[-link {Local|Site|Domain|OrganizationalUnit|RSOP}] - Link Type

If this parameter is specified, the command displays the restricted-group information for the specified link for the group policy.

[-members <gpoUserGroup>, ...] - Members, List of Users/groups

If this parameter is specified, the command displays the restricted-group information for the specified members of users and groups.

[-member-of <gpoUserGroup>, ...] - MemberOf, List of Groups

If this parameter is specified, the command displays the restricted-group information for the specified member of the group.

Examples

The following example displays information about all restricted groups that have been applied to a Vserver.

```
cluster1::> vserver cifs group-policy restricted-group show-applied
Vserver: vs_1
--------------
Group Policy Name: gpol1
   Version: 16
      Link: OrganizationalUnit
Group Name: grp1
   Members: user1
   MemberOf: GPO\g9

Group Policy Name: Resultant Set of Policy
   Version: 0
```
vserver cifs group-policy restricted-group show-defined

Show the defined restricted-group settings.

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs group-policy restricted-group show-defined command displays settings of all the restricted groups defined in Domain Controller for a Vserver.

If you do not specify any parameters, the command displays the following information about all the restricted groups defined in Domain Controller for all the Vservers in the cluster.

- Group Policy Name: Specifies the name of the group policy.
- Version: Specifies the version of the group policy.
- Link: Specifies the level in which the group policy is configured. Possible values are:
  - Local: Group policy is configured in Data ONTAP.
  - Site: Group policy is configured at the site level in the Domain Controller.
  - Domain: Group policy is configured at the domain level in the Domain Controller.
  - OrganizationalUnit: Group policy is configured at the OU level in the Domain Controller.
  - RSOP: Resultant set of policies derived from all the group policies defined at various levels.
- Group Name: Specifies the name of a restricted group.
- Members: Specifies users and groups who belong to and who do not belong to the restricted group.
- MemberOf: Specifies list of groups to which the restricted group is added. A group can be a member of groups other than the groups listed here.

Parameters

[[-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[[-instance]]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver

If this parameter is specified, the command displays the restricted-group information that is defined in Domain Controller for the specified Vserver.

[-index <integer>] - Index

If this parameter is specified, the command displays the specified index for the group policy in the restricted group. The restricted-group information for the group policy at the specified index.

[-group-name <text>] - Group Name

If this parameter is specified, the command displays the restricted-group information for the specified group name.
[-group-policy-name <text>] - Group Policy Name
   If this parameter is specified, the command displays the restricted-group information for the specified group policy name.

[-uuid <UUID>] - UUID
   If this parameter is specified, the command displays the restricted-group information for the specified UUID of the group policy.

[-version <integer>] - Version
   If this parameter is specified, the command displays the restricted-group information for the specified version of the group policy.

[-link {Local|Site|Domain|OrganizationalUnit|RSOP}] - Link Type
   If this parameter is specified, the command displays the restricted-group information for the specified link for the group policy.

[-members <gpoUserGroup>, ...] - Members, List of Users/groups
   If this parameter is specified, the command displays the restricted-group information for the specified members of users and groups.

[-member-of <gpoUserGroup>, ...] - MemberOf, List of Groups
   If this parameter is specified, the command displays the restricted-group information for the specified member of the group.

Examples
The following example displays information about all restricted groups that are defined in Domain Controller for a Vserver.

```
cluster1::> vserver cifs group-policy restricted-group show-defined
Vserver: vs_1

Group Policy Name: gpo1
   Version: 16
   Link: OrganizationalUnit
Group Name: grp1
   Members: usr1
   MemberOf: GPO\g9

Group Policy Name: Resultant Set of Policy
   Version: 0
   Link: RSOP
Group Name: grp1
   Members: usr1
   MemberOf: GPO\g9
```

vserver cifs home-directory commands
Manage home directories

vserver cifs home-directory modify
Modify attributes of CIFS home directories

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.
The `vserver cifs home-directory modify` command modifies the CIFS home directory configuration for a CIFS server. To use the home directory options `-is-home-dirs-access-for-admin-enabled` or/and `-is-home-dirs-access-for-public-enabled`, a home directory share must be configured with a dynamic share pattern preceded by a tilde(~). Valid dynamic share patterns are `~%w` and `~%d~%w`. The pattern `%u` is not supported with these options.

**Parameters**

- `-vserver <vserver>` - Vserver
  
  This parameter specifies the name of the CIFS server for which you want to modify the CIFS home directory configuration.

- `[-is-home-dirs-access-for-admin-enabled {true|false}]` - Is Home Directory Access for Admin Enabled
  
  This optional parameter specifies whether a user with Windows administrative privileges can connect to another user's home directory. The default value for this parameter is `true`.

- `[-is-home-dirs-access-for-public-enabled {true|false}]` - Is Home Directory Access for Public Enabled
  
  This optional parameter specifies whether any user can connect to another user's home directory. The default value for this parameter is `false`.

**Examples**

The following example modifies the CIFS home directory configuration for the Vserver "vs1". It enables users with Windows administrative privileges to connect to another user's home directory, and enables any user to connect to another user's home directory.

```
cluster1::> vserver cifs home-directory modify -vserver vs1 -is-home-dirs-access-for-admin-enabled true -is-home-dirs-access-for-public-enabled true
```

The following example shows the usage of the share creation pattern `~%d~%w`.

```
cluster1::> vserver cifs share create -vserver vs1 -share-name ~%d~%w -path %d/%w -share-properties homedirectory
```

The following example shows the usage of the share creation pattern `~%w`.

```
cluster1::> vserver cifs share create -vserver vs1 -share-name ~%w -path %d/%w -share-properties homedirectory
```

**vserver cifs home-directory show**

Display home directory configurations

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**

The `vserver cifs home-directory show` command displays the CIFS home directory configuration for one or more Vservers.
Parameters

```{[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

| [-instance ]] |
If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver>] - Vserver
If you specify this parameter, the command displays CIFS home directory configuration for the specified Vserver.

[-is-home-dirs-access-for-admin-enabled {true|false}] - Is Home Directory Access for Admin Enabled
If you specify this parameter, the command displays home directory configuration for CIFS servers that have the specified setting.

[-is-home-dirs-access-for-public-enabled {true|false}] - Is Home Directory Access for Public Enabled
(privilege: advanced)
If you specify this parameter, the command displays home directory configuration for CIFS servers that have the specified setting.
```

Examples

The following example lists the CIFS home directory configuration for a Vserver on the cluster.

```
cluster1::> vserver cifs home-directory show -vserver vs1
Vserver: vs1
Is Home Directory Access for Admin Enabled: true
```

At the advanced privilege level or above, the output displays the information below:

```
cluster1::*> vserver cifs options show
Vserver: vs1
Is Home Directory Access for Admin Enabled: true
Is Home Directory Access for Public Enabled: false
```

vserver cifs home-directory show-user
Display the Home Directory Path for a User

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs home-directory show-user command prints the path of a user's CIFS home directory. Use this command if multiple CIFS home directory paths exist and you want to see which path holds the user's CIFS home directory.

