OpenStack Swift API support in StorageGRID

StorageGRID supports the following specific versions of Swift and HTTP.

Item	Version
Swift specification	OpenStack Swift Object Storage API v1 as of November 2015
HTTP	1.1 For more information about HTTP, see HTTP/1.1 (RFC 2616). **Note:** StorageGRID does not support HTTP/1.1 pipelining.

OpenStack: Object Storage API

History of Swift API support in StorageGRID

You should be aware of changes to the StorageGRID system's support for the Swift REST API.

Release	Comments
11.2	Minor editorial changes to document.
11.1	Added support for using HTTP for Swift client connections to grid nodes. Updated the definitions of consistency controls.
11.0	Added support for 1,000 containers for each tenant account.
10.4	Added support for POST container and PUT, GET, and HEAD container ACL headers for Keystone configured grids. **Note:** Keystone is disabled by default. To enable Keystone, contact your NetApp representative.
10.3	Administrative updates and corrections to the document. Removed sections for configuring custom server certificates.
10.2	Initial support of the Swift API by the StorageGRID system. The currently supported version is OpenStack Swift Object Storage API v1.

How StorageGRID implements the Swift REST API

A client application can use Swift REST API calls to connect to Storage Nodes and API Gateway Nodes to create containers and to store and retrieve objects. This enables service-oriented applications developed for OpenStack Swift to connect with on-premise object storage provided by the StorageGRID system.

Swift object management

After Swift objects have been ingested in the StorageGRID system, they are managed by the information lifecycle management (ILM) rules in the system's active ILM policy. The ILM rules and policy determine how StorageGRID creates and distributes copies of object data and how it manages those copies over time. For example, an ILM rule might apply to objects in specific Swift containers

and might specify that multiple object copies be saved to several data centers for a certain number of years.

Contact your StorageGRID administrator if you need to understand how the grid's ILM rules and policies will affect the objects in your Swift tenant account.

Conflicting client requests

Conflicting client requests, such as a two clients writing to the same key, are resolved on a “latest-wins” basis. The timing for the “latest-wins” evaluation is based on when the StorageGRID system completes a given request, and not on when Swift clients begin an operation.

Consistency guarantees and controls

By default, StorageGRID provides read-after-write consistency for newly created objects and eventual consistency for object updates and HEAD operations. Any GET following a successfully completed PUT will be able to read the newly written data. Overwrites of existing objects, metadata updates, and deletes are eventually consistent. Overwrites generally take seconds or minutes to propagate, but can take up to 15 days.

StorageGRID also allows you to control consistency on a per container basis. You can change the consistency control to make a trade-off between the availability of the objects and the consistency of those objects across different Storage Nodes and sites, as required by your application.

Recommendations for implementing the Swift REST API

You should follow these recommendations when implementing the Swift REST API for use with StorageGRID.

Recommendations for HEADs to non-existent objects

If your application routinely checks to see if an object exists at a path where you do not expect the object to actually exist, you should use the “Available” consistency control. For example, you should use the “Available” consistency control if your application performs a HEAD operation to a location before performing a PUT operation to that location.

Otherwise, if the HEAD operation does not find the object, you might receive a high number of 500 Internal Server errors if one or more Storage Nodes are unavailable.

You can set the “Available” consistency control for each bucket using the PUT Bucket consistency request.

Recommendations for object names

You should not use random values as the first four characters of object names. Instead, you should use non-random, non-unique prefixes, such as `image`.

If you do need to use random and unique characters in object name prefixes, you should prefix the object names with a directory name. That is, use this format:

```
mycontainer/mydir/f8e3-image3132.jpg
```

Instead of this format:

```
mycontainer/f8e3-image3132.jpg
```

Recommendations for "range reads"

If the **Stored Object Compression** grid option is enabled for StorageGRID, Swift client applications should avoid performing GET object operations that specify a range of bytes be returned. These "range read" operations are inefficient because StorageGRID must effectively uncompress the objects to access the requested bytes. GET Object operations that request a small range of bytes from a very large object are especially inefficient; for example, it is very inefficient to read a 10 MB range from a 50 GB compressed object.

If ranges are read from compressed objects, client requests can time out.

Note: If you need to compress objects and your client application must use range reads, increase the read timeout for the application.

Configuring tenant accounts and connections

Configuring StorageGRID to accept connections from client applications requires creating one or more tenant accounts and setting up the connections.

Steps

1. Creating and configuring Swift tenant accounts on page 7
2. Identifying IP addresses for API Gateway Nodes and Storage Nodes on page 8
3. Deciding to use HTTPS or HTTP connections on page 8
4. Identifying port numbers for API Gateway Nodes and Storage Nodes on page 9
5. Testing your connection in the Swift API configuration on page 9

Creating and configuring Swift tenant accounts

A Swift tenant account is required before Swift API clients can store and retrieve objects on StorageGRID. Each tenant account has its own account ID, groups and users, and containers and objects.

Swift tenant accounts are created by a StorageGRID grid administrator using the Grid Manager or the Grid Management API.

When creating a Swift tenant account, the grid administrator specifies the following information:

- Display name for the tenant (the tenant's account ID is assigned automatically and cannot be changed)
- Optionally, a storage quota for the tenant account—the maximum number of gigabytes, terabytes, or petabytes available for the tenant's objects. A tenant's storage quota represents a logical amount (object size), not a physical amount (size on disk).
- If single sign-on (SSO) is not in use for the StorageGRID system, whether the tenant account will use its own identity source or share the grid's identity source, and the initial password for the tenant's local root user.
- If SSO is enabled, which federated group has Root Access permission to configure the tenant account.

