- `schedule <text>` - Schedule Name
  This specifies the schedule that is to be removed from the Snapshot policy.

Examples

The following example removes a schedule named `hourly` from a Snapshot policy named `snappolicy_daily` on Vserver vs0:

```
cluster1::> volume snapshot policy remove-schedule -vserver vs0 -policy snappolicy_daily -schedule hourly
```

volume snapshot policy show

Show snapshot policies

Availability: This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

Description

The `volume snapshot policy show` command displays the following information about Snapshot policies:

- Vserver name
- Snapshot policy name
- Number of schedules in the policy
- Comment for the policy
- Individual schedule names
- Maximum number of Snapshot copies associated with each schedule
- Snapshot copy name prefixes for the schedules
- SnapMirror Labels associated with the schedules

Parameters

```
[-fields <fieldname>, ...]
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

[-revert-incompatible] (privilege: advanced)
If this parameter is specified, the command displays Snapshot policies that are not supported in Data ONTAP 8.2. The total Snapshot copy count in the policy needs to be reduced to be equal to or less than the supported count for the revert operation to succeed.

[-instance]
If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver Name
If this parameter is specified, the command displays Snapshot policies on the specified Vserver.
```
[-policy <snapshot policy>] - Snapshot Policy Name
If this parameter is specified, the command displays detailed information about the specified Snapshot policy.

[-enabled {true|false}] - Snapshot Policy Enabled
If this parameter is specified, the command displays detailed information only about the Snapshot policy or policies that have the specified enabled value.

[-comment <text>] - Comment
If this parameter is specified, the command displays information only about the Snapshot policy or policies that have the specified comment.

[-total-schedules <integer>] - Total Number of Schedules in This Policy
If this parameter is specified, the command displays information only about the Snapshot policy or policies that have the specified total number of schedules.

[-schedules <text>, ...] - Schedule Name
If this parameter is specified, the command displays information only about the Snapshot policy or policies that have the specified list of schedules.

[-counts <integer>, ...] - Maximum Snapshots for the Schedule
If this parameter is specified, the command displays information only about the Snapshot policy or policies that have the specified list of maximum numbers of Snapshot copies per schedule.

[-prefixes <text>, ...] - Prefix Name
If this parameter is specified, the command displays information only about the Snapshot policy or policies that have the specified list of prefixes.

[-snapmirror-labels <text>, ...] - Label for SnapMirror Operations
If this parameter is specified, the command displays information only about the Snapshot policies that have the specified SnapMirror Label. When you specify a list of SnapMirror labels, the command displays all the Snapshot policies that contain any of the SnapMirror Labels specified in the list.

[-policy-owner <text>] - Owner of the policy
If this parameter is specified, the command displays information only about the Snapshot policies that have the specified policy owner.

[-total-count <integer>] - Total Number of Snapshots in This Policy
If this parameter is specified, the command displays information only about the Snapshot policies that have the specified total number of Snapshot copies.

Examples
The following example displays information about all Snapshot policies:

```
cluster1::> volume snapshot policy show
Vserver: cm
Policy Name                  Number of Is Schedules Enabled Comment
---------------------------------------------------------------------------------
default                     3 false   Default policy with hourly, daily & weekly schedules.
    Schedule       Count       Prefix               SnapMirror Label
    -------------- ----- -------------- ------------------
    hourly         6   hourly             -
    daily          2   daily               -
    weekly         2   weekly             -
default-weekly      3 false   Default policy with 6 hourly, 2 daily & 1 weekly schedule.
    Schedule       Count       Prefix               SnapMirror Label
    -------------- ----- -------------- ------------------
    hourly         6   hourly             -
    daily          2   daily               -
    weekly         1   weekly             -
none                      0 false   Policy for no automatic snapshots.
```

volume snapshot commands 1671
volume transition-convert-dir commands

Manage conversion of a 7-mode directory into a Cluster-mode

volume transition-convert-dir show

Display 7-Mode directories being converted

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description

The volume transition-convert-dir show command displays information about ongoing directory copy conversion operations.

Parameters

[-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

[-instance]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver Name

Displays summary information about the ongoing copy conversions of directories for the volumes in the specified Vserver.

[-volume <volume name>] - Volume Name

Displays summary information about the ongoing copy conversions of directories that are occurring on the specified volume.

[-path <text>] - Directory Being Converted

Displays summary information for the ongoing copy conversions of directories that have the specified directory path to convert.

[-job-id <integer>] - Convert Job ID

Displays summary information for the ongoing copy conversions of directories that have the specified job ID.
[-state (Initial|Queued|Running|Pausing|Paused|Quitting|Success|Failure|Reschedule|Error|Quit|Dead|Unknown|Restart|Dormant)] - Operation State

Displays summary information for the copy conversions of directories that have the specified job state.

[-bytes-total <integer>] - Bytes Total

Displays summary information for copy conversions which have the estimated number of bytes of directory content to convert.

[-bytes-completed <integer>] - Bytes Completed

Displays summary information for copy conversions which have the estimated number of bytes of directory content that have completed conversion. The value of this field will be updated approximately once per minute.

### Examples

The following example illustrates how to show directory conversions for a volume:

```
cluster1::*> volume transition-convert-dir show -volume vol1
Vserver   Volume  Convert Job ID  Directory-path  State
---------  --------- ---------------- ---------------- ------------
vs0        vol1                   151 /data/large_dir       Running
```

### volume transition-convert-dir start

Start converting a 7-Mode directory to Cluster-mode

**Availability:** This command is available to cluster and Vserver administrators at the advanced privilege level.

**Description**

The `volume transition-convert-dir start` command moves the directory entries in an existing directory to a new temporary directory and then replaces the existing directory with the temporary directory. This command only has a use for directories that were created in a non-Unicode format on a 7-Mode storage system and then transitioned to clustered Data ONTAP by using a SnapMirror relationship of type TDP. This command converts the directories to the Unicode format in a way that is less likely to disrupt the operation of the Data ONTAP systems than the existing directory conversion mechanisms. The temporary directory is visible from clients. Attempting to manipulate the directory being copied or the temporary directory might result in expected side-effects and should be avoided.

**Parameters**

- `vserver <vserver name>` - Vserver Name
  Specifies the Vserver on which the volume is located.

- `volume <volume name>` - Volume Name
  Specifies the volume in which the directory to be converted is located.

- `path <file path>` - Directory Path
  Specifies the path to the directory to be converted from the root of the volume specified with the `volume` parameter. The root directory of a volume might not be converted using this command. Also, the path must not have a symbolic link as the last component in the path.

### Examples

The following example shows how to start a 7-mode directory conversion for a given path in a volume:

```
cluster1::*> volume transition-convert-dir start -vserver vs0  -volume vol1 -path /data/large_dir
```
Vserver Commands

Manage Vservers

The vserver commands enable you to manage Vservers and their attributes, including the configuration of the CIFS and NFS protocols, export policies, name mappings between CIFS and NFS users, and network services.

vserver add-aggregates

Add aggregates to the Vserver

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The vserver add-aggregates command adds aggregates to the Vserver.

Parameters
-vserver <vserver> - Vserver
   Specifies the Vserver for which aggregates have to be added.
-aggregates <aggregate name>, ... - List of Aggregates to Be Added
   Specifies the list of aggregates to add to the Vserver. The root aggregates should not be specified in this list because though the command will return success, volumes cannot be created on root aggregates. In a MetroCluster configuration, this command does not honor the remote cluster's aggregates.

Examples
The following example illustrates how to add aggregates aggr1 and aggr2 to a Vserver named vs.example.com:

cluster1::> vserver add-aggregates -vserver vs.example.com -aggregates aggr1,aggr2

vserver add-protocols

Add protocols to the Vserver

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The vserver add-protocols command adds given protocols to a specified Vserver.

Parameters
-vserver <vserver> - Vserver
   This specifies the Vserver that is to be modified.
-protocols {nfs|cifs|fcp|iscsi|ndmp|nvme}, ... - Protocols
   This parameter specifies the list of protocols to be allowed to run on the Vserver. Possible values include nfs, cifs, fcp, iscsi, ndmp and nvme.

Examples
The following example shows adding protocol 'cifs' to a vserver named vs0.example.com.
vserver context

Set Vserver context

*Availability:* This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
Cluster administrators can use the `vserver context` command to login to a specified Vserver with a specified Vserver user name. All subsequent commands will be issued in the context of that Vserver. The role of the cluster administrator will be the same as that of the user name with which the Vserver context was set. The context is valid for the duration of the CLI or Web UI session in which it is specified. The `exit` command can be used to return to the original context.

**Parameters**
- `-vserver <vserver>` - Vserver
  
  Use this parameter to specify the Vserver.

- `[-username <text>]` - Vserver Administrator User Name
  
  Use this parameter to specify a Vserver administrator user name for the context. The default value `vsadmin` is used if one is not specified.

**Examples**

The following example sets the CLI context to Vserver `vs0.example.com`. All subsequently issued commands will be executed in the context of that Vserver:

```bash
cluster1::> vserver context -vserver vs0.example.com
Info: Use 'exit' command to return.
vs0.example.com::>
```

**Related references**

`exit` on page 1

vserver create

Create a Vserver

*Availability:* This command is available to *cluster* administrators at the *admin* privilege level.

**Description**
The `vserver create` command creates a Vserver.

**Parameters**
- `-vserver <vserver>` - Vserver
  
  This specifies the name of the Vserver that is to be created. Use a fully qualified domain name (FQDN) - for example, "data.example.com" - for the Vserver to ensure unique Vserver names across cluster leagues.

  **Note:** Maximum number of characters supported is 47, and 41 for a Vserver with subtype "sync-source". "all" is a reserved name and must not be used as a Vserver name.
[-subtype <vserver subtype>] - Vserver Subtype
This specifies the subtype of the Vserver being created. Possible values are:
  • default - For default data Vservers
  • dp-destination - For Data Protection destination Vservers
  • sync-source - For MetroCluster source Vservers
  • sync-destination - For MetroCluster destination Vservers

[-rootvolume <volume name>] - Root Volume
This parameter optionally specifies the name of the Vserver's root volume, which is created when the Vserver is created. The default name is svm_root. The size of the Vserver's root volume is 1GB

[-aggregate <aggregate name>] - Aggregate
This parameter optionally specifies the storage aggregate that holds the Vserver's root volume. Selection of the aggregate is based on the Vserver setup algorithm.
  • Creating a root volume on the SnapLock aggregate is not supported.
  • Creating a root volume of sync-source Vserver on the unmirrored aggregate is not supported.

[-rootvolume-security-style <security style>] - Root Volume Security Style
This parameter optionally specifies the security style for the Vserver's root volume. Possible values include unix (for UNIX mode bits), ntfs (for CIFS ACLs), and mixed (for mixed NFS and CIFS access). The default value is unix. Regardless of the security style, both NFS and CIFS clients can read from and write to the root volume.

[-language <Language code>] - Default Volume Language Code
This optionally specifies the default language encoding setting for the Vserver and its volumes. The recommended format is to append .UTF-8 for the language encoding values. For example, for the en_US language, the recommended format is en_US.UTF-8. The default setting is C.UTF-8.

[-snapshot-policy <snapshot policy>] - Snapshot Policy
This optionally specifies the Snapshot policy for new volumes created on the Vserver. If no value is specified, the default Snapshot policy is used. You can use the -snapshot-policy parameter on the volume create or volume modify commands to set the Snapshot policy on a specific volume, regardless of its Vserver's Snapshot policy setting.

[-data-services <LIF Service Name>, ...] - Data Services
This optionally specifies the data services for new network interfaces created on the Vserver. If no value is specified, the default services list will be applied. This information will be used to construct the default service policies for this Vserver, which can be viewed using the network interface service-policy show command.

[-comment <text>] - Comment
This optionally specifies a comment for the Vserver.

[-quota-policy <text>] - Quota Policy
This optionally specifies a quota policy for the Vserver.

[-caching-policy <text>] - Caching Policy Name
This optionally specifies the caching policy to apply to the Vserver. A caching policy defines how the system caches this volume's data in Flash Cache modules. If a caching policy is not assigned to this Vserver, the system uses the default cluster-wide policy. The available caching policies are:
  • none - Does not cache any user data or metadata blocks.
- auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
- meta - Read caches only metadata blocks.
- random_read - Read caches all metadata and randomly read user data blocks.
- random_read_write - Read caches all metadata, randomly read and randomly written user data blocks.
- all_read - Read caches all metadata, randomly read, and sequentially read user data blocks.
- all_read_random_write - Read caches all metadata, randomly read, sequentially read, and randomly written user data.
- all - Read caches all data blocks read and written. It does not do any write caching.

Default caching-policy is auto.

[-ipspace <IPspace>] - IPspace Name
This optionally specifies the IPspace the Vserver will be assigned to. If left unspecified, the Vserver will be assigned to the default IPspace.

[-foreground {true|false}] - Foreground Process
This parameter optionally specifies whether the Vserver create operation can be executed in the background. If nothing is specified, by default the Vserver create operation is executed in the foreground.

[-is-space-reporting-logical {true|false}] - Logical Space Reporting
This optionally specifies whether to report space logically on residing volumes. When space is reported logically, ONTAP reports the volume space such that all the physical space saved by the storage efficiency features are also reported as used. This parameter is not supported on FlexGroups.

[-is-space-enforcement-logical {true|false}] - Logical Space Enforcement
This optionally specifies whether to perform logical space accounting on residing volumes. When space is enforced logically, ONTAP enforces volume settings such that all the physical space saved by the storage efficiency features will be calculated as used. This parameter is not supported on FlexGroups.

Examples
The following example creates a Vserver named vs0.example.com in the IPspace ipspace123. The Vserver's root volume is named root_vs0 and is located on aggregate aggr0. The Vserver uses NIS for network information, a file for name mapping information, and the language is U.S. English:

```
cluster1::> vserver create -vserver vs0.example.com -ipspace ipspace123 -rootvolume root_vs0 -aggregate aggr0 -language en_US.UTF-8 -rootvolume-security-style mixed
```

The following example creates a Vserver named vs1 using default values. The default name for the Vserver's root volume is svm_root and the Vserver is located on an aggregate selected on the basis of the Vserver setup algorithm. The default root volume's security style is set to unix.

```
cluster1::> vserver create -vserver vs1
cluster1::> vserver show -vserver vs1 -fields rootvolume, rootvolume-security-style, aggregate
vs1       svm_root       aggr1       unix
```

volume create on page 1451
vserver delete

Delete an existing Vserver

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The vserver delete command deletes a specified Vserver. If the Vserver is associated with one or more volumes, you must manually delete volumes (including root and mirror volumes) before you delete the Vserver. If the Vserver subtype is dp-destination, change the Vserver subtype to default by specifying the Vserver as the destination in the snapmirror break command before deleting the objects owned by the Vserver.

Parameters
-vserver <vserver> - Vserver
This specifies the Vserver that is to be deleted.

[-foreground {true|false}] - Foreground Process
This optionally specifies the Vserver delete operation can be executed in the background. If nothing is specified, by default the Vserver delete operation is executed in the foreground.

Examples
The following example deletes a Vserver named vs2.example.com:

```
cluster1::> vserver delete -vserver vs2.example.com
```

Related references
snapmirror break on page 635

vserver modify

Modify a Vserver

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The vserver modify command modifies the attributes of a specified Vserver. If the Vserver subtype is of type dp-destination, then only the -aggr-list parameter can be modified.

Parameters
-vserver <vserver> - Vserver
This specifies the Vserver that is to be modified.

[{-language <Language code>}] - Default Volume Language Code
This optional parameter specifies the default language encoding setting for the Vserver and its volumes. The recommended format is to append .UTF-8 for the language encoding values. For example, for the en_US language, the recommended format is en_US.UTF-8. The default setting is C.UTF-8.

[{-snapshot-policy <snapshot policy>}] - Snapshot Policy
This optional parameter specifies the Snapshot policy for a Vserver being modified.
This optional parameter specifies a comment for the Vserver.

This optional parameter specifies a quota policy to be used for all volumes associated with a Vserver. You can create and configure multiple, different quota policies, but each Vserver must have one and only one associated quota policy.

This optional parameter specifies a confined list of aggregates on which volumes can be created for a Vserver by the Vserver administrator. But these aggregates do not become exclusive property of the Vserver, i.e. they might be assigned for use to other Vservers. If the value of this parameter is specified as "-", then the Vserver administrator cannot create any volumes for that Vserver. Note that the cluster administrator will still be able to create volumes on any aggregate and assign them to this Vserver.

This optional parameter specifies the maximum number of volumes that can be created for the Vserver, including the root volume.

Use this parameter to set the admin state of the Vserver if the Vserver start or stop job fails. Possible values include running and stopped.

This optional parameter specifies the list of protocols to be allowed to run on the Vserver. When part of vserver-modify, this field should include the existing list along with the new protocol list to be added to prevent data disruptions. Possible values include nfs, cifs, fcp, iscsi, ndmp and nvme.

This optional parameter specifies the list of protocols to be disallowed to run on the Vserver. When part of vserver-modify, this field should include the existing list along with the new protocol list to be added to prevent data disruptions. Possible values include nfs, cifs, fcp, iscsi, ndmp and nvme.

This optionally specifies which QoS policy group to apply to the Vserver. This policy group defines measurable service level objectives (SLOs) that apply to the storage objects with which the policy group is associated. If you do not assign a policy group to a Vserver, the system will not monitor and control the traffic to it. To remove this Vserver from a policy group, enter the reserved keyword "none".

This optionally specifies the caching policy to apply to the Vserver. A caching policy defines how the system caches this volume's data in Flash Cache modules. If a caching policy is not assigned to this Vserver, the system uses the default cluster-wide policy. The available caching policies are:

- none - Does not cache any user data or metadata blocks.
- auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
- meta - Read caches only metadata blocks.
- random_read - Read caches all metadata and randomly read user data blocks.
- random_read_write - Read caches all metadata, randomly read and randomly written user data blocks.
- all_read - Read caches all metadata, randomly read, and sequentially read user data blocks.
- all_read_random_write - Read caches all metadata, randomly read, sequentially read, and randomly written user data.
• all - Read caches all data blocks read and written. It does not do any write caching.

Default caching-policy is auto.

[-foreground {true|false}] - Foreground Process

This optionally specifies whether the Vserver modify operation can be executed in the background. If nothing is specified, by default the Vserver modify operation is executed in the foreground.

[-is-space-reporting-logical {true|false}] - Logical Space Reporting

This optionally specifies whether to report space logically on residing volumes which are created after this operation. Existing volumes will not be affected by modifying this value on an existing Vserver. To change whether space is reported logically for existing volumes, you will have to modify the setting on those volumes. When space is reported logically, ONTAP reports the volume space such that all the physical space saved by the storage efficiency features are also reported as used. This parameter is not supported on FlexGroups.

[-is-space-enforcement-logical {true|false}] - Logical Space Enforcement

This optionally specifies whether to perform logical space accounting on residing volumes which are created after this operation. Older volumes will continue to have old value. When space is enforced logically, ONTAP enforces volume settings such that all the physical space saved by the storage efficiency features will be calculated as used. This parameter is not supported on FlexGroups.

### Examples

The following example modifies the quota policy for a Vserver named vs0.example.com to pol1, specifies a Snapshot policy named daily, adds the comment "Sales team access".

```bash
cluster1::> vserver modify -vserver vs0.example.com -snapshot-policy daily -comment "Sales team access" -quota-policy pol1
```

### vsserver prepare-for-revert

Prepares Vservers to be reverted

**Availability:** This command is available to cluster administrators at the advanced privilege level.

**Description**
The `vserver prepare-for-revert` command prepares Vservers to be reverted to the previous version of Data ONTAP. It disables any operations that cannot be scheduled during revert.

#### Examples

The following example prepares all Vservers to be reverted.

```bash
cluster1::*> vserver prepare-for-revert
```

### vsserver remove-aggregates

Remove aggregates from the Vserver

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
The `vserver remove-aggregates` command removes aggregates from the Vserver.
Parameters
-vserver <vserver> - Vserver
   Specifies the Vserver from which aggregates have to be removed.
-aggregates <aggregate name>, ... - List of Aggregates to Be Removed
   Specifies the list of aggregates to remove from the Vserver.

Examples
The following example illustrates how to remove aggregates aggr1 and aggr2 from a Vserver named vs.example.com:

    cluster1::> vserver remove-aggregates -vserver vs.example.com -aggregates aggr1,aggr2

vserver remove-protocols
Remove protocols from the Vserver

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The vserver remove-protocols command removes the specified protocols from the specified Vserver. When you remove the protocols from a Vserver, the data access with respect to the removed protocols is disrupted.

Parameters
-vserver <vserver> - Vserver
   Specifies the Vserver that is to be modified.
-protocols {nfs|cifs|fcp|iscsi|ndmp|nvme}, ... - Protocols
   This parameter specifies the list of protocols to be removed on the Vserver. Possible values include nfs, cifs, fcp, iscsi, ndmp and nvme.

Examples
The following example shows removing protocol 'cifs' from a Vserver named vs0.example.com.

    cluster1::> vserver remove-protocols -vserver vs0.example.com -protocols cifs

vserver rename
Rename a Vserver

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The vserver rename command renames the Vserver. If the vserver being renamed is participating in an Inter-cluster Vserver peer relationship, all the corresponding remote clusters will be updated with the new peer Vserver name.

Parameters
-vserver <text> - Vserver
   This specifies the Vserver that is to be renamed.
-newname <vserver> - New Vserver name (Use Fully Qualified Domain Name, For example: data.example.com)

This specifies the Vserver's new name. The name must be a unique Vserver name in the cluster. Use a fully qualified domain name (FQDN) - for example, "data.example.com" - for the Vserver name to reduce name collisions in cluster leagues.

Note: Maximum number of characters supported is 47, and 41 for a Vserver with subtype "sync-source". "all" is a reserved name and must not be used as a Vserver name.

[-foreground {true|false}] - Foreground Process

This specifies whether the rename job will be run in foreground or backgound. By default, the job runs in foreground.

Examples
The following examples rename a Vserver named vs1.example.com as vs2.example.com, and then finally back to its original name:

(When there is no intercluster Vserver peer relationship with the vserver)
cluster1::> vserver rename -vserver vs1.example.com -newname vs2.example.com

(When there is at least one intercluster peer relationship with the Vserver)
cluster1::> vserver rename -vserver vs1.example.com -newname vs2.example.com

[Job 277] Job succeeded: Vserver rename completed successfully
cluster1::> vserver rename -vserver vs2.example.com -newname vs1.example.com -foreground false

[Job 278] Job is queued: Rename Vserver vs2.example.com to vs1.example.com.

vserver restamp-msid

Restamp the MSIDs of all the volumes in a Vserver to match or be different from the source Vserver

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The vserver restamp-msid command restamps MSIDs of all volumes in a dp-destination Vserver to make them either identical to the VserverDR source Vserver. The command is run on secondary VserverDR site and automatically updates the MSID preserve behavior for the Vserver. A snapmirror resync must be run after this command completes.

Parameters
-vserver <vserver name> - Vserver name

The name of the dp-destination Vserver.

-preserve-msid {true|false} - Make MSID same as that of source Vserver. False sets the values as different.

Boolean value through which the user can specify whether to make the MSIDs of the volumes same as that of Source Vserver. Specifying true will make the MSIDs same and specifying false will make them different.

Examples
This example will stamp all the volumes of Vserver vs1dp with the same MSID as the source Vserver.
Related references

vserver show

Display Vservers

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver show command displays the following information:

- Vserver name
- Vserver type (data, admin, node or system - detailed view only)
- Vserver subtype (default, dp-destination, sync-source, and sync-destination - detailed view only)
- Vserver universal unique identifier (detailed view only)
- Root volume name
- Aggregate on which the root volume is located
- Associated NIS domain
- Root volume security style (unix for UNIX mode bits, ntfs for CIFS ACLs, mixed for both (detailed view only)
- LDAP client
- Language (detailed view only)
- Snapshot policy (detailed view only)
- Comment text (detailed view only)
- Quota policy (detailed view only)
- Aggregate list (detailed view only)
- Maximum Volumes (detailed view only)
- Qos-policy-group (detailed view only)
- Config-lock (detailed view only)
- Admin state (running, stopped, starting, stopping, initializing, or deleting)
- Operational state (running, or stopped)
- Operational state stopped reason (sync-destination-and-switchover-not-done, or cluster-reboot-done, or admin-state-stopped)
- Allowed Protocols (nfs, cifs, fcp, iscsi, nvme, ndmp - detailed view only)
- Disallowed Protocols (nfs, cifs, fcp, iscsi, nvme, ndmp - detailed view only)
• IPspace to which the Vserver belongs (detailed view only)
• Caching policy

Parameters

`[-fields <fieldname>, ...]`
If you specify the `--fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `--fields ?` to display the fields to specify.

`[-protocols]`
If this optional parameter is specified, the command displays the allowed and disallowed set of protocols for the Vserver(s).

`[-instance]`
If you specify the `--instance` parameter, the command displays detailed information about all fields.

`[-vserver <vserver>] - Vserver`
If this parameter is specified, the command displays detailed information about the specified Vserver.

`[-type <vserver type>] - Vserver Type`
If this parameter is specified, the command displays information only about the Vserver or Vservers that have the specified Vserver type. Types include `admin` for the cluster-wide management Vserver, `system` for cluster-level communications in an IPspace, `data` for data serving Vserver, and `node` for node management Vserver.

`[-subtype <vserver subtype>] - Vserver Subtype`
If this parameter is specified, the command displays information only about the Vserver or Vservers that have the specified Vserver subtype. Types include:

• `default` for default data Vserver
• `dp-destination` for Data Protection destination Vserver.
• `sync-source` for MetroCluster source Vserver,
• `sync-destination` for MetroCluster destination Vserver.

`[-uuid <UUID>] - Vserver UUID`
If this parameter is specified, the command displays information only about the Vserver that match the specified UUID.

`[-rootvolume <volume name>] - Root Volume`
If this parameter is specified, the command displays information only about the Vserver or Vservers that have the specified root volume.

`[-aggregate <aggregate name>] - Aggregate`
If this parameter is specified, the command displays information only about the Vserver or Vservers that have their root volumes contained by the specified aggregate.

`[-nisdomain <nis domain>] - NIS Domain`
If this parameter is specified, the command displays information only about the Vserver or Vservers that use the specified NIS domain.

`[-rootvolume-security-style <security style>] - Root Volume Security Style`
If this parameter is specified, the command displays information only about the Vserver or Vservers that have the specified root-volume security style.
[-ldap-client <text>] - LDAP Client
    If this parameter is specified, the command displays information only about the Vserver or Vservers that use the specified LDAP client.

[-language <Language code>] - Default Volume Language Code
    If this parameter is specified, the command displays information only about the Vserver or Vservers that use the specified language. To determine the available languages, enter "vserver show -language ?" at the clustershell command prompt and at the Vserver prompt.

[-snapshot-policy <snapshot policy>] - Snapshot Policy
    If this parameter is specified, the command displays information only about the Vserver or Vservers that have the specified Snapshot policy.

[-data-services <LIF Service Name>, ...] - Data Services
    If this parameter is specified, the command displays information only about the Vserver or Vservers that match the specified data services.

[-comment <text>] - Comment
    If this parameter is specified, the command displays information only about the Vserver or Vservers that match the specified comment.

[-quota-policy <text>] - Quota Policy
    If this parameter is specified, the command displays information only about the Vserver or Vservers that use the specified quota policy.

[-aggr-list <aggregate name>, ...] - List of Aggregates Assigned
    If this parameter is specified, the command displays information only about the Vserver or Vservers to which the specified aggregate(s) are assigned for use.

[-max-volumes <unsigned32_or_unlimited>] - Limit on Maximum Number of Volumes allowed
    If this parameter is specified, the command displays information only about the Vserver or Vservers on which the specified maximum volume count is configured.

[-admin-state {running|stopped|starting|stopping}] - Vserver Admin State
    If this parameter is specified, the command displays information only about the Vserver or Vservers that match the specified admin-state.

[-operational-state {running|stopped}] - Vserver Operational State
    If this parameter is specified, the command displays information only about the Vserver or Vservers that match the specified operational-state. This field determines the state of the Vserver LIFs. New LIFs created on a Vserver, which is in running state, will be operationally up and the LIFs created on a Vserver, which is in stopped state, will be operationally down.

[-operational-state-stopped-reason {sync destination and switchover is not done|cluster reboot is done|admin state stopped| dp destination not started}] - Vserver Operational State Stopped Reason
    If this parameter is specified, the command displays information only about the Vserver or Vservers that are operationally stopped due to the specified reason. This field indicates the reason for the operational-state of the Vserver being stopped

[-allowed-protocols {nfs|cifs|fcp|iscsi|ndmp|nvme}, ...] - Allowed Protocols
    If this parameter is specified, the command displays information only about the Vserver or Vservers on which the specified protocols are allowed to run.

[-disallowed-protocols {nfs|cifs|fcp|iscsi|ndmp|nvme}, ...] - Disallowed Protocols
    If this parameter is specified, the command displays information only about the Vserver or Vservers on which the specified protocols are disallowed to run.

vserver show
[-is-repository {true|false}] - Is Vserver with Infinite Volume
   If this parameter is no longer supported.

[-qos-policy-group <text>] - QoS Policy Group
   Display the Vservers that match the specified qos-policy-group.
   A policy group defines measurable service level objectives (SLOs) that apply to the storage objects with which the policy group is associated. If you do not assign a policy group to a Vserver, the system will not monitor and control the traffic to it.

[-caching-policy <text>] - Caching Policy Name
   Display the Vservers that match the specified caching-policy.
   A caching policy defines the caching behavior of this Vserver at the Flash Cache level. If a caching policy is not assigned to this Vserver, the system uses the default cluster-wide policy. The available caching policies are:
   • none - Does not cache any user data or metadata blocks.
   • auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
   • meta - Read caches only metadata blocks.
   • random_read - Read caches all metadata and randomly read user data blocks.
   • random_read_write - Read caches all metadata, randomly read, and randomly written user data blocks.
   • all_read - Read caches all metadata, randomly read, and sequentially read user data blocks.
   • all_read_random_write - Read caches all metadata, randomly read, sequentially read, and randomly written user data.
   • all - Read caches all data blocks read and written. It does not do any write caching.
   Default caching-policy is auto.

[-config-lock {true|false}] - Config Lock
   This parameter specifies if the Vserver is locked or unlocked for modification. If the config-lock is set to true, then modifying the Vserver's configuration is not allowed.

[-ipspace <IPspace>] - IPspace Name
   If this parameter is specified, the command displays information only about the Vservers that are assigned to the specified IPspace.

[-foreground {true|false}] - Foreground Process
   This optionally specifies whether the Vserver show operation can be executed in the background. If nothing is specified, by default the Vserver show operation is executed in the foreground.

[-is-space-reporting-logical {true|false}] - Logical Space Reporting
   This optionally specifies whether to report space logically on residing volumes. When space is reported logically, ONTAP reports the volume space such that all the physical space saved by the storage efficiency features are also as reported as used. This parameter is not supported on FlexGroups.

[-is-space-enforcement-logical {true|false}] - Logical Space Enforcement
   This optionally specifies whether to perform logical space accounting on residing volumes. When space is enforced logically, ONTAP enforces volume settings such that all the physical space saved by the storage efficiency features will be calculated as used. This parameter is not supported on FlexGroups.

Examples
   The following example displays information about all Vservers.
cluster1::> vserver show

non mcc setup:

vserver show-aggregates

Show details of aggregates in a Vserver

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The vserver show-aggregates command displays the details of all the aggregates that are associated with Vservers. The aggregate details displayed are the aggregate name, state, available size, the type of aggregate and the SnapLock type.

**Parameters**

[-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver>] - Vserver

If this optional parameter is specified, the command displays the details of aggregates that are associated with the specified Vserver.

[-aggregate <aggregate name>] - Aggregate

If this optional parameter is specified, the command displays all of the Vservers configured with the specified aggregate.

**Examples**
The following example displays the aggregates configured for Vserver vs.

cluster1::> vserver show-aggregates -vserver vs

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Aggregate</th>
<th>State</th>
<th>Available Size</th>
<th>Type</th>
<th>SnapLock-Type</th>
</tr>
</thead>
</table>
vserver show-protocols

Show protocols for Vserver

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver show-protocols command displays the running protocols on a given Vserver.

Parameters

[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance ]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver>] - Vserver
If this parameter is specified, the command displays the allowed set of protocols for the specified Vserver.

[-protocol {nfs|cifs|fcp|iscsi|ndmp|nvme}, ...] - Protocols
If this optional parameter is specified, the command displays all the Vservers configured with the specified protocols.

Examples
The following example displays the protocols configured for Vserver vs1.

cluster1:--> vserver show-protocols -vserver vs1
Vserver: vs1
Protocols: nfs, cifs

vserver start

Start a Vserver

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The vserver start command starts data access on a Vserver.

Parameters

-vserver <vserver> - Vserver
This specifies the name of the Vserver on which the data access is to be started. This operation is only supported on a data Vserver.

Note: The name must be of 47 characters length or less.
[-foreground (true|false)] - Foreground Process

This specifies if the vserver start command should be executed in the foreground or background. If you do not enter this parameter, it is set to true, and the vserver start command is executed in the foreground.

[-force [true]] - Force Vserver Start

In case of a MetroCluster configuration or Vserver disaster recovery, by using this parameter you can start the Vserver that is either locked (which prevents any configuration changes) or its partner Vserver is operationally running. If you do not enter this parameter, it is set to false.

**Examples**

The following example starts data access on Vserver vs0.example.com in the background.

```
cluster1::> vserver start -vserver vs0.example.com -foreground false
```

**vserver stop**

Stop a Vserver

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

The vserver stop command stops data access on a Vserver.

**Parameters**

-vserver <vserver> - Vserver

This specifies the name of the Vserver on which the data access is to be stopped. This operation is only supported on a data Vserver.

**Note:** The name must be of 47 characters length or less.

[-foreground (true|false)] - Foreground Process

This specifies if vserver stop command should be executed in the foreground or background. If you do not enter this parameter, it is set to true, and the vserver stop command is executed in the foreground.

**Examples**

The following example stops data access on Vserver vs0.example.com in the background.

```
cluster1::> vserver stop -vserver vs0.example.com -foreground false
```

**vserver unlock**

Unlock Vserver configuration

**Availability:** This command is available to cluster administrators at the advanced privilege level.

**Description**

The vserver unlock command revokes the administrative lock on the Vserver configuration. When a Vserver is unlocked, changes to the configuration are permitted. The unlock operation fails if the Vserver is not locked by the administrator or if it is locked by internal applications. If the Vserver fails to unlock due to an error condition, you can use the -force option.
Parameters

-vserver <vserver> - Vserver

The name of the Vserver that has to be unlocked.

[-force [true]] - Force Unlock

This option is specified to unlock the Vserver when the Vserver fails to unlock due to an error condition.

Examples

The following example illustrates how to unlock the Vserver named vs123.example.com, forcefully:

```
cluster1::> vserver unlock -vserver vs1.example.com -force true
```

vserver active-directory commands

Manage Active Directory

vserver active-directory create

Create an Active Directory account. If joining a domain, this command may take several minutes to complete.

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The `vserver active-directory create` command creates an Active Directory account for a Vserver. When you create the Active Directory account, you must add it to an existing Windows Active Directory domain. When you enter this command, you are prompted to provide the credentials of a user account that has sufficient privileges to add computers to the -ou container within the -domain domain. The user account must have a password that cannot be empty. When joining a domain, this command may take several minutes to complete.

Note: Each Vserver can have only one Active Directory account.

Parameters

-vserver <vserver> - Vserver

This parameter specifies the name of the Vserver for which you want to create the Active Directory account. The Vserver must already exist.

-account-name <NetBIOS> - Active Directory NetBIOS Name

This parameter specifies the name of the Active Directory account (up to 15 characters).

-domain <TextNoCase> - Fully Qualified Domain Name

This parameter specifies the name of the Active Directory domain.

[[-ou <text>] - Organizational Unit

This parameter specifies the organizational unit within the Active Directory domain. By default, this parameter is set to CN=Computers. When specifying this parameter, specify only the organizational unit portion of the distinguished name. Data ONTAP appends the value provided for the required -domain parameter onto the value provided for -ou parameter to produce the Active Directory distinguished name, which is used when creating the Vserver’s Active Directory account in the domain.

Note: Nested OUs must be provided in a specific order with all containers separated by a comma. Reading from left to right you travel up the directory tree until you reach the root OU.
**Examples**

The following example creates an Active Directory account `ADSERVER1` for Vserver `vs1` and domain `example.com`.

```
cluster1::> vserver active-directory create -vserver vs1 -account-name ADSERVER1 -domain example.com
```

In order to create an Active Directory machine account, you must supply the name and password of a Windows account with sufficient privileges to add computers to the "CN=Computers" container within the "example.com" domain.

Enter the user name: Administrator

Enter the password:

The following example creates an Active Directory account `ADSERVER2` for Vserver `vs2`, domain `example.com` and organizational unit `sample_ou`.

```
cluster1::> vserver active-directory create -vserver vs2 -account-name ADSERVER2 -domain example.com -ou OU=sample_ou
```

In order to create an Active Directory machine account, you must supply the name and password of a Windows account with sufficient privileges to add computers to the "OU=sample_ou" container within the "example.com" domain.

Enter the user name: Administrator

Enter the password:

The following example creates an Active Directory account `ADSERVER2` for Vserver `vs2`, domain `example.com` and nested organizational unit `OU=developers,OU=engineering,OU=corp`.

```
cluster1::> vserver active-directory create -vserver vs2 -account-name ADSERVER2 -domain example.com -ou OU=developers,OU=engineering,OU=corp
```

In order to create an Active Directory machine account, you must supply the name and password of a Windows account with sufficient privileges to add computers to the "OU=developers,OU=engineering,OU=corp" container within the "example.com" domain.

Enter the user name: Administrator

Enter the password:

---

**vserver active-directory delete**

Delete an Active Directory account

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver active-directory delete` command deletes the Active Directory account for a specified Vserver.

**Parameters**

- `-vserver <vserver>` - Vserver

  This parameter specifies the Vserver for the Active Directory account you want to delete.

**Examples**

The following example deletes the Active Directory account for a Vserver named `vs1`:
vserver active-directory modify

Modify the domain of an Active Directory account. If re-joining the current domain or joining a new one, this command may take several minutes to complete.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `vserver active-directory modify` command modifies the domain of an Active Directory account. You can also re-join the current domain or join a new one. When joining a domain, this command may take several minutes to complete.

**Parameters**

- `-vserver <vserver>` - Vserver
  
  This parameter specifies the Vserver for the Active Directory account whose associated domain you want to modify.

- `[ -domain <TextNoCase> ]` - Fully Qualified Domain Name
  
  This parameter specifies the fully qualified name of the Active Directory domain to associate with the Active Directory account.

**Examples**
The following example modifies the Active Directory domain associated with Vserver `vs1`.

```
cluster1::> vserver active-directory modify -vserver vs1 -domain example.com
```

vserver active-directory password-change

Change the domain account password for an Active Directory account

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `vserver active-directory password-change` command changes the domain account password for the specified Vserver's Active Directory account.
Parameters
-vserver <vserver> - Vserver

This parameter specifies the name of the Vserver associated with the Active Directory account whose domain account password you want to change.

Examples
The following example changes the password for the Active Directory account for a Vserver named vs1.

```
cluster1::> vserver active-directory password-change -vserver vs1
```

vserver active-directory password-reset

Reset the domain account password for an Active Directory account

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver active-directory password-reset command resets the domain account password for the Active Directory account. This may be required if the password stored along with the machine account in the Windows Active Directory domain is changed or reset without the Vserver's knowledge. The operation requires the credentials for a user with permission to reset the password in the organizational unit (OU) that contains the machine account.

Parameters
-vserver <vserver> - Vserver

This parameter specifies the name of the Vserver associated with the Active Directory account whose domain account password you want to reset.

Examples
The following example resets the password for the Active Directory account for a Vserver named vs1.

```
cluster1::> vserver active-directory password-reset -vserver vs1
Enter your user ID: Administrator
Enter your password:
```

vserver active-directory show

Display Active Directory accounts

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver active-directory show command displays information about Active Directory accounts. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all Active Directory accounts:

- Vserver name
- Active Directory account NetBIOS name
- Domain or workgroup name
You can specify the `-fields` parameter to specify which fields of information to display about Active Directory accounts. You can use `-fields ?` to display the valid values for the `-fields` parameter. In addition to the fields above, you can display the following fields:

- Fully-qualified domain name
- Organizational unit

You can specify additional parameters to display only information that matches those parameters. For instance, to display information only about Active Directory accounts that are in the Windows Active Directory domain named `RUBY`, run the command with the value of the `-domain-workgroup` parameter set to `RUBY`.

You can specify the `-instance` parameter to display all information for all Active Directory accounts in list form.

### Parameters

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command only displays the fields that you specify.

```
[-instance]
```

If you specify the `-instance` parameter, the command displays detailed information about all entries.

```
[-vserver <vserver>] - Vserver
```

If you specify this parameter, the command displays information only about the Active Directory account for the specified Vserver.

```
[-account-name <NetBIOS>] - Active Directory NetBIOS Name
```

If you specify this parameter, the command displays information only for the Active Directory accounts that match the specified NetBIOS account name.

```
[-domain-workgroup <CIFS domain>] - NetBIOS Domain/Workgroup Name
```

If you specify this parameter, the command displays information only for the Active Directory accounts that are in the specified NetBIOS domain or workgroup.

**Note:** Workgroups are not supported in this release.

```
[-domain <TextNoCase>] - Fully Qualified Domain Name
```

If you specify this parameter, the command displays information only for the Active Directory accounts that are in the specified domain.

```
[-ou <text>] - Organizational Unit
```

If you specify this parameter, the command displays information only for the Active Directory accounts that are in the specified organizational unit.

```
[-auth-style {domain|workgroup|realm}] - Authentication Style
```

If you specify this parameter, the command displays information only for the Active Directory accounts that are in the specified authentication style.

### Examples

The following example displays a subset of the information about all Active Directory accounts.

```bash
cluster1::> vserver active-directory show

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Account Name</th>
<th>Domain/Workgroup Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>
<td>ADSERVER1</td>
<td>EXAMPLE</td>
</tr>
</tbody>
</table>
```

The following example displays all information about all Active Directory Vservers in list form.
Vserver Audit Commands

Manage auditing of protocol requests that the Vserver services

The vserver audit commands enable you to manage auditing of protocol requests that the Vserver services.

vserver audit create

Create an audit configuration

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The vserver audit create command creates an audit configuration for a Vserver.

When you create an audit configuration, you can also specify the rotation method. By default, the audit log is rotated based on size.

You can use the time-based rotation parameters in any combination (\(-rotate\)-schedule-month, \(-rotate\)-schedule-dayofweek, \(-rotate\)-schedule-day, \(-rotate\)-schedule-hour, and \(-rotate\)-schedule-minute). The \(-rotate\)-schedule-minute parameter is mandatory. All other time-based rotation parameters are optional.

The rotation schedule is calculated by using all the time-related values. For example, if you specify only the \(-rotate\)-schedule-minute parameter, the audit log files are rotated based on the minutes specified on all days of the week, during all hours on all months of the year. If you specify only one or two time-based rotation parameters (say \(-rotate\)-schedule-month and \(-rotate\)-schedule-minutes), the log files are rotated based on the minute values that you specified on all days of the week, during all hours, but only during the specified months. For example, you can specify that the audit log is to be rotated during the months January, March, and August on all Mondays, Wednesdays, and Saturdays at 10:30.

If you specify values for both \(-rotate\)-schedule-dayofweek and \(-rotate\)-schedule-day, they are considered independently. For example if you specify \(-rotate\)-schedule-dayofweek as Friday and \(-rotate\)-schedule-day as 13 then the audit logs would be rotated on every Friday and on the 13th day of the specified month, not just on every Friday the 13th.

**Parameters**

- **\(-vserver <vserver name>\)** - Vserver
  
  This parameter specifies the name of the Vserver on which to create the audit configuration. The Vserver must already exist.

- **\(-destination <text>\)** - Log Destination Path
  
  This parameter specifies the audit log destination path where consolidated audit logs are stored. If the path is not valid, the command fails. The path can be up to 864 characters in length and must have read-write permissions.

- **\([-events {file-ops|cifs-logon-logoff|cap-staging|file-share|audit-policy-change|user-account|authorization-policy-change|security-group},...}\)** - Categories of Events to Audit
  
  This parameter specifies the categories of events to be audited. Supported event categories are: file access events (both CIFS and NFS), CIFS logon and logoff events, Central Access Policy(CAP) staging events, File share events, Audit policy change events, Local User Account Management Events, Local Security Group...
Management Events and Authorization Policy Change Events. The corresponding parameter values are:

- `file-ops`
- `cifs-logon-logoff`
- `cap-staging`
- `file-share`
- `audit-policy-change`
- `user-account`
- `security-group`
- `authorization-policy-change`

By default, `file-ops`, `cifs-logon-logoff` and `audit-policy-change` events are enabled. The support for `audit-policy-change` event can be modified from diag promt using `vserver audit modify` command.

```
[format (xml|evtx)] - Log Format
```

This parameter specifies the output format of the audit logs. The output format can be either Data ONTAP-specific XML or Microsoft Windows EVTX log format. By default, the output format is EVTX.

```
[-rotate-size {<integer> [KB|MB|GB|TB|PB]}] - Log File Size Limit
```

This parameter specifies the audit log file size limit. By default, the audit log is rotated based on size. The default audit log size is 100 MB.

```
[-rotate-schedule-month <cron_month>, ...] - Log Rotation Schedule: Month
```

This parameter specifies the monthly schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated during the months January, March, and August, or during all the months. Valid values are January, February, March, April, May, June, July, August, September, October, November, December, and all. Specify "all" to rotate the audit logs every month.

```
[-rotate-schedule-dayofweek <cron_dayofweek>, ...] - Log Rotation Schedule: Day of Week
```

This parameter specifies the daily (day of the week) schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated on Tuesdays and Fridays, or during all the days of a week. Valid values are Sunday, Monday, Tuesday, Wednesday, Thursday, Friday, Saturday, and all. Specify "all" to rotate the audit logs every day.

```
[-rotate-schedule-day <cron_dayofmonth>, ...] - Log Rotation Schedule: Day
```

This parameter specifies the day of the month schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated on the 10th and 20th days of a month, or all days of a month. Valid values range from 1 to 31.

```
[-rotate-schedule-hour <cron_hour>, ...] - Log Rotation Schedule: Hour
```

This parameter specifies the hourly schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated at 6 a.m and 10 a.m. Valid values range from 0 (midnight) to 23 (11:00 p.m.). Specify "all" to rotate the audit logs every hour.

```
[-rotate-schedule-minute <cron_minute>, ...] - Log Rotation Schedule: Minute
```

This parameter specifies the minute schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated at the 30th minute. Valid values range from 0 to 59.

```
[-rotate-limit <integer>] - Log Files Rotation Limit
```

This parameter specifies the audit log files rotation limit. A value of 0 indicates that all the log files are retained. The default value is 0. For example, if you enter a value of 5, the last five audit logs are retained.

```
[-retention-duration {[<integer>d] [<integer>h] [<integer>m] [<integer>s]>}] - Log Retention Duration
```

This parameter specifies the audit log files retention duration. A value of 0s indicates that all the log files are retained. The default value is 0s. For example, if you enter a value of 5d0h0m, logs more than 5 days old are deleted.

---

**Examples**

The following examples create an audit configuration for Vserver vs1 using size-based rotation.

```
cluster1::> vserver audit create -vserver vs1 -destination /audit_log -rotate-size 10MB -rotate-limit 5
```

---
The following example creates an audit configuration for Vserver vs1 using time-based rotation. The audit logs are rotated monthly, all days of the week, at 12:30.

```
cluster1::> vserver audit create -vserver vs1 -destination /audit_log -rotate-schedule-month all -rotate-schedule-dayofweek all -rotate-schedule-hour 12 -rotate-schedule-minute 30
```

The following example creates an audit configuration for Vserver vs1 using time-based rotation. The audit logs are rotated in January, March, May, July, September, and November on Monday, Wednesday, and Friday, at 6:15, 6:30, 6:45, 12:15, 12:30, 12:45, 18:15, 18:30, and 18:45. The last 6 audit logs are retained.

```
cluster1::> vserver audit create -vserver vs1 -destination /audit_log -rotate-schedule-month January, March, May, July, September, November -rotate-schedule-dayofweek Monday, Wednesday, Friday -rotate-schedule-hour 6, 12, 18 -rotate-schedule-minute 15, 30, 45 -rotate-limit 6
```

The following example creates an audit configuration for Vserver vs1 for auditing CIFS and NFS file access events in the output log format EVTX.

```
cluster1::> vserver audit create -vserver vs1 -destination /audit_log -format evtx -events file-ops
```

vserver audit modify on page 1698

vserver audit delete

Delete audit configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver audit delete command deletes the audit configuration for a Vserver.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver associated with the audit configuration to be deleted.

[-force [true]] - Force Delete (privilege: advanced)

This parameter is used to forcibly delete the audit configuration. By default the setting is false.

Examples

The following example deletes the audit configuration for Vserver vs1.

```
cluster1::> vserver audit delete -vserver vs1
```

vserver audit disable

Disable auditing

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver audit disable command disables auditing for a Vserver.
Parameters

-vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver for which auditing is to be disabled. The Vserver audit configuration must already exist.

Examples

The following example disables auditing for Vserver vs1.

cluster1::> vserver audit disable -vserver vs1

vserver audit enable

Enable auditing

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver audit enable command enables auditing for a Vserver.

Note: Events on FlexGroup volumes are not emitted to the audit log.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver for which auditing is to be enabled. The Vserver audit configuration must already exist.

[-force [true]] - Force Enable (privilege: advanced)

This parameter is used to ignore errors while enabling auditing.

Examples

The following example enables auditing for Vserver vs1:

cluster1::> vserver audit enable -vserver vs1

vserver audit modify

Modify the audit configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver audit modify command modifies an audit configuration for a Vserver.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver for which the audit configuration is to be modified. The Vserver audit configuration must already exist.

If you have configured time-based rotation, modifying one parameter of time-based rotation schedule does not affect the other parameters. For example, if the rotation schedule is set to run at Monday 12:30 a.m., and you modify the -rotate-schedule-dayofweek parameter to Monday,Wednesday, Friday, the new rotation-schedule rotates the audit logs on Monday, Wednesday, and Friday at 12:30 a.m. To clear time-based rotation parameters, you must explicitly set that portion to "-". Some time-based parameters can also be set to "all".
[-destination <text>] - Log Destination Path
This parameter specifies the audit log destination path where consolidated audit logs are stored. If the path is not valid, the command fails. The path can be up to 864 characters in length and must have read-write permissions.

[-events {file-ops|cifs-logon-logoff|cap-staging|file-share|audit-policy-change|user-account|authorization-policy-change|security-group}, ...] - Categories of Events to Audit
This parameter specifies the categories of events to be audited. Supported event categories are: file access events (both CIFS and NFS), CIFS logon and logoff events, Central Access Policy(CAP) staging events, File share events, Audit policy change events, Local User Account Management Events, Local Security Group Management Events and Authorization Policy Change Events. The corresponding parameter values are: file-ops, cifs-logon-logoff, cap-staging, file-share, audit-policy-change, user-account, security-group and authorization-policy-change. By default, file-ops, cifs-logon-logoff and audit-policy-change events are enabled.

[-format {xml|evtx}] - Log Format
This parameter specifies the output format of the audit logs. The output format can be either Data ONTAP-specific XML or Microsoft Windows EVTX log format. By default, the output format is EVTX.

{ [-rotate-size <integer> [KB|MB|GB|TB|PB]] } - Log File Size Limit
This parameter specifies the audit log file size limit. By default, the audit log is rotated based on size. The default audit log size is 100 MB.

{ [-rotate-schedule-month <cron_month>, ...] } - Log Rotation Schedule: Month
This parameter specifies the monthly schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated during the months January, March, and August, or during all the months. Valid values are January, February, March, April, May, June, July, August, September, October, November, December, and all. Specify "all" to rotate the audit logs every month.

{ [-rotate-schedule-dayofweek <cron_dayofweek>, ...] } - Log Rotation Schedule: Day of Week
This parameter specifies the daily (day of the week) schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated on Tuesdays and Fridays, or during all the days of a week. Valid values are Sunday, Monday, Tuesday, Wednesday, Thursday, Friday, Saturday, and all. Specify "all" to rotate the audit logs every day.

{ [-rotate-schedule-day <cron_dayofmonth>, ...] } - Log Rotation Schedule: Day
This parameter specifies the day of the month schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated on the 10th and 20th days of a month, or all days of a month. Valid values range from 1 to 31.

{ [-rotate-schedule-hour <cron_hour>, ...] } - Log Rotation Schedule: Hour
This parameter specifies the hourly schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated at 6 a.m and 10 a.m. Valid values range from 0 (midnight) to 23 (11:00 p.m.). Specify "all" to rotate the audit logs every hour.

{ [-rotate-schedule-minute <cron_minute>, ...] } - Log Rotation Schedule: Minute
This parameter specifies the minute schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated at the 30th minute. Valid values range from 0 to 59.

{ [ -rotate-limit <integer> ] } - Log Files Rotation Limit
This parameter specifies the audit log files rotation limit. A value of 0 indicates that all the log files are retained. The default value is 0.

{ [ -retention-duration <[<integer>d] [<integer>h] [<integer>m] [<integer>s]> ] } - Log Retention Duration
This parameter specifies the audit log files retention duration. A value of 0s indicates that all the log files are retained. For example, if you enter a value of 5d0h0m0s, logs more than 5 days old are deleted.
Examples
The following example modifies the rotate-size and rotate-limit field for Vserver vs1.

```
cluster1::> vserver audit modify -vserver vs1 -rotate-size 10MB -rotate-limit 3
```

The following example modifies an audit configuration for Vserver vs1 using the time-based rotation method. The audit logs are rotated monthly, all days of the week, at 12:30.

```
cluster1::> vserver audit modify -vserver vs1 -destination /audit_log -rotate-schedule-month all -rotate-schedule-dayofweek all -rotate-schedule-hour 12 -rotate-schedule-minute 30
```

The following example modifies an audit configuration for Vserver vs1 for auditing CIFS and NFS file access events in the output log format EVTX.

```
cluster1::> vserver audit modify -vserver vs1 -format evtx -events file-ops
```

vserver audit prepare-to-downgrade

Restore the Audit configuration to Earlier Release of Data ONTAP

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The vserver audit prepare-to-downgrade command restores the Audit configurations for ONTAP based on the input parameter disable-feature-set.

Parameters
```
-disable-feature-set <downgrade version> - Data ONTAP Version
```

This parameter specifies the ONTAP version that introduced the new Audit features and needs to be removed. The value can be one of the following:

- 9.0.0 - Disables the Audit features introduced in the ONTAP release 9.0.0. The following events are removed from the event list:
  - File share event. The corresponding parameter value is file-share.
  - Audit policy change event. The corresponding parameter value is audit-policy-change.
  - Local user account management event. The corresponding parameter value is user-account.
  - Local security group management event. The corresponding parameter value is security-group.
  - Authorization policy change event. The corresponding parameter value is authorization-policy-change.

Examples
```
cluster1::*> vserver audit prepare-to-downgrade -disable-feature-set 9.0.0
```
vserver audit rotate-log

Rotate audit log

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `vserver audit rotate-log` command rotates audit logs for a Vserver.

**Parameters**
- `vserver <vserver name>` - Vserver
  This parameter specifies the name of the Vserver for which audit logs are to be rotated. The Vserver audit configuration must already exist. Auditing must be enabled for the Vserver.

**Examples**
The following example rotates audit logs for Vserver vs1.

```
cluster1::> vserver audit rotate-log -vserver vs1
```

vserver audit show

Display the audit configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `vserver audit show` command displays audit configuration information about Vservers. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all the Vservers:

- Vserver name
- Audit state
- Target directory

You can specify the `-fields` parameter to specify which audit configuration information to display about Vservers. You can specify additional parameters to display only information that matches those parameters. For instance, to display information about the log file rotation size of a Vserver whose value matches 10 MB, run the command with the `-rotate-size` parameter.

You can specify the `-instance` parameter to display audit configuration information for all Vservers in list form.

**Parameters**

- `[-fields <fieldname>, ...]`
  If you specify the -fields <fieldname>, ... parameter, the command only displays the fields that you specify.

- `[-log-save-details]`
  You can specify the `-log-save-details` parameter to display the following information about all the Vservers:
  - Vserver name
  - Rotation file size
- Rotation schedules
- Rotation limit

|--instance|--

If you specify the -instance parameter, the command displays detailed information about all entries.

|--vserver <vserver name>|-- Vserver

If you specify this parameter, the command displays information about the specified Vserver.

|--state {true|false}|-- Auditing State

If you specify this parameter, the command displays information about the Vservers that use the specified audit state value.

|--destination <text|-- Log Destination Path

If you specify this parameter, the command displays information about the Vservers that use the specified destination path.

|--events {file-ops|cifs-logon-logoff|cap-staging|file-share|audit-policy-change|user-account|authorization-policy-change|security-group}, ...|-- Categories of Events to Audit

If you specify this parameter, the command displays information about the Vservers that use the specified category of events that are audited. Valid values are file-ops, cifs-logon-logoff, cap-staging, file-share, audit-policy-change, user-account, security-group and authorization-policy-change. audit-policy-change will appear only in diag mode.

|--format {xml|evtx}|-- Log Format

If you specify this parameter, the command displays information about the Vservers that use the specified log format.

|--rotate-size (<integer> [KB|MB|GB|TB|PB])|-- Log File Size Limit

If you specify this parameter, the command displays information about the Vservers that use the specified log file rotation size.

|--rotate-schedule-month <cron_month>, ...|-- Log Rotation Schedule: Month

If you specify this parameter, the command displays information about the Vservers that use the specified month of the time-based log rotation scheme. Valid values are January, February, March, April, May, June, July, August, September, October, November, and December.

|--rotate-schedule-dayofweek <cron_dayofweek>, ...|-- Log Rotation Schedule: Day of Week

If you specify this parameter, the command displays information about the Vservers that use the specified day of the week of the time-based log rotation scheme. Valid values are Sunday, Monday, Tuesday, Wednesday, Thursday, Friday, and Saturday.

|--rotate-schedule-day <cron_dayofmonth>, ...|-- Log Rotation Schedule: Day

If you specify this parameter, the command displays information about the Vservers that use the specified day of the month of the time-based log rotation scheme. Valid values range from 1 to 31.

|--rotate-schedule-hour <cron_hour>, ...|-- Log Rotation Schedule: Hour

If you specify this parameter, the command displays information about the Vservers that use the specified hour of the time-based log rotation scheme. Valid values range from 0 (midnight) to 23 (11:00 p.m.).

|--rotate-schedule-minute <cron_minute>, ...|-- Log Rotation Schedule: Minute

If you specify this parameter, the command displays information about the Vservers that use the specified minute of the time-based log rotation scheme. Valid values range from 0 to 59.

|--rotate-schedule-description <text|-- Rotation Schedules

If you specify this parameter, the command displays information about the Vservers that use the specified rotation schedules. This field is derived from the rotate-time fields.
[-rotate-limit <integer>] - Log Files Rotation Limit

If you specify this parameter, the command displays information about the Vservers that use the specified rotation limit value.

[-retention-duration <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Log Retention Duration

If you specify this parameter, the command displays information about the Vservers audit logs retention duration.

**Examples**

The following example displays the name, audit state, event types, log format, and target directory for all Vservers.

```
cluster1::> vserver audit show
Vserver     State  Event Types Log Format Target Directory
----------- ------ ----------- ---------- --------------------
vs1         false  file-ops    evtx       /audit_log
```

The following example displays the Vserver names and details about the audit log for all Vservers.

```
cluster1::> vserver audit show -log-save-details
Rotation                           Rotation
Vserver     File Size Rotation Schedule        Limit
----------- --------- ------------------------ --------
vs1         100MB     -                        0
```

The following example displays in list form all audit configuration information about all Vservers.

```
cluster1::> vserver audit show -instance
Vserver: vs1
Auditing state: true
Log Destination Path: /audit_log
Categories of Events to Audit: file-ops
Log Format: evtx
Log File Size Limit: 100MB
Log Rotation Schedule: Month: -
Log Rotation Schedule: Day of Week: -
Log Rotation Schedule: Day: -
Log Rotation Schedule: Hour: -
Log Rotation Schedule: Minute: -
Rotation Schedules: -
Log Files Rotation Limit: 0
Log Retention Time: 0s
```

**vserver check commands**

The check directory

**vserver check lif-multitenancy commands**

The lif-multitenancy directory

**vserver check lif-multitenancy run**

Run check for LIF multitenancy

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.
Description

The run command checks the specified Vserver to verify that it has connectivity to the configured external servers providing services such as Active Directory, NIS, and DNS. The output can consist of three types of messages. Failure messages indicate that a Vserver does not have the connectivity required to a server exporting a service. Warning messages indicate configuration or operational issues that are possible causes of the failures. A success message is displayed if the Vserver has network connectivity to each of the configured servers for each service.

You can use this command to verify configuration changes such as creating a Vserver or changing the configured servers for one or more services. It is also useful for diagnosing operational problems that result from failures that could be caused by the inability to make network connections to configured servers.

The services that are checked are DNS, NIS, CIFS preferred domain controllers, CIFS discovered domain controllers, KDC, Active Directory, Admin, Password, LDAP, and LDAP preferred Active Directory.

Only a single run for a Vserver is allowed to run in a cluster. If multiple runs are attempted for a Vserver, a message will be displayed indicating that a run is already in progress.

For each service, this command will ping each configured server until a successful ping is completed. In certain circumstances where a subnet is offline or LIFs are operationally down, this command may take a long time to run. In order to show that forward progress is being made, an activity indicator of a '.' is displayed for each ping sent.

The following fields are reported in table format. Some fields may not be relevant to a type of message and will consist of the text "-.

- Vserver name
- Service external server is exporting
- Address of external server
- Connectivity to that external server
- More information describing the problem
- Suggestions to remediate the problems
- Success when there are no problems

Parameters

-vserver <vserver> - vserver

Use this parameter to specify the Vserver to check.

[-verbose {true|false}] - Show Positive and Negative Result (privilege: advanced)

When this parameter is specified the results of all connectivity tests will be displayed in the success and failure cases.

Examples

This is an example of a successful run:

```bash
cluster1::> vserver check lif-multitenancy run -vserver vs0
...
SUCCESS: All external servers are reachable.
```

This is an example of a run with warnings and failures that need to be corrected:

```bash
cluster1::> vserver check lif-multitenancy run -vserver vs0
Vserver    Severity Service            Address         LIF             Connected  Details
----------- ----- ------------------ --------------- --------------- ----------
-           -     -                   -               -               -          -
```

Commands: Manual Page Reference
vs0             warning  -                  -               vs0_lif1        -
operationally down

vs0             warning  -                  -               vs0_lif2        -
operationally down

... vs0             failure  DNS                10.98.200.20    -               no         cache
... vs0             failure  NIS domain         10.98.13.53     -               no         cache

Error : command failed:   FAILURES FOUND.
You must correct these failures to avoid service disruptions in DOT 8.3 and above. Corrective actions may include:
- removing decommissioned external servers from the vserver configuration
- restoring network interfaces that are down
- adding network interfaces or routes
- modifying the locations where network interfaces may reside
  (through
  adjusting failover groups/policies or changing the home-node or auto-revert settings).
For assistance, please consult the 8.3 Upgrade Document, or contact support personnel.

At advanced privilege, additional information for messages at all severities is displayed.

vserver check lif-multitenancy show
Show the summary of the latest multitenancy network run

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
You can view summary information about the latest completed run, or the run in progress for a Vserver. It will show the following fields:

- Vserver - Name of Vserver that was checked for LIF connectivity
- Start Time - Date And Time the run was started
- Status - Not Started, In Progress, Complete, or Aborted
- Success - Yes if the run has a Status of Complete with no failures. No if the run has a status of Complete with one or more failures.
- Updated - The date and time the scan was last updated.

Parameters
[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.
If you specify the `instance` parameter, the command displays detailed information about all fields.

`-vserver <vserver>` - Vserver

Selects the summary information matching the specified Vserver.

`-start-time <MM/DD/YYYY HH:MM:SS>` - Start Time

Selects the summary information matching the specified date and time the run was started.

`-status {not started|in progress|complete|aborted}` - Run Status

Selects the summary information matching the specified status of the run.

`-success {yes|no}` - Successful Run

Selects the summary information matching the specified success or failure of the run.

`-updated <MM/DD/YYYY HH:MM:SS>` - Run Updated

Selects the summary information matching the last time the run was still in progress.

### Examples

This is what a successful run looks like:

```
cluster1::> vserver check lif-multitenancy show
Vserver         Start Time           Status        Success
--------------  -------------------  ------------  -------
vs0 7/16/2014 14:28:35   complete      yes
```

This is what a failed run looks like:

```
cluster1::> vserver check lif-multitenancy show
Vserver         Start Time           Status        Success
--------------  -------------------  ------------  -------
vs0 7/16/2014 14:40:55   complete      no
```

This is what specifying the Vserver looks like:

```
cluster1::> vserver check lif-multitenancy show -vserver vs0
Vserver: vs0
Start Time: 7/16/2014 14:40:55
Run Status: complete
Successful Run: no
```

Advanced privilege adds in the Updated field.

```
cluster1::*> vserver check lif-multitenancy show
Vserver Start Time Status Success Updated
-------------- -------------- ---------- ------- ---------------
vs0 7/16/2014 14:40:55 complete no 7/16/2014 14:40:56
```

Diagnostic privilege adds in the Details field:
vserver check lif-multitenancy show

Show the results of the latest multitenancy network run

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
You can view detailed information about the latest completed run, or the run for a Vserver.

- **Vserver** - name of vserver run was for
- **Severity** - severity of the message which is failure, warning, or info.
- **Service** - name of service that is being checked for connectivity
- **Address** - address of server configured for the above service that is being
- **LIF** - the LIF a successful connectivity check to the above server was made from
- **Connected** - true of there is connectivity, false if there is not
- **Status** - additional information useful for resolving issues

**Parameters**

{-fields <fieldname>, ...}

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

{-instance}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

{-vserver <vserver>}- Vserver
Selects the messages matching the specified Vserver

{-severity <text>}- Severity
Selects the messages matching the specified severity of failure, warning, and info.

{-service <text>}- Service Name
Selects the messages matching the specified service.

{-address <text>}- Address of Server
Selects the messages matching the specified address.

{-lif <lif-name>}- Logical Interface
Selects the messages matching the specified LIF.

{-connected {yes|no}}- Vserver Connectivity
Selects the messages matching the specified connectivity.

{-status <text>}- Additional Information
Selects the messages matching the specified search criteria.
Examples

Runs that are successful will not have any content.

```
class1::> vserver check lif-multitenancy show-results -vserver vs0
This table is currently empty.
```

Successful runs made with -verbose true will show the LIF used to Ping the network address from.

```
class1::> vserver check lif-multitenancy show-results -vserver vs0

Network      Logical
Vserver     Severity  Service      Address      Interface  Connected  Status
----------  --------  -----------  -----------  ---------  ---------- -------
vs0
  info      DNS          10.98.200.20
  info      NIS domain   10.98.13.53 vs0_lif1   yes        ping
2 entries were displayed.
```

Successful runs made with -verbose true will show the LIF used to Ping the network address from.

```
class1::> vserver check lif-multitenancy show-results -vserver vs0

Network      Logical
Vserver     Severity  Service      Address      Interface  Connected  Status
----------  --------  -----------  -----------  ---------  ---------- -------
vs0
  info      DNS          10.98.200.20
    vs0_lif1   yes        ping
  info      NIS domain   10.98.13.53 vs0_lif1   yes        ping
2 entries were displayed.
```

Runs that fail display each failure that needs to be fixed.

```
class1::> vserver check lif-multitenancy show-results -vserver vs0

Network      Logical
Vserver     Severity  Service      Address      Interface  Connected  Status
----------  --------  -----------  -----------  ---------  ---------- -------
vs0
  warning   -            -            vs0_lif1   -          operationally down
  failure   DNS          10.98.200.20
    vs0_lif1   -            operationally down
  failure   NIS domain   10.98.13.53
    -          no         cache
4 entries were displayed.
```

vserver cifs commands

Manage the CIFS configuration of a Vserver

vserver cifs add-netbios-aliases

Add NetBIOS aliases for the CIFS server name

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.
Description
The `vserver cifs add-netbios-aliases` command creates or adds a list of NetBIOS aliases for the CIFS server name.

Parameters
- `vserver <vserver name>` - Vserver
  This parameter specifies the name of the Vserver for which NetBIOS alias are to be created or added.
- `-netbios-aliases <NetBIOS>`, ... - List of NetBIOS Aliases
  This parameter specifies one or more NetBIOS aliases to be added to an existing list of NetBIOS aliases. A new list of NetBIOS aliases is created if the list is currently empty.

Examples
The following example creates a new list of NetBIOS aliases for Vserver vs_a.

```
cluster1::> cifs show -display-netbios-aliases
Vserver: vs_a
   Server Name: CIFS_SERVER
   NetBIOS Aliases: -
cluster1::> cifs add-netbios-aliases -netbios-aliases alias_1,alias_2,alias_3
cluster1::> cifs show -display-netbios-aliases
Vserver: vs_a
   Server Name: CIFS_SERVER
   NetBIOS Aliases: ALIAS_1, ALIAS_2, ALIAS_3
```

The following example adds several NetBIOS aliases for the CIFS server CIFS_SERVER on Vserver vs_a.

```
cluster1::> cifs add-netbios-aliases -netbios-aliases alias_4,alias_5,alias_6
cluster1::> cifs show -display-netbios-aliases
Vserver: vs_a
   Server Name: CIFS_SERVER
   NetBIOS Aliases: ALIAS_1, ALIAS_2, ALIAS_3, ALIAS_4, ALIAS_5, ALIAS_6
cluster1::> vserver cifs add-netbios-aliases -vserver v1 -netbios-aliases alias_7
cluster1::> cifs show -display-netbios-aliases
Vserver: vs_a
   Server Name: CIFS_SERVER
   NetBIOS Aliases: ALIAS_1, ALIAS_2, ALIAS_3, ALIAS_4, ALIAS_5, ALIAS_6, ALIAS_7
```

**vserver cifs check**

Display Validation Status of CIFS Configuration from Each Node

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**
Use the `vserver cifs check` command to check the status of configured CIFS server on a particular vserver.
Parameters

\{-fields <fieldname>, ...\}

If you specify the \{-fields <fieldname>, ...\} parameter, the command output also includes the specified field or fields. You can use \{-fields ?\} to display the fields to specify.

\{-instance \}

If you specify the \{-instance\} parameter, the command displays detailed information about all fields.

\{-vserver <vserver name>\} - Vserver

Use this parameter to specify the Vserver whose CIFS server needs to be validated.

\{-node {<nodename> | local}\} - Node

Use this parameter to specify the node name from which CIFS server connectivity needs to be validated.

\{-netbios-name <TextNoCase>\} - CIFS NetBIOS Name

Use this parameter to display netbios-name of the configured CIFS server.

\{-cifs-status <TextNoCase>\} - CIFS Server Status

Use this parameter to display status of configured CIFS server.

\{-site <TextNoCase>\} - CIFS Server Site

This parameter specifies the site discovered from Data ONTAP for the Active Directory domain associated with the CIFS server. If the discovery fails, this parameter will be updated with the default-site of associated cifs server.

\{-server <TextNoCase>\} - Domain Controller Name

Use this parameter to display Domain name of the configured CIFS server.

\{-server-ip <text>\} - Domain Controller IP Addr

Use this parameter to display IP-address of the configured CIFS server.

\{-status {down | up}\} - Connectivity Status

Use this parameter to display information only about CIFS servers with a status that matches the value you specify.

\{-status-details <text>\} - Connectivity Status Details

Use this parameter to display information only about CIFS servers with status details that match the value you specify.

Examples

The following example checks the connectivity of CIFS server on vserver vs0 from each node.

```
cluster1::> vserver cifs check -vserver vs0

Vserver : vs0
    Cifs NetBIOS Name : NEWSERVER
    Cifs Status : up
    Site : Bangalore

<table>
<thead>
<tr>
<th>Node Name</th>

<td>10.11.12.13</td>
<td>down</td>
<td>Secd: No Server available.</td>
</tr>
</tbody>
</table>
```

vserver cifs create

Create a CIFS server

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.
Description
The `vserver cifs create` command creates a CIFS server on a Vserver. When you create the CIFS server, you can add it to an existing CIFS domain, or you can join it to a workgroup. When you add it to an existing CIFS domain, the storage system prompts you to provide the credentials of a user account that has sufficient privileges to add computers to the `-ou` container within the `-domain` domain. The user account must have a password that cannot be empty. If the new CIFS server is joining a domain, this command might take several minutes to complete.

**Note:** Each Vserver can have only one CIFS server.

Parameters
- `vserver <vserver name>` - Vserver
  
  This parameter specifies the name of the Vserver on which to create the CIFS server. The Vserver must already exist.

- `cifs-server <NetBIOS>` - CIFS Server NetBIOS Name
  
  This parameter specifies the name of the CIFS server (up to 15 characters).

- `{domain <TextNoCase>` - Fully Qualified Domain Name
  
  This parameter specifies the name of the Active Directory domain to associate with the CIFS server.

- `[-ou <text>]` - Organizational Unit
  
  This parameter specifies the organizational unit within the Active Directory domain to associate with the CIFS server. By default, this parameter is set to CN=Computers. When specifying this parameter, specify only the organizational unit portion of the distinguished name. Data ONTAP appends the value provided for the required `-domain` parameter onto the value provided for `-ou` parameter to produce the Active Directory distinguished name, which is used to associate with the CIFS server.

  **Note:** Nested OUs must be provided in a specific order with all containers separated by a comma. Reading from left to right you travel up the directory tree until you reach the root OU.

- `[-default-site <text>]` - Default Site Used by LIFs Without Site Membership
  
  This parameter specifies the site within the Active Directory domain to associate with the CIFS server if Data ONTAP cannot determine an appropriate site.

- `[-workgroup <NetBIOS>]` - Workgroup Name
  
  This parameter specifies the name of the workgroup (up to 15 characters).

- `[-status-admin {down|up}]` - CIFS Server Administrative Status
  
  Use this parameter to specify whether the initial administrative status of the cifs server is up or down. The default setting is `up`.

- `[-comment <text>]` - CIFS Server Description
  
  This optional parameter specifies a text comment for the server. CIFS clients can see this CIFS server description when browsing servers on the network. The comment can be up to 48 characters long. If there is a space in the descriptive remark or the path, you must enclose the entire string in quotation marks.

- `[-netbios-aliases <NetBIOS>,...]` - List of NetBIOS Aliases
  
  This parameter specifies a list of NetBIOS aliases, which are alternate names to the CIFS server name.

Examples
The following example creates a CIFS server CIFSSERVER1 for Vserver vs1 and domain EXAMPLE.com.

```
class1:> vserver cifs create -vserver vs1 -cifs-server CIFSSERVER1 -domain EXAMPLE.com
```

In order to create an Active Directory machine account for the CIFS server, you must supply the name and password of a Windows account with sufficient privileges to add computers to the "CN=Computers" container within the "EXAMPLE.com" domain.
Enter the user name: Administrator
Enter the password:

The following example creates a CIFS server CIFSSERVER1 for Vserver vs1 and workgroup Sales:

```
cluster1::> vserver cifs create -vserver vs1 -cifs-server CIFSSERVER1 -workgroup Sales
```

The following example creates a CIFS server CIFSSERVER1 for Vserver vs1 and domain EXAMPLE.com with a user Administrator1 from a different domain, in this case an administrator from a trusted domain TRUST.LAB.COM:

```
cluster1::> vserver cifs create -vserver vs1 -cifs-server CIFSSERVER1 -domain EXAMPLE.com
```

In order to create an Active Directory machine account for the CIFS server, you must supply the name and password of a Windows account with sufficient privileges to add computers to the "CN=Computers" container within the "EXAMPLE.com" domain.

Enter the user name: Administrator1@TRUST.LAB.COM
Enter the password:

The following example creates a CIFS server CIFSSERVER1 for Vserver vs1 with domain EXAMPLE.com using nested OUs:

```
cluster1::> vserver cifs create -vserver vs1 -cifs-server CIFSSERVER1 -domain EXAMPLE.com -ou OU=developers,OU=engineering,OU=corp
```

In order to create an Active Directory machine account for the CIFS server, you must supply the name and password of a Windows account with sufficient privileges to add computers to the "OU=developers,OU=engineering,OU=corp" container within the "EXAMPLE.com" domain.

Enter the user name: Administrator
Enter the password:

---

**vserver cifs delete**

Delete a CIFS server

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The *vserver cifs delete* command deletes a CIFS server.

**Parameters**

- `-vserver <vserver name>` *- Vserver*

  This parameter specifies the Vserver for the CIFS server you want to delete.

**Examples**
The following example deletes the CIFS server from a Vserver named vs1:

```
cluster1::> vserver cifs delete -vserver vs1
```
vserver cifs modify

Modify a CIFS server

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs modify command modifies the site within the Active Directory domain to associate with the CIFS server if Data ONTAP cannot determine an appropriate site. You also can modify the name and ou of the CIFS server, join to a new domain or a workgroup, or rejoin to current domain. When a CIFS server is joining a domain, this command might take several minutes to complete.

Parameters
- vserver <vserver name> - Vserver
  This parameter specifies the Vserver for the CIFS server whose associated site you want to modify.

- [cifs-server <NetBIOS>] - CIFS Server NetBIOS Name
  This parameter specifies the name of the CIFS server (up to 15 characters). Before setting this parameter, the CIFS server must be stopped using the vserver cifs modify -status-admin down command. When the command completes successfully, the administrative status of the CIFS server is automatically set to up.

- [domain <TextNoCase>] - Fully Qualified Domain Name
  This parameter specifies the fully qualified name of the Active Directory domain to associate with the CIFS server. Before setting this parameter, the CIFS server must be stopped using the vserver cifs modify -status-admin down command. When the command completes successfully, the administrative status of the CIFS server is automatically set to up. Modifications to this parameter are not supported for workgroup CIFS servers.

- [ou <text>] - Organizational Unit
  This parameter specifies the organization unit within the Active Directory domain to associate with the CIFS server. By default, this parameter is set to CN=Computers. Before setting this parameter, the CIFS server must be stopped using the vserver cifs modify -status-admin down command. When the command completes successfully, the administrative status of the CIFS server is automatically set to up. Modifications to this parameter are not supported for workgroup CIFS servers.

- [default-site <text>] - Default Site Used by LIFs Without Site Membership
  This parameter specifies the site within the Active Directory domain to associate with the CIFS server if Data ONTAP cannot determine an appropriate site. Modifications to this parameter are not supported for workgroup CIFS servers.

- [workgroup <NetBIOS>] - Workgroup Name
  This parameter specifies the name of the workgroup (up to 15 characters).

- [status-admin (down|up)] - CIFS Server Administrative Status
  Use this parameter to modify the administrative status of the cifs server. Modify the administrator status to down to stop cifs access.

- [comment <text>] - CIFS Server Description
  Use this parameter to modify the comment of the server.

Examples
The following example changes the default site and administrative status of the CIFS server associated with Vserver "vs1":

cluster1::> vserver cifs modify -vserver vs1 -default-site default -status-admin up
The following example modifies the Active Directory domain and ou for the CIFS server associated with Vserver "vs1". The administrative status of the CIFS server must be set to "down" to proceed with Active Directory domain modification. If the command completes successfully, the administrative status is automatically set to "up".

```
cluster1::> vserver cifs modify -vserver vs1 -domain example.com -ou ou-example_ou -cifs-server example -status-admin down
```

In order to create an Active Directory machine account for the CIFS server, you must supply the name and password of a Windows account with sufficient privileges to add computers to the "ou-example_ou" container within the "example.com" domain.

Enter the user name: administrator
Enter the password:

```
cluster1::>
```

The following example modifies the CIFS server associated with Vserver "vs1" from a domain to a workgroup. The administrative status of the CIFS server must be set to "down" for this command. If the command completes successfully, the administrative status is automatically set to "up".

```
cluster1::> vserver cifs modify -vserver vs1 -workgroup Sales -status-admin down
```

Warning: To enter workgroup mode, all domain-based features must be disabled and their configuration removed automatically by the system, including continuously-available shares, shadow copies, and AES. However, domain-configured share ACLs such as "EXAMPLE.COM\userName" will not work properly, but cannot be removed by Data ONTAP. Remove these share ACLs as soon as possible using external tools after the command completes. If AES is enabled, you may be asked to supply the name and password of a Windows account with sufficient privileges to disable it in the "EXAMPLE.COM" domain.

Do you want to continue? {y|n}: y

```
cluster1::>
```

The following example modifies the CIFS server associated with Vserver "vs1" from a workgroup to a domain. The administrative status of the CIFS server must be set to "down" for this command. If the command completes successfully, the administrative status is automatically set to "up".

```
cluster1::> vserver cifs modify -vserver vs1 -domain example.com -status-admin down
```

In order to create an Active Directory machine account for the CIFS server, you must supply the name and password of a Windows account with sufficient privileges to add computers to the "ou-example_ou" container within the "example.com" domain.

Enter the user name: administrator
Enter the password:

```
cluster1::>
```

The following example modifies the CIFS server name associated with Vserver "vs1" from above example. The administrative status of the CIFS server must be set to "down" to proceed with Active Directory domain modification. If the command completes successfully, the administrative status is automatically set to "up" and there will be a job running to update related configurations.

```
cluster1::> vserver cifs modify -vserver vs1 -cifs-server new_example -status-admin down
```

In order to create an Active Directory machine account for the CIFS server, you must supply the name and password of a Windows account with sufficient privileges to add computers to the "ou-example_ou" container within the "example.com" domain.
vserver cifs nbtstat

Display NetBIOS information over TCP connection

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs nbtstat command displays information about NetBIOS over TCP (NBT) connections for the cluster. It displays the IP address associated with the interfaces, the IP addresses of the WINS servers in use, and information about the registered NetBIOS names for the cluster. You can use this command to troubleshoot NetBIOS name resolution problems.

Note: NetBIOS name service (NBNS) over IPv6 is not supported.

Parameters
{-fields <fieldname>, ...}
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-node {<nodename> | local}] - Node
If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified node.

[-vserver <vserver name>] - Vserver
If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified Vserver.

[-nbt-name <text>] - NBT Name
If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified NetBIOS name.

[-netbios-suffix <Hex String>] - NetBIOS Suffix
If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified NetBIOS suffix.

[-interface <IP Address>, ...] - Interfaces
If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified IP address.

[-wins-servers <IP Address>, ...] - Servers
If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified WINS servers.

[-server-state <text>, ...] - Server State (active, inactive)
If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified WINS server state. The following are possible values for this parameter:
• active
• inactive

[-nbt-scope <text>] - NBT Scope
If you specify this optional parameter, the command displays the NetBIOS name service information only for
the specified NetBIOS name scope.

[-nbt-mode <text>] - NBT Mode
If you specify this optional parameter, the command displays the NetBIOS name service information only for
the specified NetBIOS name service mode. The following are possible values for this parameter:
• 'p' - Point to Point
• 'h' - Hybrid
• 'm' - Mixed
• 'b' - Broadcast

[-state <text>] - State
If you specify this optional parameter, the command displays the NetBIOS name service information only for
the specified NetBIOS name registration state. The following are possible values for this parameter:
• must_register
• must_unregister
• wins
• broadcast
• name_released
• wins_conflict
• broadcast_conflict

[-time-left <integer>] - Time Left
If you specify this optional parameter, the command displays the NetBIOS name service information only for
the specified registration time left in minutes with the WINS server.

[-type <text>] - Type
If you specify this optional parameter, the command displays the NetBIOS name service information only for
the specified name registration type. The following are possible values for this parameter:
• registered
• active
• permanent
• group

Examples
The following example displays the NetBIOS name service information.

cluster1::> nbtstat
    (vserver cifs nbtstat)
    Vserver: vs1
    Node:    cluster1-01
    Interfaces:
vserver cifs prepare-to-downgrade

Restore the CIFS Configurations to Earlier Release of Data ONTAP Version

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The `vserver cifs prepare-to-downgrade` command restores the CIFS configurations for Data ONTAP based on the input parameter disable-feature-set.

Parameters

`-disable-feature-set <downgrade version>` - Data ONTAP Version

This parameter specifies the Data ONTAP release for which the CIFS configurations are restored. The value can be one of the following:

- **8.3.1** - Restores the CIFS configurations for Data ONTAP release 8.3.1. These features include:
  - FPolicy "close with read" filters from FPolicy events.
  - CIFS server options `-guest-unix-user` and `-is-admin-users-mapped-to-root-enabled`.
  - CIFS security option `is-smb-encryption-required`.
  - Storage-Level Access Guard (SLAG) for qtrees.
  - CIFS share property `encrypt-data`.

- **8.3.2** - Restores the CIFS configurations for Data ONTAP release 8.3.2. These features include:
  - CIFS server option `-grant-unix-group-perms-to-others`.

- **9.0.0** - Restores the CIFS configurations for Data ONTAP release 9.0.0. These features include:
  - Disable CIFS multichannel feature and close all multichannel connections.
  - Delete all the name-mapping entries that have a hostname or an address field configured.
  - Terminate all SMB 3.1 client connections.
  - Terminate all client connections that have large MTU negotiated.
  - Remove the symlink property `no-strict-security`. 
- Remove all symlink pathmap entries with locality *freelink*.

### Examples

```
cluster1::*> vserver cifs prepare-to-downgrade -disable-feature-set 8.3.1

cluster1::*> vserver cifs prepare-to-downgrade -disable-feature-set 8.3.2

cluster1::*> vserver cifs prepare-to-downgrade -disable-feature-set 9.0.0
```

### vserver cifs remove-netbios-aliases

Remove NetBIOS aliases

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The *vserver cifs remove-netbios-aliases* command deletes NetBIOS aliases for the CIFS server.

**Parameters**
- **-vserver <vserver name>** - *Vserver*
  
  This parameter specifies the name of the Vserver from which the list of NetBIOS aliases are deleted.

- **-netbios-aliases <NetBIOS>, ...** - *List of NetBIOS Aliases*
  
  This parameter specifies one or more NetBIOS aliases to be deleted. To delete all the NetBIOS aliases of a Vserver use '-'.

### Examples

The following example deletes NetBIOS aliases for the CIFS server CIFS_SERVER on Vserver vs_a.

```
cluster1::> cifs show -display-netbios-aliases
Vserver: vs_a
    Server Name: CIFS_SERVER
    NetBIOS Aliases: ALIAS_1, ALIAS_2, ALIAS_3, ALIAS_4,
                     ALIAS_5, ALIAS_6, ALIAS_7
cluster1::> cifs remove-netbios-aliases -netbios-aliases alias_1,alias_3,alias_5
cluster1::> cifs show -display-netbios-aliases
Vserver: vs_a
    Server Name: CIFS_SERVER
    NetBIOS Aliases: ALIAS_2, ALIAS_4, ALIAS_6, ALIAS_7
cluster1::> cifs remove-netbios-aliases -netbios-aliases alias_7
cluster1::> cifs show -display-netbios-aliases
Vserver: vs_a
    Server Name: CIFS_SERVER
    NetBIOS Aliases: ALIAS_2, ALIAS_4, ALIAS_6
```
vserver cifs repair-modify

Repair a partially-failed Vserver CIFS server modify operation

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description
Use this `vserver cifs repair-modify -vserver <vserver name>` command when the background job created during a Vserver CIFS server modify operation fails.

Parameters
- `-vserver <vserver name>` - Vserver
  This parameter specifies a Vserver containing a configured CIFS server that has been modified.

Examples
The following example starts the CIFS server modify job on Vserver vs1 successfully:

```
cluster1::*> vserver cifs repair-modify -vserver vs1
Successfully queued CIFS Server Modify job [id: 10] for CIFS server "CIFSNAME1". To view the status of the job, use the "job show -id <jobid>" command.
```

The following example fails the command with specific error:

```
cluster1::*> vserver cifs repair-modify -vserver vs2
Error: Job Out of memory. Failed to queue CIFS Server Modify Job for CIFS server "CIFSNAME2". Retry the operation by running (privilege: advanced) "vserver cifs repair-modify -vserver vs2".
Error: command failed: unable to save data
```

vserver cifs show

Display CIFS servers

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description
The `vserver cifs show` command displays information about CIFS servers. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all CIFS servers:
• Vserver name
• CIFS server NetBIOS name
• Domain or workgroup name
• Authentication style

You can specify the `-fields` parameter to specify which fields of information to display about CIFS servers. In addition to the fields above, you can display the following fields:

• Default site
• Fully-qualified domain name

You can specify additional parameters to display only information that matches those parameters. For instance, to display information only about CIFS servers that are in the CIFS domain named RUBY, run the command with the `-domain-workgroup RUBY` parameter.

You can specify the `-instance` parameter to display all information for all CIFS servers in list form.

**Parameters**

```
[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command only displays the fields that you specify.

[-display-netbios-aliases]
If you specify this parameter, the command displays information about configured NetBIOS aliases.

[-instance]
If you specify the -instance parameter, the command displays detailed information about all entries.

[-vserver <vserver name>] - Vserver
If you specify this parameter, the command displays information only about the CIFS servers for the specified Vserver.

[-cifs-server <NetBIOS>] - CIFS Server NetBIOS Name
If you specify this parameter, the command displays information only for CIFS servers that match the specified CIFS server NetBIOS name.

[-domain-workgroup <CIFS domain>] - NetBIOS Domain/Workgroup Name
If you specify this parameter, the command displays information only for CIFS servers that are in the specified NetBIOS domain or workgroup.

[-domain <TextNoCase>] - Fully Qualified Domain Name
If you specify this parameter, the command displays information only for CIFS servers that are in the specified domain.

[-ou <text>] - Organizational Unit
If you specify this parameter, the command displays information only for CIFS servers that are in the specified organizational unit.

[-default-site <text>] - Default Site Used by LIFs Without Site Membership
If you specify this parameter, the command displays information only for CIFS servers that have the specified default site.

[-workgroup <NetBIOS>] - Workgroup Name
If you specify this parameter, the command displays information only for CIFS servers that are in the specified workgroup.
[-auth-style {domain|workgroup|realm}] - Authentication Style
If you specify this parameter, the command displays information only for CIFS servers that match the specified authentication style.

[-status-admin {down|up}] - CIFS Server Administrative Status
If you specify this parameter, the command displays information only for CIFS servers that match the specified administrative status.

[-comment <text>] - CIFS Server Description
If you specify this parameter, the command displays information only for CIFS servers that match the specified comment field.

[-netbios-aliases <NetBIOS>,...] - List of NetBIOS Aliases
If you specify this parameter, the command displays information only for CIFS servers that have specified NetBIOS alias.

Examples
The following example displays a subset of the information about all CIFS servers:

```bash
cluster1::> vserver cifs show
Vserver Server Domain/Workgroup Authentication Style
-------------- ----------- ---------------- -------------------
vs1 CIFSSERVER1 EXAMPLE domain
```

The following example displays all information about all CIFS-enabled Vservers in list form:

```bash
cluster1::> vserver cifs show -instance
Vserver: vs1
CIFS Server NetBIOS Name: CIFSSERVER1
NetBIOS Domain/Workgroup Name: EXAMPLE
Fully Qualified Domain Name: EXAMPLE.COM
Organizational Unit: CN=Computers
Default Site Used by LIFs Without Site Membership:
  Workgroup Name: -
  Authentication Style: domain
CIFS Server Administrative Status: up
CIFS Server Description:
  List of NetBIOS Aliases: ALIAS_2, ALIAS_4, ALIAS_6
```

The following example displays the NetBIOS aliases for the CIFS server CIFSSERVER1

```bash
cluster1::> cifs show -display-netbios-aliases
Vserver: vs1
Server Name: CIFSSERVER1
NetBIOS Aliases: ALIAS_2, ALIAS_4, ALIAS_6
```

vserver cifs start
Start a CIFS server

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.
**Description**
This command starts the CIFS server on the specified Vserver. The CIFS server must already exist. To create a CIFS server, run `vserver cifs create`.

**Parameters**

`-vserver <vserver name> - Vserver`
This parameter specifies a Vserver containing a configured CIFS server that has been stopped.

**Examples**
The following example starts the CIFS server on Vserver vs1:
```
cluster1::> cifs start -vserver vs1
```

**Related references**

`vserver cifs create` on page 1710

---

**vserver cifs stop**

Stop a CIFS server

**Availability:** This command is available to cluster and Vserver administrators at the `admin` privilege level.

**Description**
This command stops the CIFS server on the specified Vserver.

**Note:** Established sessions will be terminated and their open files closed. Workstations with cached data will not be able to save those changes, which could result in data loss.

**Parameters**

`-vserver <vserver name> - Vserver`
This parameter specifies a Vserver containing a configured CIFS server that is running.

**Examples**
The following example stops the CIFS server on Vserver vs1:
```
cluster1::> cifs stop -vserver vs1
```

---

**BranchCache Commands**

Manage CIFS BranchCache settings

The `vserver cifs branchcache` commands are used to manage the CIFS BranchCache service. BranchCache permits clients at a remote location to cache data locally to avoid repeated transfer of large data sets that are updated infrequently. CIFS BranchCache is disabled by default.

**vserver cifs branchcache create**

Create the CIFS BranchCache service

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.
Description

The vserver cifs branchcache create command creates the configuration for computing and retrieving BranchCache hash data. Only a single instance of the BranchCache service can be created on a Vserver.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the CIFS-enabled Vserver on which you want to set up the BranchCache service.

[ -versions {v1-enable|v2-enable|enable-all}, ... ] - Supported BranchCache Versions

This optional parameter specifies a list of versions of the BranchCache protocol that the storage system supports. The default is enable-all. This list can include one or more of the following:

- v1-enable - This option enables BranchCache Version 1.
- v2-enable - This option enables BranchCache Version 2.
- enable-all - This option enables all supported versions of BranchCache.

-hash-store-path <text> - Path to Hash Store

This parameter specifies an existing directory into which the hash data is stored. Read-only paths, such as snapshot directories, are not allowed.

[ -hash-store-max-size {<integer>[KB|MB|GB|TB|PB]} ] - Maximum Size of the Hash Store

This optional parameter specifies the maximum size to use for the hash data. If the size of the hash data exceeds this value, older hashes are deleted to make room for newer hashes. The default is 1 GB.

[ -server-key <text> ] - Encryption Key Used to Secure the Hashes

This optional parameter specifies a server key that the BranchCache service uses to prevent clients from impersonating the BranchCache server.

[ -operating-mode <BranchCache Mode> ] - CIFS BranchCache Operating Modes

This optional parameter specifies the mode in which the BranchCache service operates. The default is per-share. Possible values include:

- disable - This option disables the BranchCache service for the Vserver.
- all-shares - This option enables the BranchCache service for all the shares on this Vserver.
- per-share - This option enables the BranchCache service on a per-share basis. You can enable the BranchCache service on an existing share by adding the branchcache flag in the -share-properties parameter of the vserver cifs share modify command.

Examples

The following example creates the BranchCache service on the Vserver named vs1. The path to the hash store is /vs1_hash_store.

```
cluster1::> vserver cifs branchcache create -vserver vs1 -hash-store-path /vs1_hash_store
```

The following example creates the BranchCache service on the Vserver vs1. The path to the hash store is /vs_hash_store. The service is enabled on all the shares of the Vserver, supports BranchCache version 2, supports a maximum of 1 GB of BranchCache hashes, and secures the hashes using the key "vs1 secret".

```
cluster1::> vserver cifs branchcache create -vserver vs1 -hash-store-path /vs_hash_store -operating-mode all-shares -versions v2-enable -hash-store-max-size 1GB -server-key "vs1 secret"
```

vserver cifs share modify on page 1807

vserver cifs branchcache delete

Stop and remove the CIFS BranchCache service

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver cifs branchcache delete command stops and removes the Vserver BranchCache configuration.

Parameters

- vserver <vserver name> - Vserver
  This parameter specifies the CIFS-enabled Vserver whose BranchCache configuration you want to remove.

- flush-hashes {true|false} - Delete Existing Hashes
  This parameter specifies whether to keep or delete all existing hashes after deleting the BranchCache service.

Examples

The following example stops and removes the BranchCache service on the Vserver vs1. It also deletes all existing hashes.

```
cluster1::> vserver cifs branchcache delete -flush-hashes true -vserver vs1
```

vserver cifs branchcache hash-create

Force CIFS BranchCache hash generation for the specified path or file

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver cifs branchcache hash-create command causes the BranchCache service to compute hashes for a single file, for a directory, or for all the files in a directory structure if you specify the -recurse option.

Parameters

- vserver <vserver name> - Vserver
  This parameter specifies the CIFS-enabled Vserver on which the hash is computed.

- path <text> - Path of File or Directory to Hash
  This parameter specifies the path of the directory or file for which hashes are to be computed. If a file is specified, the hashes are computed on the whole file. If a directory is specified, hashes are computed on all files within the directory.

- recurse {true|false} - Process All Files in the Directory Recursively
  If this option is set to true and the -path parameter specifies a directory, hashes are computed recursively for all directories in the path.

Examples

The following example creates hashes for the file "report.doc":

```
cluster1::> vserver cifs branchcache hash-create -vserver vs1 -path /repository/report.doc -recurse false
```
The following example creates hashes for all the files in the directory "repository":
```
cluster1::> vserver cifs branchcache hash-create -vserver vs1 -path /repository -recurse false
```

The following example recursively creates hashes for all the files and directories inside the directory "documents":
```
cluster1::> vserver cifs branchcache hash-create -vserver vs1 -path /documents -recurse true
```

**vserver cifs branchcache hash-flush**

Flush all generated BranchCache hashes.

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The `vserver cifs branchcache hash-flush` command deletes all hash data from the configured hash store.

**Parameters**

- `-vserver <vserver name>` - Vserver

  This parameter specifies the CIFS-enabled Vserver whose hash data is to be deleted.

**Examples**

The following example flushes all the hashes for Vserver vs1:
```
cluster1::> vserver cifs branchcache hash-flush -vserver vs1
```

**vserver cifs branchcache modify**

Modify the CIFS BranchCache service settings.

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The `vserver cifs branchcache modify` command modifies the configuration for computing and retrieving BranchCache hash data.

**Parameters**

- `-vserver <vserver name>` - Vserver

  This parameter specifies the CIFS-enabled Vserver whose BranchCache service is to be modified.

  `[ -versions {v1-enable|v2-enable|enable-all}, ... ]` - Supported BranchCache Versions

  This optional parameter specifies a list of versions of the BranchCache protocol that the storage system supports. The default is `enable-all`. This list can include one or more of the following:

  - v1-enable - This option enables BranchCache Version 1.
  - v2-enable - This option enables BranchCache Version 2.
  - enable-all - This option enables all supported versions of BranchCache.

  `[-operating-mode <BranchCache Mode>]` - CIFS BranchCache Operating Modes

  This optional parameter specifies the mode in which the BranchCache service operates. The default is `per-share`. Possible values include:
• disable - This option disables the BranchCache service for the Vserver.

• all-shares - This option enables the BranchCache service for all the shares on this Vserver.

• per-share - This option enables the BranchCache service on a per-share basis. You can enable the BranchCache service on an existing share by adding the `branchcache` flag in the `-share-properties` parameter of the `vserver cifs share modify` command.

`[-hash-store-max-size <integer>[KB|MB|GB|TB|PB]]` - Maximum Size of the Hash Store

This optional parameter specifies the maximum size to use for the hash data. If the size of the hash data exceeds this value, older hashes are deleted to make room for newer hashes. The default is 1 GB.

`[-flush-hashes {true|false}]` - Delete Existing Hashes

This parameter specifies whether to keep or delete all the existing hashes. This must be set to true when modifying the server key.

`[-hash-store-path <text>]` - Path to Hash Store

This parameter specifies an existing directory into which the hash data is stored. Read-only paths, such as snapshot directories, are not allowed.

`[-server-key <text>]` - Encryption Key Used to Secure the Hashes

This optional parameter specifies a server key that the BranchCache service uses to prevent clients from impersonating the BranchCache server. If you specify this parameter, all existing hashes for the Vserver are deleted.

### Examples

The following example modifies the BranchCache service on the Vserver named vs1. The path to the hash store is `/vs1_hash_store_2`, the server key used to secure the hashes is set to "new vserver secret", all existing hashes are removed, the service supports all BranchCache versions, and is enabled on a per-share basis.

```
cluster1::> vserver cifs branchcache modify -vserver vs1 -hash-store-path /vs1_hash_store_2 -server-key "new vserver secret" -flush-hashes true -versions enable-all -operating-mode per-share
```

The following example modifies the BranchCache service on the Vserver vs1. The service is enabled on all the shares of the Vserver, supports BranchCache version 1, and supports a maximum of 1 TB of BranchCache hashes.

```
cluster1::> vserver cifs branchcache modify -vserver vs1 -operating-mode all-shares -versions v1-enable -hash-store-max-size 1TB
```

**vserver cifs branchcache show**

Display the CIFS BranchCache service status and settings

**Availability:** This command is available to cluster and Vserver administrators at the `admin` privilege level.

**Description**

The `vserver cifs branchcache show` command displays information about the BranchCache configuration for the Vserver. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information:

- Operating Mode
- Allowed Versions
You can specify additional parameters to display only information that matches those parameters.

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command displays only the fields that you specify.

```
[-instance]
```

If you specify the `-instance` parameter, the command displays detailed information about all entries.

```
[-vserver <vserver name>] - Vserver
```

If you specify this parameter, the command displays information for the specified Vserver.

```
[-versions {v1-enable|v2-enable|enable-all}, ...] - Supported BranchCache Versions
```

If you specify this parameter, the command displays information for the Vservers that support the specified BranchCache versions.

```
[-hash-store-path <text>] - Path to Hash Store
```

If you specify this parameter, the command displays information for Vservers that store their hashes at the specified location.

```
[-hash-store-max-size {<integer>[KB|MB|GB|TB|PB]}, ...] - Maximum Size of the Hash Store
```

If you specify this parameter, the command displays information for Vservers that have a maximum hash store size that is set to the specified value.

```
[-server-key <text>] - Encryption Key Used to Secure the Hashes
```

If you specify this parameter, the command displays information for Vservers that have the specified server key.

```
[-operating-mode <BranchCache Mode>] - CIFS BranchCache Operating Modes
```

If you specify this parameter, the command displays information for Vservers whose BranchCache configuration operates in the specified mode.

**Examples**

The following example displays a subset of the information about the BranchCache service in the cluster.

```
cluster1::> vserver cifs branchcache show

Vserver Operating Allowed Max Path
----------------- -------- ---------- ------ ------------------------
vs1 per_share enable_all 1GB /hash_dir/
```

The following example displays all information about all the Vservers with BranchCache configurations.

```
cluster1::> vserver cifs show -instance

Vserver: vs1
  Supported Versions of BranchCache: enable_all
  Path to Hash Store: /hash_dir/
  Maximum Size of the Hash Store: 1GB
  Encryption Key Used to Secure the Hashes: asdad
  CIFS BranchCache Operating Modes: per_share

```

The following example displays information about BranchCache configurations that store the hash data at the location / branchcache_hash_store.
vserver cifs branchcache show -hash-store-path /branchcache_hash_store

vserver cifs cache commands

The cache directory

vserver cifs cache name-to-sid commands

The name-to-sid directory

vserver cifs cache name-to-sid delete

Delete an entry

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description

The vserver cifs cache name-to-sid delete command removes the Windows user cache entries cached by the Windows name. If cache propagation is enabled, the corresponding sid-to-name cache entry will also be removed.

Parameters

- **vserver <vserver name> - Vserver**
  
  Use this parameter to specify the Vserver for which the name-to-sid cache entry needs to be deleted.

- **-win-name <text> - Windows Name**
  
  Use this parameter to specify the Windows name for which the cached entry needs to be deleted.

Examples

The following example shows how to delete the name-to-sid cache entry for Vserver vs0 with Windows name user1:

```
cluster1::> vserver cifs cache name-to-sid delete -vserver vs0 -win-name user1
```

vserver cifs cache name-to-sid delete-all

Delete all the entries for the vservver

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description

The vserver cifs cache name-to-sid delete-all command removes all of the Windows user cache entries cached by the Windows name for the specified Vserver.

Parameters

- **vserver <vserver name> - Vserver**
  
  Use this parameter to specify the Vserver for which the name-to-sid cache entries need to be deleted.

Examples

The following example shows how to delete all of the cached name-to-sid entries for Vserver vs0:
vserver cifs cache name-to-sid show

Display name-to-sid cache entries

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The vserver cifs cache name-to-sid show command displays the Windows user information cached by Windows name.

Parameters
{ [-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.
[-instance ]
Use this parameter to display detailed information about the Windows user entries cached by the Windows name.
[-vserver <vserver name>] - Vserver
Use this parameter to specify the Vserver for which the Windows user entries that are cached by the Windows name need to be displayed.
[-win-name <text>] - Windows Name
Use this parameter to specify the Windows name for which the cached entries need to be displayed.
[-sid <text>] - SID
Use this parameter to display information only about the cached Windows user entries that have the specified security identifier (SID).
[-sid-type <integer>] - SID type
Use this parameter to display information only about the cached Windows user entries that have the specified security identifier (SID) type.
[-flags <integer>] - Flags
Use this parameter to display information only about the Windows user entries cached by the Windows name that have the specified flags.
[-domain-name <text>] - Domain Name
Use this parameter to display information only about the Windows user entries cached by the Windows name that have the specified domain name.
[-create-time <MM/DD/YYYY HH:MM:SS>] - Create Time
Use this parameter to display information only about the Windows user entries that were cached at the specified time.
[-source {none|files|dns|nis|ldap|netgrpbyname|dc}] - Source of the Entry
Use this parameter to display information only about the user entries cached by the Windows name that have the specified lookup source.

Examples
The following example shows how to display all of the Windows users which are cached by the Windows name:
vserver cifs cache settings commands

The settings directory

vserver cifs cache settings modify

Modify CIFS Cache Configuration

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The vserver cifs cache settings modify command modifies the Windows users cache configuration of the specified Vserver.

Parameters
-vserver <vserver name> - Vserver
Use this parameter to specify the Vserver for which the Windows users cache settings need to be modified.

-is-enabled {true|false} - Is Cache Enabled?
Use this parameter to specify if the cache needs to be enabled for the Windows users database. The value true means the cache is enabled and the value false means the cache is disabled. The default value for this parameter is false.

-is-negative-cache-enabled {true|false} - Is Negative Cache Enabled?
Use this parameter to specify if the cache needs to be enabled for the negative entries. Negative entries means the entries which are not present in the Windows users database and the look-up fails. The default value for this parameter is true. Negative cache is disabled by default if the parameter is-enabled is set to false.

-ttl <[integer]h [integer]m [integer]s> - Time to Live
Use this parameter to specify the time (in hours, minutes, and seconds) for which the positive entries need to be cached. The positive entries means the entries which are present in the Windows users database and the look-up succeeds. The default value is 24 hours.

-negative-ttl <[integer]h [integer]m [integer]s> - Negative Time to Live
Use this parameter to specify the time (in hours, minutes, and seconds) for which the negative entries need to be cached. The default value is 5 minutes.

-is-propagation-enabled {true|false} - Is Propagation Enabled?
Use this parameter to specify whether the cached user entries need to be propagated to the sid-to-name cache. The default value is true. Specify false to disable propagation.

Examples
The following example shows how to modify the Windows users cache configuration settings for Vserver vs0:

cluster1::> vserver cifs cache settings modify -vserver vs0 -ttl 600 -negative-ttl 300

The following example shows how to disable the Windows users cache for Vserver vs0:

cluster1::> vserver cifs cache settings modify -vserver vs0 -is-enabled false
vserver cifs cache settings show

Display CIFS Cache Configuration

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The vserver cifs cache settings show command displays information about the Windows users cache configuration of the specified Vserver.

Parameters
}[[-fields <fieldname>, ...]  
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

][[-instance]]  
Use this parameter to display detailed information about the Windows users cache configuration settings.

[-vserver <vserver name>] - Vserver  
Use this parameter to display information about the Windows users cache configuration settings for the Vserver you specify.

[-is-enabled {true|false}] - Is Cache Enabled?  
Use this parameter to display information only about the Windows users cache configuration settings that have the specified cache enabled setting. Value true displays only the entries that have cache enabled and value false displays only the entries that have cache disabled.

[-is-negative-cache-enabled {true|false}] - Is Negative Cache Enabled?  
Use this parameter to display information only about the Windows users cache configuration settings that have the specified negative cache enabled setting. Value true displays only the entries that have negative cache enabled and value false displays only the entries that have negative cache disabled.

[-ttl [<integer>h]<integer>m]<integer>s>] - Time to Live  
Use this parameter to display information only about the Windows users cache configuration settings that have the specified Time to Live.

[-negative-ttl [<integer>h]<integer>m]<integer>s>] - Negative Time to Live  
Use this parameter to display information only about the Windows users cache configuration settings that have the specified negative Time to Live.

[-is-propagation-enabled {true|false}] - Is Propagation Enabled?  
Use this parameter to display information only about the Windows users cache configuration settings that have the specified propagation enabled setting. Value true displays only the entries that have the propagation of cached entries to sid-to-name cache enabled and value false displays only the entries that have the propagation of cached entries to sid-to-name cache disabled.

Examples
The following example shows how to display the Windows users cache configuration settings for all the Vservers:

cluster1::> vserver cifs cache settings show

The following example shows how to display the Windows users cache configuration settings for Vserver vs0:
The following example shows how to display the Windows users cache configuration settings that have cache disabled:

```bash
cluster1::> vserver cifs cache settings show -is-enabled false
```

### vserver cifs cache sid-to-name commands

The sid-to-name directory

#### vserver cifs cache sid-to-name delete

Delete an entry

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `advanced` privilege level.

**Description**
The `vserver cifs cache sid-to-name delete` command removes the Windows user cache entries cached by security identifier (SID). If cache propagation is enabled, the corresponding name-to-sid cache entry will also be removed.

**Parameters**

- `-vserver <vserver name>` - Vserver
  
  Use this parameter to specify the Vserver for which the sid-to-name cache entry needs to be deleted.

- `-sid <text>` - SID
  
  Use this parameter to specify the security identifier (SID) for which the cached entry needs to be deleted.

**Examples**
The following example shows how to delete the sid-to-name cache entry for Vserver vs0 with SID S-1-5-21-1380078113-1824080971-954447143-1152:

```bash
cluster1::> vserver cifs cache sid-to-name delete -vserver vs0 -sid S-1-5-21-1380078113-1824080971-954447143-1152
```

#### vserver cifs cache sid-to-name delete-all

Delete all the entries for the vserver

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `advanced` privilege level.

**Description**
The `vserver cifs cache sid-to-name delete-all` command removes all of the Windows user cache entries cached by the security identifier (SID) for the specified Vserver.

**Parameters**

- `-vserver <vserver name>` - Vserver
  
  Use this parameter to specify the Vserver for which the sid-to-name cache entries need to be deleted.

**Examples**
The following example shows how to delete all the cached sid-to-name entries for Vserver vs0:
**vserver cifs cache sid-to-name show**

Display sid-to-name cache entries

**Availability:** This command is available to cluster and Vserver administrators at the advanced privilege level.

**Description**

The `vserver cifs cache sid-to-name show` command displays the Windows user information cached by security identifier (SID).

**Parameters**

{ [-fields <fieldname>, ...]
  If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

  | [-instance ]
  Use this parameter to display detailed information about the Windows user entries cached by the security identifier (SID).

  | [-vserver <vserver name>] - Vserver
  Use this parameter to specify the Vserver for which the Windows user entries that are cached by the security identifier (SID) need to be displayed.

  | [-sid <text>] - SID
  Use this parameter to display information only about the cached Windows user entries that have the specified security identifier (SID).

  | [-win-name <text>] - Windows Name
  Use this parameter to specify the Windows name for which the cached entries need to be displayed.

  | [-sid-type <integer>] - SID type
  Use this parameter to display information only about the cached Windows user entries that have the specified security identifier (SID) type.

  | [-sid-mode <integer>] - SID mode
  Use this parameter to display information only about the cached Windows user entries that have the specified security identifier (SID) mode.

  | [-flags <integer>] - Flags
  Use this parameter to display information only about the Windows user entries cached by the security identifier (SID) that have the specified flags.

  | [-domain-name <text>] - Domain Name
  Use this parameter to display information only about the Windows user entries cached by the security identifier (SID) that have the specified domain name.

  | [-create-time <MM/DD/YYYY HH:MM:SS>] - Create Time
  Use this parameter to display information only about the Windows user entries that were cached at the specified time.

  | [-source {none|files|dns|nis|ldap|netgrp_byname|dc}] - Source of the Entry
  Use this parameter to display information only about the Windows user entries cached by the security identifier (SID) that have the specified lookup source.
**Examples**
The following example shows how to display all of the Windows users which are cached by the security identifier (SID):

```
cluster1::> vserver cifs cache sid-to-name show
```

The following example shows how to display all of the Windows user entries cached by the security identifier (SID) for Vserver vs0:

```
cluster1::> vserver cifs cache sid-to-name show -vserver vs0
```

---

**vserver cifs character-mapping commands**

Manage character mappings for invalid characters

**vserver cifs character-mapping create**

Create character mapping on a volume

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver cifs character-mapping create` command creates the CIFS character mapping for the specified volume on a particular Vserver.

**Note:** Choose target characters in the "Private Use Area" of Unicode in the following range: U+E0000...U+F8FF.

**Caution:** The target Unicode characters must not appear in existing file names; otherwise, unwanted character mappings would occur, resulting in clients being unable to access mapped files. For example, if ":" is mapped to "-" but ":" appears in files normally, a Windows client using the mapped share to access a file named "a-b" would have its request mapped to the NFS name "a:b", which is not the desired file.

The `vserver cifs character-mapping create` command is not supported for FlexGroups.

**Parameters**

- `-vserver <vserver name>` - Vserver
  
  This parameter specifies the Vserver on which a volume is located for which you are creating the character mapping. If only one data Vserver exists, you do not need to specify this parameter.

- `-volume <volume name>` - Volume Name
  
  This parameter specifies the name of the volume for which you are creating the character mapping.

- `-mapping <text>, ...` - Character Mapping
  
  This parameter specifies the mapping of the invalid CIFS filename characters to valid CIFS filename characters. The mapping consists of a list of source-target character pairs separated by ":". The characters are Unicode characters entered using hexadecimal digits. For example: 3C:E03C.

  **Note:** The permissible Unicode character set for source mapping is: 0x01-0x19, 0x5C, 0x3A, 0x2A, 0x3F, 0x22, 0x3C, 0x3E, 0xB1.

**Examples**
The following example creates a character mapping for a volume vol1 on Vserver vs1.

```
cluster1::> vserver cifs character-mapping create -volume vol1 -mapping 3c:e17c, 3e:f17d, 2a:f745
cluster1::> vserver cifs character-mapping show
```
vserver cifs character-mapping delete

Delete character mapping on a volume

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs character-mapping delete command deletes the CIFS character mapping for the specified volume on a particular Vserver.

The vserver cifs character-mapping delete command is not supported for FlexGroups.

Parameters
-`-vserver <vserver name>` - Vserver
  This parameter specifies the Vserver on which a Volume is located for which you are deleting the character mapping. If only one data Vserver exists, you do not need to specify this parameter.

-`-volume <volume name>` - Volume Name
  This parameter specifies the name of the volume for which you are deleting the character mapping.

Examples
The following example deletes all character mappings for a volume vol1 on Vserver vs1.

```
cluster1::> vserver cifs character-mapping delete -volume vol1
```

vserver cifs character-mapping modify

Modify character mapping on a volume

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs character-mapping modify command modifies the CIFS character mapping for the specified volume on a particular Vserver.

You can modify a particular volume's character mapping by specifying the following two parameters in the modify command:

- Vserver associated with the volume
- Name of the Volume

Note: Choose target characters in the "Private Use Area" of Unicode in the following range: U+E0000...U+F8FF.

Caution: The target Unicode characters must not appear in existing file names; otherwise, unwanted character mappings would occur, resulting in clients being unable to access mapped files. For example, if ":" is mapped to "-" but "-" appears in files normally, a Windows client using the mapped share to access a file named "a-b" would have its request mapped to the NFS name "a:b", which is not the desired file.

The vserver cifs character-mapping modify command is not supported for FlexGroups.
Parameters

-vserver <vserver name> - Vserver

This parameter specifies the Vserver on which a Volume is located for which you are modifying the character mapping. If only one data Vserver exists, you do not need to specify this parameter.

-volume <volume name> - Volume Name

This parameter specifies the name of the volume for which you are modifying the character mapping.

[-mapping <text>, ...] - Character Mapping

This parameter specifies the mapping of the invalid CIFS filename characters to valid CIFS filename characters. The mapping consists of a list of source-target character pairs separated by ":". The characters are Unicode characters entered using hexadecimal digits. For example: 3C:E03C.

Note: The permissible Unicode character set for source mapping is: 0x01-0x19, 0x5C, 0x3A, 0x2A, 0x3F, 0x22, 0x3C, 0x3E, 0x7C, 0xB1.

Examples

The following example modifies a character mapping for a volume vol1 on Vserver vs1.

```
cluster1::> vserver cifs character-mapping modify -volume vol1 -mapping 3c:e17d, 3e:f17e, 2a:f746
cluster1::> vserver cifs character-mapping show
Vserver         Volume Name  Character Mapping
--------------  -----------  -------------------------------------------------
vs1             vol1         3c:e17d, 3e:f17e, 2a:f746
```

Description

The vserver cifs character-mapping show command displays information about character mapping configured for volumes. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about character mapping configured for volumes:

- Vserver name
- Volume name
- Character mapping

Parameters

{ [-fields <fieldname>, ...]

If you specify this parameter, the command displays only the fields that you specify.

| [-instance ]

If you specify the -instance parameter, the command displays detailed information about all entries.

[-vserver <vserver name>] - Vserver

If you specify this parameter, the command displays information about character mapping configured for all the volumes that belong to the specified Vserver.
If you specify this parameter, the command displays information about the character mapping configured for all the volumes that match the specified volume name.

[-mapping <text>, ...] - Character Mapping

If you specify this parameter, the command displays information about the character mapping configured for all volumes that match the specified mapping.

**Examples**

The following example displays information about all character mappings configured for volumes

```
cluster1:/> vserver cifs character-mapping show

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Volume Name</th>
<th>Character Mapping</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>
<td>vvol</td>
<td>3c:e17d, 3e:f17e</td>
</tr>
</tbody>
</table>
```

**vserver cifs connection commands**

Manage CIFS connections

**vserver cifs connection show**

Displays established CIFS connections

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The vserver cifs connection show command displays information about established CIFS connections.

**Parameters**

```
{-fields <fieldname>, ...}

Use this parameter to display only the specified fields

{-instance}

If you specify the -instance parameter, the command displays detailed information about all fields.

[-node <nodename> | local] - Node

Use this parameter to display information about CIFS connections on the specified node.

[-vserver <vserver name>] - Vserver

Use this parameter to display information about CIFS connections on the specified CIFS-enabled SVM.

[-connection-id <integer>] - Connection ID

Use this parameter to display information about CIFS connections that match the specified connection ID.

[-session-id <integer>, ...] - Session ID

Use this parameter to display information about CIFS connections that match the specified session ID.

[-workstation-ip <IP Address>] - Workstation IP Address

Use this parameter to display information about CIFS connections that are established through the specified data LIF IP address.

[-workstation-port <integer>] - Workstation Port Number

Use this parameter to display information about CIFS connections that are opened from the specified Port number.
[-lif-ip <IP Address>] - Incoming Data LIF IP Address

Use this parameter to display information about CIFS connections that are opened from the specified IP address.

[-network-context-id <integer>] - Network Context ID (privilege: advanced)

Use this parameter to display information about CIFS connections that match the specified network context ID.

**Examples**

The following example displays information about all CIFS connections:

```
cluster1::> vserver cifs connection show
Node: node1
Vserver: vs1
Connection ID: 127834
Session ID: 1
Workstation IP Address: 172.17.193.172
Workstation Port: 15536
Incoming Data LIF IP Address: 10.53.50.42
Network Context ID: 2
```

The following example displays information about a CIFS connection at advanced privilege level:

```
cluster1::*> vserver cifs connection show
Node: node1
Vserver: vs1
Connection ID: 127834
Session ID: 1
Workstation IP Address: 172.17.193.172
Workstation Port: 15536
Incoming Data LIF IP Address: 10.53.50.42
Network Context ID: 2
```

The following example displays information about a CIFS connection with session-id 1:

```
cluster1::*> vserver cifs connection show -session-id 1 -instance
Vserver: vs1
Node: node1
Connection ID: 127834
Session ID: 1
Workstation IP Address: 172.17.193.172

**vserver cifs domain commands**

Manage domain interaction

**vserver cifs domain discovered-servers commands**

Manage discovered servers

**vserver cifs domain discovered-servers reset-servers**

Reset and rediscover servers for a Vserver

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.
Description
The `vserver cifs domain discovered-servers reset-servers` command discards information the storage system has stored about domain controllers, LDAP, and NIS servers. After that, it begins the discovery process to reacquire current information about external servers.

Parameters
`-vserver <vserver name>` - Vserver

This parameter specifies the name of the Vserver.

Examples
The following is an example use of this command. It produces no output.

```
cluster1::> vserver cifs domain discovered-servers reset-servers
cluster1::>
```

`vserver cifs domain discovered-servers show`

Display discovered server information

Availability: This command is available to `cluster` and Vserver administrators at the `admin` privilege level.

Description
The `vserver cifs domain discovered-servers show` command displays information about the discovered servers for the CIFS domains of one or more Vservers. Server displays are grouped by node and Vserver, and each group is preceded by the node and Vserver identification. Within each grouping, the server display is limited to those associated with the domain specified by the domain parameter, if it is present.

Parameters
`{[-fields <fieldname>, ...]`  
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

`|[-instance]]`  
If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-node {<nodename>|local}] - Node`  
If you use this parameter, the command only displays servers for the specified node.

`[-vserver <vserver name>] - Vserver`  
If you use this parameter, the command only displays servers for the specified Vserver.

`[-domain <TextNoCase>] - Fully Qualified Domain Name`  
If you use this parameter, the command only displays servers in the specified domain.

`[-type {Unknown|KERBEROS|MS–LDAP|MS–DC|LDAP}] - Server Type`  
If you use this parameter, the command only displays servers of the specified type.

`[-name <text>] - Server Name`  
If you use this parameter, the command only displays servers the with the specified name. This can result in multiple lines because the same server may provide multiple services.

`[-address <InetAddress>] - Server Address`  
If you use this parameter, the command only displays servers with the specified IP address. This can result in multiple lines because the same server may provide multiple services.
[-preference {unknown|preferred|favored|adequate}] - Preference
If you use this parameter, the command only displays servers of the specified preference level.

[-status {OK|unavailable|slow|expired|undetermined|unreachable}] - Status
If you use this parameter, the command only displays servers of the specified status.

If you use this parameter, the command only displays servers with the specified functional level.

[-is-dc-read-only {true|false}] - Is DC Read Only
If this parameter is set to true, the command only displays servers with read only domain controller. If set to false, the command only displays servers with writable domain controller.

### Examples
The following example display shows the information provided by this command.

```
cluster1::> vserver cifs domain discovered-servers show
Node: node1
Vserver: vs1
```

```
<table>

</tbody>
</table>
Examples
The following example disables server discovery for a Vserver.

```
cluster1::> vserver cifs domain discovered-servers discovery-mode modify -vserver vs1 -mode none
```

vserver cifs domain discovered-servers discovery-mode show
Display Server Discovery Mode
Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The vserver cifs domain discovered-servers discovery-mode show command displays information about the discovery mode servers for the CIFS domains of one or more Vservers.

Parameters
{-fields <fieldname>, ...}
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

[-instance]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver
If you use this parameter, the command only displays discovery mode for the specified Vserver.

[-mode {all|site|none}] - Server Discovery Mode
If you use this parameter, the command only displays Vservers with the specified mode.

Examples
The following example shows the server discovery mode for all Vservers.

```
cluster1::> vserver cifs domain discovered-servers discovery-mode show
Vserver   Mode
----------  -------
vs1        all
vs2        site
vs3        none
3 entries were displayed.
```

vserver cifs domain name-mapping-search commands
Manage the list of trusted domains for name-mapping search

vserver cifs domain name-mapping-search add
Add to the list of trusted domains for name-mapping
Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs domain name-mapping-search add command adds one or more trusted domains to the list of trusted domains to be used in preference to all others by the specified Vserver for looking up Windows user names when performing Windows user to UNIX user name-mapping. If a list already exists for the specified vserver, the new list is merged with the existing list. This command is not supported for workgroup CIFS servers.
Parameters

-vserver <vserver name> - Vserver
This parameter specifies the name of the Vserver for which you want to add trusted domains.

-trusted-domains <domain name>, ... - Trusted Domains
This parameter specifies a comma-delimited list of fully-qualified domain names of the trusted domains for the home domain.

Examples

The following example adds two trusted domains (cifs1.example.com and cifs2.example.com) to the preferred list used by Vserver vs1:

```
cluster1::> vserver cifs domain name-mapping-search add -vserver vs1 -trusted-domains
cifs1.example.com, cifs2.example.com
```

vserver cifs domain name-mapping-search modify
Modify the list of trusted domains for name-mapping search

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs domain name-mapping-search modify command modifies the current list of trusted domains to be used in preference to all others by the specified Vserver to lookup Windows user names when performing Windows user to UNIX user name-mapping. The new list overwrites the existing list. This command is not supported for workgroup CIFS servers.

Parameters

-vserver <vserver name> - Vserver
This parameter specifies the name of the Vserver for which you want to modify the trusted domain list.

-trusted-domains <domain name>, ... - Trusted Domains
This parameter specifies a comma-delimited list of fully qualified domain names of the trusted domains of the home domain.

Examples

The following example modifies the trusted domain list used by Vserver vs1:

```
cluster1::> vserver cifs domain name-mapping-search modify -vserver vs1 -trusted-domains
cifs3.example.com
```

vserver cifs domain name-mapping-search remove
Remove from the list of trusted domains for name-mapping search

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs domain name-mapping-search remove command removes one or more trusted domains from the list used by the specified Vserver to lookup Windows user names when performing Windows user to UNIX user name-mapping. If a list of trusted domains is not provided, the entire trusted domain list for the specified Vserver is removed. This command is not supported for workgroup CIFS servers.
Parameters

- `vserver <vserver name>` - Vserver
  
  This parameter specifies the name of the Vserver from which you want to remove trusted domains.

- `[-trusted-domains <domain name>,... ]` - Trusted Domains
  
  This parameter specifies a comma-delimited list of trusted domains of the home domain.

Examples

The following example removes two trusted domains from the list used by Vserver vs1:

```
class1::> vserver cifs domain name-mapping-search remove -trusted-domains cifsl.example.com,
cif2.example.com
```

vserver cifs domain name-mapping-search show

Display the list of trusted domains for name-mapping searches

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The `vserver cifs domain name-mapping-search show` command displays information about trusted domains of the home domain by Vserver.

Parameters

- `[-fields <fieldname>,... ]`

  If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

- `[-instance ]]`

  If you specify the `-instance` parameter, the command displays detailed information about all fields.

- `[-vserver <vserver name>]` - Vserver

  This parameter specifies the name of the Vserver for which you want to display information about the trusted domains.

- `[-trusted-domains <domain name>,...]` - Trusted domains

  This parameter specifies a comma-delimited list of fully qualified domain names of trusted domains for which you want to display information.

Examples

The following example displays information about all preferred trusted domains:

```
class1::> vserver cifs domain name-mapping-search show
Vserver         Trusted Domains
--------------  ----------------------------------
vserver_1       CIFS1.EXAMPLE.COM
```

vserver cifs domain password commands

Manage domain account password configuration for a CIFS server
vserver cifs domain password change

Generate a new password for the CIFS server's machine account and change it in the Windows Active Directory domain.

**Availability:** This command is available to cluster and Vserver administrators at the *admin* privilege level.

**Description**
The `vserver cifs domain password change` command changes the domain account password for a CIFS server. This command is not supported for workgroup CIFS servers.

**Parameters**
- `-vserver <vserver name>` - Vserver
  
  This parameter specifies the name of the Vserver for whose CIFS server you want to change the domain account password.

**Examples**
The following example changes the password for the CIFS server on a Vserver named vs1.

```
cluster1::> vserver cifs domain password change -vserver vs1
cluster1::>
```

vserver cifs domain password reset

Reset the CIFS server's machine account password in the Windows Active Directory domain.

**Availability:** This command is available to cluster and Vserver administrators at the *admin* privilege level.

**Description**
The `vserver cifs domain password reset` command resets the domain account password for a CIFS server. This may be required if the password stored along with the machine account in the Windows Active Directory domain is changed or reset without the Vserver's knowledge. The operation requires the credentials for a user with permission to reset the password in the organizational unit (OU) that the machine account is a member of. This command is not supported for workgroup CIFS servers.

**Parameters**
- `-vserver <vserver name>` - Vserver
  
  This parameter specifies the name of the Vserver for whose CIFS server you want to reset the domain account password.

**Examples**
The following example resets the password for the CIFS server on a Vserver named vs1.

```
cluster1::> vserver cifs domain password reset -vserver vs1
Enter your user ID: Administrator
Enter your password:
cluster1::>
```

vserver cifs domain password schedule commands

The schedule directory
vserver cifs domain password schedule modify

Modify the domain account password change schedule

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs domain password schedule modify command enables you to modify a domain account password change schedule for a CIFS server. This command is not supported for workgroup CIFS servers.

Parameters
-vserver <vserver name> - Vserver
This specifies the name of the Vserver containing the CIFS server for which you want to change the domain account password.

[-is-schedule-enabled [true|false]] - Is Password Change Schedule Enabled
This specifies whether the domain account password change schedule is enabled.

[-schedule-weekly-interval <integer>] - Interval in Weeks for Password Change Schedule
This specifies the number of weeks after which the scheduled domain account password change must occur.

[-schedule-randomized-minute <integer>] - Minutes Within Which Schedule Start Can be Randomized
This specifies the minutes within which the scheduled domain account password change must begin.

[-schedule-day-of-week <cron_dayofweek>] - Day of Week for Password Change Schedule
This sets the day of week when the scheduled domain account password change occurs.

[-schedule-time-of-day <HH:MM:SS>] - Start Time for Password Change Schedule
This sets the time in HH:MM:SS at which the scheduled domain account password change starts.

Examples
The following example enables the domain account password change schedule and configures it to run at any time between 23:00:00 to 00:59:00 (one hour before midnight to one hour after midnight) on every 4th Sunday.

```
cluster1::> vserver cifs domain password schedule modify -is-schedule-enabled true -schedule-randomized-minute 120 -schedule-weekly-interval 4 -schedule-time-of-day 23:00:00 -schedule-day-of-week sunday
```

vserver cifs domain password schedule show

Display the domain account password change schedule

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs domain password schedule show command displays the domain account password change schedule configuration. It displays the following fields:

- Vserver: Vserver for which the schedule is configured
- Schedule Enabled: Whether the schedule is enabled or disabled for this Vserver
- Schedule Interval: Weeks after which the password change schedule occurs again for this Vserver
- Schedule Randomized Within: Minutes within which the schedule must begin for this Vserver
- Schedule: Password change schedule currently set on this Vserver
• Last Successful Password Change/Reset Time: Time at which the last password change or reset happened successfully on this Vserver

• Warning: Warning message, applicable only when the change password job is deleted with the feature still enabled on this Vserver

Parameters

{ [-fields <fieldname>, ...] } If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[ [-instance] ] If you specify the -instance parameter, the command displays detailed information about all fields.

[ -vserver <vserver name>] - Vserver

If you specify this parameter, the command displays information for the specified Vserver.

[ -is-schedule-enabled {true|false}] - Is Password Change Schedule Enabled

If you specify this parameter, the command displays information for all the Vservers on which the is-schedule-enabled value applies.

[ -schedule-weekly-interval <integer>] - Interval in Weeks for Password Change Schedule

If you specify this parameter, the command displays information for all the Vservers on which the schedule-weekly-interval value applies.

[ -schedule-randomized-minute <integer>] - Minutes Within Which Schedule Start Can be Randomized

If you specify this parameter, the command displays information for all the Vservers on which the schedule-randomized-minute value applies.

[ -schedule-last-changed <text>] - Last Successful Password Change/Reset Time

If you specify this parameter, the command displays information for all the Vservers on which the schedule-last-changed value applies.

[ -schedule-description <text>] - Schedule Description

If you specify this parameter, the command displays information for all the Vservers on which the schedule-description value applies.

[ -schedule-warn-msg <text>] - Warning Message in Case Job Is Deleted

If you specify this parameter, the command displays information for all the Vservers on which the schedule-warn-msg value applies.

Examples

The following example shows the domain account password change schedule configuration when the password change feature is enabled for Vserver vs1.

```
cluster1:~> vserver cifs domain password schedule show
Vserver: vs1
  Schedule Enabled: true
  Schedule Interval: 4 week
  Schedule Randomized Within: 120 min
  Schedule: Fri@23:00
  Last Changed At: Thu Apr  4 02:35:23 2013
```

The following example shows the domain account password change schedule configuration when the password change job has been accidently deleted.
vserver cifs domain preferred-dc commands

Manage preferred domain controllers

vserver cifs domain preferred-dc add

Add to a list of preferred domain controllers

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs domain preferred-dc add command adds one or more domain controllers to be used in preference to all others by the specified Vserver for interactions with the specified domain. If a list already exists for the specified domain, the new list is merged with the existing list. This command is not supported for workgroup CIFS servers.

Note: Each Vserver discovers domain controllers and attempts to sort them internally based on real-world performance. Therefore it should not be necessary to create a preferred list of domain controllers under most circumstances.

Parameters
-vserver <vserver name> - Vserver
   This parameter specifies the name of the Vserver for which you want to add preferred domain controllers.

-domain <TextNoCase> - Fully Qualifed Domain Name
   This parameter specifies the fully-qualified name of the domain that the domain controllers belong to.

-preferred-dc <InetAddress>, ... - Preferred Domain Controllers
   This parameter specifies a comma-delimited list of IP addresses for domain controllers that belong to the domain specified in the -domain parameter.

[-skip-config-validation [true]] - Skip Configuration Validation
   Use this parameter to skip the Preferred-DC configuration validation.

   The hosts specified with the -DC-servers parameter are validated to verify that each of the DC servers are reachable, and is providing NETLOGON services.

   The validation fails if there is no valid Preferred-DC server.

Examples
The following example adds two domain controllers (192.168.0.100 and 192.168.0.101) to the preferred list used by Vserver vs1 when connecting to the example.com domain:

   cluster1::> vserver cifs domain preferred-dc add -vserver vs1 -domain example.com -preferred-dc 192.168.0.100,192.168.0.101
vserver cifs domain preferred-dc check

Display validation status of the Preferred-DC configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
Use the vserver cifs domain preferred-dc check command to check the status of configured preferred DC on a particular vserver.

Parameters
{
[-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance]
If you specify the -instance parameter, the command displays detailed information about all fields.

-vserver <vserver> - Vserver
Use this parameter to specify the Vserver whose preferred DC needs to be validated.

[-server-ip <text>, ...] - DC Address
Use this parameter to display IP-address of the configured CIFS Preferred-DC servers.

[-domain <TextNoCase>, ...] - Domain Name
Use this parameter to display Domain name of the configured CIFS Preferred-DCs.

[-status {down|up}, ...] - DC Status
Use this parameter to display information only about CIFS Preferred-DC servers with a status that matches the value you specify.

[-status-details <text>, ...] - Status Details
Use this parameter to display information only about CIFS Preferred-DC servers with status details that match the value you specify.

Examples
The following example checks the connectivity of preferred DC on vserver vs0.

cluster1::> vserver cifs domain preferred-dc check -vserver vs0
Vserver : vs0

<table>
<thead>
<tr>
<th>Domain Name</th>
<th>DC Address</th>
<th>Status</th>
<th>Status Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>example.com</td>
<td>1.1.1.1</td>
<td>up</td>
<td>Response time (msec): 426</td>
</tr>
<tr>
<td>example.com</td>
<td>1.1.1.2</td>
<td>up</td>
<td>Response time (msec): 425</td>
</tr>
<tr>
<td>example1.com</td>
<td>2.2.2.2</td>
<td>up</td>
<td>Response time (msec): 423</td>
</tr>
<tr>
<td>example2.com</td>
<td>3.3.3.3</td>
<td>up</td>
<td>Response time (msec): 422</td>
</tr>
</tbody>
</table>

vserver cifs domain preferred-dc remove

Remove from a list of preferred domain controllers

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.
Description
The vserver cifs domain preferred-dc remove command removes one or more domain controllers from the list used by the specified Vserver for interactions with the specified domain. If a list of preferred domain controllers is not provided, the entire list for the specified domain is removed. This command is not supported for workgroup CIFS servers.

Parameters
- vserver <vserver name> - Vserver
  This parameter specifies the name of the Vserver from which you want to remove preferred domain controllers.
- domain <TextNoCase> - Fully Qualified Domain Name
  This parameter specifies the fully-qualified name of the domain that the domain controllers belong to.
- [preferred-dc <InetAddress>, ...] - Preferred Domain Controllers
  This parameter specifies a comma-delimited list of IP addresses for domain controllers that belong to the domain specified in the -domain parameter.

Examples
The following example removes one domain controller (192.168.0.101) from the preferred list used by Vserver vs1 when connecting to the example.com domain:

```bash
cluster1::> vserver cifs domain preferred-dc remove -vserver vs1 -domain example.com -preferred-dc 192.168.0.101
```

vserver cifs domain preferred-dc show
Display a list of preferred domain controllers

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs domain preferred-dc show command displays lists of preferred domain controllers by Vserver and domain.

Parameters
- [fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use ‘-fields ?’ to display the fields to specify.
- [instance]
  If you specify the -instance parameter, the command displays detailed information about all fields.
- vserver <vserver name> - Vserver
  This parameter specifies the name of the Vserver for which you want to display preferred domain controllers.
- domain <TextNoCase> - Fully Qualified Domain Name
  This parameter specifies the fully-qualified name of the domain of the domain controllers to display.
- [preferred-dc <InetAddress>, ...] - Preferred Domain Controllers
  This parameter specifies a comma-delimited list of IP addresses for domain controllers to display.

Examples
The following example displays all preferred domain controllers for all Vservers:
vserver cifs domain trusts commands

Manage discovered trusted domains

vserver cifs domain trusts rediscover

Reset and rediscover trusted domains for a Vserver

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs domain trusts rediscover command discards information the Vserver has stored about trusted domains. After that, it begins the discovery process to reacquire current information about trusted domains. This command is not supported for workgroup CIFS servers.

Parameters
- -vserver <vserver name> - Vserver
  This parameter specifies the name of the Vserver.

Examples
The following example redisCOVERs trusted domains. It produces no output.

```
cluster1::> vserver cifs domain trusts rediscover
```

vserver cifs domain trusts show

Display discovered trusted domain information

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs domain trusts show command displays information about the trusted domains for the CIFS home domain of one or more Vservers. The displayed trusted domain information is grouped by node and Vserver, and each group is preceded by the node and Vserver identification. This command is not supported for workgroup CIFS servers.

Parameters
{ [-fields <fieldname>, ...]  
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use ‘-fields?’ to display the fields to specify.
  
  | [-instance ]]  
  If you specify the -instance parameter, the command displays detailed information about all fields.
  
  [-node (<nodename> | local)] - Node  
  If you use this parameter, the command displays information only about trusted domains of the home domains for the specified node.}
[-vserver <vserver name>] - Vserver
If you use this parameter, the command displays information only about trusted domains of the home domain for the specified Vserver.

[-home-domain <domain name>] - Home Domain Name
If you use this parameter, the command displays information only about trusted domains of the home domain with the specified name.

[-trusted-domain <domain name>, ...] - Trusted Domain Name
If you use this parameter, the command displays information only about trusted domains with the specified name.

Examples
The following example displays information about all the bidirectional trusted domains for node-01 and vserver_1.

```
cluster1::> vserver cifs domain trusts show -node node-01 -vserver vserver_1
  Node: node-01
  Vserver: vserver_1
  Home Domain                      Trusted Domain
  ------------------------  -----------------------------------
  EXAMPLE.COM                  CIFS1.EXAMPLE.COM,
                                CIFS2.EXAMPLE.COM
```

vserver cifs group-policy commands
Manage group policies

vserver cifs group-policy modify
Change group policy configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs group-policy modify command modifies the group policy configuration of a CIFS server. This command is not supported for workgroup CIFS servers.

Parameters
-[-vserver <vserver name>] - Vserver
  This parameter specifies the Vserver whose group policy configuration you want to modify.

[-status {enabled|disabled}] - Group Policy Status
  This parameter specifies whether the CIFS-enabled Vserver's group policy is enabled or disabled.

Examples
The following example enables the group policy for CIFS-enabled Vserver vs1.

```
cluster1::> vserver cifs group-policy modify -vserver vs1 -status enabled
```
vserver cifs group-policy show

Show group policy configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs group-policy show command displays information about group policy configuration for CIFS-enabled Vserver. It displays all or a subset of the group policy configuration matching the criteria that you specify.

Parameters
{ [-fields <fieldname>, ...]
    If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.
}
| [-instance ]
    If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver
    If you specify this parameter, the command displays group policy configuration only for the Vserver that you specify.

[-status {enabled|disabled}] - Group Policy Status
    If you specify this parameter, the command displays group policy configuration only for the Vservers that match the status you specify.

| Examples |
The following example displays group policy configuration for all Vservers:

| cluster1::> vserver cifs group-policy show
<table>
<thead>
<tr>
<th>Vserver</th>
<th>GPO Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>
<td>disabled</td>
</tr>
</tbody>
</table>

vserver cifs group-policy show-applied

Show currently applied group policy setting

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs group-policy show-applied command displays information about group policies assigned to a Vserver. It displays all or a subset of the group policy information matching the criteria that you specify.

If you do not specify any parameters, the command displays the following information about all group policies applied to Vservers in the cluster:

- GPO Name: Specifies the name of the Group Policy object.
- Level: Specifies the level in which the Group Policy is configured. It could be either site level, domain level, or OU level.
- Status: Specifies whether or not this Group Policy object is enabled.

Advanced Audit Settings:
- Object Access:
• Central Access Policy Staging: Specifies the type of events to be audited for central access policy staging. Possible values are:
  ◦ none - Do not audit.
  ◦ success - Audit only success events.
  ◦ failure - Audit only failure events.
  ◦ both - Audit both success and failure events.

Registry Settings:
• Refresh Time Interval: Specifies how often the Group Policy is updated.
• Refresh Random Offset: Specifies a random time that is added to the refresh interval to prevent all clients from requesting Group Policy updates at the same time.
• Hash Publication Mode for BranchCache: Specifies the hash generation mode used to generate hashes for data stored in shared folders on which BranchCache is enabled, which is then provided to clients. Possible values are:
  ◦ per-share - Allow hash publication only for shared folders on which BranchCache is enabled.
  ◦ disabled - Disallow hash publication on all shared folders.
  ◦ all-shares - Allow hash publication for all shared folders.
• Hash Version Support for BranchCache: Specifies the version supported by the BranchCache hash generation service. Possible values are:
  ◦ all-versions - Both versions 1 and 2 (V1 and V2).
  ◦ version1 - Version 1 (V1).
  ◦ version2 - Version 2 (V2).

Security Settings:
• Event Audit and Event Log:
• Audit Logon Events: Specifies the type of logon events to be audited. Possible values are:
  ◦ none - Do not audit.
  ◦ success - Audit only success events.
  ◦ failure - Audit only failure events.
  ◦ both - Audit both success and failure events.
• Audit Object Access: Specifies the type of object access to be audited. Possible values are:
  ◦ none - Do not audit.
  ◦ success - Audit only success events.
  ◦ failure - Audit only failure events.
  ◦ both - Audit both success and failure events.
• Log Retention Method: Specifies the audit log retention method. Possible values are:
  ◦ overwrite-as-needed - Overwrite the event log when size of the log file exceeds the maximum log size.
  ◦ overwrite-by-days - Not supported.
- do-not-overwrite - Do not overwrite the event log.
- Max Log Size: Specifies the maximum size of the audit log. This size is displayed in kbytes.
- File Security: Specifies a list of files or directories on which file security is applied.
- Kerberos:
- Max Clock Skew: Specifies maximum tolerance in hours for computer clock synchronization.
- Max Ticket Age: Specifies maximum lifetime in minutes for user ticket.
- Max Renew Age: Specifies maximum lifetime in days for user ticket renewal.
- Privilege Rights:
- Take Ownership: List of users and groups that have the right to take ownership of any securable object in the system.
- Security Privilege: List of users and groups that can specify auditing options for object access of individual resources, such as files, folders, and Active Directory objects.
- Change Notify: List of users and groups that can traverse directory trees even though the users and groups might not have permissions on the traversed directory.
- Registry Values:
- Signing Required: Specifies whether SMB signing is on or off.
- Restrict Anonymous:
- No enumeration of Security Account Manager (SAM) accounts: This security setting determines what additional permissions are granted for anonymous connections to the computer. This option displays as 'no-enumeration' in Data ONTAP if enabled.
- No enumeration of SAM accounts and shares: This security setting determines whether anonymous enumeration of SAM accounts and shares is allowed. This option displays as 'no-enumeration' in Data ONTAP if enabled.
- Restrict anonymous access to shares and named pipes: This security setting restricts anonymous access to shares and pipes. This option displays as 'no-access' in Data ONTAP if enabled.
- Combined restriction for anonymous user: The combined restriction for the anonymous user is derived from the above three settings:
  - If 'no-access' is enabled, 'Combined restriction for anonymous user' is set to 'no-access'. The anonymous user is denied access to the specified shares and named pipes, and cannot use enumeration of SAM accounts and shares.
  - If 'no-enumeration' is enabled and 'no-access' is disabled, 'Combined restriction for anonymous user' is set to 'no-enumeration'. The anonymous user has access to the specified shares and named pipes, but cannot use enumeration of SAM accounts and shares.
  - If 'no-enumeration' is disabled and 'no-access' is disabled, 'Combined restriction for anonymous user' is set to 'no-restriction'. The anonymous user has full access and can use enumeration.
- Restricted Groups:
- List of restricted groups. For more information on each group, refer to the man page for the "vserver cifs group-policy restricted-group show-applied" command. Each group specifies two properties for restricted groups. The "Members" list defines who belongs and who does not belong to the restricted group. The "MemberOf" list ensures that the restricted group is added to the groups listed in "MemberOf" field. A group can be a member of groups other than those listed in "MembersOf" section.