Parameters

```{[-fields <fieldname>, ...]
If you specify this parameter, the command displays only the fields that you specify.

| [-instance ]] |
If you specify the -instance parameter, the command displays detailed information about all entries.
-vserver <vserver> - Vserver

Use this required parameter to specify the Vserver that contains the home directory of the user specified with the required -username parameter.

-username <text> - User Name

Use this required parameter to locate the home directory of the specified user. You must enter this parameter in the following format: user, domain/user or cifs_server_name/user.

[-path <text>] - Path

If you specify this parameter, the command displays information about the user's home directory with the specified path.

[-share-name <text>] - Share Name

If you specify this parameter, the command displays information about the user's home directory with the specified home-directory share.

Examples

The following command displays information about the home directory of user gpo\rpuser1 belonging to Vserver vs1.

```
cluster1::> vserver cifs home-directory show-user -vserver vs1 -username gpo\rpuser1
Vserver : vs1
Username : GPO/rpuser1
ShareName                          Home Dir Path
-------------------------------------   ----------------------------------
root                                  /home/rpuser1
rpuser1                                /home/rpuser1
-GPO-rpuser1                          /home/GPO/rpuser1
```

The following command displays information about the home directory of user gpo\rpuser1 belonging to Vserver vs1 at share path /home/rpuser1.

```
cluster1::> vserver cifs home-directory show-user -vserver vs1 -username gpo\rpuser1 -path /home/rpuser1
Vserver : vs1
Username : GPO/rpuser1
ShareName                          Home Directory Path
-------------------------------------   ----------------------------------
root                                  /home/rpuser1
rpuser1                                /home/rpuser1
2 entries were displayed.
```

The following command displays information about the home directory of user gpo\rpuser1 belonging to Vserver vs1 at share ~GPO~rpuser1.

```
cluster1::> vserver cifs home-directory show-user -vserver vs1 -username gpo\rpuser1 -share-name ~GPO~rpuser1
Vserver : vs1
Username : GPO/rpuser1
ShareName                          Home Directory Path
-------------------------------------   ----------------------------------
~GPO~rpuser1                        /home/GPO/rpuser1
```

vserver cifs home-directory search-path commands

Manage the list of paths used to find home directories
vserver cifs home-directory search-path add

Add a home directory search path

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs home-directory search-path add command adds a search path to a CIFS home directory configuration.

Parameters
-vserver <vserver name> - Vserver
This parameter specifies the CIFS-enabled Vserver containing the CIFS home directory configuration to which you want to add the search path.

-path <text> - Path
This parameter specifies the search path you want to add.

Examples
The following example adds the path /home1 to the CIFS home directory configuration on Vserver vs1.

```
cluster1::> vserver cifs home-directory search-path add -vserver vs1 -path /home1
```

vserver cifs home-directory search-path remove

Remove a home directory search path

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs home-directory search-path remove command removes a search path from a CIFS home directory configuration.

Parameters
-vserver <vserver name> - Vserver
This parameter specifies the CIFS-enabled Vserver containing the CIFS home directory configuration from which you want to remove the search path.

-path <text> - Path
This parameter specifies the search path you want to remove.

Examples
The following example removes the path /home1 from the CIFS home directory configuration on Vserver vs1.

```
cluster1::> vserver cifs home-directory search-path remove -vserver vs1 -path /home1
```

vserver cifs home-directory search-path reorder

Change the search path order used to find a match

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.
Description
The `vserver cifs home-directory search-path reorder` command moves a search path to a new position in the search path order in the CIFS home directory configuration for the CIFS-enabled Vserver.

Parameters
- **-vserver <vserver name>** - Vserver
  This parameter specifies the CIFS enabled Vserver for which you want to reorder searches.
- **-path <text>** - Path
  This parameter specifies the search path you want to move.
- **-to-position <integer>** - Target Position
  This parameter specifies the new position of the search path in the search path order.

Examples
The following example moves the search path `/home1` to position 1 in the search path order for the CIFS home directory configuration on Vserver vs1.

```
cluster1::> vserver cifs home-directory search-path reorder -vserver vs1 -path /home1 -to-position 1
```

vserver cifs home-directory search-path show
Display home directory search paths

Availability: This command is available to cluster and Vserver administrators at the `admin` privilege level.

Description
The `vserver cifs home-directory search-path show` command displays information about the search paths that are in the home directory configuration for the CIFS-enabled Vservers.

Parameters
- **{ [-fields <fieldname>, ...] }**
  If you specify this parameter, the command only displays the fields that you specify.
- **[-instance ]**
  If you specify the -instance parameter, the command displays detailed information about all entries.
- **[-vserver <vserver name>] - Vserver**
  If you specify this parameter, the command displays home directory configuration for the CIFS-enabled Vserver that you specify.
- **[-path <text>] - Path**
  If you specify this parameter, the command displays information only for the search path that you specify.

Examples
The following example displays information about search paths for all CIFS home directories on all CIFS-enabled Vservers:

```
cluster1::> vserver cifs home-directory search-path show
Vserver   Position Path
----------- -------- ------------------
vs1        1        /home1
vs2        2        /home2
```

1664
Commands: Manual Page Reference
vserver cifs options commands

Manage CIFS options

vserver cifs options modify

Modify CIFS options

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs options modify command modifies CIFS options for a CIFS server.

Parameters
-vserver <vserver name> - Vserver
   This parameter specifies the name of the CIFS server for which you want to modify CIFS options.
- [default-unix-user <text>] - Default UNIX User
   This optional parameter specifies the name of the default UNIX user for the CIFS server.
- [read-grants-exec {enabled|disabled}] - Read Grants Exec for Mode Bits
   This optional parameter specifies whether the CIFS server does read grant execution for mode bits.
- [wins-servers <InetAddress>, ...] - Windows Internet Name Service (WINS) Addresses
   This optional parameter specifies a list of Windows Internet Name Server (WINS) addresses for the CIFS server. You must specify the WINS servers using an IP address. You can enter multiple WINS addresses as a comma-delimited list.
   Note: Use an IPv4 address because WINS over IPv6 is not supported.
- [smb1-enabled {true|false}] - Enable SMB1 Protocol (privilege: advanced)
   This optional parameter specifies whether the CIFS server negotiates the SMB 1.0 version of the CIFS protocol. The default value for this parameter is true for Vservers with Infinite Volume. For other data Vservers, the default value is false.
- [smb2-enabled {true|false}] - Enable all SMB2 Protocols (privilege: advanced)
   This optional parameter specifies whether the CIFS server negotiates the SMB 2 version of the CIFS protocol. The default value for this parameter is true. This parameter is not supported for Vservers with Infinite Volume.
- [smb3-enabled {true|false}] - Enable SMB3 Protocol (privilege: advanced)
   This optional parameter specifies whether the CIFS server negotiates the SMB 3 version of the CIFS protocol. The default value for this parameter is true. This parameter is not supported for Vservers with Infinite Volume.
- [smb31-enabled {true|false}] - Enable SMB3.1 Protocol (privilege: advanced)
   This optional parameter specifies whether the CIFS server negotiates the SMB 3.1 version of the CIFS protocol. The default value for this parameter is true. This parameter is not supported for Vservers with Infinite Volume.
- [max-mpx <integer>] - Maximum Simultaneous Operations per TCP Connection (privilege: advanced)
   This optional parameter specifies the maximum number of simultaneous operations the CIFS server reports it can process per TCP connection.
- [shadowcopy-dir-depth <integer>] - Maximum Depth of Directories to Shadow Copy (privilege: advanced)
   This optional parameter specifies the maximum depth of directories on which to create shadow copies in the CIFS server. The default for this parameter is 5. The value 0 indicates that all sub-directories should be shadow copied. This parameter is not supported for Vservers with Infinite Volume and workgroup CIFS.
servers. Directories and files within a FlexGroup will not be shadow copied because FlexGroups do not support shadow copy.

`-copy-offload-enabled (true|false)` - Enable Copy Offload Feature (privilege: advanced)
This optional parameter enables the Copy Offload feature in the CIFS server. If set to false, the Copy Offload feature is disabled. The default for this parameter is true. This parameter is not supported for Vservers with Infinite Volume. Copy Offload has no effect on files in a FlexGroup because FlexGroups do not support Copy Offload.

`-is-copy-offload-direct-copy-enabled (true|false)` - Is Direct-copy Copy Offload Mechanism Enabled (privilege: advanced)
This optional parameter enables the direct-copy mechanism for ODX copy offload in the CIFS server. If set to false, the direct-copy mechanism is disabled. The default for this parameter is true. This parameter is not supported for Vservers with Infinite Volume. Copy Offload has no effect on files in a FlexGroup because FlexGroups do not support Copy Offload.

The direct-copy mechanism increases the performance of the copy offload operation when Windows clients try to open the source file of a copy in a mode that prevents the file being changed while the copy is in progress. If turned off, regular copy offloading takes place.

`-default-unix-group <text>` - Default UNIX Group
This optional parameter specifies the name of the default UNIX group for the CIFS server. If you do not specify a default UNIX group, the CIFS ACL to NFSv4 ACL translation may result in incomplete NFSv4 ACL information. This parameter is not supported by Vservers with FlexVol volumes.

`-shadowcopy-enabled (true|false)` - Enable Shadow Copy Feature (VSS) (privilege: advanced)
This optional parameter enables the Shadow Copy (VSS) feature in the CIFS server when set to true. The VSS feature is disabled when set to false. The default for this parameter is true. This parameter is not supported for Vservers with Infinite Volume and workgroup CIFS servers. Directories and files within a FlexGroup will not be shadow copied because FlexGroups do not support shadow copy.

`-is-referral-enabled (true|false)` - Refer Clients to More Optimal LIFs (privilege: advanced)
This optional parameter specifies whether the CIFS server automatically refers clients to a data LIF local to the node which hosts the root of the requested share. The default value for this parameter is false. This parameter is not supported for Vservers with Infinite Volume.

`-is-local-auth-enabled (true|false)` - Is Local User Authentication Enabled (privilege: advanced)
This optional parameter specifies whether local user authentication is enabled for the CIFS server.

`-is-local-users-and-groups-enabled (true|false)` - Is Local Users and Groups Enabled (privilege: advanced)
This optional parameter specifies whether the local users and groups feature is enabled for the CIFS server.

`-is-use-junctions-as-reparse-points-enabled (true|false)` - Is Reparse Point Support Enabled (privilege: advanced)
This optional parameter specifies whether the CIFS server exposes junction points to Windows clients as reparse points. The default value for this parameter is true. This parameter is only active if the client has negotiated use of the SMB 2 or SMB 3 protocol. This parameter is not supported for Vservers with Infinite Volume.

`-is-exportpolicy-enabled (true|false)` - Is Export Policies for CIFS Enabled (privilege: advanced)
This optional parameter specifies whether the CIFS server uses export policies to control client access. The default value for this parameter is false.

`-is-unix-nt-acl-enabled (true|false)` - Is NT ACLs on UNIX Security-style Volumes Enabled (privilege: advanced)
This optional parameter specifies whether the CIFS server has the NT ACLs enabled on UNIX security-style volumes. The default value for this parameter is true.
- Is Enumeration of Trusted Domain and Search Capability Enabled (privilege: advanced)