After a Swift tenant account is created, users with the Root Access permission can access the Tenant Manager to perform tasks such as the following:

- Setting up identity federation (unless the identity source is shared with the grid), and creating local groups and users
- Monitoring storage usage

Attention: Swift users must have the Root Access permission to access the Tenant Manager. However, the Root Access permission does not allow users to authenticate into the Swift REST API to create containers and ingest objects. Users must have the Administrator permission to authenticate into the Swift REST API.

Using tenant accounts

Identifying IP addresses for API Gateway Nodes and Storage Nodes

Client applications use the IP address of a Storage Node or API Gateway Node to connect to StorageGRID.

About this task

Client applications connect directly to StorageGRID Storage Nodes or API Gateway Nodes to store and retrieve objects. API Gateway Nodes allow ingests to be load balanced across Storage Nodes.

You can use the Grid Manager to look up the IP address of a specific Storage Node or API Gateway Node.

Steps

1. Sign in to the Grid Manager using a supported browser.
2. Select **Nodes**.
3. Select the Storage Node or API Gateway Node to which you want to connect.
4. Select the **Overview** tab.
5. In the Node Information section, note the IP addresses for the node.
6. Click **Show more** to view IPv6 addresses and interface mappings.

   You can establish connections from client applications to any of the IP addresses in the list:

   - **eth0:** Grid Network
   - **eth1:** Admin Network (optional)
   - **eth2:** Client Network (optional)

   Note: IPv6 is only supported for client application connections through the API Gateway Node.

Related information

Administering StorageGRID

Deciding to use HTTPS or HTTP connections

Client applications can use encrypted HTTPS connections or less-secure HTTP connections when they connect to the Storage Nodes or API Gateway Nodes.

By default, client applications use HTTPS for all connections with Storage Nodes and API Gateway Nodes. Optionally, the **HTTP** option can be enabled from the Grid Manager to also allow client applications to use HTTP. For example, a client application might use HTTP when testing the connection to a Storage Node in a non-production environment.

Attention: HTTP mode is intended for use in testing and debugging environments. Be careful when enabling HTTP for a production grid since requests will be sent unencrypted.

To learn how to enable this option, see information about administering StorageGRID. If the **HTTP** option has been enabled for the grid, you must use different ports for HTTP communications than for HTTPS communications.

Identifying port numbers for API Gateway Nodes and Storage Nodes on page 9

Related information

Administering StorageGRID

Identifying port numbers for API Gateway Nodes and Storage Nodes

You must know which port number to use when connecting the Swift client to the Storage Node or API Gateway Node.

The following ports are used by Swift clients to connect to the StorageGRID system. You use different ports to connect to Storage Nodes than to connect to API Gateway Nodes. The port number also depends on whether the **HTTP** grid option has been enabled and you are using an HTTP connection.

Grid node	Use	Port number
API Gateway Node	Swift port for HTTPS	8083
	Swift port for HTTP	8085
Storage Node	Swift port for HTTPS	18083
	Swift port for HTTP	18085

Testing your connection in the Swift API configuration

You can use the Swift CLI to test your connection to the StorageGRID system and to verify that you can read and write objects to the system.

Before you begin

- You must have downloaded and installed `python-swiftclient`, the Swift command-line client, at *https://swiftstack.com/docs/integration/python-swiftclient.html*.
- You must have a Swift tenant account in the StorageGRID system.

About this task

If you have not configured security, you must add the `--insecure` flag to each of these commands.

Steps

1. Query the info URL for your StorageGRID Swift deployment:

```
swift
-U <Tenant_Account_ID:User_Name>
-K <User_Password>
-A https://<FQDN | IP>:<Port>/info
capabilities
```

   This is sufficient to test that your Swift deployment is functional. To further test account configuration by storing an object, continue with the additional steps.

2. Put an object in the container:

```
touch test_object
swift
-U <Tenant_Account_ID:Account_User_Name>
-K <User_Password>
-A https://<FQDN | IP>:<Port>/auth/v1.0
upload test_container test_object
--object-name test_object
```

3. Get the container to verify the object:

```
swift
-U <Tenant_Account_ID:Account_User_Name>
-K <User_Password>
-A https://<FQDN | IP>:<Port>/auth/v1.0
list test_container
```

4. Delete the object:

```
swift
-U <Tenant_Account_ID:Account_User_Name>
-K <User_Password>
-A https://<FQDN | IP>:<Port>/auth/v1.0
delete test_container test_object
```

5. Delete the container:

```
swift
-U <Tenant_Account_ID:Account_User_Name>
-K <User_Password>
-A https://<FQDN | IP>:<Port>/auth/v1.0
delete test_container
```

Swift REST API supported operations

The StorageGRID system supports most operations in the OpenStack Swift API. Before integrating Swift REST API clients with StorageGRID, review the implementation details for account, container, and object operations.

Operations supported in StorageGRID

The following Swift API operations are supported:

- *Account operations* on page 13
- *Container operations* on page 15
- *Object operations* on page 18

Common response headers for all operations

The StorageGRID system implements all common headers for supported operations as defined by the OpenStack Swift Object Storage API v1.