Central Access Policy Settings:
- Policies:
- Specifies a list of central access policies. Central access policies and rules determine access permissions for multiple files on the Vserver.

**Parameters**

{-fields <fieldname>, ...}

If you specify the -fields <fieldname>, ... parameter, the command only displays the fields that you specify.

{-instance}

If you specify the -instance parameter, the command displays detailed information about all entries.

{-vserver <vserver name>} - Vserver

If you specify this parameter, the command displays only group policy information that has been applied to the Vserver you specify.

{-gpo-index <integer>} - GPO Index

If you specify this parameter, the command displays only group policy information at gpo-index.

**Examples**

The following example displays all group policy information about all group policies that have been applied to a Vserver:

```
cluster1::> vserver cifs group-policy show-applied
Vserver: vs1
-----------------------------
GPO Name: Default Domain Policy
    Level: Domain
    Status: enabled
Advanced Audit Settings:
    Object Access:
        Central Access Policy Staging: failure
Registry Settings:
    Refresh Time Interval: 22
    Refresh Random Offset: 8
    Hash Publication Mode for BranchCache: per-share
    Hash Version Support for BranchCache: all-versions
Security Settings:
    Event Audit and Event Log:
        Audit Logon Events: none
        Audit Object Access: success
        Log Retention Method: overwrite-as-needed
        Max Log Size: 16384
File Security:
    /vol1/home
    /vol1/dir1
Kerberos:
    Max Clock Skew: 5
    Max Ticket Age: 10
    Max Renew Age: 7
Privilege Rights:
    Take Ownership: usr1, usr2
    Security Privilege: usr1, usr2
    Change Notify: usr1, usr2
Registry Values:
    Signing Required: false
Restrict Anonymous:
    No enumeration of SAM accounts: true
    No enumeration of SAM accounts and shares: false
    Restrict anonymous access to shares and named pipes: true
    Combined restriction for anonymous user: no-access
Restricted Groups:
    gpr1
    gpr2
Central Access Policy Settings:
    Policies: cap1
        cap2
GPO Name: Resultant Set of Policy
    Level: RSOP
Advanced Audit Settings:
    Object Access:
```

vserver cifs commands
vserver cifs group-policy show-defined

Show applicable group policy settings defined in Active Directory

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs group-policy show-defined command displays information about group policies that have been defined in Active Directory. It displays all or a subset of the group policy configuration matching the criteria that you specify.

If you do not specify any parameters, the command displays the following information about all group policies defined in Active Directory:

• GPO Name: Specifies the name of the Group Policy object.
• Level: Specifies the level in which the Group Policy is configured. It could be either site level, domain level, or OU level.
• Status: Specifies whether or not this Group Policy object is enabled.

Advanced Audit Settings:

• Object Access:

• Central Access Policy Staging: Specifies the type of events to be audited for central access policy staging. Possible values are:
  • none - Do not audit.
  • success - Audit only success events.
  • failure - Audit only failure events.
- both - Audit both success and failure events.

Registry Settings:

- Refresh Time Interval: Specifies how often the Group Policy is updated.
- Refresh Random Offset: Specifies a random time that is added to the refresh interval to prevent all clients from requesting Group Policy updates at the same time.
- Hash Publication Mode for BranchCache: Specifies the hash generation mode used to generate hashes for data stored in shared folders on which BranchCache is enabled, which is then provided to clients. Possible values are:
  - per-share - Allow hash publication only for shared folders on which BranchCache is enabled.
  - disabled - Disallow hash publication on all shared folders.
  - all-shares - Allow hash publication for all shared folders.
- Hash Version Support for BranchCache: Specifies the version supported by the BranchCache hash generation service. Possible values are:
  - all-versions - Both versions 1 and 2 (V1 and V2).
  - version1 - Version 1 (V1).
  - version2 - Version 2 (V2).

Security Settings:

- Event Audit and Event Log:
- Audit Logon Events: Specifies the type of logon events to be audited. Possible values are:
  - none - Do not audit.
  - success - Audit only success events.
  - failure - Audit only failure events.
  - both - Audit both success and failure events.
- Audit Object Access: Specifies the type of object access to be audited. Possible values are:
  - none - Do not audit.
  - success - Audit only success events.
  - failure - Audit only failure events.
  - both - Audit both success and failure events.
- Log Retention Method: Specifies the audit log retention method. Possible values are:
  - overwrite-as-needed - Overwrite the event log when size of the log file exceeds the maximum log size.
  - overwrite-by-days - Not supported.
  - do-not-overwrite - Do not overwrite the event log.
- Max Log Size: Specifies the maximum size of the audit log. This size is displayed in kbytes.
- File Security: Specifies a list of files or directories on which file security is to be applied.
- Kerberos:
- Max Clock Skew: Specifies maximum tolerance in hours for computer clock synchronization.
• Max Ticket Age: Specifies maximum lifetime in minutes for user ticket.
• Max Renew Age: Specifies maximum lifetime in days for user ticket renewal.
• Privilege Rights:
  • Take Ownership: List of users and groups that have the right to take ownership of any securable object in the system.
  • Security Privilege: List of users and groups that can specify auditing options for object access of individual resources, such as files, folders, and Active Directory objects.
  • Change Notify: List of users and groups that can traverse directory trees even though the users and groups might not have permissions on the traversed directory.
• Registry Values:
  • Signing Required: Specifies whether SMB signing is on or off.
  • Restrict Anonymous:
    • No enumeration of Security Account Manager (SAM) accounts: This security setting determines what additional permissions are granted for anonymous connections to the computer. This option displays as 'no-enumeration' in Data ONTAP if enabled.
    • No enumeration of SAM accounts and shares: This security setting determines whether anonymous enumeration of SAM accounts and shares is allowed. This option displays as 'no-enumeration' in Data ONTAP if enabled.
    • Restrict anonymous access to shares and named pipes: This security setting restricts anonymous access to shares and pipes. This option displays as 'no-access' in Data ONTAP if enabled.
  • Combined restriction for anonymous user: The combined restriction for the anonymous user is derived from the above three settings:
    ◦ If 'no-access' is enabled, 'Combined restriction for anonymous user' is set to 'no-access'. The anonymous user is denied access to the specified shares and named pipes, and cannot use enumeration of SAM accounts and shares.
    ◦ If 'no-enumeration' is enabled and 'no-access' is disabled, 'Combined restriction for anonymous user' is set to 'no-enumeration'. The anonymous user has access to the specified shares and named pipes, but cannot use enumeration of SAM accounts and shares.
    ◦ If 'no-enumeration' is disabled and 'no-access' is disabled, 'Combined restriction for anonymous user' is set to 'no-restriction'. The anonymous user has full access and can use enumeration.
  • Restricted Groups:
    • List of restricted groups. For more information on each group, refer to the man page for the "vserver cifs group-policy restricted-group show-defined" command. Each group specifies two properties for restricted groups. The "Members" list defines who belongs and who does not belong to the restricted group. The "MemberOf" list ensures that the restricted group is added to the groups listed in "MemberOf" field. A group can be a member of groups other than those listed in "MembersOf" section.
  
Central Access Policy Settings:
  • Policies:
    ◦ Specifies a list of central access policies. Central access policies and rules determine access permissions for multiple files on the Vserver.

Parameters

  { [-fields <fieldname>, ...] }

  If you specify the -fields <fieldname>, ... parameter, the command only displays the fields that you specify.
If you specify the -instance parameter, the command displays detailed information about all entries.

-vserver <vserver name> - Vserver
If you specify this parameter, the command displays only group policy information that has been defined in Active Directory for the Vserver that you specify.

-gpo-index <integer> - GPO Index
If you specify this parameter, the command displays only group policy information at gpo-index.

Examples
The following example displays all group policy information for all group policies that have been defined in Active Directory:

```
cluster1:/> vserver cifs group-policy show-defined
Vserver: vs1
---------------------------------------------
GPO Name: Default Domain Policy
  Level: Domain
  Status: enabled
  Advanced Audit Settings:
    Object Access:

```
vserver cifs group-policy update

Apply group policy settings defined in Active Directory

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The *vserver cifs group-policy update* command applies the group-policy settings defined in Active Directory for the given Vserver. This command is not supported for workgroup CIFS servers.

**Parameters**
- **-vserver <vserver name>** - Vserver Name
  
  This parameter specifies the CIFS-enabled Vserver to which the group-policy settings be applied.

- **[-force-reapply-all-settings {true|false}]** - Force Re-apply All Settings
  
  This parameter specifies whether to ignore all processing optimizations and re-apply all settings. The default is false.

**Examples**
The following example applies the group-policy settings defined in Active Directory for Vserver vs1.

```bash
cluster1::> vserver cifs group-policy update -vserver vs1 -force-reapply-all-settings true
```

vserver cifs group-policy central-access-policy commands

Manage central access policy

vserver cifs group-policy central-access-policy show-applied

Show currently applied central access policies

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.
Description
The vserver cifs group-policy central-access-policy show-applied command displays information about the central access policies assigned to Vservers. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all CIFS servers:

- Vserver name
- Name of the central access policy
- SID
- Description
- Creation time
- Modification time
- Member rules

Parameters

{ [-fields <fieldname>, ...]
  
  If you specify the -fields <fieldname>, ... parameter, the command only displays the fields that you specify.
}

| [-instance ]
  
  If you specify the -instance parameter, the command displays detailed information about all entries.

[-vserver <vserver name>] - Vserver
  
  If you specify this parameter, the command displays information only for central access policies for the specified Vserver.

[-name <TextNoCase>] - Name
  
  If you specify this parameter, the command displays information only for central access policies that match the specified name.

[-sid <windows sid>] - Identifier
  
  If you specify this parameter, the command displays information only for central access policies that match the specified SID.

[-description <text>] - Description
  
  If you specify this parameter, the command displays information only for central access policies that match the specified description.

[-ctime <Date>] - Creation Time
  
  If you specify this parameter, the command displays information only for central access policies that match the specified creation time.

[-mtime <Date>] - Modification Time
  
  If you specify this parameter, the command displays information only for central access policies that match the specified modification time.

[-rules <TextNoCase>, ...] - Central Access Rules
  
  If you specify this parameter, the command displays information only for central access policies that match the specified member rules.

Examples

The following example displays information for all central access policies:
```
cluster1::> vserver cifs group-policy central-access-policy show-applied

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Name</th>
<th>SID</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>
<td>p1</td>
<td>S-1-17-3386172923-1132988875-3044489393-3993546205</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Description: policy #1</td>
</tr>
<tr>

</tbody>
</table>

2 entries were displayed.
```

---

vserver cifs group-policy central-access-policy show-defined

Show applicable central access policies defined in the Active Directory

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The `vserver cifs group-policy central-access-policy show-defined` command displays information about the central access policies that are defined in the Active Directory. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all CIFS servers:

- Vserver name
- Name of the central access policy
- SID
- Description
- Creation time
- Modification time
- Member rules

**Parameters**

- \([-\text{fields <fieldname>},...\]\\)
  If you specify the `-fields <fieldname>, ...` parameter, the command only displays the fields that you specify.

- \([-\text{instance }]\)\\)
  If you specify the `-instance` parameter, the command displays detailed information about all entries.

- `[-\text{vserver <vserver name>}] - Vserver`\\)
  If you specify this parameter, the command displays information only for central access policies for the specified Vserver.

- `[-\text{name <TextNoCase>}] - Name`\\)
  If you specify this parameter, the command displays information only for central access policies that match the specified name.
[-sid <windows sid>] - Identifier
If you specify this parameter, the command displays information only for central access policies that match the specified SID.

[-description <text>] - Description
If you specify this parameter, the command displays information only for central access policies that match the specified description.

[-ctime <Date>] - Creation Time
If you specify this parameter, the command displays information only for central access policies that match the specified creation time.

[-mtime <Date>] - Modification Time
If you specify this parameter, the command displays information only for central access policies that match the specified modification time.

[-rules <TextNoCase>, ...] - Central Access Rules
If you specify this parameter, the command displays information only for central access policies that match the specified member rules.

---

### Examples

The following example displays information for all central access policies:

```bash
cluster1:~> vserver cifs group-policy central-access-policy show-defined
Vserver     Name                 SID                                                                                     
----------  -------------------- -----------------------------------------------
vs1         p1                   S-1-17-3386172923-1132988875-3044489393-3993546205
            Description: policy #1
            Creation Time: Tue Oct 22 09:34:13 2013
            Member Rules: r1

vs1         p2                   S-1-17-1885229282-1100162114-134354072-822349040
            Description: policy #2
            Creation Time: Tue Oct 22 10:28:20 2013
            Member Rules: r1 r2

2 entries were displayed.
```

---

**vserver cifs group-policy central-access-rule commands**

Manage central access rule

**vserver cifs group-policy central-access-rule show-applied**

Show currently applied central access rules

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The `vserver cifs group-policy central-access-rule show-applied` command displays information about the central access rules assigned to Vservers. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all CIFS servers:

- Vserver name
- Name of the central access rule
• Description
• Creation time
• Modification time
• Current permissions
• Proposed permissions
• Target resources

Parameters

{-fields <fieldname>,...}  
If you specify the -fields <fieldname>, ... parameter, the command only displays the fields that you specify.

{-instance}  
If you specify the -instance parameter, the command displays detailed information about all entries.

{-vserver <vserver name>} - Vserver  
If you specify this parameter, the command displays information only for central access rules for the specified Vserver.

{-name <TextNoCase>} - Name  
If you specify this parameter, the command displays information only for central access rules that match the specified name.

{-description <text>} - Description  
If you specify this parameter, the command displays information only for central access rules that match the specified description.

{-ctime <Date>} - Creation Time  
If you specify this parameter, the command displays information only for central access rules that match the specified creation time.

{-mtime <Date>} - Modification Time  
If you specify this parameter, the command displays information only for central access rules that match the specified modification time.

{-effective <text>} - Effective Security Policy  
If you specify this parameter, the command displays information only for central access rules that match the specified effective security policy.

{-proposed <text>} - Proposed Security Policy  
If you specify this parameter, the command displays information only for central access rules that match the specified proposed security policy.

{-resource <text>} - Resource Condition  
If you specify this parameter, the command displays information only for central access rules that match the specified resource condition.

Examples

The following example displays information for all central access rules:

```
cluster1::> vserver cifs group-policy central-access-rule show-applied
Vserver    Name
---------- --------------------
vs1        r1
Description: rule #1
Creation Time: Tue Oct 22 09:33:48 2013
```
vserver cifs group-policy central-access-rule show-defined

Show applicable central access rules defined in the Active Directory

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver cifs group-policy central-access-rule show-defined command displays information about the central access rules that are defined in the Active Directory. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all CIFS servers:

- Vserver name
- Name of the central access rule
- Description
- Creation time
- Modification time
- Current permissions
- Proposed permissions
- Target resources

Parameters

{ [-fields <fieldname>,...] }

If you specify the -fields <fieldname>, ... parameter, the command only displays the fields that you specify.

{ [-instance] }

If you specify the -instance parameter, the command displays detailed information about all entries.

[-vserver <vserver name>] - Vserver

If you specify this parameter, the command displays information only for central access rules for the specified Vserver.

[-name <TextNoCase>] - Name

If you specify this parameter, the command displays information only for central access rules that match the specified name.

[-description <text>] - Description

If you specify this parameter, the command displays information only for central access rules that match the specified description.
[-ctime <Date>] - Creation Time
If you specify this parameter, the command displays information only for central access rules that match the specified creation time.

[-mtime <Date>] - Modification Time
If you specify this parameter, the command displays information only for central access rules that match the specified modification time.

[-effective <text>] - Effective Security Policy
If you specify this parameter, the command displays information only for central access rules that match the specified effective security policy.

[-proposed <text>] - Proposed Security Policy
If you specify this parameter, the command displays information only for central access rules that match the specified proposed security policy.

[-resource <text>] - Resource Condition
If you specify this parameter, the command displays information only for central access rules that match the specified resource condition.

**Examples**

The following example displays information for all central access rules:

```
cluster1::> vserver cifs group-policy central-access-rule show-defined
Vserver     Name
---------- -------------------
vs1         r1
            Description: rule #1
            Creation Time: Tue Oct 22 09:33:48 2013
            Modification Time: Tue Oct 22 09:33:48 2013
vs1         r2
            Description: rule #2
            Creation Time: Tue Oct 22 10:27:57 2013
            Modification Time: Tue Oct 22 10:27:57 2013
```

2 entries were displayed.

**vserver cifs group-policy restricted-group commands**

Manage restricted group

**vserver cifs group-policy restricted-group show-applied**

Show the applied restricted-group settings.

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The vserver cifs group-policy restricted-group show-applied command displays settings of all the restricted groups applied to a Vserver.

If you do not specify any parameters, the command displays the following information about all the restricted groups applied to all the Vservers in the cluster.

- Group Policy Name: Specifies the name of the group policy.
• Version: Specifies the version of the group policy.

• Link: Specifies the level in which the group policy is configured. Possible values are:
  ◦ Local: Group policy is configured in Data ONTAP.
  ◦ Site: Group policy is configured at the site level in the Domain Controller.
  ◦ Domain: Group policy is configured at the domain level in the Domain Controller.
  ◦ Organizational Unit: Group policy is configured at the OU level in the Domain controller.
  ◦ RSOP: Resultant set of policies derived from all the group policies defined at various levels.

• Group Name: Specifies the name of a restricted group.

• Members: Specifies users and groups who belong to and who do not belong to the restricted group.

• MemberOf: Specifies list of groups to which the restricted group is added. A group can be a member of groups other than the groups listed here.

Parameters

{ [-fields <fieldname>, ...]}

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

| [-instance ]|

If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver

If this parameter is specified, the command displays the restricted-group information that has been applied to the specified Vserver.

[-index <integer>] - Index

If this parameter is specified, the command displays the specified index for the group policy in the restricted group. The restricted-group information for the group policy at the specified index.

[-group-name <text>] - Group Name

If this parameter is specified, the command displays the restricted-group information for the specified group name.

[-group-policy-name <text>] - Group Policy Name

If this parameter is specified, the command displays the restricted-group information for the specified group policy name.

[-uuid <UUID>] - UUID

If this parameter is specified, the command displays the restricted-group information for the specified UUID of the group policy.

[-version <integer>] - Version

If this parameter is specified, the command displays the restricted-group information for the specified version of the group policy.

[-link {Local|Site|Domain|Organizational Unit|RSOP}] - Link Type

If this parameter is specified, the command displays the restricted-group information for the specified link for the group policy.

[-members <gpoUserGroup>, ...] - Members, List of Users/groups

If this parameter is specified, the command displays the restricted-group information for the specified members of users and groups.
[\text{-member-of} \ <\text{gpoUserGroup}, ... \ ] - \text{MemberOf, List of Groups}

If this parameter is specified, the command displays the restricted-group information for the specified member of the group.

**Examples**

The following example displays information about all restricted groups that have been applied to a Vserver.

```bash
cluster1::> vserver cifs group-policy restricted-group show-applied
Vserver: vs_1
----------
Group Policy Name: gpo1
  Version: 16
  Link: OrganizationalUnit
Group Name: grp1
  Members: usr1
  MemberOf: GPO\g9

Group Policy Name: Resultant Set of Policy
  Version: 0
  Link: RSOP
Group Name: grp1
  Members: usr1
  MemberOf: GPO\g9
```

**vserver cifs group-policy restricted-group show-defined**

Show the defined restricted-group settings.

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The `vserver cifs group-policy restricted-group show-defined` command displays settings of all the restricted groups defined in Domain Controller for a Vserver.

If you do not specify any parameters, the command displays the following information about all the restricted groups defined in Domain Controller for all the Vservers in the cluster.

- **Group Policy Name:** Specifies the name of the group policy.
- **Version:** Specifies the version of the group policy.
- **Link:** Specifies the level in which the group policy is configured. Possible values are:
  - Local: Group policy is configured in Data ONTAP.
  - Site: Group policy is configured at the site level in the Domain Controller.
  - Domain: Group policy is configured at the domain level in the Domain Controller.
  - OrganizationalUnit: Group policy is configured at the OU level in the Domain Controller.
  - RSOP: Resultant set of policies derived from all the group policies defined at various levels.
- **Group Name:** Specifies the name of a restricted group.
- **Members:** Specifies users and groups who belong to and who do not belong to the restricted group.
- **MemberOf:** Specifies list of groups to which the restricted group is added. A group can be a member of groups other than the groups listed here.
Parameters

{[-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

[[-instance]]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver

If this parameter is specified, the command displays the restricted-group information that is defined in Domain Controller for the specified Vserver.

[-index <integer>] - Index

If this parameter is specified, the command displays the specified index for the group policy in the restricted group. The restricted-group information for the group policy at the specified index.

[-group-name <text>] - Group Name

If this parameter is specified, the command displays the restricted-group information for the specified group name.

[-group-policy-name <text>] - Group Policy Name

If this parameter is specified, the command displays the restricted-group information for the specified group policy name.

[-uuid <UUID>] - UUID

If this parameter is specified, the command displays the restricted-group information for the specified UUID of the group policy.

[-version <integer>] - Version

If this parameter is specified, the command displays the restricted-group information for the specified version of the group policy.

[-link {Local|Site|Domain|OrganizationalUnit|RSOP}] - Link Type

If this parameter is specified, the command displays the restricted-group information for the specified link for the group policy.

[-members <gpoUserGroup>, ...] - Members, List of Users/groups

If this parameter is specified, the command displays the restricted-group information for the specified members of users and groups.

[-member-of <gpoUserGroup>, ...] - MemberOf, List of Groups

If this parameter is specified, the command displays the restricted-group information for the specified member of the group.

Examples

The following example displays information about all restricted groups that are defined in Domain Controller for a Vserver.

```
cluster1::> vserver cifs group-policy restricted-group show-defined
Vserver: vs_1
----------

Group Policy Name: gpol
Version: 16
  Link: OrganizationalUnit
Group Name: grp1
Members: usr1
MemberOf: GPO\g9

Group Policy Name: Resultant Set of Policy
```
vserver cifs home-directory commands

Manage home directories

vserver cifs home-directory modify

Modify attributes of CIFS home directories

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs home-directory modify command modifies the CIFS home directory configuration for a CIFS server. To use the home directory options (-is-home-dirs-access-for-admin-enabled or/and -is-home-dirs-access-for-public-enabled), a home directory share must be configured with a dynamic share pattern preceded by a tilde(~). Valid dynamic share patterns are ~%w and ~%d~%w. The pattern %u is not supported with these options.

Parameters
-vserver <vserver> - Vserver
This parameter specifies the name of the CIFS server for which you want to modify the CIFS home directory configuration.

[-is-home-dirs-access-for-admin-enabled {true|false}] - Is Home Directory Access for Admin Enabled
This optional parameter specifies whether a user with Windows administrative privileges can connect to another user's home directory. The default value for this parameter is true.

[-is-home-dirs-access-for-public-enabled {true|false}] - Is Home Directory Access for Public Enabled
( privilege: advanced)
This optional parameter specifies whether any user can connect to another user's home directory. The default value for this parameter is false.

Examples
The following example modifies the CIFS home directory configuration for the Vserver "vs1". It enables users with Windows administrative privileges to connect to another user's home directory, and enables any user to connect to another user's home directory.

```
cluster1::> vserver cifs home-directory modify -vserver vs1 -is-home-dirs-access-for-admin-enabled true
-is-home-dirs-access-for-public-enabled true
```

The following example shows the usage of the share creation pattern ~%d~%w.

```
cluster1::> vserver cifs share create -vserver vs1 -share-name ~%d~%w -path %d/%w -share-properties homedirectory
```

The following example shows the usage of the share creation pattern ~%w.

```
cluster1::> vserver cifs share create -vserver vs1 -share-name ~%w -path %d/%w -share-properties homedirectory
```
vserver cifs share create -vserver vs1 -share-name ~%w -path %d/%w -share-properties homedirectory

vserver cifs home-directory show

Display home directory configurations

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs home-directory show command displays the CIFS home directory configuration for one or more Vservers.

Parameters

[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance ]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver>] - Vserver
If you specify this parameter, the command displays CIFS home directory configuration for the specified Vserver.

[-is-home-dirs-access-for-admin-enabled {true|false}] - Is Home Directory Access for Admin Enabled
If you specify this parameter, the command displays home directory configuration for CIFS servers that have the specified setting.

[-is-home-dirs-access-for-public-enabled {true|false}] - Is Home Directory Access for Public Enabled (privilege: advanced)
If you specify this parameter, the command displays home directory configuration for CIFS servers that have the specified setting.

Examples
The following example lists the CIFS home directory configuration for a Vserver on the cluster.

```
cluster1::> vserver cifs home-directory show -vserver vs1
Vserver: vs1
Is Home Directory Access for Admin Enabled: true
```

At the advanced privilege level or above, the output displays the information below:

```
cluster1::*> vserver cifs options show
Vserver: vs1
Is Home Directory Access for Admin Enabled: true
Is Home Directory Access for Public Enabled: false
```
vserver cifs home-directory show-user

Display the Home Directory Path for a User

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs home-directory show-user command prints the path of a user's CIFS home directory. Use this command if multiple CIFS home directory paths exist and you want to see which path holds the user's CIFS home directory.

Parameters

[-fields <fieldname>, ...]  
If you specify this parameter, the command displays only the fields that you specify.

[-instance]  
If you specify the -instance parameter, the command displays detailed information about all entries.

-vserver <vserver> - Vserver  
Use this required parameter to specify the Vserver that contains the home directory of the user specified with the required -username parameter.

-username <text> - User Name  
Use this required parameter to locate the home directory of the specified user. You must enter this parameter in the following format: user, domain/user or cifs_server_name/user.

[-path <text>] - Path  
If you specify this parameter, the command displays information about the user's home directory with the specified path.

[-share-name <text>] - Share Name  
If you specify this parameter, the command displays information about the user's home directory with the specified home-directory share.

Examples
The following command displays information about the home directory of user gpo\rpuser1 belonging to Vserver vs1.

<table>
<thead>
<tr>
<th>ShareName</th>
<th>Home Dir Path</th>
</tr>
</thead>
<tbody>
<tr>
<td>root</td>
<td>/home/rpuser1</td>
</tr>
<tr>
<td>rpuser1</td>
<td>/home/rpuser1</td>
</tr>
<tr>
<td>-GPO-rpuser1</td>
<td>/home/GPO/rpuser1</td>
</tr>
</tbody>
</table>

The following command displays information about the home directory of user gpo\rpuser1 belonging to Vserver vs1 at share path /home/rpuser1.

<table>
<thead>
<tr>
<th>ShareName</th>
<th>Home Directory Path</th>
</tr>
</thead>
<tbody>
<tr>
<td>-GPO-rpuser1</td>
<td>/home/GPO/rpuser1</td>
</tr>
</tbody>
</table>
The following command displays information about the home directory of user gpo\rpuser1 belonging to Vserver vs1 at share ~GPO~rpuser1.

```
cluster1::> vserver cifs home-directory show-user -vserver vs1 -username gpo\rpuser1 -share-name ~GPO~rpuser1
```

Vserver : vs1
Username : GPO/rpuser1
ShareName                              Home Directory Path
-------------------------------------   ----------------------------------
~GPO~rpuser1                            /home/GPO/rpuser1

vserver cifs home-directory search-path commands

Manage the list of paths used to find home directories

vserver cifs home-directory search-path add

Add a home directory search path

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The `vserver cifs home-directory search-path add` command adds a search path to a CIFS home directory configuration.

Parameters
- `-vserver <vserver name>` - Vserver
  This parameter specifies the CIFS-enabled Vserver containing the CIFS home directory configuration to which you want to add the search path.
- `-path <text>` - Path
  This parameter specifies the search path you want to add.

Examples
The following example adds the path /home1 to the CIFS home directory configuration on Vserver vs1.

```
cluster1::> vserver cifs home-directory search-path add -vserver vs1 -path /home1
```

vserver cifs home-directory search-path remove

Remove a home directory search path

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The `vserver cifs home-directory search-path remove` command removes a search path from a CIFS home directory configuration.
Parameters

-vserver <vserver name> - Vserver

This parameter specifies the CIFS-enabled Vserver containing the CIFS home directory configuration from which you want to remove the search path.

-path <text> - Path

This parameter specifies the search path you want to remove.

Examples

The following example removes the path /home1 from the CIFS home directory configuration on Vserver vs1.

```
cluster1:~> vserver cifs home-directory search-path remove -vserver vs1 -path /home1
```

vserver cifs home-directory search-path reorder

Change the search path order used to find a match

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver cifs home-directory search-path reorder command moves a search path to a new position in the search path order in the CIFS home directory configuration for the CIFS-enabled Vserver.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the CIFS enabled Vserver for which you want to reorder searches.

-path <text> - Path

This parameter specifies the search path you want to move.

-to-position <integer> - Target Position

This parameter specifies the new position of the search path in the search path order.

Examples

The following example moves the search path /home1 to position 1 in the search path order for the CIFS home directory configuration on Vserver vs1.

```
cluster1:~> vserver cifs home-directory search-path reorder -vserver vs1 -path /home1 -to-position 1
```

vserver cifs home-directory search-path show

Display home directory search paths

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver cifs home-directory search-path show command displays information about the search paths that are in the home directory configuration for the CIFS-enabled Vservers.

Parameters

[-fields <fieldname>,...]

If you specify this parameter, the command only displays the fields that you specify.
If you specify the -instance parameter, the command displays detailed information about all entries.

\[-vserver <vserver name>] - Vserver

If you specify this parameter, the command displays home directory configuration for the CIFS-enabled Vserver that you specify.

\[-path <text>] - Path

If you specify this parameter, the command displays information only for the search path that you specify.

**Examples**

The following example displays information about search paths for all CIFS home directories on all CIFS-enabled Vservers:

```
cluster1::> vserver cifs home-directory search-path show

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Position</th>
<th>Path</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>
<td>1</td>
<td>/home1</td>
</tr>
<tr>
<td>vs2</td>
<td>2</td>
<td>/home2</td>
</tr>
</tbody>
</table>
```

**vserver cifs options commands**

Manage CIFS options

**vserver cifs options modify**

Modify CIFS options

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The `vserver cifs options modify` command modifies CIFS options for a CIFS server.

**Parameters**

\[-vserver <vserver name>] - Vserver

This parameter specifies the name of the CIFS server for which you want to modify CIFS options.

\[-default-unix-user <text>] - Default UNIX User

This optional parameter specifies the name of the default UNIX user for the CIFS server.

\[-read-grants-exec {enabled|disabled}] - Read Grants Exec for Mode Bits

This optional parameter specifies whether the CIFS server does read grant execution for mode bits.

\[-wins-servers <InetAddress>, ...] - Windows Internet Name Service (WINS) Addresses

This optional parameter specifies a list of Windows Internet Name Server (WINS) addresses for the CIFS server. You must specify the WINS servers using an IP address. You can enter multiple WINS addresses as a comma-delimited list.

**Note:** Use an IPv4 address because WINS over IPv6 is not supported.

\[-smb1-enabled {true|false}] - Enable SMB1 Protocol (privilege: advanced)

This optional parameter specifies whether the CIFS server negotiates the SMB 1.0 version of the CIFS protocol. The default value for this parameter is false.

\[-smb2-enabled {true|false}] - Enable all SMB2 Protocols (privilege: advanced)

This optional parameter specifies whether the CIFS server negotiates the SMB 2 version of the CIFS protocol. The default value for this parameter is true.
[-smb3-enabled {true|false}] - Enable SMB3 Protocol (privilege: advanced)

This optional parameter specifies whether the CIFS server negotiates the SMB 3 version of the CIFS protocol. The default value for this parameter is true.

[-smb31-enabled {true|false}] - Enable SMB3.1 Protocol (privilege: advanced)

This optional parameter specifies whether the CIFS server negotiates the SMB 3.1 version of the CIFS protocol. The default value for this parameter is true.

[-max-mpx <integer>] - Maximum Simultaneous Operations per TCP Connection (privilege: advanced)

This optional parameter specifies the maximum number of simultaneous operations the CIFS server reports it can process per TCP connection.

[-shadowcopy-dir-depth <integer>] - Maximum Depth of Directories to Shadow Copy (privilege: advanced)

This optional parameter specifies the maximum depth of directories on which to create shadow copies in the CIFS server. The default for this parameter is 5. The value 0 indicates that all sub-directories should be shadow copied. This parameter is not supported for workgroup CIFS servers. Directories and files within a FlexGroup will not be shadow copied because FlexGroups do not support shadow copy.

[-copy-offload-enabled {true|false}] - Enable Copy Offload Feature (privilege: advanced)

This optional parameter enables the Copy Offload feature in the CIFS server. If set to false, the Copy Offload feature is disabled. The default for this parameter is true. Copy Offload has no effect on files in a FlexGroup because FlexGroups do not support Copy Offload.

[-is-copy-offload-direct-copy-enabled {true|false}] - Is Direct-copy Copy Offload Mechanism Enabled (privilege: advanced)

This optional parameter enables the direct-copy mechanism for ODX copy offload in the CIFS server. If set to false, the direct-copy mechanism is disabled. The default for this parameter is true. Copy Offload has no effect on files in a FlexGroup because FlexGroups do not support Copy Offload. The direct-copy mechanism increases the performance of the copy offload operation when Windows clients try to open the source file of a copy in a mode that prevents the file being changed while the copy is in progress. If turned off, regular copy offloading takes place.

[-default-unix-group <text>] - Default UNIX Group

This optional parameter specifies the name of the default UNIX group for the CIFS server. If you do not specify a default UNIX group, the CIFS ACL to NFSv4 ACL translation may result in incomplete NFSv4 ACL information. This parameter is not supported by Vservers with FlexVol volumes.

[-shadowcopy-enabled {true|false}] - Enable Shadow Copy Feature (VSS) (privilege: advanced)

This optional parameter enables the Shadow Copy (VSS) feature in the CIFS server when set to true. The VSS feature is disabled when set to false. The default for this parameter is true. This parameter is not supported for workgroup CIFS servers. Directories and files within a FlexGroup will not be shadow copied because FlexGroups do not support shadow copy.

[-is-referral-enabled {true|false}] - Refer Clients to More Optimal LIFs (privilege: advanced)

This optional parameter specifies whether the CIFS server automatically refers clients to a data LIF local to the node which hosts the root of the requested share. The default value for this parameter is false.

[-is-local-auth-enabled {true|false}] - Is Local User Authentication Enabled (privilege: advanced)

This optional parameter specifies whether local user authentication is enabled for the CIFS server.

[-is-local-users-and-groups-enabled {true|false}] - Is Local Users and Groups Enabled (privilege: advanced)

This optional parameter specifies whether the local users and groups feature is enabled for the CIFS server.

[-is-use-junctions-as-reparse-points-enabled {true|false}] - Is Reparse Point Support Enabled (privilege: advanced)

This optional parameter specifies whether the CIFS server exposes junction points to Windows clients as reparse points. The default value for this parameter is true. This parameter is only active if the client has negotiated use of the SMB 2 or SMB 3 protocol.
Is Export Policies for CIFS Enabled (privilege: advanced)

This optional parameter specifies whether the CIFS server uses export policies to control client access. The default value for this parameter is false.

Is NT ACLs on UNIX Security-style Volumes Enabled (privilege: advanced)

This optional parameter specifies whether the CIFS server has the NT ACLs enabled on UNIX security-style volumes. The default value for this parameter is true.

Is Enumeration of Trusted Domain and Search Capability Enabled (privilege: advanced)

This optional parameter specifies whether the CIFS server supports enumeration of bidirectional trusted domains. It also supports the search in all the bidirectional trusted domains when performing Windows user lookups for UNIX user to Windows user name mapping. The default value is true. This parameter is not supported for workgroup CIFS servers.

Idle Timeout Before CIFS Session Disconnect (secs)

This optional parameter specifies the amount of idle time (in seconds) before a CIFS session is disconnected. The default value for this parameter is 900 seconds.

Is Dynamic Access Control (DAC) Enabled (privilege: advanced)

This optional parameter enables the Dynamic Access Control (DAC) feature in the CIFS server when set to true. The DAC feature is disabled when set to false. The default for this parameter is false. This parameter is not supported for workgroup CIFS servers.

Restrictions for Anonymous User (privilege: advanced)

This optional parameter controls the access restrictions of non-authenticated sessions and applies the restrictions for the anonymous user based on the permitted values. The default value for this parameter is no-restriction. Permitted values for this option are:

- no-restriction - This option specifies no access restriction for anonymous users (default).
- no-enumeration - This option specifies that only enumeration is restricted.
- no-access - This option specifies that access is restricted for anonymous users.

Is Deletion of Read-Only Files Enabled

This optional parameter controls deletion of read-only files and directories. NTFS delete semantics forbid deletion of a file or directory when the read-only attribute is set. UNIX delete semantics ignore it, focusing instead on parent directory permissions, which some applications require. This option is used to select the desired behavior. By default this option is disabled, yielding NTFS behavior.

Size of File System Sector Reported to SMB Clients (bytes) (privilege: advanced)

This optional parameter specifies the size of file system sector reported to SMB clients (in bytes). The default value for this parameter is 4096. Valid values are 512 and 4096.

Is Fake Open Support Enabled (privilege: advanced)

This optional parameter specifies whether the CIFS server supports fake open requests. This parameter allows you to optimize the open and close requests coming from SMB 2 clients. The default value for this parameter is true.

Is UNIX Extensions Enabled (privilege: advanced)

When set to true, this optional parameter enables the UNIX Extensions feature in the CIFS server. If set to false, the UNIX Extensions feature is disabled. The default for this parameter is false. UNIX Extensions allows POSIX/UNIX style security to be displayed through the CIFS protocol.
[-is-search-short-names-enabled {true|false}] - Is Search Short Names Support Enabled (privilege: advanced)

This optional parameter specifies whether the CIFS server supports searching short names. A search query with this option enabled will try to match 8.3 file names along with long file names. The default value for this parameter is false.

[-is-advanced-sparse-file-support-enabled {true|false}] - Is Advanced Sparse File Support Enabled (privilege: advanced)

This optional parameter specifies whether the CIFS server supports the advanced sparse file capabilities. This allows CIFS clients to query the allocated ranges of a file and to write zeroes or free data blocks for ranges of a file.

[-is-fsctl-file-level-trim-enabled {true|false}] - Is Fsctl File Level Trim Enabled (privilege: advanced)

This optional parameter specifies whether trim requests (FSCTL_FILE_LEVEL_TRIM) are supported on the CIFS server.

[-guest-unix-user <text>] - Map the Guest User to Valid UNIX User (privilege: advanced)

This optional parameter specifies that an unauthenticated user coming from any untrusted domain can be mapped to a specified UNIX user for the CIFS server. If the CIFS server cannot authenticate the user against a domain controller for the home domain or a trusted domain or the local database, and this option is enabled, the CIFS server considers the user as a guest user and maps the user to the specified UNIX user. The UNIX user must be a valid user.

[-smb1-max-buffer-size <integer>] - Maximum Buffer Size Used for SMB1 Message (privilege: advanced)

This optional parameter specifies the maximum buffer size used for an SMB 1.0 message that the CIFS server can receive. If the LARGE_READ or LARGE_WRITE capability is negotiated during session setup, then 'Read' or 'Write' SMB 1.0 operations are allowed to exceed the configured 'smb1-max-buffer-size' value. This parameter does not have any effect on SMB 2 or SMB 3 buffer size. The default value for this parameter is 65535. The supported range for this parameter is 4356 through 65535.

[-max-same-user-sessions-per-connection <integer>] - Maximum Same User Sessions per TCP Connection (privilege: advanced)

This optional parameter specifies the maximum number of CIFS sessions that can be set up by the same user per TCP connection. The default value of this parameter is 2500. The maximum value of this parameter is 4294967295.

[-max-same-tree-connect-per-session <integer>] - Maximum Same Tree Connect per Session (privilege: advanced)

This optional parameter specifies the maximum number of CIFS tree connects to the same share per CIFS session. The default value of this parameter is 5000. The maximum value of this parameter is 4294967295.

[-max-opens-same-file-per-tree <integer>] - Maximum Opens on Same File per Tree (privilege: advanced)

This optional parameter specifies the maximum number of existing opens on the same file per CIFS tree. The default value of this parameter is 1000. The maximum value of this parameter is 4294967295.

[-max-watches-set-per-tree <integer>] - Maximum Watches Set per Tree (privilege: advanced)

This optional parameter specifies the maximum number of watches, also known as change notifies, that can be set per CIFS tree. Tree here refers to a share connect from a single client. The default value of this parameter is 500. The maximum value of this parameter is 4294967295.

[-is-admin-users-mapped-to-root-enabled {true|false}] - Map Administrators to UNIX User 'root' (privilege: advanced)

If this optional parameter is set to true, Windows users who are members of the "BUILTIN\Administrators" group are mapped to UNIX user 'root' unless a user who is a member of this group is explicitly mapped to a UNIX user. If a Windows user is a member of the "BUILTIN\Administrators" group and an explicit user mapping exists for that user, the explicit name mapping takes precedence. If this parameter is set to false, users that are members of the "BUILTIN\Administrators" group are not mapped to UNIX 'root'. The default value for this parameter is true.
[-is-advertise-dfs-enabled {true|false}] - (DEPRECATED)-Enable DFS Referral Advertisement (privilege: advanced)
This optional parameter specifies whether to advertise DFS referral of the CIFS protocol. The default value for this parameter is false. This option is not applicable to SMB 1.0.

Note: This parameter is deprecated and may be removed in a future release of Data ONTAP. The functionality provided by this parameter is now controlled by the -symlink-properties parameter instead.

[-is-path-component-cache-enabled {true|false}] - Is Path Component Cache Enabled (privilege: advanced)
This optional parameter specifies whether the path component cache is enabled. The default value for this parameter is true.

[-win-name-for-null-user <TextNoCase>] - Map Null User to Windows User or Group (privilege: advanced)
This optional parameter specifies a valid Windows user or group name that will be added to the CIFS credentials for a NULL user Session.

[-is-hide-dotfiles-enabled {true|false}] - Is Hide Dot Files Enabled (privilege: advanced)
This optional parameter specifies whether the CIFS server supports hiding dot files. Directory enumeration with this option enabled hides files and directories that begin with a dot ("."). The default value for this parameter is false.

[-is-client-version-reporting-enabled {true|false}] - Is Client Version Reporting Enabled (privilege: advanced)
If this parameter is set to true, CIFS client version tracking information is collected by AutoSupport. The default value of this parameter is true.

[-is-client-dup-detection-enabled {true|false}] - Is Client Duplicate Session Detection Enabled (privilege: advanced)
This optional parameter specifies whether the CIFS server supports duplicate session detection. Duplicate sessions that come from the same client with VcNumber of zero with this option enabled will be closed, and is only applicable for SMB 1.0 clients. The default value for this parameter is true.

[-grant-unix-group-perms-to-others {true|false}] - Grant UNIX Group Permissions to Others (privilege: advanced)
This optional parameter specifies whether the incoming CIFS user who is not the owner of the file, can be granted the group permission. If the CIFS incoming user is not the owner of UNIX security-style file and this option is set to true, then at all times the file's "group" permissions are granted. If the CIFS incoming user is not the owner of UNIX security-style file and this option is set to false, then the normal UNIX rules are applicable to grant the permissions. The default value of this parameter is false.

[-is-multichannel-enabled {true|false}] - Is Multichannel Enabled (privilege: advanced)
This optional parameter specifies whether the CIFS server supports Multichannel or not. The default value for this parameter is false.

[-max-connections-per-session <integer>] - Maximum Connections Allowed Per Multichannel Session (privilege: advanced)
This optional parameter specifies the maximum number of connections allowed per Multichannel session. The default value for this parameter is 32.

[-max-lifs-per-session <integer>] - Maximum LIFs Advertised Per Multichannel Session (privilege: advanced)
This optional parameter specifies the maximum number of network interfaces advertised per Multichannel session. The default value for this parameter is 256.
[-is-large-mtu-enabled {true|false}] - Is Large MTU Enabled (privilege: advanced)
This optional parameter specifies whether the CIFS server supports the SMB 2.1 "large MTU" feature. The default value for this parameter is false.

[-is-netbios-over-tcp-enabled {true|false}] - Is NetBIOS over TCP (port 139) Enabled (privilege: advanced)
This optional parameter specifies whether the CIFS server supports the NetBIOS over TCP (port 139) feature. The default value for this parameter is true.

[-is-nbns-enabled {true|false}] - Is NBNS over UDP (port 137) Enabled (privilege: advanced)
This optional parameter specifies whether the CIFS server supports the NBNS protocol. The default value for this parameter is false.

[-widelink-as-reparse-point-versions <CIFS Dialects>, ...] - Protocol Versions for Which Widelink Will Be Reported as Reparse Point (privilege: advanced)
This optional parameter specifies the CIFS protocol versions for which the widelink is reported as reparse point. The default value for this parameter is SMB1.

Note: Any values entered for this parameter is replaced with the existing values.

[-max-credits <integer>] - Maximum Credits to Grant (privilege: advanced)
This optional parameter specifies the maximum number of outstanding requests on a CIFS connection. The default value for this parameter is 128.

Examples
The following example modifies CIFS options for the Vserver "vs1". It changes the default UNIX user, disables read grants exec, disables SMB2.x, changes maximum multiplex count to 1124, changes the file system sector size reported to SMB clients to 512, disables the direct-copy offload mechanism for ODX copy offload, enables the UNIX Extensions feature, disables fake open requests changes WINS servers to 192.168.11.112 and changes the client session timeout to 6000.

```
cluster1::> vserver cifs options modify -vserver vs1
-default-unix-user pcuser -read-grants-exec disabled
-smb2-enabled false -max-mpx 1124 -file-system-sector-size 512
-copy-offload-direct-copy-enabled false
-extensions-enabled true -is-fake-open-enabled false
-wins-servers 192.168.11.112 -client-session-timeout 6000
```

The following example modifies CIFS options for the Vserver "vs1". It enables the advanced sparse file support.

```
cluster1::> vserver cifs options modify -vserver vs1
-is-advanced-sparse-file-support-enabled true
```

The following example modifies CIFS options for the Vserver "vs1". It modifies limits for maximum opens on the same file, max sessions by the same user, max tree connects per session, and max watches set.

```
cluster1::> vserver cifs options modify -vserver vs1
-max-same-user-sessions-per-connection 100
-max-same-tree-connect-per-session 100 -max-opens-same-file-per-tree 150
-max-watches-set-per-tree 200
```

The following example modifies CIFS options for the Vserver "vs1". It modifies the option to disable the path component cache.
The following example modifies CIFS options for the Vserver "vs1". It modifies the option to disable CIFS client version tracking.

```
cluster1::> vserver cifs options modify -vserver vs1
   -is-path-component-cache-enabled false
```

The following example modifies CIFS options for the Vserver "vs1". It modifies the option to enable granting of UNIX group permissions to others.

```
cluster1::> vserver cifs options modify -vserver vs1
   -grant-unix-group-perms-to-others true
```

---

**vserver cifs options show**

Display CIFS options

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver cifs options show` command displays the CIFS configuration options for one or more Vservers.

**Parameters**

- `[-fields <fieldname>, ...]`
  
  If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

- `[-instance]`
  
  If you specify the `-instance` parameter, the command displays detailed information about all fields.

- `[-vserver <vserver name>] - Vserver`
  
  If you specify this parameter, the command only displays CIFS options for the specified Vserver.

- `[-default-unix-user <text>] - Default UNIX User`
  
  If you specify this parameter, the command displays options for CIFS server with the specified UNIX user.

- `[-read-grants-exec {enabled|disabled}] - Read Grants Exec for Mode Bits`
  
  If this parameter is set to enabled, the command displays options for CIFS servers that grant execution access when granting read access using mode bits. If set to disabled, the command displays options for CIFS servers that do not grant execution access when granting read access using mode bits.

- `[-wins-servers <InetAddress>, ...] - Windows Internet Name Service (WINS) Addresses`
  
  If you specify this parameter, the command displays CIFS options only for CIFS servers that use the specified Windows Internet Name Server (WINS) addresses.

- `[-smb1-enabled {true|false}] - Enable SMB1 Protocol (privilege: advanced)`
  
  If this parameter is set to true, the command displays options for CIFS servers where SMB 1.0 version of the CIFS protocol is negotiated. If set to false, the command displays options for CIFS servers where SMB 1.0 version of the CIFS protocol is not negotiated.
[-smb2-enabled \(true|false\)]  - Enable all SMB2 Protocols (privilege: advanced)
If this parameter is set to true, the command displays options for CIFS servers where SMB 2 version of the CIFS protocol is negotiated. If set to false, the command displays options for CIFS servers where SMB 2 version of the CIFS protocol is not negotiated.

[-smb3-enabled \(true|false\)]  - Enable SMB3 Protocol (privilege: advanced)
If this parameter is set to true, the command displays options for CIFS servers where SMB 3 version of the CIFS protocol is negotiated. If set to false, the command displays options for CIFS servers where SMB 3 version of the CIFS protocol is not negotiated.

[-smb31-enabled \(true|false\)]  - Enable SMB3.1 Protocol (privilege: advanced)
If this parameter is set to true, the command displays options for CIFS servers where SMB 3.1 version of the CIFS protocol is negotiated. If set to false, the command displays options for CIFS servers where SMB 3.1 version of the CIFS protocol is not negotiated.

[-max-mpx <integer>]  - Maximum Simultaneous Operations per TCP Connection (privilege: advanced)
If you specify this parameter, the command displays options for CIFS server with the specified maximum number of simultaneous operations the CIFS server can process per TCP connection.

[-shadowcopy-dir-depth <integer>]  - Maximum Depth of Directories to Shadow Copy (privilege: advanced)
If you specify this parameter, the command displays options only for CIFS servers that are configured with the specified depth of directories on which to create shadow copies.

[-copy-offload-enabled \(true|false\)]  - Enable Copy Offload Feature (privilege: advanced)
If set to true, this command displays options only for CIFS servers where the Copy Offload feature is enabled. If set to false, options are displayed for CIFS servers where the Copy Offload feature is disabled.

[-is-copy-offload-direct-copy-enabled \(true|false\)]  - Is Direct-copy Copy Offload Mechanism Enabled (privilege: advanced)
If set to true, this command displays options only for CIFS servers where the direct-copy mechanism for ODX Copy Offload is enabled. If set to false, options are displayed for CIFS servers where the direct-copy offload mechanism is disabled.
The direct-copy mechanism increases the performance of the copy offload operation when Windows clients try to open the source file of a copy in a mode that prevents the file being changed while the copy is in progress. If turned off, regular copy offloading takes place.

[-default-unix-group <text>]  - Default UNIX Group
If you specify this parameter, the command displays options for CIFS server with the specified default UNIX group.

[-shadowcopy-enabled \(true|false\)]  - Enable Shadow Copy Feature (VSS) (privilege: advanced)
If set to true, this command displays options only for CIFS servers where the Shadow Copy (VSS) feature is enabled. If set to false, options are displayed for CIFS servers where the Shadow Copy (VSS) feature is disabled.

[-is-referral-enabled \(true|false\)]  - Refer Clients to More Optimal LIFs (privilege: advanced)
If set to true, the command displays options for the CIFS server where the CIFS server automatically refers clients to a data LIF local to the node which hosts the root of the requested share. If set to false, the command displays options for the CIFS server where the mechanism, to automatically refer the clients to data LIF local to the node which hosts the root of the requested share, is disabled.

[-is-local-auth-enabled \(true|false\)]  - Is Local User Authentication Enabled (privilege: advanced)
If this parameter is set to true, the command displays CIFS options only for CIFS servers where local user authentication is enabled. If set to false, the command displays options for CIFS servers where local user authentication is disabled.
[-is-local-users-and-groups-enabled {true|false}] - Is Local Users and Groups Enabled (privilege: advanced)
If this parameter is set to true, the command displays CIFS options only for CIFS servers where the local users
and groups feature is enabled. If set to false, the command displays options for CIFS servers where the local
users and groups feature is disabled.

[-is-use-junctions-as-reparse-points-enabled {true|false}] - Is Reparse Point Support Enabled
(privilege: advanced)
If you specify this parameter, the command only displays CIFS options for Vservers which have the specified
reparse point setting.

[-is-exportpolicy-enabled {true|false}] - Is Export Policies for CIFS Enabled (privilege: advanced)
If you specify this parameter, the command only displays CIFS options for Vservers which have the specified
export policy setting.

[-is-unix-nt-acl-enabled {true|false}] - Is NT ACLs on UNIX Security-style Volumes Enabled (privilege:
advanced)
If this parameter is set to true, the command only displays CIFS options for Vservers that have the NT ACLs
on UNIX security-style volumes enabled. If set to false, the command displays CIFS options for Vservers that
have the NT ACLs on UNIX security-style volumes disabled.

[-is-trusted-domain-enum-search-enabled {true|false}] - Is Enumeration of Trusted Domain and Search
Capability Enabled (privilege: advanced)
If this parameter is set to true, the command displays CIFS options only for CIFS servers that support
enumeration of bidirectional trusted domains and that support searching in all bidirectional trusted domains
when performing Windows user lookups for UNIX user to Windows user name mapping. If set to false, the
command displays options for CIFS servers that do not support enumeration of bidirectional trusted domains.

[-client-session-timeout <integer>] - Idle Timeout Before CIFS Session Disconnect (secs)
If you specify this parameter, the command displays options only for CIFS servers that are configured with the
specified client session timeout value (in seconds).

[-is-dac-enabled {true|false}] - Is Dynamic Access Control (DAC) Enabled (privilege: advanced)
If set to true, this command displays options only for CIFS servers where the Dynamic Access Control (DAC)
feature is enabled. If set to false, options are displayed for CIFS servers where the Dynamic Access Control
(DAC) feature is disabled.

[-restrict-anonymous {no-restriction|no-enumeration|no-access}] - Restrictions for Anonymous User
(privilege: advanced)
If you specify this parameter, the command displays CIFS options only for CIFS servers that have the
specified permitted value for the anonymous user. Permitted values for this option are:

- no-restriction - There is no access restriction for anonymous users.
- no-enumeration - Only enumeration is restricted.
- no-access - Access is restricted for anonymous users.

[-is-read-only-delete-enabled {enabled|disabled}] - Is Deletion of Read-Only Files Enabled
If you specify this parameter, the command displays options only for CIFS servers that have the specified is-
read-only-delete-enabled setting.

[-file-system-sector-size {512|4096} (in bytes))] - Size of File System Sector Reported to SMB Clients
(bytes) (privilege: advanced)
If you specify this parameter, the command displays options only for CIFS servers that are configured with the
specified file system sector size (in bytes).
[\texttt{-is-fake-open-enabled \{true|false\}}] - Is Fake Open Support Enabled (privilege: advanced)

If you set this parameter to true, the command displays options for CIFS servers where fake open is enabled. If set to false, the command displays options for CIFS servers where fake open is disabled.

[\texttt{-is-unix-extensions-enabled \{true|false\}}] - Is UNIX Extensions Enabled (privilege: advanced)

If set to true, this command displays options only for CIFS servers where the UNIX Extensions feature is enabled. If set to false, options are displayed for CIFS servers where the UNIX Extensions feature is disabled. UNIX Extensions allows POSIX/UNIX style security to be displayed through the CIFS protocol.

[\texttt{-is-search-short-names-enabled \{true|false\}}] - Is Search Short Names Support Enabled (privilege: advanced)

If you set this parameter to true, the command displays options for CIFS servers where search short names is enabled. If set to false, the command displays options for CIFS servers where search short names is disabled.

[\texttt{-is-advanced-sparse-file-support-enabled \{true|false\}}] - Is Advanced Sparse File Support Enabled (privilege: advanced)

If set to true, the command displays options for CIFS servers where the advanced sparse file capabilities for CIFS are enabled. If set to false, options are displayed for CIFS servers where the advanced sparse file capabilities for CIFS are disabled.

[\texttt{-is-fsctl-file-level-trim-enabled \{true|false\}}] - Is Fsctl File Level Trim Enabled (privilege: advanced)

If set to true, the command displays options for all the CIFS servers where trim requests (FSCTL_FILE_LEVEL_TRIM) are supported. If set to false, options are displayed for all the CIFS servers where trim requests (FSCTL_FILE_LEVEL_TRIM) are not supported.

[\texttt{-guest-unix-user <text>}] - Map the Guest User to Valid UNIX User (privilege: advanced)

If you specify this parameter, the command displays options for CIFS server with the specified guest UNIX user.

[\texttt{-smb1-max-buffer-size <integer>}] - Maximum Buffer Size Used for SMB1 Message (privilege: advanced)

If you specify this parameter, the command displays options only for CIFS servers that are configured with the specified maximum buffer size value.

[\texttt{-max-same-user-sessions-per-connection <integer>}] - Maximum Same User Sessions per TCP Connection (privilege: advanced)

If you specify this parameter, the command displays options only for CIFS server that are configured with the specified maximum same user session per connection.

[\texttt{-max-same-tree-connect-per-session <integer>}] - Maximum Same Tree Connect per Session (privilege: advanced)

If you specify this parameter, the command displays options only for CIFS server that are configured with the specified maximum same tree connects per session.

[\texttt{-max-opens-same-file-per-tree <integer>}] - Maximum Opens on Same File per Tree (privilege: advanced)

If you specify this parameter, the command displays options only for CIFS server that are configured with the specified maximum opens on same file per tree.

[\texttt{-max-watches-set-per-tree <integer>}] - Maximum Watches Set per Tree (privilege: advanced)

If you specify this parameter, the command displays options only for CIFS server that are configured with the specified maximum watches set per tree. Tree here refers to a share connect from a single client.

[\texttt{-is-admin-users-mapped-to-root-enabled \{true|false\}}] - Map Administrators to UNIX User 'root' (privilege: advanced)

If you set this parameter to true, the command displays options for CIFS servers where members of "BUILTIN\Administrators" group are mapped to UNIX user 'root'. If set to false, the command displays options for CIFS servers where members of the "BUILTIN\Administrators" group are not mapped to UNIX user 'root'.
[-is-advertise-dfs-enabled {true|false}] - (DEPRECATED)-Enable DFS Referral Advertisement (privilege: advanced)

If this parameter is set to true, the command displays CIFS options only for CIFS servers where DFS referral advertisement is enabled. If set to false, the command displays options for CIFS servers where DFS referral advertisement is disabled. This option is not applicable to SMB 1.0.

**Note:** This parameter is deprecated and may be removed in a future release of Data ONTAP. The functionality provided by this parameter is now controlled by the `--symlink-properties` parameter instead.

[-is-path-component-cache-enabled {true|false}] - Is Path Component Cache Enabled (privilege: advanced)

If this parameter is set to true, the command displays options for CIFS servers where the path component cache is enabled. If set to false, the command displays options for CIFS servers where the path component cache is disabled.

[-win-name-for-null-user <TextNoCase>] - Map Null User to Windows User or Group (privilege: advanced)

If you specify this parameter, the command displays options only for CIFS servers that are configured to add the specified windows user or group into CIFS credentials for null sessions.

[-is-hide-dotfiles-enabled {true|false}] - Is Hide Dot Files Enabled (privilege: advanced)

When set to true, this optional parameter enables the Hide Dot Files feature in the CIFS server. If set to false, the Hide Dot Files feature is disabled. The default value for this parameter is false.

[-is-client-version-reporting-enabled {true|false}] - Is Client Version Reporting Enabled (privilege: advanced)

If this parameter is set to true, the command displays options for CIFS servers where CIFS client version tracking is enabled. If set to false, the command displays options for CIFS servers where CIFS client version tracking is disabled.

[-is-client-dup-detection-enabled {true|false}] - Is Client Duplicate Session Detection Enabled (privilege: advanced)

If this parameter is set to true, the command displays options for CIFS servers where client duplicate session detection is enabled. If set to false, the command displays options for CIFS servers where client duplicate session detection is not enabled.

[-grant-unix-group-perms-to-others {true|false}] - Grant UNIX Group Permissions to Others (privilege: advanced)

If this parameter is set to true, the command displays CIFS options only for CIFS servers where grant unix group permissions to others feature is enabled. If set to false, the command displays options for CIFS servers where grant unix group permissions to others feature is disabled.

[-is-multichannel-enabled {true|false}] - Is Multichannel Enabled (privilege: advanced)

If this parameter is set to true, the command displays options for CIFS servers where the multichannel is enabled. If set to false, the command displays options for CIFS servers where the multichannel is disabled.

[-max-connections-per-session <integer>] - Maximum Connections Allowed Per Multichannel Session (privilege: advanced)

If you specify this parameter, the command displays options only for CIFS server that are configured with the specified maximum connections allowed per multichannel session.

[-max-lifs-per-session <integer>] - Maximum LIFs Advertised Per Multichannel Session (privilege: advanced)

If you specify this parameter, the command displays options only for CIFS server that are configured with the specified maximum network interfaces advertised per multichannel session.
[\textbf{-is-large-mtu-enabled (true|false)}] - Is Large MTU Enabled (privilege: advanced)

If you specify this parameter, the command displays options only for CIFS servers that are configured to support the SMB 2.1 "Large MTU" feature.

[\textbf{-is-netbios-over-tcp-enabled (true|false)}] - Is NetBIOS over TCP (port 139) Enabled (privilege: advanced)

If you specify this parameter, the command displays options only for CIFS servers that are configured to support the NetBIOS over TCP (port 139) feature.

[\textbf{-is-nbns-enabled (true|false)}] - Is NBNS over UDP (port 137) Enabled (privilege: advanced)

If you specify this parameter, the command displays options only for CIFS servers that use the specified setting for the NBNS protocol.

[\textbf{-widelink-as-reparse-point-versions <CIFS Dialects>, ...}] - Protocol Versions for Which Widelink Will Be Reported as Reparse Point (privilege: advanced)

If you specify this parameter, the command displays CIFS options only for the CIFS servers that matches the specified CIFS protocol versions for which widelinks are reported as reparse points. If a list is entered, entries are returned that matches all the specified versions.

[\textbf{-max-credits <integer>}] - Maximum Credits to Grant (privilege: advanced)

If you specify this parameter, the command displays options only for CIFS servers that are configured with the specified maximum credits.

\textbf{Examples}

The following example lists CIFS options for a Vserver on the cluster.

\begin{verbatim}
cluster1::> vserver cifs options show
Vserver: vs1
    Client Session Timeout: 900
    Default Unix Group: pcuser
    Default Unix User: pcuser
    Guest Unix User: -
    Read Grants Exec: disabled
    WINS Servers: -
\end{verbatim}

At the advanced level, the output displays the information below.

\begin{verbatim}
cluster1::*> vserver cifs options show
Vserver: vs1
    Client Session Timeout: 900
    Copy Offload Enabled: true
    Default Unix Group: -
    Default Unix User: pcuser
    Guest Unix User: -
    Are Administrators mapped to 'root': true
    Is Advanced Sparse File Support Enabled: true
    Direct-Copy Copy Offload Enabled: true
    Export Policies Enabled: false
    Grant Unix Group Permissions to Others: true
    Is Advertise DFS Enabled: true
    Is Client Duplicate Session Detection Enabled: true
    Is Client Version Reporting Enabled: true
    Is DAC Enabled: false
    Is Fake Open Support Enabled: true
    Is Hide Dot Files Support Enabled: false
    Is Large MTU Enabled: true
    Is Local Auth Enabled: true
    Is Local Users and Groups Enabled: true
    Is Multichannel Enabled: false
    Is NetBIOS over TCP (port 139) Enabled: true
    Is Referral Enabled: false
    Is Search Short Names Support Enabled: false
\end{verbatim}
<table>
<thead>
<tr>

```

vserver cifs commands
vserver cifs security commands

Manage CIFS security settings

vserver cifs security modify

Modify CIFS security settings

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs security modify command modifies CIFS server security settings.

Parameters
-vserver <vserver name> - Vserver
   This parameter specifies the name of the Vserver whose CIFS security settings you want to modify.

[-kerberos-clock-skew <integer>] - Maximum Allowed Kerberos Clock Skew
   This parameter specifies the maximum allowed Kerberos ticket clock skew in minutes. The default is 5 minutes.

[-kerberos-ticket-age <integer>] - Kerberos Ticket Lifetime
   This parameter specifies the Kerberos ticket lifetime in hours. The default is 10 hours.

[-kerberos-renew-age <integer>] - Maximum Kerberos Ticket Renewal Days
   This parameter specifies the maximum Kerberos ticket renewal lifetime in days. The default is 7 days.

[-kerberos-kdc-timeout <integer>] - Timeout for Kerberos KDC Connections (Secs)
   This parameter specifies the timeout for sockets on KDCs after which all KDCs are marked as unreachable. The default is 3 seconds.

[-is-signing-required {true|false}] - Require Signing for Incoming CIFS Traffic
   This parameter specifies whether signing is required for incoming CIFS traffic. The default is false.

[-is-password-complexity-required {true|false}] - Require Password Complexity for Local User Accounts
   This parameter specifies whether password complexity is required for CIFS local users. If this parameter is set to true, password complexity is required. If the value is set to false, password complexity is not required. The default is true for CIFS servers.

[-use-start-tls-for-ad-ldap {true|false}] - Use start_tls for AD LDAP Connections
   This parameter specifies whether to use Start TLS over AD LDAP connections. When enabled, the communication between the Data ONTAP LDAP Client and the LDAP Server will be encrypted using Start TLS. Start TLS is a mechanism to provide secure communication by using the TLS/SSL protocols. If you do not specify this parameter, the default is false.
[-is-aes-encryption-enabled {true|false}] - Is AES-128 and AES-256 Encryption for Kerberos Enabled
This parameter specifies whether to use Kerberos AES-128 and AES-256 encryption types for authentication. When enabled and depending on negotiation with the KDC service, it is possible for authentication operations to utilize these encryption types. If you do not specify this parameter, the default is false.

[-lm-compatibility-level {lm-ntlm-ntlmv2-krb|ntlm-ntlmv2-krb|ntlmv2-krb|krb}] - LM Compatibility Level
This parameter specifies the LM compatibility level. The default is lm-ntlm-ntlmv2-krb (LM, NTLM, NTLMv2 and Kerberos).

[-is-smb-encryption-required {true|false}] - Require SMB Encryption for Incoming CIFS Traffic
This parameter specifies whether SMB encryption is required when accessing shares in the Vserver. When enabled and depending on negotiation during session setup, it is possible that data transfers between the client and the server are made secure by encrypting the SMB traffic. If you do not specify this parameter, the default is false.

[-session-security-for-ad-ldap {none|sign|seal}] - Client Session Security
This parameter specifies the level of security to be used for LDAP communications. If you do not specify this parameter, the default is none.
LDAP Client Session Security can be one of the following:
• none - No Signing or Sealing.
• sign - Sign LDAP traffic.
• seal - Seal and Sign LDAP traffic.

[-smb1-enabled-for-dc-connections {false|true|system-default}] - SMB1 Enabled for DC Connections
This parameter specifies whether SMB1 is enabled for use with connections to domain controllers. If you do not specify this parameter, the default is system-default.
SMB1 Enabled For DC Connections can be one of the following:
• false - SMB1 is not enabled.
• true - SMB1 is enabled.
• system-default - This sets the option to whatever is the default for the release of Data ONTAP that is running. For this release it is: SMB1 is enabled.

[-smb2-enabled-for-dc-connections {false|true|system-default}] - SMB2 Enabled for DC Connections
This parameter specifies whether SMB2 is enabled for use with connections to domain controllers. If you do not specify this parameter, the default is system-default.
SMB2 Enabled For DC Connections can be one of the following:
• false - SMB2 is not enabled.
• true - SMB2 is enabled.
• system-default - This sets the option to whatever is the default for the release of Data ONTAP that is running. For this release it is: SMB2 is enabled.

[-referral-enabled-for-ad-ldap {true|false}] - LDAP Referral Chasing Enabled For AD LDAP Connections
This parameter specifies whether LDAP referral is enabled for AD LDAP connections. If you do not specify this parameter, the default is false.
[-use-ldaps-for-ad-ldap {true|false}] - Use LDAPS for Secure Active Directory LDAP Connections

This parameter specifies whether to use LDAPS over AD LDAP connections. When enabled, the communication between the Data ONTAP LDAP Client and the LDAP Server will be encrypted using LDAPS and port 636 will be used. LDAPS is a mechanism to provide secure communication by using the TLS/SSL protocols and port 636. If you do not specify this parameter, the default is false.

Examples

The following example makes the following changes: the Kerberos clock skew is set to 3 minutes, the Kerberos ticket lifetime to 8 hours and it makes signing required for Vserver "vs1".

```
cluster1::> vserver cifs security modify -vserver vs1 -kerberos-clock-skew 3 -kerberos-ticket-age 8 -is-signing-required true
cluster1::> vserver cifs security show
Vserver: vs1

  Kerberos Clock Skew: 3 minutes
  Kerberos Ticket Age: 8 hours
  Kerberos Renewal Age: 7 days
  Kerberos KDC Timeout: 3 seconds
  Is Signing Required: true
  Is Password Complexity Required: true
  Use start_tls For AD LDAP connection: false
  Is AES Encryption Enabled: false
  LM Compatibility Level: krb
  Is SMB Encryption Required: false
  Client Session Security: none
  SMB1 Enabled For DC Connections: system-default
  SMB2 Enabled For DC Connections: system-default
  LDAP Referral Chasing Enabled For AD LDAP Connections: false
  Use LDAPS for AD LDAP Connections: true
```

vserver cifs security show

Display CIFS security settings

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver cifs security show command displays information about CIFS server security settings.

Parameters

{ [-fields <fieldname>,...]  
  If you specify the -fields parameter, the command only displays the fields that you specify.  
| [ -instance ]  
  If you specify the -instance parameter, the command displays detailed information about all fields.  
[-vserver <vserver name>] - Vserver
  This parameter specifies the name of the Vserver whose CIFS security settings you want to display.}
[-kerberos-clock-skew <integer>] - Maximum Allowed Kerberos Clock Skew
If this parameter is specified, the command displays information only about the security settings that match the specified Kerberos ticket clock skew.

[-kerberos-ticket-age <integer>] - Kerberos Ticket Lifetime
If this parameter is specified, the command displays information only about the security settings that match the specified Kerberos ticket age.

[-kerberos-renew-age <integer>] - Maximum Kerberos Ticket Renewal Days
If this parameter is specified, the command displays information only about the security settings that match the specified Kerberos renewal age.

[-kerberos-kdc-timeout <integer>] - Timeout for Kerberos KDC Connections (Secs)
If this parameter is specified, the command displays information only about the security settings that match the specified Kerberos KDC timeout.

[-realm <text>] - Kerberos Realm
If this parameter is specified, the command displays information only about the security settings that match the specified Kerberos realm.

[-kdc-ip <text>, ...] - KDC IP Address
If this parameter is specified, the command displays information only about the security settings that match the specified KDC IP address.

[-kdc-name <text>, ...] - KDC Name
If this parameter is specified, the command displays information only about the security settings that match the specified KDC name.

[-site <text>, ...] - KDC Site
If this parameter is specified, the command displays information only about the security settings that match the specified Windows site.

[-is-signing-required {true|false}] - Require Signing for Incoming CIFS Traffic
This parameter specifies whether signing is required for incoming CIFS traffic. If this parameter is specified, the command displays information only about the security settings that match the specified value for is-signing-required.

[-is-password-complexity-required {true|false}] - Require Password Complexity for Local User Accounts
If this parameter is set to true, the command displays CIFS security configuration information only for CIFS servers where password complexity for local user accounts is required. If set to false, the command displays security configuration information for CIFS servers where password complexity for local user accounts is not required.

[-use-start-tls-for-ad-ldap {true|false}] - Use start_tls for AD LDAP Connections
If this parameter is set to true, the command displays CIFS security configuration information only for CIFS servers where Start TLS is used for communication with the AD LDAP Server. If set to false, the command displays CIFS security configuration information only for CIFS servers where Start TLS is not used for communication with the AD LDAP Server.

[-is-aes-encryption-enabled {true|false}] - Is AES-128 and AES-256 Encryption for Kerberos Enabled
If this parameter is set to true, the command displays CIFS security configuration information only for CIFS servers where AES-128 and AES-256 encryption types for Kerberos are enabled. If set to false, the command displays security configuration information for CIFS servers where AES-128 and AES-256 encryption types for Kerberos are disabled.

[-lm-compatibility-level {lm-ntlm-ntlmv2-krb|ntlm-ntlmv2-krb|ntlmv2-krb|krb}] - LM Compatibility Level
If this parameter is specified, the command displays information only about the security settings that match the specified LM compatibility level.
[-is-smb-encryption-required {true|false}] - Require SMB Encryption for Incoming CIFS Traffic

If this parameter is set to true, the command displays CIFS security configuration information only for CIFS servers where SMB encryption is required. If set to false, the command displays security configuration information for CIFS servers where SMB encryption is not required.

[-session-security-for-ad-ldap {none|sign|seal}] - Client Session Security

If this parameter is set to seal, the command displays CIFS security configuration information only for CIFS servers where both signing and sealing are required for LDAP communications. If set to sign, the command displays security configuration information for CIFS servers where only signing is required for LDAP communications. If set to none, the command displays security configuration information for CIFS servers where no security is required for LDAP communications.

[-smb1-enabled-for-dc-connections {false|true|system-default}] - SMB1 Enabled for DC Connections

If this parameter is set to true, the command displays CIFS security configuration information only for CIFS servers where SMB1 is enabled for use with connections to domain controllers. If set to false, the command displays security configuration information for CIFS servers where SMB1 is not enabled for use with connections to domain controllers. If set to system-default, the command displays security configuration information for CIFS servers where the system-default setting (SMB1 enabled) is used for connections to domain controllers.

[-smb2-enabled-for-dc-connections {false|true|system-default}] - SMB2 Enabled for DC Connections

If this parameter is set to true, the command displays CIFS security configuration information only for CIFS servers where SMB2 is enabled for use with connections to domain controllers. If set to false, the command displays security configuration information for CIFS servers where SMB2 is not enabled for use with connections to domain controllers. If set to system-default, the command displays security configuration information for CIFS servers where the system-default setting (SMB2 enabled) is used for connections to domain controllers.

[-referral-enabled-for-ad-ldap {true|false}] - LDAP Referral Chasing Enabled For AD LDAP Connections

If this parameter is set to true, the command displays CIFS security configuration information only for CIFS servers where LDAP referral is enabled for AD LDAP connections. If set to false, the command displays security configuration information for CIFS servers where LDAP referral is not enabled for AD LDAP connections.

[-use-ldaps-for-ad-ldap {true|false}] - Use LDAPS for Secure Active Directory LDAP Connections

If this parameter is set to true, the command displays CIFS security configuration information only for CIFS servers where LDAPS is used for communication with the AD LDAP Server. If set to false, the command displays CIFS security configuration information only for CIFS servers where LDAPS is not used for communication with the AD LDAP Server.

Examples

The following example displays CIFS server security settings.

```
cluster1::> vserver cifs security show

Vserver: vs1

Kerberos Clock Skew:               3 minutes
Kerberos Ticket Age:               8 hours
Kerberos Renewal Age:               7 days
Kerberos KDC Timeout:               3 seconds
Is Signing Required:            true
Is Password Complexity Required:            true
Use starttls For AD LDAP connection:           false
Is AES Encryption Enabled:           false
LM Compatibility Level:             krb
Is SMB Encryption Required:           false
Client Session Security:            none
SMB1 Enabled For DC Connections:  system-default
SMB2 Enabled For DC Connections:  system-default
```
LDAP Referral Chasing Enabled For AD LDAP Connections: false
Use LDAPS for AD LDAP Connections: true

The following example displays the Kerberos clock skew for all Vservers.

```
cluster1::> vserver cifs security show -fields kerberos-clock-skew

vserver kerberos-clock-skew
------- -------------------
vs1     5
```

CIFS session Commands

Manage CIFS sessions

The `vserver cifs session` commands are used to manage established CIFS sessions and their attributes.

**vserver cifs session close**

Close an open CIFS session

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**

The `vserver cifs session close` command closes the specified CIFS sessions.

**Parameters**

- **-node `<nodename>`|local** - *Node*
  If you specify this parameter, the command will close all the opened CIFS sessions on the specified node.

- **-vserver `<vserver name>`** - *Vserver*
  If you specify this parameter, the command will close all the opened CIFS sessions on the specified CIFS-enabled Vserver.

- **-session-id `<integer>`** - *Session ID*
  If you specify this parameter, the command will close the open CIFS session that matches the specified session ID.

- **[-connection-id `<integer>`]** - *Connection ID*
  If you specify this parameter, the command will close all the opened CIFS sessions that match the specified connection ID.

- **[-lif-address `<IP Address>`]** - *Incoming Data LIF IP Address*
  If you specify this parameter, the command will close all the opened CIFS sessions that are established through the specified data LIF IP address.

- **[-address `<IP Address>`]** - *Workstation IP address*
  If you specify this parameter, the command will close all the opened CIFS sessions that are opened from the specified IP address.

- **[-auth-mechanism `<Authentication Mechanism>`]** - *Authentication Mechanism*
  If you specify this parameter, the command will close all the opened CIFS sessions that used the specified authentication mechanism. The authentication mechanism can include one of the following:
- NTLMv1 - NTLMv1 authentication mechanism
- NTLMv2 - NTLMv2 authentication mechanism
- Kerberos - Kerberos authentication mechanism
- Anonymous - Anonymous authentication mechanism

\[-windows-user <TextNoCase>] - Windows User
If you specify this parameter, the command will close all the opened CIFS sessions that are established for the specified CIFS user. The acceptable format for CIFS user is [domain\user].

\[-unix-user <text>] - UNIX User
If you specify this parameter, the command will close all the opened CIFS sessions that are established for the specified UNIX user.

\[-protocol-version <CIFS Dialects>] - Protocol Version
If you specify this parameter, the command will close all the opened CIFS sessions that are established over the specified version of CIFS protocol. The protocol version can include one of the following:

- SMB1 - SMB 1.0
- SMB2 - SMB 2.0
- SMB2_1 - SMB 2.1
- SMB3 - SMB 3.0
- SMB3_1 - SMB 3.1

\[-continuously-available <CIFS Open File Protection>] - Continuously Available
If you specify this parameter, the command will close all the opened CIFS sessions with open files that have the specified level of continuously available protection. The open files are "continuously available" if they are opened from an SMB 3 client through a share with the "continuously_available" property set. These open files are capable of non-disruptively recovering from takeover and giveback as well as general aggregate relocation between partners in a high-availability relationship. This is in addition to the traditional SMB 2 capability allowing clients to recover from LIF migration and other brief network interruptions.

**Note:** The CA protection levels depict the continuous availability at the connection level so it might not be accurate for a session if the connection has multiple sessions. Streams opened through a continuously available share are permitted, but are not currently made continuously available. Directories may be opened through a continuously available share, but, by design, will not appear continuously available as clients do not open them that way. These protection levels are applicable to the sessions on read/write volumes residing on storage failover aggregates.

The continuously available status can be one of the following:

- No - The session contains one or more open file but none of them are continuously available.
- Yes - The session contains one or more open files and all of them are continuously available.
- Partial - The session contains at least one continuously available open file but other open files that are not.

\[-is-session-signed (true|false)] - Is Session Signed
If you specify this parameter, the command will close all the opened CIFS sessions that are established with the specified SMB signing option.

\[-smb-encryption-status {unencrypted|encrypted|partially-encrypted}] - SMB Encryption Status
If you specify this parameter, the command will close all the opened CIFS sessions that are established over the specified SMB encryption status.

The SMB encryption status can be one of the following:
• unencrypted - The CIFS session is not encrypted.
• encrypted - The CIFS session is fully encrypted. Vserver level encryption is enabled and encryption happens for the entire session.
• partially-encrypted - The CIFS session is partially encrypted. Share level encryption is enabled and encryption is initiated when the tree-connect occurs.

### Examples
The following example closes all open CIFS sessions on all the nodes with protocol-version SMB2:
```
cluster1::> cifs session close -node * -protocol-version SMB2
2 entries were acted on.
```
The following example closes all open CIFS sessions for all Vservers on node node1:
```
cluster1::> cifs session close -node node1 -vserver *
3 entries were acted on.
```

### vserver cifs session show
Display established CIFS sessions

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver cifs session show` command displays information about established CIFS sessions. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all CIFS sessions:

• Node name
• Vserver name
• CIFS connection ID
• CIFS session ID
• Workstation IP address
• CIFS user name
• CIFS open files
• Session idle time

You can specify additional parameters to display only information that matches those parameters. For example, to display information only about CIFS sessions established on connection ID 2012, run the command with the `-connection-id` parameter set to 2012.

**Parameters**

`{-fields <fieldname>,...}`

If you specify this parameter, the command only displays the fields that you specify.

`{-show-win-unix-creds}`

If you specify this parameter along with a valid session-id, the command displays Windows and UNIX credentials along with the detailed information about matching CIFS sessions.
If you specify this parameter, the command displays detailed information about matching CIFS sessions.

[-node {<nodename>|local}] - Node
If you specify this parameter, the command displays information about the CIFS sessions on the specified node.

[-vserver <vserver name>] - Vserver
If you specify this parameter, the command displays information about CIFS sessions on the specified CIFS-enabled Vserver.

[-session-id <integer>] - Session ID
If you specify this parameter, the command displays information about the CIFS session that match the specified session ID.

[-connection-id <integer>] - Connection ID
If you specify this parameter, the command displays information about CIFS sessions that match the specified connection ID.

[-lif-address <IP Address>] - Incoming Data LIF IP Address
If you specify this parameter, the command displays information about CIFS sessions that are established through the specified data LIF IP address.

[-address <IP Address>] - Workstation IP address
If you specify this parameter, the command displays information about CIFS sessions that are opened from the specified IP address.

[-auth-mechanism <Authentication Mechanism>] - Authentication Mechanism
If you specify this parameter, the command displays information about CIFS sessions that used the specified authentication mechanism. The authentication mechanism can include one of the following:

- None - Could not authenticate
- NTLMv1 - NTLMv1 authentication mechanism
- NTLMv2 - NTLMv2 authentication mechanism
- Kerberos - Kerberos authentication mechanism
- Anonymous - Anonymous authentication mechanism

[-windows-user <TextNoCase>] - Windows User
If you specify this parameter, the command displays information about CIFS sessions that are established for the specified CIFS user. The acceptable format for CIFS user is [domain]\user.

[-unix-user <text>] - UNIX User
If you specify this parameter, the command displays information about CIFS sessions that are established for the specified UNIX user.

[-shares <integer>] - Open Shares
If you specify this parameter, the command displays information about CIFS sessions that have the specified number of CIFS shares opened.

[-files <integer>] - Open Files
If you specify this parameter, the command displays information about CIFS sessions that have the specified number of regular CIFS files opened.

[-other <integer>] - Open Other
If you specify this parameter, the command displays information about CIFS sessions that have the specified number of special CIFS files opened such as streams or directories.
[-connected-time <[<integer>d]<integer>h]<[<integer>m]<integer>s>] - Connected Time
If you specify this parameter, the command displays information about CIFS sessions that are established for the specified time duration.

[-idle-time <[<integer>d]<integer>h]<[<integer>m]<integer>s>] - Idle Time
If you specify this parameter, the command displays information about CIFS sessions on which there is no activity for the specified time duration.

[-protocol-version <CIFS Dialects>] - Protocol Version
If you specify this parameter, the command displays information about CIFS sessions that are established over the specified version of CIFS protocol. The protocol version can include one of the following:
• SMB1 - SMB 1.0
• SMB2 - SMB 2.0
• SMB2_1 - SMB 2.1
• SMB3 - SMB 3.0
• SMB3_1 - SMB 3.1

[-continuously-available <CIFS Open File Protection>] - Continuously Available
If you specify this parameter, the command displays information about CIFS sessions with open files that have the specified level of continuously available protection. The open files are "continuously available" if they are opened from an SMB 3 client through a share with the "continuously_available" property set. These open files are capable of non-disruptively recovering from takeover and giveback as well as general aggregate relocation between partners in a high-availability relationship. This is in addition to the traditional SMB 2 capability allowing clients to recover from LIF migration and other brief network interruptions.

Note: The CA protection levels depict the continuous availability at the connection level so it might not be accurate for a session if the connection has multiple sessions. Streams opened through a continuously available share are permitted, but are not currently made continuously available. Directories may be opened through a continuously available share, but, by design, will not appear continuously available as clients do not open them that way. These protection levels are applicable to the sessions on read/write volumes residing on storage failover aggregates.

The continuously available status can be one of the following:
• No - The session contains one or more open file but none of them are continuously available.
• Yes - The session contains one or more open files and all of them are continuously available.
• Partial - The session contains at least one continuously available open file but other open files that are not.

[-is-session-signed {true|false}] - Is Session Signed
If you specify this parameter, the command displays information about CIFS sessions that are established with the specified SMB signing option.

[-user-type {local-user|domain-user|guest-user|anonymous-user}] - User Authenticated as
If you specify this parameter, the command displays information about CIFS sessions that are established for the specified user type. The user type can include one of the following:
• local-user - Authenticated as a local CIFS user
• domain-user - Authenticated as a domain user
• guest-user - Authenticated as a guest user
• anonymous-user - Authenticated as an anonymous or null user
[\text{-netbios-name <text>}] - NetBIOS Name

If you specify this parameter, the command displays information about CIFS sessions that are established with the specified NetBIOS Name.

[\text{-smb-encryption-status \{unencrypted|encrypted|partially-encrypted\}}] - SMB Encryption Status

If you specify this parameter, the command displays information about CIFS sessions that are established with the specified SMB encryption status.

The SMB encryption status can be one of the following:

- unencrypted - The CIFS session is not encrypted.
- encrypted - The CIFS session is fully encrypted. Vserver level encryption is enabled and encryption happens for the entire session.
- partially-encrypted - The CIFS session is partially encrypted. Share level encryption is enabled and encryption is initiated when the tree-connect occurs.

[\text{-connection-count <integer>}] - Connection Count

If you specify this parameter, the command displays information about CIFS sessions that have the specified number of CIFS connections.

[\text{-is-large-mtu-enabled \{true|false\}}] - Is Large MTU Enabled

If you specify this parameter, the command displays information about CIFS sessions that are established with the specified Large MTU option.

### Examples

The following example displays information about all CIFS sessions:

```bash
cluster1::> vserver cifs session show
Node: node1
Vserver: vs1
Connection Session ID Workstation Windows User Open Files Idle Time Connection Count
---------- ------- ---------------- ---------------- --------- --------------- -----------------
127834     1       172.17.193.172 CIFSIQA\Administrator 2             22s                 4
```

The following example displays information about a CIFS session with session-id 1.

```bash
cluster1::> vserver cifs session show -session-id 1 -instance
Node: node1
Vserver: vs1
Session ID: 1
Connection ID: 127834
Incoming Data LIF IP Address: 10.53.13.224
Workstation: 172.17.193.172
Authentication Mechanism: NTLMv2
Windows User: CIFSIQA\Administrator
UNIX User: root
Open Shares: 2
Open Files: 2
Open Other: 0
Connected Time: 2d 17h 58m 5s
Idle Time: 22s
Protocol Version: SMB3
Continuously Available: No
Is Session Signed: true
User Authenticated as: domain-user
NetBIOS Name: ALIAS1
SMB Encryption Status: encrypted
Connection Count: 4
Windows Unix Credentials: -
```
CIFS session file Commands

Manage opened files over CIFS

The vserver cifs session file commands are used to manage open CIFS files and their attributes.

vserver cifs session file close

Close an open CIFS file

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver cifs session file close command closes the specified open CIFS file.

Parameters

- `-node {<nodename> | local}` - Node
  If you specify this parameter, the command will close all the opened CIFS files on the specified node.

- `-vserver <vserver name>` - Vserver
  If you specify this parameter, the command will close all the opened CIFS files on the specified CIFS-enabled Vserver.

- `-file-id <integer>` - File ID
  If you specify this parameter, the command will close the opened CIFS file that matches the specified file ID.

[[-`connection-id <integer>`] - Connection ID
  If you specify this parameter, the command will close all the opened CIFS files connected on the specified connection ID.

[[-`session-id <integer>`] - Session ID
  If you specify this parameter, the command will close all the opened CIFS files connected on the specified session ID.

Examples

The following example closes all the opened CIFS files that are connected to the data LIFs of Vserver vs1 on the node node1:

```
cluster1::> vserver cifs session file close -node node1 -vserver vs1
5 entries were acted on.
```

The following example closes all the opened CIFS files on all the nodes with the file-id 1:

```
cluster1::> vserver cifs session file close -node * -file-id 1
2 entries were acted on.
```

vserver cifs session file show

Display opened CIFS files

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.
**Description**

The `vserver cifs session file show` command displays information about all open CIFS files. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all open CIFS files:

- Node name
- Vserver name
- CIFS connection ID
- CIFS session ID
- CIFS file ID
- CIFS file type
- CIFS file open mode
- CIFS file hosting volume
- CIFS share name
- CIFS file path
- Continuously available protection level

You can specify additional parameters to display only information that matches those parameters. For example, to display information only about CIFS files opened on connection ID 2012, run the command with the `-connection-id parameter set to 2012`.

**Parameters**

`{ [-fields <fieldname>,...]
 If you specify this parameter, the command only displays the fields that you specify.

| [-instance ]
 If you specify this parameter, the command displays detailed information about matching open CIFS files.

[-node {<nodename>|local}] - Node
 If you specify this parameter, the command displays information about the open CIFS files on the specified node.

[-vserver <vserver name>] - Vserver
 If you specify this parameter, the command displays information about open CIFS files on the specified CIFS-enabled Vserver.

[-file-id <integer>] - File ID
 If you specify this parameter, the command displays information about the open CIFS file that match the specified file ID.

[-connection-id <integer>] - Connection ID
 If you specify this parameter, the command displays information about open CIFS files that are opened on the specified connection ID.

[-session-id <integer>] - Session ID
 If you specify this parameter, the command displays information about the CIFS file that are opened on the specified session ID.

[-connection-count <integer>] - Connection Count
 If you specify this parameter, the command displays information about CIFS files opened through a session that have the specified number of CIFS connections.
[-file-type <CIFS File Type>] - File Type
   If you specify this parameter, the command displays information about opened CIFS files that are of the
   specified file type. The file type can be any of these: Regular, Symlink, Stream, or Directory.

[-open-mode <CIFS Open Mode>] - Open Mode
   If you specify this parameter, the command displays information about CIFS files that are opened with the
   specified mode. The open mode can include one or more of the following:
   • R - This property specifies that the file is opened for read.
   • W - This property specifies that the file is opened for write.
   • D - This property specifies that the file is opened for delete.

   The open mode can have multiple values specified as a list with no commas.

[-hosting-aggregate <aggregate name>] - Aggregate Hosting File
   If you specify this parameter, the command displays information about open CIFS files that reside on the
   specified aggregate.

[-hosting-volume <volume name>] - Volume Hosting File
   If you specify this parameter, the command displays information about open CIFS files that reside on the
   specified volume.

[-share <Share>] - CIFS Share
   If you specify this parameter, the command displays information about CIFS files that are opened over the
   specified CIFS share.

[-path <text>] - Path from CIFS Share
   If you specify this parameter, the command displays information about open CIFS files that match the
   specified CIFS file path.

[-share-mode <CIFS Open Mode>] - Share Mode
   If you specify this parameter, the command displays information about open CIFS files that are opened with
   the specified share mode. The share mode can include one or more of the following:
   • R - This property specifies that the file is shared for read.
   • W - This property specifies that the file is shared for write.
   • D - This property specifies that the file is shared for delete.

   The share mode can have multiple values specified as a list with no commas.

[-range-locks <integer>] - Range Locks
   If you specify this parameter, the command displays information about open CIFS files that have the specified
   number of range locks.

[-continuously-available <CIFS Open File Protection>] - Continuously Available
   If you specify this parameter, the command displays information about open CIFS files with or without
   continuously available protection. The open files are "continuously available" if they are opened from an SMB
   3 client through a share with the "continuously_available" property set. These open files are capable of non-
   disruptively recovering from takeover and giveback as well as general aggregate relocation between partners in
   a high-availability relationship. Streams opened through a continuously available share are permitted, but are
   not currently made continuously available. Directories may be opened through a continuously available share,
   but, by design, will not appear continuously available as clients do not open them that way. These protection
   levels are applicable to the files on read/write volumes residing on storage failover aggregates.

   The continuously available status can be one of the following:
   • No - The open file is not continuously available.
• Yes - The open file is continuously available.

[-reconnected <text>] - Reconnected

If you specify this parameter, the command displays information about open CIFS files that have the specified reconnected state. The reconnected state can be one of the following:

• No - The open file is not reconnected.
• Yes - The open file is reconnected.

**Examples**

The following example displays information about all open CIFS files:

```
cluster1::> vserver cifs session file show
```

<table>
<thead>
<tr>
<th>Node:</th>
<th>node1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vserver:</td>
<td>vs1</td>
</tr>
<tr>
<td>Connection:</td>
<td>2192</td>
</tr>
<tr>
<td>Session:</td>
<td>1</td>
</tr>
<tr>
<td>Connection Count:</td>
<td>4</td>
</tr>
<tr>
<td>File ID</td>
<td>File Type</td>
</tr>
<tr>
<td>---------</td>
<td>------------</td>
</tr>
<tr>
<td>7</td>
<td>Regular</td>
</tr>
<tr>
<td>Path:</td>
<td>\win8b8.txt</td>
</tr>
</tbody>
</table>

The following example displays information about a CIFS file with file-id 7.

```
cluster1::> vserver cifs session file show -file-id 7 -instance
```

<table>
<thead>
<tr>
<th>Node:</th>
<th>node1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vserver:</td>
<td>vs1</td>
</tr>
<tr>
<td>File ID:</td>
<td>7</td>
</tr>
<tr>
<td>Connection ID:</td>
<td>2192</td>
</tr>
<tr>
<td>Session ID:</td>
<td>1</td>
</tr>
<tr>
<td>Connection count:</td>
<td>4</td>
</tr>
<tr>
<td>File Type:</td>
<td>Regular</td>
</tr>
<tr>
<td>Open Mode:</td>
<td>rw</td>
</tr>

<td>Yes</td>
</tr>
<tr>
<td>Reconnected:</td>
<td>No</td>
</tr>
</tbody>
</table>

**Share Commands**

Manage CIFS shares

The vserver cifs share commands are used to manage CIFS shares and their attributes.

**vserver cifs share create**

Create a CIFS share

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The vserver cifs share create command creates a CIFS share.
Parameters

-vserver <vserver name> - Vserver
This parameter specifies the CIFS-enabled Vserver on which you want to create a CIFS share.

-share-name <Share> - Share
This parameter specifies the name of the CIFS share that you want to create. A share name can be up to 256 characters long. If this is a home directory share (designated as such by specifying the homedirectory on the -share-properties parameter), you can include %w (Windows user name), %u (UNIX user name) and %d (Windows domain name) variables in any combination with this parameter to generate shares dynamically, with the resultant share names based on the authenticating user's Windows user name, UNIX user name, and/or Windows domain name. If the share is used by administrators to connect to other users’ home directory (the option is-home-dirs-access-for-admin-enabled is set to true) or by a user to connect to other users’ home directory (the option is-home-dirs-access-for-public-enabled is set to true), the dynamic share pattern must be preceded by a tilde (~).

-path <text> - Path
This parameter specifies the path to the CIFS share. This path must exist in a volume. A directory path name can be up to 256 characters long. If there is a space in the path name, you must enclose the entire string in quotation marks (for example, "/new volume/mount here"). If this is a home directory share as specified by value of home directory on the -share-properties parameter, you can make the path name dynamic by specifying the %w (Windows user name), %u (UNIX user name), or %d (domain name) variables or any of their combination as a part of the value of this parameter.

[-share-properties <share properties>, ...] - Share Properties
This optional parameter specifies a list of properties for the share. The list can include one or more of the following:

• homedirectory - This property specifies that the share and path names are dynamic. Specify this value for a home directory share. In a home directory share, Data ONTAP can dynamically generate the share's name and path by substituting %w, %u, and %d variables with the corresponding Windows user name, UNIX user name, and domain, respectively, specified as the value of the -share-name and -path parameters. For instance, if a dynamic share is defined with a name of %d_%w, a user logged on as barbara from a domain named FIN sees the share as FIN_barbara. Using the homedirectory value specifies that the share and path names are dynamically expanded. This property cannot be added or removed after share creation.

• oplocks - This property specifies that the share uses opportunistic locks, also known as client-side caching. Oplocks are enabled on shares by default; however, some applications do not work well when oplocks are enabled. In particular, database applications such as Microsoft Access are vulnerable to corruption when oplocks are enabled. An advantage of shares is that a single path can be shared multiple times, with each share having different properties. For instance, if a path named /dept/finance contains both a database and other types of files, you can create two shares to it, one with oplocks disabled for safe database access and one with oplocks enabled for client-side caching.

• browsable - This property allows Windows clients to browse the share. This is the default initial property for all shares.

• showsnapshot - This property specifies that Snapshot copies can be viewed and traversed by clients.

• changenotify - This property specifies that the share supports ChangeNotify requests. This is a default initial property for all shares.

• attributecache - This property enables the file attribute caching on the CIFS share in order to provide faster access of attributes over SMB 1.0.

Note: For certain workloads, stale file attribute data could be delivered to a client.
- continuously-available - This property permits SMB clients that support it to open files in a persistent manner. Files opened this way are protected from disruptive events, such as failover and giveback. This option is not supported for FlexGroups or workgroup CIFS servers.

- branchcache - This property specifies that the share allows clients to request BranchCache hashes on the files within this share. This option is useful only if you specify per-share as the operating mode in the CIFS BranchCache configuration, and also specify the "oplocks" share property.

- access-based-enumeration - This property specifies that Access Based Enumeration is enabled on this share. ABE-filtered shared folders are visible to a user based on that individual user's access rights, preventing the display of folders or other shared resources that the user does not have rights to access.

- namespace-caching - This property specifies that the SMB clients connecting to this share can cache the directory enumeration results returned by the CIFS servers.

- encrypt-data - This property specifies that SMB encryption must be used when accessing this share. Clients that do not support encryption will not be able to access this share.

- show-previous-versions - This property specifies that the previous version can be viewed and restored from the client. This property is enabled by default.

```bash
[-symlink-properties {enable|hide|read-only|symlinks|symlinks-and-widelinks|disable},...]
```

**Symlink Properties**

This optional parameter specifies how the storage system presents UNIX symbolic links (symlinks) to CIFS clients. The default value for this parameter is "symlinks". The list can include one or more of the following:

- enable (DEPRECATED*) - This property enables both local symlinks and wide links for read-write access. DFS advertisements are generated for both local symlinks and wide links even if the CIFS option `-is-advertise-dfs-enabled` is set to false.

- hide (DEPRECATED*) - This property hides symlinks. DFS advertisements are generated if the CIFS option `-is-advertise-dfs-enabled` is set to true.

- read-only (DEPRECATED*) - This property enables symlinks for read-only access.

- symlinks - This property enables local symlinks for read-write access. DFS advertisements are not generated even if the CIFS option `-is-advertise-dfs-enabled` is set to true.

- symlinks-and-widelinks – This property enables both local symlinks and wide links for read-write access. DFS advertisements are generated for both local symlinks and wide links even if the CIFS option `-is-advertise-dfs-enabled` is set to false.

- disable - This property disables symlinks and wide links. DFS advertisements are not generated even if the CIFS option `-is-advertise-dfs-enabled` is set to true.

- no-strict-security (OBSOLETE)- This property enables clients to follow symlinks outside share boundaries.

**Note:** *The enable, hide, and read-only parameters are deprecated and may be removed in a future release of Data ONTAP.*

**Note:** The no_strict_security setting does not apply to wide links.

```bash
[-file-umask <Octal Integer>] - File Mode Creation Mask
```

This optional parameter specifies the default UNIX umask for new files created on the share.

```bash
[-dir-umask <Octal Integer>] - Directory Mode Creation Mask
```

This optional parameter specifies the default UNIX umask for new directories created on the share.
[-comment <text>] - Share Comment
This optional parameter specifies a text comment for the share that is made available to Windows clients. The comment can be up to 256 characters long. If there is a space in the descriptive remark or the path, you must enclose the entire string in quotation marks (for example, "This is engineering's share.").

[-attribute-cache-ttl /[<integer>h] /[<integer>m] /[<integer>s]] - File Attribute Cache Lifetime
This optional parameter specifies the lifetime for the attribute cache share property, which you specify as the value of the -share-properties parameter.

Note: This value is useful only if you specify attributecache as a share property.

[-offline-files {none|manual|documents|programs}] - Offline Files
This optional parameter allows Windows clients to cache data on this share. The actual caching behavior depends upon the Windows client. The value can be one of the following:

• none - Disallows Windows clients from caching any files on this share.
• manual - Allows users on Windows clients to manually select files to be cached.
• documents - Allows Windows clients to cache user documents that are used by the user for offline access.
• programs - Allows Windows clients to cache programs that are used by the user for offline access and may use those files in an offline mode even if the share is available.

[-vscan-fileop-profile {no-scan|standard|strict|writes-only}] - Vscan File-Operations Profile
This optional parameter controls which operations trigger virus scans. The value can be one of the following:

• no-scan: Virus scans are never triggered for this share.
• standard: Virus scans can be triggered by open, close, and rename operations. This is the default profile.
• strict: Virus scans can be triggered by open, read, close, and rename operations.
• writes-only: Virus scans can be triggered only when a file that has been modified is closed.

[-max-connections-per-share <integer>] - Maximum Tree Connections on Share
This optional parameter specifies the maximum number of simultaneous connections on the new share. This limit is at the node level, not the Vserver or cluster level. The default for this parameter is 4294967295. The value 4294967295 indicates no limit. The allowed range for this parameter is (1 through 4294967295).

[-force-group-for-create <text>] - UNIX Group for File Create
This optional parameter specifies that all files that CIFS users create in a specific share belong to the same group (also called the "force-group"). The "force-group" must be a predefined group in the UNIX group database. This setting has no effect unless the security style of the volume is UNIX or mixed security style. If "force-group" has been specified for a share, the following becomes true for the share:

• Primary GID of the CIFS users who access this share is temporarily changed to the GID of the "force-group".
• All files in this share that CIFS users create belong to the same "force-group", regardless of the primary GID of the file owner.

Examples
The following example creates a CIFS share named SALES_SHARE on a Vserver named vs1. The path to the share is /sales.

```bash
cluster1::> vserver cifs share create -vserver vs1 -share-name SALES_SHARE -path /sales -symlink-properties enable
```

vserver cifs commands
The following example creates a CIFS share named SALES_SHARE on a Vserver named vs1. The path to the share is /sales and the share uses opportunistic locks (client-side caching), the share can be browsed by Windows clients, and a notification is generated when a change occurs.

```
cluster1::> vserver cifs share create -vserver vs1 -share-name SALES_SHARE -share-properties browsable,changenotify,oplocks, show-previous-versions
```

The following example creates a CIFS share named DOCUMENTS on a Vserver named vs1. The path to the share is /documents and the share uses opportunistic locks (client-side caching), a notification is generated when a change occurs, and the share allows clients to ask for BranchCache hashes for files in the share.

```
cluster1::> vserver cifs share create -vserver vs1 -share-name DOCUMENTS path /documents -share-properties branchcache,changenotify,oplocks
```

The following example creates a CIFS share named DOCUMENTS on a Vserver named vs1. The path to the share is /documents and the share uses opportunistic locks (client-side caching), a notification is generated when a change occurs, and the share allows clients to ask for BranchCache hashes for files in the share.

```
cluster1::> vserver cifs share create -vserver vs1 -share-name DOCUMENTS -path /documents -share-properties branchcache,changenotify,oplocks
```

The following example creates a home directory share on a Vserver named vs1. The path to the share has a %d and %w combination.

```
cluster1::> vserver cifs share create -share-name %d%w -path %d/%w -share-properties homedirectory -vserver vs1
```

The following example creates a home directory share on a Vserver vs1 to be used with the home directory options is-home-dirs-access-for-admin-enabled and/or is-home-dirs-access-for-public-enabled. The path to the share has a %d and %w combination.

```
cluster1::> vserver cifs share create -share-name ~%d~%w -path %d/%w -share-properties homedirectory -vserver vs1
```

### vserver cifs share delete

Delete a CIFS share

**Availability**: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `vserver cifs share delete` command deletes a CIFS share.

**Parameters**

- `-vserver <vserver name>` - Vserver
  
  This parameter specifies the Vserver from which you want to delete a CIFS share.

- `-share-name <Share>` - Share
  
  This parameter specifies the name of the CIFS share you want to delete.

**Examples**
The following example deletes a CIFS share named share1 from a Vserver named vs1.

```
cluster1::> vserver cifs share delete -vserver vs1 -share-name share1
```
vserver cifs share modify

Modify a CIFS share

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver cifs share modify` command modifies a CIFS share.

**Parameters**

- **-vserver <vserver name>** - *Vserver*
  
  This parameter specifies the CIFS-enabled Vserver containing the CIFS share you want to modify.

- **-share-name <Share>** - *Share*
  
  This parameter specifies the name of the CIFS share that you want to create. A share name can be up to 256 characters long. If this is a home directory share (designated as such by specifying the `homedirectory` on the `-share-properties` parameter), you can include %w (Windows user name), %u (UNIX user name) and %d (Windows domain name) variables in any combination with this parameter to generate shares dynamically, with the resultant share names based on the authenticating user's Windows user name, UNIX user name, and/or Windows domain name.

- **[-path <text>]** - *Path*
  
  This parameter specifies the path to the CIFS share. This path must exist in a volume. A directory path name can be up to 256 characters long. If there is a space in the path name, you must enclose the entire string in quotation marks (for example, "/new volume/mount here"). If this is a homedirectory share as specified by value of home directory on the `-share-properties` parameter, a dynamic path name must be specified using %w (Windows user name), %u (UNIX user name), or %d (domain name) variables or any of their combination as a part of the value of this parameter. If this is a continuously-available share as specified by value of continuously-available on the `-share-properties` parameter, the path must not be within a FlexGroup because this property is not supported for FlexGroups.

- **[-symlink-properties {enable|hide|read-only|symlinks|symlinks-and-widelinks|disable}, ...]** - *Symlink Properties*
  
  This optional parameter specifies how the storage system presents UNIX symbolic links (symlinks) to CIFS clients. The list can include one or more of the following:

  - **enable (DEPRECATED*)** - This property enables both local symlinks and wide links for read-write access. DFS advertisements are generated for both local symlinks and wide links even if the CIFS option `-is-advertise-dfs-enabled` is set to false.
  - **hide (DEPRECATED*)** - This property hides symlinks. DFS advertisements are generated if the CIFS option `-is-advertise-dfs-enabled` is set to true.
  - **read-only (DEPRECATED*)** - This property enables symlinks for read-only access.
  - **symlinks** - This property enables local symlinks for read-write access. DFS advertisements are not generated even if the CIFS option `-is-advertise-dfs-enabled` is set to true.
  - **symlinks-and-widelinks** - This property enables both local symlinks and wide links for read-write access. DFS advertisements are generated for both local symlinks and wide links even if the CIFS option `-is-advertise-dfs-enabled` is set to false.
  - **disable** - This property disables symlinks and wide links. DFS advertisements are not generated even if the CIFS option `-is-advertise-dfs-enabled` is set to true.
  - **no-strict-security (OBSOLETE)** - This property enables clients to follow symlinks outside share boundaries.
Note: The read_only setting does not apply to wide links.

Note: * The enable, hide, and read-only parameters are deprecated and may be removed in a future release of Data ONTAP.

Note: The no_strict_security setting does not apply to wide links.

[-file-umask <Octal Integer>] - File Mode Creation Mask
This optional parameter specifies the default UNIX umask for new files created on the share.

[-dir-umask <Octal Integer>] - Directory Mode Creation Mask
This optional parameter specifies the default UNIX umask for new directories created on the share.

[-comment <text>] - Share Comment
This optional parameter specifies a text comment for the share that is made available to Windows clients. The comment can be up to 256 characters long. If there is a space in the descriptive remark or the path, you must enclose the entire string in quotation marks (for example, "This is engineering's share.").

[-attribute-cache-ttl /[<integer>h][<integer>m][<integer>s]] - File Attribute Cache Lifetime
This optional parameter specifies the lifetime for the attribute cache share property, which you specify as the value of the -share-properties parameter.

Note: This value is useful only if you specify attributecache as a share property.

[-offline-files {none|manual|documents|programs}] - Offline Files
This optional parameter allows Windows clients to cache data on this share. The actual caching behavior depends upon the Windows client. The value can be one of the following:

• none - Disallows Windows clients from caching any files on this share.
• manual - Allows users on Windows clients to manually select files to be cached.
• documents - Allows Windows clients to cache user documents that are used by the user for offline access.
• programs - Allows Windows clients to cache programs that are used by the user for offline access and may use those files in an offline mode even if the share is available.

[-vscan-fileop-profile {no-scan|standard|strict|writes-only}] - Vscan File-Operations Profile
This optional parameter controls which operations trigger virus scans. The value can be one of the following:

• no-scan: Virus scans are never triggered for this share.
• standard: Virus scans can be triggered by open, close, and rename operations. This is the default profile.
• strict: Virus scans can be triggered by open, read, close, and rename operations.
• writes-only: Virus scans can be triggered only when a file that has been modified is closed.

[-max-connections-per-share <integer>] - Maximum Tree Connections on Share
This optional parameter specifies a maximum number of simultaneous connections to the share. This limit is at the node level, not the Vserver or cluster level. The default for this parameter is 4294967295. The value 4294967295 indicates no limit. The allowed range for this parameter is (1 through 4294967295).

[-force-group-for-create <text>] - UNIX Group for File Create
This optional parameter specifies that all files that CIFS users create in a specific share belong to the same group (also called the "force-group"). The "force-group" must be a predefined group in the UNIX group database. This setting has no effect unless the security style of the volume is UNIX or mixed security style. You can disable this option by passing a null string ".".
Examples

The following example modifies a CIFS share named SALES_SHARE on a Vserver named vs1. The share uses opportunistic locks. The file mask is set to 644 and the directory mask to 777.

```
cluster1::> vserver cifs share modify -vserver vs1 -share-name SALES_SHARE -symlink-properties hide -file-umask 644 -dir-umask 777
```

The following example modifies a CIFS share named SALES_SHARE on a Vserver named vs1. The path to the share is /sales and the share uses opportunistic locks (client-side caching), the share can be browsed by Windows clients, and a notification is not generated when a change occurs.

```
cluster1::> vserver cifs share modify -vserver vs1 -share-name SALES_SHARE -path /sales -share-properties oplocks,browsable
```

The following example modifies a CIFS share named DOCUMENTS on a Vserver named vs1. The share uses opportunistic locks (client-side caching), a notification is generated when a change occurs, and the share allows clients to ask for BranchCache hashes for files in the share.

```
cluster1::> vserver cifs share modify -vserver vs1 -share-name DOCUMENTS -share-properties branchcache,changenotify,oplocks
```

The following example modifies a CIFS share named DOCUMENTS on a Vserver named vs1. The share uses opportunistic locks (client-side caching), a notification is generated when a change occurs, and the share allows clients to cache (client-side caching) user documents on this share.

```
cluster1::> vserver cifs share modify -vserver vs1 -share-name DOCUMENTS -share-properties changenotify,oplocks -offline-files documents
```

The following example modifies a CIFS share named DOCUMENTS on a Vserver named vs1. The optional parameter "force-group-for-create" can be disabled by passing the null string as parameter to "force-group-for-create" option.

```
cluster1::> cifs share modify -vserver vs1 -share-name DOCUMENTS -force-group-for-create ""
```

The following example modifies the symlink property of all the shares on all the Vserver to "enable".

```
cluster1::> vserver cifs share modify -vserver * -share-name * -symlink-properties enable
```

vserver cifs share show

Display CIFS shares

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver cifs share show command displays information about CIFS shares. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all CIFS shares:

- Vserver name
- CIFS share name
- Path
- Share properties
- Comment
You can specify additional parameters to display only information that matches those parameters. For example, to display information only about CIFS shares that use dynamic shares, run the command with the `-share-properties dynamicshare` parameter.

**Parameters**

A. `-fields <fieldname>,...`

If you specify this parameter, the command only displays the fields that you specify.

B. `[-shadowcopy]`

If you specify this parameter, the command displays information only about CIFS shadow copy shares.

C. `[-umask]`

If you specify this parameter, the command displays file and directory masks for CIFS shares.

D. `[-instance]`

If you specify this parameter, the command displays detailed information about all CIFS shares.

E. `[-vserver <vserver name>] - Vserver`

If you specify this parameter, the command displays information only about CIFS shares on the specified CIFS-enabled Vserver.

F. `[-share-name <Share>] - Share`

If you specify this parameter, the command displays information only about the CIFS share or shares that match the specified name.

G. `[-cifs-server <NetBIOS>] - CIFS Server NetBIOS Name`

If you specify this parameter, the command displays information only about the CIFS share or shares that use the CIFS-enabled Vserver with the specified CIFS server name.

H. `[-path <text>] - Path`

If you specify this parameter, the command displays information only about the CIFS share or shares that have the specified path.

I. `[-share-properties <share properties>,...] - Share Properties`

If you specify this parameter, the command displays information only about the CIFS share or shares that have the specified share properties.

J. `[-symlink-properties {enable|hide|read-only|symlinks|symlinks-and-widelinks|disable},...] - Symlink Properties`

If you specify this parameter, the command displays information only about the CIFS share or shares that have the specified symbolic link properties.

K. `[-file-umask <Octal Integer>] - File Mode Creation Mask`

If you specify this parameter, the command displays information only about the CIFS share or shares that use the specified file mask.

L. `[-dir-umask <Octal Integer>] - Directory Mode Creation Mask`

If you specify this parameter, the command displays information only about the CIFS share or shares that use the specified directory mask.

M. `[-comment <text>] - Share Comment`

If you specify this parameter, the command displays information only about the CIFS share or shares that have the specified comment.

N. `[-acl <text>,...] - Share ACL`

If you specify this parameter, the command displays information only about the CIFS share or shares that have the specified ACL.
File Attribute Cache Lifetime
If you specify this parameter, the command displays information only about the CIFS share or shares that have the specified attribute-cache-ttl for attribute cache.

Volume Name
If you specify this parameter, the command displays information only about the CIFS shares that are present in this volume.

Offline Files {none|manual|documents|programs}
If you specify this parameter, the command displays information only about the CIFS shares that have the specified Offline Files properties.

Vscan File-Operations Profile {no-scan|standard|strict|writes-only}
If you specify this parameter, the command displays information only about the CIFS shares that have the specified Vscan fileop profile.

Maximum Tree Connections on Share
If you specify this parameter, the command displays information only about the CIFS shares that have the specified maximum connections per share configured.

UNIX Group for File Create
This optional parameter displays information about the CIFS shares that have the specified "force-group" parameter configured.

Examples
The following example displays information about all CIFS shares:

```
cluster1::> vserver cifs share show
Vserver    Share     Path              Properties    Comment    ACL
------------ ------------- ----------------- ---------- -------- -----------
vs1         ROOTSHARE /                  oplocks      -         CNC \ Everyone / Full Control
            browsable changenoti to top of Vserver global namespac e
            sy

4 entries were displayed.
```

The following example displays information about a CIFS share named SALES_SHARE on a Vserver named vs1.

```
cluster1::> vserver cifs share show -vserver vs1 -share-name SALES_SHARE
Vserver: vs1
Share: SALES_SHARE
CIFS Server NetBIOS Name: WINDATA
Path: /sales
Share Properties: oplocks browsable
Symlink Properties: enable
File Mode Creation Mask: -
Directory Mode Creation Mask: -
Share Comment: -
Share ACL: Everyone / Full Control
File Attribute Cache Lifetime: -
Offline Files: manual
Vacan File-Operations Profile: standard
```
vserver cifs share access-control commands

The access-control directory

vserver cifs share access-control create

Create an access control list

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs share access-control create command adds a user or group to a CIFS share's ACL.

Parameters
-vserver <vserver name> - Vserver
This parameter specifies the name of the Vserver containing the CIFS share.

-share <share> - Share Name
This parameter specifies the name of the CIFS share.

-user-or-group <TextNoCase> - User/Group Name
This parameter specifies the user or group to add to the CIFS share's access control list. If you specify the user name, you must include the user's domain using the format "domain\username". The user-or-group parameter is case-insensitive text.

[-user-group-type {windows|unix-user|unix-group}] - User or Group Type
This parameter specifies the type of the user or group to add to the CIFS share's access control list. The default type is windows. The user-group-type can be one of the following:
- windows
- unix-user
- unix-group

-permission <access rights> - Access Type
This parameter specifies the permissions for the user or group. The permissions can be one of the following:
- No_access
- Read
- Change
- Full_Control

Examples
The following example adds the windows group "Everyone" with "Full_Control" permission to the access control list of the share "vol3".

    val::> vserver cifs share access-control create -share vol3 -user-or-group Everyone -user-group-type windows -permission Full_Control

The following example adds the unix-user "pcuser" and unix-group "daemon" with "read" permission to the access control list of the share "vol3".

    val::> vserver cifs share access-control create -share vol3 -user-or-group pcuser -user-group-type unix-user -permission Read
    val::> vserver cifs share access-control create -share vol3 -user-or-group daemon -user-group-type unix-group -permission Read
vserver cifs share access-control delete

Delete an access control list

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs share access-control delete command deletes a user or group from a CIFS share's ACL.

Parameters
-vserver <vserver name> - Vserver
This parameter specifies the name of the Vserver containing the CIFS share.

-share <Share> - Share Name
This parameter specifies the name of the CIFS share.

-user-or-group <TextNoCase> - User/Group Name
This parameter specifies the user or group to delete from the CIFS share's access control list. If you specify a user name, you must include the user's domain using the format "domain\username". The user-or-group parameter is case-insensitive text.

[-user-group-type {windows|unix-user|unix-group}] - User or Group Type
This parameter specifies the type of the user or group to delete from the CIFS share's access control list. The default type is windows. The user-group-type can be one of the following:

- windows
- unix-user
- unix-group

Examples
The following example deletes the group "Everyone" for the access control list of share "vol3".

vsl::> vserver cifs share access-control delete -share vol3 -user-or-group Everyone

vserver cifs share access-control modify

Modify an access control list

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs share access-control modify command modifies the permissions of a user or group in a CIFS share's ACL.
Parameters

-vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver containing the CIFS share whose ACL you want to modify.

-share <Share> - Share Name

This parameter specifies the name of the CIFS share whose ACL you want to modify.

-user-or-group <TextNoCase> - User/Group Name

This parameter specifies the user or group to modify. If you specify the user name, you must include the user's domain using the format “domain\username”. The user-or-group parameter is case-insensitive text.

[-user-group-type {windows|unix-user|unix-group}] - User or Group Type

This parameter specifies the type of the user or group to modify. The default type is windows. The user-group-type can be one of the following:

• windows
• unix-user
• unix-group

[-permission <access rights>] - Access Type

This parameter specifies the permissions for the user or group. The permissions can be one of the following:

• No_access
• Read
• Change
• Full_Control

Examples

The following example modifies the access control list for a share named "vol3". It changes the permission for the windows group "Everyone" to "Full_Control".

```
vs1::*> vserver cifs share access-control modify -share vol3 -user-or-group Everyone -user-group-type windows -permission Full_Control
```

The following example modifies the access control list for a share named "vol3". It changes the permission for the unix-user “pcuser” and unix-group “daemon” to "change".

```
vs1::> vserver cifs share access-control modify -share vol3 -user-or-group pcuser -user-group-type unix-user -permission change
total: 20
vs1::> vserver cifs share access-control modify -share vol3 -user-or-group daemon -user-group-type unix-group -permission change
```

vserver cifs share access-control show

Display access control lists on CIFS shares

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver cifs share access-control show command displays the ACLs of CIFS shares.
Parameters

{ [-fields <fieldname>, ...]  
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.  
  
  [-instance ]  
  If you specify the -instance parameter, the command displays detailed information about all fields.  
  
  [-vserver <vserver name>] - Vserver  
  This optional parameter specifies the name of the Vserver containing the share for which you want to display the access control list.  
  
  [-share <Share>] - Share Name  
  This optional parameter specifies the name of the CIFS share for which you want to display the access control list.  
  
  [-user-or-group <TextNoCase>] - User/Group Name  
  If you specify this optional parameter, the command displays only access control lists for the CIFS shares that have ACLs matching the specified user or group.  
  
  [-user-group-type {windows|unix-user|unix-group}] - User or Group Type  
  If you specify this optional parameter, the command displays only access control lists for the CIFS shares that have ACLs matching the specified user-group-type. The user-group-type can be one of the following:  
  • windows  
  • unix-user  
  • unix-group  
  
  [-permission <access rights>] - Access Type  
  If you specify this optional parameter, the command displays only access control lists for the CIFS shares that have ACLs matching the specified permission. The permissions can be one of the following:  
  • No_access  
  • Read  
  • Change  
  • Full_Control  
  
  [-winsid <windows sid>] - Windows SID  
  If you specify this optional parameter, the command displays only access control lists for the CIFS shares that have ACLs matching the specified Windows SID.  
  
  [-access-mask <Hex Integer>] - Access mask  
  If you specify this optional parameter, the command displays only access control lists for the CIFS shares that have ACLs matching the specified access rights.

Examples

The following example displays all the ACLs for shares in Vserver vs1.

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Share</th>
<th>User/Group</th>
<th>User/Group Type</th>
<th>Access Permission</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>
<td>vol3</td>

<td>Full_Control</td>
</tr>
</tbody>
</table>

vserver cifs commands
vserver cifs share properties commands

Manage share properties

vserver cifs share properties add

Add to the list of share properties

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The `vserver cifs share properties add` command adds share properties to the list of share properties of an existing CIFS share. You can add one or more share properties. You can add additional share properties at any time by rerunning this command. Any share properties that you have previously specified will remain in effect and newly added properties are appended to the existing list of share properties.

Parameters

-vserver <vserver name> - Vserver
This parameter specifies the name of the Vserver containing the CIFS share whose share properties you want to add.

-share-name <Share> - Share
This parameter specifies the name of the CIFS share.

-share-properties <share properties>, ... - Share Properties
This parameter specifies the list of share properties you want to add to the CIFS share. The share properties can be one or more of the following:

• oplocks - This property specifies that the share uses opportunistic locks, also known as client-side caching. This is a default initial property for all shares; however, some applications do not work well when oplocks are enabled. In particular, database applications such as Microsoft Access are vulnerable to corruption when oplocks are enabled. An advantage of shares is that a single path can be shared multiple times, with each share having different properties. For instance, if a path named /dept/finance contains both a database and other types of files, you can create two shares to it, one with oplocks disabled for safe database access and one with oplocks enabled for client-side caching.

• browsable - This property allows Windows clients to browse the share. This is a default initial property for all shares.

• showsnapshot - This property specifies that Snapshot copies can be viewed and traversed by clients.

• changenotify - This property specifies that the share supports ChangeNotify requests. This is a default initial property for all shares.

• attributecache - This property enables the file attribute caching on the CIFS share in order to provide faster access of attributes over SMB 1.0.

   Note: For certain workloads, stale file attribute data could be delivered to a client.

• continuously-available - This property permits SMB clients that support it to open files in a persistent manner. Files opened this way are protected from disruptive events, such as failover and giveback. This option is not supported for FlexGroups or workgroup CIFS servers.
• branchcache - This property specifies that the share allows clients to request BranchCache hashes on the files within this share. This option is useful only if you specify "per-share" as the operating mode in the CIFS BranchCache configuration, and also specify the "oplocks" share property.

• access-based-enumeration - This property specifies that Access Based Enumeration(ABE) is enabled on this share. ABE-filtered shared folders are visible to a user based on that individual user's access rights, preventing the display of folders or other shared resources that the user does not have rights to access.

• namespace-caching - This property specifies that the SMB clients connecting to this share can cache the directory enumeration results returned by the CIFS servers.

• encrypt-data - This property specifies that SMB encryption must be used when accessing this share. Clients that do not support encryption will not be able to access this share.

• show-previous-versions - This property specifies that the previous version can be viewed and restored from the client. This property is enabled by default.

Note: The oplock, browsable, changenotify and show-previous-versions share properties are assigned to a share by default. If you have removed them from a share, you can use the vserver cifs share properties add command to add these properties to the share.

Examples
The following example adds the "showsnapshot" and "changenotify" properties to a share named "sh1".

    cluster1::> vserver cifs share properties add -vserver vs1 -share-name sh1 -share-properties showsnapshot,changenotify

vserver cifs share properties remove
Remove from the list of share properties

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs share properties remove command removes share properties from the list of share properties of an existing CIFS share. You can remove one or more share properties. You can remove additional share properties at any time by rerunning this command. Any existing share properties that you do not remove remain in effect.

Parameters
-vserver <vserver name> - Vserver
This parameter specifies the name of the Vserver containing the CIFS share whose share properties you want to remove.

-share-name <Share> - Share
This parameter specifies the name of the CIFS share.

-share-properties <share properties>, ... - Share Properties
This parameter specifies the list of share properties you want to remove from the CIFS share. The share properties can be one or more of the following:

• oplocks - This property specifies that the share uses opportunistic locks, also known as client-side caching. Oplocks are enabled on shares by default; however, some applications do not work well when oplocks are enabled. In particular, database applications such as Microsoft Access are vulnerable to corruption when oplocks are enabled. An advantage of shares is that a single path can be shared multiple times, with each share having different properties. For instance, if a path named /dept/finance contains both a database
and other types of files, you can create two shares to it, one with oplocks disabled for safe database access and one with oplocks enabled for client-side caching.

- **browsable** - This property allows Windows clients to browse the share.
- **showsnapshot** - This property specifies that Snapshot copies can be viewed and traversed by clients.
- **changenotify** - This property specifies that the share supports ChangeNotify requests. This is a default initial property for all shares.
- **attributecache** - This property enables the file attribute caching on the CIFS share in order to provide faster access of attributes over SMB 1.0.
  
  **Note:** For certain workloads, stale file attribute data could be delivered to a client.

- **continuously-available** - This property permits SMB clients that support it to open files in a persistent manner. Files opened this way are protected from disruptive events, such as failover and giveback. This option is not supported for FlexGroups or workgroup CIFS servers.
- **branchcache** - This property specifies that the share allows clients to request BranchCache hashes on the files within this share. This option is useful only if you specify "per-share" as the operating mode in the CIFS BranchCache configuration, and also specify the "oplocks" share property.
- **access-based-enumeration** - This property specifies that Access Based Enumeration (ABE) is enabled on this share. ABE-filtered shared folders are visible to a user based on that individual user's access rights, preventing the display of folders or other shared resources that the user does not have rights to access.
- **namespace-caching** - This property specifies that the SMB clients connecting to this share can cache the directory enumeration results returned by the CIFS servers.
- **encrypt-data** - This property specifies that SMB encryption must be used when accessing this share. Clients that do not support encryption will not be able to access this share.
- **show-previous-versions** - This property specifies that the previous version can be viewed and restored from the client. This property is enabled by default.

### Examples

The following example removes "showsnapshot" and "changenotify" properties to a share named "sh1".

```
cluster1::> vserver cifs share properties remove -vserver vs1 -share-name sh1 -share-properties showsnapshot,changenotify
```

### vserver cifs share properties show

Display share properties

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver cifs share properties show` command displays the CIFS share properties.

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.
If you specify the `--instance` parameter, the command displays detailed information about all fields.

`--vserver <vserver name>` - Vserver

This optional parameter specifies the name of the Vserver containing the CIFS share for which you want to display share properties.

`--share-name <Share>` - Share

If you specify this parameter, the command displays share properties only for the CIFS share that you specify.

`--share-properties <share properties>, ...` - Share Properties

If you specify this parameter, the command displays share properties only for CIFS shares using the properties you specify. The share properties can be one or more of the following:

- `homedirectory` - This property specifies that the share and path names are dynamic. Specify this value for a home directory share. In a home directory share, the share's name and path can be generated by substituting `%w` and `%d` variables with the corresponding user's name and domain, respectively, specified as the value of the `--share-name` and `--path` parameters. For instance, if a dynamic share is defined with a name of `%d_%w`, a user logged on as `barbara` from a domain named `FIN` sees the share as `FIN_barbara`.

- `oplocks` - This property specifies that the share uses opportunistic locks, also known as client-side caching.

- `Browsable` - This property allows Windows clients to browse the share.

- `showsnapshot` - This property specifies that Snapshot copies can be viewed and traversed by clients.

- `changenotify` - This property specifies that the share supports Change Notify requests.

- `attributecache` - This property enables the file attribute caching on the CIFS share in order to provide faster access of attributes over SMB 1.0.

  **Note:** For certain workloads, stale file attribute data could be delivered to a client.

- `continuously-available` - This property permits SMB clients that support it to open files in a persistent manner. Files opened this way are protected from disruptive events, such as failover and giveback. This attribute is not supported for FlexGroups and workgroup CIFS servers.

- `branchcache` - This property specifies that the share allows clients to request BranchCache hashes on the files within this share. This option is useful only if you specify "per-share" as the operating mode in the CIFS BranchCache configuration, and also specify the "oplocks" share property.

- `shadowcopy` - This property specifies that the share is pointing to a shadow copy. This attribute cannot be added nor removed from a share.

- `access-based-creation` - This property specifies that Access Based Enumeration is enabled on this share. ABE-filtered shared folders are visible to a user based on that individual user's access rights, preventing the display of folders or other shared resources that the user does not have rights to access.

- `namespace-caching` - This property specifies that the SMB clients connecting to this share can cache the directory enumeration results returned by the CIFS servers.

- `encrypt-data` - This property specifies that SMB encryption must be used when accessing this share. Clients that do not support encryption will not be able to access this share.

- `show-previous-versions` - This property specifies that the previous version can be viewed and restored from the client. This property is enabled by default.

**Examples**
The following example displays share properties for shares in Vserver vs1.
vserver cifs superuser commands

(DEPRECATED) Manage superuser permissions on CIFS accounts

vserver cifs superuser create

Adds superuser permissions to a CIFS account

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The `vserver cifs superuser create` command elevates the privileges of the specified domain account in this Vserver to superuser. With superuser privileges, Data ONTAP bypasses some of the security checks. This command is not supported for workgroup CIFS servers.

Parameters
- `-vserver <vserver name>` - Vserver
  Vserver name.
- `-domain <CIFS domain>` - Domain
  The domain name of accountname.
- `-accountname <CIFS account>` - User
  The domain account to which you want to give superuser privileges.

Examples
The following example shows how to elevate ExampleUser in EXAMPLE domain to superuser for a Vserver vs1.

```
vs1::> vserver cifs superuser create -domain EXAMPLE -accountname ExampleUser -vserver vs1
```

vserver cifs superuser delete

Deletes superuser permissions from a CIFS account

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The `vserver cifs superuser delete` command removes the superuser privileges for the specified domain account in this Vserver. With superuser privileges, Data ONTAP bypasses some of the security checks.
Parameters
-vserver <vserver name> - Vserver
Vserver name.
-domain <CIFS domain> - Domain
The domain name of accountname.
-accountname <CIFS account> - User
The domain account name you want to remove superuser privileges.

Examples
The following example shows how to remove superuser privileges for ExampleUser in EXAMPLE domain for a Vserver vs1.

    vs1::> vserver cifs superuser delete -domain EXAMPLE -accountname ExampleUser -vserver vs1

vserver cifs superuser show
Display superuser permissions for CIFS accounts

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The vserver cifs superuser show command displays all account names with superuser privileges. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following superuser information for all CIFS servers:

- Vserver name
- CIFS server NetBIOS name
- Domain
- Account Name

Parameters
[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver
If you specify this parameter, the command displays superuser information of only the specified Vservers.

[-domain <CIFS domain>] - Domain
If you specify this parameter, the command displays superuser information of only for accounts that are in the specified domain.

[-accountname <CIFS account>] - User
If you specify this parameter, the command displays superuser information of only the CIFS servers with the specified superuser account.
[-cifs-server <NetBIOS>] - CIFS Server NetBIOS Name

If you specify this parameter, the command displays superuser information of only the Vservers with specified CIFS server name.

Examples

The following example displays superuser information of all Vservers.

```
vs1::> vserver cifs superuser show
Vserver        CIFS Server     Domain          Account Name
-------------- --------------- --------------- ------------
vs1            SMB_SERVER1     CIFSDOMAIN      ADMINISTRATOR
vs2            SMB_SERVER2     CIFSDOMAIN      ADMINISTRATOR
```

vserver cifs symlink commands

Manage symbolic and wide links

vserver cifs symlink create

Create a symlink path mapping

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver cifs symlink create command creates a symbolic link mapping for CIFS. A mapping consists of a Vserver name, a UNIX (NFS) path, a CIFS share name, and a CIFS path. You can also specify a CIFS server name and whether the CIFS symbolic link is a local link, a free link (obsolete), or wide link. A local symbolic link maps to the local CIFS share. A free symbolic link can map anywhere on the local server. A wide symbolic link maps to any CIFS share on the network. If the target share is a Home Directory, then the -home-directory field must be set to true for correct processing.

Parameters

- -vserver <vserver name> - Vserver
  This parameter specifies the Vserver on which you want to create the mapping.
- -unix-path <text> - UNIX Path
  This parameter specifies the UNIX (NFS) path for the mapping.
  Note: It must begin and end with a forward slash (/).
- [-share-name <Share>] - CIFS Share
  This parameter specifies the CIFS share for the mapping.
- [-cifs-path <TextNoCase>] - CIFS Path
  This parameter specifies the CIFS path for the mapping. Note that this value is specified by using a UNIX-style path.
  Note: It must begin and end with a forward slash (/).
- [-cifs-server <TextNoCase>] - Remote NetBIOS Server Name
  This parameter specifies a new CIFS server DNS name, IP address, or NetBIOS name for the mapping.
- [-locality (local|widelink)] - Local or Wide Symlink
  This parameter specifies whether the CIFS symbolic link is a local link, a free link (obsolete), or wide link. A local symbolic link maps to the local CIFS share. A free symbolic link can map anywhere on the local server. A wide symbolic link maps to any CIFS share on the network. The default setting is local. The free link option is obsolete.
-home-directory \{true|false\}\] - Home Directory

This parameter specifies whether the target share is a home directory. The default value is false.

**Note:** This field must be set to true when the target share is a Home Directory for correct processing.

**Examples**

The following example creates a symbolic link mapping on a Vserver named vs1. It has the UNIX path /sales/, the CIFS share name SALES_SHARE, and the CIFS path /mycompany/sales/.

```
class1::> vserver cifs symlink create -vserver vs1 -unix-path /sales/ -share-name SALES_SHARE -cifs-path "mycompany/sales/"
```

The following example creates a symbolic link mapping on a Vserver named vs1. It has the UNIX path /example/, the CIFS share name EXAMPLE_SHARE, the CIFS path /mycompany/example/, the CIFS server IP address, and is a wide link.

```
class1::> vserver cifs symlink create -vserver vs1 -unix-path /example/ -share-name EXAMPLE_SHARE -cifs-path "mycompany/example/" -cifs-server CIFSSERVER1 -locality widelink
```

**vserver cifs symlink delete**

Delete a symlink path mapping

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The *vserver cifs symlink delete* command deletes a symbolic link mapping for CIFS.

**Parameters**

- **-vserver <vserver name>** - *Vserver*
  
  This specifies the Vserver on which the symbolic link mapping is located.

- **-unix-path <text>** - *UNIX Path*
  
  This specifies the UNIX (NFS) path of the mapping that you want to delete.

**Examples**

The following example deletes a symbolic link mapping to a UNIX path /example/ from a Vserver named vs1:

```
class1::> vserver cifs symlink delete -vserver vs1 -unix-path /example/
```

**vserver cifs symlink modify**

Modify a symlink path mapping

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The *vserver cifs symlink modify* command modifies the CIFS share name, CIFS path, CIFS server name, or locality of a symbolic link mapping. It can also be used to modify the value of -home-directory field.

**Parameters**

- **-vserver <vserver name>** - *Vserver*
  
  This parameter specifies the Vserver on which the symbolic link mapping is located.
- **unix-path** <text> - UNIX Path
  This parameter specifies the UNIX (NFS) path of the mapping that you want to modify.
  
  **Note:** It must begin and end with a forward slash (/).

- **-share-name** <Share> - CIFS Share
  This parameter specifies a new CIFS share name for the mapping.

- **-cifs-path** <TextNoCase> - CIFS Path
  This parameter specifies a new CIFS path for the mapping. Note that this value is specified by using a UNIX-style path.
  
  **Note:** It must begin and end with a forward slash (/).

- **-cifs-server** <TextNoCase> - Remote NetBIOS Server Name
  This parameter specifies a new CIFS server DNS name, IP address, or NetBIOS name for the mapping.

- **-locality** {local|widelink} - Local or Wide Symlink
  This parameter specifies a new locality for the mapping. A local symbolic link maps to the local CIFS share. A free symbolic link can map anywhere on the local server. A wide symbolic link maps to any CIFS share on the network. The default setting is local. The free link option is obsolete.

- **-home-directory** {true|false} - Home Directory
  This parameter specifies whether the new target share is a home directory.
  
  **Note:** This field must be set to true when the target share is a Home Directory for correct processing.

### Examples

The following example modifies the symbolic link mapping to a UNIX path `/example/` on a Vserver named vs1. The mapping is modified to use the CIFS path `/mycompany/example/`.

```bash
cluster1::> vserver cifs symlink modify -vserver vs1 -unix-path /example/ -cifs-path "/mycompany/example/"
```

The following example modifies the symbolic link mapping to a UNIX path `/example/` on a Vserver named vs1. The mapping is modified to use the CIFS share name `EXAMPLE_SHARE`, the CIFS path `/mycompany/example/`, on the CIFS server `cifs.example.com`, and to be a wide link.

```bash
cluster1::> vserver cifs symlink modify -vserver vs1 -unix-path /example/ -share-name EXAMPLE_SHARE -cifs-path "/mycompany/example/" -cifs-server cifs.example.com -locality widelink
```

### vserver cifs symlink show

Show symlink path mappings

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver cifs symlink show` command displays the following information about symbolic link mappings for CIFS:

- Vserver
- UNIX (NFS) path
- The DNS name, IP address, or NetBIOS name of the CIFS server
- CIFS share name
• CIFS path

• Whether the locality of the CIFS server is a local, free, or wide link. (A local symbolic link maps to the local CIFS share. A free symbolic link can map anywhere on the local server. A wide symbolic link maps to any CIFS share on the network. The free link option is deprecated and may be removed in a future release of Data ONTAP.)

Parameters

{{ [-fields <fieldname>, ...]}}
If you specify the -fields <fieldname>, ... parameter, the command only displays the fields that you specify.

{{ [-instance]}}
If you specify the -instance parameter, the command displays detailed information about all entries.

{{ [-vserver <vserver name>] - Vserver}}
If you specify this parameter, the command displays information about symbolic link mappings on the specified Vserver.

{{ [-unix-path <text>] - UNIX Path}}
If you specify this parameter, the command displays information only about the symbolic link mapping that uses the specified UNIX (NFS) path.

{{ [-share-name <Share>] - CIFS Share}}
If you specify this parameter, the command displays information only about the symbolic link mapping or mappings that use the specified CIFS share.

{{ [-cifs-path <TextNoCase>] - CIFS Path}}
If you specify this parameter, the command displays information only about the symbolic link mapping that uses the specified CIFS path.

{{ [-cifs-server <TextNoCase>] - Remote NetBIOS Server Name}}
If you specify this parameter, the command displays information only about the symbolic link mapping that uses the specified CIFS server.

{{ [-locality {local|widelink}] - Local or Wide Symlink}}
If you specify this parameter, the command displays information only about the symbolic link mappings that have the specified locality.

{{ [-home-directory {true|false}] - Home Directory}}
If you specify this parameter, the command displays information only about the symbolic link mappings that have the target share as a home directory (if true) or as a static CIFS share (if false).

Examples

The following example displays information about all symbolic link mappings for CIFS:

```
cluster1::> vserver cifs symlink show
Vserver  Unix Path  CIFS Server         CIFS Share  CIFS Path          Locality
---------- ---------- ------------------- ----------- ------------------ --------
vs1        /hr/      192.0.2.160         HR_SHARE    /mycompany/hr/     widelink
vs1        /sales/   WINDATA             SALES_SHARE /mycompany/sales/  local
vs1        /web/     cifs.example.com    WEB_SHARE   /mycompany/web/    widelink
3 entries were displayed.
```

The following example displays information about all symbolic link mappings that are wide links:

```
```
vserver cifs symlink show -locality widelink

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Unix Path</th>
<th>CIFS Server</th>
<th>CIFS Share</th>
<th>CIFS Path</th>
<th>Locality</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>
<td>/hr/</td>
<td>192.0.2.160</td>
<td>HR_SHARE</td>
<td>/mycompany/hr/</td>
<td>widelink</td>
</tr>
<tr>
<td>vs1</td>
<td>/web/</td>
<td>cifs.example.com</td>
<td>WEB_SHARE</td>
<td>/mycompany/web/</td>
<td>widelink</td>
</tr>
</tbody>
</table>

2 entries were displayed.

vserver cifs users-and-groups commands

Manage local users, groups, and privileges

vserver cifs users-and-groups remove-stale-records

Delete the Stale CIFS local users-and-groups records for the specified vserver

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The vserver cifs users-and-groups remove-stale-records command removes Stale local users and groups entries associated with old CIFS server.

Parameters
-vserver <vserver> - Vserver
The command deletes Stale local users and groups entries associated with the specified Vserver.

Examples
The following example displays the syntax of the command.

```
cluster1:/> vserver cifs users-and-groups remove-stale-records -vserver vs1
```

vserver cifs users-and-groups update-names

Update the names of Active Directory users and groups

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The vserver cifs users-and-groups update-names command updates the names of Active Directory users and groups that are registered in local databases on the cluster and reports the status of the update operations. This is done so that objects that were renamed in the Active Directory can be properly displayed and configured in the local databases.

Parameters
-vserver <vserver name> - Vserver
If you specify this parameter, the command will only be performed within the scope of the Vserver that matches the specified Vserver name.

{-display-failed-only [true|false]} - Display Only Failures
If you set this parameter to true, the command displays only the Active Directory users and groups that failed to update. If set to false, the command displays only the Active Directory users and groups that successfully updated.
If you set this parameter to true, the command does not display information about the status of the updates of Active Directory users and groups. To display information about the status of the updates, set this parameter to false or do not specify this parameter in the command.

**Examples**

The following example updates the names of Active Directory users and groups associated with Vserver "vs1". In the last case, there is a dependent chain of names that needs to be updated.

```
cluster1::*> vserver cifs users-and-groups update-names -vserver vs1
  Vserver:           vs1
  SID:               S-1-5-21-123456789-234565432-987654321-12345
  Domain:            EXAMPLE1
  Out-of-date Name:  dom_user1
  Updated Name:      dom_user2
  Status:            Successfully updated

Vserver:           vs1
  SID:               S-1-5-21-123456789-234565432-987654322-23456
  Domain:            EXAMPLE2
  Out-of-date Name:  dom_user1
  Updated Name:      dom_user2
  Status:            Successfully updated

Vserver:           vs1
  SID:               S-1-5-21-123456789-234565432-987654321-123456
  Domain:            EXAMPLE1
  Out-of-date Name:  dom_user3
  Updated Name:      dom_user4
  Status:            Successfully updated; also updated SID
  "S-1-5-21-123456789-234565432-987654321-123457" to name "dom_user5"; also updated SID
  "S-1-5-21-123456789-234565432-987654321-123458" to name "dom_user6"; also updated SID
  "S-1-5-21-123456789-234565432-987654321-123459" to name "dom_user7"; also updated SID
  "S-1-5-21-123456789-234565432-987654321-123460" to name "dom_user8"

The command completed successfully. 7 Active Directory objects have been updated.
```

**vserver cifs users-and-groups local-group commands**

Manage local groups

**vserver cifs users-and-groups local-group add-members**

Add members to a local group

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The `vserver cifs users-and-groups local-group add-members` command adds members to a local group.

**Parameters**

- `-vserver <vserver name>` - Vserver
  
  This specifies the name of the Vserver.

- `-group-name <CIFS name>` - Group Name
  
  This specifies the name of the local group.
-`member-names <CIFS name>, ...` - Names of Users or Active Directory Groups to be Added

This specifies the list of local users, Active Directory users, or Active Directory groups to be added to a particular local group.

**Examples**

The following example adds a local user "CIFS_SERVER\loc_usr1" and an Active Directory group "CIFS_SERVER\dom_grp2" to the local group "CIFS_SERVER\g1".

```bash
cluster1::> vserver cifs users-and-groups local-group add-members -vserver vs1 -group-name CIFS_SERVER\g1 -member-names CIFS_SERVER\loc_usr1,AD_DOMAIN\dom_grp2
```

### vserver cifs users-and-groups local-group create

Create a local group

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**

The `vserver cifs users-and-groups local-group create` command creates a local group and optionally sets the description of that local group. The group name must meet the following criteria:

- The group name length must not exceed 256 characters.
- The group name cannot be terminated by a period.
- The group name cannot include commas.
- The group name cannot include any of the following printable characters: ",,\,[,],[,],<,>,+,=,?,*,@
- The group name cannot include characters in the ASCII range 1-31, which are non-printable.

**Parameters**

-`-vserver <vserver name>` - Vserver
  This specifies the name of the Vserver.
-`-group-name <CIFS name>` - Group Name
  This specifies the name of the local group.
-`[-description <TextNoCase>]` - Description
  This specifies a description for this local group. If the description contains a space, enclose the parameter in quotation marks.

**Examples**

The following example creates a local group "CIFS_SERVER\g1" associated with Vserver "vs1".

```bash
cluster1::> vserver cifs users-and-groups local-group create -vserver vs1 -group-name CIFS_SERVER\g1
```

### vserver cifs users-and-groups local-group delete

Delete a local group

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.
Description
The `vserver cifs users-and-groups local-group delete` command deletes a local group. Removing a local group removes its membership records.

Parameters

- `vserver <vserver name>` - Vserver
  
  This specifies the name of the Vserver.

- `group-name <CIFS name>` - Group Name
  
  This specifies the name of the local group to delete.

Examples

The following example deletes the local group "CIFS_SERVER\g1" associated with Vserver "vs1".