This optional parameter specifies whether the CIFS server supports enumeration of bidirectional trusted domains. It also supports the search in all the bidirectional trusted domains when performing Windows user lookups for UNIX user to Windows user name mapping. The default value is true. This parameter is not supported for workgroup CIFS servers.

- Idle Timeout Before CIFS Session Disconnect (secs)

This optional parameter specifies the amount of idle time (in seconds) before a CIFS session is disconnected. The default value for this parameter is 900 seconds.

- Is Dynamic Access Control (DAC) Enabled (privilege: advanced)

This optional parameter enables the Dynamic Access Control (DAC) feature in the CIFS server when set to true. The DAC feature is disabled when set to false. The default for this parameter is false. This parameter is not supported for Vservers with Infinite Volume and workgroup CIFS servers.

- Restrictions for Anonymous User (privilege: advanced)

This optional parameter controls the access restrictions of non-authenticated sessions and applies the restrictions for the anonymous user based on the permitted values. The default value for this parameter is no-restriction. Permitted values for this option are:

- no-restriction - This option specifies no access restriction for anonymous users (default).
- no-enumeration - This option specifies that only enumeration is restricted.
- no-access - This option specifies that access is restricted for anonymous users.

- Is Deletion of Read-Only Files Enabled

This optional parameter controls deletion of read-only files and directories. NTFS delete semantics forbid deletion of a file or directory when the read-only attribute is set. UNIX delete semantics ignore it, focusing instead on parent directory permissions, which some applications require. This option is used to select the desired behavior. By default this option is disabled, yielding NTFS behavior.

- Size of File System Sector Reported to SMB Clients (bytes) (privilege: advanced)

This optional parameter specifies the size of file system sector reported to SMB clients (in bytes). The default value for this parameter is 4096. Valid values are 512 and 4096.

- Is Fake Open Support Enabled (privilege: advanced)

This optional parameter specifies whether the CIFS server supports fake open requests. This parameter allows you to optimize the open and close requests coming from SMB 2 clients. The default value for this parameter is true.

- Is UNIX Extensions Enabled (privilege: advanced)

When set to true, this optional parameter enables the UNIX Extensions feature in the CIFS server. If set to false, the UNIX Extensions feature is disabled. The default for this parameter is false. UNIX Extensions allows POSIX/UNIX style security to be displayed through the CIFS protocol.

- Is Search Short Names Support Enabled (privilege: advanced)

This optional parameter specifies whether the CIFS server supports searching short names. A search query with this option enabled will try to match 8.3 file names along with long file names. The default value for this parameter is false.
- `-is-advanced-sparse-file-support-enabled {true|false}` - Is Advanced Sparse File Support Enabled (privilege: advanced)

  This optional parameter specifies whether the CIFS server supports the advanced sparse file capabilities. This allows CIFS clients to query the allocated ranges of a file and to write zeroes or free data blocks for ranges of a file.

- `-is-fsctl-file-level-trim-enabled {true|false}` - Is Fsctl File Level Trim Enabled (privilege: advanced)

  This optional parameter specifies whether trim requests (FSCTL_FILE_LEVEL_TRIM) are supported on the CIFS server.

- `-guest-unix-user <text>` - Map the Guest User to Valid UNIX User (privilege: advanced)

  This optional parameter specifies that an unauthenticated user coming from any untrusted domain can be mapped to a specified UNIX user for the CIFS server. If the CIFS server cannot authenticate the user against a domain controller for the home domain or a trusted domain or the local database, and this option is enabled, the CIFS server considers the user as a guest user and maps the user to the specified UNIX user. The UNIX user must be a valid user.

- `-smb1-max-buffer-size <integer>` - Maximum Buffer Size Used for SMB1 Message (privilege: advanced)

  This optional parameter specifies the maximum buffer size used for an SMB 1.0 message that the CIFS server can receive. If the LARGE_READ or LARGE_WRITE capability is negotiated during session setup, then 'Read' or 'Write' SMB 1.0 operations are allowed to exceed the configured 'smb1-max-buffer-size' value. This parameter does not have any effect on SMB 2 or SMB 3 buffer size. The default value for this parameter is 65535. The supported range for this parameter is 4356 through 65535.

- `-max-same-user-sessions-per-connection <integer>` - Maximum Same User Sessions per TCP Connection (privilege: advanced)

  This optional parameter specifies the maximum number of CIFS sessions that can be set up by the same user per TCP connection. The default value of this parameter is 2500. The maximum value of this parameter is 4294967295.

- `-max-same-tree-connect-per-session <integer>` - Maximum Same Tree Connect per Session (privilege: advanced)

  This optional parameter specifies the maximum number of CIFS tree connects to the same share per CIFS session. The default value of this parameter is 5000. The maximum value of this parameter is 4294967295.

- `-max-opens-same-file-per-tree <integer>` - Maximum Opens on Same File per Tree (privilege: advanced)

  This optional parameter specifies the maximum number of existing opens on the same file per CIFS tree. The default value of this parameter is 1000. The maximum value of this parameter is 4294967295.

- `-max-watches-set-per-tree <integer>` - Maximum Watches Set per Tree (privilege: advanced)

  This optional parameter specifies the maximum number of watches, also known as change notifies, that can be set per CIFS tree. Tree here refers to a share connect from a single client. The default value of this parameter is 500. The maximum value of this parameter is 4294967295.

- `-is-admin-users-mapped-to-root-enabled {true|false}` - Map Administrators to UNIX User 'root' (privilege: advanced)

  If this optional parameter is set to true, Windows users who are members of the "BUILTIN\Administrators" group are mapped to UNIX user 'root' unless a user who is a member of this group is explicitly mapped to a UNIX user. If a Windows user is a member of the "BUILTIN\Administrators" group and an explicit user mapping exists for that user, the explicit name mapping takes precedence. If this parameter is set to false, users that are members of the "BUILTIN\Administrators" group are not mapped to UNIX 'root'. The default value for this parameter is true.

- `-is-advertise-dfs-enabled {true|false}` - (DEPRECATED)-Enable DFS Referral Advertisement (privilege: advanced)

  This optional parameter specifies whether to advertise DFS referral of the CIFS protocol. The default value for this parameter is false. This option is not applicable to SMB 1.0.
Note: This parameter is deprecated and may be removed in a future release of Data ONTAP. The functionality provided by this parameter is now controlled by the `-symlink-properties` parameter instead.