Related information

OpenStack: Object Storage API

Supported Swift API endpoints

StorageGRID supports the following Swift API endpoints: the info URL, the auth URL, and the storage URL.

info URL

You can determine the capabilities and limitations of the StorageGRID Swift implementation by issuing a GET request to the Swift base URL with the `/info` path.

```
https://FQDN | Node_IP:Swift_Port/info/
```

In the request:

- *`FQDN`* is the fully qualified domain name.
- *`Node_IP`* is the IP address for the Storage Node or the API Gateway Node on the StorageGRID network.
- *`Swift_Port`* is the port number used for Swift API connections on the Storage Node or API Gateway Node.

For example, the following info URL would request information from a Storage Node with the IP address of `10.99.106.103` and using port 18083.

```
https://10.99.106.103:18083/info/
```

The response includes the capabilities of the Swift implementation as a JSON dictionary. A client tool can parse the JSON response to determine the capabilities of the implementation and use them as constraints for subsequent storage operations.

The StorageGRID implementation of Swift allows unauthenticated access to the info URL.

auth URL

A client can use the Swift auth URL to authenticate as a tenant account user.

```
https://FQDN | Node_IP:Swift_Port/auth/v1.0/
```

You must provide the tenant account ID, user name, and password as parameters in the `X-Auth-User` and `X-Auth-Key` request headers, as follows:

```
X-Auth-User: Tenant_Account_ID:Username
```

```
X-Auth-Key: Password
```

In the request headers:

- *`Tenant_Account_ID`* is the account ID assigned by StorageGRID when the Swift tenant was created. This is the same tenant account ID used on the Tenant Manager sign-in page.
- *`Username`* is the name of a tenant user that has been created in the Tenant Manager. This user must belong to a group that has the Administrator permission. The tenant's root user cannot be configured to use the Swift REST API.
  If Identity Federation is enabled for the tenant account, provide the username and password of the federated user from the LDAP server. Alternatively, provide the LDAP user's domain name. For example:

  ```
  X-Auth-User: Tenant_Account_ID:Username@Domain_Name
  ```

- *`Password`* is the password for the tenant user. User passwords are created and managed in the Tenant Manager.

The response to a successful authentication request returns a storage URL and an auth token, as follows:

```
X-Storage-Url: https://FQDN | Node_IP:Swift_Port/v1/Tenant_Account_ID
X-Auth-Token: token
X-Storage-Token: token
```

By default, the token is valid for 24 hours from generation time.

Tokens are generated for a specific tenant account. A valid token for one account does not authorize a user to access another account.

storage URL

A client application can issue Swift REST API calls to perform supported account, container, and object operations against an API Gateway Node or Storage Node. Storage requests are addressed to the storage URL returned in the authentication response. The request must also include the `X-Auth-Token` header and value returned from the auth request.

```
https://FQDN | IP:Swift_Port/v1/Tenant_Account_ID
[/container][/object]
X-Auth-Token: token
```

Some storage response headers that contain usage statistics might not reflect accurate numbers for recently modified objects. It might take a few minutes for accurate numbers to appear in these headers.

The following response headers for account and container operations are examples of those that contain usage statistics:

- `X-Account-Bytes-Used`
- `X-Account-Object-Count`
- `X-Container-Bytes-Used`
- `X-Container-Object-Count`

Account operations

The following Swift API operations are performed on accounts.

GET account

This operation retrieves the container list associated with the account and account usage statistics.

The following request parameter is required:

- `Account`

The following request header is required:

- `X-Auth-Token`

The following supported request query parameters are optional:

- `Delimiter`
- `End_marker`
- `Format`
- `Limit`
- `Marker`
- `Prefix`

A successful execution returns the following headers with an “HTTP/1.1 204 No Content” response if the account is found and has no containers or the container list is empty; or an “HTTP/1.1 200 OK” response if the account is found and the container list is not empty:

- `Accept-Ranges`
- `Content-Length`
- `Content-Type`
- `Date`
- `X-Account-Bytes-Used`
- `X-Account-Container-Count`
- `X-Account-Object-Count`
- `X-Timestamp`
- `X-Trans-Id`

HEAD account

This operation retrieves account information and statistics from a Swift account.

The following request parameter is required:

- `Account`

The following request header is required:

- `X-Auth-Token`

A successful execution returns the following headers with an “HTTP/1.1 204 No Content” response:

- `Accept-Ranges`
- `Content-Length`
- `Date`
- `X-Account-Bytes-Used`
- `X-Account-Container-Count`
- `X-Account-Object-Count`
- `X-Timestamp`
- `X-Trans-Id`

Related references

Swift operations tracked in the audit logs on page 32

Container operations

StorageGRID supports a maximum of 1,000 containers per Swift account. The following Swift API operations are performed on containers.

DELETE container

This operation removes an empty container from a Swift account in a StorageGRID system.

The following request parameters are required:

- `Account`
- `Container`

The following request header is required:

- `X-Auth-Token`

A successful execution returns the following headers with an "HTTP/1.1 204 No Content" response:

- `Content-Length`
- `Content-Type`
- `Date`
- `X-Trans-Id`

GET container

This operation retrieves the object list associated with the container along with container statistics and metadata in a StorageGRID system.