```
cluster1::> vserver cifs users-and-groups local-group delete -vserver vs1 -group-name CIFS_SERVER \g1
```

vserver cifs users-and-groups local-group modify

Modify a local group

Availability: This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

Description
The `vserver cifs users-and-groups local-group modify` command modifies the description of a local group.

Parameters

- `vserver <vserver name>` - Vserver
  
  This specifies the name of the Vserver.

- `group-name <CIFS name>` - Group Name
  
  This specifies the name of the local group.

- `[-description <TextNoCase>]` - Description
  
  This specifies a description for this local group. If the description contains a space, enclose the parameter in quotation marks.

Examples

The following example modifies the description of the local group "CIFS_SERVER\g1" associated with Vserver "vs1".

```
cluster1::> vserver cifs users-and-groups local-group modify -vserver vs1 -group-name CIFS_SERVER \g1 -description "Example Description"
```

vserver cifs users-and-groups local-group remove-members

Remove members from a local group

Availability: This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

Description
The `vserver cifs users-and-groups local-group remove-members` command removes members from a local group.
Parameters

-vserver <vserver name> - Vserver
This specifies the name of the Vserver.

-group-name <CIFS name> - Group Name
This specifies the name of the local group.

-member-names <CIFS name>, ... - Names of Users or Active Directory Groups to be Removed
This specifies the list of local users, Active Directory users, or Active Directory groups to be removed from a particular local group.

Examples

The following example removes the local users "CIFS_SERVER\u1" and "CIFS_SERVER\u2" from the local group "CIFS_SERVER\g1".

cluster1::> vserver cifs users-and-groups local-group remove-members -vserver vs1 -group-name CIFS_SERVER\g1 -member-names CIFS_SERVER\u1,CIFS_SERVER\u2

vserver cifs users-and-groups local-group rename

Rename a local group

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs users-and-groups local-group rename command renames a local group. The new group name must remain in the same domain as the old group name. The new group name must meet the following criteria:

• The group name length must not exceed 256 characters.
• The group name cannot be terminated by a period.
• The group name cannot include commas.
• The group name cannot include any of the following printable characters: ",/,\,[,],.:, <,>,+,=,;?,*,@.
• The group name cannot include characters in the ASCII range 1-31, which are non-printable.

Parameters

-vserver <vserver name> - Vserver
  This specifies the name of the Vserver.

-group-name <CIFS name> - Group Name
  This specifies the local group's name.

-new-group-name <CIFS name> - New Group Name
  This specifies the local group's new name.

Examples

The following example renames the local group "CIFS_SERVER\g_old" to "CIFS_SERVER\g_new" on Vserver "vs1".

cluster1::> vserver cifs users-and-groups local-group rename -group-name CIFS_SERVER\g_old -new-group-name CIFS_SERVER\g_new -vserver vs1
vserver cifs users-and-groups local-group show

Display local groups

*Availability:* This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The `vserver cifs users-and-groups local-group show` command displays local groups.

**Parameters**

`{ [-fields <fieldname>, ...]`

If you specify the `[-fields <fieldname>, ...]` parameter, the command output also includes the specified field or fields. You can use `--fields ?` to display the fields to specify.

`[-instance]`

If you specify the `[-instance]` parameter, the command displays detailed information about all fields.

`[-vserver <vserver name>]` - Vserver

If this parameter is specified, the command displays information only about local groups that match the specified Vserver name.

`[-group-name <CIFS name>]` - Group Name

If this parameter is specified, the command displays information only about local groups that match the specified group name.

`[-description <TextNoCase>]` - Description

If this parameter is specified, the command displays information only about local groups that match the specified description.

**Examples**

The following example displays all local groups associated with Vserver "vs1".

```
cluster1::> vserver cifs users-and-groups local-group show -vserver vs1
Vserver | Group Name                       | Description
---------|----------------------------------|-----------------------------
vs1      | BUILTIN\Administrators           | Built-in Administrators group
vs1      | BUILTIN\Backup Operators         | Backup Operators group
vs1      | BUILTIN\Power Users              | Restricted administrative privileges
vs1      | BUILTIN\Users                    | All users
vs1      | CIFS\g1                          | All users
vs1      | CIFS\g2                          | All users
6 entries were displayed.
```

vserver cifs users-and-groups local-group show-members

Display local groups' members

*Availability:* This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The `vserver cifs users-and-groups local-group show-members` command displays members of a local group. The members can be local or Active Directory users or groups.
Parameters

{ [-fields <fieldname>, ...] }

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

[ [-instance ]] }

If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver

If this parameter is specified, the command displays group members of local groups that match the specified Vserver name.

[-group-name <CIFS name>] - Group Name

If this parameter is specified, the command displays group members of local groups that match the specified group name.

[-member <CIFS name>, ...] - Member Name

If this parameter is specified, the command displays group members that match the specified member name.
The name can be that of a local user, Active Directory user, or Active Directory group.

Examples

The following example displays members of local groups associated with Vserver "vs1".

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Group Name</th>
<th>Members</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>
<td>BUILTIN\Administrators</td>
<td>CIFS_SERVER\Administrator</td>
</tr>
<tr>
<td></td>
<td></td>
<td>AD_DOMAIN\Domain Admins</td>
</tr>
<tr>
<td></td>
<td></td>
<td>AD_DOMAIN\dom_grp1</td>
</tr>
<tr>
<td></td>
<td>AD_DOMAIN\Users</td>
<td>AD_DOMAIN\Domain Users</td>
</tr>
<tr>
<td></td>
<td></td>
<td>AD_DOMAIN\dom_usr1</td>
</tr>
<tr>
<td></td>
<td>CIFS_SERVER\g1</td>
<td>CIFS_SERVER\u1</td>
</tr>
</tbody>
</table>
6 entries were displayed.

vserver cifs users-and-groups local-user commands

Manage local users

vserver cifs users-and-groups local-user create

Create a local user

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver cifs users-and-groups local-user create command creates a local user and optionally sets the attributes for that local user. The command prompts for the local user's password.
The user name must meet the following criteria:

• The user name length must not exceed 20 characters.
• The user name cannot be terminated by a period.
• The user name cannot include commas.
• The user name cannot include any of the following printable characters: ":, /, \, [, ], :, <, >, =, ;, ?, *, @
• The user name cannot include characters in the ASCII range 1-31, which are non-printable.
The password must meet the following criteria:

- The password must be at least six characters in length.
- The password must not contain user account name.
- The password must contain characters from three of the following four categories:
  - English uppercase characters (A through Z)
  - English lowercase characters (a through z)
  - Base 10 digits (0 through 9)
  - Special characters: ~, !, @, #, $, %, ^, &, *, _, -, +, =, `., |, (, ), [ ], :, ;, "", ', <, >, ,, ., ?, /

Parameters

-vserver <vserver name> - Vserver
  This specifies the name of the Vserver.

-user-name <CIFS name> - User Name
  This specifies the user name.

[ -full-name <TextNoCase>] - Full Name
  This specifies the user's full name. If the full name contains a space, enclose the full name within double quotation marks.

[ -description <TextNoCase>] - Description
  This specifies a description for this local user. If the description contains a space, enclose the parameter in quotation marks.

[ -is-account-disabled {true|false}] - Is Account Disabled
  This specifies whether the user account is enabled or disabled. Set this parameter to true to disable the account. Set this parameter to false to enable the account. If this parameter is not specified, the default is to enable the user account.

Examples

The following example creates a local user "CIFS_SERVER\user1" associated with Vserver "vs1".

```
cluster1::> vserver cifs users-and-groups local-user create -vserver vs1 -user-name CIFS_SERVER\user1
Enter the password:
Confirm the password:
```

vserver cifs users-and-groups local-user delete

Delete a local user

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver cifs users-and-groups local-user delete command deletes a local user. Upon deletion, all membership entries for this local user are deleted.

Parameters

-vserver <vserver name> - Vserver
  This specifies the name of the Vserver.
**Examples**

The following example deletes the local user "CIFS_SERVER\u1" associated with Vserver "vs1".

```plaintext
cluster1::> vserver cifs users-and-groups local-user delete -vserver vs1 -user-name CIFS_SERVER\u1
```

vserver cifs users-and-groups local-user modify

Modify a local user

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The `vserver cifs users-and-groups local-user modify` command modifies attributes of a local user.

**Parameters**

- **-vserver <vserver name>** - Vserver
  
  This specifies the name of the Vserver.

- **-user-name <CIFS name>** - User Name
  
  This specifies the user name.

- **[-full-name <TextNoCase>] - Full Name**
  
  This specifies the user's full name. If the full name contains a space in the name, enclose it within double quotation marks.

- **[-description <TextNoCase>] - Description**
  
  This specifies a description for this local user. If the description contains a space, enclose the parameter in quotation marks.

- **[-is-account-disabled {true|false}] - Is Account Disabled**
  
  This specifies if the user account is enabled or disabled. Set this parameter to true to disable the account. Set this parameter to false to enable the account.

**Examples**

The following example modifies the full name of the local user "CIFS_SERVER\u1".

```plaintext
cluster1::> vserver cifs users-and-groups local-user modify -user-name CIFS_SERVER\u1 -full-name "John Smith" -vserver vs1
```
vserver cifs users-and-groups local-user rename

Rename a local user

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs users-and-groups local-user rename command renames a local user. The new user name must remain in the same domain as the old user name. The new user name must meet the following criteria:

- The user name length must not exceed 20 characters.
- The user name cannot be terminated by a period.
- The user name cannot include commas.
- The user name cannot include any of the following printable characters: ",, /, [, ], :, |, <, >, +, =, ?, *, @
- The user name cannot include characters in the ASCII range 1-31, which are non-printable.

Parameters
- -vserver <vserver name> - Vserver
  This specifies the name of the Vserver.
- -user-name <CIFS name> - User Name
  This specifies the user name.
- -new-user-name <CIFS name> - New User Name
  This specifies the new user name.

Examples
The following example renames the local user "CIFS_SERVER\u_old" to "CIFS_SERVER\u_new" on Vserver "vs1".

    cluster1::> vserver cifs users-and-groups local-user rename -user-name CIFS_SERVER\u_old -new-user-name CIFS_SERVER\u_new -vserver vs1

vserver cifs users-and-groups local-user set-password

Set a password for a local user

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs users-and-groups local-user set-password command sets the password for the specified local user. The password must meet the following criteria:

- The password must be at least six characters in length.
- The password must not contain user account name.
- The password must contain characters from three of the following four categories:
  - English uppercase characters (A through Z)
  - English lowercase characters (a through z)
  - Base 10 digits (0 through 9)
### Parameters

- **vserver <vserver name>** - Vserver
  
  This specifies the name of the Vserver.

- **-user-name <CIFS name>** - User Name
  
  This specifies the user name.

### Examples

The following example sets the password for the local user "CIFS_SERVER\u1" associated with Vserver "vs1".

```
cluster1::> vserver cifs users-and-groups local-user set-password -user-name CIFS_SERVER\u1 -
vserver vs1
Enter the new password:
Confirm the new password:
```

The following example attempts to set the password but fails because the password did not meet password complexity requirements.

```
cluster1::> vserver cifs users-and-groups local-user set-password -user-name CIFS_SERVER\u1 -
vserver vs1
Enter the new password:
Confirm the new password:
Error: command failed: The password does not meet the password complexity
requirements. Refer to the man page for details.
```

### vserver cifs users-and-groups local-user show

Display local users

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The `vserver cifs users-and-groups local-user show` command displays local users and their attributes.

**Parameters**

{ 
  [-fields <fieldname>, ...]
  If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified
  field or fields. You can use `-fields ?` to display the fields to specify.

  [-instance]
  If you specify the `-instance` parameter, the command displays detailed information about all fields.

  [-vserver <vserver name>] - Vserver
  If this parameter is specified, the command displays information only about local users that match the
  specified Vserver name.

  [-user-name <CIFS name>] - User Name
  If this parameter is specified, the command displays information only about local users that match the
  specified user name.

```
```
If this parameter is specified, the command displays information only about local users that match the specified full name.

[-description <TextNoCase>] - Description

If this parameter is specified, the command displays information only about local users that match the specified description.

[-is-account-disabled {true|false}] - Is Account Disabled

If this parameter is specified, the command displays information only about local users that match the status specified.

**Examples**

The following example displays information about all local users.

```
cluster1>::> vserver cifs users-and-groups local-user show
Vserver User Name                   Full Name            Description
------------ --------------------------- -------------------- -------------
vs1          CIFS_SERVER\Administrator   James Raynor         Built-in administrator account
vs1          CIFS_SERVER\u1              Sarah Kerrigan
2 entries were displayed.
```

**vserver cifs users-and-groups local-user show-membership**

Display local users' membership information

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The vserver cifs users-and-groups local-user show-membership command displays the membership of local users.

**Parameters**

{{ [-fields <fieldname>, ...]}}

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

{{ [-instance]}}

If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver

If this parameter is specified, the command displays local user membership information for local users that are associated with the specified Vserver.

[-user-name <CIFS name>] - User Name

If this parameter is specified, the command displays local user membership information for a local user that matches the specified user name.

[-membership <CIFS name>, ...] - Local Group That This User is a Member of

If this parameter is specified, the command displays local user membership information for the local group of which this local user is a member.

**Examples**

The following example displays the membership information of all local users; user "CIFS_SERVER\Administrator" is a member of "BUILTIN\Administrators" group, and "CIFS_SERVER\u1" is a member of "CIFS_SERVER\g1" group.
vserver cifs users-and-groups privilege commands

Manage privileges

vserver cifs users-and-groups privilege add-privilege

Add local privileges to a user or group

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs users-and-groups privilege add-privilege command adds privileges to a local or Active Directory user or group.

Parameters
- \( -vserver <vserver name> \) - Vserver
  This specifies the name of the Vserver.
- \( -user-or-group-name <CIFS name> \) - User or Group Name
  This specifies the name of the local or Active Directory user or group.
- \( -privileges <Privilege>,... \) - Privileges
  This specifies the list of privileges to be associated with this user or group.

Examples
The following example adds the privileges "SeTcbPrivilege" and "SeTakeOwnershipPrivilege" to the user "CIFS_SERVER\u1".

```
cluster1::> vserver cifs users-and-groups privilege add-privilege -vserver vs1 -user-or-group-name CIFS_SERVER\u1 -privileges SeTcbPrivilege,SeTakeOwnershipPrivilege
```

vserver cifs users-and-groups privilege remove-privilege

Remove privileges from a user or group

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver cifs users-and-groups privilege remove-privilege command removes privileges from a local or Active Directory user or group. This command creates a new or modifies an existing privilege entry.

Parameters
- \( -vserver <vserver name> \) - Vserver
  This specifies the name of the Vserver.
- \( -user-or-group-name <CIFS name> \) - User or Group Name
  This specifies the name of the local or Active Directory user or group.
-privileges <Privilege>, ... - Privileges

This specifies the list of privileges to be removed from this user or group.

**Examples**

The following example removes the previously added "SeTcbPrivilege" and "SeTakeOwnershipPrivilege" privileges from the user "CIFS_SERVER\u1".

```bash
cluster1::> vserver cifs users-and-groups privilege show
Vserver        User or Group Name           Privileges
-------------- ---------------------------- -------------------
vs1            CIFS_SERVER\u1               SeTcbPrivilege
               SeTakeOwnershipPrivilege

cluster1::> vserver cifs users-and-groups privilege remove-privilege -vserver vs1 -user-or-group-name CIFS_SERVER\u1 -privileges SeTcbPrivilege,SeTakeOwnershipPrivilege

cluster1::> vserver cifs users-and-groups privilege show
Vserver        User or Group Name           Privileges
-------------- ---------------------------- -------------------
vs1            CIFS_SERVER\u1               -
```

The following example removes "SeBackupPrivilege" from the group "BUILTIN\Administrators".

```bash
cluster1::> vserver cifs users-and-groups privilege show
This table is currently empty.

cluster1::> vserver cifs users-and-groups privilege remove-privilege -vserver vs1 -user-or-group-name BUILTIN\Administrators -privileges SeBackupPrivilege

cluster1::> vserver cifs users-and-groups privilege show
Vserver        User or Group Name           Privileges
-------------- ---------------------------- -------------------
vs1            BUILTIN\Administrators       SeRestorePrivilege
               SeSecurityPrivilege
               SeTakeOwnershipPrivilege
```

vserver cifs users-and-groups privilege reset-privilege

Reset local privileges for a user or group

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `vserver cifs users-and-groups privilege reset-privilege` command resets privileges of a local or Active Directory user or group.

**Parameters**

- `-vserver <vserver name>` - Vserver
  This specifies the name of the Vserver.

- `-user-or-group-name <CIFS name>` - User or Group Name
  This specifies the name of the local or Active Directory user or group.

**Examples**
The following example resets the privileges for the local user "CIFS_SERVER\u1". This operation removes the privilege entry, if any, associated with the local user "CIFS_SERVER\u1".
vserver cifs users-and-groups privilege show

Display privileges

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `vserver cifs users-and-groups privilege show` command displays privilege overrides assigned to local or Active Directory users or groups.

**Parameters**

`[-fields <fieldname>, ...]`
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

`[-instance]`
If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-vserver <vserver name>] - Vserver`
If this parameter is specified, the command displays information only about privilege overrides assigned to local or Active Directory users or groups that match the specified Vserver name.

`[-user-or-group-name <CIFS name>] - User or Group Name`
If this parameter is specified, the command displays information only about privilege overrides assigned to local or Active Directory users or groups that match the specified user name or group name.

`[-privileges <Privilege>, ...] - Privileges`
If this parameter is specified, the command displays information only about privilege overrides assigned to local or Active Directory users or groups that match the specified privileges.
Examples
The following example displays all privileges explicitly associated with local or Active Directory users or groups for Vserver "vs1".

```
cluster1::> vserver cifs users-and-groups privilege show -vserver vs1
```

<table>
<thead>
<tr>

vserver config-replication commands
The Vserver configuration replication directory

vserver config-replication pause
Temporarily pause Vserver configuration replication

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
Vserver domain locking functionality locks the Vserver while Vserver DM is recording a configuration baseline. This command aborts the ongoing baseline generation activity, unlocks the Vserver and temporarily pauses configuration replication for the Vserver. Command confirmations have to be enabled to execute this command. The time at which replication resumes is displayed after successful completion of the command. Configuration changes made after executing this command are not replicated to the partner cluster. If a disaster occurs during this time, the configuration changes made are lost. Replication can be manually resumed by executing the `vserver config-replication resume` command.

Parameters
`-vserver <vserver name>` - Vserver name

Examples
```
cluster::> vserver config-replication pause -vserver vs1
Vserver configuration replication will be paused, then automatically resumed after five minutes.
Manually resume configuration replication by running the "vserver config-replication resume -vserver vs1" command.
Do you want to continue ? {y|n}: y
Vserver configuration replication is paused and will be resumed at: 5/24/2014 06:11:23
```

`vserver config-replication resume` on page 1841

vserver config-replication resume
Resume Vserver configuration replication

Availability: This command is available to cluster administrators at the advanced privilege level.
Description
This command resumes configuration replication of the Vserver which was temporarily paused by using the `vserver config-replication pause` command. Successful completion of the command ensures that configuration replication has been resumed for the Vserver.

Parameters
-vserver `<vserver name>` - Vserver name

Examples
```
cluster::> vserver config-replication resume -vserver vs1
```

Related references
`vserver config-replication pause` on page 1841

vserver config-replication show
Display Vserver configuration replication resume time

Availability: This command is available to cluster administrators at the `advanced` privilege level.

Description
The `vserver config-replication show` command displays the time at which the configuration replication resumes for the Vserver.

Parameters

[-fields `<fieldname>`, ...]
If you specify the `-fields `<fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `-fields` `?` to display the fields to specify.

| [-instance ] |
If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver `<vserver>`] - Vserver
If you specify this parameter, the command displays resume time for the specified Vserver.

[-resume-time `<MM/DD/YYYY HH:MM:SS>`] - Replication resume time
If you specify this parameter, the command displays Vservers whose configuration replications are resumed at the specified resume time.

Examples
```
cluster::> vserver config-replication show
+--------------+------------------+
<table>
<thead>
<tr>
<th>Vserver</th>
<th>Resume Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>
<td>12/9/2014 03:18:48</td>
</tr>
</tbody>
</table>
```

Commands: Manual Page Reference
vserver export-policy commands

Manage export policies and rules

vserver export-policy check-access

Given a Volume And/or a Qtree, Check to See If the Client Is Allowed Access

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver export-policy check-access command checks whether a specific client is allowed access to a specific export path. This enables you to test export policies to ensure they work as intended and to troubleshoot client access issues.

The command takes the volume name (and optionally the qtree name) as input and computes the export path for the volume/qtree. It evaluates the export policy rules that apply for each path component and displays the policy name, policy owner, policy rule index and access rights for that path component. If no export policy rule matches the specified client IP address access is denied and the policy rule index will be set to 0. The output gives a clear view on how the export policy rules are evaluated and helps narrow down the policy and (where applicable) the specific rule in the policy that grants or denies access.

Parameters

`[-fields <fieldname>, ...]`
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

`[-instance]`
If you specify the `-instance` parameter, the command displays detailed information about all fields.

`-vserver <vserver name>` - Vserver Name
This parameter specifies the name of the Vserver in which the export policy resides.

`-volume <volume name>` - Volume Name
This parameter specifies the name of the volume that you want to check export access for. To check export access for a qtree use the `-qtree` parameter. The `-qtree` parameter is optional. If you specify the `-qtree` parameter, you must provide the name of the volume containing the qtree. If you do not specify the `-qtree` parameter, export access will be checked only for the volume.

`-client-ip <IP Address>` - Client IP Address
This parameter specifies the IP address of the client that you want to check export access for.

`-authentication-method <authentication method>` - Authentication Method
This parameter specifies the authentication method of the client that is attempting access. Possible values include the following:

- **sys**: The authentication method used by the client is AUTH_SYS.
- **krb5**: The authentication method used by the client is Kerberos v5.
- **krb5i**: The authentication method used by the client is Kerberos v5 with integrity service.
- **krb5p**: The authentication method used by the client is Kerberos v5 with privacy service.
- **ntlm**: The authentication method used by the client is CIFS NTLM.
- The authentication method used by the client is not explicitly listed in the list of values in the rorule.

-protocol <Client Access Protocol> - Protocol

This parameter specifies the protocol that the client is using when attempting to access the exported path. Possible values include the following:

- *nfs3* - The NFSv3 protocol
- *nfs4* - The NFSv4 protocol
- *cifs* - The CIFS protocol

-access-type {read|read-write} - Access Rights to Check for

This parameter specifies the type of access you want to check for. Possible values are read for read-only access and read-write for read-write access.

[-qtree <qtree name>] - Name of the Qtree

This optional parameter specifies the qtree in the volume that is part of the exported path. If you specify this parameter, you must also provide the name of the volume the qtree belongs to.

[-path <text>] - Path

Selects the entries in the output that match the specified path value. This field describes the junction-path path component encountered when evaluating the export policies starting from the root ('/') of the Vserver.

[-policy <text>] - Export Policy

Selects the entries in the output that match the specified policy value. This field describes the export policy that is in effect for the path encountered so far when evaluating the export policies starting from the root ('/') of the Vserver.

[-policy-owner <text>] - Export Policy Owner

Selects the entries in the output that match the specified policy owner value. This field describes the owner of the export policy that is in effect for the path encountered so far when evaluating the export policies starting from the root ('/') of the Vserver.

[-policy-owner-type {volume|qtree}] - Type of Export Policy Owner

Selects the entries in the output that match the specified type of the owner of an export policy. Possible values include the following:

- *volume* - The owner of the export policy is a volume
- *qtree* - The owner of the export policy is a qtree

[-rule-index <integer>] - Export Policy Rule Index

Selects the entries in the output that match the specified export policy rule index. This field describes the rule index of the rule in the export policy that grants or denies access. If the value of the rule index is 0 it implies none of the client match strings provided in the rules of the export policy matched the specified IP address of the client.

[-access {read|read-write}] - Access Rights

Selects the entries in the output that match the specified access value. This field describes the access rights to the path. Possible values include the following:

- *read* - Read access is granted
- *read-write* - Read-write access is granted
- *denied* - Requested access is denied
[-partial-rule-match (true|false)] - Did a Subset of the Rules Match?

Selects the entries in the output that match if a partially matched subset of rules in the export policy were used to grant access to the client.

[-clientmatch <text>] - Client Match Spec

Selects the entries in the output that match the specified clientmatch string. The clientmatch string denotes the string that resulted in a rule match for the specified client IP address.

**Examples**

The following examples of the vserver export-policy check-access command display various possible results for client export access checks.

```bash
cluster1::> vserver export-policy check-access -vserver vs1 -client-ip 10.22.32.42 -volume flex_vol -authentication-method sys -protocol nfs3 -access-type read
Path                          Policy     Owner     Owner Type  Index Access
----------------------------- ---------- --------- ---------- ------ ----------
/                             default    vs1_root  volume          1 read
/dir1                         default    vs1_root  volume          1 read
/dir1/dir2                    default    vs1_root  volume          1 read
/dir1/dir2/flex1              data       flex_vol  volume         10 read
4 entries were displayed.

cluster1::> vserver export-policy check-access -vserver vs1 -client-ip 10.22.32.42 -volume flex_vol -authentication-method sys -protocol nfs3 -access-type read-write
Policy    Policy       Rule
Path                          Policy     Owner     Owner Type  Index Access
----------------------------- ---------- --------- ---------- ------ ----------
/                             default    vs1_root  volume          1 read
/dir1                         default    vs1_root  volume          1 read
/dir1/dir2                    default    vs1_root  volume          1 read
/dir1/dir2/flex1              data       flex_vol  volume         10 read-write
4 entries were displayed.

cluster1::> vserver export-policy check-access -vserver vs1 -client-ip 10.22.32.42 -volume flex_vol -authentication-method sys -protocol nfs3 -access-type read-write -qtree qt1
Policy    Policy       Rule
Path                          Policy     Owner     Owner Type  Index Access
----------------------------- ---------- --------- ---------- ------ ----------
/                             default    vs1_root  volume          1 read
/dir1                         default    vs1_root  volume          1 read
/dir1/dir2                    default    vs1_root  volume          1 read
/dir1/dir2/flex1              data       flex_vol  volume         10 read
/dir1/dir2/flex1/qt1          primarynames qt1           qtree       0 denied
5 entries were displayed.

cluster1::> vserver export-policy check-access -vserver vs1 -client-ip 10.22.32.42 -volume flex_vol -authentication-method ntlm -protocol cifs -access-type read-write -qtree qt1
Policy    Policy       Rule
Path                          Policy     Owner     Owner Type  Index Access

/dir1                         default    vs1_root  volume          1 read
/dir1/dir2                    default    vs1_root  volume          1 read
/dir1/dir2/flex1              data       flex_vol  volume         10 read
/dir1/dir2/flex1/qt1          primarynames qt1           qtree       2 denied
5 entries were displayed.
```

**vserver export-policy copy**

Copy an export policy

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.
Description
The `vserver export-policy copy` command creates a copy of an export policy on the same or a different Vserver. The command fails if an export policy with the specified new name already exists on the target Vserver.

Parameters
- `vserver <vserver name>` - Vserver
  This parameter specifies the Vserver on which the export policy that you want to copy is located.
- `policyname <export policy name>` - Policy Name
  This parameter specifies the export policy that you want to copy.
- `newvserver <vserver name>` - New Vserver
  This parameter specifies the Vserver to which you want to copy the export policy.
- `newpolicyname <export policy name>` - New Export Policy Name
  This parameter specifies the name of the new policy.

Examples
The following example copies an existing policy named `read_only_expolicy` located on a Vserver named `vs0` to a new policy named `default_expolicy` located on a Vserver named `vs1`.
```
vs1::> vserver export-policy copy -vserver vs0 -policyname read_only_expolicy -newvserver vs1 -newpolicyname default_expolicy
```

vserver export-policy create
Create a rule set

Availability: This command is available to cluster and Vserver administrators at the `admin` privilege level.

Description
The `vserver export-policy create` command creates an export policy. You can use the `vserver export-policy rule create` command to add rules to a policy. Each cluster has an empty default export policy with the ID 0. This default export policy does not contain any rules. You cannot delete the default export policy, but you can rename or modify it.

Parameters
- `vserver <vserver name>` - Vserver
  This parameter specifies the Vserver on which you want to create the export policy.
- `policyname <export policy name>` - Policy Name
  This parameter specifies the export policy that you want to create.

Examples
The following example creates an export policy named `read_only_expolicy` on a Vserver named `vs0`:
```
vs1::> vserver export-policy create -vserver vs0 -policyname read_only_expolicy
```

Related references
`vserver export-policy rule create` on page 1869
vserver export-policy delete

Delete a rule set

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver export-policy delete command deletes an export policy. You cannot delete the default policy (named default) for a Vserver unless you delete the Vserver.

Parameters
-vserver <vserver name> - Vserver
This parameter specifies the Vserver on which the export policy that you want to delete is located.

-policyname <export policy name> - Policy Name
This parameter specifies the export policy that you want to delete.

Examples
The following example deletes an export policy named test_expolicy from a Vserver named vs0:

```
vsl::> vserver export-policy delete -vserver vs0 -policyname test_expolicy
```

vserver export-policy rename

Rename an export policy

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver export-policy rename command renames an export policy.

Parameters
-vserver <vserver name> - Vserver
This parameter specifies the Vserver on which the export policy is located.

-policyname <export policy name> - Policy Name
This parameter specifies the export policy that you want to rename.

-newpolicyname <export policy name> - New Export Policy Name
This parameter specifies the new name of the export policy.

Examples
The following example renames an export policy named user_expolicy with the name read_only_expolicy on a Vserver named vs0:

```
vsl::> vserver export-policy rename -vserver vs0 -policyname user_expolicy -newpolicyname read_only_expolicy
```

vserver export-policy show

Display a list of rule sets

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.
Description
The `vserver export-policy show` command displays the following information:

- Vserver name
- Export policy name
- Policy ID (diagnostic privilege level only)

Parameters

```
[-fields <fieldname>,...]
```
If you specify the `-fields` parameter, the command only displays the fields that you specify.

```
[-instance ]
```
If you specify the `-instance` parameter, the command displays detailed information about all entries.

```
[-vserver <vserver name> ] - Vserver
```
If you specify this parameter, the command displays a list of export policies that are located on the Vserver that you specify.

```
[-policyname <export policy name> ] - Policy Name
```
If you specify this parameter, the command displays only the export policy or sets that match the specified name.

Examples
The following example displays a list of all export policies:

```
vserver export-policy show
VServer          Policy Name
---------------  -------------------
vs0              default_expolicy
vs0              read_only_expolicy
vs1              default_expolicy
vs1              test_expolicy
4 entries were displayed.
```

vserver export-policy access-cache commands
The access-cache directory

vserver export-policy access-cache flush
Flush an entry from the access cache

Availability: This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

Description
The `vserver export-policy access-cache flush` command can be used to remove all entries in the access cache that belong to the specified export policy. The command can also be used to remove the access cache entry for a specific IP address belonging to an export policy. You must provide the name of the node that hosts the access cache and the name of the Vserver that owns the export policy. This command differs from the `vserver export-policy cache flush` command. The `vserver export-policy access-cache flush` command allows you to flush all access cache entries across all export policies in a Vserver. In contrast the `vserver export-policy access-cache flush` command gives you the granularity to flush a specific access cache entry or the granularity to flush all access cache entries for a specific export policy.

This command is useful to clear out a negative access cache entry. A negative cache entry is one where a client IP address experiences an access denied error due to stale export policy rule information present in the cache entry. Data ONTAP maintains several caches in the kernel and userspace to speed access to exports. A negative cache entry can get created in the access cache.
if a client tries to access an export path before the export rules or the name server settings or the caches in management gateway have been updated to grant access to that client. The negative cache entry will remain in the access cache until the TTL for the entry expires and the entry is refreshed. You can use the `export-policy access-cache config show` command to find out the refresh intervals and timeouts for the access cache. If you know that the caches in userspace have the latest information for the client and don't want to wait until the TTL for the access cache entry expires then you can use this command to remove the access cache entry in the kernel and force the cache entry to get re-populated with the latest information that will allow the client to access the export path.

You can use the `vserver export-policy access-cache entry show` and `vserver export-policy access-cache entry show-rules` commands to examine the contents of an entry in the access cache before removing it using the flush command.

**Parameters**

- `-vserver <vserver name> - Vserver`
  
  This parameter specifies the name of the Vserver on which you want to flush the access cache entry.

- `-node <nodename> - Node`
  
  This parameter specifies the node on which you want to flush the access cache entry.

- `-policy <text> - Export Policy Name`
  
  This parameter specifies the name of the export policy that is effective for the exported path that the client is trying to access.

- `[-address <IP Address>] - IP Address`
  
  This parameter is optional. It specifies the IP address of the client whose access cache entry you want to remove. If this parameter is not specified all access cache entries belonging to the specified export policy will be removed.

**Examples**

The following example flushes the access cache entry for client IP address '1.2.3.4' in volume 'flex1' having export policy 'testpol' in a Vserver named 'vs1' on node 'vsim1':

```
cluster1::*> vserver export-policy access-cache flush -vserver vs1 -node vsim1 -policy testpol -address 1.2.3.4
Successfully removed access cache entry for IP address "1.2.3.4" belonging to export policy "testpol" in Vserver "$vs1" on node "$vsim1".
```

```
cluster1::*> vserver export-policy access-cache flush -vserver vs1 -node vsim1 -policy testpol
Warning: This command removes all access cache entries for export policy "testpol" in Vserver "vs1" on node "vsim1". Do you want to continue? (y|n): y
Successfully removed 1 access cache entry for export policy "testpol" in Vserver "$vs1" on node "$vsim1".
```

`vserver export-policy cache flush` on page 1858

**vserver export-policy access-cache show**

Display information about the access cache entry

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.
Description
The `vserver export-policy access-cache show` command can be used to display the contents of an access cache entry of the specified node for a particular client IP address belonging to an export policy in a Vserver.

The command will display information such as the flags of the access cache entry, the age of the entry, any errors that were encountered when looking up the export policy rules from the management gateway, and the number of policy rules from the export policy that matched the specified client IP address. If an error is encountered when looking up the export policy rules from the management gateway process, the first rule index in the export policy that encountered the error is displayed. The client match string or the anon string in the rule that caused the rule evaluation to fail is also displayed. A more detailed view of the output of this command is available if you specify the `-instance` switch to the command.

The command output lists the rule indexes of the policy rules that matched. If you are interested in finding out the security settings for each policy rule that matched then you can use the `vserver export-policy access-cache show-rules` command.

If the client IP address is not cached in the access cache then the command will display an error message stating that the entry does not exist.

Parameters

`[-fields <fieldname>, ...]`
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

`[-instance]`
If you specify the `-instance` parameter, the command displays detailed information about all fields.

`-node <nodename> - Node`
This parameter specifies the node on which you want to examine the access cache entry.

`-vserver <vserver name> - Vserver`
This parameter specifies the name of the Vserver on which you want to see the access cache entry.

`-policy <export policy name> - Policy Name`
This parameter specifies the name of the export policy that is in effect on the export path that the client is trying to access.

`-address <IP Address> - IP Address`
This parameter specifies the IP address of the client whose access cache entry you want to examine.

`[-flags {pending|refreshing|is-abandoned|is-queued-for-update|is-updating|has-usable-data}, ...] - Access Cache Entry Flags`
Selects the access cache entries that match the specified flags value. The flags describe the internal state of the access cache entry. The access cache entry could be in 'pending' state. This denotes the initial state of the access cache entry when a client first tries to access the exported mount point and the rules in the export policy are being matched against the IP address of the client. The 'refreshing' state denotes that the access cache entry is being refreshed. The 'abandoned' state denotes that the access cache entry has been cleared as a result of a cache flush operation. If the access cache entry has been successfully evaluated this field will not be set to any value.

`[-result <integer>] - Result Code`
Selects the access cache entries that match the specified result value. This field describes the error code of the error encountered when matching the IP address of the client against the rules specified in the export policy. If all rules were evaluated successfully this field will be set to 0.

`[-first-unresolved-index <integer>] - First Unresolved Rule Index`
Selects the access cache entries that match the specified unresolved rule index value. This field describes the rule index of the first rule in the export policy that could not be evaluated successfully when matching the IP address of the client against the rules specified in the export policy. If all rules were evaluated successfully this field will not be set to any value.
[-unresolved-clientmatch <text>] - Unresolved Clientmatch

Selects the access cache entries that match the specified unresolved client match value. This field describes the client match string that caused the rule evaluation to fail at the displayed rule index. Client match strings that denote a netgroup, hostname or a domain name can fail in evaluation if there are problems in contacting the name servers configured to serve them. If all rules were evaluated successfully this field will not be set to any value.

[-num-rules <integer>] - Number of Matched Policy Rules

Selects the access cache entries that match the specified number of matched export rules. This field describes the number of rules in the export policy that were matched successfully against the IP address of the client. If the number of matched rules is 0 and the 'result' field is also 0 then the client will experience an access denied error during mount. If the number of matched rules is non-zero and the 'result' field is 0 then access is granted or denied based on the ro, rw, superuser and other security settings in the matched rules. If the number of matched rules is 0 and the 'result' field has a non-zero value in it the client will experience a hang until the error that caused the rule evaluation to fail is resolved. If the number of matched rules is non-zero and the 'result' field has a non-zero value then this represents a situation where an error was encountered that stopped the match of rules in the export policy against the IP address of the client. The rules that have matched so far are used to make access decisions. (Note that the match of rules follows an ordering precedence determined by the rule index). Access may be granted if the security settings in the rules that have matched so far allow access. The security settings in the partial subset of matched rules are never used to deny access because they represent an incomplete set of matched export rules. Instead the client will experience a hang until the error that caused the rule evaluation to fail is resolved.

[-ruleindex-list <integer>, ...] - List of Matched Policy Rule Indexes

Selects the access cache entries that match the specified list of matched rule indexes. This field describes a comma separated list of the indexes of the rules in the export policy that matched the IP address of the client. If no rules match the IP address of the client or an error was encountered in the client match process then this field will not be set to any value.

[-age <[<integer>h][<integer>m][<integer>s]>] - Age of Entry

Selects the access cache entries that match the specified age of the entry. This field describes the age of the access cache entry.

[-polarity {positive|negative|init}] - Access Cache Entry Polarity

Selects the access cache entries that match the specified polarity of the entry. The polarity of an access cache entry can be positive or negative. A positive polarity denotes that access is granted to the client IP address. A negative polarity denotes that access is denied to the client IP address.

[-duration-since-last-use <[<integer>h][<integer>m][<integer>s]>] - Time Elapsed since Last Use for Access Check

Selects the access cache entries that match the specified time duration since the entry was last used for access determination.

[-duration-since-last-update-attempt <[<integer>h][<integer>m][<integer>s]>] - Time Elapsed since Last Update Attempt

Selects the access cache entries that match the specified time duration since the access cache entry was last updated.

[-last-update-attempt-result <integer>] - Result of Last Update Attempt

Selects the access cache entries that match the specified result obtained when the access cache entry was last updated.

[-clientmatch-list <text>, ...] - List of Client Match Strings

Selects the access cache entries that match the specified list of clientmatch strings that matched the specified client IP address.
Examples
The following example shows the contents of the access cache entry for client IP address '10.22.33.32' in volume 'flex1' having export policy 'testpol' in a Vserver named 'vs1' on node 'vsim1':

```
cluster1::*> vserver export-policy access-cache show -vserver vs1 -policy testpol -node vsim1 -address 10.22.33.32
```

Node: vsim1
Vserver: vs1
Policy Name: testpol
IP Address: 10.22.33.32
Access Cache Entry Flags: has-usable-data
Result Code: 0
First Unresolved Rule Index: -
Unresolved Clientmatch: -
Number of Matched Policy Rules: 1
List of Matched Policy Rule Indexes: 20
Age of Entry: 77s
Access Cache Entry Polarity: positive
Time Elapsed since Last Update Attempt: 8s
Time Elapsed since Last Use for Access Check: 3s
Result of Last Update Attempt: 7208
List of Client Match Strings: 0.0.0.0/0

vserver export-policy access-cache show-rules on page 1852

vserver export-policy access-cache show-rules
Display information about the export policy rules in the access cache entry

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver export-policy access-cache show-rules command is used in conjunction with the vserver export-policy access-cache show command. The vserver export-policy access-cache show command displays the state and contents of an access cache entry on the specified node for a particular client IP address belonging to an export policy in a Vserver. The command lists the rule indexes of the export policy rules that matched. If you are interested in finding out the security settings for each policy rule that matched then you can use the vserver export-policy access-cache show-rules command. You can use the -instance switch to get a more detailed listing. Do note that the security settings of the rules cached in the access cache entry match the security settings of the rules that can be obtained by running the vserver export-policy rule show command with the corresponding rule index.

If the client IP address is not cached in access cache then the command will display an error message stating that the entry does not exist.

Parameters

```
[[-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

|[-instance]]

If you specify the -instance parameter, the command displays detailed information about all fields.

-node <nodename> - Node
This parameter specifies the node on which you want to examine the export policy rule details in the access cache entry.

1852

Commands: Manual Page Reference
-vserver <vserver name> - Vserver
  This parameter specifies the name of the Vserver on which you want to see the policy rule details in the access cache entry.

-policy <export policy name> - Policy Name
  This parameter specifies the name of the export policy that is in effect on the export path that the client is trying to access.

-address <IP Address> - IP Address
  This parameter specifies the IP address of the client whose access cache entry you want to examine in greater detail.

[-ruleindex <integer>] - Entry Policy Rule Index
  This optional parameter specifies the index number of the export rule of a specific policy.

[-protocol <Client Access Protocol>, ...] - Access Protocol
  This optional parameter specifies the list access protocols of export rules.

[-rorule <authentication method>, ...] - RO Access Rule
  This parameter specifies the security type for read-only access to volumes that use the export rule.

[-rerule <authentication method>, ...] - RW Access Rule
  This parameter specifies the security type for read-write access to volumes that use the export rule.

[-superuser <authentication method>, ...] - Superuser Security Types
  This parameter specifies a security type for superuser access to files.

[-anon-uid <integer>] - Anonymous User ID
  This parameter specifies an anonymous user ID that the user credentials are mapped to.

[-anon-gid <integer>] - Anonymous User Primary GID
  This parameter specifies an anonymous User Primary GID.

[-anon-gid-list <integer>, ...] - Anonymous User GID List
  This parameter specifies an anonymous User Primary GID list.

[-protocol-flags {allow-suid|allow-dev}, ...] - Protocol Flags
  This parameter specifies protocol flags such as allow-suid and allow-dev.

[-ntfs-unix-security-ops {ignore|fail}] - NTFS Unix Security Options
  This parameter specifies whether UNIX-type permissions changes on NTFS (Windows) volumes are prohibited (fail) or allowed (ignore).

[-chown-mode {restricted|unrestricted}] - Change Ownership Mode
  This parameter specifies a change ownership mode.

[-clientmatch <text>] - Client Match String
  This parameter specifies the client or clients to which the export rule applies.

[-anonuser <text>] - Anonymous Username or ID
  This parameter specifies a UNIX user ID or user name that the user credentials are mapped to.

Examples
The following example shows the contents of the access cache entry for client IP address '1.2.3.4' in volume 'flex1' having export policy 'testpol' in a Vserver named 'vs1' on node 'vsim1'. This entry has two export policy rules with rule indexes 1 and 2 that matched and are cached in the entry. To examine what the rule settings are in each of these rules we can use the show-rules variant of the command.
cluster1::*>vserver export-policy access-cache show -vserver vs1 -node vsim1 -policy testpol -address 1.2.3.4

Node: vsim1
Vserver: vs1
Policy Name: testpol
IP Address: 1.2.3.4
Access Cache Entry Flags: -
Result Code: 0
Failure Type Code: 0
Number of Matched Policy Rules: 2
List of Matched Policy Rule Indexes: 1, 2
Age of Entry: 5s

cluster1::*>vserver export-policy access-cache show-rules -vserver vs1 -node vsim1 -policy testpol -address 1.2.3.4

vserver export-policy access-cache config commands

Modify exports access cache configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver export-policy access-cache config modify command modifies access cache timeout values per Vserver. Modifying these values from any node updates the values on all the nodes in the cluster. The modified values persist across reboots.

Parameters
-vserver <vserver name> - Vserver
This parameter specifies the Vserver name for which the timeout values need to be modified.

[-ttl-positive <integer>] - TTL For Positive Entries (Secs)
This parameter specifies the duration after which positive access cache entries will be refreshed upon client access. The value is specified in seconds. The default value is 3600 seconds. Valid values range from 300 seconds to 86400 seconds.

[-ttl-negative <integer>] - TTL For Negative Entries (Secs)
This parameter specifies the duration after which negative access cache entries will be refreshed upon client access. The value is specified in seconds. The default value is 3600 seconds. Valid values range from 60 seconds to 86400 seconds.

[-harvest-timeout <integer>] - Harvest Timeout (Secs)
This parameter specifies the time period after which Data ONTAP deletes unused entries in the access cache. The value is specified in seconds. The default value is 86400 seconds. Valid values range from 60 seconds to 2592000 seconds.

Examples
The following command sets the positive TTL value to 36000 seconds, the negative TTL value to 3600 seconds, and the harvest timeout value to 43200 seconds for Vserver 'vs0':

```bash
cluster1:/> vserver export-policy access-cache config modify -ttl-positive 36000 -ttl-negative 3600 -harvest-timeout 43200
cluster1:/> vserver export-policy access-cache config show -vserver vs0
  Vserver: vs0
  TTL For Positive Entries (secs): 36000
```
vserver export-policy access-cache config modify-all-vservers

Modify exports access cache configuration for all Vservers

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The `vserver export-policy access-cache config modify-all-vservers` command modifies access cache timeout values for all Vservers. Modifying these values from any node updates the values on all the nodes in the cluster. The modified values persist across reboots.

Note: This command is not supported in a cluster with effective cluster version of Data ONTAP 9.0.0 or later. The access cache settings are modified on a per-Vserver basis starting Data ONTAP 9.0.0. See the `vserver export-policy access-cache config modify` command.

Parameters

[<ttl-positive <integer>>] - TTL For Positive Entries (Secs)

This parameter specifies the duration after which positive access cache entries will be refreshed when the client accesses.

[<ttl-negative <integer>>] - TTL For Negative Entries (Secs)

This parameter specifies the duration after which negative access cache entries will be refreshed when the client accesses.

[<harvest-timeout <integer>>] - Harvest Timeout (Secs)

This parameter specifies the time period after which Data ONTAP deletes unused entries in the access cache.

Examples

The following command sets the positive TTL value to 36000 seconds, the negative TTL value to 3600 seconds, and the harvest timeout value to 43200 seconds for all Vservers in a cluster where the effective cluster version is earlier than Data ONTAP 9.0.0.

```
cluster1::*> vserver export-policy access-cache config modify-all-vservers -ttl-positive 36000 -
        ttl-negative 3600 -harvest-timeout 43200

cluster1::*> vserver export-policy access-cache config show-all-vservers
        TTL For Positive Entries (secs): 36000
        TTL For Negative Entries (secs): 3600
        Harvest Timeout (secs): 43200
```

vserver export-policy access-cache config modify on page 1855

vserver export-policy access-cache config show

Display exports access cache configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.
Description
The `vserver export-policy access-cache config show` command displays the timeout attributes related to the exports access cache. The access cache maintains export rules applicable to a client that is accessing the volume or qtree. The command output displays the following timeout parameters and their values for each Vserver:

- **TTL for Positive Entries**: This is the TTL for positive entries in the access cache. During client access, if the TTL for the access cache entry that is allowing access has expired, that access cache entry will be refreshed. While the refresh is in progress, client access will be evaluated with the existing information in the access cache entry.

- **TTL for Negative Entries**: This is the TTL for negative entries in the access cache. During client access, if the TTL for the access cache entry that is denying access has expired, that access cache entry will be refreshed. While the refresh is in progress, client access will be evaluated with the existing information in the access cache entry.

- **TTL for Entries with Failure**: This is the TTL for access cache entries for which a failure was encountered while trying to get matching rules.

- **Harvest Timeout**: If Data ONTAP does not use an entry that is stored in the access cache for this period of time, it deletes the entry.

Parameters

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance]
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[-vserver <vserver name>] - Vserver
```

If this parameter is specified, the command displays the timeout values for the specified Vserver.

```
[-ttl-positive <integer>] - TTL For Positive Entries (Secs)
```

If this parameter is specified, the command displays the timeout values for Vservers whose ttl-positive matches the provided value.

```
[-ttl-negative <integer>] - TTL For Negative Entries (Secs)
```

If this parameter is specified, the command displays the timeout values for Vservers whose ttl-negative matches the provided value.

```
[-harvest-timeout <integer>] - Harvest Timeout (Secs)
```

If this parameter is specified, the command displays the timeout values for Vservers whose harvest-timeout matches the provided value.

Examples

The following command displays the exports access cache timeout values for all Vservers in the cluster:

```
class1:*> vserver export-policy access-cache config show
```

<table>
<thead>
<tr>
<th>Vserver</th>
<th>TTL Positive (secs)</th>
<th>TTL Negative (secs)</th>
<th>TTL Failure (secs)</th>
<th>Harvest Timeout (secs)</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs0</td>
<td>300</td>
<td>60</td>
<td>1</td>
<td>3600</td>
</tr>
<tr>
<td>vs1</td>
<td>36000</td>
<td>3600</td>
<td>5</td>
<td>3600</td>
</tr>
</tbody>
</table>

2 entries were displayed.
vserver export-policy access-cache config show-all-vservers

Display exports access cache configuration for all Vservers

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The vserver export-policy access-cache config show-all-vservers command displays the timeout attributes related to the exports access cache. The access cache maintains export rules applicable to a client that is accessing the volume or qtree. Data ONTAP obtains the access cache timeout values from the node where you run the command. The command output displays the following timeout parameters and their values:

- TTL for Positive Entries: This is the TTL for positive entries in the access cache. During client access, if the TTL for the access cache entry that is allowing access has expired, that access cache entry will be refreshed. While the refresh is in progress, client access will be evaluated with the existing information in the access cache entry.

- TTL for Negative Entries: This is the TTL for negative entries in the access cache. During client access, if the TTL for the access cache entry that is denying access has expired, that access cache entry will be refreshed. While the refresh is in progress, client access will be evaluated with the existing information in the access cache entry.

- Harvest Timeout: If Data ONTAP does not use an entry that is stored in the access cache for this period of time, it deletes the entry.

Note: This command is not supported in a cluster with effective cluster version of Data ONTAP 9.0.0 or later. The access cache settings are stored on a per-Vserver basis starting Data ONTAP 9.0.0. See the vserver export-policy access-cache config show command.

Examples
The following command displays the exports access cache timeout values for all Vservers in a cluster where the effective cluster version is earlier than Data ONTAP 9.0.0:

```
cluster1::*> vserver export-policy access-cache config show-all-vservers
TTL For Positive Entries (secs): 36000
TTL For Negative Entries (secs): 3600
Harvest Timeout (secs): 43200
```

vserver export-policy cache commands

Manage the export-policy cache

vserver export-policy cache flush
Flush the Export Caches

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The vserver export-policy cache flush command clears out the contents of the export policy caches for a Vserver. You might need to flush the caches to allow the changes to immediately take effect for your NFS clients because of:

- A change to your export policy rules.
• Modifying a host name record in a name server (i.e., local hosts or DNS).
• Modifying a PTR record in a DNS server (i.e., reverse DNS lookup).
• Modifying the entries in a netgroup in a name server (i.e., local netgroup, LDAP, or NIS).
• Recovering from a network outage that resulted in a netgroup being partially expanded.

To flush the caches, you must specify the following items:
• Vserver: either a specific Vserver or use "*" to flush all of them.

You can optionally specify the following items:
• Node: if flushing the access cache, you can also specify which node to flush it on.
• Cache to flush: by default all but showmount will be flushed.

Note that the showmount cache is not used to determine NFS client access and as such is only flushable explicitly.

Parameters
-vserver <vserver name> - Vserver
   This parameter specifies the name of the Vserver on which you want to flush the caches.

[-node <nodename>] - Node
   This parameter specifies the node on which you want to flush the access cache.

[-cache {all|access|host|id|name|netgroup|showmount|ip}] - Cache Name
   This parameter specifies the name of the cache which you want to flush. Possible values include the following:
   • all - All caches but showmount. This is the default.
   • access - The export-policy rules access cache.
   • host - The host name to IP cache.
   • id - The ID to credential cache.
   • ip - The IP to host name cache.
   • name - The name to ID cache.
   • netgroup - The netgroup cache.
   • showmount - The showmount caches.

Examples
The following example flushes the access cache on a Vserver named vs0:

```
cluster1::> vserver export-policy cache flush -vserver vs0 -cache access
```

vserver export-policy config-checker commands
The config-checker directory

vserver export-policy config-checker show
Show the status of export policy configuration checker jobs

Availability: This command is available to cluster administrators at the admin privilege level.
Description
The `vserver export-policy config-checker show` command displays status information about export policy configuration checker job. This command displays the following information:

- Vserver name
- Export policy name
- Export policy configuration checker job state
- Export policy rule checked count
- Export policy rule being checked rule index
- Export policy rule with issue count

Note: This command output will only be available after running the export policy configuration checker job.

Parameters
```
{ [-fields <fieldname>, ...]
       If you specify the -fields parameter, the command only displays the fields that you specify.

 | [-instance]]
       If you specify the -instance parameter, the command displays detailed information about all entries.

[-vserver <vserver name>] - Vserver
       If you specify this parameter, the command displays export policy configuration checker job state information for Vservers that match the specified value.

[-policy <export policy name>] - Policy Name
       If you specify this parameter, the command displays export policy configuration checker job state information for policy that match the specified value.

[-rules-checked <integer>] - Number of Rules Checked
       If you specify this parameter, the command displays export policy configuration checker job state information that have the specified rules-checked count matching.

[-rule-being-checked <integer>] - Rule Being Checked
       If you specify this parameter, the command displays export policy configuration checker job state information that have the specified rule-being-checked index matching.

[-rules-with-issues <integer>] - Number of Rules with Issues
       If you specify this parameter, the command displays export policy configuration checker job state information that have the specified rules-with-issues count matching.

[-state {Initial|Queued|Running|Waiting|Pausing|Paused|Quitting|Success|Failure|Reschedule|Error|Quit|Dead|Unknown|Restart|Dormant}] - Job State
       If you specify this parameter, the command displays export policy configuration checker job state information that have the specified state matching.
```

Examples
The following example displays an export policy configuration checker job state information for vserver vs2 and policy default:
vserver export-policy config-checker start

Start export policy configuration checker job

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver export-policy config-checker start` command invokes background job, which will check export policy configuration and if issue found in rules then error entry is created for each affected rule in export policy configuration checker error rule list.

**Note:** Export policy configuration checker only validates hostname, netgroup and anonymous user related configuration.

**Parameters**

- `-vserver <vserver name>` - Vserver
  
  If you specify this parameter, the export policy configuration checker job will be triggered for specified Vserver.

- `[-policy <export policy name>]` - Export Policy Name
  
  If you specify this parameter, the export policy configuration checker job will be triggered for specified policy.

**Examples**
The following example start a export policy configuration checker job for vserver vs2 and policy default:

```
cluster1::> vserver export-policy config-checker start -vserver vs2 -policy default

[Job 644] Job is queued: Export Policy configuration checker.
```

vserver export-policy config-checker stop

Stop export policy configuration checker job

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver export-policy config-checker stop` command stops running export policy configuration checker job.

**Note:** Export policy configuration checker stop command only works if the keys provided are same as the keys provided at the time of starting export policy configuration checker job.

**Parameters**

- `-vserver <vserver name>` - Vserver
  
  If you specify this parameter, the command stops export policy configuration checker job, if any export policy configuration checker job is running for the specified Vserver.

- `[-policy <export policy name>]` - Export Policy Name
  
  If you specify this parameter, the command stops export policy configuration checker job, if any export policy configuration checker job is running for the specified policy.
vserver export-policy config-checker rule commands

The rule directory

vserver export-policy config-checker rule delete

Delete error entries for rules from export policy configuration checker error rule list

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The vserver export-policy config-checker rule delete command deletes error rule entries from export policy configuration checker error rule list. You can delete a specific error entry rule by specifying its rule index number.

Parameters

- **-node** `<nodename>|local>` - Node
  
  This parameter specifies the node on which the export policy configuration error rule entries are stored.

- **-vserver** `<vserver name>` - Vserver
  
  This parameter specifies the Vserver which contains the export policy.

- **-policy** `<export policy name>` - Policy Name
  
  This parameter specifies the export policy from which you want to delete an error rule entry.

- **-rule-index** `<integer>` - Rule Index
  
  This parameter specifies the index number of the error rule entry that you want to delete. You can use the vserver export-policy config-checker rule show command to view a list of rules with their index numbers.

Examples

The following example deletes an error rule entry from config-checker error rule list, with the index number 1 from an export policy named default on a Vserver named vs34:

```
cluster1::> vserver export-policy config-checker rule delete -node node-vsim3 -vserver vs34 -policy test -rule-index 1
(vserver export-policy config-checker rule delete)
1 entry was deleted.
```

Related references

vserver export-policy config-checker rule show on page 1862

vserver export-policy config-checker rule show

Show error entries for rules in export policy configuration checker job

Availability: This command is available to cluster administrators at the admin privilege level.
Description
The `vserver export-policy config-checker rule show` command displays information about error related to configuration in export policy rules. If a rule has any issues the configuration checker job will log information about such errors on the node where the job runs. The command displays the following information:

- Node name
- Vserver name
- Export policy name
- Export policy rule index number
- Export policy rule error

Parameters

`[-fields <fieldname>,...]`
If you specify the `fields` parameter, the command only displays the fields that you specify.

`[-instance]`
If you specify the `instance` parameter, the command displays detailed information about all entries.

`[-node <nodename>|local]` - Node
If you specify this parameter, the command displays detailed error information for node that matches the specified value.

`[-vserver <vserver name>]` - Vserver
If you specify this parameter, the command displays detailed error information for Vservers that match the specified value.

`[-policy <export policy name>]` - Policy Name
If you specify this parameter, the command displays detailed error information for policy that match the specified value.

`[-rule-index <integer>]` - Rule Index
If you specify this parameter, the command displays detailed error information for rule-index that match the specified value.

`[-error <text>]` - Error Details
If you specify this parameter, the command displays rule index information for error that match the specified value. The complete error string needs to be specified within "{}".

Examples

The following example displays information about error related to export rules:

```
cluster1::> vserver export-policy config-checker rule show -node node-vsim3 -vserver vs34 -policy test
(vserver export-policy config-checker rule show)
<table>
<thead>
<tr>
<th>Node</th>
<th>Vserver</th>
<th>Policy</th>
<th>Index</th>
<th>Error</th>
</tr>
</thead>
<tbody>
<tr>
<td>node-vsim3</td>
<td>vs34</td>
<td>test</td>
<td>1</td>
<td>DNS lookup for host &quot;h1&quot; failed</td>
</tr>
<tr>
<td></td>
<td>vs34</td>
<td>test</td>
<td>2</td>
<td>Entry not found for &quot;UserName: testuser&quot;, DNS lookup for host &quot;h2&quot; failed</td>
</tr>
</tbody>
</table>

2 entries were displayed.
```

```
cluster1::> vserver export-policy config-checker rule show -node node-vsim3 -vserver vs34 -policy test -rule-index 1
(vserver export-policy config-checker rule show)
Node: node-vsim3
```

vserver export-policy commands
vserver export-policy netgroup commands

The netgroup directory

vserver export-policy netgroup check-membership

Check to see if the client is a member of the netgroup

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver export-policy netgroup check-membership command determines if the client IP address is a member of the netgroup. Data ONTAP can determine the membership information only after it has fully loaded the netgroup into the cache. Until then, while the reverse lookup scan algorithm might find a match, both DNS round robin and DNS aliases prevent ruling out non-matches. You can use the vserver export-policy netgroup queue show command to monitor the loading of the netgroup.

Parameters

-vserver <vserver name> - Vserver
This parameter specifies the name of the Vserver whose netgroup you want to check for client membership.

-netgroup <text> - Name of the Netgroup
This parameter specifies the name of the netgroup that you want to check for client membership.

-client-ip <IP Address> - Client Address
This parameter specifies the IP address of the client whose netgroup membership you want to check.

Examples
The following examples of the vserver export-policy netgroup check-membership command display various possible results for client membership checks.

```
cluster1::*> vserver export-policy netgroup check-membership -vserver vs1 -netgroup mercury -client-ip 172.17.16.72
Client 172.17.16.72 is a member of netgroup "mercury" for Vserver "vs1" with state "reverse lookup scan".

cluster1::*> vserver export-policy netgroup check-membership -vserver vs1 -netgroup mercury -client-ip 172.17.16.72
Client 172.17.16.72 is a member of netgroup "mercury" for Vserver "vs1" with state "cache".

cluster1::*> vserver export-policy netgroup check-membership -vserver vs1 -netgroup mercury -client-ip 172.17.16.14
Client 172.17.16.14 is not a member of netgroup "mercury" for Vserver "vs1".
```

vserver export-policy netgroup queue show on page 1867

vserver export-policy netgroup cache commands

The cache directory

vserver export-policy netgroup cache show

Show the Netgroup Cache

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver export-policy netgroup cache show command displays the contents of the export policy netgroup cache for a Vserver. Entries shown here correspond to the caches used to evaluate client membership in a netgroup. To show the netgroup cache, you must specify the following item:

- Vserver: The name of the Vserver whose netgroup cache you want to display.

The following information is displayed per cache entry:

- Vserver name: The name of the Vserver.
- Netgroup name: The name of the netgroup.
- State of the cache entry: The state of the cache entry. There are four possible values:
  - initializing: The cache entry is being populated for the first time.
  - ready: Processing of the cache entry is complete and it is ready to be used.
  - not-found: The netgroup could not be found.
  - abandoned: The cache entry has been abandoned.
- Total number of hosts in the netgroup cache: The number of host names retrieved from the name service in mapping the netgroup to a list of hosts.
- How long it took to expand the netgroup: How long it took to expand the netgroup the last time in the queue.
- Entry is refreshing: If the entry is a complete miss or refresh.
- Next refresh time: When the next refresh is scheduled to take place.
- Netgroup by host state: Boolean state indicating if netgroup-by-host feature is used for resolving netgroup membership check.
• Number of IP addresses cached: Number of client IP addresses that are matched for the netgroup. The count includes both positive and negative results.

Parameters

\{-fields <fieldname>, ...\}

If you specify the \{-fields <fieldname>, ...\} parameter, the command output also includes the specified field or fields. You can use \{-fields ?\} to display the fields to specify.

\{-instance\}

If you specify the \{-instance\} parameter, the command displays detailed information about all fields.

\{-vserver <vserver name>\} - Vserver

If you specify this parameter, the command displays the netgroup cache information only if the Vserver name matches the specified value.

\{-netgroup <text>\} - Name of the Netgroup

If you specify this parameter, the command displays the netgroup cache information only if the netgroup name matches the specified value.

\{-cache-state \{initializing|ready|not-found|abandoned\}\} - State of the Cache Entry

If you specify this parameter, the command displays the netgroup cache information only if the netgroup cache state matches the specified value.

\{-total-hosts <integer>\} - Total Number of Hosts in the Netgroup

If you specify this parameter, the command displays the netgroup cache information only if the netgroup record's count of host names matches the specified value.

\{-expansion-duration <[[<hours>:]<minutes>:]<seconds>>\} - Expansion Duration

If you specify this parameter, the command displays the netgroup cache information only if the netgroup record expansion time matches the specified value.

\{-is-refreshing \{true|false\}\} - Is Entry Refreshing?

If you specify this parameter, the command displays the netgroup cache information only if the netgroup record refreshing state matches the specified value.

\{-time-next-refresh <Date>\} - Next Refresh Time

If you specify this parameter, the command displays the netgroup cache information only if the time of the next scheduled refresh matches the specified value.

\{-num-ip-addrs-cache <integer>\} - Number of Cached IP Addresses

If you specify this parameter, the command displays the netgroup cache information only if the number of cached IP addresses matches the specified value.

Examples

The following example displays the netgroup cache for the Vserver vs1 and the netgroup netgroup1:

```
cluster1::> vserver export-policy netgroup cache show -vserver vs1 -netgroup netgroup1
Vserver Netgroup State
-------- ---------- ------------
vs1      netgroup1 Ready
```

vserver export-policy netgroup queue commands

The queue directory
vserver export-policy netgroup queue show

Show the Netgroup Processing Queue

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The vserver export-policy netgroup queue show command displays the ongoing processing of the netgroup cache for a node. Entries shown here are not used to evaluate client membership in a netgroup. The following information is displayed per queue entry:

- Vserver name: The name of the Vserver.
- Netgroup name: The name of the netgroup.
- Age of entry in the queue: How long the entry has been in the queue.
- Queue state: The state of the entry in the queue. There are three possible values:
  - running: The entry is currently being processed.
  - waiting: The entry is waiting to be processed.
  - retrying: The entry is waiting to be reprocessed.

Note that as the vserver export-policy netgroup queue show command is not atomic. Several queue entries might show up in the 'running' state.

- Number of times retried in the queue: The number of times was the entry was taken off of the netgroup processing queue and added back on it.
- Total number of hosts in the netgroup: The number of host names retrieved from the name service in mapping the netgroup to a list of hosts.

Parameters

{ [-fields <fieldname>, ...]  
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance ]|  
If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver
If you specify this parameter, the command displays the netgroup cache information only if the Vserver name matches the specified value.

[-netgroup <text>] - Name of the Netgroup
If you specify this parameter, the command displays the netgroup cache information only if the netgroup name matches the specified value.

[-queue-state {waiting|running|retrying}] - State of Entry in the Queue
If you specify this parameter, the command displays the netgroup cache information only if the netgroup queue state matches the specified value.

[-age {[<hours>:]<minutes>:}<seconds>] - Age of Entry in the Queue
If you specify this parameter, the command displays the netgroup cache information only if the age of when the netgroup record was put on the netgroup processing queue matches the specified value.

vserver export-policy commands
Number of Retries on the Queue

If you specify this parameter, the command displays the netgroup cache information only if, during a refresh, the number of times the netgroup record has been put back on the netgroup processing queue matches the specified value.

Total Number of Hosts in the Netgroup

If you specify this parameter, the command displays the netgroup cache information only if the netgroup record's count of hosts matches the specified value.

Examples

The following example displays the netgroup queue:

```
cluster1::> vserver export-policy netgroup queue show

Age on     Total
Vserver    Netgroup   State         Queue     Hosts
---------- ---------- --------- --------- ---------
testvs1    test-netgr retrying     0:0:47     12441
testvs1    test       waiting     0:01:35         -
```

vserver export-policy rule commands

Manage export rules

vserver export-policy rule add-clientmatches

Add list of clientmatch strings to an existing rule

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver export-policy rule add-clientmatches command adds a list of strings to the clientmatch field of a specified export rule in a policy. This command only operates on the clientmatch field; to modify other fields in a rule use the vserver export-policy modify command.

Parameters

- `vserver <vserver name>` - Vserver
  
  This parameter specifies the Vserver on which the export policy is located.

- `policyname <export policy name>` - Policy Name
  
  This parameter specifies the name of the export policy containing the export rule to which you want to add additional clientmatch strings.

- `ruleindex <integer>` - Rule Index
  
  This parameter specifies the index number of the export rule to which you want to add additional clientmatch strings. To view a list of rules with their index numbers, use the vserver export-policy rule show command.

- `clientmatches <text>` - List of Clientmatch Strings to Add
  
  This parameter specifies list of the match strings specifying the client or clients to add to the export rule. Duplicate match strings will not be created and the list may not contain duplicates entries. Match strings from the clientmatches list are added to the clientmatch field if the match string is not identical to one of the strings already in the clientmatch field. You can specify the match string in any of the following formats:
  
  - As a hostname; for instance, host1
  - As an IPv4 address; for instance, 10.1.12.24
- As an IPv6 address; for instance, fd20:8b1e:b255:4071::100:1
- As an IPv4 address with a subnet mask expressed as a number of bits; for instance, 10.1.12.0/24
- As an IPv6 address with a subnet mask expressed as a number of bits; for instance, fd20:8b1e:b255:4071::/64
- As an IPv4 address with a network mask; for instance, 10.1.16.0/255.255.255.0
- As a netgroup, with the netgroup name preceded by the @ character; for instance, @eng
- As a domain name preceded by the . character; for instance, .example.com

Note: Entering an IP address range, such as 10.1.12.10-10.1.12.70, is not allowed. Entries in this format are interpreted as a text string and treated as a hostname.

Examples

The following example adds match strings "2.2.2.2" and "3.3.3.3" to the clientmatch field of the export rule with index number 3 in an export policy named default_expolicy on a Vserver named vs0.

```
cluster1::> vserver export-policy rule add-clientmatches -vserver vs0 -policyname default_expolicy -ruleindex 3 -clientmatches "2.2.2.2,3.3.3.3"
```

vserver export-policy rule create

Create a rule

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver export-policy rule create command creates an export rule and adds it to a policy. To create an export rule, you must specify the following items:

- Vserver
- Export policy
- Clients that match the rule
- Read-only access rule
- Read-write access rule

You can optionally specify the following items:

- Index number; that is, the location of the export rule in the policy
- Access protocol
- Anonymous ID
- Superuser security type
- Whether suid access is enabled
- Whether creation of devices is enabled
• Whether UNIX-type permissions changes on NTFS (Windows) volumes are prohibited or allowed when the request originates from an NFS client (advanced privilege and higher only)

• Whether ownership changes are restricted or not (advanced privilege and higher only)

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the Vserver on which the export policy is located.

-policyname <export policy name> - Policy Name

This parameter specifies the name of the export policy to which you want to add the new export rule. The export policy must already exist. To create an export policy, see the vserver export-policy create command.

[-ruleindex <integer>] - Rule Index

This optional parameter specifies the index number of the export rule that you want to create. If you specify an index number that already matches a rule, the index number of the existing rule is incremented, as are the index numbers of all subsequent rules, either to the end of the list or to an open space in the list. If you do not specify an index number, the new rule is placed at the end of the policy's list.

[-protocol <Client Access Protocol>, ...] - Access Protocol

This optional parameter specifies the list of access protocols for which you want to apply the export rule. Possible values include the following:

• any - Any current or future access protocol
• nfs - Any current or future version of NFS
• nfs3 - The NFSv3 protocol
• nfs4 - The NFSv4 protocol
• cifs - The CIFS protocol

You can specify a comma-separated list of multiple access protocols for an export rule. If you specify the protocol as any, you cannot specify any other protocols in the list. If you do not specify this parameter, the value defaults to any. If you enable NFSv4, you will not be able to apply the policy to which this rule belongs to a FlexGroup, as FlexGroups do not support NFSv4 protocol access.

-clientmatch <text> - List of Client Match Hostnames, IP Addresses, Netgroups, or Domains

This parameter specifies list of the match strings specifying the client or clients to which the export rule applies. Duplicate match strings in the same rule are not allowed. You can specify the match string in any of the following formats:

• As a hostname; for instance, host1
• As an IPv4 address; for instance, 10.1.12.24
• As an IPv6 address; for instance, fd20:8b1e:b255:4071::100:1
• As an IPv4 address with a subnet mask expressed as a number of bits; for instance, 10.1.12.0/24
• As an IPv6 address with a subnet mask expressed as a number of bits; for instance, fd20:8b1e:b255:4071::/64
• As an IPv4 address with a network mask; for instance, 10.1.16.0/255.255.255.0
• As a netgroup, with the netgroup name preceded by the @ character; for instance, @eng
• As a domain name preceded by the . character; for instance, .example.com
Note: Entering an IP address range, such as 10.1.12.10-10.1.12.70, is not allowed. Entries in this format are interpreted as a text string and treated as a hostname.

-rorule <authentication method>, ... - RO Access Rule

This parameter specifies the security type for read-only access to volumes that use the export rule. Possible values include the following:

- **sys** - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is AUTH_SYS. The effective security type of the incoming request (to be used subsequently in evaluation of rerule/superuser) becomes sys.

- **krb5** - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is Kerberos v5. The effective security type of the incoming request (to be used subsequently in evaluation of rerule/superuser) becomes krb5.

- **krb5i** - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is Kerberos v5 with integrity service. The effective security type of the incoming request (to be used subsequently in evaluation of rerule/superuser) becomes krb5i.

- **krb5p** - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is Kerberos v5 with privacy service. The effective security type of the incoming request (to be used subsequently in evaluation of rerule/superuser) becomes krb5p.

- **ntlm** - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is CIFS NTLM. The effective security type of the incoming request (to be used subsequently in evaluation of rerule/superuser) becomes ntlm.

- **any** - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume regardless of the security type of that incoming request. The effective security type of the incoming request (to be used subsequently in evaluation of rerule/superuser) remains the same as the security type of the incoming request.

  Note: If the security type of the incoming request is AUTH_NONE, read access will be granted to that incoming request as an anonymous user.

- **none** - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume as an anonymous user if the security type of that incoming request is not explicitly listed in the list of values in the rorule. The effective security type of the incoming request (to be used subsequently in evaluation of rerule/superuser) becomes none.

- **never** - For an incoming request from a client matching the clientmatch criteria, do not allow any access to the volume regardless of the security type of that incoming request.

You can specify a comma-separated list of multiple security types for an export rule. If you specify the security type as *any* or *never*, you cannot specify any other security types.

  Note: For an incoming request from a client matching the clientmatch criteria, if the security type doesn't match any of the values listed in rorule (as explained above), access will be denied to that incoming request.

-rerule <authentication method>, ... - RW Access Rule

This parameter specifies the security type for read-write access to volumes that use the export rule. Possible values include the following:

- **sys** - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the effective security type (determined from rorule) of that incoming request is AUTH_SYS.

- **krb5** - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the effective security type (determined from rorule) of that incoming request is Kerberos v5.
• **krb5** - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the effective security type (determined from rorule) of that incoming request is Kerberos v5 with integrity service.

• **krb5p** - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the effective security type (determined from rorule) of that incoming request is Kerberos v5 with privacy service.

• **ntlm** - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the effective security type (determined from rorule) of that incoming request is CIFS NTLM.

• **any** - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume regardless of the effective security type (determined from rorule) of that incoming request.

  **Note:** If the effective security type (determined from rorule) of the incoming request is none, write access will be granted to that incoming request as an anonymous user.

• **none** - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume as an anonymous user if the effective security type (determined from rorule) of that incoming request is none.

• **never** - For an incoming request from a client matching the clientmatch criteria, do not allow write access to the volume regardless of the effective security type (determined from rorule) of that incoming request.

You can specify a comma-separated list of multiple security types for an export rule. If you specify the security type as **any** or **never**, you cannot specify any other security types.

**Note:** For an incoming request from a client matching the clientmatch criteria, if the effective security type (determined by rorule) doesn't match any of the values listed in rwrule (as explained above), write access will be denied to that incoming request.

[-anon <text>] - User ID To Which Anonymous Users Are Mapped

This parameter specifies a UNIX user ID or user name that the user credentials are mapped to when evaluation of rorule or superuser parameters result in user being mapped to the anonymous user. The default setting of this parameter is 65534. NFS clients typically associate user ID 65534 with the user name nobody. In clustered Data ONTAP, this user ID is associated with the user pcuser. To disable access by any client with a user ID of 0, specify a value of 65535 which is associated with the user nobody.

[-superuser <authentication method>,...] - Superuser Security Types

This parameter specifies a security type for superuser access to files. The default setting of this parameter is **none**. Possible values include the following:

• **sys** - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume if the effective security type (determined from rorule) of that incoming request is AUTH_SYS.

• **krb5** - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume if the effective security type (determined from rorule) of that incoming request is Kerberos v5.

• **krb5i** - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume if the effective security type (determined from rorule) of that incoming request is Kerberos v5 with integrity service.

• **krb5p** - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume if the effective security type (determined from rorule) of that incoming request is Kerberos v5 with privacy service.
- ntlm - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume if the effective security type (determined from rorule) of that incoming request is CIFS NTLM.

- any - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume regardless of the effective security type (determined by rorule) of that incoming request.

  Note: If the effective security type (determined from rorule) of the incoming request is none, access will be granted to that incoming request as an anonymous user.

- none - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow access to the volume as an anonymous user if the effective security type (determined from rorule) of that incoming request is none.

You can specify a comma-separated list of multiple security types for superuser access. If you specify the security type as any, you cannot specify any other security types.

  Note: For an incoming request from a client matching the clientmatch criteria and with the user ID 0, if the effective security type doesn't match any of the values listed in superuser (as explained above), the user ID is mapped to anonymous user.

[-allow-suid {true|false}] - Honor SetUID Bits in SETATTR

  This parameter specifies whether set user ID (suid) and set group ID (sgid) access is enabled by the export rule. The default setting is true.

[-allow-dev {true|false}] - Allow Creation of Devices

  This parameter specifies whether the creation of devices is enabled by the export rule. The default setting is true.

[-ntfs-unix-security-ops {ignore|fail}] - NTFS Unix Security Options (privilege: advanced)

  This parameter specifies whether UNIX-type permissions changes on NTFS (Windows) volumes are prohibited (fail) or allowed (ignore) when the request originates from an NFS client. The default setting is fail.

[-chown-mode {restricted|unrestricted}] - Change Ownership Mode (privilege: advanced)

  This parameter specifies who is allowed to change the ownership mode of a file. The default setting is restricted. The allowed values are:

  • restricted - Only root may change the ownership of the file.
  • unrestricted - Non-root users may change file ownership provided the on-disk permissions allow the operation.

Examples

The following example creates an export rule with index number 1 in an export policy named read_only_expolicy on a Vserver named vs0. The rule matches all clients in the domains named example.com or example.net. The rule enables all access protocols. It enables read-only access by any matching client and requires authentication by AUTH_SYS, NTLM, or Kerberos 5 for read-write access. Clients with the UNIX user ID zero are mapped to user ID 65534 (which normally maps to the user name nobody). It does not enable suid and sgid access or the creation of devices.

cluster1::> vserver export-policy rule create -vserver vs0 -policyname read_only_expolicy -ruleindex 1 -protocol any -clientmatch ".example.com,.example.net" -rorule any -rwrule "ntlm,krb5,sys" -anon 65534 -allow-suid false -allow-dev false
vserver export-policy rule delete

Delete a rule

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver export-policy rule delete command deletes an export rule from a policy. You can specify the export rule by specifying its index number in the policy. When you delete a rule, the other rules in the policy are not automatically renumbered or reordered. You can use the vserver export-policy rule setindex command to reorder the rules in a rule set.

Parameters
- `vserver <vserver name>` - Vserver
  This parameter specifies the Vserver which contains the export policy.
- `policyname <export policy name>` - Policy Name
  This parameter specifies the export policy from which you want to delete a rule.
- `ruleindex <integer>` - Rule Index
  This parameter specifies the index number of the rule that you want to delete. You can use the vserver export-policy rule show command to view a list of rules with their index numbers.

Examples
The following example deletes an export rule with the index number 5 from an export policy named rs1 on a Vserver named vs0:

```
cluster1::> vserver export-policy rule delete -vserver vs0
-policynname read_only_expolicy -ruleindex 5
```

vserver export-policy rule setindex on page 1880

vserver export-policy rule modify

Modify a rule

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver export-policy rule modify command modifies a specified export rule in a policy. This command cannot change the position of a rule in a policy; to reorder rules in a policy, use the vserver export-policy rule setindex command. Duplicate match strings in the same rule are not allowed. You can use this command to change the following attributes of an export rule:

- Access protocol
- Client match specification
- Read-only access rule
- Read-write access rule
• Anonymous ID
• Superuser security type
• Whether suid access is enabled
• Whether creation of devices is enabled
• Whether UNIX-type permissions changes on NTFS (Windows) volumes are prohibited or allowed when the request originates from an NFS client (advanced privilege and higher only)
• Whether ownership changes are restricted or not (advanced privilege and higher only)

Parameters

-vserver <vserver name> - Vserver
   This parameter specifies the Vserver on which the export policy is located.

-policyname <export policy name> - Policy Name
   This parameter specifies the name of the export policy containing the export rule that you want to modify.

-ruleindex <integer> - Rule Index
   This parameter specifies the index number of the export rule that you want to modify. To view a list of rules with their index numbers, use the vserver export-policy rule show command.

[-protocol <Client Access Protocol>, ...] - Access Protocol
   This optional parameter specifies the list of access protocols for which you want to apply the export rule. Possible values include the following:
   • any - Any current or future access protocol
   • nfs - Any current or future version of NFS
   • nfs3 - The NFSv3 protocol
   • nfs4 - The NFSv4 protocol
   • cifs - The CIFS protocol
   You can specify a comma-separated list of multiple access protocols for an export rule. If you specify the protocol as any, you cannot specify any other protocols in the list. If you do not specify this parameter, the value defaults to any. If you enable NFSv4, you will not be able to apply the policy to which this rule belongs to a FlexGroup, as FlexGroups do not support NFSv4 protocol access.

[-clientmatch <text>] - List of Client Match Hostnames, IP Addresses, Netgroups, or Domains
   This parameter specifies list of the match strings specifying the client or clients to which the export rule applies. You can specify the match string in any of the following formats:
   • As a hostname; for instance, host1
   • As an IPv4 address; for instance, 10.1.12.24
   • As an IPv6 address; for instance, fd20:8b1e:b255:4071::100:1
   • As an IPv4 address with a subnet mask expressed as a number of bits; for instance, 10.1.12.0/24
   • As an IPv6 address with a subnet mask expressed as a number of bits; for instance, fd20:8b1e:b255:4071::/64
   • As an IPv4 address with a network mask; for instance, 10.1.16.0/255.255.255.0
   • As a netgroup, with the netgroup name preceded by the @ character; for instance, @eng
• As a domain name preceded by the . character; for instance, .example.com

Note: Entering an IP address range, such as 10.1.12.10-10.1.12.70, is not allowed. Entries in this format are interpreted as a text string and treated as a hostname.

[-rorule <authentication method>, ...] - RO Access Rule

This parameter modifies the security type for read-only access to volumes that use the export rule. Possible values include the following:

• **sys** - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is AUTH_SYS. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes sys.

• **krb5** - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is Kerberos v5. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes krb5.

• **krb5i** - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is Kerberos v5 with integrity service. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes krb5i.

• **krb5p** - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is Kerberos v5 with privacy service. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes krb5p.

• **ntlm** - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is CIFS NTLM. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes ntlm.

• **any** - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume regardless of the security type of that incoming request. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) remains the same as the security type of the incoming request.

  **Note:** If the security type of the incoming request is AUTH_NONE, read access will be granted to that incoming request as an anonymous user.

• **none** - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume as an anonymous user if the security type of that incoming request is not explicitly listed in the list of values in the rorule. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes none.

• **never** - For an incoming request from a client matching the clientmatch criteria, do not allow any access to the volume regardless of the security type of that incoming request.

You can specify a comma-separated list of multiple security types for an export rule. If you specify the security type as **any** or **never**, you cannot specify any other security types.

  **Note:** For an incoming request from a client matching the clientmatch criteria, if the security type doesn’t match any of the values listed in rorule (as explained above), access will be denied to that incoming request.

[-rwrule <authentication method>, ...] - RW Access Rule

This parameter modifies the security type for read-write access to volumes that use the export rule. Possible values include the following:

• **sys** - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the effective security type (determined from rorule) of that incoming request is AUTH_SYS.
- **krb5** - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the effective security type (determined from rorule) of that incoming request is Kerberos v5.

- **krb5i** - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the effective security type (determined from rorule) of that incoming request is Kerberos v5 with integrity service.

- **krb5p** - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the effective security type (determined from rorule) of that incoming request is Kerberos v5 with privacy service.

- **ntlm** - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the effective security type (determined from rorule) of that incoming request is CIFS NTLM.

- **any** - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume regardless of the effective security type (determined from rorule) of that incoming request.

  **Note:** If the effective security type (determined from rorule) of the incoming request is none, write access will be granted to that incoming request as an anonymous user.

- **none** - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume as an anonymous user if the effective security type (determined from rorule) of that incoming request is none.

- **never** - For an incoming request from a client matching the clientmatch criteria, do not allow write access to the volume regardless of the effective security type (determined from rorule) of that incoming request.

You can specify a comma-separated list of multiple security types for an export rule. If you specify the security type as any or never, you cannot specify any other security types.

  **Note:** For an incoming request from a client matching the clientmatch criteria, if the effective security type (determined by rorule) doesn’t match any of the values listed in rwrule (as explained above), write access will be denied to that incoming request.

---

**[-anon <text>] - User ID To Which Anonymous Users Are Mapped**

This parameter specifies a UNIX user ID or user name that the user credentials are mapped to when evaluation of rorule or superuser parameters result in user being mapped to the anonymous user. The default setting of this parameter is 65534, which is normally associated with the user name nobody. The following notes apply to the use of this parameter:

- To disable access by any client with a user ID of 0, specify a value of 65535.

---

**[-superuser <authentication method>,...] - Superuser Security Types**

This parameter specifies a security type for superuser access to files. The default setting of this parameter is none. Possible values include the following:

- **sys** - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume if the effective security type (determined from rorule) of that incoming request is AUTH_SYS.

- **krb5** - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume if the effective security type (determined from rorule) of that incoming request is Kerberos v5.

- **krb5i** - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume if the effective security type (determined from rorule) of that incoming request is Kerberos v5 with integrity service.
- For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume if the effective security type (determined from rorule) of that incoming request is Kerberos v5 with privacy service.

- For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume if the effective security type (determined from rorule) of that incoming request is CIFS NTLM.

- For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume regardless of the effective security type (determined by rorule) of that incoming request.

  **Note:** If the effective security type (determined from rorule) of the incoming request is none, access will be granted to that incoming request as an anonymous user.

- For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow access to the volume as an anonymous user if the effective security type (determined from rorule) of that incoming request is none.

You can specify a comma-separated list of multiple security types for superuser access. If you specify the security type as *any*, you cannot specify any other security types.

  **Note:** For an incoming request from a client matching the clientmatch criteria and with the user ID 0, if the effective security type doesn't match any of the values listed in superuser (as explained above), the user ID is mapped to anonymous user.

- **allow-suid** *(true|false)* - Honor SetUID Bits in SETATTR
  This parameter specifies whether set user ID (suid) and set group ID (sgid) access is enabled by the export rule. The default setting is *true*.

- **allow-dev** *(true|false)* - Allow Creation of Devices
  This parameter specifies whether the creation of devices is enabled by the export rule. The default setting is *true*.

- **ntfs-unix-security-ops** *(ignore|fail)* - NTFS Unix Security Options (privilege: advanced)
  This parameter specifies whether UNIX-type permissions changes on NTFS (Windows) volumes are prohibited (with value *fail*) or allowed (with value *ignore*) when the request originates from an NFS client. The default setting is *fail*. This parameter is only used if you set the NTFS UNIX security option for the Vserver to *use-export-policy*; otherwise, it has no effect.

- **chown-mode** *(restricted|unrestricted)* - Change Ownership Mode (privilege: advanced)
  This parameter specifies who is authorized to change the ownership mode of a file. The default setting is *restricted*. This parameter is only used if you set the change ownership mode option for the Vserver to *use-export-policy*; otherwise, it has no effect. The allowed values are:

  - restricted - Only root user can change the ownership of the file.
  - unrestricted - Non-root users may change file ownership provided the on-disk permissions allow the operation.

**Examples**

The following example modifies the export rule with index number 3 in an export policy named default_expolicy on a Vserver named vs0. The rule is modified to match any clients in the netgroups named group1 or group2 to enable NFSv2 and CIFS support, to enable read-only access by any matching client, to require authentication by NTLM or Kerberos 5 for read-write access, and to enable suid and sgid access.
vserver export-policy rule remove-clientmatches

Remove list of clientmatch strings from an existing rule

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The *vserver export-policy rule remove-clientmatches* command removes a list of strings from the clientmatch field of a specified export rule in a policy. This command only operates on the clientmatch field; to modify other fields in a rule use the *vserver export-policy modify* command.

**Parameters**

- `-vserver <vserver name>` - Vserver
  This parameter specifies the Vserver on which the export policy is located.

- `-policyname <export policy name>` - Policy Name
  This parameter specifies the name of the export policy containing the export rule from which you want to remove clientmatch strings.

- `-ruleindex <integer>` - Rule Index
  This parameter specifies the index number of the export rule from which you want to remove clientmatch strings. To view a list of rules with their index numbers, use the *vserver export-policy rule show* command.

- `-clientmatches <text>` - List of Clientmatch Strings to Remove
  This parameter specifies list of the match strings specifying the client or clients to remove from the export rule. Match strings are removed from the clientmatch field if the match string is identical to one of the elements in the clientmatches list. If all match strings are removed from the clientmatch field the entire export rule is deleted. You can specify the match string in any of the following formats:

  - As a hostname; for instance, host1
  - As an IPv4 address; for instance, 10.1.12.24
  - As an IPv6 address; for instance, fd20:8b1e:b255:4071::100:1
  - As an IPv4 address with a subnet mask expressed as a number of bits; for instance, 10.1.12.0/24
  - As an IPv6 address with a subnet mask expressed as a number of bits; for instance, fd20:8b1e:b255:4071::/64
  - As an IPv4 address with a network mask; for instance, 10.1.16.0/255.255.255.0
  - As a netgroup, with the netgroup name preceded by the @ character; for instance, @eng
  - As a domain name preceded by the . character; for instance, .example.com

  **Note:** Entering an IP address range, such as 10.1.12.10-10.1.12.70, is not allowed. Entries in this format are interpreted as a text string and treated as a hostname.

---

vserver export-policy commands
Examples
The following example removes match strings "2.2.2.2" and "3.3.3.3" from the clientmatch field of the export rule with index number 3 in an export policy named default_expolicy on a Vserver named vs0.

```
cluster1::> vserver export-policy rule remove-clientmatches -vserver vs0 -policyname default_expolicy -ruleindex 3 -clientmatches "2.2.2.2,3.3.3.3"
```

Related references
vserver export-policy rule show on page 1880

vserver export-policy rule setindex
Move a rule to a specified index

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver export-policy rule setindex command modifies the index number of the specified export rule. If the new index number is already in use, the command reorders the list to accommodate it. If the existing index is given a higher index number (that is, later in the list), the command decrements the index numbers of rules between the moved rule and moved-to rule; otherwise, the command increments the index numbers between the moved-to rule and the existing rule.

You can use the vserver export-policy rule show command to view a list of rules with their index numbers.

Parameters
-vserver <vserver name> - Vserver
This parameter specifies the Vserver on which the export policy is located.

-policyname <export policy name> - Policy Name
This parameter specifies the export policy that contains the rule whose index number you want to modify.

-ruleindex <integer> - Rule Index
This parameter specifies the index number of the rule that you want to move.

-newruleindex <integer> - Index
This parameter specifies the new index number for the rule.

Examples
The following example changes the index number of a rule at index number 5 to index number 3 in an export policy named rs1 on a Vserver named vs0:

```
cluster1::> vserver export-policy rule setindex -vserver vs0 -policyname read_only_policy -ruleindex 5 -newruleindex 3
```

vserver export-policy rule show on page 1880

vserver export-policy rule show
Display a list of rules

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.
Description
The vserver export-policy rule show command displays information about export rules. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information:

- Vserver name
- Export policy name
- Export rule index number
- Access protocol
- Client match
- Read-only access rule
- Read-write access rule

To display detailed information about a specific export rule, run the command with the -vserver, -policyname, and -ruleindex parameters. The detailed view provides all of the information in the previous list and the following additional information:

- Anonymous ID
- Superuser security type
- Whether set user ID (suid) and set group ID (sgid) access is enabled
- Whether creation of devices is enabled
- NTFS security settings
- Change ownership mode

You can specify additional parameters to display only the information that matches those parameters. For example, to display information only about export rules that have a read-write rule value of never, run the command with the -rrule never parameter.

Parameters

{ [-fields <fieldname> , ...]
  If you specify the -fields parameter, the command only displays the fields that you specify.
}

[ [-instance ]] 
  If you specify the -instance parameter, the command displays detailed information about all entries.

[-vserver <vserver name>] - Vserver
  If you specify this parameter, the -policyname parameter, and the -ruleindex parameter, the command displays detailed information about the specified export rule. If you specify this parameter by itself, the command displays information only about the export rules on the specified Vserver.

[-policyname <export policy name>] - Policy Name
  If you specify this parameter, the -vserver parameter, and the -ruleindex parameter, the command displays detailed information about the specified export rule. If you specify this parameter by itself, the command displays information only about the export rules on the specified policy.

[-ruleindex <integer>] - Rule Index
  If you specify this parameter, the -vserver parameter, and the -policyname parameter, the command displays detailed information about the specified export rule. If you specify this parameter by itself, the command displays information only about the export rules that have the specified index number.
[-protocol <Client Access Protocol>, ...] - Access Protocol

If you specify this parameter, the command displays information only about the export rules that have the specified access protocol or protocols. Possible values include the following:

- any - Any current or future access protocol
- nfs - Any current or future version of NFS
- nfs3 - The NFSv3 protocol
- nfs4 - The NFSv4 protocol
- cifs - The CIFS protocol

You can specify a comma-separated list of multiple access protocols for an export rule. If you specify the protocol as any, you cannot specify any other protocols in the list.

[-clientmatch <text>] - List of Client Match Hostnames, IP Addresses, Netgroups, or Domains

If you specify this parameter, the command displays information only about the export rules that have a clientmatch list containing all of the strings in the specified client match. You can specify the match as a list of strings in any of the following formats:

- As a hostname; for instance, host1
- As an IPv4 address; for instance, 10.1.12.24
- As an IPv6 address; for instance, fd20:8b1e:b255:4071::100:1
- As an IPv4 address with a subnet mask expressed as a number of bits; for instance, 10.1.12.0/24
- As an IPv6 address with a subnet mask expressed as a number of bits; for instance, fd20:8b1e:b255:4071::/64
- As an IPv4 address with a network mask; for instance, 10.1.16.0/255.255.255.0
- As a netgroup, with the netgroup name preceded by the @ character; for instance, @eng
- As a domain name preceded by the . character; for instance, .example.com

[-rorule <authentication method>, ...] - RO Access Rule

If you specify this parameter, the command displays information only about the export rule or rules that have the specified read-only rule. Possible values include the following:

- sys - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is AUTH_SYS. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes sys.
- krb5 - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is Kerberos v5. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes krb5.
- krb5i - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is Kerberos v5 with integrity service. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes krb5i.
- krb5p - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is Kerberos v5 with privacy service. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes krb5p.
• **ntlm** - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is CIFS NTLM. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes ntlm.

• **any** - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume regardless of the security type of that incoming request. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) remains the same as the security type of the incoming request.

  **Note:** If the security type of the incoming request is AUTH_NONE, read access will be granted to that incoming request as an anonymous user.

• **none** - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume as an anonymous user if the security type of that incoming request is not explicitly listed in the list of values in the rorule. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes none.

• **never** - For an incoming request from a client matching the clientmatch criteria, do not allow any access to the volume regardless of the security type of that incoming request.

You can specify a comma-separated list of multiple security types for an export rule. If you specify the security type as `any` or `never`, you cannot specify any other security types.

  **Note:** For an incoming request from a client matching the clientmatch criteria, if the security type doesn’t match any of the values listed in rorule (as explained above), access will be denied to that incoming request.

```bash
[vserver export-policy commands]
```

• **rwrule <authentication method>, ...** - RW Access Rule

  If you specify this parameter, the command displays information only about the export rule or rules that have the specified read-write rule. Possible values include the following:

  • **sys** - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the effective security type (determined from rorule) of that incoming request is AUTH_SYS.

  • **krb5** - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the effective security type (determined from rorule) of that incoming request is Kerberos 5.

  • **krb5i** - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the security type of that incoming request is Kerberos v5 with integrity service. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes krb5i.

  • **krb5p** - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the security type of that incoming request is Kerberos v5 with privacy service. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes krb5p.

  • **ntlm** - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the effective security type (determined from rorule) of that incoming request is CIFS NTLM.

  • **any** - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume regardless of the effective security type (determined from rorule) of that incoming request.

  **Note:** If the effective security type (determined from rorule) of the incoming request is none, write access will be granted to that incoming request as an anonymous user.

• **none** - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume as an anonymous user if the effective security type (determined from rorule) of that incoming request is none.
•  never - For an incoming request from a client matching the clientmatch criteria, do not allow write access
to the volume regardless of the effective security type (determined from rorule) of that incoming request.

You can specify a comma-separated list of multiple security types for an export rule. If you specify the
security type as any or never, you cannot specify any other security types.

Note: For an incoming request from a client matching the clientmatch criteria, if the effective security type
(determined by rorule) doesn't match any of the values listed in rwrule (as explained above), write access
will be denied to that incoming request.

[~anon <text>] - User ID To Which Anonymous Users Are Mapped

If you specify this parameter, the command displays information only about the export rule or rules that have
the specified anonymous ID.

[~superuser <authentication method>,...] - Superuser Security Types

If you specify this parameter, the command displays information only about the export rule or rules that have
the specified superuser security type. Possible values include the following:

•  sys - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow
superuser access to the volume if the effective security type (determined from rorule) of that incoming
request is AUTH_SYS.

•  krb5 - For an incoming request from a client matching the clientmatch criteria and with the user ID 0,
allow superuser access to the volume if the effective security type (determined from rorule) of that
incoming request is Kerberos v5.

•  krb5i - For an incoming request from a client matching the clientmatch criteria, allow read access to the
volume if the security type of that incoming request is Kerberos v5 with integrity service. The effective
security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes
krb5i.

•  krb5p - For an incoming request from a client matching the clientmatch criteria, allow read access to the
volume if the security type of that incoming request is Kerberos v5 with privacy service. The effective
security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes
krb5p.

•  ntlm - For an incoming request from a client matching the clientmatch criteria and with the user ID 0,
allow superuser access to the volume if the effective security type (determined from rorule) of that
incoming request is CIFS NTLM.

•  any - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow
superuser access to the volume regardless of the effective security type (determined by rorule) of that
incoming request.

Note: If the effective security type (determined from rorule) of the incoming request is none, access will
be granted to that incoming request as an anonymous user.

• none - For an incoming request from a client matching the clientmatch criteria and with the user ID 0,
allow access to the volume as an anonymous user if the effective security type (determined from rorule) of
that incoming request is none.

• never - For an incoming request from a client matching the clientmatch criteria and with the user ID 0,
allow access to the volume as an anonymous user regardless of the effective security type (determined from
rorule) of that incoming request.

Note: Only export rules that were created in an earlier release can have the superuser parameter set to
the security type never

You can specify a comma-separated list of multiple security types for superuser access. If you specify the
security type as any, you cannot specify any other security types.
**Note:** For an incoming request from a client matching the clientmatch criteria and with the user ID 0, if the effective security type doesn't match any of the values listed in superuser (as explained above), the user ID is mapped to anonymous user.

[-allow-suid {true|false}] - Honor SetUID Bits in SETATTR

If you specify this parameter, the command displays information only about the export rule or rules that have the specified setting for set user ID (suid) and set group ID (sgid) access.

[-allow-dev {true|false}] - Allow Creation of Devices

If you specify this parameter, the command displays information only about the export rule or rules that have the specified setting for the creation of devices.

[-ntfs-unix-security-ops {ignore|fail}] - NTFS Unix Security Options (privilege: advanced)

If you have specified this parameter for a particular export policy rule, then the command displays information about the UNIX security options that apply to that export policy rule. The setting can either prohibit (with value fail) or allow (with value ignore) UNIX-type permissions changes on NTFS (Windows) volumes when the request originates from an NFS client. If the Vserver NTFS UNIX security option is set to fail or allow for the Vserver, then this parameter is overridden.

[-ntfs-unix-security-ops-vs {fail|ignore|use-export-policy}] - Vserver NTFS Unix Security Options (privilege: advanced)

If you specify this parameter, the command displays information about the UNIX security options that apply to all volumes in this Vserver. The setting can either prohibit (with value fail) or allow (with value ignore) UNIX-type permissions changes on NTFS (Windows) volumes when the request originates from an NFS client, or you can set it to use-export-policy. If you set this parameter to fail or allow, this parameter overrides the individual UNIX security options set for the export policy rules. If you set this parameter to use-export-policy, the UNIX security options associated with the respective export policy rule is used.

[-chown-mode {restricted|unrestricted}] - Change Ownership Mode (privilege: advanced)

If you have specified this parameter for a particular export policy rule, then the command displays information about the change ownership mode that applies to that export policy rule. The setting can either allow only the root (with value restricted) or all users (with value unrestricted) to change file ownership provided the on-disk permissions allow the operation. If the Vserver change ownership mode is set to restricted or unrestricted for the Vserver, then this parameter is overridden.

[-chown-mode-vs {restricted|unrestricted|use-export-policy}] - Vserver Change Ownership Mode (privilege: advanced)

If you specify this parameter, the command displays information about the change ownership mode that applies to all volumes in this Vserver. The setting can allow only the root (with value restricted) or all users (with value unrestricted) to change ownership of the files that they own, or you can set it to use-export-policy. If you set this parameter to restricted or unrestricted, this parameter overrides the individual change ownership mode set for the export policy rules. If you set this parameter to use-export-policy, the change ownership mode associated with the respective export policy rule is used.

**Examples**

The following example displays information about all export rules:

```
cluster1::> vserver export-policy rule show
Vserver Policy Rule Access Client Protocol Match RO Rule
------------------ ------ --------- -------- -------------------------- -----
vs0 default_expolicy 1 any 0.0.0.0/0,::0/0 any
vs0 read_only_expolicy 2 any 0.0.0.0/0 any
vs1 default_expolicy 1 any 10.10.10.10,11.11.11.11 any
vs1 test_expolicy 1 any 0.0.0.0/0 any
4 entries were displayed.
```
vserver fcp commands

Manage the FCP service on a Vserver

Commands used for managing the FCP service configuration of a Vserver.

vserver fcp create

Create FCP service configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command creates an FCP service for a Vserver. An FCP service must be licensed before you can manage FCP services. If the FCP service is not licensed, the FCP command returns an error.

When you create an FCP service on a Vserver, the Vserver has the following configuration defaults:

- The administrative status of the FCP service is up.
- The FCP command automatically generates a unique World Wide Node Name (WWNN).

Parameters

- `-vserver <Vserver Name>` - Vserver Name
  Specifies the Vserver for the FCP service.

- `[-target-name <text>]` - Target Name (privilege: advanced)
  The FCP World Wide Node Name (WWNN) for the service. All FCP LIFs in the Vserver will share the specified WWNN. The format for a WWNN is "XX:XX:XX:XX:XX:XX:XX:XX" where X is a hexadecimal digit.

  Unless the force option is also provided, the specified WWNN must be within one of the following vendor registered namespaces:
  - 2X:XX:00:a0:98:XX:XX:XX
  - 2X:XX:00:a0:b8:XX:XX:XX
  - 2X:XX:d0:39:ea:XX:XX:XX

  The user must ensure that the target name is not in use elsewhere outside the cluster. ONTAP cannot verify that the target name is unique outside the cluster if ONTAP did not generate the target name.

- `[-status-admin {down|up}]` - Administrative Status
  Specifies the administrative status of the FCP service of a Vserver. If you set this parameter to up, the FCP service will accept login requests from FCP initiators. If you set this parameter to down, FCP initiators will not be allowed to log in.

- `[-force | -f [true]]` - Force (privilege: advanced)
  Allows you to specify a World Wide Node Name outside one of the known vendor registered namespaces. If you use this parameter without a value, it is set to true, and the command does not error when the specified WWNN is outside one of the vendor registered namespaces.
vserver fcp delete

Delete FCP service configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
Deletes an FCP service of a Vserver. Before you can delete an FCP service, the administration status must be down. Use the vserver fcp modify command to change the administration status.

Parameters
-vserver <Vserver Name> - Vserver Name
  Specifies the Vserver for the FCP service.

Examples
cluster1::> vserver fcp delete -vserver vs_1

Related references
vserver fcp modify on page 1887

vserver fcp modify

Modify FCP service configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command modifies an FCP service configuration on a Vserver.

Parameters
-vserver <Vserver Name> - Vserver Name
  Specifies the Vserver for the FCP service.

[-target-name <text>] - Target Name (privilege: advanced)
  The FCP World Wide Node Name (WWNN) for the service. All FCP LIFs in the Vserver will share the specified WWNN. The format for a WWNN is "XX:XX:XX:XX:XX:XX:XX:XX" where X is a hexadecimal digit.
  Unless the force option is also provided, the specified WWNN must be within one of the following vendor registered namespaces:
  - 2X:XX:00:a0:98:XX:XX:XX
  - 2X:XX:00:a0:b8:XX:XX:XX
  - 2X:XX:d0:39:ea:XX:XX:XX
The user must ensure that the target name is not in use elsewhere outside the cluster. ONTAP cannot verify that the target name is unique outside the cluster if ONTAP did not generate the target name.

[-status-admin {down|up}] - Administrative Status

Specifies the administrative status of the FCP service of a Vserver. If you set this parameter to up, the FCP service accepts login requests from FCP initiators. If you set this parameter to down, FCP initiators cannot log in.

[-force | -f [true]] - Force (privilege: advanced)

Allows you to specify a World Wide Node Name outside one of the known vendor registered namespaces. If you use this parameter without a value, it is set to true, and the command does not error when the specified WWNN is outside one of the vendor registered namespaces.

Examples

cluster1::> vserver fcp modify -vserver vs_1 -status-admin down

vserver fcp show

Display FCP service configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
Displays the current status of the FCP service in a cluster.

Parameters

[-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance]

If you specify the -instance parameter, the command displays detailed information about all fields.

[vserver <Vserver Name>] - Vserver Name

Use this parameter to display the FCP services that match the Vserver that you specify.

[target-name <text>] - Target Name

Use this parameter to display the FCP service that matches the target name that you specify.

[status-admin {down|up}] - Administrative Status

Use this parameter to display the FCP services that match the administrative status that you specify.

Examples

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Target Name</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs0</td>
<td>20:00:00:a0:98:0c:b0:eb</td>
<td>up</td>
</tr>
<tr>
<td>vs2</td>
<td>20:01:00:a0:98:0c:b0:eb</td>
<td>up</td>
</tr>
</tbody>
</table>

2 entries were displayed.
vserver fcp start

Starts the FCP service

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command starts the FCP service of a Vserver. When you start the FCP service, the logical interfaces are brought online. You must have a license before you can start the FCP service. Use system license add to enable the FCP license.

Parameters
- `vserver <Vserver Name>` - Vserver Name
  Specifies the Vserver for the FCP service.

Examples
```
cluster1::> vserver fcp start -vserver vs_1
    (vserver fcp start)
```

Related references
- `system license add` on page 1254

vserver fcp stop

Stops the FCP service

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command stops the FCP service of a Vserver. When you stop the FCP service, the operation status of all FCP logical interfaces in the Vserver will be down.

Parameters
- `vserver <Vserver Name>` - Vserver Name
  Specifies the Vserver for the FCP service.

Examples
```
cluster1::> vserver fcp stop -vserver vs_1
    (vserver fcp stop)
```

vserver fcp initiator commands

The initiator directory

Commands for managing the active initiators for an FCP service.

vserver fcp initiator show

Display FCP initiators currently connected

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.
**Description**

This command displays information about FCP initiators that are currently logged in.

If you do not specify a Vserver, the command displays all initiators logged into all FCP Vservers within a cluster. If you specify a Vserver but not a logical interface, the command displays information about all initiators connected to all logical interfaces within the specified Vserver.

If an initiator belongs to an initiator group or has a World Wide Port Name (WWPN) alias, the command displays this information.

**Parameters**

```
{ [-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?' to display the fields to specify.

  [-instance ]
  If you specify the -instance parameter, the command displays detailed information about all fields.

  [-vserver <Vserver Name>] - Vserver
  Use this parameter to display the FCP initiators logged into the Vserver that you specify.

  [-lif <lif-name>] - Logical Interface
  Use this parameter to display the FCP initiators that match the logical interfaces that you specify.

  [-wwpn <text>]- Initiator WWPN
  Use this parameter to display the FCP initiators that matches the World Wide Port Name (WWPN) that you specify.

  [-port-address <Hex Integer>] - Port Address
  Use this parameter to display FCP initiators that match the port address that you specify.

  [-wwnn <text>]- Initiator WWNN
  Use this parameter to display the FCP initiator that matches the World Wide Node Name (WWNN) that you specify.

  [-alias <text>, ...] - Initiator WWPN Alias
  Use this parameter to display the FCP initiator that matches the alias name that you specify.

  [-igroup <text>, ...] - Igroup Name
  Use this parameter to display the FCP initiator that matches the initiator group that you specify.

  [-data-protocol {fcp|fc-nvme}] - Data Protocol
  Use this parameter to display the FCP initiator that matches the data protocol that you specify.
```

**Examples**

```
cluster1::> vserver fcp initiator show
  Logical    Initiator      Initiator
  Vserver   Interface  WWNN           WWPN          Igroup
  --------- ---------- -------------- ------------- -------------------------
  vs1       vs1.fcp    2f:a2:00:a0:98:0b:56:13 2f:a2:00:a0:98:0b:56:15 igroup1
```

vserver fcp interface commands

The interface directory

Commands used for managing FCP data logical interfaces for a Vserver.

vserver fcp interface show

Display configuration information for an FCP interface

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

This command displays FCP logical interface information. If you do not specify a Vserver, the command displays all of the FCP data interfaces of a cluster.

Parameters

\{-fields \<fieldname\>, ...\}

If you specify the \{-fields \<fieldname\>, ...\} parameter, the command output also includes the specified field or fields. You can use ‘-fields ?’ to display the fields to specify.

\{-instance\}

If you specify the \{-instance\} parameter, the command displays detailed information about all fields.

\{-vserver \<Vserver Name\>\} - Vserver

Use this parameter with other options to display information about FCP logical interfaces scoped to the specified Vserver.

\{-lif \<lif-name\>\} - Logical Interface

Use this parameter to display FCP logical interfaces that match the names of logical interfaces that you specify. You can provide a partial logical interface name, and press tab to complete the name or the closest match.

\{-wwpn \<text\>\} - WWPN

Use this parameter to display FCP logical interfaces that match the World Wide Port Name (WWPN) that you specify.

\{-wwnn \<text\>\} - WWNN

Use this parameter to display FCP logical interfaces that match the World Wide Node Name (WWNN) that you specify.

\{-status-admin \(up\|down\)\} - Administrative Status

Specifies the configured status of the FCP logical interface. If you set this parameter to \(up\) the command displays all FCP logical interfaces with the administrative status of \(up\) If you set this parameter to \(down\) the command displays all the FCP logical interfaces with the administrative status of \(down\).

\{-status-oper \(up\|down\)\} - Operational Status

Specifies the current status of the FCP logical interface. If you set this parameter to \(up\) the command displays all the FCP logical interfaces with the operational status of \(up\) If you set this parameter to \(down\) the command displays all the FCP logical interfaces with the operational status of \(down\).

\{-status-extended \<text\>\} - Extended Status

Use this parameter to display more detailed information on the status of the FCP logical interface that you specify.

\{-port-address \<Hex Integer\>\} - Host Port Address

Use this parameter to display FCP logical interfaces that match the host port address that you specify.
[-curr-node <nodename>] - Current Node
Use this parameter to display FCP logical interfaces that are on the node that you specify.

[-curr-port <netport>|<ifgrp>] - Current Port
Use this parameter to display FCP logical interfaces that are on the port that you specify.

[-is-home {true|false}] - Is Home
Specifies whether the node hosting the FCP interface is the initially configured node. If you use this command without using this parameter, it is set to true, and the command displays all FCP interfaces that are on the initially configured node.

[-relative-port-id <integer>] - Relative Port ID
Use this parameter to display FCP logical interfaces that match the relative target port ID that you specify. The system assigns each LIF and target portal group a relative target port ID that is Vserver unique. You cannot change this ID.

Examples

```
classifier1::> vserver fcp interface show
Logical Interface Admin/Oper WWPN Current Current Is
Vserver    Interface  Status      WWPN       Node       Port    Home
---------- ---------- ---------- ---------------- ------------- ------- -----
vsl        vs1.fcp    up/down    2f:a2:00:a0:98:0b:56:13 node1      0c   true
```

vserver fcp nameserver commands

FCP fabric name server directory

vserver fcp nameserver show
Display FCP fabric name server entries

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command show entries in the fabric name server database.

Parameters
{-fields <fieldname>,...}
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver
Use this parameter to select the Vservers that contain FCP LIFs.

[-lif <text>] - LIF Name
Use this parameter to select the FCP LIFs.

[-port-id <integer>] - Port Identifier
Use this parameter to select the assigned port identifier of the LIF.

[-unzoned [true]] - Show unzoned name server entries
Use this parameter to show unzoned name server information.
[-port-type <text>] - Port Type
  Use this parameter to select the port type of the LIF.

[-port-wwn <text>] - Port WWN
  Use this parameter to select World Wide Port Name (WWPN) of the LIF.

[-fabric-port-wwn <text>] - Fabric Port WWN
  Use this parameter to select the fabric World Wide Port Name (WWPN) of the lif.

[-node-wwn <text>] - Node WWN
  Use this parameter to select the World Wide Node Name (WWNN) of the LIF.

[-service-class <text>] - Service Class
  Use this parameter to select the registered class of services as defined in the FC-FS standard.

[-fc4-type <text>] - FC4 Type
  Use this parameter to select the registered FC4 type.

[-switch-port <text>] - Switch Port
  Use this parameter to select the name of switch port connected to target array.

Examples

    cluster1::> vserver fcp nameserver show
    Vserver:Lif          Node WWN, Port WWN       Port Id       Port Type       FC4 Type
    ------------------- ------------------------ -------- ------------ ------------
    vs1 :lif1            20:00:00:a0:98:55:73:38 8130561  N-Port       FCP
    20:01:00:a0:98:55:73:38 8130561  N-Port       FCP
    20:00:00:90:fa:73:12:dd 8194560  N-Port
    vs1 :lif2            20:00:00:90:fa:94:29:ee 8201984  N-Port       FCP
    10:00:00:90:fa:94:29:ee 8201984  N-Port       FCP
    3 entries were displayed.

vserver fcp ping-igroup commands

The FCP ping igroup directory

Command for performing a connectivity check (ping) between the FCP initiators of an initiator group (igroup) and the FCP LIFs for which they are configured.

vserver fcp ping-igroup show

Ping FCP by Igroup

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command performs a connectivity check (ping) between the FCP initiators of an igroup and the FCP LIFs for which they are configured.

Parameters

    { [-fields <fieldname>, ...] }

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.
If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-vserver <Vserver Name>]- Vserver`
Use this parameter to select the Vservers that contain initiators and FCP LIFs.

`[-igroup <text>]- Igroup Name`
Use this parameter to select the FCP initiators that belong to the specified igroup and FCP LIFs that belong to the portset that is bound to the igroup. If the igroup is not bound to a portset, then the default portset (all FCP LIFs in the Vserver), is used.

`[-wwpn <text>]- FCP initiator WWPN`
Use this parameter to select the FCP initiator WWPN.

`[-lif <text>]- LIF Name`
Use this parameter to limit the test to a subset of the FCP LIFs available for the igroup.

`[-portset <text>]- Portset`
Use this parameter to select igroups bound to the specified portset.

`[-node <nodename>]- Node`
Use this parameter to select the nodes that contain the specified FCP LIFs.

`[-status {unknown|reachable|not-reachable|not-zoned|cannot-ping-same-wwpn|fcp-service-busy|lif-is-down|zone-info-not-available}]- Ping Status`
Use this parameter to select the status of FCP ping command.

Use this parameter to select the extended status of FCP ping command.

`[-check-fabric [true]]- Query Fabric Records (privilege: advanced)`
Use this parameter to query the unzoned name server for the FCP initiator WWPN.

### Examples

```
cluster1::> vserver fcp ping-igroup show
 Vserver   Igroup   WWPN       Node   Logical Interface       Ping      Extended Status
--------- ----------- -------------- ---------- --------- ------------- ---------- ----------
    vserver_1 igroup_1 c0:03:ff:e4:70:06:00:e4    node_1       lif_1     reachable  wwpn-logged-in
    vserver_1 igroup_1 c0:03:ff:e4:70:06:00:e6    node_2       lif_2     not-zoned  -
2 entries were displayed.
```

### vserver fcp ping-initiator commands
The ping directory
Command for performing a connectivity check (ping) between FCP initiators and FCP LIFs.

### vserver fcp ping-initiator show
Ping FCP initiator

Availability: This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.
Description
This command performs a connectivity check (ping) between FCP initiators and FCP LIFs.

Parameters

{-fields <fieldname>, ...}
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

{-instance}
If you specify the -instance parameter, the command displays detailed information about all fields.

{-vserver <Vserver Name> - Vserver}
Use this parameter to select the Vservers that contain FCP initiators and FCP LIFs.

{-wwpn <text> - Remote WWPN}
Use this parameter to select the remote WWPN (most likely, FCP initiator).

{-lif <text> - LIF Name}
Use this parameter to limit the test to a subset of the FCP LIFs available for the igroup.

Use this parameter to query the unzoned name server for the FCP initiator WWPN.

{-node <nodename> - Node}
Use this parameter to select the nodes that contain the specified FCP LIFs.

{-status {unknown|reachable|not-reachable|not-zoned|cannot-ping-same-wwpn|fcp-service-busy|lif-is-down|zone-info-not-available} - Ping Status}
Use this parameter to select the result of FCP ping command.

{-ext-status {logged-in|not-logged_in|not-in-fabric|not-in-same-zone|fabric-info-not-available} - Extended Status}
Use this parameter to select the extended result of FCP ping command.

Examples

cluster1::> vserver fcp ping-initiator show

<table>
<thead>
<tr>
<th>Vserver</th>
<th>WWPN</th>
<th>Logical Name</th>
<th>Ping Status</th>
<th>Extended Status</th>
</tr>
</thead>
<tbody>

vserver fcp portname commands

The portname directory
Commands used for managing the World Wide Port Names (WWPN) of FCP data logical interfaces in a Vserver.

vserver fcp portname set
Assigns a new WWPN to a FCP adapter
Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.
Description
This command assigns a new World Wide Port Name (WWPN) to a logical interface. The administration status of logical interface must be down before you can change the WWPN.

Use the `network interface modify` to change the administration status of the logical interface.

Parameters
- `-vserver <Vserver Name>` - Vserver
  Specifies the Vserver.
- `-lif <lif-name>` - Logical Interface
  Specifies the logical interface to which you want to assign a new WWPN.
- `-wwpn <text>` - FCP Adapter WWPN
  Specifies the WWPN that you want to change.
- `[-force | -f [true]]` - Force
  Allows you to use a WWPN that is not in the format 2X:XX:0a:09:80:XX:XX:XX when set to true. If you use this parameter without a value, it is set to true, and the command does not prompt you when the WWNN does not follow this format.

Examples
```
cluster1::*> vserver fcp portname set -vserver vs_1 -lif vs_1.fcp -wwpn 2f:a2:00:a0:98:0b:56:13
```

`network interface modify` on page 340

`vserver fcp portname show`
Display WWPN for FCP logical interfaces

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command displays a list of World Wide Port Names (WWPN) that are used by the FCP logical interfaces.

Parameters

<table>
<thead>
<tr>
<th><code>-fields &lt;fieldname&gt;, ...</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>If you specify the <code>-fields &lt;fieldname&gt;, ...</code> parameter, the command output also includes the specified field or fields. You can use <code>-fields ?</code> to display the fields to specify.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><code>-instance</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>If you specify the <code>-instance</code> parameter, the command displays detailed information about all fields.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><code>-vserver &lt;Vserver Name&gt;</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Use this parameter to display a list of FCP logical interfaces and their WWPNs that match the Vserver name you specify.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><code>-lif &lt;lif-name&gt;</code></th>
</tr>

vserver fcp topology commands

The vserver fcp topology directory

vserver fcp topology show

Show FCP topology interconnect elements

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

Show FCP topology interconnect elements

**Parameters**

```
[-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.
```

```
[-instance]

If you specify the -instance parameter, the command displays detailed information about all fields.
```

```
[-vserver <Vserver Name>] - Vserver

Use this parameter to select the interconnect elements for the specified Vservers.
```

```
[-lif <text>] - LIF Name

Use this parameter to select the interconnect elements for the specified FCP LIFs.
```

```
[-domain-id <integer>] - Domain Identifier

Use this parameter to select the interconnect elements with the specified domain identifier
```

```
[-logical-name <text>] - Logical Name

Use this parameter to select the interconnect elements with the specified logical name
```

```
[-vendor <text>] - Vendor

Use this parameter to select the interconnect elements with the specified vendor
```

```
[-release <text>] - Release

Use this parameter to select the interconnect elements with the specified release
```
[-wwn <text>] - World Wide Name
Use this parameter to select the interconnect elements with the specified World Wide Name

[-port-count <integer>] - Port Count
Use this parameter to select the interconnect elements with the specified port count

Examples

```
cluster1::> vserver fcp topology show

vserver fcp wwn commands
The wwn directory

vserver fcp wwn blacklist commands
Manage blacklisted WWNs

The vserver fcp wwn blacklist commands manage blacklisted WWNs.

A blacklisted WWN is a WWN that is prohibited for use as either a fiber channel protocol service WWNN or a fiber channel data LIF WWPN.

vserver fcp wwn blacklist show
Displays the blacklisted WWNs

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
This command displays WWNs that have been blacklisted from re-use.

A blacklisted WWN is a WWN that is prohibited for use as either a fiber channel protocol service WWNN or a fiber channel data LIF WWPN.

Parameters

- `-fields <fieldname>, ...`
  If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

- `[-instance]`
  If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-wwn <text>] - World Wide Name
Selects the blacklisted WWNs that match the parameter value.
[-vserver <Vserver Name>] - Vserver Name

Selects the blacklisted WWNs that were previously assigned to the Vserver(s) that match the parameter value.

<table>
<thead>
<tr>

vserver fcp wwpn-alias commands

The wwpn-alias directory

Commands used for managing the WWPN Aliases of active initiators for an FCP service.

vserver fcp wwpn-alias remove

Removes an alias for a World Wide Port Name of an initiator.

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

This command removes an alias from a World Wide Port Name (WWPN).

Parameters

- -vserver <Vserver Name> - Vserver Name

  Specifies the Vserver.

  { -alias | -a <text>, ... - Initiator WWPN Alias

  Specifies the alias of the WWPN that you want to remove.

  | -wwpn | -w <FC WWN> } - Initiator WWPN

  Specifies the WWPN.

<table>
<thead>
<tr>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>cluster1::&gt; vserver fcp wwpn-alias remove -vserver vs_1 -wwpn 2f:a0:00:a0:98:0b:56:13</td>
</tr>
</tbody>
</table>

On Vserver vs_1, removes all the aliases on WWPN 2f:a0:00:a0:98:0b:56:13.

cluster1::> vserver fcp wwpn-alias remove -vserver vs_1 -alias my_alias |

vserver fcp wwpn-alias set

Set an alias for a World Wide Port Name of an initiator that might login to the target.

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.
**Description**
This command creates a new alias for a World Wide Port Name (WWPN). You can create multiple aliases for a WWPN, but you cannot use the same alias for multiple WWPNs.

An alias name is a case-sensitive name that must contain one to 32 characters. Spaces are not allowed.

**Parameters**
- `vserver <Vserver Name>` - Vserver Name
  Specifies the Vserver.
- `alias | -a <text>` - Initiator WWPN Alias
  Specifies the alias of the WWPN.
- `wwpn | -w <FC WWN>` - Initiator WWPN
  Specifies the WWPN.
- `[-force | -f [true]]` - Force
  Allows you to override a WWPN associated with an existing alias with a newly specified WWPN. If you use this parameter without a value, it is set to true, and the command does not prompt you when you override an existing alias.

**Examples**
```
cluster1::> vserver fcp wwpn-alias set -vserver vs_1 -alias my_alias -wwpn 2f:a0:00:a0:98:0b:56:13
```

**vserver fcp wwpn-alias show**
Displays a list of the WWPN aliases configured for initiators

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
This command displays aliases associated with World Wide Port Names (WWPN).

**Note:** You can also use these commands to display WWPN aliases:

- `lun igroup show`
- `lun igroup create`
- `lun igroup add`
- `lun igroup remove`
- `vserver fcp show`

**Parameters**

- `[-fields <fieldname>, ...]`
  If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

- `[-instance]`
  If you specify the `-instance` parameter, the command displays detailed information about all fields.
[-vserver <Vserver Name>] - Vserver Name

Use this parameter to display a list of WWPNs and the associated aliases that match the Vserver name that you specify.

[-alias] -a <text> - Initiator WWPN Alias

Use this parameter to display the WWPN that matches the alias that you specify.

[-wwpn] -w <FC WWN> - Initiator WWPN

Use this parameter to display a list of aliases that match the WWPN that you specify.

Examples

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Initiator WWPN</th>
<th>Alias</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>
<td>2f:a0:00:a0:98:0b:56:13</td>
<td>my_alias</td>
</tr>
</tbody>
</table>

vserver fpolicy commands

Manage FPolicy

vserver fpolicy disable

Disable a policy

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver fpolicy disable command disables an FPolicy policy for the specified Vserver.

Parameters

-vserver <Vserver Name> - Vserver

This parameter specifies the name of the Vserver on which you want to disable an FPolicy policy.

-policy-name <Policy name> - Policy

This parameter specifies the name of the FPolicy policy you want to disable.

Examples

The following command disables an FPolicy policy.

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Policy Name</th>
<th>Sequence</th>
<th>Status</th>
<th>Engine</th>
</tr>
</thead>
<tbody>
<tr>
<td>vsl.example.com</td>
<td>vsl_pol</td>
<td>-</td>
<td>off</td>
<td>native</td>
</tr>
<tr>
<td>vs2.example.com</td>
<td>vs2_pol</td>
<td>5</td>
<td>on</td>
<td>external</td>
</tr>
</tbody>
</table>
vserver fpolicy enable

Enable a policy

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver fpolicy enable command enables FPolicy policies for the specified Vserver and sets their sequence (priority). The sequence is used when multiple policies have subscribed to the same file access event. To modify the sequence number of a policy, the administrator must disable the policy (if it is enabled) and then use this command to enable it with the new sequence number. Policies that use the native engine configuration have a higher priority than policies for any other engine, regardless of the sequence number assigned to them.

Note: Events on FlexGroup volumes do not notify the FPolicy server.

Parameters
-vserver <Vserver Name> - Vserver
This parameter specifies the name of the Vserver on which you want to enable an FPolicy policy. The Vserver administrator can enable FPolicy policies created within the scope of the Vserver and can also enable an FPolicy policy created by the cluster administrator. The cluster administrator can enable FPolicy policies for any Vserver but cannot enable them with a scope of cluster. The scope is determined at a Vserver level.

-policy-name <Policy name> - Policy
This parameter specifies the name of the FPolicy policy you want to enable.

-sequence-number <integer> - Policy Sequence Number
This parameter specifies the sequence number that is assigned to the policy.

Examples
The following command enables an FPolicy policy:

```
cluster1::> vserver fpolicy show
Vserver    Policy Name            Sequence  Status     Engine
------------------------ ------------- -------- ----------- --------
vs1.example.com  vs1_pol          -          off      native
vs2.example.com  vs2_pol          -          off      external
2 entries were displayed.

cluster1::> vserver fpolicy enable -vserver vs2.example.com -policy-name vs2_pol -sequence-number 5
```

```
cluster1::> vserver fpolicy show
Vserver    Policy Name            Sequence  Status     Engine
------------------------ ------------- -------- ----------- --------
vs1.example.com  vs1_pol          -          off      native
```

Commands: Manual Page Reference
The `vserver fpolicy engine-connect` command establishes a connection to an FPolicy server to a specified node. Connecting the FPolicy server to a node enables FPolicy processing, provided that the FPolicy configuration is complete. Before connecting an FPolicy server to a node, you must configure FPolicy by completing the following tasks:

- Create an FPolicy event
- Create an FPolicy external engine
- Create an FPolicy policy
- Create a scope for the FPolicy policy

**Note:** The FPolicy event and external engine must be attached to the FPolicy policy.

**Note:** The FPolicy policy should be enabled.

### Parameters

- `-node <nodename>|local` - Node
  
  This parameter specifies the node that you want to connect to the FPolicy server. The value `local` specifies the current node.

- `-vserver <Vserver Name>` - Vserver
  
  This parameter specifies the Vserver that you want to connect to the specified FPolicy server using the specified FPolicy policy.

- `-policy-name <Policy name>` - Policy
  
  This parameter specifies the name of the FPolicy policy that is attached to an external engine.

- `-server <IP Address>` - Server
  
  This parameter specifies the FPolicy server to which you want to connect the node. The specified server must be present in the external engine configuration of the above specified policy.

### Examples

The following example connects an FPolicy server.

```bash
cluster1::> vserver fpolicy engine-connect -node FPolicy-01 -vserver vs1.example.com -policy-name p -server 1.1.1.1

cluster1::> vserver fpolicy show
```

<table>

</tr>
</tbody>
</table>
vserver fpolicy engine-disconnect

Terminate connection to FPolicy server

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver fpolicy engine-disconnect command disconnects an FPolicy server from a specified node.

Parameters
- **node <nodename>|local> - Node**
  This parameter specifies the node that you want to disconnect from the FPolicy server. The value local specifies the current node.
- **vserver <Vserver Name> - Vserver**
  This parameter specifies the Vserver that you want to disconnect from the specified FPolicy server with the specified attached FPolicy policy.
- **policy-name <Policy name> - Policy**
  This parameter specifies the name of the FPolicy policy that is attached with an external engine.
- **-server <IP Address> - Server**
  This parameter specifies the FPolicy server you want to disconnect. The specified server must be present in the external engine configuration of the above specified FPolicy policy.

Examples
The following example disconnects an FPolicy server.

```
cluster1::> vserver fpolicy engine-disconnect -node FPolicy-01 -vserver vs1.example.com -policy-name p -server 1.1.1.1
```

```
cluster1::> vserver fpolicy show
FPolicy Vserver Policy Node Server status type
---------- ---------- ---------- ---------- ----------
vs1.example.com p FPolicy-01 1.1.1.1 disconnected primary
```

vserver fpolicy show

Display all policies with status

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver fpolicy show command displays status information about all FPolicy policies in the Vserver. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all FPolicy policies:
• Vserver name
• Policy name
• Sequence number
• Status

You can specify the -fields parameter to specify which fields of information to display about FPolicy policies.
You can specify the -instance parameter to display information for all FPolicy policies in a list format.

Parameters

{ [-fields <fieldname>, ...] 
If you specify the -fields <fieldname>, ... parameter, the command only displays the fields that you specify.

[ -instance ]
If you specify the -instance parameter, the command displays detailed information about all entries.

[ -vserver <Vserver Name> ] - Vserver
If you specify this parameter, the command displays information only about the FPolicy policies for the specified Vserver.

[ -policy-name <Policy name> ] - Policy
If you specify this parameter, the command displays information only about the FPolicy policy that you specify.

[ -sequence-number <integer> ] - Sequence Number
If you specify this parameter, the command displays information only about the FPolicy policy or policies that use the specified sequence-number.

[ -status { on | off } ] - Status
If you specify this parameter, the command displays information only about the FPolicy policy or policies that use the specified status.

[ -engine <Engine name> ] - FPolicy Engine
If you specify this parameter, the command displays information only about the FPolicy policy or policies that use the specified engine.

Examples

The following example displays the information about FPolicy policies on the cluster using the vserver fpolicy show command.

```bash
cluster1::> vserver fpolicy show

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Policy Name</th>
<th>Sequence Number</th>
<th>Status</th>
<th>Engine</th>
</tr>
</thead>
<tbody>
<tr>
<td>FPolicy</td>
<td>cserver_policy</td>
<td>-</td>
<td>off</td>
<td>eng1</td>
</tr>
<tr>
<td>vs1.example.com</td>
<td>v1p1</td>
<td>-</td>
<td>off</td>
<td>eng2</td>
</tr>
<tr>
<td>vs1.example.com</td>
<td>v1p2</td>
<td>-</td>
<td>off</td>
<td>native</td>
</tr>
<tr>
<td>vs1.example.com</td>
<td>v1p3</td>
<td>-</td>
<td>off</td>
<td>native</td>
</tr>
<tr>
<td>vs1.example.com</td>
<td>cserver_policy</td>
<td>-</td>
<td>off</td>
<td>eng1</td>
</tr>
<tr>
<td>vs2.example.com</td>
<td>v1p1</td>
<td>3</td>
<td>on</td>
<td>native</td>
</tr>
<tr>
<td>vs2.example.com</td>
<td>v1p2</td>
<td>1</td>
<td>on</td>
<td>eng3</td>
</tr>
<tr>
<td>vs2.example.com</td>
<td>cserver_policy</td>
<td>2</td>
<td>on</td>
<td>eng1</td>
</tr>
</tbody>
</table>

8 entries were displayed.
```

vserver fpolicy commands
vserver fpolicy show-enabled

Display all enabled policies

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

The `vserver fpolicy show-enabled` command displays information about all enabled policies in the Vserver. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all FPolicy policies:

- Vserver name
- Policy name
- Priority

You can specify the `-fields` parameter to specify which fields of information to display about FPolicy policies.

You can specify the `-instance` parameter to display information for all FPolicy policies in a list format.

**Parameters**

`{ [-fields <fieldname>, ...]`

If you specify the `-fields <fieldname>, ...` parameter, the command only displays the fields that you specify.

`[[-instance]]`

If you specify the `-instance` parameter, the command displays detailed information about all entries.

`[-vserver <vserver>] - Vserver`

If you specify this parameter, the command displays information only about the FPolicy policies for the specified Vserver.

`[-policy-name <Policy name>] - Policy Name`

If you specify this parameter, the command displays information only about the FPolicy policy that you specify.

`[-priority <text>] - Policy Priority`

If you specify this parameter, the command displays information only about the FPolicy policies with the policy priority that you specify.

**Examples**

The following example displays the information about enabled FPolicy policies on the cluster.

```
cluster1::> vserver fpolicy show-enabled
Vserver          Policy Name           Priority
-------------------------------------------
vs1.example.com   pol_native           native
vs1.example.com   pol_native2         native
vs1.example.com   pol1                2
vs1.example.com   pol2                4
```
vserver fpolicy show-engine

Display FPolicy server status

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver fpolicy show-engine command displays status information for all FPolicy external engines or displays status information only for FPolicy servers for a specified Vserver. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information for all FPolicy servers:

- Vserver name
- Node name
- FPolicy policy name
- FPolicy server IP Address
- FPolicy server status
- FPolicy server type

You can specify the -fields parameter to specify which fields of information to display about FPolicy servers. You can specify specific parameters to display only information that matches those parameters. For instance, to display information only about all FPolicy servers (external engines) that are connected, run the command with the -fields parameter set to server and -server-status parameter set to connected.

You can specify the -instance parameter to display all information for all policies in the list form.

Parameters

\[
\begin{align*}
\{ & -\text{fields} <\text{fieldname}>, ... \\
\} & \{ -\text{instance} \} \\
\{ & -\text{node} \{ <\text{nodename}> | local \} - \text{Node} \\
\} & \{ -\text{vserver} <\text{Vserver Name}> \} - \text{Vserver} \\
\{ & -\text{policy-name} <\text{Policy name}> \} - \text{Policy} \\
\} & \{ -\text{server} <\text{IP Address}> \} - \text{Server} \\
\{ & -\text{server-status} <\text{Status}> \} - \text{Server Status}
\end{align*}
\]

If you specify the -fields <fieldname>, ... parameter, the command only displays the fields that you specify.

If you specify the -instance parameter, the command displays detailed information about all entries.

If you specify this parameter, the command displays information only about the FPolicy external engine attached to the specified node.

If you specify this parameter, the command displays information only about the FPolicy server for the specified Vserver.

If you specify this parameter, the command displays information only about the FPolicy servers that are attached with the specified policy.

If you specify this parameter, the command displays information only about the FPolicy servers that you specify.

If you specify this parameter, the command displays information only about the FPolicy servers that have the specified status.
[-server-type <Server Type>] - Server Type
If you specify this parameter, the command displays information only about the FPolicy servers that have the specified server type.

[-connected-since <MM/DD/YYYY HH:MM:SS>] - Time FPolicy Server was Connected
If you specify this parameter, the command displays information only about the FPolicy servers that have been connected since the specified time.

[-disconnected-since <MM/DD/YYYY HH:MM:SS>] - Time FPolicy Server was Disconnected
If you specify this parameter, the command displays information only about the FPolicy servers that have been disconnected since the specified time.

[-disconnect-reason <text>] - Reason for FPolicy Server Disconnection
If you specify this parameter, the command displays information only about the FPolicy servers that are disconnected because of the specified reason.

[-disconnect-reason-id <integer>] - ID for FPolicy Server Disconnection
If you specify this parameter, the command displays information about the FPolicy servers that are disconnected because of the specified disconnect reason ID. There is a unique ID associated with each disconnect reason, which can be used to identify the reason for FPolicy server disconnection.

[-session-id <text>] - Session ID
If you specify this parameter, the command displays information about the FPolicy server that is connected with the specified session ID. There is a unique session ID associated with each connection to FPolicy server, which can be used to identify the established connection.

Examples
This example displays information about all FPolicy servers (external engines).

```
cluster1::> vserver fpolicy show-engine
FPolicy Policy Node Server Server- Server-
Vserver         name-        status type
--------------- ------------- -------------- -----------
vs2.example.com vs2_pol FPolicy-01 9.9.9.9 connected primary
vs1.example.com vs1_pol FPolicy-01 1.1.1.1 connected primary
2 entries were displayed.
```

This example displays information only about all connected FPolicy servers (external engines).

```
cluster1::> vserver fpolicy show-engine -fields server -server-status connected
node vserver policy-name server
---------- --------------- ----------- -------
FPolicy-01 vs1.example.com vs1_pol 1.1.1.1
```

This example displays information about an FPolicy server.

```
cluster1::> vserver fpolicy show-engine -server 10.72.204.118 -instance
Node: fpol-01
Vserver: vserver_1.example.com
Policy: pol_cifs
Server: 10.72.204.118
Server Status: disconnected
Server Type: primary
Time FPolicy Server was Connected: -
Time FPolicy Server was Disconnected: 2/5/2013 05:06:22
Reason for FPolicy Server Disconnection: TCP Connection to FPolicy server failed.
```
vserver fpolicy show-passthrough-read-connection

Display connection status for FPolicy passthrough-read

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The `vserver fpolicy show-passthrough-read-connection` command displays the status of the passthrough-read connection from all FPolicy servers. Passthrough-read is a way to read data for offline files without restoring the files to primary storage. If you do not specify any parameters, the command displays following information about the passthrough-read connection from FPolicy servers:

- Vserver name
- FPolicy policy name
- Node name
- FPolicy server IP address
- Passthrough-read connection status

You can specify the `-fields` parameter to specify which fields of information to display. In addition to the fields above, you can display the following fields:

- Session ID of the control channel
- Time passthrough-read channel was connected
- Time passthrough-read channel was disconnected
- Reason for passthrough-read channel disconnection

You can specify the `-instance` parameter to display information for all passthrough-read connections in the list form.

Parameters

```
[[-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command only displays the fields that you specify.

| [-instance]]
  If you specify the -instance parameter, the command displays detailed information about all entries.

[-node [<nodename>|local]] - Node
  If you specify this parameter, the command displays information only about the passthrough-read connections on the specified node.

[-vserver <Vserver Name>] - Vserver
  If you specify this parameter, the command displays information only about the passthrough-read connections for the specified Vserver.

[-policy-name <Policy name>] - Policy
  If you specify this parameter, the command displays information only about the passthrough-read connections that are attached with the specified FPolicy policy.
```
[-server <IP Address>] - Server
If you specify this parameter, the command displays information only about the passthrough-read connections from the specified FPolicy server.

[-control-session-id <text>] - Session ID of the Control Channel
If you specify this parameter, the command displays information only about the passthrough-read connections that are connected with the specified control session ID. The passthrough-read connection is attached to a control connection that has a unique control session ID.

[-server-status <Status of FPolicy passthrough-read connection>] - Server Status
If you specify this parameter, the command displays information only about the passthrough-read connections that have the specified status.

[-connected-since <MM/DD/YYYY HH:MM:SS>] - Time Channel Was Connected
If you specify this parameter, the command displays information only about the passthrough-read connections that have the specified connection time.

[-disconnected-since <MM/DD/YYYY HH:MM:SS>] - Time Channel Was Disconnected
If you specify this parameter, the command displays information only about the passthrough-read connections that have the specified disconnection time.

[-disconnect-reason <Reason for FPolicy passthrough-read disconnection>] - Reason for Disconnection
If you specify this parameter, the command displays information only about the passthrough-read connections that are disconnected because of the specified disconnect reason.

Examples
This example displays information about passthrough-read connections from all FPolicy servers.

```
cluster1::> vserver fpolicy show-passthrough-read-connection
FPolicy          Server
Vserver          Policy Name   Node         Server            Status
---------------  ------------- ------------ ----------------- --------------
vs2.example.com  pol_cifs_2    FPolicy-01   2.2.2.2           disconnected
vs1.example.com  pol_cifs_1    FPolicy-01   1.1.1.1           connected
2 entries were displayed.
```

This example displays information about passthrough-read connections from all connected FPolicy servers.

```
cluster1::> vserver fpolicy show-passthrough-read-connection -server-status connected
FPolicy          Server
Vserver          Policy Name   Node         Server            Status
---------------  ------------- ------------ ----------------- --------------
vs1.example.com  pol_cifs_1    FPolicy-01   1.1.1.1           connected
```

This example displays information about passthrough-read connections from FPolicy servers configured in an FPolicy policy.

```
cluster1::> vserver fpolicy show-passthrough-read-connection -policy-name pol_cifs_1 -instance
   Node: FPolicy-01
   Vserver: vs1.example.com
   Policy: pol_cifs_1
   Server: 2.2.2.2
   Session ID of the Control Channel: 8cef052e-2502-11e3-88d4-123478563412
   Server Status: connected
   Time Passthrough Read Channel was Connected: 9/24/2013 10:17:45
```

1910

Commands: Manual Page Reference
vserver fpolicy policy commands

Manage FPolicy policies

vserver fpolicy policy create

Create a policy

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver fpolicy policy create command creates an FPolicy policy. You must create an FPolicy event name before creating an FPolicy policy. If you are using an external FPolicy server, you must also create an FPolicy engine before creating a policy.

Parameters
-vserver <Vserver Name> - Vserver
This parameter specifies the name of the Vserver on which you want to create an FPolicy policy.

-policy-name <Policy name> - Policy
This parameter specifies the name of the FPolicy policy that you want to create. An FPolicy policy name can be up to 256 characters long and is a string that can only contain any combination of ASCII-range alphanumeric characters (a-z, A-Z, 0-9), "_" and "." .

-events <Event name>,... - Events to Monitor
This parameter specifies a list of events to monitor for the FPolicy policy. All the events in the event list should be created by the administrator of the specified Vserver or the cluster administrator. The events must already exist. Create events using the fpolicy policy event create command.

-engine <Engine name> - FPolicy Engine
This parameter specifies an external engine for this FPolicy policy. An external engine contains information required by the node to send notifications to an FPolicy server. The Vserver administrator of the specified Vserver or the cluster administrator creates the external engine prior to creating the FPolicy policy. If this parameter is not specified, the default native external engine is used. The native external engine is internal to Data ONTAP and is used if you want to configure native file blocking and you do not want to use an external FPolicy server.

[-is-mandatory {true|false}] - Is Mandatory Screening Required
This parameter specifies what action to take on a file access event in a case when all primary and secondary servers are down or no response is received from the FPolicy servers within a given timeout period. When this parameter is set to true, file access events will be denied under these circumstances. To allow file access events under these circumstances, set this parameter to false. By default, it is true.

[-allow-privileged-access {yes|no}] - Allow Privileged Access
This parameter specifies privileged access for FPolicy servers. It is used to specify whether privileged access is required for FPolicy servers. Privileged access is used when the FPolicy server requires direct access to the cluster nodes. With this option set to yes, FPolicy servers can access files on the cluster using a separate data channel with privileged access. By default, it is no.

[-privileged-user-name <text>] - User Name for Privileged Access
This parameter specifies the privileged user name. It is used to specify the privileged user name for accessing files on the cluster using a separate data channel with privileged access. The input for this field should be in
"domain\user name" format. If -allow-privileged-access is set to no, any value set for this field is ignored.

[-is-passthrough-read-enabled {true|false}] - Is Passthrough Read Enabled

This parameter specifies whether passthrough-read should be allowed for FPolicy servers registered for the policy. Passthrough-read is a way to read data for offline files without restoring the files to primary storage. Offline files are the files which have been moved to secondary storage. If passthrough-read is enabled, the FPolicy server provides the data for the file over a separate channel instead of restoring the file to primary storage. By default, this parameter is false.

**Examples**

The following example creates an FPolicy policy.

```bash
cluster1::> vserver fpolicy policy create -vserver vs1.example.com -policy-name vs1_pol -events cserver_evt,v1e1 -engine native -is-mandatory true -allow-privileged-access no -is-passthrough-read-enabled false
```

```bash
cluster1::> vserver fpolicy policy show -vserver vs1.example.com -policy-name vs1_pol
Vserver: vs1.example.com
Policy Name: vs1_pol
Events to Monitor: cserver_evt, v1e1
FPolicy Engine: native
Is Mandatory Screening Required: true
Allow Privileged Access: no
User Name for Privileged Access: -
Is Passthrough Read Enabled: false
```

**vserver fpolicy policy delete**

Delete a policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The `vserver fpolicy policy delete` command deletes an FPolicy policy.

**Parameters**

- `-vserver <Vserver Name>` - Vserver
  
  This parameter specifies the name of the Vserver from which you want to delete the FPolicy policy.

- `-policy-name <Policy name>` - Policy
  
  This parameter specifies the name of the FPolicy policy that you want to delete.

**Examples**

The following example deletes an FPolicy policy.

```bash
cluster1::> vserver fpolicy policy delete -vserver vs1.example.com -policy-name vs1_pol
```
vserver fpolicy policy modify

Modify a policy

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver fpolicy policy modify command modifies an FPolicy policy.

Parameters
-vserver <Vserver Name> - Vserver
   This parameter specifies the name of the Vserver on which you want to modify an FPolicy policy.

-policy-name <Policy name> - Policy
   This parameter specifies the name of the FPolicy policy that you want to modify. An FPolicy policy name can be up to 256 characters long and is a string that can only contain any combination of ASCII-range alphanumeric characters (a-z, A-Z, 0-9), "," and ".".