```bash
-is-path-component-cache-enabled {true|false} - Is Path Component Cache Enabled (privilege: advanced)
```

This optional parameter specifies whether the path component cache is enabled. The default value for this parameter is true.

```bash
-win-name-for-null-user <TextNoCase> - Map Null User to Windows User or Group (privilege: advanced)
```

This optional parameter specifies a valid Windows user or group name that will be added to the CIFS credentials for a NULL user Session.

```bash
-is-hide-dotfiles-enabled {true|false} - Is Hide Dot Files Enabled (privilege: advanced)
```

This optional parameter specifies whether the CIFS server supports hiding dot files. Directory enumeration with this option enabled hides files and directories that begin with a dot ("."). The default value for this parameter is false.

```bash
-is-client-version-reporting-enabled {true|false} - Is Client Version Reporting Enabled (privilege: advanced)
```

If this parameter is set to true, CIFS client version tracking information is collected by AutoSupport. The default value of this parameter is true.

```bash
-is-client-dup-detection-enabled {true|false} - Is Client Duplicate Session Detection Enabled (privilege: advanced)
```

This optional parameter specifies whether the CIFS server supports duplicate session detection. Duplicate sessions that come from the same client with VcNumber of zero with this option enabled will be closed, and is only applicable for SMB 1.0 clients. The default value for this parameter is true.

```bash
-grant-unix-group-perms-to-others {true|false} - Grant UNIX Group Permissions to Others (privilege: advanced)
```

This optional parameter specifies whether the incoming CIFS user who is not the owner of the file, can be granted the group permission. If the CIFS incoming user is not the owner of UNIX security-style file and this option is set to true, then at all times the file's "group" permissions are granted. If the CIFS incoming user is not the owner of UNIX security-style file and this option is set to false, then the normal UNIX rules are applicable to grant the permissions. The default value of this parameter is false.

```bash
-is-large-mtu-enabled {true|false} - Is Large MTU Enabled (privilege: advanced)
```

This optional parameter specifies whether the CIFS server supports the SMB 2.1 "large MTU" feature. The default value for this parameter is false. This parameter is not supported for Vservers with Infinite Volume.

```bash
-is-netbios-over-tcp-enabled {true|false} - Is NetBIOS over TCP (port 139) Enabled (privilege: advanced)
```

This optional parameter specifies whether the CIFS server supports the NetBIOS over TCP (port 139) feature. The default value for this parameter is true.

```bash
-is-nbns-enabled {true|false} - Is NBNS over UDP (port 137) Enabled (privilege: advanced)
```

This optional parameter specifies whether the CIFS server supports the NBNS protocol. The default value for this parameter is false.