The following request parameters are required:

- `Account`
- `Container`

The following request header is required:

- `X-Auth-Token`

The following supported request query parameters are optional:

- `Delimiter`
- `End_marker`
- `Format`
- `Limit`
- `Marker`
- `Path`
- `Prefix`

A successful execution returns the following headers with an "HTTP/1.1 200 Success" or a "HTTP/1.1 204 No Content" response:

- `Accept-Ranges`
- `Content-Length`

- `Content-Type`
- `Date`
- `X-Container-Bytes-Used`
- `X-Container-Object-Count`
- `X-Timestamp`
- `X-Trans-Id`

When this operation is set in Keystone enabled configurations, the following headers are returned to admin users:

- `X-Container-Read`
- `X-Container-Write`

Note: Keystone is disabled by default. To enable Keystone, contact your NetApp representative.

HEAD container

This operation retrieves container statistics and metadata from a StorageGRID system.

The following request parameters are required:

- `Account`
- `Container`

The following request header is required:

- `X-Auth-Token`

A successful execution returns the following headers with an "HTTP/1.1 204 No Content" response:

- `Accept-Ranges`
- `Content-Length`
- `Date`
- `X-Container-Bytes-Used`
- `X-Container-Object-Count`
- `X-Timestamp`
- `X-Trans-Id`

When this operation is set in Keystone enabled configurations, the following headers are returned to admin users:

- `X-Container-Read`
- `X-Container-Write`

Note: Keystone is disabled by default. To enable Keystone, contact your NetApp representative.

POST container

This operation creates, modifies, or deletes the ACL metadata for an existing container by an admin user in a Keystone configured StorageGRID system.

Note: This operation is supported only for Swift Keystone accounts. Keystone is disabled by default. To enable Keystone, contact your NetApp representative.

When Keystone is disabled (default), a status of Not Implemented is returned for this operation.

The following request parameters are required:

- `Account`
- `Container`

The following request header is required:

- `X-Auth-Token`

The following request headers are optional:

- `X-Container-Read`

  Note: You can specify a referrer in the `X-Container-Read` metadata, but StorageGRID ignores this value.

- `X-Container-Write`
- `X-Remove-Container-Read`
- `X-Remove-Container-Write`

Note: No other metadata operations are supported and will result in the operation being ignored.

A successful execution returns the following headers with an "HTTP/1.1 204 No Content" response:

- `Content-Length`
- `Date`
- `X-Timestamp`
- `X-Trans-Id`

PUT container

This operation creates a container for an account in a StorageGRID system.

The following request parameters are required:

- `Account`
- `Container`

The following request header is required:

- `X-Auth-Token`

A successful execution returns the following headers with an "HTTP/1.1 201 Created" or "HTTP/1.1 202 Accepted" (if the container already exists under this account) response:

- `Content-Length`
- `Date`
- `X-Timestamp`
- `X-Trans-Id`

A container name must be unique in the StorageGRID namespace. If the container exists under another account, the following header is returned: "HTTP/1.1 409 Conflict."

The following optional headers are supported only for admin users in Keystone enabled configurations:

- `X-Container-Read`

  Note: You can specify a referrer in the `X-Container-Read` metadata, but StorageGRID ignores this value.

- `X-Container-Write`
- `X-Remove-Container-Read`
- `X-Remove-Container-Write`

Note: These optional headers are supported only for Swift Keystone accounts. Keystone is disabled by default. To enable Keystone, contact your NetApp representative.

Related references

Swift operations tracked in the audit logs on page 32

Object operations

The following Swift API operations are performed on objects.

DELETE object

This operation deletes an object's content and metadata from the StorageGRID system.

The following request parameters are required:

- `Account`
- `Container`
- `Object`

The following request header is required:

- `X-Auth-Token`

A successful execution returns the following response headers with an "HTTP/1.1 204 No Content" response:

- `Content-Length`
- `Content-Type`
- `Date`
- `X-Trans-Id`

GET object

This operation retrieves the object content and gets the object metadata from a StorageGRID system.

The following request parameters are required:

- `Account`

- `Container`
- `Object`

The following request header is required:

- `X-Auth-Token`

The following request headers are optional:

- `Accept-Encoding`
- `If-Match`
- `If-Modified-Since`
- `If-None-Match`
- `If-Unmodified-Since`
- `Range`

A successful execution returns the following headers with an "HTTP/1.1 200 OK" response:

- `Accept-Ranges`
- `Content-Length`
- `Content-Type`
- `Date`
- `ETag`
- `Last-Modified`
- `X-Timestamp`
- `X-Trans-Id`

HEAD object

This operation retrieves metadata and properties of an ingested object from a StorageGRID system.

The following request parameters are required:

- `Account`
- `Container`
- `Object`

The following request header is required:

- `X-Auth-Token`

A successful execution returns the following headers with an "HTTP/1.1 200 OK" response:

- `Accept-Ranges`
- `Content-Length`
- `Content-Type`
- `Date`

- `ETag`
- `Last-Modified`
- `X-Timestamp`
- `X-Trans-Id`

PUT object

This operation creates a new object with data and metadata, or replaces an existing object with data and metadata in a StorageGRID system.

Note: StorageGRID supports objects up to 5 TB in size.

Attention: Conflicting client requests, such as a two clients writing to the same key, are resolved on a “latest-wins” basis. The timing for the “latest-wins” evaluation is based on when the StorageGRID system completes a given request, and not on when Swift clients begin an operation.