-events <Event name>, ... - Events to Monitor
   This parameter specifies a list of events to monitor for the FPolicy policy. All the events in the event list should be created by the administrator of the specified Vserver or the cluster administrator. The events must already exist. Create events using the fpolicy policy event create command.

-engine <Engine name> - FPolicy Engine
   This parameter specifies an external engine for this FPolicy policy. An external engine contains information required by the node to send notifications to an FPolicy server. The Vserver administrator of the specified Vserver or the cluster administrator creates the external engine prior to modifying the FPolicy policy. If this parameter is not specified, the default native external engine is used. The native external engine is internal to Data ONTAP and is used if you want to configure native file blocking and you do not want to use an external FPolicy server.

-is-mandatory {true|false} - Is Mandatory Screening Required
   This parameter specifies what action to take on a file access event in a case when all primary and secondary servers are down or no response is received from the FPolicy servers within a given timeout period. When this parameter is set to true, file access events will be denied under these circumstances. To allow file access events under these circumstances, set this parameter to false. By default, it is true.

-allow-privileged-access {yes|no} - Allow Privileged Access
   This parameter specifies privileged access for FPolicy servers. It is used to specify whether privileged access is required for FPolicy servers. Privileged access is used when the FPolicy server requires direct access to the cluster nodes. With this option set to yes, FPolicy servers can access files on the cluster using a separate data channel with privileged access. By default, it is no.

-privileged-user-name <text> - User Name for Privileged Access
   This parameter specifies the privileged user name. It is used to specify the privileged user name for accessing files on the cluster using a separate data channel with privileged access. The input for this field should be in "domain\user name" format. If -allow-privileged-access is set to no, any value set for this field is ignored.

-is-passthrough-read-enabled {true|false} - Is Passthrough Read Enabled
   This parameter specifies whether passthrough-read should be allowed for FPolicy servers registered for the policy. Passthrough-read is a way to read data for offline files without restoring the files to primary storage. Offline files are the files which have been moved to secondary storage. If passthrough-read is enabled, the FPolicy server provides the data for the file over a separate channel instead of restoring the file to primary storage. By default, this parameter is false.
Examples

The following example modifies an FPolicy policy.

```
cluster1::> vserver fpolicy policy modify -vserver vs1.example.com -policy-name vs1_pol -events cserverEvt,v1e1
          -engine native -is-mandatory true -allow-privileged-access no -is-passthrough-read-enabled false
```

```
cluster1::> vserver fpolicy policy show -vserver vs1.example.com -policy-name vs1_pol

Vserver: vs1.example.com
Policy Name: vs1_pol
Events to Monitor: cserverEvt, v1e1
FPolicy Engine: native
Is Mandatory Screening Required: true
Allow Privileged Access: no
User Name for Privileged Access: -
Is Passthrough Read Enabled: false
```

**vserver fpolicy policy show**

Display policy configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The `vserver fpolicy policy show` command displays information about all FPolicy policies belonging to the Vserver. Any Vserver administrator can see FPolicy policies associated with their Vserver as well as policies created by the cluster administrator. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all FPolicy policies:

- Vserver name
- Policy name
- Events to monitor
- FPolicy engine
- Is mandatory screening required
- Allow privileged access
- User name for privileged access

You can specify the `-fields` parameter to specify which fields of information to display about FPolicy policies. You can specify additional parameters to display only information that matches those parameters. For example, to display information only about FPolicy policies where the FPolicy server requires privileged access, run the command with the `-fields` parameter set to policy-name (no "-"), and `-allow-privileged-access` parameter set to `yes`.

You can specify the `-instance` parameter to display all information for all policies in the list form.

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command only displays the fields that you specify.
If you specify the -instance parameter, the command displays detailed information about all entries.

- **vserver <Vserver Name>** - Vserver
  If you specify this parameter, the command displays information only about the FPolicy policies for the specified Vserver. FPolicy policies created by the cluster administrator are visible for all Vservers.

- **policy-name <Policy name>** - Policy
  If you specify this parameter, the command displays information only about the FPolicy policy that you specify.

- **events <Event name>, ...** - Events to Monitor
  If you specify this parameter, the command displays information only about the FPolicy policy or policies that use the specified event or events.

- **engine <Engine name>** - FPolicy Engine
  If you specify this parameter, the command displays information only about the FPolicy policy or policies that use the specified engine.

- **is-mandatory {true|false}** - Is Mandatory Screening Required
  If you specify this parameter, the command displays information only about the FPolicy policy or policies that use the specified mandatory attribute.

- **allow-privileged-access {yes|no}** - Allow Privileged Access
  If you specify this parameter, the command displays information only about the FPolicy policy or policies that use the specified privileged access.

- **privileged-user-name <text>** - User Name for Privileged Access
  If you specify this parameter, the command displays information only about the FPolicy policy or policies that use the specified privileged user name.

- **is-passthrough-read-enabled {true|false}** - Is Passthrough Read Enabled
  If you specify this parameter, the command displays information only about the FPolicy policies that use the specified passthrough-read setting.

### Examples

The following example displays the information about FPolicy policies on the cluster using the `vserver fpolicy policy show` command.

```
cluster1::> vserver fpolicy policy show
Vserver    Policy     Events     Engine         Is Mandatory  PrivAccess
----------- -----------  ---------- -------------  ------------  ----------
Cluster     cserver_pol  cserver_  cserver_eng    true          yes
            r          r
vs1.example.com p            r          n              true          no
vs2.example.com cserver_pol  cserver_  cserver_eng    true          yes
            r          r
4 entries were displayed.
```

The following example displays FPolicy policy name information about all Vserver FPolicy policies with the `allow-privileged-access` parameter set to "yes".

```
cluster1::> vserver fpolicy policy show -fields policy-name -allow-privileged-access yes
vserver    policy-name
```

vserver fpolicy commands
vserver fpolicy policy event commands

Manage policy event for FPolicy

vserver fpolicy policy event create

Create an event

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver fpolicy policy event create command creates an FPolicy event. An event describes what to monitor. An event can contain protocol, file operations, filters, and volume operation event types. In the FPolicy configuration, an event is attached to an FPolicy policy. You can attach the same event to one or more policies.

Note: Three parameters have dependency rules: -protocol, -files-operations and -filters. The following combinations are supported:

- Both -protocol and -file-operations
- All of -protocol, -file-operations and -filters
- Specify none of three

Parameters
-vserver <Vserver Name> - Vserver
This parameter specifies the name of the Vserver on which you want to create an FPolicy event.

-event-name <Event name> - Event
This parameter specifies the name of the FPolicy event that you want to create. An event name can be up to 256 characters long. An event name value is a string that can only contain any combination of ASCII-range alphanumeric characters (a-z, A-Z, 0-9), "_" and ".".

[-protocol <Protocol>] - Protocol
This parameter specifies the protocol name for which the event will be created. By default, no protocol is selected. The value of this parameter must be one of the following:

- cifs - This specifies that the event is for the CIFS protocol.
- nfsv3 - This specifies that the event is for the NFSv3 protocol.
- nfsv4 - This specifies that the event is for the NFSv4 protocol.

Note: If you specify -protocol, then you must also specify a valid value for the -file-operations parameter.
[\texttt{-file-operations <File Operation>, ...}] - File Operations

This parameter specifies a list of file operations for the FPolicy event. The event will check the operations specified in this list from all client requests using the protocol specified in the \texttt{-protocol} parameter. The list can include one or more of the following operations:

- \texttt{close} - File close operations.
- \texttt{create} - File create operations.
- \texttt{create_dir} - Directory create operations.
- \texttt{delete} - File delete operations.
- \texttt{delete_dir} - Directory delete operations.
- \texttt{getattr} - Get attribute operations.
- \texttt{link} - Link operations.
- \texttt{lookup} - Lookup operations.
- \texttt{open} - File open operations.
- \texttt{read} - File read operations.
- \texttt{write} - File write operations.
- \texttt{rename} - File rename operations.
- \texttt{rename_dir} - Directory rename operations.
- \texttt{setattr} - Set attribute operations.
- \texttt{symlink} - Symbolic link operations.

\textbf{Note:} If you specify \texttt{-file-operations} then you must specify a valid protocol in the \texttt{-protocol} parameter.

[\texttt{-filters <Filter>, ...}] - Filters

This parameter specifies a list of filters of given file operation or operations for the protocol specified in the \texttt{-protocol} parameter. The values in the \texttt{-filters} parameter are used to filter client requests. The list can include one or more of the following:

- \texttt{monitor-ads} - Filter the client request for alternate data stream.
- \texttt{close-with-modification} - Filter the client request for close with modification.
- \texttt{close-without-modification} - Filter the client request for close without modification.
- \texttt{close-with-read} - Filter the client request for close with read.
- \texttt{first-read} - Filter the client requests for the first-read. When this filter is used for CIFS events, the first-read request within a CIFS session results in FPolicy processing. When this filter is used for NFS events, the \texttt{-file-session-io-grouping-count} and \texttt{-file-session-io-grouping-duration} configurations determine the first-read-request for which FPolicy processing is done.
- \texttt{first-write} - Filter the client requests for the first-write. When this filter is used for CIFS events, the first-write request within a CIFS session results in FPolicy processing. When this filter is used for NFS events, the \texttt{-file-session-io-grouping-count} and \texttt{-file-session-io-grouping-duration} configurations determine the first-write request for which FPolicy processing is done.
• offline-bit - Filter the client request for offline bit set. Setting this filter, FPolicy server receives notification only when offline files are accessed.

• open-with-delete-intent - Filter the client request for open with delete intent. Setting this filter, FPolicy server receives notification only when an attempt is made to open a file with the intent to delete it. This is used by file systems when the FILE_DELETE_ON_CLOSE flag is specified.

• open-with-write-intent - Filter the client request for open with write intent. Setting this filter, FPolicy server receives notification only when an attempt is made to open a file with the intent to write something in it.

• write-with-size-change - Filter the client request for write with size change.

• setattr-with-owner-change - Filter the client setattr requests for changing owner of a file or directory.

• setattr-with-group-change - Filter the client setattr requests for changing group of a file or directory.

• setattr-with-sacl-change - Filter the client setattr requests for changing sacl on a file or directory.

• setattr-with-dacl-change - Filter the client setattr requests for changing dacl on a file or directory.

• setattr-with-modify-time-change - Filter the client setattr requests for changing the modification time of a file or directory.

• setattr-with-access-time-change - Filter the client setattr requests for changing the access time of a file or directory.

• setattr-with-creation-time-change - Filter the client setattr requests for changing the creation time of a file or directory.

• setattr-with-mode-change - Filter the client setattr requests for changing the mode bits on a file or directory.

• setattr-with-size-change - Filter the client setattr requests for changing the size of a file.

• setattr-with-allocation-size-change - Filter the client setattr requests for changing the allocation size of a file.

• exclude-directory - Filter the client requests for directory operations. When this filter is specified directory operations are not monitored.

Note: If you specify a value for the --filters parameter, then you must also specify valid values for the --file-operations and --protocol parameters.

Note: If the client sends multiple read/write requests simultaneously for the same file, then the first-read and first-write filters can result in more than one FPolicy notification.

[-volume-operation (true|false)] - Send Volume Operation Notifications

This parameter specifies whether volume operations generate notifications for the FPolicy event. If this field is set to true then FPolicy sends notifications when volumes are mounted or unmounted. By default, it is false.

Examples

The following example creates an FPolicy event.

```
cluster1::> vserver fpolicy policy event create -vserver vs1.example.com -event-name cifs_event -protocol cifs -file-operations open,close,read,write
```
## vserver fpolicy policy event delete

Delete an event

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver fpolicy policy event delete` command deletes an FPolicy event.

**Parameters**
- **-vserver `<Vserver Name>`** - Vserver
  
  This parameter specifies the Vserver from which you want to delete an FPolicy event.

- **-event-name `<Event name>`** - Event
  
  This parameter specifies the name of the FPolicy event you want to delete.

**Examples**
The following example deletes an FPolicy event.

```bash
cluster1::> vserver fpolicy policy event delete  -vserver vs1.example.com -event-name cifs_event
```

## vserver fpolicy policy event modify

Modify an event

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver fpolicy policy event modify` command modifies an FPolicy event. An event describes what to monitor. An event can contain protocol, file operations, filters, and volume operation event types. In the FPolicy configuration, an event is attached to an FPolicy policy. You can attach the same event to one or more policies. You can modify an event while it is attached to an FPolicy policy. Any changes to the event take effect immediately.

**Note:** Three parameters have dependency rules: `-protocol`, `-files-operations` and `-filters`. The following combinations are supported:

- Both `-protocol` and `-file-operations`
- All of `-protocol`, `-file-operations` and `-filters`
- Specify none of three

**Parameters**

- **-vserver <Vserver Name>** - *Vserver*
  
  This parameter specifies the name of the Vserver on which you want to modify an FPolicy event.

- **-event-name <Event name>** - *Event*
  
  This parameter specifies the name of the FPolicy event that you want to modify. An event name can be up to 256 characters long. An event name value is a string that can only contain any combination of ASCII-range alphanumeric characters (a-z, A-Z, 0-9), "_" and ".".

- **[-protocol <Protocol>]** - *Protocol*
  
  This parameter specifies the protocol name for which the event will be modified. By default, no protocol is selected. The value of this parameter must be one of the following:
  
  - *cifs* - This specifies that the event is for the CIFS protocol.
  - *nfsv3* - This specifies that the event is for the NFSv3 protocol.
  - *nfsv4* - This specifies that the event is for the NFSv4 protocol.

  **Note:** If you specify *-protocol*, then you must also specify a valid value for the *-file-operations* parameter.

- **[-file-operations <File Operation>, ...]** - *File Operations*
  
  This parameter specifies a list of file operations for the FPolicy event. The event will check the operations specified in this list from all client requests using the protocol specified in the *-protocol* parameter. The list can include one or more of the following operations:
  
  - *close* - File close operations.
  - *create* - File create operations.
  - *create_dir* - Directory create operations.
  - *delete* - File delete operations.
  - *delete_dir* - Directory delete operations.
  - *getattr* - Get attribute operations.
  - *link* - Link operations.
  - *lookup* - Lookup operations.
  - *open* - File open operations.
  - *read* - File read operations.
  - *write* - File write operations.
  - *rename* - File rename operations.
  - *rename_dir* - Directory rename operations.
  - *setattr* - Set attribute operations.
  - *symlink* - Symbolic link operations.

  **Note:** If you specify *-file-operations* then you must specify a valid protocol in the *-protocol* parameter.
[-filters <Filter>, ...] - Filters

This parameter specifies a list of filters of given file operation or operations for the protocol specified in the -protocol parameter. The values in the -filters parameter are used to filter client requests. The list can include one or more of the following:

• monitor-ads - Filter the client request for alternate data stream.

• close-with-modification - Filter the client request for close with modification.

• close-without-modification - Filter the client request for close without modification.

• close-with-read - Filter the client request for close with read.

• first-read - Filter the client requests for the first-read. When this filter is used for CIFS events, the first-read request within a CIFS session results in FPolicy processing. When this filter is used for NFS events, the -file-session-io-grouping-count and -file-session-io-grouping-duration configurations determine the first read-request for which FPolicy processing is done.

• first-write - Filter the client requests for the first-write. When this filter is used for CIFS events, the first-write request within a CIFS session results in FPolicy processing. When this filter is used for NFS events, the -file-session-io-grouping-count and -file-session-io-grouping-duration configurations determine the first-write request for which FPolicy processing is done.

• offline-bit - Filter the client request for offline bit set. Setting this filter, FPolicy server receives notification only when offline files are accessed.

• open-with-delete-intent - Filter the client request for open with delete intent. Setting this filter, FPolicy server receives notification only when an attempt is made to open a file with the intent to delete it. This is used by file systems when the FILE_DELETE_ON_CLOSE flag is specified.

• open-with-write-intent - Filter the client request for open with write intent. Setting this filter, FPolicy server receives notification only when an attempt is made to open a file with the intent to write something in it.

• write-with-size-change - Filter the client request for write with size change.

• setattr-with-owner-change - Filter the client setattr requests for changing owner of a file or directory.

• setattr-with-group-change - Filter the client setattr requests for changing group of a file or directory.

• setattr-with-sacl-change - Filter the client setattr requests for changing sacl on a file or directory.

• setattr-with-dacl-change - Filter the client setattr requests for changing dacl on a file or directory.

• setattr-with-modify-time-change - Filter the client setattr requests for changing the modification time of a file or directory.

• setattr-with-access-time-change - Filter the client setattr requests for changing the access time of a file or directory.

• setattr-with-creation-time-change - Filter the client setattr requests for changing the creation time of a file or directory.

• setattr-with-mode-change - Filter the client setattr requests for changing the mode bits on a file or directory.

• setattr-with-size-change - Filter the client setattr requests for changing the size of a file.
• **setattr-with-allocation-size-change** - Filter the client setattr requests for changing the allocation size of a file.

• **exclude-directory** - Filter the client requests for directory operations. When this filter is specified directory operations are not monitored.

**Note:** If you specify a value for the **-filters** parameter, then you must also specify valid values for the **-file-operations** and **-protocol** parameters.

**Note:** If the client sends multiple read/write requests simultaneously for the same file, then the first-read and first-write filters can result in more than one FPolicy notification.

[**-volume-operation {true|false}**] - **Send Volume Operation Notifications**

This parameter specifies whether volume operations generate notifications for the FPolicy event. If this field is set to true then FPolicy sends notifications when volumes are mounted or unmounted. By default, it is false.

### Examples

The following example modifies an FPolicy event.

```
cluster1::> vserver fpolicy policy event modify -vserver vs1.example.com -event-name cifs_event -protocol cifs -file-operations open,close,read,write -filters first-read,offline-bit -volume-operation true
```

```
cluster1::> vserver fpolicy policy event show -vserver vs1.example.com -event-name cifs_event
```

- **Vserver:** vs1.example.com
- **Event Name:** cifs_event
- **Protocol:** cifs
- **File Operations:** open, close, read, write
- **Filters:** first-read, offline-bit
- **Volume Operation:** true

### vserver fpolicy policy event show

Display events

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The `vserver fpolicy policy event show` command displays information about all FPolicy events belonging to the Vserver. Any Vserver administrator can see FPolicy events associated with their Vserver as well as FPolicy events created by the cluster administrator. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all FPolicy events:

- **Vserver name**
- **FPolicy event name**
- **Protocol name**
- **List of file operations**
- **List of filters**
You can specify the `-fields` parameter to specify which fields of information to display about FPolicy events. You can specify additional parameters to display only information that matches those parameters. For example, to display information only about all CIFS events configured with the `-volume-operation` field set, run the command with the `-fields parameter set to `-event-name` event-name `-protocol` cifs `-volume-operation` yes.

You can specify the `-instance` parameter to display all information for all policies in a list format.

**Parameters**

`{ [-fields <fieldname>, ...]`

If you specify the `-fields <fieldname>, ...` parameter, the command only displays the fields that you specify.

`[[-instance]]`

If you specify the `-instance` parameter, the command displays detailed information about all entries.

`[-vserver <Vserver Name>] - Vserver`

If you specify this parameter, the command displays information only about the FPolicy events for the specified Vserver. Events created on the admin Vserver by the cluster administrator are visible in all Vservers.

`[-event-name <Event name>] - Event`

If you specify this parameter, the command displays information only about the FPolicy event that matches the specified event name.

`[-protocol <Protocol>] - Protocol`

If you specify this parameter, the command displays information only about the FPolicy event or events that use the specified protocol.

`[-file-operations <File Operation>, ...] - File Operations`

If you specify this parameter, the command displays information only about the FPolicy event or events that use the specified file operation or operations.

`[-filters <Filter>, ...] - Filters`

If you specify this parameter, the command displays information only about the FPolicy event or events that use the specified filter or filters.

`[-volume-operation {true|false}] - Send Volume Operation Notifications`

If this field is set to `true`, then FPolicy displays information about those events for which it sends notifications when volumes are mounted or unmounted. If you set this parameter to `true`, the command displays information about events where the `-volume-operation` parameter is set `true` and volume operations such as mount and unmount are monitored. If you set this parameter to `false`, the command displays information about events where volume operations are not monitored.

**Examples**

The following example displays the information about all Vserver FPolicy policy events.

```
cluster1::> vserver fpolicy policy event show

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Event Name</th>
<th>Protocols</th>
<th>File Operations</th>
<th>Filters</th>
<th>Volume Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cluster</td>
<td>cservEvt</td>
<td>cifs</td>
<td>open, close,</td>
<td>first-write, true</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>read, write</td>
<td>first-read</td>
<td></td>
</tr>
<tr>
<td>vs1.example.com</td>
<td>cservEvt</td>
<td>cifs</td>
<td>open, close,</td>
<td>first-write, true</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>read, write</td>
<td>first-read</td>
<td></td>
</tr>
<tr>
<td>vs1.example.com</td>
<td>vs1e1</td>
<td>cifs</td>
<td>open, read</td>
<td>first-read</td>
<td>-</td>
</tr>
<tr>
<td>vs1.example.com</td>
<td>vs1e2</td>
<td>cifs</td>

```
The following example displays event name information about all Vserver FPolicy policy events with CIFS as a protocol and with false as volume operation.

```
cluster1::> vserver fpolicy policy event show -fields event-name -protocol cifs -volume-operation false
vserver         event-name
--------------- ----------
vs1.example.com  v1e2
```

vserver fpolicy policy external-engine commands

Manage FPolicy external engine

vserver fpolicy policy external-engine create

Create an external engine

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver fpolicy policy external-engine create` command creates an FPolicy external engine. The cluster uses the external engine to hold configuration information that it needs in order to send notification information to the FPolicy servers. It specifies the primary servers and secondary servers to which the cluster will send notifications. It also specifies FPolicy server related configuration information.

**Parameters**

- **-vserver <Vserver Name>** - Vserver
  
  This parameter specifies the name of the Vserver on which you want to create an FPolicy external engine.

- **-engine-name <Engine name>** - Engine
  
  This parameter specifies the name of the FPolicy external engine that you want to create. An external engine name can be up to 256 characters long. An external engine name is a string that can only contain any combination of ASCII-range alphanumeric characters (a-z, A-Z, 0-9), ",", and ".".

- **-primary-servers <IP Address>, ...** - Primary FPolicy Servers
  
  This parameter specifies a list of IP addresses for the primary FPolicy servers to which you want the external engine you create to apply. The `-primary-servers` parameter is used to specify a list of servers to which to send file access events for a given FPolicy policy. When an administrator configures multiple servers as primary servers, notifications are sent to the FPolicy servers in a round-robin fashion.

- **-port <integer>** - Port Number of FPolicy Service
  
  This parameter specifies the port number for the FPolicy service.

- **[-secondary-servers <IP Address>, ...]** - Secondary FPolicy Servers
  
  This parameter specifies a list of IP addresses for the secondary FPolicy servers to which you want the external engine you create to apply. Secondary servers will be used only when all the primary servers are not reachable. When an administrator configures multiple servers as secondary servers, notifications are sent to FPolicy server in a round-robin fashion. By default, no secondary server is selected.
[-extern-engine-type <External Engine Type>] - External Engine Type

This parameter specifies the type of the external engine. This specifies how the FPolicy server should behave, synchronously or asynchronously. By default, it is synchronous in nature. When set to synchronous, after sending a notification to the external FPolicy server, request processing does not continue until after receiving a response from the FPolicy server. At that point request flow either continues or processing results in denial, depending on whether the response from the FPolicy server permits the requested action. When set to asynchronous, after sending a notification to the external FPolicy server, file request processing continues.

-ssl-option {no-auth|server-auth|mutual-auth} - SSL Option for External Communication

This parameter specifies the SSL option for external communication with the FPolicy server. Possible values include the following:

- no-auth: When set to no-auth, no authentication takes place. The communication link is established over the TCP protocol.

- server-auth: When set to server-auth, only the FPolicy server is authenticated by the Vserver. With this option, before creating the FPolicy external engine, the administrator must install the public certificate of the certificate authority (CA) that signed the FPolicy server certificate.

- mutual-auth: When set to mutual-auth, mutual authentication takes place between the Vserver and the FPolicy server, i.e., authentication of the FPolicy server by the Vserver along with authentication of the Vserver by the FPolicy server. With this option, before creating the FPolicy external engine, the administrator must install the public certificate of the certificate authority (CA) that signed the FPolicy server certificate along with the public certificate and key file for authentication of the Vserver.

The public certificate of certificate authority (CA) that is used to sign the FPolicy server certificate is installed using the security certificate install command with -type set to client_ca. The private key and public certificate required for authentication of the Vserver is installed using the security certificate install command with -type set to server.

[-reqs-cancel-timeout <[<integer>h]<integer>m]<integer>s>] - Timeout for Canceling a Request (privilege: advanced)

This parameter specifies the timeout for canceling a request. It is used to specify the time interval in which the node waits for a response from the FPolicy server. Beyond this timeout, a cancel request is sent to the FPolicy server to cancel the pending request. The request is then sent to an alternate FPolicy server that is registered for the policy. This timeout helps in handling a FPolicy server that is not responding, which can improve CIFS/NFS client response. Also, this feature can help in releasing of system resources since the request is moved from a down/bad FPolicy server to an alternate FPolicy server. The value for this field must be between 0s and 100s. By default, it is 20s.

[-reqs-abort-timeout <[<integer>h]<integer>m]<integer>s>] - Timeout for Aborting a Request (privilege: advanced)

This parameter specifies the timeout for aborting a request. The value for this field must be between 0s and 200s. By default, it is 40s.

[-status-req-interval <[<integer>h]<integer>m]<integer>s>] - Interval for Sending Status Requests (privilege: advanced)

This parameter specifies the interval for sending status requests. It is used to specify the interval after which a status request will be sent to the FPolicy server. The value for this field must be between 0s and 50s. By default, it is 10s.

[-max-connection-retries <integer>] - Max Reconnect Attempt (privilege: advanced)

This parameter specifies the maximum number of attempts to reconnect to the FPolicy server from a Vserver. It is used to specify the number of times a broken connection will be retried. The value for this field must be between 0 and 20. By default, it is 5.
[-max-server-reqs <integer>] - Maximum Outstanding Requests for FPolicy Server (privilege: advanced)

This parameter specifies the maximum number of outstanding requests for the FPolicy server. It is used to specify maximum outstanding requests that will be queued up for the FPolicy server. The value for this field must be between 1 and 10000. By default, it is 50.

[-server-progress-timeout {[<integer>h] [<integer>m] [<integer>s]}] - Timeout for Disconnecting Non-responsive Server (privilege: advanced)

This parameter specifies the timeout for disconnecting non-responsive FPolicy servers. It is used to specify the time interval after which the connection to the FPolicy server is terminated. This happens only when the FPolicy server's queue contains the maximum allowed number of requests that it can hold in its queue and no response is received within this timeout. The maximum allowed number of requests is either 50 (the default) or the number specified by the -max-server-reqs parameter. The value for this field must be between 1s and 100s. By default, it is 60s.

[-keep-alive-interval {[<integer>h] [<integer>m] [<integer>s]}] - Interval for Sending Keep-Alive Messages (privilege: advanced)

This parameter specifies the interval in hours (h), minutes (m), or seconds (s) at which keep-alive messages are sent to the FPolicy server. Keep-alive messages are used to detect half-open connections. The range of supported values for this field is 10 through 600 (h, m, or s). Alternatively, the value can be set to 0, which disables keep-alive messages and prevents them from being sent to the FPolicy servers. The default value for this field is 120s.

[-certificate-common-name <FQDN or Custom Common Name>] - FQDN or Custom Common Name

This parameter specifies the certificate name as a fully qualified domain name (FQDN) or custom common name. The certificate is used if SSL authentication between the Vserver and the FPolicy server is configured.

[-certificate-serial <text>] - Serial Number of Certificate

This parameter specifies the serial number of the certificate used for authentication if SSL authentication between the Vserver and the FPolicy server is configured.

[-certificate-ca <text>] - Certificate Authority

This parameter specifies the certificate authority (CA) name of the certificate used for authentication if SSL authentication between the Vserver and the FPolicy server is configured.

[-recv-buffer-size <integer>] - Receive Buffer Size (privilege: advanced)

This parameter specifies the receive buffer size of the connected socket for the FPolicy server. The default value is set to 256 kilobytes (Kb). When the value is set to 0, the size of the receive buffer is set to a value defined by the system. For example, if the default receive buffer size of the socket is 65536 bytes, by setting the tunable value to 0, the socket buffer size is set to 65536 bytes. You can use any non-default value to set the size (in bytes) of the receive buffer.

[-send-buffer-size <integer>] - Send Buffer Size (privilege: advanced)

This parameter specifies the send buffer size of the connected socket for the FPolicy server. The default value is set to 256 kilobytes (Kb). When the value is set to 0, the size of the send buffer is set to a value defined by the system. For example, if the default send buffer size of the socket is set to 65536 bytes, by setting the tunable value to 0, the socket buffer size is set to 65536 bytes. You can use any non-default value to set the size (in bytes) of the send buffer.

[-session-timeout {[<integer>h] [<integer>m] [<integer>s]}] - Session ID Purge Timeout During Reconnection (privilege: advanced)

This parameter specifies the interval after which a new session ID is sent to the FPolicy server during reconnection attempts. The value for this field must be between 0s and 200s. The default value is set to 10 seconds. If the connection between the storage controller and the FPolicy server is terminated and reconnection is made within the -session-timeout interval, the old session ID is sent to FPolicy server so that it can send responses for old notifications.
Is Resiliency Feature Enabled

This parameter specifies whether the resiliency feature is enabled. When this parameter is set to `true` and all the primary and secondary servers are down, or no response is received from the FPolicy servers, file access events are stored inside the storage controller under the specified `-resiliency-directory-path`. To deny the file access events from being stored under these circumstances, set this parameter to `false`. By default, it is `false`.

Maximum Notification Retention Duration

This parameter specifies the duration for which the notifications are written to files inside the storage controller during network outage. The value for this field must be between 0s and 600s. By default, it is set to 180s.

Directory for Notification Storage

This parameter specifies the directory path under the `-vserver` namespace, where notifications are stored in the files whenever network outage happens.

```
Examples

The following example creates an FPolicy external engine.

class=cluster1,cmd=vserver fpolicy policy external-engine create -vserver vs1.example.com -engine-name new_engine -primary-servers 1.1.1.1 -port 10 -secondary-servers 2.2.2.2 -ssl-option mutual-auth -extern-engine-type synchronous -certificate-serial 8DDE112A114D1FBC -certificate-common-name Sample1-FPolicy-Client -certificate-ca TASample1
class=cluster1,cmd=vserver fpolicy policy external-engine show -vserver vs1.example.com -engine-name new_engine
```

Vserver: vs1.example.com
Engine: new_engine
Primary FPolicy Servers: 1.1.1.1
Port Number of FPolicy Service: 10
Secondary FPolicy Servers: 2.2.2.2
External Engine Type: synchronous
SSL Option for External Communication: mutual-auth
FQDN or Custom Common Name: Sample1-FPolicy-Client
Serial Number: 8DDE112A114D1FBC
Certificate Authority: TASample1

vserver fpolicy policy external-engine delete

Delete an external engine

Availability: This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

Description

The `vserver fpolicy policy external-engine delete` command deletes an FPolicy external engine.

Parameters

- `-vserver <Vserver Name>` - Vserver
  
  This parameter specifies the Vserver from which you want to delete an FPolicy external engine.

- `-engine-name <Engine name>` - Engine
  
  This parameter specifies the name of the FPolicy external engine you want to delete.
Examples
The following example deletes an FPolicy external engine.

```
cluster1::> vserver fpolicy policy external-engine show -vserver vs1.example.com -engine-name new_engine
Vserver: vs1.example.com
  Engine: new_engine
  Primary FPolicy Servers: 1.1.1.1
  Port Number of FPolicy Service: 10
  Secondary FPolicy Servers: 2.2.2.2
  External Engine Type: synchronous
  SSL Option for External Communication: mutual-auth
  FQDN or Custom Common Name: Sample1-FPolicy-Client
  Serial Number: 8DDE112A114D1FBC
  Certificate Authority: TASample1
```

```
cluster1::> vserver fpolicy policy external-engine delete -vserver vs1.example.com -engine-name new_engine
```

vserver fpolicy policy external-engine modify
Modify an external engine

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver fpolicy policy external-engine modify command modifies an FPolicy external engine. The cluster uses the external engine to hold configuration information that it needs in order to send notification information to the FPolicy servers. It specifies the primary servers and secondary servers to which the cluster will send notifications. It also specifies FPolicy server related configuration information.

Parameters
-vserver <Vserver Name> - Vserver
This parameter specifies the name of the Vserver on which you want to modify an FPolicy external engine.

-engine-name <Engine name> - Engine
This parameter specifies the name of the FPolicy external engine that you want to modify. An external engine name can be up to 256 characters long. An external engine name is a string that can only contain any combination of ASCII-range alphanumeric characters (a-z, A-Z, 0-9), ",", and ".".

[-primary-servers <IP Address>, ...] - Primary FPolicy Servers
This parameter specifies a list of IP addresses for the primary FPolicy servers to which you want the external engine you modify to apply. The -primary-servers parameter is used to specify a list of servers to which to send file access events for a given FPolicy policy. When an administrator configures multiple servers as primary servers, notifications are sent to the FPolicy servers in a round-robin fashion.

[-port <integer>] - Port Number of FPolicy Service
This parameter specifies the port number for the FPolicy service.

[-secondary-servers <IP Address>, ...] - Secondary FPolicy Servers
This parameter specifies a list of IP addresses for the secondary FPolicy servers to which you want the external engine you modify to apply. Secondary servers will be used only when all the primary servers are not reachable. When an administrator configures multiple servers as secondary servers, notifications are sent to FPolicy server in a round-robin fashion. By default, no secondary server is selected.
[-extern-engine-type <External Engine Type>] - External Engine Type
This parameter specifies the type of the external engine. This specifies how the FPolicy server should behave, synchronously or asynchronously. By default, it is synchronous in nature. When set to synchronous, after sending a notification to the external FPolicy server, request processing does not continue until after receiving a response from the FPolicy server. At that point request flow either continues or processing results in denial, depending on whether the response from the FPolicy server permits the requested action. When set to asynchronous, after sending a notification to the external FPolicy server, file request processing continues.

[[-ssl-option {no-auth|server-auth|mutual-auth}] - SSL Option for External Communication
This parameter specifies the SSL option for external communication with the FPolicy server. Possible values include the following:

- no-auth: When set to no-auth, no authentication takes place. The communication link is established over the TCP protocol.

- server-auth: When set to server-auth, only the FPolicy server is authenticated by the Vserver. With this option, before creating the FPolicy external engine, the administrator must install the public certificate of the certificate authority (CA) that signed the FPolicy server certificate.

- mutual-auth: When set to mutual-auth, mutual authentication takes place between the Vserver and the FPolicy server, i.e. authentication of the FPolicy server by the Vserver along with authentication of the Vserver by the FPolicy server. With this option, before creating the FPolicy external engine, the administrator must install the public certificate of the certificate authority (CA) that signed the FPolicy server certificate along with the public certificate and key file for authentication of the Vserver.

The public certificate of certificate authority (CA) that is used to sign the FPolicy server certificate is installed using the security certificate install command with -type set to client_ca. The private key and public certificate required for authentication of the Vserver is installed using the security certificate install command with -type set to server.

[-reqs-cancel-timeout <[<integer>h][<integer>m][<integer>s]>] - Timeout for Canceling a Request (privilege: advanced)
This parameter specifies the timeout for canceling a request. It is used to specify the time interval in which the node waits for a response from the FPolicy server. Beyond this timeout, a cancel request is sent to the FPolicy server to cancel the pending request. The request is then sent to an alternate FPolicy server that is registered for the policy. This timeout helps in handling a FPolicy server that is not responding, which can improve CIFS/NFS client response. Also, this feature can help in releasing of system resources since the request is moved from a down/bad FPolicy server to an alternate FPolicy server. The value for this field must be between 0s and 100s. By default, it is 20s.

[-reqs-abort-timeout <[<integer>h][<integer>m][<integer>s]>] - Timeout for Aborting a Request (privilege: advanced)
This parameter specifies the timeout for aborting a request. The value for this field must be between 0s and 200s. By default, it is 40s.

[-status-req-interval <[<integer>h][<integer>m][<integer>s]>] - Interval for Sending Status Requests (privilege: advanced)
This parameter specifies the interval for sending status requests. It is used to specify the interval after which a status request will be sent to the FPolicy server. The value for this field must be between 0s and 50s. By default, it is 10s.

[-max-connection-retries <integer>] - Max Reconnect Attempt (privilege: advanced)
This parameter specifies the maximum number of attempts to reconnect to the FPolicy server from a Vserver. It is used to specify the number of times a broken connection will be retried. The value for this field must be between 0 and 20. By default, it is 5.
[-max-server-reqs <integer>] - Maximum Outstanding Requests for FPolicy Server (privilege: advanced)

This parameter specifies the maximum number of outstanding requests for the FPolicy server. It is used to specify the maximum outstanding requests that will be queued up for the FPolicy server. The value for this field must be between 1 and 10000. By default, it is 50.

[-server-progress-timeout <[<integer>h] [<integer>m] [<integer>s]>] - Timeout for Disconnecting Non-responsive Server (privilege: advanced)

This parameter specifies the timeout for disconnecting non-responsive FPolicy servers. It is used to specify the time interval after which the connection to the FPolicy server is terminated. This happens only when the FPolicy server's queue contains the maximum allowed number of requests that it can hold in its queue and no response is received within this timeout. The maximum allowed number of requests is either 50 (the default) or the number specified by the -max-server-reqs parameter. The value for this field must be between 1s and 100s. By default, it is 60s.

[-keep-alive-interval <[<integer>h] [<integer>m] [<integer>s]>] - Interval for Sending Keep-Alive Messages (privilege: advanced)

This parameter specifies the interval in hours (h), minutes (m), or seconds (s) at which keep-alive messages are sent to the FPolicy server. Keep-alive messages are used to detect half-open connections. The range of supported values for this field is 10 through 600 (h, m, or s). Alternatively, the value can be set to 0, which disables keep-alive messages and prevents them from being sent to the FPolicy servers. The default value for this field is 120s.

[-certificate-common-name <FQDN or Custom Common Name>] - FQDN or Custom Common Name

This parameter specifies the certificate name as a fully qualified domain name (FQDN) or custom common name. The certificate is used if SSL authentication between the Vserver and the FPolicy server is configured.

[-certificate-serial <text>] - Serial Number of Certificate

This parameter specifies the serial number of the certificate used for authentication if SSL authentication between the Vserver and the FPolicy server is configured.

[-certificate-ca <text>] - Certificate Authority

This parameter specifies the certificate authority (CA) name of the certificate used for authentication if SSL authentication between the Vserver and the FPolicy server is configured.

[-recv-buffer-size <integer>] - Receive Buffer Size (privilege: advanced)

This parameter specifies the receive buffer size of the connected socket for the FPolicy server. The default value is set to 256 kilobytes (Kb). When the value is set to 0, the size of the receive buffer is set to a value defined by the system. For example, if the default receive buffer size of the socket is 65536 bytes, by setting the tunable value to 0, the socket buffer size is set to 65536 bytes. You can use any non-default value to set the size (in bytes) of the receive buffer.

[-send-buffer-size <integer>] - Send Buffer Size (privilege: advanced)

This parameter specifies the send buffer size of the connected socket for the FPolicy server. The default value is set to 256 kilobytes (Kb). When the value is set to 0, the size of the send buffer is set to a value defined by the system. For example, if the default send buffer size of the socket is set to 65536 bytes, by setting the tunable value to 0, the socket buffer size is set to 65536 bytes. You can use any non-default value to set the size (in bytes) of the send buffer.

[-session-timeout <[<integer>h] [<integer>m] [<integer>s]>] - Session ID Purge Timeout During Reconnection (privilege: advanced)

This parameter specifies the interval after which a new session ID is sent to the FPolicy server during reconnection attempts. The value for this field must be between 0s and 200s. The default value is set to 10 seconds. If the connection between the storage controller and the FPolicy server is terminated and reconnection is made within the -session-timeout interval, the old session ID is sent to FPolicy server so that it can send responses for old notifications.
- **is-resiliency-enabled (true|false)** - Is Resiliency Feature Enabled

   This parameter specifies whether the resiliency feature is enabled. When this parameter is set to `true` and all the primary and secondary servers are down, or no response is received from the FPolicy servers, file access events are stored inside the storage controller under the specified `-resiliency-directory-path`. To deny the file access events from being stored under these circumstances, set this parameter to `false`. By default, it is `false`.

- **-resiliency-max-retention-duration <[<integer>h][<integer>m][<integer>s]>** - Maximum Notification Retention Duration

   This parameter specifies the duration for which the notifications are written to files inside the storage controller during network outage. The value for this field must be between 0s and 600s. By default, it is set to 180s.

- **-resiliency-directory-path <text>** - Directory for Notification Storage

   This parameter specifies the directory path under the `-vserver` namespace, where notifications are stored in the files whenever network outage happens.

### Examples

The following example modifies an FPolicy external engine.

```bash
cluster1::> vserver fpolicy policy external-engine modify -vserver vs1.example.com -engine-name new_engine -primary-servers 1.1.1.1 -port 10 -secondary-servers 2.2.2.2
```

```bash
cluster1::> vserver fpolicy policy external-engine show -vserver vs1.example.com -engine-name new_engine
```

```
Vserver: vs1.example.com
Engine: new_engine
Primary FPolicy Servers: 1.1.1.1
Port Number of FPolicy Service: 10
Secondary FPolicy Servers: 2.2.2.2
External Engine Type: synchronous
SSL Option for External Communication: mutual-auth
FQDN or Custom Common Name: Sample1-FPolicy-Client
Certificate Authority: TASample1
```

The following example shows how to modify `-recv-buffer-size` and `-send-buffer-size` to a non-default value of 0.

```bash
cluster1::*> vserver fpolicy policy external-engine modify -vserver vs1.example.com -engine-name new_engine -recv-buffer-size 0 -send-buffer-size 0
```

### Related references

- `security certificate install` on page 476

- **vserver fpolicy policy external-engine show**

  Display external engines

  **Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

  **Description**

  The `vserver fpolicy policy external-engine show` command displays information about all FPolicy external engines belonging to the Vserver. Any Vserver administrator can see FPolicy external engines associated to their Vserver as well as external engines created by cluster administrator. The command output depends on the parameter or parameters.
specified with the command. If you do not specify any parameters, the command displays the following information about all FPolicy external engines:

- Vserver name
- FPolicy external engine name
- List of primary FPolicy servers
- List of secondary FPolicy servers
- Port number for FPolicy service
- FPolicy external engine type

You can specify the `-fields` parameter to specify which fields of information to display about FPolicy external engines. You can specify additional parameters to display only information that matches those parameters. For instance, to display information only about all external engines where the `-port` parameter is set to 9, run the command with the `-field` parameter set to engine-name and `-port` parameter set to 9.

You can specify the `-instance` parameter to display all information for all policies in a list format.

**Parameters**

`{[-fields <fieldname>, ...]}

If you specify the -fields <fieldname>, ... parameter, the command only displays the fields that you specify.

`{[-instance]}

If you specify the -instance parameter, the command displays detailed information about all entries.

`{[-vserver <Vserver Name>] - Vserver

If you specify this parameter, the command displays information only about the FPolicy external engines for the specified Vserver. FPolicy external engines that the cluster administrator creates are visible in all Vservers.

`{[-engine-name <Engine name>] - Engine

If you specify this parameter, the command displays information only about the FPolicy external engine that you specify.

`{[-primary-servers <IP Address>, ...] - Primary FPolicy Servers

If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified IP addresses as primary FPolicy servers.

`{[-port <integer>] - Port Number of FPolicy Service

If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified port for the FPolicy service.

`{[-secondary-servers <IP Address>, ...] - Secondary FPolicy Servers

If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified IP addresses as secondary FPolicy servers.

`{[-extern-engine-type <External Engine Type>] - External Engine Type

If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified engine type.

`{[-ssl-option {no-auth|server-auth|mutual-auth}] - SSL Option for External Communication

If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified SSL option.
[-reqs-cancel-timeout <[<integer>h] [<integer>m] [<integer>s]> - Timeout for Canceling a Request (privilege: advanced)

If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified timeout for canceling a request.

[-reqs-abort-timeout <[<integer>h] [<integer>m] [<integer>s]> - Timeout for Aborting a Request (privilege: advanced)

If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified timeout for aborting a request.

[-status-req-interval <[<integer>h] [<integer>m] [<integer>s]> - Interval for Sending Status Requests (privilege: advanced)

If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified interval for sending status requests.

[-max-connection-retries <integer>] - Max Reconnect Attempt (privilege: advanced)

If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified maximum reconnect attempts.

[-max-server-reqs <integer>] - Maximum Outstanding Requests for FPolicy Server (privilege: advanced)

If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified FPolicy server maximum outstanding requests.

[-server-progress-timeout <[<integer>h] [<integer>m] [<integer>s]> - Timeout for Disconnecting Non-responsive Server (privilege: advanced)

If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified timeout for disconnecting non-responsive server.

[-keep-alive-interval <[<integer>h] [<integer>m] [<integer>s]> - Interval for Sending Keep-Alive Messages (privilege: advanced)

If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified keep-alive interval.

[-certificate-common-name <FQDN or Custom Common Name>] - FQDN or Custom Common Name

If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified certificate common name.

[-certificate-serial <text>] - Serial Number of Certificate

If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified certificate serial number.

[-certificate-ca <text>] - Certificate Authority

If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified certificate authority name.

[-recv-buffer-size <integer>] - Receive Buffer Size (privilege: advanced)

If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified receive buffer size.

[-send-buffer-size <integer>] - Send Buffer Size (privilege: advanced)

If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified send buffer size.

[-session-timeout <[<integer>h] [<integer>m] [<integer>s]> - Session ID Purge Timeout During Reconnection (privilege: advanced)

If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified session timeout.
[-is-resiliency-enabled {true|false}] - Is Resiliency Feature Enabled

If you specify this parameter set to true, the command displays information only about the FPolicy external engine or engines that has the resiliency feature enabled.

[-resiliency-max-retention-duration <[<integer>h][<integer>m][<integer>s]>] - Maximum Notification Retention Duration

If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified network outage duration.

[-resiliency-directory-path <text>] - Directory for Notification Storage

If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified directory path.

Examples

The following example displays the information about the configured external engines using the vserver fpolicy policy external-engine show command.

cluster1::> vserver fpolicy policy external-engine show
Vserver           Engine       Primary Servers                       Secondary Servers             Port Engine Type
------------------ ----------- ------------------------------- ------------------------------- ------ -----------
Cluster           cserver_eng  9.9.9.9                             -                      9 synchronous
vs1.example.com cserver_eng  9.9.9.9                             -                      9 synchronous
vs1.example.com v1n1        1.1.1.1                             2.2.2.2                 1 synchronous
vs2.example.com cserver_eng  9.9.9.9                             -                      9 synchronous
vs2.example.com v2n1        3.3.3.3                             5.5.5.5                 2 synchronous
5 entries were displayed.

The following example displays the information about all Vserver FPolicy external engines with the -port parameter set to 9.

cluster1::> vserver fpolicy policy external-engine show -fields engine-name -port 9
vserver           engine-name
------------------ -----------
Cluster           cserver_eng
vs1.example.com cserver_eng
vs2.example.com cserver_eng
vs2.example.com cserver_eng
3 entries were displayed.

The following example displays the values of all the advanced-level parameters for the external engine v1n1 in Vserver vs1.example.com.

cluster1::*> vserver fpolicy policy external-engine show -vserver vs1.example.com -engine-name v1n1 -instance (vserver fpolicy policy external-engine show)

Vserver: vs1.example.com
Engine: v1n1
Primary FPolicy Servers: 1.1.1.1
Port Number of FPolicy Service: 1
Secondary FPolicy Servers: 2.2.2.2
External Engine Type: synchronous
SSL Option for External Communication: no-auth
Timeout for Canceling a Request: 20s
Timeout for Aborting a Request: 40s
Interval for Sending Status Requests: 10s
Max Reconnect Attempt: 5
Maximum Outstanding Requests for FPolicy Server: 50
Timeout for Disconnecting Non-responsive Server: 1m
vserver fpolicy policy scope commands

Manage policy scope for FPolicy

vserver fpolicy policy scope create

Create scope

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver fpolicy policy scope create command creates an FPolicy scope for an FPolicy policy. A scope defines the boundaries on which the FPolicy policy will apply. The Vserver is the basic scope boundary. When you create a scope for an FPolicy policy, you must define the FPolicy policy to which it will apply and you must designate to which Vserver you want to apply the scope. There are a number of parameters that further restrict the scope within the specified Vserver. You can restrict the scope by specifying what to include in the scope. Or you can restrict the scope by specifying what to exclude from the scope. For example, you can restrict the scope by specifying which volumes to include using the -volumes-to-include parameter or which volumes to exclude using the -volumes-to-exclude parameter. Once you apply a scope to an enabled policy, policy event checks get applied to the scope defined by this command.

Note: There are special considerations for the scope for a cluster FPolicy policy. The cluster FPolicy policy is a policy that the cluster administrator creates for the admin Vserver. If the cluster administrator also creates the scope for that cluster FPolicy policy, a Vserver administrator cannot create a scope for that same policy. However, if the cluster administrator does not create a scope for the cluster FPolicy policy, then any Vserver administrator can create the scope for that cluster policy. In the event that the Vserver administrator creates a scope for that cluster FPolicy policy, the cluster administrator cannot subsequently create a cluster scope for that same cluster policy. This is because the cluster administrator cannot override the scope for the same cluster policy.

Parameters
-vserver <Vserver Name> - Vserver
This parameter specifies the name of the Vserver on which you want to create an FPolicy policy scope.

-policy-name <Policy name> - Policy
This parameter specifies the name of the FPolicy policy for which you want to create the scope.

[-shares-to-include <Share name>, ...] - Shares to Include
This parameter specifies a list of shares for file access monitoring. With this option, the administrator provides a list of shares, separated by commas. For file access events relative to the specified shares and file operations monitored by the FPolicy policy, a notification is generated. The -shares-to-include parameter can contain regular expressions and can include metacharacters such as "?" and "*".

Note: When a share is included in the -shares-to-include parameter and the parent volume of the share is included in the -volumes-to-exclude parameter, -volumes-to-exclude has precedence over -shares-to-include.
[-shares-to-exclude <Share name>, ...] - Shares to Exclude

This parameter specifies a list of shares to exclude from file access monitoring. With this option, the administrator provides a list of shares, separated by commas. When a share is specified in the -shares-to-exclude parameter, no notification is sent for files accessed relative to that share. The -shares-to-exclude parameter can contain regular expressions and can include metacharacters such as "?" and ".

[-volumes-to-include <volume name>, ...] - Volumes to Include

This parameter specifies a list of volumes for file access monitoring. With this option, the administrator provides a list of volumes, separated by commas. For file access events within the volume and file operations monitored by the FPolicy policy, a notification is generated. The -volumes-to-include parameter can contain regular expressions and can include metacharacters such as "?" and ".

[-volumes-to-exclude <volume name>, ...] - Volumes to Exclude

This parameter specifies a list of volumes to exclude from file access monitoring. With this option, the administrator provides a list of volumes, separated by commas, for which no file access notifications are generated. The -volumes-to-exclude parameter can contain regular expressions and can include metacharacters such as "?" and ".

Note: When a share is included in the -shares-to-include parameter and the parent volume of the share is included in the -volumes-to-exclude parameter, -volumes-to-exclude has precedence over -shares-to-include. Similarly, when an export policy is included in the -export-policies-to-include parameter and the parent volume of the export-policy is included in the -volumes-to-exclude parameter, -volumes-to-exclude has precedence over -export-policies-to-include.

[-export-policies-to-include <FPolicy export policy>, ...] - Export Policies to Include

This parameter specifies a list of export policies for file access monitoring. With this option, the administrator provides a list of export policies, separated by commas. For file access events within an export policy and file operations monitored by the FPolicy policy, a notification is generated. The -export-policies-to-include parameter can contain regular expressions and can include metacharacters such as "?" and ".

Note: When an export policy is included in the -export-policies-to-include parameter and the parent volume of the export policy is included in the -volumes-to-exclude parameter, -volumes-to-exclude has precedence over -export-policies-to-include.

[-export-policies-to-exclude <FPolicy export policy>, ...] - Export Policies to Exclude

This parameter specifies a list of export policies to exclude from file access monitoring. With this option, the administrator provides a list of export policies, separated by commas, for which no file access notification is sent. The -export-policies-exclude parameter can contain regular expressions and can include metacharacters such as "?" and ".

[-file-extensions-to-include <File extension>, ...] - File Extensions to Include

This parameter specifies a list of file extensions, separated by commas, for a given FPolicy policy for which FPolicy processing is required. Any file access to files with the same extensions included in the -file-extensions-to-include parameter generates a notification. The -file-extensions-to-include parameter can contain regular expressions and can include metacharacters such as "?".

[-file-extensions-to-exclude <File extension>, ...] - File Extensions to Exclude

This parameter specifies a list of file extensions, separated by commas, for a given FPolicy policy for which FPolicy processing will be excluded. Using the exclude list, the administrator can request notification for all extensions except those in the excluded list. Any file access to files with the same extensions included in the -file-extensions-to-exclude parameter does not generate a notification. The -file-extensions-to-exclude parameter can contain regular expressions and can include metacharacters such as "?".

Note: An administrator can specify both -file-extensions-to-include and -file-extensions-to-exclude lists. The -file-extensions-to-exclude parameter is checked first before the -file-extensions-to-include parameter is checked.
[-is-file-extension-check-on-directories-enabled {true|false}] - Is File Extension Check on Directories Enabled (privilege: advanced)

This parameter specifies whether the file name extension checks apply to directory objects as well. If this parameter is set to true, the directory objects are subjected to same extension checks as regular files. If this parameter is set to false, the directory names are not matched for extensions and notifications would be sent for directories even if their name extensions do not match. By default, it is false.

[-is-monitoring-of-objects-with-no-extension-enabled {true|false}] - Is Monitoring of Objects with No Extension Enabled (privilege: advanced)

This parameter specifies whether the extension checks apply to objects with no extension as well. If this parameter is set to true, the objects with no extension are also monitored along with the objects with extension. By default, it is false.

Note: This parameter is ignored when file-extensions-to-include and file-extensions-to-exclude lists are empty.

### Examples

The following example creates an FPolicy policy scope.

```
class1::> vserver fpolicy policy scope create  
-vserver vsl.example.com 
-policy-name vsl_pol 
-file-extensions-to-include flv,wmv,mp3,mp4 

cluster1::> vserver fpolicy policy scope show 

Vserver           Policy              Extensions           Extensions
Name              Name                Included             Excluded
----------------- ------------------- -------------------- -------------------
Cluster           cserver_pol         txt                  mp3, wmv
vsl.example.com   vsl_pol             flv, wmv, mp3, mp4   cpp, c, h, txt
2 entries were displayed.
```

vserver fpolicy policy scope delete

Delete scope

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver fpolicy policy scope delete command deletes an FPolicy policy scope.

Parameters

-vserver <Vserver Name> - Vserver

This parameter specifies the name of the Vserver from which you want to delete the FPolicy policy scope.

-policy-name <Policy name> - Policy

This parameter specifies the name of the FPolicy policy for which you want to delete the scope.

### Examples

The following example deletes a scope of an FPolicy policy.
vserver fpolicy policy scope modify

Modify scope

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver fpolicy policy scope modify command modifies an FPolicy scope for an FPolicy policy. A scope defines the boundaries on which the FPolicy policy will apply. The Vserver is the basic scope boundary. When you modify a scope for an FPolicy policy, you must define the FPolicy policy to which it will apply and you must designate to which Vserver you want to apply the scope. There are a number of parameters that further restrict the scope within the specified Vserver. You can restrict the scope by specifying what to include in the scope. Or you can restrict the scope by specifying what to exclude from the scope. For example, you can restrict the scope by specifying which volumes to include using the -volumes-to-include parameter or which volumes to exclude using the -volumes-to-exclude parameter. Once you apply a scope to an enabled policy, policy event checks get applied to the scope defined by this command.

Parameters

-vserver <Vserver Name> - Vserver

This parameter specifies the name of the Vserver on which you want to modify an FPolicy policy scope.

-policy-name <Policy name> - Policy

This parameter specifies the name of the FPolicy policy for which you want to modify the scope.

[-shares-to-include <Share name>, ...] - Shares to Include

This parameter specifies a list of shares for file access monitoring. With this option, the administrator provides a list of shares, separated by commas. For file access events relative to the specified shares and file operations monitored by the FPolicy policy, a notification is generated. The -shares-to-include parameter can contain regular expressions and can include metacharacters such as "?" and "*".

Note: When a share is included in the -shares-to-include parameter and the parent volume of the share is included in the -volumes-to-exclude parameter, -volumes-to-exclude has precedence over -shares-to-include.

[-shares-to-exclude <Share name>, ...] - Shares to Exclude

This parameter specifies a list of shares to exclude from file access monitoring. With this option, the administrator provides a list of shares, separated by commas. When a share is specified in the -shares-to-exclude parameter, no notification is sent for files accessed relative to that share. The -shares-to-exclude parameter can contain regular expressions and can include metacharacters such as "?" and "*".

[-volumes-to-include <volume name>, ...] - Volumes to Include

This parameter specifies a list of volumes for file access monitoring. With this option, the administrator provides a list of volumes, separated by commas. For file access events within the volume and file operations monitored by the FPolicy policy, a notification is generated. The -volumes-to-include parameter can contain regular expressions and can include metacharacters such as "?" and "*".

[-volumes-to-exclude <volume name>, ...] - Volumes to Exclude

This parameter specifies a list of volumes to exclude from file access monitoring. With this option, the administrator provides a list of volumes, separated by commas, for which no file access notifications are generated. The -volumes-to-exclude parameter can contain regular expressions and can include metacharacters such as "?" and "*".
Note: When a share is included in the -shares-to-include parameter and the parent volume of the share is included in the -volumes-to-exclude parameter, -volumes-to-exclude has precedence over -shares-to-include. Similarly, when an export policy is included in the -export-policies-to-include parameter and the parent volume of the export-policy is included in the -volumes-to-exclude parameter, -volumes-to-exclude has precedence over -export-policies-to-include.

[-export-policies-to-include <FPolicy export policy>, ...] - Export Policies to Include
This parameter specifies a list of export policies for file access monitoring. With this option, the administrator provides a list of export policies, separated by commas. For file access events within an export policy and file operations monitored by the FPolicy policy, a notification is generated. The -export-policies-to-include parameter can contain regular expressions and can include metacharacters such as "?" and "*".

Note: When an export policy is included in the -export-policies-to-include parameter and the parent volume of the export policy is included in the -volumes-to-exclude parameter, -volumes-to-exclude has precedence over -export-policies-to-include.

[-export-policies-to-exclude <FPolicy export policy>, ...] - Export Policies to Exclude
This parameter specifies a list of export policies to exclude from file access monitoring. With this option, the administrator provides a list of export policies, separated by commas, for which no file access notification is sent. The -export-policies-exclude parameter can contain regular expressions and can include metacharacters such as "?" and "*".

[-file-extensions-to-include <File extension>, ...] - File Extensions to Include
This parameter specifies a list of file extensions, separated by commas, for a given FPolicy policy for which FPolicy processing is required. Any file access to files with the same extensions included in the -file-extensions-to-include parameter generates a notification. The -file-extensions-to-include parameter can contain regular expressions and can include metacharacters such as "?".

[-file-extensions-to-exclude <File extension>, ...] - File Extensions to Exclude
This parameter specifies a list of file extensions, separated by commas, for a given FPolicy policy for which FPolicy processing will be excluded. Using the exclude list, the administrator can request notification for all extensions except those in the excluded list. Any file access to files with the same extensions included in the -file-extensions-to-exclude parameter does not generate a notification. The -file-extensions-to-exclude parameter can contain regular expressions and can include metacharacters such as "?".

Note: An administrator can specify both -file-extensions-to-include and -file-extensions-to-exclude lists. The -file-extensions-to-exclude parameter is checked first before the -file-extensions-to-include parameter is checked.

[-is-file-extension-check-on-directories-enabled {true|false}] - Is File Extension Check on Directories Enabled (privilege: advanced)
This parameter specifies whether the file name extension checks apply to directory objects as well. If this parameter is set to true, the directory objects are subjected to same extension checks as regular files. If this parameter is set to false, the directory names are not matched for extensions and notifications would be sent for directories even if their name extensions do not match. By default, it is false.

[-is-monitoring-of-objects-with-no-extension-enabled {true|false}] - Is Monitoring of Objects with No Extension Enabled (privilege: advanced)
This parameter specifies whether the extension checks apply to objects with no extension as well. If this parameter is set to true, the objects with no extension are also monitored along with the objects with extension. By default, it is false.

Note: This parameter is ignored when file-extensions-to-include and file-extensions-to-exclude lists are empty.
Examples
The following example modifies an FPolicy policy scope.

```
cluster1::> vserver fpolicy policy scope modify
            -vserver vs1.example.com
            -policy-name vs1_pol
            -file-extensions-to-include
            flv,wmv,mp3,mp4
            -file-extensions-to-exclude
            cpp,c,h,txt

cluster1::> vserver fpolicy policy scope show
```

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Policy</th>
<th>Included</th>
<th>Excluded</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cluster</td>
<td>cserver_pol</td>
<td>txt</td>
<td>mp3, wmv</td>
</tr>
<tr>
<td>vs1.example.com</td>
<td>vs1_pol</td>
<td>flv, wmv, mp3, mp4</td>
<td>cpp, c, h, txt</td>
</tr>
</tbody>
</table>

2 entries were displayed.

vserver fpolicy policy scope show
Display scope

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver fpolicy policy scope show command displays scope information about all FPolicy policies belonging to the Vserver. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all FPolicy scopes:

- Vserver name
- Policy name
- The file extensions to include
- The file extensions to exclude

You can use the -fields parameter to specify which fields of information to display about FPolicy scopes. In addition to the fields above, you can display the following fields:

- The shares to include
- The shares to exclude
- The volumes to include
- The volumes to exclude
- The export policies to include
- The export policies to exclude
- Whether file extention check on directories is enabled
- Whether monitoring of objects with no extension is enabled

You can specify specific parameters to display only information that matches those parameters. For example, to display scope information only about all FPolicy policies where the -file-extensions-to-include parameter is set to txt, run the command with the -fields parameter set to policy-name and -file-extensions-to-include parameter set to txt.
You can specify the `-instance` parameter to display scope information for all FPolicy policies in a list format.

**Parameters**

[-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command only displays the fields that you specify.

[-instance ]

If you specify the `-instance` parameter, the command displays detailed information about all entries.

-vserver <Vserver Name> - Vserver

If you specify this parameter, the command displays scope information only about the FPolicy policies for the specified Vserver.

-policy-name <Policy name> - Policy

If you specify this parameter, the command displays information only about the specified FPolicy policy.

-shares-to-include <Share name>, ... - Shares to Include

If you specify this parameter, the command displays scope information only about the FPolicy policy or policies that use the specified share or shares in the include list.

-shares-to-exclude <Share name>, ... - Shares to Exclude

If you specify this parameter, the command displays scope information only about the FPolicy policy or policies that use the specified share or shares in the exclude list.

-volumes-to-include <volume name>, ... - Volumes to Include

If you specify this parameter, the command displays scope information only about the FPolicy policy or policies that use the specified volume or volumes in the include list.

-volumes-to-exclude <volume name>, ... - Volumes to Exclude

If you specify this parameter, the command displays scope information only about the FPolicy policy or policies that use the specified volume or volumes in the exclude list.

-export-policies-to-include <FPolicy export policy>, ... - Export Policies to Include

If you specify this parameter, the command displays scope information only about the FPolicy policy or policies that use the specified export policy or policies in the include list.

-export-policies-to-exclude <FPolicy export policy>, ... - Export Policies to Exclude

If you specify this parameter, the command displays scope information only about the FPolicy policy or policies that use the specified export policy or policies in the exclude list.

-file-extensions-to-include <File extension>, ... - File Extensions to Include

If you specify this parameter, the command displays scope information only about the FPolicy policy or policies that use the specified file extension or extensions in the include list.

-file-extensions-to-exclude <File extension>, ... - File Extensions to Exclude

If you specify this parameter, the command displays scope information only about the FPolicy policy or policies that use the specified file extension or extensions in the exclude list.

-is-file-extension-check-on-directories-enabled {true|false} - Is File Extension Check on Directories Enabled (privilege: advanced)

If you specify this parameter, the command displays scope information only about the FPolicy policy or policies that use the specified file extension check on directories. If set to true, the command displays information about scopes where file extension checks on directories is enabled. If set to false, the command displays information about scopes where file extension checks on directories is disabled.

-is-monitoring-of-objects-with-no-extension-enabled {true|false} - Is Monitoring of Objects with No Extension Enabled (privilege: advanced)

If you specify this parameter, the command displays scope information only about the FPolicy policy or policies that use the specified monitoring of objects with no extension setting. If set to true, the command
displays information about scope of policy or policies for which monitoring of objects with no extension is enabled.

**Examples**

The following example displays scope information about FPolicy policies.

```bash
cluster1::> vserver fpolicy policy scope show
<table>
<thead>
<tr>
<th>Vserver</th>
<th>Policy</th>
<th>Extensions Included</th>
<th>Extensions Excluded</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cluster</td>
<td>cserver_pol</td>
<td>-</td>
<td>-</td>
</tr>
<tr>
<td>vs1.example.com</td>
<td>p</td>
<td>-</td>
<td>-</td>
</tr>
<tr>
<td>vs1.example.com</td>
<td>vs1_pol</td>
<td>mp3</td>
<td>-</td>
</tr>
</tbody>
</table>
3 entries were displayed.
```

**vserver iscsi commands**

Manage the iSCSI services on a Vserver

Commands used to manage the iSCSI service of a Vserver.

**vserver iscsi create**

Create a Vserver's iSCSI service

**Availability:** This command is available to cluster and Vserver administrators at the `admin` privilege level.

**Description**

This command creates an iSCSI target for a specified Vserver. By default the system creates a default iSCSI target name with the status-admin set to enabled. Until you create an iSCSI service, iSCSI initiators cannot log into the Vserver.

**Parameters**

- `-vserver <Vserver Name>` - Vserver
  Specifies the Vserver for the iSCSI service.

- `[<-target-name <text>]` - Target Name (privilege: advanced)
  Specifies a iSCSI target name of a Vserver. This name is unique and is not case sensitive. The target name must conform to this format `iqn.1995-08.com.example:string` and the following rules:
  - Contains up to 128 bytes.
  - Contains alphanumeric characters. The period ".", hyphen "-", and colon ":" are acceptable.
  - Does not contain the underscore character "_".

- `[<-target-alias <text>]` - Target Alias
  Specifies an iSCSI target alias name of a Vserver. The maximum number of characters for an alias name is 128. The alias default name is the Vserver name.

- `[<-status-admin {down|up}]` - Administrative Status
  Specifies the administrative status of the iSCSI service of a Vserver. If you set this parameter to up, the command creates an iSCSI service with the administrative status of up. If you set this parameter to down, the command creates an iSCSI service with the administrative status of down.
[-retain-timeout <integer>] - RFC3720 DefaultTime2Retain Value (in sec) (privilege: advanced)
   Specifies the wait time before an active task reassignment is possible after an unexpected connection
termination. For example, a value of 0 means that the connection or task state is immediately discarded by the
target. The default is 20 seconds.

[-login-timeout <integer>] - Login Phase Duration (in sec) (privilege: advanced)
   Specifies the login phase duration. The default is 15 seconds.

[-max-conn-per-session <integer>] - Max Connections per Session (privilege: advanced)
   Specifies the maximum number of connections per session that a target can accept. The default is 4
connections.

[-max-ios-per-session <integer>] - Max Commands per Session (privilege: advanced)
   Specifies the maximum number of commands per session that a target can accept. The default is 128
commands per session.

[-tcp-window-size <integer>] - TCP Receive Window Size (in bytes) (privilege: advanced)
   Specifies the TCP receive window size (in bytes). The default is 131,400 bytes.

[-force | -f [true]] - Allow Non-Vendor Target Name (privilege: advanced)
   Force the command to accept a target name that would normally be rejected as invalid.

Examples
cluster1::> vserver iscsi create -vserver vs_1

vserver iscsi delete
Delete a Vserver's iSCSI service

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command deletes the iSCSI service from a Vserver.

Note: You must first disable the service with the command vserver iscsi modify with "-status-admin down" before you
can delete the service.

Parameters
-vserver <Vserver Name> - Vserver
   Specifies the Vserver for the iSCSI service.

Examples
cluster1::> vserver iscsi delete -vserver vs_1

vserver iscsi modify on page 1943

vserver iscsi modify
Modify a Vserver's iSCSI service

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.
**Description**
This command modifies the configuration for an iSCSI service.

Modifications take effect immediately after you execute the command. Making modifications to your service can result in traffic loss on a live system. Call technical support if you are unsure of the possible consequences.

**Parameters**

- **-vserver <Vserver Name> - Vserver**
  Specifies the Vserver for the iSCSI service.

- **[[-target-name <text> - Target Name (privilege: advanced)]**
  Specifies an iSCSI target name of a Vserver. This name is unique and is not case sensitive. The target name must conform to this format iqn.1995-08.com.example:string and the following rules:
  - Contains up to 128 bytes.
  - Contains alphanumeric characters. The period ".", hyphen "-", and colon ":" are acceptable.
  - Does not contain the underscore character ".".
  
  **Note:** The iSCSI service must be down in order to change the target name.

- **[[-target-alias <text> - Target Alias**
  Specifies the new target alias of the iSCSI service.

- **[[-clear -c [true]] - Clear the Target Alias**
  Clears the current target alias from the iSCSI service configuration.

- **[[-status-admin {down|up}] - Administrative Status**
  Specifies the configured administrative status of a service. If you set this parameter to up, the iSCSI service begins to accept login requests from iSCSI initiators. If you set this parameter to down, iSCSI initiators cannot log in.

- **[[-retain-timeout <integer> - RFC3720 DefaultTime2Retain Value (in sec) (privilege: advanced)]**
  Specifies the wait time before active task reassignment is possible after an unexpected connection termination. For example, a value of 0 means that the connection or task state is immediately discarded by the target.

- **[[-login-timeout <integer> - Login Phase Duration (in sec) (privilege: advanced)]**
  Specifies maximum time the login phase remains active until the iSCSI target terminates the connection.

- **[[-max-conn-per-session <integer> - Max Connections per Session (privilege: advanced)]**
  Specifies the maximum number of connections per session that the iSCSI target can accept.

- **[[-max-ios-per-session <integer> - Max Commands per Session (privilege: advanced)]**
  Specifies the maximum number of commands per session that the iSCSI target can accept.

- **[[-tcp-window-size <integer> - TCP Receive Window Size (in bytes) (privilege: advanced)]**
  Specifies the TCP receive window size (in bytes).
  A change to the TCP receive window size value takes effect for all network interfaces when you restart the iSCSI service for the Vserver as follows:

  ```bash
  vserver iscsi stop -vserver <vserver name>
  vserver iscsi start -vserver <vserver name>
  ```

  If you change an individual network interface from up to down back to up, as follows, the new value for TCP receive window size takes effect for that network interface:
network interface modify -vserver <vserver name> -lif <LIF name> -status-admin down
network interface modify -vserver <vserver name> -lif <LIF name> -status-admin up

[force | -f [true]] - Allow Non-Vendor Target Name (privilege: advanced)

Force the command to accept a target name that would normally be rejected as invalid.

Examples

Specifies the TCP receive window size (in bytes).

A change to the TCP receive window size value takes effect for all network interfaces when you restart the iSCSI service for the Vserver as follows:

```bash
vserver iscsi stop -vserver <vserver name>
vserver iscsi start -vserver <vserver name>
```

If you change an individual network interface from up to down back to up, as follows, the new value for TCP receive window size takes effect for that network interface:

```bash
network interface modify -vserver <vserver name> -lif <LIF name> -status-admin down
network interface modify -vserver <vserver name> -lif <LIF name> -status-admin up
```

```bash
cluster1::> vserver iscsi modify -vserver vs_1 -status-admin down
```

**vserver iscsi show**

Display a Vserver's iSCSI configuration

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

This command displays the current configuration of the iSCSI service.

**Parameters**

```bash
[[-fields <fieldname>, ...]
    If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.
]

[[-instance]]
    If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver
    Selects the iSCSI services for the Vserver that matches the parameter value.

[-target-name <text>] - Target Name
    Selects the iSCSI services with a target name that matches the parameter value.
```
[\texttt{-target-alias <text>}] - Target Alias

Selects the iSCSI services with a target alias that matches the parameter value.

[\texttt{-status-admin (\textit{down} | \textit{up})}] - Administrative Status

Selects the iSCSI services with a configured status that matches the parameter value.

[\texttt{-retain-timeout <integer>}] - RFC3720 DefaultTime2Retain Value (in sec) (privilege: advanced)

Selects the iSCSI services with a wait time that matches the parameter value. The wait time is the amount of time before active task reassignment is possible after an unexpected connection termination.

[\texttt{-login-timeout <integer>}] - Login Phase Duration (in sec) (privilege: advanced)

Selects the iSCSI services with a login phase duration that matches the parameter value.

[\texttt{-max-conn-per-session <integer>}] - Max Connections per Session (privilege: advanced)

Selects the iSCSI services with a maximum connection per session that matches the parameter value.

[\texttt{-max-ios-per-session <integer>}] - Max Commands per Session (privilege: advanced)

Selects the iSCSI services with a maximum number of commands per session that matches the parameter value.

[\texttt{-tcp-window-size <integer>}] - TCP Receive Window Size (in bytes) (privilege: advanced)

Selects the iSCSI services with a TCP receive window size (in bytes) that matches the parameter value.

**Examples**

```
class cluster1::>
  \texttt{vserver iscsi show}
  Vserver   Target            Target     Status
  --------- ------------------- ---------- ----
  vs_1      iqn.1992-08.com.example:sn.c7c82a22bf9f11df83e5123478563412:vs.2
             vs_1_alias         up
  1 entries were displayed.

  \texttt{vserver iscsi show -instance}
  Vserver: vs_1
  Target Name: iqn.1992-08.com.example:sn.c7c82a22bf9f11df83e5123478563412:vs.2
  Target Alias: vs_1_alias
  Administrative Status: up
  1 entries were displayed.
```

Displays the output of the show command at the admin privilege level.

```
class cluster1::*> vserver iscsi show
  Vserver   Target            Target     Status
  --------- ------------------- ---------- ----
  vs_1      iqn.1992-08.com.example:sn.c7c82a22bf9f11df83e5123478563412:vs.2
             vs_1_alias         up
  1 entries were displayed.
```

Displays the output of the show command at the advanced privilege level.

```
class cluster1::*> vserver iscsi show -instance
  Vserver: vs_1
  Target Name: iqn.1992-08.com.example:sn.c7c82a22bf9f11df83e5123478563412:vs.2
  Target Alias: vs_1_alias
  RFC3720 DefaultTime2Retain Value (in sec): 20
```
vserver iscsi start

Starts the iSCSI service

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
This command starts the iSCSI service of a Vserver. You can also use `vserver iscsi modify` with "-status-admin up".

**Parameters**
- `-vserver <Vserver Name>` - Vserver
  
  Specifies the Vserver for the iSCSI service.

**Examples**
```
cluster1::> vserver iscsi start -vserver vs_1
```

**Related references**

- `vserver iscsi modify` on page 1943

vserver iscsi stop

Stops the iSCSI service

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
Stops the iSCSI service of a Vserver. This command shuts down all active iSCSI sessions and stops any new iSCSI sessions. You can also use `vserver iscsi modify` with "-status-admin down".

**Parameters**
- `-vserver <Vserver Name>` - Vserver

  Specifies the Vserver for the iSCSI service.

**Examples**
```
cluster1::> vserver iscsi stop -vserver vs_1
```

**Related references**

- `vserver iscsi modify` on page 1943

vserver iscsi command commands

The command directory

Commands used to manage active iSCSI commands.
vserver iscsi command show

Display active iSCSI commands

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command displays the status of active iSCSI commands in an iSCSI session. If you specify an iSCSI command ID, the command shows what commands are active in a session and is useful for initiator debugging.

Parameters

{ [-fields <fieldname>, ...] 
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.
  }

[-instance ]
  If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver
  Use this parameter to display a list of active iSCSI commands that match the Vserver name that you specify.

[-tpgroup <text>] - Target Portal Group
  Use this parameter to display a list of active iSCSI commands that are within the target portal group.

[-tsih <integer>] - Target Session ID
  Use this parameter to display a list of active iSCSI commands that match the target session ID handle that you specify.

[-command-id <integer>] - Command ID
  Use this parameter to display a list of active iSCSI commands that match the command ID that you specify.

[-initiator-name <text>] - Initiator Name
  Use this parameter to display a list of active iSCSI commands that match the initiator name that you specify.

[-initiator-alias <text>] - Initiator Alias
  Use this parameter to display a list of active iSCSI commands that match the initiator alias that you specify.

[-isid <text>] - Initiator Session ID
  Use this parameter to display a list of active iSCSI commands that match the initiator session ID that you specify.

[-command-sub-id <integer>] - Command Sub ID
  Use this parameter to display a list of active iSCSI commands that match the command sub ID that you specify.

[-command-state {iSCSI Command States}] - Command State
  Use this parameter to display a list of active iSCSI commands that match the command state that you specify.

[-command-type (Sequenced|Imm_Taskmgmt|Imm_Other)] - Command Type
  If you use this parameter, the command displays a list of active iSCSI commands that contains the specified command type. The command types indicate:
  •  "Sequenced" -- the system processes the commands in sequence
  •  "Imm_Taskmgmt" -- the system processes the commands immediately
  •  "Imm_Other" -- the system processes the commands as queued
vserver iscsi commands

The connection directory

Commands used for managing iSCSI connections.

vserver iscsi connection show

Display active iSCSI connections

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command displays iSCSI connection information within a session. If you do not specify a connection, the command displays all information for all connections.

An active iSCSI session can contain one or multiple iSCSI connections. If an iSCSI connection has not completed the iSCSI login sequence, the iSCSI session might not contain iSCSI connections.

This command gives real-time status of connection activity. You can use the parameters header-digest-enabled and data-digest-enabled to troubleshoot performance problems.

Parameters

[-fields <fieldname>, ...] If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

[-instance ]] If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver
Use this parameter to display iSCSI connections that match the Vserver that you specify.

[-tpgroup <text>] - Target Portal Group
Use this parameter to display iSCSI connections that match the target portal group that you specify.

[-tsih <integer>] - Target Session ID
Use this parameter to display iSCSI connections that match the target session ID that you specify.

[-connection-id <integer>] - Connection ID
Use this parameter to display iSCSI connections that match the connection ID that you specify.

[-connection-state <iSCSI Connection State>] - Connection State
Use this parameter to display iSCSI connections that match the connection state you specify.
-has-session {true|false} - Connection Has session
  Specifies if a session is established for a connection. If you enter this command using the parameter without a
  value, it is set to true, and the command displays all connections that have an established session. If you set
  this parameter to false, the command displays all connections that do not have established sessions.

-lif <text> - Logical interface
  Use this parameter to display iSCSI connections that match the logical interface that you specify.

-tpgroup-tag <integer> - Target Portal Group Tag
  Use this parameter to display iSCSI connections that use the target portal group tag that you specify.

-local-address <text> - Local IP Address
  Use this parameter to display iSCSI connections that use the local IP address that you specify.

-local-ip-port <integer> - Local TCP Port
  Use this parameter to display iSCSI connections that use the local TCP port that you specify.

-authentication-method {CHAP|deny|none} - Authentication Type
  Use this parameter to display iSCSI connections that match the authentication type that you specify. CHAP
  requires password validation. Deny does not allow connections. None allows all connections.

-data-digest-enabled {true|false} - Data Digest Enabled
  Specifies if data digest is enabled for a connection. If you enter this command using the parameter without a
  value, it is set to true, and the command displays all connections that support data digest. If you set this
  parameter to false, the command displays all connections that do not support data digest.

-header-digest-enabled {true|false} - Header Digest Enabled
  Specifies if header digest is supported. If you enter this command using the parameter without a value, it is set
to true, and the command shows all connections that support header digest. If you set this parameter to false,
the command displays all connections that do not support header digest.

-rcv-window-size <integer> - TCP/IP Recv Size
  Use this parameter to display iSCSI connections that match the specified negotiated size of the TCP/IP receive
  window in bytes.

-initiator-mrdsl <integer> - Initiator Max Recv Data Length
  Use this parameter to display iSCSI connections that match the maximum length of message that the initiator
  can receive.

-remote-address <text> - Remote IP address
  Use the parameter to display iSCSI connections that match the IP address of the initiator that you specify.

-remote-ip-port <integer> - Remote TCP Port
  Use this parameter to display iSCSI connections that match the specified TCP port of initiator that you specify.

-target-mrdsl <integer> - Target Max Recv Data Length
  Use this parameter to display iSCSI connections that match the maximum message size that a target can
  receive.

Examples

```bash
cluster1:/> vserver iscsi connection show -vserver vs1
Vserver       Name          TSIH   ID    Address         Address         TCP Recv
-------------- ------------- ----- ----- --------------- --------------- --------
vs1           vs1.iscsi      6     0 10.63.8.163     10.60.141.65      131400
vs1           vs1.iscsi      7     0 10.63.8.163     10.62.8.75        131400
2 entries were displayed.
```

Commands: Manual Page Reference
vserver iscsi connection shutdown

Shut down a connection on a node

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
This command shuts down a specified iSCSI connection within a session. If you want to shut down all iSCSI connections in a session, use the vserver iscsi session shutdown command.

Parameters
-vserver <Vserver Name> - Vserver
  Specifies the Vserver.

-tpgroup <text> - Target Portal Group
  Specifies the target portal group that contains the connection you want to shut down.

-tsish <integer> - Target Session ID
  Specifies the target session ID that you want to shut down.

-connection-id <integer> - Connection ID
  Specifies the connection ID that you want to shut down.

Examples
cluster1::*> vserver iscsi connection shutdown -vserver vs_1 -tpgroup tpgroup_1 -tsish 4 -connection-id 0

vserver iscsi session shutdown on page 1971

vserver iscsi initiator commands

The initiator directory
Commands used for managing the initiators connected to SAN targets.

vserver iscsi initiator show

Display iSCSI initiators currently connected

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command displays a list of active initiators currently connected to a specified Vserver.

Parameters
{ [-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

  | [-instance ]
  If you specify the -instance parameter, the command displays detailed information about all fields.
}
vserver iscsi initiator show

Use this parameter to display the active initiators that match the Vserver that you specify.

-vserver <Vserver Name> - Vserver

Use this parameter to display the active initiators that match the Vserver that you specify.

-tpgroup <text> - Target Portal Group

Use this parameter to display the active initiators that match the name of the target portal group that you specify.

-tsih <integer> - Target Session ID

Use this parameter to display the active initiators that match the target session ID you specify.

-initiator-name <text> - Initiator Name

Use this parameter to display the active initiators that match the initiator name that you specify.

-initiator-alias <text> - Initiator Alias

Use this parameter to display the active initiators that match the alias name that you specify.

-tpgroup-tag <integer> - TPGroup Tag

Use this parameter to display the active initiators that match the target portal group tag that you specify.

-isid <text> - Initiator Session ID

Use this parameter to display the active initiators that match the initiator session ID that you specify.

-igroup <text>, ... - Igroup Name

Use this parameter to display the active initiators that match the initiator group that you specify.

Examples

```
cluster1::> vserver iscsi initiator show -vserver vs_1
           Tpgroup      Initiator
  Vserver Name     TSIH Name                  ISID              IGroup
  ------- -------- ---- --------------------- ----------------- ----------------- 
  vs_1    vs_1.iscsi  6 iqn.1994-05.com.redhat:6ed6dfb0489e 00:02:3d:03:00:00 -
  vs_1    vs_1.iscsi  7 iqn.1993-08.org.debian:01:fa752b8a5a3a 00:02:3d:01:00:00 igroup_1
2 entries were displayed.
```

vserver iscsi interface commands

The interface directory

Commands used to manage iSCSI data logical interfaces.

vserver iscsi interface disable

Disable the specified interfaces for iSCSI service

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

This command disables the specified logical interfaces for an iSCSI service. Once disabled, all subsequent attempts to establish new iSCSI connections over the logical interface will fail.

Parameters

-vserver <Vserver Name> - Vserver

Specifies the Vserver.

{-lif <lif-name>, ...} - Logical Interface

Specifies the logical interfaces on a Vserver you want to disable.
| -all | -a [true] | - All
| Specifies that all logical interfaces on the Vserver are disabled.

| -force | -f [true] | - Force
| When set to true, forces the termination of any active iSCSI sessions without prompting you for a confirmation.

**Examples**

```
cluster1::> vserver iscsi interface disable -vserver vs_1 -lif vs_1.iscsi
```

**vserver iscsi interface enable**

Enable the specified interfaces for iSCSI service

*Availability:* This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

This command enables specified logical interfaces for iSCSI Vserver service. Once enabled, your system accepts new iSCSI connections and services iSCSI requests over the newly enabled logical interfaces.

**Parameters**

- **-vserver <Vserver Name>** - Vserver
  
  Specifies the Vserver.

- **{-lif <lif-name>,...} - Logical Interface**
  
  Specifies the logical interfaces on a Vserver that you want to enable.

- **| -all | -a [true] | - All**
  
  When set to true, all logical interfaces are enabled. If you use this parameter without a value, it is set to true, and the command enables all logical interfaces.

**Examples**

```
cluster1::> vserver iscsi interface enable -vserver vs_1 -lif vs_1.iscsi
```

**vserver iscsi interface modify**

Modify network interfaces used for iSCSI connectivity

*Availability:* This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

**Description**

The `vserver iscsi interface modify` command modifies the iSCSI specific configuration for an iSCSI LIF.

**Parameters**

- **-vserver <Vserver Name>** - Vserver
  
  Specifies the Vserver.

- **-lif <lif-name>** - Logical Interface
  
  Use this parameter to specify the logical interface on a Vserver that you want to modify.
[-sendtargets-fqdn <text>] - iSCSI Discovery SendTargets FQDN

Use this parameter to specify the Fully Qualified Domain Name (FQDN) to return during an iSCSI Discovery SendTargets operation. To clear the FQDN, set this parameter to "". If unset, the IP address of the LIF is used in iSCSI SendTargets discovery.
This is not part of iSNS and will not affect the iSNS configuration.

Examples

The following example modifies the sendtargets-fqdn of the iSCSI LIF vs1_iscsi1 for Vserver vs1 to myhost.example.com.

```
cluster1::> vserver iscsi interface modify -vserver vs1 -lif vs1_iscsi1 -sendtargets_fqdn myhost.example.com
```

Related references

network interface modify on page 340

vserver iscsi interface show

Show network interfaces used for iSCSI connectivity

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

This command shows the iSCSI logical interfaces for a specified Vserver. If you do not specify any of the parameters, the command displays all of the interfaces on a Vserver.

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance]
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[-vserver <Vserver Name>] - Vserver
```

Use this parameter to display iSCSI logical interfaces that match the Vserver that you specify.

```
[-lif <lif-name>] - Logical Interface
```

Use this parameter to display iSCSI logical interfaces that that you specify.

```
[-status-admin (up|down)] - Administrative Status
```

Specifies the configured status of the logical interface. If you set this parameter to up, the command displays all iSCSI logical interfaces with the administrative status of up. If you set this parameter to down, the command displays all the iSCSI logical interfaces with the administrative status of down.

```
[-status-oper (up|down)] - Operational Status
```

Specifies the current status of the logical interface. If you set this parameter to up, the command displays all the iSCSI logical interfaces with the operational status of up. If you set this parameter to down, the command displays all the iSCSI logical interfaces with the operational status of down.

```
[-enabled (true|false)] - Enabled
```

Specifies if this logical unit is enabled for iSCSI service. If you enter this command without a parameter, its effective value is true, and the command displays all the enabled iSCSI logical interfaces.
[address <IP Address>] - IP Address
   Use this parameter to display iSCSI logical interfaces that match the IP address that you specify.

[ip-port <integer>] - IP Port Number
   Use this parameter to display iSCSI logical interfaces that match IP port number for the logical interface that
   you specify.

[curr-node <nodename>] - Current Node
   Use this parameter to display iSCSI logical interfaces that match current node that you specify.

[curr-port <netport>|<ifgrp>] - Current Port
   Use this parameter to display iSCSI logical interfaces that match specified current physical port that you
   specify.

[is-home {true|false}] - Is Home
   Specifies if the node hosting the logical interface is the initially configured node. If you use this command
   without using this parameter, it is set to true, and the command displays all iSCSI interfaces that are on the
   initially configured node.

[tpgroup <text>] - TPGroup Name
   Use this parameter to display iSCSI logical interfaces that match the target portal group name that you specify.

[tpgroup-tag |-t <integer>] - TPGroup Tag
   Use this parameter to display iSCSI logical interfaces that match the target portal group tag that you specify.

[relative-port-id <integer>] - Relative Port ID
   Use this parameter to display the iSCSI logical interface that matches the relative target port ID that you
   specify. The system assigns each logical interfaces and target portal group a relative target port ID that is
   Vserver unique. You cannot change this ID.

[sendtargets-fqdn <text>] - iSCSI Discovery SendTargets FQDN (privilege: advanced)
   Use this parameter to display the iSCSI logical interfaces that match the iSCSI Discovery SendTargets Fully
   Qualified Domain Name (FQDN) that you specify.

Examples
The following example displays information for logical interfaces on Vserver vs_1.

```
cluster1::> vserver iscsi interface show -vserver vs_1

Vserver    Logical Interface  Status     TPGT Admin/Oper Address         Curr Node        Curr Port Enabled
---------- ---------- ---- ---------- --------------- ----------- ---- -------
vs_1       vs_1.iscsi  up/up    10.63.8.165     node1       e0c  true
vs_1       vs_1.iscsi2  up/up    10.63.8.166     node1       e0c  true
```

2 entries were displayed.

The following example displays the logical interface vs_1.iscsi with the relative target port ID of 1.

```
cluster1::> vserver iscsi interface show -vserver vs_1 -relative-port-id 1

Vserver    Logical Interface  Status     TPGT Admin/Oper Address         Curr Node        Curr Port Enabled
---------- ---------- ---- ---------- --------------- ----------- ---- -------
vs_1       vs_1.iscsi  up/up    10.63.8.165     node1       e0c  true
```

vserver iscsi interface accesslist commands
The accesslist directory
Commands used to manage iSCSI accesslists.
vserver iscsi interface accesslist add

Add the iSCSI LIFs to the accesslist of the specified initiator

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command adds network interfaces to an access list for a specified initiator. An access list ensures that an initiator only logs in with IP addresses associated with the interfaces defined in the access list.

You can restrict an initiator to certain network interfaces to improve performance and security. Access lists are useful where a particular initiator cannot access all of the network interfaces on a node.

Access list policies are based on the interface name. The accesslist rules are:

- If you disable the network interface for iSCSI through the vserver iscsi interface disable command, for example, the network interface is not accessible to any initiator regardless of any access lists in effect.
- If an initiator does not have an access list, that initiator can access any iSCSI-enabled network interface.
- If an initiator has an access list, that initiator can only login to network interfaces in its access list. Additionally, the initiator cannot discover any IP addresses that are not on this access list. If an initiator sends an iSCSI sendtargets request, the node responds with a list of IP addresses for iSCSI data logical interfaces that are in its access list.
- If an initiator does not have an access list, you automatically create an access list when you issue the vserver iscsi interface accesslist add command.
- If you remove all the interfaces from the access list of an initiator with the vserver iscsi interface accesslist remove command, the accesslist is also deleted.
- Creating or modifying access list requires that initiator log out and log back in before changes take effect.

When you use the add or remove commands, the system warns you if an iSCSI session could be affected.

Note: You will not affect any iSCSI sessions if you use the -a parameter when adding or removing all interfaces.

Parameters
-vserver <Vserver Name> - Vserver
  Specifies the Vserver name.

-initiator-name <text> - Initiator Name
  Specifies the initiator you want to add to the access list.

{-lif <lif-name>, ...} - Logical Interface
  Specifies the lif you want to add to an access list.

|-all |-a [true] - All
  If you use this parameter without a value, it is set to true, and the command adds all iSCSI data logical interfaces for a vserver to an initiator's accesslist. If the initiator does not have an accesslist, the system creates a new accesslist.

[-force | -f [true]] - Force
  If you use this parameter without a value, it is set to true, and the command does not prompt you when an active iSCSI service or any active iSCSI data logical interfaces could be affected. If you do not use this parameter, the command prompts for confirmation if the iSCSI service is active or if any active data logical interfaces would be affected.
Examples

```
cluster1::> vserver iscsi interface accesslist add -vserver vs_1 -initiator-name iqn.1992-08.com.example:abcdefg -a
```

- `vserver iscsi interface accesslist remove` on page 1957

**vserver iscsi interface accesslist remove**

Remove the iSCSI LIFs from the accesslist of the specified initiator

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

This command removes network interfaces from an access list for a specified initiator. The system removes the access list when the list is empty. When you remove a network interface from an initiator, this action could result in the shutdown of active sessions.

**Parameters**

- `-vserver <Vserver Name>` - Vserver
  
  Specifies the Vserver name.

- `-initiator-name <text>` - Initiator Name
  
  Specifies the initiator that you want to remove logical interfaces from.

- `{ -lif <lif-name>, ... }` - Logical Interface
  
  Specifies the logical interface you want to remove.

- `|-all | -a [true]` - All
  
  If you use this parameter without a value, it is set to true, and the command removes all of the iSCSI data logical interfaces from an initiator's accesslist. If you remove all the network interfaces from an access list, the system removes the access list.

- `|-force | -f [true]` - Force
  
  If you use this parameter without a value, it is set to true, and the command does not prompt you when an active iSCSI service or any active iSCSI data logical interfaces could be affected. If you do not use this parameter, the command prompts for confirmation if the iSCSI service is active or if any active data logical interfaces would be affected.

Examples

```
cluster1::> vserver iscsi interface accesslist remove -vserver vs_1 -initiator-name iqn.1992-08.com.example:abcdefg -a
```

**vserver iscsi interface accesslist show**

Show accesslist of the initiators for iSCSI connectivity

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.
**Description**
This command displays an access list for an initiator. An access list is a list of logical interfaces that an initiator can use for iSCSI logins. The system records the access lists as part of the node configuration and preserves the access lists during reboots.

**Parameters**
```
[-fields <fieldname>, ...]
```
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance]
```
If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[-vserver <Vserver Name>] - Vserver
```
Use this parameter to display the access lists that match the Vserver name that you specify.

```
[-initiator-name <text>] - Initiator Name
```
Use this parameter to display the access lists that match the initiator that you specify.

```
[-lif <lif-name>] - Logical Interface
```
Use this parameter to display the access lists that match the logical interface that you specify.

**Examples**
```
class1::> vserver iscsi interface accesslist show -vserver vs1
Vserver             Initiator Name                Logical Interface
------------------ ----------------------------- -----------------------------
vs1                iqn.2010-01.com.example:aaaaa isw1
                  iqn.2010-01.com.example:aaabb isw1
                  isw2
4 entries were displayed.
```

**vserver iscsi isns commands**

The isns directory

**vserver iscsi isns create**
Configure the iSNS service for the Vserver

**Availability:** This command is available to cluster and Vserver administrators at the `admin` privilege level.

**Description**
This command creates and starts an iSNS service with the IP address of the iSNS server.

**Note:** A Vserver management LIF must exist before you can create an iSNS service. This LIF is used to communicate with the iSNS server. To create a Vserver management LIF, use the `network interface create` command, with `-role data` and `-data-protocol none`.

**Parameters**
```
-vserver <Vserver Name> - Vserver Name
```
Specifies the Vserver for the iSNS service that you want to create.

```
-address <IP Address> - iSNS Server IP Address
```
Specifies the IP address of the iSNS server. Both IPv4 and IPv6 address families are supported. The address family must be the same as that of the vserver management LIF.
**Note:** A default route must exist for the specified vserver. To create a route, use the `network routing-groups route create` command. To view existing routes, use the `network routing-groups route show` command.

`[-status-admin {down|up}]` - Administrative Status

Specifies the administrative status of the iSNS service of a Vserver. If you set this parameter to up, the iSNS service starts for the Vserver and registers with the configured iSNS server. If you set this parameter to down, the Vserver loses its ability to register with the iSNS server and to be discovered by iSNS clients.

`[-force [true]]` - Force

`vserver iscsi isns create` fails if vserver management LIF is not configured. When you set this option to "true," you create an iSNS service on a Vserver even if the vserver does not have a vserver management LIF.

### Examples
```
cluster1::> vserver iscsi isns create -vserver vs_1 -address 10.60.1.1 -status-admin up
```
Creates the iSNS service for Vserver vs_1 using the IPv4 address.

```
cluster1::> vserver iscsi isns create -vserver vs_1 -address fd20:8b1e:b255:840b:a0df:565b:19b5:4d06 -status-admin up
```

### Related references

`network interface create` on page 335

---

**vserver iscsi isns delete**

Remove the iSNS service for the Vserver

**Availability:** This command is available to cluster and Vserver administrators at the `admin` privilege level.

**Description**
This command deletes the iSNS service for the Vserver.

**Parameters**

`-vserver <Vserver Name>` - Vserver Name

Specifies the Vserver for the iSNS service that you want to delete.

### Examples
```
cluster1::> vserver iscsi isns delete -vserver vs_1
```

---

**vserver iscsi isns modify**

Modify the iSNS service for the Vserver

**Availability:** This command is available to cluster and Vserver administrators at the `admin` privilege level.

**Description**
This command modifies the configuration of an iSNS service.

Modifications take effect immediately after you execute the command.
Parameters

-vserver <Vserver Name> - Vserver Name

  Specifies the Vserver for the iSNS service that you want to modify.

-[address <IP Address>] - iSNS Server IP Address

  Specifies the IP address of the iSNS server. Both IPv4 and IPv6 address families are supported. The address family must be the same as that of the vserver management LIF.

  **Note:** A default route must exist for the specified vserver. To create a route, use the `network routing-groups route create` command. To view existing routes, use the `network routing-groups route show` command.

-[status-admin {down|up}] - Administrative Status

  Specifies the administrative status of the iSNS service of a Vserver. If you set this parameter to up, the iSNS service starts for the Vserver, and registers with the configured iSNS server. If you set this parameter to down, the Vserver loses its ability to register with the iSNS server and to be discovered by iSNS clients.

-[force [true]] - Force

  vserver iscsi isns modify fails to modify the iSNS server address if vserver management LIF is not configured. When you set this option to "true," you can modify the iSNS service on a Vserver even if the vserver does not have a vserver management LIF.

Examples

```
cluster1::> iscsi isns modify -vserver vs_1 -status-admin up
```

vserver iscsi isns show

Show iSNS service configuration

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

Shows the iSNS service configuration.

Parameters

{ [-fields <fieldname>, ...] }

  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use ‘-fields ?’ to display the fields to specify.

| [-instance] |

  If you specify the -instance parameter, the command displays detailed information about all fields.

-[vserver <Vserver Name>] - Vserver Name

  Use this parameter to display the iSNS services that match the Vserver name that you specify.

-[address <IP Address>] - iSNS Server IP Address

  Use this parameter to display the iSNS services that match the IP address of the iSNS server that you specify.

-[status-admin {down|up}] - Administrative Status

  Use this parameter to display the iSNS services that match the configured status of the service that you specify.

-[entity-id <text>] - iSNS Server Entity Id

  Use this parameter to display the iSNS services that match the configured iSNS server entity-id that you specify.
[[-last-successful-update <MM/DD/YYYY HH:MM:SS>]] - Last Successful Update

Use this parameter to display the iSNS services that match the time of the last successful attempt.

[[-last-update-attempt <MM/DD/YYYY HH:MM:SS>]] - Last Update Attempt

Use this parameter to display the iSNS services that match the time of the last update attempt.

[[-last-update-result <isnsErrors>]] - Last Update Result

Use this parameter to display the iSNS services that match the result of the last update attempt.

Examples

```
cluster1::> vserver iscsi isns show
<table>
<thead>
<tr>
<th>Vserver</th>
<th>iSNS Server Entity Identifier</th>
<th>iSNS Server IP Address</th>
<th>iSNS Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>iscsi_vs</td>
<td>isns:00000044</td>
<td>10.229.136.188</td>
<td>up</td>
</tr>
</tbody>
</table>
```

Displays the output of the show command for all Vservers in a cluster.

```
cluster1::> vserver iscsi isns show -instance
Vserver Name: vs1
iSNS Server IP Address: 10.72.19.11
Administrative Status: up
iSNS Server Entity Id: isns.0000001c
Last Successful Update: 11/12/2011 10:18:45
  Last Update Attempt: 11/12/2011 10:18:45
  Last Update Result: iSNS_Ok

Vserver Name: vs2
iSNS Server IP Address: 10.72.16.13
Administrative Status: up
iSNS Server Entity Id: isns.0000001b
Last Successful Update: 11/12/2011 13:38:05
  Last Update Attempt: 11/12/2011 13:38:05
  Last Update Result: iSNS_Ok
```

2 entries were displayed.

vserver iscsi isns start

Starts the iSNS service

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

Starts the iSNS service. Once you start the iSNS service, the Vserver automatically register with the iSNS server.

Parameters

`-vserver <Vserver Name>` - Vserver Name

 Specifies the Vserver for the iSNS service that you want to start.

Examples

```
cluster1::> vserver iscsi isns start -vserver vs_1
```
**vserver iscsi isns stop**

Stops the iSNS service

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

Stops the iSNS service. Once you stop the iSNS service, the Vserver loses the ability to register with the iSNS server and to be discovered by iSNS clients.

**Parameters**

- **-vserver <Vserver Name>** - Vserver Name
  
  Specifies the Vserver for the iSNS service that you want to stop.

**Examples**

```
cluster1::> vserver iscsi isns stop -vserver vs_1
```

---

**vserver iscsi isns update**

Force update of registered iSNS information

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

Forces an update of the registration information with the iSNS server. Normally, the system checks for iSNS configuration changes on the Vserver every few minutes and automatically sends updates to the iSNS server.

**Parameters**

- **-vserver <Vserver Name>** - Vserver Name
  
  Specifies the Vserver for the iSNS service that you want to update.

**Examples**

```
cluster1::> vserver iscsi isns update -vserver vs_1
```

---

**vserver iscsi security commands**

The security directory

Commands used to manage iSCSI security configuration.

**vserver iscsi security add-initiator-address-ranges**

Add IP Address Ranges

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

Add IP address ranges to an existing iSCSI security entry
Parameters

-vserver <Vserver Name> - Vserver
   Specifies the Vserver.

-initiator-name | -i <text> - Initiator Name
   Specifies the initiator.

-initiator-address-ranges {<ipaddr>|<ipaddr>-<ipaddr>}, ... - Initiator IP Address Ranges
   Specifies one or more initiator source IP address range. The IPv4 or IPv6 address range contains a start address and an end address. The start and end addresses themselves are included in the range.

   An example of a valid IPv4 address range is: '192.168.1.100-192.168.1.150'.

   An example of a valid IPv6 address range is: '2001:db8::1000:1-2001:db8::1000:50'.

Examples

cluster1::> vserver iscsi security add-initiator-address-range
   -vserver vs1 -initiator-name iqn.1993-08.com.example:01:e3f87c7cf2e4
   -initiator-address-range 192.168.2.1-192.168.2.255

vserver iscsi security create

Create an iSCSI authentication configuration for an initiator

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

This command configures the security method for an iSCSI initiator on a Vserver. The outbound CHAP password and user name are optional. If you want mutual authentication, you need to configure both inbound and outbound CHAP passwords and user names.

You cannot use the same password for inbound and outbound settings.

Parameters

-vserver <Vserver Name> - Vserver
   Specifies the Vserver.

-initiator-name | -i <text> - Initiator Name
   Specifies the initiator that you want to create a security method for. You can use either an iqn such as iqn.1995-08.com.example:string or eui such as eui.0123456789abcdef for the initiator.

-auth-type | -s {CHAP|deny|none} - Authentication Type
   Specifies the authentication type:
   • CHAP - Authenticates using a CHAP user name and password.
   • none - The initiator can access the Vserver without authentication.
   • deny - The initiator cannot access the Vserver.

[<user-name | -n <text>] - Inbound CHAP User Name
   Specifies the inbound CHAP user name. CHAP user names can be one to 128 bytes. A null user name is not allowed. If provided, you will be prompted to provide the corresponding inbound CHAP password.

[<outbound-user-name | -m <text>] - Outbound CHAP User Name
   Specifies the outbound CHAP user name. CHAP user names can be one to 128 bytes. If provided, you will be prompted to enter the corresponding outbound CHAP password.
[-initiator-address-ranges \(<ipaddr>|<ipaddr>-<ipaddr>\), ...] - Initiator IP Address Ranges

Specifies one or more initiator source IP address ranges. If this list is empty, the initiator is allowed to log in from any IP address. The IPv4 or IPv6 address range contains a start address and an end address. The start and end addresses themselves are included in the range.

An example of a valid IPv4 address range is: '192.168.1.100-192.168.1.150'.
An example of a valid IPv6 address range is: '2001:db8::1000:1-2001:db8::1000:50'.

Examples

```bash
cluster1::> vserver iscsi security create -initiator eui.0123456789abcdef -auth-type CHAP -user-name bob -outbound-user-name bob2
Password: {enter password}
Outbound Password: {enter password}
```

Creates authentication method chap for initiator eui.0123456789abcdef with inbound and outbound usernames and passwords.

```bash
cluster1::> vserver iscsi security create -vserver vs_1
-initiator-name iqn.1995-08.com.example:e3f87c7cf2e4 -auth-type none
-initiator-address-ranges 192.168.1.1-192.168.1.255
```

vserver iscsi security default

Configure the default authentication settings

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**

This command defines a default iSCSI authentication method for your Vserver. If you do not configure the initiator to use a user-defined authentication method, the system assigns the default authentication method automatically to the initiator. Use the `vserver iscsi security create` command if you want to configure a user-defined authentication method.

The outbound CHAP user name and password are optional. If you want a bi-directional handshake, provide the outbound user name and you will be prompted for the corresponding password.

You cannot use the same password for inbound and outbound settings.

**Parameters**

- **-vserver** `<Vserver Name>` - Vserver
  Specifies the Vserver.

- **-auth-type [s CHAP|deny|none]** - Authentication Method
  Specifies the authentication type:
  
  - CHAP - Authenticates using a CHAP user name and password.
  - none - The initiator can access the Vserver without authentication.
  - deny - The initiator cannot access the Vserver.

- **[-user-name | -n <text>]** - Inbound CHAP User Name
  Specifies the inbound CHAP user name. CHAP user names can be one to 128 bytes. A null user name is not allowed. If provided, you will be prompted to provide the corresponding inbound CHAP password.
{ [-outbound-user-name | -m <text>] - Outbound CHAP User Name
  Specifies the outbound CHAP user name. CHAP user names can be one to 128 bytes. If provided, you will be
  prompted to enter the corresponding outbound CHAP password.

| [-clear-outbound [true]] | - Clear Outbound CHAP Parameters
  Removes the outbound user name and the outbound password information from the default authentication
  method. After you clear the outbound information, you no longer have a bi-directional handshake.

---

Examples

```shell
cluster1::> vserver iscsi security default -vserver vs1 -security chap -user-name bob -outbound-
  user-name bob_out
Password:
Outbound Password:
```

```
-vserver iscsi security create on page 1963
```

vserver iscsi security delete

Delete the iSCSI authentication configuration for an initiator

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

This command removes the security settings for this initiator. The default authentication setting now applies to this initiator.

**Parameters**

```
-vserver <Vserver Name> - Vserver
  Specifies the Vserver.

-initiator-name | -i <text> - Initiator Name
  Specifies the initiator that you want to remove the authentication setting from.
```

**Examples**

```shell
cluster1::> vserver iscsi security delete -vserver vs1 -initiator iqn.1992-08.com.example:abcdefg
```

vserver iscsi security modify

Modify the iSCSI authentication configuration for an initiator

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The command modifies an existing authentication method for an initiator. To delete the authentication setting for an initiator, use the `vserver iscsi security delete` command.

The outbound CHAP password and user name are optional. If you want a bi-directional handshake, you need to configure both inbound and outbound CHAP passwords and user names.

You do not need to know the inbound or outbound passwords to change them.
Parameters

- `vserver <Vserver Name>` - Vserver
  Specifies the Vserver.

- `initiator-name -i <text>` - Initiator Name
  Specifies the initiator name that you want to modify the existing authentication method.

- `[-auth-type | -s {CHAP|deny|none}]` - Authentication Type
  Specifies the authentication type:
  - CHAP - Authenticates using a CHAP user name and password.
  - none - The initiator can access the Vserver without authentication.
  - deny - The initiator cannot access the Vserver.

- `[-user-name | -n <text>]` - Inbound CHAP User Name
  Specifies the inbound CHAP user name. CHAP user names can be one to 128 bytes. A null user name is not allowed. If provided, you will be prompted to provide the corresponding inbound CHAP password.

- `[-clear-outbound [true]]` - Clear Outbound CHAP Parameters
  Removes the outbound user name and the outbound password information from the authentication method. After you clear the outbound information, you no longer have a bi-directional handshake.

Examples

```
cluster1::> vserver iscsi security modify -vserver vs_1 -initiator iqn.1992-08.com.example:abcdefg 
-auth-type chap -user-name bob -outbound-user-name bob_out
Password:
Outbound Password:
```

**vserver iscsi security prepare-to-downgrade**

Prepares the system for downgrade

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

This command prepares the cluster for a downgrade to an earlier version of Data ONTAP. Before using this command verify that all security entries do not have any initiator address ranges defined. This may be done by running the command `vserver iscsi security show address-ranges`

Examples

```
cluster1::> vserver iscsi security prepare-to-downgrade
```
vserver iscsi commands

vserver iscsi security remove-initiator-address-ranges
Remove an IP Address Range

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
Remove IP address ranges to an existing iSCSI security entry

Parameters

-vserver <Vserver Name> - Vserver
  Specifies the Vserver.

-initiator-name | -i <text> - Initiator Name
  Specifies the initiator.

-initiator-address-ranges {<ipaddr>|<ipaddr>-<ipaddr>}, ... - Initiator IP Address Ranges
  Specifies one or more initiator source IP address range. The IPv4 or IPv6 address range contains a start address and an end address. The start and end addresses themselves are included in the range.

  An example of a valid IPv4 address range is: '192.168.1.100-192.168.1.150'.

  An example of a valid IPv6 address range is: '2001:db8::1000:1-2001:db8::1000:50'.

Examples

| netapp-clus-1::> vserver iscsi security remove-initiator-address-range
|   -vserver vs1 -initiator-name iqn.1993-08.com.example:01:e3f87c7cf2e4
|   -initiator-address-range 192.168.2.1-192.168.2.255 |

vserver iscsi security show
Show the current iSCSI authentication configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command displays the default authentication and all initiator-specific authentication information. Data ONTAP authentication overrides all other service authentication methods.

Parameters

{-fields <fieldname>, ...}
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use ‘-fields ?’ to display the fields to specify.

{-address-masks }
  Display the list of IP Address ranges in CIDR notation that each initiator is allowed to originate from. If this list is empty, the initiator is allowed to log in from any IP address. The IPv4 or IPv6 address range contains a start address and an end address. The start and end addresses themselves are included in the range.
Display the list of IP Address ranges that each initiator is allowed to originate from. If this list is empty, the
initiator is allowed to log in from any IP address. The IPv4 or IPv6 address range contains a start address and
an end address. The start and end addresses themselves are included in the range.

If you specify the -instance parameter, the command displays detailed information about all fields.

Use this parameter to display authentication information that matches the Vserver name that you specify.

Use this parameter to display authentication information that matches the initiator that you specify.

Use this parameter to display authentication information that matches the authentication type that you specify.

Use this parameter to display authentication information that matches the inbound CHAP user name that you
specify.

Use this parameter to display authentication information that matches the outbound CHAP user name that you
specify.

Use this parameter to display authentication information that matches the authentication CHAP policy that you
specify.

Use this parameter to display authentication information that matches the initiator address range that you
specify. If this list is empty, the initiator is allowed to log in from any IP address. The IPv4 or IPv6 address
range contains a start address and an end address. The start and end addresses themselves are included in the
range.

An example of a valid IPv4 address range is: '192.168.1.100-192.168.1.150'.

An example of a valid IPv6 address range is: '2001:db8::1000:1-2001:db8::1000:50'.

Use this parameter to display authentication information that matches the initiator address masks that you
specify. If this list is empty, the initiator is allowed to log in from any IP address. The IPv4 or IPv6 address
range contains a start address and an end address. The start and end addresses themselves are included in the
range.

An example of a valid IPv4 address range in CIDR notation is: 192.168.1.3/32.

An example of a valid IPv6 address range in CIDR notation is: 2001:db8::1000:1/128.

Displays the authentication information for Vserver vs1.
### vserver iscsi session commands

The session directory

#### vserver iscsi session show

Display iSCSI sessions

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

This command displays iSCSI session information. If you do not specify the target session ID (TSIH), the command displays all session information for the specified Vserver. If a Vserver is not specified, the command displays all session information in the cluster. Use the `vserver iscsi connection show` command to display connection information. Use the `vserver iscsi session parameter show` command to show the parameters used when creating the session.

You can use session information for troubleshooting performance problems.

An iSCSI session can have one or multiple connections. Typically a session has at least one connection.

Most of the parameters are read-only. However, some parameters can be modified with the `vserver iscsi modify` command.

**Parameters**

```bash
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.
If you specify the -instance parameter, the command displays detailed information about all fields.

-vserver <Vserver Name> - Vserver
Use this parameter to display iSCSI session information that matches the Vserver name that you specify.

-tpgroup <text> - Target Portal Group
Use this parameter to display iSCSI session information that matches the target portal group name that you specify.

-tsih <integer> - Target Session ID
Use this parameter to display iSCSI session information that matches the target session ID that you specify.

-max-ios-per-session <integer> - Max Commands per Session
Use this parameter to display iSCSI session information that matches the maximum commands per session count you specify.

-data-pdu-in-order {true|false} - Data PDU in Order
Specifies if the data PDUs are in sequence order. If you enter this command without using this parameter, it is set to true, and the command displays all session information that supports PDUs in order. If you provide a false value, the command displays all session information that does not support PDUs in order.

-data-sequence-in-order {true|false} - Data Sequence in Order
Specifies if the data is in sequence order. If you enter this command without using this parameter, it is set to true, and the command displays all session information where data sequence is supported. If you provide a false value, the command displays all session information that does not support data sequence.

-default-time-to-retain <integer> - Default Time to Retain
Use this parameter to display session information that matches the retain time that you specify. This value specifies the amount of time before active reassignment is possible after an unexpected connection termination or a connection reset. A value of 0 means the connection task state is immediately discarded by the target.

-default-time-to-wait <integer> - Default Time to Wait
Use this parameter to display session information that matches the logout or active task assignment wait time that you specify. Wait time refers to the amount of time before attempting an explicit or implicit logout or active task assignment after an unexpected connection termination or connection reset.

-error-recovery-level <integer> - Error Recovery Level
Use this command to display session information that matches the error recovery level that you specify.

-first-burst-length <integer> - First Burst Length
Use this parameter to display session information that matches the first burst length that you specify. First burst length is the maximum amount of unsolicited data in bytes that can be sent during the execution of a single iSCSI packet. First burst length covers the total amount of immediate data and the unsolicited data-out PDU. The first burst length must not exceed the maximum burst length.

-immediate-data-enabled {true|false} - Immediate Data
Specifies if immediate data is supported. When immediate data is supported, the initiator can send immediate data. If you enter this command using the parameter without a value, it is set to true, and the command displays all session information that supports immediate data. If you provide a false value, the command displays all session information that does not support immediate data.

-initiator-alias <text> - Initiator Alias
Use this parameter to display iSCSI session information that matches the alias name of the initiator that you specify.

-initial-r2t-enabled {true|false} - Initial R2T Enabled
Specifies if the initiator supports Initial Ready to Transfer (R2T). R2T is the mechanism that allows the target to request the initiator for output data. If you enter this command using the parameter without a value, it is set
to true, and the command displays all session information that supports initial R2T data. If you provide a false value, the command displays all session information that does not support initial R2T data.

```
[-initiator-name <text>] - Initiator Name
    Use this parameter to display the iSCSI session information that matches the initiator name that you specify.

[-isid <text>] - Initiator Session ID
    Use this parameter to display iSCSI session information that matches the initiator session ID that you specify.

[-max-burst-length <integer>] - Max Burst Length for Session
    Use this parameter to display iSCSI session information that matches the maximum burst length that you specify. Maximum burst length is the maximum iSCSI data payload in bytes for a data-in or solicited data-out sequence.

[-max-connections <integer>] - Max Connections for Session
    Use this parameter to display iSCSI session information that matches the maximum number of connections that you specify.

[-max-outstanding-r2t <integer>] - Max Outstanding R2T for Session
    Use this parameter to display iSCSI session information that matches the maximum number of outstanding R2T per task that you specify.

[-session-type <iSCSI Session Type>] - Session Type
    Use this parameter to display iSCSI session information that matches the session type that you specify.

[-tpgroup-tag <integer>] - Target Portal Group Tag
    Use this parameter to display iSCSI session information that matches the target portal group tag that you specify.

[-connection-ids <integer>, ...] - Active Connection IDs
    Use this parameter to display iSCSI session information that matches the active connection IDs that you specify.
```

### Examples

```
cluster1::> vserver iscsi session show -vserver vs_1
ViV::
Tpgroup        Initiator                        Initiator
Vserver   Name    TSIH   Name                   ISID      Alias
--------- ------- ------ ---------------------- --------- -----------------------
vs_1      tpgroup_1                iqn.1993-08.org.debian:01:fa752b8a5a3a
          2      00:02:3d:01:00:00
initiator-alias
```

Displays session information for all sessions on Vserver vs_1.

### vserver iscsi session shutdown

Shut down a session on a node

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `advanced` privilege level.
Description
This command forces a shutdown of all connections in a session. If you want to shut down a single connection in a session, use the `vserver iscsi connection shutdown` command.

Parameters

- `-vserver <Vserver Name>` - Vserver
 Specifies the Vserver.

- `-tpgroup <text>` - Target Portal Group
  Specifies the target portal group that contains the session you want to shutdown.

- `-tsih <integer>` - Target Session ID
  Specifies the target session ID that you want to shut down.

Examples

```
cluster1::*> vserver iscsi session shutdown -vserver vs_1 -tpgroup tpgroup_1 -tsih 2
```

vserver iscsi session parameter commands

The parameter directory
Commands used for displaying parameters used for iSCSI sessions

vserver iscsi session parameter show

Display the parameters used to establish an iSCSI session

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command displays session parameter information. This command is intended for troubleshooting performance problems.

Most of the parameters are read-only. However, some parameters can be modified with the `vserver iscsi modify` command.

Parameters

```
{ [-fields <fieldname>, ...] 
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.
  [-instance ] 
  If you specify the -instance parameter, the command displays detailed information about all fields.
  [-vserver <Vserver Name>] - Vserver
  Use this parameter to display session information that matches the Vserver name that you specify.
  [-tpgroup <text>] - Target Portal Group
  Use this parameter to display session information that matches the target portal group name that you specify.
  [-tsih <integer>] - Target Session ID
  Use this parameter to display session information that matches the target session ID that you specify.
```
[-cmd-window-size <integer>] - Max Commands per Session
Use this parameter to display session information that matches the command window size that you specify.

[-data-pdu-in-order {true|false}] - Data PDU in Order
Use this parameter to display session information with the value of the Protocol Data Units (PDU) in order flag you specify. This parameter indicates if the data within a sequence can be in any order or must be in sequence. If you enter this command without using this parameter, it is set to true, and the command displays all session information that supports PDUs in order. If you provide a false value, the command displays all session information that does not support PDUs in order.

[-data-sequence-in-order {true|false}] - Data Sequence in Order
Use this parameter to display session information with the value of the data sequence in order flag that you specify. If you enter this command without using this parameter, it is set to true, and the command displays all session information that supports data sequence. If you set the values to false, the command displays all session information that does not support data sequence.

[-default-time-to-retain <integer>] - Default Time to Retain
Use this parameter to display session information that matches the retain time that you specify. This value specifies the amount of time before active reassignment is possible after an unexpected connection termination or a connection reset. A value of 0 means the connection task state is immediately discarded by the target.

[-default-time-to-wait <integer>] - Default Time to Wait
Use this parameter to display session information that matches the logout or active task assignment wait time that you specify. Wait time refers to the amount of time before attempting an explicit or implicit logout or active task assignment after an unexpected connection termination or connection reset.

[-error-recovery-level <integer>] - Error Recovery Level
Use this parameter to display session information that matches the error recovery level that you specify.

[-first-burst-length <integer>] - First Burst Length
Use this parameter to display session information that matches the first burst length that you specify. First burst length is the maximum amount of unsolicited data in bytes that can be sent during the execution of a single iSCSI packet. First burst length covers the total amount of immediate data and the unsolicited data-out PDU. The first burst length must not exceed the maximum burst length.

[-immediate-data-enabled {true|false}] - Immediate Data
Use this parameter to display session information with the value of the immediate data-enabled flag that you specify. If you enter this command without using this parameter, it is set to true, and the command displays all session information that supports immediate data. If you set the value to false, the command displays all session information that does not support immediate data.

[-initial-r2t-enabled {true|false}] - Initial R2T Enabled
Use this parameter to display session information with the value of the R2T data-enabled flag that you specify. If you enter this command without using this parameter, it is set to true, and the command displays all session information that supports R2T data. If you set the value to false, the command displays all session information that does not support R2T data.

[-initiator-alias <text>] - Initiator Alias
Use this parameter to display iSCSI session information that matches the initiator alias name you specify.

[-initiator-name <text>] - Initiator Name
Use this parameter to display iSCSI session information that matches the initiator name you specify.

[-isid <text>] - Initiator Session ID
Use this parameter to display iSCSI session information that matches the initiator session identifier you specify.
[-max-burst-length <integer>] - Max Burst Length for Session
Use this parameter to display iSCSI session information that matches the maximum burst length that you specify. Maximum burst length is the maximum iSCSI data payload in bytes for a data-in or solicited data-out sequence.

[-max-connections <integer>] - Max Connections for Session
Use this parameter to display iSCSI session information that matches the maximum number of connections that you specify.

[-max-outstanding-r2t <integer>] - Max Outstanding R2T for Session
Use this parameter to display iSCSI session information that matches the maximum number of outstanding R2T per task that you specify.

[-session-type <iSCSI Session Type>] - Session Type
Use this parameter to display iSCSI session information that matches the session type you specify.

[-tpgroup-tag <integer>] - Target Portal Group Tag
Use this parameter to display iSCSI session information that matches the target portal group tag you specify.

[-initiator-mrdsl <integer>, ...] - Initiator Max Recv Data Len
Use this parameter to display iSCSI session information that matches the initiator maximum receivable data segment length you specify. An iSCSI initiator declares the maximum data segment length in bytes it can receive in an iSCSI PDU during the iSCSI login phase.

[-target-mrdsl <integer>, ...] - Target Max Recv Data Len
Use this parameter to display iSCSI session information that matches the target maximum receivable data segment length you specify. An iSCSI target declares the maximum data segment length in bytes it can receive in an iSCSI PDU during the iSCSI login phase.

**Examples**

```
cluster1::> iscsi session parameter show -vserver vs_1
Tpgroup     Max  Data PDU Data Seq Time 2 Time 2 Error   Imm   Initial
Vserver Name TSIH Conn In Order In Order Retain Wait   Rec Lvl Data  R2T
------- ------- ---- ---- -------- -------- ------ ------ ------- ----- -------
vs_1    vs_1.iscsi 6    1 true     true          0      2       0 true  false
vs_1    vs_1.iscsi 7    1 true     true          0      2       0 true  false
2 entries were displayed.
```

**vserver locks commands**

Manage Client Locks

**vserver locks break**

Break file locks based on a set of criteria

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The vserver locks break command breaks one or more locks.
Parameters

- `vserver <vserver name>` - Vserver
  This parameter specifies the Vserver containing the lock.

- `volume <volume name>` - Volume
  This parameter specifies the name of the volume containing the lock.

- `lif <lif-name>` - Logical Interface
  This parameter specifies the logical interface through which the lock was established.

- `lif-id <integer>` - Logical Interface ID
  This parameter specifies the logical interface id through which the lock was established.

- `path <text>` - Object Path
  This parameter specifies a path to the lock.

- `lockid <UUID>` - Lock UUID
  This parameter specifies the universally unique identifier (UUID) for the lock. Queries and wildcard characters are not supported.

- `owner-id <text>` - Owner ID
  This parameter specifies an owner ID for a lock. This parameter must be used with the query notation `{ }` exhibited in the second example.

- `protocol <lock protocol>` - Lock Protocol
  This parameter specifies the protocol that was used to establish a lock. This parameter must be used with the query notation `{ }` exhibited in the second example.

- `client-address <IP Address>` - Client Address
  This parameter specifies a client address associated with a lock. This parameter must be used with the query notation `{ }` exhibited in the second example.

- `client-address-type {ipv4|ipv6|ipv6z}` - Client Address Type
  This parameter specifies the type of ip address a client used to create its lock (ipv4, ipv6). This parameter must be used with the query notation `{ }` exhibited in the second example.

- `flexcache-volume <text>` - FlexCache Volume Name
  This parameter specifies the name of the FlexCache volume. This parameter must be used with the query notation `{ }` exhibited in the third example.

- `flexcache-vserver <text>` - FlexCache Vserver Name
  This parameter specifies the name of the Vserver hosting the FlexCache volume. This parameter must be used with the query notation `{ }` exhibited in the third example.

- `flexcache-cluster <text>` - FlexCache Cluster Name
  This parameter specifies the name of the cluster hosting the FlexCache volume. This parameter must be used with the query notation `{ }` exhibited in the third example.

Examples

The following example breaks the locks on all objects on the Vserver named vs0 in the volume named vol0, regardless of the paths to the locked objects and the logical interface through which the locks were established.

```
cluster1::*> vserver locks break -vserver vs0 -volume vol0 -path * -lif *
WARNING: Breaking file locks can cause applications to become unsynchronized and may lead to data corruption.
Do you want to continue? {y|n}: y
1 entry was acted on.
```
The vserver locks break command can also be issued using a query on the parameters available to the vserver locks show command. The following example breaks all NLM protocol lock objects locked by the client at address 12.34.56.78.

```
cluster1::*> vserver locks break { -protocol nlm -client-address 12.34.56.78 }
Warning: Breaking file locks can cause applications to become unsynchronized and may lead to data corruption.
Do you want to continue? {y|n}: y
1 entry was acted on.
```

The following example breaks all FlexCache lock objects locked for FlexCache volume "fc1" in Vserver "vs12".

```
cluster1::*> vserver locks break { -flexcache-volume fc1 -flexcache-vserver vs12 -flexcache-cluster cluster2 }
Warning: Breaking file locks can cause applications to become unsynchronized and may lead to data corruption.
Do you want to continue? {y|n}: y
1 entry was acted on.
```

**vserver locks show**

Display current list of locks

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The *vserver locks show* command displays information about locks. A lock is a synchronization mechanism for enforcing limits on concurrent access to files where many clients can be accessing the same file at the same time. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about locks:

- Vserver name
- Volume name
- Object path
- Logical interface name
- Lock protocol
- Lock type
- Client

**Note:** The *vserver locks show* command is also used to display FlexCache specific locks. FlexCache locks are not stored on the FlexCache volume. Instead all of the locks are stored on the origin of a FlexCache volume. To view the FlexCache locks use the *vserver locks show* command on the origin cluster.

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify the *-fields <fieldname>, ...* parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-smb-attrs]
```

If you specify the *-smb-attrs* parameter, the command displays information related to SMB2 and higher.
If you specify the `-instance` parameter, the command displays detailed information about all fields.

If you specify this parameter, the command displays information about locks on the specified Vserver.

If you specify this parameter, the command displays information about locks on the specified volume.

Note: For the FlexCache locks, this parameter displays the origin of a FlexCache volume name.

If you specify this parameter, the command displays information about locks established through the specified logical interface name.

Note: For the FlexCache locks, this parameter is unset if the FlexCache volume is not local to the cluster.

If you specify this parameter, the command displays information about locks established through the specified logical interface id.

Note: For the FlexCache locks, this parameter displays the logical interface id of the FlexCache cluster.

If you specify this parameter, the command displays information about locks at the specified path name.

If you specify this parameter, the command displays information about the lock with the specified universally unique identifier (UUID).

If you specify this parameter, the command displays information only about volumes that either are or are not constituents of a FlexGroup, depending on the value provided.

If you specify this parameter, the command displays information about locks established through the specified protocol. Some of the valid protocols are:

- `cifs`: SMB locks
- `nls`: NFS3 locks
- `nfsv4`: NFS4.0 locks
- `nfsv4.1`: NFS4.1 locks
- `crposix`: CrPosix locks for CREATE and LINK
- `fcache`: Delegations for 7-mode destination FlexCache volumes

If you specify this parameter, the command displays information about locks of the specified lock type. The four types of locks are:

- Byte-range locks: Lock only a portion of a file.
- Share locks: Represent opened files.
- Opportunistic locks: Control client-side caching over SMB.
- Delegations: Control client-side caching over NFSv4.
```plaintext
[-node <nodename>] - Node Holding Lock State

If you specify this parameter, the command displays information about all locks on the specified node.

[-lock-state <lock_state>] - Lock State

If you specify this parameter, the command displays information about the state of the lock. Some of the valid states are:

- **granted**: The lock is established.
- **revoking**: The server is currently coordinating with the client to change the state of this lock.
- **revoked**: The lock is undergoing revocation to be downgraded or released.
- **adjusted**: The lock is undergoing revocation to be replaced by a lock equal to or weaker than the current lock.
- **subsumed**: The lock is one of a set of locks that will replace a lock that is being revoked.
- **waiting**: The lock is waiting to be granted, because it conflicts with another lock.
- **denied**: The lock has been denied.
- **timeout**: The lock was waiting and has now timed out.
- **gone**: The lock is about to be released.
- **unused**: The lock is allocated but has not been processed into any state.

[-bytelock-offset <integer>] - Bytelock Starting Offset

If you specify this parameter, the command displays information about bytelocks with the specified offset value. This is the index in the file (in bytes) where the lock begins.

[-bytelock-length <integer>] - Number of Bytes Locked

If you specify this parameter, the command displays information about bytelocks with the specified length. This is the number of bytes that are locked by this particular lock.

[-bytelock-mandatory {true|false}] - Bytelock is Mandatory

If you specify this parameter, the command displays information only about mandatory bytelocks. A mandatory bytelock enforces the requirement of byte range locking on clients before accessing the associated range.

[-bytelock-exclusive {true|false}] - Bytelock is Exclusive

If you specify this parameter, the command displays information only about exclusive bytelocks. When an exclusive bytelock is granted, no other bytelock may be granted whose range overlaps it.

[-bytelock-super {true|false}] - Bytelock is Superlock

If you specify this parameter, the command displays information only about super-bytelocks. When a super-bytelock is granted, all other locks on that file are released, and no other operations will be allowed on that file.

[-bytelock-soft {true|false}] - Bytelock is Soft

If you specify this parameter, the command displays information only about softened bytelocks. An NFSv4 bytelock might become softened if the connection to the client is interrupted. Soft locks might be reclaimed if the client reconnects. However if another client requests a lock that conflicts with a soft lock, then the soft lock will be released.

[-oplock-level {exclusive|level2|batch|null|read-batch}] - Oplock Level

If you specify this parameter, the command displays information about locks with the specified oplock level. The oplock level determines which operations the client may cache locally. Those operations include opening, reading, writing, closing, and creating and destroying bytelocks on a file. The five valid oplock levels are:
```
- **batch**: The client may cache all operations on the file.
- **exclusive**: The client may cache reads and writes on the file.
- **read-batch**: The client may cache reads and opens on the file.
- **level2**: The client may cache reads on the file.
- **null**: The client may not cache any operations on the file.

**[sharelock-mode <share lock mode>] - Shared Lock Access Mode**

If you specify this parameter, the command displays information about locks with the specified sharelock mode. The parameter has two components separated by a hyphen: the access mode followed by the share mode. The access mode specifies which operations the client is allowed to perform on the file. The share mode specifies which operations other clients are disallowed to perform. The two modes are a combination of one or more of these permissions:

- **read**
- **write**
- **delete**
- **all**
- **none**

For example, the sharelock mode `read_write-deny_delete` allows the client to read and write the file, and disallows other clients to delete the file. A special mode is `delete-on-close`, which specifies that the server will delete the file as soon as it is closed.

**[sharelock-soft {true|false}] - Shared Lock is Soft**

If you specify this parameter, the command displays information only about softened sharelocks. A NFSv4 sharelock can become softened when the connection to the client is interrupted. If the client reconnects, it might reclaim the sharelock. However, if another client creates a sharelock that conflicts with the softened sharelock, the softened sharelock will be released.

**[delegation-type {read|write}] - Delegation Type**

If you specify this parameter, the command displays information only about locks with the specified delegation-type setting. The delegation type determines which operations the client may cache locally. The two valid delegation types are:

- **read**: The client may cache reads on the file.
- **write**: The client may cache reads and writes on the file.

**[owner-id <text>] - Owner ID**

If you specify this parameter, the command displays information only about locks with the specified owner ID. The owner ID is an opaque byte string generated by the server for each file lock request.

**[client-address <IP Address>] - Client Address**

If you specify this parameter, the command displays information only about locks from the specified client IP address.

**[client-address-type {ipv4|ipv6|ipv6z}] - Client Address Type**

If you specify this parameter, the command displays information only about locks corresponding to a certain IP address type. Please note that locks created over the NFSv4 or NFSv4.1 protocol cannot have their address types resolved. Valid options are:

- **ipv4**: Clients operating over an IPv4 interface.
• ipv6: Clients operating over an IPv6 interface.

[[-smb-open-type {none|durable|persistent}] - SMB Open Type

If you specify this parameter, the command displays information only about locks with the specified SMB open type. Valid open types are

• durable: Durability is a feature of SMB2. A durable lock might become "disconnected" if the connection between the client and server is disrupted. A disconnected durable lock might be reconnected if the connection is reestablished.

• persistent: Persistence is a feature of SMB3. Persistent locks can become disconnected and later reconnected, like durable locks. Persistent locks are used to facilitate continuously available shares.

• none: The lock is neither durable nor persistent.

[[-smb-connect-state <Lock Connect State>] - SMB Connect State

If you specify this parameter, the command displays information only about locks with the specified SMB connection state. Some of the valid states are:

• connected: This is the normal state of a SMB lock when the server and client are connected.

• disconnected: If a lock is durable or persistent, it might become disconnected if the connection between the server and its client is interrupted. Disconnected locks may later be reconnected if the connection is reestablished.

[[-smb-expiration-time <integer>] - SMB Expiration Time (Secs)

If you specify this parameter, the command displays information only about locks with the specified SMB lock expiration time. When a lock is disconnected, -smb-expiration-time shows the time remaining until the lock expires. The server releases the lock after it expires.

[[-smb-open-group-id <text>] - SMB Open Group ID

If you specify this parameter, the command displays information only about locks with the specified SMB open group identifier. This is an opaque byte string provided by the client as the SMB lease key when the lock is first established.

[[-is-flexcache-lock {true|false}] - Is FlexCache Lock

If you specify this parameter, the command displays information only about locks with the specified value.

[[-flexcache-volume <text>] - FlexCache Volume Name

If you specify this parameter, the command displays information only about locks with the specified FlexCache volume.

[[-flexcache-vserver <text>] - FlexCache Vserver Name

If you specify this parameter, the command displays information only about locks with the specified Vserver hosting a FlexCache volume.

[[-flexcache-vserver-uuid <UUID>] - FlexCache Vserver UUID

If you specify this parameter, the command displays information only about locks with the specified UUID of a Vserver hosting a FlexCache volume.

[[-flexcache-volume-msid <integer>] - FlexCache Volume MSID

If you specify this parameter, the command displays information only about locks with the specified FlexCache volume MSID.

[[-flexcache-cluster <text>] - FlexCache Cluster Name

If you specify this parameter, the command displays information only about locks with the specified cluster hosting a FlexCache volume.
Examples

The following example displays default information about all locks:

```
cluster1::> vserver locks show

Vserver: vs0
Volume Object Path               LIF         Protocol  Lock Type   Client
-------- ------------------------- ----------- --------- ----------- ----------
vol1     /vol1/notes.txt           node1_data1 cifs share-level 192.168.1.5
Sharelock Mode: read_write-deny_delete
Oplock Level: read-batch
/vol1/notes1.txt          node1_data1 cifs share-level 192.168.1.5
Sharelock Mode: read_write-deny_delete
Oplock Level: batch
/vol1                     node1_data2 cifs share-level 192.168.1.5
Sharelock Mode: read-deny_delete
/vol1/notes.txt           node1_data2 cifs share-level 192.168.1.5
Sharelock Mode: read_write-deny_delete
Oplock Level: read-batch
7 entries were displayed.
```

The following example displays the SMB related information about all locks:

```
cluster1::> vserver locks show -smb-attrs

Vserver: vs0

vserver name-mapping commands

The name-mapping directory

vserver name-mapping create

Create a name mapping

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver name-mapping create command creates a name mapping. Name mappings are applied in the order in which they occur in the priority list; for example, a name mapping that occurs at position 2 in the priority list is applied before a name mapping that occurs at position 3. Each mapping direction (Kerberos-to-UNIX, Windows-to-UNIX, and UNIX-to-Windows) has its own priority list. Data ONTAP prevents you from creating two name mappings with the same pattern.

Patterns can be expressed as POSIX regular expressions. For information about regular expressions, see the UNIX reference page for regex(7).

Each Vserver can have up to 1024 name mappings in each direction.

Note: If you are using the CLI, you must delimit all regular expressions with double quotation marks ("). For instance, to enter the regular expression (.+) in the CLI, type "(.+)" at the command prompt. To add a "?" to the expression, press ESC followed by the "?".

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the Vserver on which you want to create the name mapping.

-direction {krb-unix|win-unix|unix-win} - Direction

This parameter specifies the direction of the name mapping. Possible values are krb-unix for a Kerberos-to-UNIX name mapping, win-unix for a Windows-to-UNIX name mapping, and unix-win for a UNIX-to-Windows name mapping.

-position <integer> - Position

This parameter specifies the name mapping's position in the priority list. Specify the position as a positive integer.

Note: If you want to create a new name mapping at a position that is already occupied in the priority list, use the vserver name-mapping insert command instead of the vserver name-mapping create command.

-pattern <text> - Pattern

This parameter specifies the pattern you want to match. Refer to the command description section for details. The pattern can be up to 256 characters in length.

-replacement <text> - Replacement

This parameter specifies the replacement pattern. The replacement pattern can be up to 256 characters in length.

{ [-address <IP Address/Mask>] - IP Address with Subnet Mask

This optional parameter specifies the IP address that can be used to match the client's workstation IP address with the pattern.
| [–hostname <text>] | - Hostname

This optional parameter specifies the hostname that can be used to match the corresponding client's workstation IP address with the list of IP addresses with the pattern.

**Examples**

The following example creates a name mapping on a Vserver named vs1. The mapping is from UNIX to Windows at position 5 in the priority list. The mapping maps the pattern cifs to the replacement EXAMPLE\Domain Users.

```
cluster1::> vserver name-mapping create -vserver vs1 -direction unix-win -position 5 -pattern cifs -replacement "EXAMPLE\Domain Users -address 10.238.33.245/24"
```

**Related references**

`vserver name-mapping insert` on page 1986

**vserver name-mapping delete**

Delete a name mapping

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**

The `vserver name-mapping delete` command deletes a name mapping.

**Parameters**

- `–vserver <vserver name>` - Vserver
  
  This parameter specifies the Vserver from which you want to delete the name mapping.

- `–direction {krb-unix|win-unix|unix-win}` - Direction
  
  This parameter specifies the direction of the name mapping that you want to delete.

- `–position <integer>` - Position
  
  This parameter specifies the position of the name mapping that you want to delete. Specify the position as a positive integer.

**Examples**

The following example deletes a name mapping on a Vserver named vs1. The name mapping is from UNIX to Windows and is at position 5.

```
cluster1::> vserver name-mapping delete -vserver vs1 -direction unix-win -position 5
```

**vserver name-mapping insert**

Create a name mapping at a specified position

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**

The `vserver name-mapping insert` command creates a name mapping at a specified position in the priority list. The command rearranges the list as needed to accommodate the new entry. For instance, if you have a priority list of five mappings and insert a new mapping at position 3, the mapping previously at position 3 is moved to position 4, the mapping previously at
position 4 is moved to position 5, and the mapping previously at position 5 is moved to position 6. Each mapping direction (Kerberos-to-UNIX, Windows-to-UNIX, and UNIX-to-Windows) has its own priority list.

You can specify patterns as POSIX regular expressions. For information about regular expressions, see the UNIX reference page for "regex(7)."

Each Vserver can have up to 1024 name mappings in each direction.

**Note:** If you are using the CLI, you must delimit all regular expressions with double quotation marks ("."). For instance, to enter the regular expression ".*" in the CLI, type ""."" at the command prompt. To add a "?" to the expression, press ESC followed by the "?".

**Parameters**

- **vserver <vserver name> - Vserver**
  This parameter specifies the Vserver on which you want to create the name mapping.

- **direction {krb-unix|win-unix|unix-win} - Direction**
  This parameter specifies the direction of the name mapping. Possible values are krb-unix for a Kerberos-to-UNIX name mapping, win-unix for a Windows-to-UNIX name mapping, and unix-win for a UNIX-to-Windows name mapping.

- **position <integer> - Position**
  This parameter specifies the position in the priority list at which you want to insert the new name mapping. Specify a position as a positive integer.

- **pattern <text> - Pattern**
  This parameter specifies the pattern you want to match. Refer to the command description section for details.
  The pattern can be up to 256 characters in length.

- **replacement <text> - Replacement**
  This parameter specifies the replacement pattern. The replacement pattern can be up to 256 characters in length.

- **[ -address <IP Address/Mask>] - IP Address with Subnet Mask**
  This optional parameter specifies the IP address that can be used to match the client's workstation IP address with the pattern.

- **[ -hostname <text>] - Hostname**
  This optional parameter specifies the hostname that can be used to match the corresponding client's workstation IP address with the list of IP addresses with the pattern.

**Examples**

The following example creates a name mapping on a Vserver named vs1. It is a user mapping from Kerberos to UNIX. It is inserted into the priority list at position 2. The name mapping maps any principal in the Kerberos realm SEC.EXAMPLE.COM to the UNIX user name corresponding to the principal's base name with any instance names removed; for example, tom/admin@SEC.EXAMPLE.COM is mapped to tom.

```
cluster1::> vserver name-mapping insert -vserver vs1 -direction krb-unix -position 2 -pattern "([^/]+)/(^[^@]+)?@SEC.EXAMPLE.COM" -replacement "\1"
```

Modify a name mapping's pattern, replacement pattern, or both

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.
Description
The vserver name-mapping modify command modifies the pattern, the replacement pattern, or both of a specified name
mapping.
You can specify patterns as POSIX regular expressions. For information about regular expressions, see the UNIX reference page
for regex(7).
Each Vserver can have up to 1024 name mappings in each direction.
Note: If you are using the CLI, you must delimit all regular expressions with double quotation marks ("). For instance, to
enter the regular expression (.+) in the CLI, type "(.+)" at the command prompt. To add a "?" to the expression, press ESC
followed by the "?".

Parameters
-vserver <vserver name> - Vserver

This parameter specifies the Vserver on which you want to modify the name mapping.
-direction {krb-unix|win-unix|unix-win} - Direction

This parameter specifies the direction of the name mapping. Possible values are krb-unix for a Kerberos-toUNIX name mapping, win-unix for a Windows-to-UNIX name mapping, and unix-win for a UNIX-toWindows name mapping.
-position <integer> - Position

This parameter specifies the name mapping's position in the priority list. A position is specified as a positive
integer. Each mapping direction (Kerberos-to-UNIX, Windows-to-UNIX, and UNIX-to-Windows) has its own
priority list.
[-pattern <text>] - Pattern
This parameter specifies the pattern you want to match. Refer to the command description section for details.
The pattern can be up to 256 characters in length.
[-replacement <text>] - Replacement
This parameter specifies the replacement pattern. The replacement pattern can be up to 256 characters in
length.
{ [-address <IP Address/Mask>] - IP Address with Subnet Mask
This optional parameter specifies the IP address that can be used to match the client's workstation IP address
with the pattern.
| [-hostname <text>]} - Hostname
This optional parameter specifies the hostname that can be used to match the corresponding client's
workstation IP address with the list of IP addresses with the pattern.
Examples
The following example modifies the name mapping on the Vserver named vs1 and direction win-unix, at position 3. The
pattern to be matched is changed to "EXAMPLE\(.+)".
cluster1::> vserver name-mapping modify -vserver vs1 -direction win-unix -position 3 -pattern
"EXAMPLE\\(.+) -address 10.238.2.54/32"
cluster1::> vserver name-mapping modify -vserver vs1 -direction win-unix -position 3 -pattern
"EXAMPLE\\(.+) -hostname google.com"

vserver name-mapping refresh-hostname-ip
Refresh the IP addresses for configured hostnames
Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

1988

Commands: Manual Page Reference


**Description**
The `vserver name-mapping refresh-hostname-ip` command will refresh the IP Address entries in the name-mapping configuration by resolving the hostname. If you run this command with no parameters, this will refresh the IP address entries for every hostname in the name-mapping configuration.

**Parameters**

- `-vserver <vserver>` - Vserver
  This parameter specifies the Vserver for which the hostname lookup needs to be done.

- `[-direction {krb-unix|win-unix|unix-win}]` - Name Mapping Direction
  This optional parameter specifies the direction of the name-mapping entry for the hostname lookup.

- `[-hostname <text>]` - Hostname
  This optional parameter specifies the hostname for which the lookup needs to be done.

**Examples**
```
cluster1::*> vserver name-mapping refresh-hostname-ip -vserver vs1 -direction win-unix -
hostname
```

---

**vserver name-mapping show**
Display name mappings

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**
The `vserver name-mapping show` command displays information about name mappings. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all name mappings:

- Vserver name
- Direction of the mapping (krb-unix for Kerberos-to-UNIX, win-unix for Windows-to-UNIX, or unix-win for UNIX-to-Windows)
- Position of the mapping in the priority list
- Pattern to be matched
- Replacement pattern

You can specify additional parameters to display only information that matches those parameters. For instance, to display information only about Kerberos-to-UNIX name mappings, run the command with the `-direction krb-unix` parameter.