```bash
-widelink-as-reparse-point-versions <CIFS Dialects>, ... - Protocol Versions for Which Widelink Will Be Reported as Reparse Point (privilege: advanced)
```

This optional parameter specifies the CIFS protocol versions for which the widelink is reported as reparse point. The default value for this parameter is `SMB1`.

Note: Any values entered for this parameter is replaced with the existing values.
Examples

The following example modifies CIFS options for the Vserver "vs1". It changes the default UNIX user, disables read grants exec, disables SMB2.x, changes maximum multiplex count to 1124, changes the file system sector size reported to SMB clients to 512, disables the direct-copy offload mechanism for ODX copy offload, enables the UNIX Extensions feature, disables fake open requests changes WINS servers to 192.168.11.112 and changes the client session timeout to 6000.

cluster1::> vserver cifs options modify -vserver vs1 -default-unix-user pcuser -read-grants-exec disabled -smb2-enabled false -max-mpx 1124 -file-system-sector-size 512 -is-copy-offload-direct-copy-enabled false -is-unix-extensions-enabled true -is-fake-open-enabled false -wins-servers 192.168.11.112 -client-session-timeout 6000

The following example modifies CIFS options for the Vserver "vs1". It enables the advanced sparse file support.

cluster1::> vserver cifs options modify -vserver vs1 -is-advanced-sparse-file-support-enabled true

The following example modifies CIFS options for the Vserver "vs1". It modifies limits for maximum opens on the same file, max sessions by the same user, max tree connects per session, and max watches set.

cluster1::> vserver cifs options modify -vserver vs1 -max-same-user-sessions-per-connection 100 -max-same-tree-connect-per-session 100 -max-opens-same-file-per-tree 150 -max-watches-set-per-tree 200

The following example modifies CIFS options for the Vserver "vs1". It modifies the option to disable the path component cache.

cluster1::> vserver cifs options modify -vserver vs1 -is-path-component-cache-enabled false

The following example modifies CIFS options for the Vserver "vs1". It modifies the option to disable CIFS client version tracking.

cluster1::> vserver cifs options modify -vserver vs1 -is-client-version-reporting-enabled false

The following example modifies CIFS option for the Vserver "vs1". It modifies the option to enable granting of UNIX group permissions to others.

cluster1::> vserver cifs options modify -vserver vs1 -grant-unix-group-perms-to-others true
vserver cifs options show

Display CIFS options

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs options show command displays the CIFS configuration options for one or more Vservers.

Parameters

{ [-fields <fieldname>, ...]
   If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified
   field or fields. You can use `-fields ?' to display the fields to specify.
}

[[-instance]]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver
If you specify this parameter, the command only displays CIFS options for the specified Vserver.

[-default-unix-user <text>] - Default UNIX User
If you specify this parameter, the command displays options for CIFS server with the specified UNIX user.

[-read-grants-exec {enabled|disabled}] - Read Grants Exec for Mode Bits
If this parameter is set to enabled, the command displays options for CIFS servers that grant execution access
when granting read access using mode bits. If set to disabled, the command displays options for CIFS servers
that do not grant execution access when granting read access using mode bits.

[-wins-servers <InetAddress>, ...] - Windows Internet Name Service (WINS) Addresses
If you specify this parameter, the command displays CIFS options only for CIFS servers that use the specified
Windows Internet Name Server (WINS) addresses.

[-smb1-enabled {true|false}] - Enable SMB1 Protocol (privilege: advanced)
If this parameter is set to true, the command displays options for CIFS servers where SMB 1.0 version of the
CIFS protocol is negotiated. If set to false, the command displays options for CIFS servers where SMB 1.0
version of the CIFS protocol is not negotiated.

[-smb2-enabled {true|false}] - Enable all SMB2 Protocols (privilege: advanced)
If this parameter is set to true, the command displays options for CIFS servers where SMB 2 version of the
CIFS protocol is negotiated. If set to false, the command displays options for CIFS servers where SMB 2
version of the CIFS protocol is not negotiated.

[-smb3-enabled {true|false}] - Enable SMB3 Protocol (privilege: advanced)
If this parameter is set to true, the command displays options for CIFS servers where SMB 3 version of the
CIFS protocol is negotiated. If set to false, the command displays options for CIFS servers where SMB 3
version of the CIFS protocol is not negotiated.

[-smb31-enabled {true|false}] - Enable SMB3.1 Protocol (privilege: advanced)
If this parameter is set to true, the command displays options for CIFS servers where SMB 3.1 version of the
CIFS protocol is negotiated. If set to false, the command displays options for CIFS servers where SMB 3.1
version of the CIFS protocol is not negotiated.

[-max-mpx <integer>] - Maximum Simultaneous Operations per TCP Connection (privilege: advanced)
If you specify this parameter, the command displays options for CIFS server with the specified maximum
number of simultaneous operations the CIFS server can process per TCP connection.
[-shadowcopy-dir-depth <integer>] - Maximum Depth of Directories to Shadow Copy (privilege: advanced)
    If you specify this parameter, the command displays options only for CIFS servers that are configured with the
    specified depth of directories on which to create shadow copies.

[-copy-offload-enabled {true|false}] - Enable Copy Offload Feature (privilege: advanced)
    If set to true, this command displays options only for CIFS servers where the Copy Offload feature is enabled.
    If set to false, options are displayed for CIFS servers where the Copy Offload feature is disabled.

[-is-copy-offload-direct-copy-enabled {true|false}] - Is Direct-copy Copy Offload Mechanism Enabled
    (privilege: advanced)
    If set to true, this command displays options only for CIFS servers where the direct-copy mechanism for ODX
    Copy Offload is enabled. If set to false, options are displayed for CIFS servers where the direct-copy offload
    mechanism is disabled.
    The direct-copy mechanism increases the performance of the copy offload operation when Windows clients try
    to open the source file of a copy in a mode that prevents the file being changed while the copy is in progress. If
    turned off, regular copy offloading takes place.

[-default-unix-group <text>] - Default UNIX Group
    If you specify this parameter, the command displays options for CIFS server with the specified default UNIX
    group.

[-shadowcopy-enabled {true|false}] - Enable Shadow Copy Feature (VSS) (privilege: advanced)
    If set to true, this command displays options only for CIFS servers where the Shadow Copy (VSS) feature is
    enabled. If set to false, options are displayed for CIFS servers where the Shadow Copy (VSS) feature is
    disabled.

[-is-referral-enabled {true|false}] - Refer Clients to More Optimal LIFs (privilege: advanced)
    If set to true, the command displays options for the CIFS server where the CIFS server automatically refers
    clients to a data LIF local to the node which hosts the root of the requested share. If set to false, the command
    displays options for the CIFS server where the mechanism, to automatically refer the clients to data LIF local
    to the node which hosts the root of the requested share, is disabled.

[-is-local-auth-enabled {true|false}] - Is Local User Authentication Enabled (privilege: advanced)
    If this parameter is set to true, the command displays CIFS options only for CIFS servers where local user
    authentication is enabled. If set to false, the command displays options for CIFS servers where local user
    authentication is disabled.

[-is-local-users-and-groups-enabled {true|false}] - Is Local Users and Groups Enabled (privilege:
    advanced)
    If this parameter is set to true, the command displays CIFS options only for CIFS servers where the local users
    and groups feature is enabled. If set to false, the command displays options for CIFS servers where the local
    users and groups feature is disabled.

[-is-use-junctions-as-reparse-points-enabled {true|false}] - Is Reparse Point Support Enabled
    (privilege: advanced)
    If you specify this parameter, the command only displays CIFS options for Vservers which have the specified
    reparse point setting.

[-is-exportpolicy-enabled {true|false}] - Is Export Policies for CIFS Enabled (privilege: advanced)
    If you specify this parameter, the command only displays CIFS options for Vservers which have the specified
    export policy setting.

[-is-unix-nt-acl-enabled {true|false}] - Is NT ACLs on UNIX Security-style Volumes Enabled (privilege:
    advanced)
    If this parameter is set to true, the command only displays CIFS options for Vservers that have the NT ACLs
    on UNIX security-style volumes enabled. If set to false, the command displays CIFS options for Vservers that
    have the NT ACLS on UNIX security-style volumes disabled.
[\text{-is-trusted-domain-enum-search-enabled \{true|false\}}] - Is Enumeration of Trusted Domain and Search Capability Enabled (privilege: advanced)