The following request parameters are required:

- `Account`
- `Container`
- `Object`

The following request header is required:

- `X-Auth-Token`

The following request headers are optional:

- `Content-Encoding`
- `Content-Length`
- `Content-Type`
- `ETag`
- `Transfer-Encoding`
- `X-Object-Meta-<`*name*`>` (object-related metadata)
  If you want to use the **User Defined Creation Time** option as the Reference Time for an ILM rule, you must store the value in a user-defined header named `X-Object-Meta-Creation-Time`. For example:

  ```
  X-Object-Meta-Creation-Time: 1443399726
  ```

  This field is evaluated as seconds since January 1, 1970.

- `X-Storage-Class: reduced_redundancy`
  Specifies a single-commit ingest operation. Use this header to specify `reduced_redundancy` only if you need to limit redundant storage at the time of ingest and only if you are willing to risk the loss of object data. For example, you might lose data if the single copy is initially stored on a Storage Node that fails before ILM evaluation can occur.
  Specifying `reduced_redundancy` only affects how many copies are created when an object is first ingested. It does not affect how many copies of the object are made when the object is evaluated by the active ILM policy. Using `reduced_redundancy` does not result in data being stored at lower levels of redundancy in the StorageGRID system.

A successful execution returns the following headers with an "HTTP/1.1 201 Created" response:

- `Content-Length`
- `Content-Type`
- `Date`
- `ETag`
- `Last-Modified`
- `X-Trans-Id`

Related references

Swift operations tracked in the audit logs on page 32

Related information

Administering StorageGRID

OPTIONS request

The OPTIONS request checks the availability of an individual Swift service. The OPTIONS request is processed by the Storage Node or API Gateway Node specified in the URL.

For example, client applications can issue an OPTIONS request to the Swift port on a Storage Node, without providing Swift authentication credentials, to determine whether the Storage Node is available. You can use this request for monitoring or to allow external load balancers to identify when a Storage Node is down.

OPTIONS method

When used with the info URL or the storage URL, the OPTIONS method returns a list of supported verbs for the given URL (for example, HEAD, GET, OPTIONS, and PUT). The OPTIONS method cannot be used with the auth URL.

The following request parameter is required:

- `Account`

The following request parameters are optional:

- `Container`
- `Object`

A successful execution returns the following headers with an “HTTP/1.1 204 No Content” response. The OPTIONS request to the storage URL does not require that the target exists.

- `Allow` (a list of supported verbs for the given URL, for example, HEAD, GET, OPTIONS, and PUT)
- `Content-Length`
- `Content-Type`
- `Date`
- `X-Trans-Id`

Related references

Supported Swift API endpoints on page 11

Error responses to Swift API operations

Understanding the possible error responses can help you troubleshoot operations.

The following HTTP status codes might be returned when errors occur during an operation:

Swift error name	HTTP status
AccountNameTooLong, ContainerNameTooLong, HeaderTooBig, InvalidContainerName, InvalidRequest, InvalidURI, MetadataNameTooLong, MetadataValueTooBig, MissingSecurityHeader, ObjectNameTooLong, TooManyContainers, TooManyMetadataItems, TotalMetadataTooLarge	400 Bad Request
AccessDenied	403 Forbidden
ContainerNotEmpty, ContainerAlreadyExists	409 Conflict
InternalError	500 Internal Server Error
InvalidRange	416 Requested Range Not Satisfiable
MethodNotAllowed	405 Method Not Allowed
MissingContentLength	411 Length Required
NotFound	404 Not Found
NotImplemented	501 Not Implemented
PreconditionFailed	412 Precondition Failed
ResourceNotFound	404 Not Found
Unauthorized	401 Unauthorized
UnprocessableEntity	422 Unprocessable Entity

StorageGRID Swift REST API operations

There are operations added on to the Swift REST API that are specific to StorageGRID system.

GET container consistency request

Consistency level makes a trade-off between the availability of the objects and the consistency of those objects across different Storage Nodes and sites. The GET container consistency request allows you to determine the consistency level being applied to a particular container.

Request

Request HTTP Header	Description
`X-Auth-Token`	Specifies the Swift authentication token for the account to use for the request.
`x-ntap-sg-consistency`	Specifies the type of request, where `true` = GET container consistency, and `false` = GET container.
`Host`	The hostname to which the request is directed.

Request example

```
GET /v1/28544923908243208806/Swift container
X-Auth-Token: SGRD_3a877009a2d24cb1801587bfa9050f29
x-ntap-sg-consistency: true
Host: test.com
```

Response

Response HTTP Header	Description
`Date`	The date and time of the response.
`Connection`	Whether the connection to the server is open or closed.
`X-Trans-Id`	The unique transaction identifier for the request.
`Content-Length`	The length of the response body.

Response HTTP Header	Description
`x-ntap-sg-consistency`	The consistency control level being applied to the container. The following values are supported: • **all**: All nodes receive the data immediately or the request will fail. • **strong-global**: Guarantees read-after-write consistency for all client requests across all sites. • **strong-site**: Guarantees read-after-write consistency for all client requests within a site. • **read-after-new-write**: Provides read-after-write consistency for new objects and eventual consistency for object updates. Offers high availability and data protection guarantees. **Note:** If your application uses HEAD requests on objects that do not exist, you might receive a high number of 500 Internal Server errors if one or more Storage Nodes are unavailable. To prevent these errors, use the "available" level. • **available** (eventual consistency for HEAD operations): Behaves the same as the "read-after-new-write" consistency level, but only provides eventual consistency for HEAD operations. Offers higher availability for HEAD operations than "read-after-new-write" if Storage Nodes are unavailable. • **weak**: Provides eventual consistency and high availability, with minimal data protection guarantees, especially if a Storage Node fails or is unavailable. Suitable only for write-heavy workloads that require high availability, do not require read-after-write consistency, and can tolerate the potential loss of data if a node fails.