**Parameters**

- `[-fields <fieldname>, ...]`
  If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

- `[-instance]`
  If you specify the `-instance` parameter, the command displays detailed information about all fields.

- `[-vserver <vserver name>]` - Vserver
  If you specify this parameter, the command displays information only about the name mapping or mappings that match the specified Vserver.
[-direction \{krb-unix|win-unix|unix-win\}] - Direction
If you specify this parameter, the command displays information only about the name mapping or mappings that have the specified mapping direction.

[-position <integer>] - Position
If you specify this parameter, the command displays information only about the name mapping that has the specified position in the priority list.

[-pattern <text>] - Pattern
If you specify this parameter, the command displays information only about the name mapping or mappings that use the specified matching pattern. The pattern can be up to 256 characters in length. Refer to the command description section for details.

[-replacement <text>] - Replacement
If you specify this parameter, the command displays information only about the name mapping or mappings that use the specified replacement pattern.

[-address <IP Address/Mask>] - IP Address with Subnet Mask
If you specify this parameter, the command displays information only about the name mapping or mappings that use the specified IP address.

[-hostname <text>] - Hostname
If you specify this parameter, the command displays information only about the name mapping or mappings that use the specified hostname.

Examples
The following example displays information about all name mappings:

```
cluster1::> vserver name-mapping show
Vserver: vs1
Direction: win-unix
Position Hostname         IP Address/Mask
-------- ---------------- ----------------
1        google.com       -                  Pattern: EXAMPLE\administrator
 Replacement: nobody
2        -                10.238.2.34/32     Pattern: EXAMPLE\(.+)
 Replacement: _1
```

vserver name-mapping swap
Exchange the positions of two name mappings

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver name-mapping swap command exchanges the positions of two name mappings in the priority list.

Parameters

- **-vserver <vserver name>** - Vserver
  This parameter specifies the Vserver on which the name mappings are located.

- **-direction \{krb-unix|win-unix|unix-win\}** - Direction
  This parameter specifies the direction of the name mappings that you want to exchange. Each mapping direction (Kerberos-to-UNIX, Windows-to-UNIX, and UNIX-to-Windows) has its own priority list.

- **-position <integer>** - Position
  This parameter specifies the position in the priority list of the first name mapping that you want to exchange. Specify a position as a positive integer.
-with-position <integer> - Position of an existing name mapping entry in the list of name mappings for this Vserver. This entry will be swapped with the entry at 'position'.

This parameter specifies the position in the priority list of the second name mapping that you want to exchange. Specify a position as a positive integer.

Examples
The following example exchanges the positions of two name mappings on a Vserver named vs1. The name mappings have the direction Windows-to-UNIX. The name mappings are exchanged between positions 2 and 4.

```sh
cluster1::> vserver name-mapping swap -vserver vs1 -direction win-unix -position 2 -with-position 4
```

vserver nfs commands
Manage the NFS configuration of a Vserver

vserver nfs create
Create an NFS configuration for a Vserver

**Availability:** This command is available to `cluster` and Vserver administrators at the `admin` privilege level.

**Description**
The `vserver nfs create` command enables and configures a Vserver to serve NFS clients. The Vserver must already exist. An NFS-enabled Vserver is associated with an NIS domain.

**Parameters**
- **-vserver <vserver name>** - Vserver
  This parameter specifies the Vserver on which you want to create the NFS configuration.

  - **-access {true|false]** - General NFS Access
    This optional parameter specifies whether to enable NFS access on the Vserver. The default setting is `true`.

  - **-rpcsec-ctx-high <integer>** - RPC GSS Context Cache High Water Mark (privilege: advanced)
    This optional parameter specifies the maximum number of RPCSEC_GSS authentication contexts, which are used by Kerberos. The default setting is zero. See RFC 2203 for information about RPCSEC_GSS contexts.

  - **-rpcsec-ctx-idle <integer>** - RPC GSS Context Idle (privilege: advanced)
    This optional parameter specifies, in seconds, the amount of time a RPCSEC_GSS context is permitted to remain unused before it is deleted. The default setting is zero seconds. See RFC 2203 for information about RPCSEC_GSS contexts.

  - **-v3 {enabled|disabled]** - NFS v3
    This optional parameter specifies whether to enable access for NFSv3 clients. The default setting is `enabled`.

  - **-v4.0 {enabled|disabled]** - NFS v4.0
    This optional parameter specifies whether to enable access for NFSv4.0 clients. The default setting is `disabled`.

  - **-udp {enabled|disabled]** - UDP Protocol
    This optional parameter specifies whether to enable NFS access over UDP. The default setting is `enabled`.

  **Note:** Even if UDP is disabled, if TCP is enabled, the Vserver does not block NFSv3 traffic over UDP. By allowing this traffic, the storage system can process NFS_NULL ops that the Solaris automounter sends to determine if the storage system is alive. (Solaris sends these ops over UDP even if configured to use TCP.)
To disallow access for certain clients, including over UDP, you can use export-policy rules. For more information, see the `vserver export-policy rule create` command.

`[-tcp {enabled|disabled}]` - TCP Protocol  
This optional parameter specifies whether to enable NFS access over TCP. The default setting is `enabled`.

`[-default-win-user <text>]` - Default Windows User  
This optional parameter specifies a list of default Windows users for the NFS server.

`[-enable-ejukebox {true|false}]` - Enable NFSv3 EJUKEBOX error (privilege: advanced)  
This optional parameter specifies whether EJUKEBOX errors are enabled for NFSv3. The default setting is `true`.

`[-v3-require-read-attributes {true|false}]` - Require All NFSv3 Reads to Return Read Attributes (privilege: advanced)  
This optional parameter specifies whether NFSv3 read operations are required to return read attributes. The default setting is `false`.

`[-v3-fsid-change {enabled|disabled}]` - Show Change in FSID as NFSv3 Clients Traverse Filesystems (privilege: advanced)  
This optional parameter specifies whether Data ONTAP shows changes in file system identifiers (FSIDs) as NFSv3 clients traverse file systems. The default setting is `enabled`.

`[-v3-connection-drop {enabled|disabled}]` - Enable the Dropping of a Connection When an NFSv3 Request is Dropped (privilege: advanced)  
This optional parameter specifies whether Data ONTAP allows to drop the connection when a NFSv3 request is dropped. The default setting is `enabled`.

`[-ntfs-unix-security-ops {fail|ignore|use-export-policy}]` - Vserver NTFS Unix Security Options (privilege: advanced)  
This optional parameter specifies how NFSv3 security changes affect NTFS volumes. If you set this parameter to ignore, Data ONTAP ignores NFSv3 security changes. If you set this parameter to fail, this overrides the unix security options set in the relevant export rules. If you set this parameter to use_export_policy, Data ONTAP processes NFSv3 security changes in accordance with the relevant export rules. The default setting is `use_export_policy` at the time of creation.

`[-chown-mode {restricted|unrestricted|use-export-policy}]` - Vserver Change Ownership Mode (privilege: advanced)  
This optional parameter specifies whether file ownership can be changed only by the superuser, or if a non-root user can also change file ownership. If you set this parameter to restricted, file ownership can be changed only by the superuser, even though the on-disk permissions allow a non-root user to change file ownership. If you set this parameter to unrestricted, file ownership can be changed by the superuser and by the non-root user, depending upon the access granted by on-disk permissions. If you set this parameter to use_export_policy, file ownership can be changed in accordance with the relevant export rules.

`[-trace-enabled {true|false}]` - NFS Response Trace Enabled (privilege: advanced)  
This optional parameter specifies whether Data ONTAP logs NFS requests when they exceed the NFS response trigger time (see the `trigger` parameter). The default setting is `false`.

`[-trigger <integer>]` - NFS Response Trigger (in secs) (privilege: advanced)  
This optional parameter specifies the amount of time, in seconds, after which Data ONTAP must log an NFS request if it has not completed (assuming the `trace-enabled` option is `true`). The default setting is 60.

`[-udp-max-xfer-size <integer>]` - UDP Maximum Transfer Size (bytes) (privilege: advanced)  
This optional parameter specifies the maximum transfer size (in bytes) that the NFS mount protocol will negotiate with the client for UDP transport. The range is 8192 to 57344. The default setting is 32768.
[tcp-max-xfer-size <integer>] - TCP Maximum Transfer Size (bytes) (privilege: advanced)

This optional parameter specifies the maximum transfer size (in bytes) that the storage system negotiates with the client for TCP transport of data for NFSv3, and NFSv4.x protocols. The range is 8192 to 1048576. The default setting is 65536.

**Note:** Setting the parameter value greater than 65536 may cause performance degradation for existing connections using smaller values. Contact technical support for guidance.

[v3-tcp-max-read-size <integer>] - NFSv3 TCP Maximum Read Size (bytes) (privilege: advanced)

This optional parameter specifies the maximum transfer size (in bytes) that the storage system negotiates with the client for TCP transport of data for NFSv3 read requests. The range is 8192 to 1048576. The default setting is 65536 when created.

**Note:** This parameter is deprecated and may be removed in a future release of Data ONTAP. Use the -tcp-max-xfer-size parameter instead.

[v3-tcp-max-write-size <integer>] - NFSv3 TCP Maximum Write Size (bytes) (privilege: advanced)

This optional parameter specifies the maximum transfer size (in bytes) that the storage system negotiates with the client for TCP transport of data for NFSv3 write requests. The range is 8192 to 65536. The default setting is 65536 when created.

**Note:** This parameter is deprecated and may be removed in a future release of Data ONTAP. Use the -tcp-max-xfer-size parameter instead.

[v4.0-acl {enabled|disabled}] - NFSv4.0 ACL Support

This optional parameter specifies whether Data ONTAP supports NFSv4.0 access control lists (ACLs). The default setting is disabled.

[v4.0-read-delegation {enabled|disabled}] - NFSv4.0 Read Delegation Support

This optional parameter specifies whether Data ONTAP supports NFSv4.0 read delegations. The default setting is disabled.

[v4.0-write-delegation {enabled|disabled}] - NFSv4.0 Write Delegation Support

This optional parameter specifies whether Data ONTAP supports NFSv4.0 write delegations. The default setting is disabled.

[v4-fsid-change {enabled|disabled}] - Show Change in FSID as NFSv4 Clients Traverse Filesystems (privilege: advanced)

This optional parameter specifies whether Data ONTAP shows changes in file system identifiers (FSIDs) as NFSv4 clients traverse file systems. The default setting is enabled.

**Note:** If users access the storage system using NFSv4 from Solaris 10 clients, you must set this option to disabled.

[v4.0-referrals {enabled|disabled}] - NFSv4.0 Referral Support (privilege: advanced)

This optional parameter specifies whether Data ONTAP supports NFSv4.0 referrals. The default setting is disabled. You can set this parameter to enabled only if you also set the -v4-fsid-change to enabled. If clients accessing the node do not support NFSv4.0 referrals, set this option to disabled; otherwise, those clients will not be able to access the file system.

[v4-id-domain <nfs domain>] - NFSv4 ID Mapping Domain

This optional parameter specifies the domain portion of the string form of user and group names as defined by the NFSv4 protocol. By default, the domain name is normally taken from the NIS domain or the DNS domain in use. However, the value of this parameter overrides the default. The domain name must be agreed upon by both the NFS client and the storage controller before NFSv4 operations can be executed. It is recommended that the domain be specified in the fully qualified domain name format.
[-v4-validate-symlinkdata {enabled|disabled}] - NFSv4 Validate UTF-8 Encoding of Symbolic Link Data (privilege: advanced)
   This optional parameter specifies whether Data ONTAP validates the UTF-8 encoding of symbolic link data. The default setting is disabled.

[-v4-lease-seconds <integer>] - NFSv4 Lease Timeout Value (in secs) (privilege: advanced)
   This optional parameter specifies the time period in which Data ONTAP irrevocably grants a lock to a client. By default, the lease period is 30 seconds. The minimum value is 10. The maximum value is one less than the value of the -v4-grace-seconds parameter.

[-v4-grace-seconds <integer>] - NFSv4 Grace Timeout Value (in secs)
   This optional parameter specifies the time period in which clients attempt to reclaim their locking state from Data ONTAP during server recovery. By default, the grace period is 45 seconds. The minimum value is 1 more than the value of the -v4-lease-seconds parameter. The maximum value is 90.

[-v4-acl-preserve {enabled|disabled}] - Preserves and Modifies NFSv4 ACL (and NTFS File Permissions in Unified Security Style)
   This optional parameter specifies if the NFSv4 ACL is preserved or dropped when chmod is performed. In unified security style, this parameter also specifies if NTFS file permissions are preserved or dropped when chmod, chgrp, or chown are performed. The default is enabled.

[-v4.1 {enabled|disabled}] - NFSv4.1 Minor Version Support
   This optional parameter specifies whether to enable access for NFSv4.1 clients. The default setting is disabled.

[-rquota {enabled|disabled}] - Rquota Enable
   This optional parameter specifies whether to enable rquota over NFS. The default setting is disabled.

[-v4.1-implementation-domain <nfs domain>] - NFSv4.1 Implementation ID Domain (privilege: advanced)
   This optional parameter specifies the NFSv4.1 implementation domain.

[-v4.1-implementation-name <text>] - NFSv4.1 Implementation ID Name (privilege: advanced)
   This optional parameter specifies the NFSv4.1 implementation name.

[-v4.1-implementation-date <Date>] - NFSv4.1 Implementation ID Date (privilege: advanced)
   This optional parameter specifies the NFSv4.1 implementation date.

[-v4.1-pnfs {enabled|disabled}] - NFSv4.1 Parallel NFS Support
   This optional parameter specifies whether Data ONTAP supports parallel NFS over NFSv4.1. The default setting is enabled.

[-v4.1-referrals {enabled|disabled}] - NFSv4.1 Referral Support (privilege: advanced)
   This optional parameter specifies whether Data ONTAP supports NFSv4.1 referrals. The default setting is disabled. You can set this parameter to enabled only if you also set the -v4-fsid-change to enabled. If clients accessing the node do not support NFSv4.1 referrals, set this option to disabled; otherwise, those clients will not be able to access the file system.

[-v4.1-acl {enabled|disabled}] - NFSv4.1 ACL Support
   This optional parameter specifies whether Data ONTAP supports NFSv4.1 access control lists (ACLs). The default setting is disabled.

[-vstorage {enabled|disabled}] - NFS vStorage Support
   This optional parameter specifies whether to enable vstorage over NFS. The default setting is disabled.

[-v4-numeric-ids {enabled|disabled}] - NFSv4 Support for Numeric Owner IDs
   This optional parameter specifies whether the support for numeric string identifiers in NFSv4 owner attributes is enabled. The default setting is enabled.
[-default-win-group <text>] - Default Windows Group
This optional parameter specifies a list of default Windows groups for the NFS server.

[-v4.1-read-delegation {enabled|disabled}] - NFSv4.1 Read Delegation Support
This optional parameter specifies whether Data ONTAP supports NFSv4.1 read delegations. The default setting is disabled.

[-v4.1-write-delegation {enabled|disabled}] - NFSv4.1 Write Delegation Support
This optional parameter specifies whether Data ONTAP supports NFSv4.1 write delegations. The default setting is disabled.

[-v4.x-session-num-slots <integer>] - Number of Slots in the NFSv4.x Session slot tables (privilege: advanced)
This optional parameter specifies the number of entries in the NFSv4.x session slot table. By default, the number of slots is 180. The maximum value is 2000.

[-v4.x-session-slot-reply-cache-size <integer>] - Size of the Reply that will be Cached in Each NFSv4.x Session Slot (in bytes) (privilege: advanced)
This optional parameter specifies the number of bytes of the reply that will be cached in each NFSv4.x session slot. By default, the size of the cached reply is 640 bytes. The maximum value is 4096.

[-v4-acl-max-aces <integer>] - Maximum Number of ACEs per ACL (privilege: advanced)
This optional parameter specifies the maximum number of ACEs in an NFSv4 ACL. The range is 192 to 1024. The default value is 400. Setting it to a value more than the default could cause performance problems for clients accessing files with NFSv4 ACLs.

[-mount-rootonly {enabled|disabled}] - NFS Mount Root Only
This optional parameter specifies whether the Vserver allows MOUNT protocol calls only from privileged ports (port numbers less than 1024). The default setting is enabled.

[-nfs-rootonly {enabled|disabled}] - NFS Root Only
This optional parameter specifies whether the Vserver allows NFS protocol calls only from privileged ports (port numbers less than 1024). The default setting is disabled.

[-auth-sys-extended-groups {enabled|disabled}] - AUTH_SYS Extended Groups Enabled (privilege: advanced)
This optional parameter specifies whether Data ONTAP supports fetching auxillary groups from a name service rather than from the RPC header. The default setting is disabled.

[-extended-groups-limit <integer>] - AUTH_SYS and RPCSEC_GSS Auxillary Groups Limit (privilege: advanced)
This optional parameter specifies the maximum number of auxillary groups supported over RPC security flavors AUTH_SYS and RPCSEC_GSS in Data ONTAP. The range is 32 to 1024. The default value is 32.

[-validate-qtree-export {enabled|disabled}] - Validation of Qtree IDs for Qtree File Operations (privilege: advanced)
This optional parameter specifies whether clustered Data ONTAP performs an additional validation on qtree IDs. The default setting is enabled. This parameter is ignored unless a non-inherited policy has been or is assigned to a qtree.

[-mountd-port <integer>] - NFS Mount Daemon Port (privilege: advanced)
This optional parameter specifies which port the NFS mount daemon (mountd) uses. The port numbers allowed are 635 (the default) and 1024 through 9999.

[-nlm-port <integer>] - Network Lock Manager Port (privilege: advanced)
This optional parameter specifies which port the network lock manager (NLM) uses. The port numbers allowed are 1024 through 9999. The default setting is 4045.
[\[-nsm-port <\text{integer}>\] - Network Status Monitor Port (privilege: advanced)

This optional parameter specifies which port the network status monitor (NSM) uses. The port numbers allowed are 1024 through 9999. The default setting is 4046.

[\[-rquotad-port <\text{integer}>\] - NFS Quota Daemon Port (privilege: advanced)

This optional parameter specifies which port the NFS quota daemon (rquotad) uses. The port numbers allowed are 1024 through 9999. The default setting is 4049.

[\[-permitted-enc-types <\text{NFS Kerberos Encryption Type}>,...\] - Permitted Kerberos Encryption Types

This optional parameter specifies the permitted encryption types for Kerberos over NFS. The default setting is des, des3, aes-128, aes-256.

[\[-showmount \{\text{enabled}|\text{disabled}\}\] - Showmount Enabled

This optional parameter specifies whether to allow or disallow clients to see the Vserver's NFS exports list. The default setting is enabled.

\textbf{Note:} Showmount leverages the MOUNT protocol in NFSv3 to issue an EXPORT query to the NFS server. If the mount port is not listening or blocked by a firewall, or if NFSv3 is disabled on the NFS server, showmount queries fail.

[\[-name-service-lookup-protocol \{TCP | UDP\}\] - Set the Protocol Used for Name Services Lookups for Exports

This optional parameter specifies the protocol to use for doing name service lookups. The allowed values are TCP and UDP. The default setting is UDP.

[\[-map-unknown-uid-to-default-windows-user \{\text{enable}|\text{disable}\}\] - Map Unknown UID to Default Windows User (privilege: advanced)

If you enable this optional parameter, unknown UNIX users that do not have a name mapping to a Windows user are mapped to the configured default Windows user. This allows all unknown UNIX users access with the credentials of the default Windows user. If you disable it, all unknown UNIX users without name mapping are always denied access. By default, this parameter is enabled.

[\[-netgroup-dns-domain-search \{\text{enabled}|\text{disabled}\}\] - DNS Domain Search Enabled During Netgroup Lookup (privilege: advanced)

If you enable this optional parameter, during client access check evaluation in a netgroup, Data ONTAP performs an additional verification to ensure that the domain returned from DNS for that client is listed in the DNS configuration of the Vserver. This enables you to validate the domain when clients have the same short name in multiple domains. The default setting is enabled.

[\[-netgroup-trust-any-ns-switch-no-match \{\text{enabled}|\text{disabled}\}\] - Trust No-Match Result from Any Name Service Switch Source During Netgroup Lookup (privilege: advanced)

This optional parameter specifies if you can consider a no-match result from any netgroup ns-switch source to be authoritative. If this option is enabled, then a no-match response from any one of the netgroup ns-switch sources is deemed conclusive even if other sources could not be searched. The default setting is 'disabled', which causes all netgroup ns-switch sources to be consulted before a no-match result is deemed conclusive.

[\[-ntacl-display-permissive-perms \{\text{enabled}|\text{disabled}\}\] - Display maximum NT ACL Permissions to NFS Client (privilege: advanced)

This optional parameter controls the permissions that are displayed to NFSv3 and NFSv4 clients on a file or directory that has an NT ACL set. When true, the displayed permissions are based on the maximum access granted by the NT ACL to any user. When false, the displayed permissions are based on the minimum access granted by the NT ACL to any user. The default setting is false.

[\[-v3-ms-dos-client \{\text{enabled}|\text{disabled}\}\] - NFSv3 MS-DOS Client Support

This optional parameter specifies whether to enable access for NFSv3 MS-DOS clients. The default setting is disabled.
[-ignore-nt-acl-for-root {enabled|disabled}] - Ignore the NT ACL Check for NFS User 'root' (privilege: advanced)

This optional parameter specifies whether Windows ACLs affect root access from NFS. If this option is enabled, root access from NFS ignores the NT ACL set on the file or directory. If auditing is enabled for the Vserver and there is no name-mapping present, then a default SMB credential (Builtin\administrator) is used for auditing, and an EMS warning is generated. The default setting is 'disabled', which causes NFS 'root' to be mapped to a Windows account, like any other NFS user.

[-cached-cred-positive-ttl <integer>] - Time To Live Value (in msecs) of a Positive Cached Credential (privilege: advanced)

This optional parameter specifies the age of the positive cached credentials after which they will be cleared from the cache. The value specified must be between 60000 and 604800000. The default setting is 86400000.

[-cached-cred-negative-ttl <integer>] - Time To Live Value (in msecs) of a Negative Cached Credential (privilege: advanced)

This optional parameter specifies the age of the negative cached credentials after which they will be cleared from the cache. The value specified must be between 60000 and 604800000. The default setting is 7200000.

[-skip-root-owner-write-perm-check {enabled|disabled}] - Skip Permission Check for NFS Write Calls from Root/Owner (privilege: advanced)

This optional parameter specifies if permission checks are to be skipped for NFS WRITE calls from root/owner. For copying read-only files to a destination folder which has inheritable ACLs, this option must be enabled. Warning: When enabled, if an NFS client does not make use of an NFS ACCESS call to check for user-level permissions and then tries to write onto read-only files, the operation will succeed. The default setting is disabled.

[-v3-64bit-identifiers {enabled|disabled}] - Use 64 Bits for NFSv3 FSIDs and File IDs (privilege: advanced)

This optional parameter specifies whether Data ONTAP uses 64 bits (instead of 32 bits) for file system identifiers (FSIDs) and file identifiers (file IDs) that are returned to NFSv3 clients. The default setting is disabled. When -v3-fsid-change is disabled, enable this parameter to avoid file ID collisions.

[-v4-inherited-acl-preserve {enabled|disabled}] - Ignore Client Specified Mode Bits and Preserve Inherited NFSv4 ACL When Creating New Files or Directories (privilege: advanced)

This optional parameter specifies whether the client-specified mode bits should be ignored and the inherited NFSv4 ACL should be preserved when creating new files or directories. The default setting is disabled.

[-v3-search-unconverted-filename {enabled|disabled}] - Fallback to Unconverted Filename Search (privilege: advanced)

This optional parameter specifies whether to continue search without converting the filename to the Unicode character set while doing lookup in a directory.

[-file-session-io-grouping-count <integer>] - I/O Count to Be Grouped as a Session (privilege: advanced)

This optional parameter specifies the number of read or write operations on a file from a single client that are grouped and considered as one session for event generation applications, such as FPolicy. The event is generated on the first read or write of a file, and subsequently the event is generated only after the specified -file-session-io-grouping-count. The default value is 5000.

[-file-session-io-grouping-duration <integer>] - Duration for I/O to Be Grouped as a Session (Secs) (privilege: advanced)

This optional parameter specifies the duration for which the read or write operations on a file from a single client are grouped and considered as one session for event generation applications, such as FPolicy. The default value is 120 seconds.

[-checksum-for-replay-cache {enabled|disabled}] - Enable or disable Checksum for Replay-Cache (privilege: advanced)

This optional parameter specifies whether to enable replay cache checksum for NFS requests. The default value is enabled.
[-cached-cred-harvest-timeout <integer>] - Harvest timeout (in msecs) for a Cached Credential (privilege: advanced)
This optional parameter specifies the harvest timeout for cached credentials. The value specified must be between 60000 and 604800000. The default setting is 86400000.

[-idle-connection-timeout <integer>] - Idle Connection Timeout Value (in seconds)
This optional parameter specifies the idle connection timeout value for NFS connections in seconds. The value specified must be between 120 and 86400.

[-allow-idle-connection {enabled|disabled}] - Are Idle NFS Connections Supported
This optional parameter specifies whether to enable idle NFS connections. The default setting is disabled.

[-v3-hide-snapshot {enabled|disabled}] - Hide Snapshot Directory under NFSv3 Mount Point
This optional parameter specifies whether to hide the .snapshot directory while listing under NFSv3 mount points. However an explicit access to the .snapshot directory will still be allowed even though the option is enabled. The default setting is disabled.

[-showmount-rootonly {enabled|disabled}] - Provide Root Path as Showmount State
This optional parameter specifies whether to provide root path as showmount state when -showmount parameter is disabled. The default value for showmount-rootonly is disabled.

Examples
The following example enables and configures NFS access on a Vserver named vs0. NFS access is enabled. The maximum number of RPCSEC_GSS authentication contexts is set to 5. The RPCSEC_GSS idle time is set to 360 seconds. Access is enabled for NFS v3 clients over both UDP and TCP.

```
cluster1::> vserver nfs create -vserver vs0 -access true -rpcsec-ctx-high 5 -rpcsec-ctx-idle 360 -v3 enabled -udp enabled -tcp enabled
```

vserver export-policy rule create on page 1869

vserver nfs delete
Delete the NFS configuration of a Vserver

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver nfs delete command deletes the NFS configuration of a specified Vserver. This command does not delete the Vserver itself, just its ability to serve NFS clients.

Note: If you delete a Vserver, the Vserver's NFS configuration is automatically deleted. Any Windows-to-UNIX or UNIX-to-Windows name mappings defined for the Vserver are also deleted because they require both the CIFS and NFS servers.

Parameters
-vserver <vserver name> - Vserver
This specifies the Vserver whose NFS configuration you want to delete.

Examples
The following example deletes the NFS configuration of a Vserver named vs2:

```
cluster1::> vserver nfs delete -vserver vs2
```
vserver nfs modify

Modify the NFS configuration of a Vserver

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver nfs modify command modifies the configuration of an NFS-enabled Vserver.

Parameters
-vserver <vserver name> - Vserver
This specifies the Vserver whose NFS configuration you want to modify.

[-access {true|false}] - General NFS Access
This optional parameter specifies whether NFS access is enabled on the Vserver.

[-rpcsec-ctx-high <integer>] - RPC GSS Context Cache High Water Mark (privilege: advanced)
This optional parameter specifies the maximum number of RPCSEC_GSS authentication contexts, which are used by Kerberos. The default setting is zero at the time of creation. See RFC 2203 for information about RPCSEC_GSS contexts.

[-rpcsec-ctx-idle <integer>] - RPC GSS Context Idle (privilege: advanced)
This optional parameter specifies, in seconds, the amount of time a RPCSEC_GSS context is permitted to remain unused before it is deleted. The default setting is zero seconds at the time of creation. See RFC 2203 for information about RPCSEC_GSS contexts.

[-v3 {enabled|disabled}] - NFS v3
This optional parameter specifies whether to enable access for NFS v3 clients.

[-v4.0 {enabled|disabled}] - NFS v4.0
This optional parameter specifies whether to enable access for NFSv4.0 clients. The default setting is enabled at the time of creation.

[-udp {enabled|disabled}] - UDP Protocol
This optional parameter specifies whether to enable NFS access over UDP.

Note: Even if UDP is disabled, if TCP is enabled, the Vserver does not block NFSv3 traffic over UDP. By allowing this traffic, the storage system can process NFS_NULL ops that the Solaris automounter sends to determine if the storage system is alive. (Solaris sends these ops over UDP even if configured to use TCP.) To disallow access for certain clients, including over UDP, you can use export-policy rules. For more information, see the vserver export-policy rule create command.

[-tcp {enabled|disabled}] - TCP Protocol
This optional parameter specifies whether to enable NFS access over TCP.

[-default-win-user <text>] - Default Windows User
This optional parameter specifies a list of default Windows users for the NFS server.

[-enable-ejukebox {true|false}] - Enable NFSv3 EJUKEBOX error (privilege: advanced)
This optional parameter specifies whether EJUKEBOX errors are enabled for NFSv3. The default setting is true at the time of creation.

[-v3-require-read-attributes {true|false}] - Require All NFSv3 Reads to Return Read Attributes (privilege: advanced)
This optional parameter specifies whether NFSv3 read operations are required to return read attributes. The default setting is false at the time of creation.
[-v3-fsid-change {enabled|disabled}] - Show Change in FSID as NFSv3 Clients Traverse Filesystems
(privilege: advanced)

This optional parameter specifies whether Data ONTAP shows changes in file system identifiers (FSIDs) as
NFSv3 clients traverse file systems. If you change the value of this parameter, clients must remount any paths
over which they are using NFSv3.

[-v3-connection-drop {enabled|disabled}] - Enable the Dropping of a Connection When an NFSv3 Request
is Dropped (privilege: advanced)

This optional parameter specifies whether NFS v3 connection drop is enabled. The default setting is enabled
at the time of creation.

[-ntfs-unix-security-ops {fail|ignore|use-export-policy}] - Vserver NTFS Unix Security Options
(privilege: advanced)

This optional parameter specifies how NFSv3 security changes affect NTFS volumes. If you set this parameter
to ignore, Data ONTAP ignores NFSv3 security changes. If you set this parameter to fail, this overrides the
unix security options set in the relevant export rules. If you set this parameter to use_export_policy, Data
ONTAP processes NFSv3 security changes in accordance with the relevant export rules. The default setting is
use_export_policy at the time of creation.

[-chown-mode {restricted|unrestricted|use-export-policy}] - Vserver Change Ownership Mode
(privilege: advanced)

This optional parameter specifies whether file ownership can be changed only by the superuser, or if a non-
root user can also change file ownership. If you set this parameter to restricted, file ownership can be
changed only by the superuser, even though the on-disk permissions allow a non-root user to change file
ownership. If you set this parameter to unrestricted, file ownership can be changed by the superuser and
by the non-root user, depending upon the access granted by on-disk permissions. If you set this parameter to
use-export-policy, file ownership can be changed in accordance with the relevant export rules.

[-trace-enabled {true|false}] - NFS Response Trace Enabled (privilege: advanced)

This optional parameter specifies whether Data ONTAP logs NFS requests when they exceed the NFS
response trigger time (see the trigger parameter). The default setting is false at the time of creation.

[-trigger <integer>] - NFS Response Trigger (in secs) (privilege: advanced)

This optional parameter specifies the amount of time, in seconds, after which Data ONTAP must log an NFS
request if it has not completed (assuming the -trace-enabled option is set to true). The default setting is
60 at the time of creation.

[-udp-max-xfer-size <integer>] - UDP Maximum Transfer Size (bytes) (privilege: advanced)

This optional parameter specifies the maximum transfer size (in bytes) that the NFS mount protocol negotiates
with the client for UDP transport. The range is 8192 to 57344. The default setting is 32768 at the time of
creation.

[-tcp-max-xfer-size <integer>] - TCP Maximum Transfer Size (bytes) (privilege: advanced)

This optional parameter specifies the maximum transfer size (in bytes) that the storage system negotiates with
the client for TCP transport of data for NFSv3 and NFSv4.x protocols. The range is 8192 to 1048576. The
default setting is 65536 when created. Warning: Increasing/decreasing the value of this parameter could affect
the performance for existing connections.

[-v3-tcp-max-read-size <integer>] - NFSv3 TCP Maximum Read Size (bytes) (privilege: advanced)

This optional parameter specifies the maximum transfer size (in bytes) that the storage system negotiates with
the client for TCP transport of data for NFSv3 read requests. The range is 8192 to 1048576. The default
setting is 65536 when created.

Note: This parameter is deprecated and may be removed in a future release of Data ONTAP. Use the -tcp-
max-xfer-size parameter instead.
[-v3-tcp-max-write-size <integer>] - NFSv3 TCP Maximum Write Size (bytes) (privilege: advanced)

This optional parameter specifies the maximum transfer size (in bytes) that the storage system negotiates with the client for TCP transport of data for NFSv3 write requests. The range is 8192 to 65536. The default setting is 65536 when created.

**Note:** This parameter is deprecated and may be removed in a future release of Data ONTAP. Use the `-tcp-max-xfer-size` parameter instead.

[-v4.0-acl {enabled|disabled}] - NFSv4.0 ACL Support

This optional parameter specifies whether Data ONTAP supports NFSv4.0 access control lists (ACLs). The default setting is disabled when created.

[-v4.0-read-delegation {enabled|disabled}] - NFSv4.0 Read Delegation Support

This optional parameter specifies whether Data ONTAP supports NFSv4 read delegations. The default setting is disabled when created.

[-v4.0-write-delegation {enabled|disabled}] - NFSv4.0 Write Delegation Support

This optional parameter specifies whether Data ONTAP supports NFSv4 write delegations. The default setting is disabled when created.

[-v4-fsid-change {enabled|disabled}] - Show Change in FSID as NFSv4 Clients Traverse Filesystems

(privilege: advanced)

This optional parameter specifies whether Data ONTAP shows changes in file system identifiers (FSIDs) as NFSv4 clients traverse file systems. The default setting is enabled when created. If you change the value of this parameter, clients must remount any paths over which they are using NFSv4.

**Note:** If users access the storage system using NFSv4 from Solaris 10 clients, you must set this option to disabled.

[-v4.0-referrals {enabled|disabled}] - NFSv4.0 Referral Support (privilege: advanced)

This optional parameter specifies whether Data ONTAP supports NFSv4.0 referrals. The default setting is disabled when created. You can set this parameter to enabled only if the `-v4-fsid-change` option is also set to enabled. If clients accessing the node do not support NFSv4.0 referrals, set this option to disabled; otherwise, those clients will not be able to access the file system.

[-v4-id-domain <nfs domain>] - NFSv4 ID Mapping Domain

This optional parameter specifies the domain portion of the string form of user and group names as defined by the NFSv4 protocol. By default, the domain name is normally taken from the NIS domain or the DNS domain in use. However, the value of this parameter overrides the default. The domain name must be agreed upon by both the NFS client and the storage controller before NFSv4 operations can be executed. It is recommended that the domain be specified in the fully qualified domain name format.

[-v4-validate-symblinkdata {enabled|disabled}] - NFSv4 Validate UTF-8 Encoding of Symbolic Link Data

(privilege: advanced)

This optional parameter specifies whether Data ONTAP validates the UTF-8 encoding of symbolic link data. The default setting is disabled when created.

[-v4-lease-seconds <integer>] - NFSv4 Lease Timeout Value (in secs) (privilege: advanced)

This optional parameters specifies the time period in which Data ONTAP irrevocably grants a lock to a client. By default, the lease period is 30 seconds. The minimum value is 10. The maximum value is one less than the value of the `-v4-grace-seconds` parameter.

[-v4-grace-seconds <integer>] - NFSv4 Grace Timeout Value (in secs)

This optional parameter specifies the time period in which clients attempt to reclaim their locking state from Data ONTAP during server recovery. By default, the grace period is 45 seconds. The minimum value is 1 more than the value of the `-v4-lease-seconds` parameter. The maximum value is 90.
[-v4-acl-preserve {enabled|disabled}] - Preserves and Modifies NFSv4 ACL (and NTFS File Permissions in Unified Security Style)

This optional parameter specifies if the NFSv4 ACL is preserved or dropped when chmod is performed. In unified security style, this parameter also specifies if NTFS file permissions are preserved or dropped when chmod, chgrp, or chown are performed. The default is enabled.

[-v4.1 {enabled|disabled}] - NFSv4.1 Minor Version Support

This optional parameter specifies whether to enable access for NFSv4.1 clients. The default setting is enabled at the time of creation.

[-rquota {enabled|disabled}] - Rquota Enable

This optional parameter specifies whether to enable rquota over NFS. The default setting is disabled at the time of creation.

[-v4.1-implementation-domain <nfs domain>] - NFSv4.1 Implementation ID Domain (privilege: advanced)

This optional parameter specifies the NFSv4.1 implementation domain.

[-v4.1-implementation-name <text>] - NFSv4.1 Implementation ID Name (privilege: advanced)

This optional parameter specifies the NFSv4.1 implementation name.

[-v4.1-implementation-date <Date>] - NFSv4.1 Implementation ID Date (privilege: advanced)

This optional parameter specifies the NFSv4.1 implementation date.

[-v4.1-pnfs {enabled|disabled}] - NFSv4.1 Parallel NFS Support

This optional parameter specifies whether to enable access for pNFS for NFSv4.1. The default setting is enabled at the time of creation.

[-v4.1-referrals {enabled|disabled}] - NFSv4.1 Referral Support (privilege: advanced)

This optional parameter specifies whether Data ONTAP supports NFSv4.1 referrals. The default setting is disabled when created. You can set this parameter to enabled only if the -v4-fsid-change option is also set to enabled. If clients accessing the node do not support NFSv4.1 referrals, set this option to disabled; otherwise, those clients will not be able to access the file system.

[-v4.1-acl {enabled|disabled}] - NFSv4.1 ACL Support

This optional parameter specifies whether Data ONTAP supports NFSv4.1 access control lists (ACLs). The default setting is disabled when created.

[-vstorage {enabled|disabled}] - NFS vStorage Support

This optional parameter specifies whether to enable vstorage over NFS. The default setting is disabled at the time of creation.

[-v4-numeric-ids {enabled|disabled}] - NFSv4 Support for Numeric Owner IDs

This optional parameter specifies whether to enable the support for numeric string identifiers in NFSv4 owner attributes. The default setting is enabled at the time of creation.

[-default-win-group <text>] - Default Windows Group

This optional parameter specifies a list of default Windows groups for the NFS server.

[-v4.1-read-delegation {enabled|disabled}] - NFSv4.1 Read Delegation Support

This optional parameter specifies whether Data ONTAP supports NFSv4.1 read delegations. The default setting is disabled when created.

[-v4.1-write-delegation {enabled|disabled}] - NFSv4.1 Write Delegation Support

This optional parameter specifies whether Data ONTAP supports NFSv4.1 write delegations. The default setting is disabled when created.
[-v4.x-session-num-slots <integer>] - Number of Slots in the NFSv4.x Session slot tables (privilege: advanced)

This optional parameter specifies the number of entries in the NFSv4.x session slot table. By default, the number of slots is 180. The maximum value is 2000.

[-v4.x-session-slot-reply-cache-size <integer>] - Size of the Reply that will be Cached in Each NFSv4.x Session Slot (in bytes) (privilege: advanced)

This optional parameter specifies the number of bytes of the reply that will be cached in each NFSv4.x session slot. By default, the size of the cached reply is 640 bytes. The maximum value is 4096.

[-v4-acl-max-aces <integer>] - Maximum Number of ACEs per ACL (privilege: advanced)

This optional parameter specifies the maximum number of ACEs in a NFSv4 ACL. The range is 192 to 1024. The default value is 400. Setting it to a value more than the default could cause performance problems for clients accessing files with NFSv4 ACLs.

[-mount-rootonly {enabled|disabled}] - NFS Mount Root Only

This optional parameter specifies whether the Vserver allows MOUNT protocol calls only from privileged ports (port numbers less than 1024). The default setting is enabled.

[-nfs-rootonly {enabled|disabled}] - NFS Root Only

This optional parameter specifies whether the Vserver allows NFS protocol calls only from privileged ports (port numbers less than 1024). The default setting is disabled.

[-auth-sys-extended-groups {enabled|disabled}] - AUTH_SYS Extended Groups Enabled (privilege: advanced)

This optional parameter specifies whether Data ONTAP supports fetching auxiliary groups from a name service rather than from the RPC header. The default setting is disabled.

[-extended-groups-limit <integer>] - AUTH_SYS and RPCSEC_GSS Auxillary Groups Limit (privilege: advanced)

This optional parameter specifies the maximum number of auxiliary groups supported over RPC security flavors AUTH_SYS and RPCSEC_GSS in Data ONTAP. The range is 32 to 1024. The default value is 32.

[-validate-qtree-export {enabled|disabled}] - Validation of Qtree IDs for Qtree File Operations (privilege: advanced)

This optional parameter specifies whether clustered Data ONTAP performs an additional validation on qtree IDs. The default setting is enabled. This parameter is ignored unless a non-inherited policy has been or is assigned to a qtree.

[-mountd-port <integer>] - NFS Mount Daemon Port (privilege: advanced)

This optional parameter specifies which port the NFS mount daemon (mountd) uses. The port numbers allowed are 635 (the default) and 1024 through 9999.

[-nlm-port <integer>] - Network Lock Manager Port (privilege: advanced)

This optional parameter specifies which port the network lock manager (NLM) uses. The port numbers allowed are 1024 through 9999. The default setting is 4045.

[-nsm-port <integer>] - Network Status Monitor Port (privilege: advanced)

This optional parameter specifies which port the network status monitor (NSM) uses. The port numbers allowed are 1024 through 9999. The default setting is 4046.

[-rquotad-port <integer>] - NFS Quota Daemon Port (privilege: advanced)

This optional parameter specifies which port the NFS quota daemon (rquotad) uses. The port numbers allowed are 1024 through 9999. The default setting is 4049.

[-permitted-enc-types <NFS Kerberos Encryption Type>, ...] - Permitted Kerberos Encryption Types

This optional parameter specifies the permitted encryption types for Kerberos over NFS. The default setting is des.des3.aes-128.aes-256.
[ -showmount {enabled|disabled} ] - Showmount Enabled

This optional parameter specifies whether to allow or disallow clients to see the Vserver’s NFS exports list. The default setting is enabled.

**Note:** Showmount leverages the MOUNT protocol in NFSv3 to issue an EXPORT query to the NFS server. If the mount port is not listening or blocked by a firewall, or if NFSv3 is disabled on the NFS server, showmount queries fail.

[ -name-service-lookup-protocol {TCP|UDP} ] - Set the Protocol Used for Name Services Lookups for Exports

This optional parameter specifies the protocol to use for doing name service lookups. The allowed values are TCP and UDP. The default setting is UDP.

[ -map-unknown-uid-to-default-windows-user {enable|disable} ] - Map Unknown UID to Default Windows User (privilege: advanced)

If you enable this optional parameter, unknown UNIX users that do not have a name mapping to a Windows user are mapped to the configured default Windows user. This allows all unknown UNIX users access with the credentials of the default Windows user. If you disable it, all unknown UNIX users without name mapping are always denied access. By default, this parameter is enabled.

[ -netgroup-dns-domain-search {enabled|disabled} ] - DNS Domain Search Enabled During Netgroup Lookup (privilege: advanced)

If you enable this optional parameter, during client access check evaluation in a netgroup, Data ONTAP performs an additional verification to ensure that the domain returned from DNS for that client is listed in the DNS configuration of the Vserver. This enables you to validate the domain when clients have the same short name in multiple domains. The default setting is enabled.

[ -netgroup-trust-any-ns-switch-no-match {enabled|disabled} ] - Trust No-Match Result from Any Name Service Switch Source During Netgroup Lookup (privilege: advanced)

This optional parameter specifies if you can consider a no-match result from any of the netgroup ns-switch sources to be authoritative. If this option is enabled, then a no-match response from any of the netgroup ns-switch sources is deemed conclusive even if other sources could not be searched. The default setting is disabled, which causes all netgroup ns-switch sources to be consulted before a no-match result is deemed conclusive.

[ -ntacl-display-permissive-perms {enabled|disabled} ] - Display maximum NT ACL Permissions to NFS Client (privilege: advanced)

This optional parameter controls the permissions that are displayed to NFSv3 and NFSv4 clients on a file or directory that has an NT ACL set. When true, the displayed permissions are based on the maximum access granted by the NT ACL to any user. When false, the displayed permissions are based on the minimum access granted by the NT ACL to any user. The default setting is false.

[ -v3-ms-dos-client {enabled|disabled} ] - NFSv3 MS-DOS Client Support

This optional parameter specifies whether to enable access for NFSv3 MS-DOS clients. The default setting is disabled at the time of creation.

[ -ignore-nt-acl-for-root {enabled|disabled} ] - Ignore the NT ACL Check for NFS User 'root' (privilege: advanced)

This optional parameter specifies whether Windows ACLs affect root access from NFS. If this option is enabled, root access from NFS ignores the NT ACL set on the file or directory. If auditing is enabled for the Vserver and there is no name-mapping present, then a default SMB credential (Builtin\administrator) is used for auditing, and an EMS warning is generated. The default setting is ‘disabled’, which causes NFS ‘root’ to be mapped to a Windows account, like any other NFS user.

[ -cached-cred-positive-ttl <integer> ] - Time To Live Value (in msecs) of a Positive Cached Credential (privilege: advanced)

This optional parameter specifies the age of the positive cached credentials after which they will be cleared from the cache. The value specified must be between 60000 and 604800000. The default setting is 86400000.
[-cached-cred-negative-ttl <integer>] - Time To Live Value (in msecs) of a Negative Cached Credential (privilege: advanced)

This optional parameter specifies the age of the negative cached credentials after which they will be cleared from the cache. The value specified must be between 60000 and 604800000. The default setting is 7200000.

[-skip-root-owner-write-perm-check {enabled|disabled}] - Skip Permission Check for NFS Write Calls from Root/Owner (privilege: advanced)

This optional parameter specifies if permission checks are to be skipped for NFS WRITE calls from root/owner. For copying read-only files to a destination folder which has inheritable ACLs, this option must be enabled. Warning: When enabled, if an NFS client does not make use of an NFS ACCESS call to check for user-level permissions and then tries to write onto read-only files, the operation will succeed. The default setting is disabled.

[-v3-64bit-identifiers {enabled|disabled}] - Use 64 Bits for NFSv3 FSIDs and File IDs (privilege: advanced)

This optional parameter specifies whether Data ONTAP uses 64 bits (instead of 32 bits) for file system identifiers (FSIDs) and file identifiers (file IDs) that are returned to NFSv3 clients. If you change the value of this parameter, clients must remount any paths over which they are using NFSv3. When -v3-fsid-change is disabled, enable this parameter to avoid file ID collisions.

[-v4-inherited-acl-preserve {enabled|disabled}] - Ignore Client Specified Mode Bits and Preserve Inherited NFSv4 ACL When Creating New Files or Directories (privilege: advanced)

This optional parameter specifies whether the client-specified mode bits should be ignored and the inherited NFSv4 ACL should be preserved when creating new files or directories. The default setting is disabled.

[-v3-search-unconverted-filename {enabled|disabled}] - Fallback to Unconverted Filename Search (privilege: advanced)

This optional parameter specifies whether to continue search without converting the filename to the Unicode character set while doing lookup in a directory.

[-file-session-io-grouping-count <integer>] - I/O Count to Be Grouped as a Session (privilege: advanced)

This optional parameter specifies the number of read or write operations on a file from a single client that are grouped and considered as one session for event generation applications, such as FPolicy. The event is generated on the first read or write of a file, and subsequently the event is generated only after the specified -file-session-io-grouping-count. The default value is 5000.

[-file-session-io-grouping-duration <integer>] - Duration for I/O to Be Grouped as a Session (Secs) (privilege: advanced)

This optional parameter specifies the duration for which the read or write operationss on a file from a single client are grouped and considered as one session for event generation applications, such as FPolicy. The default value is 120 seconds.

[-checksum-for-replay-cache {enabled|disabled}] - Enable or disable Checksum for Replay-Cache (privilege: advanced)

This optional parameter specifies whether to enable replay cache checksum for NFS requests. The default value is enabled.

[-cached-cred-harvest-timeout <integer>] - Harvest timeout (in msecs) for a Cached Credential (privilege: advanced)

This optional parameter specifies the harvest timeout for cached credentials. The value specified must be between 60000 and 604800000. The default setting is 86400000.

[-idle-connection-timeout <integer>] - Idle Connection Timeout Value (in seconds)

This optional parameter specifies the idle connection timeout for NFS connections. The value specified must be between 120 and 86400.

[-allow-idle-connection {enabled|disabled}] - Are Idle NFS Connections Supported

This optional parameter specifies whether to enable idle NFS connections. The default setting is disabled.
[-v3-hide-snapshot {enabled|disabled}] - Hide Snapshot Directory under NFSv3 Mount Point
This optional parameter specifies whether to hide the .snapshot directory while listing under NFSv3 mount
points. However an explicit access to the .snapshot directory will still be allowed even though the option is
enabled. The default setting is disabled at the time of creation.

[-showmount-rootonly {enabled|disabled}] - Provide Root Path as Showmount State
This optional parameter specifies whether to provide root path as showmount state when -showmount
parameter is disabled. The default value for showmount-rootonly is disabled.

**Examples**
The following example enables NFS access on a Vserver named vs0 for NFS clients that use NFS v3 over TCP:
```
class1::> vserver nfs modify -vserver vs0 -access true -v3 enabled -udp disabled -tcp enabled
```

**Related references**
- `vserver export-policy rule create` on page 1869

**vserver nfs off**
Disable the NFS service of a Vserver

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver nfs off` command disables NFS access on a Vserver. The Vserver must already exist.

**Parameters**

- `-vserver <vserver name>` - Vserver
  This parameter specifies the Vserver on which you want to disable NFS access.

**Examples**
The following example disables NFS access on a Vserver named vs0.
```
class1::> vserver nfs off -vserver vs0
```

**vserver nfs on**
Enable the NFS service of a Vserver

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver nfs on` command enables NFS access on a Vserver. The Vserver must already exist.

**Parameters**

- `-vserver <vserver name>` - Vserver
  This parameter specifies the Vserver on which you want to enable NFS access.

**Examples**
The following example enables NFS access on a Vserver named vs0.
vserver nfs prepare-for-v3-ms-dos-client-downgrade

Disable NFSv3 MS-DOS Client Support

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**
The `vserver nfs prepare-for-v3-ms-dos-client-downgrade` command verifies that the NFSv3 MS-DOS client setting is disabled on all Vservers and disables the NFSv3 MS-DOS client support capability on the cluster when downgrading Data ONTAP to a version that does not support NFSv3 MS-DOS clients.

**Examples**
The following example disables NFSv3 MS-DOS client support on the Vservers.

```
cluster1::> vserver nfs prepare-for-v3-ms-dos-client-downgrade
```

vserver nfs prepare-to-downgrade

Remove NFS configurations that are not compatible with earlier versions of Data ONTAP

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**
The `vserver nfs prepare-to-downgrade` command removes NFS configurations incompatible with the earlier release of Data ONTAP.

**Parameters**
```
-disable-feature-set <downgrade version> - Data ONTAP Version
```

This parameter specifies the Data ONTAP version that introduced the new NFS configurations and needs to be removed before downgrade. The value can be one of the following:

- 9.2.0 - Remove the NFS configurations introduced in Data ONTAP release 9.2.0. The configurations include the following:
  - `-file-session-io-grouping-count`
  - `-file-session-io-grouping-duration`

**Examples**

```
cluster1::*> vserver nfs prepare-to-downgrade -disable-feature-set 9.2.0
```

vserver nfs show

Display the NFS configurations of Vservers

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.
Description
The `vserver nfs show` command displays information about NFS-enabled Vservers. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays the following information about all NFS-enabled Vservers:

- Vserver name
- Whether general NFS access is enabled
- Whether access to NFSv3 clients is enabled
- Whether access to NFSv4 clients is enabled
- Whether NFS access over UDP is enabled
- Whether NFS access over TCP is enabled
- List of default Windows users (detailed view only)

You can specify additional parameters to display only information that matches those parameters. For instance, to display information only about Vservers that enable access over TCP, enter the command with the `-tcp-enable true` parameter.

Parameters

```
[-fields <fieldname>, ...]
```

If you specify the `-fields` parameter, the command only displays the fields that you specify.

```
[-krb-opts] (privilege: advanced)
```

If you specify the parameter for `-instance`, the command shows detailed information about all NFS-enabled Vservers. Otherwise, if the `-krb-opts` parameter is specified, the command shows the following Kerberos-related information:

- Vserver name
- Maximum number of RPCSEC_GSS authentication contexts
- Time, in seconds, an RPCSEC_GSS context can remain idle before being deleted

Otherwise, if the `-fields` parameter is specified, the command shows information about all of the NFS-enabled Vservers that you specify as a comma-delimited list.

```
[-instance]
```

If you specify the `-instance` parameter, the command displays detailed information about all entries.

```
[-vserver <vserver name>] - Vserver
```

If you specify this parameter, the command displays information only about the specified NFS-enabled Vserver.

```
[-access {true|false}] - General NFS Access
```

If you specify this parameter, the command displays information only about the NFS-enabled Vservers that have the specified general-access setting.

```
[-rpcsec-ctx-high <integer>] - RPC GSS Context Cache High Water Mark (privilege: advanced)
```

If you specify this parameter, the command displays information only about NFS-enabled Vservers that have the specified maximum number of RPCSEC_GSS authentication contexts.

```
[-rpcsec-ctx-idle <integer>] - RPC GSS Context Idle (privilege: advanced)
```

If you specify this parameter, the command displays information only about the NFS-enabled Vservers that have the specified timeout value for idle RPCSEC_GSS contexts.
[-v3 {enabled|disabled}] - NFS v3
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the v3 option matches the specified input.

[-v4.0 {enabled|disabled}] - NFS v4.0
If you specify this parameter, the command displays information only about NFS-enabled Vservers for which the v4.0 option matches the specified input.

[-udp {enabled|disabled}] - UDP Protocol
If you specify this parameter, the command displays information only about the NFS-enabled Vservers that have the specified NFS-over-UDP access setting.

[-tcp {enabled|disabled}] - TCP Protocol
If you specify this parameter, the command displays information only about the NFS-enabled Vservers that have the specified NFS-over-TCP setting.

[-default-win-user <text>] - Default Windows User
If you specify this parameter, the command displays information only about the NFS-enabled Vservers that have the specified list of default Windows users.

[-enable=ejukebox {true|false}] - Enable NFSv3 EJUKEBOX error (privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the enable=ejukebox option matches the specified input.

[-v3-require-read-attributes {true|false}] - Require All NFSv3 Reads to Return Read Attributes (privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which NFSv3 read operations are required or not required to return read attributes.

[-v3-fsid-change {enabled|disabled}] - Show Change in FSID as NFSv3 Clients Traverse Filesystems (privilege: advanced)
If you specify this parameter, the command displays information about changes in file system identifiers (FSIDs) as NFSv3 clients traverse file systems.

[-v3-connection-drop {enabled|disabled}] - Enable the Dropping of a Connection When an NFSv3 Request is Dropped (privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the v3-connection-drop option matches the specified input.

[-ntfs-unix-security-ops {fail|ignore|use-export-policy}] - Vserver NTFS Unix Security Options (privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the NTFS-UNIX security setting matches the specified input.

[-chown-mode {restricted|unrestricted|use-export-policy}] - Vserver Change Ownership Mode (privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the chown-mode setting matches the specified input.

[-trace-enabled {true|false}] - NFS Response Trace Enabled (privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the trace-enabled option matches the specified input.

[-trigger <integer>] - NFS Response Trigger (in secs) (privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers with the specified NFS response trigger time.
[-udp-max-xfer-size <integer>] - UDP Maximum Transfer Size (bytes) (privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers with
the specified UDP maximum transfer size. The range is 8192 to 57344.

[-tcp-max-xfer-size <integer>] - TCP Maximum Transfer Size (bytes) (privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers with
the specified TCP maximum transfer size. The range is 8192 to 1048576.

[-v3-tcp-max-read-size <integer>] - NFSv3 TCP Maximum Read Size (bytes) (privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers with
the specified TCP maximum transfer size for NFSv3 read requests. The range is 8192 to 1048576.

**Note:** This parameter is deprecated and may be removed in a future release of Data ONTAP. Use the -tcp-
max-xfer-size parameter instead.

[-v3-tcp-max-write-size <integer>] - NFSv3 TCP Maximum Write Size (bytes) (privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers with
the specified TCP maximum transfer size for NFSv3 write requests. The range is 8192 to 65536.

**Note:** This parameter is deprecated and may be removed in a future release of Data ONTAP. Use the -tcp-
max-xfer-size parameter instead.

[-v4.0-acl {enabled|disabled}] - NFSv4.0 ACL Support
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for
which the v4.0-acl option matches the specified input.

[-v4.0-read-delegation {enabled|disabled}] - NFSv4.0 Read Delegation Support
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for
which the v4.0-read-delegation option matches the specified input.

[-v4.0-write-delegation {enabled|disabled}] - NFSv4.0 Write Delegation Support
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for
which the v4.0-write-delegation option matches the specified input.

[-v4-fsid-change {enabled|disabled}] - Show Change in FSID as NFSv4 Clients Traverse Filesystems
(privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for
which the showing of NFSv4 file system identifier (FSID) changes has been enabled or disabled.

[-v4.0-referrals {enabled|disabled}] - NFSv4.0 Referral Support (privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for
which the v4.0-referrals option matches the specified input.

[-v4-id-domain <nfs domain>] - NFSv4 ID Mapping Domain
If you specify this parameter, the command displays information only about the NFS-enabled Vservers having
the specified domain name.

[-v4-validate-symlinkdata {enabled|disabled}] - NFSv4 Validate UTF-8 Encoding of Symbolic Link Data
(privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for
which validation of UTF-8 encoding of symbolic link data has been enabled or disabled.

[-v4-lease-seconds <integer>] - NFSv4 Lease Timeout Value (in secs) (privilege: advanced)
If you specify this parameter, it displays the locking lease period. It is expressed in seconds. Clients that have
been inactive for a period equal or longer to the lease period may lose all their locking state on a node.

[-v4-grace-seconds <integer>] - NFSv4 Grace Timeout Value (in secs)
If you specify this parameter, it displays the grace period for clients to reclaim file locks after a server failure.
The grace period is expressed in seconds.
[-v4-acl-preserve {enabled|disabled}] - Preserves and Modifies NFSv4 ACL (and NTFS File Permissions in Unified Security Style)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the v4-acl-preserve option matches the specified input.

[-v4.1 {enabled|disabled}] - NFSv4.1 Minor Version Support
If you specify this parameter, the command displays information only about NFS-enabled Vservers for which the v4.1 option matches the specified input.

[-rquota {enabled|disabled}] - Rquota Enable
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the rquota option matches the specified input.

[-v4.1-implementation-domain <nfs domain>] - NFSv4.1 Implementation ID Domain (privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the v4.1-implementation-domain option matches the specified input.

[-v4.1-implementation-name <text>] - NFSv4.1 Implementation ID Name (privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the v4.1-implementation-name option matches the specified input.

[-v4.1-implementation-date <Date>] - NFSv4.1 Implementation ID Date (privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the v4.1-implementation-date option matches the specified input.

[-v4.1-pnfs {enabled|disabled}] - NFSv4.1 Parallel NFS Support
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the v4.1-pnfs option matches the specified input.

[-v4.1-referrals {enabled|disabled}] - NFSv4.1 Referral Support (privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the v4.1-referrals option matches the specified input.

[-v4.1-acl {enabled|disabled}] - NFSv4.1 ACL Support
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the v4.1-acl option matches the specified input.

[-vstorage {enabled|disabled}] - NFS vStorage Support
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the vstorage option matches the specified input.

[-v4-numeric-ids {enabled|disabled}] - NFSv4 Support for Numeric Owner IDs
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the v4-numeric-ids option matches the specified input.

[-default-win-group <text>] - Default Windows Group
If you specify this parameter, the command displays information only about the NFS-enabled Vservers that have the specified list of default Windows groups.

[-v4.1-read-delegation {enabled|disabled}] - NFSv4.1 Read Delegation Support
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the v4.1-read-delegation option matches the specified input.

[-v4.1-write-delegation {enabled|disabled}] - NFSv4.1 Write Delegation Support
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the v4.1-write-delegation option matches the specified input.
[-v4.x-session-num-slots <integer>] - Number of Slots in the NFSv4.x Session slot tables (privilege: advanced)

If you specify this parameter, this command displays information only about the NFS-enabled Vservers for which the `-v4.x-session-num-slots` option matches the specified input. The range is 1 to 2000.

[-v4.x-session-slot-reply-cache-size <integer>] - Size of the Reply that will be Cached in Each NFSv4.x Session Slot (in bytes) (privilege: advanced)

If you specify this parameter, this command displays information only about the NFS-enabled Vservers for which the `-v4.x-session-slot-reply-cache-size` option matches the specified input. The cache size is expressed in bytes. The range is 512 to 4096.

[-v4.acl-max-aces <integer>] - Maximum Number of ACEs per ACL (privilege: advanced)

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the `-v4.acl-max-aces` option matches the specified input.

[-mount-rootonly {enabled|disabled}] - NFS Mount Root Only

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the `-mount-rootonly` option matches the specified input.

[-nfs-rootonly {enabled|disabled}] - NFS Root Only

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the `-nfs-rootonly` option matches the specified input.

[-auth-sys-extended-groups {enabled|disabled}] - AUTH_SYS Extended Groups Enabled (privilege: advanced)

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the `-auth-sys-extended-groups` option matches the specified input.

[-extended-groups-limit <integer>] - AUTH_SYS and RPCSEC_GSS Auxiliary Groups Limit (privilege: advanced)

If you specify this parameter, the command displays information about the NFS-enabled Vservers for which the `-extended-groups-limit` option matches the specified input. The range is 32 to 1024.

[-validate-qtree-export {enabled|disabled}] - Validation of Qtree IDs for Qtree File Operations (privilege: advanced)

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the `-validate-qtree-export` option matches the specified input.

[-mountd-port <integer>] - NFS Mount Daemon Port (privilege: advanced)

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the `-mountd-port` option matches the specified input.

[-nlm-port <integer>] - Network Lock Manager Port (privilege: advanced)

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the `-nlm-port` option matches the specified input.

[-nsm-port <integer>] - Network Status Monitor Port (privilege: advanced)

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the `-nsm-port` option matches the specified input.

[-rquotad-port <integer>] - NFS Quota Daemon Port (privilege: advanced)

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the `-rquotad-port` option matches the specified input.

[-permitted-enc-types <NFS Kerberos Encryption Type>, ...] - Permitted Kerberos Encryption Types

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the `-permitted-enc-types` option matches any of the following: des, des3, aes-128, aes-256.
[-showmount {enabled|disabled}] - Showmount Enabled
If you specify this parameter, the command displays information only about the NFS-enabled Vserver's for which the showmount option matches the specified input.

[-name-service-lookup-protocol {TCP|UDP}] - Set the Protocol Used for Name Services Lookups for Exports
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which -name-service-lookup-protocol matches the parameter.

[-map-unknown-uid-to-default-windows-user {enable|disable}] - Map Unknown UID to Default Windows User (privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which -map-unknown-uid-to-default-windows-user is enabled or disabled.

[-netgroup-dns-domain-search {enabled|disabled}] - DNS Domain Search Enabled During Netgroup Lookup (privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which -netgroup-dns-domain-search is enabled or disabled.

[-netgroup-trust-any-ns-switch-no-match {enabled|disabled}] - Trust No-Match Result from Any Name Service Switch Source During Netgroup Lookup (privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which -netgroup-trust-any-ns-switch-no-match is enabled or disabled.

[-ntacl-display-permissive-perms {enabled|disabled}] - Display maximum NT ACL Permissions to NFS Client (privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which -ntacl-display-permissive-perms matches the parameter.

[-v3-ms-dos-client {enabled|disabled}] - NFSv3 MS-DOS Client Support
If you specify this parameter, the command displays information only about NFS-enabled Vservers for which NFSv3 MS-DOS client support is enabled or disabled.

[-ignore-nt-acl-for-root {enabled|disabled}] - Ignore the NT ACL Check for NFS User 'root' (privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which -ignore-nt-acl-for-root is enabled or disabled.

[-cached-cred-positive-ttl <integer>] - Time To Live Value (in msecs) of a Positive Cached Credential (privilege: advanced)
If you specify this parameter, the command displays information about the NFS-enabled Vservers time to live value of the positive cached credentials.

[-cached-cred-negative-ttl <integer>] - Time To Live Value (in msecs) of a Negative Cached Credential (privilege: advanced)
If you specify this parameter, the command displays information about the NFS-enabled Vservers time to live value of the negative cached credentials.

[-skip-root-owner-write-perm-check {enabled|disabled}] - Skip Permission Check for NFS Write Calls from Root/Owner (privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which -skip-root-owner-write-perm-check is enabled or disabled.

[-v3-64bit-identifiers {enabled|disabled}] - Use 64 Bits for NFSv3 FSIDs and File IDs (privilege: advanced)
If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which -v3-64bit-identifiers is enabled or disabled.
[-v4-inherited-acl-preserve {enabled|disabled}] - Ignore Client Specified Mode Bits and Preserve Inherited NFSv4 ACL When Creating New Files or Directories (privilege: advanced)

If you specify this parameter, the command displays information about the NFS-enabled Vservers for which -v4-inherited-acl-preserve matches the specified input.

[-v3-search-unconverted-filename {enabled|disabled}] - Fallback to Unconverted Filename Search (privilege: advanced)

If you specify this parameter, the command displays information about the NFS-enabled Vservers for which -v3-search-unconverted-filename matches the specified input.

[-file-session-io-grouping-count <integer>] - I/O Count to Be Grouped as a Session (privilege: advanced)

If you specify this parameter, the command displays information about the NFS-enabled SVMs for which the -file-session-io-grouping-count matches the specified input.

[-file-session-io-grouping-duration <integer>] - Duration for I/O to Be Grouped as a Session (Secs) (privilege: advanced)

If you specify this parameter, the command displays information about the NFS-enabled SVMs for which the -file-session-io-grouping-duration matches the specified input.

[-checksum-for-replay-cache {enabled|disabled}] - Enable or disable Checksum for Replay-Cache (privilege: advanced)

If you specify this parameter, the command displays information about the NFS-enabled SVMs for which the -checksum-for-replay-cache matches the specified input.

[-cached-cred-harvest-timeout <integer>] - Harvest timeout (in msecs) for a Cached Credential (privilege: advanced)

If you specify this parameter, the command displays information about the NFS-enabled Vservers harvest timeout for cached credentials.

[-idle-connection-timeout <integer>] - Idle Connection Timeout Value (in seconds)

If you specify this parameter, the command displays information about the NFS-enabled Vservers idle connections timeout

[-allow-idle-connection {enabled|disabled}] - Are Idle NFS Connections Supported

If you specify this parameter, the command displays information only about NFS-enabled Vservers for which the -allow-idle-connection option matches the specified input.

[-v3-hide-snapshot {enabled|disabled}] - Hide Snapshot Directory under NFSv3 Mount Point

If you specify this parameter, the command displays information about the NFS-enabled Vservers for which -v3-hide-snapshot matches the specified input.

[-showmount-rootonly {enabled|disabled}] - Provide Root Path as Showmount State

If you specify this parameter, the command displays information about the NFS-enabled Vservers for which -showmount-rootonly matches the specified input.

Examples

The following example displays information about all NFS-enabled Vservers:

```
cluster1::> vserver nfs show
General
Vserver      Access  v3       v4       v4.1     UDP      TCP      Windows User
------------ ------- -------- -------- -------- -------- -------- ------------
vs0          true    enabled  disabled disabled enabled  enabled  -
vs1          true    enabled  disabled disabled enabled  enabled  -
2 entries were displayed.
```

The following example displays Kerberos-related information about all NFS-enabled Vservers:
vserver nfs show

Vserver Context High Context Idle
-------------- ------------ ------------
vs0            30           30
vs1            30           30
2 entries were displayed.

vserver nfs start

Start the NFS service of a Vserver

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver nfs start command starts the NFS service on a Vserver to serve NFS clients. The Vserver must already exist.

Parameters
-vserver <vserver name> - Vserver

This parameter specifies the Vserver on which you want to start the NFS service.

Examples
The following example starts the NFS service on a Vserver named vs0.

cluster1::> vserver nfs start -vserver vs0

vserver nfs status

Display the status of the NFS service of a Vserver

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver nfs status command shows the status of NFS on a Vserver. The Vserver must already exist.

Parameters
-vserver <vserver name> - Vserver

This parameter specifies the Vserver for which you want to see the NFS status.

[-is-enabled {true|false}] - NFS Service Enabled

If you specify this optional parameter, the command displays whether NFS is enabled or not. This parameter is true if the NFS server is running.

Examples
The following example shows the status of NFS on a Vserver named vs0 for which NFS is enabled.

cluster1::> vserver nfs status -vserver vs0.
The NFS server is running.
**vserver nfs stop**

Stop the NFS service of a Vserver

*Availability:* This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `vserver nfs stop` command stops the NFS service on a Vserver to serve NFS clients. The Vserver must already exist.

**Parameters**
- `-vserver <vserver name>` - *Vserver*
  
  This parameter specifies the Vserver on which you want to stop the NFS service.

**Examples**
The following example stops the NFS service on a Vserver named vs0.

```
cluster1::> vserver nfs stop -vserver vs0
```

**vserver nfs credentials commands**

Manage NFS cached credentials

**vserver nfs credentials count**

Count credentials cached by NFS

*Availability:* This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**
The `vserver nfs credentials count` command displays the number of credentials stored in NFS credentials cache on a specific node. This command has no effect if the specified node has no active data.

**Parameters**
- `-node <nodename>` - *Node*
  
  The name of the node on which the command is executed.

**Examples**
Lists the number of credentials stored by NFS on node node1

```
cluster1::*> vserver nfs credentials count -node node1
Number of credentials cached by NFS on node "node1": "2"
```

**vserver nfs credentials flush**

Flush credentials cached by NFS

*Availability:* This command is available to *cluster* administrators at the *advanced* privilege level.
Description
The `vserver nfs credentials flush` command deletes credentials from the NFS credentials cache on a specific node for a given Vserver or a given UNIX user. This command has no effect if the vserver that is specified has no active data interfaces on the node where the command is run.

Parameters
- `-node <nodename>` - Node
  The name of the node on which the command is executed.
- `-vserver <vserver name>` - Vserver
  Use this parameter to clear the credential cache for the Vserver you specify.
- `{-unix-user-id <integer>}` - UNIX User ID
  Use this parameter to clear the credential cache for the UNIX user id you specify.
- `{-client-ip <IP Address>}` - Client IP Address
  Use this parameter to clear the credential cache for the client IP address you specify.
- `{-unix-user-name <text>}` - UNIX User Name
  Use this parameter to clear the credential cache for the UNIX user name you specify.
- `{-unix-group-id <integer>}` - UNIX Group ID
  Use this parameter to clear the credential cache for the UNIX group id you specify.
- `{-unix-group-name <text>}` - UNIX Group Name
  Use this parameter to clear the credential cache for the UNIX group name you specify.

Examples
Clear the credential cache for user user1 on node node1 in Vserver vs1.

```
cluster1::*> vserver nfs credentials flush -node node1 -vserver vs1 -unix-user-name user1
Number of matching credentials flushed: 1
```

vserver nfs credentials show
Show credentials cached by NFS

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The `vserver nfs credentials show` command displays the user account credentials stored on a specific node for a given UNIX user. This command has no effect if the vserver specified has no active data interfaces on the node where the command is run.

Parameters
`{[-fields <fieldname>, ...]}`
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

`{[-instance]}`
If you specify the `-instance` parameter, the command displays detailed information about all fields.
-node <nodename> - Node
  The name of the node on which the command is executed.

-vserver <vserver name> - Vserver
  Use this parameter to search for user credentials in the Vserver you specify.

  { -unix-user-id <integer> - UNIX User ID
    Use this parameter to search for user credentials for the UNIX user id you specify.

  [-client-ip <IP Address>] - Client IP Address
    Use this parameter to search for user credentials for the client ip you specify.

  | -unix-user-name <text> - UNIX User Name
    Use this parameter to search for user credentials for the UNIX user name you specify.

  | -unix-group-id <integer> - UNIX Group ID
    Use this parameter to search for user credentials for the UNIX group id you specify.

  | -unix-group-name <text>} - UNIX Group Name
    Use this parameter to search for user credentials for the UNIX group name you specify.

  [ -flags {ip-qualifier-configured|ip-qualifier-not-configured|unix-extended-creds-present|
    no-unix-extended-creds|unix-extended-creds-requested|unix-creds-transient-failure|cifs-
    creds-present|no-cifs-creds|cifs-creds-requested|cifs-cifs-transient-failure|place-holder|
    transient-failure|transient-error-on-last-refresh|id-name-mapping-present|no-id-name-
    mapping|id-name-mapping-requested|id-name-mapping-transient-failure},...] - Credential Entry Flags
    The credential entry flags.

  [-last-refresh-time <[<integer>h][<integer>m][<integer>s]>] - Time since Last Refresh
    Time since last refreshed.

  [-last-access-time <[<integer>h][<integer>m][<integer>s]>] - Time since Last Access
    Time since last access.

  [-hit-count <integer>] - Number of Hits
    Number of times the cached credential is fetched successfully.

  [-unix-cred-flags <integer>] - UNIX Credential Flags
    UNIX credentials flags.

  [-unix-cred-domain-id <integer>] - UNIX Credential Domain ID
    UNIX credentials domain ID.

  [-unix-cred-uid <integer>] - UNIX Credential UID
    User ID of the UNIX user.

  [-unix-cred-primary-gid <integer>] - UNIX Credential Primay GID
    Primary GID of the UNIX user.

  [-unix-cred-additional-gids <integer>,...] - UNIX Credential Additional GIDs
    Additional GIDs of the UNIX user.

  [-win-cred-flags <integer>] - Windows Credential Flags
    Windows credentials flags.

  [-win-cred-user-sid <text>] - Windows Credential User SID
    SID of the windows user.

  [-win-cred-primary-group-sid <text>] - Windows Credential Primary Group SID
    SID of the windows user's primary group.
[-win-cred-domain-sids <text>, ...] - Windows Credential Domain SIDs

Domain SIDs of the Windows user.

Examples
Show the credentials cached by NFS Cred Store for the UNIX user node1 on node node1.

gnk1cluster1::*> vserver nfs credentials show -node gnk1cluster1-01 -vserver coke -unix-user-name root

Credentials
-----------
Node: gnk1cluster1-01
Vserver: coke
Client IP: -
Flags: ip-qualifier-not-configured, unix-extended-creds-present, cifs-creds-present, id-name-mapping-present
Time since Last Refresh: 10s
Time since Last Access: 5s
Hit Count: 24

Unix Credentials:

vserver nfs kerberos commands
The kerberos directory

vserver nfs kerberos interface commands
Manage the Kerberos interface configuration for an NFS server

vserver nfs kerberos interface disable
Disable NFS Kerberos on a LIF

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver nfs kerberos interface disable command disables NFS Kerberos on a logical interface.

Parameters
-vserver <vserver name> - Vserver
This parameter specifies the Vserver in which the logical interface exists.
-lif <lif-name> - Logical Interface

This parameter specifies the name of the logical interface on which you want to disable NFS Kerberos.

[-admin-username <text>] - Account Creation Username

This optional parameter specifies the administrator user name.

[-admin-password <text>] - Account Creation Password

This optional parameter specifies the administrator password.

Examples

The following example disables NFS Kerberos on a Vserver named vs0 and a logical interface named datalif1.

```
vserver nfs kerberos interface disable -vserver vs0 -lif datalif1
```

### vsensor nfs kerberos interface enable

Enable NFS Kerberos on a LIF

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The `vserver nfs kerberos interface enable` command enables NFS Kerberos on a logical interface.

#### Parameters

- **-vserver <vserver name>** - Vserver

  This parameter specifies the Vserver in which the logical interface exists.

- **-lif <lif-name>** - Logical Interface

  This parameter specifies the name of the logical interface on which you want to enable NFS Kerberos.

- **-spn <text>** - Service Principal Name

  This optional parameter specifies the service principal name (SPN) for the logical interface you want to enable. This value must be in the form nfs/host_name@REALM, where host_name is the fully qualified host name of the Kerberos server, nfs is the service, and REALM is the name of the Kerberos realm (for instance, EXAMPLE.COM). Specify Kerberos realm name in uppercase.

- **-admin-username <text>** - Account Creation Username

  This optional parameter specifies the administrator user name.

- **-admin-password <text>** - Account Creation Password

  This optional parameter specifies the administrator password.

- **-keytab-uri {ftp|http}://(hostname|IPv4 Address|IPv6 Address)...** - Load Keytab from URI

  This optional parameter specifies loading a keytab file from the specified URI.

- **-ou <text>** - Organizational Unit

  This optional parameter specifies the organizational unit (OU) under which the Microsoft Active Directory server account will be created when you enable Kerberos using a realm for Microsoft KDC. If this parameter is not specified, the default OU is "CN=Computers".

- **-machine-account <text>** - Machine Account Name

  This optional parameter specifies the machine account to create in Active Directory
Examples
The following example enables NFS Kerberos on a Vserver named vs0 and a logical interface named datalif1. The SPN is nfs/sec.example.com@AUTH.SEC.EXAMPLE.COM and the keytab file is loaded from ftp://ftp.example.com/keytab.

```
vs1::> vserver nfs kerberos interface enable -vserver vs0 -lif datalif1 -spn nfs/sec.example.com@AUTH.SEC.EXAMPLE.COM -keytab-uri ftp://ftp.example.com/keytab
```
Examples
The following example enables an NFS Kerberos configuration on a Vserver named vs0 and a logical interface named datalif1. The SPN is nfs/sec.example.com@AUTH.SEC.EXAMPLE.COM and the keytab file is loaded from ftp://ftp.example.com/keytab.

```
vsl::> vserver nfs kerberos interface modify -vserver vs0 -lif datalif1
       -kerberos enabled -spn nfs/sec.example.com@AUTH.SEC.EXAMPLE.COM -keytab-uri
       ftp://ftp.example.com/keytab
```

vserver nfs kerberos interface show
Display the Kerberos configurations of NFS servers

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver nfs kerberos interface show command displays information about Kerberos configurations for NFS. The command output depends on the parameters specified with the command. If you do not specify any parameters, the command displays the following information about all Kerberos configurations for NFS:

- Vserver name
- Logical interface name
- Logical interface IP address
- Whether Kerberos is enabled or disabled
- The Kerberos service principal name (SPN)
- The permitted encryption types

You can specify additional parameters to display only information that matches those parameters. For instance, to display information only about Kerberos configurations for NFS that are enabled, run the command with the -kerberos enabled parameter.

Parameters

```
[~-fields <fieldname>, ...]
```
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

```
|~-instance ]
```
If you specify the -instance parameter, the command displays detailed information about all fields.

```
--vserver <vserver name> - Vserver
```
If you specify this parameter and the -lif parameter, the command displays information only about the Kerberos configuration or configurations for NFS that are associated with the specified Vserver and logical interface.

```
-lif <lif-name> - Logical Interface
```
If you specify this parameter and the -vserver parameter, the command displays information only about the Kerberos configuration or configurations for NFS that are associated with the specified logical interface and Vserver.

```
-address <IP Address> - IP Address
```
If you specify this parameter, the command displays information only about the Kerberos configurations for NFS that are associated with the specified logical-interface IP address.
[-kerberos {enabled|disabled}] - Kerberos Enabled
    If you specify this parameter, the command displays information only about the Kerberos configurations for
    NFS that match the specified value.

[-spn <text>] - Service Principal Name
    If you specify this parameter, the command displays information only about the Kerberos configuration or
    configurations for NFS that match the specified SPN.

[-permitted-enc-types <NFS Kerberos Encryption Type>, ...] - Permitted Encryption Types
    If you specify this parameter, the command displays information only about the Kerberos configuration for
    NFS that matches the specified encryption types.

[-machine-account <text>] - Machine Account Name
    If you specify this parameter, the command displays information only about the Kerberos configuration for
    NFS that matches the specified machine account.

Examples
The following example displays information about the Kerberos configuration for NFS associated with the Vserver vs0
and the logical interface datalif1:

```
vs1::> vserver nfs kerberos interface show -vserver vs0 -lif datalif1
Vserver: vs1
Logical Interface: datalif1
IP Address: 192.0.2.130
Kerberos Enabled: enabled
Service Principal Name: nfs/sec.example.com@AUTH.SEC.EXAMPLE.COM
Permitted Encryption Types: des,des3,aes-128,aes-256
```

vserver nfs kerberos realm commands
Manage NFS Kerberos realm configurations

vserver nfs kerberos realm create
Create a Kerberos realm configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver nfs kerberos realm create command creates a Kerberos realm configuration.

Parameters
-vserver <vserver name> - Vserver
    This parameter specifies the Vserver associated with the Kerberos realm configuration that you want to create.

-realm <text> - Kerberos Realm
    This parameter specifies the name of the Kerberos realm for the configuration.

-kdc-vendor <Kerberos Key Distribution Center (KDC) Vendor> - KDC Vendor
    This optional parameter specifies the KDC vendor. Specify Microsoft if you are using a Microsoft Active
    Directory server; specify Other if you are using a UNIX server.

-kdc-ip <IP Address> - KDC IP Address
    This optional parameter specifies the IP address of the Kerberos Distribution Center (KDC) server.

[-kdc-port <integer>] - KDC Port
    This optional parameter specifies the port number of the KDC server. The default setting is 88.
[-clock-skew <integer>] - Clock Skew
This optional parameter specifies how many seconds of clock skew between the clients and the server are permitted. The default setting is 300 seconds.

[-adserver-name <text>] - Active Directory Server Name
This optional parameter specifies the name of an Active Directory server for the configuration. Use this parameter only if you specified the value of -kdc-vendor parameter as Microsoft.

[-adserver-ip <IP Address>] - Active Directory Server IP Address
This optional parameter specifies the IP address of an Active Directory server for the configuration. Use this parameter only if you specified the value of the -kdc-vendor parameter as Microsoft.

[-comment <text>] - Comment
This optional parameter specifies a comment for the Kerberos realm configuration.

[-adminserver-ip <IP Address>] - Admin Server IP Address
This optional parameter specifies the IP address of the administrative server. Use this parameter only if you specified the value of the -kdc-vendor parameter as Other. The default setting for this parameter is the KDC server's IP address as specified by the -kdc-ip parameter.

[-adminserver-port <integer>] - Admin Server Port
This optional parameter specifies the port number of the administrative server. The default setting is 749. Use this parameter only if you specified the value of -kdc-vendor parameter as Other.

[-passwordserver-ip <IP Address>] - Password Server IP Address
This optional parameter specifies the IP address of the password server. Use this parameter only if you specified the value of the -kdc-vendor parameter as Other. The default setting for this parameter is the KDC server's IP address as specified by the -kdc-ip parameter.

[-passwordserver-port <integer>] - Password Server Port
This optional parameter specifies the port number of the password server. The default setting is 464. Use this parameter only if you specified the value of -kdc-vendor parameter as Other.

Examples
The following example creates a Kerberos realm named SEC.EXAMPLE.COM for the Vserver named AUTH. The permitted clock skew is 15 seconds. The KDC's IP address is 192.0.2.170 and its port is 88. The KDC vendor is Other (for a UNIX KDC). The administrative server's IP address is 192.0.2.170 and its port is 749. The password server's IP address is 192.0.2.170 and its port is 464.

cluster1::> vserver nfs kerberos realm create -vserver AUTH -realm SEC.EXAMPLE.COM -clock-skew 15 -kdc-ip 192.0.2.170 -kdc-port 88 -kdc-vendor Other -adminserver-ip 192.0.2.170 -adminserver-port 749 -passwordserver-ip 192.0.2.170 -passwordserver-port 464

vserver nfs kerberos realm delete
Delete a Kerberos realm configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver nfs kerberos realm delete command deletes a Kerberos realm configuration from the system.

Parameters
-vserver <vserver name> - Vserver
This parameter specifies the name of the Vserver for the Kerberos realm configuration that you want to delete.
-realm <text> - Kerberos Realm

This parameter specifies the name of the Kerberos realm for the configuration.

Examples

The following example deletes the Kerberos realm SEC.EXAMPLE.COM from the Vserver named AUTH:

```
cluster1::> vserver nfs kerberos realm delete -vserver AUTH -realm SEC.EXAMPLE.COM
```

vserver nfs kerberos realm modify

Modify a Kerberos realm configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver nfs kerberos realm modify command modifies one or more attributes of a Kerberos realm configuration.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver for the Kerberos realm configuration that you want to modify.

-realm <text> - Kerberos Realm

This optional parameter specifies the name of a Kerberos realm for the configuration.

[-kdc-vendor <Kerberos Key Distribution Center (KDC) Vendor>] - KDC Vendor

This optional parameter specifies the KDC vendor. Specify Microsoft if you are using a Microsoft Active Directory server; specify Other if you are using a UNIX server.

[-kdc-ip <IP Address>] - KDC IP Address

This optional parameter specifies the IP address of the Kerberos Distribution Center (KDC) server.

[-kdc-port <integer>] - KDC Port

This optional parameter specifies the port number of the KDC server. The default setting at the time of creation is 88.

[-clock-skew <integer>] - Clock Skew

This optional parameter specifies how many seconds of clock-skew between server and the clients are permitted. The default setting at the time of creation is 300 seconds.

[-adserver-name <text>] - Active Directory Server Name

This optional parameter specifies the name of an Active Directory server for the configuration. Use this parameter if you specified the value of -kdc-vendor parameter as Microsoft.

[-adserver-ip <IP Address>] - Active Directory Server IP Address

This optional parameter specifies the IP address of an Active Directory server for the configuration. Use this parameter if you specified the value of the -kdc-vendor parameter as Microsoft.

[-comment <text>] - Comment

This optional parameter specifies a comment for the Kerberos realm configuration.

[-adminserver-ip <IP Address>] - Admin Server IP Address

This optional parameter specifies the IP address of the administrative server. Use this parameter if you specified the value of -kdc-vendor parameter as Other.
[-adminserver-port <integer>] - Admin Server Port

This optional parameter specifies the port number of the administrative server. The default setting at the time of creation is 749. Use this parameter if you specified the value of the -kdc-vendor parameter as Other.

[-passwordserver-ip <IP Address>] - Password Server IP Address

This optional parameter specifies the IP address of the password server. Use this parameter if you specified the value of -kdc-vendor parameter as Other.

[-passwordserver-port <integer>] - Password Server Port

This optional parameter specifies the port number of the password server. The default setting at the time of creation is 464. Use this parameter only if you specified the value of -kdc-vendor parameter as Other.

Examples

The following example modifies the Kerberos realm SEC.EXAMPLE.COM for the Vserver named AUTH to use a Microsoft KDC server with the IP address 192.0.2.170 and an Active Directory server named AUTH.SEC.EXAMPLE.COM with the IP address 192.0.2.170:

```
classid1::> vserver nfs kerberos realm modify -vserver AUTH -realm SEC.EXAMPLE.COM -adserver-name AUTH.SEC.EXAMPLE.COM -adserver-ip 192.0.2.170 -kdc-ip 192.0.2.170 -kdc-vendor Microsoft
```

vserver nfs kerberos realm show

Display Kerberos realm configurations

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver nfs kerberos realm show command displays information about Kerberos realm configurations. The command output depends on the parameters specified with the command. If you do not specify any parameters, the command displays the following information about all Kerberos realm configurations:

- Vserver
- Kerberos realm name
- Active Directory server name
- Kerberos Distribution Center (KDC) vendor
- KDC IP address
- The permitted encryption types

Parameters

{ [-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use ‘-fields?’ to display the fields to specify.

[[-instance]]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver

If you specify this parameter, the command displays information only about the Kerberos realm configurations for the specified Vserver.
[-realm <text>] - Kerberos Realm
If you specify this parameter, the command displays information only about the Kerberos realm configurations that use the specified Kerberos realm.

[-kdc-vendor <Kerberos Key Distribution Center (KDC) Vendor>] - KDC Vendor
If you specify this parameter, the command displays information only about the Kerberos realm configurations that use the specified KDC vendor.

[-kdc-ip <IP Address>] - KDC IP Address
If you specify this parameter, the command displays information only about the Kerberos realm configurations that use the specified KDC IP address.

[-kdc-port <integer>] - KDC Port
If you specify this parameter, the command displays information only about the Kerberos realm configurations that use the specified KDC port number.

[-clock-skew <integer>] - Clock Skew
If you specify this parameter, the command displays information only about the Kerberos realm configurations that use the specified clock skew.

[-adserver-name <text>] - Active Directory Server Name
If you specify this parameter, the command displays information only about the Kerberos realm configurations that use the Active Directory server that has the specified name.

[-adserver-ip <IP Address>] - Active Directory Server IP Address
If you specify this parameter, the command displays information only about the Kerberos realm configurations that use the Active Directory server that has the specified IP address.

[-comment <text>] - Comment
If you specify this parameter, the command displays information only about the Kerberos realm configurations that match the specified comment text.

[-adminserver-ip <IP Address>] - Admin Server IP Address
If you specify this parameter, the command displays information only about the Kerberos realm configurations that use the specified administrative-server IP address.

[-adminserver-port <integer>] - Admin Server Port
If you specify this parameter, the command displays information only about the Kerberos realm configurations that use the specified administrative-server port number.

[-passwordserver-ip <IP Address>] - Password Server IP Address
If you specify this parameter, the command displays information only about the Kerberos realm configurations that use the specified password-server IP address.

[-passwordserver-port <integer>] - Password Server Port
If you specify this parameter, the command displays information only about the Kerberos realm configurations that use the specified password-server port number.

[-permitted-enc-types <NFS Kerberos Encryption Type>, ...] - Permitted Encryption Types
If you specify this parameter, the command displays information only about the Kerberos realm configuration that match the specified encryption types.

Examples
The following example displays information about all Kerberos realm configurations:

```
cluster1::> vserver nfs kerberos realm show
<table>
<thead>
<tr>
<th>Vserver</th>
<th>Realm</th>
<th>Active Directory</th>
<th>KDC</th>
<th>Vendor</th>
<th>KDC IP Address</th>
</tr>
</thead>
</table>
```

vserver nfs commands
vserver nfs pnfs commands

Manage pNFS Devices and its Mappings

pNFS Device Commands

The devices directory

The `vserver nfs pnfs devices` command enables users to manage pNFS devices and their properties, including their configuration and state of the cache in the Data ONTAP kernel. A pNFS Device is a logical representation of a volume and determines how a volume is exported to the pNFS clients. pNFS clients acquire layouts on pNFS devices, which enable them to access storage via optimal network paths. A pNFS device consists of information about the device itself and mappings that enable direct network access to the storage constituents for the device. The information related to pNFS devices is visible via commands `vserver nfs pnfs devices show` and `vserver nfs pnfs devices mappings show`. All the commands implemented under this directory are for troubleshooting purposes only and users are NOT expected to execute them without the supervision of the NetApp Support personnel.

- `vserver nfs pnfs devices mappings show` on page 2032

vserver nfs pnfs devices create

Create a new pNFS device and its mapping

Availability: This command is available to `cluster` and `Vserver` administrators at the `advanced` privilege level.

Description

The `vserver nfs pnfs devices create` command creates a pNFS device for a given instance of a volume. The actual creation of pNFS devices is automatically done by the pNFS implementation in Data ONTAP kernel. The usage of this command might interfere with the functionality of the pNFS server. Thus, it is advised that this command not be used without supervision by technical support.

Parameters

- `[-global-device-table-id <integer>]` - Global Device Mapping Table ID
  This optional parameter specifies the unique identifier that the pNFS devices subsystem assigns to the device that corresponds to the MSID described below. The pNFS devices implementations keeps track of the global unique identifier that needs to be assigned to this device. It is expected that users need not specifically input the device identifier while creation.

- `vserver <vserver name>` - Vserver Name
  This parameter specifies the Vserver to which the volumes belong.

- `msid <integer>` - Volume MSID
  This parameter uniquely identifies the volume for which you are creating a pNFS device.

- `striping-epoch <integer>` - Striping Epoch
  This optional parameter specifies the striping epoch identifier for a volume for which you are creating a pNFS device. For flexible volumes, the value is always 1.
-device-access <integer> - Device Access Flags

This optional parameter specifies the type of access that is given to the pNFS device that you are creating. If the value is 1, it means write access. If the value if 0, it means read access. By default, the device is created with write access.

-version <integer> - Device Version

This optional parameter specifies the version associated with the pNFS device identifier. By default, the version is set to 1.

[-generation-count <integer>] - Device Generation

This optional parameter specifies the generation count associated with the pNFS device identifier. If a device already exists, the existing device is invalidated and the generation number for the device is bumped. If a device does not already exist, a new device is created with generation number 1.

[-create-time <MM/DD/YYYY HH:MM:SS>] - Device Creation Time

This optional parameter specifies the time at which the device is created. If the parameter is not specified, the time at which the device is created is stored along with the device.

[-mapping-status {available|notavailable}] - Device Mapping Status

This optional parameter specifies if the mapping exists for a device. If the value is set to "available", the mappings will be created in the device mappings table. If the value is set to "notavailable", the mappings will not be created in the device mappings table.

Examples

vserver nfs pnfs devices delete

Delete a pNFS device

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description

The vserver nfs pnfs devices delete command deletes a unique pNFS device. The pNFS device to be deleted is identified by the unique device mapping identifier (mid) parameter passed to this operation. When this operation is successful, the device mappings corresponding to the device and the information corresponding to the device itself are removed. You can obtain the global mapping identifier from the list of devices using the command vserver nfs pnfs devices show.

Parameters

-global-device-table-id <integer> - Global Device Mapping Table ID

This parameter specifies the pNFS global device mapping identifier that uniquely identifies a pNFS device

Examples

The following example deletes the device information of a device with global mapping identifier value 2.

```
cluster1::> vserver nfs pnfs delete -mid 2
```

Related references

vserver nfs pnfs devices show on page 2030
vserver nfs pnfs devices mappings show on page 2032
vserver nfs pnfs devices show

Display pNFS device information

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The vserver nfs pnfs devices show command displays a pNFS device for a given instance of a volume. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all pNFS devices:

- Vserver name
- The global device mapping identifier of the device
- The master data set ID (MSID) of the volume that leads to this device
- The mapping status of the device
- The generation number of the device

You can specify additional parameters to display only information that matches those parameters. For instance, to display information only about devices that are exported as write-only devices, enter the command with the -access-flags 1 parameter.

Parameters
{ [-fields <fieldname>, ...]  
  If you specify the -fields parameter, the command only displays the fields that you specify.}
{ [-instance ]]  
  If you specify the -instance parameter, the command displays detailed information about all entries.
[-global-device-table-id <integer>] - Global Device Mapping Table ID
  If you specify this parameter, the command displays information only about the unique identifier that the pNFS devices subsystem assigns to the device that is being output.
[-vserver <vserver name>] - Vserver Name
  If you specify this parameter, the command displays information only about the Vserver that owns the volume represented by MSID.
[-msid <integer>] - Volume MSID
  If you specify this parameter, the command displays information only about the volume or volumes that match the specified MSID.
[-striping-epoch <integer>] - Striping Epoch
  If you specify this parameter, the command displays information only about the striping epoch identifier for a volume that serves as the basis for the pNFS device.
[-device-access <integer>] - Device Access Flags
  If you specify this parameter, the command displays information only about access flags which specify the type of access that is given to the pNFS device. If the value is 1, it means write access. If the value is 0, it means read access.
[-version <integer>] - Device Version
  If you specify this parameter, the command displays information only about pNFS devices that match the specified version number.
[-generation-count <integer>] - Device Generation
If you specify this parameter, the command displays information only about generation count associated with
the pNFS device identifier.

[-create-time <MM/DD/YYYY HH:MM:SS>] - Device Creation Time
If you specify this parameter, the command displays information only about pNFS devices that were created at
the specified time.

[-mapping-status {available|notavailable}] - Device Mapping Status
If you specify this parameter, the command displays information only about if the mapping exists for a device.
If the value is set to "available", the mappings can be seen in the device mappings table. If the value is set to
"notavailable", the mappings will not be seen in the device mappings table.

Examples
The following example displays the information of a device with global mapping identifier 6. The device corresponds to a
volume with MSID 2147484673 on Vserver vs1. The device mappings corresponding to this device follow in the
mappings table.

```
cluster1::*> vserver nfs pnfs devices show
<table>
<thead>
<tr>
<th>Vserver Name</th>
<th>Mapping ID</th>
<th>Msid</th>
<th>Mapping Status</th>
<th>Generation</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>
<td>1</td>
<td>2147484673</td>
<td>available</td>
<td>6</td>
</tr>
</tbody>
</table>
```

```
cluster1::*> vserver nfs pnfs devices mappings show
<table>
<thead>
<tr>
<th>Vserver Name</th>
<th>Mapping ID</th>
<th>Dsid</th>
<th>LIF IP</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>
<td>1</td>
<td>1025</td>
<td>10.53.4.14</td>
</tr>
</tbody>
</table>
```

pNFS Device Cache Command
Manage pNFS Device Cache in N-blade
The vserver nfs pnfs devices cache command enables users to manage the pNFS device mappings cache present in the
protocol stack of Data ONTAP kernel. The only supported action implemented is to flush the cache. This is to be mainly used
for testing purposes only and users are NOT expected to use this without the supervision of NetApp support personnel.

vserver nfs pnfs devices cache show
Display the device cache
Availabitily: This command is available to cluster administrators at the advanced privilege level.

Description
The vserver nfs pnfs devices cache show command displays the device cache.

Parameters
{-fields <fieldname>, ...}
If you specify the -fields parameter, the command only displays the fields that you specify.
{-instance}
If you specify the -instance parameter, the command displays detailed information about all entries.

vserver nfs commands 2031
```plaintext
[-node {<nodename>|local}] - Node
  If you specify this parameter, the command displays information only about the pNFS devices cache present on the node.

[-vserver <vserver name>] - Vserver Name
  If you specify this parameter, the command displays information only about the Vserver that has the pNFS devices cache.

Examples

pNFS Device Mappings Command

Manage Device Mappings

The vserver nfs pnfs devices mappings command enables you to manage the pNFS device mappings corresponding to every pNFS device. The only supported action implemented for this command is to display the device mappings.

vserver nfs pnfs devices mappings show

Display the list of pNFS device mappings

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description

The vserver nfs pnfs devices show command displays a pNFS device for a given instance of a volume. The command output depends on the parameter or parameters specified with the command. If you do not specify parameters, the command displays the following information about all pNFS devices:

- Vserver name
- The global device mapping identifier of the device
- The Data Set ID (DSID) of the constituent volume
- The LIF IP address that serves the constituent on the same controller.

You can specify additional parameters to display only information that matches those parameters. For instance, to display information only about devices that are exported as write-only devices, enter the command with the --access-flags 1 parameter.

Parameters

{ [-fields <fieldname>,...]
  If you specify the --fields parameter, the command only displays the fields that you specify.

  |[-instance ]
  If you specify the --instance parameter, the command displays detailed information about all entries.

[-global-device-table-id <integer>] - Global Device Mapping Table ID
  This specifies the unique identifier that the pNFS devices subsystem assigns to the device whose mappings are being output.

[-vserver <vserver name>] - Vserver Name
  If you specify this parameter, the command displays information only about the Vserver that the mapping identifier and DSID belong to.
```
[-dsid <integer>] - Constituent Volume DSID
If you specify this parameter, the command displays information only about the volume or volumes that match the specified DSID.

[-lifip <IP Address>] - LIF IP Address
If you specify this parameter, the command displays information only about the pNFS devices that match the specified LIF IP address.

Examples
The following example displays the device information of a device with global mapping identifier 6. The device corresponds to a volume with MSID 2147484673 on Vserver vs1. The device has one constituent with DSID 1025 and is served by the LIF with the IP address 10.53.4.14.

```
cluster1::*> vserver nfs pnfs devices* show
Vserver Name     Mapping ID      Msid            Mapping Status  Generation
---------------  --------------- --------------- --------------- -------------
vs1              1               2147484673      available       6
cluster1::*> vserver nfs pnfs devices mappings show
Vserver Name    Mapping ID      Dsid            Lif IP
--------------  --------------- --------------- --------------------
vs1             1               1025            10.53.4.14
```

vserver nvme commands
Manage the NVMe Service on a Vserver

Commands used for managing the NVMe service configuration of a Vserver.

vserver nvme create
Create NVMe service configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver nvme create command creates an NVMe service for a Vserver.

When you create the NVMe service on a Vserver, the Vserver must have only nvme in the allowed-protocols list.

When you create the NVMe service on a Vserver, the administrative status of the service is up by default.

Parameters
-vserver <Vserver Name> - Vserver Name
  Specifies the Vserver for the NVMe service.

[-status-admin {down|up}] - Administrative Status
  Specifies the configured administrative status of a service.
vserver nvme delete
Delete NVMe service configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver nvme delete command deletes an NVMe service of a Vserver. Before you can delete an NVMe service, the administrative status must be down. Use the vserver nvme modify command to change the administrative status.

Parameters
-vserver <Vserver Name> - Vserver Name
Specifies the Vserver for the NVMe service.

Examples
cluster1:*> vserver nvme delete -vserver vs_1

Related references
vserver nvme modify on page 2034

vserver nvme modify
Modify NVMe service configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver nvme modify command modifies an NVMe service configuration on a Vserver.

Parameters
-vserver <Vserver Name> - Vserver Name
Specifies the Vserver for the NVMe service.

[-status-admin {down|up}] - Administrative Status
Specifies the configured administrative status of a service. If you set this parameter to down, the Vserver will not serve NVMe traffic.

Examples
cluster1:*> vserver nvme modify -vserver vs_1 -status-admin down
vserver nvme show

Show NVMe service configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver nvme show command displays the current status of the NVMe service in a cluster.

Parameters
{ [-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

  [-instance ]
  If you specify the -instance parameter, the command displays detailed information about all fields.

  [-vserver <Vserver Name>] - Vserver Name
  Use this parameter to display the NVMe services that match the Vserver that you specify.

  [-status-admin {down|up}] - Administrative Status
  Use this parameter to display the NVMe services that match the administrative status that you specify.

Examples
clust1::*> vserver nvme show
Vserver  Status  Admin
---------- ------------
vs1        up
vs2        up
2 entries were displayed.

vserver nvme show-interface

Display the NVMe over Fabrics LIF configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver nvme show-interface command displays the currently available interfaces to the NVMe protocol.

Parameters
{ [-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

  [-instance ]
  If you specify the -instance parameter, the command displays detailed information about all fields.

  [-vserver <Vserver Name>] - Vserver Name
  Use this parameter to display the NVMe interfaces that match the Vserver that you specify.

  [-lif <lif-name>] - Logical Interface
  Use this parameter to display the NVMe interfaces that match the LIF that you specify.
[-vserver-uuid <UUID>] · Vserver UUID
Use this parameter to display the NVMe interfaces that match the Vserver UUID that you specify.

[-home-node <nodename>] · Home Node
Use this parameter to display the NVMe interfaces that match the home node that you specify.

[-home-port {<netport>|<ifgrp>}] · Home Port
Use this parameter to display the NVMe interfaces that match the home port that you specify.

[-status-admin {up|down}] · Status Admin
Use this parameter to display the NVMe interfaces that match the administrative status that you specify.

[-physical-protocol <fibre-channel>] · Physical Protocol
Use this parameter to display the NVMe interfaces that match the physical protocol that you specify.

[-transport-protocol {fc-nvme|rdma-nvme}, ...] · Transport Protocol
Use this parameter to display the NVMe interfaces that match the transport protocol that you specify.

[-transport-address <text>] · Transport Address
Use this parameter to display the NVMe interfaces that match the transport address that you specify.

[-comment <text>] · Comment
Use this parameter to display the NVMe interfaces that match the textual comment that you specify.

[-fc-wwnn <FC WWN>] · FC WWNN
Use this parameter to display the NVMe interfaces that match the FC WWNN that you specify.

[-fc-wwpn <FC WWN>] · FC WWPN
Use this parameter to display the NVMe interfaces that match the FC WWPN that you specify.

[-lif-id <integer>] · LIF ID
Use this parameter to display the NVMe interfaces that match the LIF ID that you specify.

[-lif-uuid <UUID>] · LIF UUID
Use this parameter to display the NVMe interfaces that match the LIF UUID that you specify.

Examples

cluster1::*> vserver nvme show-interface
Vserver Logical Interface    Home Node:Port     Transport Protocols
-- ------------- ------------------ -----------------------------
vs_1           node1:1a     fc-nvme
Transport Address: nn-0x2000005056b45113:pn-0x2001005056b45113

vserver nvme feature commands

The feature directory

vserver nvme feature show
Display NVMe target features

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
Displays the list of currently enabled NVMe over Fabrics features and limits.
vserver nvme namespace commands

Manage the NVMe Namespaces on a Vserver

vserver nvme namespace create

Create NVMe namespace

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver nvme namespace create command creates a new NVMe namespace of a specific size. You must create NVMe namespaces at the root of a volume or qtree.

When you create an NVMe namespace, it is non-space reserved.

Note: This command is not supported for FlexGroups or Vservers with Infinite Volumes.

Parameters

-vserver <Vserver Name> - Vserver Name
  Specifies the Vserver.

-path <path> - Namespace Path
  Specifies the path of the NVMe namespace. Examples of correct NVMe namespace paths are /vol/vol1/ns1 and /vol/vol1/qtree1/ns1.

-size {<integer>[KB|MB|GB|TB|PB]} - Size
  Specifies the size of the NVMe namespace in bytes. You can specify a multiplier suffix:
  • KB (1024 bytes)
  • MB (KB*KB bytes)
  • GB (KB*MB bytes)
  • TB (MB*MB bytes)

-ostype {vmware|hyper_v|windows|linux|xen} - OS Type
  Specifies the operating system type of the NVMe namespace. The OS types are:
  • hyper_v - the NVMe namespace stores Windows Hyper-V file system data.
  • linux - the NVMe namespace stores Linux file system data.
  • vmware - the NVMe namespace stores VMware file system data.
  • windows - the NVMe namespace stores Windows file system data.
  • xen - the NVMe namespace stores Xen file system data.
[-comment <text>] - Comment
  Contains a textual description of the NVMe namespace.

[-block-size {512|4KB}] - Block Size
  Specifies the block size of the NVMe namespace in bytes. Valid block sizes are
  • 512 (in Data ONTAP 9.6 and later)
  • 4096

Examples

```
cluster1::*> vserver nvme namespace create -vserver vs_1 -path /vol/nsvol/namespace1 -size 100g -ostype linux
```

vserver nvme namespace delete

Delete the namespace

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver nvme namespace delete command deletes an NVMe namespace from a specified Vserver and volume.

Parameters

- -vserver <Vserver Name> - Vserver Name
  Specifies the Vserver.

- -path <path> - Namespace Path
  Specifies the path of the NVMe namespace. Examples of correct NVMe namespace paths are /vol/vol1/ns1 and /vol/vol1/qtrees1/ns1.

- -skip-mapped-check [true] - Skip Mapped Check
  This option is required to delete an NVMe namespace that is attached to a subsystem.

Examples

```
cluster1::*> vserver nvme namespace delete -vserver vs1 -path /vol/nsvol/ns1
```

vserver nvme namespace modify

Modify NVMe namespace

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver nvme namespace modify command modifies NVMe namespace attributes.

Parameters

- -vserver <Vserver Name> - Vserver Name
  Specifies the Vserver.
- **-path `<path>` - Namespace Path**
  Specifies the path of the NVMe namespace. Examples of correct NVMe namespace paths are `/vol/vol1/ns1` and `/vol/vol1/qtree1/ns1`.

  **[-comment `<text>`] - Comment**
  Contains a textual description of the NVMe namespace.

**Examples**

```
cluster1:/> vserver nvme namespace modify -path /vol/nsvol/ns1 -vserver vs_1 -comment "Comment text."
```

### vserver nvme namespace show

Display NVMe namespaces

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The **vserver nvme namespace show** command displays information for NVMe namespaces.

**Parameters**

```
[-fields `<fieldname>`, ...]
  If you specify the `-fields `<fieldname>`, ...` parameter, the command output also includes the specified field or fields. You can use `-fields '?'` to display the fields to specify.

[-instance ]
  If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver `<Vserver Name>`] - Vserver Name
  Use this parameter to display the NVMe namespaces that match the Vserver that you specify.

[-path `<path>`] - Namespace Path
  Use this parameter to display the NVMe namespace that matches the path that you specify.

[-size `<integer>[KB|MB|GB|TB|PB]`] - Size
  Use this parameter to display the NVMe namespaces that match the size that you specify.

[-size-used `<integer>[KB|MB|GB|TB|PB]`] - Size Used
  Use this parameter to display the NVMe namespaces that match this parameter value.

[-ostype {vmware|hyper_v|windows|linux|xen}] - OS Type
  Use this parameter to display the NVMe namespaces that match this parameter value.

[-comment `<text>`] - Comment
  Use this parameter to display the NVMe namespaces that match this parameter value.

[-block-size {512|4KB}] - Block Size
  Use this parameter to display the NVMe namespaces that match this parameter value.

[-state {online|offline|nvfail|space-error}] - State
  Use this parameter to display the NVMe namespaces that match this parameter value.

[-is-read-only {true|false}] - Is Read Only
  Use this parameter to display the NVMe namespaces that match this parameter value.
[-creation-timestamp <MM/DD/YYYY HH:MM:SS>] - Creation Time
   Use this parameter to display the NVMe namespaces that match this parameter value.

[-uuid <UUID>] - Namespace UUID
   Use this parameter to display the NVMe namespaces that match this parameter value.

[-restore-inaccessible {true|false}] - Restore Inaccessible
   Use this parameter to display the NVMe namespaces that match this parameter value.

[-node <nodename>] - Node Hosting the Namespace
   Use this parameter to display the NVMe namespaces that match this parameter value.

[-volume <volume name>] - Volume Name
   Use this parameter to display the NVMe namespaces that match this parameter value.

[-qtree <qtree name>] - Qtree Name
   Use this parameter to display the NVMe namespaces that match this parameter value.

[-subsystem <text>] - Mapped Subsystem
   Use this parameter to display the NVMe namespaces that are attached to a Subsystem that matches this parameter value.

[-nsid <Hex 32bit Integer>] - Namespace ID
   Use this parameter to display the NVMe namespaces that match this parameter value.

[-anagrpid <Hex 32bit Integer>] - ANA Group ID (privilege: advanced)
   Use this parameter to display the NVMe namespaces that match Asymmetric Namespace Access (ANA) group identifier that you specify.

[-vserver-id <integer>] - Vserver ID
   Use this parameter to display the NVMe namespaces that match this parameter value.

[-container-state {online|aggregate-offline|volume-offline|error}] - Namespace Container State (privilege: advanced)
   Selects the namespaces that match this parameter value. The container states are:
   • online- The namespace's aggregate and volume are online.
   • aggregate-offline- The namespace's aggregate is offline.
   • volume-offline- The namespace's volume is offline.
   • error- An error occurred accessing the namespace's volume.

[-include-offline-containers {true}] - Include Namespaces on Offline Volumes and Aggregates (privilege: advanced)
   If true, include available information for namespaces in offline aggregates and offline volumes in the output. By default, namespaces in offline aggregates and offline volumes are excluded from the output.

### Examples

```
cluster::*> vserver nvme namespace show -vserver vs1

<table>
<thead>
<tr>

Commands: Manual Page Reference
vserver nvme subsystem commands

Manage the NVMe target subsystems on a Vserver

vserver nvme subsystem create

Create an NVMe target subsystem

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver nvme subsystem create` command creates a new NVMe target subsystem.

When you create an NVMe subsystem on a Vserver, the Vserver must meet the following pre-conditions:

- The Vserver must have an NVMe service created.
- The Vserver must not already have an NVMe subsystem by the same name.

**Note:** The NVMe subsystem identifiers are assigned by the system. The NQN is derived from the Vserver UUID and subsystem name and may not be specified or modified by the user.

**Parameters**

- `vserver <Vserver Name>` - Vserver Name
  Specifies the Vserver.

- `subsystem <text>` - Subsystem
  Specifies the NVMe target subsystem.

- `ostype {windows|linux|vmware|xen|hyper_v}` - OS Type
  Specifies the operating system type of the NVMe subsystem. The OS types are:
  - hyper_v - the initiators belong to a Hyper-V parent host.
  - linux - the initiators belong to a Linux host.
  - vmware - the initiators belong to a VMware ESX host.
  - windows - the initiators belong to a Windows host.
  - xen - the initiators belong to a Xen hypervisor host.

- `[-comment <text>]` - Comment
  Contains a textual description of the NVMe subsystem.

**Examples**

```
cluster1:*> vserver nvme subsystem create -vserver vs_1 -subsystem sub_1 -ostype linux
```

vserver nvme subsystem delete

Delete the subsystem

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver nvme subsystem delete` command deletes an NVMe subsystem from a specified Vserver.
Parameters

-vserver <Vserver Name> - Vserver Name
  Specifies the Vserver.

-subsystem <text> - Subsystem
  Specifies the NVMe target subsystem.

[-skip-mapped-check [true]] - Skip Mapped Namespace Check
  Required to delete an NVMe subsystem with attached NVMe namespaces.

[-skip-host-check [true]] - Skip Host Check
  Required to delete an NVMe subsystem with associated hosts.

Examples

  cluster1::*> vserver nvme subsystem delete -vserver vs_1 -subsystem sub_1

vserver nvme subsystem modify

Modify an NVMe target subsystem

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver nvme subsystem modify command modifies an existing NVMe target subsystem.

Parameters

-vserver <Vserver Name> - Vserver Name
  Specifies the Vserver.

-subsystem <text> - Subsystem
  Specifies the NVMe target subsystem.

[-comment <text>] - Comment
  Contains a textual description of the NVMe subsystem.

Examples

  cluster1::*> vserver nvme subsystem modify -vserver vs_1 -subsystem sub_1 -comment "Example Comment"

vserver nvme subsystem show

Display NVMe target subsystems

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver nvme subsystem show command displays information for NVMe subsystems.
Parameters
{[-fields <fieldname>, ...]
   If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified
   field or fields. You can use -fields ? to display the fields to specify.

[-instance ]
   If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver Name
   Use this parameter to display the NVMe subsystems that match the Vserver that you specify.

[-subsystem <text>] - Subsystem
   Use this parameter to display the NVMe subsystem that matches the name that you specify.

[-ostype {windows|linux|vmware|xen|hyper_v}] - OS Type
   Use this parameter to display the NVMe subsystems that match this parameter value.

[-comment <text>] - Comment
   Use this parameter to display the NVMe subsystems that match this parameter value.

[-target-nqn <text>] - Target NQN
   Use this parameter to display the NVMe subsystems that match this parameter value.

[-serial-number <text>] - Serial Number
   Use this parameter to display the NVMe subsystems that match this parameter value.

[-default-io-queue-count <integer>] - Default Number of Host I/O Queue Pairs
   Specifies the default maximum IO queue count inherited by hosts added to this subsystem.

[-default-io-queue-depth <integer>] - Default Host I/O Queue Depth
   Specifies the default maximum IO queue depth inherited by hosts added to this subsystem.

Examples
cluster1:/> vserver nvme subsystem show -vserver vs_1
Vserver Subsystem    Target NQN
---------------------- --------------------------------------------------------
vs_1
   ss1    nqn.1992-08.netapp.com:sn.ccb5a7d5d9311e7924e0056b45113:subsystem.ss1
   ss2    nqn.1992-08.netapp.com:sn.ccb5a7d5d9311e7924e0056b45113:subsystem.ss2
2 entries were displayed.

vserver nvme subsystem controller commands
The controller directory

vserver nvme subsystem controller show
Display active NVMe controllers

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver nvme subsystem controller show command displays information for established NVMe controllers. An
NVMe controller is established upon each host connection to a subsystem.
Parameters

{[-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use ‘-fields ?’ to display the fields to specify.

[-instance ]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver Name

Use this parameter to display the NVMe controllers that match the Vserver that you specify.

[-subsystem <text>] - Subsystem

Use this parameter to display the NVMe controllers that match the subsystem that you specify.

[-controller-id <Hex 16bit Integer>] - Controller ID

Use this parameter to display the NVMe controllers that match the controller ID that you specify. The controller ID is the identifier assigned by the NVMe subsystem upon host login and controller creation.

[-lif <text>] - Logical Interface

Use this parameter to display the NVMe controllers that match the LIF that you specify.

[-node <nodename>] - Node

Use this parameter to display the NVMe controllers that match the cluster node that you specify.

[-host-nqn <text>] - Host NQN

Use this parameter to display the NVMe controllers that match the host NQN that you specify. The host NQN is the NVMe identifier assigned to a specific host.

[-transport-protocol {fc-nvme|rdma-nvme}] - Transport Protocol

Use this parameter to display the NVMe controllers that match the transport protocol that you specify.

[-initiator-transport-address <text>] - Initiator Transport Address

Use this parameter to display the NVMe controllers that match the initiator transport address that you specify. The initiator transport address format depends on the transport protocol in use.

[-host-id <Hex String>] - Host Identifier

Use this parameter to display the NVMe controllers that match the host identifier that you specify. The host identifier is a 128-bit identifier assigned to a specific host.

[-io-queue-count <integer>] - Number of I/O Queues

Use this parameter to display the NVMe controllers that match the I/O queue count that you specify.

[-io-queue-depth <integer>, ...] - I/O Queue Depths

Use this parameter to display the NVMe controllers that match the I/O queue depth that you specify.

[-admin-queue-depth <integer>] - Admin Queue Depth

Use this parameter to display the NVMe controllers that match the administrative queue depth that you specify.

Examples

<table>
<thead>
<tr>

2044 Commands: Manual Page Reference
vserver nvme subsystem host commands

The host directory

vserver nvme subsystem host add

Add a host to a subsystem

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver nvme subsystem host add command adds an FC-NVMe host to an NVMe subsystem on a Vserver.

Parameters
-vserver <Vserver Name> - Vserver Name
  Specifies the Vserver.
-subsystem <text> - Subsystem
  Specifies the NVMe target subsystem.
-host-nqn <text> - Host NQN
  Specifies the NVMe subsystem host NQN.

Examples
cluster::*> vserver nvme subsystem host add -vserver vs_1 -subsystem sub_1 -host-nqn nqn.2001-01.com.example:nvme-host1

vserver nvme subsystem host remove

Remove a host from a subsystem

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver nvme subsystem host remove command removes an FC-NVMe host from an NVMe subsystem on a Vserver.

Parameters
-vserver <Vserver Name> - Vserver Name
  Specifies the Vserver.
-subsystem <text> - Subsystem
  Specifies the NVMe target subsystem.
-host-nqn <text> - Host NQN
  Specifies the NVMe subsystem host NQN.
**Examples**

```
cluster::*> vserver nvme subsystem host remove -vserver vs_1 -subsystem sub_1 -host-nqn nqn.2001-01.com.example:host1
```

---

**vserver nvme subsystem host show**

Display NVMe hosts configured to the subsystem

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver nvme subsystem host show` command displays information for the NVMe subsystem hosts.

**Parameters**

```
[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified
field or fields. You can use -fields ? to display the fields to specify.

[-instance ]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver Name
Use this parameter to display the NVMe subsystem hosts that match the Vserver that you specify.

[-subsystem <text>] - Subsystem
Use this parameter to display the NVMe subsystem hosts that match the subsystem that you specify.

[-host-nqn <text>] - Host NQN
Use this parameter to display the NVMe subsystem host that matches the subsystem host NQN that you
specify.

[-io-queue-count <integer>] - Number of I/O Queue Pairs
Use this parameter to display the NVMe subsystem hosts that match the maximum IO queue count that you
specify.

[-io-queue-depth <integer>] - I/O Queue Depth
Use this parameter to display the NVMe subsystem hosts that match the maxium IO queue depth that you
specify.
```

---

**Examples**

```
cluster::*> vserver nvme subsystem host show -vserver vs_1 -subsystem sub_1
Vserver Subsystem Host NQN
---------------------------
vs_1 sub_1 nqn.2001-08.com.example:nvme:host1
nqn.2001-08.com.example:nvme:host2
nqn.2001-08.com.example:nvme:host3
3 entries were displayed.
```

---

**vserver nvme subsystem map commands**

The map directory
vserver nvme subsystem map add

Add a namespace map

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `vserver nvme subsystem map add` command creates an association on an NVMe namespace to an NVMe subsystem. When you add an NVMe subsystem map, the following pre-conditions must hold:

- The NVMe namespace must not be already mapped to a different subsystem.
- There must be an FC-NVMe LIF on the NVMe namespace owning node.

**Parameters**

- `-vserver <Vserver Name>` - Vserver Name
  Specifies the Vserver.

- `-subsystem <text>` - Subsystem
  Specifies the NVMe target subsystem.

- `-path <path>` - Namespace Path
  Specifies the path of the NVMe namespace. Examples of correct NVMe namespace paths are `/vol/vol1/ns1` and `/vol/vol1/qtree1/ns1`.

**Examples**

```
cluster::*> vserver nvme subsystem map add -vserver vs_1 -subsystem sub_1 -path /vol/nsvol/namespace1
```

vserver nvme subsystem map remove

Remove a namespace map

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `vserver nvme subsystem map remove` command deletes an association on an NVMe namespace to an NVMe subsystem.

**Parameters**

- `-vserver <Vserver Name>` - Vserver Name
  Specifies the Vserver.

- `-subsystem <text>` - Subsystem
  Specifies the NVMe target subsystem.

- `-path <path>` - Namespace Path
  Specifies the path of the NVMe namespace. Examples of correct NVMe namespace paths are `/vol/vol1/ns1` and `/vol/vol1/qtree1/ns1`. 
vserver nvme subsystem map show

Display namespace maps within the subsystem

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `vserver nvme subsystem map show` command displays information about NVMe subsystem maps.

**Parameters**

[-fields <fieldname>, ...]
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

[--instance]]
If you specify the `--instance` parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver Name
Use this parameter to display the NVMe subsystem maps that match the Vserver that you specify.

[-subsystem <text>] - Subsystem
Use this parameter to display the NVMe subsystem maps that match the subsystem that you specify.

[-nsid <Hex 32bit Integer>] - NSID
Use this parameter to display the NVMe subsystem maps that match the NVMe namespace NSID that you specify.

[-path <path>] - Namespace Path
Use this parameter to display the NVMe subsystem maps that match the NVMe namespace path that you specify.

[-anagrpid <Hex 32bit Integer>] - ANA Group ID (privilege: advanced)
Use this parameter to display the NVMe namesapces that match the Asymmetric Namespace Access (ANA) group identifier that you specify.

[-namespace-uuid <UUID>] - Namespace UUID
Use this parameter to display the NVMe subsystem maps that match the NVMe namespace UUID that you specify.

**Examples**

cluster-1::*> vserver nvme subsystem map show -vserver vs_1
Vserver Subsystem NSID Namespace Path
---------- --------- ----------- ------------------------------------------
vs_1 sub_1 00000001h /vol/nsvol1/ns1
2 entries were displayed.
vserver peer commands
Create and manage Vserver peer relationships

The vserver peer commands enable you to create and manage Vserver peering relationships.

vserver peer accept
Accept a pending Vserver peer relationship

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
The vserver peer accept command is used to accept the Vserver peer relationship between two Vservers. This command is used only for intercluster Vserver peer relationships.

**Parameters**
- **-vserver <vserver>** - Vserver Name
  Specifies name of the local Vserver for which you want to accept the Vserver peer relationship.

- **-peer-vserver <vserver>** - Peer Vserver Name
  Specifies name of the peer Vserver with which the Vserver peer relationship was initiated.

- **[-local-name <vserver>]** - Peer Vserver Local Name
  Specifies the unique local name to identify the peer Vserver with which the Vserver peer relationship was initiated. The default value is the remote peer Vserver name.

**Examples**
The following example illustrates how to accept the Vserver peer relationship between Vservers `pvs1.example.com` residing on `cluster2`, and `lvs1.example.com` residing on `cluster1`.

```bash
cluster2::> vserver peer accept -vserver pvs1.example.com -peer-vserver lvs1.example.com
```

The following example illustrates how to accept the Vserver peer relationship between Vservers `pvs1.example.com` residing on `cluster2`, and `pvs1.example.com` residing on `cluster1`. During execution of vserver peer create command on peer cluster, peer Vserver name is locally refered by unique system generated name `pvs1.example.com.1`. Using vserver peer accept command specify the unique `-local-name` for peer Vserver.

```bash
cluster2::> vserver peer accept -vserver pvs1.example.com -peer-vserver pvs1.example.com.1 -local-name locallyUniqueName
```

vserver peer create
Create a new Vserver peer relationship

**Availability:** This command is available to cluster administrators at the admin privilege level.
Description
The `vserver peer create` command creates a Vserver peer relationship between two Vservers residing on the same cluster or across two clusters. For intercluster Vserver peer relationships, the cluster administrator must accept or reject the relationship on the peer cluster.

Parameters
- `vserver <vserver>` - Vserver Name
  Specifies the name of the local Vserver.
- `peer-vserver <vserver>` - Peer Vserver Name
  Specifies the name of the peer Vserver with which you want to create the Vserver peer relationship.
- `peer-cluster <text>` - Peer Cluster Name
  Specifies the name of the peer cluster. If this is not specified, it is assumed that the peer Vserver resides on the same cluster.
- `applications {snapmirror|file-copy|lun-copy|flexcache}, ...` - Peering Applications
  Specifies the applications for which the Vserver peer relationship is created.
- `local-name <vserver>` - Peer Vserver Local Name
  Specifies the unique local name to identify the peer Vserver with which you want to create the Vserver peer relationship. The default value is the remote peer Vserver name.

Examples
The following example illustrates how to create an intercluster Vserver peer relationship between Vserver `lvs1.example.com`, residing on `cluster1`, and `pvs1.example.com`, residing on `cluster2`. The relationship is created for SnapMirror.

```
cluster1::> vserver peer create -vserver lvs1.example.com -peer-vserver pvs1.example.com -peer-cluster cluster2 -applications snapmirror
```

The following example illustrates how to create an intercluster Vserver peer relationship between Vserver `lvs1.example.com`, residing on `cluster1`, and `lvs1.example.com`, residing on `cluster2`. The relationship is created for SnapMirror. The `-local-name` parameter is specified to create a local name used to identify the peer Vserver in cases where the name of the peer Vserver name is not uniquely referenced from local cluster.

```
cluster1::> vserver peer create -vserver lvs1.example.com -peer-vserver lvs1.example.com -peer-cluster cluster2 -applications snapmirror -local-name cluster2lvs1locallyUniqueName
```

```
cluster1::> vserver peer show
Peer        Peer                           Peering        Remote
Vserver     Vserver     State        Peer Cluster      Applications   Vserver
----------- ----------- ------------ ----------------- -------------- ---------
lvs1.example.com cluster2lvs1locallyUniqueName initiated cluster2     snapmirror     lvs1.example.com
```

```
cluster1::> vserver peer show -instance
Local Vserver Name: lvs1.example.com
Peer Vserver Name: cluster2lvs1locallyUniqueName
Peering State: initiated
Peering Applications: snapmirror
Remote Vserver Name: lvs1.example.com
```

The following example illustrates how to create an intercluster Vserver peer relationship between Vserver `lvs1`, residing on `cluster1`, and Vserver `pvs1`, residing on `cluster2`. The relationship is created for SnapMirror. The following Vserver peer permission exists on remote cluster `cluster2` for local Vserver `pvs1`.

vserver peer delete

Delete a Vserver peer relationship

Availability: This command is available to cluster administrators at the admin privilege level.

Description

The vserver peer delete command deletes the Vserver peer relationship between two Vservers.

Parameters

-vserver <vserver> - Vserver Name

Specifies the local Vserver name for which you want to delete the Vserver peer relationship.

-peer-vserver <vserver> - Peer Vserver Name

Specifies the peer Vserver name with which the Vserver peer relationship was established.

[-force [true]] - Force Delete

Deletes the Vserver peer relationship even if the remote cluster is not accessible due to, for example, network connectivity issues.

[-foreground {true|false}] - Foreground

This parameter optionally specifies whether the Vserver peer delete operation can be executed in the background. If nothing is specified, by default the Vserver peer delete operation is executed in the background.
Examples
The following example illustrates how to delete the Vserver peer relationship between two Vservers `lvs1.example.com` residing on `cluster1`, and `pvs1.example.com` residing on `cluster2`.

```
cluster1::> vserver peer delete -vserver lvs1.example.com -peer-vserver pvs1.example.com
```

`vserver peer create` on page 2049

vserver peer modify
Modify a Vserver peer relationship

Availability: This command is available to `cluster` administrators at the `admin` privilege level.

Description
The `vserver peer modify` command modifies applications of the Vserver peer relationship.

Parameters
- `-vserver <vserver>` - Vserver Name
  Specifies name of the local Vserver for which you want to modify applications of the Vserver peer relationship.
- `-peer-vserver <vserver>` - Peer Vserver Name
  Specifies name of the peer Vserver for which you want to modify applications of the Vserver peer relationship.
- `-applications {snapmirror|file-copy|lun-copy|flexcache},...` - Peering Applications
  Specifies the Vserver peer applications.

Examples
The following example illustrates how to modify applications that are part of the peer relationship between the Vservers `lvs1.example.com` residing on `cluster1`, and `pvs1.example.com` residing on `cluster2`.

```
cluster1::> vserver peer modify -vserver lvs1.example.com -peer-vserver pvs1.example.com -applications snapmirror
```

vserver peer modify-local-name
Modify the local name for a peer Vserver

Availability: This command is available to `cluster` administrators at the `admin` privilege level.

Description
The `vserver peer modify-local-name` command modifies the local name for a remote peer Vserver. The new local name must be unique.
**Parameters**

- `peer-cluster <text>` - Peer Cluster
  
  Use this parameter to specify the peer cluster.

- `peer-vserver <text>` - Remote Peer Vserver
  
  Use this parameter to specify the existing remote peer Vserver name.

- `new-name <vserver>` - Remote Peer Vserver Local Name
  
  Use this parameter to specify the new local name of the peer Vserver. The new local name must conform to the same rules as a Vserver name.

**Examples**

```
cluster2::> vserver peer modify-local-name -peer-cluster cluster1 -peer-vserver vs51.example.com -new-name vs51_cluster1.example.com
```

**vserver peer reject**

Reject a Vserver peer relationship

**Availability:** This command is available to `cluster` administrators at the `admin` privilege level.

**Description**

The `vserver peer reject` command is used to reject the Vserver peer relationship between the two Vservers. This command is used only for an intercluster Vserver peer relationship.

**Parameters**

- `vserver <vserver>` - Vserver Name
  
  Specifies the name of the local Vserver for which you want to reject the Vserver peer relationship.

- `peer-vserver <vserver>` - Peer Vserver Name
  
  Specifies the name of the peer Vserver with which the Vserver peer relationship was initiated.

**Examples**

The following example illustrates how to reject the Vserver peer relationship between two Vservers `lvsl.example.com` residing on `cluster1`, and `pvsl.example.com` residing on `cluster2`.

```
cluster1::> vserver peer reject -vserver lvsl.example.com -peer-vserver pvsl.example.com
```

**vserver peer repair-peer-name**

Repair the peer vserver name that was not updated during the last rename operation

**Availability:** This command is available to `cluster` administrators at the `advanced` privilege level.

**Description**

Updates the peer Vserver name in remote peer clusters for the specified Vserver in the local cluster.
Parameters

\texttt{-vserver <vserver> - vserver}

Name of the Vserver in the local cluster. This name will be repaired on remote peer clusters.

\begin{Verbatim}
Examples
The following example updates the peer-Vserver name across the peered clusters:

\begin{verbatim}
cluster1::*> vserver peer repair-peer-name -vserver vs1.example.com
Info: Command completed successfully
\end{verbatim}
\end{Verbatim}

\textbf{vserver peer resume} \textbf{Resume a Vserver peer relationship}

\textbf{Availability}: This command is available to \textit{cluster} administrators at the \textit{admin} privilege level.

\textbf{Description}
The \texttt{vserver peer resume} command resumes the Vserver peer relationship between two Vservers.

\textbf{Parameters}

\texttt{-vserver <vserver> - Vserver Name}

Specifies name of the local Vserver for which you want to resume the Vserver peer relationship.

\texttt{-peer-vserver <vserver> - Peer Vserver Name}

Specifies name of the peer Vserver with which you want to resume the Vserver peer relationship.

\texttt{[-force [true]] - Force Resume}

Resumes the Vserver peer relationship even if the remote cluster is not accessible due to, for example, network connectivity issues.

\begin{Verbatim}
Examples
The following example illustrates resuming a Vserver peer relationship between two Vservers \texttt{lvs1.example.com} residing on \texttt{cluster1}, and \texttt{pvs1.example.com} residing on \texttt{cluster2}.

\begin{verbatim}
cluster1::> vserver peer resume -vserver lvs1.example.com -peer-vserver pvs1.example.com
\end{verbatim}
\end{Verbatim}

\textbf{Related references}

\textit{vserver peer suspend} on page 2058

\textbf{vserver peer show} \textbf{Display Vserver peer relationships}

\textbf{Availability}: This command is available to \textit{cluster} and \textit{Vserver} administrators at the \textit{admin} privilege level.

\textbf{Description}
The \texttt{vserver peer show} command displays the following information about Vserver peer relationships:

\begin{itemize}
  \item Local Vserver name
\end{itemize}
- Peer Vserver name
- Local Vserver UUID
- Peer Vserver UUID
- Peer cluster name
- State of the peering relationship
- Applications
- Remote Vserver name

**Parameters**

`[-fields <fieldname>,...]`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

`[-instance]`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-vserver <vserver>] - Local Vserver Name`

If this parameter is specified, the command displays relationships that match the specified local Vserver.

`[-peer-vserver <text>] - Peer Vserver Name`

If this parameter is specified, the command displays relationships that match the specified peer Vserver.

`[-peer-state {peered|pending|initializing|initiated|rejected|suspended|deleted}] - Peering State`

If this parameter is specified, the command displays relationships that match the specified peer state.

`[-applications {snapmirror|file-copy|lun-copy|flexcache},...] - Peering Applications`

If this parameter is specified, the command displays relationships that have the specified applications.

`[-peer-cluster <text>] - Peer Cluster Name`

If this parameter is specified, the command displays relationships that have the specified peer cluster name.

`[-peer-vserver-uuid <UUID>] - Peer Vserver UUID (privilege: advanced)`

If this parameter is specified, the command displays relationships that match the specified peer Vserver UUID.

`[-vserver-uuid <UUID>] - Local Vserver UUID (privilege: advanced)`

If this parameter is specified, the command displays relationships that match the specified local Vserver UUID.

`[-remote-vserver-name <text>] - Remote Vserver Name`

If this parameter is specified, the command displays relationships that match the specified remote Vserver.

**Examples**

The following examples illustrate how to display Vserver peer relationships.

Cluster administrator:

```bash
cluster1::> vserver peer show

Vserver       Peer          Peer Cluster      Applications       Remote Vserver
------------- ----------- ----------------- -------------- ---------
lvs1.example.com lvs2.example.com peered          cluster1      snapmirror     lvs2.example.com
lvs1.example.com pvs1.example.com peered          cluster2      snapmirror     pvs1.example.com
```

vserver peer commands
vserver peer show-all

(DEPRECATED)-Display Vserver peer relationships in detail

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The vserver peer show-all command displays the following information about Vserver peer relationships:

- Local Vserver name
- Peer Vserver name
- Local Vserver UUID
- Peer Vserver UUID
- Peer cluster name
- Applications
- State of the peering relationship
- Remote Vserver name

Parameters
`
[-fields <fieldname>, ...]
`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.
If you specify the `instance` parameter, the command displays detailed information about all fields.

`-vserver <vserver>` - Local Vserver Name
If this parameter is specified, the command displays relationships that match the specified local Vserver.

`-peer-vserver <text>` - Peer Vserver Name
If this parameter is specified, the command displays relationships that match the specified peer Vserver.

`-vserver-uuid <UUID>` - Local Vserver UUID (privilege: advanced)
If this parameter is specified, the command displays relationships that match the specified local Vserver UUID.

`-peer-vserver-uuid <UUID>` - Peer Vserver UUID (privilege: advanced)
If this parameter is specified, the command displays relationships that match the specified peer Vserver UUID.

`-peer-state {peered|pending|initializing|initiated|rejected|suspended|deleted}` - Peering State
If this parameter is specified, the command displays relationships that match the specified peer state.

`-applications {snapmirror|file-copy|lun-copy|flexcache},...` - Peering Applications
If this parameter is specified, the command displays relationships that have the specified applications.

`-peer-cluster <text>` - Peer Cluster Name
If this parameter is specified, the command displays relationships that have the specified peer cluster name.

`-remote-vserver-name <text>` - Remote Vserver Name
If this parameter is specified, the command displays relationships that match the specified remote Vserver.

### Examples

The following example illustrates how to display Vserver peer relationships.

```
cluster1::> vserver peer show-all
Peer        Peer                           Peering        Remote
Vserver     Vserver     State        Peer Cluster      Applications   Vserver
----------- ----------- ------------ ----------------- -------------- ---------
lvs1.example.com lvs2.example.com peered       cluster1          snapmirror     lvs2.example.com
lvs1.example.com pvs1.example.com peered       cluster2          snapmirror     pvs1.example.com
lvs2.example.com lvs1.example.com peered       cluster1          snapmirror     lvs1.example.com
lvs1.example.com pvs1_cluster3.example.com peered       cluster3          snapmirror     pvs1.example.com
lvs1.example.com lvs1_cluster4.example.com peered       cluster4          snapmirror

5 entries were displayed.
```

### Related references

`vserver peer show` on page 2054
vserver peer suspend

Suspend a Vserver peer relationship

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The vserver peer suspend command suspends the Vserver peer relationship between two Vservers.

Parameters
-vserver <vserver> - Vserver Name

Specifies name of the local Vserver for which you want to suspend the Vserver peer relationship.

-peer-vserver <vserver> - Peer Vserver Name

Specifies name of the peer Vserver for which you want to suspend the Vserver peer relationship.

[-force [true]] - Force Suspend

Suspends the Vserver peer relationship even if the remote cluster is not accessible due to, for example, network connectivity issues.

Examples
The following example illustrates how to suspend the Vserver peer relationship between two Vservers lvs1.example.com residing on cluster1, and pvs1.example.com residing on cluster2.

```

    cluster1::> vserver peer suspend -vserver lvs1.example.com -peer-vserver pvs1.example.com
```

vserver peer permission commands

Create or Manage Vserver peer permissions

vserver peer permission create

Create a new Vserver peer permission

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The vserver peer permission create command creates a new Vserver peer permission that can be used during intercluster Vserver peer relationship creation. Once this permission exists for a local Vserver and peer cluster combination on local cluster, no explicit vserver peer accept command is required for any incoming Vserver peer relationship creation request from a remote cluster for that local Vserver. Peer relationship directly changes state to peered on both clusters.

Parameters
-peer-cluster <text> - Peer Cluster Name

Specifies the name of the peer Cluster.

-vserver <text> - Vserver Name

Specifies the name of the local Vserver. Use "*" to create permission that applies for all local Vservers.
-applications {snapmirror|flexcache}, ... - Peering Applications

Specifies the applications that can make use of the intercluster Vserver peer relationship.

### Examples

The following example illustrates how to create Vserver peer permissions:

```bash
cluster1::> vserver peer permission create -peer-cluster cluster2 -vserver vs1 -applications snapmirror
```

The following example illustrates how to create a Vserver peer permission that applies for all the local Vservers:

```bash
cluster1::> vserver peer permission create -peer-cluster cluster2 -vserver "*" -applications snapmirror
```

Warning: This Vserver peer permission applies to all local Vservers. After that no explicit "vserver peer accept" command required for Vserver peer relationship creation request from peer cluster "cluster2" with any of the local Vservers. Do you want to continue? [y|n]: y

```bash
cluster1::> vserver peer permission show
```

<table>
<thead>
<tr>
<th>Peer Cluster</th>
<th>Vserver</th>
<th>Applications</th>
</tr>
</thead>
<tbody>
<tr>
<td>cluster2</td>
<td>vs1</td>
<td>snapmirror</td>
</tr>
<tr>
<td>cluster2</td>
<td>&quot;*&quot;</td>
<td>snapmirror</td>
</tr>
</tbody>
</table>

2 entries were displayed.

Note that both all Vservers and any local Vserver name permission can exists at same time.

### vserver peer permission delete

Delete a Vserver peer permission

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**
The `vserver peer permission delete` command deletes Vserver peer permissions.

**Parameters**

- `-peer-cluster <text>` - Peer Cluster Name
  Specifies the name of the peer Cluster.

- `-vserver <text>` - Vserver Name
  Specifies the name of the local Vserver.

**Examples**
The following example illustrates how to delete Vserver peer permissions:

```bash
cluster1::> vserver peer permission delete -peer-cluster cluster2 -vserver vs1
```
vserver peer permission modify

Modify the Existing Vserver peer permission

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The vserver peer permission modify command is used to modify attributes of the Vserver peer permission relationship. Changes made using this command will only apply to Vserver peer relationships that are created after the Vserver peer permission have been modified. Vserver peer permission is used to give permission to a local Vserver for intercluster Vserver peer relationship creation so that the command vserver peer accept is not required for incoming Vserver peer relationship creation from a remote cluster for that local Vserver.

Parameters
-peer-cluster <text> - Peer Cluster Name
  Specifies the name of the peer cluster.
-vserver <text> - Vserver Name
  Specifies name of the local Vserver for which you want to modify applications of the Vserver peer permission relationship.
-applications {snapmirror|flexcache}, ... - Peering Applications
  Specifies the applications that can make use of the intercluster Vserver peer relationship.

Examples
The following example illustrates how to modify Vserver peer permissions:

```
cluster1::*> vserver peer permission modify -peer-cluster cluster2 -vserver vs1 -applications snapmirror
```

Related references
vserver peer accept on page 2049

vserver peer permission show

Display Vserver peer permissions

Availability: This command is available to cluster administrators at the admin privilege level.

Description
The vserver peer permission show command displays the following information about Vserver peer permissions:

- Peer cluster name
- Local Vserver name
- Applications

Parameters
{[-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.
If you specify the `-instance` parameter, the command displays detailed information about all fields.

`-peer-cluster <text>` - Peer Cluster Name
If this parameter is specified, the command displays permissions that have the specified peer cluster name.

`-vserver <text>` - Vserver Name
If this parameter is specified, the command displays permissions that match the specified local Vserver.

`-applications {snapmirror|flexcache},...` - Peering Applications
If this parameter is specified, the command displays permissions that have the specified applications.

### Examples
The following examples illustrate how to display Vserver peer permissions:

```plaintext
cluster1::> vserver peer permission show
Peer Cluster   Vserver   Applications
--------------- --------------- -----------------
cluster2        "*"        snapmirror
cluster3        vs1         snapmirror
2 entries were displayed.
```

### vserver peer transition commands
Create and manage transition peer relationships.

The `vserver peer transition` commands enables you to create and manage transition peer relationships.

#### vserver peer transition create
Create a new transition peer relationship between a 7-Mode system and a Vserver.

**Availability:** This command is available to cluster administrators at the `admin` privilege level.

**Description**
The `vserver peer transition create` command creates a transition peer relationship between a 7-Mode system and a Vserver.

**Parameters**

- `-local-vserver <vserver name>` - Local Vserver name
  Specifies the name of the local Vserver.

- `-src-filer-name <text>` - Source 7-Mode system
  Specifies the name of the source 7-Mode system (hostname or IP address).

- `[multi-path-address <text>]` - Additional address for source 7-Mode system
  Additional address (hostname or IP address) for the source 7-Mode system.

- `[local-lifs <lif-name>,... ]` - List of Local LIFs
  List of LIFs to be used for this peering relationship. The LIF role can be data or node-mgmt or intercluster or cluster-mgmt.
The following example illustrates how to create a transition peer relationship between Vserver vs1.example.com, residing on Cluster1, and a 7-Mode system src1.example.com. We can also specify an additional multipath address src1-e0d.example.com, for load balancing and list of local LIFs lif1, lif2 to be used.

```bash
Cluster1::> vserver peer transition create -vserver vs1.example.com -src-filer-name src1.example.com -multi-path-address src1-e0d.example.com -local-lifs lif1,lif2
```

## vserver peer transition delete

Delete a transition peer relationship.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The `vserver peer transition delete` command deletes the transition peer relationship.

**Parameters**

- `-local-vserver <vserver name>` - Local Vserver name
  
  Specifies the name of the local Vserver.

- `-src-filer-name <text>` - Source 7-Mode system
  
  Specifies the name of the source 7-Mode system(hostname or IP address).

**Examples**

The following example illustrates how to delete the transition peer relationship between a Vserver lvs1.example.com residing on cluster1, and source 7-Mode systems src1.example.com.

```bash
cluster1::> vserver peer transition delete -vserver lvs1.example.com -src-filer-name src1.example.com
```

**Related references**

- `vserver peer transition show` on page 2063

## vserver peer transition modify

Modify a transition peer relationship.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The `vserver peer transition modify` command is used to modify the multipath address or local LIFs of the transition peer relationship.
Parameters

- **local-vserver <vserver name>** - Local Vserver name
  Specifies the name of the local Vserver.

- **src-filer-name <text>** - Source 7-Mode system
  Specifies the name of the source 7-Mode system (hostname or IP address).

- **multi-path-address <text>** - Additional address for source 7-Mode system
  Additional address (hostname or IP address) for the source 7-Mode system.

- **local-lifs <lif-name>, ...** - List of Local LIFs
  List of LIFs to be used for this peering relationship. The LIF role can be data or node-mgmt or intercluster or cluster-mgmt.

Examples

The following example illustrates how to modify a transition peer relationship`s multipath address.

```
cluster1::> vserver peer transition modify -vserver vs1.example.com -src-filer-name src1.example.com -multi-path-address src1-e0b.example.com
```

The following example illustrates how to modify the local LIFs of a transition peer relationship.

```
Cluster1::> vserver peer transition modify -vserver vs1.example.com -src-filer-name src1.example.com -local-lifs lif1,lif2
```

- [vserver peer transition delete](#) on page 2062
- [vserver peer transition show](#) on page 2063

**vserver peer transition show**

Display transition peer relationships.