If this parameter is set to true, the command displays CIFS options only for CIFS servers that support enumeration of bidirectional trusted domains and that support searching in all bidirectional trusted domains when performing Windows user lookups for UNIX user to Windows user name mapping. If set to false, the command displays options for CIFS servers that do not support enumeration of bidirectional trusted domains.

[\text{-client-session-timeout <integer>}] - Idle Timeout Before CIFS Session Disconnect (secs)

If you specify this parameter, the command displays options only for CIFS servers that are configured with the specified client session timeout value (in seconds).

[\text{-is-dac-enabled \{true|false\}}] - Is Dynamic Access Control (DAC) Enabled (privilege: advanced)

If set to true, this command displays options only for CIFS servers where the Dynamic Access Control (DAC) feature is enabled. If set to false, options are displayed for CIFS servers where the Dynamic Access Control (DAC) feature is disabled.

[\text{-restrict-anonymous \{no-restriction|no-enumeration|no-access\}}] - Restrictions for Anonymous User (privilege: advanced)

If you specify this parameter, the command displays CIFS options only for CIFS servers that have the specified permitted value for the anonymous user. Permitted values for this option are:

- no-restriction - There is no access restriction for anonymous users.
- no-enumeration - Only enumeration is restricted.
- no-access - Access is restricted for anonymous users.

[\text{-is-read-only-delete-enabled \{enabled|disabled\}}] - Is Deletion of Read-Only Files Enabled

If you specify this parameter, the command displays options only for CIFS servers that have the specified is-read-only-delete-enabled setting.

[\text{-file-system-sector-size \{512|4096 \{in\ bytes\}\}}] - Size of File System Sector Reported to SMB Clients (bytes) (privilege: advanced)

If you specify this parameter, the command displays options only for CIFS servers that are configured with the specified file system sector size (in bytes).

[\text{-is-fake-open-enabled \{true|false\}}] - Is Fake Open Support Enabled (privilege: advanced)

If you set this parameter to true, the command displays options for CIFS servers where fake open is enabled. If set to false, the command displays options for CIFS servers where fake open is disabled.

[\text{-is-unix-extensions-enabled \{true|false\}}] - Is UNIX Extensions Enabled (privilege: advanced)

If set to true, this command displays options only for CIFS servers where the UNIX Extensions feature is enabled. If set to false, options are displayed for CIFS servers where the UNIX Extensions feature is disabled. UNIX Extensions allows POSIX/UNIX style security to be displayed through the CIFS protocol.

[\text{-is-search-short-names-enabled \{true|false\}}] - Is Search Short Names Support Enabled (privilege: advanced)

If you set this parameter to true, the command displays options for CIFS servers where search short names is enabled. If set to false, the command displays options for CIFS servers where search short names is disabled.

[\text{-is-advanced-sparse-file-support-enabled \{true|false\}}] - Is Advanced Sparse File Support Enabled (privilege: advanced)

If set to true, the command displays options for CIFS servers where the advanced sparse file capabilities for CIFS are enabled. If set to false, options are displayed for CIFS servers where the advanced sparse file capabilities for CIFS are disabled.
[-is-fsctl-file-level-trim-enabled {true|false}] - Is Fsctl File Level Trim Enabled (privilege: advanced)
If set to true, the command displays options for all the CIFS servers where trim requests (FSCTL_FILE_LEVEL_TRIM) are supported. If set to false, options are displayed for all the CIFS servers where trim requests (FSCTL_FILE_LEVEL_TRIM) are not supported.

[-guest-unix-user <text>] - Map the Guest User to Valid UNIX User (privilege: advanced)
If you specify this parameter, the command displays options for CIFS server with the specified guest UNIX user.

[-smb1-max-buffer-size <integer>] - Maximum Buffer Size Used for SMB1 Message (privilege: advanced)
If you specify this parameter, the command displays options only for CIFS servers that are configured with the specified maximum buffer size value.

[-max-same-user-sessions-per-connection <integer>] - Maximum Same User Sessions per TCP Connection (privilege: advanced)
If you specify this parameter, the command displays options only for CIFS server that are configured with the specified maximum same user session per connection.

[-max-same-tree-connect-per-session <integer>] - Maximum Same Tree Connect per Session (privilege: advanced)
If you specify this parameter, the command displays options only for CIFS server that are configured with the specified maximum same tree connects per session.

[-max-opens-same-file-per-tree <integer>] - Maximum Opens on Same File per Tree (privilege: advanced)
If you specify this parameter, the command displays options only for CIFS server that are configured with the specified maximum opens on same file per tree.

[-max-watches-set-per-tree <integer>] - Maximum Watches Set per Tree (privilege: advanced)
If you specify this parameter, the command displays options only for CIFS server that are configured with the specified maximum watches set per tree. Tree here refers to a share connect from a single client.

[-is-admin-users-mapped-to-root-enabled {true|false}] - Map Administrators to UNIX User 'root' (privilege: advanced)
If you set this parameter to true, the command displays options for CIFS servers where members of "BUILTIN\Administrators" group are mapped to UNIX user 'root'. If set to false, the command displays options for CIFS servers where members of the "BUILTIN\Administrators" group are not mapped to UNIX user 'root'.

[-is-advertise-dfs-enabled {true|false}] - (DEPRECATED)-Enable DFS Referral Advertisement (privilege: advanced)
If this parameter is set to true, the command displays CIFS options only for CIFS servers where DFS referral advertisement is enabled. If set to false, the command displays options for CIFS servers where DFS referral advertisement is disabled. This option is not applicable to SMB 1.0.

  Note: This parameter is deprecated and may be removed in a future release of Data ONTAP. The functionality provided by this parameter is now controlled by the -symlink-properties parameter instead.

[-is-path-component-cache-enabled {true|false}] - Is Path Component Cache Enabled (privilege: advanced)
If this parameter is set to true, the command displays options for CIFS servers where the path component cache is enabled. If set to false, the command displays options for CIFS servers where the path component cache is disabled.

[-win-name-for-null-user <TextNoCase>] - Map Null User to Windows User or Group (privilege: advanced)
If you specify this parameter, the command displays options only for CIFS servers that are configured to add the specified windows user or group into CIFS credentials for null sessions.
[-is-hide-dotfiles-enabled {true|false}] - Is Hide Dot Files Enabled (privilege: advanced)
When set to true, this optional parameter enables the Hide Dot Files feature in the CIFS server. If set to false, the Hide Dot Files feature is disabled. The default value for this parameter is false.

[-is-client-version-reporting-enabled {true|false}] - Is Client Version Reporting Enabled (privilege: advanced)
If this parameter is set to true, the command displays options for CIFS servers where CIFS client version tracking is enabled. If set to false, the command displays options for CIFS servers where CIFS client version tracking is disabled.

[-is-client-dup-detection-enabled {true|false}] - Is Client Duplicate Session Detection Enabled (privilege: advanced)
If this parameter is set to true, the command displays options for CIFS servers where client duplicate session detection is enabled. If set to false, the command displays options for CIFS servers where client duplicate session detection is not enabled.

[-grant-unix-group-perms-to-others {true|false}] - Grant UNIX Group Permissions to Others (privilege: advanced)
If this parameter is set to true, the command displays CIFS options only for CIFS servers where grant unix group permissions to others feature is enabled. If set to false, the command displays options for CIFS servers where grant unix group permissions to others feature is disabled.

[-is-large-mtu-enabled {true|false}] - Is Large MTU Enabled (privilege: advanced)
If you specify this parameter, the command displays options only for CIFS servers that are configured to support the SMB 2.1 "Large MTU" feature.

[-is-netbios-over-tcp-enabled {true|false}] - Is NetBIOS over TCP (port 139) Enabled (privilege: advanced)
If you specify this parameter, the command displays options only for CIFS servers that are configured to support the NetBIOS over TCP (port 139) feature.

[-is-nbns-enabled {true|false}] - Is NBNS over UDP (port 137) Enabled (privilege: advanced)
If you specify this parameter, the command displays CIFS options only for CIFS servers that use the specified setting for the NBNS protocol.

[-widelink-as-reparse-point-vers <CIFS Dialects>, ...] - Protocol Versions for Which Widelink Will Be Reported as Reparse Point (privilege: advanced)
If you specify this parameter, the command displays CIFS options only for the CIFS servers that matches the specified CIFS protocol versions for which widelinks are reported as reparse points. If a list is entered, entries are returned that matches all the specified versions.

### Examples

The following example lists CIFS options for a Vserver on the cluster.