Response example

```
HTTP/1.1 204 No Content
Date: Sat, 29 Nov 2015 01:02:18 GMT
Connection: CLOSE
X-Trans-Id: 1936575373
Content-Length: 0
x-ntap-sg-consistency: strong-site
```

PUT container consistency request

The PUT container consistency request allows you to specify the consistency level to apply to operations performed on a container. By default, new containers are created using the “read-after-new-write” consistency level.

Request

Request HTTP Header	Description
`X-Auth-Token`	The Swift authentication token for the account to use for the request.
`x-ntap-sg-consistency`	The consistency control level to apply to operations on the container. The following values are supported: • **all**: All nodes receive the data immediately or the request will fail. • **strong-global**: Guarantees read-after-write consistency for all client requests across all sites. • **strong-site**: Guarantees read-after-write consistency for all client requests within a site. • **read-after-new-write**: Provides read-after-write consistency for new objects and eventual consistency for object updates. Offers high availability and data protection guarantees. **Note:** If your application uses HEAD requests on objects that do not exist, you might receive a high number of 500 Internal Server errors if one or more Storage Nodes are unavailable. To prevent these errors, use the “available” level. • **available** (eventual consistency for HEAD operations): Behaves the same as the “read-after-new-write” consistency level, but only provides eventual consistency for HEAD operations. Offers higher availability for HEAD operations than “read-after-new-write” if Storage Nodes are unavailable. • **weak**: Provides eventual consistency and high availability, with minimal data protection guarantees, especially if a Storage Node fails or is unavailable. Suitable only for write-heavy workloads that require high availability, do not require read-after-write consistency, and can tolerate the potential loss of data if a node fails.
`Host`	The hostname to which the request is directed.

Request example

```
PUT /v1/28544923908243208806/Swift container
X-Auth-Token: SGRD_3a877009a2d24cb1801587bfa9050f29
```

```
x-ntap-sg-consistency: strong-site
Host: test.com
```

Response

Response HTTP Header	Description
`Date`	The date and time of the response.
`Connection`	Whether the connection to the server is open or closed.
`X-Trans-Id`	The unique transaction identifier for the request.
`Content-Length`	The length of the response body.

Response example

```
HTTP/1.1 204 No Content
Date: Sat, 29 Nov 2015 01:02:18 GMT
Connection: CLOSE
X-Trans-Id: 1936575373
Content-Length: 0
```

Configuring security for the REST API

You should review the security measures implemented for the REST API and understand how to secure your system.

How StorageGRID provides security for the REST API

The StorageGRID system uses Transport Layer Security (TLS) connection security, server authentication, client authentication, and client authorization. When considering security issues, you might find it helpful to understand how the StorageGRID system implements security, authentication, and authorization for the REST API.

The StorageGRID system accepts HTTPS commands submitted over a network connection that uses TLS to provide connection security, application authentication and, optionally, transport encryption. Commands that do not use TLS are rejected. If an object is encrypted when it is ingested, it stays encrypted for the lifetime of the object in the StorageGRID system.

TLS enables the exchange of certificates as entity credentials and allows a negotiation that can use hashing and encryption algorithms.

When a StorageGRID system is installed, a certificate authority (CA) certificate is generated for the system, as well as server certificates for each Storage Node. These server certificates are all signed by the system CA. You need to configure client applications to trust this CA certificate. When a client application connects to any Storage Node using TLS, the application can authenticate the Storage Node by verifying that the server certificate presented by the Storage Node is signed by the trusted system CA.

Alternatively, you can supply a single, custom server certificate that should be used on all Storage Nodes rather than the generated ones. The custom server certificate must be signed by a CA selected by the administrator. The server authentication process by the client application is the same, but uses a different trusted CA.

To configure certificates, see the instructions for administering StorageGRID.

The following table shows how security issues are implemented in the S3 and Swift REST APIs:

Security issue	Implementation for REST API
Connection security	TLS
Server authentication	X.509 server certificate signed by system CA or custom server certificate supplied by administrator
Client authentication	• S3: S3 account (access key ID and secret access key) • Swift: Swift account (user name and password) **Note:** By request, you can enable OpenStack's Keystone identity service for use with the Swift REST API. If Keystone is enabled, you must use an additional token for validation. To enable Keystone support, contact your NetApp representative.
Client authorization	• S3: Bucket ownership and all applicable access control policies • Swift: Administrator role access

Administering StorageGRID

Security certificates for client applications

When a client application establishes a TLS session to the StorageGRID system, the system sends a server certificate to the client application for verification to ensure that the HTTPS connection is secure.

The client application loads the grid CA certificate and uses it to verify that the client application is communicating with the expected StorageGRID system. This process protects against man-in-the-middle and impersonation attacks.

Supported hashing and encryption algorithms for TLS libraries

Client applications use the HTTPS protocol to communicate with the StorageGRID system over a network connection that uses Transport Layer Security (TLS). The StorageGRID system supports a limited set of hashing and encryption algorithms from the TLS libraries that client applications can use when establishing a TLS session. When you are setting up the communication processes, it is important for you to know which security algorithms the system uses.