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The `vserver peer transition show` command displays the following information about transition peer transition relationships:

- Local Vserver name
- Source 7-Mode system
- Multi-path address
- Local LIFs

**Parameters**

```
{ [-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.
  }
```

```
[-instance]
  If you specify the -instance parameter, the command displays detailed information about all fields.
```

vserver peer commands
[-local-vserver <vserver name>] - Local Vserver name
   If this parameter is specified, the command displays transition peer information about the specified local Vserver.

[-src-filer-name <text>] - Source 7-Mode system
   If this parameter is specified, the command displays transition peer information about the specified source 7-Mode system.

[-multi-path-address <text>] - Additional address for source 7-Mode system
   If this parameter is specified, the command displays information about the specified multipath-address.

[-local-lifs <lif-name>,...] - List of Local LIFs
   If this parameter is specified, the command displays information about the specified local LIFs.

Examples

cluster1::> vserver peer transition show
   Vserver  Source Filer  Multi Path Address    Local LIFs
   -------  ------------  -----------------     ----------------
   vs1.example.com                              lif1, lif2
   src1.example.com
   src1-e0b.example.com

vserver san commands

Manage SAN Vservers

Commands used for managing the SAN in-memory cache configuration of a Vserver.

vserver san prepare-to-downgrade

Restore the SAN Configurations to Earlier Release of Data ONTAP Version.

Availability: This command is available to cluster administrators at the admin privilege level.

Description

This command initiates the procedure to restore the configuration to Earlier Release of Data ONTAP Version.

As part of this command, capability for making SAN LIF offline if placed on the DR auxiliary partner as part of LIF placement in Metrocluster environment will be disabled.

Parameters

-<feature-set <ClusterVersion> - Disable the capability introduced in the Data ONTAP Version
   Specifies the DATA ONTAP Cluster Version from revert to.

Examples

cluster1::> vserver san prepare-to-downgrade -feature-set 8.3.1
vserver security commands
Manage ontap security

vserver security file-directory commands
Manage file security

vserver security file-directory apply
Apply security descriptors on files and directories defined in a policy to a Vserver

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver security file-directory apply command applies security settings to files and directories defined in a security policy of a Vserver.

Applying a security policy to a Vserver is the last step to creating and applying NTFS ACLs to files or folders. A security policy contains definitions for the security configuration of a file (or folder) or set of files (or, folders). The policy is a container for tasks. A task associates a file/folder path name to the security descriptor that needs to be set on the file/folder. Every task in a policy is uniquely identified by the file/folder path. A policy cannot have duplicate task entries. There can be only one task per path.

The steps to creating and applying NTFS ACLs are the following:

• Create an NTFS security descriptor.
• Add DACLs and SACLs to the NTFS security descriptor.
  Note: If you want to audit file and directory events, you must configure auditing on the Vserver in addition to adding the SACL to the security descriptor.
• Create a file/directory security policy.
  This step associates the policy with a Vserver.
• Create policy tasks.
  A policy task refers to a single operation to apply to a file (or folder) or to a set of files (or folders). Amongst other things, the task defines which security descriptor to apply to a path.
• Apply a policy to the associated Vserver.

Parameters
-vserver <vserver name> - Vserver
  Specifies the Vserver that contains the path to which the security policy is applied.

-policy-name <Security policy name> - Policy Name
  Specifies the security policy to apply.

[-ignore-broken-symlinks {true|false}] - Skip Broken Symlinks (privilege: advanced)
  If you specify this parameter as true, the file-directory apply job will skip all the symlinks that are broken instead of failing the job.

Examples
The following example applies a security policy named “p1” to Vserver vs0.
vserver security file-directory remove-slag

Removes Storage-Level Access Guard

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The `vserver security file-directory remove-slag` command removes Storage-Level Access Guard (SLAG) security from the specified volume or qtree path.

**Parameters**

- `-vserver <vserver>` - Vserver
  
  Specifies the name of the Vserver that is associated with the volume or qtree path from where you want to remove SLAG.

- `-path <text>` - Path
  
  Specifies the volume or qtree mounted junction path from which you want to remove SLAG security.

**Examples**

The following example removes SLAG security from the volume path "/vol1" on Vserver vs1.

```bash
cluster1::> vserver security file-directory show -vserver vs1 -path /vol1
Vserver: vs1
File Path: /vol1
Security Style: mixed
Effective Style: unix
DOS Attributes: 10
DOS Attributes in Text: ----D---
Expanded Dos Attributes: -
Unix User Id: 0
Unix Group Id: 0
Unix Mode Bits: 755
Unix Mode Bits in Text: rwxr-xr-x
ACLs: Storage-Level Access Guard

security
(Applies to Directories):
ALLOW-CIFS1\Administrator-0x1200a9
DACL (Applies to Files):
ALLOW-CIFS1\Administrator-0x1200a9

cluster1::> vserver security file-directory remove-slag -path /vol1 -vserver vs1
```

The following example removes SLAG security from the qtree path "/vol1/q1" on Vserver vs1.

```bash
cluster1::> vserver security file-directory show -vserver vs1 -path /vol1/q1
Vserver: vs1
File Path: /vol1/q1
Security Style: mixed
Effective Style: unix
DOS Attributes: 10
DOS Attributes in Text: ----D---
Expanded Dos Attributes: -
Unix User Id: 0
Unix Group Id: 0
Unix Mode Bits: 755
Unix Mode Bits in Text: rwxr-xr-x
ACLs: -
```
vserver security file-directory show

Display file/folder security information

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver security file-directory show command displays file/folder security information. The command output depends on the parameter or parameters specified with the command.

The -vserver and -path parameters are required for this command. If you do not specify any of the optional parameters, the command displays all security information in list format for the specified path.

You can specify the -fields parameter to specify which fields of information to display about files and folders security.

You can specify the -instance parameter to display all the security information in list format.

Parameters

{-fields <fieldname>, ...}
If you specify the -fields <fieldname>, ... parameter, the command only displays the fields that you specify.

{-instance}
If you specify the -instance parameter, the command displays detailed information about all entries.

-vserver <vserver> - Vserver
Use this required parameter to specify the Vserver that contains the path to the file or folder specified with the required -path parameter.
[-path <text>] - File Path
Use this field to specify the path of the file or folder for which you want to display security information. If the volume name is not specified in the path, the path is relative to the Vserver root volume. If the path’s last subcomponent has a wildcard (“*”), the output will display information for all files and directories below the parent path.

**Note:** If you want to display information of a file or directory which contains wildcard (“*”) as its last sub-component, then provide the complete path inside "<path>".

For instance, vserver security file-directory show -vserver vs1 -path "/vol1/*" will show ACL information for the directory named "*", only.

[-inode <integer>] - File Inode Number
Use this field to specify the inode number of the file or folder for which you want to display security information. If the volume name is not specified, inode is searched in the Vserver root volume.

[-volume-name <volume name>] - Volume Name
If you specify this parameter, the command displays information about file and directory security only for files and directories where the specified path is relative to the specified volume. If this parameter is not specified, the Vserver root volume is taken as default.

[-share-name <Share>] - Share Name
If you specify this parameter, the command displays information about file and directory security only for files and directories contained where the specified path is relative to the root of the specified share. If this parameter is not specified, the Vserver root volume is taken as default.

[-lookup-names {true|false}] - SID to Name Lookups
If you specify this parameter, the command displays information about file and directory security for files and directories where the information about owner and group are stored as names. If set to false, the command displays information about file and directory security for files and directories where the information for owner and group are stored as SIDs.

[-expand-mask {true|false}] - Expand Bit Masks
If you specify this parameter, the command displays information about file and directory security for files and directories where the hexadecimal bit mask entries are in expanded bit form. If set to false, the command displays information about file and directory security for files and directories where the hexadecimal bit mask entries are in collapsed form.

[-textual-mask {true|false}] - Show Textual Mask
If you specify this parameter as true, the command displays information about file and directory security for files and directories where the hexadecimal bit mask is translated to textual format.

[-sddl {true|false}] - Display ACLs in SDDL Format
If you specify this parameter, the command displays the ACL information for files and directories in Security Descriptor Definition Language (SDDL) format. If the file has effective-style as "unix" then this flag has no effect.

[-security-style <security style>] - Security Style
If you specify this parameter, the command displays information about file and directory security only for files and directories with paths in volumes of the specified security style.

[-effective-style <security style>] - Effective Style
If you specify this parameter, the command displays information about file and directory security only for files and directories with the specified effective security style on the path.

[-dos-attributes <Hex Integer>] - DOS Attributes
If you specify this parameter, the command displays information about file and directory security only for files and directories with the specified DOS attributes.
[-text-dos-attr <TextNoCase>] - DOS Attributes in Text
If you specify this parameter, the command displays information about file and directory security only for files and directories with the specified text DOS attributes.

[-expanded-dos-attr <TextNoCase>] - Expanded Dos Attributes
If you specify this parameter, the command displays information about file and directory security only for files and directories with the specified extended DOS attributes. This parameter is useful only for files or directories where the -expand-mask is set to true.

[-user-id <user name>] - UNIX User Id
If you specify this parameter, the command displays information about file and directory security only for files and directories with the specified UNIX user ID.

[-group-id <group name>] - UNIX Group Id
If you specify this parameter, the command displays information about file and directory security only for files and directories with the specified UNIX group ID.

[-mode-bits <Octal Permission>] - UNIX Mode Bits
If you specify this parameter, the command displays information about file and directory security only for files and directories with the specified UNIX mode bits in Octal form.

[-text-mode-bits <text>] - UNIX Mode Bits in Text
If you specify this parameter, the command displays information about file and directory security only for files and directories with the specified UNIX mode bits in text form.

[-acls <Security acl>,...] - ACLs
If you specify this parameter, the command displays information about file and directory security only for files and directories with the specified ACLs. If the specified path is a volume or qtree path and Storage-Level Access Guard (SLAG) is configured on the volume or qtree, this parameter displays the SLAG information. It also displays the Dynamic Access Control (DAC) policies if DAC is configured for the given file or directory path. The following ACL information can be entered:

• Type of ACL - NTFS or NFSV4
• Control bits in the security descriptors
• Owner - only in case of NTFS security descriptors
• Group - only in case of NTFS security descriptors
• Access Control Entries - discretionary access control list (DACL) and system access control list (SACL) access control entries (ACEs) in the ACL

Examples
The following example displays the security information about the path "/vol4" in Vserver vs1.

```
cluster1::> vserver security file-directory show -vserver vs1 -path /vol4
(vserver security file-directory show)
Vserver: vs1
File Path: /vol4
File Inode Number: 64
Security Style: ntfs
Effective Style: ntfs
DOS Attributes: 10
DOS Attributes in Text: ----D---
Expanded Dos Attributes: -
Unix User Id: 0
Unix Group Id: 0
Unix Mode Bits: 777
Unix Mode Bits in Text: rwxrwxrwx
ACLs: NTFS Security Descriptor
```
The following example displays the security information about the path "/a/b/file.txt" in Vserver vs1.

```
cluster1::> vserver security file-directory show -vserver vs1 -path /a/b/file.txt -
volume-name vol1
(vserver security file-directory show)
```

```
Vserver: vs1
File Path: /vol1/a/b/file.txt
File Inode Number: 101
Security Style: ntfs
Effective Style: ntfs
DOS Attributes: 10

**vserver security file-directory show-effective-permissions**

Display effective file or folder permissions

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The `vserver security file-directory show-effective-permissions` command displays the effective permission granted to a Windows or UNIX user on the specified file or folder path. The command output depends on the parameter or parameters specified with the command.

The `-vserver`, `-win-user-name` or `-unix-user-name` and `-path` parameters are required for this command. If the optional parameter `-share-name` is specified, it will display the effective share permission.

**Parameters**

```
{ [-fields <fieldname>, ...]
  If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.
| [-instance ]
  If you specify the `-instance` parameter, the command displays detailed information about all fields.
```
vserver <vserver> - Vserver

Use this required parameter to specify the Vserver that contains the path to the file or folder specified with the required -path parameter. Query characters, such as "*", are not supported.

{ -win-user-name <text> - Windows User Name

Use this parameter to specify the Windows user for which effective permission needs to be displayed on the given file or folder.

| -unix-user-name <text> - Unix User Name

Use this parameter to specify the UNIX user for which effective permission needs to be displayed on the given file or folder.

-path <text> - File Path

Use this mandatory parameter to specify the path of the file or the folder for which you want to display effective permissions. The path is relative to the Vserver root volume. If -share-name is specified then the path will be relative to the share path. Query characters, such as "*", are not supported.

[-share-name <Share>] - CIFS Share Name

If you specify this optional parameter, the command displays the file or directory effective permission for the mentioned user, only for files and directories contained where the specified path is relative to the root of the specified share. If this parameter is not specified, the Vserver root volume is taken as the default. If this optional parameter is specified, then it will also display the effective share permission of the user. Wildcard query characters are not supported.

[-client-ip-address <IP Address>] - Client IP Address

If you specify this optional parameter, the command displays the effective permission for the user with the specified client ip address.

[-expand-mask {true|false}] - Expand Bit Masks

If you specify this optional parameter, the command displays effective permission for files and directories where the hexadecimal bit mask entries are in expanded bit form. If set to default (false), the command displays effective permission for file or directory in collapsed (textual) form.

[-share-path <text>] - CIFS Share Path

If you specify this parameter, the command displays information only about the CIFS share that match the specified path. Query characters, such as "*", are not supported.

[-permission <Security acl>, ...] - Effective Permissions

If you specify this parameter, the command displays effective permission only if specified permission matches. Wildcard query characters are not supported.

vserver security file-directory job commands

Manage file security jobs

vserver security file-directory job show

Display a list of file security jobs

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver security file-directory job show command displays information about security file-directory jobs.

To display detailed information about a specific job, run the command with the -id parameter.

You can specify additional parameters to select information that matches the values you specify for those parameters. For example, to display information only about security file-directory jobs running on a specific node, run the command with the -node parameter.
Parameters

```[-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.
```

```[-inprogress]

Displays the job ID, the job name, the owning Vserver, and the progress of the security file-directory job.
```

```[-jobstate]

Displays information about each job’s state, including the queue state, whether the job was restarted and when the job has completely timed out.
```

```[-sched]

Displays the job ID, the job name, the owning Vserver, and the schedule on which the security file-directory job runs.
```

```[-times]

Displays the job ID, the job name, the owning Vserver, the time when the job was last queued, the time when the job was last started, and the time when the job most recently ended.
```

```[-type]

Displays the job ID, the job name, the job type, and the job category.
```

```[-jobuuid] (privilege: advanced)

Displays the job ID, the job name, the owning Vserver, and the job UUID.
```

```[-instance]

If you specify the `-instance` parameter, the command displays detailed information about all fields.
```

```[-id <integer>] - Job ID

Selects the jobs that match the ID or range of IDs that you specify.
```

```[-vserver <vserver name>] - Owning Vserver

Selects jobs that are owned by the specified Vserver.
```

```[-name <text>] - Name

Selects the jobs that match this parameter value.
```

```[-description <text>] - Description

Selects the jobs that match this parameter value.
```

```[-priority {Low|Medium|High|Exclusive}] - Priority

Selects the jobs that match this parameter value.
```

```[-node <nodename>] - Node

Selects the jobs that match this parameter value.
```

```[-affinity {Cluster|Node}] - Affinity

Selects the jobs that match this parameter value.
```

```[-schedule <job_schedule>] - Schedule

Selects the jobs that match this parameter value.
```

```[-queuetime <MM/DD HH:MM:SS>] - Queue Time

Selects the jobs that match this parameter value.
```

```[-starttime <MM/DD HH:MM:SS>] - Start Time

Selects the jobs that match this parameter value.
```
[-endtime <MM/DD HH:MM:SS>] - End Time
Selects the jobs that match this parameter value.

[-dropdeadtime <MM/DD HH:MM:SS>] - Drop-dead Time
Selects the jobs that match this parameter value.

[-restarted {true|false}] - Restarted?
Selects the jobs that match this parameter value.

[-state {Initial|Queued|Running|Waiting|Pausing|Paused|Quitting|Success|Failure|Reschedule|Error|Quit|Dead|Unknown|Restart|Dormant}] - State
Selects the jobs that match this parameter value.

[-code <integer>] - Status Code
Selects the jobs that match this parameter value.

[-completion <text>] - Completion String
Selects the jobs that match this parameter value.

[-jobtype <text>] - Job Type
Selects the jobs that match this parameter value.

[-category <text>] - Job Category
Selects the jobs that match this parameter value.

[-uuid <UUID>] - UUID
Selects the jobs that match this parameter value.

[-progress <text>] - Execution Progress
Selects the jobs that match this parameter value.

[-username <text>] - User Name
Selects the jobs that match this parameter value.

[-process <text>] - Process
Selects jobs with the specified process number.

### Examples
The following example displays information about the file-directory security job.

```
cluster1::> vserver security file-directory apply -policy-name pol -vserver vs1
cluster1::> vserver security file-directory job show
```

<table>
<thead>
<tr>
<th>Job ID</th>
<th>Name</th>
<th>Vserver</th>
<th>Node</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>25</td>
<td>Fsecurity Apply</td>
<td>vsim2.3</td>
<td>vsim2.3-01</td>
<td>Success</td>
</tr>
</tbody>
</table>

Description: File Directory Security Apply Job

### vserver security file-directory ntfs commands
Manage NTFS security descriptors

### vserver security file-directory ntfs create
Create an NTFS security descriptor

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.
Description
The `vserver security file-directory ntfs create` command creates an NTFS security descriptor to which you can add access control entries (ACEs) to the discretionary access control list (DACL) and the system access control list (SACL).

Creating an NTFS security descriptor is the first step in configuring and applying NTFS access control lists (ACLs) to files and folders residing within a namespace. Later, you will associate the security descriptor to a policy task.

You can create NTFS security descriptors for files and folders residing within FlexVol volumes with NTFS security-style or on NTFS security descriptors on mixed security-style volumes.

The steps to creating and applying NTFS ACLs are the following:

- Create an NTFS security descriptor.
- Add DACLs and SACLs to the NTFS security descriptor.
  
  **Note:** If you want to audit file and directory events, you must configure auditing on the Vserver in addition to adding a SACL to the security descriptor.

- Create a file/directory security policy.
  This step associates the policy with a Vserver.

- Create a policy task.
  A policy task refers to a single operation to apply to a file (or folder) or to a set of files (or folders). Amongst other things, the task defines which security descriptor to apply to a path.

- Apply a policy to the associated Vserver.

Parameters
```
vserver <vserver name> - Vserver

Specifies the name of the Vserver on which to create the security descriptor.

-ntfs-sd <ntfs sd name> - NTFS Security Descriptor Name

Specifies the name of the security descriptor you want to create. After you create a security descriptor, you can add SACL and DACL access control entries (ACEs) to it.

**Note:** Every newly created security descriptor contains the 4 default DACL ACEs as mentioned below:
```

<table>
<thead>
<tr>
<th>Account Name</th>
<th>Access</th>
<th>Access</th>
<th>Apply</th>
</tr>
</thead>
<tbody>
<tr>
<td>BUILTIN\Administrators</td>
<td>allow</td>
<td>full-control</td>
<td>this-</td>
</tr>
<tr>
<td>BUILTIN\Users</td>
<td>allow</td>
<td>full-control</td>
<td>this-</td>
</tr>
<tr>
<td>CREATOR OWNER</td>
<td>allow</td>
<td>full-control</td>
<td>this-</td>
</tr>
<tr>
<td>NT AUTHORITY\SYSTEM</td>
<td>allow</td>
<td>full-control</td>
<td>this-</td>
</tr>
</tbody>
</table>
```

```
[-owner <name or sid>] - Owner

Specifies the owner of the security descriptor. You can specify the owner using either a user name or SID.
```
The owner of the security descriptor can modify the permissions on the file (or folder) or files (or folders) to which the security descriptor is applied and can give other users the right to take ownership of the object or objects to which the security descriptor is applied. You can use any of the following formats when specifying the value for this parameter:

- SID
- Domain\user-name
- user-name@Domain
- user-name@FQDN

**Note:** If you specify any of the three user name formats for the value of `-owner`, keep in mind that the value for the user name is case insensitive. The value for the user name is ignored for Storage-Level Access Guard (SLAG).

`[-group <name or sid>]` - Primary Group (privilege: advanced)

Specifies the owner group of the security descriptor. You can specify the owner group using either a group name or SID. You can use any of the following formats when specifying the value for this parameter:

- SID
- Domain\user-name
- user-name@Domain
- user-name@FQDN

**Note:** If you specify any of the three user name formats for the value of `-group`, keep in mind that the value for the user name is case insensitive. The value for the user name is ignored for SLAG.

`[-control-flags-raw <Hex Integer>]` - Raw Control Flags (privilege: advanced)

Specifies the control flags in the security descriptor.

**Note:** The value for the control flag is ignored for SLAG.

### Examples

Every newly created security descriptor contains the 4 default DACL ACEs as mentioned below:

<table>
<thead>
<tr>
<th>Account Name</th>
<th>Access Type</th>
<th>Access Rights</th>
<th>Apply To</th>
</tr>
</thead>
<tbody>
<tr>
<td>BUILTIN\Administrators</td>
<td>allow</td>
<td>full-control</td>
<td>this-folder, sub-folders, files</td>
</tr>
<tr>
<td>BUILTIN\Users</td>
<td>allow</td>
<td>full-control</td>
<td>this-folder, sub-folders, files</td>
</tr>
<tr>
<td>CREATOR OWNER</td>
<td>allow</td>
<td>full-control</td>
<td>this-folder, sub-folders, files</td>
</tr>
<tr>
<td>NT AUTHORITY\SYSTEM</td>
<td>allow</td>
<td>full-control</td>
<td>this-folder, sub-folders, files</td>
</tr>
</tbody>
</table>

The following example creates an NTFS security descriptor named “sd1” on Vserver “vs1” and assigns “DOMAIN \Administrator” as the security descriptor owner.
vserver security file-directory ntfs delete

Delete an NTFS security descriptor

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver security file-directory ntfs delete command deletes an NTFS security descriptor. Deleting a security descriptor also deletes all the contained DACL and SACL access control entries (ACEs).

Parameters
- `vserver <vserver name>` - Vserver
  Specifies the name of the Vserver that is associated with the security descriptor that you want to delete.

- `ntfs-sd <ntfs sd name>` - NTFS Security Descriptor Name
  Specifies the name of the security descriptor to delete.

Examples
The following example deletes an NTFS security descriptor named "sd1" on Vserver vs1.

```
cluster1::> vserver security file-directory ntfs delete -ntfs-sd sd1 -vserver vs1
```
objects to which the security descriptor is applied. You can use any of the following formats when specifying the value for this parameter:

- SID
- Domain\user-name
- user-name@Domain
- user-name@FQDN

**Note:** If you specify any of the three user name formats for the value of `-owner`, keep in mind that the value for the user name is case insensitive. The value for the user name is ignored for Storage-Level Access Guard (SLAG).

```bash
[-group <name or sid>] - Primary Group (privilege: advanced)
```

Specifies the owner group of the security descriptor. You can specify the owner group using either a group name or SID. You can use any of the following formats when specifying the value for this parameter:

- SID
- Domain\user-name
- user-name@Domain
- user-name@FQDN

**Note:** If you specify any of the three user name formats for the value of `-group`, keep in mind that the value for the user name is case insensitive. The value for the user name is ignored for SLAG.

```bash
[-control-flags-raw <Hex Integer>] - Raw Control Flags (privilege: advanced)
```

Specifies the control flags in the security descriptor to be modified.

**Note:** The value for the control flag is ignored for SLAG.

### Examples

The following example modifies the owner of an NTFS security descriptor named "sd2" on Vserver vs1.

```bash
cluster1::> vserver security file-directory ntfs modify -ntfs-sd sd2 -vserver vs1
           -owner domain\administrator

cluster1::> vserver security file-directory ntfs show -vserver vs1 -ntfs-sd sd2
Vserver: vs1
Security Descriptor Name: sd2
Owner of the Security Descriptor: DOMAIN\Administrator
```

### vserver security file-directory ntfs show

Display an NTFS security descriptors

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**

The `vserver security file-directory ntfs show` command displays information about the security descriptor. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays all information about all security descriptors defined on the cluster.

You can specify the `-fields` parameter to specify which fields of information to display about security descriptors.
You can specify the `-instance` parameter to display all the information about security descriptors in list format.

**Parameters**

```bash
{ [-fields <fieldname>, ...] }  
    If you specify the -fields <fieldname>, ... parameter, the command only displays the fields that you specify.

[ [-instance ]]  
    If you specify the -instance parameter, the command displays detailed information about all entries.

[ -vserver <vserver name> ] - Vserver
    If you specify this parameter, the command displays information only about the security descriptors associated with the Vserver that you specify.

[ -ntfs-sd <ntfs sd name> ] - NTFS Security Descriptor Name
    If you specify this parameter, the command displays information only about the security descriptors that you specify.

[ -owner <name or sid> ] - Owner
    If you specify this parameter, the command displays information only about the security descriptors owned by the specified user name or SID.

[ -group <name or sid> ] - Primary Group (privilege: advanced)
    If you specify this parameter, the command displays information only about the security descriptors associated with the owner group.

[ -control-flags-raw <Hex Integer> ] - Raw Control Flags (privilege: advanced)
    If you specify this parameter, the command displays information only about the security descriptors associated with the control flags.
```

**Examples**

The following example displays information about an NTFS security descriptor named “sd2” on Vserver vs1.

```
cluster1::> vserver security file-directory ntfs show -vserver vs1 -ntfs-sd sd2
Vserver: vs1
  Security Descriptor Name: sd2
  Owner of the Security Descriptor: DOMAIN\Administrator
```

---

### vserver security file-directory ntfs dacl commands

Manage NTFS file security DACLs

**vserver security file-directory ntfs dacl add**

Add a DACL entry to NTFS security descriptor

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**

The `vserver security file-directory ntfs dacl add` command adds access control entries (ACEs) into a security descriptor’s discretionary access control list (DACL).

If the security descriptor contains a DACL that has existing ACEs, the command adds the new ACE to the DACL. If the security descriptor does not contain a DACL, the command creates the DACL and adds the new ACE to it.

Adding a DACL entry to the security descriptor is the second step in configuring and applying ACLs to a file or folder. Before you can add a DACL entry to a security descriptor, you must first create the security descriptor.
The steps to creating and applying NTFS ACLs are the following:

- Create an NTFS security descriptor.
- Add DACLs and SACLs to the NTFS security descriptor.
  
  **Note:** If you want to audit file and directory events, you must configure auditing on the Vserver in addition to adding the SACL to the security descriptor.
- Create a file/directory security policy.
  This step associates the policy with a Vserver.
- Create policy tasks.
  A policy task refers to a single operation to apply to a file (or folder) or to a set of files (or folders). Amongst other things, the task defines which security descriptor to apply to a path.
- Apply a policy to the associated Vserver.

**Parameters**

- `vserver <vserver name>` - Vserver
  
  Specifies the name of the Vserver associated with the security descriptor to which you want to add a discretionary access control entry (discretionary ACE).

- `ntfs-sd <ntfs sd name>` - NTFS Security Descriptor Name
  
  Specifies the name of the security descriptor to which you want to add a discretionary access control entry.

- `access-type {deny|allow}` - Allow or Deny
  
  Specifies whether the discretionary access control entry is an *allow* or *deny* type of access control.

- `account <name or sid>` - Account Name or SID
  
  Specifies the account on which to apply the discretionary access control entry. You can specify the account by using a user name or SID. You can use any of the following formats when specifying the value for this parameter:
  
  - SID
  - Domain\user-name
  - user-name@Domain
  - user-name@FQDN
  
  **Note:** If you specify any of the three user name formats for the value of -account, keep in mind that the value for the user name is case insensitive.

- `{ [ -rights {no-access|full-control|modify|read-and-execute|read|write} ] }` - DACL ACE's Access Rights
  
  Specifies the right that you want to add for the account specified in the -account parameter. The -rights parameter is mutually exclusive with the -advanced-rights and -rights-raw parameter. If you specify the -rights parameter, you can only specify one value.

  You can specify one of the following rights values:
  
  - no-access
  - full-control
  - modify
  - read-and-execute
• read
• write

[-advanced-rights <Advanced access right>, ...] - DACL ACE's Advanced Access Rights

Specifies the advanced rights that you want to add for the account specified in the -account parameter. The -advanced-rights parameter is mutually exclusive with the -rights and -rights-raw parameter. You can specify more than one advanced-rights value by using a comma-delimited list.

You can specify one or more of the following advanced rights:

• read-data
• write-data
• append-data
• read-ea
• write-ea
• execute-file
• delete-child
• read-attr
• write-attr
• delete
• read-perm
• write-perm
• write-owner
• full-control

[-rights-raw <Hex Integer>] - DACL ACE's Raw Access Rights (privilege: advanced)

Specifies the raw rights that you want to add for the account specified in the -account parameter. The rights-raw parameter is mutually exclusive with the -advanced-rights and -rights parameter. Specify the value as a hexadecimal integer, for example: 0xA10F or 0xb3ff etc.

[-apply-to {this-folder|sub-folders|files}, ...] - Apply DACL Entry

Specifies where to apply the discretionary access control entry. You can specify more than one value by using a comma-delimited list.

You can specify one or more of the following values:

• this-folder
• sub-folder
• files

Note: Select one of the following combinations of values for the -apply-to parameter for Storage-Level Access Guard (SLAG):

• this-folder, sub-folder, files
• this-folder, sub-folder
• files
If you specify an invalid `-apply-to` value, this security descriptor is removed from the associated Storage-Level Access Guard (SLAG) security file-directory policy task.

### Examples

The following example adds a DACL entry to the security descriptor named “sd1” on Vserver “vs1” for the “DOMAIN\Administrator” account.

```
cluster1::> vserver security file-directory ntfs dacl add -ntfs-sd sd1 -access-type deny -account DOMAIN\Administrator -rights full-control -apply-to this-folder -vserver vs1
```

```
cluster1::> vserver security file-directory ntfs dacl show -vserver vs1 -ntfs-sd sd1 -access-type deny -account domain\administrator
```

| Vserver: vs1 |
| Security Descriptor Name: sd1 |
| Allow or Deny: deny |
| Account Name or SID: DOMAIN\Administrator |
| Access Rights: full-control |
| Advanced Access Rights: - |
| Apply To: this-folder |
| Access Rights: full-control |

### vserver security file-directory ntfs dacl modify

Modify an NTFS security descriptor DACL entry

**Availability:** This command is available to cluster and Vserver administrators at the **admin** privilege level.

**Description**

The `vserver security file-directory ntfs dacl modify` command modifies parameters in an existing discretionary access control (DACL) entry.

You can unambiguously define which DACL entry to modify by specifying the following four parameters in the modify command:

- Vserver associated with the security descriptor that contains the DACL entry
- Name of the security descriptor that contains the DACL entry
- Whether the DACL is an allow or deny type of DACL entry
- The account name or SID to which the DACL is applied

You can modify the following parameters:

- `-right`, `-advanced-rights`, `-rights-raw`
- `-apply-to`

**Parameters**

- `-vserver <vserver name>` - Vserver
  
  Specifies the name of the Vserver associated with the security descriptor containing the discretionary access control entry whose parameters you want to modify.

- `-ntfs-sd <ntfs sd name>` - NTFS Security Descriptor Name
  
  Specifies the name of the security descriptor that contains the discretionary access control entry that you want to modify.
-access-type {deny|allow} - Allow or Deny
   Specifies whether the discretionary access control entry that you want to modify is an allow or deny type of access control.

-account <name or sid> - Account Name or SID
   Specifies the account associated with the discretionary access control entry you want to modify. You can specify the account by using a user name or SID. You can use any of the following formats when specifying the value for this parameter:
   • SID
   • Domain\user-name
   • user-name@Domain
   • user-name@FQDN
   Note: If you specify any of the three user name formats for the value of -account, keep in mind that the value for the user name is case insensitive.

{ [-rights {no-access|full-control|modify|read-and-execute|read|write}] - Access Rights
   Specifies the right that you want to add for the account specified in the -account parameter. The -rights parameter is mutually exclusive with the -advanced-rights and -rights-raw parameter. If you specify the -rights parameter, you can only specify one value.
   You can specify one of the following rights values:
   • no-access
   • full-control
   • modify
   • read-and-execute
   • read
   • write

| [{-rights-raw <Hex Integer>}] - Raw Access Rights (privilege: advanced)
   Specifies the raw rights that you want to add for the account specified in the -account parameter. The -rights-raw parameter is mutually exclusive with the -advanced-rights and -rights parameter. Specify the value as a hexadecimal integer, for example: 0xA10F or 0xb3ff etc.

| [{-advanced-rights <Advanced access right>, ...}] - Advanced Access Rights
   Specifies the advanced rights that you want to add for the account specified in the -account parameter. The -advanced-rights parameter is mutually exclusive with the -rights and -rights-raw parameter. You can specify more than one advanced-rights value by using a comma-delimited list.
   You can specify one or more of the following advanced rights:
   • read-data
   • write-data
   • append-data
   • read-ea
   • write-ea
   • execute-file
• delete-child
• read-attr
• write-attr
• delete
• read-perm
• write-perm
• write-owner
• full-control

[-apply-to {this-folder|sub-folders|files}, ...] - Apply DACL Entry

Specifies where to apply the discretionary access control entry. You can specify more than one value by using a comma-delimited list.

You can specify one or more of the following values:

• this-folder
• sub-folder
• files

**Note:** Select one of the following combinations of values for the `-apply-to` parameter for Storage-Level Access Guard (SLAG):

• this-folder, sub-folder, files
• this-folder, sub-folder
• files

If you specify an invalid `-apply-to` value, this security descriptor is removed from the associated Storage-Level Access Guard (SLAG) security file-directory policy task.

### Examples

The following example modifies the `-right` and `-apply-to` parameters in the DACL entry associated to the security descriptor named “sd2” on Vserver vs1 for the "BUILTIN\Administrators" account.

```
cluster1::> vserver security file-directory ntfs dacl modify -ntfs-sd sd2 -access-type allow -account BUILTIN\Administrators -vserver vs1 -rights modify -apply-to this-folder,sub-folders
cluster1::> vserver security file-directory ntfs dacl show -vserver vs1 -ntfs-sd sd2 -account BUILTIN\Administrators -instance

Vserver: vs1
Security Descriptor Name: sd2
Allow or Deny: allow
Account Name or SID: BUILTIN\Administrators
Access Rights: modify
Advanced Access Rights: -
   Apply To: this-folder, sub-folders
   Access Rights: modify
```
**vserver security file-directory ntfs dacl remove**

Remove a DACL entry from NTFS security descriptor.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The *vserver security file-directory ntfs dacl remove* command removes a discretionary access control entry from a security descriptor.

You can unambiguously define which DACL entry to remove by specifying the following four parameters in the command:

- Vserver associated with the security descriptor that contains the DACL entry
- Name of the security descriptor that contains the DACL entry
- Whether the DACL is an allow or deny type of DACL entry
- The account name or SID to which the DACL is applied

**Parameters**

- **-vserver <vserver name>** - Vserver
  - Specifies the name of the Vserver associated with the security descriptor from which you want to remove a discretionary access control entry.

- **-ntfs-sd <ntfs sd name>** - NTFS Security Descriptor Name
  - Specifies the name of the security descriptor that contains the discretionary access control entry that you want to remove.

- **-access-type {deny|allow}** - Allow or Deny
  - Specifies whether the discretionary access control entry you want to remove is an *allow* or *deny* of access control.

- **-account <name or sid>** - Account Name or SID
  - Specifies the account name or SID associated with the discretionary access control entry that you want to remove.

**Examples**

The following example removes a DACL entry from the security descriptor named “sd2” with “allow” access type for the "BUILTIN\Administrators" account on Vserver vs1.

```
cluster1::> vserver security file-directory ntfs dacl remove -ntfs-sd sd2 -access-type allow -account BUILTIN\Administrators -vserver vs1
```

**vserver security file-directory ntfs dacl show**

Display NTFS security descriptor DACL entries

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The *vserver security file-directory ntfs dacl show* command displays information about all the discretionary access control entries in the Vserver. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all DACL entries:
• Vserver name
• Security descriptor
• List of DACL entries

You can specify the -fields parameter to specify which fields of information to display about DACL entries.

You can specify the -instance parameter to display all information about DACL entries in a list format.

**Parameters**

```
[[-fields <fieldname>,...]
  If you specify the -fields <fieldname>, ... parameter, the command only displays the fields that you specify.

| [-instance ]
  If you specify the -instance parameter, the command displays detailed information about all entries.

[ -vserver <vserver name> ] - Vserver
  If you specify this parameter, the command displays information only about discretionary access control entries associated with the specified Vserver.

[ -ntfs-sd <ntfs sd name> ] - NTFS Security Descriptor Name
  If you specify this parameter, the command displays information only about the discretionary access control entries for the security descriptor that you specify.

[ -access-type {deny|allow} ] - Allow or Deny
  If you specify this parameter, the command displays information only about the discretionary access control entries with the access type that you specify.

[ -account <name or sid> ] - Account Name or SID
  If you specify this parameter, the command displays information only about the discretionary access control entries associated with the account name or SID that you specify. You can use any of the following formats when specifying the value for this parameter:

  • SID
  • Domain\user-name
  • user-name@Domain
  • user-name@FQDN

  **Note:** If you specify any of the three user name formats for the value of -account, keep in mind that the value for the user name is case insensitive.

[ -rights {no-access|full-control|modify|read-and-execute|read|write} ] - Access Rights
  If you specify this parameter, the command displays information only about the discretionary access control entries with the user right that you specify. Only one value can be specified.

  You can specify one of the following rights values:

  • no-access
  • full-control
  • modify
  • read-and-execute
  • read
  • write
[-rights-raw <Hex Integer>] - Raw Access Rights (privilege: advanced)

If you specify this parameter, the command displays information only about the discretionary access control entries with the advanced user rights that you specify. This value for this parameter is mutually exclusive with any other rights values. Specify the value as a hexadecimal integer, for example: 0xA10F or 0xb3ff etc.

[-advanced-rights <Advanced access right>, ...] - Advanced Access Rights

If you specify this parameter, the command displays information only about the discretionary access control entries with the advanced user rights that you specify. You can specify more than one value by using a comma-delimited list.

You can specify one or more of the following advanced rights:

- read-data
- write-data
- append-data
- read-ea
- write-ea
- execute-file
- delete-child
- read-attr
- write-attr
- delete
- read-perm
- write-perm
- write-owner
- full-control

[-apply-to {this-folder|sub-folders|files}, ...] - Apply DACL Entry

If you specify this parameter, the command displays information only about the discretionary access control entries with the -applied-to value or values that you specify. You can specify more than one value by using a comma-delimited list.

You can specify one or more of the following values:

- this-folder
- sub-folder
- files

[-readable-access-rights <TextNoCase>] - Access Rights

If you specify this parameter, the command displays information only the discretionary access control entries with the readable access rights that you specify.

Examples

The following example shows information about a DACL entry.
vserver security file-directory ntfs sacl commands

Manage NTFS file security SACLs

vserver security file-directory ntfs sacl add

Add a SACL entry to NTFS security descriptor

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver security file-directory ntfs sacl add` command adds system access control list entries (ACEs) into a security descriptor’s system access control list (SACL).

If the security descriptor contains a SACL that has existing security ACEs, the command adds the new security ACE to the SACL. If the security descriptor does not contain a SACL, the command creates the SACL and adds the new security ACE to it.

Adding a SACL entry to the security descriptor is the second step in configuring and applying security ACLs to a file or folder. Before you can add a SACL entry to a security descriptor, you must first create the security descriptor.

The steps to creating and applying NTFS ACLs are the following:

- Create an NTFS security descriptor.
- Add DACL and SACL entries to the NTFS security descriptor.
  
  **Note:** If you want to audit file and directory events, you must configure auditing on the Vserver in addition to adding the SACL to the security descriptor.
- Create a file/directory security policy.
  
  This step associates the policy with a Vserver.
- Create policy tasks.
  
  A policy task refers to a single operation to apply to a file (or folder) or to a set of files (or folders). Amongst other things, the task defines which security descriptor to apply to a path.
- Apply a policy to the associated Vserver.

**Parameters**

-vserver `<vserver name>` - **Vserver**

Specifies the name of the Vserver associated with the security descriptor to which you want to add a system access control list entry.

-ntfs-sd `<ntfs sd name>` - **NTFS Security Descriptor Name**

  Specifies the name of the security descriptor to which you want to add a system access control list entry.
-access-type {failure|success} - Success or Failure
  Specifies whether the system access control list entry that you want to add is a failure or success access audit type.

-account <name or sid> - Account Name or SID
  Specifies the account on which to apply the system access control list entry. You can specify the account by using a user name or SID. You can use any of the following formats when specifying the value for this parameter:
  • SID
  • Domain\user-name
  • user-name@Domain
  • user-name@FQDN

  Note: If you specify any of the three user name formats for the value of -account, keep in mind that the value for the user name is case insensitive.

{-rights {no-access|full-control|modify|read-and-execute|read|write}]} - Access Rights
  Specifies the right that you want to add for the account specified in the -account parameter. The -rights parameter is mutually exclusive with the -advanced-rights and -rights-raw parameter. If you specify the -rights parameter, you can only specify one value.

  You can specify one of the following rights values:
  • no-access
  • full-control
  • modify
  • read-and-execute
  • read
  • write

{[-advanced-rights <Advanced access right>, ...]} - Advanced Access Rights
  Specifies the advanced rights that you want to add for the account specified in the -account parameter. The -advanced-rights parameter is mutually exclusive with the -rights and -rights-raw parameter. You can specify more than one advanced-rights value by using a comma-delimited list.

  You can specify one or more of the following advanced rights:
  • read-data
  • write-data
  • append-data
  • read-ea
  • write-ea
  • execute-file
  • delete-child
  • read-attr
  • write-attr
• delete
• read-perm
• write-perm
• write-owner
• full-control

| [[-rights-raw <Hex Integer>]] - Raw Access Rights (privilege: advanced) |
|-----------------|-----------------|
| Specifies the raw rights that you want to add for the account specified in the -account parameter. The -rights-raw parameter is mutually exclusive with the -advanced-rights and -rights parameter. Specify the value as a hexadecimal integer, for example: 0xA10F or 0xb3ff etc. |

| [-apply-to [this-folder|sub-folders|files], ...] - Apply SACL To |
|-----------------|-----------------|
| Specifies where to apply the system access control list entry. You can specify more than one value by using a comma-delimited list. |
| You can specify one or more of the following values: |
| • this-folder |
| • sub-folder |
| • files |
| **Note**: Select one of the following combinations of values for the -apply-to parameter for Storage-Level Access Guard (SLAG): |
| • this-folder, sub-folder, files |
| • this-folder, sub-folder |
| • files |
| If you specify an invalid -apply-to value, this security descriptor is removed from the associated Storage-Level Access Guard (SLAG) security file-directory policy task. |

**Examples**
The following example adds a SACL entry to the security descriptor named “sd1” on Vserver vs1.

```
cluster1::> vserver security file-directory ntfs sacl add -ntfs-sd sd1 -access-type failure -account DOMAIN\Administrator -rights full-control -apply-to this-folder -vserver vs1
```

```
cluster1::> vserver security file-directory ntfs sacl show -vserver vs1 -ntfs-sd sd1 -access-type deny -account DOMAIN\Administrator
```

```
Vserver: vs1
Security Descriptor Name: sd1
Access type for Specified Access Rights: failure
Account Name or SID: DOMAIN\Administrator
Access Rights: full-control
Advanced Access Rights: -
Apply To: this-folder
Access Rights: full-control
```
vserver security file-directory ntfs sacl modify

Modify an NTFS security descriptor SACL entry

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver security file-directory ntfs sacl modify command modifies parameters in an existing system access control list entry.

You can unambiguously define which SACL entry to modify by specifying the following four parameters in the modify command:

- Vserver associated with the security descriptor that contains the SACL entry
- Name of the security descriptor that contains the SACL entry
- Whether the SACL is a success or failure type of SACL entry
- The account name or SID to which the SACL is applied

You can modify the following parameters:

- -rights,-advanced-rights,-rights-raw
- -apply-to

Parameters
-vserver <vserver name> - Vserver
  Specifies the name of the Vserver associated with the security descriptor containing the system access control list entry whose fields you want to modify.

-ntfs-sd <ntfs sd name> - NTFS Security Descriptor Name
  Specifies the name of the security descriptor that contains the system access control list entry that you want to modify.

-access-type {failure|success} - Success or Failure
  Specifies whether the system access control list entry that you want to modify is a failure or success access audit type.

-account <name or sid> - Account Name or SID
  Specifies the account on which to apply the system access control list entry. You can specify the account by using a user name or SID. You can use any of the following formats when specifying the value for this parameter:
  - SID
  - Domain\user-name
  - user-name@Domain
  - user-name@FQDN

  Note: If you specify any of the three user name formats for the value of -account, keep in mind that the value for the user name is case insensitive.

{ [-rights {no-access|full-control|modify|read-and-execute|read|write}] - Access Rights
  Specifies the right that you want to add for the account specified in the -account parameter. The -rights parameter is mutually exclusive with the -advanced-rights and -rights-raw parameter. If you specify the -rights parameter, you can only specify one value.}
You can specify one of the following rights values:

- no-access
- full-control
- modify
- read-and-execute
- read
- write

[-rights-raw <Hex Integer>] - Raw Access Rights (privilege: advanced)

Specifies the raw rights that you want to add for the account specified in the -account parameter. The -rights-raw parameter is mutually exclusive with the -advanced-rights and -rights parameter. Specify the value as a hexadecimal integer, for example: 0xA10F or 0xb3ff etc.

[-advanced-rights <Advanced access right>, ...] - Advanced Access Rights

Specifies the advanced rights that you want to add for the account specified in the -account parameter. The -advanced-rights parameter is mutually exclusive with the -rights and -rights-raw parameter. You can specify more than one advanced-rights value by using a comma-delimited list.

You can specify one or more of the following advanced rights:

- read-data
- write-data
- append-data
- read-ea
- write-ea
- execute-file
- delete-child
- read-attr
- write-attr
- delete
- read-perm
- write-perm
- write-owner
- full-control

[-apply-to (this-folder|sub-folders|files), ...] - Apply SACL To

Specifies where to apply the system access control list entry. You can specify more than one value by using a comma-delimited list.

You can specify one or more of the following values:

- this-folder
- sub-folder
- files
**Note:** Select one of the following combinations of values for the `-apply-to` parameter for Storage-Level Access Guard (SLAG):

- this-folder, sub-folder, files
- this-folder, sub-folder
- files

If you specify an invalid `-apply-to` value, this security descriptor is removed from the associated Storage-Level Access Guard (SLAG) security file-directory policy task.

### Examples

The following example modifies the rights and `-apply-to` fields in the SACL entry.

```
cluster1::> vserver security file-directory ntfs sacl modify -ntfs-sd sd2 -access-type success -account BUILTIN\Administrators -vserver vs1 -rights modify -apply-to this-folder,sub-folders

cluster1::> vserver security file-directory ntfs sacl show -vserver vs1 -ntfs-sd sd2 -account BUILTIN\Administrators -instance

Vserver: vs1
Security Descriptor Name: sd2
Access type for Specified Access Rights: success
  Account Name or SID: BUILTIN\Administrators
  Access Rights: modify
  Advanced Access Rights: -
    Apply To: this-folder, sub-folders
    Access Rights: modify
```

**vserver security file-directory ntfs sacl remove**

Remove a SACL entry from NTFS security descriptor

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The `vserver security file-directory ntfs sacl remove` command removes a system access control list entry from a security descriptor.

You can unambiguously define which SACL entry to remove by specifying the following four parameters in the command:

- Vserver associated with the security descriptor that contains the SACL entry
- Name of the security descriptor that contains the SACL entry
- Whether the SACL is a success or failure type of SACL entry
- The account name or SID to which the SACL is applied

**Parameters**

- `vserver <vserver name>` - Vserver
  
  Specifies the name of the Vserver associated with the security descriptor from which you want to remove the system access control list entry.

- `ntfs-sd <ntfs sd name>` - NTFS Security Descriptor Name
  
  Specifies the name of the security descriptor that contains the system access control list entry that you want to remove.
-access-type \texttt{\{failure|success\}} - Success or Failure

Specifies whether the system access control list entry that you want to remove is a failure or success access audit type.

-account \texttt{<name or sid>} - Account Name or SID

Specifies the account name or SID associated with the system access control list entry that you want to remove.

**Examples**

The following example removes a SACL entry named “sd2” on Vserver vs1 with an access type of “success” associated with the “BUILTIN\Administrators” account.

```
cluster1::> vserver security file-directory ntfs sacl remove -ntfs-sd sd2 -access-type success -account BUILTIN\Administrators -vserver vs1
```

\texttt{vserver security file-directory ntfs sacl show}

Display NTFS security descriptor SACL entries

**Availability:** This command is available to cluster and Vserver administrators at the \texttt{admin} privilege level.

**Description**

The \texttt{vserver security file-directory ntfs sacl show} command displays information about all the system access control list entries in the Vserver. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all SACL entries:

- Vserver name
- Security descriptor
- List of SACL entries

You can specify the \texttt{-fields} parameter to specify which fields of information to display about SACL entries.

You can specify the \texttt{-instance} parameter to display all information about SACL entries in a list format.

**Parameters**

\{ \texttt{-fields <fieldname>, ...} \}

If you specify the \texttt{-fields <fieldname>, ...} parameter, the command only displays the fields that you specify.

\{ \texttt{-instance} \}

If you specify the \texttt{-instance} parameter, the command displays detailed information about all entries.

\texttt{-vserver <vserver name>} - Vserver

If you specify this parameter, the command displays information only about system access control list entries associated with the specified Vserver.

\texttt{-ntfs-sd <ntfs sd name>} - NTFS Security Descriptor Name

If you specify this parameter, the command displays information only about the system access control list entries for the security descriptor that you specify.

\texttt{-access-type \{failure|success\}} - Success or Failure

If you specify this parameter, the command displays information only about the system access control list entries with the access type that you specify.
[-account <name or sid>] - Account Name or SID

If you specify this parameter, the command displays information only about the system access control list entries associated with the account name or SID that you specify. You can use any of the following formats when specifying the value for this parameter:

- SID
- Domain\user-name
- user-name@Domain
- user-name@FQDN

**Note:** If you specify any of the three user name formats for the value of -account, keep in mind that the value for the user name is case insensitive.

[-rights {no-access|full-control|modify|read-and-execute|read|write}] - Access Rights

If you specify this parameter, the command displays information only about the system access control list entries with the user right that you specify. The value for this parameter is mutually exclusive with any other rights values. Only one value can be specified.

You can specify one of the following rights values:

- no-access
- full-control
- modify
- read-and-execute
- read
- write

[-rights-raw <Hex Integer>] - Raw Access Rights (privilege: advanced)

If you specify this parameter, the command displays information only about the system access control list entries with the advanced user rights that you specify. This value for this parameter is mutually exclusive with any other rights values. Specify the value as a hexadecimal integer, for example: 0xA10F or 0xb3ff etc.

[-advanced-rights <Advanced access right>, ...] - Advanced Access Rights

If you specify this parameter, the command displays information only about the system access control list entries with the advanced user rights that you specify. You can specify more than one value by using a comma-delimited list.

You can specify one or more of the following advanced rights values:

- read-data
- write-data
- append-data
- read-ea
- write-ea
- execute-file
- delete-child
- read-attr
• write-attr
• delete
• read-perm
• write-perm
• write-owner
• full-control

[-apply-to {this-folder|sub-folders|files}, ...] - Apply SACL To

If you specify this parameter, the command displays information only about the system access control list entries with the -applied-to value or values that you specify. You can specify more than one value by using a comma-delimited list.

You can specify one or more of the following values:
• this-folder
• sub-folder
• files

[-readable-access-rights <TextNoCase>] - Access Rights

If you specify this parameter, the command displays information only about the system access control list entries with the readable access rights that you specify.

Examples

The following example shows a SACL entry.

```
cluster1::> vserver security file-directory sacl show
  (vserver security file-directory ntfs sacl show)
Vserver: vs1
  NTFS Security Descriptor Name: sd1

  Account Name     Access   Access             Apply To
  Type     Rights            -----------
  -----------     -------  -------            -----------
  domain\user      success  full-control      this-folder, sub-folders, files
```

```

vserver security file-directory policy commands

Manage file security policies

vserver security file-directory policy create

Create a file security policy

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver security file-directory policy create command creates a security policy for a Vserver. A policy acts as a container for various tasks where each task is a single entry that can be applied to a file/folder.

Creating a security policy is the third step in configuring and applying security ACLs to a file or folder. You will later add tasks to the security policy.
Note: You cannot modify a security policy. If you want to apply a policy with the same settings to a different Vserver, you must create a new policy with the same configuration and apply it to the desired Vserver.

The steps to creating and applying NTFS ACLs are the following:

- Create an NTFS security descriptor.
- Add DACLS and SACLS to the NTFS security descriptor.
  
  Note: If you want to audit file and directory events, you must configure auditing on the Vserver in addition to adding SACLS to the security descriptor.

- Create a file/directory security policy.
  This step associates the policy with a Vserver.

- Create policy tasks.
  A policy task refers to a single operation to apply to a file (or folder) or to a set of files (or folders). Amongst other things, the task defines which security descriptor to apply to a path.

- Apply a policy to the associated Vserver.

**Parameters**

-vserver <vserver name> - Vserver
  Specifies the name of the Vserver on which to create the security policy.

-policy-name <Security policy name> - Policy Name
  Specifies the name of the security policy.

**Examples**

The following example creates a security policy named “policy1” on Vserver vs1.

```
cluster1::> vserver security file-directory policy create -policy-name policy1 -vserver vs1
```

```
cluster1::> vserver security file-directory policy show

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Policy Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>
<td>policy1</td>
</tr>
</tbody>
</table>
```

**vserver security file-directory policy delete**

Delete a file security policy

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The vserver security file-directory policy delete command deletes a security policy from a Vserver.

**Note:** Deleting a policy fails if a job is currently running for the specified policy.

**Parameters**

-vserver <vserver name> - Vserver
  Specifies the name of the Vserver associated with the security policy that you want to delete.

-policy-name <Security policy name> - Policy Name
  Specifies the name of the security policy you want to delete.
Examples

The following example deletes a security policy named “policy1” from Vserver vs1.

    cluster1::> vserver security file-directory policy delete -policy-name policy1 -vserver vs1

vserver security file-directory policy show

Display file security policies

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver security file-directory policy show command displays information about all security policies in the Vserver. The command output depends on the parameter or parameters specified with the command.

You can specify the -fields parameter to specify which fields of information to display about security policies.

You can specify the -instance parameter to display information for all security policies in a list format.

Parameters

\{ [-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command only displays the fields that you specify.

\{ [-instance]

If you specify the -instance parameter, the command displays detailed information about all entries.

[-vserver <vserver name>] - Vserver

If you specify this parameter, the command displays information only about security policies associated with the specified Vserver.

[-policy-name <Security policy name>] - Policy Name

If you specify this parameter, the command displays information only about the security policy you specify.

Examples

The following example displays information about the security policies on the cluster.

    cluster1::> vserver security file-directory policy show
    Vserver          Policy Name
    -------------     --------------
    vs1              policy1
    vs1              policy2
    2 entries were displayed.

vserver security file-directory policy task commands

Manage file security policy tasks

vserver security file-directory policy task add

Add a policy task

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.
Description
The vserver security file-directory policy task add command adds a single task entry to a security policy. A task refers to a single operation that can be done by a security policy to a file/folder.

Before you create a security policy task, you must first create a security policy and a security descriptor. You should also add DACL entries and SACL entries (if desired) to the security descriptor before you create the security policy task.

Note: You can add DACL and SACL entries to the security descriptor after you have associated it to a security policy task.

Creating a policy task is the fourth step in configuring and applying ACLs to a file or folder. When you create the policy task, you associate a security descriptor to it. You also associate the task to a security policy.

The steps to creating and applying NTFS ACLs are the following:

• Create an NTFS security descriptor.
• Add DACLS and SACLS to the NTFS security descriptor.
  Note: If you want to audit file and directory events, you must configure auditing on the Vserver in addition to adding SACLS to the Security Descriptor.
• Create a file/directory security policy. This step associates the policy with a Vserver.
• Create policy tasks. A policy task refers to a single operation to apply to a file (or folder) or to a set of files (or folders). Amongst other things, the task defines which security descriptor to apply to a path.
  Note: Adding a policy task fails if a job is currently running for the specified policy to which a task is being added.
• Apply a policy to the associated Vserver.

Parameters
-vserver <vserver name> - Vserver
  Specifies the Vserver associated with the security policy to which you want to add a task.

-policy-name <Security policy name> - Policy Name
  Specifies the name of the security policy into which you want to add the task.

-path <text> - Path
  Specifies the path of the file/folder on which to apply the security descriptor associated with this task.

[-index-num <integer>] - Position
  Specifies the index number of a task. Tasks are applied in order. A task with a larger index value is applied after a task with a lower index number. If you do not specify this optional parameter, new tasks are applied to the end of the index list.

  The range of supported values is 1 through 9999. If there is a gap between the highest existing index number and the value entered for this parameter, the task with this number is considered to be the last task in the policy and is treated as having an index number of the previous highest index plus one.
  Note: If you specify an index number that is already assigned to an existing task, index number will be auto arranged to highest index number in the table.

[-security-type {ntfs|nfsv4}] - Security Type of the File
  Specifies whether the security descriptor associated with this task is an NTFS or a NFSv4 security descriptor type. If you do not specify a value for this optional parameter, the default is “ntfs”.
  Note: The nfsv4 security descriptor type is not supported in this release. If you specify this optional parameter, you must enter ntfs for the -security-type value.
[-ntfs-mode {propagate|ignore|replace}] - Propagation Mode

Specifies how to propagate security settings to child subfolders and files. This setting determines how child files and/or folders contained within a parent folder inherit access control and audit information from the parent folder.

You can specify one of the three parameter values that correspond to three types of propagation modes:

- propagate - propagate inheritable permissions to all subfolders and files
- replace - replace existing permissions on all subfolders and files with inheritable permissions
- ignore - do not allow permissions on this file or folder to be replaced

Note: The ntfs-mode value is ignored for Storage-Level Access Guard (SLAG).

[-ntfs-sd <ntfs sd name>, ...] - NTFS Security Descriptor Name

Specifies the list of security descriptor names to apply to the path specified in the -path parameter.

[-access-control {file-directory|slag}] - Access Control Level

Specifies the access control of the task to be applied. Valid values are file-directory or slag. Use the value slag to apply the specified security descriptors with the task for the volume or qtree. Otherwise, the security descriptors are applied on files and directories at the specified path. The value slag is not supported on FlexGroups. The default value is file-directory.

Examples

The following example adds a security policy task entry to the policy named “policy1” on Vserver vs1.

```
cluster1::> vserver security file-directory policy task add -vserver vs1 -policy-name policy1 -path / -access-control slag -security-type ntfs -ntfs-mode propagate -ntfs-sd sd -index-num 1
```

```
cluster1::> vserver security file-directory policy task add -vserver vs1 -policy-name policy2 -path /l -security-type ntfs -ntfs-mode propagate -ntfs-sd sd1, sd2
```

```
cluster1::> vserver security file-directory policy task show
```

```
Vserver: vs1
Policy: policy1
    Index  File/Folder  Access     Security  NTFS       NTFS Security
    -----  -----------  ---------------  --------  ---------- ---------------
    1      /            slag            ntfs      propagate  sd
```

```
Vserver: vs1
Policy: policy2
    Index  File/Folder  Access     Security  NTFS       NTFS Security
    -----  -----------  ---------------  --------  ---------- ---------------
    1      /l           file-directory ntfs      propagate  sd1, sd2
```

vserver security file-directory policy task modify

Modify policy tasks

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver security file-directory policy task modify command modifies a task entry in a security policy.

Note: Modifying a policy task fails if a job is currently running for the specified policy in which a task is being modified.
You can unambiguously define which task to modify by specifying the following three parameters in the modify command:

- Vserver associated with the task
- Name of the security policy that contains the task
- Name of the path to which the task is applied

You can modify the following parameters:

- `-ntfs-mode`
- `-ntfs-sd`
- `-index-num`

Note: The only security type supported in this Data ONTAP release is "ntfs"; therefore, you cannot modify the `-security-type` parameter.

**Parameters**

- **-vserver `<vserver name>` - Vserver**
  Specifies the Vserver associated with the security policy that contains the task you want to modify.

- **-policy-name `<Security policy name>` - Policy Name**
  Specifies the name of the security policy that contains the task you want to modify.

- **-path `<text>` - Path**
  Specifies the path of the file/folder associated with the task that you want to modify.

[[-index-num `<integer>`] - Position]

  Specifies the index number of a task. Tasks are applied in order. A task with a larger index value is applied after a task with a lower index number. If you do not specify this optional parameter, new tasks are applied to the end of the index list.

  The range of supported values is 1 through 9999. If there is a gap between the highest existing index number and the value entered for this parameter, the task with this number is considered to be the last task in the policy and is treated as having an index number of the previous highest index plus one.

  Note: If you specify an index number that is already assigned to an existing task, the command fails when you attempt to create a duplicate entry.

- **[-security-type {ntfs|nfsv4}] - Security Type**
  Specifies whether the security descriptor in the task that you want to modify should be an NTFS security descriptor type or an NFSv4 security descriptor type. Default value is `ntfs`.

  Note: The nfsv4 security descriptor type is not supported in this release. If you specify this optional parameter, you must enter ntfs for the `security-type` value.

- **[-ntfs-mode {propagate|ignore|replace}] - NTFS Propagation Mode**
  Specifies how to propagate security settings to child subfolders and files. This setting determines how child files and/or folders contained within a parent folder inherit access control and audit information from the parent folder.

  You can specify one of the three parameter values that correspond to three types of propagation modes:

  - propagate - propagate inheritable permissions to all subfolders and files
  - replace - replace existing permissions on all subfolders and files with inheritable permissions
  - ignore - do not allow permissions on this file or folder to be replaced
[-ntfs-sd <ntfs sd name>, ...] - NTFS Security Descriptor Name

Specifies the list of security descriptor names to apply to the path specified in the -path parameter.

Examples
The following example modifies the ntfs mode, index, and ntfs-sd parameters in the security policy task entry.

```
classroom1::> vserver security file-directory policy task modify -vserver vs1 -policy-name policy1 -path / -security-type ntfs -ntfs-mode propagate -ntfs-sd sd -index-num 1

classroom1::> vserver security file-directory policy task modify -vserver vs1 -policy-name policy1 -path /1 -security-type ntfs -ntfs-mode propagate -ntfs-sd sd1, sd2 -index-num 2

classroom1::> vserver security file-directory policy task show -vserver vs1 -policy-name policy1

Vserver: vs1
Policy: policy1
Index    File/Folder     Access     Security       NTFS       NTFS Security descriptor name
-----    --------     -----------  ------     -----      -----------------
1        /           file-directory ntfs  propagate  sd
2        /1          file-directory ntfs  propagate  sd1, sd2
```

vserver security file-directory policy task remove

Remove a policy task

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver security file-directory policy task remove command removes a task entry from a security policy.

Note: Removing a policy task fails if a job is currently running for the specified policy from which a task is being removed.

Parameters

- `-vserver <vserver name>` - Vserver
  Specifies the Vserver associated with the security policy that contains the task you want to remove.

- `-policy-name <Security policy name>` - Policy Name
  Specifies the name of the security policy that contains the task you want to remove.

- `-path <text>` - Path
  Specifies the path of the file/folder associated with the task that you want to remove.

Examples
The following example removes a security policy task entry.

```
classroom1::> vserver security file-directory policy task remove -vserver vs1 -policy-name policy1 -path /
```

vserver security file-directory policy task show

Display policy tasks

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.
Description

The `vserver security file-directory policy task show` command displays information about all the task entries in the Vserver. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all task entries:

- Vserver name
- Policy name
- Task entries

Parameters

`{ [-fields <fieldname>, ...]`  
If you specify the `-fields <fieldname>, ...` parameter, the command only displays the fields that you specify.

`[-instance]`  
If you specify the `-instance` parameter, the command displays detailed information about all entries.

`[-vserver <vserver name>]` - Vserver  
If you specify this parameter, the command displays information only tasks associated with the specified Vserver.

`[-policy-name <Security policy name>]` - Policy Name  
If you specify this parameter, the command displays information only about tasks associated with the specified security policy.

`[-index-num <integer>]` - Position  
If you specify this parameter, the command displays information only about tasks assigned the index number that you specify.

`[-path <text>]` - Path  
If you specify this parameter, the command displays information only about tasks applied to the specified path.

`[-security-type {ntfs|nfsv4}]` - Security Type  
If you specify this parameter, the command displays information only about tasks associated with the specified security type.

  **Note:** The nfsv4 security descriptor type is not supported in this release.

`[-ntfs-mode {propagate|ignore|replace}]` - NTFS Propagation Mode  
If you specify this parameter, the command displays information only about tasks configured with the NTFS propagation mode that you specify.

`[-ntfs-sd <ntfs sd name>, ...]` - NTFS Security Descriptor Name  
If you specify this parameter, the command displays information only about the policy tasks associated with the NTFS security descriptor that you specify.

`[-access-control {file-directory|slag}]` - Access Control Level  
If you specify this parameter, the command displays information only about tasks associated to the access control.

Examples

The following example displays policy task entries for a policy named “policy1” on Vserver vs1.

```
cluster1::> vserver security file-directory policy task show -vserver vs1 -policy-name policy1

Vserver: vs1
Policy: policy1
```

vserver security commands
vserver security trace commands

Manage security tracing

vserver security trace filter commands

Here we create a filter for tracing files and directories.

vserver security trace filter create

Create a security trace entry

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `vserver security trace filter create` command creates a security trace filter entry. Prior to Data ONTAP 9.3, this feature was only supported for CIFS. In Data ONTAP 9.3 and later, this feature is supported for both NFS and CIFS.

NFS security trace filters are not supported for FlexGroup volumes, and will only be applied to the FlexVol volumes within the specified Vserver.

**Parameters**
- `vserver <vserver name>` - *Vserver*
  
  This parameter specifies the name of the Vserver on which the permission trace is applied.

- `index <integer>` - Filter Index
  
  This parameter specifies the index number you want to assign to the trace filter. A maximum of 10 entries can be created. The allowed values for this parameter are 1 through 10.

- `protocols {cifs|nfs}, ...` - Protocols
  
  This parameter specifies the protocols for which the permission trace is created. If the `protocols` parameter is not specified, the filter will only apply to the CIFS protocol.

- `client-ip <IP Address>` - Client IP Address to Match
  
  This parameter specifies the IP Address from which the user is accessing the Vserver.

- `path <TextNoCase>` - Path
  
  This parameter specifies the path to which permission tracing is applied. The value can be the complete path, starting from the root of the share (for a CIFS filter) or the root of the junction path (for an NFS filter) that the client is accessing, or the value can be a part of the path that the client is accessing. Use NFS style directory separators in the path value.

- `{ [windows-name <TextNoCase>] - Windows User Name }
  
  This parameter specifies the Windows user name to trace. You can use any of the following formats when specifying the value for this parameter:
  
  • user_name
  
  • domain\user_name
[-unix-name \<TextNoCase\>] - UNIX User Name or User ID
This parameter specifies the UNIX user name to trace. It accepts UNIX user ID only for NFS filters.

[-trace-allow \{yes\|no\}] - Trace Allow Events
Security tracing can trace deny events and allow events. Deny event tracing is always ON by default. Allow
events can optionally be traced. If set to yes, this option allows tracing of allow events. If set to no, allow
events are not traced.

[-enabled \{enabled\|disabled\}] - Filter Enabled
This parameter specifies whether to enable or disable the filter. Filters are enabled by default.

[-time-enabled \<integer\>] - Minutes Filter is Enabled
This parameter specifies a timeout for this filter, after which it is disabled.

Examples
The following example creates a security trace filter.

```
cluster1::> vserver security trace filter create -vserver vs0 -index 1 -time-enabled 120 -client-ip 10.72.205.207
```

The following examples create filters that include the -path option. If the client is accessing a file with the path \server
\sharename\dir1\dir2\dir3\file.txt, for a filter applicable to CIFS, a complete path starting from the root of the share or a
partial path can be given as shown:

```
cluster1::> vserver security trace filter create -vserver vs0 -index 1 -path /dir1/dir2/dir3/file.txt
cluster1::> vserver security trace filter create -vserver vs0 -index 1 -path dir3/file.txt
```

Similarly, while creating a filter for NFS, if -path option is specified and the client is accessing a file with path /
junction_path1/junction_path2/dir1/file.txt, a complete path starting from the last junction path or a
partial path can be given as shown:

```
cluster1::> vserver security trace filter create -vserver vs0 -index 1 -protocols nfs -path dir1/file.txt
cluster1::> vserver security trace filter create -vserver vs0 -index 1 -protocols nfs -path file.txt
```

The following example creates a filter that is applicable to both CIFS and NFS.

```
cluster1::> vserver security trace filter create -vserver vs0 -index 1 -protocols cifs,nfs -unix-user root
```

vserver security trace filter delete
Delete a security trace entry

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver security trace filter delete command deletes a security trace filter entry. Prior to Data ONTAP 9.3,
this feature was only supported for CIFS. In Data ONTAP 9.3 and later, this feature is supported for both NFS and CIFS.

NFS security trace filters are not supported for FlexGroup volumes, and will only be applied to the FlexVol volumes within the
specified Vserver.
Parameters

-vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver on which the tracing filter entry that you want to delete is applied.

-index <integer> - Filter Index

This parameter specifies the index number for the filter that you want to delete. You can display a list of the filter index numbers by using the vserver security trace filter show command.

Examples

The following example deletes a security trace filter.

cluster1:/> vserver security trace filter delete -vserver vs0 -index 1

vserver security trace filter show on page 2107

vserver security trace filter modify

Modify a security trace entry

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver security trace filter modify command modifies a security trace filter entry. Prior to Data ONTAP 9.3, this feature was only supported for CIFS. In Data ONTAP 9.3 and later, this feature is supported for both NFS and CIFS.

NFS security trace filters are not supported for FlexGroup volumes, and will only be applied to the FlexVol volumes within the specified Vserver.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver on which the permission trace is applied.

-index <integer> - Filter Index

This parameter specifies the index number for the filter. A maximum of 10 entries can be created. The allowed values for this parameter are 1 through 10.

-protocols {cifs,nfs}, ... - Protocols

This parameter specifies the protocols for which the permission trace is created.

-client-ip <IP Address> - Client IP Address to Match

This parameter specifies the IP Address from which the user is accessing the Vserver.

-path <TextNoCase> - Path

This parameter specifies the path to which permission tracing is applied. The value can be the complete path, starting from the root of the share (for a CIFS filter) or the root of the junction path (for an NFS filter) that the client is accessing, or the value can be a part of the path that the client is accessing. Use NFS style directory separators in the path value.

{ -windows-name <TextNoCase> - Windows User Name

This parameter specifies the Windows user name to trace. You can use any of the following formats when specifying the value for this parameter:

• user_name
• domain\user_name

[-unix-name <TextNoCase>] - UNIX User Name or User ID
This parameter specifies the UNIX user name to trace. It accepts UNIX user ID only for NFS filters.

[-trace-allow (yes|no)] - Trace Allow Events
Security tracing can trace deny events and allow events. Deny event tracing is always ON by default. Allow events can optionally be traced. If set to yes, this option allows tracing of allow events. If set to no, allow events are not traced.

[-enabled (enabled|disabled)] - Filter Enabled
This parameter specifies whether to enable or disable the filter. Filters are enabled by default.

[-time-enabled <integer>] - Minutes Filter is Enabled
This parameter specifies a timeout for this filter, after which it is disabled.

**Examples**

The following example modifies a security trace filter.

```
cluster1::> vserver security trace filter modify -vserver vs0 -index 1 -time-enabled 120 -client-ip 10.72.205.207
```

The following examples modify filters that include the -path option. If the client is accessing a file with the path \server\sharename\dir1\dir2\dir3\file.txt, for a filter applicable to CIFS, a complete path starting from the root of the share or a partial path can be given as shown:

```
cluster1::> vserver security trace filter modify -vserver vs0 -index 1 -path /dir1/dir2/dir3/file.txt
cluster1::> vserver security trace filter modify -vserver vs0 -index 1 -path dir3/file.txt
```

Similarly, for filters applicable to NFS, if -path option is specified and the client is accessing a file with path /junction_path1/junction_path2/dir1/file.txt, a complete path starting from the last junction path or a partial path can be given as shown:

```
cluster1::> vserver security trace filter modify -vserver vs0 -index 1 -protocols nfs -path dir1/file.txt
cluster1::> vserver security trace filter modify -vserver vs0 -index 1 -protocols nfs -path file.txt
```

The following example modifies a filter that is applicable to both CIFS and NFS.

```
cluster1::> vserver security trace filter modify -vserver vs0 -index 1 -protocols cifs,nfs -unix-user root -path file.txt
```

**vserver security trace filter show**

Display a security trace entry

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver security trace filter show` command displays information about security trace filter entries. Prior to Data ONTAP 9.3, this feature was only supported for CIFS. In Data ONTAP 9.3 and later, this feature is supported for both NFS and CIFS.
NFS security trace filters are not supported for FlexGroup volumes, and will only be applied to the FlexVol volumes within the specified Vserver.

Parameters

{-fields <fieldname>, ...]
   If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?' to display the fields to specify.

{[-instance ]}
   If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver
   If you specify this parameter, the command displays permission tracing information only for filters applied to the specified Vserver.

{-index <integer>]} - Filter Index
   If you specify this parameter, the command displays permission tracing information only for filters with the specified filter index number.

{-protocols {cifs|nfs}, ...] - Protocols
   If you specify this parameter, the command displays permission tracing information only for filters applied to the specified protocols.

{-client-ip <IP Address>] - Client IP Address to Match
   If you specify this parameter, the command displays permission tracing information only for filters applied to the specified client IP address.

{-path <TextNoCase>] - Path
   If you specify this parameter, the command displays permission tracing information only for filters applied to the specified path.

{-windows-name <TextNoCase>] - Windows User Name
   If you specify this parameter, the command displays permission tracing information only for filters applied to the specified Windows user name.

{-unix-name <TextNoCase>] - UNIX User Name or User ID
   If you specify this parameter, the command displays permission tracing information only for filters applied to the specified UNIX user name or user ID(for NFS specific filters).

{-trace-allow {yes|no}] - Trace Allow Events
   If you specify this parameter, the command displays information only about events that either trace or do not trace allow events, depending on the value provided.

{-enabled {enabled|disabled}] - Filter Enabled
   If you specify this parameter, the command displays information only about filters that either are enabled or disabled, depending on the value provided.

{-time-enabled <integer>]} - Minutes Filter is Enabled
   If you specify this parameter, the command displays information only about filters that are disabled after the specified minutes.

Examples

The following example displays security trace filters for Vserver vserver1.

```
cluster1::> vserver security trace filter show
+-------------+----------+----------+----------------+-----------------+---------------+-----------------+
| Vserver     | Index    | Client-IP| Path           | Trace-Allow     | Windows-Name  | Protocol       |
|-------------+----------+----------+----------------+-----------------+---------------+-----------------+
| vserver1    | 1        | -        | -              | no              | domain\user   | cifs            |
| vserver1    | 2        | 192.168.2.3 | -              | yes             | -             | cifs            |
```

Commands: Manual Page Reference
vserver security trace trace-result commands

Trace results can be seen here.

vserver security trace trace-result delete

Delete security trace results

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
Delete the specified security tracing event record.

**Parameters**
- **-node {<nodename>|local} - Node**
  This parameter specifies the cluster node on which the permission tracing event that you want to delete occurred.
- **-vserver <vserver name> - Vserver**
  This parameter specifies the Vserver on which the permission tracing event that you want to delete occurred.
- **-seqnum <integer> - Sequence Number**
  This parameter specifies the sequence number of the log entry to be deleted.

**Examples**
The following example deletes the security trace result record for the Vserver vserver_1 on node Node_1 whose sequence number is 999.

```
cluster1::> vserver security trace trace-result delete -vserver vserver_1 -node Node_1 -seqnum 999
```

vserver security trace trace-result show

Display security trace results

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver security trace trace-result show` command displays the list of security trace event records stored on the cluster. These records are generated in response to security trace filters that are created using the `vserver security trace filter create` command. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all the security trace events generated since the filter was enabled:

- Vserver name
- Cluster node name
- Security trace filter index number
- User name
You can specify additional parameters to display only information that match those parameters. For example, to display information about events that occurred for the user "guest", run the command with -user-name parameter set to guest.

Parameters
{ [-fields <fieldname>, ...]
  If you specify this parameter, the command only displays the fields that you specify.

| [-instance ]] | If you specify this parameter, the command displays detailed information about all security trace events.

[-node (nodename) | local)] - Node
  If you specify this parameter, the command displays information only about security trace events on the specified node.

[-vserver vserver name] - Vserver
  If you specify this parameter, the command displays information only about security trace events on the specified Vserver.

[-seqnum <integer>] - Sequence Number
  If you specify this parameter, the command displays information only about the security trace events with this sequence number.

[-keytime Date] - Time
  If you specify this parameter, the command displays information only about security trace events that occurred at the specified time.

[-index <integer>] - Index of the Filter
  If you specify this parameter, the command displays information only about security trace events that occurred as a result of the filter corresponding to the specified filter index number.

[-client-ip IP Address] - Client IP Address
  If you specify this parameter, the command displays information only about security trace events that occurred as a result of file access from the specified client IP address.

[-path TextNoCase] - Path of the File Being Accessed
  If you specify this parameter, the command displays information only about the security trace events that occurred as a result of file accesses to the specified path.

[-win-user TextNoCase] - Windows User Name
  If you specify this parameter, the command displays information only about the security trace events that occurred as a result of file access by the specified Windows user.

[-security-style security style] - Effective Security Style On File
  If you specify this parameter, the command displays information only about the security trace events that occurred on file systems with the specified security style. The allowed values for security style are the following:
  • SECURITY_NONE - Security not Set
  • SECURITY_UNIX_MODEBITS - UNIX and UNIX permissions
  • SECURITY_UNIX_ACL - UNIX and NFSv4 ACL
  • SECURITY_UNIX_SD - UNIX and NT ACL
[-result <TextNoCase>] - Result of Security Checks

If you specify this parameter, the command displays information about the security trace events that have the specified result. Access to a file or a directory can be 'allowed' or 'denied'. Output from this command displays the result as a combination of the reason for allowing or denying access, the location where access is either allowed or denied, and the access right for which the file operation is allowed or denied.

The following are the reasons why an access can be allowed:

• Access is allowed because the operation is trusted and no security is configured
• Access is allowed because the user has UNIX root privileges
• Access is allowed because the user has UNIX owner privileges
• Access is allowed because UNIX implicit permission grants requested access
• Access is allowed because the CIFS user is owner
• Access is allowed because the user has take ownership privilege
• Access is allowed because there is no CIFS ACL
• Access is allowed because CIFS implicit permission grants requested access
• Access is allowed because the security descriptor is corrupted and the user is a member of the Administrators group
• Access is allowed because the ACL is corrupted and the user is a member of the Administrators group
• Access is allowed because the user has UNIX permissions
• Access is allowed because explicit ACE grants requested access
• Access is allowed because the user has audit privileges
• Access is allowed because the user has superuser credentials
• Access is allowed because inherited ACE grants requested access
• Access is allowed because storage-level access guard (SLAG) grants requested access
• Access is allowed because no central access policies applied
• Access is allowed because no central access policies could be applied from the corrupt SACL
• Access is allowed because matching central access policy could not be located
• Access is allowed because no central access rules apply to the object
• Access is allowed because skipped one or more corrupt central access rules
• Access is allowed because all evaluated central access rules grant access

The following are the reasons why an access can be denied:
• Access is denied by UNIX permissions
• Access is denied by an explicit ACE
• Access is denied. The requested permissions are not granted by the ACE
• Access is denied. The security descriptor is corrupted
• Access is denied. The ACL is corrupted
• Access is denied. The sticky bit is set on the parent directory and the user is not the owner of file or parent directory
• Access is denied. The owner can be changed only by root
• Access is denied. The UNIX permissions/uid/gid/NFSv4 ACL can be changed only by owner or root
• Access is denied. The GID can be set by owner to a member of its legal group list only if 'Owner can chown' is not set
• Access is denied. The file or the directory has readonly bit set
• Access is denied. There is no audit privilege
• Access is denied. Enforce DOS bits blocks the access
• Access is denied. Hidden attribute is set
• Access is denied by an inherited ACE
• Access is denied as the volume is readonly or directory is a snapshot
• Access is denied. System attribute is not set in the request
• Access is denied by the storage-level access guard (SLAG)
• Access is denied, file is infected
• Access is denied. Central access policy DB not ready
• Access is denied. Central access rule is corrupt
• Access is denied. Central access rule explicitly denied access
• Access is denied. Matching central access policy not found
• Access is denied because the user does not have UNIX root privileges
• Access is denied because the UNIX user could not be mapped to a valid NT user
• Access is denied because the UNIX permissions/uid/gid/NFSv4 ACL cannot be set in an NTFS qtree

The command or the location at which access was denied or allowed are as follows:
• while traversing the directory.
• while truncating the file.
• while creating the directory.
• while creating the file.
• while checking parent's mode bits during delete.
• while deleting the child.
• while checking for child-delete access on the parent.
• while reading security descriptor.
• while accessing the link.
• while creating the directory.
• while creating or writing the file.
• while opening existing file or directory.
• while setting the attributes.
• while traversing the directory.
• while reading the file.
• while reading the directory.
• while deleting the target during rename.
• while deleting the child during rename.
• while writing data in the parent during rename.
• while adding a directory during rename.
• while adding a file during rename.
• while updating the target directory during rename.
• while setting attributes.
• while writing to the file.
• while extending the coral file.
• while creating the vdisk file.
• while checking for stale locks before open.
• while deleting a file or a directory.
• while truncating a hidden file.
• while truncating a file.
• while truncating a system file.
• while appending to a file or setting a file attribute.
• while opening a file or directory for delete.
• while checking for permission on parent directory during create.
• while appending to the file.
• while creating the device file.
• while reading the user's access rights on an object.

The access rights for which the file operation is allowed or denied are as follows:
• Append.
• Delete.
• Delete Child.
• Execute.
• Generic All.
• Generic Execute.
• Generic Read.
• Generic Write.
• Maximum Allowed.
• Read.
• Read Attributes.
• Read Control.
• Read EA.
• System Security.
• Synchronize.
• Write.
• Write Attributes.
• Write DAC.
• Write EA.
• Write Owner.
• None.

[-unix-user <TextNoCase>] - UNIX User Name
   If you specify this parameter, the command displays information only about the security trace events that occurred as a result of file access by the specified UNIX user.

[-session-id <integer>] - CIFS Session ID
   If you specify this parameter, the command displays information only about the security trace events that occurred as a result of file access by the specified CIFS session ID.

[-share-name <TextNoCase>] - Accessed CIFS Share Name
   If you specify this parameter, the command displays information only about the security trace events that occurred as a result of file access by the specified CIFS share name.

[-protocol {cifs|nfs}] - Protocol
   If you specify this parameter, the command displays information only about the security trace events that occurred for the specified protocol.
If you specify this parameter, the command displays information only about the security trace events that occurred as a result of file access by the specified volume name.

### Examples

The following example displays information about security trace records:

```bash
cluster1::> vserver security trace trace-result show
Vserver: vserver_1

<table>
<thead>
<tr>
<th>Node</th>
<th>Index</th>
<th>Filter Details</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>cluster1-01</td>
<td>1</td>
<td>Security Style: MIXED and NT ACL</td>
<td>Access is allowed because CIFS implicit permission grants requested access while opening existing file or directory. Access is granted for: &quot;Read Attributes&quot;</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Protocol: cifs</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Share: sh1</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Path: /stk/bit</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Win-User: cifs1\administrator</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>UNIX-User: root</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Session-ID: 58455810</td>
<td></td>
</tr>
</tbody>
</table>

1 entries were displayed.

The following example displays information about security trace records for path /stk/bit/set:

```bash
cluster1::> vserver security trace trace-result show -path /stk/bit/set
Vserver: vserver_1

<table>
<thead>
<tr>
<th>Node</th>
<th>Index</th>
<th>Filter Details</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>cluster1-01</td>
<td>1</td>
<td>Security Style: MIXED and UNIX permissions</td>
<td>Access is allowed because the user has UNIX root privileges while opening existing file or directory. Access is granted for: &quot;Read&quot;</td>
</tr>

Access Check

**vserver services access-check authentication commands**

Check Authentication Information
vserver services access-check authentication get-claim-name

Get the Name of a Claim

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The `vserver services access-check authentication get-claim-name` command obtains the display name for a given claim.

Parameters

- `-node {<nodename> | local}` - Node Name
  The name of the node on which the command is executed.

- `-vserver <vserver>` - Vserver Name
  The name of the Vserver.

- `-claim-cn <text>` - Claim CN
  The claim ID of the claim display name.

Examples

This example gets the display name of a claim for the CIFS server created on Vserver vs2.

```
cluster1::vserver services access-check*> authentication get-dc-info -node vsim1 -vserver vs2 -claim-cn ad://ext/accountExpires:88d065c21536d9fe
  Name of claim ad://ext/accountExpires:88d065c21536d9fe: accountExpires
```

vserver services access-check authentication get-dc-info

Get Domain Controller Information

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The `vserver services access-check authentication get-dc-info` command obtains information about one of the Domain Controllers (DC) for the domain of which the CIFS server is a member. The information fetched is the Forest and Domain of which the DC is a member, the NetBIOS name of the Domain, the NetBIOS Hostname of the DC, the CIFS Server site, the CIFS Client site, GUID of the domain and flags. Flags describe the features and roles of the DC.

Parameters

- `-node {<nodename> | local}` - Node Name
  The name of the node on which the command is executed.

- `-vserver <vserver>` - Vserver Name
  The name of the Vserver.

Examples

This example gets the information about a Domain Controller for CIFS server created on Vserver vs2.

```
cluster1::vserver services access-check*> authentication get-dc-info -node vsim2-d1-01 -vserver vs2
  DC Information:
  -----------------
  Forest: cifs.lab.netapp.com
```
vserver services access-check authentication login-cifs

Authenticate a CIFS user

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The vserver services access-check authentication login-cifs command authenticates a Windows user through the specified node using the specified Vserver's configuration. Upon success, it displays the user's Windows and UNIX credentials.

Parameters

- **[-node {<nodename>|local}] - Node**
  The name of the node on which the command is executed.

- **-vserver <vserver> - Vserver**
  The name of a Vserver with a configured CIFS server.

- **-user <text> - Windows Name**
  The name of a user that is a member of the Windows or a trusted domain that the CIFS server in the specified Vserver belongs to.

- **[-clientIp <IP Address>] - Client IP Address**
  The IP address of the client as specified by the user

Examples

This example authenticates the Windows user "administrator" through node "node2" using the configuration of "vs1." Upon success, it displays the Windows and UNIX credentials for user "administrator."

```
cluster1:vserver services access-check*> authentication login-cifs -vserver vs1 -user administrator -node node2
Enter the password:
Primary Grp: S-1-5-21-1407423728-2963865486-1834115207-513
  Domain: S-1-5-21-1407423728-2963865486-1834115207 Rids: 500, 520, 513, 22226, 26625, 1842, 512, 519, 518, 8323, 1645, 1648, 1644, 1647
  Domain: S-1-1 Rids: 0
  Domain: S-1-5 Rids: 11, 2
  Unix ID: 0, GID: 0
  Flags: 1
  Domain ID: 0
  Other GIDs:
Authentication Succeeded.
```
vserver services access-check authentication ontap-admin-login-cifs

Authenticate Data ONTAP admin CIFS user

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The vserver services access-check authentication ontap-admin-login-cifs command authenticates the Data ONTAP administrator's user through the specified node using the specified Vserver's configuration. Upon success, it displays the user's Windows credentials.

Parameters
[-node <nodename>|local] - Node
   The name of the node on which the command is executed.

-vserver <vserver> - Vserver
   The name of a Vserver with a configured CIFS server.

-user <text> - User Name
   The name of a user that is a member of the Windows or a trusted domain that the CIFS server in the specified Vserver belongs to.

[-clientIp <IP Address>] - Client IP Address
   The IP address of the client as specified by the user

Examples
This example authenticates the Data ONTAP administrator user "administrator" through node "node2" using the configuration of Vserver "vs1." Upon success, it displays the CIFS credentials for "administrator."

```
cluster1::vserver services access-check*> authentication ontap-admin-login-cifs -vserver vs1 -user administrator -node node2
Enter the password:
Primary Grp: S-1-5-21-1407423728-2963865486-1834115207-513
   Domain: S-1-5-21-1407423728-2963865486-1834115207 Rids: 500, 520, 513, 22226, 26625, 1842, 512, 519, 518, 5823, 1645, 1648, 1644, 1647, 1003
   Domain: S-1-1 Rids: 0
   Domain: S-1-5 Rids: 11, 2
Authentication Succeeded.
```

vserver services access-check authentication show-creds

Display a user's credentials based on a UNIX UID or Windows SID

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The vserver services access-check authentication show-creds command returns the credentials for a Windows user using SID, a Windows user using a Windows username, a UNIX user using UID, or a UNIX user using a UNIX user name. This command is useful for retrieving information such as account type, SIDs, UIDs, GIDs, privileges, and domain or group membership.

Parameters
[-node <nodename>|local] - Node
   The name of the node on which the command is executed.
-vserver <vserver> - Vserver

The command displays information for the specified Vserver.

{-uid <integer> - UID

The UNIX user's UID.

| -sid <text> - SID

The Windows user's SID.

| -unix-user-name <text> - Unix User Name

The UNIX username.

| -win-name <text>} - Windows Name

The Windows username.

[-list-name (true|false)] - Display Translated Names

If this parameter is specified, the command displays information as translated names.

[-list-id (true|false)] - Display IDs

If this parameter is specified, the command displays information as IDs.

[-clientIp <IP Address>] - Client IP Address

The IP address of the client as specified by the user

[-skip-domain-group (true|false)] - Skip Domain Groups

If this parameter is specified, Windows domain group membership will not be fetched and only local group membership will be displayed, if any.

Examples

This example returns credential information for UNIX user with UID "0" on node "node1" for Vserver "vs1."

```
cluster1::*> vserver services access-check authentication show-creds -node node1 -vserver vs1 -uid 0
(vserver services access-check authentication show-creds)

UNIX UID: root <> Windows User: CIFSQA\Administrator (User)

GID: root
Supplementary GIDs: <None>

Windows Membership:
CIFSQA\Schema Admins (Domain group)
CIFSQA\Enterprise Admins (Domain group)
CIFSQA\Domain Admins (Domain group)
CIFSQA\Domain Users (Domain group)
CIFSQA\Group Policy Creator Owners (Domain group)
BUILTIN\Administrators (Alias)
BUILTIN\Users (Alias)
User is also a member of Everyone, Authenticated Users, and Network Users

Privileges (0x2b7):
SeBackupPrivilege
SeRestorePrivilege
SeTakeOwnershipPrivilege
```

This example returns credential information for UNIX user with UID "0" on node "node1" for Vserver "vs1" when list-name "false" and list-id "true."

```
cluster1::*> vserver services access-check authentication show-creds -node node1 -vserver vs1 -uid 0 -list-name false -list-id true
(vserver services access-check authentication show-creds)

vserver services access-check authentication show-ontap-admin-unix-creds

Display Data ONTAP admin Unix credentials based on username or user ID

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**
The `vserver services access-check authentication show-ontap-admin-unix-creds` uses the Vserver's ns-switch configuration to determine and display Data ONTAP administrator's UNIX information.

**Parameters**

- `-node {<nodename>|local}` - Node
  The name of the node on which the command is executed.

- `-vserver <vserver>` - Vserver
  The name of the Vserver.

- `{ -unix-user-name <text> - Unix User Name
  The UNIX username.

- | -uid <integer> } - Unix User ID
  The UID of a UNIX user.

**Examples**

This example shows Data ONTAP administrator's UNIX user's UID, GID, home directory, and login shell for user "root" on Vserver "vs1" for node "node2."

```
cluster1::vserver services access-check*> authentication show-ontap-admin-unix-creds -vserver vs1 -unix-user-name root -node node2
  User ID: 0
  Group ID: 1
  Home Directory: /
  Login Shell: /bin/csh
```

vserver services access-check authentication sid-to-uid

Translate a Windows SID to a UNIX user ID

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**
The `vserver services access-check authentication sid-to-uid` translates a Windows SID to a UNIX UID.

**Parameters**

- `-node {<nodename>|local}` - Node Name
  The name of the node on which the command is executed.

- `-vserver <vserver>` - Vserver Name
  The name of the Vserver.

- `-sid <text>` - Windows SID
  The SID of a Windows user.

- `[ -clientIp <IP Address> ]` - Client IP Address
  The IP address of the client as specified by the user
**Examples**

This example translates a Windows SID on node "node2" and returns the corresponding UNIX user's UID.

```
cluster1::vserver services access-check*> sid-to-uid -vserver vs1 -sid
S-1-5-21-1407423728-2963865486-1834115207-500 -node node2
UID: 0
```

**vserver services access-check authentication sid-to-unix-name**

Translate a Windows SID to a UNIX User Name

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**

The `vserver services access-check authentication sid-to-unix-name` translates a Windows SID to a UNIX Name.

**Parameters**

`[-node {<nodename>|local}] - Node Name`

- The name of the node on which the command is executed.

`-vserver <vserver> - Vserver Name`

- The name of the Vserver.

`-sid <text> - Windows SID`

- The Windows SID which is to be translated to the corresponding UNIX name.

**Examples**

This example translates a Windows SID on node "node2" and returns the corresponding UNIX name.

```
cluster1::vserver services access-check*> sid-to-unix-name -node node2 -vserver vs1 -sid
S-1-5-21-1407423728-2963865486-1834115207-500
SID Type: User
UNIX Name: test
Domain Name: TESTDOMAIN
Windows Name: test
```

**vserver services access-check authentication translate**

Translate between Various Names and Their Identifiers

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**

The `vserver services access-check authentication translate` command translates SIDs, UIDs, and GIDs to names. If you enter a SID, the command returns a Windows name; if you enter a Windows name, the command returns a SID; if you enter a UNIX username, the command returns a UID; if you enter a UID, the command returns a UNIX username; if you enter a GID, the command returns a UNIX group name; if you enter a UNIX group-name, the command returns a GID.

**Parameters**

`[-node {<nodename>|local}] - Node Name`

- The name of the node on which the command is executed.
-vserver <vserver> - Vserver Name
The name of the Vserver.

{-uid <integer> - UNIX User ID
The UNIX user's UID.

| -gid <integer> - UNIX Group ID
The UNIX user's GID.

| -sid <text> - Windows SID
The Windows user's SID.

| -unix-user-name <text> - UNIX User Name
The UNIX username.

| -unix-group-name <text> - UNIX Group Name
The UNIX group name.

| -win-name <text> - Windows Name
The Windows name.

**Examples**
This example translates the UNIX UID 0 to username "root" on node "node2" for Vserver "vs1."

```
cluster1::vserver services access-check*> authentication translate -vserver vs1 -uid 0 -node node2
root
```

This example translates and the Windows username "administrator" to the corresponding SID on node "node2" for Vserver "vs1."

```
cluster1::vserver services access-check*> authentication translate -vserver vs1 -win-name administrator -node node2
S-1-5-21-1407423728-2963865486-1834115207-500
```

**vserver services access-check authentication uid-to-sid**
Translate a UNIX user ID to a Windows SID

**Availability:** This command is available to cluster administrators at the advanced privilege level.

**Description**
The `vserver services access-check authentication uid-to-sid` translates a UNIX UID to a Windows SID.

**Parameters**

- [-node {<nodename>|local}] - Node Name
  The name of the node on which the command is executed.

- -vserver <vserver> - Vserver Name
  The name of the Vserver.

- -uid <integer> - UNIX User ID
  The user ID of a UNIX user.

- [-clientIp <IP Address>] - Client IP Address
  The IP address of the client as specified by the user
Examples
This example translates a UNIX user's UID on node "node2" and returns the corresponding SID.

```
class1::vserver services access-check*> uid-to-sid -vserver vs1 -uid 0 -node node2
SID: S-1-5-21-1407423728-2963865486-1834115207-500
```

vserver services access-check dns commands

Check DNS Lookups

vserver services access-check dns forward-lookup

Perform DNS forward lookup

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The `vserver services access-check dns forward-lookup` returns the IP address of a hostname based on the lookup done on the DNS server specified or the Vserver's DNS configuration.

Parameters

[-node `<nodename>|local>`] - Node
This specifies the name of the node on which the command is executed.

-vserver `<vserver>` - Vserver
This specifies the name of the Vserver.

-hostname `<text>` - Hostname
This specifies the hostname to be looked up on the DNS server.

[lookup-type `{ipv4|ipv6|all}`] - Lookup Type (default: all)
This specifies the type of IP address to be looked up on the DNS server. If you specify "all", it looks up both IPv4 and IPv6 addresses.

Examples
The following example returns the IPv6 addresses of the hostname "example" in Vserver "vs1" from the node "node2".

```
class1::vserver services access-check*> dns forward-lookup -vserver vs1 -node node2
   -domains example.com -name-servers 10.72.46.234 -hostname example -lookup-type ipv6
6ffe::1
3ffe::1
```

vserver services access-check dns srv-lookup

Perform DNS lookup for SRV records

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The `vserver services access-check dns srv-lookup` returns the IP addresses of a host that is providing the specified service in the network, based on the SRV record lookup done on the Vserver's DNS server.
Parameters

[-node {<nodename> | local}] - Node
This specifies the name of the node on which the command is executed.

-vserver <vserver> - Vserver
This specifies the name of the Vserver.

[-name-servers <IP Address>, ...] - Name Servers
This specifies the DNS servers in which the hostname lookup needs to be done.

-lookup-string <text> - Name to Lookup For
This specifies the complete string for which SRV record needs to be looked up on the DNS server.

-lookup-type {ipv4 | ipv6 | all} - Lookup Type (default: all)
This specifies the type of IP address to be looked up on the DNS server. If you specify "all", it looks up both IPv4 and IPv6 addresses. The lookup string must be in the form “service.protocol.domain”.

Examples

The following example returns the IPv6 addresses of the host providing "http" service on "tcp" protocol in Vserver "vs1" from the node "node2".

```
cluster1::vserver services access-check*> dns srv-lookup -vserver vs1 -node node2
-lookup-string _http._tcp.nw7.na -lookup-type ipv6
9ffe::1
5ffe::1
```

vserver services access-check name-mapping commands

Check Name Mapping Operations

vserver services access-check name-mapping show

Display or verify name mapping configuration

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The vserver services access-check name-mapping show command tests the name mapping configuration for the specified Vserver on the specified node. The command can perform name mapping for Kerberos to UNIX, Windows to UNIX, and UNIX to Windows directions.

Parameters

[-node {<nodename> | local}] - Node
The name of the node on which the command is executed.

-vserver <vserver> - Vserver
The name of the Vserver.

-direction {krb-unix | win-unix | unix-win} - Mapping Direction
The mapping direction.

-name <text> - Name
The username.

[-clientIp <IP Address>] - Client IP Address
The IP address of the client as specified by the user
Examples
This example shows a name mapping on Vserver "vs1" from UNIX username "root," which is mapped to a Windows name "EXAMPLE\Administrator" on node "node2."

```
cluster1::vserver services access-check*> name-mapping show -vserver vs1 -direction unix-win -name root -node node2
root maps to EXAMPLE\Administrator
```

This example shows a name mapping on Vserver "vs1" from Windows name "EXAMPLE\Administrator" to a UNIX name "root."

```
cluster1::vserver services access-check*> name-mapping show -vserver vs1 -direction win-unix -name EXAMPLE\Administrator -node node2
EXAMPLE\Administrator maps to root
```

vserver services access-check server-discovery commands
Check Server Discovery Information

vserver services access-check server-discovery reset
Reset server discovery information for a Vserver

**Availability:** This command is available to cluster administrators at the advanced privilege level.

**Description**
The `vserver services access-check server-discovery reset` command deletes all of the discovered server information for a given Vserver on the given node. It returns a success message upon deleting. The next attempt to access external servers will trigger the server discovery process to acquire up-to-date server information.

**Parameters**
- `-node {<nodename>|local}] - Node`
  The name of the node on which the command is executed.
- `-vserver <vserver> - Vserver`
  The name of the Vserver on which you want to delete all of the discovered server information.

**Examples**
This example deletes all of the discovered server information for Vserver "vs1" on the node "node2."

```
cluster1::vserver services access-check*> server-discovery reset -vserver vs1 -node node2
Discovery Reset succeeded for Vserver: vs1
```

vserver services access-check server-discovery show-host
Display information about service host machines

**Availability:** This command is available to cluster administrators at the advanced privilege level.

**Description**
The `vserver services access-check server-discovery show-host` command displays information about service host machines.
Parameters

[-node <nodename>|local] - Node

The name of the node on which the command is executed.

Examples

This example shows the host name and IP Address for five different service host machines.

```bash
cluster1::vserver services access-check*> server-discovery show-host
Host Name: 172.19.3.11
Cifs Domain:
AD Domain:
IP Address: 172.19.3.11

Host Name: example-dc-1
Cifs Domain:
AD Domain:
IP Address: 172.17.152.40

Host Name: example-dc-2
Cifs Domain:
AD Domain:
IP Address: 172.17.152.41

Host Name: example-dc-3
Cifs Domain:
AD Domain:
IP Address: 172.17.152.42

Host Name: example-dc-4
Cifs Domain:
AD Domain:
IP Address: 172.17.152.43
```

vserver services access-check server-discovery show-site

Display site membership

Availability: This command is available to cluster administrators at the advanced privilege level.

Description

The `vserver services access-check server-discovery show-site` command displays the site membership for a given Vserver on a given node.

Parameters

[-node <nodename>|local] - Node

The name of the node on which the command is executed.

-vserver <vserver> - Vserver

The name of the Vserver.

Examples

This example shows the site membership for Vserver "vs1" from the perspective of node "node2".

```bash
cluster1::vserver services access-check*> server-discovery show-site -node node2 -vserver vs1 california
```
vserver services access-check server-discovery test

Verify server discovery

**Availability:** This command is available to cluster administrators at the advanced privilege level.

**Description**
The command `vserver services access-check server-discovery test` completes the entire discovery including domain controller (DC), LDAP, and NIS servers for the default domain for a given Vserver on a given node. The Vserver must have CIFS configured for it to run successfully. If the discovery is successful, the command returns a success message. The discovered server information can be seen using the command `vserver cifs domain discovered-servers`.

**Parameters**

`[-node <nodename> | local] - Node`

The name of the node on which the command is executed.

`-vserver <vserver> - Vserver`

The name of the Vserver on which you want to test all of the discovered server information.

**Examples**

This example tests all of the discovered server information on Vserver "vs1" on node "node2."

```
cluster1::vserver services access-check*> server-discovery test -vserver vs1 -node node2
Discovery Global succeeded for Vserver: vs1
```

Manage Name Services

**vserver services name-service cache commands**

The cache directory

**vserver services name-service cache group-membership commands**

The group-membership directory

**vserver services name-service cache group-membership delete**

Delete an entry

**Availability:** This command is available to cluster and Vserver administrators at the advanced privilege level.

**Description**
The `vserver services name-service cache group-membership delete` command removes the cached group membership entries of the users.
Parameters
-\texttt{\textit{vserver \textit{vserver name}} - Vserver}

Use this parameter to specify the Vserver for which the group membership entries need to be deleted.

-\texttt{\textit{user \textit{text}} - User Name}

Use this parameter to specify the user name for which the cached group membership entries need to be deleted.

-\texttt{\textit{group \textit{integer}} - Gid}

Use this parameter to specify the primary group identifier or GID for which the cached group membership entries need to be deleted.

\textbf{Examples}

The following example deletes all the cached group membership entries for Vserver vs0, user 'a' and group '1':

\begin{verbatim}
cluster1::> vserver services name-service cache group-membership delete -vserver vs0 -user a -group 1
\end{verbatim}

\texttt{vserver services name-service cache group-membership delete-all}

Delete all the entries for the vserver

\textbf{Availability:} This command is available to \textit{cluster} and \textit{Vserver} administrators at the \textit{advanced} privilege level.

\textbf{Description}
The \textit{vserver services name-service cache group-membership delete} command removes the cached group membership entries of the users for the specified Vserver.

\textbf{Parameters}

-\texttt{\textit{vserver \textit{vserver name}} - Vserver}

Use this parameter to specify the Vserver for which the group membership entries need to be deleted.

\textbf{Examples}

The following example deletes all the cached group membership entries for Vserver vs0:

\begin{verbatim}
cluster1::> vserver services name-service cache group-membership delete-all -vserver vs0
\end{verbatim}

\textbf{Related references}

-\texttt{vserver services name-service cache group-membership delete} on page 2129

\texttt{vserver services name-service cache group-membership show}

Display group list

\textbf{Availability:} This command is available to \textit{cluster} and \textit{Vserver} administrators at the \textit{advanced} privilege level.

\textbf{Description}
The \textit{vserver services name-service cache group-membership show} command displays the cached group membership information of the users.
Parameters

`{ [-fields <fieldname>, ...]`  
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

`[ -instance ]`  
Use this parameter to display detailed information about the cached group membership details of the user.

`[-vserver <vserver name>]` - Vserver  
Use this parameter to specify the Vserver for which the group membership entries need to be displayed.

`[-user <text>]` - User Name  
Use this parameter to display information only about the cached group membership entries that have the specified user name.

`[-group <integer>]` - Gid  
Use this parameter to display information only about the cached group membership entries of the users that have the specified primary group identifier or GID.

`[-ngroups <integer>]` - Number of Groups  
Use this parameter to display information only about the cached group membership entries of the users who belong to the specified number of groups.

`[-groups <integer>, ...]` - Group List  
Use this parameter to display information only about the cached group membership entries of the users who belong to the specified group identifiers or GIDs.

`[-create-time <MM/DD/YYYY HH:MM:SS>]` - Create Time  
Use this parameter to display information only about the group membership entries that were cached at the specified time.

`[-is-partial {true|false}]` - Is Partial Result  
Use this parameter to display information only about the group membership entries that have the specified value for partial result. The Value `true` displays only the cached entries that have partial result and the value `false` displays only the cached entries that do not have partial result.

Examples

The following example displays the group membership details of the users for all the vservers:

```
cluster1::> vserver services name-service cache group-membership show
```

The following example displays all the group membership details of the users for Vserver vs0:

```
cluster1::> vserver services name-service cache group-membership show -vserver vs0
```
Parameters
-vserver <vserver name> - Vserver
Use this parameter to specify the Vserver for which the group membership cache settings need to be modified.

[-is-enabled {true|false}] - Is Cache Enabled?
Use this parameter to specify if the cache needs to be enabled for the group membership database. The value true means the cache is enabled and the value false means the cache is disabled. The default value for this parameter is true.

[-grplist-ttl {<integer>h}<integer>m}<integer>s}] - Time to Live for Grplist
Use this parameter to specify the time (in hours, minutes and seconds) for which the group membership entries need to be cached. The default value is 24 hours.

Examples
The following example modifies the group membership cache configuration settings for Vserver vs0:

```
cluster1::> vserver services name-service cache group-membership settings modify -vserver vs0 -ttl 600
```

The following example disables the group membership cache for Vserver vs0:

```
cluster1::> vserver services name-service cache group-membership settings modify -vserver vs0 -is-enabled false
```

Display Group Membership Cache Configuration

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The vserver services name-service cache group-membership settings show command displays information about the group membership cache configuration for the users.

Parameters

{ [-fields <fieldname>, ...] } If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance ]
Use this parameter to display detailed information about the group membership cache configuration settings.

[-vserver <vserver name>] - Vserver
Use this parameter to display information about the group membership cache configuration settings for the Vserver you specify.

[-is-enabled {true|false}] - Is Cache Enabled?
Use this parameter to display information only about the group membership cache configuration settings that have the specified cache enabled setting. The value true displays only the entries that have cache enabled and the value false displays only the entries that have cache disabled.

[-grplist-ttl {<integer>h} [<integer>m] [<integer>s]}] - Time to Live for Grplist
Use this parameter to display information only about the group membership cache configuration settings that have the specified Time to Live.
Examples
The following example shows the group membership cache configuration settings for all the Vservers:

```
cluster1::> vserver services name-service cache group-membership settings show
```

The following example shows the group membership cache configuration settings for Vserver vs0:

```
cluster1::> vserver services name-service cache group-membership settings show -vserver vs0
```

vserver services name-service cache hosts commands

The hosts directory

vserver services name-service cache hosts forward-lookup commands

The forward-lookup directory

vserver services name-service cache hosts forward-lookup delete

Delete an entry

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The `vserver services name-service cache hosts forward-lookup delete` command removes a cached host to IP lookup entry.

Parameters
- `-vserver <vserver name>` - Vserver
  Use this parameter to specify the Vserver for which the cached forward lookup table entries need to be deleted.
- `-host <text>` - Hostname
  Use this parameter to specify the hostname of the cached forward lookup table entries that need to be deleted.
- `-protocol {Any|ICMP|TCP|UDP}` - Protocol
  Use this parameter to specify the protocol of the cached forward lookup table entries that need to be deleted.
- `-sock-type {SOCK_ANY|SOCK_STREAM|SOCK_DGRAM|SOCK_RAW}` - Sock Type
  Use this parameter to specify the socket type of the cached forward lookup table entries that need to be deleted.
- `-flags {FLAG_NONE|AI_PASSIVE|AI_CANONNAME|AI_NUMERICHOST|AI_NUMERICSERV}` - Flags
  Use this parameter to specify the flag of the cached forward lookup table entries that need to be deleted.
- `-family {Any|Ipv4|Ipv6}` - Family
  Use this parameter to specify the family of the cached forward lookup table entries that need to be deleted.

Examples
The following example deletes the cached forward lookup entry for Vserver vs0 and host "abc":

```
cluster1::> vserver services name-service cache hosts forward-lookup delete -vserver vs0 -host abc
```

vserver services name-service cache hosts forward-lookup delete-all
Delete all the entries for the vserver

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

**Description**
The `vserver services name-service cache hosts forward-lookup delete-all` command removes all the cached host to IP lookup entries for a Vserver.

**Parameters**
```
-vserver <vserver name> - Vserver
```
Use this parameter to specify the Vserver for which the cached forward lookup entries need to be deleted.

**Examples**
The following example deletes all the cached forward lookup entries for Vserver vs0:

```
cluster1::> vserver services name-service cache hosts forward-lookup delete-all -vserver vs0
```

### Display host-byname struct

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

**Description**
The `vserver services name-service cache hosts forward-lookup show` command displays the cached host to IP lookup entries.

**Parameters**
```
[-fields <fieldname>, ...]
```
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance]
```
Use this parameter to display detailed information about the cached forward lookup table entries.

```
-vserver <vserver name> - Vserver
```
Use this parameter to specify the Vserver for which the cached forward lookup table entries need to be displayed.

```
-host <text> - Hostname
```
Use this parameter to display information only about the cached forward lookup table entries that have the specified hostname.

```
-protocol {Any|ICMP|TCP|UDP} - Protocol
```
Use this parameter to display information only about the cached forward lookup table entries that have the specified protocol.

```
-sock-type {SOCK_ANY|SOCK_STREAM|SOCK_DGRAM|SOCK_RAW} - Sock Type
```
Use this parameter to display information only about the cached forward lookup table entries that have the specified socket type.

```
-flags {FLAG_NONE|AI_PASSIVE|AI_CANONNAME|AI_NUMERICHOST|AI_NUMERICSERV} - Flags
```
Use this parameter to display information only about the cached forward lookup table entries that have the specified flags.
[-family {Any|Ipv4|Ipv6}] - Family
Use this parameter to display information only about the cached forward lookup table entries that have the specified family.

[-canonname <text>] - Canonical Name
Use this parameter to display information only about the cached forward lookup table entries that have the specified canonical name.

[-ips <IP Address>, ...) - IP Addresses
Use this parameter to display information only about the cached forward lookup table entries that have the specified IPs.

[-ip-protocol {Any|ICMP|TCP|UDP}, ...) - Protocol
Use this parameter to display information only about the cached forward lookup table entries that have the specified protocol of the resolved IP address from forward lookup.

[-ip-sock-type {SOCK_ANY|SOCK_STREAM|SOCK_DGRAM|SOCK_RAW}, ...) - Sock Type
Use this parameter to display information only about the cached forward lookup table entries that have the specified socket type of the resolved IP address from forward lookup.

[-ip-family {Any|Ipv4|Ipv6}, ...) - Family
Use this parameter to display information only about the cached forward lookup table entries that have the specified IP address family of the resolved IP address from forward lookup.

[-ip-addr-length <integer>, ...) - Length
Use this parameter to display information only about the cached forward lookup table entries that have the specified IP address length of the resolved IP address from forward lookup.

[-source {none|files|dns|nis|ldap|netgrp_byname|dc}] - Source of the Entry
Use this parameter to display information only about the cached forward lookup table entries that have the specified IP source of the resolved IP address from forward lookup.

[-create-time <MM/DD/YYYY HH:MM:SS>] - Create Time
Use this parameter to display information only about the cached forward lookup table entries that have the specified time when the entry was cached.

[-ttl <integer>] - DNS TTL
Use this parameter to display information only about the cached forward lookup table entries that have the specified Time To Live.

Examples
The following example displays all the cached forward lookup entries:

```
cluster1::> vserver services name-service cache hosts forward-lookup show
```

The following example displays all the cached forward lookup entries for Vserver vs0:

```
cluster1::> vserver services name-service cache hosts forward-lookup show -vserver vs0
```

vserver services name-service cache hosts reverse-lookup commands
The reverse-lookup directory
vserver services name-service cache hosts reverse-lookup delete
Delete an entry
Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.
Description
The `vserver services name-service cache hosts reverse-lookup delete` command removes a cached IP to host lookup entry.

Parameters

- `-vserver <vserver name>` - Vserver
  Use this parameter to specify the Vserver for which the cached reverse lookup table entries need to be deleted.

- `-ip <IP Address>` - IP Address
  Use this parameter to specify the IP address of the cached reverse lookup table entries that need to be deleted.

- `-serv-flag <integer>` - Service flags
  Use this parameter to specify the service flag of the cached reverse lookup table entries that need to be deleted.

Examples
The following example deletes the cached reverse lookup entry for Vserver vs0 and IP address 1.1.1.1:

```
cluster1::> vserver services name-service cache hosts reverse-lookup delete -vserver vs0 -ip 1.1.1.1
```

Availability: This command is available to `cluster` and `Vserver` administrators at the `advanced` privilege level.

Description
The `vserver services name-service cache hosts reverse-lookup delete-all` command removes all the cached IP to host lookup entries for a Vserver.

Parameters

- `-vserver <vserver name>` - Vserver
  Use this parameter to specify the Vserver whose cached reverse lookup entries need to be deleted.

Examples
The following example deletes all the cached reverse lookup entries for Vserver vs0:

```
cluster1::> vserver services name-service cache hosts reverse-lookup delete-all -vserver vs0
```

Availability: This command is available to `cluster` and `Vserver` administrators at the `advanced` privilege level.

Description
The `vserver services name-service cache hosts reverse-lookup show` command displays the cached IP to host lookup(reverse lookup) entries.

Parameters

{ [-`fields <fieldname>, ...`]
  If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

Vserver services name-service cache hosts reverse-lookup show
Use this parameter to display detailed information about the cached reverse lookup table entries.

-vserver <vserver name> - Vserver
Use this parameter to specify the Vserver for which the cached reverse lookup table entries need to be displayed.

-ip <IP Address> - IP Address
Use this parameter to display information only about the cached reverse lookup table entries that have the specified IP address.

-serv-flag <integer> - Service flags
Use this parameter to display information only about the cached reverse lookup table entries that have the specified service flag.

-host <text> - Hostname
Use this parameter to display information only about the cached reverse lookup table entries that have the specified hostname.

-service <text> - Service Name
Use this parameter to display information only about the cached reverse lookup table entries that have the specified service name.

-aliases <text>, ... - Host Aliases
Use this parameter to display information only about the cached reverse lookup table entries that have the specified aliases.

-addrtype <integer> - Address Type
Use this parameter to display information only about the cached reverse lookup table entries that have the specified address type.

-addrlength <integer> - Address Length
Use this parameter to display information only about the cached reverse lookup table entries that have the specified address length.

-create-time <MM/DD/YYYY HH:MM:SS> - Create Time
Use this parameter to display information only about the cached reverse lookup table entries that have the specified create time.

-source {none|files|dns|nis|ldap|netgrp_byname|dc} - Source of the Entry
Use this parameter to display information only about the cached reverse lookup table entries that have the specified source.

-ttl <integer> - DNS TTL
Use this parameter to display information only about the cached reverse lookup table entries that have the specified Time To Live.

Examples
The following example displays all the cached reverse lookup entries:

```
cluster1::> vserver services name-service cache hosts reverse-lookup show
```

The following example displays the cached reverse lookup entries for Vserver vs0:

```
cluster1::> vserver services name-service cache hosts reverse-lookup show -vserver vs0
```
**vserver services name-service cache hosts settings commands**

The settings directory

vserver services name-service cache hosts settings modify

Modify Hosts Cache Configuration

**Availability:** This command is available to cluster and Vserver administrators at the advanced privilege level.

**Description**
The `vserver services name-service cache hosts settings modify` command modifies the hosts cache configuration of the specified Vserver.

**Parameters**

- `vserver <vserver name>` - Vserver
  
  Use this parameter to specify the Vserver for which the hosts cache settings need to be modified.

- `[ -is-enabled {true|false} ]` - Is Cache Enabled?
  
  Use this parameter to specify if the cache needs to be enabled for the hosts database. The value `true` means the cache is enabled and the value `false` means the cache is disabled. The default value for this parameter is `true`.

- `[ -is-negative-cache-enabled {true|false} ]` - Is Negative Cache Enabled?
  
  Use this parameter to specify if the cache needs to be enabled for the negative entries. Negative entries means the entries which are not present in the hosts database and the lookup fails. The default value for this parameter is `true`. Negative cache is disabled by default if the parameter `is-enabled` is set to `false`.

- `[ -ttl <[<integer>h][<integer>m][<integer>s]> ]` - Time to Live
  
  Use this parameter to specify the time (in hours, minutes and seconds) for which the positive entries need to be cached. The positive entries means the entries which are present in the hosts database and the lookup succeeds. The default value is 24 hours.

- `[ -negative-ttl <[<integer>h][<integer>m][<integer>s]> ]` - Negative Time to Live
  
  Use this parameter to specify the time for which the negative entries need to be cached. The default value is 1 minute.

- `[ -is-dns-ttl-enabled {true|false} ]` - Is TTL Taken from DNS
  
  Specifies whether TTL is taken from DNS or host settings. If this parameter is true, TTL is based on the DNS setting. If false, TTL is based on the host setting. The default value is true.

**Examples**
The following example modifies the hosts cache configuration settings for Vserver vs0:

```
cluster1::> vserver services name-service cache hosts settings modify -vserver vs0 -ttl 600 -negative-ttl 300
```

The following example disables the cache for Vserver vs0:

```
cluster1::> vserver services name-service cache hosts settings modify -vserver vs0 -is-enabled false
```

vserver services name-service cache hosts settings show

Display Hosts Cache Configuration

**Availability:** This command is available to cluster and Vserver administrators at the advanced privilege level.
Description

The `vserver services name-service cache hosts settings show` command displays information about the hosts cache configuration of the specified Vserver.

Parameters

`[-fields <fieldname>, ...]`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

`[-instance]`

Use this parameter to display detailed information about the hosts cache configuration settings.

`[-vserver <vserver name>]` - Vserver

Use this parameter to display information about the hosts cache configuration settings for the Vserver you specify.

`[-is-enabled {true|false}]` - Is Cache Enabled?

Use this parameter to display information only about the hosts cache configuration settings that have the specified cache enabled setting. Value `true` displays only the entries that have cache enabled and value `false` displays only the entries that have cache disabled.

`[-is-negative-cache-enabled {true|false}]` - Is Negative Cache Enabled?

Use this parameter to display information only about the hosts cache configuration settings that have the specified negative cache enabled setting. Value `true` displays only the entries that have negative cache enabled and value `false` displays only the entries that have negative cache disabled.

`[-ttl <[<integer>h][<integer>m][<integer>s]>]` - Time to Live

Use this parameter to display information only about the hosts cache configuration settings that have the specified Time to Live.

`[-negative-ttl <[<integer>h][<integer>m][<integer>s]>]` - Negative Time to Live

Use this parameter to display information only about the hosts cache configuration settings that have the specified negative Time to Live.

`[-is-dns-ttl-enabled {true|false}]` - Is TTL Taken from DNS

Specifies whether TTL is based on the DNS or host settings.

Examples

The following example shows the hosts cache configuration settings for Vserver vs0:

```
cluster1::> vserver services name-service cache hosts settings show -vserver vs0
```

The following example shows the hosts cache configuration settings that have cache disabled:

```
cluster1::> vserver services name-service cache hosts settings show -is-enabled false
```

vserver services name-service cache netgroups commands

The netgroups directory

vserver services name-service cache netgroups ip-to-netgroup commands

The ip-to-netgroup directory

vserver services name-service cache netgroups ip-to-netgroup delete
Delete netgroup.byhost cache entry

**Availability:** This command is available to cluster and Vserver administrators at the advanced privilege level.

**Description**
The `vserver services name-service cache netgroups ip-to-netgroup delete` command removes the cached client IP to netgroup entries.

**Parameters**

- `-vserver <vserver name>` - Vserver  
  Use this parameter to specify the Vserver for which the cached client IP to netgroup entries need to be deleted.

- `-host <text>` - Host field  
  Use this parameter to specify the IP address for which the cached IP to netgroup entries need to be deleted.

- `-netgrp <text>` - Netgroup field  
  Use this parameter to specify the netgroup for which the cached IP to netgroup entries need to be deleted.

**Examples**
The following example deletes all the cached IP to netgroup entries for Vserver vs0, host 1.1.1.1 and netgrp 'abc':

```
cluster1::> vserver services name-service cache netgroups ip-to-netgroup delete -vserver vs0 -host 1.1.1.1 -netgrp abc
```

vserver services name-service cache netgroups ip-to-netgroup delete-all

Delete all the entries for the vserver

**Availability:** This command is available to cluster and Vserver administrators at the advanced privilege level.

**Description**
The `vserver services name-service cache netgroups ip-to-netgroup delete-all` command removes all the cached client IP to netgroup entries of the specified Vserver.

**Parameters**

- `-vserver <vserver name>` - Vserver  
  Use this parameter to specify the Vserver for which the cached client IP to netgroup entries need to be deleted.

**Examples**
The following example deletes all the cached IP to netgroup entries for Vserver vs0:

```
cluster1::> vserver services name-service cache netgroups ip-to-netgroup delete-all -vserver vs0
```

vserver services name-service cache netgroups ip-to-netgroup show

Display netgroup.byhost cache entries

**Availability:** This command is available to cluster and Vserver administrators at the advanced privilege level.

**Description**
The `vserver services name-service cache netgroups ip-to-netgroup show` command displays the cached client IP to netgroup entries.
Parameters

\{-fields <fieldname>, ...\}

If you specify the \{-fields <fieldname>, ...\} parameter, the command output also includes the specified field or fields. You can use \{-fields ?\} to display the fields to specify.

\{-instance \}

Use this parameter to display detailed information about the cached client IP to netgroup entries.

\{-vserver <vserver name>\} - Vserver

Use this parameter to specify the Vserver for which the cached client IP to netgroup entries need to be displayed.

\{-host <text>\} - Host field

Use this parameter to display information only about the cached IP to netgroup entries that have the specified IP address.

\{-netgrp <text>\} - Netgroup field

Use this parameter to display information only about the cached IP to netgroup entries that have the specified netgroup.

\{-create-time <MM/DD/YYYY HH:MM:SS>\} - Create Time

Use this parameter to display information only about the IP to netgroup entries that were cached at the specified time.

\{-source {none|files|dns|nis|ldap|netgrpbyname|dc}\} - Source of the Entry

Use this parameter to display information only about the cached IP to netgroup entries that have the specified look-up source.

Examples

The following example displays all the cached IP to netgroup entries:

```
cluster1::> vserver services name-service cache netgroups ip-to-netgroup show
```

The following example deletes all the cached IP to netgroup entries for Vserver vs0:

```
cluster1::> vserver services name-service cache netgroups ip-to-netgroup show -vserver vs0
```

**vserver services name-service cache netgroups members commands**

The members directory

vserver services name-service cache netgroups members delete

Delete netgroup cache entry

**Availability:** This command is available to cluster and Vserver administrators at the advanced privilege level.

**Description**

The `vserver services name-service cache netgroups members delete` command deletes the cached members of the netgroups.

**Parameters**

\{-vserver <vserver name>\} - Vserver

Use this parameter to specify the Vserver for which the cached netgroup members entries need to be deleted.

\{-netgroup <text>\} - Netgroup

Use this parameter to specify the netgroup for which the cached netgroup members entries need to be deleted.
Examples
The following example deletes all the cached netgroup members entries for Vserver vs0 and netgroup 'abc':

```
cluster1::> vserver services name-service cache netgroups members delete -vserver vs0 -netgroup abc
```

vserver services name-service cache netgroups members delete-all
Delete all the entries for the vserver

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The `vserver services name-service cache netgroups members delete-all` command deletes all the cached netgroup member entries of the specified Vserver.

Parameters
- `vserver <vserver name>` - Vserver
  Use this parameter to specify the Vserver for which the cached netgroup members entries need to be deleted.

Examples
The following example deletes all the cached netgroup members of Vserver vs0:

```
cluster1::> vserver services name-service cache netgroups members delete-all -vserver vs0
```

vserver services name-service cache netgroups members show
Display netgroup cache entries

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The `vserver services name-service cache netgroups members show` command displays the cached members of the netgroups.

Parameters

- `{[-fields <fieldname>, ...]}
  If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

- `[-instance]`
  Use this parameter to display detailed information about the cached members of a netgroup.

- `vserver <vserver name>` - Vserver
  Use this parameter to specify the Vserver for which the cached netgroup members entries need to be displayed.

- `netgroup <text>` - Netgroup
  Use this parameter to display information only about the cached members that belong to the specified netgroup.

- `hosts <text>` - Hosts
  Use this parameter to display information only about the cached netgroups that have the specified host as a member.
[-create-time <MM/DD/YYYY HH:MM:SS>] - Create Time

Use this parameter to display information only about the netgroup member entries that were cached at the specified time.

[-source {none|files|dns|nis|ldap|netgrp_byname|dc}] - Source of the Entry

Use this parameter to display information only about the cached netgroup member entries that have the specified look-up source.

Examples

The following example displays all the cached netgroup members entries:

```
cluster1::> vserver services name-service cache netgroups members show
```

The following example displays all the cached netgroup members entries for Vserver vs0:

```
cluster1::> vserver services name-service cache netgroups members show -vserver vs0
```

**vserver services name-service cache netgroups settings commands**

The settings directory

vserver services name-service cache netgroups settings modify

Modify Netgroup Cache Configuration

**Availability:** This command is available to cluster and Vserver administrators at the advanced privilege level.

**Description**

The `vserver services name-service cache netgroups settings modify` command modifies the netgroups cache configuration of the specified Vserver.

**Parameters**

-vserver <vserver name> - Vserver

Use this parameter to specify the Vserver for which the netgroups cache settings need to be modified.

[-is-enabled {true|false}] - Is Cache Enabled?

Use this parameter to specify if the cache needs to be enabled for the netgroups database. The value `true` means the cache is enabled and the value `false` means the cache is disabled. The default value for this parameter is `true`.

[-is-negative-cache-enabled {true|false}] - Is Negative Cache Enabled?

Use this parameter to specify if the cache needs to be enabled for the negative entries. Negative entries means the entries which are not present in the netgroups database and the look-up fails. The default value for this parameter is `true`. Negative cache is disabled by default if the parameter `is-enabled` is set to `false`.

[-ttl <[<integer>h][<integer>m][<integer>s]>] - Time to Live

Use this parameter to specify the time (in hours, minutes and seconds) for which the positive entries need to be cached. The positive entries means the entries which are present in the netgroups database and the look-up succeeds. The default value is 24 hours.

[-negative-ttl <[<integer>h][<integer>m][<integer>s]>] - Negative Time to Live

Use this parameter to specify the time (in hours, minutes and seconds) for which the negative entries need to be cached. The default value is 30 minutes.
[-ttl-members \(<\text{<integer>h}} [\text{<integer>m}} [\text{<integer>s}}]\)] - TTL for netgroup members

Use this parameter to specify the time (in hours, minutes and seconds) for which the netgroup members need to be cached. The default value is 24 hours.

**Examples**

The following example modifies the netgroups cache configuration settings for Vserver vs0:

```
cluster1::> vserver services name-service cache netgroups settings modify -vserver vs0 -ttl 600 -negative-ttl 300
```

The following example disables the cache for Vserver vs0:

```
cluster1::> vserver services name-service cache netgroups settings modify -vserver vs0 -is-enabled false
```

The `vserver services name-service cache netgroups settings show` command displays information about the netgroups cache configuration of the specified Vserver.

**Parameters**

{ [-fields \(<\text{fieldname}>\), ...]

If you specify the `-fields \(<\text{fieldname}>\), ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

[ [-instance ]]

Use this parameter to display detailed information about the netgroups cache configuration settings.

[-vserver \(<\text{vserver name}>\)] - Vserver

Use this parameter to display information about the netgroups cache configuration settings for the Vserver you specify.

[-is-enabled \(\text{true} | \text{false} \)] - Is Cache Enabled?

Use this parameter to display information only about the netgroups cache configuration settings that have the specified cache enabled setting. Value `true` displays only the entries that have cache enabled and value `false` displays only the entries that have cache disabled.

[-is-negative-cache-enabled \(\text{true} | \text{false} \)] - Is Negative Cache Enabled?

Use this parameter to display information only about the netgroups cache configuration settings that have the specified negative cache enabled setting. Value `true` displays only the entries that have negative cache enabled and value `false` displays only the entries that have negative cache disabled.

[-ttl \(<\text{<integer>h}} [\text{<integer>m}} [\text{<integer>s}}]\)] - Time to Live

Use this parameter to display information only about the netgroups cache configuration settings that have the specified Time to Live.

[-negative-ttl \(<\text{<integer>h}} [\text{<integer>m}} [\text{<integer>s}}]\)] - Negative Time to Live

Use this parameter to display information only about the netgroups cache configuration settings that have the specified negative Time to Live.
- **ttl-members <[<integer>h][<integer>m][<integer>s]>** - TTL for netgroup members
  
  Use this parameter to display information only about the netgroups cache configuration settings that have the specified Time to Live for netgroup members.

**Examples**

The following example shows the netgroups cache configuration settings for Vserver vs0:

```bash
cluster1::> vserver services name-service cache netgroups settings show -vserver vs0
```

The following example shows the netgroups cache configuration settings that have cache disabled:

```bash
cluster1::> vserver services name-service cache netgroups settings show -is-enabled false
```

---

**vserver services name-service cache settings commands**

The settings directory

---

**vserver services name-service cache settings modify**

Modify nameservice global cache settings

**Availability:** This command is available to cluster administrators at the advanced privilege level.

**Description**

The `vserver services name-service cache settings modify` command modifies the global name service cache configuration.

**Parameters**

- **[-eviction-time-interval <[<integer>h][<integer>m][<integer>s]>** - Cache Eviction Time Interval
  
  Use this parameter to specify the time interval after which a periodic cache eviction will happen. The default value is 4 hours.

- **[-is-remote-fetch-enabled {true|false}]** - Is Remote Fetch Enabled
  
  Use this parameter to specify whether a node is allowed to fetch the data from a remote node or not. If the value is set as `false`, the node is not allowed to fetch the data from the remote node. If the value is set as `true`, remote fetch is allowed.

**Examples**

The following example modifies the global nameservice cache configuration:

```bash
cluster1::> vserver services name-service cache settings modify -eviction-time-interval 1h -is-remote-fetch-enabled true
```

---

**vserver services name-service cache settings show**

Display nameservice global cache settings

**Availability:** This command is available to cluster administrators at the advanced privilege level.

**Description**

The `vserver services name-service cache settings show` command displays information about the global nameservice cache configuration.
vserver services name-service cache unix-group commands

The unix-group directory

vserver services name-service cache unix-group group-by-gid commands

The group-by-gid directory

vserver services name-service cache unix-group group-by-gid delete

Delete an entry

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description

The vserver services name-service cache unix-group group-by-gid delete command removes the group entries that are cached by the group identifier or GID. If group cache propagation is enabled, the corresponding group-by-name cache entry will also be removed.

Parameters

-vserver <vserver name> - Vserver

Use this parameter to specify the Vserver for which the group entries that are cached by the group identifier or GID need to be deleted.

-gr-gid <integer> - gr_gid field

Use this parameter to specify the group identifier or GID for which the cached entries need to be deleted.

Examples

The following example deletes all the cached group entries for Vserver vs0 and the group identifier or GID 123:

cluster1::> vserver services name-service cache unix-group group-by-gid delete -vserver vs0 -gr-gid 123

vserver services name-service cache unix-group group-by-gid delete-all

Delete all the entries for the vserver

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description

The vserver services name-service cache unix-group group-by-gid delete-all command removes all the group entries that are cached by the group identifier or GID.

Parameters

-vserver <vserver name> - Vserver

Use this parameter to specify the Vserver for which the group entries that are cached by the group identifier or GID need to be deleted.
Examples
The following example deletes all the cached group entries for Vserver vs0:

```
cluster1::> vserver services name-service cache unix-group group-by-gid delete-all -vserver vs0
```

```
vserver services name-service cache unix-group group-by-gid show
```

Display group struct

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The `vserver services name-service cache unix-group group-by-gid show` command displays the group information cached by the group identifier or GID.

Parameters

```
{-fields <fieldname>, ...} If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.
```

```
{-instance} Use this parameter to display detailed information about the group entries cached by the group identifier or GID.
```

```
{-vserver <vserver name>} - Vserver Use this parameter to specify the Vserver for which the group entries that are cached by the group identifier or GID need to be displayed.
```

```
{-gr-gid <integer>} - gr_gid field Use this parameter to display information only about the cached group entries that have the specified group identifier or GID.
```

```
{-gr-name <text>} - gw_name field Use this parameter to display information only about the cached group entries that have the specified group name.
```

```
{-create-time <MM/DD/YYYY HH:MM:SS>} - Create Time Use this parameter to display information only about the group entries that were cached at the specified time.
```

```
{-source {none|files|dns|nis|ldap|netgrp_byname|dc}} - Source of the Entry Use this parameter to display information only about the group entries cached by the group identifier or GID that have the specified lookup source.
```

Examples
The following example displays all the groups which are cached by the group identifier or GID:

```
cluster1::> vserver services name-service cache unix-group group-by-id show
```

The following example displays all the group entries cached by the group identifier or GID for Vserver vs0:

```
cluster1::> vserver services name-service cache unix-group group-by-id show -vserver vs0
```
**vserver services name-service cache unix-group group-by-name commands**

The group-by-name directory

vserver services name-service cache unix-group group-by-name delete

Delete an entry

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

**Description**
The `vserver services name-service cache unix-group group-by-name delete` command removes the group entries that are cached by group name. If group cache propagation is enabled, the corresponding group-by-gid cache entry will also be removed.

**Parameters**

- `-vserver <vserver name>` - Vserver
  
  Use this parameter to specify the Vserver for which the group entries that are cached by group name need to be deleted.

- `-gr-name <text>` - gw_name field
  
  Use this parameter to specify the group name for which the cached entries need to be deleted.

**Examples**
The following example deletes all the cached group entries for Vserver vs0 and group name abc:

```
cluster1::> vserver services name-service cache unix-group group-by-name delete -vserver vs0 -gr-name abc
```

vserver services name-service cache unix-group group-by-name delete-all

Delete all the entries for the vserver

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

**Description**
The `vserver services name-service cache unix-group group-by-name delete-all` command removes all the group entries that are cached by the group name for the specified Vserver.

**Parameters**

- `-vserver <vserver name>` - Vserver
  
  Use this parameter to specify the Vserver for which the group entries that are cached by group name need to be deleted.

**Examples**
The following example deletes all the cached group entries for Vserver vs0:

```
cluster1::> vserver services name-service cache unix-group group-by-name delete-all -vserver vs0
```

vserver services name-service cache unix-group group-by-name show

Display group struct

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.
Description
The vserver services name-service cache unix-group group-by-name show command displays the group information cached by group name.

Parameters

\[-fields <fieldname>, ...\]
If you specify the \(-fields <fieldname>, ...\) parameter, the command output also includes the specified field or fields. You can use \(-fields ?\) to display the fields to specify.

\[-instance\]
Use this parameter to display detailed information about the group entries cached by group name.

\[-vserver <vserver name>\] - Vserver
Use this parameter to specify the Vserver for which the group entries that are cached by group name need to be displayed.

\[-gr-name <text>\] - gw_name field
Use this parameter to display information only about the cached group entries that have the specified group name.

\[-gr-gid <integer>\] - gr_gid field
Use this parameter to display information only about the cached group entries that have the specified group identifier or GID.

\[-create-time <MM/DD/YYYY HH:MM:SS>\] - Create Time
Use this parameter to display information only about the group entries that were cached at the specified time.

\[-source {none|files|dns|nis|ldap|netgrp_byname|dc}\] - Source of the Entry
Use this parameter to display information only about the group entries cached by group name that have the specified lookup source.

Examples

The following example displays all the groups which are cached by group name:

```
cluster1::> vserver services name-service cache unix-group group-by-name show
```

The following example displays all the group entries cached by group name for Vserver vs0:

```
cluster1::> vserver services name-service cache unix-group group-by-name show -vserver vs0
```

vserver services name-service cache unix-group settings commands
The settings directory
vserver services name-service cache unix-group settings modify

Modify UNIX Group Cache Configuration

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The vserver services name-service cache unix-group settings modify command modifies the groups cache configuration of the specified Vserver.
Parameters

-vserver <vserver name> - Vserver

Use this parameter to specify the Vserver for which the groups cache settings need to be modified.

-[is-enabled {true|false}] - Is Cache Enabled?

Use this parameter to specify if the cache needs to be enabled for the groups database. The value true means the cache is enabled and the value false means the cache is disabled. The default value for this parameter is true.

-[is-negative-cache-enabled {true|false}] - Is Negative Cache Enabled?

Use this parameter to specify if the cache needs to be enabled for the negative entries. Negative entries means the entries which are not present in the groups database and the lookup fails. The default value for this parameter is true. Negative cache is disabled by default if the parameter is-enabled is set to false.

-[ttl [<integer>h][<integer>m][<integer>s]] - Time to Live

Use this parameter to specify the time (in hours, minutes and seconds) for which the positive entries need to be cached. The positive entries means the entries which are present in the groups database and the lookup succeeds. The default value is 24 hours.

-[negative-ttl [<integer>h][<integer>m][<integer>s]] - Negative Time to Live

Use this parameter to specify the time (in hours, minutes and seconds) for which the negative entries need to be cached. The default value is 5 minutes.

-[is-propagation-enabled {true|false}] - Is Propagation Enabled?

Use this parameter to specify whether the cached groups entries need to be propagated to the group by the group identifier or GID cache. The default value is true. Specify false to disable propagation.

Examples

The following example modifies the groups cache configuration settings for Vserver vs0:

```
cluster1::> vserver services name-service cache unix-group settings modify -vserver vs0 -ttl 600 -negative-ttl 300
```

The following example disables the cache for Vserver vs0:

```
cluster1::> vserver services name-service cache unix-group settings modify -vserver vs0 -is-enabled false
```

vserver services name-service cache unix-group settings show

Display UNIX Group Cache Configuration

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description

The vserver services name-service cache unix-group settings show command displays information about the groups cache configuration of the specified Vserver.

Parameters

{ [-fields <fieldname>, ...]  
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

  | [-instance]  
  Use this parameter to display detailed information about the groups cache configuration settings.}

2150  Commands: Manual Page Reference
[\texttt{-vserver <vserver name>}] - \texttt{Vserver}

Use this parameter to display information about the groups cache configuration settings for the Vserver you specify.

[\texttt{-is-enabled \{true|false\}]} - \texttt{Is Cache Enabled?}

Use this parameter to display information only about the groups cache configuration settings that have the specified cache enabled setting. The value \texttt{true} displays only the entries that have cache enabled and the value \texttt{false} displays only the entries that have cache disabled.

[\texttt{-is-negative-cache-enabled \{true|false\}]} - \texttt{Is Negative Cache Enabled?}

Use this parameter to display information only about the groups cache configuration settings that have the specified negative cache enabled setting. The value \texttt{true} displays only the entries that have negative cache enabled and the value \texttt{false} displays only the entries that have negative cache disabled.

[\texttt{-ttl <[<integer>h][<integer>m][<integer>s]>}] - \texttt{Time to Live}

Use this parameter to display information only about the groups cache configuration settings that have the specified Time to Live.

[\texttt{-negative-ttl <[<integer>h][<integer>m][<integer>s]>}] - \texttt{Negative Time to Live}

Use this parameter to display information only about the groups cache configuration settings that have the specified negative Time to Live.

[\texttt{-is-propagation-enabled \{true|false\}]} - \texttt{Is Propagation Enabled?}

Use this parameter to display information only about the groups cache configuration settings that have the specified propagation enabled setting. The value \texttt{true} displays only the entries that have the propagation of cached entries to groups by the group identifier or GID cache enabled and the value \texttt{false} displays only the entries that have the propagation of cached entries to groups by the group identifier or GID cache disabled.

\textbf{Examples}

The following example shows the groups cache configuration settings for all the Vservers:

\begin{verbatim}
cluster1::> vserver services name-service cache unix-group settings show
\end{verbatim}

The following example shows the groups cache configuration settings for Vserver vs0:

\begin{verbatim}
cluster1::> vserver services name-service cache unix-group settings show -vserver vs0
\end{verbatim}

The following example shows the groups cache configuration settings that have cache disabled:

\begin{verbatim}
cluster1::> vserver services name-service cache unix-group settings show -is-enabled false
\end{verbatim}

\textbf{vserver services name-service cache unix-user commands}

The unix-user directory

\begin{verbatim}
vserver services name-service cache unix-user settings commands
\end{verbatim}

The settings directory

vserver services name-service cache unix-user settings modify

Modify UNIX users Cache Configuration

\textbf{Availability:} This command is available to \texttt{cluster} and \texttt{Vserver} administrators at the \texttt{advanced} privilege level.
Description
The `vserver services name-service cache unix-user settings modify` command modifies the users cache configuration of the specified Vserver.

Parameters
- `vserver <vserver name>` - Vserver
  Use this parameter to specify the Vserver for which the users cache settings need to be modified.

  - `-is-enabled {true|false}]` - Is Cache Enabled?
    Use this parameter to specify if the cache needs to be enabled for the users database. The value `true` means the cache is enabled and the value `false` means the cache is disabled. The default value for this parameter is `true`.

  - `-is-negative-cache-enabled {true|false}]` - Is Negative Cache Enabled?
    Use this parameter to specify if the cache needs to be enabled for the negative entries. Negative entries means the entries which are not present in the users database and the look-up fails. The default value for this parameter is `true`.

      Negative cache is disabled by default if the parameter `is-enabled` is set to `false`.

  - `-ttl <[<integer>h][<integer>m][<integer>s]>]` - Time to Live
    Use this parameter to specify the time (in hours, minutes and seconds) for which the positive entries need to be cached. The positive entries means the entries which are present in the users database and the look-up succeeds. The default value is 24 hours.

  - `-negative-ttl <[<integer>h][<integer>m][<integer>s]>]` - Negative Time to Live
    Use this parameter to specify the time (in hours, minutes and seconds) for which the negative entries need to be cached. The default value is 5 minutes.

  - `-is-propagation-enabled {true|false}]` - Is Propagation Enabled?
    Use this parameter to specify whether the cached users entries need to be propagated to the users by id cache. The default value is `true`. Specify `false` to disable propagation.

Examples
The following example modifies the users cache configuration settings for Vserver vs0:

```
cluster1::> vserver services name-service cache unix-user settings modify -vserver vs0 -ttl 600 -negative-ttl 300
```

The following example disables the cache for Vserver vs0:

```
cluster1::> vserver services name-service cache unix-user settings modify -vserver vs0 -is-enabled false
```

vserver services name-service cache unix-user settings show
Display UNIX users Cache Configuration

Availability: This command is available to `cluster` and `Vserver` administrators at the `advanced` privilege level.

Description
The `vserver services name-service cache unix-user settings show` command displays information about the users cache configuration of the specified Vserver.

Parameters

```
[-fields <fieldname>, ]...
```
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.
Use this parameter to display detailed information about the users cache configuration settings.

\[-vserver <vserver name>\] - Vserver

Use this parameter to display information about the users cache configuration settings for the Vserver you specify.

\[-is-enabled {true|false}]\] - Is Cache Enabled?

Use this parameter to display information only about the users cache configuration settings that have the specified cache enabled setting. Value \texttt{true} displays only the entries that have cache enabled and value \texttt{false} displays only the entries that have cache disabled.

\[-is-negative-cache-enabled {true|false}]\] - Is Negative Cache Enabled?

Use this parameter to display information only about the users cache configuration settings that have the specified negative cache enabled setting. Value \texttt{true} displays only the entries that have negative cache enabled and value \texttt{false} displays only the entries that have negative cache disabled.

\[-ttl \langle<integer>h\rangle[<integer>m][<integer>s]\rangle\] - Time to Live

Use this parameter to display information only about the users cache configuration settings that have the specified Time to Live.

\[-negative-ttl \langle<integer>h\rangle[<integer>m][<integer>s]\rangle\] - Negative Time to Live

Use this parameter to display information only about the users cache configuration settings that have the specified negative Time to Live.

\[-is-propagation-enabled \{true|false\}]\] - Is Propagation Enabled?