```
cluster1::> vserver cifs options show
Vserver: vs1
   Client Session Timeout: 900
   Default Unix Group: -
   Default Unix User: pcuser
   Guest Unix User: guestusers
   Read Grants Exec: disabled
   WINs Servers: -
```

At the advanced level, the output displays the information below.

```
cluster1::*> vserver cifs options show
Vserver: vs1
```
At the diagnostic level, the output displays the information below.

```
cluster1::*> vserver cifs options show
Vserver: vs1

Client Session Timeout: 900
Copy Offload Enabled: true
Default Unix Group: -
Default Unix User: pcuser
Guest Unix User: -
Are Administrators mapped to 'root': true
Is Advanced Sparse File Support Enabled: true
Direct-Copy Copy Offload Enabled: true
Export Policies Enabled: false
Grant Unix Group Permissions to Others: true
Is Advertise DFS Enabled: true
Is Client Duplicate Session Detection Enabled: true
Is Client Version Reporting Enabled: true
Is DAC Enabled: false
Is Fake Open Support Enabled: true
Is Hide Dot Files Support Enabled: false
Is Large MTU Enabled: true
Is Local Auth Enabled: true
Is Local Users and Groups Enabled: true
Is NetBIOS over TCP (port 139) Enabled: true
Is Referral Enabled: false
Is Search Short Names Support Enabled: false
Is Trusted Domain Enumeration And Search Enabled: true
Is UNIX Extensions Enabled: false
Is Use Junction as Reparse Point Enabled: true
Max Multiplex Count: 255
Max Same User Session Per Connection: 2500
Max Same Tree Connect Per Session: 5000
Max Opens Same File Per Tree: 1000
Max Watches Set Per Tree: 500
NBNS Interfaces : -
Is Path Component Cache Enabled: true
NT ACLs on UNIX Security Style Volumes Enabled: true
Read Grants Exec: disabled
Read Only Delete: disabled
Reported File System Sector Size: 4096
Restrict Anonymous: no-restriction
Shadowcopy Dir Depth: 5
Shadowcopy Enabled: true
SMB1 Enabled: true
SMB2 Enabled: true
SMB3 Enabled: true
SMB3.1 Enabled: true
Map Null User to Windows User or Group: cifsGroup
WINS Servers: -
Report Widelink as Reparse Point Versions: SMB1
```

**vserver cifs security commands**

Manage CIFS security settings

**vserver cifs security modify**

Modify CIFS security settings

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The vserver cifs security modify command modifies CIFS server security settings.

**Parameters**

- **vserver <vserver name>** - *Vserver*
  
  This parameter specifies the name of the Vserver whose CIFS security settings you want to modify.

- **[-kerberos-clock-skew <integer>]** - Maximum Allowed Kerberos Clock Skew
  
  This parameter specifies the maximum allowed Kerberos ticket clock skew in minutes. The default is 5 minutes.

- **[-kerberos-ticket-age <integer>]** - Kerberos Ticket Lifetime
  
  This parameter specifies the Kerberos ticket lifetime in hours. The default is 10 hours.

- **[-kerberos-renew-age <integer>]** - Maximum Kerberos Ticket Renewal Days
  
  This parameter specifies the maximum Kerberos ticket renewal lifetime in days. The default is 7 days.

- **[-kerberos-kdc-timeout <integer>]** - Timeout for Kerberos KDC Connections (Secs)
  
  This parameter specifies the timeout for sockets on KDCs after which all KDCs are marked as unreachable. The default is 3 seconds.
[-is-signing-required {true|false}] - Require Signing for Incoming CIFS Traffic

This parameter specifies whether signing is required for incoming CIFS traffic. The default is false.

[-is-password-complexity-required {true|false}] - Require Password Complexity for Local User Accounts

This parameter specifies whether password complexity is required for CIFS local users. If this parameter is set to true, password complexity is required. If the value is set to false, password complexity is not required. The default is true for CIFS servers.

[-use-start-tls-for-ad-ldap {true|false}] - Use start_tls for AD LDAP Connections

This parameter specifies whether to use Start TLS over AD LDAP connections. When enabled, the communication between the Data ONTAP LDAP Client and the LDAP Server will be encrypted using Start TLS. Start TLS is a mechanism to provide secure communication by using the TLS/SSL protocols. If you do not specify this parameter, the default is false.

[-is-aes-encryption-enabled {true|false}] - Is AES-128 and AES-256 Encryption for Kerberos Enabled

This parameter specifies whether to use Kerberos AES-128 and AES-256 encryption types for authentication. When enabled and depending on negotiation with the KDC service, it is possible for authentication operations to utilize these encryption types. If you do not specify this parameter, the default is false.

[-lm-compatibility-level {lm-ntlm-ntlmv2-krb|ntlm-ntlmv2-krb|ntlmv2-krb|krb}] - LM Compatibility Level

This parameter specifies the LM compatibility level. The default is lm-ntlm-ntlmv2-krb (LM, NTLM, NTLMv2 and Kerberos).

[-is-smb-encryption-required {true|false}] - Require SMB Encryption for Incoming CIFS Traffic