The StorageGRID system supports the following cipher suite security algorithms:

TLS version	Cipher suite	Benefit
v1.1	TLS_RSA_WITH_AES_128_CBC_SHA	**Note:** TLS v1.1 is deprecated. Support for TLS v1.1 will be removed in a future StorageGRID release.
	TLS_RSA_WITH_AES_256_CBC_SHA	
v1.2	TLS_RSA_WITH_AES_128_CBC_SHA	**Note:** Support for CBC ciphers and SHA1 ciphers is deprecated. Support for these ciphers will be removed in a future release.
	TLS_RSA_WITH_AES_256_CBC_SHA	
	TLS_RSA_WITH_AES_128_GCM_SHA256	Provide secure encryption and more efficient processing of large objects.
	TLS_RSA_WITH_AES_256_GCM_SHA384	
	TLS_ECDHE_RSA_WITH_AES_128_GCM_SHA256	Support perfect forward secrecy.
	TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384	

The TLS session negotiates the connection, using either AES128 or AES256 based on the client application requirements, and the need to balance performance with encryption security.

Attention: SSLv3 is no longer supported for connections to the Storage Node or API Gateway Node.

Monitoring and auditing operations

You can monitor workloads and efficiencies for client operations by viewing transaction counts for all Storage Nodes or a specific Storage Node. You can use audit messages to monitor client operations and transactions.

Steps

1. Monitoring object ingest and retrieval rates on page 29
2. Accessing and reviewing audit logs on page 31

Monitoring object ingest and retrieval rates

You can monitor object ingest and retrieval rates as well as metrics for object counts, queries, and verification. You can view the number of successful and failed attempts by client applications to read, write, and modify objects in the StorageGRID system.