Use this parameter to display information only about the users cache configuration settings that have the specified propagation enabled setting. Value \texttt{true} displays only the entries that have the propagation of cached entries to users by id cache enabled and value \texttt{false} displays only the entries that have the propagation of cached entries to users by id cache disabled.

\begin{example}

\textbf{Examples}

The following example shows the users cache configuration settings for all the Vservers:

```
cluster1::> vserver services name-service cache unix-user settings show
```

The following example shows the users cache configuration settings for Vserver vs0:

```
cluster1::> vserver services name-service cache unix-user settings show -vserver vs0
```

The following example shows the users cache configuration settings that have cache disabled:

```
cluster1::> vserver services name-service cache unix-user settings show -is-enabled false
```

\end{example}

\textbf{vserver services name-service cache unix-user user-by-id commands}

The user-by-id directory

\texttt{vserver services name-service cache unix-user user-by-id delete}

Delete an entry

\textbf{Availability}: This command is available to \textit{cluster} and \textit{Vserver} administrators at the \textit{advanced} privilege level.
Description
The `vserver services name-service cache unix-user user-by-id delete` command removes the user entries that are cached by the user identifier or UID. If user cache propagation is enabled, the corresponding user-by-name cache entry will also be removed.

Parameters

- `vserver <vserver name>` - Vserver
  
  Use this parameter to specify the Vserver for which the user entries that are cached by the user identifier or UID need to be deleted.

- `pw-uid <integer>` - pw_uid field
  
  Use this parameter to specify the user identifier or UID for which the cached entries need to be deleted.

Examples

The following example deletes all the user entries cached by the user identifier or UID for Vserver vs0 and user identifier or UID 123:

```
cluster1::> vserver services name-service cache unix-user user-by-id delete -vserver vs0 -pw-uid 123
```

vserver services name-service cache unix-user user-by-id delete-all

Delete all the entries for the vserver

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description

The `vserver services name-service cache unix-user user-by-id delete-all` command removes all the user entries that are cached by the user identifier or UID for the specified Vserver.

Parameters

- `vserver <vserver name>` - Vserver
  
  Use this parameter to specify the Vserver for which the user entries that are cached by the user identifier or UID need to be deleted.

Examples

The following example deletes all the cached user entries for Vserver vs0:

```
cluster1::> vserver services name-service cache unix-user user-by-id delete-all -vserver vs0
```

vserver services name-service cache unix-user user-by-id show

Display password struct

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description

The `vserver services name-service cache unix-user user-by-id show` command displays the user information cached by the user identifier or UID.

Parameters

```
[ -fields <fieldname>, ... ]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.
Use this parameter to display detailed information about the user entries cached by the user identifier or UID.

```
[-instance]
```

Use this parameter to specify the Vserver for which the user entries that are cached by the user identifier or UID need to be displayed.

```
[-vserver <vserver name>]
```

Use this parameter to specify the user identifier or UID for which the cached entries need to be displayed.

```
[-pw-uid <integer>]
```

Use this parameter to display information only about the cached user entries that have the specified user identifier or GID.

```
[-pw-gid <integer>]
```

Use this parameter to display the user entries that were cached at the specified time.

```
[-create-time <MM/DD/YYYY HH:MM:SS>]
```

Use this parameter to display information only about the user entries cached by the user identifier or UID that have the specified lookup source.

```
[-source {none|files|dns|nis|ldap|netgrp_byname|dc}]
```

Use this parameter to display information only about the cached user entries that have the specified lookup source.

```
Examples
```

The following example displays all the users which are cached by the user identifier or UID:

```
cluster1::> vserver services name-service cache unix-user user-by-id show
```

The following example displays all the users entries cached by the user identifier or UID for Vserver vs0:

```
cluster1::> vserver services name-service cache unix-user user-by-id show-vserver vs0
```

```
vserver services name-service cache unix-user user-by-name commands
```

The user-by-name directory

```
vserver services name-service cache unix-user user-by-name delete
```

Delete an entry

**Availability:** This command is available to cluster and Vserver administrators at the advanced privilege level.

**Description**
The `vserver services name-service cache unix-user user-by-name delete` command removes the user entries that are cached by the user name. If user cache propagation is enabled, the corresponding user-by-id cache will also be removed.

**Parameters**

```
[-vserver <vserver name>]
```

Use this parameter to specify the Vserver for which the user entries that are cached by user name need to be deleted.

```
[-pw-name <text>]
```

Use this parameter to specify the user name for which the cached entries need to be deleted.
Examples

The following example deletes all the cached user entries for Vserver vs0 and user name abc:

```
cluster1::> vserver services name-service cache unix-user user-by-name delete -vserver vs0 -pw-name abc
```

vserver services name-service cache unix-user user-by-name delete-all

Delete all the entries for the vserver

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description

The `vserver services name-service cache unix-user user-by-name delete-all` command removes all the user entries that are cached by the user name for the specified Vserver.

Parameters

- `--vserver <vserver name>` - Vserver
  
  Use this parameter to specify the Vserver for which the user entries that are cached by user name need to be deleted.

Examples

The following example deletes all the cached user entries for Vserver vs0:

```
cluster1::> vserver services name-service cache unix-user user-by-name delete-all -vserver vs0
```

vserver services name-service cache unix-user user-by-name show

Display password struct

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description

The `vserver services name-service cache unix-user user-by-name show` command displays the user information cached by the user name.

Parameters

{ |-fields <fieldname>,... |

  If you specify the `--fields <fieldname>,...` parameter, the command output also includes the specified field or fields. You can use `--fields ?` to display the fields to specify.

  [|--instance |]

  Use this parameter to display detailed information about the user entries cached by the user name.

  [|--vserver <vserver name> |] - Vserver

  Use this parameter to specify the Vserver for which the user entries that are cached by the user name need to be displayed.

  [|--pw-name <text> |] - pw_name field

  Use this parameter to display information only about the cached user entries that have the specified user name.

  [|--pw-uid <integer> |] - pw_uid field

  Use this parameter to display information only about the cached user entries that have the specified user identifier or UID.
- `pw_gid <integer>` - `pw_gid` field
  Use this parameter to display information only about the cached user entries that have the specified group identifier or GID.

- `create-time <MM/DD/YYYY HH:MM:SS>` - `Create Time`
  Use this parameter to display information only about the user entries that were cached at the specified time.

- `source {none|files|dns|nis|ldap|netgrp_bynamel|dc}` - `Source of the Entry`
  Use this parameter to display information only about the user entries cached by user name that have the specified look-up source.

### Examples
The following example displays all the users which are cached by user name:
```
cluster1::> vserver services name-service cache unix-user user-by-name show
```

The following example displays all the users entries cached by user name for Vserver vs0:
```
cluster1::> vserver services name-service cache unix-user user-by-name show -vserver vs0
```

### vserver services name-service dns commands
Manage DNS service

### vserver services name-service dns check
Display validation status of a DNS configuration

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**
Use the `vserver services name-service dns check` command to check the status of configured DNS servers.

**Parameters**

- `[-fields <fieldname>, ...]`
  If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

- `[-instance]`
  If you specify the `-instance` parameter, the command displays detailed information about all fields.

- `vserver <vserver name>` - `Vserver`
  Use this parameter to specify the Vserver whose DNS mapping needs to be validated.

- `name-server <IP Address>` - `Name Server`
  Use this parameter to display information only about name-servers that match the value you specify.

- `status {up|down}` - `Name Server Status`
  Use this parameter to display information only about name-servers with a status that matches the value you specify.

- `status-details <text>` - `Status Details`
  Use this parameter to display information only about name-servers with status details that match the value you specify.
Examples
The following example checks the DNS server mapping on the Vserver vs0:

```
cluster1::> vserver services name-service dns check -vserver vs0
Vserver          Name Server     Status  Status Details
---------------- --------------- ------- --------------------------
vs0              10.11.12.13     up      Response time (msec): 55
vs0              10.11.12.14     up      Response time (msec): 70
vs0              10.11.12.15     down    Connection refused.
```

vserver services name-service dns create

Create a new DNS table entry

Availability: This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

Description
The `vserver services name-service dns create` command creates new DNS server mappings. DNS servers provide remote connection information, such as IP addresses, based on domain and system names.

Parameters

- `-vserver <vserver name>` - Vserver
  Use this parameter to specify the Vserver on which to create the new DNS server mapping.

- `-domains <text>, ...` - Domains
  Use this parameter to specify the domains of the Vserver. Separate multiple domains with commas.

- `-name-servers <IP Address>, ...` - Name Servers
  Use this parameter to specify the IP addresses of the DNS servers that provide name service for the domains in this DNS server mapping. Separate multiple addresses with commas.

- `[-timeout <integer>]` - Timeout (secs)
  Use this parameter to specify a timeout value (in seconds) for queries to the name servers. The default value is 2 seconds.

- `[-attempts <integer>]` - Maximum Attempts
  Use this parameter to specify the number of attempts the Vserver should make when querying the DNS name servers. The default value is 1 attempt.

- `[-is-tld-query-enabled {true|false}]` - Is TLD Query Enabled? (privilege: advanced)
  Use this parameter to enable or disable top-level domain (TLD) queries. If the parameter is set to `false`, the resolver will not attempt to resolve a name that has no "." characters in it. The default value for this parameter is `true`.

- `[-require-source-address-match {true|false}]` - Require Source and Reply IPs to Match (privilege: advanced)
  Use this parameter to allow dns responses sourced from an IP that does not match where the vserver sent the request. If the parameter is set to `false`, the resolver will allow response from an IP other than the one to which the request was sent. The default value for this parameter is `true`.

- `[-require-packet-query-match {true|false}]` - Require Packet Queries to Match (privilege: advanced)
  Use this parameter to check if the query section of the reply packet is equal to that of the query packet. If the parameter is set to `false`, the resolver will not check if the query section of the reply packet is equal to that of the query packet. The default value for this parameter is `true`.
[-skip-config-validation {true}] - Skip Configuration Validation

Use this parameter to skip the DNS configuration validation.

The domain name specified with the -domains is validated with the following rules:

- The name must contain only the following characters: A through Z, a through z, 0 through 9, ".", "." or ".".
- The first character of each label, delimited by ",", must be one of the following characters: A through Z or a through z or 0 through 9.
- The last character of each label, delimited by ",", must be one of the following characters: A through Z, a through z, or 0 through 9.
- The top level domain must contain only the following characters: A through Z, a through z.
- The maximum supported length is 254 characters.
- The system reserves the following names: "all", "local", and "localhost".

The hosts specified with the -name-servers parameter are validated to verify that each of the name servers is reachable, and is providing DNS services.

The validation fails, if the domain name is invalid, or there is no valid name server.

Examples

This example creates a new DNS server mapping for the Vserver vs0 in the domain example.com, specifying that 192.168.0.16 and 192.168.0.24 are the name servers for this domain.

```
cluster1::> vserver services name-service dns create -vserver vs0 -domains example.com -name-servers 192.168.0.16,192.168.0.24
```

vserver services name-service dns delete

Remove a DNS table entry

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver services name-service dns delete command removes the DNS server mapping from a Vserver.

Deleting a DNS server mapping removes it permanently. If you delete a DNS server mapping, commands or jobs that do not use IP addresses do not succeed.

Parameters

- `-vserver <vserver name>` - Vserver

Use this parameter to specify the Vserver whose DNS server mapping is deleted.

Examples

This example removes the DNS server mapping from the Vserver node1.

```
cluster1::> vserver services name-service dns delete -vserver vs0
```

vserver services name-service dns modify

Change a DNS table entry

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.
Description
Use the vserver services name-service dns modify command to modify an existing DNS server mapping.

To permanently remove a mapping, use the vserver services name-service dns delete command.

Parameters
-vserver <vserver name> - Vserver
Use this parameter to specify the Vserver whose DNS mapping is modified.

[-domains <text>, ...] - Domains
Use this parameter to specify a domain for the Vserver.

[-name-servers <IP Address>, ...] - Name Servers
Use this parameter to specify the IP addresses of the DNS name servers for this Vserver.

[-timeout <integer>] - Timeout (secs)
Use this parameter to specify a timeout value (in seconds) for queries to the DNS servers.

[-attempts <integer>] - Maximum Attempts
Use this parameter to specify the number of times to attempt queries to the DNS servers.

[-is-tld-query-enabled {true|false}] - Is TLD Query Enabled? (privilege: advanced)
Use this parameter to enable or disable top-level domain (TLD) queries. If the parameter is set to false, the resolver will not attempt to resolve a name that has no "." characters in it. The default value for this parameter is true.

[-require-source-address-match {true|false}] - Require Source and Reply IPs to Match (privilege: advanced)
Use this parameter to allow dns responses sourced from an IP that does not match where the vserver sent the request. If the parameter is set to false, the resolver will allow response from an IP other than the one to which the request was sent.

[-require-packet-query-match {true|false}] - Require Packet Queries to Match (privilege: advanced)
Use this parameter to check if the query section of the reply packet is equal to that of the query packet. If the parameter is set to false, the resolver will not check if the query section of the reply packet is equal to that of the query packet.

[-skip-config-validation {true}] - Skip Configuration Validation
Use this parameter to skip the DNS configuration validation.

The domain name specified with the -domains is validated with the following rules:

• The name must contain only the following characters: A through Z, a through z, 0 through 9, ".", ":" or "_".
• The first character of each label, delimited by ".", must be one of the following characters: A through Z or a through z or 0 through 9.
• The last character of each label, delimited by ",", must be one of the following characters: A through Z, a through z, or 0 through 9.
• The top level domain must contain only the following characters: A through Z, a through z.
• The maximum supported length is 254 characters.
• The system reserves the following names: "all", "local", and "localhost".

The hosts specified with the -name-servers parameter are validated to verify that each of the name servers is reachable, and is providing DNS services.

The validation fails, if the domain name is invalid, or there is no valid name server.
Examples
This example modifies the DNS server mapping for the domain example.com on the Vserver vs0, specifying that 10.0.0.1 and 10.0.0.2 are the name servers for this domain.

cluster1::> vserver services name-service dns modify -vserver vs0 -domains example.com -name-servers 10.0.0.1,10.0.0.2

Related references
vserver services name-service dns delete on page 2159

vserver services name-service dns show
Display DNS configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver services name-service dns show command displays information about DNS server mappings. DNS servers provide remote connection information, such as IP addresses, based on domain and system names.

Parameters

[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

[-instance ]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver
Use this parameter to display information only about the DNS server mapping of the Vservers you specify.

[-domains <text>, ...] - Domains
Use this parameter to display information only about the DNS server mappings for Vservers in the domains you specify.

[-name-servers <IP Address>, ...] - Name Servers
Use this parameter to display information only about DNS server mappings that use the DNS name servers you specify.

[-timeout <integer>] - Timeout (secs)
Use this parameter to display information only about DNS server mappings that have the timeout value you specify.

[-attempts <integer>] - Maximum Attempts
Use this parameter to display information only about DNS server mappings that make the maximum number of attempts you specify.

[-is-tld-query-enabled {true|false}] - Is TLD Query Enabled? (privilege: advanced)
Use this parameter to display information only about DNS server mappings that have the specified TLD query setting.

[-require-source-address-match {true|false}] - Require Source and Reply IPs to Match (privilege: advanced)
Use this parameter to display information only about DNS server mappings that have the specified setting to require the source address of the response packet to match the address where the vserver sent the request.
[−require-packet-query-match {true|false}]] - Require Packet Queries to Match (privilege: advanced)

Use this parameter to display information only about DNS server mappings that have the specified setting to require the query section of the reply packet to match that of the query packet.

Examples
The following example shows typical output from the command. Note that cluster1 uses different name servers for example.com.

```
cluster1::> vserver services name-service dns show

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Domains</th>
<th>Servers</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>
<td>example.com</td>
<td>10.0.0.1, 10.0.0.2</td>
</tr>
<tr>
<td>vs2</td>
<td>example.com, example2.com</td>
<td>10.0.0.1, 10.0.0.2</td>
</tr>
<tr>
<td>vs3</td>
<td>example.com, example2.com</td>
<td>192.168.0.1, 192.168.0.2</td>
</tr>
</tbody>
</table>
```

vserver services name-service dns dynamic-update commands
Manage Dynamic DNS Updates

vserver services name-service dns dynamic-update modify
Modify a Dynamic DNS Update Configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver services name-service dns dynamic-update modify command modifies the configuration for dynamic DNS updates for a Data Vserver.

Parameters
−vserver <vserver name> - Vserver
Use this parameter to specify the Vserver for which you want to modify the dynamic DNS update configuration.

[−is-enabled {true|false}] - Is Dynamic DNS Update Enabled?
Use this parameter with value true to enable the dynamic DNS update feature. This field is set to false by default.

[−use-secure {true|false}] - Use Secure Dynamic Update?
Use this parameter with value true to enable secure dynamic DNS updates. This field is set to false by default.

[−vserver-fqdn <text>] - Vserver FQDN to Be Used for DNS Updates
Use this parameter to modify the Vserver FQDN to be used for dynamic DNS updates.

[−ttl <[integer]>h [<integer>m] [<integer>s]>] - Time to Live for DNS Updates (privilege: advanced)
Use this parameter to modify the Time to Live value for the dynamic DNS updates. The default value is set to 24 hours. The maximum supported value for TTL is 720 hours.

[−skip-fqdn-validation {true}] - Skip Vserver FQDN Validation
If the parameter is specified, the FQDN name validation is skipped.
Examples
The following example enables the dynamic DNS update feature and modifies the FQDN to be used for dynamic DNS updates for the Vserver vs1, specifying vs1.abcd.com as the new FQDN.

```
cluster1::*> vserver services name-service dns dynamic-update modify -vserver vs1 -is-enabled true -vserver-fqdn vs1.abcd.com
```

The following example modifies the dynamic DNS updates configuration to only send secure updates to the DNS server configured for the Vserver vs1.

```
cluster1::*> vserver services name-service dns dynamic-update modify -vserver vs1 -is-enabled true -use-secure true
```

vserver services name-service dns dynamic-update prepare-to-downgrade
Disable the Dynamic DNS update feature to be compatible with releases earlier than Data ONTAP 8.3.1

**Availability:** This command is available to cluster administrators at the advanced privilege level.

**Description**
The vserver services name-service dns dynamic-update prepare-to-downgrade command disables the Dynamic DNS updates on all Vservers and removes all related configurations. This command is used to prepare for downgrading the system to a release earlier than Data ONTAP 8.3.1 only.

Examples
The following example disables the dynamic DNS updates feature.

```
cluster1::*> vserver services name-service dns dynamic-update prepare-to-downgrade
Warning: This command will disable dynamic DNS updates on all Vservers, remove all related configurations, and disable the dynamic DNS update feature. Use this command to prepare for downgrading the system to a release earlier than Data ONTAP 8.3.1 only.
Do you want to continue? {y|n}:
```

vserver services name-service dns dynamic-update show
Display Dynamic DNS Update Configuration

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The vserver services name-service dns dynamic-update show command shows the dynamic DNS update configuration related to the DNS server for a Vserver.

**Parameters**

```
[-fields <fieldname>, ...]
```
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance]
```
If you specify the -instance parameter, the command displays detailed information about all fields.
[-vserver <vserver name>] - Vserver

Use this parameter to display dynamic DNS update configuration for the Vservers you specify.

[-is-enabled {true|false}] - Is Dynamic DNS Update Enabled?

Use this parameter with value true to display information about dynamic DNS update configurations that are active.

[-use-secure {true|false}] - Use Secure Dynamic Update?

Use this parameter with value true to display information about dynamic DNS update configurations that are set to send secure dynamic updates only.

[-vserver-fqdn <text>] - Vserver FQDN to Be Used for DNS Updates

Use this parameter to display information about dynamic DNS update configurations that are set to send the dynamic updates with the FQDN you have specified.

[-ttl <[<integer>h][<integer>m][<integer>s]]> - Time to Live for DNS Updates (privilege: advanced)

If you specify this parameter, the command displays dynamic DNS update configurations having the specified Time to Live value.

### Examples

The following example shows all information about dynamic DNS update configurations.

```
cluster1::*> vserver services name-service dns dynamic-update show
gupgclust-3::> dns dynamic-update show
Vserver Is-Enabled Use-Secure Vserver FQDN TTL
-------------------- -------------- ---------- ------------------------ -------
vs1 true false vs1.abcd.com 24h
vs2 false false vs2.abcd.com 24h
2 entries were displayed.
```

### vserver services name-service dns dynamic-update record commands

The Record Directory

```
vserver services name-service dns dynamic-update record add
```

Adds a New DNS Resource Record

**Availability:** This command is available to cluster and Vserver administrators at the advanced privilege level.

**Description**

The `vserver services name-service dns dynamic-update record add` command sends an update to add a new DNS resource record of an existing logical interface (LIF) of the Vserver to the configured DNS server.

**Parameters**

- `-vserver <vserver name>` - Vserver

  Use this parameter to specify the Vserver for which you want to add a resource record on the configured DNS server.

- `-lif <lif-name>` - Logical Interface

  Use this parameter to specify the Logical Interface(LIF) name for which you want to add a resource record on the configured DNS server.

### Examples

The following example adds a resource record entry for the Logical Interface lif1 belonging to the Vserver vs1 to the configured DNS server.
vserver services name-service dns dynamic-update record delete

Deletes a DNS Resource Record

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

**Description**
The `vserver services name-service dns dynamic-update record delete` command sends an update to remove an existing DNS resource record of the Logical Interface (LIF) of the Vserver from the configured DNS server.

**Parameters**
- `-vserver <vserver name>` - *Vserver*
  - Use this parameter to specify the Vserver of which you want to delete a resource record from the configured DNS server.

  `{ -lif <lif-name> } - Logical Interface`
  - Use this parameter to specify the Logical Interface (LIF) name whose corresponding resource record you want to remove from the configured DNS server.

  `| -address <IP Address>` - *IP Address*
  - Use this parameter to specify the IP address of the Logical Interface whose corresponding resource record you want to remove from the configured DNS server.

**Examples**
The following example removes a resource record entry of the Logical Interface lif1 belonging to the Vserver vs1 from the configured DNS server.

```bash
cluster1::*> vserver services name-service dns dynamic-update record delete -vserver vs1 -lif lif1
```

The following example removes a resource record entry of the Logical Interface whose address is 1.1.1.1 belonging to the Vserver vs1 from the configured DNS server.

```bash
cluster1::*> vserver services name-service dns dynamic-update record delete -address 1.1.1.1 -vserver vs1
```

---

**vserver services name-service dns hosts commands**

Manage local mapping for host names

**vserver services name-service dns hosts create**

Create a new host table entry

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.
Description
Use the `vserver services name-service dns hosts create` command to create new DNS host table entries. These entries map hostnames to IP addresses.

Parameters
- `vserver <vserver name>` - Vserver
  Use this parameter to specify the Vserver on which the host table entry will be created.
- `address <IP Address>` - IP Address
  Use this parameter to specify the IP address of the new host table entry.
- `hostname <text>` - Canonical Hostname
  Use this parameter to specify the full hostname for the new host table entry.
- `aliases <text>, ...` - Aliases
  Use this parameter to specify any aliases to include in the new host table entry. Separate multiple aliases with commas.

Examples
This example creates a new DNS host table entry for 10.0.0.17 on the vserver vs1, with the hostname test.example.com and the alias test.

```
cluster1::> vserver services name-service dns hosts create -vserver vs1 -address 10.0.0.17 -hostname test.example.com -aliases test
```

vserver services name-service dns hosts delete
Remove a host table entry

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
Use the `vserver services name-service dns hosts delete` command to delete DNS host table entries.

Parameters
- `vserver <vserver name>` - Vserver
  Use this parameter to specify the Vserver whose host table entry will be deleted.
- `address <IP Address>` - IP Address
  Use this parameter to specify the IP address of the host table entry to delete.

Examples
This example removes the DNS host table entry of 10.0.0.15 from the host table of the vserver vs1.

```
cluster1::> vserver services name-service dns hosts delete -vserver vs1 -address 10.0.0.15
1 entry was deleted.
```

vserver services name-service dns hosts modify
Modify hostname or aliases

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.
Description
Use the `vserver services name-service dns hosts modify` command to modify existing DNS host table entries.

Parameters

- **-vserver <vserver name>** - Vserver
  
  Use this parameter to specify the Vserver whose host table will be modified.

- **-address <IP Address>** - IP Address
  
  Use this parameter to specify the IP address of the host table entry to modify.

- **[-hostname <text>]** - Canonical Hostname
  
  Use this parameter to specify a full hostname for the host table entry.

- **[-aliases <text>, ...]** - Aliases
  
  Use this parameter to specify alternate hostnames for the host table entry.

Examples

This example changes the host table of vserver vs1 so that the hostname stored in the host table entry for 10.0.0.57 is pgh.example.com.

```
cluster1::> vserver services name-service dns hosts modify -vserver -vs1 -address 10.0.0.57 -hostname pgh.example.com
1 entry was modified.
```

This example changes the host table of vserver vs1 to store the name loghost as an alternate hostname for IP address 10.0.0.5.

```
cluster1::> vserver services name-service dns hosts modify -vserver vs1 -address 10.0.0.5 -aliases loghost
1 entry was modified.
```

`vserver services name-service dns hosts show`

Display IP address to hostname mappings

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

Use the `vserver services name-service dns hosts show` command to display Domain Name System (DNS) host table entries. These entries map hostnames to IP addresses. Entries may also include alternate hostnames, known as aliases. Host table entries enable you to refer to other Internet hosts by a memorable name instead of by a numeric IP address. This host table is similar to the */etc/hosts* file found on most UNIX style systems.

Parameters

{ [-fields <fieldname>, ...]
  
  If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

  [-instance ]
  
  If you specify the `-instance` parameter, the command displays detailed information about all fields.

  [-vserver <vserver name>] - Vserver
  
  Use this parameter to display information only about host table entries on the Vservers you specify.

  [-address <IP Address>] - IP Address
  
  Use this parameter to display information only about host table entries that match the IP addresses you specify.}

vserver services commands
-hostname <text> - Canonical Hostname
  Use this parameter to display information only about host table entries that match the hostnames you specify.

-aliases <text>, ... - Aliases
  Use this parameter to display information only about host table entries that include the alternate hostnames you specify.

Examples
The following example shows a typical host table.

```
cluster1::> vserver services name-service dns hosts show
Vserver    Address        Hostname        Aliases
---------- -------------- --------------- ----------------------
vs1        10.0.0.10      mail.example.com mail, mailhost, snmp
vs1        10.0.0.15      ftp.example.com ftp
vs1        10.0.0.16      www.example.com www
vs2        10.0.0.10      mail.example.com mail, mailhost, snmp
vs2        10.0.0.15      ftp.example.com ftp
vs2        10.0.0.16      www.example.com www
vs2        10.0.0.17      test.example.com
7 entries were displayed.
```

vserver services name-service getxxbyyyy commands
Execute getXXbyYY for the given command.

The vserver services name-service getxxbyyyy command performs name lookups for a given Vserver. The underlying service for doing the lookup is selected based on the configured name service switch order.

vserver services name-service getxxbyyyy getaddrinfo
Gets the IP address information by using the host name.

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The vserver services name-service getxxbyyyy getaddrinfo gets the IP address information by using the host name for a given Vserver. The underlying service for doing the lookup is selected based on the configured name service switch order.

Parameters
- node (<nodename>|local) - Node Name
  Use this parameter to specify the node where the lookup will be performed
- vserver <vserver name> - Vserver Name
  Use this parameter to specify the Vserver where the lookup will be performed
- hostname <text> - Host Name
  Use this parameter to specify the Host Name for which the IP address information is needed
- [address-family {ipv4|ipv6|all}] - Return Addresses for Family
  Use this parameter to specify the Address Family for which the IP address information is needed
- [show-source {true|false}] - Show Source used for Lookup
  Use this parameter to specify if source used for lookup needs to be displayed
- [use-cache {true}] - Enable/Disable cache
  If set to true, locally-cached values will be used. The default value is false.
Examples
The following example requests address information for localhost:

    cluster1::*> vserver services name-service getxxbyyy getaddrinfo -node cluster1-01 -vserver vs1 -
    hostname localhost -address-family all -show-source true -use-cache false
    Source used for Lookup: Files
    Host name: localhost
    Canonical name: localhost
    IPv4 : 127.0.0.1
    IPv6 : ::1

vserver services name-service getxxbyyy getgrbygid

Gets the group members by using the group identifier or GID.

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The vserver services name-service getxxbyyy getgrbygid gets the group members by using the group identifier
or GID for a given Vserver. The underlying service for doing the lookup is selected based on the configured name service switch
order.

Parameters

- **-node** \( (<\text{nodename}> | \text{local}) \) - Node Name
  Use this parameter to specify the node where the lookup will be performed

- **-vserver** \( (<\text{vserver name}> \) - Vserver Name
  Use this parameter to specify the Vserver where the lookup will be performed

- **-groupID** \( (<\text{integer}> \) - Group ID
  Use this parameter to specify the GroupID for which the members are requested

- **[-show-source \{true|false\}]** - Source used for Lookup
  Use this parameter to specify if source used for lookup needs to be displayed

- **[-use-cache \{true\}]** - Use Locally-Cached Values
  If set to true, locally-cached values will be used. The default value is false.

Examples
The following example requests group information for the given groupid

    cluster1::*> vserver services name-service getxxbyyy getgrbygid -node cluster1-01 -vserver
    vs1 -groupID 1
    name: daemon
    gid: 1

vserver services name-service getxxbyyy getgrbyname

Gets the group members by using the group name.

Availability: This command is available to cluster administrators at the advanced privilege level.

Description
The vserver services name-service getxxbyyy getgrbyname gets the group members by using the group name.
Parameters

- **node** `<nodename>|local` - Node Name
  
  Use this parameter to specify the node where the lookup will be performed

- **vserver** `<vserver name>` - Vserver Name
  
  Use this parameter to specify the Vserver where the lookup will be performed

- **groupname** `<text>` - Group Name
  
  Use this parameter to specify the Group Name for which the members are requested

- **-show-source** `{true|false}` - Source used for Lookup
  
  Use this parameter to specify if source used for lookup needs to be displayed

- **-use-cache** `{true|false}` - Use Locally-Cached Values
  
  If set to `true`, locally-cached values will be used. The default value is `false`.

Examples

The following example requests group information for the given group name

```bash
clusterv1::*> vserver services name-service getxxbyyy getgrbyname -node clusterv1-01 -vserver vs1 -groupname daemon -show-source false name: daemon gid: 1
```

vserver services name-service getxxbyyy getgrlist

Gets the group list by using the user name.

**Availability:** This command is available to cluster administrators at the advanced privilege level.

**Description**

The `vserver services name-service getxxbyyy getgrlist` gets the list of groups to which user belongs. This command will go through all the sources configured for the group database in the name servers ns-switch configuration.

Parameters

- **node** `<nodename>|local` - Node Name
  
  Use this parameter to specify the node where the lookup will be performed

- **vserver** `<vserver name>` - Vserver Name
  
  Use this parameter to specify the Vserver where the lookup will be performed

- **username** `<text>` - User Name
  
  Use this parameter to retrieve the list of groups where the given user is a member

- **-use-cache** `{true|false}` - Use Locally-Cached Values
  
  If set to `true`, locally-cached values will be used. The default value is `false`.

Examples

The following example requests the grouplist for the given username
vserver services name-service getxxbyyy gethostbyaddr

Gets the host information from the IP address.

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**
The `vserver services name-service getxxbyyy gethostbyaddr` gets the host name by using the IP address. The underlying service for doing the lookup is selected based on the configured name service switch order.

**Parameters**
- `-node {<nodename>|local}` - Node Name
  Use this parameter to specify the node where the lookup will be performed
- `-vserver <vserver name>` - Vserver Name
  Use this parameter to specify the Vserver where the lookup will be performed
- `-ipaddress <IP Address>` - IP Address
  Use this parameter to specify the IPv4/IPv6 address for which the host information is needed
- `[-show-source {true|false}]` - Source used for Lookup
  Use this parameter to specify if source used for lookup needs to be displayed
- `[-use-cache [true]]` - Enable/Disable cache
  If set to `true`, locally-cached values will be used. The default value is `false`.

**Examples**
The following example requests host information for the given IP address:

```
cluster1::*> vserver services name-service getxxbyyy gethostbyaddr -node cluster1-01 -vserver vs1 -ipaddress 127.0.0.1 -show-source false -use-cache false
IP address: 127.0.0.1
Host name: localhost
```

vserver services name-service getxxbyyy gethostbyname

Gets the IP address information from host name.

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**
The `vserver services name-service getxxbyyy gethostbyname` gets the IP address by using the host name. The underlying service for doing the lookup is selected based on the configured name service switch order. When the lookup happens from the hosts file, only the first IP address is returned for a host configured with multiple IP addresses.
Parameters

- `node <nodename>|local` - Node Name
  
  Node Use this parameter to specify the node where the lookup will be performed

- `vserver <vserver name>` - Vserver Name
  
  Vserver Name Use this parameter to specify the Vserver where the lookup will be performed

- `hostname <text>` - Host Name
  
  Use this parameter to specify the Hostname for which the IP address information is requested

- `show-source {true|false}]` - Source used for Lookup
  
  Use this parameter to specify if source used for lookup needs to be displayed

Examples

The following example requests IP Address information from the given hostname

```
cluster1::*> vserver services name-service getxxbyyy gethostbyname -node cluster1-01 -vserver vs1 -hostname localhost -show-source false
Host name: localhost
Canonical name: localhost
IPv4: 127.0.0.1
```

vserver services name-service getxxbyyy getnameinfo

Gets the name information by using the IP address.

**Availability:** This command is available to `cluster` administrators at the `advanced` privilege level.

**Description**

The `vserver services name-service getxxbyyy getnameinfo` gets the host and service by using the socket address. The underlying service for doing the lookup is selected based on the configured name service switch order.

Parameters

- `node <nodename>|local` - Node Name
  
  Use this parameter to specify the node where the lookup will be performed

- `vserver <vserver name>` - Vserver Name
  
  Use this parameter to specify the Vserver where the lookup will be performed

- `ipaddress <IP Address>` - IP Address
  
  Use this parameter to specify IPv4/IPv6 address for which the name information is requested

- `show-source {true|false}]` - Source used for Lookup
  
  Use this parameter to specify if source used for lookup needs to be displayed

- `use-cache {true}` - Enable/Disable cache
  
  If set to `true`, locally-cached values will be used. The default value is `false`.

Examples

The following example gets the name information for the given IP Address:
vserver services name-service getxxbyyy getpwbyname

Gets the password entry by using the user name.

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**
The *vserver services name-service getxxbyyy getpwbyname* gets the password entry by using the user name. The underlying service for doing the lookup is selected based on the configured name service switch order.

**Parameters**
- **-node** `<nodename>|local` - Node Name
  Use this parameter to specify the node where the lookup will be performed
- **-vserver** `<vserver name>` - Vserver Name
  Use this parameter to specify the Vserver where the lookup will be performed
- **-username** `<text>` - User Name
  Use this parameter to specify the Username for which the password entry is requested
- **[-show-source {true|false}]** - Source used for Lookup
  Use this parameter to specify if source used for lookup needs to be displayed
- **[-use-cache {true}]** - Enable/Disable cache
  If set to *true*, locally-cached values will be used. The default value is *false*.

**Examples**
The following example requests password entry from the given username:

```
cluster1::*> vserver services name-service getxxbyyy getpwbyname -node cluster1-01 -vserver vs1 -username vsadmin -show-source true -use-rbac false -use-cache false
Source used for lookup: Files
pw_name: daemon
pw_passwd: *
pw_uid: 1, pw_gid: 1
pw_gecos: Owner of many system processes
pw_dir: /root
pw_shell: /usr/sbin/nologin
```

vserver services name-service getxxbyyy getpwbyuid

Gets the password entry by using the user identifier or UID.

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**
The *vserver services name-service getxxbyyy getpwbyuid* gets the password entry by using the user identifier or UID. The underlying service for doing the lookup is selected based on the configured name service switch order.
Parameters

- **node** \(<nodename>|local\) - Node Name
  
  Use this parameter to specify the node where the lookup will be performed

- **vserver** \(<vserver name>\) - Vserver Name
  
  Use this parameter to specify the Vserver where the lookup will be performed

- **userID** \(<integer>\) - User ID
  
  Use this parameter to specify the UserID for whom the password entry is requested

- **-show-source** \((true|false)\) - Source used for Lookup
  
  Use this parameter to specify if source used for lookup needs to be displayed

- **-use-cache** \((true)\) - Enable/Disable cache
  
  If set to true, locally-cached values will be used. The default value is false.

Examples

The following example requests password entry by using the user ID:

```bash
cluster1::> vserver services name-service getxxbyyy getpwbyuid -node cluster1-01 -vserver vs1 -userID 1001 -show-source true -use-rbac true -use-cache false
Source used for Lookup: Files
pw_name: vsadmin
pw_passwd: $1$f7b22f688KihT1ptYqpEj4jE60f0
pw_uid: 1001
pw_gid: 65533
pw_gecos: User
pw_dir: /var/home/vsadmin
pw_shell: /sbin/ngsh
```

**vserver services name-service getxxbyyy netgrpcheck**

Check if a client is part of a netgroup using combined API

**Availability:** This command is available to cluster administrators at the advanced privilege level.

**Description**

The `vserver services name-service getxxbyyy netgrpcheck` checks if a client is part of a netgroup. The underlying service for doing the lookup is selected based on the configured name service switch order.

Parameters

- **node** \(<nodename>|local\) - Node Name
  
  Use this parameter to specify the node where the lookup will be performed

- **vserver** \(<vserver name>\) - Vserver Name
  
  Use this parameter to specify the Vserver where the lookup will be performed

- **netgroup** \(<text>\) - Netgroup Name
  
  Use this parameter to specify the Netgroup name

- **clientIP** \(<IP Address>\) - Client IP Address
  
  Use this parameter to specify the Client IP for which the membership in a given netgroup needs to be checked

- **-enable-domain-search-flag** \((true|false)\) - Use DNS domain
  
  Use this parameter to use DNS domain. Default value for this field is true
[-trust-any-source (true|false)] - Trust any source
Use this parameter to set trust any source parameter. Default value for this field is false

[-show-source (true|false)] - Source Used for Lookup
Use this parameter to specify if source used for lookup needs to be displayed

Examples
The following example checks if the given client is part of the given netgroup:

```
cluster1::*> vserver services name-service getxxbyyy netgrpcheck -node cluster1-01 -
vserver vs1 -netgroup net1 -clientIP 10.232.98.198 -show-source false
10.232.98.198 is a member of net1
```

vserver services name-service ldap commands
Manage LDAP configuration

vserver services name-service ldap check
Display validation status of a LDAP configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
Use the `vserver services name-service ldap check` command to check the status of the LDAP configuration.

Parameters

`[-fields <fieldname>,...]
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

`[-instance ]
If you specify the `-instance` parameter, the command displays detailed information about all fields.

-vserver <Vserver Name> - Vserver
Use this parameter to specify the Vserver whose LDAP configuration needs to be validated.

-<client-config <text>] - Client Configuration Name
Use this parameter to specify the LDAP client configuration which is assigned to LDAP configuration for the specified Vserver.

-ldap-status (up|down] - LDAP Status
Use this parameter to display information only about LDAP configurations with a status that matches the value you specify.

-ldap-status-details <text> - LDAP Status Details
Use this parameter to display information only about LDAP configurations with a status detail that matches the value you specify.

-ldap-dn-status-details <text>,... - LDAP DN Status Details
Use this parameter to display information only about LDAP DN configurations with a status detail that matches the value you specify.
Examples
The following examples check the LDAP configuration on the SVM vs0:

```
cluster1::> vserver services name-service ldap check -vserver vs0
Vserver: vs0
Client Configuration Name: cl
  LDAP Status: up
  LDAP Status Details: Successfully connected to LDAP server "10.11.12.13".
  LDAP DN Status Details: All the configured DNs are available.
```

```
cluster1::> vserver services name-service ldap check -vserver vs0
Vserver: vs0
Client Configuration Name: cl
  LDAP Status: up
  LDAP Status Details: Successfully connected to LDAP server "10.11.12.13".
  LDAP DN Status Details: Validation of Domains specified in the LDAP client configuration
  failed. Reason: bind-dn is invalid or bind credentials are invalid. Correct the configuration and
  try again.

In the above example, you can correct the LDAP configuration by performing either of the
following procedures:
-- If the bind-dn is invalid, use the "ldap client modify" command to correct it.
-- If the bind credentials are invalid, use the "ldap client modify-bind-password" command to
correct them.
```

vserver services name-service ldap create

Create an LDAP configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver services name-service ldap create command associates an LDAP client configuration with a Vserver.

Parameters

- `vserver <Vserver Name>` - Vserver
  This parameter specifies the Vserver with which you want to associate the LDAP client configuration. A data
  Vserver or admin Vserver can be specified.

- `client-config <text>` - LDAP Client Configuration
  This parameter specifies the name of the LDAP client configuration, defined under the vserver services
  name-service ldap client command, that you want to associate with the Vserver. The value of the bind-
as-cifs-server parameter on this LDAP client should be false, if the CIFS server of the associated data Vserver
does not exist or exists in workgroup mode.

[<-skip-config-validation [true]] - Skip Configuration Validation

Use this parameter to skip the LDAP configuration validation.

The LDAP client configuration, specified by the `client-config` parameter, that you want to associate with
the Vserver is validated to verify that at least one of the LDAP servers is reachable, and is providing LDAP
services.

. The validation fails if ONTAP was unable to connect to any LDAP server with the specified `client-
config`. 
Examples
The following example associates the LDAP client configuration "corp" with the Vserver "vs1":

```sh
cluster1::> vserver services name-service ldap create -vserver vs1 -client-config corp
```

- `vserver services name-service ldap client` on page 2179

vserver services name-service ldap delete
Delete an LDAP configuration

Availability: This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

Description
The `vserver services name-service ldap delete` command removes the LDAP configuration, which is an LDAP client configuration's association with a Vserver.

Note: Make sure that you remove 'ldap' from the Vserver's `--ns-switch` and `--nm-switch` parameters and test connectivity before deleting a working LDAP configuration.

Parameters

- `-vserver <Vserver Name>` - Vserver
  This parameter specifies the Vserver from which you want to disassociate the LDAP client configuration. A data Vserver or admin Vserver can be specified.

Examples
The following example disassociates the current LDAP client configuration from Vserver "vs1".

```sh
cluster1::> vserver services name-service ldap delete -vserver vs1
```

vserver services name-service ldap modify
Modify an LDAP configuration

Availability: This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

Description
The `vserver services name-service ldap modify` command modifies an LDAP client configuration's association with a Vserver.

Note: Make sure that you remove 'ldap' from the Vserver's `--ns-switch` and `--nm-switch` configurations and test connectivity before disabling a working LDAP configuration.

Parameters

- `-vserver <Vserver Name>` - Vserver
  This parameter specifies the Vserver with which you want to associate the LDAP client configuration. A data Vserver or admin Vserver can be specified.

  `[-client-config <text>]` - LDAP Client Configuration
  This parameter specifies the name of the LDAP client configuration, defined under `vserver services name-service ldap client` command, that you want to associate with the Vserver. The value of the bind-
as-cifs-server parameter on this LDAP client should be false if the CIFS server of the associated data Vserver does not exist or exists in workgroup mode.

`[--skip-config-validation [true]]` - Skip Configuration Validation

Use this parameter to skip the LDAP configuration validation. The LDAP client configuration, specified by the `--client-config` parameter, that you want to associate with the Vserver is validated to verify that at least one of the LDAP servers is reachable, and is providing LDAP services.

The validation fails if ONTAP was unable to connect to any LDAP server with the specified `--client-config`.

**Examples**

The following example modifies the LDAP client configuration used by Vserver "vs1" to "corpnew":

```
cluster1::> vserver services name-service ldap modify --vserver vs1 --client-config corpnew
```

`vserver services name-service ldap client` on page 2179

**vserver services name-service ldap show**

Display LDAP configurations

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**

The `vserver services name-service ldap show` command displays information about LDAP configurations.

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify the `--fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `--fields ?` to display the fields to specify.

```
[-instance]
```

If you specify the `--instance` parameter, the command displays detailed information about all fields.

```
[-vserver <Vserver Name>] - Vserver
```

If you specify this parameter, the command displays information about the LDAP configuration on the specified Vserver. A data Vserver or admin Vserver can be specified.

```
[-client-config <text>] - LDAP Client Configuration
```

If you specify this parameter, the command displays information about LDAP configurations using the specified client.

**Examples**

The following example shows the LDAP configuration for Vserver "vs1":

```
cluster1::> vserver services name-service ldap show --vserver vs1 --client-config corpnew
```
vserver services name-service ldap client commands

Manage LDAP client configurations

vserver services name-service ldap client create

Create an LDAP client configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver services name-service ldap client create command creates an LDAP client configuration. A client configuration is associated with a Vserver using the vserver services name-service ldap commands.

Parameters
-vserver <Vserver Name> - Vserver
This parameter specifies the Vserver for which configuration is created. A data Vserver or admin Vserver can be specified.

-client-config <text> - Client Configuration Name
This parameter specifies the name that you would like to use to refer to the new LDAP client configuration.

{ -ldap-servers <text>, ... - LDAP Server List
This parameter specifies the list of LDAP servers used when making LDAP connections using this client configuration. If you specify this parameter, you cannot specify the -servers, -ad-domain, -preferred-ad-servers or -bind-as-cifs-server parameters. This parameter takes both FQDNs and IP addresses.

| -servers <IP Address>, ... - (DEPRECATED)-LDAP Server List
(DEPRECATED)This parameter specifies the list of LDAP servers used when making LDAP connections using this client configuration. If you specify this parameter, you cannot specify the -ldap-servers, -ad-domain, -preferred-ad-servers or -bind-as-cifs-server parameters. This parameter is deprecated 9.1.0 and onwards. Use -ldap-servers instead.

| -ad-domain <TextNoCase> - Active Directory Domain
This parameter specifies the name of the Active Directory domain used to discover LDAP servers for use by this client. This assumes that the Active Directory schema has been extended to act as a NIS replacement. If you use this parameter, you cannot specify the -ldap-servers and -servers parameter. However, you can specify a list of preferred servers using the -preferred-ad-servers parameter.

[-preferred-ad-servers <IP Address>, ...] - Preferred Active Directory Servers
This parameter specifies a list of LDAP servers that are preferred over those that are discovered in the domain specified in the -ad-domain parameter.

[-bind-as-cifs-server {true|false}] - Bind Using the Vserver's CIFS Credentials
This parameter specifies whether LDAP binds made using this client configuration use the Vserver's CIFS server credentials. If you do not specify this parameter, and the -ad-domain is configured, the default is true, otherwise the default is false.
-schema <text> - Schema Template
This parameter specifies the name of the schema template the Vserver uses when making LDAP queries. You can view and modify the templates using the `vserver services name-service ldap client schema` commands.

[-port <integer>] - LDAP Server Port
This parameter specifies the port that the LDAP client uses to connect to LDAP servers. Use port 636 to enable LDAPS. If you do not specify this parameter, the default is port 389.

[-query-timeout <integer>] - Query Timeout (sec)
This parameter specifies the amount of time (in seconds) that the LDAP client waits for a query to complete. If you do not specify this parameter, the default is 3 seconds.

[-min-bind-level {anonymous|simple|sasl}] - Minimum Bind Authentication Level
This parameter specifies the lowest acceptable level of security the LDAP client uses to bind to an LDAP server. If you do not specify this parameter, the default is an anonymous bind.

[-bind-dn <ldap_dn>] - Bind DN (User)
This parameter specifies the user that binds to the LDAP servers. For Active Directory servers, specify the user in the account (DOMAIN\user) or principal (user@domain.com) form. Otherwise, specify the user in distinguished name (CN=user,DC=domain,DC=com) form. This parameter is ignored if `-bind-as-cifs-server` is set.

[-base-dn <ldap_dn>] - Base DN
This parameter specifies the default base DN for all searches, including user, group, and netgroup searches. For example, "DC=example,DC=com". If you do not specify this parameter, the default is the root, specified by an empty (""") set.

[-base-scope {base|onelevel|subtree}] - Base Search Scope
This parameter specifies the default search scope for LDAP queries. Specify `base` to search just the named entry, `onelevel` to search entries immediately below the DN, or `subtree` to search the named DN entry and the entire subtree below the DN. If you do not specify this parameter, the scope is set to `subtree` by default.

[-user-dn <ldap_dn>] - User DN (privilege: advanced)
This parameter specifies the user DN, which overrides the base DN for user lookups.

  **Note:** To specify multiple DNs, separate multiple DN entries with semicolons (;). If you configure multiple user or group DNs and a DN contains a semicolon, add an escape character (\) immediately before the semicolon or enclose the entire DN with quotation marks ("").

[-user-scope {base|onelevel|subtree}] - User Search Scope (privilege: advanced)
This parameter specifies the user search scope. If you do not specify this parameter, the scope is set to `subtree` by default.

[-group-dn <ldap_dn>] - Group DN (privilege: advanced)
This parameter specifies the group DN, which overrides the base DN for group lookups.

  **Note:** To specify multiple DNs, separate multiple DN entries with semicolons (;). If you configure multiple user or group DNs and a DN contains a semicolon, add an escape character (\) immediately before the semicolon or enclose the entire DN with quotation marks ("").

[-group-scope {base|onelevel|subtree}] - Group Search Scope (privilege: advanced)
This parameter specifies the group search scope. If you do not specify this parameter, the scope is set to `subtree` by default.

[-netgroup-dn <ldap_dn>] - Netgroup DN (privilege: advanced)
This parameter specifies the netgroup DN, which overrides the base DN netgroup lookups.
Note: To specify multiple DNs, separate multiple DN entries with semicolons (;). If you configure multiple netgroup DNs and a DN contains a semicolon, add an escape character (\) immediately before the semicolon or enclose the entire DN with quotation marks (").

[-netgroup-scope {base|onelevel|subtree}] - Netgroup Search Scope (privilege: advanced)

This parameter specifies the netgroup search scope. If you do not specify this parameter, the scope is set to subtree by default.

[-use-start-tls {true|false}] - Use start-tls Over LDAP Connections

This parameter specifies whether or not to use Start TLS over LDAP connections. When enabled, the communication between the Data ONTAP LDAP Client and the LDAP Server will be encrypted using Start TLS. Start TLS is a mechanism to provide secure communication by using the TLS/SSL protocols. If you do not specify this parameter, the default is false.

[-is-netgroup-byhost-enabled {true|false}] - Enable Netgroup-By-Host Lookup (privilege: advanced)

Use this parameter to enable or disable netgroup-by-host lookup. If your LDAP directory contains map structures equivalent to the netgroup.byhost map in NIS, enabling this feature greatly speeds up netgroup resolution queries over LDAP. By default this parameter is set to false.

[-netgroup-byhost-dn <ldap_dn>] - Netgroup-By-Host DN (privilege: advanced)

This parameter specifies the netgroup-by-host DN, which overrides the base DN for netgroup-by-host lookups.

Note: To specify multiple DNs, separate multiple DN entries with semicolons (;). If you configure multiple netgroup DNs and a DN contains a semicolon, add an escape character (\) immediately before the semicolon or enclose the entire DN with quotation marks (").

[-netgroup-byhost-scope {base|onelevel|subtree}] - Netgroup-By-Host Scope (privilege: advanced)

This parameter specifies the netgroup-by-host search scope for LDAP queries. If you do not specify this parameter, the scope is set to subtree by default.

[-session-security {none|sign|seal}] - Client Session Security

This parameter specifies the level of security to be used for LDAP communications. If you do not specify this parameter, the default is none.

LDAP Client Session Security can be one of the following:

- none - No Signing or Sealing.
- sign - Sign LDAP traffic.
- seal - Seal and Sign LDAP traffic.

[-referral-enabled {true|false}] - LDAP Referral Chasing

This parameter specifies whether LDAP referral is enabled or not.

[-group-membership-filter <text>] - Group Membership Filter (privilege: advanced)

This parameter specifies the custom LDAP search filter to be used when looking up group membership from an LDAP server. Examples of valid filters are "(cn=*99)"", "(cn=1*)", "(|(cn=*22)(cn=*33))".

Examples

The following example creates an LDAP client configuration named corp that makes anonymous binds to ldapserver.example.com for Vserver vs1:

```
cluster1::> vserver services name-service ldap client create -vserver vs1 -client-config corp -ldap-servers ldapserver.example.com
```

vserver services commands
The following example creates an LDAP client configuration named **corp** that makes binds to **ldapserver.example.com** for Vserver **vs1** for bind-dn **diag**:

```
cluster1::> vserver services name-service ldap client create -vserver vs1 -client-config corp -ldap-servers ldapserver.example.com -bind-dn diag
Please enter password:
Confirm password:
```

The following example creates an LDAP client configuration with multiple user DNs.

**Note:** The following commands are only available in advanced mode.

```
cluster1::*> vserver services ldap client create -vserver vs1 -client-config corp -ldap-servers ldapserver.example.com -user-dn "ou=People,dc=mypc,dc=example,dc=com; ou=People1,dc=mypc1,dc=example2,dc=com"
```

The following example creates an LDAP client configuration with multiple user DNs, one of them containing a semicolon.

```
cluster1::*> vserver services ldap client create -vserver vs1 -client-config corp -ldap-servers ldapserver.example.com -user-dn "ou=People,dc=mypc,dc=example,dc=com; ou=People1,dc=mypc1,dc=example2,dc=com"
```

The following example creates an LDAP client configuration with multiple user DNs, one of them containing a semicolon and a backslash.

```
cluster1::*> vserver services ldap client create -vserver vs1 -client-config corp -ldap-servers ldapserver.example.com -user-dn "ou=People\;,dc=mypc,dc=example,dc=com\; ou=People1,dc=mypc1,dc=example2,dc=com"
```

The following example creates an LDAP client configuration with netgroup by host DN.

```
cluster1::*> vserver services ldap client create -vserver vs1 -client-config corp -ldap-servers ldapserver.example.com -netgroup-byhost-dn nisMapName="netgroup.byhost",dc=rfcbis,dc=com
```

The following example creates an LDAP client configuration with ldap-servers as list of ip addresses.

```
cluster1::*> vserver services ldap client create -vserver vs1 -client-config corp -ldap-servers 172.16.0.100,172.16.0.101 -netgroup-byhost-dn nisMapName="netgroup.byhost",dc=rfcbis,dc=com
```

The following example creates an LDAP client configuration with ldap-servers as list of ip addresses and hostnames.

```
cluster1::*> vserver services ldap client create -vserver vs1 -client-config corp -ldap-servers ldapserver.example.com,172.16.0.100,172.16.0.101 -netgroup-byhost-dn nisMapName="netgroup.byhost",dc=rfcbis,dc=com
```
vserver services name-service ldap client delete
Delete an LDAP client configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver services name-service ldap client delete command deletes an LDAP client configuration. A Vserver administrator can only delete configurations owned by the Vserver.

Parameters
-[-vserver <Vserver Name>] - Vserver
  This parameter specifies the name of the Vserver which owns the LDAP client you want to delete. A data Vserver or admin Vserver can be specified.

-[-client-config <text>] - Client Configuration Name
  This parameter specifies the name of the LDAP client configuration you want to delete.

Examples
The following example deletes an LDAP client configuration named corp owned by Vserver vs1:

```
cluster1::> vserver services name-service ldap client delete -vserver vs1 -client-config corp
```

vserver services name-service ldap client modify
Modify an LDAP client configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver services name-service ldap client modify command modifies an LDAP client configuration. A Vserver administrator can modify only configurations owned by the Vserver. Use the vserver services name-service ldap client modify-bind-password command to modify the bind password.

Parameters
-[-vserver <Vserver Name>] - Vserver
  This parameter specifies the name of the Vserver which owns the LDAP client you want to modify. A data Vserver or admin Vserver can be specified.

-[-client-config <text>] - Client Configuration Name
  This parameter specifies the name of the LDAP client configuration.

  { [-ldap-servers <text>, ...] - LDAP Server List
    This parameter specifies the list of LDAP servers used when making LDAP connections using this client configuration. If you specify this parameter, you cannot specify the -servers, -ad-domain, -preferred-ad-servers or -bind-as-cifs-server parameters.

  | [-servers <IP Address>, ...] - (DEPRECATED)-LDAP Server List
    (DEPRECATED)This parameter specifies the list of LDAP servers used when making LDAP connections using this client configuration. If you specify this parameter, you cannot specify the -ldap-servers, -ad-}
domain, -preferred-ad-servers or -bind-as-cifs-server parameters. This parameter is deprecated 9.1.0 and onwards. Use -ldap-servers instead.

[-ad-domain <TextNoCase>] - Active Directory Domain
This parameter specifies the name of the Active Directory domain used to discover LDAP servers for use by this client. This assumes that the Active Directory schema has been extended to act as a NIS replacement. If you use this parameter, you cannot specify the -servers, -ldap-servers parameter. However, you can specify a list of preferred servers using the -preferred-ad-servers parameter.

[-preferred-ad-servers <IP Address>, ...] - Preferred Active Directory Servers
This parameter specifies a list of LDAP servers that are preferred over those that are discovered in the domain specified in the -ad-domain parameter.

[-bind-as-cifs-server {true|false}] - Bind Using the Vserver's CIFS Credentials
This parameter specifies whether or not LDAP binds made using this client configuration use the Vserver's CIFS server credentials. If you do not specify this parameter, the default is false.

[-schema <text>] - Schema Template
This parameter specifies the name of the schema template the Vserver uses when making LDAP queries. You can view and modify the templates using the vserver services name-service ldap client schema commands.

[-port <integer>] - LDAP Server Port
This parameter specifies the port that the LDAP client uses to connect to LDAP servers. Use port 636 to enable LDAPS. If you do not specify this parameter, the default is port 389.

[-query-timeout <integer>] - Query Timeout (sec)
This parameter specifies the amount of time (in seconds) that the LDAP client waits for a query to complete. If you do not specify this parameter, the default is 3 seconds.

[-min-bind-level {anonymous|simple|sasl}] - Minimum Bind Authentication Level
This parameter specifies the lowest acceptable level of security the LDAP client uses to bind to an LDAP server. If you do not specify this parameter, the default is an anonymous bind.

[-bind-dn <ldap_dn>] - Bind DN (User)
This parameter specifies the user that binds to the LDAP servers. For Active Directory servers, specify the user in the account (DOMAIN\user) or principal (user@domain.com) form. Otherwise, specify the user in distinguished name (CN=user,DC=domain,DC=com) form. This parameter is ignored if -bind-as-cifs-server is set.

[-base-dn <ldap_dn>] - Base DN
This parameter specifies the default base DN for all searches, including user, group, and netgroup searches. For example, "DC=example,DC=com". If you do not specify this parameter, the default is the root, specified by an empty ("") set.

[-base-scope {base|onelevel|subtree}] - Base Search Scope
This parameter specifies the default search scope for LDAP queries. Specify base to search just the named entry, onelevel to search entries immediately below the DN, or subtree to search the named DN entry and the entire subtree below the DN. If you do not specify this parameter, the scope is set to subtree by default.

[-user-dn <ldap_dn>] - User DN (privilege: advanced)
This parameter specifies the user DN, which overrides the base DN for user lookups.

Note: To specify multiple DNs, separate multiple DN entries with semicolons (;). If you configure multiple user or group DNs and a DN contains a semicolon, add an escape character (\) immediately before the semicolon or enclose the entire DN with quotation marks ("").
[-user-scope {base|onelevel|subtree}] - User Search Scope (privilege: advanced)

This parameter specifies the user search scope. If you do not specify this parameter, the scope is set to subtree by default.

[-group-dn <ldap_dn>] - Group DN (privilege: advanced)

This parameter specifies the group DN, which overrides the base DN for group lookups.

**Note:** To specify multiple DNs, separate multiple DN entries with semicolons (;). If you configure multiple user or group DNs and a DN contains a semicolon, add an escape character (\) immediately before the semicolon or enclose the entire DN with quotation marks (").

[-group-scope {base|onelevel|subtree}] - Group Search Scope (privilege: advanced)

This parameter specifies the group search scope. If you do not specify this parameter, the scope is set to subtree by default.

[-netgroup-dn <ldap_dn>] - Netgroup DN (privilege: advanced)

This parameter specifies the netgroup DN, which overrides the base DN netgroup lookups.

**Note:** To specify multiple DNs, separate multiple DN entries with semicolons (;). If you configure multiple netgroup DNs and a DN contains a semicolon, add an escape character (\) immediately before the semicolon or enclose the entire DN with quotation marks (").

[-netgroup-scope {base|onelevel|subtree}] - Netgroup Search Scope (privilege: advanced)

This parameter specifies the netgroup search scope. If you do not specify this parameter, the scope is set to subtree by default.

[-use-start-tls {true|false}] - Use start-tls Over LDAP Connections

This parameter specifies whether or not to use Start TLS over LDAP connections. When enabled, the communication between the Data ONTAP LDAP Client and the LDAP Server will be encrypted using Start TLS. Start TLS is a mechanism to provide secure communication by using the TLS/SSL protocols. If you do not specify this parameter, the default is false.

[-is-netgroup-byhost-enabled {true|false}] - Enable Netgroup-By-Host Lookup (privilege: advanced)

Use this parameter to enable or disable netgroup-by-host lookup. If your LDAP directory contains map structures equivalent to the netgroup.byhost map in NIS, enabling this feature greatly speeds up netgroup resolution over LDAP. By default this parameter is set to false.

[-netgroup-byhost-dn <ldap_dn>] - Netgroup-By-Host DN (privilege: advanced)

This parameter specifies the netgroup-by-host DN, which overrides the base DN for netgroup-by-host lookups.

**Note:** To specify multiple DNs, separate multiple DN entries with semicolons (;). If you configure multiple netgroup DNs and a DN contains a semicolon, add an escape character (\) immediately before the semicolon or enclose the entire DN with quotation marks (").

[-netgroup-byhost-scope {base|onelevel|subtree}] - Netgroup-By-Host Scope (privilege: advanced)

This parameter specifies the netgroup-by-host search scope for LDAP queries. If you do not specify this parameter, the scope is set to subtree by default.

[-session-security {none|sign|seal}] - Client Session Security

This parameter specifies the level of security to be used for LDAP communications. If you do not specify this parameter, the default is none.

LDAP Client Session Security can be one of the following:

- none - No Signing or Sealing.
- sign - Sign LDAP traffic.
- seal - Seal and Sign LDAP traffic.
### [-skip-config-validation {true}] - Skip Configuration Validation

Use this parameter to skip the LDAP client configuration validation.

The LDAP client configuration specified with the `-client-config` parameter is validated to verify that all the Vservers associated with this LDAP client configuration has at least one of the LDAP servers reachable, and is providing LDAP services.

The validation fails if ONTAP was unable to connect to any LDAP server with the specified `-client-config`.

### [-referral-enabled {true|false}] - LDAP Referral Chasing

This parameter specifies whether LDAP referral is enabled or not.

### [-group-membership-filter <text>] - Group Membership Filter (privilege: advanced)

This parameter specifies the custom LDAP search filter to be used when looking up group membership from an LDAP server. Examples of valid filters are "(cn=*99)", "(cn=1*)", "(|(cn=*22)(cn=*33))".

#### Examples

The following example modifies an existing LDAP client configuration named `corp` owned by Vserver `vs1` to require simple binds using the `administrator@example.com` account:

```
cluster1::> vserver services name-service ldap client modify -client-config corp -vserver vs1 -bind-dn administrator@example.com -min-bind-level simple
```

The following example modifies the user DN of an existing LDAP client configuration to contain multiple DNs separated by a semicolon.

```
cluster1::> vserver services ldap client modify -client-config corp -vserver vs1 -bind-dn administrator@example.com -user-dn "ou=People,dc=mypc,dc=example,dc=in; ou=People1,dc=mypc,dc=example2,dc=com" -min-bind-level simple
```

The following example demonstrates how you can use a semicolon as a valid character in a DN instead of a separator.

```
cluster1::> vserver services ldap client modify -client-config corp -vserver vs1 -bind-dn administrator@example.com -user-dn "ou=People,dc=mypc,dc=example,dc=com; ou=People1,dc=mypc,dc=example2,dc=com"
```

The following example modifies an existing LDAP client configuration with multiple user DNs, one of them containing a semicolon and a backslash.

```
cluster1::> vserver services ldap client modify -client-config corp -vserver vs1 -bind-dn administrator@example.com -user-dn "ou=People,dc=mypc,dc=example,dc=com; ou=People1,dc=mypc,dc=example2,dc=com"
```

The following example modifies an existing LDAP client configuration with netgroup by host DN.

```
cluster1::> vserver services ldap client modify -vserver vs1 -client-config corp -netgroup-byhost-dn nisMapName="netgroup.byhost",dc=rfcbis,dc=com
```

**vserver services name-service ldap client modify-bind-password**

Modify Bind Password of an LDAP client configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The `vserver services name-service ldap client modify-bind-password` command modifies bind-password of a given LDAP client configuration.

**Parameters**

| `-vserver <Vserver Name>` | - Vserver
This parameter specifies the name of the Vserver which owns the LDAP client you want to modify. A data Vserver or admin Vserver can be specified.

| `-client-config <text>` | - Client Configuration Name
This parameter specifies the name of the LDAP client configuration.

**Examples**

The following example modifies the password for a given LDAP client configuration

```
cluster1:/> vserver services name-service ldap client modify-bind-password -client-config corp
Please enter password:
Confirm password:
```

---

**vserver services name-service ldap client show**

Display LDAP client configurations

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The `vserver services name-service ldap client show` command displays information about LDAP client configurations which a Vserver can be associated with. An LDAP client configuration created by a Vserver's administrator or by the cluster administrator for the Vserver is owned by the Vserver. A cluster-wide LDAP client configuration is created by a cluster administrator by specifying the admin Vserver's name as a value to the `-vserver` parameter. In addition to its owned LDAP client configurations, a Vserver can be associated with such cluster-wide LDAP client configurations.

**Parameters**

| `[-fields <fieldname>, ...]` | If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

| `[-instance]` | If you specify the `-instance` parameter, the command displays detailed information about all fields.

| `-vserver <Vserver Name>` | - Vserver
If you specify this parameter, the command displays all LDAP client configurations that can be associated with the specified Vserver. A data Vserver or admin Vserver can be specified.
[-client-config <text>] - Client Configuration Name
    If you specify this parameter, the command displays information about the LDAP client configuration you specify.

[-ldap-servers <text>, ...] - LDAP Server List
    If you specify this parameter, the command displays LDAP client configurations using the specified list of LDAP servers.

[-servers <IP Address>, ...] - (DEPRECATED)-LDAP Server List
    (DEPRECATED)-If you specify this parameter, the command displays LDAP client configurations using the specified list of LDAP servers.

[-ad-domain <TextNoCase>] - Active Directory Domain
    If you specify this parameter, the command displays LDAP client configurations using the specified domain to discover their list of LDAP servers.

[-preferred-ad-servers <IP Address>, ...] - Preferred Active Directory Servers
    If you specify this parameter, the command displays LDAP client configurations using the specified list of preferred servers.

[-bind-as-cifs-server {true|false}] - Bind Using the Vserver's CIFS Credentials
    If you specify this parameter, the command displays LDAP client configurations that bind using CIFS server credentials. If the CIFS server is in workgroup mode, the value of this parameter should be false.

[-schema <text>] - Schema Template
    If you specify this parameter, the command displays LDAP client configurations using the specified schema.

[-port <integer>] - LDAP Server Port
    If you specify this parameter, the command displays LDAP client configurations using the specified server port.

[-query-timeout <integer>] - Query Timeout (sec)
    If you specify this parameter, the command displays LDAP client configurations using the specified query timeout (in seconds).

[-min-bind-level {anonymous|simple|sasl}] - Minimum Bind Authentication Level
    If you specify this parameter, the command displays LDAP client configurations using the specified minimum bind level.

[-bind-dn <ldap_dn>] - Bind DN (User)
    If you specify this parameter, the command displays LDAP client configurations using the specified bind DN.

[-base-dn <ldap_dn>] - Base DN
    If you specify this parameter, the command displays LDAP client configurations using the specified base DN.

[-base-scope {base|onelevel|subtree}] - Base Search Scope
    If you specify this parameter, the command displays LDAP client configurations using the specified base search scope.

[-user-dn <ldap_dn>] - User DN (privilege: advanced)
    If you specify this parameter, the command displays LDAP client configurations using the specified user DN.

[-user-scope {base|onelevel|subtree}] - User Search Scope (privilege: advanced)
    If you specify this parameter, the command displays LDAP client configurations using the specified user search scope.

[-group-dn <ldap_dn>] - Group DN (privilege: advanced)
    If you specify this parameter, the command displays LDAP client configurations using the specified group DN.
[-group-scope \{base|onelevel|subtree\}] - Group Search Scope (privilege: advanced)

If you specify this parameter, the command displays LDAP client configurations using the specified group search scope.

[-netgroup-dn <ldap_dn>] - Netgroup DN (privilege: advanced)

If you specify this parameter, the command displays LDAP client configurations using the specified netgroup DN.

[-netgroup-scope \{base|onelevel|subtree\}] - Netgroup Search Scope (privilege: advanced)

If you specify this parameter, the command displays LDAP client configurations using the specified netgroup search scope.

[-is-owner \{true|false\}] - Vserver Owns Configuration

If you set this parameter to true, the command displays LDAP client configurations with the Vservers which own them.

[-use-start-tls \{true|false\}] - Use start-tls Over LDAP Connections

This parameter specifies whether or not to use Start TLS over LDAP connections. When enabled, the communication between the Data ONTAP LDAP Client and the LDAP Server will be encrypted using Start TLS. Start TLS is a mechanism to provide secure communication by using the TLS/SSL protocols. If you do not specify this parameter, the default is false.

[-is-netgroup-byhost-enabled \{true|false\}] - Enable Netgroup-By-Host Lookup (privilege: advanced)

If you set this parameter to true, the command displays LDAP client configurations for which netgroup-by-host lookup is enabled.

[-netgroup-byhost-dn <ldap_dn>] - Netgroup-By-Host DN (privilege: advanced)

If you specify this parameter, the command displays LDAP client configurations using the specified netgroup-by-host DN.

[-netgroup-byhost-scope \{base|onelevel|subtree\}] - Netgroup-By-Host Scope (privilege: advanced)

If you specify this parameter, the command displays LDAP client configurations using the specified netgroup-by-host search scope.

[-session-security \{none|sign|seal\}] - Client Session Security

If this parameter is set to seal, the command displays LDAP client configurations where both signing and sealing are required for LDAP communications. If set to sign, the command displays LDAP client configurations where only signing is required for LDAP communications. If set to none, the command displays LDAP client configurations where no security is required for LDAP communications.

[-referral-enabled \{true|false\}] - LDAP Referral Chasing

If you specify this parameter, the command displays information about LDAP referral configurations using the specified client.

[-group-membership-filter <text>] - Group Membership Filter (privilege: advanced)

If you specify this parameter, the command displays LDAP client configurations using the specified group-membership filter.

**Examples**

The following example shows a summary of all of the LDAP client configurations available for Vserver **vsl1**:

<table>
<thead>
<tr>
<th>Vserver</th>

**vserver services name-service ldap client schema commands**

Manage LDAP client schema templates

vserver services name-service ldap client schema copy

Copy an existing LDAP schema template

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

**Description**
The *vserver services name-service ldap client schema copy* command creates a new LDAP schema template from an existing one. In addition to an owned LDAP schema template, a Vserver administrator can also copy a cluster-wide LDAP schema template that is owned by the admin Vserver.

**Parameters**

[-vserver *<Vserver Name>*] - Vserver

This parameter specifies the Vserver for which you want to copy an existing LDAP schema template.

-schema *<text>* - Schema Template

This parameter specifies the name of the existing schema template you want to copy.

-new-schema-name *<text>* - New Schema Template Name

This parameter specifies the name of the schema template copy.

**Examples**
The following example creates a copy of the *RFC-2307* schema template and names it *corp-schema* for Vserver "vs1":

```
cluster1::> vserver services name-service ldap client schema copy -vserver vs1 -schema RFC-2307 -new-schema-name corp-schema
```

vserver services name-service ldap client schema delete

Delete an LDAP schema template

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

**Description**
The *vserver services name-service ldap client schema delete* command deletes an LDAP schema template. A Vserver administrator can only delete templates owned by the Vserver.

**Note:** You cannot delete the default schema templates.

**Parameters**

[-vserver *<Vserver Name>*] - Vserver

This parameter specifies the name of Vserver owning the LDAP schema template you want to delete.

-schema *<text>* - Schema Template

This parameter specifies the name of the schema template you want to delete.

**Examples**
The following example deletes a schema template named *corp-schema* owned by Vserver *vs1*:

```
cluster1::> vserver services name-service ldap client schema delete -vserver vs1 -schema corp-schema
```
vserver services name-service ldap client schema modify

Modify an LDAP schema template

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The vserver services name-service ldap client schema modify command modifies an existing LDAP schema template. You cannot modify the default schema templates. Create a copy of a default schema template using the vserver services name-service ldap client schema copy command, and then modify the copy. A Vserver administrator can only modify templates owned by the Vserver.

Parameters
-vserver <Vserver Name> - Vserver
This parameter specifies the name of the Vserver owning the LDAP schema template you want to modify.

-schema <text> - Schema Template
This parameter specifies the name of the schema template you want to modify.

-comment <text> - Comment
This parameter specifies a comment that describes the schema template.

-posix-account-object-class <text> - RFC 2307 posixAccount Object Class
This parameter specifies the RFC 2307 posixAccount object class name defined by the schema.

-posix-group-object-class <text> - RFC 2307 posixGroup Object Class
This parameter specifies the RFC 2307 posixGroup object class name defined by the schema.

-nis-netgroup-object-class <text> - RFC 2307 nisNetgroup Object Class
This parameter specifies the RFC 2307 nisNetgroup object class name defined by the schema.

-uid-attribute <text> - RFC 2307 uid Attribute
This parameter specifies the RFC 2307 uid attribute name defined by the schema.

-uid-number-attribute <text> - RFC 2307 uidNumber Attribute
This parameter specifies the RFC 2307 uidNumber attribute name defined by the schema.

-gid-number-attribute <text> - RFC 2307 gidNumber Attribute
This parameter specifies the RFC 2307 gidNumber attribute name defined by the schema.

-cn-group-attribute <text> - RFC 2307 cn (for Groups) Attribute
This parameter specifies the RFC 2307 cn (for Groups) attribute name defined by the schema.

-cn-netgroup-attribute <text> - RFC 2307 cn (for Netgroups) Attribute
This parameter specifies the RFC 2307 cn (for Netgroups) attribute name defined by the schema.

-user-password-attribute <text> - RFC 2307 userPassword Attribute
This parameter specifies the RFC 2307 userPassword attribute name defined by the schema.

-gecos-attribute <text> - RFC 2307 gecos Attribute
This parameter specifies the RFC 2307 gecos attribute name defined by the schema.

-home-directory-attribute <text> - RFC 2307 homeDirectory Attribute
This parameter specifies the RFC 2307 homeDirectory attribute name defined by the schema.

-login-shell-attribute <text> - RFC 2307 loginShell Attribute
This parameter specifies the RFC 2307 loginShell attribute name defined by the schema.

-member-uid-attribute <text> - RFC 2307 memberUid Attribute
This parameter specifies the RFC 2307 memberUid attribute name defined by the schema.
[-member-nis-netgroup-attribute <text>] - RFC 2307 memberNisNetgroup Attribute
This parameter specifies the RFC 2307 memberNisNetgroup attribute name defined by the schema.

[-nis-netgroup-triple-attribute <text>] - RFC 2307 nisNetgroupTriple Attribute
This parameter specifies the RFC 2307 nisNetgroupTriple attribute name defined by the schema.

[-enable-rfc2307bis {true|false}] - Enable Support for Draft RFC 2307bis
This parameter specifies whether RFC 2307bis is enabled for the schema.

[-group-of-unique-names-object-class <text>] - RFC 2307bis groupOfUniqueNames Object Class
This parameter specifies the RFC 2307bis groupOfUniqueNames object class name defined by the schema.
This parameter takes effect only when RFC 2307bis is enabled for the schema.

[-unique-member-attribute <text>] - RFC 2307bis uniqueMember Attribute
This parameter specifies the RFC 2307bis uniqueMember attribute name defined by the schema. This parameter takes effect only when RFC 2307bis is enabled for the schema.

[-windows-to-unix-object-class <text>] - Data ONTAP Name Mapping windowsToUnix Object Class
This parameter specifies the name mapping windowsToUnix object class name defined by the schema.

[-windows-account-attribute <text>] - Data ONTAP Name Mapping windowsAccount Attribute
This parameter specifies the name mapping windowsAccount attribute name defined by the schema.

[-windows-to-unix-attribute <text>] - Data ONTAP Name Mapping windowsToUnix Attribute
This parameter specifies the name mapping windowsToUnix attribute name defined by the schema.

[-windows-to-unix-no-domain-prefix {true|false}] - No Domain Prefix for windowsToUnix Name Mapping
This parameter specifies the name mapping windowsToUnixNoDomainPrefix setting defined by the schema.

[-nis-object-class <text>] - RFC 2307 nisObject Object Class
This parameter specifies the nisObject class name defined by the schema. This parameter takes effect only when netgroup.byhost is enabled for the vserver.

[-nis-mapname-attribute <text>] - RFC 2307 nisMapName Attribute
This parameter specifies the nisMapName attribute name defined by the schema. This parameter takes effect only when netgroup.byhost is enabled for the vserver.

[-nis-mapentry-attribute <text>] - RFC 2307 nisMapEntry Attribute
This parameter specifies the nisMapEntry attribute name defined by the schema. This parameter takes effect only when netgroup.byhost is enabled for the vserver.

Examples
The following example modifies the schema template called corp-schema owned by Vserver vs1 to use User as the uid attribute name:

```
cluster1::> vserver services name-service ldap client schema modify -vserver vs1 -schema corp-schema -uid-attribute User
```

vserver services name-service ldap client schema copy on page 2190
vserver services name-service ldap client schema show

Display LDAP schema templates

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.
Description
The `vserver services name-service ldap client schema show` command shows information about LDAP schema templates which a Vserver can access. An LDAP schema template created by a Vserver's administrator or by the cluster administrator for the Vserver is owned by the Vserver. A cluster-wide LDAP schema template is created by a cluster administrator by specifying the admin Vserver's name as a value to the `-vserver` parameter. In addition to its owned LDAP schema templates, a Vserver can access such cluster-wide LDAP schema templates.

Parameters
{-fields <fieldname>,...}
If you specify the `-fields <fieldname>,...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

{[-instance ]}
If you specify the `-instance` parameter, the command displays detailed information about all fields.

{-vserver <Vserver Name> } - Vserver
If you specify this parameter, the command displays all LDAP schema templates that can be accessed by the specified Vserver.

{-schema <text>} - Schema Template
If you specify this parameter, the command displays the schema template with the specified name.

{-comment <text>} - Comment
If you specify this parameter, the command displays schema templates with the specified comment.

{-posix-account-object-class <text>} - RFC 2307 posixAccount Object Class
If you specify this parameter, the command displays schema templates with the specified posixAccount object class.

{-posix-group-object-class <text>} - RFC 2307 posixGroup Object Class
If you specify this parameter, the command displays schema templates with the specified posixGroup object class.

{-nis-netgroup-object-class <text>} - RFC 2307 nisNetgroup Object Class
If you specify this parameter, the command displays schema templates with the specified nisNetgroup object class.

{-uid-attribute <text>} - RFC 2307 uid Attribute
If you specify this parameter, the command displays schema templates with the specified uid attribute.

{-uid-number-attribute <text>} - RFC 2307 uidNumber Attribute
If you specify this parameter, the command displays schema templates with the specified uidNumber attribute.

{-gid-number-attribute <text>} - RFC 2307 gidNumber Attribute
If you specify this parameter, the command displays schema templates with the specified gidNumber attribute.

{-cn-group-attribute <text>} - RFC 2307 cn (for Groups) Attribute
If you specify this parameter, the command displays schema templates with the specified cn (for Groups) attribute.

{-cn-netgroup-attribute <text>} - RFC 2307 cn (for Netgroups) Attribute
If you specify this parameter, the command displays schema templates with the specified cn (for Netgroups) attribute.

{-user-password-attribute <text>} - RFC 2307 userPassword Attribute
If you specify this parameter, the command displays schema templates with the specified userPassword attribute.
[-gecos-attribute <text>] - RFC 2307 gecos Attribute
If you specify this parameter, the command displays schema templates with the specified gecos attribute.

[home-directory-attribute <text>] - RFC 2307 homeDirectory Attribute
If you specify this parameter, the command displays schema templates with the specified homeDirectory attribute.

[-login-shell-attribute <text>] - RFC 2307 loginShell Attribute
If you specify this parameter, the command displays schema templates with the specified loginShell attribute.

[-member-uid-attribute <text>] - RFC 2307 memberUid Attribute
If you specify this parameter, the command displays schema templates with the specified memberUid attribute.

[-member-nis-netgroup-attribute <text>] - RFC 2307 memberNisNetgroup Attribute
If you specify this parameter, the command displays schema templates with the specified memberNisNetgroup attribute.

[-nis-netgroup-triple-attribute <text>] - RFC 2307 nisNetgroupTriple Attribute
If you specify this parameter, the command displays schema templates with the specified nisNetgroupTriple attribute.

[-enable-rfc2307bis {true|false}] - Enable Support for Draft RFC 2307bis
If you set this parameter to true, the command displays RFC 2307bis enabled LDAP schema templates.

[-group-of-unique-names-object-class <text>] - RFC 2307bis groupOfUniqueNames Object Class
If you specify this parameter, the command displays schema templates with the specified groupOfUniqueNames object class.

[-unique-member-attribute <text>] - RFC 2307bis uniqueMember Attribute
If you specify this parameter, the command displays schema templates with the specified uniqueMember attribute.

[-windows-to-unix-object-class <text>] - Data ONTAP Name Mapping windowsToUnix Object Class
If you specify this parameter, the command displays schema templates with the specified windowsToUnix object class.

[-windows-account-attribute <text>] - Data ONTAP Name Mapping windowsAccount Attribute
If you specify this parameter, the command displays schema templates with the specified windowsAccount attribute.

[-windows-to-unix-attribute <text>] - Data ONTAP Name Mapping windowsToUnix Attribute
If you specify this parameter, the command displays schema templates with the specified windowsToUnix attribute.

[-windows-to-unix-no-domain-prefix {true|false}] - No Domain Prefix for windowsToUnix Name Mapping
If you specify this parameter, the command displays schema templates with the specified windowsToUnixNoDomainPrefix setting.

[-is-owner {true|false}] - Vserver Owns Schema
If you set this parameter to true, the command displays LDAP schema templates with the Vservers which own them.

[-nis-object-class <text>] - RFC 2307 nisObject Object Class
If you specify this parameter, the command displays schema templates with the specified nisObject attribute.

[-nis-mapname-attribute <text>] - RFC 2307 nisMapName Attribute
If you specify this parameter, the command displays schema templates with the specified nisMapName attribute.
If you specify this parameter, the command displays schema templates with the specified nisMapEntry attribute.

**Examples**

The following example shows a summary of all of the default LDAP schema templates defined in the cluster:

```
cluster1::> vserver services name-service ldap client schema show
Vserver Schema Template Comment
------- --------------- -------------------------------------------------------
cluster-node3 MS-AD-BIS Schema based on Active Directory Identity Management for UNIX (read-only)
cluster-node3 AD-IDMU Schema based on Active Directory Identity Management for UNIX (read-only)
cluster-node3 AD-SFU Schema based on Active Directory Services for UNIX (read-only)
cluster-node3 RFC-2307 Schema based on RFC 2307 (read-only)
4 entries were displayed.
```

### vserver services name-service netgroup commands

**Manage local netgroups**

**vserver services name-service netgroup load**

Load netgroup definitions from a URI

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**

The `vserver services name-service netgroup load` command loads netgroup definitions from a uniform resource identifier (URI) to a specified Vserver. You can load from a netgroup file at an FTP or a HTTP location (source URI) using the respective protocol.

Before Data ONTAP saves the new netgroup definitions, it checks that the netgroup file does not have any file structure issues, does not contain any syntax errors, and all entries comply with the following rules:

- A domain name consists of one or more labels separated by periods (\.).
- A hostname is a valid domain name, IPv4 address, or IPv6 address.
- Valid characters for a label are all alphanumeric characters, underscore (\_), and dash (-). A label may not begin or end with a dash.
- Valid characters for a username are all ASCII printable characters with the exception of whitespace, parentheses, and comma (,).
- Valid characters for a netgroup name are all alphanumeric characters, underscore (\_), and dash (-). A netgroup name may not begin with a dash.
- A single line in the netgroup file may not exceed 4096 characters.

If the file is found to contain errors, Data ONTAP will issue an error to that effect and netgroup definitions will not be loaded into the specified Vserver. After correcting the error, reload the netgroup file into the specified Vserver.

**Parameters**

`-vserver <vserver name>` - Vserver

This parameter specifies the Vserver for which you want to load netgroup definitions.
-source {(ftp|http)://(hostname|IPv4 Address|'['IPv6 Address'])...} - URI to Load from
This parameter specifies the source URI from which you want to load netgroup definitions. You can load from a URI either using the FTP or the HTTP protocol.

[-foreground {true|false}] - Load Netgroup in the Foreground
This parameter specifies whether the operation runs in the foreground. The default setting is true (the operation runs in foreground). When set to true, the command does not return until the operation completes.

[-skip-hostname-validation {true}] - Skip Hostname Validation (privilege: advanced)
If this parameter is specified, the hostname validation is skipped.

[-skip-file-size-check {true}] - Skip File Size Check Before Download (privilege: advanced)
If this parameter is specified, the file is downloaded without checking the file size. Use this parameter if the server does not supply the file size or does not provide an accurate value. This parameter can also be used to download a file greater than the default 5 MB size limit.

**Note:** If this parameter is specified and the file is very large, the transfer may take a long time or fail due to disk space limitations.

[-skip-file-duplicate-check {true}] - Skip Netgroup File Duplicate Check (privilege: advanced)
If this parameter is specified, the netgroup file is downloaded even if the contents are same as the existing netgroup file. In this case, the existing file will be replaced.

**Examples**
The following example loads netgroup definitions into a Vserver named vs1 from the file netgroup1 at FTP location ftp://ftp.example.com:

```
cluster1::> vserver services name-service netgroup load -vserver vs1 -source ftp://ftp.example.com/netgroup1
```

**vserver services name-service netgroup status**
Display local netgroup definitions status

**Availability:** This command is available to cluster and Vserver administrators at the advanced privilege level.

**Description**
The `vserver services name-service netgroup status` command displays the status of local netgroup definitions across a cluster. This enables you to verify that netgroup definitions are consistent across all nodes that back a Vserver into which netgroup definitions have been loaded.

The command displays the following information:

- Vserver name
- Node name
- Load time for netgroup definitions
- Hash value of the netgroup definitions
- Hash value of the netgroup-by-host database
- File size of the netgroup definitions file
Parameters

[-fields <fieldname>, ...]
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

[-instance]
If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver
If you specify this parameter, the command displays the netgroup status only for the specified Vserver.

[-node <nodename> | local] - Node
If you specify this parameter, the command displays the netgroup status only for the specified node.

[-timestamp <MM/DD/YYYY HH:MM:SS>] - Load Time
If you specify this parameter, the command displays the status only for the netgroup definitions that were loaded at the specified time. Specify time in the format MM/DD/YYYY HH:MM:SS. Note that the load time stamps for identical definitions are different on different nodes, because each node downloads the definitions from the URI individually.

[-hashvalue <text>] - Hash Value
If you specify this parameter, the command displays the status only for the netgroup definitions that have the specified hash value. Note that the primary purpose of the command is to verify that the definitions on all nodes have the same hash value, so querying on a specific hash value is not useful in most cases.

[-hashvalue-byhost <text>] - Hash Value Byhost
If you specify this parameter, the command displays the status only for the netgroup definitions that have the specified hash value for netgroup-by-host database. Note that the primary purpose of the command is to verify that the definitions on all nodes have the same hash value for netgroup-by-host database.

[-filesize <integer> [KB|MB|GB|TB|PB]] - File Size
If you specify this parameter, the command displays the status only for the netgroup definitions that have the specified file size. Note that the primary purpose of the command is to verify that the definitions on all nodes have the same file size, so querying on a specific file size is not useful in most cases.

Examples
The following example displays the netgroup definition status for all Vservers:

```
cluster1::*> vserver services name-service netgroup file commands
Manage Local Netgroup Files
vserver services name-service netgroup file commands
```

vserver services name-service netgroup file delete
Remove a local netgroup file

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The `vserver services name-service netgroup file delete` command deletes the local netgroup files for given Vservers.

Parameters
- `-vserver <vserver name>` - Vserver
  Use this parameter to specify the Vservers whose local netgroup file you want to delete. Separate multiple Vserver names with commas.

Examples
The following example deletes the local netgroup file for a Vserver named vs1.
```
cluster1::> vserver services netgroup file delete -vserver vs1
```

vserver services name-service netgroup file show
Display a local netgroup file

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The `vserver services netgroup file show` command displays the contents of the local netgroup file for the specified Vservers. All the entries under a given netgroup, specified in the Netgroup column of the command output, list the members of that netgroup. Each netgroup file specifies netgroups, which are sets of tuples. Each member of a netgroup is either the name of another netgroup, specified in the Member Netgroup column, or a specification of a tuple as follows: (Host, User, Domain) where Host, User, and Domain are character string names for the corresponding component. Any of the components of a tuple can either be empty to specify a wildcard value or a dash (-) to specify no valid value.

Parameters

- `-field <fieldname>,...` If you specify the -fields fieldname, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.
- `[-instance ]` If you specify the -instance parameter, the command displays detailed information about all fields.
- `-vserver <vserver name>` - Vserver
  Use this parameter to display the local netgroup file contents for the Vservers you specify.
- `-netgroup <text>` - Netgroup Name
  If you specify this parameter, the command displays information about the netgroup you specify.
- `-netgrpmemb <text>` - Member Netgroup
  If you specify this parameter, the command displays information about the member netgroup you specify.
- `-host <text>` - Member Host
  If you specify this parameter, the command displays information about the host you specify.
Examples

The following example displays the netgroup file contents for the Vserver named vs1.

```
cluster1::> vserver services netgroup file show -vserver vs1
<table>
<thead>
<tr>
<th>Member</th>
<th>Netgroup</th>
<th>Host</th>
<th>User</th>
<th>Domain</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs1</td>
<td>netgrp1</td>

</table>
```

vserver services name-service nis-domain commands

Manage Network Information Service domains

vserver services name-service nis-domain create

Create a NIS domain configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver services name-service nis-domain create command creates a configuration for an NIS domain. You can configure only one NIS domain for a given Vserver. You can also configure more than one Vserver with the same NIS domain.

Parameters

- **-vserver <Vserver Name>** - Vserver
  Use this parameter to specify the Vserver on which the NIS domain configuration is created. A data Vserver or admin Vserver can be specified.

- **-domain <nis domain>** - NIS Domain
  Use this parameter to specify the NIS domain for which a configuration is created. Maximum Supported NIS Domain length: 64 characters.

- **{-nis-servers <text>}, ...** - NIS Servers
  Use this parameter to specify the hostnames/IP addresses of NIS servers used by the NIS domain configuration. Separate multiple hostnames/IP addresses with commas.

- **{|-servers <IP Address>}, ...** - (DEPRECATED)-NIS Server
  Note: This parameter has been deprecated and might be removed in a future version of ONTAP.
  Use this parameter to specify the IP addresses of NIS servers used by the NIS domain configuration. Separate multiple IP addresses with commas.
Examples
The following example creates an NIS domain configuration on the Vserver named vs0. The NIS domain is named nisdomain and uses an NIS server with the IP address 192.0.2.180.

```
cluster1::> vserver services name-service nis-domain create -vserver vs0 -domain nisdomain -nis-servers 192.0.2.180
```

vserver services name-service nis-domain delete
Delete a NIS domain configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The `vserver services name-service nis-domain delete` command deletes an NIS domain configuration. Deleting a NIS domain configuration removes it permanently.

Parameters
- `-vserver <Vserver Name>` - Vserver
  Use this parameter to specify the Vserver from which the NIS domain configuration is deleted. A data Vserver or admin Vserver can be specified.

- `-domain <nis domain>` - NIS Domain
  Use this parameter to specify the NIS domain whose configuration is deleted.

Examples
The following example deletes the configuration of an NIS domain named testnisdomain from a Vserver named vs2:

```
cluster1::> vserver services name-service nis-domain delete -vserver vs2 -domain testnisdomain
```

vserver services name-service nis-domain modify
Modify a NIS domain configuration

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
Use the `vserver services name-service nis-domain modify` command to modify the NIS server of a NIS domain configuration.

To change the NIS domain, delete the NIS configuration using the `vserver services name-service nis-domain delete` command and then create the NIS configuration with new NIS domain using the `vserver services name-service nis-domain create` command. To permanently remove a configuration, use the `vserver services name-service nis-domain delete` command.

Parameters
- `-vserver <Vserver Name>` - Vserver
  Use this parameter to specify the Vserver whose NIS domain configuration is modified. A data Vserver or admin Vserver can be specified.

- `-domain <nis domain>` - NIS Domain
  Use this parameter to specify the NIS domain whose configuration is modified.
{ [-nis-servers <text>, ...] - NIS Servers

Use this parameter to specify the hostnames/IP addresses of NIS servers used by the the NIS domain configuration. Separate multiple hostnames/IP addresses with commas.

[[-servers <IP Address>, ...]} - (DEPRECATED)-NIS Server

Note: This parameter has been deprecated and might be removed in a future version of ONTAP.
Use this parameter to specify the IP addresses of NIS servers used by the the NIS domain configuration. Separate multiple IP addresses with commas.

Examples

The following example modifies the NIS servers of a NIS domain named nisdomain on a Vserver named vs0:

cluster1::> vserver services name-service nis-domain modify -vserver vs0 -domain nisdomain -nis-servers 192.0.2.180

Related references

vserver services name-service nis-domain delete on page 2200
vserver services name-service nis-domain create on page 2199

vserver services name-service nis-domain show

Display NIS domain configurations

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver services name-service nis-domain show command displays information about NIS domain configurations.

Parameters

{ [-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use ‘-fields ?’ to display the fields to specify.

[[-instance]]

If you specify the -instance parameter, the command displays detailed information about all fields.

[[-vserver <Vserver Name>]} - Vserver

Use this parameter to display information only about the NIS domain configurations of the Vservers you specify. Use this parameter with the -domain parameter to display information only about a particular NIS domain configuration on the Vserver you specify. A data Vserver or admin Vserver can be specified.

[[-domain <nis domain>]} - NIS Domain

Use this parameter to display information only about the NIS domain configurations that match the NIS domain name you specify. Use this parameter with the -vserver parameter to display information only about a particular NIS domain configuration on the Vserver you specify.

[-nis-servers <text>, ...] - NIS Servers

Use this parameter to display information only about the NIS domain configurations that use the NIS servers at the hostnames/IP addresses you specify.

[-servers <IP Address>, ...] - (DEPRECATED)-NIS Server

Note: This parameter has been deprecated and might be removed in a future version of ONTAP.
Use this parameter to display information only about the NIS domain configurations that use the NIS servers at the IP addresses you specify.

**Examples**

The following example displays information about all NIS domain configurations:

```
cluster1::> vserver services name-service nis-domain show

Vserver       Domain        NIS Server
------------- ------------- ------------
vs1           nisdomain     192.0.2.180
vs2           nisdomain     10.0.2.15
vs3           testnisdomain 192.0.2.128, 192.0.2.180
3 entries were displayed.
```

**vserver services name-service nis-domain show-bound**

Display binding status of a NIS domain configuration

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver services name-service nis-domain show-bound` command displays binding information about NIS domain configurations.

**Parameters**

{{-
fields <fieldname>, ...
}
If you specify the `fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

|-
instance

If you specify the `instance` parameter, the command displays detailed information about all fields.

|-
vserver <vserver name>

If you use this parameter, the command displays binding information only about the NIS domain configurations of the specified Vservers. Use this parameter with the `domain` parameter to display binding information only about a particular NIS domain configuration on the specified Vserver. A data Vserver or admin Vserver can be specified.

|-
domain <nis domain>

If you use this parameter, the command displays binding information only about the NIS domain configurations that match the specified NIS domain name. Use this parameter with the `vserver` parameter to display binding information only about a particular Vserver on the specified NIS domain name.

|-
bound-servers <IP Address>, ...

If you use this parameter, the command displays NIS binding information only about the specified NIS servers.

**Examples**
The following example displays binding information about all NIS domain configurations:

```
cluster1::> vserver services name-service nis-domain show-bound

Vserver       Domain        NIS Server
------------- ------------- ------------
```

vserver services name-service nis-domain group-database commands

Manage NIS group database

**vserver services name-service nis-domain group-database build**

Build NIS group database

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

**Description**
The `vserver services name-service nis-domain group-database build` command rebuilds the NIS group.byuser DB for a given Vserver if NIS is added as source for group and an active nis-domain exists.

**Parameters**

- `-vserver <vserver name>` - Vserver Name
  
  Use this parameter to specify the Vserver for which NIS group.byuser DB will be rebuilt. A data Vserver can be specified.

**Examples**
The following example rebuilds NIS group.byuser DB for Vserver vs0.

```
cluster1::> vserver services name-service nis-domain group-database build -vserver vs0
```

**vserver services name-service nis-domain group-database status**

Display NIS group database status of the local node

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

**Description**
The `vserver services name-service nis-domain group-database status` command displays the status of local NIS group.byuser db across a cluster. This enables you to verify that NIS group.byuser db are consistent across all nodes.

The command displays the following information:

- Vserver name
- Node name
- Last build time of NIS group.byuser db
- Hash value of the NIS group.byuser db
- File size of the NIS group.byuser db

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.
If you specify the \texttt{-instance} parameter, the command displays detailed information about all fields.

\textbf{\texttt{-vserver <vserver name>}} - Vserver

If you specify this parameter, the command displays the NIS group.byuser db status only for the specified Vserver.

\textbf{\texttt{-node {<nodename>|local}}} - Node

If you specify this parameter, the command displays the NIS group.byuser db status only for the specified node.

\textbf{\texttt{-timestamp <MM/DD/YYYY HH:MM:SS>}} - Load Time

If you specify this parameter, the command displays the status only for the NIS group.byuser db that were built at the specified time. Specify time in the format MM/DD/YYYY HH:MM:SS. Note that the load time stamps for identical definitions are different on different nodes, because each node extracts the db individually.

\textbf{\texttt{-filesize <integer>[KB|MB|GB|TB|PB]}} - File Size

If you specify this parameter, the command displays the status only for the NIS group.byuser db that have the specified file size. Note that the primary purpose of the command is to verify that the definitions on all nodes have the same file size, so querying on a specific file size is not useful in most cases.

\textbf{\texttt{-hashvalue <text>}} - Hash Value

If you specify this parameter, command displays the status only for the NIS group.byuser db that have the specified hash value. Note that the primary purpose of the command is to verify that the definitions on all nodes have the same hash value, so querying on a specific hash value is not useful in most cases.

\begin{center}

\end{center}

\textbf{\textit{vserver services name-service ns-switch commands}}

Manage Name Services Switch ordering

Manages name service switch configurations. Each name service switch entry specifies the order in which to lookup the name service sources, for a given Vserver and name service database. Each name service database contains some information regarding hosts, group, password, netgroup or name_map. Such a database comes from one or more name service sources such as files, DNS, LDAP or NIS.

\textbf{Note:} If a name service switch entry is deleted, default entry of 'files' will be used for the requested name service database except for hosts database for which default source list of ‘files, dns’ will used.

\textbf{Note:} If "files" is not specified as the default source for "passwd" or "group" database, ensure that default user and group entries for 'passwd' and 'group' respectively are present in the source configured. Default entries for passwd database: nobody, pcuser, root, sshd, toor, daemon, operator, bin, tty, kmem, games, news, man, ssmtp, mailnull, bind, proxy, uucp, pop, www, admin, diag, autosupport. Default entries for group database: wheel, daemon, kmem, sys, tty, operator, mail, bin, news, man, games, ftp, staff, sshd, ssmtp, mailnull, guest, bind, proxy, authpf, _pflogd, _dhcp, uucp, dialer, network, audit, www, antivirus, nrogup, nobody.
vserver services name-service ns-switch create

Create a new Name Service Switch table entry

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver services name-service ns-switch create command specifies the order in which to lookup the name service sources, for a given Vserver and name service database. Each name service database contains some information regarding hosts, group, password, netgroup or namemap. Such a database comes from one or more name service sources such as files, DNS, LDAP or NIS.

Note: The vserver services name-service ns-switch command provides the functionality of the /etc/nsswitch.conf file on UNIX systems. For more information, see the UNIX man page for nsswitch.conf(5).

Parameters
-vserver <vserver name> - Vserver
Use this parameter to specify the Vserver on which to create the new name service switch entry

-database {hosts|group|passwd|netgroup|namemap} - Name Service Switch Database
Name Service Switch Database Use this parameter to specify the name service database for which the order of the source lookup is being specified. This parameter can have the following values:

• hosts
• group
• passwd
• netgroup
• namemap

-sources {files|dns|ldap|nis}, ... - Name Service Source Order
Name Service Source Order Use this parameter to specify the name service sources and the order in which to look them up for the specified Vserver and name service database. Each name service source in the list for this parameter must be one of the following:

• files
• dns
• ldap
• nis

Separate multiple name service sources with commas.

For each database specified with the -database parameter, one or more sources must be specified. The valid sources for each database type are shown in the following table:

<table>
<thead>
<tr>
<th>Database</th>
<th>Valid Sources</th>
</tr>
</thead>
<tbody>
<tr>
<td>hosts</td>
<td>files, dns</td>
</tr>
<tr>
<td></td>
<td>group</td>
</tr>
<tr>
<td></td>
<td>passwd</td>
</tr>
<tr>
<td></td>
<td>netgroup</td>
</tr>
<tr>
<td></td>
<td>namemap</td>
</tr>
<tr>
<td></td>
<td>files, nis, ldap</td>
</tr>
<tr>
<td></td>
<td>files, nis, ldap</td>
</tr>
<tr>
<td></td>
<td>files, nis, ldap</td>
</tr>
<tr>
<td></td>
<td>files, ldap</td>
</tr>
</tbody>
</table>
Note: If “files” is not specified as the default source for the "passwd" or "group" database, ensure that default user and group entries for the 'passwd' and 'group' respectively are present in the source configured. Default entries for "passwd" database: nobody, pcuser, root, sshd, toor, daemon, operator, bin, tty, kmem, games, news, man, smmsp, mailnull, bind, proxy, uucp, pop, www, admin, diag, autosupport. Default entries for "group" database: wheel, daemon, kmem, sys, tty, operator, mail, bin, news, man, games, ftp, staff, sshd, smmsp, mailnull, guest, bind, proxy, authpf, _pflogd, _dhcp, uucp, dialer, network, audit, www, antivirus, nogroup, nobody.

Examples

The following example creates name service source ordering for the hosts database on a Vserver named vs0. The order of looking up the sources is specified as files followed by DNS.

```
cluster1::> vserver services name-service ns-switch create -vserver vs0 -database hosts -sources files,dns
```

The following example creates the name service source ordering for the passwd database on a Vserver named vs1. The order of looking up the sources is specified as files, NIS and LDAP.

```
cluster1::> vserver services nameservice ns-switch create -vserver vs1 -database passwd -sources files,nis,ldap
```

**vserver services name-service ns-switch delete**

Remove a Name Service Switch table entry

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

Use the `vserver services name-service ns-switch delete` command to permanently remove an existing name service switch entry.

**Parameters**

- `-vserver <vserver name>` - Vserver
  Vserver Use this parameter to specify the Vserver for which to delete the name service switch entry.

- `-database {hosts|group|passwd|netgroup|namemap}` - Name Service Switch Database
  Name Service Switch Database Use this parameter to specify the name service database, of the Vserver, for which the name service switch entry is to be deleted. Following are the possible values for this parameter:
  - hosts
  - group
  - passwd
  - netgroup
  - name_map
Examples

The following example deletes the name service switch entry for the hosts database on a Vserver named vs0.

```
cluster1::> vserver services name-service ns-switch delete -vserver vs0 -database hosts.
```

The following example deletes the name service switch entry for the group database on a Vserver named vs1.

```
cluster1::> vserver services name-service ns-switch delete -vserver vs1 -database group.
```

vserver services name-service ns-switch modify

Change a Name Service Switch table entry

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

Use the `vserver services name-service ns-switch modify` command to modify the order of looking up the name service sources, for an existing name service switch entry.

Parameters

- **-vserver <vserver name>** - Vserver
  
  Vserver Use this parameter to specify the Vserver on which to modify the name service switch entry. A data Vserver or admin Vserver can be specified.

- **-database {hosts|group|passwd|netgroup|namemap}** - Name Service Switch Database
  
  Name Service Switch Database Use this parameter to specify the name service database, of the given Vserver, for which to modify the name service switch entry. Following are the possible values for this parameter:
  
  - hosts
  - group
  - passwd
  - netgroup
  - namemap

- **[-sources {files|dns|ldap|nis}, ...]** - Name Service Source Order
  
  Name Service Source Order Use this parameter to specify the name service sources and the order in which look up for the specified Vserver and name service database. Each name service source in the list for this parameter must be one of the following:
  
  - files
  - dns
  - ldap
  - nis

Separate multiple sources with commas.

For each database specified with the `-database` parameter, one or more sources must be specified. The valid sources for each database type are shown in the following table:
### Database Valid Sources

<table>
<thead>
<tr>
<th>Database</th>
<th>Valid Sources</th>
</tr>
</thead>
<tbody>
<tr>
<td>hosts</td>
<td>files, dns</td>
</tr>
<tr>
<td>group</td>
<td>files, nis, ldap</td>
</tr>
<tr>
<td>passwd</td>
<td>files, nis, ldap</td>
</tr>
<tr>
<td>netgroup</td>
<td>files, nis, ldap</td>
</tr>
<tr>
<td>namemap</td>
<td>files, ldap</td>
</tr>
</tbody>
</table>

**Note:** If "files" is not specified as the default source for the "passwd" or "group" database, ensure that default user and group entries for the 'passwd' and 'group' respectively are present in the source configured. Default entries for "passwd" database: nobody, pcuser, root, sshd, toor, daemon, operator, bin, tty, kmem, games, news, man, smmssp, mailnull, bind, proxy, uucp, pop, www, admin, diag, autosupport. Default entries for "group" database: wheel, daemon, kmem, sys, tty, operator, mail, bin, news, man, games, ftp, staff, sshd, smmssp, mailnull, guest, bind, proxy, authpf, _pflogd, _dhcp, uucp, dialer, network, audit, www, antivirus, nogroup, nobody.

### Examples

The following example modifies the name service source ordering for the hosts database on a Vserver named vs0. The order of looking up the sources is changed to only DNS.

```bash
cluster1::> vserver services name-service ns-switch modify -vserver vs0 -database hosts -sources dns
```

The following example modifies the name service source ordering for the passwd database on a Vserver named vs1. The order of looking up the sources is changed to LDAP followed by NIS.

```bash
cluster1::> vserver services name-service ns-switch modify -vserver vs1 -database passwd -sources ldap,nis
```

### vserver services name-service ns-switch show

Display Name Service Switch configuration

**Availability:** This command is available to cluster and Vserver administrators at the *admin* privilege level.

**Description**

Use the `vserver services name-service ns-switch show` command to display information about one or more name service switch entries. A name service switch entry provides information about the order of looking up the name service sources, for a Vserver and name service database.

**Parameters**

| [-fields <fieldname>, ...] | If you specify the -fields [fieldname], ... parameter, the command only displays the fields that you specify. |
| [-instance] | If you specify the -instance parameter, the command displays detailed information about all entries. |
| [-vserver <vserver name>] | Vserver Use this parameter to display only the name service switch entries for the Vserver you specify. A data Vserver or admin Vserver can be specified. |
[-database {hosts|group|passwd|netgroup|namemap}] - Name Service Switch Database

Name Service Switch Database Use this parameter to display only the name service switch entries of the name service database type you specify. Following are the possible values for this parameter:

- hosts
- group
- passwd
- netgroup
- name_map

[-sources {files|dns|ldap|nis}, ...] - Name Service Source Order

Name Service Source Order Use this parameter to display only name service switch entries with the specified name service source order. Each name service source in the list for this parameter must be one of the following:

- files
- dns
- ldap
- nis

Separate multiple sources with commas.

Examples

The following example shows the output of the vserver services name-service ns-switch show command.

```bash
cluster1::> vserver services name-service ns-switch show

Source       Vserver   Database     Order
------------- --------- ---------- ----------
            vs0       hosts       files,
            vs0       dns        dns
            vs1       passwd      files,
            vs1       ldap, nis

2 entries were displayed.
```

vserver services name-service unix-group commands

Manage local UNIX group accounts

vserver services name-service unix-group adduser

Add a user to a local UNIX group

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The vserver services name-service unix-group adduser command adds a user to a local UNIX group.

**Parameters**

- `-vserver <vserver name>` - Vserver

Use this parameter to specify the Vserver location of the local UNIX group to which the user is added.
- **name <text>** - Group Name
  Use this parameter to specify the local UNIX group to which to add the user.

- **username <text>** - Name of User
  Use this parameter to specify the user name to add to the local UNIX group.

[-**skip-name-validation {true|false}**] - Skip Name Validation
  By default, Data ONTAP validates the name to ensure it complies with the following rules:
  - The name contains only these valid characters: 0 through 9, A through Z, a through z, ",", ".", and ":".
  - The name does not start with the character ":".
  - The name does not contain "$" except as the last character.
  If the parameter is set to **true**, the name validation is skipped.

### Examples
The following example adds a user named tsmith to a local UNIX group named sales on a Vserver named vs0:
```bash
cluster1::> vserver services name-service unix-group adduser -vserver vs0 -name sales -username tsmith
```

### vserver services name-service unix-group create
Create a local UNIX group

**Availability:** This command is available to **cluster** and **Vserver** administrators at the **admin** privilege level.

**Description**
The `vserver services name-service unix-group create` command creates a local UNIX group on a Vserver. Use a local UNIX group for Windows-to-UNIX and UNIX-to-Windows group mappings.

**Parameters**

- **vserver <vserver name>** - Vserver
  Use this parameter to specify the Vserver on which to create the local UNIX group.

- **name <text>** - Group Name
  Use this parameter to specify the name of the group to create.

- **id <integer>** - Group ID
  Use this parameter to specify an ID number for the group.

[-**skip-name-validation {true|false}**] - Skip Name Validation
  By default, Data ONTAP validates the name to ensure it complies with the following rules:
  - The name contains only valid characters: 0 through 9, A through Z, a through z, ",", ".", and ":".
  - The name does not start with ":".
  - The name does not contain "$" except as the last character.
  If the parameter is set to **true**, the name validation is skipped.

### Examples
The following example creates a group named sales on a Vserver named vs0. The group has the ID 94.
```bash
vserver services name-service unix-group create
```

2210  
Commands: Manual Page Reference
vserver services name-service unix-group delete
Delete a local UNIX group

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver services name-service unix-group delete command deletes a local UNIX group from a Vserver.

Parameters
-vserver <vserver name> - Vserver
Use this parameter to specify the Vserver location of the local UNIX group to delete.

-name <text> - Group Name
Use this parameter to specify the local UNIX group to delete.

Examples
The following example deletes a local UNIX group named testgroup from a Vserver named vs0:

```
cluster1::> vserver services name-service unix-group delete -vserver vs0 -name testgroup
```

vserver services name-service unix-group deluser
Delete a user from a local UNIX group

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver services name-service unix-group deluser command removes a user from a local UNIX group.

Parameters
-vserver <vserver name> - Vserver
Use this parameter to specify the Vserver location of the local UNIX group from which the user is removed.

-name <text> - Group Name
Use this parameter to specify the local UNIX group from which to remove the user.

-username <text> - Name of User
Use this parameter to specify the user name to remove from the local UNIX group.

Examples
The following example removes a user named testuser from a local UNIX group named sales on a Vserver named vs0:

```
cluster1::> vserver services name-service unix-group deluser -vserver vs0 -name eng -username testuser
```

vserver services name-service unix-group load-from-uri
Load one or more local UNIX groups from a URI

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.
Description
The `vserver services name-service unix-group load-from-uri` command loads UNIX groups from a universal resource identifier (URI). The URI must contain group information in the UNIX /etc/group format:

`group_name:password:group_ID:comma_separated_list_of_users`

The command discards the value of the `password` field.

Parameters
- `-vserver <vserver>` - Vserver
  
  Use this parameter to specify the Vserver on which to locate the local UNIX groups.

- `-uri {ftp|http://(hostname|IPv4 Address|IPv6 Address)...) - URI to Load From`

  Use this parameter to specify the URI from which the command loads group information.

- `[--overwrite {true|false}] - Overwrite Entries`

  Use this parameter with the value `true` to specify that group information loaded from the URI should overwrite existing group information. The default value is `false`, specifying that group information loaded from the URI should not overwrite existing group information.

- `[--skip-name-validation {true|false}] - Skip Name Validation`

  By default, Data ONTAP validates the name to ensure it complies with the following rules:
  
  • The name contains only valid characters: 0 through 9, A through Z, a through z, "_", ".", and ",".
  
  • The name does not start with "-".
  
  • The name does not contain "$" except as the last character.

  If the parameter is set to `true`, the name validation is skipped.

- `[--foreground {true|false}] - Load Unix Groups file in the Foreground`

  If this parameter is set to `false`, the operation runs as a job in the background. Otherwise, the command does not return until the operation is complete. The default value is `true`.

Examples
The following example loads group information from the URI `ftp://ftp.example.com/groups` onto a Vserver named `vs0`:

```
cluster1::> vserver services name-service unix-group load-from-uri -vserver vs0 -uri ftp://ftp.example.com/groups
```

```
vserver services name-service unix-group modify
Modify a local UNIX group

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
Use the `vserver services name-service unix-group modify` command to modify a local UNIX group's group ID.

Parameters
- `-vserver <vserver name>` - Vserver

  Use this parameter to specify the Vserver location of the local UNIX group to modify.

- `-name <text>` - Group Name

  Use this parameter to specify the name of the group to modify.
[-id <integer>] - Group ID

Use this parameter to specify an ID number for the group.

Examples

The following example changes a local UNIX group named sales on a Vserver named vs0 to have the group ID 100:

```
cluster1::> vserver services name-service unix-group modify -vserver vs0 -group sales -id 100
```

### vserver services name-service unix-group show

Display local UNIX groups

**Availability:** This command is available to cluster and Vserver administrators at the *admin* privilege level.

**Description**

The `vserver services name-service unix-group show` command displays information about local UNIX groups.

**Parameters**

```
{-fields <fieldname>, ...}
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-members]
```

Use this parameter to display the list of users in each local UNIX group.

```
[-instance]
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[-vserver <vserver name>]
```

Use this parameter with the `-name` parameter to display information only about the local UNIX group you specify. Use this parameter without `-name` to display information only about the local UNIX groups that are located on the specified Vserver.

```
[-name <text>]
```

Use this parameter with the `-vserver` parameter to display information only about the local UNIX group you specify. Use this parameter without `-vserver` to display information only about the local UNIX groups that match the name you specify.

```
[-id <integer>]
```

Use this parameter to display information only about the local UNIX group that has the ID you specify.

```
[-users <text>, ...]
```

Use this parameter to display information only about the local UNIX groups that include the user names you specify.

**Examples**

The following example displays information about all local UNIX groups, including lists of their users:

```
cluster1::> vserver services name-service unix-group show -members
Vserver   Name   ID
vs0       dev    44
Users: admin, jdoe, tsmith
vs0       sales  12
Users: admin, guest, pjones
vs1       testgroup  13
```

vserver services commands
vserver services name-service unix-group file commands

Manage local UNIX-group file

vserver services name-service unix-group file show

Display local UNIX groups file

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description

The vserver services name-service unix-group file show command displays information about local UNIX groups. It displays the content as it is from the actual UNIX group file which resides in the mroot volume.

Parameters

-vserver <vserver> - Vserver

If you specify this parameter, the command displays information about the local UNIX group or groups that are located on the specified Vserver.

[-search-string <text>] - Pattern to be searched

If you specify this parameter and the -vserver parameter, the command only displays information from the UNIX group file which matches the specified parameter.

Examples

The following example displays information about all local UNIX groups belonging to a specific Vserver:

```
cluster1::> vserver services name-service unix-group file show -vserver vs0
Line No  File content
----------  ----------------
1  daemon:*:1:
2  nobody:*:65535:
3  pcuser:*:65534:
4  root:*:0:
```

vserver services name-service unix-group file status

Display local Unix Groups file status

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description

The vserver services name-service unix-group file status command displays the status of local UNIX group file across a cluster. This enables you to verify that UNIX group files are consistent across all nodes that back a Vserver into which UNIX group files have been loaded.

The command displays the following information:

- Vserver name
- Node name
- Load time for the UNIX group file
• Hash value of the UNIX group file
• Hash value of the UNIX group database file
• Hash value of the UNIX group byuser database file
• File size of the UNIX group file

Parameters
{[-fields <fieldname>, ...]
   If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

|[[-instance]]
   If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver
   If you specify this parameter, the command displays the UNIX group status only for the specified Vserver.

[-node {<nodename>|local}] - Node
   If you specify this parameter, the command displays the UNIX group status only for the specified node.

[-timestamp <MM/DD/YYYY HH:MM:SS>] - Load Time
   If you specify this parameter, the command displays the status only for the UNIX group file that were loaded at the specified time. Specify time in the format MM/DD/YYYY HH:MM:SS. Note that the load time stamps for identical files are different on different nodes, because each node downloads the definitions from the source URI individually.

[-hashvalue <text>] - Hash Value
   If you specify this parameter, command displays the status only for the UNIX group files that have the specified hash value. Note that the primary purpose of the command is to verify that the files on all nodes have the same hash value, so querying on a specific hash value is not useful in most cases.

[-hashvalue-db-grp <text>] - Hash Value DB
   If you specify this parameter, command displays the status only for the UNIX group files that have the specified hash value for the UNIX group database. Note that the primary purpose of the command is to verify that the files on all nodes have the same hash value, so querying on a specific hash value is not useful in most cases.

[-hashvalue-db <text>] - Hash Value byuser DB
   If you specify this parameter, the command displays the status only for the UNIX group files that have the specified hash value for the UNIX group byuser database. Note that the primary purpose of the command is to verify that the files on all nodes have the same hash value for UNIX group database.

[-filesize {<integer> [KB|MB|GB|TB|PB]}] - File Size
   If you specify this parameter, the command displays the status only for the UNIX group files that have the specified file size. Note that the primary purpose of the command is to verify that the files on all nodes have the same file size, so querying on a specific file size is not useful in most cases.

Examples
The following example displays the UNIX group file status for all Vservers:

```bash
cluster1:*> vserver services name-service unix-group file status -instance

  Vserver: vs1
  Node: node1
  Load Time: 8/9/2016 19:56:25
  Hash Value: 835c7f530fb76f96c3bca00e380d36b7
  Hash Value DB: e6cb38ec1396a280c0d2b77e3a89eda2
  Hash Value byuser DB: 913a182a72aa1872498be198ecbb2cd23
```
vserver services name-service unix-group max-limit commands

Manage Configuration Limits for UNIX-Group

**vserver services name-service unix-group max-limit modify**

Change Configuration Limits for UNIX-Group

**Availability:** This command is available to cluster administrators at the *advanced* privilege level.

**Description**
The `vserver services name-service unix-group max-limit modify` command enables you to modify maximum UNIX groups and group-members that can be configured on the system. This allows you to set certain limits to prevent performance issues due to service configurations using excessive resources.

**Parameters**

[-limit <integer>] - System Limit

This parameter specifies the maximum limit that you want to set for unix-group. The default setting for the limit is 32768. The supported range of values for this parameter is 0 to 65536.

**Examples**
The following example modifies the system-wide limit of the total number of UNIX groups and members that can be configured on the cluster.

```
vserver services name-service unix-group max-limit modify -limit 33792
```

**vserver services name-service unix-group max-limit show**

Display Configuration Limits for UNIX-Group

**Availability:** This command is available to cluster administrators at the *advanced* privilege level.

**Description**
The `vserver services name-service unix-group max-limit show` command displays information on UNIX group limits that are configurable with `vserver services name-service unix-group max-limit modify` command. The output will show the following:

- Limit: The configured limit on the total number of UNIX groups and group members configurable.
- Current Count: Total number of current entries for UNIX groups and group members.

**Examples**
The following example shows the limits and total number of current entries for UNIX group configuration:

vserver services name-service unix-group max-limit modify on page 2216

vserver services name-service unix-user commands

Manage local UNIX user accounts

vserver services name-service unix-user create

Create a local UNIX user

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver services name-service unix-user create command creates a local UNIX user on a Vserver. You can use local UNIX users for Windows-to-UNIX and UNIX-to-Windows name mappings.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the Vserver on which you want to create the local unix user.

-user <text> - User Name

This parameter specifies the user account that you want to create.

-id <integer> - User ID

This parameter specifies an ID number for the user.

-primary-gid <integer> - Primary Group ID

This parameter specifies the ID number of the user's primary group.

[full-name <text>] - User's Full Name

This parameter specifies the user's full name.

[skip-name-validation {true|false}] - Skip Name Validation

By default, Data ONTAP validates the name to ensure it complies with the following rules:

- The name contains only valid characters: 0 through 9, A through Z, a through z, "_", ",", and "-
- The name does not start with "-
- The name does not contain "$" except as the last character

If the parameter is set to true, the name validation is skipped.

Examples

The following example creates a local UNIX user named tsmith on a Vserver named vs0. The user has the ID 4219 and the primary group ID 100. The user's full name is Tom Smith.
vserver services name-service unix-user delete

Delete a local UNIX user

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `vserver services name-service unix-user delete` command deletes a local UNIX user from a Vserver.

**Parameters**
- **-vserver <vserver name>** - Vserver
  This parameter specifies the Vserver on which the local UNIX user is located.
- **-user <text>** - User Name
  This parameter specifies the user that you want to delete.

**Examples**
The following example deletes a local UNIX user named testuser from a Vserver named vs0:

```
vs1::> vserver services name-service unix-user delete -vserver vs0 -user testuser
```

vserver services name-service unix-user load-from-uri

Load one or more local UNIX users from a URI

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `vserver services name-service unix-user load-from-uri` command loads one or more UNIX users from a universal resource identifier (URI). The URI must contain user information in the UNIX /etc/passwd format:

- `user_name`: The name of the user.
- `password`: The user's password.
- `user_ID`: The user's ID.
- `group_ID`: The group ID.
- `full_name`: The full name of the user.
- `home_directory`: The home directory.
- `shell`: The shell.

The command discards the value of the `password` field and of the fields after the `full_name` field (`home_directory` and `shell`).

**Parameters**
- **-vserver <vserver>** - Vserver
  This specifies the Vserver on which the local UNIX user or users are to be located.
- **-uri {ftp|http://(hostname|IPv4 Address|'[IPv6 Address'])...}** - URI to Load From
  This specifies the URI from which user information is to be loaded.
- **[-overwrite {true|false}] - Overwrite Entries**
  This optionally specifies whether user information from the URI overwrites existing user information. The default setting is `false`.
- **[-skip-name-validation {true|false}] - Skip Name Validation**
  By default, Data ONTAP validates the name to ensure it complies with the following rules:
  - The name contains only valid characters: 0 through 9, A through Z, a through z, ",", ".", and "-"
  - The name does not start with "."
- The name does not contain "$" except as the last character

If the parameter is set to true, the name validation is skipped.

[-foreground (true|false)] - Load Unix Users file in the Foreground

If this parameter is set to false, the operation runs as a job in the background. Otherwise, the command does not return until the operation is complete. The default value is true.

Examples
The following example loads user information from the URI ftp://ftp.example.com/users onto a Vserver named vs0:

```
node::> vserver services name-service unix-user load-from-uri -vserver vs0 -uri ftp://ftp.example.com/users
```

vserver services name-service unix-user modify
Modify a local UNIX user

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver services name-service unix-user modify command modifies a local UNIX user's ID, primary group ID, or full name.

Parameters

- -vserver <vserver name> - Vserver
  This parameter specifies the Vserver on which the local UNIX user is located.

- -user <text> - User Name
  This parameter specifies the user account that you want to modify.

- -id <integer> - User ID
  This optional parameter specifies an ID number for the user.

- -primary-gid <integer> - Primary Group ID
  This optional parameter specifies the ID number of the user's primary group.

- -full-name <text> - User's Full Name
  This optional parameter specifies the user's full name.

Examples
The following example modifies the local UNIX user named pjones on a Vserver named vs0. The user's primary group ID is changed to 100 and the user's full name is Peter Jones.

```
vs1::> vserver services name-service unix-user modify -vserver vs0 -user pjones -primary-gid 100 -full-name "Peter Jones"
```

vserver services name-service unix-user show
Display local UNIX users

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.
Description
The vserver services name-service unix-user show command displays information about local UNIX users. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all local UNIX users:

- Vserver name
- User name
- User ID
- Primary group ID
- Full name

Parameters

{ [-fields <fieldname>, ...]
    If you specify the -fields parameter, the command only displays the fields that you specify.
}

| [-instance ]
| If you specify the -instance parameter, the command displays detailed information about all entries.

[ -vserver <vserver name> ] - Vserver
If you specify this parameter and the -user parameter, the command displays information only about the specified local UNIX user. If you specify this parameter by itself, the command displays information only about the local UNIX user or users that are located on the specified Vserver.

[ -user <text> ] - User Name
If you specify this parameter and the -vserver parameter, the command displays information only about the specified local UNIX user. If you specify this parameter by itself, the command displays information only about the local UNIX user or users that have the specified name.

[ -id <integer> ] - User ID
If you specify this parameter, the command displays information only about the local UNIX user that has the specified ID.

[ -primary-gid <integer> ] - Primary Group ID
If you specify this parameter, the command displays information only about the local UNIX user or users that have the specified primary group ID.

[ -full-name <text> ] - User's Full Name
If you specify this parameter, the command displays information only about the local UNIX user or users that match the specified name.

Examples
The following example displays information about all local UNIX users:

```
vs1::> vserver services name-service unix-user show

<table>
<thead>
<tr>
<th>Vserver</th>
<th>User</th>
<th>User ID</th>
<th>Group ID</th>
<th>Full Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>vs0</td>
<td>admin</td>
<td>100</td>
<td>100</td>
<td>administrator</td>
</tr>
<tr>

Commands: Manual Page Reference
**vserver services name-service unix-user file commands**

Manage local UNIX-user file

**vserver services name-service unix-user file show**

Display local UNIX users file

**Availability:** This command is available to cluster and Vserver administrators at the advanced privilege level.

**Description**
The `vserver services name-service unix-user file show` command displays information about local UNIX users. It displays the content as it is from the actual UNIX user file which resides in the mroot volume.

**Parameters**

- `-vserver <vserver>` - Vserver

  If you specify this parameter, the command displays information about the local UNIX user or users that are located on the specified Vserver.

- `[-search-string <text>]` - Pattern to be searched

  If you specify this parameter and the `-vserver` parameter, the command only displays information from the UNIX user file which matches the specified parameter.

**Examples**
The following example displays information about all local UNIX users belonging to a specific Vserver:

```
cluster1::> vserver services name-service unix-user file show -vserver vs0
Line No  File content
----------  ----------------
 1  nobody:*:65535:65535::::
 2  pcuser:*:65534:65534:::;
 3  root:*:0:1:;;;;
```

**vserver services name-service unix-user file status**

Display local Unix Users file status

**Availability:** This command is available to cluster and Vserver administrators at the advanced privilege level.

**Description**
The `vserver services name-service unix-user file status` command displays the status of local UNIX user file across a cluster. This enables you to verify that UNIX user files are consistent across all nodes that back a Vserver into which UNIX user files have been loaded.

The command displays the following information:

- Vserver name
- Node name
- Load time for the UNIX user file
- Hash value of the UNIX user file
- Hash value of the UNIX user database file
- File size of the UNIX user file
Parameters

[-fields <fieldname>...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

[-instance]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver

If you specify this parameter, the command displays the UNIX user status only for the specified Vserver.

[-node (<nodename>|local)] - Node

If you specify this parameter, the command displays the UNIX user status only for the specified node.

[-timestamp <MM/DD/YYYY HH:MM:SS>] - Load Time

If you specify this parameter, the command displays the status only for the UNIX user file that were loaded at the specified time. Specify time in the format MM/DD/YYYY HH:MM:SS. Note that the load time stamps for identical files are different on different nodes, because each node downloads the definitions from the source URI individually.

[-hashvalue <text>] - Hash Value

If you specify this parameter, command displays the status only for the UNIX user files that have the specified hash value. Note that the primary purpose of the command is to verify that the files on all nodes have the same hash value, so querying on a specific hash value is not useful in most cases.

[-hashvalue-db <text>] - Hash Value DB

If you specify this parameter, the command displays the status only for the UNIX user files that have the specified hash value for the UNIX user database. Note that the primary purpose of the command is to verify that the files on all nodes have the same hash value for UNIX user database.

[-filesize <integer>[KB|MB|GB|TB|PB]] - File Size

If you specify this parameter, the command displays the status only for the UNIX user files that have the specified file size. Note that the primary purpose of the command is to verify that the files on all nodes have the same file size, so querying on a specific file size is not useful in most cases.

Examples

The following example displays the UNIX user file status for all Vservers:

```
cluster1::*> vserver services name-service unix-user file status
Vserver  Node     Load Time           Hash Value                       Hash Value DB
--------- -------  ------------------- --------------------------------
        DB                    File Size
 --------- -------  ------------------- --------------------------------
-------------------------------- ----------
vs1
  node1  5/20/2016 16:04:55  e6cb38ec1396a280c0d2b77e3a84eda2 913a182a72aa1872495be398a2b2cd23 1.00KB

vs2
  node1  5/20/2016 16:06:26  c0d2b77e3a84eda2e6cb38ec1396a280 009321edeb45611e95df7f27ec0621 2.3MB
  node2  5/20/2016 16:06:27  c0d2b77e3a84eda2e6cb38ec1396a280 009321edeb45611e95df7f27ec0621 2.3MB
4 entries were displayed.
```

vserver services name-service unix-user max-limit commands

Manage Configuration Limits for UNIX-User

2222

Commands: Manual Page Reference
**vserver services name-service unix-user max-limit modify**

Change Configuration Limits for UNIX-User

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**
The *vserver services name-service unix-user max-limit modify* command enables you to modify maximum UNIX users that can be configured on the system. This allows you to set certain limits to prevent performance issues due to service configurations using excessive resources.

**Parameters**

[[-limit <integer>]] - **System Limit**

This parameter specifies the maximum limit that you want to set for unix-user. The default setting for the limit is 32768. The supported range of values for this parameter is 0 to 65536.

**Examples**
The following example modifies the system-wide limit of the total number of UNIX users that can be configured on the cluster.

```bash
vserver services name-service unix-user max-limit modify -limit 33792
```

**vserver services name-service unix-user max-limit show**

Display Configuration Limits for UNIX-User

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**
The *vserver services name-service unix-user max-limit show* command displays information on UNIX user limits that are configurable with *vserver services name-service unix-user max-limit modify* command. The output will show the following:

- **Limit:** The configured limit on the total number of UNIX users configurable.
- **Current Count:** Total number of current entries for UNIX users configuration.

**Examples**
The following example shows the limits and total number of current entries for UNIX user configuration:

```bash
cluster1::> vserver services name-service unix-user max-limit show
(vserver services name-service unix-user max-limit show)
Limit Current Count
--------------- --------------
400           3
```

**Related references**

- *vserver services name-service unix-user max-limit modify* on page 2223

**vserver services name-service ypbind commands**

The ypbind directory
vserver services name-service ypbind start

Start ypbind

Availability: This command is available to cluster administrators at the advanced privilege level.

**Description**
The `vserver services name-service ypbind start` starts the ypbind. NIS creation will fail if ypbind is stopped. This command starts ypbind on all the nodes in a cluster and is persistent across node reboots.

**Examples**
The following example starts ypbind:

```
vsl::> vserver services name-service ypbind start
```

vserver services name-service ypbind status

Current ypbind status

Availability: This command is available to cluster administrators at the advanced privilege level.

**Description**
The `vserver services name-service ypbind status` displays whether the ypbind is running or stopped.

**Examples**
The following example displays ypbind status:

```
vsl::> vserver services name-service ypbind status
Status: Running
```

vserver services name-service ypbind stop

Stop ypbind

Availability: This command is available to cluster administrators at the advanced privilege level.

**Description**
The `vserver services name-service ypbind stop` stops the ypbind. Command fails if NIS entries are present. This command stops ypbind on all the nodes in a cluster and is persistent across node reboots.

**Examples**
The following example stops ypbind:

```
vsl::> vserver services name-service ypbind stop
```

vserver services ndmp commands

Manage vserver scoped NDMP
vserver services ndmp generate-password

Generates NDMP password for a user

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command is used to generate NDMP password for a given user in the specified Vserver context. The generated NDMP password is based on the user's login password. For this reason regenerate it whenever the user's login password changes. This command fails if a user does not exist for the Vserver.

Parameters
{-fields <fieldname>, ...}
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance ]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver
Specify the Vserver context for which password is to be generated.

[-user <text>] - User
Specify the user name for which the NDMP password needs to be generated.

[-password <text>] - Password
The generated NDMP password string that is used for authentication.

Examples
The following example shows the usage this command to generate NDMP password for a user belonging to a specific Vserver:

```
cluster1::> vserver services ndmp generate-password -vserver vserver1 -user user1
Vserver: vserver1
User: user1
Password: a9cCCUp32yjGmBiD
```

vserver services ndmp kill

Kill the specified NDMP session

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
This command terminates a specific NDMP session on a particular Vserver in the cluster.

Parameters
<text> - Session Identifier
Session ID of the NDMP session. A session-id is a string used to identify a particular NDMP session.

Examples
The following example shows how a specific NDMP session on the Vserver named vserver1 can be terminated:
vserver services ndmp kill-all

Kill all NDMP sessions

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
This command terminates all NDMP sessions on a particular Vserver in the cluster.

**Parameters**
- `vserver <vserver name> - Vserver`
  Specifies the Vserver name in which all NDMP sessions that are to be terminated are running.

**Examples**
The following example shows how all NDMP sessions on the Vserver named vserver1 can be terminated:

```
cluster1::> vserver services ndmp kill-all -vserver vserver1
```

vserver services ndmp modify

Modify NDMP Properties

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
This command is used to change NDMP options on Vservers.

One or more of the options specified in the parameters section can be modified for a specific Vserver, by this command. A short description of each of the options is provided in the parameters section.

**Parameters**
- `vserver <Vserver Name> - Vserver`
  This parameter specifies the name of the Vserver.

  `[-ignore-ctime-enabled {true|false}] - Ignore Ctime`
  This option, when *true*, allows user to exclude files with ctime changed from storage system' incremental dumps since other processes like virus scanning often alter the ctime of files. When this option is *false*, backup on the Vserver will include all files with a change or modified time later then the last dump in the previous level dump. The default value is *false*. This option is persistent across reboots.

  Most WIN32 APIs are often unaware of the "last changed time", ctime, they often incorrectly set a later time for files, causing these files to be included in the Vserver's incremental dumps, making the incremental dump very large. This is partially defying the purpose of having incremental dumps, since one uses incremental dumps to speed up the backup by only dumping files that were truly changed since the last backup.

  The `-option-value` for this parameter should be true/false.
-offset-map-enable \{true|false\} - Enable Offset Map

This option is used to enable or disable generation of the inode offset map during NDMP based dump backups. The offset map is required to perform Enhanced Direct Access Restore (DAR) on the backup data. Enhanced DAR provides support for directory DAR and DAR of files with NT streams. The default value for this option is true. This option is persistent across reboots.

The -option-value for this parameter should be true/false.

-tcpnodelay \{true|false\} - Enable TCP Nodelay

Enables/Disables the TCPNODELAY configuration parameter for the socket between the Vserver and the DMA. When set to true, the Nagle algorithm is disabled and small packets are sent immediately rather than held and bundled with other small packets. This optimizes the system for response time rather than throughput.

This option becomes active when the next NDMP session starts. Existing sessions are unaffected. The default value for this option is false. This option is persistent across reboots.

The -option-value for this parameter should be true/false.

tcpwinsize <integer> - TCP Window Size

This option can be used to change the TCP buffer size of the NDMP data connection. The minimum and maximum values are 8192(8K) and 7,631,441(7.2M), respectively. The default value for this option is 32768(32K).

This option is persistent across reboots.

The -option-value for this parameter should be a number between 8192(8K) and 7,631,441(7.2M).

-data-port-range <text> - Data Port Range

This option allows administrators to specify a port range on which the NDMP server can listen for data connections.

The format of this option is start_port - end_port. start_port, end_port can have values between [1024-65535]; start_port must be lesser than or equal to end_port. If a valid range is specified, NDMP uses a port within that range to listen for data connections. A listen request fails if no ports in the specified range are free.

This option is modifiable only from the admin Vserver context and the said option is applicable for all the data Vservers and the admin Vserver. For example, if the value of the above option is set with 2000-3000, the same value will be applicable throughout the cluster. The value all implies that any available port can be used to listen for data connections. The default value for this option is all. This option is persistent across reboots.

The -option-value for this option should be in the format {<start_port>-<end_port> | all } - where start_port, end_port can have values between [1024-65535]; start_port must be lesser than or equal to end_port.

-backup-log-enable \{true|false\} - Enable Backup Log

Backup logging captures important events during dump/restore and records them in /mroot/etc/log/backup on the root volume. The option allows users to enable or disable this feature. The default value for this option is true. This option is persistent across reboots.

The -option-value for this parameter should be true/false.

-per-qtree-exclude-enable \{true|false\} - Enable per Qtree Exclusion

If this option is true, users can specify exclude list on a per qtree basis to be excluded from backup. This exclude list will override any values already present due to 'EXCLUDE' environment variable. The user can specify the exclusion list through a .exclude_list file which resides at the root of the qtree. The exclusion list can be a list of files or files that match a specified pattern. The default value for this option is false. This option is persistent across reboots.
The **-option-value** for this parameter should be true/false.

**[-authtype <NDMP Authentication types>, ...] - Authentication Type**

Allows the administrator to choose the authentication method. NDMP supports three authentication types: challenge, plaintext and plaintext_sso. The plaintext_sso authentication type is mutually exclusive with the other authentication types. By setting the authentication type as plaintext_sso, the actual password for the user can be used to authenticate instead of having to generate an NDMP specific password. The default of this option is **challenge**. This option is persistent across reboots.

The **-option-value** for this parameter can be {challenge | plaintext | plaintext_sso | challenge, plaintext | plaintext, challenge}.

**[-debug-enable {true|false}] - Enable Debug (privilege: advanced)**

This option enables debug logging for NDMP. Debug messages will be logged to the ndmpd log file / mroot/etc/log/mlog/ndmpd.log. The default value for this option is **false**. This option is persistent across reboots.

The **-option-value** for this parameter should be true/false.

**[-debug-filter <text>] - Debug Filter (privilege: advanced)**

This option controls the NDMP modules for which debug logging is to be enabled. option-value can take five values for this option: all, none, normal, backend or "filter-expression".

- **all** enables debug logging for all modules.
- **none** disables debug logging for all modules. It is equivalent to modify -vserver vserver_name -debug-enable false.
- **normal** is a shortcut option that enables debug logging for all modules except verbose and io_loop. The equivalent filter string is all-verbose-io_loop.
- **backend** is a shortcut option that enables debug logging for all modules except verbose, io_loop, ndmps and ndmpp. The equivalent filter string is all-verbose-io_loop-ndmps-ndmpp.

(filter-expression) is a combination of one or more modules for which debug logs needs to be enabled. Multiple module names can be combined using following operators:

- ^ to add the given module or modules to the list of modules specified in the filter string. For example the filter ndmpp^mover^data will enable debug logging for ndmpp, mover and data.

The possible module names and a brief description is given below:-

<table>
<thead>
<tr>
<th>Modules</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>verbose</td>
<td>verbose message</td>
</tr>
<tr>
<td>io</td>
<td>I/O process loop</td>
</tr>
<tr>
<td>io_loop</td>
<td>I/O process loop verbose messages</td>
</tr>
<tr>
<td>ndmps</td>
<td>NDMP service</td>
</tr>
<tr>
<td>ndmpp</td>
<td>NDMP Protocol</td>
</tr>
<tr>
<td>rpc</td>
<td>General RPC service</td>
</tr>
<tr>
<td>fdc_rpc</td>
<td>RPC to FC driver service</td>
</tr>
<tr>
<td>auth</td>
<td>Authentication</td>
</tr>
<tr>
<td>mover</td>
<td>NDMP MOVER (tape I/O)</td>
</tr>
<tr>
<td>data</td>
<td>NDMP DATA (backup/restore)</td>
</tr>
<tr>
<td>scsi</td>
<td>NDMP SCSI (robot/tape ops)</td>
</tr>
<tr>
<td>bkup_rpc</td>
<td>RPC to Backup service client</td>
</tr>
<tr>
<td>bkup_rpc_s</td>
<td>RPC to Backup service server</td>
</tr>
<tr>
<td>conf</td>
<td>Debug configure/reconfigure</td>
</tr>
</tbody>
</table>
The default value for this option is *none*. This option is persistent across reboots.

The **-option-value** for this parameter can be `{all | none | normal | backend | 'filter-expression'}`.

[-dump-logical-find <text>] - Enable Logical Find for Dump (privilege: advanced)

This option specifies whether to follow inode-file walk or tree walk for phase I of the dump. Choosing inode-file walk or tree walk affects the performance of the dump. This option can take following values:

If *default* is specified, then level 0 and incremental volume as well as qtree dumps will use inode walk. All the subtree dumps will use tree walk.

If *always* is specified, all dumps will follow treewalk.

A comma-separated list of values in any combination from the following list:

• volBaseline: Level 0 full volume backup will follow treewalk.
• volIncr: Incremental full volume backup will follow treewalk.
• qtreeBaseline: Level 0 qtree backup will follow treewalk.
• qtreeIncr: Incremental qtree backup will follow treewalk.

The default value for this option is *default*. This option is persistent across reboots.

The **-option-value** for this parameter could be `{default | always | 'volBaseline' | 'volBaseline,qtreeBaseline' | ...`.

[-abort-on-disk-error {true|false}] - Enable Abort on Disk Error (privilege: advanced)

If this option is *true*, dump will abort the backup operation on detection of irrecoverable data blocks in user files. If this option is *false*, dump will proceed with backup operation - even if irrecoverable data blocks in user files are detected. On detection of irrecoverable data blocks, dump will send a log message to DMA and also log an entry in `/mroot/etc/log/backup` file. The default value for this option is *false*. This option is persistent across reboots.

The **-option-value** for this parameter should be true/false.

[-fh-dir-retry-interval <integer>] - FH Throttle Value for Dir (privilege: advanced)

NDMP protocol sends back file history information for all directories in phase 3 of dump to DMA. In the presence of slow DMA or high latency networks, the amount of file history being generated exceeds the amount being consumed by the DMA. To handle a slow reader, a flow control mechanism is now introduced where file history generation is throttled when a DMA is slow in consuming them. The value for this option indicates how frequently should the file history be resent if it was throttled. The default value is 250 milliseconds. This option is persistent across reboots.

The **-option-value** for this parameter should be a number.

[-fh-node-retry-interval <integer>] - FH Throttle Value for Node (privilege: advanced)

NDMP protocol sends back file history information for all files in phase 4 of dump to DMA. In the presence of slow DMA or high latency networks, the amount of file history being generated exceeds the amount being consumed by the DMA. To handle slow reader conditions, a flow control mechanism is now introduced where file history generation is throttled when a DMA is slow in consuming them. The value for this option indicates...
how frequently should the file history be resent if it was throttled. The default value is 250 milliseconds. This option is persistent across reboots.

The `option-value` for this parameter should be a number.

```
[-restore-vm-cache-size <integer>] - Restore VM File Cache Size (privilege: advanced)
```

This option mandates the number of WAFL buffers pinned in memory by various meta-files used by logical restore. The minimum and maximum values are 4 and 1024, respectively. The default value for this option is 64. This option is persistent across reboots.

Depending on the value of this option, various meta-files are assigned a number of WAFL buffers that need to be pinned in memory.

<table>
<thead>
<tr>
<th>Meta-filename</th>
<th>Number of WAFL buffers to be pinned in memory</th>
</tr>
</thead>
<tbody>
<tr>
<td>dumpmap</td>
<td>ndmpd.restore.vm_cache_size</td>
</tr>
<tr>
<td>filemap</td>
<td>ndmpd.restore.vm_cache_size</td>
</tr>
<tr>
<td>aclfile_map</td>
<td>ndmpd.restore.vm_cache_size</td>
</tr>
<tr>
<td>inomap</td>
<td>ndmpd.restore.vm_cache_size / 2</td>
</tr>
<tr>
<td>basemap</td>
<td>ndmpd.restore.vm_cache_size / 2</td>
</tr>
<tr>
<td>filmap</td>
<td>ndmpd.restore.vm_cache_size / 2</td>
</tr>
<tr>
<td>revmap</td>
<td>ndmpd.restore.vm_cache_size / 2</td>
</tr>
<tr>
<td>clrimap</td>
<td>ndmpd.restore.vm_cache_size / 4</td>
</tr>
<tr>
<td>mfp_for_inotab</td>
<td>ndmpd.restore.vm_cache_size / 4</td>
</tr>
<tr>
<td>map</td>
<td>ndmpd.restore.vm_cache_size / 4</td>
</tr>
<tr>
<td>offsetfile_map</td>
<td>ndmpd.restore.vm_cache_size / 4</td>
</tr>
</tbody>
</table>

The `option-value` for this parameter should be a number between 4 and 1024.

```
[-enable {true|false}] - Enable NDMP on Vserver
```

When the option is set to `true`, the NDMP daemon handles requests, and when set to `false`, the NDMP daemon does not handle requests. Enabling and disabling the option is equivalent to executing the following commands: `vserver services ndmp on` and `vserver services ndmp off` respectively. This option is persistent across reboots. The default value of this option is `false`.

The `option-value` for this parameter is either true or false.

```
[-preferred-interface-role {cluster|data|node-mgmt|intercluster|cluster-mgmt},... ] - Preferred Interface Role
```

This option allows the user to specify the preferred Logical Interface (LIF) role while establishing an NDMP data connection channel. The NDMP data server or the NDMP mover establishes a data channel from the node that owns the volume or the tape device respectively. This option is used on the node that owns the volume or the tape device. The order of IP addresses that are used to establish the data connection depends on the order of LIF roles specified in this option.

The default value for this option for the admin Vserver is `intercluster, cluster-mgmt, node-mgmt`

The default value for this option for a data Vserver is `intercluster, data`.

```
[-secondary-debug-filter <text>] - Secondary Debug Filter (privilege: advanced)
```

This option allows control on NDMP debug logging. This option takes a comma separated tag=value pairs. The supported tag is `IPADDR` which can be used to specify Vserver IP addresses for which NDMP debugging is required. If this option is set and the option `debug-enable` is set to true, then the debug-filter option is applicable to sessions whose control connection IP addresses match the IP addresses that are listed in the option. If this option is not set, the debug filter is applicable to all Vserver sessions. By default, this option does not have a value set.
**[-is-secure-control-connection-enabled (true|false)]** - Is Secure Control Connection Enabled

This option enables NDMP service to accept control connections over secure sockets on TCP port 30000. This option is persistent across reboots. The default value of this option is `false`.

**Examples**

The following example show how to enable NDMP on a Vserver and set authorization type to plaintext:

```bash
cluster1::> vserver services ndmp modify -vserver vs1 -enable true -authtype plaintext
cluster1::>
```

**vserver services ndmp off**

Disable NDMP service

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

This command is used to disable NDMP service on a specific Vserver.

**Parameters**

-`-vserver <Vserver Name>` - *Vserver*
  
  This parameter specifies the name of the Vserver.

**Examples**

The following example disables NDMP on a specific Vserver:

```bash
cluster1::> vserver services ndmp off -vserver vs1
```

**vserver services ndmp on**

Enable NDMP service

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

This command is used to enable NDMP service on a specific Vserver.

**Parameters**

-`-vserver <Vserver Name>` - *Vserver*
  
  This parameter specifies the name of the Vserver.

**Examples**

The following example enables NDMP service on a specific Vserver:

```bash
cluster1::> vserver services ndmp on -vserver vs1
```
vserver services ndmp probe
Display list of NDMP sessions

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The system services ndmp probe command displays diagnostic information about NDMP sessions belonging to a specific Vserver in the cluster. The following fields are displayed for each of the sessions:

- Vserver
- Session identifier
- NDMP version
- Session authorized
- Data state
- Data operation
- Data server halt reason
- Data server connect type
- Data server connect address
- Data server connect port
- Data bytes processed
- Mover state
- Mover mode
- Mover pause reason
- Mover halt reason
- Mover record size
- Mover record number
- Mover bytes moved
- Mover seek position
- Mover bytes left to read
- Mover window offset
- Mover window length
- Mover position
- Mover SetRecordSize flag
- Mover SetWindow flag
- Mover connect type
- Mover connect address
- Mover connect port
- Effective host
- NDMP client address
- NDMP client port
- SCSI device ID
- SCSI hostadapter
- SCSI target ID
- SCSI LUN ID
- Tape device
- Tape mode
- Node
- Is Secure Control Connection
- Data Backup Mode
- Data Path
- NDMP Source Address

**Parameters**

[-vserver <vserver name>] - Vserver

This parameter Specifies the Vserver context in which NDMP sessions are running.

[-session-id <text>] - Session Identifier

If this parameter is specified, the command displays information about a specific NDMP session. A session-id is a string used to identify a particular NDMP session.

[-ndmp-version <integer>] - NDMP Version

This parameter refers to the NDMP protocol version being used in the session.

[-session-authorized {true|false}] - Session Authorized

This parameter indicates whether an NDMP session is authenticated or not.

[-data-state <component state>] - Data State

This parameter identifies the current state of the data server's state machine.

[-data-operation <data operation>] - Data Operation

This parameter identifies the data server's current operation.

[-data-halt-reason <halt reason>] - Data Server Halt Reason

This parameter identifies the event that caused the data server state machine to enter the HALTED state.

[-data-con-addr-type <address type>] - Data Server Connect Type

This parameter specifies the type of data connection established by the data server. The data connection can be established locally within a given system or between remote networked systems.

[-data-con-addr <text>] - Data Server Connect Address

This parameter specifies the connection endpoint information for the data server's data connection.

[-data-con-port <integer>] - Data Server Connect Port

This parameter specifies the TCP/IP port that the data server will use when establishing a data connection.
[-data-bytes-processed <integer>] - Data Bytes Processed
This parameter represents the cumulative number of data stream bytes transferred between the backup or
recovery method and the data connection during the current data operation.

[-mover-state <component state>] - Mover State
This parameter identifies the current state of the NDMP tape server's mover state machine.

[-mover-mode <mover mode>] - Mover Mode
This parameter identifies the direction of the mover data transfer.

[-mover-pause-reason <pause reason>] - Mover Pause Reason
This parameter identifies the event that caused the mover state machine to enter the PAUSED state.

[-mover-halt-reason <halt reason>] - Mover Halt Reason
This parameter field identifies the event that caused the mover state machine to enter the HALTED state.

[-mover-record-size <integer>] - Mover Record Size
This parameter represents the current mover record size in bytes.

[-mover-record-num <integer>] - Mover Record Number
This parameter represents the last tape record processed by the mover.

[-mover-bytes-moved <integer>] - Mover Bytes Moved
This parameter represents the cumulative number of data stream bytes written to the data connection or the
number of data stream bytes read from the data connection and written to the tape subsystem, depending on
the mode of mover operation.

[-mover-seek-position <integer>] - Mover Seek Position
This parameter represents the data stream offset of the first byte the DMA requested the mover to transfer to
the data connection during a mover read operation.

[-mover-bytes-left-to-read <integer>] - Mover Bytes Left to Read
This parameter represents the number of data bytes remaining to be transferred to the data connection to
satisfy the current NDMP_MOVER_READ request.

[-mover-window-offset <integer>] - Mover Window Offset
This parameter represents the absolute offset of the first byte of the mover window within the overall data
stream.

[-mover-window-length <integer>] - Mover Window Length
This parameter represents the length of the current mover window in bytes.

[-mover-position <integer>] - Mover Position
This parameter can be used to list only those sessions, whose mover position matches a specific value. Mover-
position should be an integer.

[-mover-setrecordsize-flag {true|false}] - Mover SetRecordSize Flag
This parameter is used by the DMA to establish the record size used for mover-initiated tape read and write
operations.

[-mover-setwindow-flag {true|false}] - Mover SetWindow Flag
This flag represents whether a mover window has been set or not. A mover window represents the portion of
the overall backup stream that is accessible to the mover without intervening DMA tape manipulation.

[-mover-con-addr-type <address type>] - Mover Connect Type
This parameter specifies the type of data connection established by the mover. The data connection can be
established locally within a given system or between remote networked systems.
[-mover-con-addr <text>] - Mover Connect Address
This parameter specifies the endpoint address or addresses that the mover will use when establishing a data connection.

[-mover-con-port <integer>] - Mover Connect Port
This parameter specifies the TCP/IP port that the mover will use when establishing a data connection.

[-eff-host <host type>] - Effective Host
This parameter indicates the host context in which the NDMP session runs. The valid values are: PRIMARY or PARTNER.

[-client-addr <text>] - NDMP Client Address
This parameter specifies the client's IP address.

[-client-port <integer>] - NDMP Client Port
This parameter specifies the client's port number.

[-spt-device-id <text>] - SCSI Device ID
This parameter specifies the SCSI device ID.

[-spt-ha <integer>] - SCSI Host Adapter
This parameter specifies the SCSI host adapter.

[-spt-scsi-id <integer>] - SCSI Target ID
This parameter specifies the SCSI target.

[-spt-scsi-lun <integer>] - SCSI LUN ID
This parameter specifies the SCSI LUN ID.

[-tape-device <text>] - Tape Device
This parameter specifies the name to identify the tape device.

[-tape-mode <mover mode>] - Tape Mode
This parameter specifies the mode in which tapes are opened.

[-node {<nodename>|local}] - Node
If this parameter is specified, the command displays information about the sessions running on the specified node only. Node should be a valid node name.

[-is-secure-control-connection {true|false}] - Is Secure Control Connection
This parameter specifies whether the control connection is secure or not.

[-data-backup-mode <text>] - Data Backup Mode
This parameter specifies whether the mode of data backup is Dump or SMTape.

[-data-path <text>] - Data Path
This parameter specifies the path of data being backed up.

[-source-addr <text>] - NDMP Source Address
This parameter specifies the control connection IP address of the NDMP session.

**Examples**

The following example displays diagnostic information about all the sessions in the cluster:

```bash
cluster1::> vserver services ndmp probe
  Vserver Name: vserver1
  Session Identifier: 1000:7445
  NDMP Version: 4
  Session Authorized: true
  Data State: IDLE
```

vserver services commands

2235
The following example displays diagnostic information of sessions associated with Vserver vserver1 only:

```
cluster1::> vserver services ndmp probe -vserver vserver1
```

```
Vserver Name: vserver1
Session Identifier: 1000:7445
NDMP Version: 4
Session Authorized: true
Data State: IDLE
Data Operation: NOACTION
Data Server Halt Reason: NA
```

**vserver services ndmp show**

Display NDMP Properties

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**

This command is used to display NDMP options on Vservers.

A combination of parameters can be optionally specified so as to list only a subset of Vservers where specific values of NDMP options are met. A short description of each of the options is provided in the parameters section.

**Parameters**

```
[[-fields <fieldname>, ...]]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

```
[[-instance]]
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[-vserver <Vserver Name>] - Vserver
```

If this parameter is specified, the command displays NDMP options for that Vserver alone.
[-maxversion <integer>] - NDMP Version

If this parameter is specified, the command displays NDMP options for Vservers where the highest NDMP protocol version supported matches the specified input value. The only supported value is 4.

[-ignore-ctime-enabled {true|false}] - Ignore Ctime

If this parameter is specified, the command displays NDMP options for Vservers, where the value for ignore-ctime-enabled matches the specified input value.

This option, when true, allows users to exclude files with ctime changed from storage system's incremental dumps since other processes like virus scanning often alter the ctime of files. When this option is false, backup on the Vserver will include all files with a change or modified time later then the last dump in the previous level dump. The default value is false. This option is persistent across reboots.

Most WIN32 APIs are often unaware of the "last changed time", ctime, they often incorrectly set a later time for files, causing these files to be included in the Vserver's incremental dumps, making the incremental dump very large. This is partially defying the purpose of having incremental dumps, since one uses incremental dumps to speed up the backup by only dumping files that were truly changed since the last backup.

The possible value for this parameter is either true or false.

[-offset-map-enable {true|false}] - Enable Offset Map

If this parameter is specified, the command displays NDMP options for Vservers, where the value for offset-map-enable matches the specified input value.

This option is used to enable or disable generation of the inode offset map during NDMP based dump backups. The offset map is required to perform Enhanced Direct Access Restore (DAR) on the backup data. Enhanced DAR provides support for directory DAR and DAR of files with NT streams. The default value for this option is true. This option is persistent across reboots.

The possible value for this parameter is either true or false.

[-tcpnodelay {true|false}] - Enable TCP Nodelay

If this parameter is specified, the command displays NDMP options for Vservers, where the value for tcpnodelay matches the specified input value.

This parameter Enables/Disables the TCPNODELAY configuration parameter for the socket between the Vserver and the DMA. When set to true, the Nagle algorithm is disabled and small packets are sent immediately rather than held and bundled with other small packets. This optimizes the system for response time rather than throughput.

This option becomes active when the next NDMP session starts. Existing sessions are unaffected. The default value for this option is false. This option is persistent across reboots.

The possible value for this parameter is either true or false.

[-tcpwinsize <integer>] - TCP Window Size

If this parameter is specified, the command displays NDMP options for Vservers, where the value for tcpwinsize matches the specified input value.

This option shows the TCP buffer size of the NDMP data connection. The minimum and maximum values are 8192(8K) and 262,144(256K), respectively. The default value for this option is 32768(32K).

This option is persistent across reboots.

The possible value for this parameter is a number between 8192(8K) and 262,144(256K).

[-data-port-range <text>] - Data Port Range

If this parameter is specified, the command displays NDMP options for Vservers, where the value for data-port-range matches the specified input value.

This option shows the port range on which the NDMP server can listen for data connections.
The format of this option is `start_port - end_port` `start_port`, `end_port` can have values between [1024-65535]; `start_port` must be lesser than or equal to `end_port`. If a valid range is specified, NDMP uses a port within that range to listen for data connections. A listen request fails if no ports in the specified range are free.

This option is modifiable only from the admin Vserver context and the said option is applicable for all the data Vservers and the admin Vserver. For example, if the value of the above option is set with 2000-3000, the same value will be applicable throughout the cluster. The value `all` implies that any available port can be used to listen for data connections. The default value for this option is `all`. This option is persistent across reboots.

The value for this option is displayed in the format `{ <start_port>-<end port> | all }- where start_port, end_port can have values between [1024-65535]; start_port must be lesser than or equal to end_port.

```
[-backup-log-enable {true|false}] - Enable Backup Log
```

If this parameter is specified, the command displays NDMP options for Vservers, where the value for `backup-log-enable` matches the specified input value.

Backup logging captures important events during dump/restore and records them in /mroot/etc/log/backup on the root volume. The default value for this option is `true`. This option is persistent across reboots.

The possible value for this parameter is true/false.

```
[-per-qtree-exclude-enable {true|false}] - Enable per Qtree Exclusion
```

If this parameter is specified, the command displays NDMP options for Vservers, where the value for `per-qtree-exclude-enable` matches the specified input value.

If this option is `true`, users can specify exclude list on a per qtree basis to be excluded from backup. This exclude list will override any values already present due to 'EXCLUDE' environment variable. The user can specify the exclusion list through a .exclude_list file which resides at the root of the qtree. The exclusion list can be a list of files or files that match a specified pattern. The default value for this option is `false`. This option is persistent across reboots.

The possible value for this parameter is either true or false.

```
[-authtype <NDMP Authentication types>, ...] - Authentication Type
```

If this parameter is specified, the command displays NDMP options for Vservers, where the value for `authtype` matches the specified input value.

Allows the administrator to choose the authentication method. NDMP supports three authentication types: challenge, plaintext and plaintext_sso. The plaintext_sso authentication type is mutually exclusive with the other authentication types. By setting the authentication type as plaintext_sso, the actual password for the user can be used to authenticate instead of having to generate an NDMP specific password. The default of this option is `challenge`. This option is persistent across reboots.

The possible value for this parameter can be `{challenge | plaintext | plaintext_sso | challenge, plaintext | plaintext, challenge}`.

```
[-debug-enable {true|false}] - Enable Debug (privilege: advanced)
```

If this parameter is specified, the command displays NDMP options for Vservers, where the value for `debug-enable` matches the specified input value.

This option enables debug logging for NDMP. Debug messages will be logged to the ndmpd log file / mroot/etc/log/mlog/ndmpd.log. The default value for this option is `false`. This option is persistent across reboots.

The possible value for this parameter is either true or false.

```
[-debug-filter <text>] - Debug Filter (privilege: advanced)
```

If this parameter is specified, the command displays NDMP options for Vservers, where the value for `debug-filter` matches the specified input value.
This option controls the NDMP modules for which debug logging is to be enabled. option-value can take five values for this option: all, none, normal, backend or "filter-expression".

- **all** enables debug logging for all modules.
- **none** disables debug logging for all modules. It is equivalent to `modify -vserver vserver_name - debug-enable false`.
- **normal** is a shortcut option that enables debug logging for all modules except verbose and io_loop. The equivalent filter string is all-verbose-io_loop.
- **backend** is a shortcut option that enables debug logging for all modules except verbose, io_loop, ndmps and ndmpd. The equivalent filter string is all-verbose-io_loop-ndmps-ndmpp.
- **(filter-expression)** is a combination of one or more modules for which debug logs needs to be enabled. Multiple module names can be combined using following operators:
  - `-` to remove the given module from the list of specified modules in the filter string. For example the filter `all-ndmpp` will enable debug logging for all modules but not ndmpp.
  - `^` to add the given module or modules to the list of modules specified in the filter string. For example the filter `ndmpp^mover^data` will enable debug logging for ndmpp, mover and data.

The possible module names and a brief description is given below:

<table>
<thead>
<tr>
<th>Modules</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>verbose</td>
<td>verbose message</td>
</tr>
<tr>
<td>io</td>
<td>I/O process loop</td>
</tr>
<tr>
<td>io_loop</td>
<td>I/O process loop verbose messages</td>
</tr>
<tr>
<td>ndmps</td>
<td>NDMP service</td>
</tr>
<tr>
<td>ndmpd</td>
<td>NDMP Protocol</td>
</tr>
<tr>
<td>rpc</td>
<td>General RPC service</td>
</tr>
<tr>
<td>fdc_rpc</td>
<td>RPC to FC driver service</td>
</tr>
<tr>
<td>auth</td>
<td>Authentication</td>
</tr>
<tr>
<td>mover</td>
<td>NDMP MOVER (tape I/O)</td>
</tr>
<tr>
<td>data</td>
<td>NDMP DATA (backup/restore)</td>
</tr>
<tr>
<td>scsi</td>
<td>NDMP SCSI (robot/tape ops)</td>
</tr>
<tr>
<td>bkup_rpc</td>
<td>RPC to Backup service client</td>
</tr>
<tr>
<td>bkup_rpc_s</td>
<td>RPC to Backup service server</td>
</tr>
<tr>
<td>conf</td>
<td>Debug configure/reconfigure</td>

</tr>
<tr>
<td>ext</td>
<td>NDMP extensions messages</td>
</tr>
<tr>
<td>ndmprpc</td>
<td>NDMP Mhost RPC server</td>
</tr>
</tbody>
</table>

The default value for this option is **none**. This option is persistent across reboots.

The possible value for this parameter can be {all | none | normal | backend |'filter-expression'}.

```
[-dump-logical-find <text>] - Enable Logical Find for Dump (privilege: advanced)
```

If this parameter is specified, the command displays NDMP options for Vservers, where the value for `dump-logical-find` matches the specified input value.

This option specifies whether to follow inode-file walk or tree walk for phase I of the dump. Choosing inode-file walk or tree walk affects the performance of the dump. This option can take following values:

- If **default** is specified, then level 0 and incremental volume as well as qtree dumps will use inode walk. All the subtree dumps will use tree walk.
If \textit{always} is specified, all dumps will follow treewalk.

A \textit{comma-separated} list of values in any combination from the following list:

- vol\_baseline: Level 0 full volume backup will follow treewalk.
- vol\_incr: Incremental full volume backup will follow treewalk.
- qtree\_baseline: Level 0 qtree backup will follow treewalk.
- qtree\_incr: Incremental qtree backup will follow treewalk.

The default value for this option is \textit{default}. This option is persistent across reboots.

The possible value for this parameter could be \{default \mid always \mid \textquote{vol\_baseline} \mid \textquote{vol\_baseline,qtree\_baseline} \mid \ldots\}.

\[\text{-abort-on-disk-error \{true|false\}}\] - Enable Abort on Disk Error (privilege: advanced)

If this parameter is specified, the command displays NDMP options for Vservers, where the value for \textit{abort-on-disk-error} matches the specified input value.

If this option is \textit{true}, dump will abort the backup operation on detection of irrecoverable data blocks in user files. If this option is \textit{false}, dump will proceed with backup operation - even if irrecoverable data blocks in user files are detected. On detection of irrecoverable data blocks, dump will send a log message to DMA and also log an entry in /mroot/etc/log/backup file. The default value for this option is \textit{false}. This option is persistent across reboots.

The value for this parameter is either true or false.

\[\text{-fh-dir-retry-interval <integer>}\] - FH Throttle Value for Dir (privilege: advanced)

If this parameter is specified, the command displays NDMP options for Vservers, where the value for \textit{fh-dir-retry-interval} matches the specified input value.

NDMP protocol sends back file history information for all directories in phase 3 of dump to DMA. In the presence of slow DMA or high latency networks, the amount of file history being generated exceeds the amount being consumed by the DMA. To handle a slow reader, a flow control mechanism is now introduced where file history generation is throttled when a DMA is slow in consuming them. The value for this option indicates how frequently should the file history be resent if it was throttled. The default value is 250 milliseconds. This option is persistent across reboots.

The value for this parameter is a number.

\[\text{-fh-node-retry-interval <integer>}\] - FH Throttle Value for Node (privilege: advanced)

If this parameter is specified, the command displays NDMP options for Vservers, where the value for \textit{fh-node-retry-interval} matches the specified input value.

NDMP protocol sends back file history information for all files in phase 4 of dump to DMA. In the presence of slow DMA or high latency networks, the amount of file history being generated exceeds the amount being consumed by the DMA. To handle slow reader conditions, a flow control mechanism is now introduced where file history generation is throttled when a DMA is slow in consuming them. The value for this option indicates how frequently should the file history be resent if it was throttled. The default value is 250 milliseconds. This option is persistent across reboots.

The value for this parameter is a number.

\[\text{-restore-vm-cache-size <integer>}\] - Restore VM File Cache Size (privilege: advanced)

If this parameter is specified, the command displays NDMP options for Vservers, where the value for \textit{restore-vm-cache-size} matches the specified input value.

This option mandates the number of WAFL buffers pinned in memory by various meta-files used by logical restore. The minimum and maximum values are 4 and 1024, respectively. The default value for this option is 64. This option is persistent across reboots.
Depending on the value of this option, various meta-files are assigned a number of WAFL buffers that need to be pinned in memory.

<table>
<thead>
<tr>
<th>Meta-filename</th>
<th>Number of WAFL buffers to be pinned in memory</th>
</tr>
</thead>
<tbody>
<tr>
<td>dumpmap</td>
<td>ndmpd.restore.vm_cache_size</td>
</tr>
<tr>
<td>filemap</td>
<td>ndmpd.restore.vm_cache_size</td>
</tr>
<tr>
<td>aclfile_map</td>
<td>ndmpd.restore.vm_cache_size</td>
</tr>
<tr>
<td>inomap</td>
<td>ndmpd.restore.vm_cache_size / 2</td>
</tr>
<tr>
<td>basemap</td>
<td>ndmpd.restore.vm_cache_size / 2</td>
</tr>
<tr>
<td>revmap</td>
<td>ndmpd.restore.vm_cache_size / 2</td>
</tr>
<tr>
<td>clrimap</td>
<td>ndmpd.restore.vm_cache_size / 4</td>
</tr>
<tr>
<td>mfp_for_inotab</td>
<td>ndmpd.restore.vm_cache_size / 4</td>
</tr>
<tr>
<td>map</td>
<td>ndmpd.restore.vm_cache_size / 4</td>
</tr>
<tr>
<td>offsetfile_map</td>
<td>ndmpd.restore.vm_cache_size / 4</td>
</tr>
</tbody>
</table>

The possible value for this parameter is a number between 4 and 1024.

[-enable {true|false}] - Enable NDMP on Vserver

If this parameter is specified, the command displays NDMP options for Vservers, where the value for enable matches the specified input value.

When the option is set to true, the NDMP daemon handles requests, and when set to false, the NDMP daemon does not handle requests. Enabling and disabling the option is equivalent to executing the following commands: `vserver services ndmp on` and `vserver services ndmp off` respectively. This option is persistent across reboots. The default value of this option is false.

The value for this parameter is either true or false.

[-preferred-interface-role {cluster|data|node-mgmt|intercluster|cluster-mgmt},...] - Preferred Interface Role

If this parameter is specified, the command displays NDMP options for Vservers, where the value for preferred-interface-role matches the specified input value.

This option allows the user to specify the preferred Logical Interface (LIF) role while establishing an NDMP data connection channel. The NDMP data server or the NDMP mover establishes a data channel from the node that owns the volume or the tape device respectively. This option is used on the node that owns the volume or the tape device. The order of IP addresses that are used to establish the data connection depends on the order of LIF roles specified in this option.

The default value for this option for the admin Vserver is intercluster, cluster-mgmt, node-mgmt.

The default value for this option for a data Vserver is intercluster, data.

[-secondary-debug-filter <text>] - Secondary Debug Filter (privilege: advanced)

If this parameter is specified, the command displays NDMP options for Vservers, where the value for secondary-debug-filter matches the specified input value.

This option allows control on NDMP debug logging. This option takes a comma separated tag=value pairs. The supported tag is IPADDR which can be used to specify Vserver IP addresses for which NDMP debugging is required. If this option is set and the option debug-enable is set to true, then the debug-filter option is applicable to sessions whose control connection IP addresses match the IP addresses that are listed in the option. If this option is not set, the debug filter is applicable to all Vserver sessions. By default, this option does not have a value set.
[-is-secure-control-connection-enabled {true|false}]- Is Secure Control Connection Enabled

If this parameter is specified, the command displays NDMP options for Vservers, where the value for **is-secure-control-connection-enabled** matches the specified input value.

This option enables NDMP service to accept control connections over secure sockets on TCP port 30000. This option is persistent across reboots. The default value of this option is **false**.

### Examples

#### The following example displays NDMP options for the Vserver(s).

```
cluster1::> vserver services ndmp show
+-----------------+--------+-------------------+
<table>
<thead>
<tr>
<th>VServer</th>
<th>Enabled</th>
<th>Authentication type</th>
</tr>
</thead>
<tbody>
<tr>
<td>cluster</td>
<td>true</td>
<td>plaintext</td>
</tr>
<tr>
<td>vs1</td>
<td>true</td>
<td>plaintext</td>
</tr>
<tr>
<td>vs2</td>
<td>true</td>
<td>plaintext</td>
</tr>
</tbody>
</table>
3 entries were displayed.
```

#### The following example displays detailed NDMP options for a Vserver.

```
cluster1::*> vserver services ndmp show -vserver vs1 -instance
```

Vserver: vs1
NDMP Version: 4
Ignore Ctime: false
Enable Offset Map: true
TCP Window Size: 32768
TCP Window Size: 32768
Data Port Range: all
Enable Backup Log: true
Enable per Qtree Exclusion: false
Authentication Type: plaintext
Enable Debug: false
Debug Filter: none
Enable Logical Find for Dump: default
Enable Abort on Disk Error: false
FH Throttle Value for Dir: 250
FH Throttle Value for Node: 250
Restore VM File Cache Size: 64
Is Secure Control Connection Enabled: false

```
```

### vserver services ndmp status

Display list of NDMP sessions

**Availability:** This command is available to **cluster** and **Vserver** administrators at the **admin** privilege level.

**Description**

The `vserver services ndmp status` command lists NDMP sessions belonging to a specific Vserver in the cluster. By default it lists the following details about the active sessions:

- Vserver Name
- Session ID
A combination of parameters can be optionally supplied so as to list only those sessions which match specific conditions. A short description of each of the parameter is provided in the parameters section.

**Parameters**

```
{ [-fields <fieldname>, ...] }
```

This optional parameter specifies which all additional fields to display. Any combination of the following fields are valid:

- ndmp-version
- session-authorized
- data-state
- data-operation
- data-halt-reason
- data-con-addr-type
- data-con-addr
- data-con-port
- data-bytes-processed
- mover-state
- mover-mode
- mover-pause-reason
- mover-halt-reason
- mover-record-size
- mover-record-num
- mover-bytes-moved
- mover-seek-position
- mover-bytes-left-to-read
- mover-window-offset
- mover-window-length
- mover-position
- mover-setrecordsize-flag
- mover-setwindow-flag
- mover-con-addr-type
- mover-con-addr
- mover-con-port
- eff-host
- client-addr
- client-port
If this parameter is specified, the command displays detailed information about all the active sessions.

\[-vserver <vserver name>] - Vserver
Specifies the Vserver context in which NDMP sessions are running.

\[-session-id <text>] - Session Identifier
If this parameter is specified, the command displays information about specific NDMP session. A session-id is a string used to identify a particular NDMP session.

\[-ndmp-version <integer>] - NDMP Version
This parameter refers to the NDMP protocol version being used in the session.

\[-session-authorized {true|false}] - Session Authorized
This field indicates whether an NDMP session is authenticated or not.

\[-data-state <component state>] - Data State
This field identifies the current state of the data server's state machine.

\[-data-operation <data operation>] - Data Operation
This field identifies the data server's current operation.

\[-data-halt-reason <halt reason>] - Data Server Halt Reason
This field identifies the event that caused the data server state machine to enter the HALTED state.

\[-data-con-addr-type <address type>] - Data Server Connect Type
This field specifies the type of data connection established by the data server. The data connection can be established locally within a given system or between remote networked systems.

\[-data-con-addr <text>] - Data Server Connect Address
This specifies the connection endpoint information for the data server's data connection.

\[-data-con-port <integer>] - Data Server Connect Port
This specifies the TCP/IP port that the data server will use when establishing a data connection.

\[-data-bytes-processed <integer>] - Data Bytes Processed
This field represents the cumulative number of data stream bytes transferred between the backup or recovery method and the data connection during the current data operation.

\[-mover-state <component state>] - Mover State
This parameter identifies the current state of the NDMP tape server's mover state machine.
[-mover-mode <mover mode>] - Mover Mode
This parameter identifies the direction of the mover data transfer.

[-mover-pause-reason <pause reason>] - Mover Pause Reason
This parameter identifies the event that caused the mover state machine to enter the PAUSED state.

[-mover-halt-reason <halt reason>] - Mover Halt Reason
This integer field identifies the event that caused the mover state machine to enter the HALTED state.

[-mover-record-size <integer>] - Mover Record Size
This field represents the current mover record size in bytes.

[-mover-record-num <integer>] - Mover Record Number
This field represents the last tape record processed by the mover.

[-mover-bytes-moved <integer>] - Mover Bytes Moved
This field represents the cumulative number of data stream bytes written to the data connection or the number of data stream bytes read from the data connection and written to the tape subsystem, depending on the mode of mover operation.

[-mover-seek-position <integer>] - Mover Seek Position
This field represents the data stream offset of the first byte the DMA requested the mover to transfer to the data connection during a mover read operation.

[-mover-bytes-left-to-read <integer>] - Mover Bytes Left to Read
This field represents the number of data bytes remaining to be transferred to the data connection to satisfy the current NDMP_MOVER_READ request.

[-mover-window-offset <integer>] - Mover Window Offset
This field represents the absolute offset of the first byte of the mover window within the overall data stream.

[-mover-window-length <integer>] - Mover Window Length
This field represents the length of the current mover window in bytes.

[-mover-position <integer>] - Mover Position
This parameter can be used to list only those sessions, whose mover position matches a specific value. Mover-position should be an integer.

[-mover-setrecordsize-flag {true|false}] - Mover SetRecordSize Flag
This field is used by the DMA to establish the record size used for mover-initiated tape read and write operations.

[-mover-setwindow-flag {true|false}] - Mover SetWindow Flag
This flag represents whether a mover window has been set or not. A mover window represents the portion of the overall backup stream that is accessible to the mover without intervening DMA tape manipulation.

[-mover-con-addr-type <address type>] - Mover Connect Type
This field specifies the type of data connection established by the mover. The data connection can be established locally within a given system or between remote networked systems.

[-mover-con-addr <text>] - Mover Connect Address
This specifies the endpoint address or addresses that the mover will use when establishing a data connection.

[-mover-con-port <integer>] - Mover Connect Port
This specifies the TCP/IP port that the mover will use when establishing a data connection.

[-eff-host <host type>] - Effective Host
This field indicates the host context in which the NDMP session runs. The valid values are: PRIMARY or PARTNER.
[-client-addr <text>] - NDMP Client Address
This parameter specifies the client's IP address.

[-client-port <integer>] - NDMP Client Port
This parameter specifies the client's port number.

[-spt-device-id <text>] - SCSI Device ID
This parameter specifies the SCSI device ID.

[-spt-ha <integer>] - SCSI Host Adapter
This parameter specifies the SCSI host adapter.

[-spt-scsi-id <integer>] - SCSI Target ID
This parameter specifies the SCSI target.

[-spt-scsi-lun <integer>] - SCSI LUN ID
This parameter specifies the SCSI LUN ID.

[-tape-device <text>] - Tape Device
This parameter specifies the name to identify the tape device.

[-tape-mode <mover mode>] - Tape Mode
This parameter specifies the mode in which tapes are opened.

[-node {<nodename>|local}] - Node
If this parameter is specified, the command displays information about the sessions running on the specified node only. Node should be a valid node name.

[-is-secure-control-connection {true|false}] - Is Secure Control Connection
This parameter specifies whether the control connection is secure or not.

[-data-backup-mode <text>] - Data Backup Mode
This parameter specifies whether the mode of data backup is Dump or SMTape.

[-data-path <text>] - Data Path
This parameter specifies the path of data being backed up.

[-source-addr <text>] - NDMP Source Address
This parameter specifies the control connection IP address of the NDMP session.

Examples
The following example displays all the NDMP sessions on the cluster:

```
cluster1::> vserver services ndmp status
           Session     Vserver     Id
                --------   --------
                   vserver1  1000:7445
                   vserver2  1000:7446
                   vserver2  1000:7447
3 entries were displayed.
```

The following example shows how to display only the sessions running belonging to Vserver vserver2:

```
cluster1::> vserver services ndmp status -vserver vserver2
           Session     Vserver    Id
                --------   --------
                   vserver2  1000:7446
```
vserver services ndmp extensions commands

The extensions directory

vserver services ndmp extensions modify

Modify NDMP extension status

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description

This command is used to enable/disable an NDMP extension in the Vserver-aware NDMP mode.

Parameters

[-is-extension-0x2050-enabled {true|false}] - Is Extension 0x2050 Enabled

If this parameter is specified, the command can be used to modify the status of the extension in the Vserver-aware mode.

Examples

The following example shows how to enable NDMP extension 0x2050 in the Vserver-aware NDMP mode of operation:

```
cluster1::> vserver services ndmp extension modify -is-extension-0x2050-enabled true
cluster1::>
```

vserver services ndmp extensions show

Display NDMP extension status

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description

This command displays whether an NDMP extension is enabled in the Vserver-aware NDMP mode or not.

Examples

The following example shows how to check the status of NDMP extension 0x2050 in a cluster:

```
cluster1::> vserver services ndmp extension show
Is Extension 0x2050 Enabled: true
cluster1::>
```

vserver services ndmp log commands

The log directory
vserver services ndmp log start

Start logging for the specified NDMP session

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
This command is used to start logging on an active NDMP session on a vserver.

Parameters

- **vserver** `<vserver name>` - Vserver
  
  This parameter specifies the name of the Vserver.

- **-session-id** `<text>` - Session Identifier
  
  This parameter specifies the NDMP session-id on which logging needs to be started.

- **-filter** `<text>` - Level Filter
  
  Use this parameter to specify the filter for a particular session ID. This parameter controls the NDMP modules for which logging is to be enabled. This parameter can take five values. They are as follow: `all, none, normal, backend` or "filter-expression". The default value for this is `none`.

  - `all` turns on logging for all modules.
  - `none` disables logging for all modules.
  - `normal` is a short cut parameter that enables logging for all modules except `verbose` and `io_loop`. The equivalent filter string is `all-verbose-io_loop`
  - `backend` is a short cut parameter that enables logging for all modules except `verbose`, `io_loop`, `ndmps` and `ndmppd`. The equivalent filter string is `all-verbose-io_loop-ndmps-ndmpp`
  - `(filter-expression)` is a combination of one or more modules for which logs needs to be enabled. Multiple module names can be combined using following operators:
    - `^` to add the given module or modules to the list of modules specified in the filter string. For example the filter `ndmpp,mover,data` will enable logging for `ndmpp`, `mover` and `data`.

The possible module names and a brief description is given below:

<table>
<thead>
<tr>
<th>Modules</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>verbose</td>
<td>verbose message</td>
</tr>
<tr>
<td>io</td>
<td>I/O process loop</td>
</tr>
<tr>

</tbody>
</table>
## Examples

The following example shows how to start logging on a specific NDMP session 1000:35512, running on vserver cluster1-01 with filter all.

```
cluster1::*> vserver services ndmp log start -vserver cluster1-01 -session-id 1000:35512 -filter all
```

### `vserver services ndmp log stop`

Stop logging for the specified NDMP session

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `advanced` privilege level.

**Description**
This command is used to stop logging on an active NDMP session on a vserver.

**Parameters**

- `-vserver <vserver name>` - Vserver
  
  This parameter specifies the name of the Vserver.

- `-session-id <text>` - Session Identifier
  
  This parameter specifies the NDMP session-id on which logging needs to be stopped.

**Examples**

The following example shows how to stop logging on a specific NDMP session 1000:35512, running on vserver cluster1-01.

```
cluster1::*> vserver services ndmp log stop -vserver cluster1-01 -session-id 1000:35512
```

## `vserver services ndmp restartable-backup commands`

The restartable-backup directory

### `vserver services ndmp restartable-backup delete`

Delete an NDMP restartable backup context

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.
Description

The `vserver services ndmp restartable-backup delete` command deletes an NDMP restartable backup context. The `-force` flag can be used to forcibly destroy a NDMP restartable backup context.

Parameters

- `-vserver <Vserver Name>` - Vserver
  
  This parameter specifies the name of the Vserver for which NDMP restartable backup context is to be deleted.

- `-context-id <UUID>` - Context Identifier
  
  This parameter specifies the NDMP restartable backup context ID which needs to be deleted.

- `[-force [true]]` - Force Delete (privilege: advanced)
  
  If this parameter is specified, the context is deleted even if there are internal errors.

Examples

The following example shows how to delete an NDMP restartable backup context:

```
cluster1::> vserver services restartable-backup delete -vserver cluster1-01 -context-id 0f8f5c44-d540-11e5-8c45-005056963504
cluster1::>
```

`vserver services ndmp restartable-backup show`

Display NDMP restartable backup contexts

Availability: This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

Description

The `vserver services ndmp restartable-backup show` command lists the NDMP restartable backup contexts present in the cluster. By default it lists the following details about the context:

- Vserver Name
- Context Identifier
- Is Cleanup Pending?

A combination of parameters can be optionally supplied so as to list only those contexts which match specific conditions. A short description of each of the parameter is provided in the parameters section.

Parameters

```
[[-fields <fieldname>, ...]]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance]
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[-vserver <Vserver Name>] - Vserver
```

If this parameter is specified, the command displays NDMP restartable backup contexts that match the specified Vserver.

```
[-context-id <UUID>] - Context Identifier
```

If this parameter is specified, the command displays NDMP restartable backup contexts where the value for `-context-id` matches the specified input value.
This parameter specifies the UUID of NDMP restartable backup contexts.

[\-volume <volume name>] - Volume Name

If this parameter is specified, the command displays NDMP restartable backup contexts where the value for volume matches the specified input value.

This parameter specifies the volume path information.

[\-is-cleanup-pending {true|false}] - Is Cleanup Pending?

If this parameter is specified, the command displays NDMP restartable backup contexts where the value for is-cleanup-pending matches the specified input value.

This parameter indicates whether the context is being deleted.

[\-engine-type <text>] - Backup Engine Type

If this parameter is specified, the command displays NDMP restartable backup contexts where the value for engine-type matches the specified input value.

This parameter specifies the backup engine type.

[\-auto-snapshot {true|false}] - Is Snapshot Copy Auto-created?

If this parameter is specified, the command displays NDMP restartable backup contexts where the value for auto-snapshot matches the specified input value.

This parameter indicates if the Snapshot copy was created by DUMP engine.

[\-no-acls {true|false}] - Is NO_ACLS Set? (privilege: advanced)

If this parameter is specified, the command displays NDMP restartable backup contexts where the value for no-acls matches the specified input value.

This parameter specifies if NO_ACLS environment variable is set.

[\-dump-path <text>] - Dump Path

If this parameter is specified, the command displays NDMP restartable backup contexts where the value for dump-path matches the specified input value.

This parameter represents the corresponding local volume path which is being backed up.

[\-backup-level <integer>] - Incremental Backup Level ID

If this parameter is specified, the command displays NDMP restartable backup contexts where the value for backup-level matches the specified input value.

This parameter specifies the backup level.

[\-dump-date <integer>] - Dump Date (privilege: advanced)

If this parameter is specified, the command displays NDMP restartable backup contexts where the value for dumpdate matches the specified input value.

This parameter specifies the dumpdate value in epoch.

[\-base-date <integer>] - Base Date (privilege: advanced)

If this parameter is specified, the command displays NDMP restartable backup contexts where the value for basedate matches the specified input value.

This parameter specifies the basedate value in epoch.

[\-update-dump-dates {true|false}] - Dump Dates Require Update? (privilege: advanced)

If this parameter is specified, the command displays NDMP restartable backup contexts where the value for update-dumpdates matches the specified input value.

This parameter indicates if dumpdates needs to be updated.
[-dump-name <text>] - Dump Name
If this parameter is specified, the command displays NDMP restartable backup contexts where the value for
dumpname matches the specified input value.
This parameter indicates the name for the dump instance.

[-all-non-qtree {true|false}] - Is NON_QUOTA_QTREE Set? (privilege: advanced)
If this parameter is specified, the command displays NDMP restartable backup contexts where the value for
all-non-qtree matches the specified input value.
This parameter indicates if NON_QUOTA_TREE environment variable is set.

[-print-options <integer>] - Backup Log Level (privilege: advanced)
If this parameter is specified, the command displays NDMP restartable backup contexts where the value for
print-options matches the specified input value.
This parameter specifies the logging level during dump.

[-last-update <integer>] - Context Last Updated Time
If this parameter is specified, the command displays NDMP restartable backup contexts where the value for
last-update matches the specified input value.
This parameter specifies the last time(in epoch) when the context was modified.

[-has-offset-map {true|false}] - Has Offset Map?
If this parameter is specified, the command displays NDMP restartable backup contexts where the value for
has-offset-map matches the specified input value.
This parameter indicates if offset map is present in the backup image.

[-offset-verify {true|false}] - Offset Verify
If this parameter is specified, the command displays NDMP restartable backup contexts where the value for
offset-verify matches the specified input value.
This parameter indicates if offset map is successfully verified during backup.

[-ndmp-env-keys <text>, ...] - NDMP Environment Keys (privilege: advanced)
If this parameter is specified, the command displays NDMP restartable backup contexts where the value for
ndmpenvkeys matches the specified input value.
This parameter represents the list of NDMP environment variables set during backup.

[-ndmp-env-values <text>, ...] - NDMP Environment Values (privilege: advanced)
If this parameter is specified, the command displays NDMP restartable backup contexts where the value for
ndmpenvvalues matches the specified input value.
This parameter represents the values set for the NDMP environment variables.

[-ndmp-env-count <integer>] - Count of NDMP Environment Variables (privilege: advanced)
If this parameter is specified, the command displays NDMP restartable backup contexts where the value for
ndmpenvcount matches the specified input value.
This parameter represents the number of NDMP environment variables set during backup.

[-is-restartable {true|false}] - Is Context Restartable?
If this parameter is specified, the command displays NDMP restartable backup contexts where the value for is-
restartable matches the specified input value.
This parameter indicates if the NDMP restartable backup context is restartable.
[--is-busy \{true|false\}] - Is Context Busy?
   If this parameter is specified, the command displays NDMP restartable backup contexts where the value for is-
   busy matches the specified input value.
   This parameter indicates if the NDMP restartable backup context is busy.

[--multi-subtree \{true|false\}] - Is MULTI_SUBTREE_NAMES Set? (privilege: advanced)
   If this parameter is specified, the command displays NDMP restartable backup contexts where the value for multi-
   subtree matches the specified input value.
   This parameter indicates if the NDMP environment variable MULTI_SUBTREE_NAMES is set.

[--logical-find \{true|false\}] - Is LOGICAL_FIND Set? (privilege: advanced)
   If this parameter is specified, the command displays NDMP restartable backup contexts where the value for logical-
   find matches the specified input value.
   This parameter indicates if the NDMP environment variable LOGICAL_FIND is set.

[--exclude-list <text>] - Is EXCLUDE Set? (privilege: advanced)
   If this parameter is specified, the command displays NDMP restartable backup contexts where the value for exclude-
   list matches the specified input value.
   This parameter represents the value of the the NDMP environment variable EXCLUDE.

[--restart-pass <integer>] - Restart Pass
   If this parameter is specified, the command displays NDMP restartable backup contexts where the value for rest-
   art-pass matches the specified input value.
   This parameter specifies the dump phase from which to restart.

[--backup-results <integer>] - Status of Backup
   If this parameter is specified, the command displays NDMP restartable backup contexts where the value for backup-
   results matches the specified input value.
   This parameter specifies the status of the backup.

[--snap-name <text>] - Snapshot Copy Name
   If this parameter is specified, the command displays NDMP restartable backup contexts where the value for snap-
   name matches the specified input value.
   This parameter specifies the name of the Snapshot copy.

[--is-dp-vol \{true|false\}] - Is DP Volume? (privilege: advanced)
   If this parameter is specified, the command displays NDMP restartable backup contexts where the value for is-
   dp-vol matches the specified input value.
   This parameter indicates if the volume specified in the NDMP restartable context is of type DP.

[--context-status <integer>] - State of the Context
   If this parameter is specified, the command displays NDMP restartable backup contexts where the value for con-
   text-status matches the specified input value.
   This parameter specifies the state of the NDMP restartable context.

### Examples

The following example displays all the NDMP restartable contexts on the cluster:

```bash
cluster1::> vserver services ndmp restartable-backup show
Vserver     Context Identifier                   Is Cleanup Pending?
----------- ------------------------------------ ---------------
  vserver1   53a6760e-d245-11e5-a33b-005056bb2685 false
  vserver2   68902360-d245-11e5-a33b-005056bb2685 true
```
The following example shows how to display only the contexts belonging to Vserver vserver2:

```
cluster1::> vserver services ndmp restartable-backup show -vserver vserver2
Vserver     Context Identifier                   Is Cleanup Pending?
----------- ------------------------------------ ---------------
vserver2    68902360-d245-11e5-a33b-005056bb2685 true
vserver2    d7b74e0d-d24c-11e5-a33b-005056bb2685 false
2 entries were displayed.
```

### Web Services Configuration

Manage web services

These commands manage the availability and authorization for all web services in the cluster.

**vserver services web modify**

Modify the configuration of web services

**Availability:** This command is available to cluster administrators at the admin privilege level.

**Description**

This command modifies the availability of the web services on Vservers. Only the services that are installed on every node in the cluster can be configured on Vservers whose type is not 'node'. Enabled services must include authorization configuration in the `vserver services web access` command for the services to be externally available.

**Parameters**

- `-vserver <Vserver Name>` - `Vserver`
  Identifies a Vserver for hosting a specific web service.

- `-name <text>` - `Service Name`
  Identifies the name of the web service.

- `[-enabled {true|false}]` - `Enabled`
  Defines the availability of a service on the Vserver. Disabled services are not accessible through the Vserver's network interfaces. This parameter's default value is dependent on the service. In general, services that provide commonly used features are enabled by default.

- `[-ssl-only {true|false}]` - `SSL Only`
  Defines the encryption enforcement policy for a service on the Vserver. Services for which this parameter is set to true support SSL only and cannot be used over unencrypted HTTP. The default for this value is 'false'.

**Examples**

The following command sets access to the web port to SSL only:

```
cluster1::> vserver services web modify -vserver vs1 -name portal -ssl-only true
```

vserver services web show

Display the current configuration of web services

Availability: This command is available to cluster administrators at the admin privilege level.

Description
This command displays the availability of the web services on Vservers. Only the services that are installed on every node in the cluster can be configured on Vservers whose type is not 'node'. Enabled services must include authorization configuration in the vserver services web access command for the services to be externally available.

Parameters

{ [-fields <fieldname>, ...]
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[[-instance ]}
  If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver
  Identifies a Vserver for hosting a specific web service.

[-name <text>] - Service Name
  Identifies the name of the web service.

[-type <vserver type>] - Type of Vserver
  Identifies the type of Vserver on which the service is hosted.

[-version <text>] - Version of Web Service
  Defines the version number of the service in the format of major.minor.patch.

[-description <text>] - Description of Web Service
  Provides a short description of the web service.

[-long-description <text>] - Long Description of Web Service
  Provides a long description of the web service.

[-requires <requirement>, ...] - Service Requirements
  Defines the list of requirements that must be met for the service to be successfully executed. Requirements are defined as a service name, a comparison operator (<=}), and a version number.

[-default-roles <text>, ...] - Default Authorized Roles
  Defines the roles that are automatically granted access to the service in the vserver services web access show configuration.

[-enabled {true|false}] - Enabled
  Defines the availability of a service on the Vserver. Disabled services are not accessible through the Vserver's network interfaces. This parameter's default value is dependent on the service. In general, services that provide commonly used features are enabled by default.

[-ssl-only {true|false}] - SSL Only
  Defines the encryption enforcement policy for a service on the Vserver. Services for which this parameter is set to true support SSL only and cannot be used over unencrypted HTTP. The default for this value is 'false'.

Web Services Authorization

Manage the authorization for web services

These commands manage the user authorizations for web services in the cluster.

vserver services web access create

Authorize a new role for web service access

Availability: This command is available to cluster administrators at the admin privilege level.

Description

This command authorizes roles to access the Vserver's web services. For the user to access services that require authentication, the user's roles, as defined by security login show, must be included in this configuration.

Note: Node Vserver services are authorized with the data Vserver's roles.

Parameters

-vserver <Vserver Name> - Vserver

Identifies a Vserver for hosting a specific web service.

-name <text> - Service Name

Identifies the name of the web service.

-role <text> - Role Name

Identifies the new role to be authorized for this service.
Examples
The following example authorizes the role auditor - created previously - for the web service:

cluster1::> vserver services web access create -name ontapi -role auditor

Related references
security login show on page 542

vserver services web access delete
Remove role authorization for web service access

Availability: This command is available to cluster administrators at the admin privilege level.

Description
This command removes the authorization of a role from the Vserver's web services. A service for which no roles are defined has a single role of 'none' automatically displayed in this configuration.

Note: Node Vserver services are authorized with the data Vserver's roles.

Parameters
-vserver <Vserver Name> - Vserver
Identifies a Vserver for hosting a specific web service.

-name <text> - Service Name
Identifies the name of the web service.

-role <text> - Role Name
Identifies the role whose authorization is to be removed. You cannot remove the authorization of the role 'none'. Use vserver services web access create to authorize access for the role.

Examples
The following example removes authorization for the role auditor for the web service:

cluster1::> vserver services web access delete -name ontapi -role auditor

Related references
vserver services web access create on page 2256

vserver services web access show
Display web service authorization for user roles

Availability: This command is available to cluster administrators at the admin privilege level.

Description
This command displays the roles that are authorized to access the Vserver's web services. For the user to access services that require authentication, the user's roles, as defined by security login show, must be included in this configuration.

Note: Node Vserver services are authorized with the data Vserver's roles.
Parameters

{[-fields <fieldname>, ...]}

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

{[-instance ]}

If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver

Identifies a Vserver for hosting a specific web service.

[-name <text>] - Service Name

Identifies the name of the web service.

[-role <text>] - Role Name

Identifies a role assigned for accessing the service. A service without any authorizations has a role of 'none' assigned to it automatically.

[-type <vserver type>] - Type of Vserver

Identifies the type of Vserver on which the service is hosted.

Examples

The following example displays the roles that are authorized to access the web services.

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Type</th>
<th>Service Name</th>
<th>Role</th>
</tr>
</thead>
<tbody>
<tr>
<td>cluster1</td>

vserver smtape commands

The smtape directory

vserver smtape break

Make a restored volume read-write

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

This command breaks the relationship between the tape backup of a volume and a restored volume, changing the restored volume from read-only to read/write.
Parameters

-vserver <vserver name> - Vserver Name
Use this parameter to specify the Vserver name on which the volume is located.

-volume <volume name> - Volume Name
Use this parameter to specify the name of the read-only volume that needs to be changed into a read/writeable volume after an smtape restore.

Examples
Make the read-only volume datavol on Vserver vserver0 writeable after a restore.

```
cluster1::> vserver smtape break -vserver vserver0 -volume datavol
[Job 84] Job succeeded: SnapMirror Break Succeeded
```

SnapDiff RPC Server Commands
SnapDiff RPC server configuration commands

The vserver snapdiff-rpc-server commands help you manage the SnapDiff RPC Servers for a Vserver.

vserver snapdiff-rpc-server off
Stop the SnapDiff RPC server

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The vserver snapdiff-rpc-server off command turns the SnapDiff RPC server off.

Parameters

-vserver <vserver name> - Vserver
This parameter specifies the Vserver for which you want to turn the SnapDiff RPC server off.

Examples
The following example turns the SnapDiff RPC server off for a Vserver named vs0:

```
cluster1::> vserver snapdiff-rpc-server off -vserver vs0
```

vserver snapdiff-rpc-server on
Start the SnapDiff RPC Server

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The vserver snapdiff-rpc-server on command turns the SnapDiff RPC server on.
Parameters

-vserver <vserver name> - Vserver

This parameter specifies the Vserver for which you want to turn the SnapDiff RPC server on.

Examples

The following example enables the SnapDiff RPC server access for a Vserver named vs0:

```
cluster1::> vserver snapdiff-rpc-server on -vserver vs0
```

vserver snapdiff-rpc-server show

Display the SnapDiff RPC server configurations of Vservers

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description

The `vserver snapdiff-rpc-server show` command displays the state of the SnapDiff RPC server for all the Vservers. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays the following information about all the configured Vservers:

- Vserver name
- Whether SnapDiff RPC server access is enabled

You can specify additional parameters to display only the information that matches those parameters. For instance, to display the information only for the Vservers that have access enabled, enter the command with the `-state on` parameter.

Parameters

`[-fields <fieldname>, ...]`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

`[-instance]`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-vserver <vserver name>] - Vserver`

If you specify this parameter, the command displays information only about the specified Vserver.

`[-state {on|off}] - SnapDiff RPC Server state`

If you specify this parameter, the command displays information only about the specified SnapDiff RPC server state.

Examples

The following example displays information about all the Vservers with SnapDiff RPC server configured:

```
cluster1::> vserver snapdiff-rpc-server show
Vserver                  SnapDiff RPC Server State
------------------------- -----------------------------
vs0                      on
vs1                      off
2 entries were displayed.
```
**vserver vscan commands**

Manage Vscan

**vserver vscan disable**

Disable Vscan on a Vserver

*Availability:* This command is available to cluster and Vserver administrators at the *admin* privilege level.

**Description**
The `vserver vscan disable` command disables Vscan on a Vserver.

**Parameters**
- `-vserver <vserver name>` - Vserver
  
  This parameter specifies the name of the Vserver on which you want to disable Vscan.

**Examples**
The following example disables Vscan on Vserver vs1.

```
cluster1::> vserver vscan disable -vserver vs1
cluster1::> vserver vscan show -vserver vs1
  Vserver: vs1
  Vscan Status: off
```

**vserver vscan enable**

Enable Vscan on a Vserver

*Availability:* This command is available to cluster and Vserver administrators at the *admin* privilege level.

**Description**
The `vserver vscan enable` command enables Vscan on a Vserver.

**Parameters**
- `-vserver <vserver name>` - Vserver

  This parameter specifies the name of the Vserver on which you want to enable Vscan. The Vscan configuration must already exist.

**Examples**
The following example enables Vscan on Vserver vs1.

```
cluster1::> vserver vscan enable -vserver vs1
cluster1::> vserver vscan show -vserver vs1
```
vserver vscan reset
Discard cached scan information

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver vscan reset command discards the cached information of the files that have been successfully scanned. After running this command, the files are scanned again when they are accessed.

Parameters
-vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver for which you want to discard the cached information.

Examples
The following example discards the cached information of the successfully scanned files.

cluster1::> vserver vscan reset -vserver vs1
Warning: Running this command can cause performance degradation because files are scanned again when they are accessed.
Do you want to continue? {y|n}: y
cluster1::>

vserver vscan show
Display Vscan status

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver vscan show command displays Vscan status information of the Vservers. If you do not specify any parameters, the command displays the following information about all Vservers:

• Vserver name
• Vscan status

Parameters

{-fields <fieldname>, ...}
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance ] |
If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver
If you specify this parameter, the command displays information only about the specified Vserver.
[-vscan-status (on|off)] - Vscan Status
If you specify this parameter, the command displays information only about the Vservers that have the specified status.

Examples
The following example displays the Vscan status information.

```
cluster1::> vserver vscan show
Vserver          Vscan Status
--------------   ------------
vs1              on
vs2              off
2 entries were displayed.
```

vserver vscan show-events
Display Vscan events

Availability: This command is available to cluster and Vserver administrators at the advanced privilege level.

Description
The `vserver vscan show-events` command displays contents of the event log, which is generated by the cluster to capture important events. If you do not specify any parameters, the command displays the following information for all Vscan servers:

- Vserver name
- Node name
- Vscan server
- Event type
- Event time

You can specify the `-fields <fieldname>, ...` parameter to specify which fields of information to display. In addition to the fields above, you can display the following fields:

- File path
- Vscan server vendor
- Vscan server version
- Disconnect reason
- Scan engine status code
- Vserver LIF used for connection
- Consecutive occurrence count

Parameters

```
[-fields <fieldname>, ...]
```
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.
If you specify the -instance parameter, the command displays detailed information about all fields.

- **node {<nodename>|local}** - Node
  If you specify this parameter, the command displays information only about the events that have occurred on the specified node.

- **vserver <vserver name>** - Vserver
  If you specify this parameter, the command displays information only about the events that have occurred for the specified Vserver.

- **event-time <MM/DD/YYYY HH:MM:SS>** - Event Log Time
  If you specify this parameter, the command displays information only about the events that have occurred at the specified time.

- **server <IP Address>** - Server
  If you specify this parameter, the command displays information only about the events that have occurred for the specified server.

- **event-type <event-type>** - Event Type
  If you specify this parameter, the command displays information only about the events that are of the specified event type.

- **file-path <text>** - File Path
  If you specify this parameter, the command displays information only about the events that have the specified file path.

- **vendor <text>** - Vscanner Vendor
  If you specify this parameter, the command displays information only about the events that have the specified scan-engine vendor.

- **version <text>** - Vscanner Version
  If you specify this parameter, the command displays information only about the events that have the specified scan-engine version.

- **disconnect-reason <reason>** - Server Disconnect Reason
  If you specify this parameter, the command displays information only about the events that have the specified reason of the server disconnection.

- **lif <IP Address>** - Vserver LIF Used for Connection
  If you specify this parameter, the command displays information only about the events that have the specified IP address, which is used for connecting clustered Data ONTAP with the Vscan server.

### Examples

The following example displays all the events captured in the cluster:

```
ccluster1::*> vserver vscean show-events
Vserver  Node            Server          Event Type        Event Time
----------- --------------- --------------- ----------------- ------------------
vs1         Cluster-01      192.168.1.1     file-infected     9/5/2014 11:37:38
vs1         Cluster-01      192.168.1.1     scanner-updated   9/5/2014 11:37:08
vs1         Cluster-01      192.168.1.1     scanner-connected 9/5/2014 11:34:55
3 entries were displayed.
```

The following example displays detailed event information about all the infected files:

```
ccluster1::*> vserver vscean show-events -instance
Vserver     Node            Server          Event Type        Event Time
----------- --------------- --------------- ----------------- ------------------
vs1         Cluster-01      192.168.1.1     file-infected     9/5/2014 11:37:38
vs1         Cluster-01      192.168.1.1     scanner-updated   9/5/2014 11:37:08
vs1         Cluster-01      192.168.1.1     scanner-connected 9/5/2014 11:34:55
3 entries were displayed.
```
Vserver Vscan Connection-status Commands

Display connection status of Vscan servers

The vserver vscan connection-status commands display connection status of external virus-scanning servers, or "Vscan servers".

vserver vscan connection-status show

Display Vscan servers connection status summary

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver vscan connection-status show command displays connection status summary of the external virus-scanning servers, or "Vscan servers" for a Vserver. If you do not specify any parameters, the command displays the following information for all Vservers:

- Vserver name
- Node name
- List of connected Vscan servers
- Connected count

Parameters

{-fields <fieldname>, ...}
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

{-instance}
If you specify the -instance parameter, the command displays detailed information about all fields.

[-node <nodename> | local] - Node
If you specify this parameter, the command displays information only about the Vscan servers attached to the specified node.

[-vserver <vserver name>] - Vserver
If you specify this parameter, the command displays information only about the Vscan servers for the specified Vserver.

[-servers <IP Address>, ...] - List of Connected Vscan Servers
If you specify this parameter, the command displays information only about the Vservers that have the specified server or servers.
[-connection-count <integer>] - Number of Connected Vscan Servers Serving the Vserver

If you specify this parameter, the command displays information only about the Vservers that have the specified connection count.

Examples

The following example displays connection-status summary for all Vservers.

```
cluster1::> vserver vscan connection-status show

Vserver         Node                Server-Count Servers
--------------- ------------------- ------------ -----------------------------
vs1             Cluster-01                     2 1.1.1.1, 2.2.2.2
vs2             Cluster-01                     0 -
2 entries were displayed.
```

vserver vscan connection-status show-all

Display Vscan servers connection status

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver vscan connection-status show-all command displays connection status information of the external virus-scanning servers, or "Vscan servers". If you do not specify any parameters, the command displays the following information for all Vscan servers:

- Vserver name
- Node name
- Vscan server
- Connection status
- Disconnect reason

You can specify the -fields parameter to specify which fields of information to display. In addition to the fields above, you can display the following fields:

- Server type
- Vscan server vendor
- Vscan server version
- Privileged user
- Vscan server connected since
- Vscan server disconnected since
- Vserver LIF used for connection

Parameters

{-fields <fieldname>, ...}

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.
If you specify the -instance parameter, the command displays detailed information about all fields.

-node {<nodename> [local]} - Node
If you specify this parameter, the command displays information only about the Vscan servers attached to the specified node.

-vserver <vserver name> - Vserver
If you specify this parameter, the command displays information only about the Vscan servers for the specified Vserver.

-server <IP Address> - Server
If you specify this parameter, the command displays information only about the Vscan server that you specify.

-server-status <Status> - Server Status
If you specify this parameter, the command displays information only about the Vscan servers that have the specified status.

-server-type <Server type> - Server Type
If you specify this parameter, the command displays information only about the Vscan servers that have the specified server type.

-vendor <text> - Vscanner Vendor
If you specify this parameter, the command displays information only about the Vscan servers that are running scan-engine of the specified vendor.

-version <text> - Vscanner Version
If you specify this parameter, the command displays information only about the Vscan servers that are running scan-engine of the specified version.

-disconnect-reason <reason> - Server Disconnect Reason
If you specify this parameter, the command displays information only about the Vscan servers that are disconnected because of the specified reason.

-disconnected-since <MM/DD/YYYY HH:MM:SS> - Time When Vscanner Was Disconnected
If you specify this parameter, the command displays information only about the Vscan servers that have been disconnected since the specified time.

-privileged-user <text> - Privileged User Used for Connection
If you specify this parameter, the command displays information only about the Vscan servers that are connected to clustered Data ONTAP using the specified privileged user.

-connected-since <MM/DD/YYYY HH:MM:SS> - Time When Vscanner Was Connected
If you specify this parameter, the command displays information only about the Vscan servers that have been connected since the specified time.

-lif <IP Address> - Vserver LIF Used for Connection
If you specify this parameter, the command displays information only about the Vscan servers that have used the specified IP address for connecting to clustered Data ONTAP.

Examples
The following example displays connection-status information about all Vscan servers.

```
cluster1::> vserver vscan connection-status show-all
Vserver     Node              Server          Status         Disconnect Reason
----------- ----------------- --------------- -------------- -----------------
vs1         Cluster-01        1.1.1.1         disconnected   remote-closed
vs1         Cluster-01        2.2.2.2         connected      -
```

vserver vscan commands
The following example displays detailed connection-status information about all Vscan servers which are connected.

```
cluster1::> vserver vscan connection-status show-all -instance
          -server-status connected

          Node: Cluster-01
          Vserver: vs1
          Server: 2.2.2.2
          Server Status: connected
          Server Type: primary
          Vscanner Vendor: XYZ
          Vscanner Version: 1.12.2
          Server Disconnect Reason: -
          Time When Server Was Disconnected: -
          Privileged User Used for Connection: cifs\u2
          Time When Server Was Connected: 6/3/2013 08:44:21
          Vserver LIF Used for Connection: 10.238.41.223
```

### vserver vscan connection-status show-connected

Display connection status of connected Vscan servers

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The `vserver vscan connection-status show-connected` command displays connection status information of the connected external virus-scanning servers, or "Vscan servers". If you do not specify any parameters, the command displays the following information for all Vscan servers:

- Vserver name
- Node name
- Vscan server
- Vscan server vendor
- Privileged user

You can specify the `-fields` parameter to specify which fields of information to display. In addition to the fields above, you can display the following fields:

- Server type
- Vscan server version
- Vscan server connected since
- Vserver LIF used for connection

**Parameters**

`
[ -fields <fieldname>, ... ]
`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.
If you specify the -instance parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node
If you specify this parameter, the command displays information only about the Vscan servers attached to the specified node.

[-vserver <vserver name>] - Vserver
If you specify this parameter, the command displays information only about the Vscan servers for the specified Vserver.

[-server <IP Address>] - Server
If you specify this parameter, the command displays information only about the Vscan server that you specify.

[-vendor <text>] - Vscan Server Vendor
If you specify this parameter, the command displays information only about the Vscan servers that are running scan-engine of the specified vendor.

[-version <text>] - Vscan Server Version
If you specify this parameter, the command displays information only about the Vscan servers that are running scan-engine of the specified version.

[-privileged-user <text>] - Privileged User Used for Connection
If you specify this parameter, the command displays information only about the Vscan servers that are connected to clustered Data ONTAP using the specified privileged user.

[-connected-since <MM/DD/YYYY HH:MM:SS>] - Time When Vscan Server Was Connected
If you specify this parameter, the command displays information only about the Vscan servers that have been connected since the specified time.

[-server-type <Server type>] - Server Type
If you specify this parameter, the command displays information only about the Vscan servers that have the specified server type.

[-lif <IP Address>] - Vserver LIF Used for Connection
If you specify this parameter, the command displays information only about the Vscan servers that have used the specified IP address for connecting to clustered Data ONTAP.

**Examples**

The following example displays connection-status information about all connected Vscan servers.

```
cluster1::> vserver vscan connection-status show-connected

Vserver  Node      Server   Vendor  Privileged
--------  --------  -------  --------  ---------------
vs1       Cluster-01 1.1.1.1  ABC     cifs\u2
vs1       Cluster-01 2.2.2.2  XYZ     cifs\u2

2 entries were displayed.
```

The following example displays detailed connection-status information about connected Vscan servers which are running XYZ scan-engine.

```
cluster1::> vserver vscan connection-status show-connected -instance -vendor XYZ

Node: Cluster-01
Vserver: vs1
Server: 2.2.2.2
Vscanner Vendor: XYZ
Vscanner Version: 1.12
```
vserver vscan connection-status show-not-connected

Display connection status of Vscan servers which are allowed to connect but not yet connected

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver vscan connection-status show-not-connected command displays connection status information of the external virus-scanning servers, or "Vscan servers" that are ready to accept connection but are not yet connected. This command could be useful for troubleshooting. If you do not specify any parameters, the command displays the following information for all Vscan servers:

- Vserver name
- Node name
- Vscan server
- Connection status
- Disconnect reason

You can specify the -fields parameter to specify which fields of information to display. In addition to the fields above, you can display the following fields:

- Server type
- Vscan server disconnected since

Parameters

[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance ]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-node (<nodename>|local)] - Node
If you specify this parameter, the command displays information only about the Vscan servers attached to the specified node.

[-vserver <vserver name>] - Vserver
If you specify this parameter, the command displays information only about the Vscan servers for the specified Vserver.

[-server <IP Address>] - Server
If you specify this parameter, the command displays information only about the Vscan server that you specify.

[-server-status <Status>] - Server Status
If you specify this parameter, the command displays information only about the Vscan servers that have the specified status.
[-disconnect-reason <reason>] - Server Disconnect Reason
If you specify this parameter, the command displays information only about the Vscan servers that are
disconnected because of the specified reason.

[-disconnected-since <MM/DD/YYYY HH:MM:SS>] - Time When Vscan Server Was Disconnected
If you specify this parameter, the command displays information only about the Vscan servers that have been
disconnected since the specified time.

[-server-type <Server type>] - Server Type
If you specify this parameter, the command displays information only about the Vscan servers that have the
specified server type.

Examples
The following example displays connection-status information about all Vscan servers which are ready to accept
connection but not yet connected.

```
cluster1::> vserver vscan connection-status show-not-connected
Connection    Disconnect
Vserver       Node              Server           Status        Reason
------------- ----------------- ---------------- ------------- ---------------
vs2           Cluster-01        3.3.3.3          disconnected  invalid-
server-id
vs2           Cluster-01        4.4.4.4          disconnected  remote-closed
2 entries were displayed.
```

The following example displays detailed connection-status information about Vscan servers which are disconnected
because the connection is remotely closed.

```
cluster1::> vserver vscan connection-status show-not-connected -instance
-disconnect-reason remote-closed
Node: Cluster-01
Vserver: vs2
Server: 4.4.4.4
Server Status: disconnected
Server Disconnect Reason: remote-closed
Server Type: primary
```

vserver vscan on-access-policy commands
Manage Vscan On-Access policies

vserver vscan on-access-policy create
Create an On-Access policy

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver vscan on-access-policy create command creates an On-Access policy.

Parameters
-vserver <vserver name> - Vserver
This parameter specifies the name of the Vserver on which you want to create an On-Access policy.
-policy-name <Policy name> - Policy
This parameter specifies the name of the On-Access policy that you want to create. An On-Access policy name can be up to 256 characters long and is a string that can only contain any combination of ASCII-range alphanumeric characters (a-z, A-Z, 0-9), "_", "-" and ".".

-protocol <CIFS> - File-Access Protocol
This parameter specifies the protocol name for which the On-Access policy will be created. Currently only CIFS is supported.

[-filters {scan-ro-volume|scan-execute-access}, ...] - Filters
This parameter specifies a list of filters which can be used to define the scope of the On-Access policy more precisely. The list can include one or more of the following:

* scan-ro-volume - Enable scans for read-only volume.
* scan-execute-access - Scan only files opened with execute-access (CIFS only).

[-scan-mandatory {on|off}] - Mandatory Scan
This parameter specifies whether access to a file is allowed if there are no external virus-scanning servers available for virus scanning. By default, it is on.

[-max-file-size {<integer>[KB|MB|GB|TB|PB]}] - Max File Size Allowed for Scanning
This parameter specifies the maximum size of the file which will be considered for virus scanning. By default, it is 2GB.

[-paths-to-exclude <File path>, ...] - File Paths Not to Scan
This parameter specifies a list of paths, separated by commas, to exclude from virus scanning. This path is given from the root of the Vserver and can be up to 255 characters long. By default, no paths are excluded. CIFS protocol based On-Access policies must use "\" as the path separator. The path can be in one of the following forms:

* \dir1\dir2\name - This would match "\dir1\dir2\name" as well as "\dir1\dir2\name\...".
* \dir1\dir2\name - This would only match "\dir1\dir2\name\".

Note: If you are using the CLI, you must delimit all paths with double quotation marks ("). For instance, to add the paths \vol\a b" and \vol\a,b" to the -paths-to-exclude in the CLI, type "\vol\a b \", \"\vol\a,b\" at the command prompt. To add a "?" to the expression, press ESC followed by the "?".

[-file-ext-to-exclude <File extension>, ...] - File Extensions Not to Scan
This parameter specifies a list of file extensions, separated by commas, to exclude from virus scanning. By default, no file extensions are excluded. Each file extension can be up to 16 characters long. The -file-ext-to-exclude supports wildcard patterns containing "*" and "?". Pattern matching is defined as:

* Matches any string, including the empty string. For example, mp* would match mp, mp3, mp4, mpeg etc.
* ? Matches any single character. For example, mp? would match mp3, mp4 but not mp and mpeg.

Note: If you are using the CLI, you must delimit all patterns with double quotation marks ("). For instance, to enter the pattern mp* in the CLI, type "mp*" at the command prompt. To add a "?" to the expression, press ESC followed by the "?".

[-file-ext-to-include <File extension>, ...] - File Extensions to Scan
This parameter specifies a list of file extensions, separated by commas, to include for virus scanning. By default it is *, which means all the file extensions are considered for virus scanning except those which match one of the patterns provided in -file-ext-to-exclude list. Each file extension can be up to 16 characters long. The -file-ext-to-include supports wildcard patterns containing "*" and "?". Pattern matching is defined as:
• * - Matches any string, including the empty string. For example, mp* would match mp, mp3, mp4, mpeg etc.

• ? - Matches any single character. For example, mp? would match mp3, mp4 but not mp and mpeg.

**Note:** If you are using the CLI, you must delimit all patterns with double quotation marks ("'). For instance, to enter the pattern mp* in the CLI, type "mp*" at the command prompt. To add a "?" to the expression, press ESC followed by the "?".

**Note:** If you specify both `-file-ext-to-include` and `-file-ext-to-exclude` lists, then only those file extensions are considered for virus scanning which match one of the patterns provided in `-file-ext-to-include` list but do not match any of the patterns provided in `-file-ext-to-exclude` list.

`[-scan-files-with-no-ext {true|false}]` - Scan Files with No Extension

This parameter specifies if the files without any extension are considered for virus scanning or not. By default, it is true.

---

**Examples**

The following example creates an On-Access policy.

```
cluster1::> vserver vsan on-access-policy create -vserver vs1 -policy-name test
   -protocol CIFS -scan-mandatory on -filters scan-ro-volume -max-file-size 3GB
   -file-ext-to-exclude "mp3","txt" -file-ext-to-include "mp*","tx*"
   -paths-to-exclude "\vol\a\b","\vol\a,b"
```

```
cluster1::> vserver vsan on-access-policy show -instance -vserver vs1 -policy-name test

 Vserver: vs1
 Policy: test
 Policy Status: off
 Policy Config Owner: vserver
 File-Access Protocol: CIFS
 Filters: scan-ro-volume
 Mandatory Scan: on
 Max File Size Allowed for Scanning: 3GB
 File Paths Not to Scan: \vol\a\b, \vol\a,b
 File Extensions Not to Scan: mp3, txt
 File Extensions to Scan: mp*, tx*
 Scan Files with No Extension: true
```

**vserver vsan on-access-policy delete**

Delete an On-Access policy

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The vserver vsan on-access-policy delete command deletes an On-Access policy.

**Parameters**

- `-vserver <vserver name>` - Vserver

  This parameter specifies the name of the Vserver from which you want to delete an On-Access policy.

- `-policy-name <Policy name>` - Policy

  This parameter specifies the name of the On-Access policy that you want to delete.
Examples
The following example deletes an On-Access policy.

```
cluster1::> vserver vscan on-access-policy delete -vserver vs1 -policy-name test
cluster1::> vserver vscan on-access-policy show -vserver vs1 -policy-name test
There are no entries matching your query.
```

vserver vscan on-access-policy disable

Disable an On-Access policy

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The `vserver vscan on-access-policy disable` command disable an On-Access policy for the specified Vserver.

**Parameters**
- `-vserver <vserver name>` - Vserver
  - This parameter specifies the name of the Vserver on which you want to disable an On-Access policy. The Vserver administrator can disable On-Access policies created within the scope of the Vserver and can also disable an On-Access policy created by the cluster administrator. The cluster administrator can disable On-Access policies for any Vserver.

- `-policy-name <Policy name>` - Policy
  - This parameter specifies the name of the On-Access policy you want to disable.

Examples
The following command disable an On-Access policy on specified Vserver.

```
cluster1::> vserver vscan on-access-policy disable -vserver vs1 -policy-name new
cluster1::> vserver vscan on-access-policy show -instance -vserver vs1 -policy-name new
  Vserver: vs1
  Policy: new
  Policy Status: off
  Policy Config Owner: vserver
  File-Access Protocol: CIFS
  Filters: scan-ro-volume
  Mandatory Scan: on
  Max File Size Allowed for Scanning: 4GB
  File-Paths Not to Scan: \vol\temp
  File-Extensions Not to Scan: txt
```

vserver vscan on-access-policy enable

Enable an On-Access policy

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.
Description
The `vserver vscan on-access-policy enable` command enables an On-Access policy for the specified Vserver. Only one On-Access policy of a specific protocol can be enabled at one time.

Parameters
- `vserver <vserver name>` - Vserver
  
  This parameter specifies the name of the Vserver on which you want to enable an On-Access policy. The Vserver administrator can enable On-Access policy created within the scope of the Vserver or the cluster. The cluster administrator can enable On-Access policy for any Vserver but cannot enable them with a scope of cluster. The scope is determined at a Vserver level.

- `policy-name <Policy name>` - Policy
  
  This parameter specifies the name of the On-Access policy you want to enable.

Examples
The following command enables an On-Access policy on specified Vserver.

```
cluster1::> vserver vscan on-access-policy enable -vserver vs1 -policy-name new
cluster1::> vserver vscan on-access-policy show -instance -vserver vs1 -policy-name new

  Vserver: vs1
  Policy: new
  Policy Status: on
  Policy Config Owner: vserver
  File-Access Protocol: CIFS
  Filters: scan-ro-volume
  Mandatory Scan: on
  Max File Size Allowed for Scanning: 4GB
  File-Paths Not to Scan: \vol\temp
  File-Extensions Not to Scan: txt
```

`vserver vscan on-access-policy modify`

Modify an On-Access policy

Availability: This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

Description
The `vserver vscan on-access-policy modify` command modifies an On-Access policy.

Parameters
- `vserver <vserver name>` - Vserver
  
  This parameter specifies the name of the Vserver on which you want to modify an On-Access policy.

- `policy-name <Policy name>` - Policy
  
  This parameter specifies the name of the On-Access policy that you want to modify.

- `[-filters {scan-ro-volume|scan-execute-access}, ...]` - Filters
  
  This parameter specifies a list of filters which can be used to define the scope of the On-Access policy more precisely. The list can include one or more of the following:

- `scan-ro-volume` - Enable scans for read-only volume.
- `scan-execute-access` - Scan only files opened with execute-access (CIFS only).
[[-scan-mandatory {on|off}] - Mandatory Scan
   This parameter specifies whether access to a file is allowed if there are no external virus-scanning servers
   available for virus scanning.

[[-max-file-size {<integer>[KB|MB|GB|TB|PB]}] - Max File Size Allowed for Scanning
   This parameter specifies the maximum size of the file which will be considered for virus scanning.

[[-paths-to-exclude <File path>, ...] - File Paths Not to Scan
   This parameter specifies a list of paths, separated by commas, to exclude from virus scanning. This path
   is given from the root of the Vserver and can be up to 255 characters long. CIFS protocol based On-Access
   policies must use "\" as the path separator. The path can be in one of the following forms:
   
   • \dir1\dir2\name - This would match "\dir1\dir2\name" as well as "\dir1\dir2\name\...".
   
   • \dir1\dir2\name\ - This would only match "\dir1\dir2\name\...".

   Note: If you are using the CLI, you must delimit all paths with double quotation marks ("). For instance, to
   add the paths "\vol\a\b" and "\vol\a,b\" to the -paths-to-exclude in the CLI, type "\vol\a b \", "\vol\a,b\" at
   the command prompt. To add a "?" to the expression, press ESC followed by the "?".

[[-file-ext-to-exclude <File extension>, ...] - File Extensions Not to Scan
   This parameter specifies a list of file extensions, separated by commas, to exclude from virus scanning. Each
   file extension can be up to 16 characters long. The -file-ext-to-exclude supports wildcard patterns
   containing "*" and "?". Pattern matching is defined as:
   
   • * - Matches any string, including the empty string. For example, mp* would match mp, mp3, mp4, mpeg
     etc.
   
   • ? - Matches any single character. For example, mp? would match mp3, mp4 but not mp and mpeg.

   Note: If you are using the CLI, you must delimit all patterns with double quotation marks ("). For instance,
   to enter the pattern mp* in the CLI, type "mp*" at the command prompt. To add a "?" to the expression,
   press ESC followed by the "?".

[[-file-ext-to-include <File extension>, ...] - File Extensions to Scan
   This parameter specifies a list of file extensions, separated by commas, to include for virus scanning. Each
   file extension can be up to 16 characters long. The -file-ext-to-include supports wildcard patterns
   containing "*" and "?". Pattern matching is defined as:
   
   • * - Matches any string, including the empty string. For example, mp* would match mp, mp3, mp4, mpeg
     etc.
   
   • ? - Matches any single character. For example, mp? would match mp3, mp4 but not mp and mpeg.

   Note: If you are using the CLI, you must delimit all patterns with double quotation marks ("). For instance,
   to enter the pattern mp* in the CLI, type "mp*" at the command prompt. To add a "?" to the expression,
   press ESC followed by the "?".

   Note: If you specify both -file-ext-to-include and -file-ext-to-exclude lists, then only those
   file extensions are considered for virus scanning which match one of the patterns provided in -file-ext-
   to-include list but do not match any of the patterns provided in -file-ext-to-exclude list.

[[-scan-files-with-no-ext {true|false}] - Scan Files with No Extension
   This parameter specifies if the files without any extension are considered for virus scanning or not.

Examples

The following example modifies an On-Access policy.
vserver vscan on-access-policy show

Display On-Access policies

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver vscan on-access-policy show command displays information about the On-Access policies belonging to the Vserver. It also displays the current status in Vserver scope. If you do not specify any parameters, the command displays the following information about all On-Access policies:

- Vserver name
- Policy name
- Policy status
- Policy owner
- Protocol
- File paths to exclude
- File extensions to exclude

You can specify the -fields parameter to specify which fields of information to display about On-Access policies. In addition to the fields above, you can display the following fields:

- List of filters
- Mandatory scan
- Max file size
- File extensions to include
- Scan files without extension
Parameters

[[-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

[-instance ]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver

If you specify this parameter, the command displays information only about the On-Access policies for the specified Vserver.

[-policy-name <Policy name>] - Policy

If you specify this parameter, the command displays information only about the specified On-Access policy.

[-policy-status {on|off}] - Policy Status

If you specify this parameter, the command displays information only about the On-Access policies that have the specified status.

[-owner <Configuration owner>] - Policy Config Owner

If you specify this parameter, the command displays information only about the On-Access policies that have the specified owner.

[-protocol <CIFS>] - File-Access Protocol

If you specify this parameter, the command displays information only about the On-Access policies that have the specified protocol.

[-filters (scan-ro-volume|scan-execute-access), ...] - Filters

If you specify this parameter, the command displays information only about the On-Access policies that have the specified filter or filters in the filter list.

[-scan-mandatory {on|off}] - Mandatory Scan

If you specify this parameter, the command displays information only about the On-Access policies that have mandatory scanning enabled.

[-max-file-size {<integer>[KB|MB|GB|TB|PB]}] - Max File Size Allowed for Scanning

If you specify this parameter, the command displays information only about the On-Access policies that have the specified max-file-size.

[-paths-to-exclude <File path>, ...] - File Paths Not to Scan

If you specify this parameter, the command displays information only about the On-Access policies that have the specified path or paths in the exclude list.

[-file-ext-to-exclude <File extension>, ...] - File Extensions Not to Scan

If you specify this parameter, the command displays information only about the On-Access policies that have the specified file extension or extensions in the exclude list.

[-file-ext-to-include <File extension>, ...] - File Extensions to Scan

If you specify this parameter, the command displays information only about the On-Access policies that have the specified file extension or extensions in the include list.

[-scan-files-with-no-ext {true|false}] - Scan Files with No Extension

If you specify this parameter, the command displays information only about the On-Access policies that have the specified value.

Examples

The following example displays information about all On-Access policies.
```plaintext
cluster1::> vserver vscan on-access-policy show

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Policy Name</th>
<th>Owner</th>
<th>Protocol</th>
<th>Paths Excluded</th>
<th>File-Ext Excluded</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cluster</td>
<td>default_</td>
<td>cluster</td>
<td>CIFS</td>
<td>-</td>
<td>-</td>
<td>off</td>
</tr>
<tr>
<td>vs1</td>
<td>default_</td>
<td>cluster</td>
<td>CIFS</td>
<td>-</td>
<td>-</td>
<td>on</td>
</tr>
<tr>
<td>vs1</td>
<td>new</td>
<td>vs1</td>
<td>CIFS</td>
<td>\vol\temp</td>
<td>txt</td>
<td>off</td>
</tr>
<tr>
<td>vs2</td>
<td>default_</td>
<td>cluster</td>
<td>CIFS</td>
<td>-</td>
<td>-</td>
<td>on</td>
</tr>
</tbody>
</table>

4 entries were displayed.

The following example displays detailed information about an On-Access policy.

```plaintext
cluster1::> vserver vscan on-access-policy show -instance -vserver vs1 -policy-name new

Vserver: vs1
Policy: new
Policy Status: off
Policy Config Owner: vs1
File-Access Protocol: CIFS
Filters: scan-ro-volume
Mandatory Scan: on
Max File Size Allowed for Scanning: 4GB
File Paths Not to Scan: \vol\temp
File Extensions Not to Scan: txt
File Extensions to Scan: *
Scan Files with No Extension: true

```plaintext

**vserver vscan on-access-policy file-ext-to-exclude commands**

Manage list of file extensions to be excluded in an On-Access policy

**vserver vscan on-access-policy file-ext-to-exclude add**

Add to the list of file extensions to exclude

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `vserver vscan on-access-policy file-ext-to-exclude add` command adds a file extension or a list of file extensions that must be excluded from scanning to the specified policy name.

**Parameters**

- `<vserver name>` - Vserver
  
  This parameter specifies the name of the Vserver containing the specified on-access policy to which you want to add a file extension or a list of file extensions that must be excluded from scanning.

- `<policy-name>` - Policy

  This parameter specifies the name of the on-access policy to which you want to add a file extension or a list of file extensions that must be excluded from scanning.

- `<file-ext-to-exclude>` - File Extensions Not to Scan

  This parameter specifies the file extension or a list of file extensions that must be excluded from scanning.
Examples

The following example adds a list of file extensions that must be excluded from scanning to the specified on-access policy:

cluster1::> vserver vscan on-access-policy file-ext-to-exclude add -vserver vs1
   -policy-name policy1 -file-ext-to-exclude txt,mp4

cluster1::> vserver vscan on-access-policy file-ext-to-exclude show -vserver vs1
   -policy-name policy1

Vserver: vs1
Policy: policy1
File-Extensions Not to Scan: mp3, mp4, txt, wav

vserv vscan on-access-policy file-ext-to-exclude remove

Remove from the list of file extensions to exclude

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver vscan on-access-policy file-ext-to-exclude remove command removes a file extension or a list of file extensions that are excluded from scanning from the specified policy name.

Parameters

-`-vserver <vserver name>` - Vserver
  This parameter specifies the name of the Vserver containing the specified on-access policy from which you want to remove a file extension or a list of file extensions that are excluded from scanning.

-`-policy-name <Policy name>` - Policy
  This parameter specifies the name of the on-access policy from which you want to remove a file extension or a list of file extensions that are excluded from scanning.

-`-file-ext-to-exclude <File extension>, ...` - File Extensions Not to Scan
  This parameter specifies the file extension or a list of file extensions that must be removed from the on-access policy.

Examples

The following example removes a list of file extensions that are to be excluded from scanning from the specified on-access policy:

cluster1::> vserver vscan on-access-policy file-ext-to-exclude remove -vserver vs1
   -policy-name policy1 -file-ext-to-exclude mp3,txt

cluster1::> vserver vscan on-access-policy file-ext-to-exclude show -vserver vs1
   -policy-name policy1

Vserver: vs1
Policy: policy1
File-Extensions Not to Scan: mp4, wav
vserver vscan on-access-policy file-ext-to-exclude show

Display list of file extensions to exclude

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver vscan on-access-policy file-ext-to-exclude show command displays the list of file extensions that are excluded from scanning belonging to the Vserver. If you do not specify any parameters, the command displays the following information about all on-access policies:

- Vserver name
- Policy name
- List of File-Extensions to exclude

Parameters

{ [-fields <fieldname>, ...]  
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify. }

| [-instance ] |  
| If you specify the -instance parameter, the command displays detailed information about all fields. |

[-vserver <vserver name>] - Vserver

If you specify this parameter, the command displays information only about the policy names for the specified Vserver.

[-policy-name <Policy name>] - Policy

If you specify this parameter, the command displays information only about the specified policy name.

[-file-ext-to-exclude <File extension>, ...] - File Extensions Not to Scan

If you specify this parameter, the command displays information only about the policies that have the specified file extensions that are excluded from scanning.

Examples

The following example displays the list of file extensions that are excluded from scanning for all the policies:

```
cluster1::> vserver vscan on-access-policy file-ext-to-exclude show
Vserver   Policy Name       File-Ext Excluded
---------- ----------------- --------------------------------------------
cluster1   default_CIFS      txt
vs1        default_CIFS      txt
vs1        policy1           mp4, wav
vs1        policy3           wmv
vs2        default_CIFS      txt
vs2        policy2           mp3
6 entries were displayed.
```

vserver vscan on-access-policy file-ext-to-include commands

Manage list of file extensions to be included in an On-Access policy
vserver vscan on-access-policy file-ext-to-include add

Add to the list of file extensions to include

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver vscan on-access-policy file-ext-to-include add command adds a file extension or list of file extensions to include for virus scanning to the specified policy.

Parameters
- **-vserver <vserver name> - Vserver**
  This parameter specifies the name of the Vserver containing the specified on-access policy to which you want to add a file extension or a list of file extensions to include for virus scanning.

- **-policy-name <Policy name> - Policy**
  This parameter specifies the name of the on-access policy to which you want to add a file extension or a list of file extensions to include for virus scanning.

- **-file-ext-to-include <File extension>, ... - File Extensions to Scan**
  This parameter specifies the file extension or a list of file extensions to include for virus scanning.

Examples
The following example adds a list of file extensions to include for virus scanning to the specified on-access policy.

```
cluster1::> vserver vscan on-access-policy file-ext-to-include add -vserver vs1 -policy-name policy1 -file-ext-to-include "mp*","tx*"
cluster1::> vserver vscan on-access-policy file-ext-to-include show -vserver vs1 -policy-name policy1
Vserver: vs1
Policy: policy1
File Extensions to Scan: mp*, tx*, wav
```

vserver vscan on-access-policy file-ext-to-include remove

Remove from the list of file extensions to include

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver vscan on-access-policy file-ext-to-include remove command removes a file extension or list of file extension that are included for virus scanning from the specified policy.

Parameters
- **-vserver <vserver name> - Vserver**
  This parameter specifies the name of the Vserver containing the specified on-access policy from which you want to remove a file extension or list of file extensions that are included for virus scanning.

- **-policy-name <Policy name> - Policy**
  This parameter specifies the name of the on-access policy from which you want to remove a file extension or a list of file extensions that are included for virus scanning.
-file-ext-to-include <File extension>, ... - File Extensions to Scan

This parameter specifies the file extension or a list of file extensions that you want to remove from the specified on-access policy.

Examples

The following example removes a list of file extensions from the specified on-access policy.

```bash
cluster1::> vserver vscan on-access-policy file-ext-to-include remove -vserver vs1 -policy-name policy1 -file-ext-to-include "txt","wav"

cluster1::> vserver vscan on-access-policy file-ext-to-include show -vserver vs1 -policy-name policy1
Vserver: vs1
Policy: policy1
File Extensions to Scan: mp*
```

vserver vscan on-access-policy file-ext-to-include show

Display list of file extensions to include

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The `vserver vscan on-access-policy file-ext-to-include show` command displays the list of file extensions to include for virus scanning belonging to the Vserver. If you do not specify any parameters, the command displays the following information about all on access policies:

- Vserver name
- Policy name
- List of File-Extensions to Scan

Parameters

`[-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use ‘-fields ?’ to display the fields to specify.

`[-instance ]`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-vserver <vserver name>] - Vserver`

If you specify this parameter, the command displays information only about the policies for the specified Vserver.

`[-policy-name <Policy name>] - Policy`

If you specify this parameter, the command displays information only about the specified policy.

`[-file-ext-to-include <File extension>, ...] - File Extensions to Scan`

If you specify this parameter, the command displays information only about the policies that have the specified file extensions that are included for virus scanning.
Examples
The following example displays the list of file extensions that are included for virus scanning for all policies.

```
cluster1::> vserver vscan on-access-policy file-ext-to-include show
Vserver       Policy Name      File-Ext Included
--------------- ----------------- --------------------------------------------
cluster1       default_CIFS    *
vs1            default_CIFS    *
vs1            policy1         mp*
vs1            policy3         doc*, xl*
vs2            default_CIFS    *
vs2            policy2         d*, m*, t*
6 entries were displayed.
```

vserver vscan on-access-policy paths-to-exclude commands
Manage list of paths to be excluded in an On-Access policy

vserver vscan on-access-policy paths-to-exclude add
Add to the list of paths to exclude

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver vscan on-access-policy paths-to-exclude add command adds a path or a list of paths that must be excluded from scanning to the specified policy name.

Parameters
-vserver <vserver name> - Vserver
This parameter specifies the name of the Vserver containing the specified on-access policy to which you want to add a path or a list of paths that must be excluded from scanning.

-policy-name <Policy name> - Policy
This parameter specifies the name of the on-access policy to which you want to add a path or a list of paths that must be excluded from scanning.

-paths-to-exclude <File path>, ... - Paths Not to Scan
This parameter specifies the path or list of paths that must be excluded from scanning.

Examples
The following example adds a list of paths that must be excluded from scanning to the specified on-access policy:

```
cluster1::> vserver vscan on-access-policy paths-to-exclude add -vserver vs1
                      -policy-name policy1 -paths-to-exclude \test\test2, \test\test3

cluster1::> vserver vscan on-access-policy paths-to-exclude show -vserver vs1
                      -policy-name policy1
Vserver: vs1
Policy: policy1
File-Paths Not to Scan: \test\test1, \test\test2, \test\test3
```
vserver vscan on-access-policy paths-to-exclude remove

Remove from the list of paths to exclude

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The `vserver vscan on-access-policy paths-to-exclude remove` command removes a path or a list of paths that are excluded from scanning from the specified policy name.

Parameters
- `-vserver <vserver name>` - Vserver
  This parameter specifies the name of the Vserver containing the specified on-access policy from which you want to remove a path or list of paths that are excluded from scanning.
- `-policy-name <Policy name>` - Policy
  This parameter specifies the name of the on-access policy from which you want to remove a path or a list of paths that are excluded from scanning.
- `-paths-to-exclude <File path>, ...` - Paths Not to Scan
  This parameter specifies the path or a list of paths that must be removed from the on-access policy.

Examples
The following example removes a list of paths that are excluded from scanning from the specified policy name:

```
cluster:> vserver vscan on-access-policy paths-to-exclude remove -vserver vs1 -policy-name policy1 -paths-to-exclude \test\test2,\test\test3
cluster1:> vserver vscan on-access-policy paths-to-exclude show -vserver vs1 -policy-name policy1
  Vserver: vs1
  Policy: policy1
  File-Paths Not to Scan: \test\test1
```

vserver vscan on-access-policy paths-to-exclude show

Display list of paths to exclude

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The `vserver vscan on-access-policy paths-to-exclude show` command displays the list of paths that are excluded from scanning belonging to the Vserver. If you do not specify any parameters, the command displays the following information about all on-access policies:

- Vserver name
- Policy name
- List of Paths to exclude
Parameters

{[-fields <fieldname>, ...]
  
  If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use -fields ? to display the fields to specify.

| [-instance ]
  
  If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver
  
  If you specify this parameter, the command displays information only about the policy names for the specified Vserver.

[-policy-name <Policy name>] - Policy
  
  If you specify this parameter, the command displays information only about the specified policy name.

[-paths-to-exclude <File path>, ...] - File Paths Not to Scan
  
  If you specify this parameter, the command displays information only about the policies that have the specified paths that are excluded from scanning.

Examples

The following example displays the list of paths that are excluded from scanning for all the policies:

```
cluster1::> vserver vsan on-access-policy paths-to-exclude show
Vserver         Policy Name       Paths Excluded
--------------- ----------------- --------------------------------------------
cluster1        default_CIFS      \test\test1
vs1             default_CIFS      \test\test1
vs1             policy1           \test\test2,\test\test3
vs1             policy3           \test\test4
vs2             default_CIFS      \test\test1
vs2             policy2           \test\test3
6 entries were displayed.
```

vserver vsan on-demand-task commands

Manage Vscan On-Demand scans

vserver vsan on-demand-task create

Create an On-Demand task

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver vsan on-demand-task create command creates an On-Demand task. The On-Demand task consists of a set of attributes that are used for configuring the scope of scanning. It also specifies the cron schedule at which the task should run.

Parameters

- vserver <vserver name> - Vserver
  
  This parameter specifies the name of the Vserver on which you want to create an On-Demand task.

- task-name <text> - Task Name
  
  This parameter specifies the name of the On-Demand task that you want to create. An On-Demand task name can be up to 256 characters long.
-scan-paths <text>, ... - List of Scan Paths

This parameter specifies a list of paths, separated by commas, for virus scanning. This path is given from the root of the Vserver using UNIX path delimiter "/".

-report-directory <text> - Report Directory Path

This parameter specifies a directory path where the On-Demand report file is created. Each run for a task creates a new file. The report directory path is given from the root of the Vserver using UNIX path delimiter "/".

-schedule <text>] - Job Schedule

This parameter specifies the already existing cron schedule. The On-Demand task triggers virus scanning for the specified scan-paths at the time configured in the schedule.

Note: A Vserver can have only one scheduled task at a time.

-max-file-size {<integer>[KB|MB|GB|TB|PB]} - Max File Size Allowed for Scanning

This parameter specifies the maximum size of the file that will be considered for virus scanning. By default, it is 10GB.

-paths-to-exclude <text>, ...] - File Paths Not to Scan

This parameter specifies a list of paths, separated by commas, to exclude from virus scanning. This path is given from the root of the Vserver using UNIX path delimiter "/". By default, no paths are excluded. The path can be in one of the following forms:

- /dir1/dir2/name - This would match "/dir1/dir2/name" as well as "/dir1/dir2/name/...".
- /dir1/dir2/name/ - This would only match "/dir1/dir2/name/...".

Note: If you are using the CLI, you must delimit all paths with double quotation marks ("). For instance, to add the paths "/vol/a/b" and "/vol/a,b/" to the -paths-to-exclude in the CLI, type "/vol/a b/","/vol/a,b/" at the command prompt.

-file-ext-to-exclude <File extension>, ...] - File Extensions Not to Scan

This parameter specifies a list of file extensions, separated by commas, to exclude from virus scanning. By default, no file extensions are excluded. Each file extension can be up to 16 characters long. The -file-ext-to-exclude supports wildcard patterns containing "*" and "?". Pattern matching is defined as:

- * - Matches any string, including the empty string. For example, mp* matches mp, mp3, mp4, mpeg etc.
- ? - Matches any single character. For example, mp? matches mp3, mp4 but not mp and mpeg.

Note: If you are using the CLI, you must delimit all patterns with double quotation marks ("'). For instance, to enter the pattern mp* in the CLI, type "mp*" at the command prompt. To add a "?" to the expression, press ESC followed by the "?".

-file-ext-to-include <File extension>, ...] - File Extensions to Scan

This parameter specifies a list of file extensions, separated by commas, to include for virus scanning. By default it is *, which means all the file extensions are considered for virus scanning except those that match one of the patterns provided in -file-ext-to-exclude list. Each file extension can be up to 16 characters long. The -file-ext-to-include supports wildcard patterns containing "*" and "?". Pattern matching is defined as:

- * - Matches any string, including the empty string. For example, mp* matches mp, mp3, mp4, mpeg etc.
- ? - Matches any single character. For example, mp? matches mp3, mp4 but not mp and mpeg.

Note: If you are using the CLI, you must delimit all patterns with double quotation marks ("'). For instance, to enter the pattern mp* in the CLI, type "mp*" at the command prompt. To add a "?" to the expression, press ESC followed by the "?".
**Note:** If you specify both `-file-ext-to-include` and `-file-ext-to-exclude` lists, then only those file extensions are considered for virus scanning which match one of the patterns provided in `-file-ext-to-include` list but do not match any of the patterns provided in `-file-ext-to-exclude` list.

`[-scan-files-with-no-ext (true|false)]` - Scan Files with No Extension

This parameter specifies if the files without any extension are considered for virus scanning or not. By default, it is true.

`[-request-timeout <[<integer>h][<integer>m][<integer>s]>]` - Request Service Timeout

This parameter specifies the timeout value for a scan request. It is used to specify the time interval in which the node waits for a response from the Vscan server. Beyond this timeout period, the scan request is considered as failed. The value for this field must be between 10s and 1h. By default, it is 5m.

`[-cross-junction (true|false)]` - Cross Junction

This parameter specifies if the On-Demand task is allowed to cross volume junctions. If the parameter is set to false, crossing junctions is not allowed. By default, it is true.

`[-directory-recursion (true|false)]` - Directory Recursion

This parameter specifies if the On-Demand task is allowed to recursively scan through sub-directories. If the parameter is set to false, recursive scanning is not allowed. By default, it is true.

`[-scan-priority (low|normal)]` - Scan Priority

This parameter specifies the priority of the On-Demand scan requests generated by this task compared to On-Access scan requests. By default, it is low.

`[-report-log-level (verbose|info|error)]` - Report Log Level

This parameter specifies the log level of the On-Demand report. By default, it is info.

**Examples**

The following example creates an On-Demand task:

```
cluster1::> vserver vserv on-demand-task create -vserver vs1 -task-name t1
     -scan-paths "/vol1/", "/vol2/cifs/" -report-directory "/report"
     -schedule daily -max-file-size 5GB -paths-to-exclude "/vol1/cold-files/"
     -file-ext-to-include "vmdk?","mp*" -file-ext-to-exclude "mp3","mp4"
     -scan-files-with-no-ext false -request-timeout 2m -cross-junction false
     -directory-recursion true -scan-priority low -report-log-level verbose

[Job 126]: Vscan On-Demand job is queued. Use the "job show -id 126" command to view the status.
```

```
cluster1::> vserver vserv on-demand-task show -instance -vserver vs1 -task-name t1

Vserver: vs1
Task Name: t1
List of Scan Paths: /vol1/, /vol2/cifs/
Report Directory Path: /report
Job Schedule: daily
Max File Size Allowed for Scanning: 5GB
File Paths Not to Scan: /vol1/cold-files/
File Extensions Not to Scan: mp3, mp4
File Extensions to Scan: vmdk, mp*
Scan Files with No Extension: false
Request Service Timeout: 2m
Cross Junction: false
Directory Recursion: true
Scan Priority: low
Report Log Level: verbose
```
vserver vscan on-demand-task delete

Delete an On-Demand task

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver vscan on-demand-task delete command deletes an On-Demand task.

Parameters
-vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver from which you want to delete an On-Demand task.

-task-name <text> - Task Name

This parameter specifies the name of the On-Demand task that you want to delete.

Examples
The following example deletes an On-Demand task:

```
cluster1::> vserver vscan on-demand-task delete -vserver vs1 -task-name t1
cluster1::> vserver vscan on-demand-task show -vserver vs1 -task-name t1
There are no entries matching your query.
```

vserver vscan on-demand-task modify

Modify an On-Demand task

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver vscan on-demand-task modify command modifies an On-Demand task. The On-Demand task consists of a set of attributes that are used for configuring the scope of scanning. It also specifies the cron schedule at which the task should run.

Parameters
-vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver on which you want to modify an On-Demand task.

-task-name <text> - Task Name

This parameter specifies the name of the On-Demand task that you want to modify.

- [scan-paths <text>, ...] - List of Scan Paths

This parameter specifies a list of paths, separated by commas, for virus scanning. This path is given from the root of the Vserver using UNIX path delimiter "/".

This parameter specifies a directory path where the On-Demand report file is created. Each run for a task creates a new file. The report directory path is given from the root of the Vserver using UNIX path delimiter "/".
-schedule <text> - Job Schedule

This parameter specifies the already existing cron schedule. The On-Demand task triggers virus scanning for
the specified scan-paths at the time configured in the schedule. Providing empty schedule (""") unschedules the
task.

**Note:** A Vserver can have only one scheduled task at a time.

-max-file-size {<integer>[KB|MB|GB|TB|PB]} - Max File Size Allowed for Scanning

This parameter specifies the maximum size of the file which will be considered for virus scanning.

-paths-to-exclude <text>, ... - File Paths Not to Scan

This parameter specifies a list of paths, separated by commas, to exclude from virus scanning. This path is
given from the root of the Vserver using UNIX path delimiter ".". The path can be in one of the following
forms:

- /dir1/dir2/name - This would match "/dir1/dir2/name" as well as "/dir1/dir2/name/...".
- /dir1/dir2/name/ - This would only match "/dir1/dir2/name/...".

**Note:** If you are using the CLI, you must delimit all paths with double quotation marks ("."). For instance, to
add the paths "/vol/a,b/" and "/vol/a,b/" to the -paths-to-exclude in the CLI, type "/vol/a
b/","/vol/a,b/" at the command prompt.

-file-ext-to-exclude <File extension>, ... - File Extensions Not to Scan

This parameter specifies a list of file extensions, separated by commas, to exclude from virus scanning. Each
file extension can be up to 16 characters long. The -file-ext-to-exclude supports wildcard patterns
containing "*" and "?". Pattern matching is defined as:

- * - Matches any string, including the empty string. For example, mp* matches mp, mp3, mp4, mpeg etc.
- ? - Matches any single character. For example, mp? matches mp3, mp4 but not mp and mpeg.

**Note:** If you are using the CLI, you must delimit all patterns with double quotation marks ("."). For instance,
to enter the pattern mp* in the CLI, type "mp*" at the command prompt. To add a "?" to the expression,
press ESC followed by the "?".

-file-ext-to-include <File extension>, ... - File Extensions to Scan

This parameter specifies a list of file extensions, separated by commas, to include for virus scanning. Each
file extension can be up to 16 characters long. The -file-ext-to-include supports wildcard patterns
containing "*" and "?". Pattern matching is defined as:

- * - Matches any string, including the empty string. For example, mp* matches mp, mp3, mp4, mpeg etc.
- ? - Matches any single character. For example, mp? matches mp3, mp4 but not mp and mpeg.

**Note:** If you are using the CLI, you must delimit all patterns with double quotation marks ("."). For instance,
to enter the pattern mp* in the CLI, type "mp*" at the command prompt. To add a "?" to the expression,
press ESC followed by the "?".

file-ext-to-include and -file-ext-to-exclude lists, then only those
file extensions are considered for virus scanning which match one of the patterns provided in -file-ext-
to-include list but do not match any of the patterns provided in -file-ext-to-exclude list.

-scan-files-with-no-ext {true|false} - Scan Files with No Extension

This parameter specifies if the files without any extension are considered for virus scanning or not.
[request-timeout (<integer>h)<integer>m[<integer>s]> - Request Service Timeout
This parameter specifies the timeout value for a scan request. It is used to specify the time interval in which
the node waits for a response from the Vscan server. Beyond this timeout period, the scan request is
considered as failed. The value for this field must be between 10s and 1h.

[cross-junction {true|false}] - Cross Junction
This parameter specifies if the On-Demand task is allowed to cross volume junctions. If the parameter is set to
false, crossing junctions is not allowed.

directory-recursion {true|false} - Directory Recursion
This parameter specifies if the On-Demand task is allowed to recursively scan through sub-directories. If the
parameter is set to false, recursive scanning is not allowed.

[scan-priority {low|normal}] - Scan Priority
This parameter specifies the priority of the On-Demand scan requests generated by this task compared to On-
Access scan requests.

[report-log-level {verbose|info|error}] - Report Log Level
This parameter specifies the log level of the On-Demand report.

Examples
The following example modifies an On-Demand task:

```
class1::> vserver vscan on-demand-task modify -server vs1 -task-name t1
        -scan-paths "/vol3/","/vol4/cifs/" -report-directory "/report-dir"
        -schedule custom -max-file-size 2GB -paths-to-exclude "/vol1/cold-files/"
        -file-ext-to-include "*" -file-ext-to-exclude "mp3","mp4"
        -scan-files-with-no-ext true -request-timeout 1m -cross-junction true

[Job 136]: Vscan On-Demand job is queued. Use the "job show -id 136" command to view the status.
```

class1::> vserver vscan on-demand-task show -instance -server vs1 -task-name t1

```
Vserver: vs1
Task Name: t1
List of Scan Paths: /vol3/, /vol4/cifs/
Report Directory Path: /report-dir
Job Schedule: custom
Max File Size Allowed for Scanning: 2GB
File Paths Not to Scan: /vol1/cold-files/
File Extensions Not to Scan: mp3, mp4
File Extensions to Scan: *
Scan Files with No Extension: true
Request Service Timeout: 1m
Cross Junction: true
Directory Recursion: true
Scan Priority: low
Report Log Level: verbose
```

vserver vscan on-demand-task run
Run an On-Demand task

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver vscan on-demand-task run command start virus scanning immediately for an On-Demand task.
Parameters

-vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver on which you want to start virus scanning.

-task-name <text> - Task Name

This parameter specifies the name of the On-Demand task that you want to start virus scanning.

Examples

The following example starts virus scanning an On-Demand task:

```
cluster1::> vserver vscan on-demand-task run -vserver vs1 -task-name t1
[Job 161]: Vscan On-Demand job is queued. Use the "job show -id 161" command to view the status.
```

vserver vscan on-demand-task schedule

Schedule an On-Demand task

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver vscan on-demand-task schedule command schedules an On-Demand task.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver on which you want to schedule an On-Demand task.

-task-name <text> - Task Name

This parameter specifies the name of the On-Demand task that you want to schedule.

-schedule <text> - Schedule Name

This parameter specifies the already existing cron schedule. The On-Demand task triggers virus scanning for the specified scan-paths at the time configured in the schedule.

Note: A Vserver can have only one scheduled task at a time.

Examples

The following example schedules an On-Demand task:

```
cluster1::> vserver vscan on-demand-task schedule -vserver vs1 -task-name t1 -schedule daily
[Job 150]: Vscan On-Demand job is queued. Use the "job show -id 150" command to view the status.

cluster1::> vserver vscan on-demand-task show -instance -vserver vs1 -task-name t1
  Vserver: vs1
  Task Name: t1
  List of Scan Paths: /test
  Report Directory Path: /report
  Job Schedule: daily
  Max File Size Allowed for Scanning: 2GB
  File Paths Not to Scan: /vol1/cold-files/
  File Extensions Not to Scan: mp3, mp4
  File Extensions to Scan: *
  Scan Files with No Extension: true
  Request Service Timeout: 1m
  Cross Junction: true
  Directory Recursion: true
```
vserver vscan on-demand-task show

Display On-Demand tasks

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver vscan on-demand-task show command displays information about the On-Demand tasks belonging to the Vserver. If you do not specify any parameters, the command displays the following information about all On-Demand tasks:

- Vserver name
- Task name
- Scan paths
- Report directory path
- Schedule

You can specify the -fields parameter to specify which fields of information to display about On-Demand tasks. In addition to the fields above, you can display the following fields:

- Max file size
- File paths to exclude
- File extensions to exclude
- File extensions to include
- Scan files without extension
- Scan timeout
- Cross junction
- Directory recursion
- Scan priority
- Report log level

Parameters

[-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use ‘-fields ?’ to display the fields to specify.

[-instance ]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>]. Vserver

If you specify this parameter, the command displays information only about the On-Demand tasks for the specified Vserver.
[-task-name <text>] - Task Name
If you specify this parameter, the command displays information only about the specified On-Demand task.

[-scan-paths <text>, ...] - List of Scan Paths
If you specify this parameter, the command displays information only about the On-Demand tasks that have the specified path or paths in the scan-paths list.

[-report-directory <text>] - Report Directory Path
If you specify this parameter, the command displays information only about the On-Demand tasks that have the specified report-directory.

[-schedule <text>] - Job Schedule
If you specify this parameter, the command displays information only about the On-Demand tasks that have the specified schedule.

[-max-file-size {<integer>[KB|MB|GB|TB|PB]}] - Max File Size Allowed for Scanning
If you specify this parameter, the command displays information only about the On-Demand tasks that have the specified max-file-size.

[-paths-to-exclude <text>, ...] - File Paths Not to Scan
If you specify this parameter, the command displays information only about the On-Demand tasks that have the specified path or paths in the exclude list.

[-file-ext-to-exclude <File extension>, ...] - File Extensions Not to Scan
If you specify this parameter, the command displays information only about the On-Demand tasks that have the specified file extension or extensions in the exclude list.

[-file-ext-to-include <File extension>, ...] - File Extensions to Scan
If you specify this parameter, the command displays information only about the On-Demand tasks that have the specified file extension or extensions in the include list.

[-scan-files-with-no-ext {true|false}] - Scan Files with No Extension
If you specify this parameter, the command displays information only about the On-Demand tasks that have the specified value.

[-request-timeout <[<integer>h][<integer>m][<integer>s]>] - Request Service Timeout
If you specify this parameter, the command displays information only about the On-Demand tasks that have the specified request-timeout.

[-cross-junction {true|false}] - Cross Junction
If you specify this parameter, the command displays information only about the On-Demand tasks that have the specified value.

[-directory-recursion {true|false}] - Directory Recursion
If you specify this parameter, the command displays information only about the On-Demand tasks that have the specified value.

[-scan-priority {low|normal}] - Scan Priority
If you specify this parameter, the command displays information only about the On-Demand tasks that have the specified scan-priority.

[-report-log-level {verbose|info|error}] - Report Log Level
If you specify this parameter, the command displays information only about the On-Demand tasks that have the specified report-log-level.

Examples
The following example displays information about all On-Demand tasks:
The following example displays detailed information about an On-Demand task:

```
cluster1::> vserver vscan on-demand-task show -instance -vserver vs1 -task-name t1

Vserver: vs1
Task Name: t1
List of Scan Paths: /test
Report Directory Path: /report
Job Schedule: -
Max File Size Allowed for Scanning: 2GB
File Paths Not to Scan: /vol1/cold-files/
File Extensions Not to Scan: mp3, mp4
File Extensions to Scan: *
Scan Files with No Extension: true
Request Service Timeout: 1m
Cross Junction: true
Directory Recursion: true
Scan Priority: low
Report Log Level: verbose
```

vserver vscan on-demand-task unschedule

Unschedule an On-Demand task

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The vserver vscan on-demand-task unschedule command unschedules an On-Demand task.

**Parameters**
- `-vserver <vserver name>` - Vserver
  
  This parameter specifies the name of the Vserver on which you want to unschedule an On-Demand task.

- `-task-name <text>` - Task Name
  
  This parameter specifies the name of the On-Demand task that you want to unschedule.

**Examples**
The following example unschedules an On-Demand task:

```
cluster1::> vserver vscan on-demand-task unschedule -vserver vs1 -task-name t1

cluster1::> vserver vscan on-demand-task show -instance -vserver vs1 -task-name t1

Vserver: vs1
Task Name: t1
List of Scan Paths: /test
Report Directory Path: /report
Job Schedule: -
Max File Size Allowed for Scanning: 2GB
File Paths Not to Scan: /vol1/cold-files/
File Extensions Not to Scan: mp3, mp4
```
### vserver vscan on-demand-task report commands

Manage Vscan On-Demand reports

### vserver vscan on-demand-task report delete

Delete an On-Demand report

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**
The vserver vscan on-demand-task report delete command deletes an On-Demand report.

**Parameters**

- **-vserver <vserver name>** - Vserver
  
  This parameter specifies the name of the Vserver from which you want to delete an On-Demand report.

- **-task-name <text>** - Task Name
  
  This parameter specifies the name of the On-Demand task whose report you want to delete.

- **-report-file <text>** - Report File Path
  
  This parameter specifies the path of the report-file whose report record you want to delete.

  **[-delete-report-file {true|false}]** - Delete Report File Also
  
  This parameter specifies if the corresponding report file is also to be deleted. By default, it is false.

**Examples**
The following example deletes only On-Demand report record:

```bash
cluster1::> vserver vscan on-demand-task report delete -vserver vs1 -task-name t1 -report-file /rep/avod_146_20150902_161439.log

cluster1::> vserver vscan on-demand-task report delete -vserver vs1 -task-name t1 -report-file /rep/avod_146_20150902_161439.log

There are no entries matching your query.
```

The following example deletes an On-Demand report file along with the report record:

```bash
cluster1::> vserver vscan on-demand-task report delete -vserver vs1 -task-name t1 -report-file /rep/avod_146_20150902_161439.log -delete-report-file true

cluster1::> vserver vscan on-demand-task report delete -vserver vs1 -task-name t1 -report-file /rep/avod_146_20150902_161439.log -delete-report-file true

There are no entries matching your query.
```
vserver vscan on-demand-task report show

Display On-Demand reports

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver vscan on-demand-task report show command displays information about the On-Demand reports belonging to the Vserver. A new report record is generated at the end of an On-Demand task run. If you do not specify any parameters, the command displays the following information about all On-Demand tasks:

- Vserver name
- Task name
- Report file path
- Number of clean files
- Number of infected files

You can specify the -fields parameter to specify which fields of information to display about On-Demand report. In addition to the fields above, you can display the following fields:

- Job ID
- Job duration
- Number of attempted scans
- Number of files skipped from scanning
- Number of already scanned files
- Number of successful scans
- Number of failed scans
- Number of timed-out scans
- Job start time
- Job end time

Parameters

{-fields <fieldname>, ...}

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

[-instance ]

If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver

If you specify this parameter, the command displays information only about the On-Demand reports for the specified Vserver.

[-task-name <text>] - Task Name

If you specify this parameter, the command displays information only about the On-Demand reports for the specified task.
[-report-file <text>] - Report File Path
If you specify this parameter, the command displays information only about the On-Demand reports that have the specified report file-path.

[-job-id <integer>] - Job ID
If you specify this parameter, the command displays information only about the On-Demand reports that have the specified job ID.

[-job-duration <[<integer>h] [<integer>m] [<integer>s]>] - Job Duration
If you specify this parameter, the command displays information only about the On-Demand reports that have the specified value.

[-attempted-scans <integer>] - Number of Attempted Scans
If you specify this parameter, the command displays information only about the On-Demand reports that have the specified value.

[-skipped-scans <integer>] - Number of Files Skipped from Scanning
If you specify this parameter, the command displays information only about the On-Demand reports that have the specified value.

[-already-scanned-files <integer>] - Number of Already Scanned Files
If you specify this parameter, the command displays information only about the On-Demand reports that have the specified value.

[-successful-scans <integer>] - Number of Successful Scans
If you specify this parameter, the command displays information only about the On-Demand reports that have the specified value.

[-failed-scans <integer>] - Number of Failed Scans
If you specify this parameter, the command displays information only about the On-Demand reports that have the specified value.

[-timedout-scans <integer>] - Number of Timedout Scans
If you specify this parameter, the command displays information only about the On-Demand reports that have the specified value.

[-files-cleaned <integer>] - Number of Clean Files
If you specify this parameter, the command displays information only about the On-Demand reports that have the specified value.

[-files-infected <integer>] - Number of Infected Files
If you specify this parameter, the command displays information only about the On-Demand reports that have the specified value.

[-internal-error <integer>] - Number of Internal Error (privilege: advanced)
If you specify this parameter, the command displays information only about the On-Demand reports that have the specified value.

[-scan-retries <integer>] - Number of Scan Retries (privilege: advanced)
If you specify this parameter, the command displays information only about the On-Demand reports that have the specified value.

[-job-start-time <MM/DD/YYYY HH:MM:SS>] - Job Start Time
If you specify this parameter, the command displays information only about the On-Demand reports that have the specified value.

[-job-end-time <MM/DD/YYYY HH:MM:SS>] - Job End Time
If you specify this parameter, the command displays information only about the On-Demand reports that have the specified value.
Examples

The following example displays information about all On-Demand reports:

```bash
cluster1::> vscan on-demand-task report show

Vserver     Task Name   Report File Path                     Cleaned  Infected
----------- ----------  ---------------------------------- --------- ---------
vs1         t1          /rep/avod_146_20150902_161439.log       6240         5
vs1         t1          /rep/avod_149_20150903_160313.log        115         0

2 entries were displayed.
```

The following example displays detailed information about an On-Demand task:

```bash
cluster1::> vscan on-demand-task report show -vserver vs1 -task-name t1
  -report-file /rep/avod_146_20150902_161439.log

Vserver: vs1
Task Name: t1
Report File Path: /rep/avod_146_20150902_161439.log
Job ID: 146
Job Duration: 76s
Number of Attempted Scans: 6245
Number of Files Skipped from Scanning: 1286
Number of Already Scanned Files: 987
Number of Successful Scans: 6245
Number of Failed Scans: 0
Number of Timedout Scans: 0
Number of Clean Files: 6240
Number of Infected Files: 5
Job Start Time: 9/2/2015 16:14:39
Job End Time: 9/2/2015 16:15:55
```

**vserver vscan scanner-pool commands**

Manage Vscan scanner pools

**vserver vscan scanner-pool apply-policy**

Apply scanner-policy to a scanner pool

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**
The `vserver vscan scanner-pool apply-policy` command applies a scanner policy to the specified scanner pool on a specified Vserver.

**Parameters**

- **-vserver <vserver name>** - *Vserver*
  This parameter specifies the name of the Vserver on which you want to apply the scanner policy. The Vserver administrator can apply the scanner policy to a scanner pool created within the scope of the Vserver or the cluster. The cluster administrator can apply the scanner policy to a scanner pool for any Vserver but cannot apply it within the scope of cluster. The scope is determined at a Vserver level.

- **-scanner-pool <Scanner pool>** - *Scanner Pool*
  This parameter specifies the name of the scanner pool.
-scanner-policy <Scanner policy> - Scanner Policy

This parameter specifies the scanner policy that you want to apply to the specified scanner pool on a Vserver. Currently only system policies are available. Available system policies are:

- **primary** - Makes it active always.
- **secondary** - Makes it active only when none of the primary external virus-scanning servers are connected.
- **idle** - Makes it inactive always.

[-cluster <Cluster name>] - Cluster on Which Policy Is Applied

This parameter specifies the name of the cluster on which you want to apply the scanner policy of a scanner pool. By default, it is applied on the local cluster. This parameter does not have any significance if the cluster is not in a DR relationship.

### Examples

The following command applies a scanner policy to the specified scanner pool on a specified Vserver.

```
cluster1::> vserver vsan scanner-pool apply-policy -vserver vs1
   -scanner-pool p1 -scanner-policy primary -cluster cluster2

cluster1::> vserver vsan scanner-pool show -vserver vs1 -scanner-pool p1
Vserver: vs1
Scanner Pool: p1
Applied Policy: primary
Current Status: on
Cluster on Which Policy Is Applied: cluster2
Scanner Pool Config Owner: vserver
List of IPs of Allowed Vscan Servers: 1.1.1.1, 2.2.2.2
List of Privileged Users: cifs\u1, cifs\u2
```

**vserver vsan scanner-pool create**

Create a scanner pool

**Availability:** This command is available to cluster and Vserver administrators at the admin privilege level.

**Description**

The `vserver vsan scanner-pool create` command creates a Vscan scanner pool. Scanner pool is a set of attributes which are used to validate and manage connection between clustered Data ONTAP and external virus-scanning server, or "Vscan server". It also specifies other parameters which are used for connection management. After creating a scanner pool, a scanner-policy must be applied to it using the command `vserver vsan scanner-pool apply-policy`. The default applied policy is idle, which means the scanner pool is inactive.

**Parameters**

- **-vserver <vserver name>** - Vserver

  This parameter specifies the name of the Vserver on which you want to create a scanner pool.

- **-scanner-pool <Scanner pool>** - Scanner Pool

  This parameter specifies the name of the scanner pool. Scanner pool name can be up to 256 characters long and is a string that can only contain any combination of ASCII-range alphanumeric characters (a-z, A-Z, 0-9), ".", ",", and ".".
-hostnames <text>, ... - List of Host Names of Allowed Vscan Servers

This parameter specifies a list of host names or IP addresses of the Vscan servers which are allowed to connect to clustered Data ONTAP.

-privileged-users <Privileged user>, ... - List of Privileged Users

This parameter specifies a list of privileged users. A valid form of privileged user-name is "domain-name\user-name" and can be up to 256 characters long. Privileged user-names are stored and treated as case-insensitive strings. Virus scanners must use one of the registered privileged users for connecting to clustered Data ONTAP for exchanging virus-scanning protocol messages and to access file for scanning, remedying and quarantining operations.

[-request-timeout </integer>h] [<integer>m] [<integer>s>] - Request Service Timeout (privilege: advanced)

This parameter specifies the timeout value for a scan request. It specifies the time interval in which the node waits for a response from the Vscan server. If the timeout is reached, the node allows the file-operation if the applicable On-Access policy has scan-mandatory set to 'off'. If the policy has scan-mandatory set to 'on', then the node will retry the scan or disallow the file-operation depending on the remaining lifetime of the CIFS request. Valid values for this field are from 10s to 40s. However, if scan-mandatory is set to 'off', the effective value is limited to a maximum of 35s. The default value is 30s.

[-scan-queue-timeout </integer>h] [<integer>m] [<integer>s>] - Scan Queue Timeout (privilege: advanced)

This parameter specifies the timeout value for a scan request in scan-engine's queue. The value for this field must be between 10s and 30s. By default, it is 20s.

[-session-setup-timeout </integer>h] [<integer>m] [<integer>s>] - Session Setup Timeout (privilege: advanced)

This parameter specifies the timeout value for a response for session-setup-message. The value for this field must be between 5s and 10s. By default, it is 10s.

[-session-teardown-timeout </integer>h] [<integer>m] [<integer>s>] - Session Teardown Timeout (privilege: advanced)

This parameter specifies the timeout value for a response for session-teardown-message, or for any message to be received for a session-id, after the underlying connection has been disconnected. The value for this field must be between 5s and 10s. By default, it is 10s.

[-max-session-setup-retries <integer>] - Max Number of Consecutive Session Setup Attempts (privilege: advanced)

This parameter specifies the maximum number of consecutive session-setup attempts. The value for this field must be between 1 and 10. By default, it is 5.

Examples

The following example creates a scanner pool.

```
Cluster1::> vserver vscan scanner-pool create -vserver vs1 -scanner-pool SP 
    -hostnames 1.1.1.1,vmwin204-27.fsct.nb -privileged-users cifs\u1,cifs\u2

Cluster1::> vserver vscan scanner-pool show -vserver vs1 -scanner-pool SP

  Vserver: vs1
  Scanner Pool: SP
  Applied Policy: idle
  Current Status: off
  Cluster on Which Policy Is Applied: -
  Scanner Pool Config Owner: vserver
  List of IPs of Allowed Vscan Servers: 1.1.1.1, 10.72.204.27
```
List of Host Names of Allowed Vscan Servers: 1.1.1.1, vmwin204-27.fsct.nb
List of Privileged Users: cifs\u1, cifs\u2

vserver vscan scanner-pool delete
Delete a scanner pool

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver vscan scanner-pool delete command deletes a scanner pool.

Parameters
- vserver <vserver name> - Vserver
  This parameter specifies the name of the Vserver from which you want to delete a scanner pool.

- scanner-pool <Scanner pool> - Scanner Pool
  This parameter specifies the name of the scanner-pool that you want to delete.

Examples
The following example deletes a scanner pool.

    cluster1::> vserver vscan scanner-pool delete -vserver vs1 -scanner-pool test
    cluster1::> vserver vscan scanner-pool show -vserver vs1 -scanner-pool test
    There are no entries matching your query.

vserver vscan scanner-pool modify
Modify a scanner pool

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver vscan scanner-pool modify command modifies a Vscan scanner pool. Scanner pool is a set of attributes which are used to validate and manage connection between clustered Data ONTAP and external virus-scanning server, or "Vscan server". It also specifies other parameters which are used for connection management.

Parameters
- vserver <vserver name> - Vserver
  This parameter specifies the name of the Vserver on which you want to modify a scanner pool.

- scanner-pool <Scanner pool> - Scanner Pool
  This parameter specifies the name of the scanner pool. Scanner pool name can be up to 256 characters long and is a string that can only contain any combination of ASCII-range alphanumeric characters (a-z, A-Z, 0-9), "_", "," and ".".
[-hostnames <text>, ...] - List of Host Names of Allowed Vscan Servers

This parameter specifies a list of host names or IP addresses of the Vscan servers which are allowed to connect to clustered Data ONTAP.

[-privileged-users <Privileged user>, ...] - List of Privileged Users

This parameter specifies a list of privileged users. A valid form of privileged user-name is "domain-name\user-name" and can be up to 256 characters long. Privileged user-names are stored and treated as case-insensitive strings. Virus scanners must use one of the registered privileged users for connecting to clustered Data ONTAP for exchanging virus-scanning protocol messages and to access file for scanning, remedying and quarantining operations.

[-request-timeout <[<integer>h][<integer>m][<integer>s]>] - Request Service Timeout (privilege: advanced)

This parameter specifies the timeout value for a scan request. It specifies the time interval in which the node waits for a response from the Vscan server. If the timeout is reached, the node allows the file-operation if the applicable On-Access policy has scan-mandatory set to 'off'. If the policy has scan-mandatory set to 'on', then the node will retry the scan or disallow the file-operation depending on the remaining lifetime of the CIFS request. Valid values for this field are from 10s to 40s. However, if scan-mandatory is set to 'off', the effective value is limited to a maximum of 35s.

[-scan-queue-timeout <[<integer>h][<integer>m][<integer>s]>] - Scan Queue Timeout (privilege: advanced)

This parameter specifies the timeout value for a scan request in scan-engine's queue. The value for this field must be between 10s and 30s.

[-session-setup-timeout <[<integer>h][<integer>m][<integer>s]>] - Session Setup Timeout (privilege: advanced)

This parameter specifies the timeout value for a response for session-setup-message. The value for this field must be between 5s and 10s.

[-session-teardown-timeout <[<integer>h][<integer>m][<integer>s]>] - Session Teardown Timeout (privilege: advanced)

This parameter specifies the timeout value for a response for session-teardown-message, or for any message to be received for a session-id, after the underlying connection has been disconnected. The value for this field must be between 5s and 10s.

[-max-session-setup-retries <integer>] - Max Number of Consecutive Session Setup Attempts (privilege: advanced)

This parameter specifies the maximum number of consecutive session-setup attempts. The value for this field must be between 1 and 10.

### Examples

The following example modifies a scanner pool.

```
Cluster1::> vserver vscan scanner-pool modify -vserver vs1 -scanner-pool SP
                   -hostnames 2.2.2.2,vmwin204-29.fsct.nb -privileged-users cifs\u3
Cluster1::> vserver vscan scanner-pool show -vserver vs1 -scanner-pool SP

  Vserver: vs1
  Scanner Pool: SP
  Applied Policy: idle
  Current Status: off
  Cluster on Which Policy Is Applied: -
  Scanner Pool Config Owner: vserver
  List of IPs of Allowed Vscan Servers: 2.2.2.2, 10.72.204.29
```
vserver vscan scanner-pool resolve-hostnames

Resolve the hostnames configured in the scanner pool

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver vscan scanner-pool resolve-hostnames command resolves the hostnames configured in the scanner pool and update it with the IP addresses. This command also updates the active scanner pool configuration of the Vserver if the scanner pool is part of that. You must run this command for the scanner pool whose host name entry is modified in the DNS server.

Parameters
-vserver <vserver> - Vserver
This parameter specifies the name of the Vserver for which you want to resolve host names.

-scanner-pool <Scanner pool> - Scanner Pool
This parameter specifies the name of the scanner pool for which you want to resolve host names.

Examples
The following example resolves the host names of a scanner pool:

```bash
cluster1::> vserver vscan scanner-pool resolve-hostnames -vserver vs1 -scanner-pool SP
Cluster1::> vserver vscan scanner-pool show -vserver vs1 -scanner-pool SP
Vserver: vs1
Scanner Pool: SP
Applied Policy: primary
Current Status: on
Cluster on Which Policy Is Applied: Cluster1
Scanner Pool Config Owner: vserver
List of IPs of Allowed Vscan Servers: 10.72.204.27, 10.72.204.29
List of Host Names of Allowed Vscan Servers: vmwin204-27.fsct.nb, vmwin204-29.fsct.nb
List of Privileged Users: cifs\u1, cifs\u2
```

vserver vscan scanner-pool show

Display scanner pools

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver vscan scanner-pool show command displays information about the Vscan scanner pools belonging to the Vserver. It also displays the scanner policy applied to the scanner pool and its current status in Vserver scope. If you do not specify any parameters, the command displays the following information about all scanner pools:

- Vserver name
- Scanner pool
• Scanner pool owner
• Scanner policy
• Current status
• Cluster on which policy is applied
• List of servers
• List of host names
• List of privileged user

Parameters

{-fields <fieldname>, ...} [If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.]

{-instance} [If you specify the -instance parameter, the command displays detailed information about all fields.]

{-vserver <vserver name>} - Vserver
[If you specify this parameter, the command displays information only about the scanner pools for the specified Vserver.]

{-scanner-pool <Scanner pool>} - Scanner Pool
[If you specify this parameter, the command displays information only about the specified scanner pool.]

{-scanner-policy <Scanner policy>} - Applied Policy
[If you specify this parameter, the command displays information only about the scanner pools for the specified scanner policy.]

{-current-status {on|off}} - Current Status
[If you specify this parameter, the command displays information only about the scanner pools that have the specified status.]

{-cluster <Cluster name>} - Cluster on Which Policy Is Applied
[If you specify this parameter, the command displays information only about the scanner pools that are applied to the specified cluster.]

{-owner <Configuration owner>} - Scanner Pool Config Owner
[If you specify this parameter, the command displays information only about the scanner pools that have the specified owner.]

{-servers <IP Address>, ...} - List of IPs of Allowed Vscan Servers
[If you specify this parameter, the command displays information only about the scanner pools that have the specified IP address or IP addresses.]

{-hostnames <text>, ...} - List of Host Names of Allowed Vscan Servers
[If you specify this parameter, the command displays information only about the scanner pools that have the specified host name or host names.]

{-privileged-users <Privileged user>, ...} - List of Privileged Users
[If you specify this parameter, the command displays information only about the scanner pools that have the specified privileged user or users.]
-request-timeout <[integer]h][integer]m[integer]s> - Request Service Timeout (privilege: advanced)
  If you specify this parameter, the command displays information only about the scanner pools that have the specified request-timeout.

-scan-queue-timeout <[integer]h][integer]m[integer]s> - Scan Queue Timeout (privilege: advanced)
  If you specify this parameter, the command displays information only about the scanner pools that have the specified scan-queue-timeout.

  If you specify this parameter, the command displays information only about the scanner pools that have the specified session-setup-timeout.

-session-teardown-timeout <[integer]h][integer]m[integer]s> - Session Teardown Timeout (privilege: advanced)
  If you specify this parameter, the command displays information only about the scanner pools that have the specified session-teardown-timeout.

-max-session-setup-retries <integer> - Max Number of Consecutive Session Setup Attempts (privilege: advanced)
  If you specify this parameter, the command displays information only about the scanner pools that have the specified max-session-setup-retries.

**Examples**

The following example displays information about all scanner pools.

```
Cluster1::> vserver vsan scanner-pool show
Vserver: vs1
  Pool: SP
  Owner: vserver
  Servers: 1.1.1.1, 10.72.204.27
  Users: cifs\u1, cifs\u2
  Policy: primary
2 entries were displayed.
```

The following example displays detailed information about one scanner pool.

```
Cluster1::> vserver vsan scanner-pool show -vserver vs1 -scanner-pool SP
Vserver: vs1
  Scanner Pool: SP
  Owner: vserver
  Servers: 1.1.1.1, 10.72.204.27
  Privileged Users: cifs\u1, cifs\u2
  Policy: primary
  Current Status: on
  Cluster on Which Policy Is Applied: Cluster1
  Scan Config Owner: vserver
  List of IPs of Allowed Vscan Servers: 1.1.1.1, 10.72.204.27
  List of Host Names of Allowed Vscan Servers: 1.1.1.1, vmwin204-27.fsct.nb
  List of Privileged Users: cifs\u1, cifs\u2
```

**vserver vsan scanner-pool show-active**

Display active scanner pools

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.
The vserver vscan scanner-pool show-active command displays active scanner pool information available to the Vserver. The active scanner pool configuration is derived by merging the information of the scanner pools which are currently active on a Vserver. If you do not specify any parameters, the command displays the following information about all Vservers:

- Vserver name
- List of scanner pools
- List of servers
- List of privileged user

Parameters

[-fields <fieldname>, ...]
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

[-instance ]
If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name> ] - Vserver
If you specify this parameter, the command displays information only about the specified Vserver.

[-scanner-pools <Scanner pool>, ...] - List of Enabled Scanner Pools
If you specify this parameter, the command displays information only about the Vservers that have the specified scanner pool or pools. A scanner pool becomes part of this list if it is active at this time.

[-servers <IP Address>, ...] - Merged List of IPs of Allowed Vscan Servers
If you specify this parameter, the command displays information only about the Vservers that have the specified server or servers. Servers of all active scanner pools on a Vserver are merged to derive this effective server list.

[-privileged-users <Privileged user>, ...] - Merged List of Privileged Users
If you specify this parameter, the command displays information only about the Vservers that have the specified privileged user or users. Privileged users of all active scanner pools on a Vserver are merged to derive this effective privileged user list.

[-request-timeout <[<integer>h] [<integer>m] [<integer>s]> ] - Request Service Timeout (privilege: advanced)
If you specify this parameter, the command displays information only about the Vservers that have the specified request-timeout. This is set to the maximum value of the request-timeout of all active scanner pools on a Vserver.

[-scan-queue-timeout <[<integer>h] [<integer>m] [<integer>s]> ] - Scan Queue Timeout (privilege: advanced)
If you specify this parameter, the command displays information only about the Vservers that have the specified scan-queue-timeout. This is set to the maximum value of the scan-queue-timeout of all active scanner pools on a Vserver.

[-session-setup-timeout <[<integer>h] [<integer>m] [<integer>s]> ] - Session Setup Timeout (privilege: advanced)
If you specify this parameter, the command displays information only about the Vservers that have the specified session-setup-timeout. This is set to the maximum value of the session-setup-timeout of all active scanner pools on a Vserver.
[-session-teardown-timeout <[integer]h][<integer>m][<integer>s>] - Session Teardown Timeout (privilege: advanced)

If you specify this parameter, the command displays information only about the Vservers that have the specified session-teardown-timeout. This is set to the maximum value of the session-teardown-timeout of all active scanner pools on a Vserver.

[-max-session-setup-retries <integer>] - Max Number of Consecutive Session Setup Attempts (privilege: advanced)

If you specify this parameter, the command displays information only about the Vservers that have the specified max-session-setup-retries. This is set to the maximum number of the max-session-setup-retry of all active scanner pools on a Vserver.

Examples

The following example displays information about active scanner pool on all Vservers.

<table>
<thead>
<tr>

</table>

2 entries were displayed.

vserver vscan scanner-pool privileged-users commands

Manage list of privileged users of a scanner pool

vserver vscan scanner-pool privileged-users add

Add to the list of privileged users

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver vscan scanner-pool privileged-users add command adds one privileged users or list of privileged users to the specified scanner pool.

Parameters

- vserver <vserver name> - Vserver

This parameter specifies the name of the Vserver containing the specified scanner pool on which you want to add a privileged user or users.

- scanner-pool <Scanner pool> - Scanner Pool

This parameter specifies the name of the scanner pool to which you want to add a privileged user or users.
-privileged-users <Privileged user>, ... - List of Privileged Users

This parameter specifies the privileged user or users that you want to add to the specified scanner pool.

Examples

The following example adds a list of privileged users to the specified scanner pool.

```
cluster1::> vserver vscan scanner-pool privileged-users add -vserver vs1
       -scanner-pool pl -privileged-users cifs\u2,cifs\u3

cluster1::> vserver vscan scanner-pool privileged-users show -vserver vs1
       -scanner-pool pl
          Vserver: vs1
          Scanner Pool: pl
          List of Privileged Users: cifs\u1, cifs\u2, cifs\u3
```

vserver vscan scanner-pool privileged-users remove

Remove from the list of privileged users

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description

The vserver vscan scanner-pool privileged-users remove command removes one privileged user or list of privileged users from the specified scanner pool. All the existing privileged users of a scanner pool cannot be removed.

Parameters

- `vserver <vserver name>` - Vserver
  
  This parameter specifies the name of the Vserver containing the specified scanner pool on which you want to remove a privileged user or users.

- `scanner-pool <Scanner pool>` - Scanner Pool
  
  This parameter specifies the name of the scanner pool from which you want to remove a privileged user or users.

- `privileged-users <Privileged user>, ...` - List of Privileged Users
  
  This parameter specifies the privileged user or users that you want to remove from the specified scanner pool.

Examples

The following example removes a list of privileged users from the specified scanner pool.

```
cluster1::> vserver vscan scanner-pool privileged-users remove -vserver vs1
       -scanner-pool pl -privileged-users cifs\u2,cifs\u3

cluster1::> vserver vscan scanner-pool privileged-users show -vserver vs1
       -scanner-pool pl
          Vserver: vs1
          Scanner Pool: pl
          List of Privileged Users: cifs\u1
```
**vserver vscan scanner-pool privileged-users show**

Display list of privileged users

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The `vserver vscan scanner-pool privileged-users show` command displays the list of privileged users of the Vscan scanner pools belonging to the Vserver. If you do not specify any parameters, the command displays the following information about the scanner pools:

- Vserver name
- Scanner pool
- List of privileged users

**Parameters**

```
[-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

```
[-instance]]
```

If you specify the `-instance` parameter, the command displays detailed information about all fields.

```
[-vserver <vserver name>] - Vserver
```

If you specify this parameter, the command displays information only about the scanner pools for the specified Vserver.

```
[-scanner-pool <Scanner pool>] - Scanner Pool
```

If you specify this parameter, the command displays information only for the specified scanner pool.

```
[-privileged-users <Privileged user>, ...] - List of Privileged Users
```

If you specify this parameter, the command displays information only about the scanner pools that have the specified privileged user or users.

**Examples**

The following example displays the list of privileged users of all scanner pools.

```
cluster1::> vserver vscan scanner-pool privileged-users show
<table>
<thead>
<tr>
<th>Vserver</th>
<th>Scanner Pool</th>
<th>Privileged Users</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cluster</td>
<td>clus</td>
<td>cifs\u5</td>
</tr>
<tr>
<td>vs1</td>
<td>new</td>
<td>cifs\u7</td>
</tr>
<tr>
<td>vs1</td>
<td>clus</td>
<td>cifs\u5</td>
</tr>
<tr>
<td>vs1</td>
<td>pl</td>
<td>cifs\u1, cifs\u2</td>
</tr>
<tr>
<td>vs2</td>
<td>clus</td>
<td>cifs\u5</td>
</tr>
<tr>
<td>vs2</td>
<td>p2</td>
<td>cifs\u2</td>
</tr>
</tbody>
</table>
```

**vserver vscan scanner-pool servers commands**

Manage list of servers of a scanner pool
**vserver vscan scanner-pool servers add**

Add to the list of hostnames

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**
The `vserver vscan scanner-pool servers add` command adds one server or list of servers to the specified scanner pool.

**Parameters**

- `-vserver <vserver name>` - Vserver
  
  This parameter specifies the name of the Vserver containing the specified scanner pool on which you want to add a server or groups.

- `-scanner-pool <Scanner pool>` - Scanner Pool
  
  This parameter specifies the name of the scanner pool to which you want to add a server or groups.

- `-hostnames <text>, ... - List of Host Names for Vscan Servers`
  
  This parameter specifies the host name or host names that you want to add to the specified scanner pool.

**Examples**
The following example adds a list of servers to the specified scanner pool.

```bash
Cluster1::> vserver vscan scanner-pool servers add -vserver vs1 -scanner-pool SP -hostnames 2.2.2.2, vmwin204-27.fsct.nb
Cluster1::> vserver vscan scanner-pool servers show -vserver vs1 -scanner-pool SP
  
  Vserver: vs1
  Scanner Pool: SP
  List of IPs of Allowed Vscan Servers: 1.1.1.1, 2.2.2.2, 10.72.204.27
  List of Host Names of Allowed Vscan Servers: 1.1.1.1, 2.2.2.2, vmwin204-27.fsct.nb
```

**vserver vscan scanner-pool servers remove**

Remove from the list of hostnames

**Availability:** This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

**Description**
The `vserver vscan scanner-pool servers remove` command removes one server or list of servers from the specified scanner pool. All the existing servers of a scanner pool cannot be removed.

**Parameters**

- `-vserver <vserver name>` - Vserver
  
  This parameter specifies the name of the Vserver containing the specified scanner pool on which you want to remove a server or groups.

- `-scanner-pool <Scanner pool>` - Scanner Pool
  
  This parameter specifies the name of the scanner pool from which you want to remove a server or groups.

- `-hostnames <text>, ... - List of hostnames for Vscan Servers`
  
  This parameter specifies the host name or host names that you want to remove from the specified scanner pool.
Examples
The following example removes a list of servers from the specified scanner pool.

```
Cluster1::> vserver vsca scanner-pool servers remove -vserver vs1 -scanner-pool SP -hostnames vmwin204-27.fsct.nb
Cluster1::> vserver vsca scanner-pool servers show -vserver vs1 -scanner-pool SP
```

Vserver: vs1
Scanner Pool: SP
List of IPs of Allowed Vscan Servers: 1.1.1.1, 2.2.2.2
List of Host Names of Allowed Vscan Servers: 1.1.1.1, 2.2.2.2

vserver vsca scanner-pool servers show
Display list of servers

Availability: This command is available to cluster and Vserver administrators at the admin privilege level.

Description
The vserver vsca scanner-pool servers show command displays the list of servers of the Vscan scanner pools belonging to the Vserver. If you do not specify any parameters, the command displays the following information about all scanner pools:

- Vserver name
- Scanner pool
- List of servers

Parameters

```
[-fields <fieldname>, ...]  
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

[-instance ]]  
If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver  
If you specify this parameter, the command displays information only about the scanner pools for the specified Vserver.

[-scanner-pool <Scanner pool>] - Scanner Pool  
If you specify this parameter, the command displays information only for the specified scanner pool.

[-servers <IP Address>, ...] - List of IPs of Allowed Vscan Servers  
If you specify this parameter, the command displays information only about the scanner pools that have the specified IP address or IP addresses.

[-hostnames <text>, ...] - List of Host Names of Allowed Vscan Servers  
If you specify this parameter, the command displays information only about the scanner pools that have the specified host name or host names.
```

Examples
The following example displays the list of servers of all scanner pools.
The following example displays the list of servers and host names of all scanner pools.

```bash
cluster1::> vserver vscan scanner-pool servers show -instance  
Vserver: vs1  
Scanner Pool: SP  
List of IPs of Allowed Vscan Servers: 1.1.1.1, 10.72.204.27  
List of Host Names of Allowed Vscan Servers: 1.1.1.1, vmwin204-27.fsct.nb  
Vserver: vs2  
Scanner Pool: p1  
List of IPs of Allowed Vscan Servers: 10.72.204.29  
List of Host Names of Allowed Vscan Servers: vmwin204-29.fsct.nb  
2 entries were displayed.
```