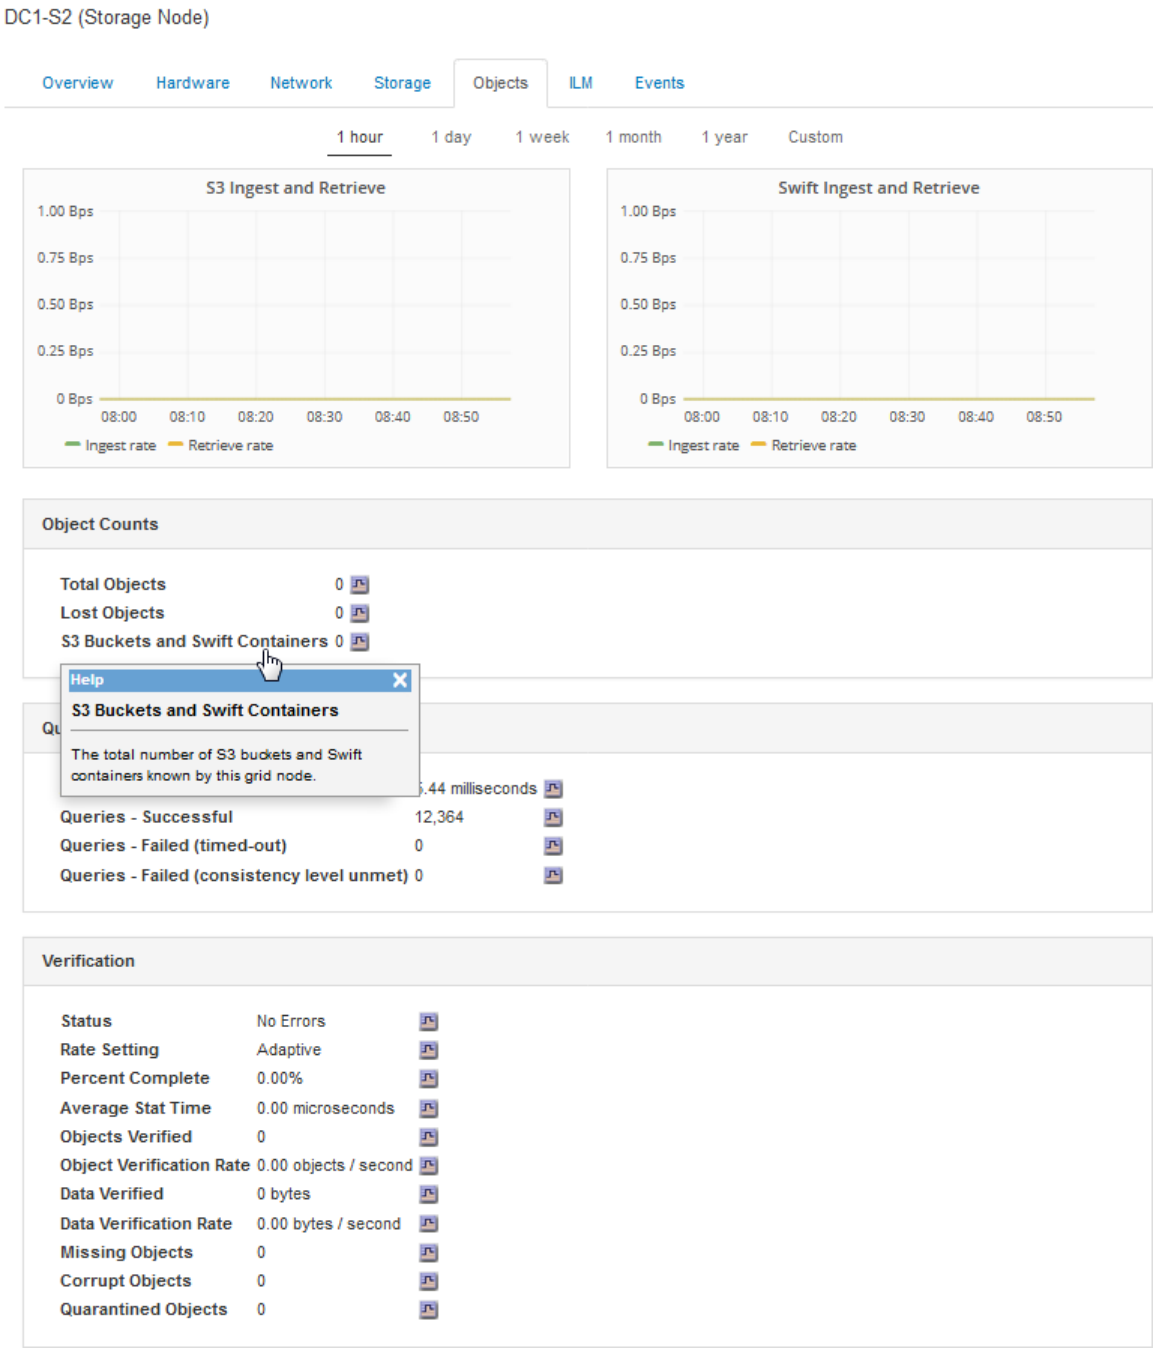
Steps

1. Sign in to the Grid Manager using a supported browser.
2. On the Dashboard, locate the Protocol Operations section.

   This section summarizes the number of client operations performed by your StorageGRID system. Protocol rates are averaged over the last two minutes.
3. Select **Nodes**.
4. From the Nodes home page (deployment level), click the **Objects** tab.

   The chart shows ingest and retrieve rates for your entire StorageGRID system in bytes per second and total bytes. You can select a time interval in hours, days, weeks, months, or years, or you can apply a custom interval.
5. To see information for a particular Storage Node, select the node from the list on the left, and click the **Objects** tab.

   The chart shows the object ingest and retrieval rates for this Storage Node. The tab also includes metrics for object counts, queries, and verification. You can click the labels to see the definitions of these metrics.



6. If you want even more detail:
   a. Select **Support** > **Grid Topology**.
   b. Select ***site*** > **Overview** > **Main**.

      The API Operations section displays summary information for the entire grid.
   c. Select ***Storage Node*** > **LDR** > ***client application*** > **Overview** > **Main**

      The Operations section displays summary information for the selected Storage Node.

Accessing and reviewing audit logs

Audit messages are generated by StorageGRID services and stored in text log files. API-specific audit messages in the audit logs provide critical security, operation, and performance monitoring data that can help you evaluate the health of your system.

Before you begin

- You must be a StorageGRID administrator with specific access permissions.
- You must have the `Passwords.txt` file. This file is included in the Recovery Package `.zip` file.
- You must know the IP address of an Admin Node.

About this task

The active audit log file is named `audit.log`, and it is stored on Admin Nodes.

Once a day, the active `audit.log` file is saved, and a new `audit.log` file is started. The name of the saved file indicates when it was saved, in the format *`yyyy-mm-dd`*`.txt`.

After a day, the saved file is compressed and renamed, in the format *`yyyy-mm-dd`*`.txt.gz`, which preserves the original date.

This example shows the active `audit.log` file, the previous day's file (`2018-04-15.txt`), and the compressed file for the prior day (`2018-04-14.txt.gz`).

```
audit.log
2018-04-15.txt
2018-04-14.txt.gz
```

Steps

1. Log in to an Admin Node:
   a. Enter the following command: `ssh admin@`*`Admin_Node_IP`*
   b. Enter the password listed in the `Passwords.txt` file.
   c. Enter the following command to switch to root: `su -`
   d. Enter the password listed in the `Passwords.txt` file.

      When you are logged in as root, the prompt changes from `$` to `#`.
2. Go to the directory containing the audit log files:

   `cd /var/local/audit/export`
3. View the current or a saved audit log file, as required.

Swift operations tracked in the audit logs

All successful storage DELETE, GET, HEAD, POST, and PUT operations are tracked in the StorageGRID audit log. Failures are not logged, nor are info, auth, or OPTIONS requests.

See *Understanding audit messages* for details about the information tracked for the following Swift operations.

Account operations

- GET account
- HEAD account

Container operations

- DELETE container
- GET container
- HEAD container
- POST container
- PUT container

Object operations

- DELETE object
- GET object
- HEAD object
- PUT object

How to send comments about documentation and receive update notifications

You can help us to improve the quality of our documentation by sending us your feedback. You can receive automatic notification when production-level (GA/FCS) documentation is initially released or important changes are made to existing production-level documents.

If you have suggestions for improving this document, send us your comments by email.

doccomments@netapp.com

To help us direct your comments to the correct division, include in the subject line the product name, version, and operating system.

If you want to be notified automatically when production-level documentation is released or important changes are made to existing production-level documents, follow Twitter account @NetAppDoc.

You can also contact us in the following ways:

- NetApp, Inc., 1395 Crossman Ave., Sunnyvale, CA 94089 U.S.
- Telephone: +1 (408) 822-6000
- Fax: +1 (408) 822-4501
- Support telephone: +1 (888) 463-8277
